Alkaloids play as antioxidant. It reduces ROS which causes oxidative damage by peroxidation, oxidation of cellular lipid, proteins, and DNA. Saponins can reduce blood cholesterol level, plays as anti-hepatic fibrosis agent, and acts as anti-inflammation [3–5]. Tannins are polyphenolic compound which in certain dose has role as anti-diabetic, anti-adipogenic, antipyretic, and antiseptic [2,6].

It is commonly found in diabetic patient that the number of ROS increase and leads to damage tissue, such as: damaging macro-vascular and micro-vascular which contributes to the other complication development like nephropathy and retinopathy diabetic [7]. ROS incline to attack phospholipid bilayer in cell membrane. The stabilized final substrate which produced by this reaction called malondialdehyde (MDA), which could be the marker of the amount of free radicals which damaging human tissues.

MDA blood level in diabetic patient which has heart complication is higher than diabetic patient without complication [8]. The similar condition also found in diabetic patient with insulin therapy than without insulin therapy [9]. The increasing amount of MDA is marker of increasing lipid peroxidation, which imply the reduction amount of body's antioxidant [10]. Antioxidants in the body include enzymatic and non-enzymatic antioxidants.

One of enzymatic antioxidants is superoxide dismutase (SOD). It has role as a catalyst in the reaction of changing radical superoxide anion to hydrogen peroxide and oxygen molecule. It has important function in protecting cell from damaging. In type 2 diabetic patients, SOD inhibit the complication of nephropathy and retinopathy diabetes mellitus [11]. Extracellular SOD has big responsibility in protect pancreas beta cell from ROS's damaging.

According to the description above, researchers thought that it's necessary to conduct research about Tithonia diversifolia leaves extract and its effects to MDA, SOD, and blood glucose level in rats induced diabetes and high fat diets, comparing with catechin's action as comparative drugs.

Material and Method

The research's design was Randomized Posttest Control Group Design. Animals that used in this study were Wistar strain rats (Rattus norvegicus), male, age between 2-3 months, weight between 150-200 grams and physically fit obtained from the Animal Implementing Unit Faculty of Medicine, Universitas Airlangga Surabaya Indonesia. The sample size were 8 rats x 4 groups = 32 rats.

Rats were given food special pellet feed and drinking ad libitum. After being adapted for 1 week, rats were divided in 4 groups. Each group of white rats contained 8 rats. There were 1 control group and 3 treatment groups. Control group was given aquades. Treatment groups were induced a dose 60 mg/kg bw of Streptozotocin (Stz) and giving a high-fat diet for 30 days. In 31st day, D2 group was given 100 mg/kg bw extract, and D3 group was given catechin as comparative drug at 10 mg/kg bw for 7 days. After that, all rats were taken for blood samples to measure the level of blood glucose, MDA and SOD level. Data were analyzed by SPSS 21 with ANOVA to measure the difference blood glucose, MDA, and SOD level among each group.

Finding:

Table 1. Average glucose levels (mg/dl) in the control and treatment groups

Groups	n	Mean±SD	Min	Max	p
D0	8	150,375±15,070	130,00	175,00	0,020*
D1	8	226,625±74,630	152,00	359,00	
D2	8	203,75±62,490	142,00	327,00	
D3	8	234,125±122,804	130,00	490,00	

*p<0.05 imply there is significant difference between groups

Table 2. Difference blood glucose level among each control group and treatment groups

Paired Groups	p
D0 – D1	0,002*
D0 – D2	0,007*
D0 – D3	0,105
D1 – D2	0,442
D1 – D3	0,505
D2 – D3	0,878

*p<0.05 imply there is significant difference between paired groups

Table 3. Average MDA levels (mg/dl) in the control and treatment groups

Groups	n	Mean±SD	Min	Max	p
D0	8	108,171±26,669	75,801	156,250	0,103
D1	8	176,404±60,078	108,897	284,040	
D2	8	209,237±129,145	106,246	503,730	
D3	8	196,647±87,953	95,298	389,162	

Table 4. Average SOD levels (mg/dl) in the control and treatment groups

Groups	n	Mean±SD	Min	Max	p
D0	8	0,138±0,059	0,052	0,257	0,207
D1	8	0,091±0,039	0,005	0,145	
D2	8	0,109±0,044	0,037	0,202	
D3	8	0,142±0,065	0,018	0,239	

Tithonia diversifolia leaves extract is more effective to reduce blood glucose level than catechin, the comparative drugs. It has been proven by the results which showed that D2 had lower level of blood glucose than D3 (Table 1). Tithonia diversifolia extract can also be a barrier to hyperinsulinemia in diabetes with streptozotocin induction and a high-fat diet. There was differences in the average glucose levels in the control and treatment groups.

The elevation of blood glucose happened in rat-induced streptozotocin. This is consistent with Samarghandian et al that blood glucose increases significantly after streptozotocin induction[12]. Olukunle et al reported that Tithonia diversifolia leaves extract significantly decrease the plasma glucose of rats induced diabetes mellitus because it improved insulin action in the cellular level[13]. Thongsom et al analyzed the total phenolic content of Tithonia diversifolia leaves is 55.92 ± 4.45 GAE mg/g and antioxidant capacity is 93.09 ± 37.91 uM TEAC/mg dry weight [14]. This amount is higher than antioxidant capacity in dietary vitamin and mineral.

Sibul et al reported significant positive correlation between phenolic and total antioxidant activity which reduce the number of reactive oxygen species (ROS) [15]. It has been known that increasing ROS also happen in diabetes patient. In diabetes mellitus patient, ROS attacks beta cell of pancreas and imply to inflammation and cell dysfunction [16]. Tagne et al reported that Tithonia diversifolia also contained flavonoid which showed as anti-diabetic effect by reducing the oxidative stress [1,17]. Flavonoid enhances GLUT-2 expression in beta cell and GLUT-4 translocation [18]. Therefore, it could be concluded that flavonoid improves glucose metabolism [19].

Nagao et al reported that there was no significant difference in blood glucose level between control and catechin treatment group in diabetes mellitus patients [20]. Other study showed that catechin injection with dosage more than 20 mg/kg BW among treatment group can reduce glucose level [12]. It has been proven that catechin has anti-diabetic effect [21]. In this research, the dosage of 10 mg/kg BW catechin which was given to rats induced diabetes. It can be concluded that the catechin dosage in this study was lower, therefore blood glucose level wasn't reduced significantly.

Streptozotocin also causes the elevation level of MDA, beside of blood glucose level [12]. MDA can be used as the marker of oxidative stress level, especially in lipid peroxidation [10]. In diabetes mellitus patient, oxidative stress alters macronutrients metabolism and increases risk of endothelial dysfunction and trigger the development of atherosclerosis [12]. Oxidative stress increases the progression and complication development of diabetes mellitus. MDA level increased significantly in diabetic patient with complication [22]. According to the result, MDA level of D2 treatment group was higher than other group. D2 was treated by Tithonia diversifolia leaves extract. D3, group with comparative drugs – catechin – had lower level of MDA than D2. Meanwhile, there was no significant different between each groups in this study ($p>0.05$).

Thongsom et al reported that injection of Tithonia

diversifolia in rats induced diabetes was significantly reduce the MDA level in liver and pancreas tissue [14]. It refers that Tithonia diversifolia treatment reduce the lipid peroxidation. Injection of catechin also related with increasing antioxidant enzyme and reducing lipid peroxidation [12]. Catechin enriched was observed decrease intra-abdominal fat [23] which is correlate with degenerative disease incidence, such as: diabetes mellitus. In this study, treatment groups were given high fat diet.

More amount of catechin in treatment group, the MDA level was lower [12]. According to the result (Table 3), in the dosage of 10 mg/kg BW; catechin was more effective to reduce MDA level than Tithonia diversifolia leaves extract in the dosage of 100 mg/kg BW. It also relates with catechin's role in preventing the onset of pancreatic islet cells from damaging of ROS [24,25].

Hyperglycemia also causes increased production of ROS because of auto-oxidation of glucose and protein glycolylation [14] [26]. Free radicals are molecules that are easy to diffuse and damage the biomolecules which cause short-lived cells [27,28]. In normal metabolism, ROS is produced from oxygen molecular [29]. During oxidative stress, the amount of antioxidant is not enough to handle free radicals or ROS which play an important role in several diseases' pathophysiology by means of redox reaction [30,31]. Higher redox reaction between ROS and antioxidant caused higher level of MDA level.

SOD acts as a catalyst in superoxide anion dismutase which is radical into hydrogen peroxide and oxygen molecules. SOD has a role in protecting cell and tissue damage caused by ROS. SOD is an antioxidant that acts against superoxide, both in the kidneys which are at risk of developing diabetes nephropathy or in eye tissue which is at risk of developing diabetes retinopathy [7]. Research in diabetic induced mice found that there was a decrease in SOD and other antioxidant enzymes in liver tissue [32].

The result showed that there was no significant difference of SOD level between all groups, but catechin-treatment group had higher level of SOD than Tithonia diversifolia group (Table 4). SOD activity has increased in catechin-treat-diabetic rats [12]. The SOD level was higher in treatment group with highest dose of catechin [12]. When the SOD level is high, more amount of SOD prevents human body from ROS; therefore the level of MDA is lower. The other side, when the SOD level is low; the body's antioxidant capacity is also lower and MDA is formed more because of ROS.

Conclusion

Streptozotocin induction causes changes in glucose levels in the treatment group. There were differences in glucose levels in the treatment and control groups. Both Tithonia diversifolia and catechin have antioxidant and anti-diabetic action which relate with blood glucose and oxidative stress. In this study, oxidative stress was determined by MDA and SOD level. There were no significant differences in MDA and SOD level, even the MDA level was higher in Tithonia diversifolia leaves extract treatment group and SOD level was higher in catechin treatment group.

Conflict of Interest: All authors who have participated in preparation of this manuscript declare that we have no conflict of interest.

Source of Funding: This study was supported by The Ministry of Research, Technology and Higher Education of Indonesia. The authors were grateful for Institution of Research and Innovation Universitas Airlangga for completion of research project (Grant No.200/UN3.14/LT/2018).

Comparison between the Antioxidant Activity of Volatile Oil and Hydrosol in Eucalyptus Camaldulensis (Young and Adult) Leaves

Lamiaa A. Gharb

Department of Biology, College of Science,University of Baghdad, Iraq

Abstract

Essential oils have been reported as an important compounds in the pharmaceutical industries for their antibacterial and antioxidant activity. This study was conducted to investigate the antioxidant activity of Eucalyptus *camaldulensis* volatile oil and hydrosol obtained from young and adult leaves. Oil extraction was carried out by using steam distillation method. The antioxidant power was estimated by using the DPPH (2,2-diphenyl-1,1-picrylhydrazyl) and FRAP(ferric reducing antioxidant power) assays. Butylated hydroxy toluene (BHT) was used as positive control. The results show that young leaves of *E. camaldulensis* provide essential oil (2-4%), while in adult leaves the oil percentage was (1-2%). The IC50 of volatile oil in young leaves for the DPPH and FRAP assays was (237.178 and 243.664 µg/ml) respectively while in adult leaves IC50 was not observed. IC50 of hydrosol in young leaves of DPPH and FRAP assays was higher as compared with control and adult leaves. The results also showed that the antioxidant activity of volatile oil and Hydrosol in adults leaves was more than in young leaves. The current study revealed the possibility of using this volatile oil and hydrosol as a natural antioxidants.

Keywords: *Hydrosol, volatile oil, antioxidants, Eucalyptus camaldulensis.*

Introduction

Aromatic plants are used in phytotherapy due to their essential oils and various biological activities such as antioxidant. Exogenous antioxidants can be a natural compounds like vitamins, flavonoids, anthocyanin but it can be also a synthetic like butylated hydroxy toluene[1]. Natural antioxidants are an important compounds to prevent the free radicals during the interaction of oxygen with molecules[2]. These radicals are dangerous when they react with DNA and cell membrane[3]. Antioxidants delay or inhibit the oxidation processes by affecting the free radical or molecular oxygen[4], so they prevent cellular damage and inhibit the pathway for cancer, aging and diseases[5,6]. They also used in foods and cosmetics industries to prevent undesirable oxidation processes. The synthetic antioxidants like butylated hydroxytoluene (BHT) and butylated hydroxyanisole (BHA) are possibly toxic so finding natural antioxidants has been increased during the last years[7,8]. Some herbal extracts and oils formulations have been proved as an important antioxidant agents[9,10]. *Eucalyptus* belongs to Myrtaceae family, it has 500 species endemic to Australia and neighboring territories. Some species have been introduced into Iraq,one of these species is *E. camaldulnesis*[11]. The leaves of this species is sensitive to dust pollution[12] and change as the tree progress from juvenility to adulthood[13], so it can be found as a young (growing tips),Mature (six mo.), aged(12-18 mo.).

The medicinal properties of *Eucalyptus* reside in its oil which is secreted and stored in the sub-dermal cavities[14]. The biological effects of this oil include: antiviral,antioxidants, antibacterial, antifungal and treat the respiratory infections as well as sinusitis[15]. The essential oil in association with hydrosol can be obtained through steam distillation process for the leaves of this aromatic plant. The hydrosol contains some of the water-soluble compounds of the essential oil which are the same of those present in volatile oil. Unlike essential oils that should be diluted prior to application attach the skin hydrosol can generally be used directly on the skin without further dilution[16]. Hydrosol has been used in different industries such as food and cosmetic as well as to the biological agriculture and soil fertilization[17]. This study was done to determine for the first time,

comparison of the antioxidant activity for *Eucalyptus camaldulensis* leaves in Iraq. This work allowed highlight in the influence of plant leaves maturity on the quantity,activity and chemical composition of essential oil and hydrosol.

Material and Method

Plant collection and extraction: Leaves (young and adult or aged) of *E. camaldulensis* Dehn**.** were harvested in October 2018 from University of Baghdad. These leaves were washed and dried in shade for three days. Dried leaves of this plant were chopped and semi grinded into small pieces and submitted to steam distillation using the Clevenger apparatus for 4 h[18]. Yield percentage was calculated according to the oil ratioequation[19].

$$\text{Extracted oil ratio} = \frac{oil\ volume}{sample\ weight} \times 100$$

The (DPPH) assay: 2, 2-diphenyl-1, 1-picrylhydrazyl: All the chemicals in this study were obtained from Sigma (Sigma-Aldrich GmbH, Germany). 2ml of samples at the concentrations (200,400.600,800,1000 µg/ml) were added to the volume(1ml) of theDPPH in methanol solution. The mixture was shaken andstand for half an hourin dark place. Spectrophotometer was used to measure the absorbance of the solution (yellow color) at 517 nm. Percentage (I%) of DPPH was collected as follow :

$$I\% = 100 \times \frac{A\ control - A\ sample}{A\ control}$$

A control=Absorbance of contro land A sample is the absorbance of test compound. Butylated hydroxytoluene (BHT) was used as a standard.[20]

The FRAP (ferric reducing antioxidant power) method: Volatile oil and Hydrosol reducing powers were determined according to procedure of[21]. Different concentrations of the extracts were mixed with phosphate buffer and 1% of water solution from potassium ferricyanide. This mixture was kept at 50°C for 20 min. Trichloroacetic acid was added to the mixture and then centrifuged at 3000 rpm for 10 min. The supernatant was mixed with distilled water and FeCl3 solution. The absorbance was read at 700 nm.

Statistical Analysis: The data were reported by using mean±standard deviation for three replicates. The IC50 value µg/ml was calculated by using Excel programme depended on the logarithm(Log.) of each concentration.

Results and Discussion

Plant Oil Yield: The results show that young leaves of *E. camaldulensis* provide more essential oil (2-4%),while in adult leaves the oil percentage was (1-2%). These leaves provide quantitatively different yields. This result agree with[22] which referred that the aged leaves yield less oil than recently mature. On the other hand the different stages of growth affected the oil yield and its chemical compositions[23].

DPPH scavenging activity and Ferric Reducing Antioxidant power (FRAP) of volatile oil from Eucalyptus leaves: The results show that the antioxidant activity increased by increasing the concentrations. This activity of volatile oil in adult leaves was higher than young leaves in the two different assays (Figure 1 and 2). At the concentrations (200,400µg/ml),the highest value of DPPH activity was obtained from the volatile oil in adult leaves in addition to its highest FRAP activity for all concentrations as compared with control. On the other hand, the IC50 (the half maximal inhibitory concentration) in both DPPH and FRAP assays was not observed in volatile oil of adult leaves while the IC50 of volatile oil in young leaves for the two assays was (237.178 and 243.664 µg/ml) respectively, as compared with BHT(233.001 and 208.855 µg/ml).

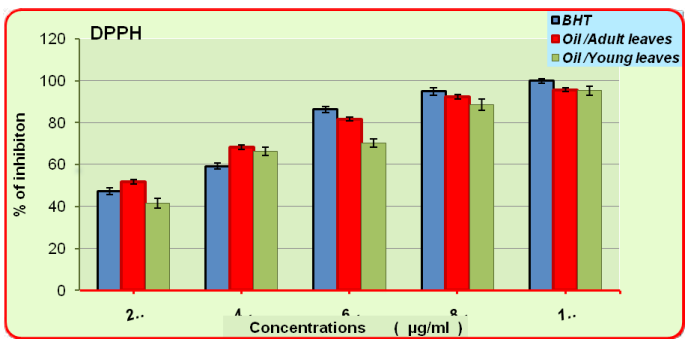

Figure 1: DPPH scavenging activity of E. camaldulensis volatile oil in adult and young leaves.

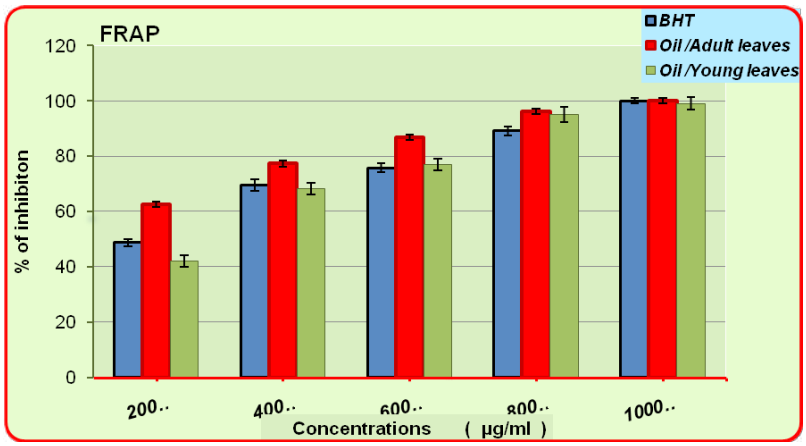

Figure 2: Ferric Reducing Antioxidant Potential of E. camaldulensis volatile oil in adult and young leaves.

DPPH scavenging activity and Ferric Reducing Antioxidant power (FRAP) of Hydrosol from Eucalyptus leaves: (Figure 3 and 4) show that the antioxidant activity of hydrosol in adult leaves was higher than young leaves in the two different assays. At FRAP assay the hydrosol of adult leaves at concentrations (400,600,800) revealed more activity as compared with control.

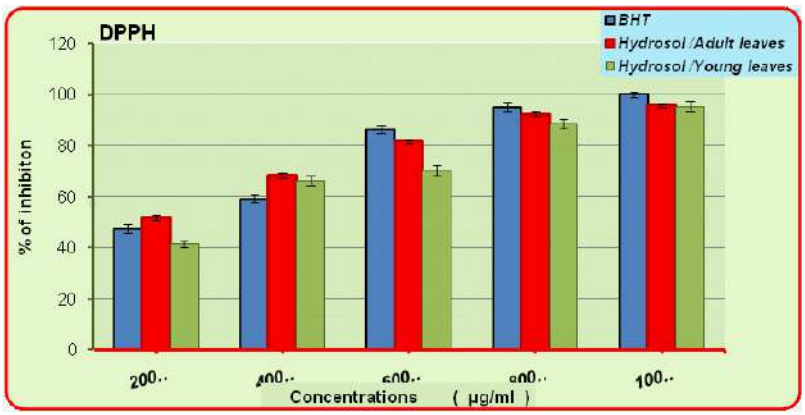

Figure 3: DPPH scavenging activity of E. camaldulensis Hydrosol in adult and young leaves.

On the other hand, IC50 of hydrosol in young leaves of DPPH and FRAP assays was higher as compared with control and adult leaves**.**

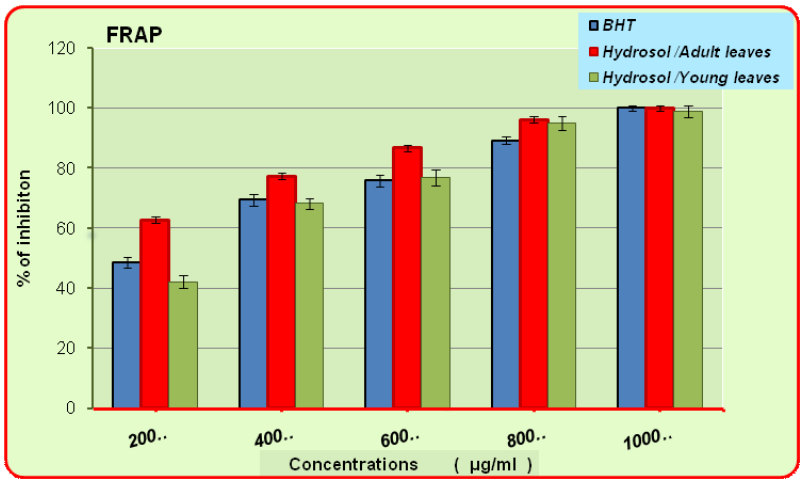

Figure 4: Ferric Reducing Antioxidant Potential of E. camaldulensis Hydrosol in adult and young leaves.

The differences in oils activity found in this experiment between different leaves may be related to the modifications of the oil composition during leaves maturation. The chemical analysis of *E, camaldulensis* essential oil revealed the presence of different compounds including: 1.8-cineole, limonene, α-pinene and p-cymene[24]. The antioxidant activity of volatile oil belongs to these compounds and the differences in their concentrations. The stronger free radical inhibitors are active at low concentrations(lower IC50)[25].The disappeared of the IC50 in both DPPH and FRAP assays in volatile oil of adult leaves revealed that it could be appeared in lower concentration than 200 which represented the lower one in this study, so this study indicate that *E. camaldulensis* volatile oil in adult leaves was more active than the control itself.

Conclusion

The volatile oil and hydrosol of *Eucalyptus camaldulensis* can be used as a natural antioxidants. There is an economical importance by using hydrosol as a raw material in the cosmetic industry and food preservation.

Abstract

The main problem of diabetes management is the patient's attitude toward their illness, because they have different concepts and beliefs. This study was to investigate the illness perception, the motivation, and the selfcare behavior in patients type 2 diabetes. This research was used cross-sectional approach. The sample size in this study was 177 patients with diabetes mellitus type 2. Stratified random sampling was used in this study. Motivation itself accounted for 43.2% of the variance in diet, 11.4% of the variance in exercise, 9.1% of the variance in blood sugar testing, 11.7% of the variance in medication adherence, 10.1% of the variance in foot care, $p < .005$. Illness perception accounted for 23.4% of the variance in selfcare behavior, 23.4% of the variance in selfcare behavior, 23.4% of the variance in selfcare behavior, 23.4% of the variance in selfcare behavior, 23.4% of the variance in selfcare behavior $p < .005$.

Keywords: *Illness perception, motivation, selfcare, diabetes mellitus.*

Introduction

Elderly population is increasing worldwide. Such a rapid growth in elderly population has challenged health care systems, to meet the complexities of caring for such a vulnerable population who are at risk of various health problems and disabilities[(1)]. Individuals with diabetes are at increased risk of developing microvascular and macrovascular complications, which could be prevented or delayed through essential self-care activities[(2)]. Nonadherence to self-care behaviors stems from a number of patient-related factors, including a decrease in motivation, self-efficacy, health literacy, and impaired disease perception[(3)].

Furthermore, there is a growing body of evidence corroborating that the perception of the disease plays an important role in the degree of compliance[(4–6)]. Previous research has shown that the extent to which patients adhere to diabetes self-care recommendations is strongly related to their perceptions of their illness and its treatment[(7)]. Illness perceptions are the central concept of the common-sense model of self-regulation of health and illness[(8)]. One's perception of his or her illness, i.e., illness perception, has been considered a critical psychosocial construct that could motivate the person with diabetes to undertake the required self-care activities. According to the common-sense model of self-regulation (CSM-SR)[(9)], individuals who are faced with a health threat, such as experiencing a diagnosis, tend to form emotional and cognitive representations that determine the selection of coping procedures and behaviors in response to the perceived health problem as well as the evaluation of treatment effects.

Motivation is an important conceptual variable in diabetes regimen adherence. As self-care for diabetes is ongoing, motivation may be best conceptualized for the process rather than a specific goal[(10)]. Cross-sectional studies have also found that motivation is associated with diabetes self-care behaviors[(11–13)]. Initiating and maintaining such a complex and demanding regimen is heavily dependent on developing and

sustaining motivation, which is the key to establishing goal-directed behavior[14,15]. While adjustments to health behavior are not inherently motivating[16], autonomous self-motivation can play a crucial role in adherence to a dietary regimen in diabetes[17]. The aim of this study was to investigate the illness perception, the motivation, and the selfcare behavior in patients with type 2 diabetes and its association with the demographic information.

Method

A descriptive cross-sectional design was used for data collection from individuals with T2DM. Data were collected from January 2018 to February 2018. A multistage stratified proportional sample design was used to draw a random sample of 177 patients; the 2 stratification criteria were educational level and, sufficient number of patients with type 2 diabetes coming to the public health center, and public health center distribution of the practices (11 primary health center). The ethical considerations were met. Participants signed an informed consent. Moreover, their privacy, confidentiality, and volunteer participation were ensured. The study was approved by Health Research Ethics Committee Faculty of Nursing Universitas Airlangga (No. 611-KEPK).

Data gathering tool included three questionnaires, the first one was related to demographic information of the patients which was created by researchers, the second one was The Brief IPQ (Illness Perception Questionnaire) and the third one was the Treatment Self-Regulation Questionnaire (TSRQ). The Brief IPQ (Illness Perception Questionnaire) has nine items. The items were developed by forming one question that best summarized the items contained in each subscale of the IPQ-R. [6].

The Treatment Self-Regulation Questionnaire-diabetes (TSRQ-diabetes) is a measure used an assessment approach introduced by Ryan and Connell[18]. We used a version of the TSRQ adapted for diabetes[19]. The Summary of Diabetes Self-Care Activities—Revised (SDSCA) is a measure that includes scales for commonly recommended diabetes self-care behavior. Validity for the original subscales has been supported by correlations of the SDSCA with other measures of diet and exercise[20].

Descriptive statistics were used to describe the demographic information, motivation, levels of illness perception, and self-care behaviors. Multivariate linear regression analyses were conducted to examine the predictive relationships among illness perception, motivation and each self-care behavior. All data were analyzed using the SPSS statistical software package (version 16.0, SPSS Inc., Chicago, IL, USA), and a value of $P < 0.05$ was considered significant.

Result

Table 1 lists the characteristics of the 177 participants. The average age of the subjects was 57.35 ±4,89 years (range 36-65 years), and 53.1% of the subjects were male. The duration of T2DM in the participants was 5.85 ± 3.29 years. The mean Social economy status (Rp) was 1,532,800 (±1,098,200), and the mean BMI (kg/m2) was 22.96 (±2,93). In multiple regressions, after adjusting for relevant covariates, duration of diabetes ($\beta = 0.309$, $P < 0.05$), social economy status ($\beta = 0.405$, $P < 0.05$), personal control ($\beta = 0.202$, $P < 0.05$), treatment control ($\beta = 0.296$, $P < 0.05$), and concern ($\beta = 0.197$, $P < 0.05$) significantly accounted for the diet in self care behavior. Duration of diabetes ($\beta = 0.309$, $P < 0.05$), BMI ($\beta = 0.200$, $P < 0.05$), identity ($\beta = -0.233$, $P < 0.05$), assesses illness comprehensibility ($\beta = 0.094$, $P < 0.05$), autonomous regulation ($\beta = 0.267$, $P < 0.05$), and controlled regulation ($\beta = -0.356$, $P < 0.05$) significantly accounted for the exercise in self care behavior. BMI ($\beta = 0.269$, $P < 0.05$), emotions ($\beta = -0.255$, $P < 0.05$), autonomous regulation ($\beta = 0.433$, $P < 0.05$), and controlled regulation ($\beta = -0.454$, $P < 0.05$) significantly accounted for the blood sugar testing in self care behavior. Social economy status ($\beta = 0.161$, $P < 0.05$), treatment control ($\beta = -0.223$, $P < 0.05$), assesses illness comprehensibility ($\beta = 0.184$, $P < 0.05$) significantly accounted for the foot care in self care behavior. Autonomous regulation ($\beta = 0.260$, $P < 0.05$) significantly accounted for the medication adherence in self care behavior.

Table 1: Number and percentage of participants according to demographic characteristics

Variable	Mean(SD)	N = 177	%
Age (36-65), y	57.35 (±4,89)		
Gender

Discussion

Overall, illness perception dimensions were associated with self-care behavior. Patients who perceived they had the ability to control their diabetes, reported to have been more physically active and to have followed the general guidelines for healthy eating and diet more often. These findings seem to support previous studies that identified control perceptions to be particularly influential on health behavior[7,21]. In addition to some of the illness perceptions dimensions, the presence of complications was found to be associated with certain self-care behavior, namely physical activity and foot care. These findings seem to partly support previous studies[22,23] suggesting that the perceived urge and need to make behavior changes primarily appear to arise in the presence of diabetes related symptoms.

We believe the relatively low proportion of significant associations between illness perceptions and self-care found in this study might be explained by several factors. First, it is difficult to determine whether the self-care behavior, with the exception of foot care, were actually performed as a part of the diabetes treatment regimen or rather as a part of an already existing lifestyle. Furthermore, the fact that we studied the effects of separate illness perception dimensions, rather than illness perception clusters, may

have contributed to the relatively few associations found with self-care behavior and lifestyle [24]; particularly considering the high perceived controllability and low perceived consequences that were generally found in this study. The low variation in selfcare behavior and illness perceptions in this group of relatively recently diagnosed T2DM patients, however, did not allow for clustering of perception dimensions.

This study found that autonomous and controlled motivation had a positive influence on exercise, but not on general diet, blood-glucose testing, medication adherence, and foot care. These findings are in line with other studies demonstrating a positive association between autonomous motivation and self-care behaviors [10,17,25,26] and between controlled motivation and exercise [10]. In the present case, controlled motivation was related to exercise in the first months after the diabetes course, whereas autonomous motivation was related to exercise in the long term, 12 months after the course. Thus, although controlled motivation can influence self-care behaviors, we can expect autonomous motivation to lead to more sustainable behavior change [10]. However, it should be noted that our results are inconsistent with other studies indicating that autonomous motivation is positively associated with dietary selfcare or blood-glucose testing [10,17,26].

Our results are consistent with previous research showing a positive association between autonomous motivation and success in maintaining health-related behavior. This body of work includes studies of smoking cessation, maintaining reduced body mass index and increased exercise following a weight loss program and improving diet and exercise among individuals with coronary artery disease [27–29]. Also consistent with this literature, feeling that one should perform self-management tasks because of the expectations of others or because one feels guilty (controlled motivation) did not predict frequency for any of the target behavior in our study [10]. In contrast to diet and blood glucose testing and in contrast with previous reports in the literature, our findings did not support an association between autonomous motivation and exercise. This may have been an artefact, at least in part, due to the very low rate of exercise among the participants in our sample. Another consideration is that our participants were not recruited as part of a training program, as was the case in studies reporting the associations between autonomous motivation and health-related behavior [27–29].

Conclusion

The illness perception and the motivation in patients with type 2 diabetes are associated with the self care behavior.

Conflict of Interest: The authors declare that they have no conflict of interest.

Ethical Approval: All procedures performed in studies involving human participants were in accordance with the ethical standards of the institutional and/or national research committee and with the 1964 Helsinki Declaration and its later amendments or comparable ethical standards. This article does not contain any studies with animals performed by any of the authors.

Informed Consent: Informed consent was obtained from all individual participants included in the study.

Funding: This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Cut off Point of Insulin-Like Growth Factor-I (IGF-1) for Prediction of Child Stunting

Masrul[1], Doddy Izwardy[2], Ricvan Dana Nindrea[3], Ikhwan Resmala Sudji[4], Idral Purnakarya[5]

[1]Department of Nutrition, Faculty of Medicine, Universitas Andalas Padang, Indonesia, [2]Director of Community Nutrition, Ministry of Health, Republic of Indonesia, [3]Department of Public Health and Community Medicine, Faculty of Medicine, Universitas Andalas, Padang City, Indonesia, [4]Biomedical Laboratory, Faculty of Medicine, Universitas Andalas Padang, Indonesia, [5]Faculty of Public Health, Universitas Andalas Padang, Indonesia

Abstract

Objectives: The aim of this study was to determine cut off point of Insulin-Like Growth Factor-I (IGF-1) for prediction of child stunting.

Method: This prognostic model was conducted subdistrict of Pasaman and West Pasaman, West Sumatera, Indonesia from July-November 2018. This study was performed on 185 children aged 0-3 years, consist of stunting group 94 respondents and not stunting 91 respondents. Determination of insulin-like growth factor-I (IGF-I) expression levels using the qRT-PCR method. Total RNA from blood samples of stunting and normal children was extracted using Trizol and stunting assesment using z-score index Height per age where the result ≤-2 SD is stunting. The mean difference of IGF-I level was analyzed by independent sample T test. A two-tailed *P*-value of <0.05 was considered statistically significant. Cut off point analysis using receiver operating characteristic (ROC) curve, the results show sensitivity, specificity and an accuracy. Data were analyzed using the SPSS version 20.0

Results: The results showed IGF level in child stunting 10.44±9.88 ng/ml and 10.09±10.08 ng/ml in child not stunting. Cut off point IGF-I for prediction of child stunting is 6.63 ng/ml with 64.2% sensitivity, 60.0% specificity and accuracy 61,3%.

Conclusion: This analysis confirmed IGF-I can predict child stunting with enough accuracy for classification.

Keywords: *Child, classification, IGF-1, prediction, stunting.*

Introduction

Stunting is the best summary measure of chronic malnutrition in children. Approximately one-quarter of children under age 5 worldwide are stunted. Stunting is an intractable public health problem affecting around one-third of children in developing countries.[1] Stunting underlies 14–17% of child deaths globally and causes long-term cognitive defects, fewer years and poorer performance at school, lower adult economic productivity and an increased risk of stunting into subsequent generations.[1,2] Poor linear growth begins *in utero*, continues during the first 2 years of life and is largely irreversible thereafter.[3] Despite its high prevalence, the reasons for stunting among children living in impoverished conditions remain uncertain. Although inadequate diet contributes to poor growth, the best nutritional interventions have only a modest impact on stunting.[4] Diarrhea has been implicated in the causal pathway to stunting but, possibly because children frequently show catch-up growth between diarrheal episodes,[5] the association has been surprisingly weak in many studies. The role of the gut in mediating stunting

has been relatively overlooked until recently, when attention has refocused on the possible contribution of enteropathy to poor growth in early life.[6,7]

Stunting affects one-third of children in developing countries, but the causes remain unclear. Stunting began *in utero* and was associated with low maternal IGF-1 levels at birth. Inflammatory markers were higher in cases than controls from 6 weeks of age and were associated with lower levels of IGF-1 throughout infancy.[1]

Stunting may therefore be driven by intestinal damage and chronic inflammation in addition to dietary inadequacy. Furthermore, since stunting begins *in utero*, the maternal inflammatory environment may have an important influence on fetal growth. However, few longitudinal studies have evaluated the mechanisms underlying poor growth among infants in developing countries. We hypothesized that an important cause of child stunting is exposure to chronic, low-grade inflammation during fetal and postnatal life, which suppresses production of IGF-1 perturbing the growth hormone axis early in life. We hypothesized that enteropathy leads to low-grade inflammation, which suppresses the growth hormone-IGF axis and mediates stunting.[8,9]

Method

Study design and research sample: This prognostic model was conducted subdistrict of Pasaman and West Pasaman, West Sumatera, Indonesia from July-November 2018. This study was performed on 185 children aged 0-3 years, consist of stunting group 94 respondents and not stunting 91 respondents. The sample size was calculated using the formula for continuous data on population.

Operational definitions: The variables of this study divided into independent variables, that is IGF-1; and a dependent variable, that is stunting.

Ethics statement: The study was approved by the ethical committee board of Faculty of Medicine Universitas Andalas, Padang City, Indonesia Number 495/KEP/FK/2017. Written informed consent was obtained from all respondents.

Data collection technique: Determination of IGF-I expression levels using the qRT-PCR method. Total RNA from blood samples of stunting and normal children was extracted using Trizol and stunting assesment using z-score index Height per age where the result ≤-2 SD is stunting.

Data analysis: The quantitative variables were recorded as Mean±SD, median and percentage. The mean difference of IGF-I level was analyzed by independent sample T test. A two-tailed *P*-value of <0.05 was considered statistically significant. Cut off point analysis using receiver operating characteristic (ROC) curve, the results show sensitivity, specificity and an accuracy. Data were analyzed using the SPSS version 24.0.

Results

Data characteristics of the respondents (Table 1).

Table 1: Characteristics of the respondents

Variables	Nutrition Status		p value
	Stunting (n=94)	Not Stunting (n=91)	
Child Characteristics			
Child's age (months), mean±SD	23.97±6.74	24.44±6.95	0.640
Birth weight (gram), mean±SD	3284.04±480.65	3210.88±478.83	0.301
Family Characteristics			
Family head's education, f(%)			
Low	62 (65.9)	42 (46.1)	0.003*
Moderate	13 (13.9)	18 (19.8)	
High	19 (20.2)	31 (34.1)	
Salary per months (Rp), mean±SD	717375±144713	1417349±202534	0.081
Family member, mean±SD	4.78±1.61	5.07±1.73	0.240

Table 1 known there were statistically significant mean difference child's age, birth weight, salary per months of head family and familiy member between stunting and not stunting groups (p>0.05). There was statistically association family head's education between stunting and not stunting groups (p<0.05).

Mean difference of IGF-I levels between child stunting and not stunting (Table 2).

Table 2: Mean difference of IGF-I levels between child stunting and not stunting

Variable	Mean±SD	p value
Child stunting (ng/ml)	10.44±9.88	0.047
Not stunting (ng/ml)	10.09±10.08	

Table 2 showed IGF-I level in child stunting 10.44±9.88 ng/ml and 10.09±10.08 ng/ml in child not stunting. There was statistically significant mean difference IGF-1 levels with stunting (p<0.05).

Determination of the cut off point of IGF-I level (Figure 1).

Table 2 showed based on analysis, we obtained cut off point IGF-I for prediction of child stunting is 6.63 ng/ml with 64.2% sensitivity and 60.0% specificity. Accuracy for cut off point of IGF-I showed in Receiver Operating Characteristics (ROC) (Figure 2).

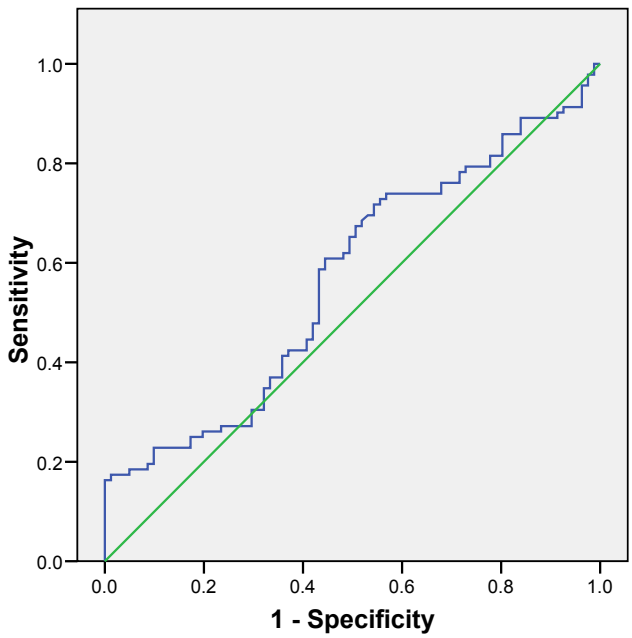

Figure 2: Receiver Operating Characteristics (ROC) for known accuracy of cut off point of IGF-I for prediction of child stunting

Figure 2 showed accuracy of IGF-I cut off point is 61.3%, it is means poor clasification.

Discussion

The results showed IGF level in child stunting 10.44±9.88 ng/ml and 10.09±10.08 ng/ml in child not stunting. Cut off point IGF-I for prediction of child stunting is 6.63 ng/ml with 64.2% sensitivity, 60.0% specificity and accuracy 61,3%..

Levels of IGF-1 were generally low compared to reported values from European infant cohorts.[10,11] However, levels of IGF-1 and its principal binding protein IGFBP3 were consistently lower among stunted compared to non-stunted infants from as early as 6 weeks of age. Whether reduced IGF-1 levels are a cause or a consequence of stunting is difficult to ascertain from our data, but given the well-characterized function of IGF-1 at growth plates, we speculate that lower levels are likely to mediate stunting in early life. In chronic inflammatory diseases such as juvenile idiopathic arthritis and Crohn's disease, elevated proinflammatory cytokines mediate growth failure through a reduction in circulating IGF-1.[8,9] Similarly, in our cohort of apparently healthy Zimbabwean infants, elevated inflammatory markers (even within the clinically normal range) were associated

with reduced IGF-1 levels. The association between low-grade chronic inflammation and suppression of the growth hormone-IGF axis was apparent soon after delivery and may account for the decline in linear growth that occurs from birth among African and Asian infants.[3] IGF-1 levels remained lower in stunted infants throughout the first year of life, but by 18 months levels were similar between groups. This suggests that a window of opportunity may exist in infancy, during which interventions to reduce inflammation and increase IGF-1 may improve linear growth.

Birth weight was related to infant IGF-1 at birth, which in turn was associated with the inflammatory status of the mother-infant dyad. The infant inflammatory milieu was closely related to the level of maternal inflammation at birth. We speculate, based on these associations, that inflammation during pregnancy may 'set' the infant inflammatory axis, which in turn influences the level of IGF-1 in early life. Optimizing the health of pregnant women may be essential to impact antenatal and postnatal stunting. Infants who became stunted were born to mothers who themselves were shorter than mothers of non-stunted infants. However, it was striking that over one-quarter of mothers of cases were overweight or obese. The relationship between maternal and fetal nutritional status is therefore complex and requires further investigation, particularly in view of the emerging obesity epidemic in countries that are experiencing the nutrition transition.[12,13,14]

In summary, our data suggest that stunting is influenced by both maternal and infant factors. Antenatally, maternal nutritional and inflammatory status may impact fetal growth, leading to intrauterine stunting and low birth weight; postnatally, low-grade inflammation early in life is associated with stunting.

Conclusion

This analysis confirmed IGF-I can predict child stunting with enough accuracy for classification.

Conflict of Interest Statement: The authors declared no potential conflicts of interest

Funding: Not applicable

Ethical Clearance: The study was approved by the ethical committee board of Faculty of Medicine Universitas Andalas, Padang City, Indonesia Number 495/KEP/FK/2017. Written informed consent was obtained from all respondents.

Effect of Generative Learning Strategy with Visual Technologies in Learning Some Basic Skills and Motor Abilities for 5-6-Years Kindergarten Children

Mayadah Khalid Jasim

Assistant Professor, Department of Physical Education and Sport Sciences, College of Basic Education, University of Mustansiriyah, Iraq

Abstract

This study aims to determine the effect of generative learning strategy with visual technology in learning some basic skills and motor abilities for 5-6-years kindergarten children. A two groups experimental design was used to guide this study. The study included male children who age 5-6-years who were selected from the Lote Tree Kindergarten at Al-Rusafa side, Baghdad City for the academic years 2017-2018. The study included 24 children who were selected and assigned into two groups; study and control, using a simple random sample method. The study sample represented 40% of the target population.

The researcher selected the skills of jogging, jumping, and the abilities of mobile balance, and the eye-hand compatibility as dependent variables. The generative learning strategy with visual technology in learning were applied to the children of the experimental group for 12-weeks of the second semester of the academic year 2017-2018, at a rate of two sessions per week on Sunday and Thursday. The total number of learning sessions was 24 sessions.Data were analyzed using the statistical package for social science (SPSS).The researcher concludes that the generative learning strategy with visual technology in learning has proven to be effective in learning jogging and jumping skills and learning the ability of mobile balance and eye-hand compatibility for study subjects.

Keywords: *Generative Learning Strategy; Basic Skills and Motor Abilities*

Introduction

The Generative Learning Theory was introduced by Wittrock; an American educational psychologist in 1974. The Generative Learning Theory rests on the notion that learners can actively integrate new ideas into their memory to enhance their educational experience Wittrock theorized that these learners processed information actively, by generating relationships between what they already knew and what they were encountering anew. He provided insight into how students who were successful at mastering new material made sense of new information they encountered and built up their working knowledge of a subject[1].

Wittrock's theory of generative learning had asimple premise. He theorized that individuals generate their own meanings of new material they encounter by building relationships between the new material and their prior knowledge. The fundamental premise of Wittrock's theory was that people enhanced their learning through this act of generating their own personal knowledge of information they received. The greater the generative activity engaged in by a participant while the new material is received, the greater is the learning that occurs. The learner may see relationships between incoming information and something already known. The learner may perceive a new relationship between one element of the new information and other elements within it.

Whether a learner sees relationships between incoming information and prior knowledge, or within different segments of incoming ideas, what was common to both these activities was generatively.

The act of generating ideas about the information and forming relationships between incoming information and a growing body of knowledge was the key to improved learning.

According to generative learning theory, to comprehend a complex topic, learners need to "electively attend to events and generate meaning for events by constructing relations between new or incoming information and previously acquired information, conceptions, and background knowledge" [(2)]. In this theory, comprehension and understanding result from the generation of relations both among concepts and between experience or prior learning and information. In other words, learners need to make their own meaning by integrating new information with current existing knowledge, rather than just transferring the presented information into memory [(3)].

The researcher believes that the attention to learning strategies; that adopt their steps and determinants fromthe literature related to education, is a priority for those looking for modernity and improving the educational outcomes of the kindergarten children as best as possible.This; in turn, cast a shadow on the importance of giving these strategies the applied role in educational sessions in the motor or skilled learning within the limits in terms ofthe learner's age and gender to increase their activity in the educational environment,

This cannot be predicted unless it is subject to systematic steps to academically studying it in order to arrive at the scientific facts that call for its application. Thus, there was an actual need and importance to try this strategy in order to achieve its practical benefit in the physical education classes for kindergartens when working on improving motor abilities and basic skills. That is, working on training children to organize ideas and the process of retrieving experiences and information and linking them to the situations they face is a requirement not only limited to the educational process, but also includes reviewing the steps of human building, particularly in the developing societies that rely on the familiar to avoid risking updates. Therefore, the study problem has emerged in an attempt to answer the following question: I it possible to adopt advance strategies for kindergarten children that enable to reorganize the cognitive structure and activate the recall processes for the acquired experiences in their age stages in order to improve the learning of some basic skills and motor abilities? Especially on investing in the vision sense through optical stimuli and their colors, not only to encourage but to increase the level of optical stimulus threshold to reach the desired goals in the education class for this school stage.

The study aims to:

1. Learn about the effect of the generative learning strategy with optical technologies in learning some basic skills of Kindergarten children aged (5-6) years.
2. To identify the effect of the strategy of generative learning strategy with optical technologies to learn some of the motor abilities of kindergarten children aged (5-6) years.

The researcher hypothesized that:

1. There are statistically significant differences between the results of the pretest and posttest of some basic skills of kindergarten children aged (5-6) for the two study groups.
2. There are statistically significant differences between the posttest results for the study and control groups in some basic skills of kindergarten children age (5-6) years.

Method

An experimental, pre-post design with two groups was used to guide this study, which is defined as "deliberate and precise change of the conditions determining the study phenomenon and observing the results of change in that phenomenon.It also defined as the use of experiment in testing the hypotheses." [(4)]

In the experimental group,there was a combination of the generative learning strategy and the optical technologies as one independent variable.For the control group,the children receive the conventional teaching method.

Sample and Sampling: The target population includes children who age 5-6-years (N = 60) in the Lote Tree Kindergarten at Al-Rusafa side, Baghdad City for the academic year (2017/2018) of (60) children. The study sample were selected purposively(n = 24) who represent (40%) of the target population;six children

were selected for the pilot study. The study sample were randomly, equally assigned into the experimental and control groups (n = 12) children in each group.

Measuring tools and study procedures: The jogging and jumping skills and the mobile balance and the eye-hand coordination were selected to fit the specificity of the study. Thereafter, the specialized measurement sources for children were selected to choose the following tests:

1. Jogging skill test (Subhi and Abdel Moneim)[5]. The rate is for 10-meters in the measurement unit of the time of passing the distance per second.
2. Jumping skill test for Sargent (valid for all ages)[6] in the measurement unit the distance of jumping by the name.
3. Mobile balance test (standing on one foot with bending and extending the trunk with touching the ground by the arms) in the measurement unit of degree[7].
4. Eye-leg compatibility test (jumping on the numbered cycles)[15] in measurement of time per second.

After conducting the pilot study and the completion of the pretests, the researcher applied the generative learning strategy on the children in the experimental group (n = 12) for 12-weeks period for the second semester, the 2017-2018 academic year at a rate of 2-sessions per week Sunday, Thursday, starting on February 25th, 2018 to May 17th, 2018. The total number of sessions is (24). While, the children in the control group have received the conventional teaching method. The statistical package for social sciences (version 24) was used to analyze data. The statistical measures of frequency, percent, mean, standard deviation, independent-sample T-test, and the paired-sample T-test were used.

Results and Discussion

Table 1: Equivalence between study groups in the pretests

Reviewing the results of table (2) reveals the improvements in each of the values of the four variables of the children in the experimental and control groups. Reviewing the results of table (3) displays that the children in the experimental group exceeded their peers in the control group in the results of these dependent variables,

The researcher attributed this to the role of strategy and the appropriateness of integrating photic technologies in the kindergarten games, which had duties the children should complete with the most efficient ability to run, jump, balance and compatibility. This led them to rearrange information and generate new experiences that allow them to complete these duties. There was a role for the photic stimulants in attracting children's attention and facilitating the cognitive processes in terms of what is required to do in the best manner. This strategy is based on the learner's role and activating his/her movement in line with the teacher's follow-up without abolishing the teacher's role. This strategy is presented from the concept of learning theories in the behavioral and cognitive schools in that the learning by which helps to increase the link between the brain stimuli and the apparent muscles of the motor behavior of its purposeful movement, and the reorganization of the child's cognitive structure in drawing the motor program of both skills and the studies abilities. Mahjoob indicates that "The availability of information about a given skill will improve the ability to learn the motor skills more than those who do not have extensive information before training" [(8)]. According to Shehata, "Prior awareness of coordination and balance increases the mechanism of movement and skill performance[(9)]. Chnichov, as mentioned by Shehata, states that "Man learns the responses because of the inter connectedness of experiences[(14)]. Hasan says that "in the first school years, the nervous system develops in the child and thus gets an important stage of development, and that the brain has increased its size to this stage it is continuing to increase."[(10)]

Conclusions and Implications

The generative learning strategy with photic technologies proved their effectiveness in learning the skills of jogging and jumping in kindergarten children aged 5-6-years.

The generative learning strategy with photic technologies proved their effectiveness in learning the abilities to mobile balance and eye-leg coordination in kindergarten children aged 5-6-years.

Implications: The researcher recommends that (1) It is necessary to pay attention to the kindergarten children's cognitive structure to guide them to play in the physical education class, (2) it is essential that the children of Kindergarten should not be viewed from the perspective of learning skills and abilities without taking the role of mind in enabling them to show them, (3) it is vital not to view kindergarten children from the perspective of learning skills and abilities without considering the role of the brain in enabling them to demonstrate such skills and abilities, and (3) It is crucial to equip kindergarten children with different, multiple systems of photic technologies to help in applying different strategies.

Conflict of Interest: The researchers report no conflict of interest.

Funding: This study did not receive any funding from any agency.

Ethical Clearance: A permission to conduct this study was obtained from the ethical committee in the College of Nursing, University of Baghdad

The Effect of Self-Regulated Learning Strategy in Motor Hyperactivity and Learning the Performance of Skill of Jump Shot in Basketball for Freshmen High School Students

Mayadah Khalid Jasim[1], Shaymaa Jasim Mohammed[2]

[1]Assistant Professor, Department of Physical Education and Sport Sciences, [2]Instructor, Department of Physical Education and Sport Sciences, College of Basic Education, University of Mustansiriyah, Iraq

Abstract

The study aims to identify the effect of the strategy of self-regulated learning in the motor hyperactivity and learning the performance of the jump shot skill of the basketball for freshmen high school students. The researchers used the experimental design with the experimental and control groups in pre and post. This study was conducted at Al-Fursan High School, the General Directorate for Education of Al-Rusafa II for the academic year 2017-2018. Male students aged 15-16-years were surveyed using hyperactivity scale to detect the phenomenon that correspond to the study problem. Students who scored (28) on this scale were purposively selected to represent (36.842%) of the original community. They were divided into two equal groups; study and control. Each group included (14) students. The researchers prepared six educational units that are applied in the physical education lesson for the study group. The study results revealed that the self-regulated learning strategy has proved its effectiveness in reducing hyperactivity and its good investment in the physical education lesson. The self-regulated learning strategy proved its effectiveness in learning the performance of jump-shot in basketball for freshmen high school. The researchers recommend that it is necessary to pay attention to the periodic psychometry in the physical education lesson in the high school to detect unwanted behaviors and change them into active and productive behaviors, and training teachers and develop their own abilities in the application of educational strategies in the physical education lesson and caring for the modern of such strategies.

Keywords: *Self-Regulated Learning; Motor Hyperactivity; Jump-Shot.*

Importance

The teaching process should be viewed as a unit that includes (objective, content, and method), and that the lesson; as a whole or parts, is closely linked to these three factors," said Ahmed. "Some of the specialists in the field of physical education teaching that the content of the physical education lesson includes some components, including a compound set of concepts, standards, and facts, and a range of sports performance method(6).

"It is necessary to assess the level of motor development that a student reaches to determine what skills he has learned and what he has not yet learned," said Mona and Jamal. (7)

Pintrichand Zeidner define the self-regulated learning (SRL) strategy as "a meaningful and active process. Learners set their educational goals and then attempt to monitor, organize, and control their cognitive, motivational, and behavioral characteristics, and their orientations in the learning environment".(10)

"The aim of self-regulation is to regulate the personal, behavioral, and environmental factors that influence the learner's performance in learning situations," said Youssef Mohamed. (9)

The learner leaders in the learning groups after roles assignment among them acquire personal and professional skills at a high level, which deepens the concept of learning as the practice facilitates the learning process of the less-experienced students in an organized and supported manner (11).

Hyperactivity is defined as "excessive, inappropriate behavior of the position, no direct goal, inappropriate development of the child's age, negatively affecting and accumulating behavior and increasing in males more than females."[5]

The academic researcher specialized in motor learning and teaching method should differentiate between the types of these behaviors for the purpose of controlling them by adopting the scientific method. Thus, they can control the system in the lesson and enable the teacher to achieve his objectives, shaping the future student personality, in addition to maintaining the spirit of teamwork and cohesion among students. This calls for continuing the scientific efforts to supply the educational process;particularly the physical education lesson,with specialized research including the psychological studies that deal with the study of behavior at different stages of life. The importance of this study lies in the importance of diagnosing and analyzing hyperactivity among middle school students.

Self-regulated learning involves metacognitive (planning, self-monitoring, evaluation, reflection) and motivational (effort, self-efficacy) processes engaged by learners to reach self-set goals [6].

One of the duties of the school is to create and organize a safe learning environment for students who are inherently descended from different social environments and families. This difference is associated with many factors. Usually,such a difference leads them to seek self-affirmation among their peers. This clearly appears in his behavior of dealing with peers which takes different forms. The researchers; throughout their visits to the schools, noticed different, unwanted behaviors including hyperactivity against others that arises among cohort in the physical education lesson, which allows them to move freely and play unrestrictedly compared to other restricted classroom environments. This enables those meant by exploring to observe these behaviors, which require careful measurement with objective tools within the parameters of the psychometric measurement of the methodology of scientific research to suit the students' characteristics, their age, level, and then the educational institutions service to prepare the programs for it later. The problem of the study lies in the researchers' attempt to achieve this diagnosis to find the scientific answer to the following question: Does the SRL strategy help in investing the organization of the excessive students' movement in favor of learning the skillful performance of jump-shot in basketball?

The study aims to (1) identify the influence of the SRL strategy on the hyperactivity of freshmen high school students, and (2)recognize the influence of the SRL strategy on learning the performance of jump-shot skill in basketball for these students.

The researchers hypothesized the following:

1. There are statistically significant differences in the hyperactivity and learning the performance of jump-shot skill in basketball between the pretest and posttest between groups.
2. There are statistically significant differences in the hyperactivity and learning the performance of jump-shot skill in basketball between for the posttest time between groups.

Method

An experimental, pretest-posttest design with two groups; study and control, was used to guide this study.

The boundaries of the research community in this study were represented by the high school freshmen. The study included 76 male students,age 15-16-years, who were recruited from Al-Fursan High School in Al-Rusafa side in Baghdad City. for the academic year (2017/2018).The study participants were selected by surveying using a scale for hyperactivity. Students who score 8 or above on this scale would be involved ($n = 28$) who were purposively selected. They represent (36.842%) of this society. Twenty students were assigned in the pilot study to test the modified version of the scale. Participants in the main study sample were assigned using the simple random sample method; 14 students in each group.

Measuring tools and study procedures: In order to diagnose hyperactivity,the hyperactivity scale developed by Abdul-Ameer[2] was adopted. It consists of 15 items with a total score of (15).Minor modifications and adapting it to 20 students to find the scientific bases. The researchers designed a performance evaluation form that includes three sections of performance the jump-shot in the basketball of (10) degrees. This performance is revealed after the students' videotaping and presented to three specialists in basketball tests.

After preparing the measuring tools for the study experiment, the educational units were prepared using the SRL strategy to employ excess energy from excessive

activity in the sense of the concept of hyperactivity by directing the students well according to the determinants of motor performance of the skill. At the same time,the educational units aim to regulate the cognitive information pertinent to that skill and the harnessing of the learner's energy for proper performance since it is not limited to the accuracy of the scoring, but the movement and harmony of the body parts of the requirements of the optimal performance that helps to such an accuracy later. The teacher's duty is to create the educational environment appropriate for applying such a strategy to be a lesson that is free from restrictions,be concerned with the learners' directions and feedback of self-regulation. Such strategies are considered as meaningful and active learning strategies sought by modern learning schools in various sciences. The educational units have been applied among students with hyperactivity for 45-days in an average of one educational unit per week for the academic year 2017-2018 after finishing the formal school time. Data were analyzed using the statistical package for social sciences (SPSS) version 24. The statistical measures of percentage, arithmetic mean, standard deviation, independent-sample T-test, and paired-sample T-test were used.

Results

Table 1: The equivalence of the study groups in the pretest

Tests	Study Group (n = 14)		Control Group (n = 14)		t	Sig.	Sig. Level
	Mean	SD	Mean	SD			
Hyperactivity	10.5	1.653	10.14	1.875	0.535	0.597	NS
Performance of jump-shot skill	2	0.961	2.43	1.089	1.104	0.28	NS

Significant at $p \leq 0.05$ at 0.05, degree of freedom n-2 = 26

Table 2. Pretest and posttest tests for the study and control groups

Tests and measurement Unit	Group	Pretest		Posttest		Mean difference	Std. Error Mean	t	Sig.	Ass.
		Mean	SD	Mean	SD					
Hyperactivity	Study	10.5	1.653	4.5	0.65	6	1.922	11.683	0.000	S
	Control	10.14	1.875	6.57	0.646	3.571	2.065	6.472	0.000	S
Performance of jump-shot skill	Study	2	0.961	7.71	0.469	5.714	1.069	20	0.000	S
	Control	2.43	1.089	5.29	0.469	2.857	1.167	9.158	0.000	S

n = 14 for each group;Significant at $p \leq 0.05$, degree of freedom = 13at 0.05; S = Significant

Table 3. The equivalence of the study groups in the posttest

Tests	Study Group (n = 14)		Control Group (n = 14)		t	Sig.	Sig. Level
	Mean	SD	Mean	SD			
Hyperactivity	4.5	0.65	6.57	0.646	8.453	0.000	S
Performance of jump-shot skill	7.71	0.469	5.29	0.469	13.706	0.000	S

Significant at $p \leq 0.05$ at 0.05, degree of freedom n-2 = 26; S = Significant

Reviewing the results of Table (2) reveals improvements in the values of the variables of the study and control groups. Reviewing Table (3) displays that the students in the study group members outweighed their counterparts in the control group pertinent to the dependent variables. This finding could be attributed to the role of SRL strategy that enabled the students to reorganize their experiences and information, improve excessive and random movement in the class, and guide it towards proper skill performance that requires aesthetic and quality determinants in the three skill sections. Thus, two objectives were met by one action that is positively reflected on the psychological status in its improvement whatever the reasons for such opportunities. At the same

time, the skilled performance that requires regulating the experience and information as indicated to regulate the movement. As well as,it helped to increase the number of units to six for one skill in improving the values of skill improvement for the performance of this skill in basketball. For the students in the control group, the researchers attribute the improvements to the role of the sports education lesson, and it achieves of educational and learning goals.

Al-Busidistated that SRL differs from self-learning developed by Skinner or using computers. In his theory, Deutsch could determine the relationship form between different organizations of mutual social interdependence(1).

Qatami stated that "The aim of Uzbel is to study the cognitive structure of the learner and the higher mental processes in order to achieve a meaningful learning and increase the efficiency of the processes of cognitive processing of the information using multiple cognitive processes and at reasonable times that facilitate the task of storing these knowledge, their transfer,and integration into the learner's cognitive structures" (8).

Thorndike stated that "The teacher and the learner must determine the characteristics of the good performance so that the practitioner can be organized to be able to diagnose errors and not repeated them and the difficulty to modify," (4)

Conclusions and Implications:

1. The SRL strategy has proved its effectiveness in reducing hyperactivity and good investment in the physical education lesson among freshmen.
2. The SRL strategy has proved its effectiveness in learning the performance of jump-shot in basketball for freshmen.

The researchers recommend the following:

1. It is necessary to pay attention to the process of periodic psychometry in the physical education lesson in the high school to detect unwanted behaviors and turn them into active and productive behaviors.
2. It is necessary to train teachers and develop their own abilities in the application of educational strategies in the physical education lesson and paying attention to the modern of such strategies.

Conflict of Interest: The researchers report no conflict of interest.

Funding: This study did not receive any funding from any agency.

Ethical Clearance: A permission to conduct this study was obtained from the ethical committee in the College of Basic Education, University of Mustansiriyah.

Influence Organizational Citizenship Behavior (OCB) on Performance Nurses Public Health Centre in the District Tuban

Miftahul Munir

Chief of Nursing Undergraduate Study Program, Institute of Health Science Nahdlatul Ulama Tuban, Indonesia

Abstract

Organization will successfully when employees not only do their tasks anyway but also want to do duty extra as wants to work, help one another, give advice, participate effectively, giving best services, and want to use time it works effectively but not all an employee with like willingly want to do[1]. A nurse having organizational behavior citizenship behavior (OCB) the atmosphere than last year in order to have a comfortable so as to cause a working relationship which harmonious in order to increase performance workers to reach organizational goals[2].

The study was observational analytic, population nurses public health centre in the district tuban were 24 people, a random sampling of sampling simple .Independent variable organizational citizenship behavior and dependent variable performance nurses and research instruments using sheets kuisioner with data analysis spearman use the rank.

Is the organizational citizenship behavior (OCB) of performance nurse

Keywords: *Organization, citizenship, behavior, performance nurse, public health centre.*

Introduction

Human resources have a very crucial role in addition to the other. owned organization. An organization can run well and get completely as performance produced by every other component running smoothly and mutually supported[3].

One attitude or behavior to improve the performance of nurses in the structure of course behavior that leads to positive things that are known as organizational behavior (OCB) citizenship that is the individual that exceeds demand and the role of. But not all employees voluntarily want to does more their formal task on their job description contains[4]

One of the ways to enhance the performance of nurses is by the presence of organizational behavior (ocb citizenship in organization so that it will give rise to the atmosphere a harmonious work[5] .Hence, very important a nurse having organizational behavior citizenship behavior (OCB) the atmosphere than last year in order to have a comfortable so as to cause a working relationship which harmonious in order to increase performance workers to reach organizational goals[6].

Material and Method

This research design of observational analytic, the population is nurses public health centre in the district tuban a total of 24 people, simple sampling technique random sampling .The independent variable citizenship organizational behavior and the dependent variable for the performance of nurses and an instrument the research uses a sheet of the questionnaire was test with data analysis using the spearman rank[7].

Findings:

Table 1: The distribution of respondents ocb nurse

No.	OCB	f	Prosentase
1	Height	16	69,6%
2	Medium	4	17,4%
3	Low	3	13,0%
	Total	**23**	**100%**

Based on the table above can be seen from 23 (100%) respondents said that the majority of 16 (69,6%) respondents own high of ocb

Table 2: The Distribution Of Respondent Based On The Nurses

No.	Performance nurse	f	Prosentase
1	Good	12	52,2%
2	Medium	10	43,5%
3	Low	1	4,3%
	Total	**23**	**100%**

Based on the table above can be seen from 23 (100%) respondents said that the majority of 12 (52,2%) respondents have a good performance

Table 3: The influence of organizational behavior citizenship (OCB) on the performance of nurses

OCB	Performance Nurse			Total
	Good	Medium	Low	
Hight	11(68,8%)	5(31,3%)	0(0,0%)	16(100%)
Medium	1(25,0%)	3(75,0%)	0(0,0%)	4(100%)
Low	0(0,0%)	2(66,7%)	1(33,3%)	3(100%)
Total	12(52,2%)	10(43,5%)	1(4,3%)	23(100%)
Value	α = 0,05	*p* = 0,005		r = 0,563

From the table above it can be seen from 23 (100%) of respondents that almost most of which have ocb high with a good track record in 11 (68.8%) of respondents, having ocb being with the performance of being 3 (75,0%) and that has ocb low with the medium of performance 2 (66.7%)

Based on an analysis by using spss for windows with the spearman rank α= 0,05 obtained the p = 0,005 value $p < \alpha$ so variable ocb have significant influence on performance a nurse with the correlation was (r = 0,564) and direction positive correlation means the higher ocb better performance nurse at work.

Discussion

Behavior identification organizational citizenship (OCB) in nurses: Most of nurses in public health centre in the district tuban having organizational citizenship behavior (OCB) the height. Organizational citizenship behavior (OCB) in generally believed that to achieve excellence must have their individual performance of as high as, because basically individual performance influences the performance as a whole ocb organization is the act of someone out kewajibanya not consider the interests of the himself[8].. This behavior have changed in line how passionate organization on welfare levels individual and appreciation organization against their contribution[9]. The majority of respondents having ocb high, because some aspects of: alturism, civic virtue, conscientiousness, courtesy, sportmanship.OCB also is the unique individual activities in working and is the customs or manners performed voluntarily, no formal is part of the job, and indirectly identified by a system of rewards[10] .So it can be concluded that ocb also called the behavior extra role of concurrent given individual exceeds main function[4].

This research result indicates that there are 16 respondents own ocb high and 3 respondents own ocb. lowIt is in because the willingness of nurses to take the role of (role) that exceeds a lead role in an organization, so called as behavior any extra roles (extra role).It is to achieve the success of an organization when its members not only working on his main job just, but also want to do extra duty, like the will to cooperate, help each other, provide input into, actively involved, provide service extra, as well as wanting to use the hours are effectively.

Identification performance nurse: Performance is the result of a work or process of an end of a activities. The performance is a motion or action that have been carried out in a conscious geared to achieving a goal or a specific target. The performance was a result of working to the awards by a person or a group of people in accordance with their respective authorities and responsibilities of each party, as forms of businesses in achieving legally organizational goals, not unlawful and in accordance with moral and ethical[11].

The performance is an illustration of the level of achievement of implementing a program or policy activities in realizing the target, the purpose of, the vision and mission of the organization that was poured through strategic planning an organization .For that reason the performance of individual basically can be influenced by

a number of factors such as the quality of, the quantity, the effectiveness of, timeliness and independence[12].

From the research the majority of respondents having a good track record .It was because the performance of supported by a factor of an external and an internal, the internal factor, that is, that deals with the properties of a person .While the external factor that is the factors that influences the performance someone who originated in the neighborhood[13].

As behavior, attitude, and the colleague, subordinate or leadership of, work facilities and climate organization .Where factors that might have an impact on working system given by organization or the hospital .Individual ocb influences the performance, and therefore this behavior is leading to the social interaction of members of an organization are more reliable, reducing the conflict, and improve the efficiency[14].

The influence of organizational citizenship behavior (OCB) on the performance of nurses: The result of this research is the organizational citizenship behavior (OCB) on the performance of nurses. OCB influential positive and significantly to the performance of individual[8]. It is anyone had showed that the of individuals having an attitude of my doubts but towards their job of his colleagues or help with the work of his colleagues the more one is high performance general of the agriculture ministry, of individuals having an inclination to favor the relevant organisation s with the role of and decrease the participation in a central organization, of individuals having the level of consciousness of doing things which includes in this data collection referred to the dispatch priorities the presence of the use of the time of work[15]. The individual had tinggat awareness in working eat, employee performance will be good too individuals having a polite and manners, organization individuals having sportifits in working involving a willingness to tolerate discomfort true and risk jobs without the complaining employees own attitude sportsmanship in working for the good performance these individuals[16].

Research conducted by researchers from the data can be proved the organizational citizenship behavior (OCB) by means of distributing the sheets for two times a week.This is evidenced by the results of research of 23 (100) percent of respondents said that almost entirely having ocb high performed well 11 (68,8%), respondents having ocb was with performance and 3 (75,0%) and who has low ocb with performance and 2 (66,7%).This karenakan willingness nurse to take the roles of (role) beyond, primary role in an organization so called as the behavior of the role of extra (extra-role).

It is to achieve the success of an organization when its members not only do, main function of only but also want to do the extra, as a willingness to cooperate,, help each other inform, active, provide service extra, and will want to make use of their working time effectively[17].

Conclusion

The influence of organizational behavior citizenship (OCB) on performance tuban public health centre in the district nurse.

Combined Exercise Effects on Lipid Profiles in Hypertensive Patients

Mitiku Daimo[1], Soumitra Mondal[2], Mahmud Abdulkader[3], Dhamodharan Mathivanan[4]

[1]Ph.D. Scholar, Department of Sports Science, Hawassa College of Teachers Education, Hawassa-Ethiopia, [2]Professor, Department of Sport Science, College of Natural and Computational Sciences, Mekelle University, Mekelle-Ethiopia, [3]Assistant Professor, Institute of Medical Microbiology and Immunology, College of Health Science, Mekelle University, Mekelle-Ethiopia, [4]Assistant Professor, Department of Sport Science, College of Natural and Computational Sciences, Mekelle University, Mekelle-Ethiopia

Abstract

Objective: The purpose of the study was to examine combined aerobic and resistance exercise training effect on lipid profiles in hypertensive patients.

Method: A total of forty-six hypertensive patients aged between 31 and 45 years were randomly assigned into two groups: control group (n=23) and exercise group (n=23). Total cholesterol (TC), high density lipoprotein cholesterol (HDL-c), low density lipoprotein cholesterol (LDL-c), and triglycerides (TGs) data were collected at baseline and after 16 weeks of the study period. Analyses of within group and between group comparisons were done using paired sample t-test and independent sample t-test, respectively.

Results: Pre-intervention data of TC, LDL-c, TGs, and HDL-c were homogeneous compared with groups (P>0.05). After completion of the study significant between group mean change difference was found in TC (-7.2 mg/dl; P=0.0001), LDL-c (-10 mg/dl; P=0.0001), TGs (-14.3 mg/dl; P=0.0001), and in HDL-c (3.8 mg/dl; P=0.001). In EG participants performed combined aerobic and resistance exercise training.

Conclusions: Combined aerobic and resistance exercise training significantly reduced TC, LDL-c, TGs and significantly increased HDL-c levels in hypertensive patients. Public awareness promotion should be designed and implemented by concerned bodies for hypertensive patients to realize the importance of combined exercise trainings and thereby increases their adherence to exercise programs.

Trial Registration: Clinicaltrials.gov Identifier: NCT03029767 on 20/01/2017.

Introduction

The behavioral change of contemporary public is associated with increasing of urbanization and these behavioral changes lead people to rise of inactive lifestyle[1]. In modern urbanized society to prevent cardiovascular and other disease levels of physical activity are clearly insufficient[2]. Physical inactivity raises risk of cardiovascular diseases (CVD), mainly hypertension (HTN) [3]. Raised occurrence of CVD in adolescents and adults is associated with low fitness levels [4], a small level of high density lipoprotein cholesterol (HDL) and elevated levels of low density lipoprotein cholesterol (LDL-c) [5]. Raised levels of total cholesterol (TC) and low level of HDL-c are among the main risk factors for HTN [6]. It is well recognized that CVD in general and HTN in particular is related to high levels of TC, LDL-C, triglycerides (TGs), and

with low levels of HDL-c. Leading sedentary lifestyle plays great role in the risk of HTN [7]. Adherence to the exercise training is a crucial aspect for the achievement of the maximum significance of the intervention on HTN [8]. Hypertensive individuals inadequately adhere to appropriate treatment and the suggested lifestyles [9]. Studies reports showing sedentary lifestyle, rising in low income countries like Ethiopia, causing acceleration in the prevalence of HTN and hypertensive patients have low adherence to exercise in Ethiopia[10, 11]. In human beings continued primary HTN has an effect on different body parts [12]. Adjustment of lifestyles, together with increased participation in exercise training should be the primary alternative to fight the rising spread of HTN in low- and middle income countries[13]. For the urban communities presently in Ethiopia for exercise training appropriate emphasis is not given [14]. Involvement in exercise training on a regular basis is a significant non pharmacological approach to reduce CVD [15, 16]. Persons those continue to engage in physical exercise on a regular basis have been revealed to have a decreased risk of CVD, this may be because of performing exercise training can positively change blood lipid profiles by increasing HDL-c and reducing TGs concentrations [17].The risk for an increase of CVD may be decreased by raising HDL-C and by reducing levels of LDL-C and TGs [18]. Combined aerobic and resistance exercise training will give participants the special advantages of each type of exercise [19]. To the best of our knowledge studies were not carried out in Ethiopia regarding combined aerobic and resistance exercise training as an alternative treatment and preventive lifestyle intervention approach for mild hypertensive patients, mainly in the present study area. Hence, the purpose of this study was to evaluate the combined aerobic and resistance exercise training effect on lipid profiles in hypertensive patients.

Material and Method

Study Area: The study was conducted at Hawassa University Referral Hospital (HURH), Hawassa City administration, Southern Region. Hawassa is the capital city of, Southern Region, located 275 km from Addis Ababa the capital city of Ethiopia.

Study design and participants: This study was registered in clinicaltrials.gov Identifier: NCT03029767 and conducted from February 20/2017 to June 17//2017 in Southern Ethiopia at HURH. Stage 1 hypertensive patients in the age range of 31 to 45 years; individuals who gave written informed consent, participants who live in the study area for the period of study, individuals who are on a single anti-hypertensive drug were included in the study. Pregnant women, individuals with known renal and cardiac problems, diabetic patients, participants who consume medications for lipid, and females who use contraceptives were excluded from the study.

Randomization: Forty six eligible participants were randomly assigned to exercise group (n=23) and control group (n=23) using a stratified random sampling method after acquisition of signed informed consent and eligibility assessment. The allocation of eligible participants in the exercise group (EG) and the control group (CG) was done by a statistician who did not take part in the study by means of computer produced random numbers in pre prepared and sealed numbered envelopes.

Procedures: The EG engaged in combined aerobic and resistance exercise training for 16 weeks. The CG participants did not take part in any structured exercise intervention program, but they sustained their usual daily activities during the period of study and were completed medical symptom's questionnaire forms monthly for the study period. The exercise intervention was given for 48 uninterrupted sessions, three sessions per week for the total of 16 consecutive weeks. To familiarize study participants with the types of exercise and its dosage two familiarization sessions were carried out before continuing the main exercise intervention and with the help of that the participants of the study became familiar to study the procedures of exercise intervention. The exercise intervention was supervised by an exercise physiologist. The EG performed 23 minutes aerobic exercises and 22 minutes resistance exercises. Intensity of exercise was progressive. Participants performed aerobic exercise (brisk walking) for 30 to 40% of heart rate reserve (HRR) or 9-11 rate of perceived exertion (RPE) from first to fourth week, and 40-60% of HRR or 12-13 RPE from fifth to sixteenth week. In addition to aerobic exercise eight resistance exercises were also made by EG. These were biceps curl, triceps extension, shoulder press, squat, heel raise, side leg raises, lower leg lift and curl-up. Resistance exercise was performed using one set and one minute rest between exercises. Intensity of resistance exercise was 30 to 40% of 1 repetition maximum (1RM) for upper body part and 50 to 60% of 1RM for the lower body part. Resistance exercises were conducted alternating between lower-body and upper- body exercises. At baseline five milliliters of

venous blood sample were collected after 48 hours of vigorous physical activity and after ten to twelve hours of overnight fasting in a sitting position from an antecubital vein from all participants. The blood sample collection was done early in the morning from 8 AM to 10 AM Analysis of lipid profiles was conducted using serum sample. For the test of TGs and TC enzymatic colorimetric assay technique was applied, whereas direct homogeneous enzymatic colorimetric assay technique was used for the test of LDL-c and HDL-c. The senior laboratory technologist of HURH collected the blood samples. Quality control samples were analyzed before performing of patient sample and sideways with patient samples for checking the right functioning of instruments and lab reagents including technical acts. Further, standard operating procedure was strictly followed for all laboratory performances from sample collection to result releasing. Post intervention data were collected following similar procedures to baseline data.

Statistical Analysis: Data entry and analysis were done using Statistical Package for Social Sciences (SPSS) Version 20. Categorical variables were summarized as frequencies, and the change was summarized in percentages, while mean values, and standard deviations were tabulated for continuous variables. Comparison of quantitative variables at the pre-intervention and after post-intervention of the same group was analyzed with paired sample t-test. Comparison of continuous variables between intervention and CG was performed using an independent sample t test. Finally, in all situations, the significance level was set at $p<0.05$.

Results

Baseline characteristics of study participants: A total of 46 (20 females and 26 males) study participants were enrolled in the study, of them 44 completed the study. However, one individual (male) from both study groups was discontinued and their data not included in the analysis. In the EG who completed the study, adherence to exercise was 98% and the mean attendance of the study participants was 47 from 48 total exercise sessions. There were no statistically significant differences between the mean age and lipid profiles between groups (P-value >0.05) (Table 1).

Table 1: Baseline between groups' comparison of lipid profiles of the study participants

Variables	EG	CG	p-value
Mean age in years	38.8(±4.3)	38.3(±4.2)	0.72
Mean TC in mg/dl	180(±13.2)	178.2(±10.4)	0.6
Mean LDL-c in mg/dl	104.4(±10.5)	103.5(±7.9)	0.76
Mean TGs in mg/dl	162.4(±16.9)	159.8(±10.8)	0.54
Mean HDL-c in mg/dl	42.6(±3.1)	42.4(±2.4)	0.8

EG= exercise group; CG=Control group; TC=total cholesterol; HDL-c; high density lipoprotein cholesterol; LDL-c; low density lipoprotein cholesterol; TGs; triglycerides; mg/dl=milligram per deciliter

Post exercise between group comparisons of lipid the profiles of study participants: After 16 weeks in EG mean TC, LDL-c and TG decreased significantly compared to CG. However, mean HDL-c significantly increased in EG compared to CG (Table 2).

Table 2: Comparisons of lipid profiles of study participants

Variables & Groups	Baseline	16 Weeks	Between Group Mean Change Difference	P-value
TC mg/dl				
Combined exercise	180(±13.2)	177(±12.53)	-7.2	0.0001
Control	178.2(±10.4)	182.4(±10.3)		
LDL-c mg/dl				
Combined exercise	104.4(±10.5)	99.1(±10.48)	-10	0.0001
Control	103.5(±7.9)	108.2(±8.05)		

Variables & Groups	Baseline	16 Weeks	Between Group Mean Change Difference	P-value
TGs mg/dl				
Combined exercise	162.4(±16.9)	154.3(±19)	-14.3	0.0001
Control	159.8(±10.8)	165.9(±12.07)		
HDL-c mg/dl				
Combined exercise	42.6(±3.1)	44.5(±3.19)	3.8	0.001
Control	42.4(±2.4)	40.6(±2.5)		

Discussion

This study was aimed to examine the effect of combined aerobic and resistance exercise training on TC, HDL-c, LDL-c, and TGs in hypertensive patients. Findings from the present study showed a significant reduction in TC, LDL-c, and TGs and a significant increase in HDL-c in EG compared to CG. The findings of the current study are similar to previous studies that also found significant decrement in TC, LDL-c, and TGs and significant increase in HDL-c[20, 21] in EG compared to CG. Various studies conducted in hypertensive patients and their reports showed that TC, LDL-c, and TGs were decreased significantly and HDL-c increased significantly in combined aerobic and resistance exercise participants [20, 21]. The findings of these studies agreed with the present study. In addition, the current study is in agreement with the study of Shaw et al.[22] in which LDL-c decreases significantly and the study of Tseng et al. [23] and Tokudome et al. [24] showed a significant decrease in TGs and a significant increase in HDL-c in combined aerobic and resistance exercise training compared to CG. HDL acts as a remover of bad cholesterol in the reverse transport of cholesterol [25]. In our study high adherence to exercise (98%) was found and this may be also the possible reason for the improvement of lipid profiles in the EG. So this study has valuable clinical significance for the participants of the study in improving their lipid profiles. Application of randomized controlled studies, higher adherence level of the participants in the exercise, provision of alternative approach research to treat HTN in Ethiopia for the first time are the strength of the study. Whereas the inclusion of only mild hypertensive patients in the study and exclusion of individuals out of the study area due to feasibility risks were the limitations of the study. The findings from the current study suggest that physicians, fitness instructors, and physical education teachers should encourage hypertensive patients to engage in combined aerobic and resistance exercise training program on a regular basis.

Conclusion

Combined aerobic and resistance exercise training significantly reduced TC, LDL-c, TGs and significantly increased HDL-c levels in hypertensive patients. Public awareness promotion should be designed and implemented by concerned bodies for hypertensive patients to realize the importance of combined exercise trainings and thereby increases their adherence to exercise programs.

Acknowledgements: The authors would like to acknowledge the Mekelle University and Hawassa College of Teachers Education for their assistance in the completion of the study. We want to express thanks also to Hawassa University Referral Hospital for their agreement to carry out the study in the hospital and also the laboratory technologists and nurses of the hospital for their highest support during data collection. Besides, our gratitude is also extended to the hypertensive participants for their voluntary involvement in the study.

Conflict of Interest: Nil.

Source of Funding: The study supported by Mekelle University.

Ethical Clearance: The study was approved by Health Research Ethics Review Committee of Health Sciences College of Mekelle University with Ref. ERC07752016. Before continuing the study written informed consent was obtained from all study participants after reading and explaining of information sheets in their local language (Amharic) regarding procedures, confidentiality and risks of the study. Further, the privacy of private data was strictly preserved.

Ego State Therapy (EST) and Systemic Desensitization (SD) to Reduce School Refusal among Senior High School Students

Mochamad Nursalim[1], Nur Hidayah[2], Adi Atmoko[2], Carolina L. Radjah[2]

[1]Postgraduate Doctoral student of Universitas Negeri Malang, [2]Faculty of Education, State University of Malang-Indonesia

Abstract

This paper compared Ego State Theraphy (EST), Systematic Desensitization (SD), and the combination of both treatments to reduce school refusal among high school students. It employed experimental approach with pretest-posttest control group design. It used Scale Revised-Child (SRS-RC). It took 40 high school students in Surabaya. The data were analyzed one-path anava. It concludes that first, school refusal declining in the subjects of experimental group which underwent EST, SD, and SDEST are significantly different from control group. Second, the three strategies tested in this research are more effective in reducing the symtomps of school refusal. Third, subjects in experiment group with SDEST strategy have sustained a decline in school refusal score greater than subjects in experiment groups which underwent single strategy

Keywords: *Ego state therapy, desensitisazation, systematic, school refusal.*

Introduction

In recent decades, school refusal has attracted much interest in international research(1). Gasparda, et al.(2) state that in modern society, the number of adolescents who refuse to go to school continues to increase. Unsuccessful school refusal lead to a great negative impact, not only on cognitive development but also on the physical and psychosocial development of children(2). Therefore, school refusal needs to be managed immediately and appropriately as soon as possible(3).If a student undergoes a prolonged school refusal his/her academic, personal, or social life will be disrupted.

School refusal is an emotional problem manifested by a child's unwillingness to attend school by showing a physical symptom, caused by anxiety separated from the closest person, due to a negative experience at school or having problems in the family. Children who undergo school refusal feel uncomfortable because of anxiety about something related to school so they can lose the ability to master developmental tasks at various stages during their development(1).

According to Kearney(4), School refusal behavior can be seen from one or a combination of the following characteristics: a) absences from school, refuses to go to school, does not want to go to school, b) attend school but then leave it before school time is dismissed, c) Present at school but exhibit unexpected behavior, from isolation behavior, do not want to be separated from its attachment figure, aggressive, uncooperative to temper tantrum, d) presents physical complaints and other complaints (excluding physical complaints) in order to avoid him or herself to go to school.

Some children undergo school refusal due to negative experience occured in school, while some of them is due to family issues. Also, there is a high probability of children undergo school refusal because a negative experience they obtained in school such as scorning, teasing, or bullying by their friends. Besides, some of them might feel ashamed because they are visually unattractive, overweight, too skinny, prone to fail in school.

School refusal has been convincingly experienced by public and private high school students in surabaya city, this data is reinforced by previous research indicating that students who are school refusal of the country ranged between 2.5% [5]. The school refusal condition in Surabaya city is higher than the international refusal condition that is 2.4% [6]. The higher prevalence of school refusal compared internationally, suggests that school refusal is a serious problem and requires immediate and comprehensive treatment.

Meanwhile, the survey also indicate that the highest cause of school refusal of students is 50% of which occurred due to traumatic experienced by schools and teachers. It is in line with King[7], who found that on psychological examination, many of the children who experienced school refusal had a phobic disorder. It also found that among the causes of school refusal, the most difficult to overcome, according to the school counselors, school refusal is caused by school phobia and traumatic events experienced.

Numerous counseling interventions is available to overcome school refusal problems (Ego State therapy (EST) and Systematic desensitization (SD)). Systematic Desensitization (SD) employs reciprocal inhibition principles, a fear-inducing stimulus paired with a response that block the emergence of feelings of fear. The child will gradually be confronted with a fear-inducing stimulus hierarchy while applying relaxation to make him/herself comfortable. Once the child is comfortable and the level of fear is reduced, he will be faced with a more difficult stimulus[8]. Erford[9]states that SD is a procedure in which clients repeatedly recall, imagine, or experience anxiety-generating events and then use a relaxation strategy to suppress the anxiety caused by the event. Meanwhile, EST is a method that focuses on the premise of personality that consists of separate parts called ego state or Mini Personality[10]. The purpose of ego state therapy is first, to allocate ego states where there is pain, trauma, anger or frustration, which is facilitated to be expressed, released and empowered. Second, it aims at facilitating the communication function among the ego state. Third, it aims at helping clients to recognize their ego state. Fourth, resolve conflicts within the client.

More specifically, this research also aims at combining Ego State therapy (EST) and Systematic desensitization (SD). Both EST and SD are combined to resolve a school refusal case which belongs to phobia due to traumatic experience underwent by students in school. The traumatic memories that a person experiences are stored within the subcortical brain region-the subconscious. According to Barabasz & Barabasz[11], when a person experiences trauma, memory associated with trauma events will stick in the brain in a non-verbal, unconscious and very-difficult-to-access section. This area can not be reached by cognitive-behavioral counseling, but can only be reached by EST. The combination of EST and SD is intended to help students who experience school refusal comprehensively. On the one hand, students need to be assisted in overcoming trauma experienced by using EST, while EST and SD are used to overcome fear of subject teachers both imaginary and in vivo. In essence, the combination of EST and SD, or SDEST (Systematic Desensitization and Ego State therapy) as an intervention strategy that seeks to constructively construct traumatic memories and increase the courage of the counselee to face current and future realities .

Method

It was an experimental research with *pretest-posttest control group design.* Senior High School Students in Surabaya undergoing school refusal were taken as research subject. It obtained 40 students as research subject and divided into for groups which consisted of 10 students in each group. One group of student was given an Ego State Therapy (EST), one group of student was given Systematic Desensitization (SD), one group of student was given combination of Systematic Desensitization (SD) and Ego State Therapy (EST)= SDEST, and one group of student was a control group with no treatment. This research utilized school refusal Revised-Child (SRS-RC) developed by Haight, et.all.[12].

The experiment was conducted by ten school counselors who obtained a training regarding EST, SD, and SDEST. The experiment was conducted six sessions which each sessions took 60 minutes. In addition, it was conducted individually and privately in counseling room. The data obtained during experiment were then analyzed by using descriptive statistic analysis and one-way analysis of variance (ANOVA).

Results

The analysis results of one-way analysis of variance (ANOVA) regarding the obtained score from group with EST treatment, group with SD treatment, group SDEST treatment, and control group are presented in the following Table.

Table 1: One-way Analysis of Variance Results

Source	JK	db	RK	F	R^2	P
Between A	23.9121	3	7.970699	32, 149	0.728	0.000
within	8, 925402	36	247, 928	--	--	--
Total	32, 837500	39	--	--	--	--

The score of F between A = 32,149 db = 3. 36 p = 0.000. Results of significance test indicate that the difference average of posttest score of school refusal scale among groups with EST, SD, SDEST, and control group are significant. The average score of group which treated by SD (A1) is 30.100, group which treated by EST (A2) is 25.300, group which treated by SDEST is 10.000, while the control group (A4) obtained 75.600.

According to the average score of posttest in school refusal scale among the four groups examined, the differences are significant. It further affirms that the proposed hypothesis in this research is accepted.

The following tables present the average score of each group and the results of T test among groups after giving treatment.

Table 2: Variabel T-test between groups

Groups	X (Posttest)	p
A1(SD) – A2 (EST)	0.682	0.507
A1(SD) – A3 (SDEST)	2.854	0.007
A1 (SD)– A4 (Control)	-6.462	0.000
A2 (EST)– A3 (SDEST)	2.173	0.034
A2 (EST)– A4 (Control)	-7.143	0.000
A3(SDEST) – A4 (Control)	-9.316	0.000

Based on t-test among treatment it can be seen that: the value of t A1-A2 = 0.682 db = 36 p = 0.253 for one tail. Significance test: the mean difference of the school refusal score between the groups treated with SD and EST was significant. So it can be concluded that between groups treated with SD and EST obtained a similar outcome in decreasing the school refusal. The value of t A1-A3 = 2.854 db = 36 p = 0.0035 for one tail. Significance test: difference of mean score of school refusal between group treated by SD (A1) and group that got combination treatment of Ego State therapy and Systematic desensitization (SDEST) (A3) is significant. So it can be concluded that the school refusal of group with SDEST was highly decreased compare to a group treated by SD.The value of t A1-A4 = -6.462 db = 36 p = 0.000 for one tail. The significance test of mean difference of school refusal between groups with Systematic desensitization (SD) and control group is significant. The value of t A2-A3 = 2.173 db = 36 p = 0.017 is for one tail. The significance test of mean difference of school refusal between groups with EST and the combination of Ego State therapy and Systematic desensitization (SDEST) is significant.

Based on the t test above, it can be summarized that the group treated with Ego State therapy and Systematic desensitization (SDEST) combination counseling strategies have a greater decrease in school refusal level compared to the group receiving Ego State therapy and Systematic desensitization (SD) separatedly.

Thus the hypothesis which states that "the combination of Ego State therapy and Systematic desensitization (SDEST) is more effective than separated treatment to handle school refusal among students ". To report the results of descriptive analysis, it was taken from school refusal score data, both the score before treatment and the score after treatment. The following is a graph showing refusal school scores of research subjects at the size before and after treatment

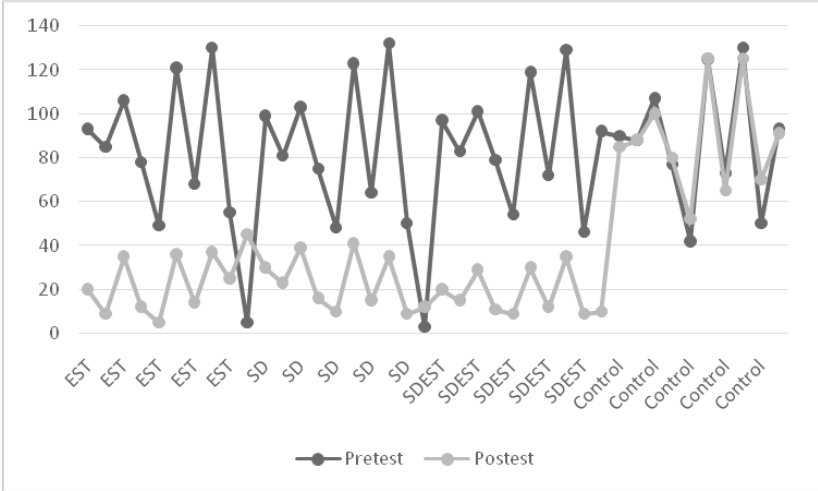

Figure 1. Scores school refusal pre and posttreatment

According to the graphic above, the counselees' score who obtained treatment (EST, SD, SDEST) before and after undergoing treatment is decreasing. On the other hand, within control group, some subjects' score decreased, while some others not and even increased.

Discussion

According to the analysis results of the obtained data from the four groups after undergoing treatment, it is found that the score of each group (EST, SD, SDEST, and control group) is different significantly. Additionally, EST, SD, and SDEST are confirmed successfully in reducing subjects' school refusal. This promote the findings revealed by Lee and Miltenberger [(13)], and Kearney and Silverman[(14)]. These initial research affirms that SD is an effective strategy to manage school refusal within children, particularly because of phobia in school. Also, it affirms that EST is able to manage effectively traumatic syndrome such as post traumatic stress disorder and acute stress disorder [(11)]. In addition, ego state therapy is effective to handle individual's trauma [(15)].

The decreasing of school refusal score average in experiment classes indicates that the treatments tested, EST, SD, and combination of Ego State Therapy (EST) and Systemic Desensitization (SDEST) in this study were successful in managing school refusal of the children.

The results of subsequent analysis indicate that the group treated with combination of EST and SD (SDEST) experienced a greated decreasing of school refusal compare with single treatment of both EST and SD. Both groups treated with single EST and SD experienced similar results in school refusal score. Hence, hypothesis stating that "Combined treatment of EST and SD is more effective than single treatment in managing students' school refusal" is accepted.

Among the three strategies tested in this research (EST, SD, SDEST), SDEST or the combination of both EST and SD is the most effective strategy which is able to manage significanctly students' school refusal. SDEST is effective to manage significantly school refusal because it is able to comperehensively construct past memories in a positive approach and promote counselees' courage in facing recent and upcoming events in an adaptive way.

In previous research, some scholars and researchers have attempted to combine systemic desensitization (SD) with other strategies. Iglesias and Iglesias [(16)] conducted a research by combining hypnosis and SD to reduce specific phobia, Ventis[(17)] combine SD and humour to reduce anxiety. While Poorgholami and Fatehi[(18)] examined combination of systemic desensitization and study-skills training to reduce students' anxiety during test. Also, Rajiah[(19)] combined psychoeducation strategy and systemic desensitization to reduce students' anxiety during test.

The combination done in this research was following the combination of the previous research, a combination done by Iglesias and Iglesias[(16)]. They have combined hypnosis and systemic desensitization. The combination model is in the form of suggestion which is part of

hypnosis given to the counselee during hierarchical scene. Ventis[17] has combined systemic desensitization and humour. Combination model arranged by Ventis is identical by Iglesias and Iglesias who merge humour within systematic desensitization.

Conclusion

The research affirm that the decline of school refusal of experimental are significantly different from control group. Second, the three strategies tested in this research (EST, SD, and SDEST) are more capable in reducing the symtomps of school refusal. Third, subjects in experiment group with SDEST strategy have sustained a decline in school refusal score greater than subjects in experiment groups which underwent single strategy. This research further implies that SDEST is the most feasible and remarkably effective strategy in managing school refusal. Fourth, SDEST offers numerous benefits to the counselee and provides less obstacles during the process.

Source of Funding: This research is sponsored by Surabaya State University and may lead to the development of products which may be licensed to Malang State University, in which I have a business and/or financial interest. I have disclosed those interests fully to Surabaya State University & Malang State University, and have in place an approved plan for managing any potential conflicts arising from this arrangement.

Ethical Clearance: We/I, the undersigned researcher(s) have read the Malang State University's Guidelines for Ethical Review of Research Involving Humans and agree to abide by them in the conduct of this research. It is understood that this includes the reporting and monitoring roles associated with the approval by Indonesian Guidance and Counseling Association.

Conflict of Interest: The research being reported in this publication was supported by Malang State University. The author(s) of this publication, has equity ownership in, which is developing products related to the research being reported. Implant Materials Used for Orbital Floor Reconstruction

Mohamed Esmail Khalil[1], Mohamed Farag Khalil[2], Raafat Mohyeldeen Abdelrahman[2], Ahmed Mohamed Kamal Elshafei[3], Tamer Ismail Gawdat[4]

[1]Assistant Lecturer, [2]Associate Professor, [3]Professor, Ophthalmology Department, Minia University, Minia, [4]Professor, Cairo University, Ophthalmology Department, Cairo University, Cairo, Egypt

Abstract

Purpose: To review different available implant materials used for orbital floor reconstruction regarding their indications, advantages and disadvantages.

Summary: Review of literature revealed the presence of a wide variety of implant options for repair of orbital floor defects. They can be broadly classified into biological materials, metals and polymers which are further divided into resorbables and non resorbables. The choice could be based on an algorithm for the defect size, the anatomical location, or the remaining structural support. Small defects may heal solely by the formation of scar tissue, whereas larger defects, especially those associated with enophthalmos, need material of a sufficient strength to support the orbital contents.

Keywords: *Blow-out fractures, Titanium, resorbable polymers.*

Introduction

Fractures of the orbit are seen in many patients who have blunt trauma to the face and skull. The prominent position of the orbit in the craniofacial skeleton predisposes this region to injury. [1]

Blow-out fracture is a special type of fracture of the orbital floor. Rene Le Fort concluded that blow-out fractures occurred through force transmission from the more rigid infraorbital rim to the relatively weak orbital floor, known as the buckling theory. [2] This theory was challenged by Pfeiffer in 1948, who observed a case series of globe-directed trauma resulting in blowout fractures, leading him to propose the hydraulic theory, which states that hydraulic pressure from the globe is transmitted to the bony orbit resulting in fracture of the thin orbital floor.[3]

In the repair of orbital fractures, the value of an implant is to regain function and aesthetic appearance by repairing the traumatic defect and bringing the globe into its correct position. In addition to the timing and method of reconstruction, a third essential factor in orbital fracture surgery is the choice of reconstruction material. [4]

Advances in biotechnology continue to introduce new implant materials for reconstruction of orbital floor fractures. Which material is best fit for orbital floor reconstruction has been a controversial issue. [5]

Characteristics of an ideal orbital reconstruction material [6]

1. **Stability and fixation:** The implant should be strong enough to support the orbital content and related forces, do not deform (sagging of material into maxillary sinus) under load and can be fixed to surrounding structures
2. **Contouring and handling:** Restores adequate volume to treat enophthalmos and diplopia, easy to shape to fit the orbital defect and regional anatomy and has smooth surface.
3. **Biological behavior:** Ideal implant is biocompatible with no infection, migration, foreign body reaction,

non-allergenic and non-carcinogenic. It should be osteosynthetic and shows high tissue incorporation but easily dissectable in implant removal during secondary reconstruction

4. **Drainage:** Spaces within the implant should be present to allow drainage of orbital fluids
5. **Donor site morbidity:** The implant should not increase surgical complication rate or donor site morbidity (pain, swelling, etc.)
6. **Radiopacity:** The implant should be radiopaque to enable radiographic evaluation without artifacts.
7. **Availability and cost-effectiveness:** Ideal implant should be readily available in sufficient quantities and acceptable costs

Types of materials used for orbital reconstruction:[6]

1. **Biological materials:**

- *Autografts/autogenous materials:*
  i. Autologous bone: calvarium, iliac crest, rib, mandibular symphysis, maxillary sinus wall
  ii. Autologous cartilage: nasal septum or concha, auricle, rib
  iii. Autologous fascia: Tensor fascia lata, temporal fascia
  iv. Autologous periosteum
- *Allografts*: Lyophilized dura mater; demineralized human bone, lyophilized cartilage, irradiated fascia lata.
- *Xenografts and animal-derived materials:* porcine sclera, porcine skin gelatin/Gelfilm, bovine bone or sclera
- *Biological ceramics (inorganic, non-metallic):* Porous hydroxyapatite (HA) and other calcium phosphates.

2. **Metals:** Titanium, Cobalt alloys
3. **Polymers (plastics):**

- *Non-porous non-resorbable (permanent) implants*: Silicone, nylon (SupraFOIL; Supramid), polytetrafluoroethylene (PTFE; Teflon, Gore-Tex), hydrogels, PEEK (poly ether ether ketone)
- *Non-porous resorbable implants:* Hyaluronate/ carboxymethylcellulose (HA/CMC; Seprafilm).
- *Porous non-resorbable implants*:

Porous polyethylene (PE; Medpor)

- *Porous resorbable (absorbable) implants:* Poly (lactic acid) (PLA), poly (glycolic acid) (PGA), PLA/PGA implants Polydioxanone (PDS), polyglactin 910/PDS implants (Ethisorb).

4. **Composites:**

HA-reinforced high density composite

Titanium/PE composite implant (Medpor Titan)

HA/PLA/polycaprolactone (PCL) sheet

Bone morphogenetic protein-loaded gelatin hydrogel

Advantages and disadvantages of currently available reconstruction materials:

- **Biological materials:** Biological materials are defined as grafts harvested from the same or another human or animal and include autografts, allo-grafts, and xenografts. [6]

Since the 18th century, autologous bone has been the 'gold standard' biomaterial for the reconstruction of bony defects in the craniofacial area.[7] Autologous bone grafts are used in orbital surgery because of their strength, rigidity, vascularization potential, and incorporation into the orbital tissues with minimal acute and chronic immune reactivity (i.e. infection, extrusion, collagenous capsule formation, and ocular tethering).[8] Donor site morbidity remains a general drawback for autologous bone harvesting. [6]

Allografts (homografts) are transplanted tissues (e.g. lyophilized dura mater or banked (demineralized) bone) from another human being. Their advantages include a decreased surgical time, preoperative customizability, absence of donor site morbidity, and abundant availability of banked bone. [4] Lyophilized dura (Lyodura) was a standard in the past for the reconstruction of smaller orbital defects because of its strength and absence of tissue reactions. [9] However, it became controversial following a case of Creutzfeldt–Jakob prion disease in a patient who received dura originating from a cadaver.[10] Consequent to this report, lyophilized dura sterilization was no longer performed with gamma irradiation but with sodium hydroxide. [11] The disadvantages of allografts include a resorption rate substantially higher than that of autologous tissue,[8] the

need for immunosuppressive pharmacotherapy, and the risk of viral transmission, such as hepatitis C virus and HIV.[12]

- **Metals**

Titanium has been used extensively in craniofacial surgery and dentistry in the form of implants, plates, and screws. [13] With its high biocompatibility and physico-mechanical properties, it could be an ideal implant for covering large anatomical defects (categories III–V) and globe malposition if implant-stabilizing surrounding bone or a distal landmark (a 'bony ledge') is absent.[14]

Titanium mesh is strong, rigidly fixable, widely available, and is subject to osseointegration with minimal foreign body reaction.[15] However, titanium is costly and may have irregular edges if not cut properly, which may impinge soft tissue. Furthermore, fibrous tissue will incorporate the mesh-holes, which can make implant replacement technically complex.[15] Late unwanted effects such as infection, corrosion, and toxic metal ion release have been reported with the use of titanium implants.[13] One Randomized Control Trial (RCT) has evaluated the effects of titanium implants as compared to perforated (PDS) foil for small orbital floor fracture reconstruction, and found no significant differences in the clinical outcomes.[16] A pilot study without controls used a low-profile 0.25-mm titanium plate in large defects (categories II and III) and found successful clinical outcomes without complications in 93% of the cases; at the 6-month follow-up, no functional or aesthetic concerns were observed. [14]

- **Polymers:** Polymers (or plastics) are large molecules comprising multiple repeated subunits and can be categorized into absorbable and non-absorbable (permanent) types. [6]

Non-absorbable permanent polymer implants: Porous ultra-high density polyethylene **(PE; Medpor™)** sheets of various sizes and thicknesses (0.4–1.5 mm) have been used widely to cover smaller floor defects since the 1990s. This widespread use is a product of the ability to easily cut the sheets into various shapes and the ability of orbital tissue to move freely over the smooth surface. Connective tissue and vascular components grow into the pores with minimal foreign body reaction. [17] In a prospective cohort study of floor reconstructions, PE sheets showed satisfactory surgical outcomes and infection rates similar to autografts.[18]

Polytetrafluoroethylene (PTFE; Teflon) is biologically and chemically inert, non-antigenic with minimal foreign body reaction, sterilizable, and easily mouldable. However, this polymer has not yet been subject to comparative clinical studies.[6]

Relatively new in orbital floor repair is the use of nylon foil, a non-porous poly-amide. Nylon foil has provided favourable results in preliminary non-comparative studies.[19]

Resorbable Osteosynthesis implants: Although the performance and biocompatibility of metallic and titanium fixation in osteosynthesis has been reported as satisfactory, a number of disadvantages have been associated with its use, including stress shielding of bone or osteopenia[20], impairment in imaging evaluation[21] and its restricted use in certain specific circumstances such as pediatric craniofacial surgery.[22]

Resorbable materials have been used widely for over 30 years in many fields of surgical practice, [23] and are of interest because of their more predictable absorption rates than biological grafts, as well as their high level of customizability and control. [24]

Chemistry and mechanism of action: Bioresorbable polymers are mainly high-molecular-weight aliphatic polyesters with repeating units of α-hydroxy acid (HOCHR-COOH) derivatives manufactured by ring-opening polymerization. The absorption of these polymers begins with depolymerization through the hydrolysis of their ester bonds and subsequent metabolism, probably by macrophages, in the citric acid cycle into water and carbon dioxide. [25]

The first clinically used bioresorbable polymer was polyglycolic acid (PGA), a highly crystalline and high-molecular weight molecule with limited clinical use for osteosynthesis because of its susceptibility to rapid degradation. Approximately 4–7 weeks after implantation, a duration which is insufficient to allow complete bone healing, PGA loses its mechanical strength in vivo. In addition, the side effects of PGA have been detected during its clinical use; these are due to the difficulty in clearing the accumulated acid degradation products. These negative effects have resulted in the minimal use of pure PGA in osteosynthesis.[26]

Polylactic acid (PLA) is another high-molecular-weight bioresorbable polymer; its optically active carbon in lactic acid generates 2

stereoisomeric forms, namely poly- L -lactide (PLLA) and poly- D -lactide (PDLA). Since the early 1990s, PLLA has been used as an osteosynthesis material. [27] Due to its crystallinity and hydrophobicity, PLLA is fairly resistant to hydrolysis, and thus bioresorption with complete loss of its strength in vitro does not occur within the first 2 years of implantation. PDLA, on the other hand, has a lower crystallinity and is less resistant to hydrolysis. Because of its slower degradation rate, PDLA has been reported to be highly biocompatible, although crystalline particles resistant to degradation may elicit some inflammatory response. [27]

By copolymerization of different derivatives of α-hydroxy acids, a variety of different mechanical qualities and degradation rates can be achieved. Copolymers of L -, D -lactides, for example, SR-P(L/DL)LA 70/30, a copolymer composed of 70% PLLA and 30% PDLA, loses all its strength in vitro after 48 weeks of implantation.[28] Copolymers of L -lactide and glycolide (PLGA) have been extensively used owing to the wide range of physiochemical properties of the components.[29]

Advantages and disadvantages of resorbable implants: The main advantages are easy handling and contourability, smooth surface and smooth edge, do not necessarily require rigid fixation, ideal for pediatric fractures, thin and can be applied in multiple layers in larger orbital volume displacement and without late implant related complications as infection, migration and extrusion. [6]

On the other hand, these materials can be radiolucent on postoperative imaging. [6]Some authors believed it may not provide enough support to orbital contents in large fractures and demonstrated an increase in orbital volume as a late complication. [30]

In a RCT, the administration of an absorbable copolymer of PLA and PGA had functional and aesthetic outcomes and complications similar to auricular cartilage implants in orbital blowout fractures with or without medial wall involvement. [31] In addition, PLA 70/30 plates were studied in a controlled trial and showed similar surgical outcomes and complications as compared to autografts in category II and III floor defects, without MRI evidence of foreign body reaction.[32]

Discussion

Depending characteristics of the different materials of orbital implants, it was feasible to postulate clinical recommendations for materials in specific cases.

Treatment algorithm for orbital wall fractures[6]:

1. Small-sized, low-complexity defects (class I): Most materials are suitable; biological behaviour is most important and resorbables may be used in these cases.
2. Medium-sized, medium-complexity defects (class II): Apart from the bio-logical behaviour of an implant, the experience of the surgeon with specific types of orbital implants will benefit the outcome. Various materials can be used, from autologous materials to alloplasts.
3. Large-sized, high-complexity defects (classes III–VI): Stability and contour become more significant and pre-bent or patient-specific titanium mesh is the preferred reconstruction material.

Conclusion

The debate on the clinical recommendations for orbital reconstruction material will likely continue because of the absence of RCTs and best practice clinical studies. Controversy exists regarding the best material features, which can be defined broadly by whether the implant is: (1) autogenous or allogenic, (2) non-resorbable or resorbable material and (3) malleable or preformed anatomical plates.

Expression of Amylin and Preptinin Iraqi Patients with Type 2 Diabetes Mellitus

Mohammed I. Hamzah[1], Israa A. Abdul Kareem[2], Mohammed Albayati[1]

[1]Clinical Chemistry, [2]Chemical Pathology, College of pharmacy, Al-Nahrain University, Iraq

Abstract

Diabetes mellitus is one of the most worldwide spread chronic diseases, and its complications are very serious if it is untreated. Type-2 diabetes mellitus (T2DM) is reported to be caused by obesity and sedentary life style. DM plays a role in accelerating the hardening and narrowing of the arteries. Preptin and amylin are pancreatic hormones which participate in glucose homeostasis. In T2DM patientsamylin peptids can be toxic to β-cells of pancreas due to Amyloid deposits within these cells, supporting the idea that islet amyloid might have an important role in the pathogenesis of T2DM.preptin is a peptide hormone that is secreted with insulin and amylin from the pancreatic β-cells. The study planned to investigate the relationship between serum amyline and preptinlevelsin patients with T2DM compared to healthy controls and to study their associations together (preptin and amylin) with serum levels of insulin and HOMA-IR. Sixty-four (64) patients were recruited from the Endocrine Outpatient clinic in Al-Imamain Al-Kadhimain city hospital from March of 2018 to May of 2018. Fasting serum samples were obtained on enrolment. (mean age, (61.73± 8.05) years;mean duration of diabetes, (8.77±2.66) years; mean HbA1c, (8.1 ± 1.7) with T2DM and body mass index (BMI) > 25.1 kg/m^2 underwent examination. Age, sex and (BMI) matched with thirty eight(38) healthy controls were also in ruled,Serum preptin and amylin levels were measured by ELISA technique. There was statistically significant difference between patients and controls serum amylin (p=0.023) and preptin (p=0.01).Patients with T2DM had significantly higher blood glucose (p=0.0001), HbA1c (p=0.0001), insulin (p=0.0001), and homeostatic model assessment of insulin resistance (HOMA-IR) (p=0.001)compared to healthy control,while total cholesterol was positively related (p=0.111) triglyceride, low-density lipoprotein cholesterol values were (p<0.001 for each), and significantly lower high-density lipoprotein cholesterol levels compared with the control group (p<0.0001). The preptin level demonstrated a significant positive association with insulin and HOMA-IR compared with healthy control. (for healthy control group: r=0.381,p=0.146, r=0.133,p=0.438) respectively; for T2DM group: (r=0.411,p=0.02, r=0.332,p=0.003), The amylin level also showed a significant positive correlation with insulin and HOMA-IR compared with healthy control. (for healthy control group: r= 0.188,p=0.309, r= -0.039,p=0.911) respectively; for T2DM group: (r=0.279,p=0.002, r=0.291,p=0.003),Conclusions: There were significant differences between healthy control and patients with T2DM concerning amylin and preptin levels. Serum Amylin and preptin increase in association with insulin in diabetic conditions. The present study suggests a potential role of amyline and preptin in the pathogenesis of T2DM.

Keywords: *Amylin, preptin, type 2 Diabetes Mellitus.*

Introduction

Diabetes mellitus (DM) is a metabolic disorder characterized by chronic hyperglycaemia with disturbances of carbohydrate, fat and protein metabolism resulting from defects in insulin secretion, insulin action, or both[(1)]. Typical presentation of Diabetes mellitus includes symptoms like thirst, polyuria, blurring of vision, and weight loss[(1)].

T2DM results from defect in insulin action in hepatic and peripheral tissues, especially muscle tissues and adipocytes[(2)]. The specific etiologic factors are not known but genetic input is much stronger inT2DM than type 1 diabetes mellitus(T1DM)[(2)]. Human islet amyloid polypeptide (hIAPP) which named as amylin, 37 amino acid, that is co-secreted with insulin from pancreatic islet β cells. This peptide when accumulates and aggregates

forms fibrils, Amyloid deposits is associated with β cells degeneration which considered as a hallmark of non-insulin dependent diabetes mellitus (NIDDM)[3]. The prevalence of diabetes for all age-groups worldwide was estimated to be 2.8% in 2000 and expected to be 4.4% in 2030 [4]. The total number of people with diabetes is projected to rise from 171 million in 2000 to 366 million in 2030. According to International Diabetes Federation data, there were some 425 million patients with diabetes worldwide in 2017, and this number is estimated to reach 629 million by 2045 [5,6,7]. Amylin is produced via gene expression on chromosome 12. It is transcribed as an 89-aminoacid prepolypeptide, which is cleaved to form the mature peptide in the β cells of the pancreas, where it is stored along with insulin and C-peptide in the same granules [8].

Amylin, which is co-secreted with insulin, regulates post-prandial glucose levels in part by inhibiting gastric emptying and suppressing glucagon release while not affecting glucose uptake[9]. Amylin has been shown to mirror insulin secretion in healthy subjects[10], obese subjects, prediabetes (subjects with impaired glucose tolerance)[11,12], and patients with T2DM[10]. These findings suggest an active role for plasma amylin levels in modulating glucose metabolism[13].

As an endocrine peptide, preptin is thought to activate the insulinlike growth factor receptor 2 (IGF2R), and as a result, induces calcium-dependent insulin secretion in association with protein C and phospholipase C when the glucose concentration is high[14]. In addition, preptin has insulin-like effects on bone metabolism, such as boosting cellular differentiation and affecting the functions of osteoblasts and osteoclasts[15]. Preptin is a 34-amino acid peptide hormone co-secreted from the βcells of pancreas along with insulin, amylin, and pancreastatin[16, 17].Females have higher preptin levels than males [18]. Preptin is believed to be a pphysiological enhancer of insulin secretion induced by glucose. There isa strong correlation between obesity, hyper-insulinemia and insulin resistance, and these associations get stronger with iincreasing bodyweight[19].Therefore, the relationship between BMI and preptin level would be a worth investigation. Hence, this study was carried out to evaluate amylin and preptinin patients with T2DM.

Subjects, Material and Method

Subjects: This study comprised sixty four consecutive patients of T2DM (26male and 38 female) and 38 healthy control (18 male and 20 female) were recruited from the Endocrine outpatient clinic in Al-Imamain Al-Kadhimain city hospital from March 2018 to May 2018.

All of the patients were asked to provide socio-demographic data, medical history, and family history. Other questions included were: theduration of disease, age of onset of the disease, any treatment taken.

Inclusion criteria: Patients who are suffering and diagnosed as T2DM patients.

Exclusion Criteria: T1DM patients., Pregnant women,Presence of other autoimmune disease like Hashimoto's thyroiditis, SLE, patients with liver disease, renal disease, recent history of cardiovascular disorder, hypertension, neurological disease, or, obese subjects with history of acute or chronic infections, any other chronic diseases, under cortisol treatment or suffering from any autoimmune disease, were excluded from the study.

Blood Sampling: Blood samples (7 ml) were collected from T2DM patients diagnosed according to the WHO protocol, and control subjects in serum separatorvacutainers (BD Vacutainer Systems, Plymouth, UK).Sera were separated and immediately stored at − 20° Cuntil analysis.

Serum Amylin and preptin: The quantitative determination of Amylinlevels and preptin were conducted by ELISA technique, using acommercial available kit,(human Amylin ELISA kit Catalog No. MBS72142 Mybiosource.com) and (human Preptin ELISA kit Catalog No. MBS764034 Mybiosource.com), respectively.

Statistical Analysis: All data were coded and entered using the program statistical package for social sciences (SPSS) version 25 under windows XP. Descriptive data was summarized using mean, standard deviation (SD), $P< 0.05$ were considered statistically significant.

Results

Serum levels of Amylin and preptin were estimated in 64 patients with T2DM, compared with 38 healthy control,age and sex matched. As expected, the patients with T2DM had significantly higher level of Amylin levels than the healthy controls($P=0.023$), as shown in table (1) and Figure(1).

The concentrations of preptin level,are presented in Table (1) are significantly higher in T2DM patients as compared with normal subjects (p=0.01).As shown in figure(2), The mean levels of amylin and preptin in normal healthy subjects and T2DM pateints was depicted in Table 1.

Table:(1): The Anthropometric and biochemical variables between the studied groups.

Parameters	Healthy Control Mean ± SD	Type 2 DM Mean ± SD	P-value
NO.	38	64	.....
Age (Years)	58.3 ± 9.1	61.73± 8.05	0.0001
BMI	26.5 ± 3.2	29.2 ± 4.2	0.411
FPG (mg/dL)	78.8± 8.1	188.3± 38.1	0.0001
HBA1c (%)	4.1 ± 1.3	8.1 ± 1.7	0.0001
Insulin (µiU/L)	6.67 ± 4.76	4.33 ± 2.53	0.0001

Amylin (pg/ml)	133.46±68.47	244±73.74	0.023
Preptin (pg/ml)	383.11±18.47	546.68±19.62	0.01

Values are Mean ± SD,.BMI: body mass index HOMA-IR: homeostatic model assessment-insulin resistance,FPG:fastingplasmasugar,HBA1c:hemoglobin A1C, HDL-C: high-density lipoprotein-cholesterol, LDL-C: low-density lipoprotein-cholesterol, $P < 0.05$ is considered statistically significant

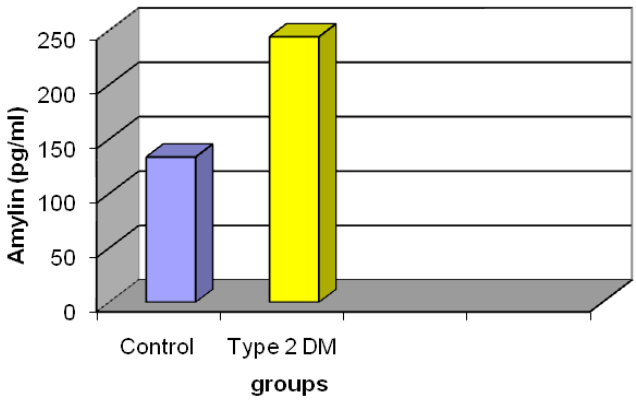

Figure (1): Mean levels of Amylin in patients with Type 2 DM compared to healthy controls.

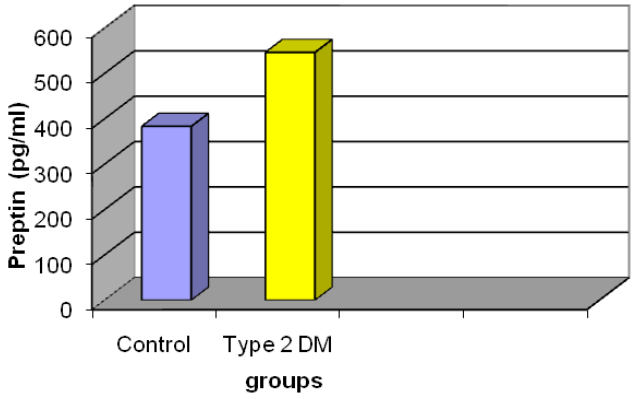

Figure (2): Mean levels of Preptinin T2DM patients compared to healthy controls

The amylin level demonstrated a significant positive correlation with insulin and HOMA-IR compared with healthy control (r=0.279,P=0.002), (r=0.291,P=0.003). Also preptin level showed a significant positive correlation with insulin and HOMA-IR compared with healthy control. (r=0.411,P= 0.02), (r=0.332,P= 0.003).

Discussion

In T2DM,the levels of amylin are raised in parallel with the increased demand for insulin, and this is thought to induce concentration-dependent amylin aggregation[20]. Islet amyloid formation is associated with reduced β-cell mass [21] and human

amylin 'oligomers' (small, soluble aggregates) are toxic to cultured islet cells[22] suggesting that they could contribute to progressive islet β-cell failure. Amylin oligomers can disrupt membranes[23] and inflict oxidative damage to cells[24]. In the present study amylin was measured and compared in type 2 DM and control, there was significant statistical difference between type 2 DM and control group where the p-value was 0.023. Researchers mentioned that islet amyloid deposits are found in >90% of T2DM patientsat autopsy[25], and action[26]. Amylin has been. However,the mechanisms and the precise role of amylin in the pathophysiology of T2DM remain unclear.

In the present study The concentrations of preptin level significantly higher in T2DM patients as compared with normal subjects (p=0.01), as illustrated in Table (1). These results agree with other results done by Yang et al.[27] who found higher levels of preptin in T2DM patients compared with control group. Higher preptin levels have also been reported in studies of patients with gestational DM and polycystic ovary syndrome [28-30].

Preptin is a physiological enhancer of insulin secretion induced by glucose. Recent studies have revealed that there is a potential association between preptin and insulin resistance in humans [31]. About diabetes mellitus, this association was also significant and this is confirmed by literature where it was shown that the concentration of preptin levels were higher in DM patients[32].

Statistical analysis revealed that Amylin significantly related to the variations seen in HOMA-IR in the present study, indicating a connection between amylin and insulin resistance in patients with T2DM.In the present study preptin level showed a significant positive relation with insulin and HOMA-IR compared with healthy control. These results consistent with other results that showed strong association between preptin levels and HOMA-IR in obese subjects as previously mentioned[33]. Similar to our research, the preptin level showed a positive correlation with insulin, HOMAIR,glucose, and HbA1c levels in a study conducted by Yang etal.[27]. Therefore, it is expected that a possible relation between amylin and preptin levels might exist. In the present study these two peptides (amylin and preptin) increase independently in T2DM patients; however, both indices demonstrated a positive correlation with insulin levels and HOMA-IR values.

Conclusion

Amylin and preptin may have an important role in the pathogenesis of T2DM, and ultimately in the degeneration and death of pancreatic islet cells. These findings provided a new rationale and opening up additional avenues of research into the etiology, pathogenesis and the treatment of T2DM. The findings of this investigation may provide significant data for in future research.

Evaluate the Correlation Between Antioxidant Capacity and Interferon Γ Level with the Disease Activity of Sle Patients in Iraqi Woman

Mohammed T. Alaanzy[1], Jinan M.J. Alsaffar[2], Ahmed Abdul Bari[3]

[1]Researcher, [2]Assist. Prof., College of Science/University of Baghdad, [3]Senior Specialist Doctor, Ibn Seena Hospital

Abstract

This study was aimed to assess total antioxidants capacity as well as interferon γ cytokine in female with Lupus Erythematosus and their relationship with disease activity. Fifty-two female SLE patients diagnosed and classified according to the American College of Rheumatology (ACR)criteria admitted to Department of Rheumatology at Baghdad and alyarmook teaching hospital. SLE patients were clinically evaluated and disease activity assessed using the SLE indicator and a particular focus on the onset, duration of the disease, and the body organs affected by the disease. Routine laboratory tests were performed for all patients. The levels of serum cytokines and antioxidant capacity were measured by enzyme linked immunosorbent assays (ELISA).In the case of total antioxidant capacity, the result showed that mean values were significantly lower in active lupus patients than inactive lupus and controls (2.050±0.276, 1.322±0.254, 1.286±0.133) respectively, and, the mean of values of **interferon γ cytokine** in active and inactive SLE patients were significantly higher than control group (83.275±15.612,71.335±14.948,32.049±7.519) respectively.

Keywords: *Systemic Lupus Erythematosus,Oxidative stress, Interferon (IFN), disease activity.*

Introduction

Systemic Lupus Erythematosus (SLE) is an inflammatory autoimmune disease that can involve nearly all human bodies, such as the kidneys, skin, cardiovascular system, joints, muscles, and nervous system [(1)]. The main cause of SLE is still unknown and more complex pathogenesis includes immunological, hormonal, hereditary and environmental variables and the disease is striking in females and affects predominantly females in reproductive age, the incidence differs in black girls between ethnic groups 1:250 and 1:4300 in white girls[(2,3).]

In SLE disease, autoantibody production, immune complex deposition and dysfunction of each T & B lymphocyte resulting in severe injury to various organs and connective tissue in huge populations worldwide[(4).]

In recent years, free radical damage and oxidative stress have been appeared to have a critical impact in obsessive procedures and clinical manifestations in SLE patients[(5)]. Free radicals and reactive oxygen species (ROS) generated interminably as a consequence of cell metabolic processes. The protection mechanism deactivates these free radicals by splitting the antioxidant chain reaction consisting of enzymes and multiple non-enzymatic antioxidants.

The main cause of oxidative stress is the imbalance between the production of reactive oxygen species (ROS) and the antioxidant defense mechanism[(6)]. The accumulated output of free radicals interferes with the redox status and can boost the expression of a broad variety of inflammatory molecules that can cause inflammation and tissue harm[(8)]. Several studies show that a risk factor for autoimmune diseases such as SLE[(7,9)] may be oxidative stress. Impaired antioxidant status in SLE patients ' saliva was also recorded [(10).]

Cytokines play an important role in the production, maturation as well as differentiation of immune system cells, cytokines cannot be systematically predicted in autoimmune SLE,These are far more complicated than the simplistic effects[(11)].

Interferon is water-soluble dimmer cytokine in the only type-II interferon member originally called the activating factor of macrophage..Two anti-parreliner blocking monomers form the biologically active INF-γ, which consists of six alpha helices composed of one nucleus and one fraction sequence extend in the C-terminal region.INF-γ is a typical type of cytokine that is secreted by Th1 cells and its expression profile is controlled by a number of IFN inducing factors, including IL-12,15,18 [12,13].It is initiated in the initial stages of the innate immune response and has been suggested to enhance the adaptive autoimmune response., It has been suggested to play the central role [14]. IFNs are a familyof three major types of proteins;type 1(IFN-α,β), type II IFN-γ and type III IFN-γ1, IFN-γ2, IFN-γ3,These three types are different in their main sequences of proteins, cognate receptors, chromosomal positions and therefore in the types of response cells. Interferon impacts a wide variety of biological responses, including viral and bacterial diseases, a variety of tumor impacts and cell regulation in each immune response[15,16].

The aim of this study was therefore to assess the levels of IFN-γ, antioxidant capacity and serological association between SLE patients and healthy control.

Patients and Method

Fifty-Two SLE female patients were enrolled, and their age range was 12 - 67 years . They were referred to the Rheumatology Department's Consultant Clinic (Teaching Hospital of Alyarmook and Teaching Hospital of Baghdad) during the period January – may 2018 for diagnosis and treatment. A control group of thirty six subjects were also included, and they were matched patients for gender and age where the age of patients and healthy individual range between 20 - 60 years.

Clinical Examination: Patients were subjected to complete history and clinical examination including skin, neurological and vascular examinations generallocomotors system, respiratory, and chest.

Disease Activity: Clinical disease activity was assessed with the SLEDAI on the day of serum sampling. Two groups of SLE patients based on disease activity were present: inactive SLE at SLEDAI<14 (n=32), active SLE at SLEDAI above 14 (n=20).Their healthy state was confirmed by both clinical and routine laboratory research.

Investigations: Investigations of each sample were donebycompletebloodpicture,erythrocytesedimentation rate, renal function tests, Complement 3, Complement 4, ANA, and Anti DNA doublestrandedantibody.

Estimation of IFN-γ and Antioxidant Capacity: Blood samples of the patient's and controls were centrifuged and the serum tested for interferon gamma (IFN-γ) and antioxidant concentrations. Sera were analyzedusingsandwichenzyme-linkedimmunosorbent assay (ELISA) according to the protocols of the manufacturer. IFN-γ assay by the ELISA kit from cusabio, Inc. ® ELISA. Catalog Number.CSB-E04577h. Assay range: 22.3-109.852 pg/ml. TOC assay by Sun Long Biotech Co., LTD, the Catalogue Number: SL2334Hu. Assay range: 0.971-2.571 pg/ml.

Statistical Analysis: Analysis of data was carried outusing the available statistical package of SPSS-25 (Statistical Packages for Social Sciences- version 25). The significance of differing means (quantitative data) has been tested using Student's-t-test to differentiate between two independent means or Paired-t-test for paired observation differences (or two dependent means), Or ANOVA test for distinction between more than two independent means. Measures the association closeness by correlation coefficient between two quantitative continuous variables. Kruskall Wallis one-way variance analysis (KW) test was used to compare the median for > 2 independent non-related samples. The P value was considered statistically significant less than 0.05.

Results

Patients Clinical Parameters: The active and inactive female SLE patients mean age was (32.95±12.72, 34.69±14.88) years, (Table I). In SLE patients, the level of ANA, Anti-dsDNA,WBC, ESR, urea and creatinine were higher than in control group. Hemoglobin, C3 and C4 levels in active SLE patients were significantly lower compared to inactive and healthy patients. (Table I).

Table I: Clinical Characteristics of Patients

Parameter	Active SLE	Inactive SLE	Healthy control	All	AxH	IxH	AxI

*Significant difference between two independent means using Student-t-test or difference among three independent means using ANOVA test at 0.05 level.

IFN-γ Level Based on disease activity and SLE clinical parameter: As shown in table II Active SLE had higher levels of IFN-γ than inactive and healthy co□trol. The serum level of IFN-γ in active SLE patients ranged from 51.528-109.85 pg/ml with a mean of 83.27±15.61 pg/ml, while its level in the inactive SLE was 46.01-99.852 pg/ml with a mean of 71.34±14.95 pg/ml, whereas in control group ranged from 22.386-49.474 pg/ml with a mean of 32.05±7.52 pg/ml. (Table II.)

TOC Level Based on disease activity and SLE clinical parameter: TOC levels differed between three SLE groups,TOC was lower in active SLE than inactive and normal controls with the mean of (1.29±0.13, 1.32±0.25, 2.05±0.28 respectively)

This indicating that **TOC** level are associated with increased disease activity.

Table II: The Level of TOC and IFN-γ in Sera

	Active SLE	In Active SLE	Healthy Control	All	AxH	IxH	AxI
IFN-γ (pg/ml)	83.27±15.61 (51.528-109.85)	71.34±14.95 (46.01-99.852)	32.05±7.52 (22.386-49.474)	0.0001*	0.0001*	0.0001*	0.008*
TOC (pg/ml)	1.29±0.13 (1.017-1.443)	1.32±0.25 (0.971-1.788)	2.05±0.28 (1.625-2.571)	0.0001*	0.0001*	0.0001*	0.567

Discussion

In our work, we detected that in SLE groups IFN- γ serum concentrations were significantly higher than groups of control. Our results are followed by other studies [17,18,19]. Contrary to our research, Yu and Wang[20] indicated that SLE group IFN-γ concentrations

were lowerthancontrol group. They explained their result by the fact that Th1 or Th2 cells in different phases of the disease may have different functions. Furthermore, the small number of patients in their study that was only 20 and the short duration of the disease ranging from 1 to 35 months can explain this..

Positive correlation between IFN-γ anti-dsDNA titer that was supported by other studies [21,22]. There was a significant correlation between serum levels of IFN-γ and SLEDAI and there were vital differences in serum concentrations of IFN-γ between inactive and very high activity groups. Gigante et al. [23], Csiszaˆ r et al.[17], and Viallardet al.[24] agree with our result. On the other hand, El-Sayed et al.[19] and Harigaiet al.[25] found nocorrelation between IFN-γ and SLEDAI.

In case of TOC, it was significantly lower in both active and inactive patients than control .This distinction can be explained by the constant oxidative stress and protein oxidation that happens even with inactive disease or mild disease activity in SLE patients [26]. Other studies have shown that the use of biomarkers-oxidants and antioxidants has increased oxidative stress i SLE patients. Lozovoy and others(2011). [26] Plasma chemiluminescence has risen significantly, reflecting enhanced lipid hydroperoxides and decreased antioxidant concentrations. Zhang*et al.* (2010) [27] Confirm the presence of oxidative stress in SLE patients by measuring protein oxidation by multiple markers. Another research found significant increases in oxidative andnitrosative stress in SLE patients, indicating an imbalance between reactive oxygen manufacturing and the development of nitrogen species and antioxidantdefensemechanisms in SLE [28].

Comparative Effect of Mulligans Mobilisation Versus Stabilisation Exercise on Chronic Nonspecific Low Back Pain: A Pilot Study

Mohan Kumar G.[1], Jibi Paul[2], Sundaram M.S.[3], Mahendranath P.[4]

[1]Research Scholar/Professor, Faculty of Physiotherapy, Dr. MGR Educational & Research Institute, [2]Professor, Faculty of Physiotherapy, Dr. MGR Educational & Research Institute, [3]Professor, School of Physiotherapy, Vels Institute of Science, Technology & Advanced Studies, [4]Associate Professor, ACS Medical College & Hospital, Chennai

Abstract

Objectives: Objective of the study is to investigate the comparative effect of mulligan's mobilization over stabilization exercise among nonspecific low back pain patients,to reduce the pain intensity, to improve the functional ability, endurance,strength of spinal extensor muscles,lumbar spinal mobility among nonspecific low back pain patients.

Methodology: It is an Experimental study design which was done in Outpatient physiotherapy department, faculty of physiotherapy, Dr. MGR Educational & research institute and Abinaya physiotherapy clinics with the comparative pre and post type. 45 samples with Chronic Nonspecific Low Back Pain have been taken by Systematic Random Sampling method and allocated with 15 subjects in each group. The subjects in Group A (n=15) received Mulligan's mobilization, the subjects in Group B (n=15) received Stabilization exercises and control group C (n=15)**.** The study duration was 6 months (Base line with 3 follows up).

Result: On comparing Mean values of Group A, Group B & Group C there is a significant difference in the Post test Mean values at 4th week,12th week & 24th week but stabilization exercises (Group B) which has the Lower Mean value is effective than Mulligan MWM (Group A) and followed by conventional (Group C) at **P ≤ 0.05.**

Keywords: *Nonspecific low back pain, Endurance, Strength, Pain, Dynamometer.*

Introduction

Nonspecific low back pain is the fifth most common condition which affects nearly 60-80% of people throughout the lifetime[(1)]. The pathology of the nonspecific low back pain is unknown. Based on the duration of the symptoms or pain it is classified into three sub groups (acute, sub-acute, and chronic)[(2)].The prevalence of low back pain as high as 84%[(1,3)], the chronic lowback pain is about 23%, disabled due to chronic low back pain is about 11-12% [(3)].Back pain in most cases is nonspecific due to poor posture, stress, anxiety[(5)]. Chronic nonspecific low back pain is a typical musculoskeletal condition regularly resulting in physical inactivity and disability.

Mulligan mobilization is a unique concept of manual technique in a weight bearing position to treat variety of musculoskeletal conditions designed to reduce pain and improve the joint range of motion. The concept of the mulligan mobilization is to assist individuals to increases the restriction ROM and the functional restrictions. The mulligan technique involves mobilization with movements (MWM'S), Natural apophyseal glides

(NAGS), Sustained natural apophysealglides (SNAGS). The fact in the mulligan concept of mobilization is multiple parameters must be used as outcome tool[6]

Stabilization exercise is the active form of therapeutic technique to improve the strength and stability of the spine and also help to prevent the low back pain [7]. It is progress in duration, intensity speed and variety. Stabilization exercise enhances stability via strengthening the deep muscles[8]. The aim of the study is to investigate the comparative effects of the mulligan mobilization and stabilization exercises. The null hypothesis states that there is no significant difference between Mulligan MWM, Stabilization Exercises and Conventional Exercises in Chronic Non Specific Low Back Pain.

Methodology

Experimental study design (PILOT STUDY), 45 subjects (both male and female) with non specific low back pain under the age group between 20 to 40 years was taken. Non specific LBP patients was categorized into three groups (n=45). Repetitive Motion, Torsion of spine, Pushing & Pulling activities, Stumbles, fall, Static/sitting work postures,Co-Contraction of muscles of Lumbar spine & Pelvis, Movement restrictions were included. The exclusion criteria is Inter vertebral disease, Facet joint degeneration, Annular tear, IVDP, Spondylolisthesis, spondylolysis, Ankylosing spondylitis, Nerve root compression,Malignant tumor, Hypertension, Pregnancy. The parameter such as Visual Analog Scale, Modified Oswestry Back Pain Disability Questionnaire, Chest Leg Dynamometer, Modified Schober's Test, Biering-Sorensen test was used.

Procedure: The 45 subjects was selected for the study according to the inclusion and exclusion criteria, with chronic nonspecific low back pain ascertained on the basis of Self administered questionnaire and they were randomly assigned in three groups, 15 subjects assigned for group-A, 15 subjects assigned for group-B and 15 subjects assigned for control group. Each subject is given intervention for 10 repetitions/exercise for 30 minutes per session with 3 session/week for 24 weeks. Group A: Mulligan's mobilization (n=15). During MWM with SNAGs the Belt is secured around the pelvis on ASIS and around therapist's gluteal folds. Therapist glides the spinous process by pushing it towards the eyeball direction of the patient. Patient is asked to perform the offending movement with the glide, which should now be pain free, 10 glides per session per movement. Group B: Stabilization exercises (n=15).Lumbar stabilization exercise program consists of stretching as a warm up (5min), Lumbar stabilization exercise (20 min) and stretching as a cool down (5min)Control Group C: conventional exercises (n=15). Conventional exercise consists of stretching as a warm up (5min), Cat & Camel exercise (20 min) and stretching as a cool down (5min)

Statistical Analysis: The collected data were tabulated and analyzed using both descriptive and inferential statistics. All the parameters were assessed using statistical package for social science (SPSS) version 24. One Way ANOVA includes of following tests (Test of Homogeneity of Variance, ANOVA, Post Hoc test Tukey HSD) (multiple comparison) was adopted to find statistical difference between three groups.

Result

On comparing Mean values of Group A, Group B & Group C on VAS, MODQ and Modified Schobers Test (Extension) significant decrease in the Post test Mean values at 4th week, 12th week & 24th week but stabilization exercises (Group B) which has the Lower Mean value is effective than Mulligan MWM (Group A) and followed by conventional (Group C) at **P ≤ 0.05.** On Modified Schobers Test (Flexion) BLC Dynamometer and Biering Sorensen Test shows significant Increase in the Post test Mean values at 12th week & 24th week but stabilization exercises (Group B) which has the Higher Mean value is effective than Mulligan MWM (Group A) and followed by conventional (Group C) at **P ≤ 0.05.** Hence Null Hypothesis is rejected.

Discussion

The purpose of the study is to analyze the efficacy of mulligan mobilization and stabilization exercise on chronic non- specific low back pain. It reveals that the stabilization exercise is effective when compared to the mulligan mobilization and it shows there is a significant difference in pre and post test values.

In (table- 1), VAS score shows that there is a significant difference in post test values (.000) when compared to the pre test values (.739) of all the three groups. In (table- 2), MODQ score shows that there is a significant difference in post test values (.000) when compared to the pre test values (.477) of all the three groups. In (table- 3), Modified schobers test (flexion) shows that there is a significant difference in post test values (.000) in 4th week (.021) when compared to the pre test values (.729) of all the three groups. In (table- 4), Modified schobers test (extension) there is a significant difference in post test values (.000) in 4th week (.220) but in the 1st day of pre test and 4th week of post test it shows no significant difference (.909). In (table- 5), BLC Dynamometer shows that there is a significant difference in post test values, in 4th week (.778) in 12th week (.41) in 24th week (.03) when compared to pre test value (.865). In (table- 6), Beiring Sorensen test shows that there is a significant difference in post test values (.000) but in the 1st day of pre test and 4th week of post test value (.111) it shows no significant difference (.617).

Mohammed Reza Pourahmadi et al (2018), concluded that the mulligan techniques decreases pain and disability and increases the ROM and their evidence is insufficient in supporting the benefits of the mulligan techniques. Min Yeong Heo et al (2015), the combination of lumbar stabilization and thoracic mobilization exercise showed greater effects in decreasing pain and increasing in functional ability and stability of the joints and increase the ROM.The effects of the lumbar stabilization is to reduce the biomechanical stress maximally in order to perform functional movements, it also reduces pain and increases the joint range of motion, seong-rae yang et al (2015). The therapeutic effect of the mulligan mobilization is to prevent the painful and limited range of motion as it corrects the positional faults in a facet joint (Hisham Mohammed hussien et al, 2017) .The hypothesis stated there is no significant difference between Mulligan MWM and there is significant difference in stabilization exercises and conventional exercises in Chronic Non Specific Low Back Pain.

Conclusion

The current study concluded that 6 months (Base line with 3 follows up)treatment program using mulligan mobilization and stabilization exercise with non-specific chronic low back pain showed that both the interventions

were effective. This study suggested that comparatively stabilization exercise showed statistically high significant improvement than mulligan mobilization.

Abstract

The International Labor Organization says almost every year as many as two million workers die from workplace accidents caused by work fatigue. Construction workers are one of the workers who have a heavy type of work. Working with heavy workloads and working hours beyond normal limits makes construction workers easily got fatigue. This study aims to determine the relationship of age of workers, length of work, work period, workload and nutritional status with work fatigue in construction workers in the Nipah building, Makassar. This type of research is observational analytic with a *cross-sectionalapproach*. Data collection was conducted in December 2017 against 74 workers as samples taken by *purposive sampling technique.* Fatigue measurements were performed using a *reaction timer,* the work load using *digital Omron*, the nutritional status by Body Mass Index using scales and *microtoice*, and the length of work and work period using a questionnaire. Data analysis carried out was univariate and bivariate with test *chi-square*. The results showed that there was a relationship between age of workers, length of work, work period, workload and nutritional status with work fatigue. The conclusion of this study is that there is a relationship between age of workers, length of work, work period, workload and nutritional status with work fatigue in construction workers in the Nipah building, Makassar.

Keywords: *Job Fatigue, Construction, Construction Workers.*

Introduction

Workers in carrying out their work are at risk of getting workplace accidents and occupational diseases. Accidents and illnesses due to work are usually preceded by the disruption of comfort and health and a decrease in work productivity. One of the health problems that can precede accidents and diseases due to work is the emergence of work fatigue. Fatigue is a process of decreasing efficiency, work performance and reduced physical strength or endurance to continue activities that must be done[1].

The working atmosphere with unhealthy, uncomfortable and unsafe environmental conditions will trigger work fatigue. Work fatigue is a phenomenon that is often experienced by workers but this cannot be ignored because it is related to the protection of the health of workers. The results of the study stated that of 80% of *human errors*, 50% were caused by work fatigue[2]. Fatigue is characterized by the weakening of labor in carrying out work or activities so that it will increase errors in doing work and the fatal consequence of the occurrence of workplace accidents[3].

According to the *International Labour Organization* (ILO), every year as many as two million workers die from workplace accidents caused by fatigue. In the study explained from 58,115 samples, 18,828 of them (32.8%) experienced fatigue. Whereas if the worker experiences a work accident caused by fatigue, it will

have a direct impact on the level of work productivity. So human factors are very influential on the level of work productivity, such as sleep problems, biological needs, and also work fatigue, even expressed that the decline in labor productivity in the field is largely due to work fatigue[4].

In Indonesia, work accidents due to unsafe labor behavior reached 31,776 cases (32.06%) of the total cases during 2009 which included fatigue conditions of workers while working and others including being undisciplined in the use of personal protective equipment. Thus, it can be concluded that the main factors causing work neglect include unsafe behavior factors and unsafe conditions[5]. Factors that cause fatigue vary greatly, which is influenced by workload, work environment, *problems*physicaland health conditions can also be influenced by individual factors such as age, health status, nutritional status, diet, gender,and psychological conditions[6].

Based on research on fatigue factors in the field of construction projects, it was found that all workers experienced fatigue, namely 29% mild fatigue, 45% moderate fatigue and 26% severe fatigue. The results showed that there were 3 variables that had a significant relationship with fatigue, namely age, heat pressure,and noise. While the most dominant variable associated with fatigue is heated pressure[7].

Individual factors such as age have a significant relationship to the occurrence of fatigue, where age is related to the process of organ degeneration which causes a decrease in the ability of organs so that the workforce becomes more easily fatigued[8]. Workers who have excessive working hours and overtime working hours beyond the ability limit can accelerate fatigue, reduce the accuracy, accuracy,and accuracy of work[9]. Fatigue is closely related to feeling bored due to monotonous work. The same work done repeatedly from day to day without any variation can cause boredom, bored and tired quickly[10]. Repeated working conditions can create a monotonous atmosphere that accumulates into boredom, where boredom is categorized as fatigue[11].

Work fatigue is a potential disorder that occurs in all workers, especially in the construction sector. Some studies show factors that correlate with work fatigue. This study aims to determine whether there is a relationship between age of workers, length of work, work period, workload and nutritional status with work fatigue in construction workers in the Nipah building, Makassar.

Materials and Method

The type of research used was observational analytic with a *cross-sectionalapproach*. This research was carried out in the construction project of the Nipah building, Makassar in December 2017. The population in this study were workers in the construction project of the Nipah building, Makassar which numbered 307 people. The sample was obtained by *purposive sampling method* which is 74 people. Retrieval of data by measuring fatigue using *L77 lakassidaya reaction timer,* workload measurement using *digital Omron type AI2,* measurement of nutritional status by Body Mass Index (BMI) using scales and *microtoice,* as well as the length of work data and work period data using a questionnaire. Data analysis performed was univariate and bivariate using the test *chi-square* by presenting data in the form of tabulations and narratives.

Findings:

Table 1: Work Fatigue

Work Fatigue	Frequency	Percent (%)
Positive	59	79.7
Negative	15	20.3
Total	74	100

Most workers experience work fatigue. The results of the work fatigue measurements using the *reaction timer*, it was found that more workers who experienced fatigue were 59 workers (79.7%)while the workers who did not experience fatigue were 15 workers (20.3%).

Table 2: The Relationship between Age of Workers and Work Fatigue

Age of Workers	Work Fatigue		N	P-value
	Positive	Negative		
Old	30	1	31	0,002
	96.8%	3.20%	100%	
Young	29	14	43	
	67.4%	32.6%	100%	
Total	59	15	74	
	79.7%	20.3%	100%	

There is a relationship between age of workers and work fatigue in construction project workers.

The results of 74 respondents, workers who

experienced work fatigue with old age categories were 30 respondents (96.8%) and young age categories were 29 respondents (67.4%). While respondents who did not experience work fatigue in the old age category were 1 respondent (3.20%) and in the young category, 14 respondents (32.6%).

In this study workers who experience,fatigue tends to be experienced by workers who are old or have 35 years of age or older than workers who are still young. This is because in general, the advanced age of a person's physical abilities is definitely decreasing. Someone who is young can-do heavy work and vice versa if someone is old then his ability to do heavy work decreases. Older workers will feel tired quickly and cannot move freely when carrying out their duties which affect their performance. Setyawati said that workers aged 40-50 years would suffer fatigue faster than the relatively younger workforce. Old-aged workers will experience a decrease in muscle strength which results in fatigue in doing their work and a decrease in muscle strength will cause muscle fatigue that occurs due to the accumulation of lactic acid in the muscle[12].

Table 3. The Relationship between Length of Work and Work Fatigue

Length of Work	Work Fatigue		N	P-value
	Positive	Negative		
Inappropriate	52	9	61	0.011
	85.2%	14.8%	100%	
Appropriate	7	6	13	
	53.8%	46.2%	100%	
Total	59	15	74	
	79.7%	20.3%	100%	

There is a relationship between the length of work and work fatigue in construction project workers.

The results of 74 respondents, workers who experienced work fatigue with an inappropriate length of work were 52 respondents (85.2%) and who have an appropriate length of work were 7 respondents (53.8%). While respondents who did not experience work fatigue with an inappropriate length of work namely 9 respondents (14.8%) and eligible categories, namely 6 respondents (46.2%).

In this study, workers whose work duration inappropriate or more than 8 hours experience more fatigue than workers who have an appropriate length of work. This is in line with Suma'mur which states that if someone does physical work, but does not do variations in work and in a time that exceeds the predetermined limit for a worker in a day it will cause contraction of the muscles of the abdominal support continuously in the long run[2].

Table 4. The Relationship between Work Period and Work Fatigue

Work Period	Work Fatigue		N	P-value
	Positive	Negative		
Old	42	5	47	0.007
	89.4%	10.6%	100%	
New	17	10	27	
	63.0%	37.0%	100%	
Total	59	15	74	
	79.7%	20.3%	100%	

There is a relationship between the work period and work fatigue in construction project workers.

The results of 74 respondents, workers who experienced work fatigue with the old work period were 42 respondents (89.4%) and new categories namely 17 respondents (63.0%). While respondents who did not experience work fatigue in the old working period were 5 respondents (10.6%) and in the new category were 10 respondents (37.0%).

Workers who have a long working period tend to experience fatigue compared to workers whose work period is classified as new. This affects the feeling of saturation due to the work carried out continuously which affects the level of fatigue experienced by construction workers. According to Suma'mur, a long period of work for work carried out in a monotonous and continuous manner can cause feelings of fatigue[13].

Table 5. The Relationship between Workload and Work Fatigue

Workload	Work Fatigue		N	P-value
	Positive	Negative		
Heavy	27	2	29	0.036
	93.1%	6.90%	100%	
Light	32	13	45	
	71.1%	28.9%	100%	
Total	59	15	74	
	79.7%	20.3%	100%	

There is a relationship between workload and work fatigue in construction project workers.

The results showed that respondents who experienced work fatigue with heavy workload categories were 27 respondents (93.1%) and light categories were 32 respondents (71.1%). While respondents who did not experience work fatigue in the heavy workload category were 2 respondents (6.90%) and in the light category, 13 respondents (28.9%).

The workload is one factor that also affects fatigue. Workers who experience fatigue are more experienced by workers with heavy workloads than workers with light workloads. This happens because the heavier the workload of someone, the ability of someone to work is also required to balance the workload. In this case, workers who have a heavy workload are not matched by their ability to work so that fatigue is easy. This is in line with the theory according to Munandar that every workload must be in accordance with physical abilities, cognitive abilities, as well as the limitations of humans who receive the burden[14]. The heavy or lightness of the workload received by a person can be used to determine how long the person can do the work in accordance with the work capacity concerned.

Table 6. The Relationship between Nutritional Status and Work Fatigue

Nutritional Status	Work Fatigue		N	P-value
	Positive	Negative		
Abnormal	21	1	22	0.030
	95.5%	4.50%	100%	
Normal	38	14	52	
	73.1%	26.9%	100%	
Total	59	15	74	
	79.7%	20.3%	100%	

There is a relationship between nutritional status and work fatigue in construction project workers.

The results of 74 respondents, workers who experienced work fatigue in the category of abnormal nutritional status were 21 respondents (95.5%) and normal categories were 38 respondents (73.1%). While respondents who did not experience work fatigue in the category of abnormal nutritional status were 1 respondent (4.50%) and in the normal category, 14 respondents (26.9%).

In this study more workers who experienced fatigue were included in workers whose nutritional status was abnormal compared to workers who had normal nutritional status. The imbalance between the energy needed by the body and the amount of energy received by the body affects the efficiency and productivity of workers, so workers easily experience fatigue. Kusmawan stated that energy intake is needed by the workforce to maintain the body's condition to always be excellent, lack of energy intake results in health problems and work productivity[15]. The level of energy intake, especially for heavy workers is a determinant of the degree of work productivity. Heavy workers, if not balanced with sufficient energy intake, usually will speed up fatigue.

Conclusion

Based on the results of the study, it can be concluded that most workers experience fatigue, the majority of workers are young, most workers have an inappropriate length of work, most workers have a long working period, most workers have a light workload and the majority of workers have normal nutritional status.

There is a relationship between age of workers, length of work, work period, workload and nutritional status with work fatigue in construction workers in the Nipah building, Makassar.

Abstract

Introduction: Community health centers as primary health care centers are required to be able to provide quality assurance services to the community. The current problems of the Community Health Centre are the low quality of services, the lack of standardized infrastructure, and the low number of quality human resources, and high constant of patients' complaints. The aim of this study is to evaluate the quality of health services at community health centers.

Material and Method: The research method is an observational study by taking data in 13 provinces in Indonesia for 3 years (2016-2018). A total of 45 randomly selected community health centers were evaluated for 3 days per health community center using an accreditation instrument that had been prepared and established by the Indonesian Ministry of Health consisting of 9 chapters, 42 standards, 168 criteria, and 776 assessment elements.

Finding and Discussion: The results showed that there were 2.2% of the community health centers which are not accredited, while the other 97.8% are accredited. The basic accreditation status was 45.5%. The status of intermediate accreditation was 40.9%. The main accreditation status was 13.6%. There was no plenary status of accreditation.

Conclusion: The conclusion of the study was that there are more community health centers with basic accreditation status so management supervision, human resources, facilities and infrastructure, and innovation of the community health center still needs to be improved.

Keywords: *Accreditation Status, Community Health Center, Service quality.*

Introduction

The World Health Organization (WHO) uses an accreditation system to evaluate the health service process to improve the quality of services provided to patients[1]. WHO recommends that each country ensures the quality of health services received by the citizens[2,3]. The aim of health development is to increase awareness, willingness and ability to live healthy for everyone in order to manifest optimal public health degrees. In order to achieve these objectives, various comprehensive, tiered and integrated health efforts were held. Minister of Health Regulation No.75 of 2014 concerning Public Health Centers stated that the community health center function as organizing the first level of Public Health

Corresponding Author:
Muhammad Tahir
Doctoral Students of Public Health Hasanuddin University, Makassar, Indonesia, Stikes Muhammadiyah Sidrap, Sidrap, Indonesia
e-mail: tahirs3unhas@gmail.com

(SME) and Health Efforts (UKP) by prioritizing promotive and preventive efforts to achieve the highest degree of public health in its working area[4].

Community health centers which are the frontline of health services have to provide quality assurance for health services to all residents in their working areas, therefore through Minister of Health Regulation Number 46 of 2015 has mandated the implementation of health center accreditation. Efforts to improve the quality of health services at the community health center level have been implemented nationally since 2015. However, these efforts are considered not sustainable because accreditation is considered as the end of quality. Historically accreditation is a process of assessment and monitoring through measurement of compliance with standards, the *Institute of Medicine* (IOM) report has produced a results-based quality improvement approach. The audit results and quality components implemented are yet difficult to determine the accreditation benefits of improving quality and patient safety[5].

The research conducted by Heuer which connects two indicators of quality, accreditation and patient satisfaction to 41 hospitals that have received accreditation scores from the *Commission on Accreditation of Healthcare Organizations* showed that there is no significant relationship between accreditation scores that represent the quality of service and patients' satisfaction rate who are the indicators of service quality. The success of policy implementation will be determined by many variables or factors, and each of these variables is related to each other[6,7,8].

Indonesia has 9,913 health centers, of which 7,508 were accredited community health center, and 2,405 community health centers had not been accredited. Although most have been accredited, community health center has yet fully provided maximum contribution to health services to the community, as a result, the community chooses to use clinical services, independent practice, hospitals, and other health facilities. In addition, the image and appearance of community health centers received less attention. The presence of leaders and staff have not been able to implement community health center management, low compliance with standards and guidelines in carrying out activities. Inability of community health center leaders to manage the culture and religion of their staff, staff incompetence in identifying innovation opportunities in improving performance achievement, inadequate quality team and Community health center internal audit team, and facilities and infrastructure issues, as well as inability to guarantee continuous quality improvement efforts.

Unsustainable quality improvement will have an impact on low patients' satisfaction, lack of trust in health services, increased morbidity and mortality, increased maternal mortality, infant mortality, under-five mortality, decreased life expectancy, and low community health status, on the other side processes for accreditation of community health center have been implemented nationally. By these various problems, an evaluation of quality of health service on the community health center will be carried out through an accreditation survey in Indonesia.

Community health center known as Puskesmas is the First Level Health Facility (FKTP) which is responsible for the health of the community in its area in one or part of the sub-district. In the Minister of Health Regulation Number 75 of 2014 concerning Public Health Centers, it is stated that the Community health center is the Regional Technical Implementation Unit (UPTD) of the District/City Health Office. The success of the Community health center can be carried out by the internal organization of the Community health center itself, which is "Community health center Performance Assessment," which includes management of resources including tools, medicine, finance and labor, and supported by management of recording and reporting systems, called Community health center Management Information Systems (SIMPUS).

Materials and Method

The method used was an observational study conducted in 13 provinces in Indonesia for 3 years (2016-2018). Out of the 76 community health centers that have been prepared, 45 health centers were randomly selected. The chosen community health centers were observed or evaluated for 3 days in each community health center using an accreditation instrument that had been prepared and stipulated by the Indonesian Ministry of Health consisting of 9 chapters, 42 standards, 168 criteria, and 776 assessment elements.

Findings and Discussion

Based on table 1, it shows that 44 (97.8%) community health centers were accredited and 1 (2.2%) health centers were not accredited.

Table 1. Distribution of Accredited Community Health Centers

Accreditation	F	%
Accredited	44	97.8
Not Accredited	1	2.2

Based on table 2, out of 44 (97.8%) accredited community health centers, the result was the basic accreditation status were 20 (45.5%) community health centers, middle accreditation status were 18 (40.9%) community health centers, main accreditation status were 6 (13.6%) community health center, and there was no plenary accreditation status.

According to table 3, the basic accreditation status was 45.5% with the characteristics of the working area, namely urban areas as much as 20%, rural areas as much as 45%, remote and very remote areas as much as 35%, with the ability to administer namely 45% non-hospitalization and 55% hospitalization. Intermediate accreditation status is as much as 40.9% with the characteristics of the working area namely urban areas as much as 16.7%, rural areas as much as 72.2%, remote and very remote areas as much as 11.1%, with the ability to administer namely non-hospitalization 38.9% and hospitalization 61.1%.

Table 2. Distribution of Community health center Accreditation Status

Accreditation Status	F	%
Basic	20	45.5
Intermediate	18	40.9
Prime	6	13.6
Plenary	0	0

Table 3. Distribution of Accredited Health Centers based on work area and organization of Community Health Center

Accreditation	Work Area						Management			
	Urban		Rural		Remote		Out patient		Inpatient	
	F	%	f	%	F	%	f	%	F	%
Basic	4	20	9	45	7	35	11	55	9	45
Intermediate	3	16.7	13	72.2	2	11.1	7	38.9	11	61.1
Prime	2	33.3	3	50.0	1	11.1	2	33.3	4	66.7
Plenary	0	-	0	-	0	-	0	-	0	-

Prime accreditation status is 13.6% with the characteristics of the working area, namely urban areas as much as 33.3%, rural areas as much as 50.0%, remote and very remote areas as much as 16.7%, with the ability to administer namely non-hospitalization 33.3% and hospitalization 66.7%. There is no plenary status accreditation.

The community health center must be accredited periodically at least for 3 years (Regulation of the Minister of Health no.75 year 2014 article 39), as well as accreditation is a credential requirement as a first-level health service facility in collaboration with BPJS. The approach uses in accreditation is the safety and rights of patients and families, while still paying attention to the rights of the officers. This principle is enforced to ensure that all patients get the best service and information in accordance with the needs and conditions of patients, regardless of social, economic, educational, gender, race or ethnicity. In order to improve the quality of the community health center, the Management Team must be able to work excellently and professionally, under the coordination and supervision of the head of the Community health center who performs their good and appropriate leadership functions according to the situation and conditions.

Provided health efforts must always pay attention to interests, needs, and expectations of the community as external consumers, the interests and satisfaction of all Community health center staff as internal consumers, and support for community health center facilities and infrastructure because the district/city government is the owner. For this reason, the District/City must prepare a Community health center to analyze the needs of services and the availability of Community health center

resources (based on Minister of Health Regulation number 75 of 2014) and assistance for Pre-Accreditation, Surveys to Post Accreditation Assistance. Accreditation according to Minister of Health Regulation No. 46 of 2015.

Accreditation based on Minister of Health Regulation number 46 of 2015 concerning Health Center Accreditation, Primary Clinics, Doctor's Independent Practice, and Dentist's Independent Practice, namely recognition given by independent institutions administering Accreditation determined by the Minister after meeting standards Accreditation.

The main purpose of Accreditation is to foster quality improvement, performance through continuous improvement of management systems, quality management systems, and clinical service delivery systems, and the application of risk management, and not just an assessment to get an accreditation certificate. Based on several other literatures, accreditation is the competence of an institution in carrying out activities in the form of formal recognition given by the accreditation body to certain suitability. Accreditation is an activity that examines all components as part of the process. The components reviewed are related to the structure that is in it[9]. The aim is to improve sustainable and continuous standards. Research results of Shaw in 73 hospitals in Europe showed that accreditation had an effect on the quality management of the services provided[10].

Accreditation is very much related primarily to clinical leadership and patient safety systems. In summary, it can be concluded that accreditation is an activity carried out to obtain formal recognition towards achieving a standard. The main achievement was in the form of continuous improvement in quality and performance. Minister of Health Regulation No. 46 of 2015 is a policy that sets standards and instruments for evaluating Community health center accreditation in providing first-rate services to the public. In articles 3 and 4, it was explained that the community health center must be accredited every 3 (three) years. Determination of accreditation status is the final result of the accreditation survey by surveyors and decisions of meetings of independent accreditation organizers. This determination was proven by the existence of an accreditation certificate.

The Accreditation Status of the Community health center consists of (1) Not accredited; (2) Basic accreditation; (3) Intermediate accredited, (4) Prime Accredited and (5) Plenary accredited. The District/ City Health Office prepares the Pre-accreditation steps until post-Community health center accreditation from the establishment of District/City Facilitation Teams, Community health center Facilities and Infrastructures, District/City APBD Budgeting and Human Resource according to their Competencies. Pre-accreditation assistance is a series of activities to prepare Community health center to meet Accreditation standards, while post-accreditation assistance is an activity to maintain and improve the achievement of accreditation standards continuously until the next accreditation assessment is conducted. Accreditation is used as an external evaluation instrument for patient quality and safety. For continuous quality improvement after post-accreditation, the Companion team works on orders and responsibilities to the head of the District/City Health Service.

Quality assurance is a concept that aims to achieve guaranteed quality of health services on an ongoing basis based on established standards. Its achievements are more emphasized in the service process in accordance with the standards so as to prevent the occurrence of services that do not meet the standards. Continuous quality assurance can be implemented if a quality system is implemented in the management of a good organization. This situation makes the organization will strive to provide services even exceeding the standard. This situation is because it focuses on internal and external customer satisfaction. Quality assurance is one form of improving service quality. The tools used in improving the quality of service consist of various types depending on the service organization. Enhancement tools used include accreditation and Quality Management System ISO 9000.

Accreditation itself is a tool that emphasizes structures. Safety culture is also an important aspect because according to Budiharjo this culture describes the provided services and is one of the efforts in quality assurance[11]. Culture is not only limited to slogans but is strategically linked to a system of socialization, Human Resource strategy, technology, training and example. Cable (1998) in Bustami (2011) reveals the key to the quality of health services, namely systems thinking, teamwork approach, leadership and continuous quality improvement. Bustami (2011) explains that based on his experience there were 6 things that can be achieved in quality assurance. The achievements are: (1) thorough examination, (2) the utilization of facilities and tools

becomes better, (3) more precise and economical treatment (4) more adequate information for patients, (5) more friendly and sympathetic services provided so tpatient trust increases, (6) results will be more effective and efficient[12,13,14].

Conclusions

Community health center with higher basic accreditation status, which is as much as 45.5% with work areas in rural areas and outpatient, so that management, human resources, facilities, and infrastructure need to be improved, and innovations for the community health center.

Conflict of Interest: There is no conflict of interest to be declared.

Abstract

Diabetes mellitus is a metabolic disorder characterized by chronic hyperglycemia due to disorders of insulin secretion, insulin sensitivity, or both. The main mode of diabetes control can be achieved with diet, exercise, and insulin replacement therapy nor with various oral hypoglycemic drugs. Diabetes mellitus also results in disorder of the lipid profile of the body so that the cells are more susceptible to lipid peroxidation. Malondialdehyde (MDA) is formed as a result of lipid peroxidation that can be used to measure lipid peroxidized. It has been reported that the polysaccharide from the pumpkin (Cucucrbitamoschata) has hypoglycemic activity by increasing plasma insulin.

This study aims to determine the activity of hypoglycemic, and the effect of hepatoprotective pumpkin in alloxan-induced diabetic rats by 30 Rattus norvegicus, divided into 6 groups of 5 each. Group K (-) was the negative control group without treatment, K (+) of untreated diabetic control group, TC1, TC2, TC4 were grouped with pumpkin flour with 1, 2 and 4 gram/kg bwt for 21 day by gavage, and the diabetic group given glibenclamide 0.45 mg/kg body weight. The hypoglycemic effect was determined by measuring the blood glucose level, the antioxidant effect determined by measuring the activity of AST and ALT enzymes and the serum malondialdehyde levels.

The results of this study showed that the pumpkin flour had the hypoglycemic effect of lowering blood glucose level at 4 g/kg bwt doses equivalent to Glibenclamide 0.45 mg/kg bwt ($p > 0.05$); had antioxidant activity by decreasing the activity of AST and ALT enzymes ($p < 0.05$) and decreasing malondialdehid levels in diabetic rats ($p < 0.05$).

Keywords: *Hypoglycemic; Antioxidant; Pumpkin; Cucurbita.*

Introduction

Diabetes is a serious chronic disease that occurs when the pancreas does not produce enough insulin (a hormone that regulates blood sugar or glucose), or if the body cannot effectively use the insulin it produces. Diabetes is an important public health problem, one of four priority non-communicable diseases (Non Communicable Disseases). Both the number of cases and the prevalence of diabetes have continued to increase over the past few decades. Diabetes of all types can cause complications in many parts of the body and may increase the risk of death as a whole early. Possible complications include heart attack, stroke, kidney failure, leg amputation, loss of vision and nerve damage.[1]

Hyperglycemia in DM increases the risk of microvascular damage (retinopathy, nephropathy and neuropathy) and macrovascular (ischemic heart disease, stroke and peripheral vascular disease). This results in a decrease in quality of life, a decrease in life expectancy, and even death can occur due to these complications.[2]

Diabetes mellitus results in disruption of the body's lipid profile so that cells are more susceptible to lipid peroxidation. Experimental studies show that

polyunsaturated fatty acids in cell membranes are very susceptible to attack by free radicals because of the many bonds. Lipid hyperperoxide (LHP) through a radical reaction between producing a highly reactive and toxic lipid radical that forms a new LHP.[3] The resulting lipidperoxide often decomposes into radicals, which in turn react with the most biologically important molecules such as proteins and lipids. Further decomposition of this lipid peroxide produces toxic malondialdehyde (MDA).[4] Malondialdehyde (MDA) is formed as a result of lipid peroxidation which can be used to measure lipid peroxide.[3]

Pumpkin is a plant that has often been used as a functional food or medicine. For hundreds of years, pumpkin has been considered as a traditional Chinese medicine used for the prevention and treatment of various diseases such as hypertension, hypercholesterolemia, tumors, immunological disorders and DM. It has been reported that polysaccharides of pumpkin (PP) have hypoglycemic activity by increasing plasma insulin in normal mice and diabetes.[5]

Material and Method

Pumpkin is obtained from traditional markets in Yogyakarta, Indonesia. White rats Rattus norvegicus Wistar strain obtained from Universitas Gadjah Mada Yogyakarta. Ingredients: ethanol, CMC (carboxy methyl cellulose), Glucose reagent kits, AST and ALT from Sigma and tiobarbiturate (TBA) reagents from Sigma. Instruments and tools: syringes, spectrophotometers, automatic pipettes 10 µl, 20 µl, 100 µl, 1000 µl, vial, white tip, yellow tip, blue tip, test tube.

The making of pumpkin flour is carried out in the laboratory of the Medical Laboratory Technology Department as follows: the pumpkin is peeled, the flesh is taken, shredded and dried in an oven at a temperature of 50-60^{o}C for 72 hours, then mashed with blender and sifted.

The treatment of experimental animals is carried out in the Central Food and Nutrition Laboratory of the Gadjah Mada University, as follows:

1. 30 rats, acclimatized using individual cages for 3 days with room temperatures ranging from 25-280 C and 12 hours daily lighting cycles. During acclimatization and during the study rats were fed standard AD II and drinking water in ad libitum.
2. Rats were divided into 6 groups, each consisting of 5 animals, namely K(-), K(+), TC1, TC2, and TC4.
3. The blood sample were taken from the retroorbital vein, then their blood glucose levels were determined.
4. Group K (-) is a negative control group without treatment, group K (+), TC1, TC2, TC4 made diabetic by giving glibenclamide at a dose of 0.45 mg/kg.
5. On day 3, all rats were determined by their blood glucose levels, AST enzyme activity, ALT and malondialdehyde levels (pre test).
6. The TC1, TC2, TC4 groups were given pumpkin flour with doses of 1, 2 and 4 grams/kg for 21 days using feeding tube, and the diabetic group given glibenclamide 0.45 mg/kg.
7. After 24 hours of the last treatment, rat blood was taken for determination of blood glucose levels, AST enzyme activity, ALT and malondialdehyde levels (post test).

Determination of blood glucose levels using the enzymatic GOD-PAP method, AST and ALT enzyme activity by kinetic enzymatic method, and malondialdehyde levels carried out by the TBA method.

Result and Discussion

Administration of yellow pumpkin flour in diabetic rats can reduce blood glucose levels, presented in the following figure:

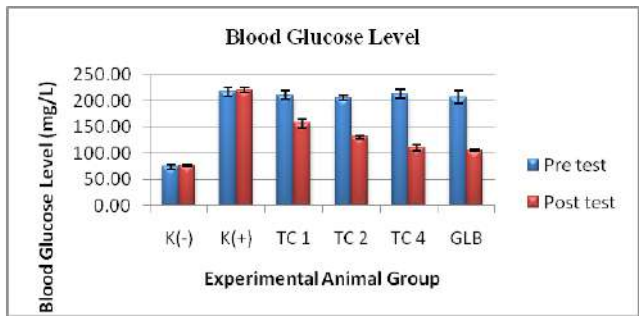

Figure 1. Blood Glucose Level Chart in Diabetic Rats

Administration of yellow pumpkin flour in diabetic rats can decrease AST and ALT enzyme activity, presented in the following figure:

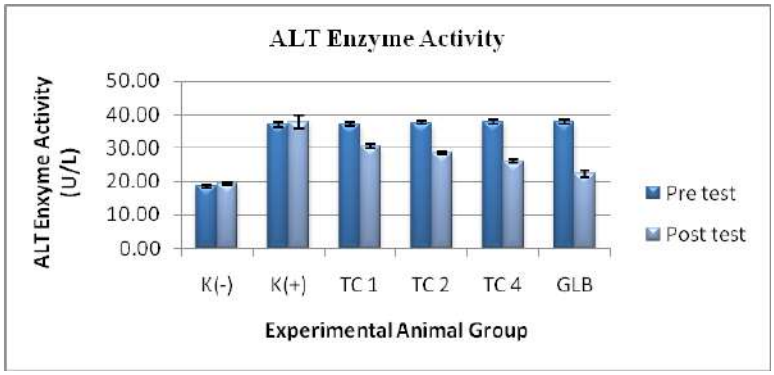

Figure 2. ALT Enzyme Activity Chart

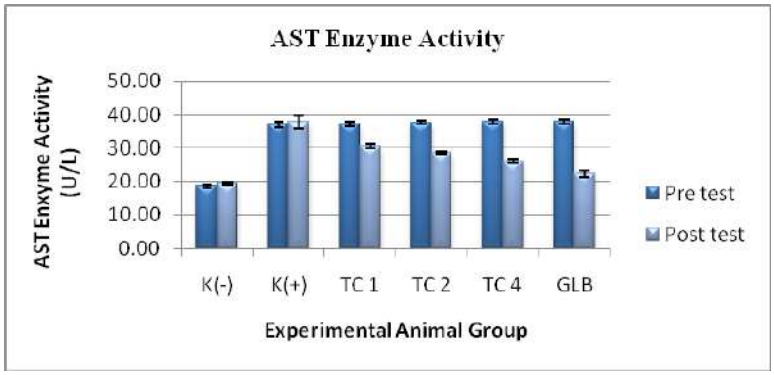

Figure 3. AST Enzyme Activity Chart

Administration of yellow pumpkin flour in diabetic rats can malondialdehyde levels, presented in the following figure:

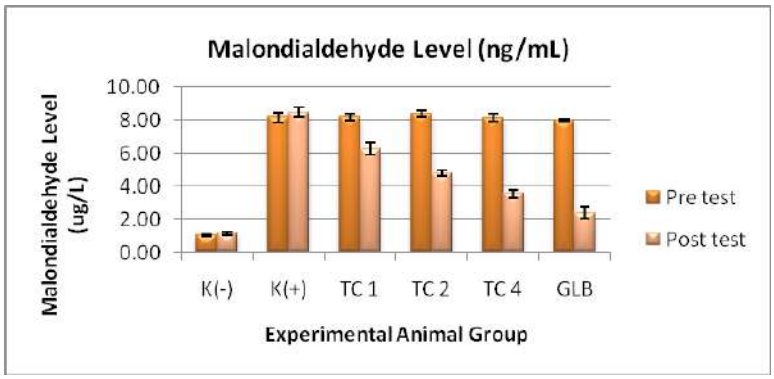

Figure 4. Malondialdehyde Level

The data obtained were analyzed statistically with the following results:

Group	Glukosa mg/dL			ALT U/L			AST U/L			MDA nmol/ml		
K(-)	77.14^{a}	±	1.94	19.32^{a}	±	0.41	38.35^{a}	±	0.77	1.13^{a}	±	0.09
K(+)	221.08^{b}	±	5.16	37.87^{b}	±	1.97	78.26^{b}	±	1.70	8.45^{b}	±	0.28
TC 1	157.44^{c}	±	8.21	30.49^{c}	±	0.72	58.16^{c}	±	2.56	6.26^{c}	±	0.34
TC 2	130.82^{d}	±	3.06	28.55^{d}	±	0.41	49.13^{d}	±	1.43	4.79^{d}	±	0.19
TC 4	110.95^{e}	±	4.78	26.02^{e}	±	0.55	43.31^{e}	±	1.21	3.54^{e}	±	0.22
GLB	106.10^{e}	±	0.62	22.33^{f}	±	1.03	40.88^{f}	±	1.25	2.39^{f}	±	0.37

Annotation: the numbers in the same column with different superscript letters show significant differences ($p < 0.05$)

Administration of yellow pumpkin flour for 21 days with a dose of 1 g/kg, 2 g/kg, and 4 g/kg lowered blood glucose levels in white rat (Rattus norvegicus) that have been made diabetic by giving alloxan. The greater the dose of pumpkin flour, the greater the decrease in blood glucose levels. The results of this study are in accordance with a previous study conducted by Jin et al (2013), which states that pumpkin flour extract in alcohol 95% is hypoglycemic. The mechanism proposed is that pumpkin flour extract does not stimulate β cells on the island of Langerhans to increase insulin secretion, but restore the island of Langerhans, repair damaged islands or act as an insulin sensitizer to increase insulin activity by improving insulin sensitivity in target tissues such as liver, muscle and adipose tissue. Pumpkin polysaccharides can also play an important role in restoring liver function and glucose use.[6]

Pumpkin contains various biologically active components, such as polysaccharides, paraaminobenzoic acid, fixed oils, sterols, proteins, peptides, carotenoids, gninobutyric acid and vitamins (Murkovic et al., 2002).

Pumpkin has antioxidant activity. Antioxidants are substances that protect membrane cells and other components of organisms against damage caused by oxidants. These compounds function by collecting free radicals, transferring electrons to them and ultimately making them inactive.[7]

Therefore, the protective effect of pumpkin pancreas and its hypoglycemic properties are caused, in part, by the antioxidant activity of this fruit. Abdel-Hassan et al. (2000) found that saponins extracted from Cucurbitaceae had high anti-diabetic activity. Flavonoid compounds, including quercetin with antioxidant activity also have a hypoglycemic effect in diabetic rats.[8] In addition, the presence of pectin itself can function as a hypoglycemic agent in pumpkin.[9]

In addition, the protective effect of PP on island cells damaged by STZ is through increased levels of SOD and MDA and reduced production of nireogen oxide (NO). PP inhibits apoptosis in damaged STZ island cells through modulating Bax/Bcl-2 expression. Given the significant protective effect of PP on small island cells, we suspect it will potentially improve the therapy of diabetes mellitus, which is used as a functional and nutraceutical food ingredient.[5]

The apoptotic signal meets the common cell death pathway, where caspase carries out apoptosis and the Bcl-2 family protein regulates it. There are two classes of regulatory proteins in the Bcl-2 family that support the opposite effect of apoptosis: anti-apoptotic members include Bcl-2 and Bcl-xL which protect cells against some forms of apoptosis, and pro-apoptotic members include Bax, tubs, and Bcl- xs that promote programmed cell death. The balance between pro-and anti-apoptotic signals from this family has a central role in the release of cytochrome C and its main consequences.[5]

In the diabetes model, regulation of decreased bcl-2 expression has been demonstrated. To further explain the protective effect of polysaccharides on pumpkin (pumpkin polysacharide = PP) and its mechanism, the effects of STZ and PP-1 on bcl-2 mRNA expression on Langerhans island cells were tested. The results showed that bcl-2 mRNA expression in Langerhans islet cells treated with streptozotocin (STZ) decreased, implying that bcl-2 was involved in the β cell apoptosis process induced by STZ. Pumpkin polysaccharides play the role of antiapoptosis by increasing the level of bcl-2 mRNA on Langerhans island cells.

Bax protein is a member of the Bcl-2 family that increases apoptosis. In previous studies it was found that bax mRNA expression was higher in the diabetes model. The study further proved that bax overexpression in Langerhans island cells treated (STZ) occurred, indicating that bax was responsible for the development of apoptosis of injured island cells. The role of pumpkin polysaccharides can reduce bax mRNA expression to protect island cells from damage to STZ.[5]

In this study, pumpkin was made flour, in the hope that it could later be used as nutrasetikal. Pumpkin flour is made a solution with the help of carboxymethylcellulose (cmc = carboxymethyl cellulose) then given to the sab diabetic model so that the dose is measured. The results of this study indicate that there was a decrease in blood glucose levels in the group of rats given yellow pumpkin flour for 21 days, the largest decrease occurred in the group with a dose of 4 grams/kg. The decrease in blood glucose levels is comparable to the glibenclamide dose of 0.45 mg/kg ($p > 0.05$), and but has not reached normal blood glucose levels ($p < 0.05$).

The results of testing the antioxidant activity in this study indicate that the administration of pumpkin flour can reduce the activity of AST and ALT enzymes. The AST and ALT enzymes are liver intracellular enzymes. In the diabetic model there is an increase in the levels

of AST and ALT enzymes due to the administration of alloxan which is also produced to be hepatotoxic resulting in liver cell damage. The decrease in the activity of these two enzymes shows that there is a mechanism for protecting liver cells from oxidative damage by alloxan.

The results of this study also showed a decrease in malondialdehyde levels in model rats given pumpkin flour. This shows the antioxidant activity in pumpkin. Malondialdehyde is one of the lipid peroxidation products. Lipid peroxidation is greatly increased in diabetic conditions because of an increase in free radicals. In alloxane-induced diabetic model rats also increase malondialdehyde levels because alloxane produces free radicals which subsequently occur lipid peroxidation to produce malondialdehyde.

These results are in accordance with the study conducted by Sopan et al. (2014) showed that Cucurbita maxima (pumpkin) flour contained phenolic compounds. This phenolic compound has many hydroxyl groups including ortho-hydroxy groups which have very strong antioxidant potential.[10]

Conclusion

Pumpkin flour has a hypoglycemic effect that is lowering blood glucose levels in diabetic mice, at a dose of 4 grams/kg BW equivalent to 0.45 mg/kg BB Glibenclamide, has antioxidant activity by reducing the enzyme activity of AST and ALT in diabetic mice ($p < 0.05$) and reduce malondialdehyde levels in diabetic mice ($p < 0.05$).Subsequent research can examine pancreatic cells to find out the mechanism of blood glucose reduction, whether through its effects on pancreatic beta cell repair, further investigating the effects of improvement on lipid profiles in diabetic conditions.

Association of Diabetes Mellitus and Estrogen Hormone Levels with Vaginal Candidiasis

Netti Suharti[1], Almudri[2], Ricvan Dana Nindrea[3], Silfina Indriani[4]

[1]Department of Microbiology, [2]Department of Clinical Phatology, [3]Department of Public Health and Community Medicine, [4]Midwifery Graduate Program, Faculty of Medicine, Universitas Andalas, Padang City, Indonesia

Abstract

Objectives: The aim of this study was to investigate the association of diabetes mellitus and estrogen hormone levels with vaginal candidiasis.

Method: A cross sectional comparative study was used on 2018 from women of childbearing age (20-35 years) and one-year oral contraceptive who came to the obstetric polyclinic who conducted visual inspection with acetic acid (VIA) in Bhayangkara Hospital Polyclinic, Padang Pasir and Nanggalo Primary Health Care Padang City, West Sumatera Province, Indonesia. We recruited 58 respondents with consecutive sampling technique. Vaginal candidiasis was measured using vaginal secretions and microscopic laboratory test. Diabetes mellitus was measured using fast blood glucose and estrogen hormone levels measured with blood sample analysis using Enzyme-Linked Immunosorbent Assays (ELISA). Chi-square test and independent sample T test were used to data analysis, P value < 0.05 was considered as statistically significant association. Data were processed using IBM SPSS Statistics 24.0.

Results: Diabetes mellitus was associated with vaginal candidiasis ($p<0.05$). There was statistically significant mean difference of estrogen hormone levels with vaginal candidiasis, estrogen hormone levels with vaginal candidiasis were 143.39 pg/ml higher than not vaginal candidiasis were 60.99 pg/ml.

Conclusion: This analysis confirmed association of diabetes mellitus and estrogen hormone levels with vaginal candidiasis.

Keywords: *Candida albicans, diabetes mellitus, estrogen hormone, vaginal candidiasis.*

Introduction

One of the reproductive tract infections in women is vaginalis candidiasis. It is estimated 80-that 90% candidiasis vaginalis was caused by *C. Albicans*.[1] Prevalence of vaginal candidiasis in Indonesia estimated 25% -50%, bacterial vaginosis 20%-40% and trichomoniasis 5% -15%.[2]

C.albicans is a normal flora in some areas of the human body and an oppurtunistic pathogenic yeast. *C.albicans* can be a pathogen if there are predisposing factors, one of which is diabetes mellitus (DM). DM patients have a higher risk of developing candidiasis vaginalis. This is because high blood glucose levels cause elevated skin glucose levels in DM patients, thereby facilitating the appearance of skin manifestations in the form of dermatitis, bacterial infections and fungal infections. The increased blood levels in the blood and urine will make it easier for *C.albicans* infections to use blood glucose as a nutrient for growth.[3,4]

Under normal conditions women has *C. Albicans* yeast on their bodies but are not aware because it is a harmless condition. One of the reasons why this *C. Albicans* can growth on the intimate part of a woman is because it contains glycogen which can support the life of fungi such as *C. Albicans*. The hormone estrogen is a hormone that is responsible against the appearance of *C. Albicans*. These hormones can trigger the vagina to produce more glycogen and support the growth of albicans candida fungi. This occurs because high levels of estrogen can affect vaginal susceptibility to infection by modulation of protective immune mechanisms such as decreased phagocytic cell activity such as neutrophils, macrophage cells and also natural killer (NK) cells.[5,6]

This study was held to determine the association of diabetes mellitus and estrogen hormone levels with vaginal candidiasis.

Method

Study design and research sample: This research was quantitative which conducted by using a cross sectional comparative study was used on 2018 from women of childbearing age (20-35 years) and one-year oral contraceptive who came to the obstetric polyclinic who conducted visual inspection with acetic acid (VIA) in Bhayangkara Hospital Polyclinic, Padang Pasir and Nanggalo Primary Health Care Padang City, West Sumatera Province, Indonesia. We recruited 58 respondents with consecutive sampling technique.

Operational definitions: The variables of this study divided into two independent variables, that are diabetes mellitus and estrogen hormone levels; and a dependent variable, that is vaginal candidiasis.

Ethics statement: The study was approved by the ethical committee board of Faculty of Medicine Universitas Andalas, Padang City, Indonesia Number 493/KEP/FK/2017. Written informed consent was obtained from all respondents.

Data collection technique: Vaginal candidiasis was measured using *vaginal secretions and* microscopic laboratory test. Diabetes mellitus was measured using fast blood glucose and estrogen hormone levels measured with blood sample analysis using Enzyme-Linked Immunosorbent Assays (ELISA).

Data Analysis: Chi-square test and independent sample T test were used to data analysis, P value < 0.05 was considered as statistically significant association. Data were processed using IBM SPSS Statistics 24.0.

Results

Data characteristics of the respondents (Table 1).

Table 1. Characteristics of the respondents

Characteristics	Vaginal candidiasis (n=29)	Not Vaginal candidiasis (n=29)
Age (Years), (mean±SD)	36.48 ±5.89	36.34 ± 5.62
Weight (Kg), (mean±SD)	57.31 ± 6.14	58,41 ± 8.29
Education level, (f/%)		
Low	6 (20.6)	4 (13.7)
Moderate	18 (62.2)	22 (76.0)
High	5 (17.2)	3 (10.3)

The mean age of respondents with vaginal candidiasis were 36.48 ±5.89 years and 36.34 ± 5.62 years with not vaginal candidiasis. Weight of respondents with vaginal candidiasis were 57.31 ± 6.14 Kg and 58,41 ± 8.29 Kg with not vaginal candidiasis. More than half of respondents have moderate level education between two groups.

Based on the results of examination of vaginal secretions in the laboratory can be seen the results of identification of *C. Albicans* (Figure 1).

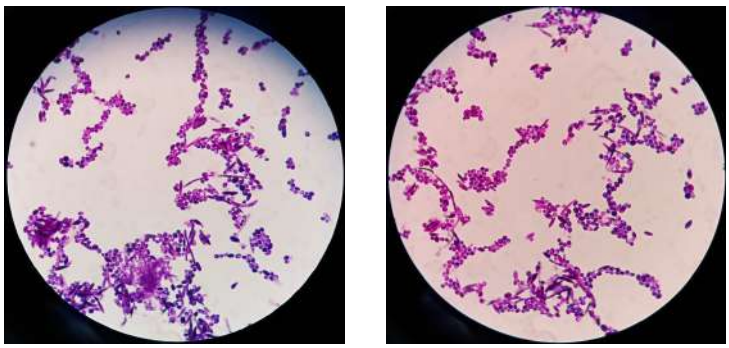

Figure 1. Identification of C. Albicans

Figure 1 showed *C. albicans* is dimorphic, producing yeast and pseudohifa.

The association of diabetes mellitus with vaginal candidiasis (Table 2).

Table 2. The association of diabetes mellitus with vaginal candidiasis

Diabetes mellitus	Vaginal candidiasis (f/%) (n=29)	Not vaginal candidiasis (f/%) (n=29)	Total	p-value
Diabetes mellitus	15 (51.7)	2 (6.9)	17 (29.3)	0.001
Not diabetes mellitus	14 (48.3)	27 (93.1)	41 (70.7)	
Total	29 (100.0)	29 (100.0)	58 (100.0)	

Table 2 known respondents with vaginal candidiasis from diabetes mellitus (51.7%) were slightly more than not diabetes mellitus (48.3%), diabetes mellitus was associated with vaginal candidiasis ($p<0.05$).

Mean difference of estrogen hormone levels with vaginal candidiasis (Figure 2).

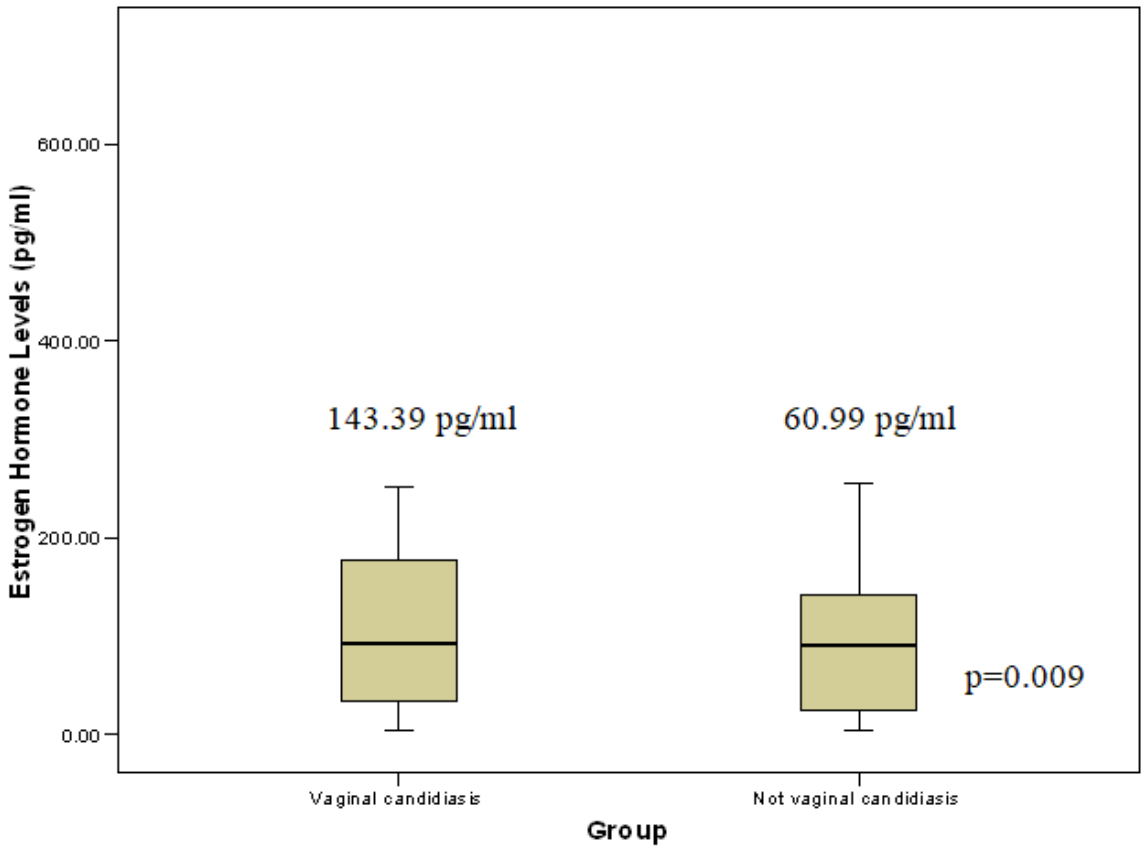

Figure 2. Mean difference of estrogen hormone levels with vaginal candidiasis

Figure 2 known there was statistically significant mean difference between estrogen hormone levels with vaginal candidiasis, estrogen hormone levels with vaginal candidiasis were 143.39 pg/ml higher than not vaginal candidiasis were 60.99 pg/ml.

Discussion

The results showed diabetes mellitus was associated with vaginal candidiasis ($p<0.05$). There was statistically significant mean difference of estrogen hormone levels

with vaginal candidiasis, estrogen hormone levels with vaginal candidiasis were 143.39 pg/ml higher than not vaginal candidiasis were 60.99 pg/ml.

Previous study known diabetes mellitus was associated with occurrence of candidiasis vaginalis ($p<0.05$).[7] Another study known the frequency of *C. albicans* higher in diabetic patients compared to non-diabetes.[8] Women with diabetes mellitus have a higher candidiasis vaginalis risk. This is because high blood glucose levels cause elevated skin glucose levels in DM patients, thereby facilitating the appearance of skin manifestations in the form of dermatitis, bacterial infections and fungal infections. The increased blood levels in the blood and urine will make it easier for *C.albicans* infections to use blood glucose as a nutrient for growth. Candida colonization increases with increasing blood glucose levels. Hyperglycemia can also cause the movement of neutrophils and monocytes to be slower and the ability of phagocytes to decrease. This resulted in increased Candida colonization.[3,4]

Increasing estrogen hormone levels can increase candidiasis vaginalis risk.[9] Estrogen levels higher in women with candidiasis vaginalis were 120.15 pg/ml compared to without candidiasis vaginalis 90.5 pg/ml.[10]

One of the reasons why this *C. Albicans* can growth on the intimate part of a woman is because it contains glycogen which can support the life of fungi such as *C. Albicans*. The hormone estrogen is a hormone that is responsible against the appearance of *C. Albicans*. These hormones can trigger the vagina to produce more glycogen and support the growth of albicans candida fungi. This occurs because high levels of estrogen can affect vaginal susceptibility to infection by modulation of protective immune mechanisms such as decreased phagocytic cell activity such as neutrophils, macrophage cells and also natural killer (NK) cells. Increased estrogen levels cause the vaginal epithelium to thicken and its surface coated with glycoproteins. This high glycogen level in the vagina is a good source of carbon for Candida growth so that the Candida fungus can thrive and multiply into pathogens.[5,6,11]

Conclusion

This analysis confirmed association of diabetes mellitus and estrogen hormone levels with vaginal candidiasis. The results of this study recommend the need to maintain blood glucose levels and use long-term contraception as well as the need for education and counseling.

P24 Antigen Quantification of Indonesian Patients Infected with HIV-1 CRF01_AE

Ni Luh Ayu Megasari[1,2], Devi Oktafiani[1], Elsa Fitriana[1], Nasronudin[1,2,3], Soetjipto[1,2]

[1]Faculty of Medicine, Universitas Airlangga, Jl Prof. Dr. Moestopo No. 47, Gubeng, Surabaya, Indonesia, [2]Institute of Tropical Disease, Universitas Airlangga, Jl Mulyorejo, Mulyorejo, Surabaya, Indonesia, [3]Universitas Airlangga Hospital, Surabaya, Indonesia

Abstract

Introduction: HIV pandemic remains a global health problem. In Southeast Asia, including Indonesia, CRF01_AE dominates the pandemic. WHO recommended viral load test to monitor patient's response to ART. However, the application of viral load assays are difficult in resource-limited settings. Several researches suggesting the use of p24 antigen assay as an alternative to viral load test, since the p24 antigen concentration was shown to exhibit linearity towards viral load.

Objective: This research aimed to quantify p24 antigen concentration in HIV-positive patients living in Bali Province, Indonesia.

Materials and Method: Fifty plasma samples collected from HIV-positive patients infected with CRF01_AE were subjected to standard, non-modified ELISA to quantify p24 antigen concentration.

Results: Detectable p24 antigen concentration was found in 11 samples (22%). Unlike viral load, no correlation found between p24 antigen concentration with ART status and length of therapy (p>0.05).

Conclusion: The result suggested that p24 antigen quantification might not always reflect viral load, especially in patients infected with CRF01_AE. Employment of standard ELISA without any modification might be having lower sensitivity in quantifying p24 antigen concentration in HIV-positive patients, either ART naive or treated patients.

Keywords: *HIV-1, CRF01_AE, p24 antigen, HIV-positive, Indonesia.*

Introduction

The number of new HIV infections globally continues to decline, but the progress is far slower in order to reach the 2020 milestone. As the HIV pandemic remains a global health problem, around 36.9 million people were reported to be living with HIV in 2017.[1] Indonesia reported 280,623 cumulative cases of HIV in the same year. Jakarta, East Java, Papua, West Java, Central Java, and Bali were the provinces with highest cumulative HIV infection and AIDS cases.[2]

The HIV pandemic exhibits extraordinary global genetic diversity. The spread and evolution of HIV has caused differential distributions of HIV-1 subtypes, circulating recombinant forms (CRFs), and unique recombinant forms (URFs) worldwide.[3] In Southeast Asia, CRF01_AE accounted for 72.8% HIV-1 infection from 2010 to 2015.[4] Indonesia, as a Southeast Asian country, was also dominated by CRF01_AE infection. The recombinant known to be pandemic in several Indonesian regions including Surabaya, West Papua, Riau, Manado, and Bali.[5-9]

The World Health Organization (WHO) recommended antiretroviral therapy (ART) to be offered

to all adults living with HIV, regardless of WHO clinical stage and at any CD4 cell count. Since 2013, WHO has also recommended viral load monitoring as the preferred approach to monitor patient's response to ART.[10] However, viral load assays require expensive equipment and reagents ($ 50–100 per test in the US), well-trained operators, and established laboratory infrastructure.[11-12] In resource-limited settings where people are most afflicted with the HIV-1 epidemic, the requirements might not be fulfilled, restricting in difficulty to implement viral load assay.[11]

There are several researches suggesting the use of p24 antigen assay as an alternative to viral load test. The assay employed a standard ELISA (enzyme-linked immunosorbent assay) format for the capture and detection of HIV-1 p24 antigens coupled with a specific amplification process to increase the assay sensitivity.[12] p24 antigen quantification shown a comparable sensitivity and parallel results towards viral load, both in subtype B and non-subtype B samples. The p24 antigen concentration was shown to exhibit linearity towards viral load.[13-15]

Previous researches were conducted mostly using samples from Europe, United States of America (USA), and Africa, but no samples were from Asia, especially Southeast Asia where most infection caused by CRF01_AE. This research aim to quantify p24 antigen concentration of HIV-infected patients, either ART naive or treated, living in Bali, Indonesia, which known as a region dominated by CRF01_AE infection.[8]

Material and Method

Sample Collection and p24 Antigen Quantification: HIV-infected individuals enrolling in drug resistance testing were recruited from the Voluntary Counselling and Testing Clinic of Buleleng Regency General Hospital, Bali. Patients with previous genotyping result showing HIV-1 CRF01_AE infection were eligible for this study. Fifty participants were included in this study. Five millilitre of ethylenediaminetetraacetic acid (EDTA) peripheral blood samples were collected from participants, with written informed consent were obtained from each participant prior to the procedure. Demographic and clinical data of study participants were retrieved from the medical records. Plasma was isolated from the blood samples using centrifugation. Quantification of p24 antigen was performed by subjecting the plasma samples to standard ELISA assay using RETRO-TEK HIV-1 p24 Antigen ELISA (Zeptometrix, New York, USA).

Stastitical Analysis: Stastitical analysis were performed with a minimum significance level of p=0.05. Descriptive analysis were performed towards demographic and p24 antigen quantification result. Differences p24 antigen concentration between sex group were analyzed using Fisher's Exact Test, while correlation between age, treatment status, and length of treatment with p24 antigen concentration were analyzed using Spearman correlation.

Results

Fifty patients enrolled in this study were comprised of 18 ART naïve and 32 treated patients. Eleven patients were treated less than or equal to six months, while 21 others were treated for more than six months. No patient has any history of treatment dropout or treatment interruption.

Quantification results showed that six ART naive and five treated patients have detectable p24 antigen concentration; 10 among them were having p24 antigen concentration >0 - 7.8 pg/mL and one with p24 antigen concentration >31.3 - 62.5 pg/mL. p24 antigen concentration was correlated neither to sex (p=0.085) and age (p=0.075), nor to treatment status (p=0.153) and length of ART (p=0.065). Demographic and clinical data of study participants as well as p24 antigen are shown in Table 1.

The production and release of p24 and particle-associated RNA are biologically linked, as both are derived from unspliced viral mRNA. p24 is an important structural component of the retroviral particle. Increasing viral transcription will normally lead to increased intracellular concentrations of both genomic RNA and viral proteins, which will be followed by increased particle formation and release, leading to increased extracellular concentrations of the two markers. In the natural course of HIV infection, viral RNA and p24 antigen concentration are expected to be linear.[16] Based on this theory, several researches suggested the use of p24 antigen assay as a substitute to viral load test.[13-17]

Those research employed ultrasensitive p24 Antigen Assay by PerkinElmer Life and Analytical Sciences.[12] The ultrasensitive p24 (Ultra p24) antigen assay uses a standard ELISA format for the capture and

detection of HIV-1 p24 antigens, and can be coupled with modifications, including the use of a more efficient virus lysis buffer and tyramide signal amplification for increased sensitivity to improved the p24 antigen assay.[12,16] Heat denaturation of the plasma prior to binding of p24 antigen in the ELISA step helps dissociate immune complexes and denature the antibodies which usually binds to the p24 antigen.[12]

Schupbach et al. reported that the HIV-1 p24 antigen and HIV-1 RNA typically decreases in parallel in successfully treated patients with subtype B infection. The p24 antigen also reported to be a good prognostic indicator of disease progression.[13] Pascual et al. Compared the results of Roche RNA assay to the ultrasensitive p24 antigen assay kit in 130 patients from the US and Malawi. Although RNA assay was more sensitive compared to the ultrasensitive p24 antigen assay (95.4% vs 84.6%, respectively), the results are comparable. Ultrasensitive p24 antigen assay detected 87% of specimens with viral loads between 10,000 and 100,000 copies/ml and 97.7% of specimens with viral load greater than 100,000 copies/ml. Asides from patients' specimen, ultrasensitive p24 antigen assay was also able to recognize isolates representing subtype A to F.[17]

Similar results were observed in Burkina Faso where the antigen assay detected 80% and 87% of samples with viral loads 1000–63,000 and >80,000 copies/mL, respectively.[14] Ribas et al. evaluated 40 treated patients infected with HIV-1 group M (subtype A-K, CRF01_AE, and several other recombinants) and group O. Results showed that among 33 patients, the p24 antigen correlated well with RNA results. The heat-denatured p24 antigen assay was capable of measuring the plasma level of p24 derived from all the HIV-1 subtypes and recombinants selected for the study, in contrast to the viral load test which lacked sensitivity towards HIV-1 group O.[15] As a remark, these researches concluded the p24 antigen assay as a reliable, sensitive and a more affordable tool that can be used for the follow-up of patients infected with B and non-B subtypes as well as recombinant forms in resource limited settings.[13-18]

However, the results of this study could not support those previous findings. After initiation of antiretroviral therapy, the plasma viral load usually decreases to concentrations below the lower limit of detection of available commercial assays within 3 months;[18] thus, p24 antigen concentration is supposed to be higher in ART naive patients compared to those of treated patients. This study found no correlation between treatment status (p=0.153) and length of ART (p=0.065) to the concentration of p24 antigen.

Among 50 samples, detectable p24 antigen concentration was found in 11 samples (22%), which comprised of six ART-naive patients, three patients treated ≤6 months, and two patients treated >6 months. Although statistically insignificant, the number of ART-naive patient with detectable p24 antigen is higher than the groups of treated patient. Highest detectable p24 antigen concentration (>31.3 - 62.5 pg/mL) also detected in ART-naive patient. These results suggested the possibility of p24 antigen concentration reflecting higher viral load in ART-naive patient compared to treated patient.

Most samples were found to have undetectable p24 antigen concentration. This might be due to lower sensitivity of standard, non-modified ELISA, in quantifying p24 antigen concentration. Modification to ELISA steps, such as heat denaturation and tyramide signal amplification, known to increase sensitivity of the p24 antigen assay.[12.16]

The results of this study might be more consistant to those of Prado et al. and Bonard et al., which found that p24 antigen assay not always reflect viral load in all samples. Prado et al. found little correlation between HIV-1 RNA and p24 antigen concentration. In the study, 76% of the treated patients and 49% of the naïve patients showed discordance between HIV-1 RNA detection and p24 detection after viral rebound.[19] p24 antigen in Plasma specimens from 14 patients in Côte d'Ivoire also found only slightly mirror the HIV RNA. p24 antigen in patients treated with highly active antiretroviral therapy shown weaker changes during treatment compared to the HIV-1 RNA results. Among seven patients failing ART, only three had p24 antigen results similar to RNA results.[20]

Table 1: Demographic and clinical data of study participants and p24 antigen concentration

Characteristics	n	Undetectable	>0 - 7.8 pg/mL	>31.3 - 62.5 pg/mL	P value
Sex					
Male	28	19	8	1	0.085[a]
Female	22	20	2		
Age (Years)					
20-29	13	11	2		
30-39	19	15	4		0.075[b]
40-49	10	9	1		
50-59	1	1	0		
ART Status					
Naïve	18	12	5	1	0.153[b]
Treated	32	27	5		
Length of ART					
Naive	18	12	5	1	0.065[b]
≤ 6 months	11	8	3		
> 6 months	21	19	2		

[a]Fisher's exact test; [b]Spearman test

Conclusion

In summary, this research suggested that the result of p24 antigen quantification might not always reflect viral load, especially in CRF01_AE infected patients. Employment of standard, non-modified ELISA, might be having lower sensitivity in quantifying p24 antigen concentration in both ART naive and treated patients, if compared to modified ELISA with heat denaturation and tyramide signal amplification.

Effect of Black Seed (Nigella Sativa) Extract on Release of Some Minerals from Human Enamel: An in Vitro Study

Nibal Mohammed Hoobi[1], Raya R. Al-Dafaai[2], Baydaa Hussain[1]

[1]Assist. Prof. College of Dentistry, University of Baghdad, [2]Assist. Prof. College of Dentistry, Ibn Sina University of Medical and Pharmaceutical Sciences, Iraq

Abstract

Background: Black seed of *Nigella sativa* has been used for centuries to promote health due to its anti-microbial, anti-oxidant and anti-inflammatory effects. This study was conducted to evaluate the ability of black seed water extract to reduce the release of potassium and zinc ions from enamel after acidic attack.

Materials and Method: Twenty five maxillary human premolars were prepared and divided into five groups. The test solutions were included, black seed water extract in three concentrations (3%, 5% % and 7%), sodium fluoride (0.05%) as control positive and de-ionized water as control negative. The teeth in each group were immersed separately in 40 ml of the test solution for two minutes, once daily and for twenty days. The teeth then prepared for subsequent etching and analysis by atomic flame spectrometer to measure the concentration of the released potassium and zinc ions.

Result: The highest mean value of dissolved potassium ion was found in de-ionized water group followed by 3% water extract of black seed while the lowest one was recorded in 7% black seed water extract. The statistical difference between the five groups was highly significant ($p<0.01$) by using ANOVA test. The highest mean value of dissolved zinc ion was found in de-ionized water group followed by 0.05% sodium fluoride and 3% black seed extract while the lowest one was recorded in 7% water extract of black seed. The statistical difference between the five groups was also highly significant ($p<0.01$).

Conclusion: Water extract of black seed has the ability to reduce the dissolution of potassium and zinc ions from the tooth and might increase tooth resistance against acid attack.

Keywords: *Nigella Sativa, potassium ion, zinc ion.*

Introduction

There is a worldwide increasing interest on the use of herbs or plants in the treatment of various diseases especially in developing countries. Black seed of *Nigella sativa*is an annual flowering plant that widely used in nutrition and medicine. This seedis rich in phenolic compounds, essential fatty acids, proteinsand bioactive compounds[(1)]. Previous studies had searched for its anti-oxidant, anti-cancer, anti-inflammatory and anti-microbial activities of this miracle seed[(2,3,4)].

Enamel is the hardest tissue in the human body. Dental enamel is 95% mineral, 4% water and 1% organic matter by weight percentage. The minerals are composed mainly from calcium and phosphate in addition to the presence of small quantities of other elements[(5)]. Zinc is essential trace element. It accumulates in the surface structures of teeth and occurs in low concentrations in subsurface material. Zinc can reduce enamel demineralization and increase enamel resistance to acid dissolution[(6)]. Regarding potassium ion, enamel content of this ion is very low in comparison with calcium and phosphors contents [(7)]. However, little data are available about the relation between tooth resistant to acid attack and potassium content. A possible relationship between enamel minerals content and caries susceptibility has been advised[(8)]. No previous study was conducted for the effect of water extract of *Nigella sativa* on the release of zinc and potassium ions from human enamel, so this study was conducted.

Materials and Method

Extracted maxillary first premolar teeth from patients aged 10-13 years old were selected from orthodontic department (college of dentistry, university of Baghdad). The total number of teeth was 25. The teeth were cleaned by using conventional hand piece and rubber cup with non-fluoridated pumice and deionized water. After cleaning, the teeth were stored in 0.1% thymol solution at 4º C until use tominimize microbial growth. This step also was done to prevent the dryness and brittleness of teeth. The water extract of black seed was prepared by the modified method of Ibraheem et al[9]. The teeth were divided into five equal groups; each group consisted of five teeth. The test solutions were included, water extract of black seed in three concentrations (3%, 5% % and 7%),sodium fluoride (0.05%) as control positive and de-ionized water as control negative. The teeth in each group were immersed separately for two minutes, once daily,for twenty days in 40 ml of the test solution. After each immersion, the specimens were washed in de-ionized water for 5 minutes and then stored in de-ionized water with thymol (0.1%)at room temperature till the next immersion.

After the treatment period (20 days), a rounded area (3 mm in diameter) were prepared on buccal surface of each tooth by applying adhesive disc and avoiding hypo plastic areas ormicroscopic cracks. The rest of enamel for each tooth was covered by a sticky wax, leaving only the rounded area (window) exposed for subsequent etching. The windows were etched for ten seconds in separated polyethylene tubes. Eachtube is containing five ml of 2NHCL[10]. The concentrations of released potassium and zinc ions were determined calorimetrically by using flame atomic absorption spectrometer.

Statistical analysis: The data was processed using SPSS version 20 statistical software. Means and standard deviation were calculated for each group. One way ANOVA and Dunnett T3 (post hoc test) were used to evaluate the significance of difference between the five groups. Probability values less than 0.05 were considered statistically significant (P<0.05). Values less than 0.01 were considered highly significant (P<0.01).

Results

Concentration of potassium ion release (mean,standard deviation and statistical analysis of ANOVA are illustrated in Table 1.The highest mean value of dissolved potassium ions was found in de-ionized water group followed by 3% water extract of black seed while the lowest mean was recorded in 7% concentration of black seed. The statistical difference between the five groups was highly significant (p<0.01). Table 2 is showing the mean differences of dissolved potassium ions concentrations between each two agents. No statistical significant differences were found between the de-ionized water and black seed extract in concentrations: 3%, 5% and 0.05% of sodium fluoride. No significant difference was found between 5% black seed extract and 0.05% sodium fluoride.

Concentration of zinc ion release (mean, standard deviation and statistical analysis of ANOVA are illustrated in Table 3. The highest mean value of dissolved zinc ion was found in de-ionized water group followed by 0.05% sodium fluoride and black seed extract 3%, while the lowest mean was recorded in water extract of black seed 7%. The statistical difference between the five groups was highly significant (p<0.01).Table 4 is showing statistical mean differences of dissolved zinc ions concentrations between each two agents. No statistical significant difference was found between the black seed extract in 5% and 7%. No significant difference was found between 3% black seed extract and 0.05% sodium fluoride.

Table 1: The released potassium ion concentrations among the selected agents

Selected Agents	No	Mean ± SD	F value	P value
Water black seed extract 3%	5	0.910±0.07	19.44	0.00**
Water black seed extract 5%	5	0.660±0.07

Discussion

In dentistry, the extract of black seed was tested in many studies to verify its oral effects due to the interested organic and inorganic constituents. The black seed showed its antimicrobial action against *Streptococcus mutans*, *Streptococcus mitis* and other types of bacteria isolated from the oral cavity [11,12]. In addition to that, *Nigella Sativa* extract had an obvious effect on the healing process of oral ulcer[13]. In previous Iraqi study, water extract of black seed was able to decrease the dissolution of inorganic phosphorous ions from teeth [14].In the current study, the water extract of black seed was tested in three concentrations to approve its ability to decrease the dissolution of zinc and potassium ions from the tooth surface and thus increase the hardness of the tooth and the resistant to acid attack. Sodium fluoride was used as control positive due to its effect in inhibiting

demineralization and enhancing remineralization of tooth surface. It is able to react with the outer enamel surface resulting in the formation of calcium fluoride[15].

The study showedthat the release of potassium ions was the least for the 7% extract and the highest release was recorded in deionized water group. The effect of sodium fluoride 0.05% in reducing the release of potassium ion was better than that reported for 3% extract.

The study also reported that the release of zinc ions was theleast for the 7% extract and the highestrelease was recorded in deionized water group. The effect of 3% extract was almost equal to the effect of sodium fluoride 0.05% in reducing the release of zinc ions. This may indicate that the application of black seed water extract can decrease the demineralizing effect of the acid used. It was alsoobvious from this study that, if theconcentration of the extract increases, theremineralizing effect of the water extract will increase. These results approve the findings of other studies regarding the effect of black seed water extract to improve the hardness of the tooth [14,16]. This effect could be attributed to thechemical composition of black seed and its mineralcontents (calcium, phosphorous, potassium, sodium, zinc and iron)which was reported by previous studies[17,18]. However, the finding of this study is needed to be confirmed byfurther investigations and larger sample sizebefore the applicationof this extract in the above mentioned concentration as mouth wash in preventive dentistry.

Conclusion

Water extract of black seed or *Nigella Sativa*has the ability to reduce the dissolution of potassium and zinc ions from the tooth.This effect might increase tooth hardness and its resistanceto acid attack.

Efficacy of Catharanthus Roseus Extract Against Dengue Virus Type 2 Infection in Vitro

Noor Zarina Abd Wahab[1], Nazlina Ibrahim[2]

[1]Lecturer, Faculty of Health Sciences, Universiti Sultan Zainal Abidin, Malaysia,
[2]Associate Professor, Faculty of Science and Technology, Universiti Kebangsaan Malaysia, Malaysia

Abstract

Catharanthus roseus, known as Madagascar periwinkle is an herbal and traditional plant used for treatment of various diseases. A study was carried out to test the cytotoxicity and antiviral effects of methanol extract from the leaves of *C. roseus*. The leaves of *C. roseus* were extracted using methanol to produce crude methanol extract. *In vitro* cytotoxicity test was performed to determine the concentration value of the extract causing 50% cell death (CC_{50}) using MTT assay. The antiviral activity has been confirmed by conducting foci forming unit reduction assay (FFURA) which involved post-treatment, pre-treatment and virucidal tests. Cytotoxicity test was performed on Vero cells indicates the CC_{50} value for *C. roseus* extract towards Vero cells was 0.13 mg/mL. The 50% Effective Concentration, EC_{50} of *C. roseus* extract was 0.025 mg/mL. Selectivity index of *C. roseus* extract against DENV-2 was 5.2. Three treatments were used in the antiviral test; 1) post-treatment, 2) pre-treatment, and 3) virucidal. The results revealed that the post-treatment was more effective in inhibiting viral replication compared to pre-treatment and virucidal.The results of this research showed that *C. roseus* extract has good potential for prospective nature-based antiviral drug.

Keywords: *Catharanthus roseus, Antiviral Activity, Dengue Virus Type 2, MTT, FFURA.*

Introduction

In this study, we investigate the cytotoxicity and antiviral properties of *C. roseus* to explore its potential as anti-DENV-2 agent. *Catharanthus roseus* (L.) G. Don (Apocynaceae) a perennial herb plant is widely used as an ornamental species in many *tropical countries.* It is more commonly known as Madagascar periwinkle. In Malaysia its known as *Kemuningcina*. This plant produces a combination of pink, purple and white flowers. These flowers are often grown for their attractive appearance and to decorate shady areas[1]. Methanolextracts of *C. roseus* has been reported to exhibit significant anti-cancer activity against different cell types *in vitro*[2.] Crude extracts of *C. roseus* showed antibacterial activity against Gram-positive and Gram-negative bacteria[3]. In addition, *C. roseus* extract also showed antifungal properties against *A. fumigatus*, *C. albicans*, *A. niger* and *F. moniliforme*[4].

Dengue virus (DENV) is a positive-sense, single-stranded RNA virus with a genome size of at least 10.7 kb. It is a member of the Family Flaviviridae, genus Flavivirus. There are four different DENV serotypes (DENV-1, DENV-2, DENV-3, and DENV-4) which are primarily transmitted between humans by the mosquito vector*Aedes aegypti* and *Aedes albopictus*[5,6]. Dengue virus can cause asymptomatic infection to mild dengue fever or severe dengue hemorrhagic fever and dengue shock syndrome[7]. All DENV serotypes are widespread geographically throughout the tropics. The incidence of dengue has grown dramatically around the world in recent decades[8]. Recovery from infection by one serotype provides lifelong immunity against that particular serotype. However, cross-immunity to

Corresponding Author:

School of Biomedical and Diagnostic, Faculty of Health Sciences, Universiti Sultan Zainal Abidin, Malaysia
e mail: zarinawahab@unisza.edu.my

the other serotypes after recovery is only partial and temporary. Secondary infection by other serotypes increase the risk of developing severe dengue[9].

Materials and Method

Plant Material and Extraction: Leaves of *C. roseus* were washed under running tap water and finally rinsed with distilled water then air dried for 48h, homogenized into a fine powder and stored in air-tight plastic containers. Dried leaves were finely ground and then extracted in a soxhlet extractor using methanol solvent. After that, the extract was evaporated to dryness using a rotavap. Lastly, freeze dry technique was performed to lyophilize the extract.

Cell and virus: Vero cell from American Type Culture Collection (ATCC) CCL-81 was used for both cytotoxicity and antiviral test. Dulbecco's Modified Eagle's Medium (DMEM) supplemented with 5% fetal bovine serum (FBS)was used for Vero cell maintenance throughout the experiment. C6/36 cells maintained in L-15 medium supplemented with 5% FBS were used for virus propagation. Dengue virus type-2 (DENV-2) used in this study is a prototype of the New Guinea C strain, a kind gift from the Faculty of Biosciences and Medical Engineering, UniversitiTeknologi Malaysia. Briefly, the virus was propagated in C6/36 cells, harvested and the virus titer was determined by focus forming assay using Vero cells[10].

Cytotoxicity Test: Cytotoxicity of *C. roseus* extract against Vero cells was determined using the MTT assay[11]. Briefly, a confluent monolayer of Vero cells in 96-well cell culture microplate were treated with increasing concentrations of *C. roseus* extract triplicates with starting concentration of 10 mg/mL. After 48 h of incubation, 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide (MTT) was added into each well and was further incubated for 3 h. After removing excess MTT, 100 µL of dimethylsulfoxide (DMSO) was added. The absorbance values of the wells were measured at 570 nm using a 96-well plate reader. Dose-response curve was plotted using Graph Pad Prism 5 and the half maximal cytotoxic concentration (CC_{50}) of *C. roseus* extract was determined from the plot.

Foci forming unit reduction assay (FFURA): FFURA was done to screen for anti-DENV-2 activity of *C. roseus* extract with different concentrations. Infected Vero cells which were treated with *C. roseus* extract was incubated for 4 days post infection in growth medium supplemented with 2% FBS and 1.5% carboxymethyl cellulose. The number of DENV-2 foci was counted using a stereomicroscope and the virus titer was expressed as Foci Forming-Unit (FFU). Antiviral activities of the compounds were determined by calculating the percentage of foci reduction (% RF) compared against the controls using the following formula:

$$RF\ (\%) = (C\text{-}T) \times 100/C$$

where, C is the mean of the number of foci from triplicates treatment without extract added and T is the mean of the number of foci from triplicates of each treatment measures with the extract[12].

Antiviral Activity: Antiviral assays composed of post-treatment, pre-treatment and virucidal assays. **Pre-treatment:** In order to determine the prophylactic effects of *C. roseus* extract against DENV-2 replication, different concentrations of *C. roseus* were added to the confluent Vero cells (2.0×10^5 cell/well) in 12-wells microplate after 5 h of virus infection. The treatment medium was removed and the treated cells were washed twice with PBS. The cells were then infected with 200 FFU of DENV-2 and incubated at 37°C for 4 days, 5% CO_2. After 4 days of infection, antiviral activity was determined by the reduction in foci number as previously described. **Post-treatment assay:** Vero cells (2.0×10^5 cell/well) grown into 12 well plate were infected with 200 FFUof DENV-2. Cells were incubated for 1.5 h to allow virus adsorption. After adsorption period, cells were washed twice with PBS to remove any residual unbound viruses. This was followed by the addition of different concentrations of *C. roseus* extract. The cells were then infected with 200 FFU of DENV-2 and incubated at 37°C for 4 days in the presence of 5% CO_2. After 4 days of infection, antiviral activity was determined by the reduction in foci number as previously described. **Virucidal assay:** A viral suspension containing 200 FFUofDENV-2incubated with equal volume of the different concentrations of *C. roseus* extract for 1.5 h at 37°C. After incubation, all tubes were diluted and titrated. Then, Vero cells were infected with the diluted treated viral suspension. Cells were washed twice with PBS after 1.5 h adsorption at 37°C and cells were overlaid by 1.5% CMC containing DMEM supplemented with 2% FBS. After 4 days of incubation, direct virucidal activity of *C. roseus* extract was determined by foci reduction as previously described.

Statistical Analysis: Values were expressed as means ± standard errors of the mean. Significance

difference, determined as $P < 0.05$, was calculated using Student's t-test (Microsoft Excel).

Results and Discussion

To determine the nontoxic dose, Vero cells were exposed to twofold serially diluted *C. roseus* methanolextract at concentrations ranging from 1 to 0.03 mg/mL. In this assay, the CC_{50} value of *C. roseus* extract was determined at 0.13 mg/mL. Figure 1 shows the percentage of cell viability versus concentration of *C. roseus* extract. Thus, maximum concentration that was used in the subsequent antiviral studies was fixed at 0.078 mg/mL.

Figure 2 shows the result obtained from antiviral assays using *C. roseus* extract. In post-treatment assay, more than 60% foci reduction was observed in *C. roseus* extract at the highest concentration (0.078 mg/mL). The lowest concentration (0.005 mg/mL) of *C. roseus* extract still exhibited mild reduction which was more than 30%. The antiviral activity of *C. roseus* extract was observed to be concentration dependent as the percentage of foci reduction is reduced with reducing *C. roseus* extract concentration. For pre-treatment assay, *C. roseus* extract showed weak activity which was less than 2% foci reduction at highest concentration (0.078 mg/mL). In virucidal assays, exposure of DENV-2 to the *C. roseus* extract at highest concentration (0.078 mg/mL) reduced more than 30% of foci reduction. This result confirms the mild virucidal activity observed in *C. roseus* extract.

The EC_{50} value of the SPD tested against the DENV-2 was 0.025 EC_{50} (mg/mL), as shown in figure3. The effectiveness of the *C. roseus* as an anti-DENV-2 expressed as selectivity index (SI). *Catharanthus roseus* possessed a moderate anti-DENV-2 activity with SI value of 5.2. Any antimicrobial agent that has SI values higher than 10 (SI>10) ensures the potential to be developed as an agent of antiviral drug. Meanwhile, SI value less than 1 are considered to be weak antiviral agent. SI value above 1 have moderate activity as antiviral agent[13].

Catharanthus roseus is an important medicinal plant distributed all over the world. The interest in this plant are due to the reports thatmore than 130alkaloids and severalof them exhibit potent pharmacological propertiescan be found in *C. roseus*[14].Based on phytochemical analyses, *C. roseus*has been proven to be rich n secondary metabolites such as alkaloids, flavonoids, phenols, tannins, saponin, terpenoids, quinines and cardiac glycosides[15,16]. *Catharanthus roseus* have been reported by many researchers to be rich in alkaloid[17,18,19]. Alkaloid from *C. roseus* inhibited simplex herpes virus (type I) and showed an antiparasitic effect against Trypanosoma[20]. Flavonoids groups have been reported by several researchers to exhibit a wide range of biological activities such as antimicrobial, antioxidant, anti- analgesic, anti-inflammatory, anti-cancer and anti-allergic[21].There have been reports on flavonoids from plant inhibited dengue virus type -2 (DENV-2) in Vero cell via Foci Forming Unit Reduction Assay (FFURA)[22]. Flavonoids from *C. roseus* were found to cause maximum antimicrobial activity towards Gram positive and Gram negative bacteria[23]. Thus, the richness of alkaloid and flavonoid in *C. roseus* may contribute to anti-DENV-2 properties.

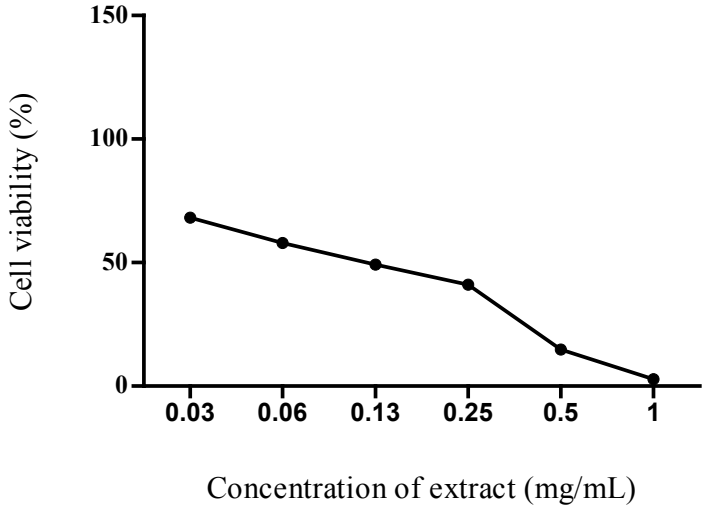

Fig. 1: Cytotoxicity assay of C. roseus extract against Vero cells. The results are presented as percentage of cell viability from triplicate assays.

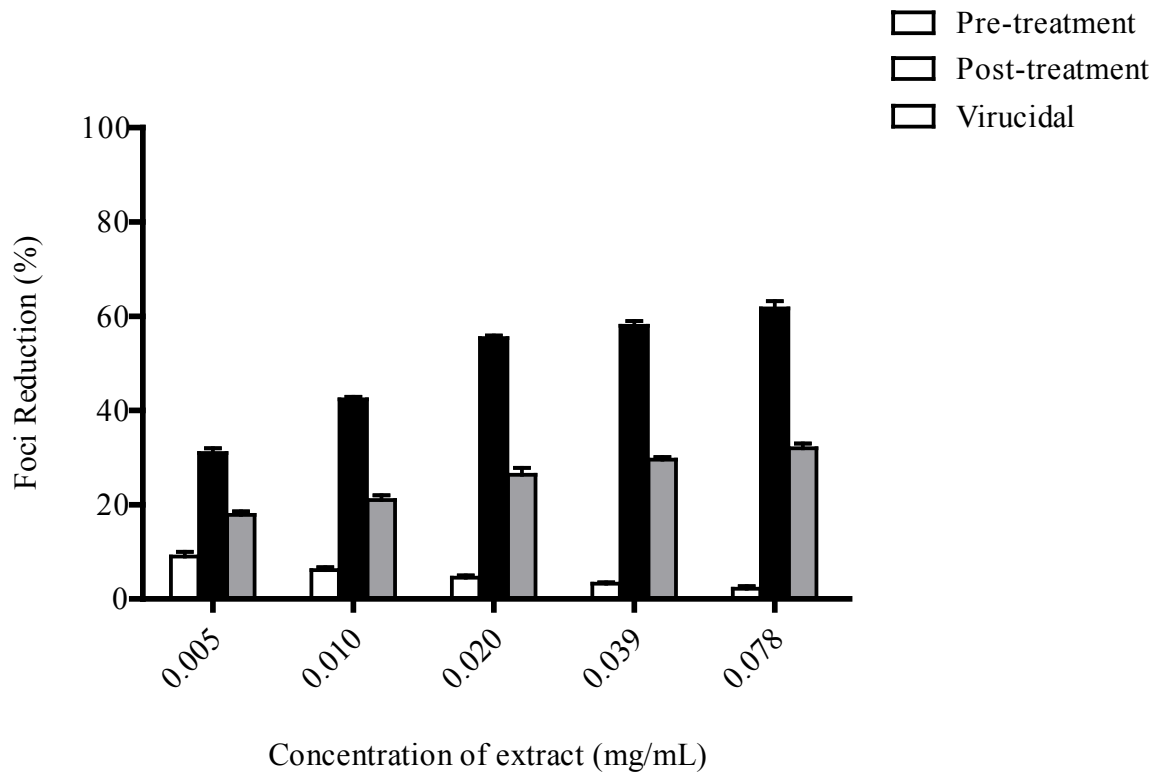

Fig. 2: Antiviral activities of C. roseus extract against HSV-1 via pre-treatment assay, post-treatment assay, and virucidal assay.

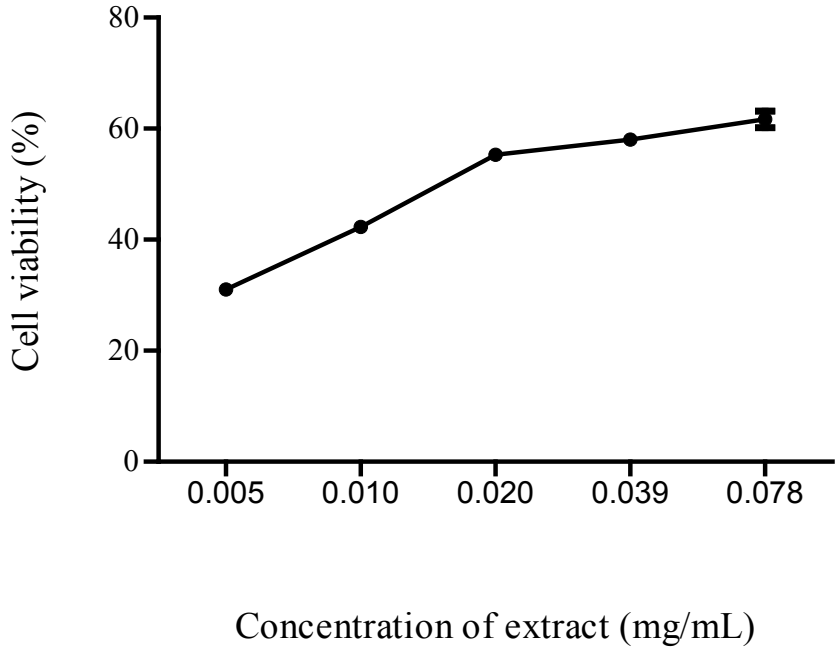

Fig. 3: Determination of Catharanthusroseus extract effective concentration (EC_{50}).

Conclusion

This study demonstrates the variable effects of *C. roseus* extract on DENV-2 replication in Vero cells. Extract had mild antiviral activities and low prophylactic function. In order to elucidate the mechanisms of inhibition, further studies are required to determine the underlying mechanisms that contribute to its antiviral activity.

Psychometric Evaluation of a Feedback Conception Scale: Building Positive Feedback Practises of Charge Nurses in Public Hospitals

Nor Hasnida Che Md Ghazali[1], Mahizer Hamzah[1], Norazilawati Abdullah[1], Zahari Suppian[1]

[1]Lecturer, Faculty of Human Development, Universiti Pendidikan Sultan Idris, Malaysia (UPSI)

Abstract

Charge nurses who have a good level of understanding on feedback conceptions will be able to practise feedback effectively towards their staffs. The purpose of this pilot study was to provide the evidence of psychometric evaluation of 'Teachers' Conceptions of Feedback (TCoF) scale of charge nurses using the Rasch Measurement Model. There are 9 constructs with 37 items altogether. One hundred and sixty-three (N=163) charge nurses from three states had completed the questionnaire. The content validity was checked by three experts in the field of measurement and medical health. The findings revealed that most items fit the model as their MNSQ values are between 0.60 and 1.40 except for four items. PMC value for all items are more than 0.20 except for three items. Two items showed a negative value of PMC. Most items are in a same direction so the item discrimination is good. Item reliability and item separation is 0.87 and 7.29 respectively, while person reliability and person separation is 0.81 and 2.81 respectively. The reliability value for item and person is high and acceptable. The separation index for item and person are also acceptable. In total, five items were deleted. The statistical analysis provides strong evidence to support the validity and reliability of the scale. The findings show that sample selection is appropriate. Hence, this instrument could be adapted or adopted by other researchers in the Malaysian health care system context.

Keywords: *Charge nurse, feedback conceptions, validity, Rasch Measurement Model.*

Introduction

Feedback is one of the most influences on someone's achievement. Feedback, by definition is any information given to someone by teachers, peers, parents, books, self or experience in providing knowledge, skills and attitude[10]. What type of information are we talking about? It could be an alternative strategy, a clarification of ideas or the correctness of a response. Feedback can be accepted, modified or rejected[11]. And, feedback which is gained from learners could make teaching become more effective as it can be used to adjust teaching approaches[19]. On the other hand, feedback is incapable in reinforcing someone or initiating further action of someone. Feedback might threaten someone if the information given is not familiar or obtrusive to them. Before we go into detail, let us look at the 'conception' of feedback. One's conceptions are the beliefs, attitudes and intentions that someone has[4]. So, in this study, conception of feedback refers to the charge nurses' beliefs, attitudes and intentions towards feedback. These feedback conceptions could influence their feedback practises towards their nursing staffs while they are on duty as [1] stated that one's conceptions contribute a lot to one's behaviour. In general, the aim of feedback is to improve achievement. Feedback is also conducted to develop confidence of learners to do peer-assessment or self-assessment, to ensure that learners are actively engaged in their own learning and to promote learning[6]. It should not be something personal or confidential but it has to based on real evidence. To gain this, a feedback has to be constructive. [2]has listed few characteristics of a constructive feedback which are the goal and standard

Corresponding Author:
Nor Hasnida Che Md Ghazali
Department of Educational Studies, Universiti Pendidikan Sultan Idris, Malaysia (UPSI)
e-mail: hasnida@fpm.upsi.edu.my

of the feedback has to be clear, exact and not vague, the information given to learners must be in a descriptive form. Next, a good feedback must be action-oriented and also solution-oriented. In addition, it has to be strictly confidential as to maintain trust between the assessor and the one being assessed. The least effective way is to give grade to the staff under them[21]. By giving only grades, the students are not able to determine what they are supposed to do to improve towards their goals. The best ways to give feedback is to provide an information on the correct answers plus some explanation and specific activities for improvement.

Problem Statement: Every day, charge nurses will face various kinds of challenges when dealing with staff nurses such as specific assignments requested by staff nurses or the challenges in increasing staff satisfaction[17]. And, one of the five main principles listed by The American Nurses Association is to assess staff skills. When assessing staff skills, not only the clinical skills that the charge nurses have to consider, but it is more than that. The whole scope of practices have to be considered such as the staff nurses characteristics, competencies, years of experience, culture and emotional intelligence and so on. When assessing, feedback will come into play as feedback could serve as a medium to enhance thinking skills[8] of staff nurses. An effective feedback might give opportunities for staff nurses to change their skills which they have previously misinterpreted or to change their motivational beliefs and self esteem[23].In addition, interviews have been conducted with few of charge nurses in public hospitals and they agree that they do not really understand the concept of feedback elements like peer and self-feedback, timeliness of feedback and things that they are supposed to focus at when giving feedback to staffs. Lack of understanding in feedback conceptions might be the reason why they are sometimes confused when it comes to assessing their staffs formatively. Hence, the researchers decided to gain data using this exclusive set of questionnaire from New Zealand researchers which has been tested in few countries[5]. Since this instrument was to be used in the Malaysian health care context, this instrument has to go under pilot study to check for validity and reliability of the instrument as only valid and reliable instrument can be used for real study.

Method

This study is using a quantitative approach which involves 163 charge nurses randomly selected from three states. The instrument used is 'Teacher Conceptions of Feedback (TCoF) inventory adapted from[9]. It consists of 9 constructs altogether with 37 items. They are Conception-Irrelevance (Students Ignore) – 4 items, Conception-Improvement (Student Use) – 4 items, Conception-Accountability (Expected) – 3 items, Conception-Encouragement + Self Type (Praise) – 6 items, Task Type– 3 items, Process Type– 4 items, Self-Regulation Type– 5 items, Peer & Self Assessment– 3 items and Timeliness– 5 items). An example of item from the second construct is 'Staff uses feedback given to improve his/her work', item from the fourth construct is 'Peers are the best source in giving feedback'. The scales were measured using a 6-point Likert scale ranging from strongly disagree to strongly agree. Using Rasch, the data was analysed to determine the validity and reliability of the TCoF. Initially, the data was not fit at all. When using data from 163 person, the value for raw variance explained by measures is -440.0% and the value for unexplained variance in 1st contrast is 69.4% which does not agree with what suggested by[13]. 58 data were deleted and it left with 105 data only and the data was analysed again. The report of the findings was discussed below.

Findings: The analysis was conducted to test item fit, item polarity, unidimensionality and local independance, items and respondents' reliability and separation index.

Item Fit: The item fit statistics (infit and outfit MNSQ) is the degree of equality between the response pattern and the expected model for each item for all respondents[3]. The misfit item due to the high value of MNSQ or Z-value could affect the unidimensionality of subscales (Linacre, 2007). According to Smith et al. (2006), MNSQ is more stable than Z-std value. According to [14], item with high value of MNSQ is a threat to validity compared to low value of MNSQ. For this study, the accetable range of values for the infit and outfit MNSQ measures are in the range of 0.6 to 1.4[14]. The range for Z-std is -2<Zstd<+2. All items which stay within this range is a productive items. If the items are not within this range, it is suggested to eliminate the items. The Rasch model prepare a fit statistics which could help researchers to come out with important decisions about the data[18]. Table 1 shows most MNSQ infit and outfit values are less than 1.0 which means that there is a lack of variation from the model. All of the items laid between 0.6 to 1.4 except for four items (item A2, A4, E18 and I37). Most items have a good overall

fit and they are retained. Four items are deleted. Looking at the Z-std value, the same thing is concluded. All the four items deleted are not in the range of -2 to +2 so it is better to delete those items.

Table 1. Item measure (INFIT, OUTFIT) MNSQ and Point Measure Correlation

Entry Number	Measure	Standard Error	INFIT MNSQ	INFIT ZSTD	OUTFIT MNSQ	OUTFIT ZSTD	PTMEA CORR	Item
1	1.05	.13	1.28	2.1	1.29	2.2	.27	A1
2	1.66	.12	1.82	5.1	1.88	5.1	.09	A2
3	2.53	.17	1.37	2.2	1.34	2.1	-.08	A3
4	2.18	.17	1.77	4.2	1.70	3.6	-.03	A4
18	-0.04	.13	1.66	3.6	1.58	3.7	.41	E18
35	1.35	.13	1.40	3.4	1.40	3.5	.31	I35
37	0.16	.13	1.88	5.2	1.88	5.7	.29	I37

Item Polarity: Item polarity is an indicator showing that the items moving in one direction as intended by constructed constructs. Point Measure Correlation (PMC) is a statistical item showing the correlation results between one points and scores for all candidates. Item polarity analysis using PMC is an early detection method for construct validity. The positive value shows that the item is in the same direction with the construct. However, if the value is negative, it shows that something has to be done by the researcher as it indicates that the item or the respondent contradict with the variables[12]. However, the acceptable value is 0.2 or more. In this study, the PMC value of all items are more than 0.2 except for the three items which are item A2 (PMC=0.09) A3 (PMC=-0.08) and item A4(PMC=-0.03). All the three items are deleted. So, most items have a good discrimination value.

Unidimensionality and Local Independence: This two measures are important as they are interconnected with each other[10]. Unidimensionality refers to a condition where items are measuring in one dimension[21]. Furthermore, unidimensionality and local independence allow us to detect whether an item is showing a different dimension or not, the item is understood or not and whether the response shows the respondents' special skills. Principal Component Analysis is used to detect unidimensionality and local independence. A good unidimensionality is when the raw variance explained by measures is more than 40% [2] or more than 60% [16]. The unexplained variance in the 1st contrast must be less than 15% [2] or less than 5% [16]. [2] states that for raw variance explained by measures, values higher than 40% is a strong dimension, higher than 30% is a moderately strong dimension and if it is more than 20%, it is a moderate dimension. The raw variance explained by measures show a value of 52.0% (higher than 40.0%) and the unexplained variance in 1st contrast is 5.2% (less than 15%) (Table 2). So, it is clear that items are not confusing with a strong dimension measures. When unidimensionality assmptions are fullfilled, then the local independence caharacteristics would be fulfilled automatically[16].

Table 2. Standard residual variance (in Eigenvalue units)

	Empirical			Modeled
Total raw variance in observations	70.6	100.0%		100.0%
Raw variance explained by measures	32.1	52.0%		51.4%
Raw variance explained by persons	6.1	10.3%		10.0%
Raw variance explained by items	26.0	36.8%		36.7%
Raw unexplained variance (total)	38.0	52.0%	100.0%	52.2%
Unexplained variance in 1st contrast	3.5	5.2%	11.1%	
Unexplained variance in 2nd contrast	3.2	5.2%	9.4%	

Reliability and Separation: Reliability of an instrument is precision. Item reliability indicates whether items are interacting well with one another showing the same attibutes[21]. On the other hand, person reliability shows reproducibility as expected if the samples are measuring the same construct in a set of items[22]. This is the same as the Cronbach Alpha value. Next is the item and person separation index. Item separation index shows the separation of item difficulty level whereas person separation index shows the separation or the difference of individual following different capability. For both measures, as long as it is more than 2.0, the measures are good. The summary of statistics of person and item are shown in Table 3. For summary of 37 measured item, item reliability is 0.87. For summary of 102 measured person, person reliability is 0.81. This shows that the reliability values are high and acceptable[15]. [14]also stresses that for an instrument to be reliable, the reliability value has to be more than 0.80. Furthermore, it shows that person factor is stable and consistent when measured. The instrument separation should at least be more than 1.0 and a value less than that shows that there might be an overlapping items or less person variability in the trait. In this study, item separation index was 7.29 which indicated the existance of 7 to 8 item strata while person separation index was 2.81 which indicated the existance of 3 people strata. However, as stated by[13], for both measures, as long as it is more than 2.0, then the measures are good.

Table 3. Summary of person and item measure

Summary of Person Measurement					
		INFIT		OUTFIT	
	Measurement	MSQ	ZSTD	MSQ	ZSTD
Mean	0.33	1.00	-0.1	1.00	-0.1
SD	0.67	0.37	1.9	0.39	1.2
Separation	2.81				
Person Reliability	0.81				
Summary of Item Measurement					
Mean	0.00	0.99	-0.2	1.00	-0.1
SD	1.05	0.36	2.5	0.29	2.7
Separation	7.29				
Item Reliability	0.87				

Discussion and Conclusion

This study aims to validate an instrument in assessing feedback conceptions amongst charge nurses in public hospitals in Malaysia using Rasch Model. The findings suggested that most items fit the model as their MNSQ values are between 0.6 to 1.4 except for four items, items A2, A4, E18 and I37 which have MNSQ infit and outfit more than 1.5. Three items do not agree with the item polarity accepted range. Two items show a negative value and the other one item has a value of less than 0.2. So, all the three items are deleted. Unidimensionality is not really an issue as it shows a good unidimensionality when the raw variance explained by measures is 52.0% which is more than 40.0%. This indicates that all the nine constructs are quite different from one another. This instrument with 37 items which represents 9 constructs shows good and acceptable indices of item and person reliability. This shows that items are consistent. After going through data analysis, finally five items were deleted. The overall item quality was good. The instrument is capable in assessing charge nurses' conceptions of feedback in the Malaysian health care system context. However, a more detailed analysis is needed, if possible. Maybe an Item Response Theory could be used for further investigation. In conclusion, for any instrument to be used in real study, it has to go through pilot testing to check for its validity and reliability. The development of this instrument in a different context cannot be assumed that it could fit with any other samples.

Factors Associated with Hypertension among Adults in West Java, Indonesia

Nurul Wahyu Wadarsih[1], Ratu Ayu Dewi Sartika[2]

[1]Post Graduate Student, [2]Professor, Department of Public Health Nutrition, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia

Abstract

Background: Hypertension is influenced by various factors including genetic, environmental and lifestyle factors.

Objectives: We aimed to identify factors associated with hypertension among adults in West Java, Indonesia.

Material and Method: The study design was a cross-sectional approach using secondary data from the 'Cohort Study of Non-Communicable Diseases (NCD)' conducted in Kebon Kalapa Village, Bogor City, Indonesia in 2017. This descriptive study used a structured questionnaire to collect primary data distributed to respondents after obtaining their consent. Nutritional status and blood pressure data were collected from participants. A 24-h dietary recall was conducted to collect nutrient intake data. Data were analysed using IBM SPSS software version 24.0.

Results: The prevalence of hypertension in this study was 34.2% and 23.9% of respondents were hypertensive. Bivariate analysis revealed that age 45–59 years, female gender, history of hypertension, overweight, and obesity were associated with hypertension status (P values = 0.0005, respectively, and odds ratios = 2.59, 2.37, 40.06, 7.60 and 10.04, respectively).

Conclusions: Factors associated with hypertension among adults in West Java, Indonesia included older age, female gender, history of hypertension, and nutritional status.

Keywords: *Hypertension, factors, adults, cross-sectional.*

Introduction

Hypertension is a disorder of blood pressure (BP) regulation due to increased cardiac output or total peripheral vascular resistance.[1] Late diagnosis of hypertension can lead to various other diseases, such as heart disease, stroke and kidney failure.[2]

The prevalence of hypertension in Indonesia based on the Indonesian Basic Health Research 2018 was 34.1%. Based on these data, among the 34.1% of people who experienced hypertension, only 1 in 4 were diagnosed and only 54.4% took regular medication for hypertension.[3]

Many studies have identified the main risk factors for developing hypertension to be male gender,[4-5] older age,[4,6,7] overweight,[4,8,6] obesity,[4,8,6,9] retirement, smoking habit,[4,10] illiteracy,[4,10,7] upper socioeconomic status, alcohol consumption, marriage,[4,5] smoking habit,[4,9] lack of physical activity,[9] and diabetes.[7,9]

The major risk factors for hypertension and the extent of their contribution remain unclear. Overcoming hypertension is challenging, given the high prevalence and lack of awareness of its long-term clinical impact. Furthermore, hypertension increases the risk of future health impact if it is not detected and treated early.

Studies have shown that targeting factors associated with hypertension is one of the best preventives that can be considered when determining intervention strategies for hypertension. Therefore, the present study aimed to identify factors associated with hypertension among adults in West Java, Indonesia.

Materials and Method

The study design was a cross-sectional approach using secondary data from the 'Cohort Study of Non-Communicable Diseases (NCD)' conducted in Kebon Kalapa Village, Bogor City in 2017. The population included permanent residents aged 25–59 years which was registered in the cohort study 2017. The study sample was selected by total sampling, and included individuals with and without hypertension.

There were 1186 initial respondents in total. We excluded respondents with heart disease, stroke and pregnant (n = 118), age ≥ 60 years (n = 49), users of hormonal contraception (pills, injections, implants) (n = 132) and outliers based on nutrient intake (n = 160). A final total of 727 respondents were included in the study.

The dependent variable was hypertension status. The independent variables were age, gender, smoking habits, family history of stroke, physical activity, history of hypertension, medication compliance, nutritional status, and nutrient intake.

Systolic and diastolic blood pressure (SBP and DBP) were measured using a digital tensimeter. Hypertension status was determined based on an average SBP ≥ 140 mmHg and/or DBP ≥ 90 mmHg[11] and/or taking anti-hypertensive drugs.[12]Body height was measured using a height measuring device with 0.1-cm accuracy, while body weight was measured using a digital weighing device with an accuracy of 0.1 kg. Nutritional status was categorised based on body mass index (BMI) as follows: underweight (<18.4 kg/m^2), normal (18.5–25.0 kg/m^2), overweight (25.1–27.0 kg/m^2) and obese (≥27 kg/m^2).[13]

Characteristics of study participants were collected using a questionnaire developed specifically for NCD cohort studies. Age was divided into two groups: 25–44 and 45–59 years.

Food consumption data was collecting using 24-h dietary recall. Nutrient intake was calculated based on the Indonesian recommended dietary allowance in the normal population, while intake in the hypertensive population was calculated based on the Dietary Approaches to Stop Hypertension (DASH) recommendations.[14]Nutrient intake was grouped as low (<90%), moderate (90%–119%) and excessive (≥120%).

Data were analysed using IBM SPSS software version 24.0 including univariate and bivariate analysis. Bivariate analysis was used to determine the relationship between each independent variable and dependent variable using the chi-square and Fisher exact test. Risk was calculated using odds ratios (ORs). A simple logistic regression test was used to calculate *P*-value and OR for independent variables with more than two categories.

Results

The average age, SBP, and DBP in the hypertensive group was higher than that in the normal population. Fat and sodium intake was higher in the normal population compared with that of the hypertensive group. The distribution of numerical variables of the participants is presented in Table 1.

Table 1. Distribution of numerical variables of study participants.

Variable	Normal Population		Hypertensive Population		Total	
	N	Mean ± SD (min–max)	N	Mean ± SD (min–max)	N	Mean ± SD (min–max)
Age (Years)	553	45.97 ± 7.83 (30–59)	174	50.82 ± 6.30 (31–59)	727	47.13 ± 7.77 (30–59)
SBP (mmHg)	459	120.77 ± 13.89 (87.50–167.00)	150	148.11 ± 19.75 (103.50–207.00)	609	127.50 ± 19.49 (87.50–207.00)
DBP (mmHg)	459	79.15 ± 9.48 (55.50–109.50)	150	94.77 ± 11.94 (69.70–141.30)	609	82.99 ± 12.17 (55.50–141.30)
Weight (kg)	459	59.76 ± 11.61 (32.80–100.30)	150	64.59 ± 12.83 (36.50–97.20)	609	60.95 ± 12.09 (32.80–100.30)

Variable	Normal Population		Hypertensive Population		Total	
	N	Mean ± SD (min–max)	N	Mean ± SD (min–max)	N	Mean ± SD (min–max)
Height (m)	459	1.56 ± 0.08 (1.33–1.81)	150	1.52 ± 0.06 (1.38–1.69)	609	1.55 ± 0.08 (1.33–1.81)
BMI	459	24.76 ± 4.74 (14.51–39.54)	150	27.94 ± 5.15 (17.03–42.33)	609	25.54 ± 5.03 (14.51–42.33)
Nutrient intake:						
Energy (kcal/day)	458	2034.85 ± 619.26 (719.88–3571.42)	150	1652.42 ± 478.89 (748.29–2729.62)	608	1940.50 ± 610.12 (719.88–3571.42)
Protein (g/day)	458	63.22 ± 21.16 (16.25–119.14)	150	52.95 ± 16.84 (16.18–101.33)	608	60.69 ± 20.65 (16.18–119.14)
Carbohydrate (g/day)	458	274.66 ± 91.71 (87.83–508.33)	150	228.68 ± 73.35 (75.54–429.34)	608	263.32 ± 89.70 (75.54–508.33)
Fat (g/day)	458	77.55 ± 31.81 (8.14–161.34)	150	58.77 ± 21.82 (16.78–107.41)	608	72.91 ± 30.73 (8.14–161.34)
Sodium (mg/day)	458	2374.47 ± 1195.38 (221.98–5495.63)	150	1839.63 ± 839.56 (205.57–4092.47)	608	2242.52 ± 1151.11 (205.57–5495.63)

The prevalence of hypertension in the present study was 34.2%, and 23.9% of respondents were hypertensive. Excessive fat and sodium intake was observed in 247 (40.6%) and 371 (60.1%) participants, respectively. Bivariate analysis revealed that age 45–59 years, female gender, history of hypertension and nutritional status were found to be associated with hypertension status.

Respondents aged 45–59 years showed a 2.59-fold higher risk of hypertension compared with those aged 25–44 years. Females showed a 2.37-fold higher risk than males, and respondents with a history of hypertension showed a 40.06-fold higher risk. Nutritional status was a risk factor for developing hypertension, and was 7.60-fold higher for overweight and 10.04-fold higher for obese individuals compared with those with normal nutritional status.

While excessive fat and sodium intake showed a 0.46 and 0.53-fold lower risk, respectively, compared with low fat and sodium intake.

The results of the bivariate analysis between characteristics of participants with and without hypertension status are presented in Table 2.

Table 2. Relationship between the characteristics of study participants according to hypertension status.

Discussion

The results of the present study revealed that hypertension was influenced by age. High incidence of hypertension was associated with increasing age, caused by changes in the structure of large blood vessel, such as narrowing of the lumen and stiffening of blood vessel walls, as a result of increased SBP.[15] Another factor related to hypertension was female gender. This finding is consistent with the findings of some studies.[16,17] In this study, most respondents in the age 45–59 years and hypertensive groups were females. In women, incidence of hypertension increases after menopause. Before age 50, women show a lower prevalence of hypertension compared with men, but after age 55, women show a greater age-related increase in proximal aortic stiffness, leading to a higher incidence of systolic hypertension. Women have two other features that tend to reduce DBP and widen pulse pressure. First, short stature causes a faster return of pulse waves to increase peak systolic pressure, and second, a faster heartbeat produces a shorter diastolic period.[15] However, other studies found that hypertension is more common in men.[4-10]

Hypertensive respondents tend to experience high BP more frequently due to inelastic blood vessels. Other factors may also play a role, such as lifestyle, medication compliance and nutritional status. Although medication adherence helps to control BP, this still requires a healthy lifestyle.[18] In the present study, medication compliance data was not sufficient to explain this finding.

Overweight and obese respondents had a higher risk of hypertension than those with normal nutritional status. An association between excessive activation of the sympathetic nervous system and the renin–angiotensin–aldosterone system (RAAS) was shown in obese people, increasing the risk of high BP.[19]High RAAS has been shown to increase sodium reabsorption which carries water so that the body tends to be hypervolemic, which ultimately increases cardiac output and BP.[20]

In the present study, excessive fat and sodium intake showed less risk compared with low fat and sodium intake. This could be due to hypertension being affected by many risk factors. Alternatively, respondents with low fat and sodium intake may have had a history of hypertension. People with hypertension tend to decrease their sodium and fat intake to prevent disease complications. This diet pattern would affect the outcome of the relationship between fat and sodium intake with hypertension status. This relationship may be affected by weight status or presence of metabolic disorder.[21]In the present study, most respondents with low fat and sodium intake were overweight and obese.

There is conflicting evidence about the effect of dietary fat intake on BP. Some studies have shown a positive correlation between dietary cholesterol intake and BP, while others found no significant correlation.[21] In another study, the relationship between dietary cholesterol and SBP was slightly stronger in the non-hypertensive group. Possible mechanisms include dietary cholesterol related to endothelial dysfunction and reduced nitric oxide bioavailability, which may lead to functional arterial stiffening leading to high BP.[22]

Conclusion

In the present study, the prevalence of hypertension was 34.2%, and 23.9% of respondents were hypertensive. Older age, female, history of hypertension and nutritional status were associated with hypertension status.

Our findings may help to determine suitable interventions to overcome and prevent the incidence of hypertension and also to find further strategies to prevent uncontrolled hypertension complications. Further studies are required to alleviate hypertension from year to year based on factors that influence the incidence of hypertension.

Conflict of Interest Statement: There are no conflicts of interest.

Abstract

Aim: To determine the correlation of Interleukin-6 (IL-6) with serum estradiol levels in menopausal women.

Method: This research is a case series research in postmenopausal women to assess the correlation between Interleukin-6 (IL-6) and serum estradiol levels that performed at H Adam Malik General Hospital Medan, starting in August 2017 until 38 samples which met the inclusion and exclusion criteria were fulfill,using non probability sampling technique with consecutive sampling. Serum estradiol and IL-6 levels was examined, then sent to the clinical laboratory. Data tabulated to be analyzed statistically.

Results: The mean serum estradiol level in menopausal women is 29.74 ± 18.69. The mean IL-6 level was 85.03 ± 33.66, in this research showed that in menopausal women there was an increase in IL-6 levels. By using the Spearman Test, the results showed that there was a significant correlation between estradiol and IL-6 with p value <0.004.

Conclusion: There is a significant negative correlation between serum estradiol and IL-6 levels, which means that there is an inverse relationship between serum estradiol and IL-6 levels with weak negative strength, where decreasing estradiol does not always increase IL-6 levels.

Keyword: *Estradiol, Interleukin-6, IL-6, Menopause, Inflammation.*

Introduction

In women with normal menstrual cycles, estradiol is the most estrogen produced by the ovary. Estradiol levels range from 40-80 pg/mL during the reproductive cycle.[1,2] 17ß-estradiol is primary estrogen originating from the ovary. Estradiol (E2 or 17β-estradiol) is a steroid hormone derived from cholesterol metabolism targeting various tissues in the female reproductive organs.The circulating estradiol level after menopause is around 10-20 pg/mL which mostly comes from peripheral conversion of estrone derived from peripheral conversion of androstenedione. The average rate of postmenopausal estrogen production is around 45µg/24 hours. [3-6]

IL-6 levels are increased in postmenopausal women compared to premenopausal women. The decrease in estrogen, especially estradiol, plays a role in increasing IL-6 during menopause. Estradiol plays a role in inhibiting proinflammatory cytokine gene expression,

NF-κB binding, and the production of proinflammatory cytokines including IL-6.There is also a positive correlation between IL-6 and expression of estrogen (ERα) receptors. [9-12] Interleukin-6 (IL-6) is a cytokine that not only plays a role in the inflammatory process and response to infection but also plays a role in metabolic, regenerative, homeostasis bone, reproduction, and neural processes. IL-6 is a unique cytokine, because besides its activity as a proinflammatory cytokine, IL-6 also plays a role in the anti-inflammatory and regeneration process.[7-8]

There is a hypothesis that estrogen can cause a decrease in serum IL-6 levels because estrogen inhibits osteoblasts as producers of IL-6 and estrogen works as an IL-6 receptor antagonist so that IL-6 work can be inhibited.[13]In the Nasution research which showed that IL-6 production showed a correlation positive with the occurrence of bone resorption in postmenopausal women through the RANKL-independent mechanism.[14] Research conducted by Kim, et al. found that attractively circulating IL-6 is influenced by age and menopause and changes in estrogen after menopause will increase the production of peripheral mononuclear cell cytokines in postmenopausal women which cause an increase in IL-6 which correlates with the occurrence of oxidative stress.[15] Research conducted by Yang, et al, Novella, et al., Rahnama, et al., and Engelmann et al., also showed similar results about the relationship between estrogen levels and IL-6.[16-19]

Material and Method

This research is a case series research to assess the correlation between Interleukin-6 (IL-6) and serum estradiol levels in menopausal women. This research was conducted at H Adam Malik General Hospital Medan and began in August 2017 until the sample size was fulfilled. The research population was female paramedics who had not experienced menstruation during the last 12 months then subjects were determined by using nonprobability sampling technique with consecutive sampling where samples that met the inclusion criteria which is willing to take part in the research, sign informed consent and female paramedics who hadn't menstruation for the past 12 months, and exclusion criteria namely hormone replacement therapy, alcohol consumption, smoking, suffering from diabetes mellitus, having a history of treatment of organic mental disorders, suffering from malignancy. The number of samples obtained is 38 samples.

Serum estradiol & 1L-6 examination: For estradiol, using the reagent "Vidas Estradiol II". Use one strip "E2II" and one SPR "E2II" for each sample, control or calibrator to be tested. Perform the test as directed at User's Manual. All testing steps are carried out automatically by the instrument. Repeat each vial and return it to a temperature of 2-8° C after pipetting. The test will be completed in about 60 minutes. After the test is complete, remove the SPR and strip from the instrument. For IL-6, Reagent "*Human IL-6 (Interleukin-6) ELISA Kit Elabscience*" is used. And add 100 µL of *Biotinylated Detection Ab working* solution to each tube. Add 100 µL*HRP Conjugated Working Solution* in each tube. Add 90 µL of reagent substrate to each tube. Cover with a new cover. Incubate for 15 minutes at 37° C. Protect the plate from exposure to light. Add 50 Ml*stop solution* to each tube.

Findings: Mean Levels of Estradiol and IL-6 in Menopausal Women for Characteristics of Age, Parity, Body Mass Index (BMI), and Duration of Menopause

Table 1. Mean Levels of Estradiol in Menopausal Women for Characteristics of Age, Parity, BMI, and Duration of Menopause

Characteristics	Total (n)	Mean±SD
Age		
• 40-49 y.o.	17	48.1±23.9
• 50-59 y.o.	21	37.5±21.3
• > 60 y.o.	0	0
Parity		
• Nullipara	0	0
• Primipara	0	0
• Multipara	38	42.4±3.71
• Grandemultipara	0	0
BMI		
• Normoweight	4	44.7±13.9
• Overweight	9	47.9±28
• Obesitas	25	39.8±22.1
Menopause Duration		
• ≤ 2 y.o.	20	53.3±23.5
• 3 y.o.	6	40.6±18.3
• ≥ 4 y.o.	12	24.5±9.2

Table 2. Mean Levels of IL-6 in Menopausal Women for Characteristics of Age, Parity, BMI, and Duration of Menopause

Characteristics	Total (n)	Mean±SD
Age		
• 40-49 y.o.	17	30.3±16.8
• 50-59 y.o.	21	55.5±51.9
• > 60 y.o.	0	0
Parity		
• Nullipara	0	0
• Primipara	0	0
• Multipara	38	44.2±41.7
• Grandemultipara	0	0
BMI		
• Normoweight	4	25.4±16.8
• Overweight	9	19.3±3.9
• Obesitas	25	56.2±46.9
Menopause Duration		
• ≤ 2 y.o.	20	29.7±18.1
• 3 y.o.	6	28.2±10.8
• ≥ 4 y.o.	12	76.6±59.7

Table 1. From the table, it can be seen in the group of 40-49 years having a mean level of estradiol of 48.1 pg/mL, whereas in the age group 50-59 years it has a mean level of estradiol of 37.5 pg/mL, so this indicates that the more increasement of age diminished exposure to estrogen.

Table 2. The table presents data that the longer the duration of menopause, the higher the level of IL-6 that can be seen from IL-6 levels in the group with menopause <2 years, the mean IL-6 level is 29.7 pg/mL, whereas in the age group of menopause> 4 years it was seen that mean IL-6 levels is 76.6 pg/mL.

Means Levels of Estradiol in Menopausal Woman

Table 3. Means Levels of Estradiol in Menopausal Woman

	Mean ± SD
Estradiol (pg/mL)	29.74± 18.69

According to table 3.it is known that the mean estradiol level in menopausal women is 29.74 ± 18.69.

Means Levels of Interleukin-6 (IL-6) in Menopausal Woman

Table 4. Means Levels of IL-6 in Menopausal Woman

	Mean ± SD
IL-6 serum (pg/ml)	85.03 ± 33.66

Based on table 4., it is known that the mean IL-6 level is 85.03 ± 33.66, in this research showed that in menopausal women there was an increase in IL-6 levels.

Correlation between Estradiol and IL-6 levels in menopausal woman

Table 5. Correlation between Estradiol and IL-6 levels in menopausal woman

Correlation	r value	p-value
Estradiol and IL-6	-0.458	0.004

Using the spearman test showed a significant correlation between estradiol and IL-6 levels with p value <0.004. The correlation coefficient is -0.458, which means that there is an inverse relationship between estradiol and IL-6 levels with weak negative forces, where decreasing estradiol does not always increase IL-6 levels.

Estradiol Mean Levels in menopausal woman for Characteristics of Age, Parity, Body Mass Index, and Duration of Menopause: The research conducted by Puspita, E.M in 2017 concluded that the aromatic aromatization process was related to women's body weight.[21] In line with research conducted by Mafucci and Gore in Morisson in 2006, which concluded that almost all mammals and vertebrates have decreased reproductive capacity during the aging process. However, menopause is unique to species with a woman's menstrual cycle. In the end, the limited collection of female ovarian follicles causes a decrease in the circulation rate of steroid hormone estradiol.[23,24]

IL-6 Mean Levels in menopausal woman for Characteristics of Age, Parity, Body Mass Index, and Duration of Menopause: The research conducted by Kim, OY obtained the results that the more age increases the higher the level of IL-6 and in this research concluded that this data is related to advanced age phenomena together with menopause, age-related increase in IL-6 in circulation in line with the findings of previous researches.[25]Many studies have also reported an increase in proinflammatory serum markers, especially IL-6

after menopause, indicating that in addition to age, in postmenopausal women, changes in the immune system have been associated with estrogen deficiency.[20]

Means Levels of Estradiol in Menopausal Woman: According to the 2012 Stanzyckresearch, it was found that estrogen levels were at a low concentration (<30 pg/mL) in prepubertal and postmenopausal women, [26] From Kaur's research in 2017, the mean estradiol value was 27.41 ± 5.05 pg/mL.[27]While the Mawiresearch in 2010 found that the mean serum estradiol was 7.54 ± 4.65 pg/mL in postmenopausal women.[28] Research Lkhagvasuren et al. the mean estradiol was 18.3 ± 13.1 pg/mL.[29]

Consistent with the theory, estradiol levels in postmenopausal women are lower than women of reproductive age in each phase of the menstrual cycle.[30]In menopausal women there is a decrease in ovarian follicular activity, the follicles will experience atresia until there are no more follicles to produce estrogen hormones.

Means Levels of Interleukin-6 (IL-6) in Menopausal Woman: The same result is seen in Jabber et al .'s 2015 research of obtaining data on mean IL-6 values in postmenopausal women of 23.9 ± 5.52.[30] In Rachon'sresearch, et al., the mean serum estradiol was 4.44 ± 2.10 pg/mL.[32] Aging theory is associated with a slight and chronic increase in several serum inflammatory mediators such as TNF-α, IL-6, and IL-1ß. TNF-α and IL-1ß with IL-6 can stimulate their production with each other.[25,33-41]According to Kim's research, 2012, it was found that there was an increase in IL-6 in postmenopausal women, a decrease in the immune system associated with a decrease in estrogen.[25]

Correlation between Estradiol and IL-6 levels in menopausal woman: The decline in estrogen, especially estradiol plays a role in increasing IL-6 during menopause. Estradiol plays a role in inhibiting proinflammatory cytokine gene expression, NF-κB binding, and the production of proinflammatory cytokines including IL-6.[18,25,33-35] Estrogen deficiency in postmenopausal women will stimulate bone loss and increase cytokine production such as IL-1, IL-6, and TNF-α.[14]

Conclusion

The results of this research show that there is a significant weak negative correlation between estradiol and IL-6, which means that there is an inverse relationship between Estradiol and IL-6 with weak negative strength, where decreasing estradiol does not always increase IL-6 levels.

Conflict of Interest: The researcher ensures that there is no conflict of interest in this research

Source of Funding: There is no source of funding in this research.

Ethical Clearance: For research permission, research approval was obtained from the research subject and the Ethics Committee of the Faculty of Medicine, University of North Sumatra who would conduct an assessment of the feasibility of the research proposal.

Abstract

Bride price represents a contract between families where material items and money are paid by the groom to the bride's family for the bride for the purpose of marriage. This study investigated High Bride Price as determinant of Marital stability among Married Akwa-Ibom people in Surulere, Lagos State, Nigeria. The purpose of the study was to: (i) assess whether highbride price is a determinant of domestic violence (ii) examinewhether high bride price is a determinant of emotional problem among married Akwa-Ibom people in Surulere, Lagos State.A descriptive research design of survey type was adopted for the study. The population for the study comprised all married Akwa-Ibom people in Surulere, Lagos State.Multi stage sampling technique consisting of purposive, clustered, proportionate and simple random sampling technique was used to sample three hundred and seventy three (373) respondents from two associations in Itire-Ikate Local Council Development Area. Researchers'-designed questionnaire with four point Likert rating scale was used for the study which was validated by experts from the Departments of Health Promotion and Environmental Health Education, Faculty of Education, University of Ilorin, Kwara State. Cronbach alpha statistical tool was used to ascertain the internal consistency of the instrument and a reliability correlation of coefficient, 'r' 0.85 was obtained through split-half method. Data collection was conducted by the researchers and trained research assistants. Inferential statistics of Chi-square (χ^2) was used to analyse the postulated null hypothesesat 0.05 level of significance. The findings of the study showed that marital stability of married Akwa-Ibom people is affected because; i. High bride price is a significant determinant of domestic violence among married Akwa-Ibom people in Surulere because (cal. χ^2value 146.678 is greater than critical x^2 value 21.03) at df 12 at 0.05 level of significance and High bride price is a significant determinant of emotional problems among married Akwa-Ibom people in Surulere because (cal. χ^2 value 143.062 is greater than critical x^2 value 21.03) at df 12 at 0.05 level of significance.The study concluded that high bride price led to domestic violence and emotional problems which determines marital stability among Akwa-Ibom people in Surulere, Lagos State.Therefore, the study recommended that high bride price should be reduced in order to avoid domestic violence which determines marital stability among Akwa-Ibom people and high bride price should be well modified in order to mitigate the occurrences of emotional problems which determine marital stability among Akwa-Ibom people in Surulere Area in Lagos State, Nigeria.

Introduction

Bride price is a complex system of material remittances in traditional societies which is used to validate customary marriages especially in many African countries. Bride price payment is a form of protection for women within marriages by providing them respect, status and acknowledgement within the

society. However, the payment of bride price ensures women's subordination to husbands, which invariable condoned the abuse of wives[5]. The various elements used as bride price include money, gifts, services or labour, a list of mandatory items (raw food stuffs, clothing, fruits, traditional accessories etc) depending on family type, culture and religion[14].

Marital stability is not only a value term, but also a relative term. It implies firmnessand strength to endure under hard as well as easy circumstances. This element of constancy must not be confused with a static condition[7]. The bride's family gives in to violent behaviours because it can only be committed by husbands willing to abandon their wife if their request is not satisfied. Thus, bride price was found to precipitate violence which has high tendency to affect stability of marriages. This model is such that the husband hurts his wife's well-being in order to extract a payment from his in-laws where he feels the bride price was overpriced[2].

People as social animals who cannot survive alone. From birth to death we are in the company of, and depend upon, significant others for survival. The relationships we partake in, may be life sustaining and nurturing and may promote personal growth and health, or may be abusive, destructive and traumatic[16]. It recorded that research has amply documented that there are short- and long-term mental and physical health benefits when the relationships we partake in throughout life are positive, whereas abusive, restricting and non-nurturing relationships have been found to impair mental and physical health. Sexual, physical or severe emotional abuse (e.g., abandonment, betrayal, malevolent intent, or repeated victimization) often has devastating effects on the recipient[13]. These effects can be long-lasting and broad ranging. Untreated trauma not only has dire effects on the individual (e.g., intense psychological distress, loss of interest among others), but also has broader ranging effect such as social and community disorganization[4].

However, bride price is being misused to abuse girls and women. Men tend to think that after paying the bride price women would become their goods, services and personal property to be owned, mistreated and dumped when they have outlived their purpose and use. The conception produces a negative effect as the relationship between men and is affected[15]. The bride price practice is a leading contributor to the spiralling levels of domestic violence which are witnessed because of the mere perception of the fact that women have been bought and sometimes many of them are forced into marriages. In such marriage, the woman has no sense of worth, respect, pride and accomplishment. This certainly leads to the development of a very negative/low sense of esteem[11]

Domestic violence and poverty are linked to bride price. For instance, a referendum was carried on the need to reform the practice of bride price, which revealed that 60 percent of the respondents insisted that the practice of bride price reduce women and girls to the status of chattel and that their inability to refund the bride price leaves them open to violence and abuse with far reaching social, economic and human rights implications[9].Bride price is a major factor contributing to domestic violence in the relationships, thereby threatening the stability of marriage[10].

High degree of explosive anger among men and women is a reaction pattern that is associated with a range of general factors, including past exposure to traumas related to human rights violations, ongoing deprivations and feelings of injustice. The problem of high bride price is a contributor to poverty, a source of conflict with the spouse and family and a possible cause of their anger[17]. Married couples affected with anxiety often avoid doing things such as going out alone or chatting to people. They usually do so because they assume that they will deal with people badly. For example, they will panic or make a fool of themselves. As an alternative to this, they adopt the avoidance strategy as they think it makes them feel better. They are unaware that the longer they avoid the possible problems, the worse they become. This typical case is so because the avoided actions get more and more associated with anxiety and consequently they find it much harder to face up the problems[5]. There are three basic conditions which elicit anxiety: over-stimulation, cognitive incongruity, and response unavailability. Over-stimulation refers to when married people are flooded with information especially about the wrong knowledge. Cognitive incongruity is when married people have difficulty reconciling with some event. Response unavailability refers to when married people do not know how to handle difficult situations[8].

Statement of the Problems: Marriage is a legal and intimate union between a man and woman which is usually consolidated with a token called bride price as it is the practice in Akwa-Ibom State. When there is marital stability, the strength, balance and level of relationship is

intact. The researcher observed that several factors have generated concern, worries and unrest among married and even intending Akwa-Ibom people as regards the exorbitant items on the list and the financial attachment involved in marrying a woman from that environment.

The researcher has seen reports, witnessed and heard of incidences of physical, sexual and majorly verbal abuse especially among married women, trivial marital conflict between spouses, abandonment of spouse, separation without notice, fear of and hatred for opposite sex, anxiety disorder, depression, chronic stress, high blood pressure, heart disease, psychosomatic disorders amongst others. The researcher observed that married people seemed to have lost identity and their position has been weakened by altered gender relations following ancient tradition which has become an opportunistic means of gathering income, resulting into gender antagonism regarding perceived roles as a result of high bride price paid by men over women. Inthe area of study, the researcher observed that high bride price has affected several marriages, health and wellbeing of the couples negatively. Discussion with married women and men showed that they were experiencing pain, bitterness, lack of affection, attention and support, the accumulation of these negative treatments will in-turn result to the variables discussed in the study.

The researcher witnessed an experience of a close married female relative, who got married to a man that struggled so hard to sort the high bride price because of the love he built for his then intended spouse and did not want to lose her on the ground of bride price. The marriage is three (3) years down the line and whenever they have slight disagreement, the man reminds her of how he went through a lot to pay her bride price in spite of the whole situation surrounding them that period. He taunts her with the bride price everytime and it usually ends with either verbal or physical abuse.

The researcher observed that no study of such has been conducted in the locale of the study, therefore this research seeks to fill this gap of high bride price as determinant of domestic violence, divorce, marital conflict, emotional and psychological problems on marital stability among married Akwa-Ibom people in Surulere, Lagos State.

Research Questions: The following research questions were answered in this study:

1. Will high bride price be a determinant of domestic violence among marriedAkwa-Ibom people in Surulere, Lagos State?
2. Will high bride price be a determinant of emotional problem among married Akwa-Ibompeople **in Surulere, Lagos State?**

Research Hypotheses: The following hypotheses were tested in this study:

1. High bride price will not significantly be a determinant of domestic violence among married Akwa-Ibom people in Surulere, Lagos State.
2. High bride price will not significantly be a determinant of emotional problems among married Akwa-Ibom people in Surulere, Lagos State.

Methodology

Descriptive research design ofsurvey type was adopted for this study. The population of the study comprised all Married Akwa-Ibom People in SurulereArea, Lagos State, Nigeria. A multi-stage sampling technique consisting purposive, cluster, proportionate and simple random sampling techniques was used to select three hundred and seventy three (373) respondents from association meetings at ItireIkate Local Council Development Area, Surulere, Lagos State. Researchers' structured questionnaire of four-point Likert rating scale format with options of Strongly Agree, Agree, Disagree and Strongly Disagree was used for the study. The instrument contained eight (8) items based on two variables namely domestic violence and emotional problem. In order to ascertain the validity of the instrument, three copies of the questionnaire were given to experts in Departments of Health Promotion and Environmental Health Education, Faculty of Education, University of Ilorin. The Split-half method was used to determine the reliability of the instrument using Cronbach Alpha statistical tool to correlate the data and a correlation of coefficient of 0.85 was obtained. Descriptive statistics of frequency and percentage was used to answer the research questions raised for the study while Inferential statistics of Chi-square was used to analyze the stated null hypotheses at 0.05 level of significance, using Statistical Package for Social Science (SPSS) version 20.0 software.

Results/Discussion of Findings

Hypothesis One: stated that the calculated Chi-square (x^2) value is 146.678 and the table (x^2) value is 21.03 with the degree of freedom 12 at 0.05 alpha level.

Since the calculated (x^2) value of 146.678 is greater than the table (x^2) value of 21.03 at 12 degree of freedom. Therefore, the null hypothesis was rejected. This implysthat high bride price is a significant determinant of domestic violence among married Akwa-Ibom people in Surulere, Lagos State, Nigeria. Theresponses of the married people include domestic violence such asphysical, verbal and sexual abuse that could result due to payment of high bride price. This finding is in line with a finding that domestic violence especially against womenis an issue which has and should receive increased attention because of its effect on health and its association with payment of high bride price across various cultures in Nigeria, especially in the south-south region. Married peoplein this area are physically, sexually and verbally disempowered thereby reducing them to commodities. Hence, the result is a battered sense of esteem, emotional imbalance, and it reduces married people to chattels which results to domestic violence[6].

Hypothesis Two: Stated that the calculated Chi-square (x^2) value is 143.062 and the table (x^2) value is 21.03 with the degree of freedom 12 at 0.05 alpha level. Since the calculated (x^2) value of 143.062 is greater than the table (x^2) value of 21.03 at 12 degree of freedom. Therefore, the null hypothesis was rejected. This implys that high bride price is a significant determinant of emotional problem among married Akwa-Ibom people in Surulere, Lagos State, Nigeria. However, the finding is in line with a statement that anxiety as one emotional problem is a major unpleasant emotional state with qualities such as dread, distress and uneasiness[1]. It was mentioned that fear and anger is a observable emotion associated with high bride price that exist among Akwa-Ibom people at the point of payment of bride price[9].

Recommendations: Based on the conclusion of the study, the researcher made the following recommendations:

i. High bride price should be reduced in order to avoid domestic violence which determines marital stability among married Akwa-Ibom people.

ii. High bride price should be well modified in order to mitigate the occurences of emotional problems which determines marital stability among married Akwa-Ibom people.

General recommendations:

iii. The government should structure a strong and reliable team to enlighten single and married on domestic violence by inviting key speakers from related agencies such as National Domestic Violence Outreach Organization, National Center for Victims of Crime, National Coalition against Domestic Violence to present at religious or professional organization, civic or volunteer group, workplace, or school from time to time.

iv. Married Akwa-Ibom people in Surulere should be sensitized and educated by Family life and Reproductive health educators on the topic of the domestic violence and the provision of needful tools in tackling all forms of abused in marriage.

v. Married Akwa-Ibom people should seek continuous counsel on the subject of personality different and emotional needs of men and women.

Abstract

The paper intends to focus on the issues of psychological and emotional impact of individuals due to excessive use of Social Networking Sites and intends to dwell into these concepts to highlight that excessive use of such sites have a substantial impact on the well-being of an individual emotionally and physically and while Social media has become immensely popular so has the mental disorderliness among young adults. The paper also brings in light the concept of 'Facebook/Insta Depression' as a concept and the rise of the this depression in young adults and some suggestions as to how avoid/deal with it.

Keywords: *Psychological, Social Networking, Social Networking Sites.*

Introduction

It's good to be happy and tell us how cool your life is and how awesome you are on social media. That's great because it inspires other people to be happy, too. But a lot of times, people are trying to be happy in the wrong ways-with money or with different things that are not true happiness. *–Jaden Smith*

Social Networking Sites (SNSs) such as Orkut, Facebook, Twitter and Instagram have attracted millions of users, many of whom have integrated these sites in their daily life and practices. There exists hundreds of Social Networking Sites with various technological affordances and supporting a wide range of interests and practices. While there key technological features are fairly consistent. The cultures that emerge around Social Networking Sites are varied and are different from site to site. Most sites support the maintenance of pre-existing social networks, but others help strangers connect based on shared interests, political views, or activities. Some sites cater to diverse audiences, while others attract people based on common language or shared racial, sexual, religious, or nationality-based identities. Sites also vary in the extent to which they incorporate new information and communication tools, such as mobile connectivity, blogging, and photo/video-sharing. Scholars from diverse fields have examined Social Networking Sites in order to understand the practices, implications, culture, and meaning of the sites, as well as the users' engaged with them.

They are increasingly attracting the attention of academic and industry researchers intrigued by their affordances and reach. Due to the internet, the term society is not dependent upon a region as the dynamics of the internet has connected the planet as a whole and the cultures that emerge around SNSs are varied and diversified.

Social Network Sites: A Definition: The definition of a Social Networking Sites is that, "Social Networking Sites are web-based services that allow individuals to

- Create a public or semi-public profile within a bounded system.
- Articulate a list of other users with whom they share a connection; and
- View and traverse their list of connections and those made by others within that system"

The actuality of the reason that the researcher uses the term "Social Network Site" is to describe the observable fact, that the term "Social Networking Sites" also appears in public discourse, and the two terms are often used interchangeably. The researcher chose not

to employ the term "Networking" for two motives i.e. Emphasis and Scope.

Networking emphasizes a relationship initiation, and often among strangers wherein Networking is possible on these sites, it is not the primary practice on many of them, nor is it what differentiates them from other forms of computer-mediated communication (**"CMC"**).

What makes these social network sites unique are that they allow users to articulate and make visible their social networks with others and not that they allow individuals to meet strangers and these results in connections between these individuals that would not otherwise normally be made. And on many of the prominent sites the users are not necessarily "Networking" or looking to meet new people whereas, they are primarily communicating with people who they already know and they are in fact a part of their extended social network and due to this critical organizing feature of these sites, they are termed as Social Network Sites (**"SNS"**).

The prominent sites also encourage users to upload a profile photo for displaying on the profile. In the present day scenario, majority of the SNS provide Privacy options for displaying information and the user can control as to what information he would like to share with everyone, what he would like to share only with friends and personalize his profile in terms of security and display as far as possible. SNS's like Orkut, Myspace and Facebook allow its users to enhance the appearance of their profiles by adding multimedia contents like songs and videos and by modifying the profile's look and feel by their choices of colours.

A pertinent reason that Facebook started slow and suddenly shot to being a force to be reckoned with was that the ideology of Mark Zuckerberg was to change from the traditional concept and move to the new era. Facebook was the first site that allowed its user to add modules **("Applications")** all sorts to make the site more addictive and fun.[1] An application called as Farmville which was added to the Facebook profile is one such example. This application was launched in the June 2009 and after its presence it was reported by London Today that users on Facebook come back three times a day only to play the game and that Farmville Farmers are 10:1 to the Real American Farmers.[2] These additions are one of the primary reasons that SNSs really achieved a stand in the modern day society.

The visibility of a profile varies by site and according to user discretion. By default, profiles on Orkut are crawled by search engines, making them visible to anyone, regardless of whether or not the viewer has an account. Whereas, Facebook takes an alternative approach and by default, allows users who are part of the same "Network" to view each other's profiles, unless a profile owner has decided to deny permission to the people in their network. These structural distinctions are one of the reasons that SNSs differentiate themselves from one another.

After making a profile on these SNSs, users are encouraged to identify others in the same system with whom they have or might have a relationship and to send invitations to those who still aren't in the system. The labels of these relationships differs from site to site, these labels could be terms likes "Friends", "Contacts" or "Fans". The majority of the SNSs require bi-directional or dual confirmation for Friendship i.e. both users have to acknowledge that they know each other whereas some don't. These one-directional ties are labelled as "Fans" or "Followers" as primarily seen in Twitter but various sites call these ties Friends as well.

The public display of connections is a crucial component of SNSs as the list contains links to other user's profile and by this a user expands his network of Friends. On most sites, the Friend List is visible to anyone who is permitted to view the profile by the user, although there are some exceptions. For instance, Facebook and Orkut allow users to opt out of displaying their profiles.

Most of the SNSs provide a means for users to leave messages on their Friends' profiles. This feature usually involves leaving "Scraps" or "Comments". In addition to this form of communication many SNSs also have a private messaging feature similar to webmail or messenger chat where both private messages and comments are made. Besides and beyond Profiles, Friends, Comments and Private Messaging SNSs vary greatly in their features and their user base. Some have photo-sharing or video-sharing competencies others have built-in microblogging and some have instant messaging technology. While SNSs are designed to be widely accessible, so it is not rare to find groups using sites to segregate themselves by nationality, age, educational level, or other factors.

Impact: Social Networking Sites were not less than a revolution upon their commencement. People were so easily attracted because it made relationships reach another level. People could connect virtually with everyone they knew instantly and could keep in touch and updated about their friends and family regardless to their physical position on the planet.

In India there is an old story of two brothers who get lost in a *'Kumb Ka Mela'* and reunite after 14 years, this situation now would never happen as he could just look his brother on the net in a second. The perception has not entirely changed of how people connect and how they meet. Sites like Facebook and Twitter not only hooked children but people from all various and diverse age groups. Bollywood stars and icons like Barack Obama connect to their followers by tweets and give their views and thoughts. These sites have made such an impression on the young and the old that perception between the Real and Virtual world has now a very thin line minuscule difference.

Legal Issues: In terms of business, members may use social networks for professional development to supplement face-to-face networking, to describe business efforts and opportunities or seek advice or opinions by asking questions to the social network community. Organizations may utilize social networks to disseminate "*Press Release*" type information and may link back to their own website for additional details. Promoting events on Facebook can result in more rapid, widespread coverage than an organization could obtain anywhere else as notifications are sent to all of a member's friends when that member RSVP'S for an event.

Companies may even use social networking to quickly respond to critics, such as recent 'tweets' *(Twitter messages)* by General Motors[3] to help diffuse severe comments by government officials and the media. An even more recent example is Domino's issuance of an apology on www.youtube.com *(YouTube)* in reaction to an earlier video showing two North Carolina based workers engaging in less than hygienic conduct while assembling pizzas.[4]

Social networking activities raise legal issues around content use and infringement, defamation, attribution as well as good old-fashioned tort liability. Social networking sites are also fertile ground for garnering evidence in criminal matters and for other investigatory purposes.

Psychosomatic Impact of Social Media?: Social media has become immensely popular, and in recent year mental disorderliness among young adults has become more common. That doesn't mean they are related but it can't be ruled out that the causes are also not unrelated and the numbers are staggering and deserve attention. Vide a recent survey In 2018, an estimated of 66.7 million adult eighteen or older in the US had a mental unwellness of one type or the another. Young adults aged 18-25 had the highest prevalence of any mental illness at 22.1% compared to adults aged 26-49 at 21.1% and aged 50 and older at 14.5%.[5]

A new phenomena called as "**Facebook/Insta Depression**" is a concern resulting from children's use of social media. A report by the American Academy of Paediatrics defines such a depression as *"depression that develops when teens and preteens spend time on social media web site and then Begin to exhibit classic symptoms of depression due to the intensity of the online world.*" The citron that may contribute to depression are the various measures of popularity that Facebook creates. In particular, Facebook can make kids feel inadequate due to the "in-your-fount" booster tallies, status updates, and moving picture of others having a good time. For well-adjusted kids, however, social media can have the opposite effect, boosting their already positive feelings about themselves.[6]

"Facebook depression" is a concern resulting from children's use of social media. A report by the American Academy of Paediatrics defines Facebook depression as *"depression that develops when teens and preteens spend time on social media sites and then begin to exhibit classic symptoms of depression due to the intensity of the online world."*

The factors that may contribute to depression are the various measures of popularity that Facebook creates. In particular, Facebook can make kids feel inadequate due to the "in-your-face" friend tallies, status updates, and pictures of others having a good time. For well-adjusted kids, however, social media can have the opposite effect, boosting their already positive feelings about themselves. In fact historically speaking the beginning of the idea of the concept of Facebook was earlier developed as a rating app by Zuckerberg along with his friends. In the year 2003, Zuckerberg along with his friends created an online programme called "Facemash", which allowed users to objectify fellow students by comparing photos of their faces and selecting who they deemed as "hotter".

The inception of an already psychological nightmare of young adults and especially young ladies getting rates as "who's hot and who's not" clearly shows the impact on a young person psyche[7].

Even as recent as 2017-18, a game called as The Blue Whale Game/"Blue Whale Challenge", an Internet "game" that claimed to exist in several countries. The game allegedly consists of a series of tasks assigned to players by administrators during a 50-day period, with the final challenge requiring the player to commit suicide. The term "Blue Whale" comes from the phenomenon of beached whales, which is linked to suicide. Blue Whale began in Russia in 2013 with "F57", one of the names of the so-called "death group" of the VKontakte social network, and allegedly caused its first suicide in 2015. Philipp Budeikin, a former psychology student who was expelled from his university, claimed that he invented the game. Budeikin stated that his purpose was to "clean" the society by pushing to suicide those he deemed as having no value and has a result of its various challenges a lot of young adults lost their lives as they committed suicide. A similar situation was seen in the 2018 "Tidepod Challenge".

As indicated by the Pew Research Center, by 2018, 86% of adolescents had cell phones. One brain science educator at San Diego State University found that adolescents who burn through at least 5 hours per day online were 81% bound to have at any rate one hazard factor for suicide contrasted with youngsters who went through just 1 hour daily on the web. The number of social media platforms used and how often they are used is related to youth mental health. A recent study found that the more social media platforms an adolescent uses, the more likely they are to have symptoms of depression and anxiety, regardless of overall time spent on social media.[8]

It is obvious that not all social media sites are healthy environments for adolescents. Intimidation, Bullying, cliques, and sexual experimentation are just as prevalent online as offline. Because children are not good at self-regulation and are susceptible to peer pressure, social media sites can be dangerous places to "hang out" specifically if unsupervised and unregulated. While countries like United States of America and Australia are having specific statutes governing the minimum age to access social media sites is 13 because the Children's Online Privacy Protection Act prohibits websites from collecting information on children younger than 13 without parental permission. However, other countries including India doesn't have till date a legislation regarding such determination of age, the problem is usually on the premise that age is based on self-report, so children younger than 13 can simply lie about their age and open accounts.[9]

While most parents do not fully comprehend social networking sites, one can safely say that most Indian parents don't even consider this a valid issue of discussion within the familyand, with many parents' busy schedules, this leaves many kids unsupervised in the online world, which can lead to problems, which again is something which can and should be addressed and is not. Parental supervision is as valuable online as it is offline in instilling values and safeguards to protect a child and adolescents from Depression, Bullying and for their general well-being again both emotional and physical.

Conclusion

As a conclusion, it is important to understand the real and actual impact of SNS in one daily life and like any other experience in life ought to be monitored by parents, limited by children and adolescents and has to be considered as a valid issue to be discussed by friends and family. Like any real events in life such SNS interaction have far more digging consequence and with the privacy factors far more darker impact in one life which can impact anyone and in any manner.

Detection of Extended-Spectrum-Beta-Lactamase (ESBL) Producing Escherichia Coli in Meat Chicken from Traditional Market in Surabaya, East Java, Indonesia

Dhandy Koesoemo Wardhana[1], Mustofa Helmi Effendi[1], Nenny Harijani[1], Hong-Kean Ooi[2]

[1]Department of Veterinary Public Health, Faculty of Veterinary Medicine, Universitas Airlangga, Surabaya, Indonesia, [2]Department of Veterinary Medicine, Azabu University, Japan

Abstract

This study to detect Extended-Spectrum-Beta-Lactamase (ESBL) – producing *Escherichia coli* (*E. coli*) in chicken meats from traditional market in Surabaya. Total of 60 chicken meat samples from ten traditional markets, with each market contributing 6 samples. The ESBL-producing *E. coli* were tested for susceptibility using disk diffusion method as described by Bauer. The study affirmed the presence of ESBL producing *E. coli* in chicken meats from traditional market Surabaya. The highest resistance from *E. coli isolates* was recorded against ceftriaxone (87%) followed by cefotaxime (75%), aztreonam (70%) and ceftazidime (28,3%).The presence of ESBL producing *E. coli* in the chicken meats is alarming and requires adaptation of hygienic practices and controlling use of antibiotics.

Keywords: *Chicken meats, E. coli, ESBL, traditional market.*

Introduction

Poultry production is one of the most important parts of farm industry in Indonesia. One of the poultry production is chicken meat.In the poultry industry, enteric bacterial pathogens pose a threat to public health and can contribute to the transmission of zoonotic diseases[1][2]. One of the zoonotic diseases is that of the foodborne disease. Food-borne diseases, caused by agents that enter the body through the intake of contaminated food materials are one of the primary public health concerns[3].Food-borne disease remain a major public health problem across the globe. It affects the people's well-being, and imposes economic impacts[4]. ESBL-producing *E.coli* is included in a food-borne disease.

The high consumption of chicken meat requires great care to provide the safety of the industry against menacing factors[5]. Along with development of poultry farms and intensive culture, occurrence of the bacterial diseases and, consequently,overusing antibiotics have been increased in recent years[6].The inappropriate use of antibiotics, not only in human medicine but also in animal husbandry, has been considered a main driver leading to the increase of multidrug-resistant bacteria[7][8].Food-producing animals are known as an important reservoir of antimicrobial-resistant zoonotic bacteria[9].

Beta Lactamases are the most frequent source of resistance to beta lactam antibiotics, and the production of beta lactamaseis the primary mechanism of antibiotic resistance in *Enterobacteriaceae*. Various beta lactamases have been reported, including penicillinases, extended-spectrum beta-lactamases (ESBLs), cephalosporinases (AmpC), metallo-beta-lactamases (MBLs), and carbapenemases (KPCs)[10][11].

Among *Enterobacteriaceae, E. coli*is the species that causes the greatest number of infections and has become the main emergence of extended spectrum beta-lactamase (ESBL) producing bacteria[12]. *E.coli* is a common inhabitant of the vertebrate intestinal tract and a frequent microbial contaminant of retail meat products[13].

The ESBL-producing *E.coli* in humans and animals has gained global notoriety during the past decade. This comes along with a fiery concern of foodanimals serving as potential reservoirs of ESBL genes [14].The purpose of this study to detect ESBL-producing *E.coli* in chicken meats from traditional market in Surabaya.

Materials and Method

Isolation and Identification of E. coli: A total of 60 chicken meat samples were obtained from 10 traditional markets in Surabaya. From each market, 6 carcasses were collected and from each carcass, 25 g chicken meat samples were homogenized in Buffered Peptone Water (BPW) media (Merck 1.07228.0500) for isolation of *E. coli*, then taking 1 ml suspension into 9 ml of Brilliant Green Bile Broth media (Merck 1.05454.0500) with Durham tube inside, and incubated at 45.5°C for 24-48 h. Gas-produced tube was positive and suspected to be *E. coli.* Taking 1 loop of suspected *E. coli* and inoculated on Eosin Methylene Blue Agar (EMBA) (Merck 1.01347.0500) and then incubated at 35°C for 24 h. All colonies with typical *E. coli* morphology were selected and confirmed by indole, methyl red, Voges–Proskauer, and citrate utilization biochemical tests.

ESBL-producing E. coli Susceptibility Test: The ESBL-producing *E. coli* were tested for susceptibility using disk diffusion method as described by Bauer. Making the bacterial suspension, one or two colonies of *E. coli* were cultured in 5 ml of sterilized NaCl (Natrium Chloride) at 37°C for 24 h and then homogenized using vortex until it was found to be similar to McFarland Standards. 0.2 ml bacterial suspension was inserted into a Petri dish containing Mueller-Hinton Agar (MHA) media (Merck1.05435.0500), then spread over the surface of agar using the sterile glass spreader carefully rotating the Petri dish at an angle of 45°C at the same time, and waited 15 min to absorb the bacterial suspension.

The ESBL-producing *E. coli* were tested against four beta-lactam antibiotics which included ceftazidime (30 µg), aztreonam (30 µg), cefotaxime (30 µg), and ceftriaxone (30 µg). The diameters of inhibition zones were measured and interpreted as per the guidelines of the Clinical and Laboratory Standards Institute [15]. The data were presented descriptively in the form of tables as percentages.

Findings: A total of 60 chicken meat samples were included in this study (mean weight 25 g). The results of *E. coli* isolation and identification from chicken meat samples revealed that 54 samples(90,03%) were positive. It is similar with Davis *et al*[16]where are chicken products (87.6%) were contaminated with *E. coli*in United States and similar with the findings of Patyal *et al*[17], who reported 68% prevalence rate of *E. coli* in Jaipur, Rajasthan, India. Sharma and Bist[18] also reported 70% prevalence rate *E. coli* in chicken meat in Mathura city of Uttar Pradesh, India.

Bacteria in food-producing animals are spread through the food chain[19].The high level of *E. coli* in meat might be caused by several factors including *E. coli* which is a normal flora in animal intestine so itis possible that the meat may come in contact with fecal contaminants [20][21].

Presence of pathogenic strains of *E. coli* in poultry meat is not only a potential threat of cross contamination but can also lead to become an infectious dose for handlers and consumers. *E. coli* presence in food materials are considered to be an indicator for the presence of other pathogenic bacteria in the respective food items[22].

The presumptive ESBL-producing *E. coli* isolates were tested for susceptibility against ceftriaxone (30 µg), cefotaxime (30 µg), aztreonam (30 µg)and ceftazidime (30 µg). According to our results from table 2, highest resistance from *E. coli* isolates from 60 chicken meat samples was recorded against ceftriaxone (87%) followed by cefotaxime (75%), aztreonam (70%) and ceftazidime (28,3%). These finding is agrees with Kwoji *et al*[23] where are similar higher resistance to ceftriaxone (96.9%) and aztreonam (98.5%) but contrast with ceftazidime (93.8%).For cefotaxime (75%) is contrast with Gundogan and Avci[24] where lower resistance to cefotaxime (33.3%) reported.

With regard to antibiotic resistance, methicillin-resistant staphylococci, in particular MRSA, and ESBL-producing *Enterobacteriaceae* are currently of special concern. In recent years, it has been widely recognized that the dissemination of MRSA and ESBL-producing bacteria is an issue no longer restricted to the medical/health care system [25–28].The emergence of ESBL producing *E. coli* in the food-producing animals and in foods of animal origin is a growing problem worldwide[29].

Wang *et al* found residues of antimicrobials in chicken meat and even detected some human antimicrobials, that are not usedas veterinary drugs. The

spread of antimicrobial resistance genes in poultry may be associated with the prophylactic use of cephalosporins injected into eggs to control *E. coli* omphalitis in broiler chickens[30]. The production of extended-spectrum beta-lactamases (ESBLs) is the worldwide most important mechanism conferring resistance to 3rd generation cephalosporins in *E. coli*[31][32].

Doi *et al*. reported that 67% of retail meat samples in Seville, Spain, contained ESBL or ESBL-like resistance genes[33]. A survey of imported raw chicken in the United Kingdom reported ESBL genes in 10 of 27 samples[34]. In fact, Gregova showed that the occurrence of ESBLs in chicken meat could be related to the environmental microbes of the slaughterhouse,to the processes of scalding, defeathering, and evisceration, and to that the bacteria can be transferred from chickens because of the contact through water and incorrect cleaning and disinfecting[35].

Considering what is known about the epidemiology of *E. coli*, the abundance of ESBL genes in chicken meat is a likely explanation for current findings in humans. Although there are extensive campaigns promoting safe handling of chicken meat during processing, enteric pathogens are frequently transferred to humans and pose a continuous public health threat[36].The high antibiotic resistance among *E. coli* recorded in this present study might be due to uncontrolled administration of antibiotics to chickens in Indonesia farms.

Table 1. E. coli isolation from chicken meat obtained from traditional market in Surabaya

Market	E. coli		Positive Percentage (%)
	Positive	Negative	
A	6	0	100
B	6	0	100
C	5	1	83,3
D	3	3	50
E	4	2	67
F	6	0	100
G	6	0	100
H	6	0	100
I	6	0	100
J	6	0	100
Mean of E. coli Positive			90,03%

Table 2. Data of ESBL from chicken meat obtained from traditional market in Surabaya

Antibiotics	ESBL Production		Positive Percentage (%)
	Positive	Negative	
Ceftriaxone	53	7	87
Cefotaxime	45	15	75
Aztreonam	42	18	70
Ceftazidime	17	43	28,3

Conclusion

The study affirmed the presence of ESBL producing *E. coli* in chicken meats from traditional market in the study area.It can be concluded that highest resistance from *E. coli* isolates to third-generation cephalosporinswas recorded against ceftriaxone (87%), cefotaxime (75%), aztreonam (70%) and ceftazidime (28,3%) out of 60 samples.

Conflict of Interest: The authors declare that they have no conflict of interest.

Source of Funding: The authors are thankful to the Rector of Universitas Airlangga, Directorate of Research and Innovation Universitas Airlangga, and Faculty of Veterinary Medicine Universitas Airlangga for proving all the necessary funds with research grant number 1408/UN3/2019.

Ethical Clearance: Ethical approval for animal research was not required as live animals were not used in this study. Meat samples were purchased from market.

Health Problems of Prospective Brides in Rural Area of East Java, Indonesia

Nunik Puspitasari[1], Sri Sumarmi[2], Yuly Sulistyorini[2], Kuntoro[3]

[1]Dept. of Biostatistics and Population, [2]Dept. of Community Nutrition,
[3]Department of Biostatistics and Sudi Population, Public Health Faculty, Universitas Airlangga, Indonesia

Abstract

Background: Health conditions of prospective brides were very important to identify before marriage because they will be "the main actors" in reproduction process of the next generation.

Objectives: The objectives was to describe the health problems of prospective brides in rural area, East Java, Indonesia.

Materials and Method: The study was an observational study. Samples of this research were all prospective brides and grooms who had been registered in nine Religious Affairs Office and nine Public Health Center in Proboling go through Pre-Marital Integrated Services by using Laduni cards in 2015. Variables under the study were consists of some demographic and health variables. Data processing and analysis were did descriptively based on the results of cross tables.

Results: Anemia tends to be more prevalent on the younger age group as well as the Body Mass Index status <18.5 and Less Energy Calories. Hip Waist Ratio>0.85 had a high enough percentage in all age groups.

Conclusions: There were many prospective brides who did not use contraception but also they did not want to have the children within one year of marriage. Anemia, underweight BMI status and Chronic Energy Malnutrition have more occur on younger age group, while the older age group have more high risk of degenerative diseases.

Keywords: *Health problem, contraceptive use, nutrition status, prospective brides, rural area.*

Introduction

Forming a happy and prosperous family as mandated by Indonesian Law No. 1 of 1974 was not a simple matter. While health conditions of prospective brides were very important to identify before marriage because they will be"the main actors" in reproduction process of the next generation. Women can be analogized as "factory as well as provider of raw materials" for the future generations. When the factory and the raw materials were not well prepared, then the future generation that will be produced will be perfunctory quality, just life but not qualified[(1)].

A number of medical examination procedures were essential for prospective brides. Blood pressure checks were necessary to anticipate the early presence of abnormal blood pressure (hypertension or hypotension) and to predict of cardiovascular disease as other indices[(2)]before prospective brides become a mother. Examination of hemoglobin blood was very useful to know whether prospective brides anemia or not[(3)]. If prospective brides was anemic then if she becomes pregnant,it will be more severe because of pregnancy can decrease hemoglobin levels up to 1.5 mg/dl from the initial conditions before pregnancy. Measurement of body weight and height was needed to calculate Body Mass Index (BMI). BMI shown a person's nutritional

status[4]. Maternal weight before pregnancy was a risk factor for low birth weight[5]. Moreover, the cause of perinatal death was thought to be related to maternal underweight status[6].The use of contraception indicates the level of contraceptive use to delay pregnancy after marriage. The desire to have children indicates potential of average age of women at the first childbirth. While the nutritional status of prospective brides will greatly affect to the quality of pregnancy and the children to be born[7].

Materials and Method

The study was an observational study, while the design of the study was a descriptive research design. The research location was at Probollinggo District, East Java Province, Indonesia.

Population of this research were all prospective brides and grooms who have been registered in nine Religious Affairs Office (RAO) and nine Public Health Center (PHC) in Probolinggo through Pre-Marital Integrated Services by using Laduni cards in 2015. Samples in this study are all of the population that consist of 774 pairs of prospective brides and the grooms that recorded in the nine RAO in Probolinggo. In general, candidates were listed on RAO wedding where prospective brides resides.

Variables that observed in this study were blood pressure, hemoglobin level, pregnancy test, Tetanus Toxoid immunization, contraceptives use, desire to have children within one year of marriage, anthropometry comprising Upper Arm Circumference (MUAC), Body Mass Index (BMI) and Waist Circumference Pelvic Ratio (waist hip ratio) to determine the nutritional status. Data processing and analysis were did descriptively using frequency distributions and cross tables.

The data collection technique used in this study was to use secondary data from the results of the prospective brides registration conducted by nine of the Office of Religious Affairs and the premarital health examination conducted by nine of the Public Health Center in each sub-district in Probolinggo District, East Java Province, Indonesia. While the data analysis was carried out descriptively based on the results of cross table analysis.

Results

Health and Nutritional problems of prospective brides: There were a number of Laduni form not filled completely or empty, so that left nearly all of the observed variables not had the same total number. Most of the prospective brides had normal blood pressure, even though there were few of the prospective brides of the prospective brides had hypotension, hypertension, and pre-hypertension. Based on the results of the pregnancy test it was known that as many as 11.6% of the prospective brides already pregnant. Almost all of prospective brides who got Tetanus Toxoid immunization (TT).Prospective brides who were not immunized TT, it was because they were unwilling or afraid of TT immunization for various reasons.

Prospective brides who already used contraception before fist pregnancy were quite a lot. Prospective brides who had been using contraception were those who have not done the wedding ceremony nor had the wedding ceremony, but had not registered marriage in the RAO. However, many prospective brides who did not use contraception said that they wanted to use contraception after the wedding ceremony. The type of contraception that most preferred by prospective brides were injection contraception and Pill. The injection contraception lot of interest since its use once every 3 months. As for those who choose birth control pills usually because they were easily stopped to used it at any time. Prospective brides that states did not want have a child in one year after the marriage were more than a half. This was contradiction with the fact that the prospective brides who wearing contraception were less than prospective brides who did not want to get pregnant within the first year of their marriage (Table 1).

Table 1: Cross tabulation of age group by contraceptive use before marriage and plan to have children within one year after marriage on prospective brides in Probolinggo district, East Java Province, Indonesia

Contraceptive use before marriage	Plans to have children within one year after marriage				Total

Most of the prospective brides known anemic. The average Hb level of the prospective brides was 11.5 g/dl, with a minimum value of hemoglobin level was 5.9 g/dl and a maximum was 18.5 g/dl. The anemic was highest in the youngest age group (15-19 years) (Table 2).

Table 2: Cross tabulation of age group by hemoglobin level (Hb) on prospective brides in Probolinggo district, East Java Province, Indonesia.

Age Group	Hemoglobin Level (Hb)				Total	
	Normal (>12g/dl)		Anemia (<12 g/dl)			
	n	%	n	%	n	%
15 - 19	154	41.7	215	58.3	369	100.0

Prospective brides who had nutritional status based on value of the Body Mass Index (BMI) were quite a lot. The nutritional status of the prospective brides by BMI showed a tendency of the young age of the bride getting underweight. Conversely the adult age group of the prospective brides, tends to increase the BMI (Table 3).

Table 3: Distribution age group with BMI status on prospective brides in Probolinggo, East Java Province, Indonesia.

Age Group	BMI status								Total	
	Underweight (<18.5)		Normal (18.5 to 25)		Excess Weight Loss (25 to 30)		Overweight (> 30)			
	n	%	n	%	n	%	n	%	n	%
15 - 19	137	35.0	224	57.3	26	6.7	4	1.0	391	100.0

Based on the ratio of waist circumference pelvis known that more than a quarter of prospective brides have a higher risk of degenerative diseases. In every age group was relatively almost no difference in the value of waist hip ratio (Waist Pelvic Ratio) between high risk and not high risk. However there was a slight tendency, increasingly older age group more high risk of degenerative diseases (Table 4).

Table 4: Distribution age group with pelvic waist circumference ratio (waist hip ratio) on the prospective bride in Probolinggo, East Java Province.

Age Group	Pelvic Waist Circumference Ratio				Total	
	High risk (> 0.85)		Not high risk (<0.85)			
	n	%	n	%	n	%
15 - 19	96	26.2	271	73.8	367	100.0
20 - 49	89	31.4	194	68.6	283	100.0

Measurements of Middle Upper Arm Circumference (MUAC) showed that a lotof the prospective brides had chronic energy deficiency. In all age groups were also relatively almost no difference value of MUAC of the prospective brides between chronic energy deficiency and normal. However, there was a tendency of younger age group of the prospective brides had the higher percentage of Less Energy Calories (LEC) (Table 5).

Table 5: Distribution age group with Median Upper Arm Circumference (MUAC) on the prospective bride in Probolinggo, East Java Province.

Age Group	MUAC				Total	
	Chronic energy deficiency (<23.5 cm)		Normal (> 23.5 cm)			
	n	%	n	%	n	%
15 - 19	134	37.6	222	62.4	356	100.0
20 - 49	63	34.8	118	65.2	181	100.0
Total	**225**	**35.1**	**416**	**64.9**	**641**	**100.0**

Discussion

The type of contraception that most preferred by prospective brides were injection contraception and Pill. Injections most desirable because it had no effect on weight gain which was not favored by women. While the pill even though it can give the effect of weight gain, but its use can be discontinued at any time[8].

Most of prospective brides that states do not want have a child in one year after the marriage. DHS in 52 countries between 2005 and 2014 reveal the most common reason that married women say they do not want to get pregnant but do not use contraception, was due to fear of side effects and health risks, rarely having sex or not at all; they or others close to them oppose contraception; and they breast-fed and/or did not continue menstruating after birth[9]. According to DHS survey results unmet need was usually higher in rural areas than in urban areas and it declines with educational attainment[10].

Most of the prospective brides were anemic. Studies in India showing one cause of iron-deficiency anemia (IDA) in rural women of childbearing age was younger age at marriage (<19 years)[11]. The other study found the net prevalence of severe/moderate anemia was higher among women whose age at marriage was<18 years than women married inhigher age groups[12].

Prospective brides who had BMI were underweight more than half. A low BMI before pregnancy would increase the risk of preterm birth and Intrauterine Growth Retardation (IUGR) of the fetus in the womb[13]. Women who were overweight before pregnancy generally would be less weight gain during pregnancy than women who were underweight[14]. Mothers with low BMI before pregnancy had greater risk of delivering low birth weight infants and spontaneous preterm birth[15]. Compared to women with a normal pre-pregnancy BMI, women who were underweight had over twice the odds of PTD. While, neither overweight nor obesity was significantly associated with increased odds of PTD[16].

While based on the ratio of waist circumference pelvis of prospective brides known that quite a lot of them had a higher risk of degenerative diseases. Pelvic waist circumference ratio values >0.85 for women would associated with an increased risk of degenerative diseases such as coronary heart disease, stroke, and diabetes mellitus type-2[17].

MUAC measurements were performed on prospective brides showed that a lot of them had chronic energy deficiency. Weight before pregnancy was a good predictor of weight babies born. Researchers from India have found that maternal nutritional status can significantly affect the weight of newborns and poor mother's nutritional status can lead to LBW[18]. Another study also from India also find the same result that widespread maternal under nutrition has led to LBW[19].

Conclusions

Most of prospective brides married at the age between 15-19 years old, only graduated from primary

school or less, nearly half of all prospective brides do not work. There were a lot of prospective brides who did not used contraception states that did not wanted to have the children in the first year of their marriage. There wasa tendency that anemia, underweight BMI status and Chronic Energy Malnutrition (CEM) more occur on the younger age (15-19) of prospective brides. There was a tendency, increasingly older age group of prospective brides, the more high risk of degenerative diseases.

Abstract

Solanum torvum has antioksidan. This study aimed to analyse cytotoxic activity and selectivity index of *Solanum torvum* on T47D breast cancer cells invitro. Identification of *Solanum torvum* fruit chemical compounds with LCMS containing Clorogenic acid, 4-O-caffeoylquinic acid, 3-O-caffeoylquinic acid, 3-O-feruloyquinic acid, 5-O-feruloylquinic acid, 3-O-feruloylquinic acid, 3,4 - O dicaffeoylquinic acid, 3,5-dicaffeoylquinic acid, 3-O-feruloylquinic acid, 5-O-feruloylquinic acid, putative dicaffeoylquinic lactone. Cytotoxic assays showed that the *Solanum torvum* Without Fermentation were IC_{50} (IGT) 1111.62µg/mL, IC_{50} (MGT)1889.20µg/mL, IC_{50} (EGT) 1171.90µg/mL, IC_{50} (FEGT) 305.98 µg/mL. Cytotoxic assays showed thatthe treatment of fermentation was IC_{50} (IBT) 1760.36 µg/mL, IC_{50} (MBT) 1631.06 µg/mL, IC_{50} (EBT) of 1111.58 µg/mL, IC_{50} (FEBT) 39.17µg/mL, IC_{50} (FHBT) 85.58 µg/mL. Index of selectivity (IS) *Solanum torvum* (without fermentation) were IS (IGT) 5.23, IS (MGT) 0.61, IS (EGT) 1.06, IS (FEGT) 1.45. Index of selectivity of *Solanum torvum* (fermentation treatment) were IS (IBT) 2.41, IS (MBT) 0.78, IS (EBT) 0.18, IS (FEBT) 4.64, IS (FHBT) 1.67. The best results are treatment of ethyl acetate fraction of *Solanum torvum*(FEBT) has IC_{50} was 39.17 µg/mL and Index selectivity was 4.64, declared safe/not toxic to normal cells, thus potentially developed as T47D breast anticancer cells.

Keywords: *Cytotoxic, T47D Breast Cells, Selectivity Index, Solanum torvum.*

Introduction

Solanum torvum in Indonesia in fertile soils has antioksidan. *Solanum torvum* contains steroids, terpenoids, saponins, tannins, alkaloids, fatty acids, 3-o-acetyl-stigmasta-5,25-diene-2,3-diol, methyl stearate, 21,25-dimethylmelianodiol[(1)]. *Solanum torvum* extraction on seeds and fruit peel has compounds of flavonoids, sterols and saponins[(2)]. Solanum torvum has alkaloids, flavonoids, saponins, tannins, glycosisides[(3)]. *Solanum torvum* has constituent chemicals such as neochlorogenin 6-O-β-D-quinovo-pyranoside, neochlorogenin 6-O-β-D-xylopyranosyl- (1 → 3) -β-D-quinovopyranoside, 6-O-α-L -rhamnopyranosyl- (1 → 3) -Dbeta quinovopyranoside, solagenin 6-O-β-D-quinovopyranoside, solagenin 6-O-α-L-rhamnopyranosyl (1 → 3) -β-D-quinovopyranoside, isoque-rcetin, routine, kaempferol and quercetin[(4)]. The wild eggplant fruit (Solanum torvum) in Indonesia was relatively used by the population because ithas not been cultivated .*Solanum torvum* containing sesquiterpen functions immunosuppressive[(5)]. Clorogenic acid serves to prevent and treat anti-inflammatory diseases[(6)]. Chlorogenic acid is a polyphenol compound proven to stimulate anti-inflammatory, antibacterial and antioxidant activities as agents for clinical treatment of hepatic I/R injuries[(7)]. Carcinogenesis is the process of the occurrence of multi-stage cancer that undergoes genetic changes and progressive transformation of normal cells into malignant cells[(8)]. The biggest cancer causes of death in the world are breast, cervix, colon, lung and stomach cancer[(9)]. The most common causes of death for women are cervical cancer and breast cancer. T47D breast cancer cells used in this study

Coresponding Author:
Harijono
Faculty of Agriculture Technology Universitas Brawijaya Malang
e-mail: harijono@ub.ac.id

have unlimited replication ability, high homogeneity and was easily replaced with frozen stock in the event of contamination[10]. This was supported by research that states that the methyl cafeat compound in Solanum torvum fruit functions as an anti-cancer[11]. The study aimed to analyze antioxidant compounds found in *Solanum torvum* fruit extracted with various solvents to function as cytotoxic and selectivity index for T47D breast cancer cells.

Materials and Method

Solanum Torvum: *Solanum torvum* was obtained from Sumber Manjing village Malang . Fruit wild eggplant was sorted, washed, drained. In the next stage processing into dry powder using 2 types of treatment. Treatment 1 was the fruit that has been cleaned in a small chunk and then vacuum dryer temperature 50^0 C for 14 hours. The two treatments were fermented, namely 5 days curing, 6.18 hours fermentation time, 50^0 C drying temperature and 14 hours drying time, thus there stored on main raw material.

Chemical Materials: Materials include, water, aquabides, methanol pa, ethanol pa, n hexane pa, ethyl acetate (p.a.), DMSO, alcohol, T47D cells and vero cells,RPMI, M199 media, FBS, PS, trypsin-EDTA, SDS in 0.01 N HCL, MTT, and PBS, Rnase, ethanol, 2 N hydrochloric acid, lead (II) acetate 0.4 M, isopropanol, chloroform, Molish, 2 N hydrochloric acid, iron (III) chloride reagent, Liebermann-Burchard, n-hexan, DPPH 0.1 mM, methanol, Folin-Ciocalteai, Gallic Acid, AICI3, Quercetin, Sodium Nitrite, Diethyl ether, Na2CO3. Chemicals obtained from the parsitology laboratory of the UGM medical faculty jogjakarta.

Analyzing Solanum Torvum using LCMS: UHPLC The brand of ACCELLA type 1250 made by Thermo Scientific which consists of vacuum degassers. Solvents A = 0.1% wet format in water and B = formic acid in Acetonitrile. A mobile phase gradient with a speed of 300 µl/minute with the following settings: 0.0-0.6.00 minutes 5% B, 0.6 - 3.0. is 2 µL at 160^0C. The column is controlled at 30ºC, and the autosampler compartment is set to 16ºC. UseLCMS/MS Triple minutes 75% B, 3.0 - 3.5 minutes 75% B, 4.0- 5.5 minutes 5%. The injection volume in the TSQ Quantum Access Max spectromethermic acid LC from Thermo Finnigan with an ESI ionization source is controlled by TSQ Tune software which is operated in negative mode. The ionization conditions of ESI are as follows: 3.0 kV spray voltage; evaporation temperature of 250ºC; capillary temperature of 300ºC; nitrogen as sheath gas pressure 40 psi, and 10 psi pressure aux gas with argon gas (12)

Preparation of breast cancer cellsT47D (13):

Ethanolextraction: Samples weighed 10 grams plus 80% ethanol as much as 100 ml then placed on elenmeyer diprasi for 24 hours while being shaken. The results of the extract were filtered put in an impermeable container, the sample was again macerated with 80% ethanol solvent which was repeated until 3 times. The results of the ethanol extract put together are concentrated with a rotary evaporator vacuum temperature of 40^0C until concentrated, then stored in bottles that are impermeable to drying with nitrogen gas until the solvent evaporates, stored in a safe place.

Methanol Extraction: 10 grams of the test sample were extracted with 100 ml of methanol concentration of 95% with 24-hour maceration. The extract was filtered with Whatman no 1 filter paper. Then evaporator until thick and with nitrogen gas until dry, stored in a safe place.

Water Extraction: 10 grams of the test sample were each extracted with 100 ml of hot water in an infusion pan for 15 minutes. The extract was filtered with Whatman filter paper No. 1. The dirotarievapore extract until thick and the results stored in a bottle then dried with frezee drying, stored in a safe place.

Hexane Fractionation: Ethanol extract of Solanum torvum fruit powder was inserted in a separating funnel, added hexane and water each 50 ml (1: 1) shaken so that 2 layers were formed. The hexane layer is collected, the water layer is extracted again with hexane up to 3 times. The results are applied with a vacuum rotary evaporator until thick and dried with nitrogen gas so that stored in a safe place.

Ethyl Acetate Fractionation: Ethanol extract of the test sample was put in a separating funnel added with ethyl acetate and 50 ml (1: 1) of water each shaken to form 2 layers. Ethyl acetate layer is accommodated, the water layer is extracted again with ethyl acetate up to 3 times. The results are applied with a vacuum evaporator until thick and dried with nitrogen gas, thus stored in a safe place.

Citotoxic analysis via MTT: Citotoxic analysis

inT47D breast cells with 9 samples treatment *Solanum torvum* were 31,25 ppm, 62,5 ppm, 125 ppm, 250 ppm, 1000 ppm with ELISA *reader* (Bencmark Bio Rad), wavelength 595[13].

Index Selectivity Analysis: The principle works the same as cytotoxic analysis but the complete media uses M199. The test sample concentrations were 1000ppm, 500ppm, 250ppm, 125 ppm, 6.25 ppm, 31.125 ppm. The results of Selectivity Index formula was (13).

$$\text{Selectivity Index} = IC_{50} \text{ Cells Vero}/IC_{50} \text{ Cells T47D}$$

Result

Identification of chromatographic chemical compounds with LCMS: The results of the identification of chemical compounds in the Solanum torvum fruit (without fermentationtreatment) can be seen in Figure 2 and Table 1.

Table 1: Chemical components of Solanum torvum

No	TR	(M- H)- (m/z)	MS^2 (m/z)	Compounds
1	3,72	353	191,127	chlorogenic acid

Discussion

Identification of *Solanum torvum* fruit chemical compounds with LCMS containing Clorogenic acid, 4-O-caffeoylquinic acid, 3-O-caffeoylquinic acid, 3-O-feruloyquinic acid, 5-O-feruloylquinic acid, 3-O-feruloylquinic acid, 3,4 - O dicaffeoylquinic acid, 3,5-dicaffeoylquinic acid, 3-O-feruloylquinic acid, 5-O-feruloylquinic acid, putative dicaffeoylquinic lactone. This was supported by opinions[14] The results of phytochemical analysis of *Solanum torvum* fruit extraction with organic solvents contained alkaloids, indole alkaloids, saponins glycosides, flavonoids, phenols, sterols, proteins, carbohydrates, alkaloid lepac, vitamin A, Vitamin C, Vitamin E, polyphenols. The results of research that have a good selectivity index are samples IGT and FEBT (Table 5).The selectivity index value greater than 3 indicates that extract is selective and not toxic, and vice versa if the selectivity index is less than 3, meaning that the extract used is not selective and has a toxicity to normal cells [15]. Antioxidants in small concentrations can prevent or slow down the rate of free radical oxidation or lipid oxidation. These antioxidant compounds can function as free radical scavengers, forming complexes with metal elements as antioxidants and functioning as reducing compounds [16]. Antioxidants were useful in preventing tumors and cancer, premature aging [17]. The best cytotoxic activity in this research wasethyl acetate fraction of*Solanum torvum* fruit

(Fermentation Treatment) IC_{50} value of 39,17 µg/mL. Doxorubicin as a positive control has an IC_{50} value of 36.76 µg/mL[18]. A very effective anticancer agent for breast cancer metastesis was doxorubicin [19]. The criteria for compounds that have antiproleferative potential are $IC_{50} \leq 100$ µg/ml [20]. The research Chromatographic analysis of *Solanum torvum* containing Clorogenic acid and derivative. That clorogenic acid functions to prevent and treat anti-inflammatory diseases [21]A new clorogenic oxide called oxovanadium complex has the potential for antioxidant agents and anti cancer (human breast cancer) [22].

Conclusion

The results of Chromatographic analysis containing Clorogenic acid, and derivative. So the best research results as cytotoxic activity of Solanum torvum ethyl acetate fraction having IC_{50} which was 39.17 µg/mL and index selectivity of 4.64 which means it was not toxic to normal cells, thus potentially developed as T47D breast anticancer

The Relationship between Father Involvement with Growth and Social-Emotional Development in Preschool Children

Nur Hijrah Tiala[1], Fitri Haryanti[2], Akhmadi[3]

[1]Student of Master Program in Nursing, [2]Lecture, Department of Child and Maternity Nursing, [3]Lecture, Departmentof Psychiatric and Community Nursing, Gadjah Mada University, Indonesia

Abstract

Background: Growth and social-emotional development in preschool children must have cared for parents. Although evidence exists of the association between them, especially mothers' involvement, only a few studies have examined fathers' involvement in parenting.

Method: This research uses Cross sectional study design. It has 106 pairs of fathers and preschool age children selected using consecutive sampling technique. Those fathers complete the questionnaire on father's involvement in parenting and questionnaire on Age Stages Questionnaire Social Emotional (ASQ-SE) based on their child's age. Furthermore, the Z-score is calculated based on the child's Body Weight/Body Height index to assess their growth. The data are analyzed using chi-square test at significance level of $p<0.05$.

Result: Father's involvement in parenting is relatively good at 51.9%. In terms of child growth based on the calculation of Z-score from Body Weight/Body Height index, 77.4% of the children are found to have normal growth. Most of the children have the risk of experiencing socio-emotional issues at 58.5%. In terms of the association between father's involvement in parenting and preschool children's growth,a value of $p>0.05$ is obtained, and in terms of the association between father's involvement in parenting and socio-emotional development of preschool children,a value of $p<0.05$ is obtained.

Conclusion: This research finds that father's involvement in parenting is not associated with preschool age children's growth,yet it has a significant association with preschool age children's socio-emotional development.

Keywords: *Father involvement, parenting, growth, social-emotional, Preschool.*

Introduction

The initial stage of a child's growth and development determines the conditions in the next stages. Preschool is the period when the father's involvement with their children is at peak than when children are still in their infancy or at elementary school.[1] In Indonesia, according to the result of nutritional status monitoring in 2018, it is reported that infants in Indonesia experience growth issues, i.e. being highly thin and thin at 10.2% and obese at 8%.[2] In addition to growth, child development issues are as extremely important for child welfare as social development which plays a role in child's health.[3]

Father's involvement in positive aspects of their child's life will promote positive achievement as well in children at their preschool years.[4] These positive achievements include positive social behavior, nutritional status improvement,[5] and low obesity occurence.[6]

Pleck identifies some components of father's involvement which consist of positive engagement activities, warmth and responsiveness, control along, indirect care, and process responsibility.[7] In developing

countries, the role of a father in their child's health has not received adequate attention. The role that a father plays in child's growth and development has not been a frequent topic for research. Some studies emphasize that mothers play an important role in their children's live and fathers are treated fairly shallowly by merely emphasizing their economic status on child's health.[8,9]

Therefore, a further study is needed to see the association between father's involvement in parenting and preschool age children's growth and social-emotional development.

Method

Research Design: This research was conducted in the area of Puskesmas Nglipar I, Gunung Kidul Regency on April-May 2019. It used cross sectional study design and its population was all pairs of father and preschool age child in the area of Puskesmas Nglipar I, Gunung Kidul Regency. This research had obtained a clearance from the ethical committee of Medicine, Public Health and Nursing Faculty at Gadjah Mada University under number KE/FK/0380/EC/2019.

Sampling: Pairs of father and preschool age child (3-6 years old) living within the area of Puskesmas Nglipar I and willing to sign the informed consent. The father should be literate (capable of reading and writing). The exclusion criteria in this research were children who had developmental disorders, sych as mental retardation, autism, or cerebral palsy and fathers with physical disability ad mental emotional disorder. To assess the mental emotional disorder, a screening was done using Self-Reporting Questionnaire-20 (SRQ-20)

Instrument:

1. Questionnaire of father's involvement in parenting of preschool children. This questionnaire was prepared by the researcher for the purpose of this research, consisting of 28 statements using Likert scale. From the result of validity test, the construct was declared valid, i.e. r statistic > r table (0.361). From the reliability test result, the value of cronbach's alpha was found to be 0.732 > 0.60. The father's involvement in parenting was divided into 2 categories, namely good (total score ≥ 72) and poor (total score <72).
2. Age and Stage Questionnaire Social Emotional (ASQ:SE): The research used ASQ:SE,particularly questionnaire of 36, 48, and 60 years of age. This questionnaire had been tested for its validity and reliability in Indonesia in Indonesian language by Ariyani (2017). From the validity test, the value of r statistic was (0.241-0.694), which was greater than r table. The reliability test value with cronbach's alpha was 0.743 > 0.60.
3. The instruments used to measure the child's growth status were microtoice as the body height measuring instrument and digital scale as the body weight measuring instrument. The value of Z-score of body weight per body height based on age was calculated using WHO Anthrosoftware.

Procedure: Those fathers who qualified the inclusion and exclusion criteria were given an explanation on the research procedure and asked for their consent by signing an informed consent. The father completed demographic questionnaire, questionnaire on father's involvement in parenting, and the child's growth and development questionnaire according to the child's age as calculated in months by the researcher. The correctly completed questionnaires were then submitted. The child's body height and body weight measurements were done by coming to the schools or posyandu (integrated service post) of the children whose fathers had agreed to be involved in the research.

Statistic: The statistical test used was correlation test, i.e. chi-square test with the level of confidence used being 95%.

Result

106 pairs of fathers and children of 3-5 years old served as the research respondents. Most of them were male (63 or 59.4%). Most of these fathers had higher education (54 or 53.8%). They mostly had formal occupations (64 or 60.4%) and most of their mothers were unemployed at 73.6%. Most of these families had low monthly income at 55.7% or below the City Minimum Wage of Gunung Kidul Regency.

From the completed questionnaire on father's involvement in parenting,it was found that 55 (51.9%) fathers had a good involvement and 51 had a poor involvement, meaning that 48.1% were less involved in parenting. The correlation betweenf father's characteristics and their involvement in parenting could be seen in Table 1.

The result of data analysis showed that father's education variable with a p value of 0.002, mother's

education with a p value of 0.001, mother's occupation with a p value of 0.018, and family income with a p value of 0.017, had significant correlations with father's involvement in parenting.

The physical growth of preschool age children was measured based on anthropometric method with body weight per body height index. The body weight was measured using a digital scale and the body height was measured using microtoice. From the 106 children measured, 1 child was found highly thin, 14 children were thin, and 9 children were fat. Furthermore, for the purpose of bivariate analysis, those children with growths other than normal one (highly thin, thin, and fat) combined to be an abnormal growth category, hence in the bivariate analysis, the growth variable was divided into 2 categories, i.e. normal and abnormal.

The correlation between father's characteristics and child's growth could be seen in table 2. The data analysis result indicated that the family income variable with a p value of 0.016 had a significant correlation with the child's growth.

.**Table 4. Relationship of Father's Involvment in Parenting with Growth**

Variable		Growth				p-value
		Normal		Abnormal		
		n	%	n	%	
Father Involvement	Well	47	85,5	8	14,5	0,063
	Less	35	68,8	16	31,4	

Table 3 showed the analysis result where the mother education variable with a p value of 0.019 and mother's occupation variable with a p value of 0.034 were found to have a significant correlation with the child's socio-emotional development.

The bivariate analysis result of father's involvement in parenting with preschool age children's growth using Chi-square test could be seen table 4.47 children raised by fathers who were well involved in parenting and 35 children raised by fathers who were poorly involved in parenting were found to have a normal growth. In terms of the children experiencing abnormal growth which was an accumulation of highly thin, thin, and fat ones, 16 of them were raised by those fathers who were poorly involved in parenting and 8 of them were raised by those fathers who were involved well in parenting. From the statistical test result, a significance value of 0.063 (p value> 0.05) was obtained, meaning that there was no correlation between father's involvement in parenting and preschool age children's growth.

Table 5: Relationship of Father's Involvement in Parenting with Social-Emotional Development

Variable		Social-Emotional Development				p-value	Odd Ratio	95% CI
		Not at risk		Risk				
		n	%	n	%			
Father Involvment	Well	33	60,0	22	40,0	0,000	5,455	2,313-12,865
	Less	11	21,6	40	78,4			

Table 5 showed the result of statistical test where a significance value of 0.000 (p-value< 0.05) was obtained, meaning that there was a correlation between father's involvement in parenting and the socio-emotional development in preschool age children.

The value of odd ratio was found to be 5.455,meaning that those children raised by fathers with poor involvement in parenting had 5.455 times risks of having socio-emotional issues than those children raised by fathers with a good involvement in parenting. The confidence interval values range from 2.313 to 12.865,meaning children raised by father's poor involvement had at least 2.313 times and a maximum of 12.865 greater risks of having socio-emotional issues.

Discussion

Most fathers had a good involvement in parenting. Nevertheless, the difference in number of fathers with good and poor involvements was shown not too substantial, i.e. 51.9% had a good involvement and 48.9% had a poor involvement. It was found that father's involvement in parenting had no correlation with child's growth as seen from the body weight per body height status based on the child's age (p value> 0.05).

Child's growth served as a direct impact of the intake of food in a long run and the child's health. The better the quality and quantity of food that the children consumed and their health, the better they will grow. In addition to food intake and disease, parents' presence also played a certain role in the child's growth.

Parenting became an indirect factor in child's growth. The parenting process was not just done by the mother, rather the father also needed to take part. However, the mother played an important role in providing and serving nutritious foods in the family, thus it had an influence on child's growth.[10] Thus, when the father was less involved in parenting,yet the mother could meet this direct factor, then it would allow the child to have a good growth.

This research also found that most children had the risk of encountering socio-emotional development

issues at 58.5%. The analysis in this research showed that father's involvement in parenting had a correlation with socio-emotional development in preschool age children (pvalue = 0.000).

The father played an important role in their child's socio-emotional development and behavior.[11,12] When the father was actively involved in parenting, their children were less likely to have behavioral problems.[13] An improvement to the quantity and quality level of father's involvement gave a positive influence on the child's social and emotional development.[14]Parenting during preschool period significantly influenced the child's social and emotional competence.[15]

Research limitation: This research used cross sectional method. The research result would be better if it used a longitudinal study method to see the father's involvement in parenting from time to time and its influence on the child's growth and social-emotional development.

Conclusion

From the discussion above, it could be concluded that there was no correlation between father's involvement in parenting and preschool children's growth, yet it had a significant correlation with preschool children's socio-emotional development.

Conflict of Interest: None

Auditory evaluation with Pure Tone Audiometry and DPOAE in Kanamycin Treatment of Multidrug-Resistant Tuberculosis

Nyilo Purnami[1], Aditya Brahmono[1], Bakti Surarso[1]

[1]Department of Otorhinolaryngology-Head and Neck Surgery, Faculty of Medicine Universitas Airlangga, Dr. Soetomo Hospital, Surabaya, Indonesia

Abstract

Background: Kanamycin treatment is mainly used in multidrug-resistant tuberculosis (MDR-TB) patients. Hearing impairment associated along with the treatment leads to be permanently. Audiology assessments and monitoring may benefits to detect early on hearing loss. This study aimed to determine the evaluation of hearing alteration after kanamycin injection in the first month treatment.

Method: We conducted a prospective study, observational longitudinal analytic with pre and post design in patients treated with kanamycin-based regimens in MDR TB Outpatients Pulmonology Department Dr. Soetomo general hospital Surabaya. Assessment of hearing result using Pure Tone Audiometry and DPOAE, compared between baseline data and after 4 weeks treatments. Statistical analysis for hearing threshold and cochlear dysfunction based on overall frequency and specific frequency DPOAE examination, using Wilcoxon ranks test and Mc Nemar test.

Results: A total of 15 patients (8 males and 7 females) with confirmed diagnosis of MDR-TB were included in this study conducted within 3 months in 2018.There were 15 ears represented with based line and compared to 4 weeks after treatment, showed on Audiometry and DPOAE on overall frequencies, found no significant difference ($p > 0.05$), but in DPOAE at frequency of 10,000 Hertz (Hz) was found a significant difference ($p = 0.002$).

Conclusion: DPOAEat high frequency (10,000 Hz) may benefits for early detection on hearing impairment. A baseline data with DPOAE is recommended, besides Audiometry for ototoxicity monitoring in Kanamycin treatment in MDRTB patients.

Keywords: *Audiometry***,** *DPOAE, kanamycin, multi drug resistant tuberculosis.*

Introduction

Hearing loss in patient with *multidrug resistant tuberculosis* (MDR TB) is suspected due to the effects of long-term kanamycin injection, kanamycin is known affected the permanent damage and the ototoxic remain lasting even after several weeks and months of administration.[1]

Drug ototoxic like aminoglycoside ototoxic effects start from the basis of cochlear and raise progressively to the apex of cochlear. This leads to appearance of *sensorineural hearing loss* (SNHL) with high frequency for the first time and gradually affects lower frequency.[3,4] Ototoxicity might be without any clinical manifestations on weeks, months, or years after stop or finish the therapy.[5] The hearing damage can be tested using several tools like pure tone audiometry and *otoacoustic emission* (OAE) especially to evaluated the damage of cochlear outer hair cell function.[2]

Peloquin *et al,* described the use of kanamycin given both daily and three times a week. They found that the size or frequency of dosage did not affect toxicity. MDR TB patients experience hearing dysfunction after 5 weeks and weeks.[6]Meanwhile, Sharma *et al*., reported only 18 out of 100 MDR-TB patients who received kanamycin after 6 weeks[7]. Pure tone audiometry examination showed that most of patient are having hearing loss on

≥ 2,000 Hz frequency with a hearing threshold of ≥ 20 decibels (dB).[6] The ototoxicity of TB MDR patients begin affecting high frequency and followed by lower frequncy in the end of second week.[8]

The aimed of this study to identify the occurrence of cochlear dysfunction after 4 weeks on MDR-TB patients using DPOAE *baseline* and pure tone audiometry.

Material and Method

This was an observational analytical longitudinal using pre and post test approach without controldesign and conducted at the in the MDR-TB outpatient clinic at Dr Soetomo Hospital Surabayafrom July 2018 until October 2018 which had been ethically legalized before. **Participants:** Subjects were 15 MDR TB patients that received 750 mg Kanamycin injection (i.m) every day for 4 weeks and the age of patients between 17 to 60 years old and not having symptoms that can be lead to hearing dysfunction (acute airway infection, allergic rhinitis, nasal polyps), working in noisy environments, pure tone audiometry results in conduction type or mixed type abnormalities, consuming ototoxic drugs and receiving streptomycin injections (Oral Anti Tuberculosis category 2).

Intervention: Subjects that were received Kanamycin injection after 4 weeks examination hearing DPOAE test with specific frequency (1000 Hz, 2000 Hz, 4000 Hz, 6000 Hz, 8000 Hz and 10000 Hz) using *Audx Pro* with overall criteria 4/6 *pass* and pure tone audiometry with specific frequency (250 Hz, 500 Hz, 1000 Hz, 2000 Hz, 4000 Hz, 6000 Hz and 8000 Hz). **Outcome:** DPOAE baseline and pure tone audiometry examination were performed to all subject which 15 ears were taken. This study was determined using the Mc Nemar test and Wilcoxon signed rank test with the level of significancy 5% (p=0.05).

Findings: This study selected 15 MDR-TB patients who received Kanamycin injection for 4 weeks after which audiometry and DPOAE examinations were performed to see hearing dysfunction due to Kanamycin injection in MDR-TB patients. In the DPOAE examination only 10,000Hz frequency can detect changes in the patient's hearing impairment but the Audiometry cannot.

Analysis data of DPOAE Test:

Table 1. The distribution and statistic analysis of DPOAE overall frequencies

DPOAE Result	Baseline	After Kanamycin Injection	p
Pass	15 (100%)	11 (73.3%)	0,12
Refer	0 (0%)	4 (26.67%)	
Total	**15 (100%)**	**15 (100%)**	

Based on the table 1, all of patients did not experience hearing impairment before Kanamycin injection treatment but after Kanamycin injection 4 weeks there were 4 patients who had hearing loss with using DPOAE. From the results of the MC Nemar test p = 0.12 which means there is no significant change in DPOAE as screening hearing in patients who experience hearing loss after Kanamycin injection for 4 weeks.

Table 2. The distribution and Statistical analysis of DPOAE each frequency.

Frequency (Hz)	Baseline			After kanamycin injection			P
	Pass	Refer	Total	Pass	Refer	Total	
1000	13 (86.6%)	2 (13.3%)	15	12 (80%)	3 (20%)	15	1.00
2000	14 (93.3%)	1 (6.6%)	15	14 (93.6%)	1 (6.6%)	15	1.00
4000	15 (100%)	0 (0%)	15	12 (80%)	3 (20%)	15	0.25
6000	12 (80%)	3 (20%)	15	9 (60%)	6 (40%)	15	0.37
8000	13 (86.6%)	2 (13.3%)	15	9 (60%)	6 (40%)	15	0.21
10000	14 (93.3%)	1 (6.6%)	15	5 (33.3%)	10 (66.6%)	15	0.002*

Based on the table above showsthat DPOAE with a frequency of 10,000Hz can identify hearing impairment in MDR-TB patients after Kanamycin injection for 4 weeks. Only 1 patient (6.6%) was previously detected as having problems *Refer*, but after therapy, DPOAE detected 10 patients (66.6%). The results of the McNemar test obtained p = 0.002 which means there is a change in the number of patients who experience hearing impairment after Kanamycin injection treatment using DPOAE.

Analysis data of Audiometry test:

Table 3. The distribution and statistic analysis of Audiometry each frequencies

Frequency (Hz)	Baseline			After kanamycin injection			p
	Normal	Hearing loss	Total	Normal	Hearing loss	Total	
250	15 (100%)	0 (0%)	15	15 (100%)	0 (0%)	15	1.00
500	15 (100%)	0 (0%)	15	15 (100%)	0 (0%)	15	1.00
1000	15 (100%)	0 (0%)	15	15 (100%)	0 (0%)	15	1.00
2000	15 (100%)	0 (0%)	15	15 (100%)	0 (0%)	15	1.00
4000	15 (100%)	0 (0%)	15	15 (100%)	0 (0%)	15	1.00
6000	15 (100%)	0 (0%)	15	14 (93.3%)	1 (6.3%)	15	0.317
8000	15 (100%)	0 (0%)	15	15 (100%)	0 (0%)	15	1.00

From table 3. it was found that all subjects baseline none of the patients were detected as having hearing impairment using audiometry at all frequencies. After Kanamycin injection for 4 weeks, only 6000Hz frequency can detect as many as 1 patient (6.3%) who have hearing impairment but from statistic result p=0,3017 that means there's no significant change in audiometry as hearing screening in patients with hearing impairment.

Table 4. The distribution mean Audiometry result each frequency

Frequency (Hz)	Baseline		After kanamycin injection	
	Mean	Total	Mean	Total
250	24.66	15	24.66	15
500	23.00	15	23.00	15
1000	23.00	15	23.00	15
2000	20.66	15	20.66	15
4000	25.00	15	25.00	15
6000	28.66	15	29.00	15
8000	23.33	15	23.33	15

From the table 4. an average Intensity of 28.6 dB can be heard with a frequency of 6000Hz from baseline using audiometry and after injection of Kanamycin 4 weeks, the average intensity is 29 dB. 26-40dB is categorized as mild deaf.

Discussion

The gender distribution of MDR TB patients who received kanamycin injections in this study hearing impairment occur more in male patient as many as 8 patient (53.3%) than female patient as many as 7 patient (46.6%). Gender can correlated with cochlear dysfunction or hearing impairment found by Kavalieratos (2012) and Rakhmawati (2015). Therefore it can be concluded that cochlear function disorders associated with hearing impairment in MDR TB patients is not influenced by gender.The WHO study in 2015 reports that the prevalence of pulmonary TB in male was 1.7 times than female. Manbeing more active and have contact with other frequently than woman. Many woman are often late and less interested in visiting health care centers than men, according to research conducted by Nakagawa.[8-10]

The age distribution of MDR TB patients who received kanamycin injections in this study was mostly in the age group 26 to 35 years as many as 5 patients, and age group 36-45 years as many as 5 patients. The results of this study in line with the research conducted by Magdalena, MDR TB patients age were less than 50 years with 65 people (80.2%). Productive age is quite dangerous to the media of transmission because they

have high mobility, easy to interact with other people, and allow to spread their disease to other people and the environment around the place of residence.[8,9]

Tinnitus was a symptommostly occurs in research subjects after injection of Kanamycin 4 weeks. DPOAE amplitude in patients with Tinnitus symptom showed a slight different. Cochlear function disorder that leads into tinnitus symptoms are characterized by a decrease in DPOAE amplitude at high frequencies above 4,000 Hz. Gouveris (2005) reported patients with tinnitus showed an increase in DPOAE amplitude at high frequencies of 4,000 Hz and 6,000 Hz and decreased amplitude at lower frequencies (1,650-2,400 Hz).[11]

The subjects of this study have the same dose injection in 15 MDR TB patients. They all received kanamycin injection of 750 mg. The duration and dose of kanamycin injection increased the risk of hearing impairment significantly. The dose and duration of therapy play an important role in hearing loss, as well as the cumulative total dose is associated with decreased hearing.[8, 12,13]

DPOAE is believed to be very useful in monitoring specific ototoxic effects on cochlear dysfunction and other effects especially on outer hair cells. DPOAE examination basically describes the motility activity of outer hair cells that show its function.[14] The examination results show that DPOAE detects as many patients who were previously detected as having disorders *Refer*only 1 patient after DPOAE therapy detected 10 patients who referred at 10,000Hz frequency.The results of the DPOAE on other study in 2016, from 52 MDR TB patients who received kanamycin injections for 4 weeks in the Kwazulu hospital, South Africa was found that 29 right ears and 30 left ears *pass* at baseline and 12 right ears and 14 left ears became *refer* after kanamycin injection.[15]

Examination using DPOAE with a frequency of 10,000Hz detected hearing impairment in MDR-TB patients after receiving a 4-week Kanamycin injection. The results of the statistical test found $p = 0.002$ ($p < 0.05$) which means that there are significant changes in patients who experience hearing loss after receiving therapybut was not significant at frequencies of 1000 Hz, 2000 Hz, 4000 Hz, 6000 Hz and 8000 Hz (table 3). Related with the result of this study was found the significant difference on DPOAE examination at frequency of 10,000Hz in high frequency as early detection. Hearing loss in those treated with aminoglycosides and polypeptides usually starts with high-frequency loss first[16]

From the Audiometry examination only 6000Hz frequency can detect as many as 1 patient (6.3%) who has hearing loss (table 6). The average Intensity that can be heard is 28.6 dBfrom baseline data and 29 dB after getting a 4-week Kanamycin injection. From the statistical results obtained $p = 0.317$ which means there are no significant specific changes in audiometry as hearing screening in patients with hearing imparment. However other frequency is not significant such as 250Hz, 500Hz, 1000Hz, 2000Hz, 4000Hz and 8000Hz.

The previous study reported that 14 people (42.4%) had normal hearing based on baseline audiometry. Meanwhile, audiometry on treatment found that only 3 people (9.1%) had normal hearing, most of them (90.9%) had hearing impairment. Mostly the hearing threshold shift at high frequencies, 6000 Hz and 8000 Hzand administration of kanamycin injection for 2 months or more was considered to have risk for ototoxicity.[17]The reason why audiometry is not maximally used as a screening for hearing loss is because the injection of Kanamycin for only 4 weeks has not given the ototoxic effect of kanamycin. The effect of cochlear toxicity usually occurs first at high frequencies which then extend towards a lower frequency depending on the length of exposure and dose given.[17] Another reason is that Audiometryc examination is only performed at the beginning of the baseline and after getting a 4-week Kanamycin injection. Audiological monitoring for ototoxicity recommends an audiometry evaluation one to two times a week[18]

Early exposure of ototoxic drugs can usually affect the basal cochlea. Further exposure causes the spread of damage towards the apex. Therefore, cochlear toxicity initially affects high frequencies and then extends to lower frequencies. Cochlear damage that occurs in outer hair cells leads to high frequency hearing loss and affects the otoacoustic emission process.[18, 19]

Conclusion

This study concludes that cochlear dysfunction occurs at a specific frequency of 10,000 Hz after 4 weeks Kanamycin injection, but not in overall frequency while in audiometry it cannot detect. Auditory evaluation at 4 weeks is considered not able to detect hearing impairment due to ototoxic drug MDR-TB. The useof ultra-high frequencies is recommended and may also use combination with OAE.

Conflict of Interest: There was no conflict of interest in this study.

Ethical Clearance: This study was received ethical approval from the Health Research Ethics Committee Dr. Soetomo Hospital Surabaya.

Assessment of Coronary Heart Disease Risk among Diabetes Mellitus Survivor in Community Health Center Purwosari Indonesia

Okti Sri Purwanti[1], Ahmad Faris Muntaha[2], Agus Sudaryanto[3]

[1]Department Medical and Surgical, [2]Department Community and Family Nursing, [3]Universitas Muhammadiyah Surakarta, Ahmad Yani Street, Pabelan, Kartasura, Surakarta, Central Java Province, Indonesia

Abstract

Diabetes mellitus if not appropriately managed will cause vascular complications such as coronary heart disease. The rate of coronary heart disease is very high, ranging from 45-70% presently. The symptoms of coronary heart disease in diabetes mellitus people can be seen clearly and also can not be seen until finally people suddenly die. According to the American Heart Association (AHA) approximately 65% of Diabetes Mellitus people die because of heart disease and stroke. The purpose of this study is to determine the description of coronary heart disease risk on diabetes mellitus people in Puskesmas Purwosari. This research is quantitative research. The population of this study was 480 Diabetes Mellitus survivor in Community Health Center Purwosari from January to August 2017. The Samples are 83 diabetes mellitus people who determined using accidental sampling technique. The data collection using an interview, medical record, and body mass index measurements then analyzed using descriptive analysis. The conclusion of this study is the characteristics diabetes mellitus people in Community Health Center Purwosari Surakarta were having a history of diabetes mellitus 1-10 years. The risk of coronary heart disease risk on Diabetes Mellitus survivors in Community Health Center Purwosari Surakarta was mostly high. Diabetes mellitus survivor should always improve the healthy lifestyle and routine to check their health up in health facilities.

Keywords: *Risk of coronary heart disease, diabetes mellitus, smoking, body mass index, complication.*

Introduction

Diabetes Mellitus is a metabolic disease characterized by hyperglycemia caused by interference with insulin secretion, reduced trauma to insulin deficiency, or both. They are for Type of Diabetes Mellitus (DM), namely type 1 Diabetes or absolute insulin deficiency, type 2 Diabetes or relative insulin deficiency, other specific Diabetes and Gestational Diabetes[1]. Type I Diabetes and Type 2 Diabetes are the two primary type of Diabetes[1-4]. The prevalence of Diabetes is high, making global burden. The incidence is rising due to the change of sociodemographic factor[4-6]. The number of Diabetes survivor in Indonesia was 10.02 million in 2015, with another 5.29 million undiagnosed[7]. Another data, Indonesia is the top 5th country, after India, China, the United States, and Pakistan with the amount most diabetics in the world, the number of the prevalence of people with diabetes in Indonesia is 9.1 million people.[8]

Poorly managed diabetes mellitus results in vascular complications make macrovascular complications such as coronary heart disease, peripheral vascular disease and stroke, and microvascular conditions such as retinopathy, nephropathy, and neuropathy[9]. Coronary heart disease is a complication that often occurs and tends not to be realized by people with diabetes mellitus.

Coronary Heart Disease (CHD) is a heart disease caused by narrowing of the coronary arteries due to the process of atherosclerosis or spasm or a combination of both. The mechanism of coronary heart disease in diabetes mellitus is complicated and the risk of atherosclerosis has influenced by many factors including hypertension, hyperglycemia, total cholesterol levels, low-density lipoprotein (LDL) cholesterol, high-density lipoprotein cholesterol levels, triglyceride levels, smoking, lack of physical exercise, male sex, aging, family history, and obesity[10]. Coronary heart disease is the primary cause of death in Diabetes survivor[11].

The research aims to explore the results of coronary heart disease risk among Diabetes survivor.

Method

This research is a quantitative research with a descriptive approach. The study population was Diabetes survivor in Community Health Center Purwosari Surakarta from January to August 2017 as many as 480 people. The study sample was 83 patients, determined using accidental sampling technique. Research data collection used interviews, medical records, and body mass index measurements.

The method of collecting data was by interviews about the characteristic of respondents, smoking history, and physical exercise activities. We made history of blood pressure measurement in the last three months from medical records data of Diabetes survivor. Furthermore, body mass index score was calculated using the calculation of patients' height and weight for each Diabetes survivor. For the grouping of coronary heart disease risk, we used the Jakarta Cardiovascular Score questionnaire. Jakarta Cardiovascular Score (a modification of Framingham score) has tested from previous research. According to the results, the Jakarta cardiovascular score was simple and easy to use[12, 13]. The function of Jakarta Cardiovascular score as a tool for assessing risk for coronary heart disease among Diabetes survivor. Risk factors measurement in the Jakarta Cardiovascular Score in this study were age, gender, history of blood pressure, body mass index, smoking history, history of diabetes mellitus and physical activity.

Results

Characteristics of respondents, results from histpry taking assessment and body mass index calculation: As many as 83 Diabetes survivors were included in this study. Table 1 shows the personal, health history, and body mass index measurement of Diabetes survivor of these respondents. Most respondents were female (54.21%), live with diabetes for period 1-10 years (87.95%), an age of 50-64 (67.47%) and obese (68.68%). Furthermore, the results from history taking assessment revealed, most of the respondents were a non smoker (80.72%), have a history of Hypertension (59.05%) and have moderate activities (37.35%).

Table 1. Characteristic, health history and body mass index measurement of Diabetes survivor in Purwosari Health Center Surakarta

Characteristics	Frequency	Percentage (%)
Gender		
a. Female	45	54.21
b. Male	38	45.79
Age		
a. 25-49	27	32.53
b. 50-64	56	67.47
Duration of sick (Diabetes Mellitus)		
a. 1 – 10 years	73	87.95
b. 11-20 years	10	12.05
History of Hypertension		
a. Hypertension	49	59.05
b. No Hypertension	34	40.94
History of Smoking		
a. Non-Smoker	67	80.72
b. smoker	16	19.28
Body mass index category		
a. Obesity	57	68.68
b. Fat	15	18.07
c. Normal	11	13.25
Activity		
a. Heavy activity	30	36.15
b. Moderate activities	31	37.35
c. Light activity	15	18.07
d. Very light/Without activity	7	8.43

Risk of coronary heart disease: Based on the history taking assessment and body mass index measurement, we calculated the risk of coronary heart disease. Table 2 shows the categories for the risk of coronary heart disease, namely low risk, medium risk, and high risk using the results from Jakarta Cardiovascular Score. From table 2 we know that most Diabetes survivors have a high risk of coronary heart disease.

Table 2. Risk of Coronary Heart Disease among Diabetes survivor in Purwosari Health Center Surakarta

Risk of Coronary Heart Disease	Frequency	Percentage (%)
Low Risk	13	16
Medium Risk	28	34
High Risk	42	50
Total	83	100

Discussion

Characteristics of Respondents: Based on the results of the study showed that the majority of respondents were female. The number of Diabetic female survivors usually higher compared with men[14]. Research shows there are differences in the characteristics of diabetes in men and women[15, 16]. Also, most respondent experience Diabetes for less than ten years. A long duration of Diabetes also significantly associated with the quality of life of persons[17]. Besides, the high level of anxiety of illness can result in a decrease in the quality of life for persons with type II diabetes[18]. Meaningfully, the duration of suffering from DM also affects the beliefs of the person which influences the self- management. Sometime, persons suffered ≥ 11 years of DM have good self-efficacy than those who suffer from DM <10 years, and this is because the person has experience in managing his illness and has good coping.

The majority of Diabetes survivor in this study were nonsmoker (80.72%). Smoking gives contribution as the risk factor for coronary heart disease because it causes atherosclerosis[19], mechanisms of inflammation, and endothelial dysfunctions[20], Smoking also affect on sympathetic nerve activity, which in turn increases vascular tone, increases energy expenditure[21]. The nicotine content in cigarettes works like cocaine, makes the brain release the hormones dopamine, serotonin, and endorphins which affect a person's pleasant sensation. That's why many people are addicted and cannot escape this habit. Diabetes survivors may get worse if they continue smoking.

Overview of the risk of coronary heart disease: From this study, the majority of Diabetes survivor have a high risk of coronary heart disease, in line this study, the relative risk of myocardial infarction is 2 to 3 fold increased for people with diabetes compared to nondiabetics[10, 22]. The risk description of coronary heart disease shows that the highest distribution is high risk. Hyperglycemia causes an increased risk of coronary heart disease, glucose levels which increase especially over a long period of time causing accumulation of glycoproteins. Abnormal accumulation of glycoprotein located on the walls of the coronary blood vessels can destroy the structure and function of the arteries causing decreased blood flow to the heart muscle.

In general, all respondents are people with DM who have a risk of coronary heart disease. Some studies show that there is a relationship between DM and coronary heart events. Patients with type 2 DM had a higher risk of developing coronary heart disease than patients without type 2 DM.

Factors that helped increase the risk of CHD in this study were the age of the respondents. The age characteristics of the highest distribution respondents are 50 - 64 years. Aging is a natural thing as well as a factor that increases heart problems involving atherosclerosis and calcification[23].

Characteristic distribution of respondents age shows that the majority of respondents are groups of individuals with a high risk of having CHD, who suggested that the risk of CHD after 40 years is high[24].

Increased risk of coronary heart disease also occurs at the age of 45 years. Furthermore, the main factors at risk for coronary heart disease were hypertension, DM disease, behavior smoking, and family history[25].

Conclusion

The characteristics of most people with diabetes mellitus in the work area of Purwosari Public Health Center Surakarta have a long history of suffering from diabetes mellitus 1 - 10 years. The description of the risk of coronary heart disease in people with diabetes mellitus in the work area of Purwosari Health Center Surakarta is mostly high risk.

Suggestion: People with Diabetes Mellitus should improve their healthy lifestyle, including always controlling their health levels, for example controlling blood sugar levels and blood pressure, then doing activities that can reduce the risk of coronary heart disease such as exercising regularly.

Conflict of Interest: No declared.

Source of Funding: Self-funding from the research team.

Ethical Clearance: The ethical clearance of this research was accepted by School Nursing Universitas Muhammadiyah Surakarta

Effectiveness of Providing Self-Management Education to Deal With Emesis Gravidarum on Decreasing Nausea Vomiting Pregnancy (NVP) at Private Practice Midwives Puskesmas IV Denpasar Selatan Work Area

Ni Nyoman Deni Witari[1], Ni Made Dewianti[1]

[1]Diploma III Kebidanan, Politeknik Kesehatan Kartini Bali, Jalan Piranha No. 2 Pegok Sesetan Denpasar Bali, Indonesia

Abstract

Data shows that 50-90% of pregnant women experience nausea in the first trimester. Excessive gravida emesis will gain weight into hyperemesis gravidarum and can disrupt the mother's metabolism including dehydration, weight loss, alkalosis, and hypokalemia. Non-pharmacological therapy is a type of complementary therapy that can be used as an intervention to treat nausea including hypnotherapy, acupressure, acupuncture, relaxation, and therapy. Self-management is regulating personal activities to live a better and healthier life. Emesis gravidarum self-management education adopts the concept of Corbin and Straus in Kate and Halsted (2003), which is outlined in a module that aims to enable pregnant women to educate themselves to be able to regulate their own lives, set goals, and provide self-reinforcement in dealing with nausea, vomiting experienced. The purpose of this study was to determine the effectiveness of providing self-management education to deal with emesis gravidarum on decreasing Nausea Vomiting Pregnancy (NVP). This is an analytical study with a pre-experimental research design (quasi-experiment design) with one group pre-test-post test design. This study was conducted at Private Practice Midwives (hereafter: PMB) Puskesmas IV Denpasar Selatan Work Area. The population of this study was pregnant women who came to PMB in the work area of Puskesmas IV Denpasar Selatan. The sample of this study was pregnant women who experienced nausea and vomiting in the first trimester who met the inclusion criteria where the sampling technique in this study was accidental sampling. Analysis of the data in this study was conducted t-test to test the differences between the two pre and post-test distributions before self-management education was given and after the providing of self-management education was faced with emesis gravidarum. The results of the study showed that the average value of PUQE 24 hours before the self-management module was given was 9.5, the standard deviation value was 2.591, the minimum and maximum values were 6.0-14.0. The average value of PUQE-24 hours after the self-management module was given was 7.1, the standard deviation value was 2,273 with minimum and maximum values of 3.0-12.0. The conclusion of giving self-management module is effective to decrease nausea and vomiting in first-trimester pregnant women.

Keywords: *First-trimester pregnant women, emesis gravidarum, self-management education.*

Introduction

Pregnancy is the growth and development of the fetus in intra-uteri starting from conception and ending until the beginning of labor. The process of pregnancy causes changes in the body of the mother. These changes are largely due to the influence of hormones, for instance the hormones estrogen and progesterone. Increased hormones estrogen and progesterone in the body cause

physiological discomfort in the mother such as nausea, vomiting, fatigue, and enlargement of the breast. The process of pregnancy causes various changes in the entire body system such as cardiovascular, respiratory and gastrointestinal systems influenced by the pregnancy hormone HCG (Chorionic Gonadotropin Hormone)[1].

Physiological adaptations to the gastrointestinal system cause discomfort in the form of nausea and vomiting. Pregnant women who have this will experience interference with their activities. Psychologically, nausea and vomiting during pregnancy affect more than 80% of pregnant women and have a significant effect on the quality of life[2].

Nausea and vomiting are one of the earliest, most common and most stressful symptoms in early pregnancy. About 50 - 90% of pregnant women experience nausea in the first trimester and about 25% of pregnant women experience nausea and vomiting problems. Nausea and vomiting most often occur in young pregnancies from the 6th week after the first day of the last menstruation. 50% of pregnant women who experience nausea and vomiting can overcome at the age of 14 weeks and 90% can overcome until the age of 22 weeks[3]. Nausea and vomiting during pregnancy, known as morning sickness, occurs in the first trimester of pregnancy and some continue until the second trimester. The frequency of occurrence of morning sickness is not only in the morning but can be daytime even at night[4].

According to the Lacase report of 367 pregnant women, 78.47% experienced nausea and vomiting that occurred in the first trimester; 52.2% experienced mild nausea and vomiting, 43.3% experienced moderate nausea and vomiting and 2.5% experience severe nausea and vomiting. In the second trimester, most pregnant women still experienced nausea and vomiting by 40% with the following details 63.3% experienced mild nausea and vomiting, 35.9% experienced moderate nausea and vomiting, 0.8% experienced severe nausea and vomiting.

Excessive emesis of gravidarum will become hyperemesis gravidarum which can disrupt the mother's metabolism, dehydration, weight loss, alkalosis, and hypokalemia. Impact on the fetus such as abortion, LBW, premature birth, and malformation in newborns[5].

Most pregnant women who experience nausea and vomiting in the community use pharmacological therapy. Some just left alone. The use of pharmacology for pregnant women needs to be considered because there are changes in pharmacokinetics and pharmacodynamics of drugs during pregnancy[6]. Non - pharmacological therapy, type of complementary therapy that can be used to treat nausea such as hypnotherapy, acupressure, acupuncture, relaxation, and therapy.

Nausea and vomiting during pregnancy are mild disorders; this condition can be overcome by self-control. In addition to self-control, nausea and vomiting can also be overcome by creating behaviors to reduce complaints[7]. Handling of nausea and vomiting in pregnant women needs to be done to improve maternal health status, one of them is by creating behaviors to reduce complaints. Creating behavior for a healthy life according to the patient's condition is part of self-management[8].

Emesis gravidarum self-management education adopts the concept of Corbin and Straus in the 7th, which is outlined in the form of a module that aims to enable pregnant women to educate themselves to be able to regulate their own lives, set goals and provide self-reinforcement in dealing with nausea and vomiting experienced

Material and Method

This study was held at PMB Puskesmas IV Denpasar Selatan's Work Area; six PMB in total. The design used in this study was a quasi-experimental with one group pretest-posttest design. The type of data collected is secondary data, obtained from the visitation register of pregnant women at PMB, Puskesmas profiles and primary data obtained directly from interviews with respondents about the characteristics, knowledge, and data on the level of nausea and vomiting. The instrument used was a questionnaire to determine the characteristics of respondents, and a questionnaire (PUQE-24 hours) to measure the severity of nausea and vomiting. The pregnant women as the respondents ware provided self-management modules and standard operating procedures to deal with emesis gravidarum. The population in this study was all pregnant women who had antenatal visits in PMB Puskesmas IV Denpasar Selatan work area in 2018. The sample of this study was pregnant women who experience nausea and vomiting who visited and met the study inclusion criteria. Criteria for inclusion; first-trimester pregnant women who experience nausea and vomiting are willing to be respondents and have not experienced complications in pregnancy. Exclusion

criteria are first-trimester pregnant women who experienced complications, hyperemesis gravidarum, and gastritis. The sampling technique used was accidental sampling, by taking respondents who happened to be present or at the time of the study. This was conducted for four months in BPM Region Puskesmas IV Denpasar Selatan. Severity measurement of nausea and vomiting on pregnant women with a questionnaire (PUQE-24 hours) was carried out twice; first, before being given self-management education (pretest) and second, two weeks after giving self-management education (posttest) modules. Data analysis used Paired T-test with a 95% confidence interval and a significance level of P <0.05.

Findings: The results of the analysis in this study are as follows:

Table 1: Frequency Distribution of Nausea and Vomiting before Providing the Self-Management Module at PMB Puskesmas IV Denpasar Selatan working area in 2019

No.	Nausea and vomiting	Frequency (f)	Percentage (%)
1	No symptoms	-	-
2.	Mild	10	25
3.	Moderate	22	55
4	Severe	8	20
	Total	**40**	**100**

Source: Primary Data Research in 2019

Based on table 1 shows that from 40 respondents before providing self-management module; 10 respondents (25%) showed mild symptoms, and 8 respondents (20%) showed severe symptoms, almost half of the respondents, 22 people (55%) showed moderate symptoms.

Table 2: Frequency Distribution of Nausea and Vomiting after Providing the Self-Management Module at PMB Puskesmas IV Denpasar Selatan work area in 2019

No.	Nausea and vomiting	Frequency (f)	Percentage (%)
1	No symptoms	3	7.5
2.	Mild	16	40
3.	Moderate	21	52.5
4	Severe	-	-
	Total	**40**	**100**

Source: Primary Data Research in 2019

Table 2 shows that from 40 respondents after providing self-management module; 3 respondents (7,5%) showed no symptoms of nausea and vomiting, almost half of respondent; 16 people (40%) showed mild symptoms, and more than half respondents; 21 people (52,5%) showed moderate symptoms, and no respondent showed severe symptoms.

Table 3: Pregnancy Unique Quantification of Emesis and Nausea (PUQE)-24 hours Score Before and After Providing Self-Management Module at PMB Puskesmas IV Denpasar Selatan Work Area in 2019

Variable	Mean	SD	Minimum	Maximum
Pretest	9,5	2,591	6,0	14,0
Posttest	7,1	2,273	3,0	12,0

Based on table 3 the mean of PUQE-24 hours before providing self-management module is 9.5, SD is 2,591, minimum and maximum are 6,0-14,0. Mean of PUQE-24 hour after providing self-management module is 7,1, SD is 2,273, minimum and maximum 3,0-12,0

Wilcoxon test was used due to not eligible data for parametric test:

Table 4: Wilcoxon Signed Ranks Test

Ranks				
		N	Mean Rank	Sum of Ranks
Post_ Modul-Pre_ Modul	Negative Ranks	31[a]	16.00	496.00
	Positive Ranks	0[b]	.00	.00
	Ties	9[c]		
	Total	40		

a. Post_Modul < Pre_Modul, b. Post_Modul > Pre_Modul, c. Post_Modul = Pre_Modul

Test Statistics	
	Post_Modul-Pre_Modul
Z	-4.886[b]
Asymp. Sig. (2-tailed)	.000

a. Wilcoxon Signed Ranks Test, b. Based on positive ranks.

Based on table 4 shows that *Asymp. Sig.(2-tailed)* with error rate 0.5%;p-value (0.000), (p < 0.05) So the Ho is declined and Ha is accepted. This means there is effectiveness in providing self-management module to decrease nausea and vomiting.

Discussion

The results of this study illustrate the tendency for a decrease in PUQE-24 scores from before and

after providing the module. The mean PUQE-24 score decreased by 2 points, 9.5 with a standard deviation of 2.591 before treatment, and 7.1 with a standard deviation of 2.273 after treatment. The results of statistical analysis with the Wilcoxon test showed the number of 31 respondents (76%) had decreased PUQE-24 scores with p-value =0,000. This proves that there is a significant effect on providing self-management modules on dealing with morning sickness. Kohen et al. (2005) categorize the severity of nausea and vomiting in pregnancy into 3 categories. The score of 0-3 has no symptoms, the score of 4-6 is mild, the score is 7-12 moderate, and the score is ≥ 13 severe categories.

Based on the characteristics of the frequency of morning sickness, before treatment there were 25% of respondents experiencing mild nausea and vomiting, 55% experienced moderate nausea and vomiting, and 20% of respondents who experienced severe nausea and vomiting. After treatment, respondents who did not experience nausea and vomiting (7.5%), those who experienced mild nausea and vomiting became 40%, and those who experienced moderate vomiting nausea 52.5%. Wilcoxon statistical test results showed a significant difference between PUQE scores before giving morning sickness self-management modules and after administration. This shows that there is an effect of morning sickness self-management module on the decrease in the frequency of nausea and vomiting in pregnant women. Value p = 0,000 so that it can be concluded that this self-management module is effective in dealing with morning sickness in pregnant women.

The use of morning sickness self-management module to decrease the frequency of nausea and vomiting in pregnant women was only investigated by Latifah L (2014) where the results of the study showed that differences in the pretest and posttest values were analyzed using the Wilcoxon test, so that a significance value : 0,000 (p <0.05) was obtained[9]. There is a difference in the PUQE score before and after giving the morning sickness self-management module. The morning sickness self-management module is effective in dealing with morning sickness in pregnant women. The previous study did not measure respondents' prior knowledge and used a minimum of 30 respondents.

The self-management module has been applied to several independent treatments for cardiovascular disease and schizophrenia. Self-management treatment method have been investigated for their effects on chronic diseases such as cardiovascular disease, diabetes mellitus, chronic obstructive pulmonary disease, and schizophrenia. Diabetic patients who follow the self-management program are shown to have significantly improved their clinical conditions (decreased blood sugar), can achieve self-care targets, and are satisfied with health care[9]. Research on the chronic obstructive pulmonary disease (PPOM) has also shown equally positive results. Patients who participated in the self management program experienced a decrease in the severity of the disease by 39.8%, a decrease in the number of hospital visits by 57.1%, a decrease in the number of visits to the doctor incidentally by 58.9%, and a decrease in visits to the emergency department by 41%[10].

Self-management is one of the most common terms used in health promotion and patient health education. Self-management is very useful for patients, especially patients with chronic diseases where only patients who can be responsible for the treatment of the disease daily during his illness. Patients with chronic diseases besides experiencing physical disorders, usually also experience psychological disorders and well-being. Therefore, self-management programs often focus on improving self-perspective and patient welfare[7].

Morning sickness self-management module contains several interventions to overcome nausea and vomiting during pregnancy, including the consumption of ginger drinks, food management, gradual mobilization during the morning, acupressure, and relaxation. Several studies have proven that ginger products which can be in the form of drinks or extracts are proven to overcome nausea and vomiting during pregnancy[12]. McKinney et al. (2009) mentioned that eating arrangements by eating small but frequent portions, avoiding oily foods, consuming more protein compared to carbohydrates, and separating eating and drinking can reduce the incidence of nausea and vomiting during pregnancy[11]. Wentorf and Dykes (2001) and Artika (2006), found that acupressure by suppressing the P6 point (Neiguan point) was significant in reducing nausea and vomiting during pregnancy[13]. During the study, there were no respondents who complained about the difficulty in implementing the tasks and recommendations in the morning sickness self-management module.

Conclusion

Providing Self-Management Education to Deal

Emesis Gravidarum Effective on Decreasing Nausea Vomiting Pregnancy (NVP) at PMB Puskesmas IV Denpasar Selatan Work Area.

The Effectiveness of Progressive Muscle Relaxation with Benson Relaxation on the Sleep Quality in Hemodialysis Patients

Theresia Uli Porman Purba[1], Ridha Dharmajaya[2], Cholina Trisa Siregar[3]

[1]Master Program, Faculty of Nursing, [2]Lecturer, Faculty of Medicine, [3]Lecturer, Faculty of Nursing, Universitas Sumatera Utara, Medan, Indonesia

Abstract

Objects: to identify effectiveness of progressive muscle with benson relaxations on the sleep quality in hemodialysis patients.

Method: the study used a quasi-experimental with comparison of pre and post-tests without control groups. The samples were selected by consecutive sampling technique based on criteria inclusion. The sample size was 48 patients. Sleep quality was measured by applying Pittsburgh Sleep Quality Index. Data analysis used Wilcoxon signed rank and Mann-Whitney U test.

Results: The result showed that there was effect of muscle relaxation with benson relaxation on the sleep quality in hemodialysis patients with p-value 0.00 ($p<0.005$).

Conclusion: The intervention of progressive muscle relaxation and benson relaxation have same effectiveness to improve the sleep quality of the hemodialysis patients with sleep disorders so that nurse should apply this intervention to improve the sleep quality patients with hemodialysis.

Keywords: *Progressive Muscle Relaxation, Benson Relaxation, Sleep Quality, Hemodialysis.*

Introduction

Hemodialysis is one of the method of treatment of end-stage kidney failure that is considered to be able to save lives [(1)]. This therapy is also a stressor for patients because it requires some lifestyle restrictions and modifications that negatively impact physical and psychological well-being[(2)]. Hemodialysis patients are considered to be very vulnerable to psychological problems due to chronic stress associated with client dependence on hemodialysis machines, duration of dialysis therapy, restrictions on physical activity, changes in body image, sexual dysfunction, as well as fluid and food restrictions[(3)].

Mollahadi, Tayyebi and Daneshmandi[(4)] said psychological problems that often occur in hemodialysis patients, namely anxiety, depression, and stress. This study is in line with research conducted by Wang and Che[(5)] stated that hemodialysis is a therapy that can affect a patient's psychological status. Psychological problems are a major factor contributing to sleep disorders in patients undergoing hemodialysis [(6)].

Sleep disturbance is the most frequently reported complication among hemodialysis patients with a prevalence of 80% [(7)]. Sleep disturbance is an abnormality in the normal sleep-wake cycle, causing distorted and fragmented sleep patterns [(8)].

Sleep disorders during long periods refer to poor sleep quality can result in physical and psychological

complications in patients undergoing hemodialysis[9]. Physical complications related to sleep disorders such as daytime drowsiness, lack of energy, psychomotor dysfunction, and can lead to decreased patient appearance such as cognitive and memory dysfunction [10]. Sleep disorders can also result in impaired immune function, obesity, diabetes, hypertension, stroke and heart disease[11].

Non-pharmacological management that can be used to improve the sleep quality of hemodialysis patients is progressive muscle relaxation and benson relaxation. Progressive muscle relaxation is a therapy that aims to provide emotional balance and peace of mind by focusing on muscle activity by identifying tense muscles and then reducing tension by using relaxation techniques to achieve a relaxation response (relax) [12].

The study by Rambod, Pourali-Mohammadi, Pasyar, Rafii and Sharifstated that Benson's relaxation has a significant effect on daytime sleep disorders in hemodialysis patients [13]. Supporting related study by Masry, Aldoushy and Abd showed that Benson's relaxation techniques have a positive effect in reducing postoperative pain and improving sleep quality among adults and elderly patients undergoing joint replacement surgery[14].

Based on the description above, researchers are interested in conducting research on "The Effectiveness of Progressive Muscle Relaxation with Benson Relaxation on the Sleep Quality of Hemodialysis Patients in H. Adam Malik General Hospital Medan".

Method

This research was a quasi-experimental research with a comparative approach. This research was carried out in the hemodialysis unit in July-September 2018. Sampling using consecutive sampling. The sample size in this study was determined using the Power Analysis table with power (1-β)=.90, effect size (γ)=.73 and α=.05. Anticipating the possibility of selected subjects or samples dropping out, it is necessary to increase the number of samples by 10% so that the sample size remains fulfilled so that the sample in each intervention becomes 48 people.

This research used The Pittsburgh Sleep Quality Index (PSQI) instrument. PSQI is the gold standard for the assessment of subjective sleep quality[15]. PSQI is a questionnaire that assesses sleep quality during a month interval. This instrument is to identify "good" and "bad" sleep quality by measuring sleep based on 7 sleep components including sleep duration, sleep disturbance, sleep latency, sleep dysfunction during the day, sleep efficiency, sleep quality, and use of sleeping pills. The score on the subjective sleep quality assessment is divided into 4 criteria: very good, good, bad, and very bad. The assessment is done by giving a score of 0-3 with a range of scores of 0 for very good and a score of 3 for very bad. Then the total score for the seventh. This component produces a global score which has a range of scores from 0 to 21. The overall PSQI score which shows ≤5 means that the respondent has good sleep quality and if it shows a number> 5 means poor sleep quality [16].

The bivariate analysis used in this study was the Wilcoxon signed ranks test. This test was to see differences in sleep quality before and after relaxation interventions in each intervention group, while the Mann-Withney U test is used to see differences in sleep quality between progressive muscle relaxation groups and Benson relaxation.

Results

Table 1: Frequency distribution of demographic characteristics of hemodialysis patients

Variable	Progressive Muscle Relaxation (n=48)		Benson Relaxation (n=48)	
	f	%	F	%
Age				
18-34 years	18	37.50	14	29.20
35-54 years	23	47.90	32	66.70
≥55 years	7	14.60	2	4.20
Gender				
Male	37	77.10	31	64.60
Female	11	22.90	17	35.40

Variable	Progressive Muscle Relaxation (n=48)		Benson Relaxation (n=48)	
	f	%	F	%
Long of Hemodialysis				
< 1 year	20	41.70	18	37.50
1-2 years	18	37.50	19	39.60
> 2 years	10	20.80	11	22.90
Hemodialysis Session				
Morning	32	66.70	30	62.50
Afternoon	16	33.30	18	37.50

Based on table 1, respondents in both intervention groups were more male, age 35-54 years old, long of hemodialysis is in the range <1 year to 1-2 years and morning hemodialysis session schedule.

Table 2: Mean rank difference in sleep quality of hemodialysis patients before and after progressive muscle relaxation and benson relaxation (n = 48)

Variable	Mean rank		Z	p-value
	Pre-test	Post-test		
Progressive Muscle Relaxation Group				
Sleep quality	21.00	,00	-5.59	,00
Benson Relaxation Group				
Sleep quality	22.50	,00	-5.78	,00

Based on table 2, the results of data processing using the Wilcoxon Signed Rank Test showed that there were differences in the sleep quality of hemodialysis patients before and after the intervention of progressive muscle relaxation and benson relaxation as measured by PSQI.

Table 3: differences in the quality of sleep of hemodialysis patients after the intervention between progressive muscle relaxation and benson relaxation groups (n = 48)

Variable	Median (minimum-maximum)	z	p-value
Progressive muscle relaxation group			
Sleep quality	4.00 (3-14)	-1.85	.06
Benson relaxation			
Sleep quality	4.00 (2-14)		

Based on table 3 the results of statistical tests using the Mann-Whitney U Test, obtained p=0.06 (p> 0.05), showed that there was no difference in the quality of sleep of hemodialysis patients after the intervention of progressive muscle relaxation and benson relaxation as measured by PSQI.

Discussions

The results of this study indicate that there was a significant difference between sleep quality before and after progressive muscle relaxation interventions (p=0.00). According to Seyedi Chegeni, Gholami, Azargoon, Hossein, Birjandi and Norollahi progressive muscle relaxation can improve sleep quality in hemodialysis patients, where by contracting and relaxing muscles it can reduce the input and output of motor neurons, i.e. pre-synapse it will reduce proprioceptive reflex control and post-synapse will reduce the control of the ecstrospective reflexes[17]. Proprioceptive and ecsteroseptive reduction will result in decreased motor evoked potential (MEP) which will further reduce the activity of the skeletal-motor system, autonomic nervous system (sympathetic and parasympathetic) and cortical pathways[18].

Activation of the parasympathetic nervous system, also called trophotropic, will manipulate the

hypothalamus by causing a feeling of relaxation and being more physiologically and emotionally comfortable, and can cause feelings of wanting to rest, and physical repair of the body, whereas a decrease in the cortical and hypothalamus can cause a relaxed sensation and calm psychological[19].This relaxed feeling will be transmitted to the hypothalamus so that the hypothalamus produces Corticotropin Releasing Factor (CRF). CRF will stimulate the pituitary gland so that the production of several hormones will increase, such as β-endorphin, encephaline and serotonin. Physiologically, the need for sleep will be fulfilled because of the decreased activity of the Reticular Activating System (RAS) and noreepineprine as a result of decreased activity of the brain stem system. The relaxation response will occur because of the activity of the nuclear nucleus parasympathetic autonomic nervous system [20].

The results of this study indicate that there was a significant difference between sleep quality before and after the benson relaxation intervention (p=0.00). Improving sleep quality can be done by using Benson relaxation. This technique is a combination of deep breath relaxation by involving the beliefs held, where by saying a word or sentence can be the name of God or a series of prayers repeatedly according to each religious beliefs accompanied by an attitude of resignation can produce an optimal relaxation response that is the condition of relaxation is not only physical but also mind. This relaxation response is needed to enter the alpha wave, which is a condition that someone needs to enter the initial sleep phase. The basis of this theory is that in the human nervous system there is a central and autonomic nervous system[13]. The function of the central nervous system is to control the desired movements, while the autonomic nervous system has two opposing functions, namely the sympathetic nerve function which stimulates the work of organs and the parasympathetic nervous system which dampens the work of organs. When humans are in tension or stress, the sympathetic nerves are stimulated so that the workings of the body's organs will increase, whereas when humans do benson relaxation will produce a relaxation response, where the resulting relaxation response will cut off the activation pathway of the sympathetic nervous system and replace it by activating the parasympathetic nerve response resulting in a decrease in the workings of body organs. This condition will accelerate someone entering the alpha wave which is a condition needed by someone to enter the early sleep phase [21].Physiologically when humans enter the relaxation phase, then they enter the alpha wave (7-14 Hz). When the brain enters this wave, the brain will produce endorphin hormones which produce a sense of comfort and calm [22].

Mann-Whitney test results, obtained p=0.06 (p>0.05), so it can be concluded that there is no difference in sleep quality between the progressive muscle relaxation and Benson relaxation groups. This can be understood because based on the theory of both progressive muscle relaxation and benson relaxation can produce trophotropic relaxation responses, where the resulting relaxation response will cut off the activation pathway of the sympathetic nervous system and replace it by activating the parasympathetic nerve response. Activation of the parasympathetic nervous system will manipulate the hypothalamus by causing feelings of wanting to rest and physical repair of the body[19].

Conclusion

Based on the results of this study, it can be concluded that progressive muscle relaxation exercises and Benson relaxation performed twice a day for 4 weeks have the same effectiveness in improving the sleep quality of hemodialysis patients. Progressive muscle relaxation and Benson relaxation can be complementary therapies in hemodialysis patients who experience sleep disturbance problems.

Characteristics of Patients with Diabetic Foot Ulcers and Predictors of Surgical Intervention in Basrah, Southern Iraq

Abdulhussein K. Marzoq[1], Rafid Abduljabbar Mohammed[2], Omran S. Habib[3]

[1]Orthopedic Surgeon, Orthopedicsdepartment, Al Fayha Teaching Hospital, Basrah, [2]General Surgery Lecturer, Department of Surgery, College of Medicine, University of Basrah, General Surgeon, Department of Surgery, Al Fayha Teaching Hospital, Basrah, Iraq, [3]Professor of Epidemiology and Health Care, Department of Community Medicine, College of Medicine, University of Basrah

Abstract

Background: Diabetes mellitus is a diseases of worldwide importance, the incidence and complications of this disease became an increasing problem. In Basrah,southern Iraq, the prevalence of DM is very high . Diabetic foot is a source of significant morbidity and change in quality of life for diabetic patients.

Objectives: To describe the characteristics of sample of patients with diabetic foot ulcer who attended Al Fayha Diabetic Foot Clinic and to evaluate the predictors of surgical intervention needed for treatment of these patients especially for those who are in need for amputation.

Method: A cross sectional descriptive study conducted in Al Fayha Diabetic Foot Clinic, Basrah, Iraq. From January 2018 until July 2019. It included 73 adult patients suffering from diabetic foot ulceration : 29 (39.7%) male patients and 44 (60.3%) female patients.

Results: The mean age was 52.86 years. The study included 71 patients with type 2 diabetes (97.3%) and 2 patients with type 1 diabetes (2.7%).The mean duration of symptoms was approximately one month. More than half of the cases who underwent debridement had wounds of grade 2 (University of Texas Classification) while 88% of cases who underwent amputation had wounds of grade 3. In the group of patients who underwent debridement, 41 cases (85.4%) had moderate infection (IDSA), while for those who underwent amputation, 16 cases (64%) had severe infection and this difference was statistically significant (p value <0.001).

Conclusions: The majority of patients were females (60%),the age group of 50 years and above constitutes more than half of the cases,almost 80% have the disease for more than 10 years,all cases showed evidence of uncontrolled disease. Wound stage (UT Classification) and IDSA severity of wound infection were the predictors for surgical intervention in patients suffering from diabetic foot ulcers in Basrah.

Keywords: *Diabetic foot ulcers, predictors, Basrah, surgical intervention.*

Introduction

Diabetes mellitus (DM) affects around 451 million people worldwide.(1) It continued to be a rising global problem. The incidence of DM is rising and consequently the complications of this disease became an increasing problem. Unfortunately complications end with morbidity and premature death in high proportion of cases. In Basrah, Iraq, the prevalence of DM is very high, about 20% of adult population are affected.(2)

Diabetic foot ulcers (DFUs) are a quite significant sequel affecting around 25% of diabetic patients[3].

DFUs are defined as non-healing or poorly healing full-thickness wound through the dermis below the ankle in individuals with diabetes for more than three months. DFUs are three types: neuropathic, ischaemic and neuro-ischaemic ulcers.[4]

Peripheral neuropathy, ulceration, infection and peripheral vascular disease are the most important causes for ulcer complication and lower limb amputation in diabetic patients.[5,6]

Diabetic foot must be managed by multidisciplinary team.[7] Proper management of diabetic foot infection should be preceded by proper clinical diagnosis, assessment of severity of infection and wound classification, control of blood sugar, debridement, obtaining adequate specimen for culture, adequate selection of antibiotics, proper timing and selection of surgical intervention with adequate wound care.[8]

Surgical debridement is cutting away of all necrotic tissue, infected material from the wound and a surrounding callus until a healthy bleeding edge is reached . The benefit of surgical debridement is the change of infected ulcer into an acute ulcer .[9,10]

Minor amputation, is amputation at the level of the foot without the need for prosthesis for walking while major amputation is amputation above the level of the ankle.[11,12]

Aims of the Study:

1. To describe the characteristics of sample of patients with diabetic foot ulcer who attended Al Fayha Diabetic Foot Clinic.
2. To evaluate the predictors of surgical intervention needed for treatment of these patients especially for those who are in need for amputation, this can aid in planning of treatment.

Patients and Method

Study Design: This is a cross sectional descriptive study conducted in Al Fayha Diabetic Foot Clinic, Basrah, Iraq. From January 2018 until July 2019. It included 73 adult patients suffering from diabetic foot ulceration:29 (39.7%) were male patients and 44 (60.3%) were female patients .A questionnaire form is completed.It included patients name, age, sex, duration of diabetes, duration of symptoms,previous use of antibiotics. Patients were assessed in three levels : the patient as a whole,the involved limb and local examination of the wound.

Local Examination of the Wound:

1. Diabetic foot wound classification according to University of Texas Classification (four grades and four stages).[13]
2. Evaluation of foot vascularity clinically and by the use of hand hold Doppler.
3. Infected diabetic foot ulcers were diagnosed clinically by presence of features of inflammation, infection severity was evaluated according to Infectious Diseases Society of America (IDSA). [14] Surgeons should keep in mind that systemic signs of inflammation (fever and leukocytosis) are not present even with advanced foot infection.[15,16]

Investigations: All patients had been sent for the following investigations :hemoglobin, random blood sugar, Hb A1c, white blood cells count, renal function test and viral markers of hepatitis B, hepatitis C and HIV. HbA1c $\geq$ 9 is considered as an indicator of poor glycemic control.[17]

Management: The patients admitted to the surgical ward of Al Fayha Hospital. Empirical antibiotics started with control of blood sugar . Surgical debridement has been done in the operating theatre and specimen from the wound has been sent to the laboratory for culture and sensitivity .This was followed by wound care. All patients were followed twice weekly for twelve weeks,then monthly for six months.

Exclusion Criteria: Patients who did not come for regular follow up were excluded.

Statistical Analysis: The results were analyzed by the use of Statistical Package for the Social Sciences (SPSS) version 23 . P-value $\leq$ 0.05 was the statistically significant level.chi-squared test and Fissures exact test were used whenever needed.

Results

Demographics of the Studied Patients: Most of the patients were females 44(60.3%) and tended to increase in proportion with advancing age in both sexes. The percentage in males increased from 13.8 to 37.9% and from 2.3 to 29.5% in females. The bulk of patients in females was in the age group 40-49 (40.9%).

The mean age was 52.86 years (standard deviation 9.059) The study included 71 patients with type 2 diabetes (97.3%) and 2 patients with type 1 diabetes (2.7%) (Table 1).

Table 1: Age and sex distribution of the studied patients

Age (Years)	Male No.%	Female No.%	Total No.%
<40	4 13.8	1 2.3	5 6.8
40-49	5 17.2	18 40.9	23 31.5
50-59	9 31.0	12 27.3	21 28.8
60 & above	11 37.9	13 29.5	24 32.9
Total	29 100.0	44 100.0	73 100.0
Sex composition	29 39.7	44 60.3	73 100.0

Characteristics of diabetes: Table 2 shows a number of characteristics of diabetes patients enrolled in the present study. The chronic status is very clearly indicated by the long duration of the disease. Almost 80% have the disease for more than 10 years. In addition cases showed very unsatisfactory control indicated by the high level of random blood sugar (Almost 94.5% have a level 200 mg/dl or more) and the high values of HbA1C (All cases showed evidence of uncontrolled disease).With respect of diabetic foot, it seems that it is a fairly recent pathology as the duration of symptoms and antibiotic use were both recent events. More than half of the patients delayed asking for doctor advice for 30 days or more.

Table 2: Some characteristics related to diabetes

Characteristic	Number	%
A. Duration of diabetes (Years)		
<10	16	21.9
10-19	45	61.6
20-30	12	16.4
B. Status of Hb A1C at the time of study		
Controlled (3.0-6.9)	0	0.0
Uncontrolled (7.0-8.9)	19	26.0
Very poor control (≥9)	54	74.0
C. Random blood sugar (Mg/dl)		
100-199	4	5.5
200-299	23	31.5
300-399	37	50.7
(≥400	9	12.3
D. Duration of symptoms before consultation (Days)		
<10	4	5.5
10-19	23	31.5
20-29	6	8.2
≥ 30	40	54.8
E. Duration of use of antibiotics before consultation (Days)		
None	20	27.4
<10	3	4.1
10-19	34	46.6
≥20	16	21.9
Total	**73**	**100.0**

Predictors of surgical management: Three types of surgical management were done to patients; debridement, minor amputation and major amputation. We attempted to use selected demographic and clinical characteristics to predict which patient needed debridement only and which patient needed amputation.

The mean age of both groups was comparable. Most patients who underwent debridement were females (30 cases), while there was no sex difference for those cases who underwent amputation. The mean duration of diabetes for both groups was approximately 12 years.

The mean duration of symptoms was approximately one month in both groups. Regarding wound grade (UT Classification), more than half of the cases who underwent debridement had wounds of grade 2 while 88% of cases who underwent amputation had wounds of grade 3.

In the group of patients who underwent debridement, 41 cases (85.4%) had moderate infection (IDSA), while for those who underwent amputation, 16 cases (64%) had severe infection and this difference was statistically significant (p value <0.001) (Tables 3).

Table 3: Univariate analysis: Association of type of management and selected variables

Characteristics	Patients undergone debridement only No.%	Patients underwent amputation No.%	Total No.%	P value
Age (Years)	53.2	52.3		0.184
Sex				
Male	18 (37.5%)	11 (44%)	29 (39.7%)	0.385
Female	30 (62.5%)	14 (56%)	44 (60.3%)	
Mean Duration of diabetes (Years)	12.8	12.2		0.92
Mean Duration of symptoms (Days)	35.3	34.2		0.22
Wound Grade (UT Classification)*				
Grade 2	27 (56.3%)	3 (12%)	30 (41.1%)	<0.001
Grade 3	21 (43.8%)	22 (88%)	43 (58.9%)

Total	48 (65.8%)	25 (34.2%)	73 (100%)	

*University of Texas Classification

Multivariate analysis: Logistic regression:

Predictors of Amputation: To predict independent and significant predictors of surgical intervention (amputation), a logistic regression analyses were done and the results are shown in Tables 4 and 5. Three variables (wound stage, wound grade and random blood sugar) were independently significant predictors of surgical intervention in patients with diabetic foot .All other variables (age, sex, HbA1c, duration of diabetes, presence of ulcer, etc…) could not predict this outcome.

Table 4: Predictors of Amputation

Variable	B	t	P value	Confidence Interval	
				Lower	Upper
Wound Stage	0.49	3.834	0.000	o.235	0.744
Wound Grade	0.403	3.411	0.001	0.167	0.639
Random Blood Sugar	0.002	2.174	0.033	0.000	0.003

However, when we introduced IDSA in addition to other variables, only IDSA and stage of the wound were significant predictors (table 5). All other variables (random blood sugar and wound grade) either lost their prediction or they were not predictors from the start.

Table 5: Predictors of Amputation

Variable	B	t	P value	Confidence Interval	
				Lower	Upper
IDSA	0.597	5.455	0.000	0.379	0.815
Wound Stage	0.429	3.588	0.001	0.190	0.667

Discussion

The prevalence of diabetes in Iraq is increasing.[18] Diabetic foot is a source of significant morbidity and change in quality of life for diabetic patients,their limbs carries 15-40% higher risk of amputation in comparison to non-diabetic patients.[19] Furthermore, major amputation leads to limited daily activity of the patient.[20]

In the study of Zameer Aziz et at which was done in Singapore in 2005 on 100 patients with diabetic foot infection, the mean age of the patients was 59.8 years with male: female ratio 1:1,they concluded that risk factors for lower limb loss were: gangrene of the foot, ankle brachial index ≤0.8,WBC ≥ 15x 10^{9}/L and hemoglobin ≤ 10.0 g/dl.[21]

In a study done in Brazil by dos Santos et al from March 1999- November 2001, included 99 patients with diabetic foot infection. Most of the patients were males (69.7%), the mean age was 60.2 years, they found that risk factors for major amputation were: age, ascending lymphangitis, calcaneal lesions, Wagner grade 5 lesions, arterial insufficiency, diabetes duration and Gram positive microorganisms in culture.[22]

In a study done by Miyajima et al in Japan between July 1997 – August 2003,they studied 210 patients with diabetic foot lesions, amputation was performed in 52% of cases, the mean age was 64.2 years, they found three independent risk factors for major amputation :multiple arterial stenosis, hemodialysis and HbA1c. While Pemayun et al in a study conducted in Indonesia between January 2012 to December 2014, they concluded in addition to peripheral arterial disease and HbA1c, hypertriglyceridemia and hypertension are predictors of lower extremity amputation.[23]

In the present study, some different findings are identified, younger age, higher proportion of female patients and the predictors of amputations were also somewhat different. The differences could be due to methodological issues, mix of patients and level of control of diabetes mellitus.

Conclusions

1. Characteristics of the studied patients with diabetic foot ulcers were as follows:
   A. The majority of patients were females (60%).
   B. The age group of 50 years and above constitutes more than half of the cases.
   C. Almost 80% have the disease for more than 10 years.
   D. All cases showed evidence of uncontrolled disease.
2. Wound stage (UT Classification) and IDSA severity of wound infection are the predictors for surgical intervention in patients suffering from diabetic foot ulcers in Basrah.

Low CD4 Level Increased the Risk of Cognitive Impairment in the HIV Patient

Nurul Azizah[1], Abdulloh Machin[1], Muhammad Hamdan[1]

[1]Faculty of Medicine, University of Airlangga, Surabaya, Indonesia, Department of Neurology, Dr. Soetomo General Hospital, Surabaya, Indonesia

Abstract

Background: HIV infection leads to neurological damage that results in cognitive and behavioural impairment called HIV-associated neurocognitive disorder (HAND). There are several factors associated with HAND which include the CD4 count. Patients who present with the CD4 level lower than 200 cells/mm^3 are considered very vulnerable of experiencing neurological complications such as HAND.

Objective: To investigate the association between CD4 level and cognitive impairment evaluated using MoCA-INA among HIV patients.

Materials and Method: This cross-sectional study involves 72 consecutive patients with HIV (Human Immunodeficiency Virus) infection from the Infecion Ward of Soetomo General Hospital Indonesia. All participating patients was measured its cognitive impairment through MoCA-INA score. Blood samples were collected for CD4 evaluation. Statistics were evaluated with SPSS 25.0.

Results: The research participant consisted of 43 (59.7%) male and 29 (40.3%) female with mean age of 38.22 ± 9.159, CD4 level of 447.4 ± 247.48 and MoCA-INA score of 26.36 ± 2.770. Chi-Square analysis showed a significant difference (p-value of 0.023) in the cognitive function in the HIV patient with low CD4 (CD4<200cell/mm^3) compared tonormal CD4 (CD4≥200 cell/mm^3) with Odd Ratio of 4.900 (95% CI, 1.278–18.793).

Conclusions: Low CD4 level increase the risk of cognitive impairment assessed using MoCA-INA scoring system. These suggested that HIV patient with low CD4 should have initial screening of cognitive impairment.

Introduction

UNAIDS (*Joint United Nations Programme on HIV/AIDS*) reported that the incidence of HIV infections across the globe reached 36.7 cases at the end of 2015. It has also been reported that there are approximately 5 million HIV cases around Asia.[1] Department of Health of the Republic of Indonesia reported the cumulative number of HIV and *Acquired Immunodeficiency Syndrome* (AIDS) cases from all 34 provinces and 407 districts/cities across the nation since the first time it was discovered in 1987 up to March 2016 were 198,219 and 78,292 cases, respectively.[2]

HIV could lead to neurological damage that results in cognitive and behavioral impairment called AIDS Dementia Complex (ADC) or HIV-associated neurocognitive disorder (HAND).[3] HAND is one of the most important HIV-related complications in this era of antiretroviral (ARV) therapy. ARV combination therapy

using highly active antiretroviral therapy (HAART) is found to substantially improve the neurocognitive function and is attributed to a significant decline in the incidence of HAND. The prevalence of neurocognitive disorders, however, is still beyond the expected number that reaches over 50%. This is attributed to the fact that in this era of HAART, there has been a shift on HAND's clinical presentation towards milder disease that results in delayed diagnosis should the formal neurocognitive and neuropsychological assessment not performed due to subtle manifestation. The prevalence, incidence and severity of HAND is increased along with the increased population of HIV patients.[4] Several factors are thought to correlate with the occurrence of HAND and one of which is the CD4 counts. The patients who present with the CD4 level lower than 200 cells/mm^3 are at a substantial risk of developing neurological complications.[4] The low CD4 level can lead to decreased systemic immunity and increased proliferation of HIV within the central nervous system (CNS).[6] Furthermore, a series of processes will take place and lead to neural cell death and eventually the cognitive impairment/HAND; however, the studies investigating the association between CD4 counts and HAND are still limited.

MoCA has been widely used in the assessment of cognitive function. We chose MoCA as the instrument for cognitive assessment in this study given the contents of the questionnaire that cover various cognitive domains, including executive function, visuospatial function, attention and concentration, memory, language, calculation and orientation.[7] Indonesian version of MoCA, also called MoCA-INA, has been developed and validated in Indonesia and thus can be used as an instrument for cognitive assessment in our population.

The objective of this study was to investigate the association between CD4 counts and the occurrence of cognitive impairment assessed using MoCA-INA scoring system among HIV patients.

Materials and Method

Research Design: This retrospective study consisted of patients with HIV infection from the Infection ward of Dr. Soetomo General Hospital, Surabaya. Eligible patients required to be ≥ 18 years old and diagnosed with HIV infection. Patient with depression, structural brain lession or illiterate are excluded.

Cognitive Impairment Measurement: Cognitive ability was measured by using Montreal Cognitive Assessment-Indonesian Version (MoCA-INA) score. All elligible patient requires to fill the questionaire.

CD4 measurement: CD4 measurement was done through blood sampling and analyzed using flowcytometry.

Statistical Analyses: Statistical analyses were performed using IBM SPSS Statistics 25.0. Data are considered significantly different if $p<0.05$. Non-parametric data were evaluated and compared using the chi-quare test.

Findings:

Demography of HIV patients: The demographic characteristics (age, gender, level of education, and ethnicity) and the clinical characteristics (body mass index, vascular risk factors, and CD4 counts) of the study participants are shown in table 1 and 2.

Table 1: Characteristic of the study participant

Variables (N = 72)	n (%)	Mean ± SD
Gender		
Male	43 (59.7)	
Female	29 (40.3)	
Age		**38.22 ± 9.159**
> 50 years	8 (11.1)	
≤ 50 years	64 (88.9)	
Years of education		**12.35 ± 2.738**
Level of education		
Elementary school	1 (1.4)	
Junior high school	15 (20.8)	
Senior high school (and equivalents)	37 (51.4)	
College/University degree	19 (26.4)	
Ethnicity		
Javanese	62 (86.1)	
Madurese	4 (5.6)	
Timor	2 (2.8)	
Malay	1 (1.4)	
Chinese	2 (2.8)	
Ambonese	1 (1.4)	

Table 2: Clinical Characteristics of Study Participants

Variables	**n (%)**	**Mean ± SD**
Body mass index		23.35 ± 4.854 (13.5-34.3)
Overweight - Obese	25 (34.7)	
Underweight- Normal	47 (65.3)	
Vascular risk factors		
Yes	13 (18.1)	
No	59 (81.9)	
CD4 counts		447.4 ± 247.48 (5-1427)
< 200	11 (15.3)	
≥ 200	61 (84.7)	
MoCA-INA score		26.36 ± 2.770 (16-30)
< 26	18 (25)	
≥ 26	54 (75)	

The statistical analyses from the patient demography showed no significant differences for all the confounding factor, hence a multivariate analysis was not necessary. The results for this analyses are presented in table 3.

Table 3: Clinical Characteristics of the Study Participants

No	16 (88.9)	43 (79.6)		

Comparison between CD4 criteria on the HIV patient with cognitive impairment and normal function showed a significant differences (p = 0.023) with an odds ratio of 4.900 (95% CI, 1.278 – 18.793). Sugessting that low CD4 may increase the risk of cognitive impairment by 4.9 times. The result can be seen on the table 4.

Table 4: Comparison between CD4 Group and Cognitive Impairment

	MoCA-INA		**p**	**OR (95%CI)**
	Impaired (%)	**Normal(%)**		
CD4 Counts			0.023	4.900 (1.278-18.793)
< 200	6 (33.3)	5 (9.3)		
≥ 200	12 (66.7)	49 (90.7)		
Total	18 (100)	54 (100)		

Discussion

This research showed that HIV patient with the CD4 counts of <200 cells/mm^3 are at 4.9 times higher risk of having impaired cognitive function based on MoCA-INA scoring system compared toHIV patient with CD4 counts of ≥ 200 cells/mm^3. Similarly, previous research also showed that CD4 level is a good predictor for HAND (HIV-associated Neurocognitive Disorder) which showed the p-value of 0.003 and odds ratio of 3.45 (95% CI, 1.51 – 7.91).[8] Another study also reported that the higher CD4 level is correlated with better cognitive function among HIV-AIDS patients evaluated using MoCA-INA (r = 0.347).[9] This suggested that HIV patient with low CD4 counts consistently showed increased risk of cognitive impairment, which should be screened properly.

The mechanism which responsible for the increased risk of cognitive impairment in the patient with low CD4 count is not fully explored in this research. However, we speculate that low CD4 level results in decreased systemic immunity among HIV patients and predisposes to the proliferation of the virus within the CNS.[5] A series of molecular processes will occur and result in both direct and indirect cellular death of the nervous system. The direct mechanism of cellular death involves neurotoxic effects exerted by the viral protein released from the infected monocytes and cause neural cell death via direct interaction between the viral protein and the neuron (gp120, Tat, and Vpr).[10]

On the other hand, the indirect cellular death mechanisms involve neurotoxic processes from the macrophages. The activated macrophages and microglial cells (in response to HIV infection or exposure to the viral particles) will secrete a number of mediators which consist of arachidonic acid and quinolinate, nitric oxide (NO), platelet activating factor, superoxide anions, matrix metalloprotease, chemokines, and pro-inflammatory cytokines including tumour necrosis factor (TNF). Subsequently, the cytokines and other substances released during this process, will interfere with neuro-protective function of the astrocytes (to maintain the blood brain barrier integrity and glutamate reuptake) as well ass increase the rates of apoptosis of the astrocytes.[10]

In addition, neurotoxic processes induced by the host factors, including secretion high amount of amino acids such as glutamate (an excitatory neurotoxic neurotransmitter at the very high level) and other N-methyl-D-Aspartate (NMDA) receptor agonists can create an excitotoxic environment that produces excessive NMDAR activation. Consequently, the intra-neuronal calcium concentration will reach the toxic level and lead to production of free radicals, including Reactive Oxygen Species (ROS) and NO as well as cellular death. These three processes subsequently lead to neural damage/cell death and eventually result in cognitive impairment/HAND.[10]

Clinical implication of this study is that patients with CD4 counts of <200 cells/mm^3 needs a baseline cognitive function assessment since their diagnosis of HIV infection. In order to implement these results, cohort studies are required to analyze the correlation and regression between CD4 counts and cognitive impairment among HIV patients.

Conclusion Patient with Low CD4 level of less than200 cells/mm^3 will have increased risk of cognitive impairment assessed byMoCA-INA scoring system. These suggested that the HIV patient with low CD4 should be screened for cognitive impairment to provide early prevention and treatment.

Conflict of Interest: The authors declare no conflict of interest

Source of Funding: This research received no external funding

Ethical Clearance: The research was conducted in accordance with the Helsinki declaration of 1975 as revised in 2000. All participating patient has signed written informed consent. The study protocol has been approved by the local ethics committee. Data which shows patient personal information was omitted.

Antibacterial Effect of the Combination of Probiotic Milk and Calliandra Honey against Streptococcus Mutans that Causes Tooth Cavities

Uswatun Chasanah[1], Isnaeni[1], Nuzul Wahyuning Dyah[1]

[1]Department of Pharmaceutical Chemistry, Faculty of Pharmacy (60286), Universitas Airlangga, Surabaya, Indonesia

Abstract

Background: *Streptococcus mutans* is a Gram-positive bacterium found in the oral cavity. As a cariogenic bacterium, *Streptococcus mutans* can cause dental caries through its ability to produce an acidic environment that can demineralize tooth structures so that the tooth layer is destroyed.

Objective: To determine the optimal combination of probiotic milk *Lactobacillus paracasei* and calliandra honey which has antibacterial activity in *Streptococcus mutans* bacteria.

Method: This study uses diffusion method on Nutrient Agar media. The study began with an examination of the physical properties of probiotic milk and calliandra honey including color, odor, taste, pH, specific gravity and viscosity. Antibacterial activity was indicated by the diameter of the Zone of inhibition (mm) in the form of clear areas around the well on the media so that containing Streptococcus mutans inoculums 0.25µl/ml.

Result: The combination of probiotic milk *Lactobacillus paracasei* and 50% calliandra honey solution produced the highest activity at a ratio of 8: 2 with Zone of inhibition diameters of 16.40 ± 0.71 mm

Conclusion: The combination of probiotic milk and calliandra honey with 5% concentration and 8: 2 ratio has the highest antibacterial activity against Streptococcus mutans that causes tooth cavities

Keywords: *Streptococcus mutans, antibacterial activity, probiotic milk, Lactobacillus paracasei, calliandra honey.*

Introduction

Streptococcus mutans is a normal flora in the oral cavity that can turn into a pathogen when there is an excessive number colonies(1). Streptococcus mutans is an anaerobic bacterium that is known to produce lactic acid as part of its metabolism and is able to attach to the tooth surface in the presence of sucrose which causes caries in the teeth(2). Streptococcus mutans produces lactic acid through a *homo-fermentation* process, forming colonies that are firmly attached to the tooth surface and more acidogenic than other species so that it can cause demineralization of tooth enamel at a critical pH of 5.5. Continuous tooth enamel demineralization will cause dental caries(3).

Several studies show that probiotic bacteria have an influence in the ecology of the oral cavity. There are several strains of probiotic bacteria that have a positive effect in reducing the number of Streptococcus mutans in the saliva of the human oral cavity, namely the acidogenic class of Lactobacillus and Bifidobacterium(4).

The combination of Lactobacillus paracasei and Bifidobacteriumlongum isolates was able to inhibit the growth of Streptococcus mutans[5].

In its development, probiotic bacteria are packaged in a probiotic product with added milk to meet the nutritional needs of these bacteria[6]. Probiotics have proteolytic and lipolytic enzymes that can make milk as a substrate and produce a variety of energy sources [7].

As an antibacterial agent, probiotic milk and honey have different mechanisms, so that a combination of both can affect both activities Antibacterial activity of combination probiotic milk Lactobacillus paracasei and Calliandra honey in inhibiting the growth of Streptococcus mutans are not known, so it needs to be done research to determine the antibacterial activity of the combination of probiotic milk Lactobacillus paracasei ATCC BAA52 and Calliandra Honey (Calliandracalothyrsus) against Streptococcus mutans in various comparisons[8]. Based on this background, this study aims to determine the combination of probiotic milk Lactobacillus paracasei ATCC BAA52 and Calliandra honey (Calliandracalothyrsus) which can provide maximum antibacterial activity against Streptococcus mutans.

Material and Method

Materialsand Equipments: The materials are Media Nutrient Agar (Oxoid), Agar de Man Ragosa Sharpe (MRS), Calliandra honey from Yogyakarta, milk, NaCl (Merck), Klindamisin, sterile distilled water and membrane filter with a size of 0.22 µm. The equipments are analytical scales, glassware, petri dishes, micro pipettes (Socorex), öse wire, ependorf, vortex (Type 161700 mixer), incubator (Memmert), vernier caliper, colony counter, shaker, refrigerator, picnometer, viscosity ostwald, viscosity Cup and Bob, autoclave (HL-340 series sterile vertical type steam), pH meter (Schott glass mainz CG 842 type), laminar air flow cabinet, lactodensimeter, and spectrophotometer (Thermo Fisher Scientific 5225 Verona Road).

Agar well diffusion method: Test bacteria aged 18-24 hours are suspended into the agar medium at around 45oC. The bacterial suspension is poured into a sterile petri dish. After the agar becomes solid, holes are made with a diameter of 6-8 mm. Into the hole, a solution of the substance is inserted which will be tested for 20 µL of activity, then incubated at 37oC for 18-24 hours[9].

Results

Table 1: Observation Result of Zone of inhibition diameter of probiotic milk at various concentrations (%) on the growth of mutant Streptococcus.

Probiotic milk concentration	Zone of inhibition diameter (mm)
	Mean ± SD
100%	9,92 ± 0,52
80%	9,50 ± 0,36
70%	9,12 ± 0,10
60%	9,07 ± 0,09
55%	9,32 ± 0,08
50%	-
25%	-
Clindamycin 0,01 ppm	32,33±0,47

From these data, it can be seen that the minimum inhibitory concentration is produced by Lactobacillus paracasei probiotic milk at a concentration of 55.00%, which results in an average diameter Zone of inhibition of 9.3 ± 0.08 mm and at a concentration of less than 55.00% there is no Zone of inhibition. The minimum inhibitory concentration was produced by probiotic milk Lactobacillus paracasei at a concentration of 55% so that for the next combination carried out at the concentration of probiotic milk Lactobacillus paracasei ATCC BAA52 was above 55%.

Table 2: Observation result of Zone of inhibition diameter of calliandra honey at various concentration (%) against Streptococcus mutans

Calliandra Honey Concentration	Zone of inhibition diameter (mm)
	Mean ± SD
50%	24,42±0,42
40%	23,20±0,12
30%	22,28±0,06
25%	21,18±0,12
12,5%	-
6,25%	-
Clindamycin 0,01 ppm	19,12±0,01

From these data, it can be seen that the minimum inhibitory concentration is produced by calliandra honey at a concentration of 25%, which results in an average diameter Zone of inhibition of 21.18 ± 0.12 mm and a concentration less than 25% there is no Zone of inhibition. Based on the table above, the minimum inhibitory concentration is produced by calliandra honey (Calliandracalothyrsus) at a concentration of 25%, so that the next combination is carried out at the concentration of calliandra honey above 25%.

Table 3: ZOI diameter observation of Combination of Probiotic Milk and calliandra Honey to Streptococcus mutans

Combination (Probiotic: Honey)	Zone of Inhibition Diameter (mm)			Mean ± SD
	1st Replication	2nd Replication	3rd Replication	
1 : 9	9,20	10,00	11,00	10,07±0,74
2 : 8	12,35	13,00	13,15	12,83±0,35
3 : 7	11,40	12,35	13,00	12,25±0,66
4 : 6	12,35	13,10	13,10	12,85±0,35
5 : 5	12,35	13,25	14,10	13,23±0,71
6 : 4	13,30	14,00	14,00	13,77±0,33
7 : 3	12,30	12,35	12,35	12,33±0,02
8 : 2**	15,40**	16,80**	17,00**	16,40±0,71**
9 : 1	15,00	15,20	16,10	15,43±0,48
Calliandra Honey	15,40	15,00	14,90	15,10±0,35
Probiotic milk	14,60	13,60	12,00	13,40±1,84
Clindamycin	21,00	21,00	21,00	21,00±0,00

From these data, it can be seen that the maximum ZOI diameter is produced by a combination of L. paracasei probiotic milk and calliandra honey at a ratio of 8: 2 which results in a diameter of the Zone of inhibition greater than the other comparison which is 16.40 ± 0.71 mm. The maximum antibacterial activity is indicated by the combination of Lactobacillus paracasei probiotic milk and 50% calliandra honey at a ratio of 8: 2 which has the largest Zone of inhibition diameter, then one-way anova statistical test (attachment 10) to determine the difference in diameter significance the average zone of inhibition (ZOI) between each group is presented in Table 4.

Table 4: Differences in ZOI Diameter mean value of Combined Zone of Probiotic L.paracasei and Calliandra Honey against S. mutans according to HSD Test

S	3,33*	0,57	1,15	0,55	0,17	0,37	1,07	3*	2,03*	1,70*		7,60*
K	10,93*	8,17*	8,75*	8,15*	7,77*	7,23*	8,67*	4,60*	5,57*	5,90*	7,60*	

Description: Yellow - Significant different (p<0,05), White - No significant different (p>0,05), M - 50% calliandra honey, S - 100% probiotic milk, K - Positive control (Clindamycin 0,01ppm)

Based on Table 4, it is known that there are differences in the average diameter of the ZOI according to Tukey-HSD for a ratio of 8: 2 with other ratio except 9: 1. But the optimal ratio is also determined by the diameter of the zone of inhibition (ZOI) which is the largest among

the other ratio. So the optimal ratio is shown by the combination of probiotic milk Lactobacillus paracasei and Calliandra honey in a ratio of 8: 2.

Table 5: ZOI diameters of Probiotic Milk Lactobacillus paracasei and Calliandra honey (Calliandracalothyrsus) combination against Streptococcus mutans

Concentration of Probiotic and Calliandra Honey Combination (8: 2)	ZOI diameter against Streptococcus mutans(mm)
	Mean ±SD
100%	17,13±0,23
50%	12,86±0,15
40%	11,03±0,55
Clindamycin 0,01 ppm	36,00±0,00

From these data, it can be seen that the minimum inhibitory concentration of Streptococcus mutans is produced by a combination of probiotic milk Lactobacillus paracasei and calliandra honey with a ratio of 8: 2 at a concentration of 40.00% which is equal to 11.03 ± 0.55 mm and at concentrations less than 40.00% there is no zone of inhibition that generated.

Discussion

From these results, it was found that probiotic milk Lactobacillus paracasei and calliandra hone had antibacterial activity against Streptococcus mutans at a minimum inhibitory concentration (MIC) of 55% and 25%. Calliandra honey has smaller MIC than probiotic Lactobacillus paracasei milk which is 25%, so it can be assumed that Calliandra honey is more potent in inhibiting the growth of Streptococcus mutans than Lactobacillus paracasei probiotic milk[10].

From these results, it can be seen that with a decrease in concentration from 100% to 60% of Lactobacillus paracasei probiotic milk, there was a decrease in the diameter of the inhibition zone, although at 55% concentration of probiotic milk Lactobacillus paracasei increased. The results also showed that Lactobacillus paracasei probiotic milk was able to inhibit the growth of Streptococcus mutans at the lowest concentration of 55% with inhibitory zone diameters of 9.32 ± 0.08 mm, because at concentrations below 50% no inhibition zones were produced.

Based on the research that has been done, the ZOI diameter of probiotic milk Lactobacillus paracasei at a concentration of 100% is 9.92 ± 0.52 mm, while at a concentration of 50%; 25% and 12.5% do not produce inhibition zones. So that the test is continued at a concentration of 80%; 70%; 60% and 55% are produced in succession of inhibitory zone diameters of 9.50 ± 0.36 mm; 9,12 ± 0,10 mm; 9.07 ± 0.09 mm and 9.32 ± 0.08 mm.

Furthermore, the antibacterial activity of a combination of probiotic milk Lactobacillus paracasei and calliandra honey was carried out to the growth of Streptococcus mutans. In this study, testing was done with agar diffusion method because in the process it is simple, inexpensive and able to test various types of microorganisms and antibacterial agents with easy results of interpretation techniques[11].

According to Ghabanchi in his research, antibacterial activity was shown by the presence of an inhibition zone (mm) in the form of a clear area around the well. The inhibition zone shows that Streptococcus mutans are not resistant to the test solution[12]. As a positive control used in testing this antibacterial activity is clindamycin, because the antibiotic is known to be sensitive to gram-positive, facultative anaerobes and has been shown to inhibit the growth of oral bacteria, especially Streptococcus mutans[10].

Based on the research by Bhushan and Chachra (2010), it was said that some probiotic bacteria act as bacteriocin or like inhibitors specifically preventing the growth of cariogenic bacteria, having the ability to protect teeth and affect the growth of supragingival plaques. Adhesion reduction can be an effective way to reduce cariogenic bacteria such as Streptococcus mutans[13].

The effect of osmotic pressure from honey is related to saturated solutions of sugar with water content usually only around 15-21% of its weight. Solids in honey, 84% is a mixture of monosaccharides namely fructose and glucose[14]. The strong interactions between sugar molecules produce water molecules that are not enough for microorganisms. Microorganisms will lose water from this osmosis process and will become dehydrated, so it can kill these microorganisms. Gluconic acid is the most dominant acid[15]. This acid is the result of enzymatic changes in glucose by the glucose oxidase enzyme, which bees secreted from the hypopharyngeal gland becomes a balance between gluconic acid and gluconolactone[16].

Conclusions

Based on the results of the study, it can be concluded that the MIC of probiotic milk Lactobacillus paracasei ATCC BAA52 against Streptococcus mutans was 55%. WhiletheMICofcalliandra(Calliandracalothyrsus)honey against Streptococcus mutans is 25%. The combination of probiotic milk Lactobacillus paracasei ATCC BAA52 and Calliandra honey (Calliandracalothyrsus) can provide maximum activity against Streptococcus mutans in a ratio of 8: 2. The combination MIC of probiotic milk Lactobacillus paracasei ATCC BAA52 and Calliandra honey (Calliandracalothyrsus) against Streptococcus mutanswas 40%.

Ethical Clearance: The research process did not involve with human, instead it is only laboratory research of parasites that is in accordant with the ethical research principle based on the regulation of research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, non-maleficence, and justice.

Conflict of Interest: The author has not received any conflict of interest so far. It is safe from the conflict

Reproductive Health Behavior of Street Youth Guided by Karya Putra Indonesia Mandiri Foundation in Central Jakarta Region

Prihayati[1], Hansrizka Raisna[2], Ridwan Amiruddin[3], Owildan Wisudawan B.[4]

[1]Faculty of Health Sciences, University of Muhammadiyah Prof. Dr. HAMKA, Jakarta, Indonesia, [1]Doctoral Program Student, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [2]Magister Program of Public Health, University of Muhammadiyah Prof. Dr. HAMKA, Jakarta, Indonesia, [3]Department of Epidemiology, Faculty of Public Health Hasanuddin University, Makassar, Indonesia, [4]Faculty of Public Health Hasanuddin University, Makassar, Indonesia

Abstract

Background: Adolescents psychologically have a negative self-concept that is easily influenced and tends to behave freely. This study aims to determine whether there is a relationship between the role of parents and the role of friends with the reproductive health behavior of street adolescents. The problem with this research is the high rate of teenage pregnancy in Indonesia and adolescents account for 30% of unwanted pregnancies and unsafe abortions.

Material and Method: Cross sectional research design. The sample in this study was YPKIM fostered adolescents aged 15-19 years. Data processing and analysis using chi square test and multiple logistic regression.

Findings and Discussion: Poor reproductive health behaviors in YPKMI street adolescents by 33.3%. Based on the results of bivariate analysis found there is a relationship between the role of parents and the role of friends with reproductive health behavior. Multivariate analysis shows that knowledge is the most dominant risk factor associated with reproductive health behavior (OR = 6,610).

Conclusion: The results of this study prove the need to increase reproductive health knowledge in street adolescents to improve reproductive health behavior better by creating programs specifically for the coaching of adolescents, especially street adolescents.

Keywords: *Reproductive health, Sexual behavior, Street youth.*

Introduction

Adolescent relationships today tend to be free and experience a shift in values, where adolescence is a critical period where changes in emotions, thoughts, social environment and responsibilities are experienced[1]. Sexual Behavior is any behavior carried out because of sexual urges. In this concept no matter how and with whom or what that impulse is released. In adolescent sexual behavior, open communication with parents seems to be importan. Teenagers need sex education from older people to access contraception or refuse peer calls or partners to have sex before they are ready. In the US, public health activities to improve open communication between parents and adolescents to produce positive adolescent health. Not all sexual relations are voluntary, especially for girls, but also because of coercion among women aged 17 years, according to data from the National Survey of Children, there are 7% who are forced to have sexual relations[2].

Sexually transmitted infections (STIs) and unwanted pregnancies are very important public health problems, although in the long term they are needed to prevent them. Because there are a number of risk factors for STIs, prevention includes the delays in the emergence of sexual relations between teenagers who are actively engaging in sexual relations[3]. In 2012, an estimated 2.1 million adolescents were living with HIV. Despite effective interventions to prevent and treat HIV, adolescents face difficulties in accessing it. As a result the emergence of new infections among adolescents infected with HIV is common. Programs designed specifically for HIV-positive adolescents must focus more on interventions that have proven to be more effective in overcoming fundamental factors that drive incidents and the lack of effective care and care in this age group.

In adolescent sexual behavior, open communication with parents seems to be important[4], Because teenagers need sex education from older people to access contraception or refuse peer calls or partners to have sex before they are ready. In the US, public health activities to improve open communication between parents and adolescents to produce positive adolescent health. Not all sexual relations are voluntary, especially for girls, but also because of coercion among 17-year-old women in the National Survey of Children, 7% are forced to have sexual relations. Data from research from Katherine in 2003, parents who communicate with their daughters about sex will influence sexual behavior in a more positive direction. A family-based approach to improving communication can reduce the risk of risky sexual risk-related behaviors related to HIV[5].

The halfway house is a temporary informal camp, where street children meet to get information and initial guidance before being referred to further development processes. The purpose of establishing a halfway house is to re-socialize to reshape children's attitudes and behaviors that are in accordance with the values and norms prevailing in society and provide early education to meet the needs of children and prepare their future so that they become productive societies. Of the dozens of Shelter Houses that carry out street youth development in the DKI Jakarta area and in the Central Jakarta area there are five Shelter Houses Foundation, two of which are still active to date and one of them is shelter Yayasan Karya Putra Indonesia Mandiri (YKPMI). Based on observations made by researchers together with interviews with the Chairperson and Staff of the YKPMI Shelter Foundation, the 2014 data of the YKPMI Shelter Foundation has 215 street children assisted in 10 points in Central Jakarta and East Jakarta.

Material and Method

This type of research is a quantitative study using a cross-sectional approach, which is a study that studies the relationship between the role of parents and the role of friends on the reproductive health behaviors of YKPMI street adolescents by observation or data collection at the same time.

This research is a descriptive-analytic study using the quantitative cross-sectional method used to analyze the relationship between parental role variables and the role of friends on reproductive health behaviors in street children fostered by YKPIM in the Central Jakarta Region in 2015.

The sample in this study has the characteristics of inclusion, namely street children fostered by YKPMI in Central Jakarta and East Jakarta, aged 15-19 years and came to YKPMI at the time determined by the researcher. The exclusion characteristics in this study were adolescents aged <15 years and street adolescents who could not read and write.

Findings and Discussion

Univariate Analysis: Univariate analysis is used to look at quantitative data obtained from descriptive research, using tables, graphs and measures of central tendencies, such as the mean or average value of each variable.

The assessment results found that most of the street adolescents fostered by the Karya Putra Indonesia Mandiri foundation had good reproductive health behaviors as many as 40 people (66.7%) and only a small proportion were behaving less well, 20 people (33.3%).

Table 1: Frequency Distribution of Street Youth Assisted by Karya Putra Indonesia Mandiri Foundation according to Reproductive Health Behavior in Jakarta

Reproductive Health Behavior	Total (n)	Percentage (%)
Poorly	20	33,3
Well	40	66,7
Total	60	100

Based on the results of table 1 analysis, it is known that most of the street adolescents fostered by Karya Putra

Indonesia Mandiri Foundation have good reproductive health behaviors, as many as 40 people (66.7%) and only a small portion whose behavior is not good, namely 20 people (33.3%). This study is consistent with Joseph's research findings that the lack of knowledge about reproductive health will affect health behaviors in adolescents[6].

Table 2: Frequency distribution of YKPIM-assisted street teenagers based on the role of parents and the role of friends in Jakarta

Variable	Total (n)	Percentage (%)
The role of parents		
Fewer roles	20	33,3
Most of the roles	40	66,7
The role of Friends		
Fewer roles	18	30,0
Most of the roles	42	70,0

Based on the results of table 2, it is known that the frequency distribution of the role of parents of YKPMI street teenagers is that most of the roles of parents are mostly 40 people (66.7%) and a small part has fewer roles, 20 people (33.3%). The distribution of the role of YKPMI street adolescent peers mostly played 42 people (70%) and a small part has fewer roles that 18 people (30%).

Bivariate Analysis: Bivariate analysis was performed to see the relationship between each independent variable with the dependent variable, namely reproductive health behavior using a statistical test, the Chi Square test. Bivariate analysis was used in this study as a method to see the relationship between the reproductive health predisposing variables of street children who are under the guidance of YKPIM Jakarta.

Table 3: Relationship between the role of parents and the role of friends with reproductive health behaviors

Variable	Reproductive Health Behavior				Total		OR (95% CI)	p-value
	Poorly		Well					
	n	%	n	%	n	%		
The Role of Parents								
Fewer roles	12	60,0	8	40,0	20	100	6,000	0,005
Most of the roles	8	20,0	32	80,0	40	100	(1,837-19,594)	
The Role of Friends								
Fewer roles	12	66,7	6	33,3	18	100	8,500	0,001
Most of the roles	8	19,0	34	81,0	42	100	(2,444-29,562)	

Based on the results of the analysis in Table 3 shows that in YKPMI street adolescents, it is known that there are 60.0% of teenagers who lack the role of parents, the behavior is not good, while in the youth group who feel the role of parents there are only 20.0% of bad behavior. Statistical test results obtained p-value 0.005 meaning that there is a significant relationship between the role of parents with reproductive health behavior. The results of the analysis obtained OR 6,000 means that a group of adolescents who do not feel the role of parents has a 6 times greater chance to have bad behavior than adolescents who feel the role of parents.

The results of the analysis showed that in the street adolescents guided by YKPMI, it was found that in the group of teenagers who felt the lack of the role of friends there were 66.7% whose behavior was not good whereas in the group of adolescents who felt the role of friends there were only 19.0% whose behavior was not good. statistics obtained P value 0.001 means that there is a significant relationship between the role of friends with reproductive health behavior. The analysis results obtained OR 8,500 means that the group of adolescents who do not feel the role of friends has a 8.5 times greater chance to have bad behavior than adolescents who feel the role of friends.

The results of this study are consistent with the results of Jennifer's research that parent and teen communication about reproductive health has an important role in improving reproductive health in adolescents[7].

Multivariate Analysis: Multivariate analysis used is multiple logistic regression test, the steps being carried out are as follows: selection of predictive model candidates. Multivariate analysis in this study was conducted to see the most dominant independent variables related to the dependent variable simultaneously, because the independent variables are categorical and the dependent variables are dichotomous categories, so the analysis conducted is multiple logistic regression. Variables that have been analyzed bivariately and have a p value <0.25 are used as candidate variables to be included in the next analysis multivariately, to determine the best model. The results can be seen in table 4 below.

Table 4: Results of variable analysis as a candidate model

Variable	p-value	Explanation
The role of parents *	0,003	Following the Multivariate
The Role of Friends*	0,001	Following the Multivariate

The results of bivariate tests that have been done previously, it is known that of the eight variables, there are four variables that can be included in multivariate analysis, namely knowledge, attitudes, the role of parents and the role of friends (p-value <0.25). Other variables (age, gender, education and media access) have p-values >0.25 so they are not included in the multivariate analysis.

Conclusions

Communication that occurs between adolescents and parents is very lacking so that there is a failure of family function, this triggers adolescents to behave freely and even violate the norms, because they feel no one cares or prevents it. Lack of appropriate sources of information from the mass media, health workers, religious leaders, religious leaders and peers causes adolescents to obtain information and choose the wrong actions so that they regret after pregnancy after having premarital sex. Although premarital sexual behavior is at risk of being influenced by individuals and the environment, sometimes parents are met who do not regret the pregnancy that occurs in their children.

Conflict of Interest: There is no conflict of interest to be declared.

Trend of Malaria Cases in Maluku Province 2012-2016

Prisilia Oktaviyani[1], Budi Hartono[2], Ranti Ekasari[3]

[1]Public Health Department, Politeknik Kesehatan Palangkaraya, Palangkaraya, [2]Environmental Health Department, Universitas Indonesia, Depok, [3]Public Health Department, Universitas Islam Negeri Alauddin Makassar, Gowa, Indonesia

Abstract

Malaria is a worldwide problem, including in Indonesia. Malaria is a vector-borne disease, and the vector is *Anopheles* mosquito. In Indonesia, the most endemic are located in the eastern regions of Indonesia. Maluku Province had the fourth highest rate of Annual Parasite Incidence (API) in 2015 at 5.81%. This research was quantitative with a descriptive analysis of malaria positive cases in Maluku. The study used secondary data from January 2012 to December 2016 that were obtained by the Health Office of Maluku. The result of this research shows that the trend of malaria, according to the current rate of positive cases found, tends to decrease every year with R square value from the linear line of 0.5534. The lowest number of cases was recorded in February. Based on gender, malaria on both genders tends to decrease every year. Maluku Barat Daya Regency had the highest rate of Annual Parasite Incidence (API) among other regencies in Maluku. As a suggestion, the government should be more concerned about the prevention program of malaria in Maluku Province. Some of the preventive ways are to disseminate knowledge to the community that if they want to do activities outside at night, they have to wear long clothes that can cover the whole body.

Keywords: *Malaria cases; API; Maluku.*

Introduction

Malaria is a disease caused by five different Plasmodium parasites that are transmitted to humans through the bite of an infected female *Anopheles* mosquito. Malaria can infect all ages and genders. A person who is infected will feel fever, shiver, sweat, have headache, have nausea, and vomit. A person with clinical symptoms has to get a laboratory test to confirm the positive status of malaria [(1)]. Malaria is considered as a threat to the gains in health and development and the attainment of the 2030 Agenda for Sustainable Development because of the high number of people at risk of the infection. More specifically, the third goal of the Sustainable Development Goals (SDGs) is "Good Health and Well-Being", so malaria as a communicable disease and the epidemic which it brings have to be eliminated and ended by 2030[(2)]. All heads of the states in the Asia Pacific region, including Indonesia, have committed to the complete elimination of malaria in their respective countries by this time as well [(3)].

In Indonesia, the most endemic areas are found in the eastern regions of Indonesia. Maluku is also located in the eastern region of Indonesia. Malaria is the main problem in some areas, including Maluku. Maluku Province had the fourth highest rate of Annual Parasite Incidence (API) in 2015 at 5.81%. Maluku is also categorized as HCI (High Cumulative Incidence) area in Indonesia [(1)].

Malaria was one of the ten most common diseases in Maluku. Based on a report from the 2014 Maluku Health Profile, the Annual Parasite Incidence (API) from 2008 to 2014 fluctuated, while in 2008 the API was 12.3/1000 citizens. That number decreased in 2009 to 7.0/1000 citizens and increased in 2010 to 10.4/1000 citizens. In 2011, the API decreased again to 9.1/1000 citizens and increased again in 2012 to 11.1/1000 citizens.

Based on the data, API in Maluku did not show a stable decreasing trend. Therefore, the province needs a comprehensive scheme of malaria prevention which

includes effective promotional, preventive, and curative efforts. It aims to reduce morbidity and mortality and to prevent outbreaks. To achieve optimal results, the preventive and curative efforts should be carried out professionally and integrated with other programs.

Maluku Province is a malaria endemic area, and currently a program referral system that refers to the cluster system is being developed. Enforcement of clinical malaria diagnosis (without laboratory confirmation) will provide an overview of the clinical malaria rate occurring in the target community [4]. After reviewing the available data, the researcher took interest in performing a research project to investigate the trend of malaria cases in Maluku from 2012 to 2016.

Method

Maluku was chosen as a location for this study because Maluku is one of the endemic areas of malaria. This research was quantitative with a descriptive analysis of malaria positive cases in Maluku. Descriptive analysis is conducted to know the existence of independent variables, either only one or more variables (stand-alone variables), without making comparisons and searching the relationship between that variable and another variable [5].

The study used secondary data from January 2012 to December 2016 that were obtained by the Health Office of Maluku. Data were analyzed by numerical processing software. The study also obtained a body of data concerning malaria positive cases based on gender, minimum and maximum monthly cases, Annual Parasite Incidence (API) from every city/regency in Maluku from 2012 to 2016, and the type of Plasmodium. The trend of malaria is presented in several figures as the results of this study.

Findings: The results of this research show that the trend of malaria, according to the rate of positive cases found, tends to decrease every year with R square value from linear line of 0.5534. It means that the model fits to 55.34%. The maximum number of malaria cases was recorded in a different month in different year. In 2012, the highest number of cases was recorded in March with 1947 positive cases. In 2013, the highest number of cases was recorded in May with 1980 cases. Moreover, in 2014, the highest number of malaria cases was recorded in April with 1913 cases. In 2015, the highest number of cases was recorded in February with 1080 cases, while in 2016, the highest number of cases was recorded in December with 1484 cases (Figure 1).

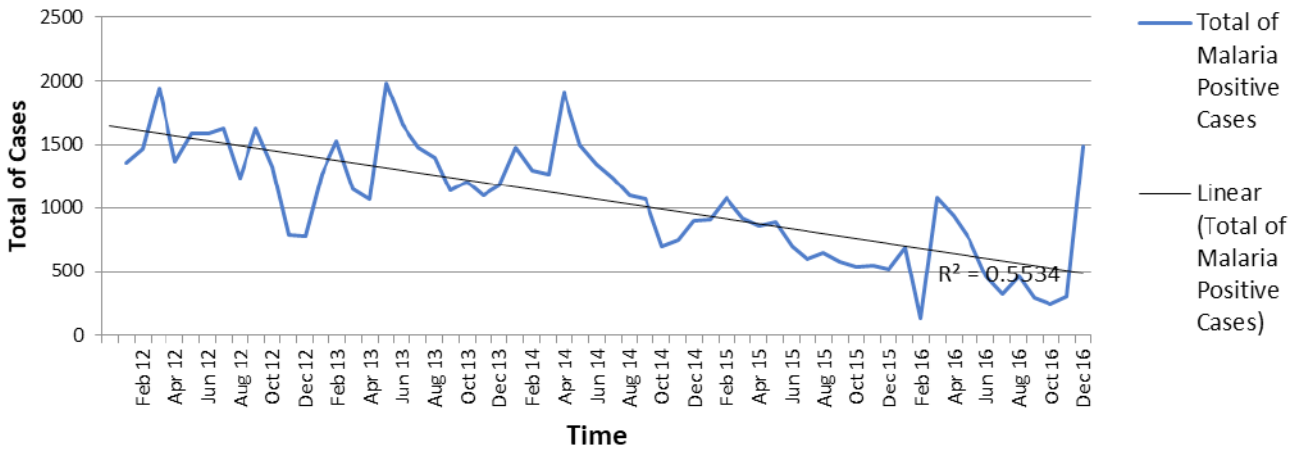

Figure 1: Malaria Positive Cases in Maluku

In contrast to the seemingly irregular occurrence of maximum number of malaria cases in each year, the monthly data about the minimum and maximum of malaria cases from 2012 to 2016 (Figure 2) show that the lowest number of cases was recorded in February. It means that rainfalls during the rainy season can also decrease malaria cases because rainfalls helped to eliminate the breeding sites of *Anopheles* [6].

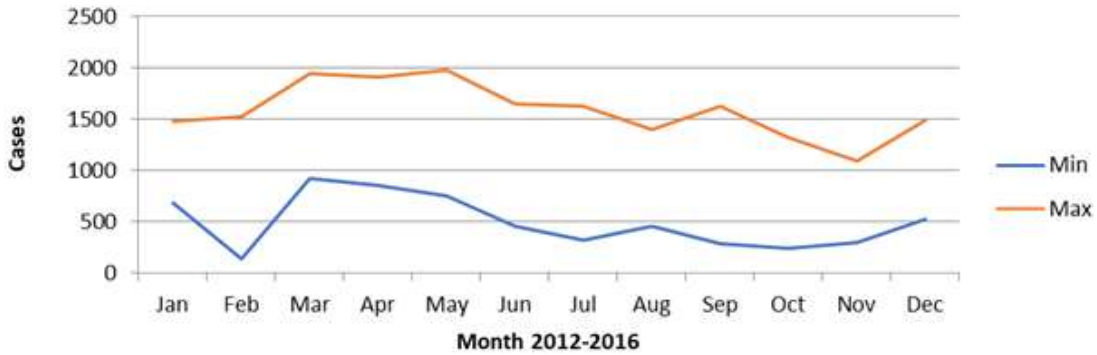

Figure 2: Minimum and Maximum Monthly Malaria Cases in 2012-2016

The trend of malaria which largely decreased from 2012 to 2016 might show the success of the governmental program to eliminate malaria, especially in Maluku Province. A study by Oktafandi *et al* (2014). found that the number of malaria cases declined every year from 2011 to 2013[7]. Although the trend showed a decrease, Maluku province is still an endemic area of malaria. Based on gender, malaria cases tend to decrease every year in both men and women. Malaria cases in men had R square value from linear line of 0.5247. It means that the model fits to 52.47% (Figure 3). Meanwhile, in women, the value was 0.5708, and it means that the model fits to 57.08% (Figure 4). However, men suffered a higher number of malaria cases than women.

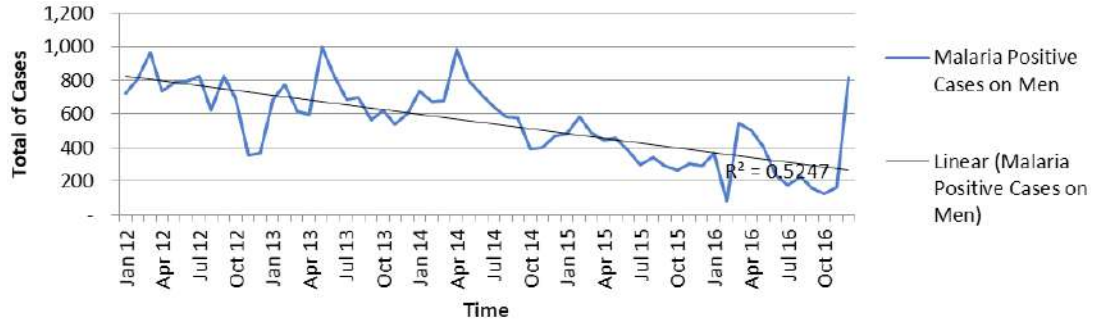

Figure 3. Malaria Positive Cases on Men in Maluku

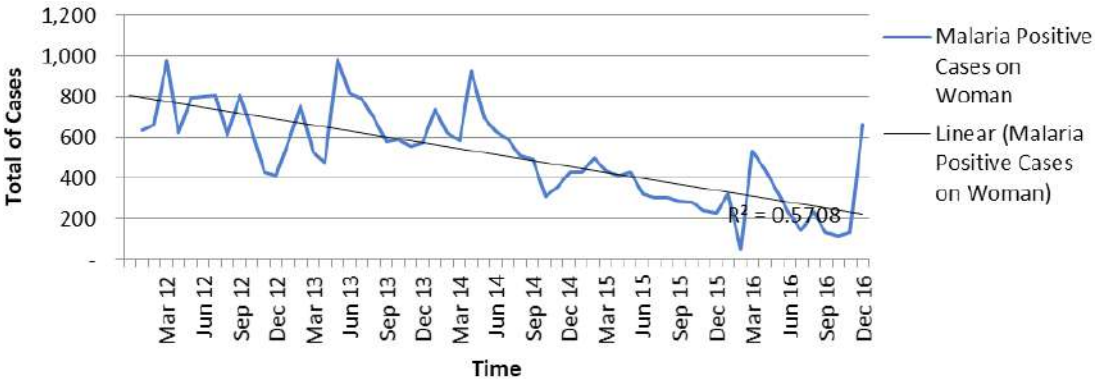

Figure 4. Malaria Positive Cases on Women in Maluku

The number of malaria cases in Maluku Province decreased from 8.31 per 1000 citizens in 2014 to 4.3 per 1000 citizens in 2016. The highest number of malaria cases was found in Maluku Barat Daya (MBD) Regency which was 25.9 per 1000 citizens, and the lowest number was found in Tual City and Buru Regency at 0.6 and 0.9 per 1000 citizens, respectively. According to the result of a study by a health research and healing team, Wetar and Moa Sub-districts were malaria endemic areas with the highest rate of incidence in MBD Regency[8]. In addition to that, the API in eleven cities/regencies in Maluku varied every year between 2012 and 2016 (Figure 5).

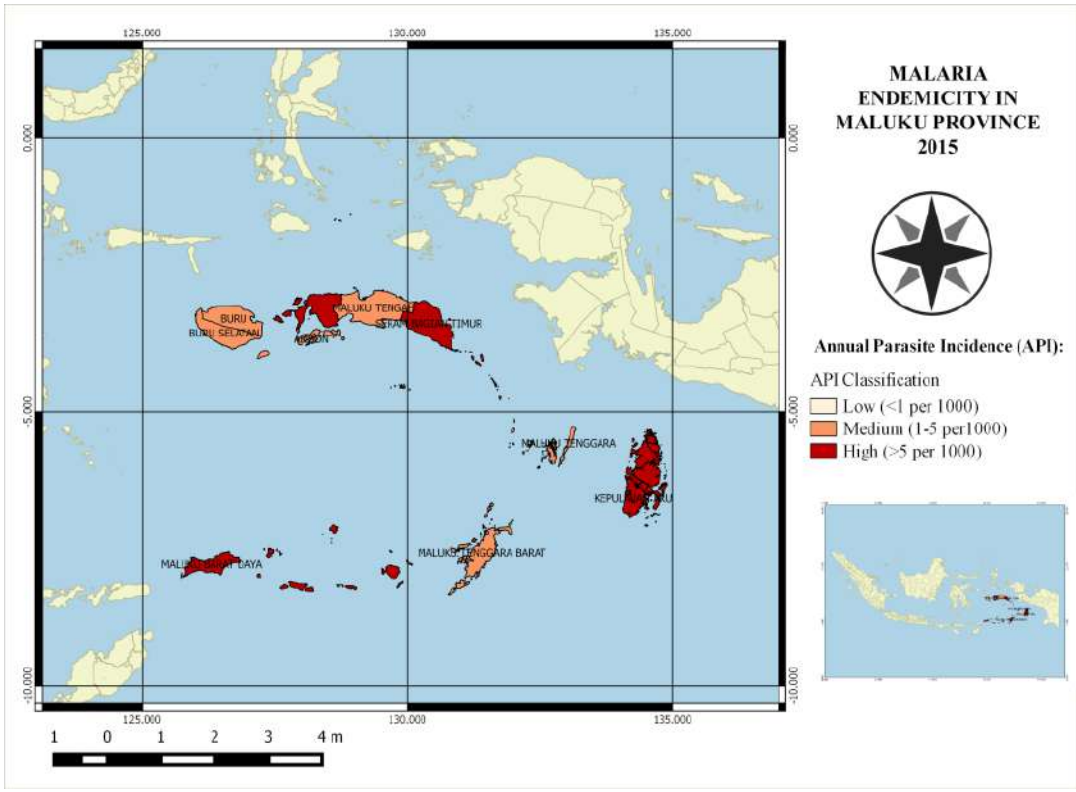

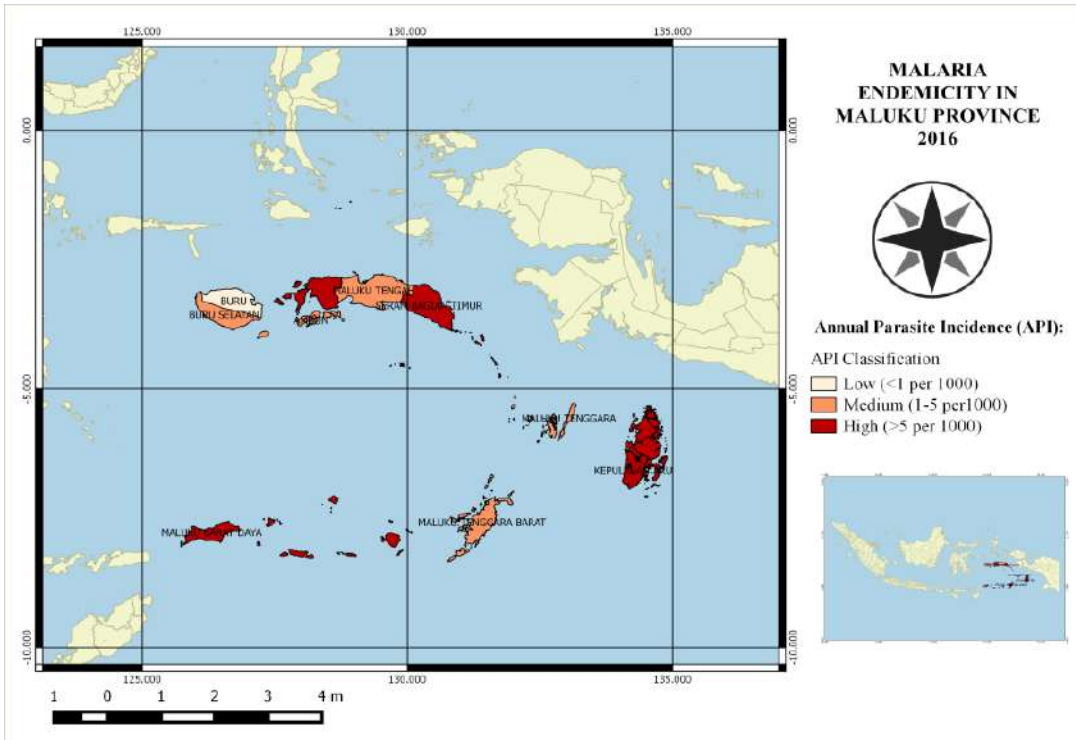

Figure 5: Annual Parasite Incidence (API) in Maluku 2012-2016

Based on current studies, there were four types of *Plasmodium* found in Maluku, while the highest number of malaria incident every year was attributed to *Plasmodium vivax* and the lowest was attributed to *Plasmodium ovale*. The risk of *Plasmodium vivax* malaria occurs almost everywhere, with several exceptional zones or pockets free of malaria risks in Java, Bali, and Sumatra, as well as fewer pockets in Sulawesi and Papua (Figure 6).

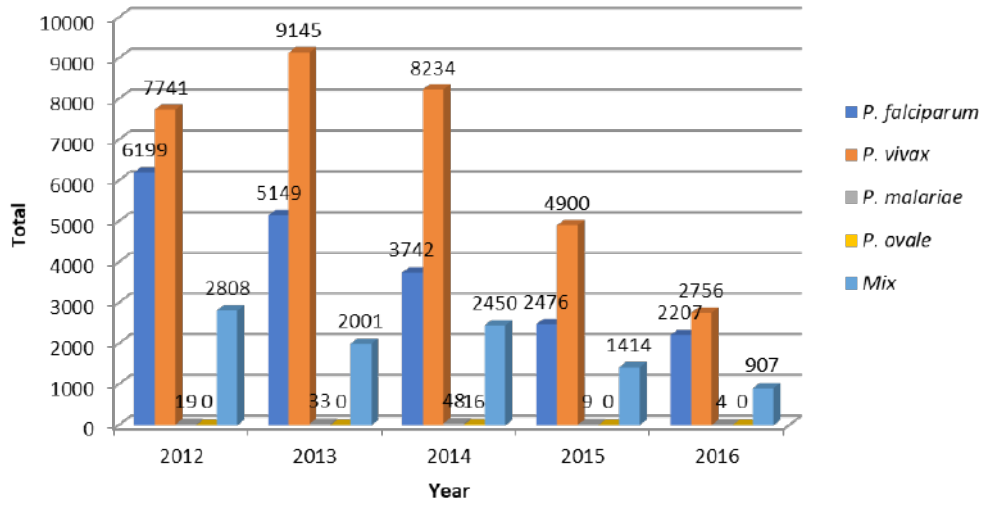

Figure 6. Total Number of Malaria Cases due to Different *Plasmodium* Types in Maluku 2012-2016

Discussion

Malaria is an entirely preventable and treatable disease. It is caused by a protozoan parasite belonging to the genus *Plasmodium*. It is spread from a person to another by *Anopheles* mosquito bites. All efforts to prevent malaria are considered as part of collective contribution to the country's sustainable development. The objectives of reducing and eliminating malaria are intrinsically linked to most Sustainable Development Goals (SDGs) as they comprise nearly all of the Millenium Development Goals (MDGs). Malaria is a result, as well as a cause, of such inhibition of development [(9)].

Maluku is an archipelagic region, which encourages the transmission of *Anopheles* as a vector of malaria. *Anopheles* cannot live in a high area at an altitude of above 2000 meters[(10)]. Maluku is one of the provinces in Indonesia with a high number of malaria cases. Maluku is located in the eastern region of Indonesia and has two main cities consisting of Ambon and Tuai. It also consists of nine regencies consisting of Buru, Buru Selatan (South Buru), Kepulauan Aru (Aru Islands), Maluku Barat Daya (Southwest Maluku), Maluku Tengah (Central Maluku), Maluku Tenggara (Southeast Maluku), Maluku Tenggara Barat (West Southeast Maluku), Seram Bagian Barat (Western Seram), and Seram Bagian Timur (Easterm Seram).

Even though the maximum number of positive malaria cases was always recorded in a different month every year, they always occurred in the same climate zone in terms of season. According to Mulyana [(11)], June, July, and August are generally considered as the dry season in Indonesia; September, October, and November are the transition period from the dry to rainy season; December, January, and February are considered as the rainy season; while March, April, and May are the transition period from the rainy to dry season. Based on the data, the highest numbers of malaria cases were recorded during the transition from the rainy to dry season in three different years, while the highest numbers of malaria cases were recorded during the rainy season in two different years.

Malaria is a protozoan infection that is transmitted by mosquitoes, which require moisture for breeding. Malaria, along with other vector-borne infections, is strongly affected by weather variables. In arid areas, the increase of rainfall can be associated with the expansion of the breeding sites of *Anopheles*, the most common malaria vector. Meanwhile, in humid areas, drought can improve breeding conditions for mosquitoes, leading to outbreaks. Natural predators of vectors also determine the vectors' abundance. If the reproductive cycle of predators is longer than that of mosquitoes, the mosquito population could increase before the predators have a chance to control it. Air temperature, rainfall, and vegetation also affect the abundance of food and the behavior of predators [(12)].

Rainfall could increase the transmission of *Anopheles* by promoting the vectors' breeding site or, conversely, it could also eliminate it by flooding the vectors' breeding site [(6)]. This phenomenon is shown by the fact that the maximum numbers of cases from 2015 to 2016 were recorded during the rainy season (December to February). It means that rainfall during the

rainy season could encourage malaria by promoting the breeding site of *Anopheles*.

Besides, ambient temperatures are required for parasite growth within the *Anopheles* mosquito. Optimum temperatures are between 25ºC and 30ºC, hence their abundance in the tropical zones, including Indonesia. Temperature affects the extrinsic or sporogonic stages of the parasite within the mosquito, which means that temperature can affect the transmission rates of malaria [13].

Besides that, in 2012, 2013, and 2014, the maximum numbers of cases were recorded in March, April, and May, respectively, while those months are classified as part of the transition period from the rainy to dry season. This could happen because the breeding site was formed at the end of the rainy season, which is in the end of February, but the transmission and cases would be detected later between March and May.

According to Oktafandi *et al.*(2014), there was a significant difference of the proportion of malaria between males and females in 2011–2013[7]. The study that was conducted by Letelay and Delima (2012) also showed that men had a higher rate of malaria infection at 53.06% than women had at 46.94% [14].

It may be due to the fact that men do more activities outside their home, including at night, so it is reasonable that malaria transmission is more common in men than in women. Based on a study by Bagaray, Umboh, and Kawatu [15], there was a significant relationship between outdoor night activities and malaria infection (OR=3.375: CI 95%: 1.303–8.744). It means that people who have activities outside at night have a 3.375 times higher risk of getting malaria infection than people who do not.

There are more than 400 different species of *Anopheles* mosquitoes, but only 30 are considered as important malaria vectors. Five species of *Plasmodium* can infect human beings, and two of them are *Plasmodium falciparum* and *Plasmodium vivax* which pose the greatest threat [16].

Most major cities in Indonesia are also free of malaria risk, even in otherwise high-risk areas. However, the highest risk is found in eastern Indonesia, especially in the provinces of East Nusa Tenggara, Maluku, and Papua [17]. Although *Plasmodium vivax* causes the highest number of malaria cases in Maluku and can cause severe illness and deaths, *Plasmodium falciparum* is the most dangerous malaria parasite. Furthermore, *Plasmodium falciparum* causes the second highest number of malaria cases after *Plasmodium vivax* in Maluku [16].

The limitation of this study included the time range of malaria cases being investigated. Expansion of the time range can show a more comprehensive and valid trend of malaria in Maluku Province. Other limitations include relatively small number of cases and lack of climate data. Besides those, the climate factor should also be included in order to generate a more thorough picture of the trend in malaria cases in Maluku.

Conclusion

In conclusion, the number of malaria cases in Maluku Province tends to decrease over the past several years. The highest numbers of cases were found during the rainy season (December to February) and the transition period from the rainy to dry season (March to May). The lowest number of cases was found in February. Men had a higher number of malaria infection than women. The highest API of monthly malaria has been found in Maluku Barat Daya Province. The government should be more concerned about the malaria prevention program in Maluku Province. The trend of malaria cases has decreased, but Maluku Province still has the High Level of Incidence (HLI) of malaria in Indonesia. The highest number of malaria cases in Maluku was caused by *Plasmodium vivax*, while the lowest was caused by *Plasmodium ovale.* Some preventive measures to deal with malaria must be introduced to the local communities, so their knowledge about the transmission and elimination of malaria can increase. Health officers can also help disseminate the knowledge by providing information that anyone who wants to do activities outside at night must wear full-length clothes that can protect their body from mosquito bites. Besides that, the local people should also use mosquito repellent lotion to prevent mosquito bites. Thus, the transmission of malaria through mosquitoes can be reduced.

Acknowledgments: The author would like to thank the Health Office of Maluku that has provided the data about malaria in Maluku as the main material in this research.

Conflict of Interest: No conflict of interest in this research.

Source of Funding: All the funding of this research is provided by the authors. There is no funding from others.

Ethical Clearance: No ethical approval for this research because it is used secondary data.

Abstract

Background: Youth nowadays are encouraged to do premarital sexual practice like kissing or making out even some of them are okay with free sex. This happens because of assertiveness deficiany among teenanger.

Objective: This qualitative study aims to explore teenage girls' experience in assetiveness toward premarital sexual behavior.

Method: Data were acquired through a thorough interview on eight teenage girls aged from 18 to 21 years old selected with purposive sampling technique. The data were analized with Colaizzi approach.

Results: The themes found related to teenage girls experience on premarital sexual behavior including sexual behavior determinant, reasons on being assertive, the assertiveness, its impact or effect, and obstacle of being assertive.

Conclusion: This study recommends healthy sexual education for teenage girls to prevent premarital sexual behavior by boldly stating the limitation on what to do and not do while in a relationship, by always having healthy communication with parents, by developing religion believes and knowledge, and as well by boldly reject any negative or unhealthy behavior while in a relationship.

Keywords: *Assertiveness, premarital sexual behavior, teenage girls.*

Introduction

Sexual activities are intensified among teenagers as the result of hormonal alteration during puberty. This is in line with youth are encouraged to do premarital sexual practice like kissing or making out even some of them are okay with free sex nowadays. Premarital sexual behavior is a kind of sexual behavior done without official marriage by law as well as religion law or customs[1].

A survey done by National Population and Family Planning Board (BKKBN) on 2009 states that teenagers in Jabotabek (51%), Bandung (54%), Surabaya (47%) and Medan (52%) openly admit having done premarital sexual activities[2]. Data from *United Nations Development and Social Affair* (UNDESA) in 2010 state that Indonesia is in 37th for the country with the highest rate of early marriage and the second highest in ASEAN after Cambodia[3]. The premarital sexual behavior also causes more than six million cases of teen pregnancy annualy, and four million cases of risky abortion among teenagers compounded by half million of teenagers are positively exposed to HIV in Asia-Pacific. This shows the piling up numbers of premarital sexual behavior cases among teenagers which also in line with the negative impact of it.

Reasons behind premarital sexual behavior are 57.5% of boys saying that they are curious while 38% of teenage girls stating that it just happened like that, and 12,6% among them admits that they are being forced to do that[3]. Some behaviors in relationship that can fairly lead to premarital sex such as respondents regularly having conversation (99%), holding hands (82%), hugging (45, 9%), kissing cheecks (47,3%), kissing lips (22%), kissing necks (11%)[1]. The unhealthy teenage

dating are exposed to risky sexual behavior which is shown through 92% of teenagers admitting holding hands, kissing (82%), and petting (63%)[4].

Teenage girls are helpless in rejecting their boyfriends' desire since they are afraid. Moreover, these girls are helpless in defending themselves to not kiss their boyfriends for some reasons, such as"…since we're dating"[5]. Violence in teenage dating happens because victims tend to be powerless or afraid to say "no", tend to isolate or to punish them selves[6]. This can be related to gender issues as males see the powerlessness on females. This corresponds with a study which shows teenage girls usually doubtful in rejecting their boyfriends' desire. They tend to be afraid of hurting their boyfriends' feeling instead of their own emotional responds such as anger or ashamed[5]. This proves on the deficiency of the girls' life skills about healthy life behavior, risky sexual behavior, and assertiveness.

Material and Method

This study is qualitative study with the use of phenomenology-descriptive approach. The strategy used to gather the data is through deep interview. The data are collected from eight participants selected with purposive sampling technique with inclusive criteria such as teenage girsl aged between 18-21 years old who used to have boyfriend or currently dating for at least a month, willing to participate, fully involved for the study, signing the given informed consent,able to tell their experience while dating, and able to speak Bahasa fluently.

The analysis of the data was done through Colaizzi analysis method, including listening to the verbatim record, transcribing, re-reading all transcripts to identify the keywords through statement filter which then can be significant with the studied phenomenon, decoding the meaning of the keywords, arranging the identified meaning into several themes, and integerating the results of the study into one narration.

Funding: There are five themes related to teenage girls' experience on assertiveness toward premarital sexual behavior.

Premarital sexual behavior determinants: Most of pasrticipants have admitted in committing premarital sexual behavior such as holding hand, hugging, and kissing.

"well, it's normal dating stuff, thinking of him and kissing him, are very normal, shame if we didn't do those stuff while we're dating… if we hanging out, we usually holding hands" (P1)

"just like other couples, while I see him, we usually chat, telling stories, but sometimes he can be annoying when he hugs me or touching me, he pretended to accidently touch my boobs…" (P3)

"when we hang out, normally we chat and holding hands, not doing weird stuff" (P2;P3;P4;P6;P8)

Some participants do not commit premarital sexual behavior.

"since we're still in college and my boyfriend is also my classmate, it will be weird if we do anything like that. When we're dating, we just hanging out, talking, in crowd, like classroom or canteen…" (P5)

"I usually see my boyfriends with my friends tagging along, while doing paperwork or having lunch together…" (P7)

Types of premarital sexual behavior by participants such as holding hands, hugging, kissing. That premarital sexual behavior of teenagers is an activity carried out by teenagers while dating starting from talking, holding hands, seducing, flirting, cuddling, kissing, hugging, caressing to having sex[6]. Dating is a phase of two individuals of the opposite sex characterized by mutual personal recognition of both the weaknesses and strengths of each individual. There are two types of dating, namely healthy and unhealthy dating. Healthy relationship while dating covers physical, psychological and social aspects. Unhealthy dating includes kissing, petting and sexual intercourse[7].

Premarital sexual behavior in teenage dating is a manifestation of sexual desire that is manifested starting from glancing towards the sensual part of the partner to intercourse performed by teenagers who are dating. Dating behavior, especially students or late adolescents (18-24 years old) currently leads to negative dating behavior or very complex sexual behavior. Sexual activity as if it has become a common thing done by teenagers in relationship[8]. The existence of sexual urges and feelings of love make teenagers want to always be close and make physical contact with their partners. Physical closeness and physical contact occuring between adolescents who are on the ground will be

different from physical proximity or physical contact between teenagers and friends and family. This physical closeness will ultimately lead to sexual behavior in teenage dating[9].

The reasons of assertiveness toward premarital sexual behavior: Almost all of participants understand on the importance of being assertive toward premarital sexual behavior as such behavior is condemned by religion as well as among their parents.

"my parents always told me, even when I was a little, to always be careful when befriend someone as well as dating like when we're together on a date, my parents told me to not get too closed to avoid any unfortunate stuff, my Koran teacher as well said the same stuff, as the devil will seduce us to do anything sinful. (P6)

"my parents always told me, to always be careful, if I hang out with a boy, I shouldn't be touched by him as he would ask for more. You know boys if we allow him to touch us, he will ask for more, so I have to be careful…" (P2;P3;P5)

"dating is prohibited by religion, it is unacceptable and sinful…" (P5;P7;P8)

The reason of assertiveness shown on teenage girls toward premarital sexual behavior is because it is prohibited by religion and parents. There are many things that make teenagers have to limit sexual activity during dating, such as family norms, religion and social custom which are signs that must be adhered to by teenagers who are dating[9]. Social prohibitions and restrictions from attaining religious rituals have created a negative impact on adolescents and have blocked the access to the right kind of information[10].

The assertive behavior toward premarital sexual behavior: Almost all participants are assertive in effort to prevent premarital sexual behavior, either through physical reaction or verbal reaction by expressing anger and fending off hand.

"if my boyfriend begun to make a move, like embracing or caressing and squeezing, I just have to fend his hand off.." (P3)

"Well, I just snapped out if my boyfriend touched me like that, I will yell him big time, he will shut off eventually and go" (P2)

"if he tried to touch me, I will be very furious at him. We have an agreement before about touching, so it is justifiable if I yell at him "(P6)l.

Participants are assertive in making efforts to avoid premarital sexual behavior both physical endeavors such as hitting and verbally ie angry or cursing. Assertive behavior is the ability of individuals to express positive or negative feelings and thoughts in a firm and free manner while still paying attention to the feelings of others. Individuals are more likely to be assertive to people when individuals feel confident and have a positive attitude towards themselves and others. Assertive behavior is used to direct individuals to remain consistent and not easily affected by an unfavorable environment, given the many problems faced by adolescents. A person who is assertive directly and clearly expresses his positive and negative feelings without disturbing or violating the feelings and freedoms of others[2].

Assertive teens are better able to say "no" to things that are negative and unwanted, able to submit requests, able to start, continue, and end public conversations. Teenagers are more able to express their emotions properly without having to be aggressive or permissive. Adolescents who are assertive are able to communicate with everyone openly, directly, honestly, and properly, have an active view of life, have efforts to get what they want, are able to express their feelings and thoughts, are able to give and receive praise and can accepting his limitations[11]. This is closely related to adolescent assertive behavior towards the opposite sex. Communication that runs less effectively often occurs in interpersonal relationships because individuals are less able to express thoughts, feelings, and desires honestly and openly. Individuals show helplessness, passivity, violated personal rights, and inability to say "no" about something that is contrary to conscience.

The impact of assertiveness toward premarital sexual behavior: Some participants recognize the impact of assertiveness toward premarital sexual behavior in teenage dating, namely breaking up, huge fight and forceful action.

"My boyfriend were offended by my action, then he got very angry while saying harsh things to me, he insisted, and grabbed my hand, I fended it off again, as he was very annoyed with me, we finally broke up..." (P3)

"He couldn't get over it, he turned back and said things to me, said I was pretentious, hypocrite, and so on... then he left me ... we broke up..." (P2)

"My boyfriend couldn't face the fact that didn't want to be touched, until finally he pulled me and forced me, until I fell ... I was really upset, and finally I got angry ... we broke up (P4)

Assertiveness of premarital sexual behavior is the ability of a person to be firm in defending his sexual rights to not be harassed and can make sexual decisions while still giving respect to the rights of others and without hurting others or their partners, and expressing themselves honestly in ways that right without disturbing anxiety so as to encourage the realization of parallels and similarities in relations with their partners[11]. The reality in society shows that there are still many individuals who are not assertive in rejecting the invitation to conduct premarital sexual behavior. This makes individuals vulnerable to sexual harassment, which is generally caused because individuals do not dare to reject the invitation to have sexual relations by their partners. Such individuals lack assertive abilities in sexual behavior[2].

As a result of being assertive in an effort to avoid premarital sexual behavior in courtship, namely breaking up, harsh words and coercion. Teenagers should not only see the momentary impact that they will receive as a result of rejecting premarital sexual behavior in courtship as decided by their boyfriend, but must think about the great risks they will experience if they have pre-marital sexual relations in courtship. Young women who are able to refuse premarital sexual behavior aim to avoid things that are not desirable[11]. There is a relationship between assertiveness and the tendency to be victims of dating violence in adolescents, namely the higher the assertiveness, the lower the tendency to become victims of dating violence, and vice versa[12].

The obstacles of assertiveness toward premarital sexual behavior: Almost all participants recognize the obstacles in being assertive toward premarital sexual behavior, which is difficult to convey their attitude.

"it's the difficulties of having a relationship, sometimes I couldn't think the way to refuse it, if he startedto touch my hands, I was afraid, if I refuse, he would be mad, while if he continue it, I was afraid if he's gonna do something else wrong,so I didn't know what to do." (P2)

"I didn't know how to be honest to him, I didn't know how, I was afraid he's going to be mad" (P6)

"It's hard for me to control my emotion... if I was upset, I impusively hit him right away ..." (P3)

Obstacles in being assertive about premarital sexual behavior are difficult in conveying his attitude.Teenagers are eager to forbid their partners to touch sensitive parts of the body but they are afraid of losing their partners[8]. Adolescents do not dare to reject their partner's wishes for fear that their partner will get angry with him. In addition, girls cannot maintain their desire not to kiss their girlfriends for the reason stated by their girlfriend, namely "the same time their boyfriend doesn't want to"[5]. Research conducted by The occurrence of violence in dating because victims tend not to dare to reject or say "no", close themselves and punish themselves[6]. Adolescent's pattern of thinking revolves around the fact that they are invincible and invulnerable[13].

Conclusion

Premarital sex behavior carried out by teenagers such as holding hands, hugging, kissing is considered a reasonable dating behavior among teenagers. Dating is used as a way of approaching between individuals of the opposite sex, which is characterized by knowing each other both the strengths and weaknesses of each. Experience of young womenin being assertive by limiting sexual activity during dating keeping in mind family, religious and community norms that become signs that must be obeyed. Adolescents who are able to be assertive are better able to say "no" to things that are negative and undesirable, able to submit requests, able to start, continue, and end a general conversation to reject pre-marital sexual behavior. Increasing the ability of adolescents to be assertive about premarital sexual behavior can be done through health education efforts.

Conflict of Interests: The authors have no conflict of interests to declare.

Abstract

Risk management is a system owned by all industrial sectors, including the industry in the educational sector, such as a university laboratory. Amongst the method of risk management that are usually applied is HIRADC method, which is a systematic stage to assess hazards, to analyze risks, and to devise controls according to the existed risks. This research is descriptive research which aims to describe the dwelled phenomena. There are several stages in this method, namely hazard identification, risk analysis, and risk control. The data is gathered by conducting observation before doing data matching with Mr. Achmad Tarmidzi, the Laboratory of Medical-Surgical's worker. The research results indicate that from two activities performed in the Laboratory of Medical-Surgical at Faculty of Nursing Universitas Airlangga, such as injection practicum and wound care practicum, there are six hazards discovered, namely medicine in ampoule packaging, needle stick, alcohol, NaCl 0.9% solution, and Chlorine 0.5% solution. The risks ascertained are skin and eyes irritation caused by the exposure of chemical substances like alcohol, NaCl 0.9% solution, and Chlorine 0.5% solution. Other than that, the risks found belong to the categories of the low-risk level and moderate-risk level. The controls and recommendations provided are the conveyance of socialization regarding the practicum in accordance with the SOP, the wearing of PPE, such as rubber gloves, goggles, and long-sleeved shirts.

Keywords: *Risk assessment, HIRADC, laboratory.*

Introduction

The rapid growth of civilization has been associated with various growth in technological sectors. One sector that is benefited by the development of technology is the educational sector. On the other hand, the development of technology can also have bad impacts. According to the book authored by Ramli (2010) entitled "*Pedoman Praktis Manajemen Risikodalam Perspektif K3*", accidents are most likely caused by the contacts between human and machine[1].

Referring to ILO (International Labour Organization), the number of occupational accidents have reached approximately two million per year, which is caused by accidents, injuries, and occupational illnesses. If compared, the number is equivalent to accidents experienced by 5,000 workers per day or 3 workers per minute. Other than that, ILO also declared that at least there are 2.78 death cases every year with 380,000 among it are occupational accidents[2].

Risk management is a system that must be owned by a company, providing risk management itself is meant to protect a company from all things that can cause losses. The risk in the field of Occupational Safety and Health in a company usually focuses on negative risks, such as injuries, property damages, or operating disruption. Denoting to OHSAS 45001, risk can be explained as the likelihood of adverse events and its severity caused by the events. Meanwhile, risk managementas cited from AS/NZS 4360, is a system, process, and culture which directly focus on the effectiveness of the management system to reduce the exposure and the consequences that may follow[1].

HIRADC (Hazard Identification, Risk Assessment, Determining Control) in ISO 45001 is interpreted as a procedure of planning, in which a company needs to perform several stages of activity, namely hazard identification, risk assessment, and determining control[3].

1. Hazard identification is a process of identifying and distinguishing dangers and hazards in a working environment. The hazards can be in forms of physical, chemical, biological, psychosocial, or ergonomic/physiological hazards and also be caused by the workers, which also known as at-risk behavior.

2. Risk assessment as referred from ISO 45001:2018 is an activity to assess the degree of the risk from dangers and hazards that have been identified as well as to review the effectiveness of the existent control program.. After passing through the stage, the results of the likelihood and severity will be inputted to risk matrix to figure out the level of each risk.

Table 1. Qualitative Measures of Likelihood by AS/ NZS-4360: 1999

Level	Description	Explanation
5	Almost certain	Expected to occur in most circumstances
4	Likely	Will probably occur in most circumstances
3	Possible	Might occur at some time
2	Unlikely	Could occur at some time
1	Rare	May occur only in exceptional circumstances

Table 2. Qualitative Measures of Consequences by AS/NZS-4360: 1999

Level	Descriptor	Example detail
1	Insignificant	No injuries, low financial loss
2	Minor	First aid treatment, on-site release immediate contained, medium financial loss
3	Moderate	Medical treatment required, on-site release contained with outside assistance, high financial loss
4	Major	Extensive injuries, loss of production capability, off-site release with no detrimental effects, major financial loss
5	Catastrophic	Death, toxic release off-site with detrimental effect, huge financial loss

Table 3. Qualitative risk-matrix Level of Risk

Likelihood	Consequence				
	1	2	3	4	5
A (Almost certain)	H	H	E	E	E
B (Likely)	M	H	H	E	E
C (Possible)	L	M	H	E	E
D (Unlikely)	L	M	M	H	E
E (Rare)	L	L	M	H	H

Explanation:

Extreme : extreme risk, immediate action required

High : high risk, senior management attention needed

Moderate : moderate risk, management responsibility must be specified

Low : low risk, manage by routine procedures

3. Determining control is an endeavor or a program that is intentionally made to lessen losses or severity that may arise. An organization to make changes and controls need hazard identification and risk assessment to notice the severity level of hazards that are likely to occur.

Table 4. Hierarchy of Risk Control (Hierarchy of Controls ANSI ZIO)

Hierarchy of Controls		
Elimination	**Eliminating potential hazards**	Make the workplace safe for workers
Substitution	Substituting equipment/ machine that is no longer suitable for use	
Engineering	Modifying by designing machine/equipment or workplace to become safer	
Administrative	Procuring posters, workshops, OSH regulations, working hours, etc.	Secure workers from exposure
Personal Protective Equipment (PPE)	Providing equipment that can lessen the risk of the occurrence of accidents or occupational illnesses	

Material and Method

This research is descriptive research, which is aimed to depict a phenomenon. The method of risk analysis applied in this research is HIRADC method in accordance with ISO 45001:2018. Conferring the method, there are several steps mentioned, namely hazard identification, risk assessment, and determining

control. The data in this research is qualitative data in form of description, words, or behavior that were observed. By referring to the classification of qualitative data by Patton in Ivanovich (2003), the data used in this research is in form of observation result[4].

In addition, hazard identification was also completed by observation by the researchers. After that, the researchers counted the risk assessment score and matched it with the Likelihood and Severity level and then matching and checking it with the laboratory worker, Mr. Achmad Tarmidzi. Thereafter, after completing risk analysis with the laboratory worker, the researchers planned control activity to reduce the risks that are likely to occur.

Findings:

Hazard Identifications: Hazard identification itself is determined based on the type of hazard. The Laboratory of Medical-Surgicalcontains two main activities, such as injection practicum (intravenous, intramuscular, intracutaneous, and subcutaneous) and wound care practicum.In fact, the hazard identification process is not only performed to hazards that can be controlled, but also to those outside the organization. Risk identification itself has several intentions, one of those is to enlist the risks that can be used as a reference of the process to strengthen, prevent, fasten the process, and many more[5].

Injection Practicum: It is noticed that there are several injection practicums, namely intravenous injection, intramuscular injection, intracutaneous injection, and subcutaneous injection. Intravenous injection is a kind of injection to deliver liquid substances, especially antibiotics, through the bloodstream system directly to a vein. It is usually done when giving infuse liquid to the patient through arm folds, leg, neck, and head. Meanwhile, intramuscular injection is one of the ways to deliver medicine in form of vitamin, vaccine, antibiotic, and antipyretic. On the other hand, intracutaneous injectionis a kind of injection by delivering medicine to the epidermis, resulting in skin induration, such as thickening and hardening of the skin that is visible to the eyes. Additionally, intracutaneous injectionis often given during the skin test, tuberculin test, or *Mantoux* test. Lastly, subcutaneous injection is perceived as delivering liquid medicine into the layer of fat under the skin by using a syringe. The types of medicine delivered are insulin and local anesthesia[6]

The injection practicum is noticed to be containing several hazards, which can be classified to physical and chemical hazards. The physical hazards that can be found are ampoule glass packaging medicine that can result inthe exposure of broken glass when opening the packaging and the syringe that can cause fingers punctured by the needle stick. Meanwhile, the chemical hazard discovered in this activity is the use of alcohol as disinfectant or sterilizer of practicum equipment that can trigger skin and eyes irritation if exposed to the chemical substance.

According to the article entitled "*Dermatitis Kontakpada Tangan Perawat Rumah Sakit: Kasus Seri*" authored by Ariwibowo (2013), it was affirmed that the type of alcohol that is commonly used by medical personnel is benzyl alcohol 1%, which functions as disinfectant and preservatives for injection materials and the installation of new tissues. On the other hand, primary alcohol, such as ethanol and methanol, can generate skin conditions, for examples, dry skin, irritation, and the increase of skin sensitivity. Additionally, benzyl alcohol has been observed to remove water and lipid from the epidermis that is believed to malfunction the epidermis barrier[7].

Moreover, there is a physical hazard, namely punctured by needle stick. This can be said so providing unsterile needle stick is one of the media to spread nosocomial infection and injury.

Wound Care Practicum: Wound care practicum is conducted to comprehend the mechanism and procedures for selecting wound dressing as well as the difference of caring between the moist wound and dry wound. The physical hazard found is the presence of scissors that can cause injury if not used properly during the practicum. In the meantime, the chemical hazard discovered is the presence of chemical substances, such as NaCl 0.9% solution, alcohol 70%, and chlorine 0.5% solution.

The selection of wound dressing is prominent in the process of wound healing. Furthermore, wound healing is also beneficial to fasten the cell replacement process to make new tissue and to prevent microorganism from entering the wound. This because the wound is one of the open doors for bacteria, virus, and other organisms that can cause infection[8].

Alcohol is a chemical substance that is most used in the field of health. Generally, alcohol is colorless and odorless liquid. Referring to the grade arranged by NFPA,

alcohol belongs to level 3 of the severity level and its impact on health. Besides causing skin irritation, alcohol 70% can also cause eyes irritation if directly exposed to it. Acute eyes irritation can be severe conjunctiva membrane irritation, cornea myopia, redness, pain, runny, and blurred vision. As for the long-term irritation or chronic, alcohol 70% can cause conjunctivitis[9].

Chlorine 0.5% solution is a greenish yellow gas with irritant characteristics that are likely to cause acute damage on the upper and lower respiratory tract. The consequences that often arise due to the exposure of chlorine are eyes and respiratory tract irritations, and in several cases, chlorine can also result in death. In the acute symptoms, chlorine gas poisoning on the eyes can cause eyes pains which eventually cause tears due to the inflammation of the conjunctiva. It may take quite some time for the onset of chronic symptoms, yet chlorine gas poisoning can cause eye burns[10].

The damage of respiratory tract caused by chlorine gas, such as mucosae membrane irritation, can manifest to become respiratory tract disorder. There are many complaints regarding the disorder, namely rhinorrhoea, persistent severe cough, shortness of breath, out of breath, and the feeling of being suffocated. This happens due to the fact that chlorine has an oxidizer characteristic by releasing oxygen nascent that can form hydrochloric acid. Later, this can lead to nose mucosae, pharynx, larynx, and trachea inflammations. In severe cases, this can trigger *laryngotracheobronchitis* or the presence of blood in the respiratory tract[10].

Risk Analysis: The risk analysis performed present suggestions for the evaluation stage, which later will be considered by the company to decide what treatment to do to the risk sources[5]. In this stage, the assessment by giving scores to hazard ratings is needed. The scores given are measured by observing the Likelihood, or the possibility of the risk occurrence, and the Severity, or the consequences of the risks.

Table 5. Risk Analysis and Risk Level

No.	Activity		Risk	Risk Analysis		Total Risk	Risk Level
				L	S		
1.	Injection practicum (intravenous, intramuscular, intracutaneous, and subcutaneous)	Ampoule glass packaged-medicine	Scratched by the glass when opening the ampoule	2	2	4	Low
		Syringe	Wounds caused by the syringe	3	2	6	Moderate
		Alcohol	Skin and eyes irritation caused by the exposure of alcohol	1	2	2	Low
2.	Wound care practicum	Scissors	Wounds caused by the sharp edge of the scissors	2	2	4	Low
		NaCl 0.9% solution (PZ)	Skin irritation caused by the exposure of chemical substances	1	2	2	Low
			Eyes irritation caused by the exposure of chemical substances	2	2	4	Low
		Alcohol 70%	Skin and eyes irritation caused by the exposure of chemical substances	1	2	2	Low
		Chlorine 0.5% solution	Skin irritation caused by the exposure of chemical substances	2	2	4	Low
			Eyes irritation caused by the exposure of chemical substances	2	2	4	Low
			Respiratory tract irritation caused by healing the steam of chemical substances	2	2	4	Low
			Skin burns caused by the exposure of chemical substances	2	3	6	Moderate

The counting and the categorization of the scores referred to the tables proposed by AS/NZS 4360-19999. It is noticed that the risks discovered belong only to two levels: moderate and low. This is caused by the low frequency of risk occurrence in the laboratory with not too detrimental impacts.

Determining Control: In this stage, the hazards and risks that have been identified are analyzed to formulate the control strategies based on each risk category. The determining control used in this research refers to the one avowed by ANSI ZIO, which consists of elimination, substitution, engineering manipulation, administrative and PPE. Determining control can also be categorized based on the level of each risk.

Table 6. Risk Level Classification

Risk Level	Follow-up	Score
Low-risk (L)	Additional control is not needed. What to be noticed is less-costly way out and the improvement that does not require a large additional cost. Monitoring is required to ensure that the control is preserved and implemented properly.	1-4
Moderate-risk (M)	Actions to decrease risks are obligatory, however, the prevention costs need to be well-calculated and limited. Risk reduction measurement needs to be implemented properly.	5-9
High-risk (H)	The works have been done until the risks are reduced. The resources allocated to reduce risks need to be considered. If the risk is found during the work, the control needs to be immediately executed.	10-16
Extreme Risk (E)	The work is not done nor continued until the risks have been reduced. If reducing risks with limited resources is impossible, then the works cannot be continued.	20-25

This research revealed that from two activities, six hazards are found, namely ampoule packaged-medicine, needle stick or syringe, alcohol, NaCl 0.9% solution, and Chlorine 0.5% solution. From those six hazards, only two hazards that belong to moderate-risk level, for instance, the risk of being punctured with needle stick or syringe and skin burns caused by the exposure of Chlorine 0.5% solution when conducting a practicum.

In accordance with control hierarchy, several controls that need to be carried out to decrease the occurrence of occupational accidents are the conveyance of manuals on the procedures and rules during every practicum, the carrying out of practicum as procedure, the wearing of Personal Protective Equipment, such as rubber gloves to prevent skin irritation due to the exposure of chemical substances and long-sleeved shirt to lessen the risk of skin burns caused by the exposure of chlorine.

Conclusions

Based on the research that has been done, can be concluded that at Laboratory of Medical – Surgical has a low-risk potential. It can bee see that from 11 risks potential only 2 from them that has a moderate-risk. Meanwhile, they has been introduced to using a PPE but many of them don't wear one such as rubber gloves or long sleeve shirts that can prevent the contact from hazard to the skin.

Denoting the research and observation that have been carried out, the recommendations that can be provided are the conveyance of socialization concerning on the SOP (Standard Operating Procedure) to the academicians who are likely to involve in the practicum activities, including laboratory workers, students, lecturers, and cleaning services.

Abstract

Introduction: Chronic myeloid leukemia (CML) is a hematopoietic stem cell cancer driven by the BCR-ABL fusion protein that arises from the translocation of chromosomes 9 and 22. Since the found of the Tyrosine Kinase Inhibitor (TKI) as a targeted therapy, the relative survival rate of 5 years has significantly increased compared to the era of the use of previous agents. As a successful leukemia treatment, it can be seen based on the survival rate. Several factors have been known to influence the survival and prognosis of CML patients, including the age of the patient at diagnosis, gender, and response to therapy and treatment. This study aims to determine how many a three-year survival rates for CML patients with targeted therapy in Makassar and the factors that affect survival.

Method: This study used a retrospective cohort using secondary data (medical records) of CML subjects who had been outpatient or inpatient followed in the same time period. The study was conducted in January 2015 to December 2017 at Dr. Wahidin Sudirohusodo Hospital, Makassar. The samples consisted of 108 subjects who met the inclusion criteria. Gender, age, BCR-ABL transcript, targeted therapy and status were taken from medical records. Data were analyzed with SPSS 22.0 version and survival analysis, Meier Kapplan curves, survival median, log-rank and test statistic

Results: There were 108 subjects of CML patients who received targeted therapy, 58 male (53.7%), 30-39 years old 32 subjects (29.6%), b3a2 transcript 67 subjects (73.6%), Imanitib 62 subjects (57.4%) and status for 36 months was followed during the targeted treatment of dead 19 subjects (17.6%) and alive 89 (82.4%). The survival rate of a three years CML subjects who received targeted therapy of 51%, found no significant relationship between gender, age, and targeted therapy

Conclusion: The survival rate of three years of CML patients at Wahidin Sudirohusodo Makassar Hospital is 51% and factors related to age, gender, and targeted therapy tend to influence even though statistically not significant

Introduction

Chronic myeloid leukemia (CML) is a hematopoietic stem cell cancer driven by the BCR-ABL fusion protein that arises from the translocation of chromosomes 9 and 22.(1) The conjugation of the breakpoint cluster region (Bcr) gene on chromosome 22 and the Abelson kinase (Abl) gene on chromosome 9 creates the Bcr-Abl oncogene, which encodes the deregulation of tyrosine

kinase. Bcr-Abl activity will create uncontrolled cell proliferation and reduce apoptosis, thereby it will increase malignant expansion of pluripotent stem cells in the bone marrow.[2,3]

Data on CML in Indonesia in 2018 obtained as many as 2,374 patients, most in Surabaya as many as 516, while at least, in Banda Aceh as many as 40, and in Makassar as many as 110. The median age for CML event is 45-55 years old and the event will increase with age.[4]

By recognizing the molecular basis of CML, a highly effective targeted therapy has been developed. This therapeutic agent will block the activity of the tyrosine kinase inhibitor (TKI) of Bcr-Abl in which will inhibit the course of the CML molecular process. Since the found of the Tyrosine Kinase Inhibitor (TKI), the relative survival rate of 5 years is much increased compared to the era of the use of the previous agent. The first generation of Tyrosine Kinase Inhibitor, Imatinib Mesylate was proven to provide excellent clinical outcomes. In Indonesia, the use of TKI has been applied to CML patients and has reached the use of the second generation namely Nilotinib (Tasigna). The comparison of the survival of the two target therapy was reported in the ENESTnd study (Evaluating Nilotinib Efficacy and Safety in Clinical Trial-Newly Diagnosed Patients) where from the 5-year follow-up of patients with nilotinib 300 mg of 93.7%; nilotinib 400 mg by 96.2% and Imatinib 400 mg by 91.7% did not show a significant difference between the two. However there were differences in death due to progression from CML, namely 16 Imatinib death 93.8% while 6 Nilotinib death 97.7%.[5] The survival of CML patients with imatinib in 2006 reported by Drukker, et al. stated an overall survival of 89% after five years.[6]

As a successful leukemia treatment, it can be seen based on the survival rate.. In leukemia patients, using a five year survival rate. This was study carried out for three years as in the second or third year the patient level of compliance sometimes begins to decrease because they felt healed. Several factors that have been known to affect the survival and prognosis of CML patients include the patient's age at diagnosis, gender, and response to therapy and treatment. Now days there is no data of survival rates of CML with targeted therapy in Makassar, therefore we are conducting this research.

Method

This study used a retrospective cohort using secondary data (medical records) of CML subjects who had been outpatient or inpatient followed in the same time period. The study was conducted in January 2015 to December 2017 at Dr. Wahidin Sudirohusodo Hospital in Makassar. Samples were CML patients who met the inclusion criteria included (1) CML patients based on BMP (2) positive BCR-Abl (3) age ≥ 18 years (4) willing to join the study. Exclusion criteria (1) Patient cannot be contacted either by telephone (2) Incomplete data. The minimum number needed is 61 research subjects. Sampling was carried out consecutively during the study period until the desired number of samples was reached. Furthermore, Data were analyzed with SPSS 22.0 version and survival analysis, Meier Kapplan curves, survival median, log-rank and test statistic.

Results

From this research, subject studied was 108 CML patients with target therapy, consisted of 58 male (53.7%) and 50 female (46.3%). Age of the subjects were 30-39 years is 32 (29.6%). Bcr-abl transcripts of the subjects is b3a2 with 67 subjects (73.6%), 22 subjects (24.2%) b2a2, and 1 subject (1.1%) c3a2 and e1a3 respectively. Subjects receiving targeted therapy were imatinib 62 subjects (57.4%) and nilotinib 46 subjects (42.6%). The last status during the administration of target therapy is dead 19 subjects (17.6%) and alive 89 (82.4%). It can be seen in table 1.

Table 1. Distribution of Sample Characteristic (n=108)

Variable		n	%
Gender	Male	58	53,7
	Female	50	46,3
Age	<30 years	24	22,2
	30-39 years	32	29,6
	40-49 years	26	24,1
	50-59 years	16	14,8
	>=60 years	10	9,3
BCR-ABL Transcript	b2a2	22	24,2
	b3a2	67	73,6
	c3a2	1	1,1
	e1a3	1	1,1
Targeted therapy	Imatinib	62	57,4
	Nilotinib	46	42,6
Status	Dead	19	17,6
	Alive	89	82,4

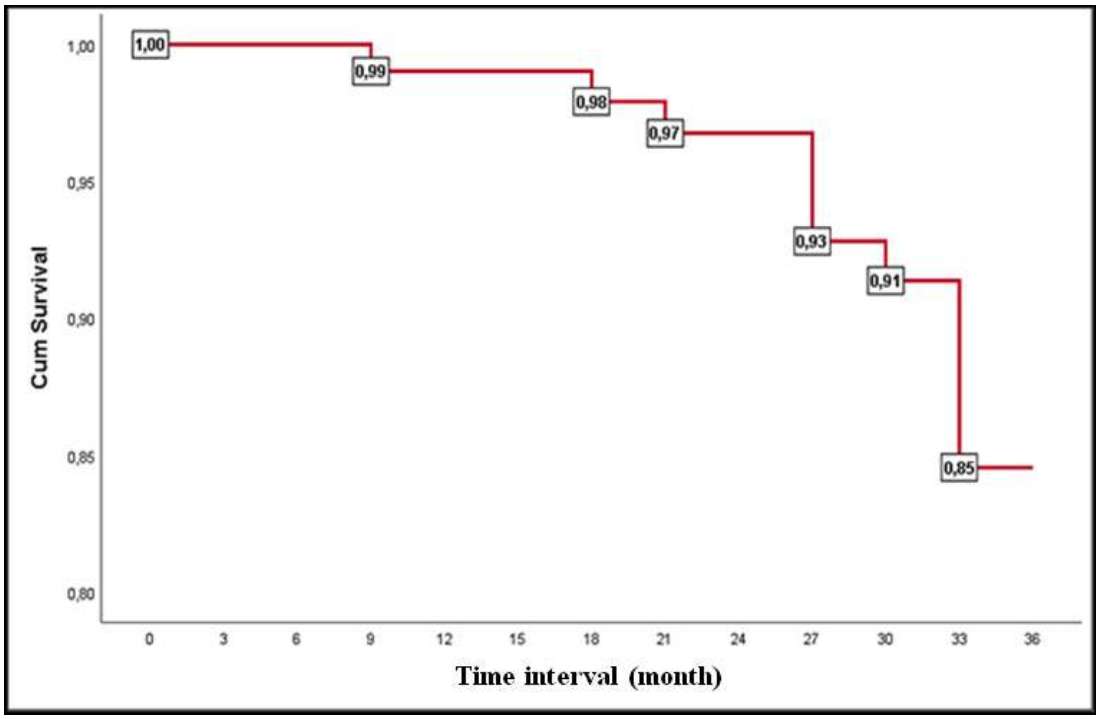

Figure 1. Kaplan-meier Curves of Three-year Survival Probability

Three-year survival rate for CML patients with targeted therapy, an analysis using the life table-Wilcoxon (Gehan) method was obtained, and a one-year survival rate (99%), a two-year survival rate (93%) and a three-year survival rate (51%) (table 2).

Table 2. A Three-Year Survival Analysis of CML Patients

Time interval (month)	n	Survival (%)
0	108	100
3	108	100
6	106	99
9	98	99
12	91	99
15	89	98
18	88	97
21	81	97
24	77	93
27	67	91
30	61	85
33	42	85
36	32	51

Figure 1 shows the probability of survival at each 3-month interval in the Kaplan-Meier curve. The duration of follow-up of all patients is from 5 to 102 months with a mean of 30.4±16.3 months.

Table 3. Three Years Survival of CML Patients by gender

Gender	n	Survival Estimation		p
		Mean (Month)	%	
Male	58	34,6	43	0,856
Female	50	34,2	57	

Table 3 shows that survival in female is higher than in male, which is 57% and 43% (34.2-34.6 month), but statistically not significant (p> 0.05).

Table 4. Three Years Survival of CML Patients by Age

Age (Years Old)	n	Survival Estimation		p
		Mean (Month)	%	
<30	24	34,5	73	0,631
30-39	32	34,9	64	
40-49	26	34,4	54	
50-59	16	34,1	37	
>=60	10	33,8	29	

Table 4 also shows a decrease with increasing age, but not statistically significant (p> 0.05). The highest survival occurred at age <30 years (73%) and the lowest was at age > = 60 years (29%).

In general, survival in the two treatment targets was not found to be statistically significant difference (p> 0.05) (table 5).

Table 5. Three Years Survival of CML Patients by Targeted Therapy

Targeted therapy	n	Survival Estimation		p
		Mean (Month)	%	
Imatinib	62	34,3	52	0,849
Nilotinib	46	34,7	47	

Table 5 also show imatinib gives the highest survival rate (52%) compared to nilotinib (47%). The mean survival rate is also not much different, namely 34.3-34.7 months.

Discussion

This study found that the subjects studied was 108 CML subjects. Most of the subjects were male: 58 (53.7%) and 50 female (46.3%). This result is in line with research conducted by Reksodiputro et. al. in 2011 in Jakarta, where 19 reported samples were studied, slightly dominant in males than females at 63.2%.[7] Several overseas studies conducted by Hofmann in 2015 reported that CML patients were more frequent in male than female.[8] Research was also supported by SEER (Surveillance, Epidemiology, and End Results) USA which stated that of all race, the ratio of male and female from CML is 2.2:1.3.[9]

Age range between 18-72 years old with an average of 39.8±13.1 years old. Research conducted by Reksodiputro et. al. in 2011 where the age of CML patients was in the age range of 13-62 years.[7] It is different from American Cancer Society data that CML cases in the United States in 2019, the average age at diagnosis of CML is around 64 years. Nearly half of the cases are diagnosed in people aged 65 and older.[10]

The duration of follow-up of all patients is from 5 to 102 months with a mean of 30.4±16.3 months. In this study, a one-year survival rate of 99%, a two-year survival rate of 93% and a three-year survival rate of 51% (table 2 and figure 1). This study carried out for three years because, in the second and third years, the patient level of adherence in treatment slowly decreased, where patients sometimes seemed to have felt healed with the disease they experienced. In a study conducted by Di Felice et. al. in 2018 in Italy, 357 subjects reported having CML after being given TKI, survivability for one year (from 83.3, 95% CI 76.2-88.5% to 91%, 95% CI 86.5-94.4%) and survival for three years (from 60.4, 95% CI 51.7- 68% to 84.5%, 95% CI 79-89%).[11]

Survival rate for female was higher at 57% and for male 43%, with a mean survival rate at 34.2-34.6 months. But it did statistically not significant (p> 0.05) (table 3). Research by Berger et. al. in 2005 in Germany reported 856 subjects with Ph/BCR-ABL-positive CML in a randomized CML study, where the survival rate was average longer in female sufferers than in male with an average of 59-49 months and this also not significance.[12]

It is well known that age is a very important prognostic marker, and old age has several times been associated with poor survival. In this study, survival analysis according to age was found to be highest at age <30 years old (73%) and lowest at age> = 60 years old (29%).The decrease occurred with increasing age, but it was not statistically significant (p> 0.05) (table 4). Research by Castagnetti F et. al. in 2017 in Italy reported 337 CML patients, obtained OS was not affected by age in the interval between 18-69 years old (OS 5 years 92%, average from 89% to 95% in different decades), but the probability of OS 5 years for old age (≥ 80 years) was significantly lower (34%, P <0.0001).[13] Research by Di Felice et. al. in 2018 in Italy, reported survival by age was relatively decreased, age <65 years old (from 69%, 95% CI 55.3-79.5% to 94%, 95% CI 88.4-97.4%), age 65-74 years old (from 46%, 95% CI 30.8 -61.2% to 69%, 95% CI 52.5-80.4%) and age> 74 years old (from 8.05%, 95% CI 0.8-26.7% to 51, 2%, 95% CI 32.4-67.1%).[11] It can be assumed that relatively older ages have poor survival.

In general, the survival the Imatinib and Nilotinib, was not found to be statistically significant (p> 0.05). Imatinib highest survival rate (52%) compared to nilotinib (47%) with the mean survival rate also not much different, ie 34.3-34.7 months (table 5). The Food and Drug Administration (FDA) approved imatinib as the first-line treatment for newly diagnosed CML in December 2002 after the International Randomized Study (IRIS), which began in June 2000, the results of this study show the effectiveness of imatinib and its remarkable superiority with respect to complete haematological response rates (CHR), molekuler and complete cytogenetic responses

(MCyR, CCyR) with an overall survival rate (OS) of 85% for patients receiving imatinib.[13] This is different from the ENESTnd study by Larson et. al. (2012) in the United States, which examined 868 subjects comparing nilotinib (300 mg and 400 mg doses respectively) with imatinib, estimated that the three-year survival rate was higher in nilotinib with imatinib is nilotinib 300 mg 95.1%, nilotinib 400 mg 97.0% and 94.0% for imatinib.[14] While another study by Sanglio et. al. (2010) in Australia also found that nilotinib at a dose of 300 mg or 400 mg twice daily was better than imatinib in CML patients with newly diagnosed positive Philadelphia chromosomes.[15] According to Au WY et. al. (2009), In general, Asian patients, the use of imatinib is still used as the first choice therapy for treating CML patients. Either from Asia, Europe or the United States for giving imatinib is generally giving a good response. Most health practitioners in Asia follow the guidelines found on ELN (European Leukemia Net) or NCCN (National Comprehensive Cancer Network). Based on the results of studies that have been collected regarding the response of CML patients to imatinib, in Europe and the United States shows a complete hematological response of more than 95%, while in Thailand, Philippines, India, China, Hong Kong and South Korea by 90-100%.[16]

This study carried out no dose distribution of nilotinib or imatinib and no further examination of the molecular response achieved which should be examined every year after administration of target therapy so that the results found were inadequate. Besides, various factors influencing the survival of the comparison between the two target therapy are not evaluated precisely such as adherence to take medication or how to take medication, cause of death and the presence or absence of a previous comorbid patient history.

Conclusion

Survival rate of three years of CML patients at Wahidin Sudirohusodo Hospital in Makassar was 51% and factors related to age, gender, and target therapy tended to influence even though it was not statistically significant.

Conflict of Interest: No Potential conflict of interest relevant to be declared.

Fund: All funds in this study were covered by personal fund of the authors.

Ethics Committee: It has been approved by the ethical committee of Hasanuddin University Faculty of Medicine with reference number: 429/UN4.6.4.5.31/ PP36-KOMETIK/2019.

The Effect of Alkaloid Extract of Teucrium Polium L. Against Some Pathogenic Bacteria of Urinary Tracts and on Pyelonephritis Induced in Rats

Rawa'a A. Kushaish[1], Bushra A.M. AL-Salem[2], Mouayed A. Hussein[3]

[1]Lecturer, [2]Assist Prof., [3]Prof. University of Basrah, Chemistry Department, Iraq, Basra

Abstract

Objective: In view of the reported literature, the medicinal reputation of *T. polium* plant stills the researcher's attention. This study was conducted to evaluate the antibacterial effect of the alkaloid extract of aerial parts of *Teucrium polium L.* on some pathogenic bacteria and to evaluate the effect of the alkaloid extract in the treatment of induced pyelonephritis in rats.

Method: The aerial parts of *Teucrium polium* was powdered, extracted with ethanol, filtered, and dried. Antibacterial activity of alkaloid extract (250 mg/mL) was evaluated by agar diffusion method. 24 female rats became pyelonephritis by intraperitoneal injection of *Escherichia coli*. The animals were divided randomly into four groups. The experimental patients groups received this alkaloid extract and antibiotic gentamycin freely for 10 days but the control group received tap water. Biochemical parameters such as urea and creatinine (CRT) were measured by kinetic (Enzymatic) and colorimetric method

Results: Our results showed that antibacterial of alkaloid extract gave inhibitory efficacy against the studied bacteria. The results also showed that alkaloid extract can decrease serum urea and creatinine significantly ($P<0.05$, $P<0.001$ respectively).

Conclusion: Alkaloid extract of *T. Polium* have good antibacterial activity and it can be used in the treatment of pyelonephritis instead of antibiotic.

Keywords: *Teucrium polium L.; alkaloid extract; pyelonephritis; rats.*

Introduction

In recent years, due to alarming increase in the rate of infections with antibiotic resistant microorganisms and side effects of some synthetic antibiotics, there is increasing interest in medicinal plants as a natural alternate to synthetic drugs. Plants are known to produce a variety of compounds to protect themselves against a variety of their own pathogens and therefore can serve as antimicrobial substances[1,2]. *Teucrium polium L.* (family *Lamiaceae*) is a medicinal plant growing in the western Mediterranean region. *T. polium* is a grass plant, durable, with 10-30 cm in height and callous white exterior that ordinarily have dispersal in rocky and sandy area of Europe zones, North of Africa and South West of Asia[3]. *T. polium* has been used for different pathological conditions such as anti-diabetic, anti- spasmodic, anti-inflammatory, analgesic, and anti-oxidant effects[4-10].

In view of the reported literature, the medicinal reputation of *T. polium* plant stills the researcher's attention. The present study was carried out to investigate the possibility of the drug in the treatment of urinary tract infections and pyelonephritis induced by Escherichia coli in rats.

Materials and Method

Extraction and Isolation: *Teucrium polium L.* was collected from Basrah, Iraq. The aerial parts were separated, dried for one week in the shade at room temperature and then ground to a fine powder, and stored at 7°C in glass containers until used**.**The powdered plant material (250 gm) was extracted with a suitable volume of ethanol and 10% acetic acid on continuous mixing under room temperature for 4 hours. The mixture was filtered by using filter paper and concentrated by a rotary

evaporator at 70°C. The sulfuric acid (2%) was added to the concentrated filtrate and the concentrated filtrate was treated with concentrated ammonia until the pH=9, then the solution was filtered and separated by addition 20 ml of chloroform. This procedure was repeated three times and then the organic layer was isolated and dried at room temperature[11].

Bacterial Strains: Five bacterial species used in this study. The gram–positive species were *Staph scuiri (S. scuiri)* and Gram negative species bacteria were *Escherichia coli (E.coli), Pseudomonas aeruginosa (P.aeruginosa),Proteus sp*., and *Klebsilla pneumoniae (K.pneumoniae)*. These species were originally isolated from patients and identified by standard biochemical reactions.

Antibacterial Susceptibility Testing: Agar well diffusion method was followed for the determination of antimicrobial activity. The assay was conducted as described by[12]. Briefly, microorganisms from growth on nutrient agar incubated at 37°C for 18 hrs. were suspended in saline solution 0.85% NaCl and adjusted to a turbidity of 0.5 Mac Farland standards (10^8 cfu/ml). The suspension was used to inoculate 90 mm diameter Petri plates with a sterile nontoxic cotton swab on a wooden applicator. Eight millimeters diameter wells were punched in the Muller Hinton agar (MHA) and filled with 100 µl of 250 mg/ml of alkaloids and other compounds isolated from *T.polium*. The dissolution of the compounds was aided by 1% (v/v) DMSO which did not affect microorganism's growth, according to our control experiments. Commercial antibiotics were used as positive reference standard to determine the sensitivity of the strains. Discs were directly placed onto the bacterial culture. Plates were incubated at 37°C for 24 h. Antibacterial activities were evaluated by measuring inhibition zone diameters by millimeter.

MIC Determination: Minimal inhibitory concentration (MIC) of alkaloidal crude extract of *T.polium* was determined by agar Well diffusion method. Alkaloidal crude extract was dissolved in DMSO into different concentrations (1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 80, 160, 200 mg/ml). Standard inoculums of bacteria were spread on Muller Hinton Agar (MHA). Wells were made on the plates using yellow tip (8 mm diameter). Each sample of alkaloidic compounds (100 µl) was poured into the well and incubated for overnight at 37°C[13]. The lowest concentration at which zone of inhibition appeared was considered as MIC.

Animals: Adult female rats (150-200 g) was purchased from the animal house of the College of Veterinary Medicine/University of Basrah, Basrah, Iraq. The animal house temperature was maintained at 20± 2°C with a 12 h light/dark cycle. All animals were kept for one week prior to experimentation and were given free access to food and water.

Experimental Design: To induce experimental pyelonephritis animal, rats (n = 18) were injected with 0.5 mL of a freshly prepared *E. coli* solution into their left renal medullae [14]. Control rats (n =6) were administered 0.1 mL of distilled water. Pyelonephritic rats were divided into randomly and equally into 3 groups: first group considered as control,second group as treatment that received by intraperitoneal of 1 mL/rat (equivalent to 0.6 g/kg body weight) of alkaloid crude extract for 10 days, while third group were treated i.p. with 0.5 mL/rat of antibiotic gentamycin for 10 days. After collecting the blood samples, they were left for half an hour, to be coagulated. Then, blood serum was separated by centrifugation for 10 minutes at 3000 rpm. Biochemical parameters such as urea and creatinine (CRT) were measured by kinetic (Enzymatic) and colorimetric method.

Statistical Analysis: The data were analyzed as mean ± SD of variables in different groups using statistical program for social science (SPSS-18). $P \leq 0.05$ was considered as the significant level.

Results and Discussion

The results of antibacterial activity of alkaloidal crude extract of *T.polium* against some pathogenic bacteria are shown in (Table 1). The results showed that antibacterial of alkaloid extract gave inhibitory efficacy against the studied bacteria relative to other active compounds isolated from *T. polium* where the diameter of the inhibition zone of alkaloid extract against E.coli, S.scuiri, P.aeruginosa and K.pneumonia was 25 mm while the alkaloidal extract showed the highest inhibitory diameter against proteus sp. where it was 30 mm. MIC results showed that MIC of alkaloidal crude extract against E.coli and proteus sp. was 40 mg/mL while MIC against P.aeruginosa, K.pneumonia and S.scuiri were 4, 5, 10 mg/mL respectively as shown in (Table 2).

Table 1: Antibacterial activities of alkaloid extract of T.polium against some urinary tracts bacteria

Bacterial species	Concentration of alkaloidal crude extract (mg/ml)	Antibiotic					
	250	ER	CAZ	TE	VA	CN	CIP
E.coli	25	25	15	R	R	R	R
S.scuiri	25	8	R	16	2	R	R
P.aeruginosa	25	21	14	18	27	R	23
K.pneumoniae	25	26	17	R	15	R	R
Proteus sp.	30	40	17	R	R	17	R

R: Resistant, ER: Erythromycin 15 µg; CAZ: Ceftazidime 30 µg; TE: Tetracycline 30 µg; VA: Vancomycin 30 µg; CN: Gentamycin 10 µg; CIP: Ciprofloxacin 5 µg

Table 2: The minimal inhibitory concentrations of alkaloid extract isolated from T.polium in mg/ml

Bacterial Species	MIC of alkaloidal crude extract (mg/ml)
E.coli	40
S.scuiri	10
P.aerginosa	5
K.pneumonia	4
Proteus sp	40

Following the induction of pyelonphritis (10 days after adminstration of *Esherichia coli*) the pateints rats showed highly significant increased (27.217±2.6263 vs. 42.233±17.044 and 0.666± 0.2065 vs. 0.366± 0.1366, in urea and creatinine, respectively P<0.05,Table 3) as compared to the control group. However, 10 days after the initiation of treatments, alkaloid extract and gentamycin treated rats showed a significant decrease (0.243±0.1181 and 0.293±0.0265 in urea of treated rats with alkaloid extract and gentamycine, respectively vs. 0.666±0.2065 in untreated rats, P<0.001, Fig. 1), while alkaloid extract treated rats showed a signifiant decrease (29.100± 9.1945 vs. 42.233 17.044, P<0.05, Fig. 2) in level of urea as compared to the paients group.

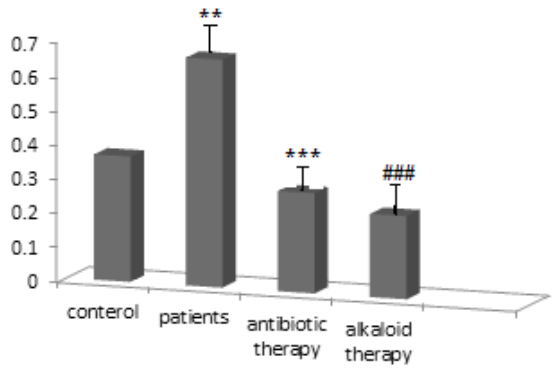

Fig. 1: effect of alkaloid extract of T.polium on the level of creatinine in treated pyelonephritis group as compared to untreated pyelonephritis rats.

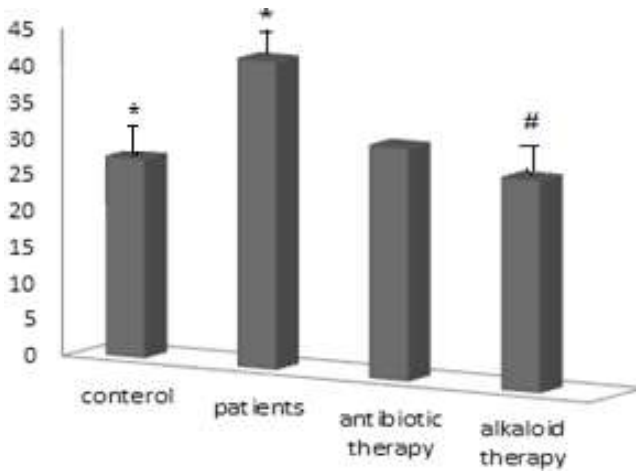

Fig. 2: The effect of alkaloid extract of T.polium on the level of urea in treated pyelonephritis group as compared to untreated pyelonephritis rat

In Figure 1,the effect of alkaloid extract of *T.polium* on the level of creatinine in treated pyelonephritis group as compared to untreated pyelonephritis rats. Data are presented as mean ± SD. ** indicates a signficant difference (P<0.01) between patients and control group, *** indicates a signficant difference (P<0.001 significance between antibiotic therapy and patients group, ### indicated a significant difference (P<0.001) between alkaloid therapy and patients group.

In Figure 2,the effect of alkaloid extract of *T.polium* on the level of urea in treated pyelonephritis group as compared to untreated pyelonephritis rats. There was also a significant difference in pyelonephritis rats as compared to healthy control group. Data are presented as mean ± SD. * indicates a signficant difference (P<0.05) between patients and control groups, # indicates a signficant difference (P<0.05) between alkaloid

Table 3: Compartion between the biochemical parameters in phylenophritis and normal groups.

Group	Biochemical Parameters	
	Urea	Creatinine
Control	27.217±2.6263	0.366±0.1366
Patients	42.233±17.0448	0.666±0.2065**
Gentamycin therapy	31.916±7.6122	0.293±0.0265***
Alkaloid therapy	29.100±9.1945#	0.243±0.1181###

Data are presented as mean as mean ± SD. * indicates a signficant difference (P<0.05) between patients and control groups, # indicates a signficant difference (P<0.05) between alkaloid therapy and patients groups, ** indicates a signficant difference (P<0.01) between patients and control group, *** indicates a signficant difference (P<0.001 significance between antibiotic therapy and patients group, ### indicated a significant difference (P<0.001) between alkaloid therapy and patients group.

Discussion

On the basis of this study, alkaloidal crude extract from the aerial parts of *T.polium*is effective against both gram-positive and gram-negative bacteria. Alkaloid crude extract at 250 mg/ml showed high antibacterial activity, so these finding support the previous report by Singh et al.[15] and [16] who indicated an alkaloids have physiological effects and a great medical effect to treat many diseases, including urinary tract infections. Cowan [17]showed that The mechanism of action of alkaloids is the formation of chemical bonds between these active compounds and the nucleic acids (DNA, RNA) of these microorganisms and then inhibit metabolism. While[18]attributed the effectiveness of alkaloids to the interference with the respiratory chain enzymes containing the thiol group. Through substitution and replacement in the carbonyl group, the alkaloids are transformed into a more toxic compound. It also lead to the mutagenic proteins and interfere with the protein enzymes containing the thiol group and lead to the moth and sedimentation of cellular proteins and through the ability to link with the enzymes involved in the building of amino acids and enzymes involved in the construction of proteins, which leads to inhibition of work and the most important of these enzymes DNA ligase and RNA polymerase. The alkaloids act to break the covalent bonds of the nucleotides and thus destroy the DNA of the microorganism. The MIC for *K.pneumoniae,P. aeruginosa* and *S. scuiri* was found at (4, 5, 10 mg/ml)respectively, while for *E. coli* and *Proteus sp.* was 40 mg/ml. This result is accordance with Darabpour et al.[19] who confirmed that *Escherichia coli* and *Proteus sp.* were more resistant than others. This observed resistance probably could be due to the presence of outer membrane of peptidoglycan in *E.coli* and *proteus* mayprevent the transport of compounds into the cell or due to other genetic factors. Our results also showed alkaloid crude extract of *T.polium* has high activity against pyelonephritis induced in rats. A significant decrease in serum urea and creatinine was observed in rats with pyelonephritis after 10 days of treatment with alkaloid extract. These results confirm several previous studies that *T. polium*can be used anti-inflammatory [7].

In conclusion, the findings of the current study illustrate that intraperitoneal administrated alkaloid extract of *T.polium* improved the renal function and good antibacterial alternative to antibiotic. These data suggest that alkaloid extract of T.polium might have a future role in the treatment acute pyelonephritis.

A Study of Complications of Infants of Diabetic Mothers in Babylon Teaching Hospital for Maternity and Pediatrics

Rebee Mohsin Al-Ithary

Department of Pediatrics, College of Medicine, University of Babylon, Hilla, Iraq

Abstract

Background: Infants born to diabetic mothers are liable for a wide range of systemic & metabolic complications.

Objectives: The aim of this study was to do early detection and early managements of signs and symptoms and complications that happened in infants of diabetic mothers. Also to show the outcome of infants of diabetic mothers.

Materials and Method: Medical history, physical examination, and investigations (biochemical & radiological) were done on 100 infants of diabetic mothers over about 5 months period.

Results: We found that 78% of cases delivered by caesarean section, and 55% of them have history of affected baby, 27% history of miscarriage & 9% chronic sibling morbidity & these results might be due to poor glycemic control, bad antenatal care, or maternal & social neglect. Macrosomia was 42%. Congenital anomalies include congenital heart disease 16%, Birth trauma occurs in 5% in form of fracture clavicle & brachial plexus injury. Hypoglycemia presented in 85%. Perinatal mortality, birth injuries, systemic, hematologic & metabolic complications are more encountered in infants born to diabetic mothers.

Conclusion: Infants of diabetic mothers have a lot of risky complications and they need screening even in asymptomatic cases.

Keywords: *Complication, infant, diabetic mother.*

Introduction

Infants of diabetic mother are those born to a mother who has persistently elevated blood sugar during pregnancy.[1]

Diabetes has long been associated to maternal and perinatal morbidity and mortality[2,3]. Since the discovery of insulin; infants of diabetic mothers have experienced an almost 30 fold decrease in mortality and morbidity.[3] Of mothers with preexisting diabetes, 35% had type 1 diabetes mellitus, and 65% had type 2 diabetes mellitus.[4]

Maternal hyperglycemia causes fetal hyperglycemia, which contributed to that complications on infants of diabetic mother.[5]

Hyperglycemic hyperinsulinemic state leads to fetal macrosomia which causes birth asphyxia, cardiomyopathy, respiratory distress syndrome, polycythemia and iron abnormality which in turn lead to poor neuro developmental outcome.[6]

Chronic fetal hyperglycemia and hyperinsulinemia increase the fetal basal metabolic rate and oxygen consumption leading to a relative hypoxic state . The fetus responds by increasing oxygen-carrying capacity through increased erythropoietin production, potentially leading to polycythemia.[7]

Prior to birth, elevated insulin levels inhibit the maturational effect of cortisol on the lung, including the production of surfactant from type 2 pneumocytes. This puts the fetus at risk for developing respiratory distress syndrome.[8]

Other comorbidities include miscarriages,birth defects[9], metabolic disturbances such as hyperglycemia, hypoglycemia, and hypoxia.[10] Growth Restriction occurs in pregnancy because of underlying vascular disease[11]. Hyperinsulinemia results in excessive fetal growth. All organs are involved except the brain and kidney.[12]

Birth injuries e.g. shoulder dystocia, brachial plexus injury, and cephalhematoma are also common.[13] Hypoglycemia especially occurs in early hours of life which may be asymptomatic or symptomatic like irritability, lethargy, poor feeding, and seizure.[14]

Those infants are also liable for pulmonary disease e.g. RDS and primary pulmonary hypertension [15], hyperbilirubinemia, polycythemia, hypocalcaemia with or without hypomagnesaemia believed to be secondary to parathyroid hormone suppression.[16]

Cardiomyopathy and inter ventricular hypertrophy may occur in these infants and detected by echocardiography.[17]

The aim of this study was to do early detection and early managements of signs and symptoms and complications that happened in infants of diabetic mothers. Also to show the outcome of infants of diabetic mothers.

Materials and Method

From (3754) neonates admitted to Babylon maternity and pediatrics teaching hospital at period from 1st. April 2009 to 17th. August 2010 we found 100 neonates of pregnant diabetic mothers. We took history from those mothers regarding type of diabetes, its treatment, parity, age, history of affected neonates or miscarriage, and calculated gestational age, also we looked for type of delivery and its events.

We studied in neonates of diabetic mothers, the early moments of life regarding APGAR score, resuscitation, examinations, early investigations needed accordingly and managements.

We look for biochemical and radiographic abnormities in those neonates as follows:

Serum blood glucose which taken by peripheral venous blood examined by spectrophotometer or by glucometer digital measuring total serum bilirubin taken by heel prick test read by bilirubinometer, packed cell volume taken from peripheral venous sample, serum calcium by non-tourniquet venous sample, blood culture taken via cleaning the punctured area with alcohol and take venous sample for suspected cases of sepsis. Chest X-ray, echocardiograph, electrocardiograph, abdominal ultrasound and brain ultrasound & CT scan of brain as needed.

Results

64% of mothers have gestational diabetes, 36% as pre-existing DM, 27% are primigravida & 35% have age less than thirty years, 78% neonate delivered by caesarean section, male neonates 58% & females 42% .

History of affected baby 55% as we regard macrosomia as congenital malformation & history of miscarriage 27%. Sibling with history of chronic morbidity 9%.

Regarding hospital staying: 1st day discharge 16%,2nd day discharge 22%, 3rd day discharge 46%, & 4th day discharge 16%.

Perinatal Mortality rate in these one hundred cases are 4% due to (two with complex congenital malformation, one with still birth, & one from respiratory failure), morbidity rate 85% as medical & biochemical abnormalities need intervention only 11% are apparently normal & from those 11% are nine mother with strict glycemic control .

The APGAR score 30% have less than 4 score in 1st minute & increase to more than 4 score at five & ten minutes as 78% & 93% respectively.

In 1st day of life 85% have respiratory rate more than 60 breath/minute while at the 4th. day the respiratory rate less than 60 is 68%. The grunting present in 85% in 1st day & become 20% at 4th. day of life.

The oxygen saturation improve in 9% of patients whom complain of hypoxia at 1st. day to reach 4% at the 4th. day of life .

The heart rate > 160 beats/minute in 1st day was 10% & only 2% still tachycardia at the end of the 3rd. day of life .

Hypoglycemia improve from the1st.day to the 4th. day as 86% to 4% respectively .

The hematocrit > 65% present only in 9% & only 3 patients need partial blood exchange transfusion.

The respiratory complications was about 33% as hyaline membrane disease & transient tachypnea of newborn 45%, 2% complicated to respiratory failure, 1% pneumothorax, 1% eventration of diaphragm (Figure 1).

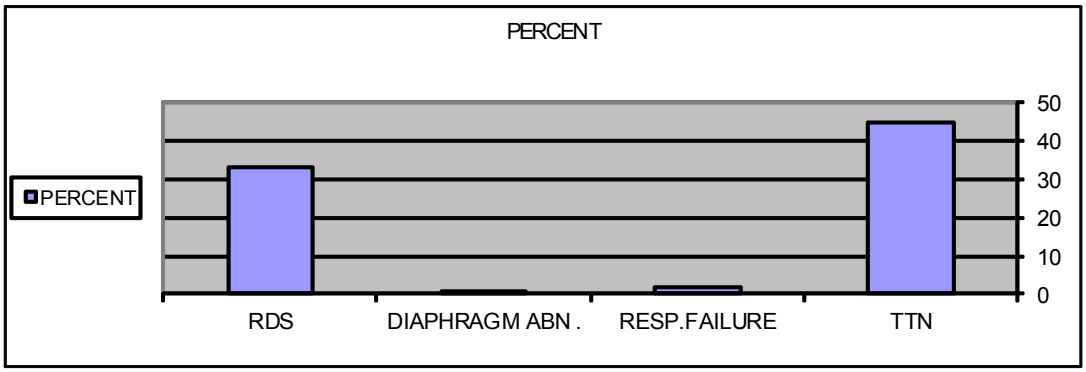

Figure 1: Percentages of respiratory complications proportions

In relation to the cardiac complications seen in 16% as following 6% have murmur in 1st. four day of life, and 7% have heart failure documented by chest X ray and echocardiograph, 3% have VSD, 1% PDA,1% ASD, cardio myopathy in 2% (Figure 2).

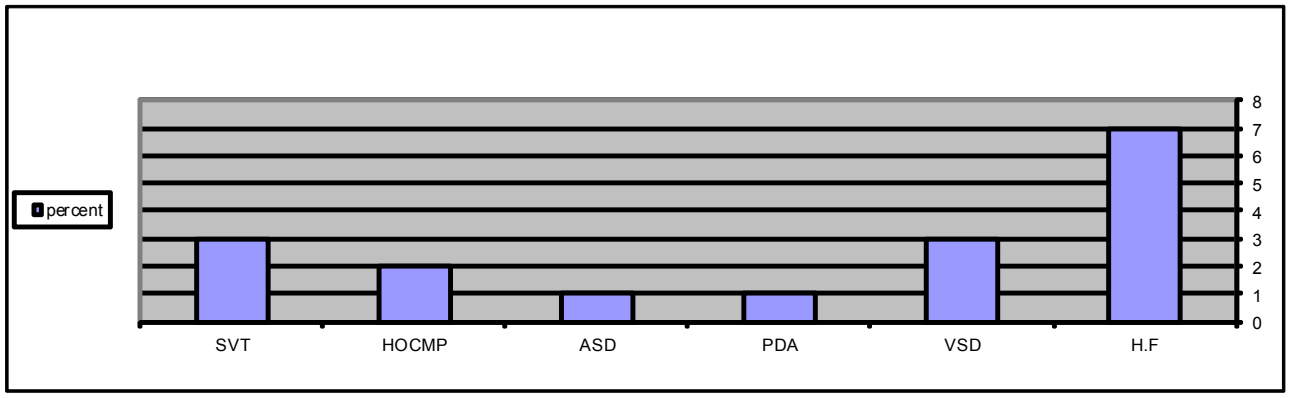

Figure 2: Percentages of cardiac complications

Regarding intestinal complications: 2% have Intestinal obstruction, 1% imperforated anus, 1% had diaphragmatic hernia.

The neurological abnormalities seen in 24% as following: 20% as birth asphyxia, 2% intracranial hemorrhage, 2% neural tube defect, 1% facial palsy as in Figure 3.

The skeletal complications as: 1% congenital dysplasia of the hip, 1% absent left hand & 5% has shoulder dislocation with or without clavicular fractures (Figure 3).

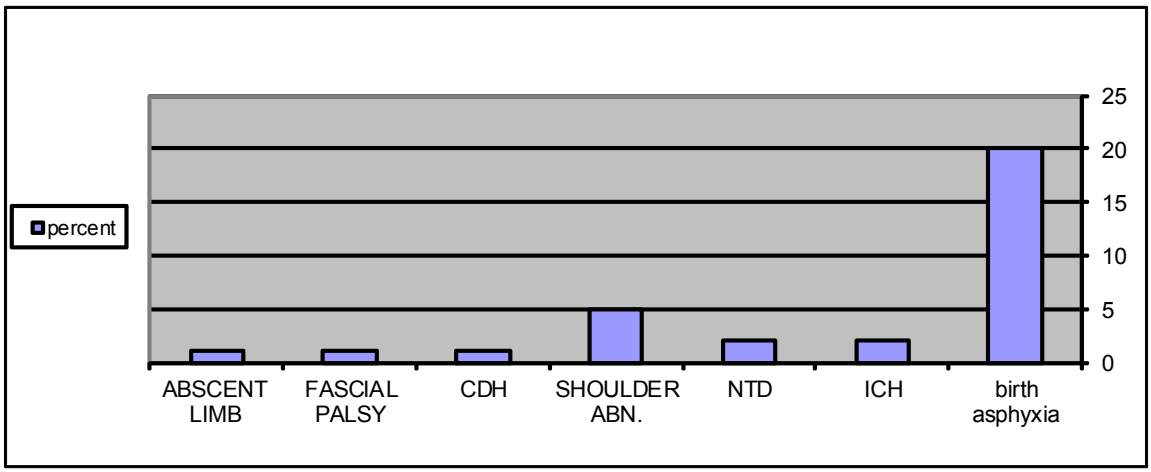

Figure 3: The neuro-skeletal complications proportions

Genito-renal abnormalities as 2% undescended testes, 1% hypospadias, 1% single kidney.

Neonatal jaundice present in 40%, one fifth of them in 1st day & about half appear in the 2nd day of life & 12 patients (12%) need blood exchange transfusion. The body weight from 2-3.5 kg about 48%, ≥4.6 kg about 52%, as in Figure 4.

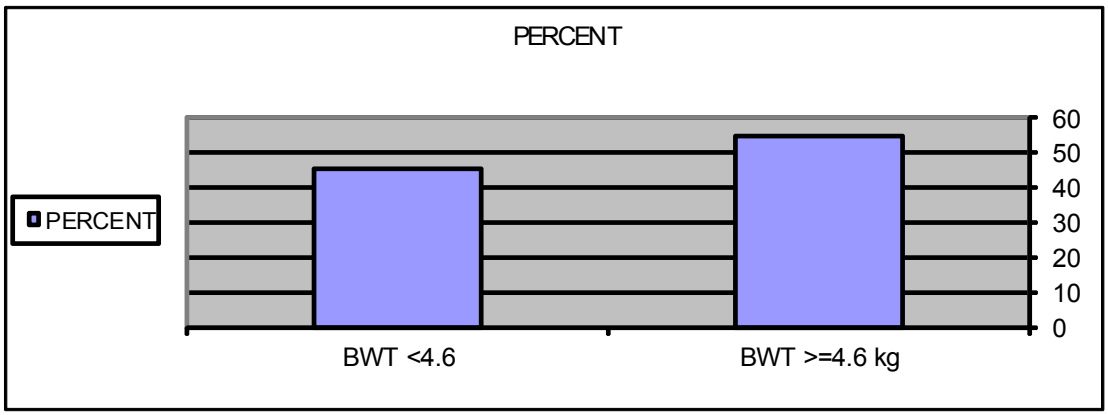

Figure 4: Percentages of body weight proportions.

Discussion

In our study, we found 78% of cases delivered by caesarean section which is higher than the results found by Cousins which is 45% & this might be due to bad obstetric history, fetal macrosomia, failure of induction of labor, or obstetrical miscalculation [18]

We found 55% have history of affected baby, 27% history of miscarriage & 9% chronic sibling morbidity & these results might be due to poor glycemic control, bad antenatal care, or maternal & social neglect.

Macrosomia is 42% but in Thomas R. Moore (15-45%) & to Charles F. Potter (26%). This might be due to good glycemic control in their study.[19]

Perinatal mortality was 4% which is highly different to results in study of Charles F. Potter which was about 30 -50% & specially to infant with gestational diabetes, this might be due to small number of my study as in figure 5.[20]

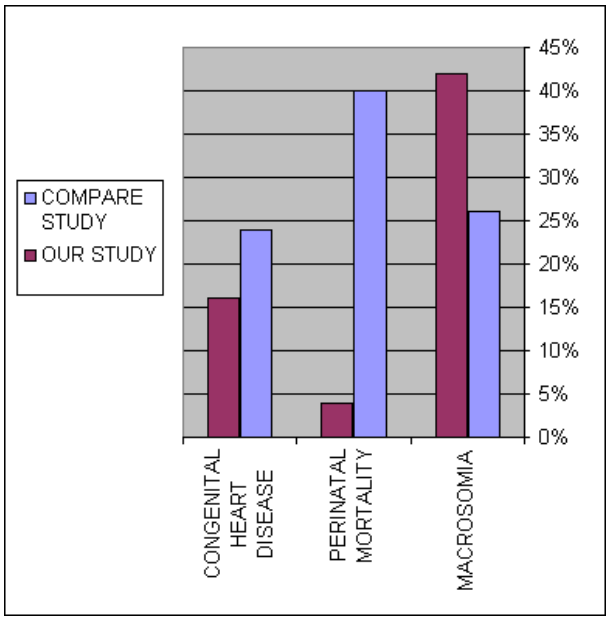

Figure 5: Differences between our study & compared study regarded macrosomia, perinatal death, & congenital heart disease.

Congenital anomalies include congenital heart disease 16% which is closer to 16% by-Moore & slightly lower than Charles F. Potter 24% & hypertrophic cardiomyopathy 7%. [19] Birth trauma occurs in 5% in form of fracture clavicle & brachial plexus injury which is relatively similar to the result of Thomas R. Moore about 4% this might due to macrosomia, or need of assisted vaginal delivery. [19]

Hypoglycemia present in 85% which higher than the result of Moore where the result about 62% [19].

Respiratory distress syndrome about 33% which is slightly higher to 26% of Thomas R. Moore & it is statistically significant, this might due to increased incidence of cesarean section or prematurity & this could be supported by about 40% is the percent of prematurity by pediatric examination in this study .[19]

Jaundice was seen in 40% of cases while 25.5% in Moore could be caused by hemolysis or polycythemia.[19]

Polycythemia seen in about 9% which is closet to 5-10% of the result in Thomas R. Moore & this could be the result of fetal hypoxia as in figure 6.[19]

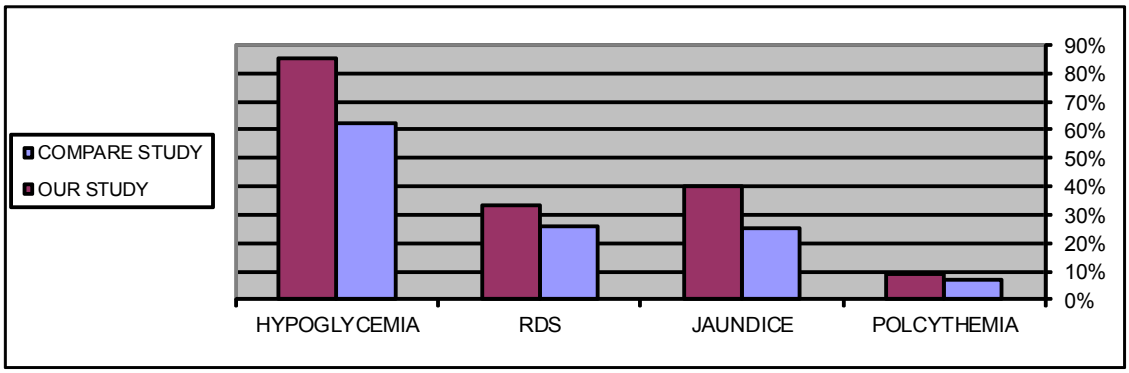

Figure 6: Differences between our study & compared study regarded hypoglycemia, respiratory distress syndrome, jaundice & polycythemia.

Hypocalcemia was seen in 10% in compare to 6% result of Thomas R. Moore [19]. Preterm by clinical examinations are about 40% while show 29% by Charles F. Potter.[7]

Conclusion

There is good relation between strict glycemic control & near normal neonates, so fetal life without hyperglycemic state & without subsequent hyperinsulinemic state lessen complications & vice versa. It is important to screen for neonatal hypoglycemia even in asymptomatic patients because a lot of patient have asymptomatic hypoglycemia. Neonates of diabetic mothers have a lot of risky complications to be screened for. Good dietary techniques & doing caesarean section decrease the risk of birth trauma (in our study we show about 80% of affected neonates with perinatal injury were due to normal vaginal delivery). Most teratogenic complications occur in infant born to mother with diabetes that is poorly controlled.

Ethical Clearance: The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki. The study protocol and the subject information and consent from were reviewed and approved by a local Ethics Committee.

Conflicts of Interest: None of the authors have any conflicts of interest relevant to what is written.

Funding Source: University funding was provided for: data collection, analysis, and interpretation; trial design; patient recruitment. No public funding was received.

Acknowledgments: Author would like to express her thanks and gratitude to Prof. Alaa Al-Charrakh (University of Babylon) for critical reading of the manuscript.

Abstract

Background: Obesity is a condition of chronic accumulation of body fat and a factor for the onset of serious diseases such as dyslipidemia. Obesity and dyslipidemia are emerging as significant public health challenges in South Asian countries

Aim: This study aimed to assess the association of obesity with dyslipidemia by measuring LDL and HDL in adolescents

Method: This study is an observational analytic study with a cross-sectional design. Sixty-two adolescents aged 17-19 years were randomly using systematic random sampling. LDL and HDL, anthropometric (weight, height, and BMI). Analysis data was performed using an independent t-test, chi-square test, and Fisher test

Results: The results showed that the samples with a high risk for the measurement of LDL and HDL.

Conclusions: It was concluded that obese adolescents have close links with dyslipidemia and have low HDL level. Obesity in adolescents is essential as early as possible so that it does become a significant health problem.

Keywords: *Obesity, Dyslipidemia, LDL, and HDL.*

Introductions

Obesity is a chronic disease that can cause various other degenerative diseases. The development of the problem of obesity has been widespread throughout the country, and its occurrence has increased every year for the past 40 years. The increase in the incidence of obesity also increases the increase in the incidence of degenerative diseases. Such as dyslipidemia which even increased in adolescence.

The Problem of Body Weight Proportion has experienced a very remarkable development, from 1975 to 2014, with changes in the average value of BMI of the world's population, ranging from 21.7 kg/m^2 in 1975 to 24.2 kg/m^2 in 2014, where in males from 22.1 kg/m^2 in 1975 to 24.4 kg/m^2 in 2014. These data indicate that an increase in BMI of the world population supports a positive shift towards obesity BMI. And finally in 2014 the face of the world changes increasingly concentrated due to obesity problems with the prevalence of morbidity due to obesity globally of 0, 64% of male sex and 1.4% of women[1]. Thus, the change in BMI of the world's population for four decades supports the spread of obesity to high mortality rates.

Likewise, the development of the problem of obesity in Indonesia is clearly illustrated in the 2007 Riskesdas data with the national prevalence of obesity in people

aged> 18 years by 13.9% and becoming 19.7% in 2013 [2]. The picture of the population above the age of 18 shows that for the Indonesian population the coverage of adults and the elderly has a problem of obesity which is quite alarming and requires special attention in their snacks.

The incidence of obesity for South Sulawesi has experienced a very large increase. The prevalence of obesity in the Selayar Archipelago District is 32.49% greater than the prevalence of obesity at the provincial level in South Sulawesi which amounted to 23.67% in 2016.

Where in adolescence, obesity, drugs cannot be done because they are still in growth period. While on the other hand the condition of obesity experienced by adolescents raises new problems namely dyslipidemia.

LDL and HDL changes that occur in adolescents can cause dyslipidemia problems more quickly at a younger age. This change is a very big dynamic from very high LDL and very lace HDL in adolescents. Or a standard LDL level but a very low HDL level.

This study aimed to assess the association of obesity with dyslipidemia by measuring LDL and HDL in adolescents. The purpose of this study is to prove that there are changes in LDL and HDL in adolescents due to their obesity. This is important to be the reason for the importance of promoting obesity treatment in adolescents. To prevent dyslipidemia.

Method

In our respondents we measured LDL, HDL, and anthropometric measurements including abdominal circumference using measuring tape, body weight with weight scales, height with microtoa, and BMI (Body Mass Index).

BMI measurement by calculating body weight in Kg divided by height in meters squared. Like the following formula:

$$BMI = \frac{weight(Kg)}{(height\ (m))^2}$$

Measurements of LDL and HDL were carried out as a result of venous blood tests taken from adolescents and measured in Lab. Prodia Makassar, Indonesia.

The data of this study were analyzed by independent t-test, chi-square test, and Fisher test to see the relationship of several measured variables.

Results

The results of this study

Table 1. Characteristics of Adolescent Respondents

Variabel	N	%
Gender		
Men	27	43.5
Women	35	56.5
Age		
17	5	8.1
18	45	72.6
19	12	19.4
Central Obesity		
Normal	21	33.8
Obesity	41	66.2
BMI		
Normal	22	35.5
Obesity	40	64.5

Based on table 1 above shows the majority of respondents are female adolescents with a percentage of 56.5%. and dominated by 18 years old with 72.6%. Respondents who had central obesity based on measurements of abdominal circumference were 66.2%, and for respondents who were obese based on the results of BMI measurements were 64.5%.

Table 2. Lipid Profile and Obesity According to Central Obesity of Adolescent

	Central Obesity		
Variable	**Normal Mean ± SD (n=21)**	**Obesity Mean ± SD (n=41)**	**P**
HDL	51.9 ± 10	43.9 ± 7	0.001
LDL	98 ± 18	115 ± 33	0.01
LDL/HDL	2.2 ± 0.58	2.6 ± 1	0.063

From table 2 above shows that HDL levels in adolescents with central obesity conditions are much lower than in adolescents with normal abdominal circumference which is a mean of 43.9 ± 7 with a value of P <0.005.

Table 3. Lipid Profile and Obesity According to Body Mass Index of Adolescent

	Body Mass Indeks		
Variable	**Normal Mean ± SD (n=22)**	**Obesity Mean ± SD (n=40)**	**P**
HDL	51.4 ± 10.4	44 ± 7.6	0.002
LDL	98.2 ± 17	116.3 ± 32.8	0.007
LDL/HDL	2.2 ± 0.6	2.6 ± 1.05	0.057

In table 3 above shows that adolescents with obese conditions have very low HDL levels compared to normal adolescents. This obesity measurement was based on the Adolescent Body Mass Index adjusted for BMI chart percentile tables for children and adolescents based on CDC 2000.

Table 4. Obesity Based by Waist Circumferences According to Lipid Profile of Adolescent

Variabel		LDL					HDL					LDL/HDL				
		Hight Risk		Low Risk		P	Low Risk		Hight Risk		P	Low Risk		Hight Risk		P
		N	%	N	%		N	%	N	%		N	%	N	%	
Central Obesity	Obesity	29	70.7	12	29.3	0.153 *	14	34.1	27	65.9	0.036*	11	26.8	30	73.2	0.046**
	Normal	11	52.4	10	47.6		2	9.5	19	90.5		1	4.8	20	95.2	

*Chi-square test, **Fisher test

Based on table 4 above shows that central obesity has a close relationship with HDL levels and LDL/HDL ratio which shows a close relationship with the risk of heart disease. This is seen as a significant value from the Chi-squer and Fisher test analysis results as attached in table 4 above.

Table 5. Obesity Based by Body Mass Index According to Lipid Profile of Adolescent

Variabel		LDL					HDL					LDL/HDL				
		Hight Risk		Low Risk		P	Low Risk		Hight Risk		P	Low Risk		Hight Risk		P
		N	%	N	%		n	%	N	%		N	%	N	%	
Obesity by BMI	Obesity	29	72.5	11	27.5	0.076*	13	32.5	27	67.5	0.104*	11	27.5	29	72.5	0.042**
	Normal	11	50	11	50		3	13.6	19	86.4		1	4.5	21	95.5	

*Chi-square test, **Fisher test

Based on table 5, the relationship of obesity based on BMI in adolescents shows a very close relationship with the LDL/HDL ratio for those who are at high risk of heart disease.

Discussion

This study provides an overview of the relationship of Obesity in adolescents both based on BMI and Abdominal Circumference have very low HDL levels and this poses a severe risk for heart disease in the future. This research provides evidence of the obesity conditions experienced by adolescents putting the burden of other health problems. And giving the weight of obesity management treatments is important given to adolescents to prevent the occurrence of diseases due to weight gain.

The high prevalence of dyslipidemia problems in children is higher in the community of children with obesity so that the examination of lipid profiles in children with obesity is needed for prevention[3]. Conditions like this have a bad impact on their health status in adulthood[4].

One important determinant that can cause early atherosclerosis problems at a younger age is adiponectin[5]. Low adiponectin is associated with atherogenic lipid profiles[6]. Likewise, the problem of cardio vascular disease in adulthood is suspected of having begun since childhood[7]. This is the main key to the importance of examining the lipid profile in the condition of observation both in children and adolescents.

Because further research is still needed to answer and provide a big picture of this in younger age groups and the involvement of more respondents.

Conclusion

Based on the results of this study it can be concluded that obesity experienced by adolescents can reduce HDL levels in lipid metabolism in adolescents' bodies and has a high risk of the appearance of heart disease.

Conflict of Interest: None.

The Individual Factor and the Quality of Building's Physical Environment in Correlation with the Occurrence of Sick Building Syndrome (SBS) on Employees of PT. Telkom Jember

Rizki Adi Sulistyanto[1], Ragil Ismi Hartanti[2], Prehatin Trirahayu Ningrum[2], Abdul Rohim Tualeka[1]

[1]Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, Indonesia,
[2]Department of Occupational Health and Safety, Faculty of Public Health, Jember University, Indonesia

Abstract

Sick Building Syndrome (SBS) is a situation in which occupants complained about health and comfort issues, which are related to time spent in a building, but the symptoms are not specific and the cause can't be identified, such as lethargy, nasal congestion, dry throat, headache, itchy eyes, sore eyes, dry eyes, runny nose, tense eyes, sore, sore neck or back, in the same period. There are 45.7% of employees in PT. Telkom Jember who got Sick Building Syndrome. This study aims to analyze the correlation of individual factor and quality of the physical environment of building with Sick Building Syndrome occurrence of employees in PT. Telkom Jember. This study uses an analytical study with Cross-Sectional approach. The populations were employees of PT. Telkom Jember. The samples were 35 respondents using Simple Random Sampling technique. The analysis used chi-square test (a = 0.05). The results showed that there was a correlation between age, occupation, and smoking behavior with Sick Building Syndrome (p-value <0.05) and there wasn't a correlation between sex, psychosocial condition, nutritional status and physical environment quality (temperature, humidity, airflow velocity, and illumination) with the occurrence of Sick Building Syndrome (p-value> 0.05). It can be concluded that the incidence of Sick Building Syndrome on employees of PT. Telkom Jember is less experienced by Sick Building Syndrome.

Keywords: *Sick Building Syndrome (SBS), individual factors, the quality of the physical environment.*

Introduction

In the last twenty years in the world, there have been a lot of high-rise buildings completely enclosed with air vents that depend entirely on various machines, such as offices or offices which are one of the workplaces that use ventilation with an Air Conditioning (AC) system. This causes pollution, especially air pollution caused by system ventilation Air conditioner has its own air circulation so that it will affect indoor air quality[1]. At a glance, the luxuriously constructed building rooms are equipped with adequate infrastructure, and the air conditioner that can be arranged as comfortably as possible is considered a very comfortable place to work. But in fact, it is precisely in a room like this that the health of people who work is often disrupted[2]. Various complaints and symptoms can arise when someone is in the building. Air quality, temperature, radiation, ventilation, lighting and the use of various chemicals in the building, are very potential causes for the emergence of complaints and symptoms in workers/employees when they are inside the building[3].

According to the Head of the National Population Agency (BAKNAS) around the world, an estimated 2.7 million people die from indoor air pollution. Even though 70-80% of most human time is spent indoors. EPA consistently ranks indoor air pollution as the top five for environmental health risks in public health.

The incidence of Sick Building Syndrome (SBS) is caused by many factors including chemical factors such as CO, CO2, formaldehyde, asbestos, and dust, then physical factors are related to temperature, humidity, airflow velocity, lighting, biological factors also affect such as bacteria and fungi and individual characteristics such as age, gender, smoking, length of work and psychosocial factors[4]. According to the results of research at PT. Infomedia Surabaya obtained data that the physical factors of air quality cause discomfort and health problems for employees who work including skin, eye, nose, nerve disorders, and respiratory disorders[5].

Sick Building Syndrome can usually be a dry cough, headache, eye irritation, nose and throat, dry and itchy skin, weak body and others. These complaints usually persist for at least two weeks. Complaints that are usually not too great, but quite disturbing and of course this can affect the productivity of work of someone who is exposed to this disease. Sick Building Syndrome can be considered if more than 20% or even 50% of users of a building have complaints as mentioned before[1].

One of the tallest and most closed buildings in Jember Regency is located at Gajah Mada Street No.182-184, Jember regency consists of 8 floors. The results of the preliminary study conducted by researchers on 10 samples of employees of PT. Telkom Jember found that 50% of the samples felt symptoms of red eyes, watery eyes, dizziness, nausea, coughing, increased body temperature, lethargy, sneezing, frequent urination, dry throat and said the symptoms disappeared after leaving the building

Method

This study is an analytical study with a cross-sectional approach. The study population was the employees of PT. Telkom Jember. The number of samples is 35 respondents with sampling using the Simple Random Sampling technique. The exclusion criteria in this study are employees who suffer from chronic diseases that are considered to have similarities with SBS events, such as suffering from chronic illness (anemia), history of respiratory diseases, tuberculosis, eye diseases, diseases related to body metabolism (liver and kidney disease), have a history of allergies, and female employees who are pregnant.

The independent variables in this study were age, gender, years of service, smoking behavior, psychosocial conditions, nutritional status, temperature, humidity, air flow velocity, and lighting. The dependent variable in this study is the incidence of Sick Building Syndrome in employees of PT. Telkom Jember. The research data collection technique was conducted using a questionnaire for interviews, measurement, and documentation. The research data analysis technique used the chi-square test ($\alpha = 0.05$).

Result

The incidence of Sick Building Syndrome in employees of PT. Telkom Jember can be seen in the following table:

Table 1. The incidence of Sick Building Syndrome (SBS)

Incidence SBS	n	(%)
Not SBS	16	45,7
SBS	19	54,3

In table 1, it can be seen that the respondents who experienced the incidence of Sick Building Syndrome were 45.7%.

Distribution of Individual Factors and Physical Environmental Quality

Distribution of individual factors can be seen in the following table:

Table 2. Faktor Individu

Faktor Individu	n	%
Age		
≤40 years old	22	62,9
>40 years old	13	37,1
Gender		
Man	25	71,4
Woman	10	28,6
Working time		
≤10 year	25	71,4
>10 year	10	28,6
Smoking behavior		
Often	5	14,3
Sometimes	13	37,1
Not smoking	17	48,6
Psychosocial Condition		
Well	29	82,9
Bad	6	17,1
Nutritional status		
Thin	5	14,3
Normal	22	62,9
Fat	8	22,9

Based on table 2, the individual factors show that the employees in most respondents aged <40 years was 62.9%, male respondents were more than 71.4%, respondents who had a working period of <10 years were 71.4%, respondents who have smoking behavior that is equal to 51.4%, respondents who have good psychosocial conditions are equal to 82.9%, and respondents who have normal nutritional status that is equal to 62.9%.

The results of measuring the quality of the physical environment can be seen in the following table:

Table 3. Physical Environmental Quality

Variable	Floor					
	1	2	3	4	5	6
Temperature (°C)	30,1	30,3	31,8	30,6	29,4	28,1
Humidity (%)	63,2	59,5	61	59,9	63,9	51
Airflow speed (m/s)	0,85	0,80	0,85	0,18	0,24	0,71
Lighting (lux)	223	241	222	302	179	257

Based on table 3, related to temperature, humidity, air flow velocity, and lighting can understand that most are in accordance with the standards determined by regulations (KepMenkes RI Number 1405/Menkes/SK/XI/2002).

The relationship between Individual Factors and Sick Building Syndrome Events in PT. Telkom Regency of Jember:

Table 4. The relationship between individual factors and the incidence of Sick Building Syndrome in employees of PT. Telkom Jember

Individual factor variables	Sick Building Syndrome				P-value
	Yes		Not		
	n	%	n	%	
Age					
<40 Years old	7	31,8	15	68,2	0,032
>40 Years old	9	69,2	4	30,8	
Gender					
Man	13	52	12	48	0,285
Woman	3	30	7	70	
Working time					
<10 years	8	32	17	68	0,022
>10 years	8	80	2	20	
Smoking behavior					
Smoking	12	66,7	6	33,3	0,010
Not smoking	4	23,5	13	76,5	
Psychosocial condition					
Well	15	51,7	14	48,3	0,187
Bad	1	16,7	5	83,3	
Nutritional status					
Thin	1	20	4	80	0,326
Normal	10	45,5	12	54,5	
Fat	5	62,5	3	37,5	

In Table 4, the value of p-value of the age of 0.032 (p <0.05) means that Ho is rejected, the p-value of the working period is 0.022 (p <0.05), meaning Ho is rejected and the value of p-value of smoking behavior is 0.010 (p <0.05), meaning Ho is rejected.

The Relationship between Physical Environmental Quality and Sick Building Syndrome in PT. Telkom Jember:

Table 5. Relationships between Physical Environmental Quality and Sick Building Syndrome Incidents at PT. Telkom Jember

Physical Environmental Quality	p-value
Temperature	0,123
Humidity	0,631
Airflow Speed	0,631
Lighting	0,064

In table 5, shows that the p-value of the quality of the physical environment (temperature, humidity, the velocity of air flow, and lighting is greater than 0.05, which means that He is accepted.

Discussion

Based on the results of research on the relationship between the incidence of Sick Building Syndrome to employees of PT. Telkom Jember that there are several relationships between individual factors (age, years of service, and smoking behavior) with the incidence of Sick Building Syndrome in employees of PT. Jember Regency Telkom, while there is no relationship between several individual factors (gender, psychosocial conditions, and nutritional status) and the quality of the physical environment with the incidence of Sick Building Syndrome in employees of PT. Telkom Jember.

The results of research conducted on employees of PT. Telkom Jember can be seen that over 40 years of age experience SBS more than under 40 years of age.

Age is very influential on the level of risk of occurrence of a work-related illness including the incidence of SBS. The process of someone's aging causes a reduction in workability caused by changes in the functions of the body's instruments, the cardiovascular system, and the body's hormonal system[6].

The majority of employees of PT. Telkom Jember is male so that in buildings that are at risk of experiencing SBS are men, although, in theory, the riskier ones are women, because the results obtained from a total of 35 respondents who experienced SBS were 16 people, 13 of whom were men and 3 people are women. The male sex experienced more SBS complaints, this was due to several factors including the majority of the total number of employees in the building were male and most active smokers were susceptible to SBS complaints[7].

The results of research on employees of PT. Telkom Jember can be seen that the tenure of more than 10 years is more susceptible to SBS events compared to work periods of less than 10 years. Then it can be interpreted, the longer the working period of a person the more vulnerable the person experiences SBS[8].

Smoking behavior can cause changes in the structure and function of the respiratory tract and lung tissue. Smoking can also lower your lung's vital capacity compared to some occupational health hazards. Smoking habits will accelerate the decline in pulmonary physiology[3]. If the person is an active smoker, the person is more susceptible to experiencing SBS. This is because of the total 35 research respondents 18 of whom were active smokers, 12 of them experienced SBS events compared to passive smokers, and 3 people who smoked during working hours.

SBS complaints are also influenced by factors outside the environment, such as personal, occupational and psychological problems that are considered to affect one's sensitivity to SBS[9]. The results of research on employees of PT. This Telkom Jember can be seen that psychosocial conditions are not related to the incidence of SBS.

Nutritional status is the end result of the balance between food entering the body (nutrient input) with the body's needs (nutrient output) of these nutrients. The results of research on employees of PT. Telkom Jember can be seen that nutritional status is not related to SBS events. This is not in accordance with Budiono's theory (2003) that workers who have good nutritional conditions will have better work capacity and endurance[10].

The temperature is too high or low the body can feel fatigue faster than normal and experience various symptoms such as eye irritation, sore throat and coughing which are symptoms ofSBS[11]. The results of research conducted at PT. Telkom Jember can be seen that the temperature is not related to the SBS incident because the rooms are not only dependent on the AC but also the influence of the doors and parts of the window that is open so that the indoor air exchange can occur naturally. So that when measuring the average temperature in the room is normal (18-30°C).

Based on the NAB that applies to the work environment in accordance with the Minister of Health of the Republic of Indonesia Number 1405/Menkes/SK/XI/2002 for humidity, it ranges from 40%-60%. The results of the research in the building of PT. Telkomjember can be seen that humidity is not related to SBS events, this is because these rooms are not only dependent on central air conditioning, but also the influence of additional air conditioning, opening of lobby doors, central air conditioning that does not function properly and open windows so that the humidity in the room is not in accordance with the stipulated NAV.

Air speeds less than 0.1 meters/second or lower make the room uncomfortable because there is no air movement. Conversely, if the airspeed is too high it will cause noise in the room[3]. The results of the research on the building of PT. Telkom Jember can be seen that the speed of air flow is not related to SBS events, this is because the rooms are not only dependent on air conditioning/air conditioning systems but also from ventilation and open doors, so the condition of the air flow velocity in the building is unstable.

According to (Decree of the Minister of Health of the Republic of Indonesia Number 405/Menkes/SK/XI/2002) good lighting allows workers to see objects that they do clearly, quickly and without unnecessary effort[12].Moreover, adequate lighting gives a better view and a refreshing environment. Lighting problems include the ability of humans to see things, characteristics of the sense of sight. Poor lighting can result in eye fatigue with reduced power and work efficiency[12].The results of research on room lighting in the building of PT. Telkom Jember can be seen that lighting is not related to SBS incident. Based on the time of going down the study in the building of PT. Telkom Jember, these rooms not

only depend on artificial lighting but also the influence of natural lighting namely sunlight, so that employees of PT. Telkom Jember can easily adjust the need for light intensity in the workspace as needed. Normal light intensity makes the workplace feel comfortable and free of complaints caused by poor lighting.

This is in line with the statement of Acmadi (1991) stating that SBS is not caused by a single cause, but is a set of conditions that cover various kinds of environmental components related to low air quality, among others, related to physical factors namely temperature, humidity, and velocity of air flow, chemical factors, and partly biological factors. Some components of this cause together and each in a low dose will cause non-specific complaints called SBS[13].

Conclusions

The incidence of Sick Building Syndrome in employees of PT. Telkom can find out that those who did not experience Sick Building Syndrome were 19 respondents or equal to (54.3%).

There is a relationship between individual factors (Age, years of service, and smoking behavior) with the incidence of Sick Building Syndrome in employees of PT. Telkom Jember because the value of p-value is smaller than 0.05

Ethical Clearance: The study was approved by the Institutional Ethical Board of Public Health Faculty, Universityof Jember.

All subjects have been fully informed about the information and forms for the informed consent form.

Source of Funding: The source of this research costs from self.

Conflict of Interest: All authors have no conflicts of interest to declare.

Public Knowledge on Over the Counter Analgesics at Private Pharmacy Store in Makassar City Indonesia

Rizqi Nur Azizah[1], Hendra Herman[1,2]

[1]Pharmacology Laboratory, Pharmacy Faculty, Universitas Muslim Indonesia, Makassar, Indonesia,
[2]Ibnu Sina Hospital, Makassar, Indonesia

Abstract

Objectives: To determine the level of public knowledge of Makassar City on the use of Analgesics Over the Counter (OTC) drugs in the self-medication to pain treatment and also determined the role of the pharmacist in providing information about OTC to the community.

Method: This research is a quantitative approach cross-sectional study using a questionnaire which has been modified and validated. The sampling method used is incidental sampling by distributing questionnaires to the respondents that conducted in 3 Private Pharmacy Store in the city of Makassar.

Result: From 215 questionnaire, 200 were filled in correctly and analyzed (respond rate 93%). Paracetamol generic is the most popular analgesic (54.5%) of the questioned respondent prefer it to relieve the pain (Headache). More than 53% of respondent did not know how to take medicine and 60.5% of respondent were not read brochure before taking medicine. The respondent more confidence with doctor and family recommendation than the pharmacist in consultation.

Conclusion: The level of knowledge about the use of analgesic drugs Makassar city community still low and the role of the pharmacist as a source of drug information providers needs to be improved.

Keywords: *Knowledge, Analgesics, OTC, Pharmacy.*

Introduction

Self-medication is the treatment of common health problems with medicines especially designed and labeled for use without medical supervision and approved as safe and effective for such use[1]. Medicines for self-medication are often called 'nonprescription' or 'over the counter' (OTC) and are available without a doctor's prescription through pharmacies[2]. When practiced correctly, self-medication can save the time spent in waiting to see a doctor, may be economical and also offer savings for medical schemes and the national healthcare system. The WHO has also pointed out that responsible self-medication can help prevent and treat ailments that do not require medical consultation and provides a cheaper alternative for treating common illnesses[3]. With self-medication, the individual bears primary responsibility for the use of self-medication products. All parties involved in self-medication should be aware of the benefits and risks of any self-medication product[4].

More over, the consumers are not aware of the safety of these drugs and its frequent use may result in various adverse effect. It is the part of patients to read out the label packaging instructions for OTC medications to know how much one should take, the possible side effect that may encounter and the various condition and drug interactions should be considered before taking OTC drugs. Pharmacist and drug companies will have an increasingly important role in giving information and advices to the patients[5].

Analgesics are the most widely and frequently used non-prescription medications. There are many analgesic drugs, dosage forms and analgesic therapeutic procedures available today. This will certainly also persist in the future, since there will never be a single analgesic drug suitable for all patients and all types of pain because of considerable inter-individual variability in the effect of analgesics. Even a respected analgesic drug will not relieve pain in all patients[6].

Urge of self-care, feeling of sympathy towards family members in sickness, lack of health services, poverty, ignorance, misbelieves, extensive advertisement and availability of drugs in other than drug shops are responsible for growing trend of self-medication[7]. Previous studies have confirmed that among the other age groups, OTC medicines are purchased and more often used by elderly patients who frequently have multiple comorbid diseases, and therefore use polypharmacy. As a result, drug-drug interactions between OTC and prescription medicines (Rx) may occur. While patients are aware of possible drug-drug interactions between Rx medicines, patient knowledge regarding interactions between OTC and Rx medicines has not been well studied, although the occurrence of the aforementioned interactions has been described as frequent[8,9].

Self-treatment of common illnesses by people is common in developing countries. Common reasons cited for self-medication are inaccessibility of health care facilities, economic constraints and previous experience of illness. Positive and responsible attitudes towards self-care and self-medication are spreading throughout the world. Thereis a demand by consumers for more information and particularly for reliable sources of information about healthcare in general and medicines in particular. In a comprehensive survey, members of patients' organizations expressed their strongest agreement with the need for improving healthcare systems through accurate, relevant and comprehensive information, to help them make informed decisions about treatment. Today the internet is emerging as a major source of information on health issues and (with appropriate quality control) offers great promise in helping people with self-care[10].

Self-treatment of common illnesses by people is common in developing countries. Common reasons cited for self-medication are inaccessibility of health care facilities, economic constraints and previous experience of illness. Positive and responsible attitudes towards self-care and self-medication are spreading throughout the world. Thereis a demand by consumers for more information and particularly for reliable sources of information about healthcare in general and medicines in particular. In a comprehensive survey, members of patients' organizations expressed their strongest agreement with the need for improving healthcare systems through accurate, relevant and comprehensive information, to help them make informed decisions about treatment. Today the internet is emerging as a major source of information on health issues and (with appropriate quality control) offers great promise in helping people with self-care[10].

Study on self-medication shows that it is influenced by many factors such as education, family, society, law availability of drugs and exposure to advertisements. A high level of education and professional status has been mentioned as predictive factor for self-medication. Pharmacist can play very important and active role in advising and educating consumers on the correct use of OTC analgesics. It is essential that the practicing pharmacists have information about patients' preferences, habits and individual experience in OTC analgesics in order to improve and rationalize their use[11].

Materials and Method

This research is a quantitative approach cross sectional study using a questionnaire (Lefterofa and Getov, 2004) which has been modified and validated with the permission of the manufacturer's questionnaire. The sampling method used is incidental sampling by distributing questionnaires to the respondents. The sampling technique used in this study is a samplingmethod that is incidental sampling technique based on chance, that anyone who accidentally/incidentally met with investigators can be used as a sample, when viewed people who happen to encounter it suitable as a data source Further data collection and statistical analysis.

Results and Discussion

Result: The result were based upon the data capture from 200 patients. The prevalence of self-medication was reported as percentages. Of the 215 questionnaires distributed, 200 (93.00%) were answered and the rest were probably ignored by the patients and noticed a certain difficulty in answering.

Discussion

According to the demographic of the respondent characteristic, distribution of respondents by gender can be seen in Table 1. The majority of respondents were female as much as 128 respondents (64%), while male respondents as much as 72 respondents (36%). Distribution of respondents by age of the respondents is shown in Table 2. The majority of respondents were in the age group of 21-30 years as many as 64 respondents (32%) and the 61-70 age group are in the minority as much as 11 respondents (6%). This is due to the majority of people who visit the city of Makassar pharmacies that are in the age range 21-30 years. Distribution of respondents by education level of respondents can be seen in Table 3. The majority of respondents are at the level of high school education/equivalent as much as 111 respondents (55.5%). Based on the data obtained in table 3., the visitors pharmacies mostly work as a student and a housewife who had high school/equivalent.

The results of analysis based on long-term use OTC analgesics on the respondents as shown in Table 4. shows 57 respondents (28.5%) Long-term use of analgesics. Anti-inflammatory steroids used in high doses and for a long period can cause serious side effects on the gastrointestinal tract. In the stomach, COX - 1 produces prostaglandin (PGE2 and PGI2) that take action to keep the gastric mucosa. Nonselective NSAIDs inhibit COX-1 and COX-2, because of these NSAIDs reduce prostaglandin cytoprotective effects, these drugs often cause serious side effects in the upper gastrointestinal, including GI bleeding and ulcer. NSAIDs also likely to cause nephrotoxic. This is due to prostaglandin PGE2 and PGI2 is a powerful vasodilator involved in the control of renal blood flow and excretion of salt and water. Inhibition of renal prostaglandin synthesis may cause sodium retention, decreased renal blood flow and renal failure, especially in patients with conditions associated with catecholamine release vasocontrictor and angiotensin II (eg, congestive heart failure, cirrhosis). In addition, NSAIDs may cause interstitial nephritis and hyperkalemia. Long-term abuse of analgesic for many years associated with papillary necrosis and chronic renal failure.

In Table 4. shows that the majority of respondents often experience headaches as many as 89 respondents (44.5%). According to the results of interviews with respondents, one of the causes of headaches they experienced because of the effect of changes in employment and erratic weather in the city of Makassar lead to headache accompanied by fever (influenza symptoms). In table 5, can be seen the healing of headaches experienced by respondents relieved by taking a generic paracetamol. One cause of many community people using generic paracetamol in pain management because these drugs earlier known to the public. This is according to the data (table 11) that the resources that they get the most from the experience of the family, in other words that they get the information from generation to generation.

The results of the analysis by the parties suggested the respondent to use analgesics can be seen in Table 7. shows the majority of respondents were 86 respondents (43%) get advice from a doctor. This shows that the people of the city of Makassar are increasingly aware of health. If the pain it will go to the doctor and ask for advice from a medical expert for treatment. In addition to asking the advice of medical experts, according to the second largest number of 60 respondents (30%) ask for advice from others in this family. This is because the tribal customs Bugis-Makassar has a sense of high concern among families with each other.

Based on the data obtained 8. tables majority of respondents obtain drug information from the physicians as much as 43 respondents at 21.5%, followed by obtaining information from the family as much as 42 respondents at 21%. This proves that the level of trust in the family is still greater than the trust of the medical experts. But not so significantly different that differ only 0.5%.

In Table 6, data showed that the majority of people taking the drug did not read the brochure first (60.5%). This means that the level of public awareness is still low. This proves the lack of attention from medical experts in providing information about the importance of the rules of use of OTC analgesics. This proves the lack of role and the attention of medical experts in providing information related to the drug. Drugs information service which is the duty of the pharmacist cannot run well. The importance of reading the brochure for the use of OTC analgesic drug that is not in accordance with the rules of use can cause serious side effects.

Data from table 8, which highlighted the role of the pharmacist as a primary source of information that only 12% of drugs. This data is still far from the 21% physician role as a conduit of information medicine. The role of pharmacists simplest is to educate the public so that the drugs appropriately. What is meant here is

how to take the drug if the drug is taken before or after meals, as well as how to give the right. Therefore, as pharmacists, need to convey to the public the importance of reading the brochure for the use of OTC analgesic drug that is not in accordance with the rules of use can cause serious side effects.

Conclusion

Based on the data obtained, it can be concluded that:

1. The level of knowledge about the use of analgesic drugs Makassar city community still low.
2. The role of the pharmacist as a source of drug information providers needs to be improved.

Effect of Different Levels of Coriandrum Sativum and Piper Nigrum and their Interaction on Production, Biochemical Parameter, Liver Enzymes, TSH and Growth Hormone for Broiler Chickens

S.G. Hussein[1], H.Q. Baker[2]

[1]Assistant Professor, [2]Assistant Lecturer, College of Agriculture, University of Sumer, Thi Qar-64001, Iraq

Abstract

This study was conducted in Agri. Faculty field, University of Sumer De-Qar province for period from 10th of April 2019 to 14th of May 2019, they had fed 35 days. The objective of this study was to evaluate the effective of watery extraction of Coriander and Black pepper to (80) chickens, one day old, Strain Rose 308, unsexed birds and breed in four cages of batteries. This experiment was divided into four groups, three treatments with different levels and the fourth as a control. The results showed a significant increase of weekly body weight (BW), as well the treatments were improving feed consumption $P < 0.05$, furthermore there is increase in feed conversion ratio with significant result $P<0.05$. The study reported about biochemical parameters, It showed that a significant decrease in cholesterol and triglyceride (T.G.) $P<0.05$ incompared with the control and no significant difference with total protein. Liver enzymes activity after use medicinal herbs and spice for broiler chicks were recorded a significant reduction in GOT and GPT and no Significant effect on ALP, $P<0.05$. As well as the herbs and spice gave increase in growth hormone maybe that herbs contain mineral and vitamins which increased growth hormones $P<0.05$ the efficient of growth hormone (somatotrophin) was increase protein retention and glycogen deposited in the muscles, as well increase in TSH hormone that gave significant result $P<0.05$. Increased of TSH hormone secrete from pituitary gland and causes elevated in T_3, T_4 and increased the **metabolism.** The result indicated that there is significant differences between treatments for Immunological test of N.D. $P<0.05$ when compared with a control and no significant differences for I.B. test. It is concluded the extraction enhanced the performance and health situation with improvement antibody titer against N.D. but the medicinal herbs did not effect on infection bronchitis (IB) disease as well all the chickens were vaccinated with N.D. and No vaccine with IB.

Keywords: *Coriander seed, spices, Liver enzymes, Growth hormone and chickens Rose 308.*

Introduction

Coriander is an annual, short, fast–growing and prefer dry climates and thrives in well-drained soils. [8] The plant grow up to 1-3 Feet high, the leaves are light green in color. The flowers are white or pink, the stem is green, erect Sympodial, which grow up to the height of 75cm, the plant blooms during late Summer. The plant yield a seed as a fruit. The brownish seed are round ¼ inch long and 6mm as a diameter. The seed possess sweet and orange flavor. Herbs and spices have recently emerged as alternatives to antibiotics in animal production. They are known to exert antimicrobial actions in vitro against important Pathogens including fungi[6]. It has also been reported that plant extracts and spices as single compound or as mixed preparations can play a role in supporting both performance and health status of the animal[17]. About 20 gram of Coriander leaves contains 5 calories 0.73 gram of carbohydrate, 0.19. of Fat, 0.43g of protein, 3% daily value of Vit. B_9 and daily value of Vit. C. It possesses antioxidants such as selenium, Ascorbic acid, Vit. A., Beta-Carotene and Vit. E.[8]

Functions of Coriandrum sativum:

1. Reduce cholesterol. Its possesses oleic acid, Linoleic acid, Stearic acid and ascorbic acid which lower the

level of cholesterol and bad cholesterol in the inner walls of veins and arteries.

2. Prevents anemia: Coriander contains good amount of iron which is helpful for the anemia patients.
3. Anti-allergic activity: Anti-histamine properties in coriander helps to lower the uncomfortable condition caused by hay fever and seasonal allergies.

Black Pepper: Piper Nigrum is a flowering vine extracted from the core of a pepper plant and belongs to the family Piperaceae, genus Piper and spices Piper Nigrum. Black Pepper has been shown to be rich in glutathione peroxidase and glucose-6-phosphate dehydrogenase[13].

The antioxidant and radical scavenging properties of black pepper Seed have been well documented.[9]

[12]:Showed that piperine Can increase the absorption of Selenium, Vit B Complex, beta Carotene and Curcumin as well.

The pepper is a Creeper and normally grown on tall trees and grows up to 4 meter. The pepper we use at home is the dried pepper Fruit, when ripe the pepper fruit is red in color and when dried it becomes black. A tea spoon of pepper which makes about four grams gives as low as (10) Calories and contributes to daily value requirement of about 10% Mn, 5.4% Vit.k, 14.4% Iron 4.9% copper and about 2.8% of dietary fiber, its Promotes production of hydrochloric acid in stomach and improves digestion. Black pepper antioxidant benefits as well established and known to promote good intestinal health. It is help food to stay no longer than required there by reducing stomach gas and irritations. The pipperine seems to increase metabolic reactions to keep the fat levels under control. Black pepper also a good antiseptic, it prevents or reduce temperatures during fever.

Chickens Rose 308: is recognized globally as a broiler that will give consistent performance in broiler house.

Integrated and independent producers value the growth rate, Feed efficiency and robust performance.

Rose 308 is a robust, fast growing, Feed efficient broiler with good meat yield.

It is designed to satisfy the demands of customers who require consistency of performance and the versatility to meat a broad range of end product requirements.

Features of Broilers Rose 308:

1. Rapid growth, the possibility of early Slaughtering.
2. More muscle mass.
3. Bright skin.
4. High performance

Advantages of cross broiler Rose 308

1. Excellent Live weight gain.
2. Large and long legs.
3. Excellent Feed Conversion.
4. White and large breasts.

Materials and Method

The experiment started from 10th of April 2019 to 14th of May 2019 the chickens Fed ad-libitum for 35 days. Its was done in Agri. Faculty Field, Univ. of Sumer, De- Qar/Raifae.

The project divided into four groups, three treatments with different levels and the fourth as a control.

The chickens Rose (308) were distributed randomly for (3) treatments and the fourth as control.

T_1 = Control : just water drank .

T_2 = Coriandrumsativum only 4 mL Ext.COR./Lit. Water.

T_3 = Coriander + Black Pepper 3 mL Ext. COR. + 1 ml Ext. B.P./Lit. water.

T_4= Coriander + Black Pepper 2.5 mL Ext. COR. + 1.5 ml Ext. B.P./Lit. water.

The procedure of extraction: The medicinal herbs plant was brought from popular Market and Mill the seeds by electrical Machine to get Powder, after that it was dissolved with distilled water and left for 24 hours.

The percentage recorded 1g. Powder dissolved with 2ml of distilled water then the solution was kept in water bath on 60C° until boiling then left it to cool and filtered by sterile gauze after that the solution was ready for use.

Statistical Analysis: The statistical computations were done by using SAS Software program (SAS, 2012). Duncan's multiple range test (1955) to comparison between means. (21 and 22).

Results

The study deal with different treatments of herbs on many differ Biological Parameters. It contain (6) tables.

Table 1: Effect of Extraction for medicinal herbs and spices on feed consumption of broiler chickens

C.F.C.	Weekly age					Treat
	5	4	3	2	1	
18.28 ± 3247.40 d	12.35 ± 1560.47 c	5.66 ± 813.33 b	3.49 ± 534.57c	1.67 ± 217.95	1.13 ± 121.08	T_1
16.11 ± 3369.93 c	10.29 ± 1655.58b	6.14 ± 817.05 b	2.95 ± 553.26 b	1.33 ± 223.20	0.96 ± 120.84	T_2
17.83 ± 3460.83 a	11.33 ± 1709.72 a	6.11 ± 838.47 ab	2.77 ± 569.73 ab	1.58 ± 223.79	1.11 ± 119.12	T_3
18.83 ± 3501.07 a	1.33 ± 1717.30a	5.83 ± 855.71 a	3.18 ± 582.96a	1.38 ± 223.94	1.11 ± 121.16	T_4
*	*	*	*	*	N.S	L.s.ig

There is significant decrease in cumulative feed consumption P<0.05 and as well between the treatments,started from third week of the experiment.

Table 2: Effect of extraction for medicinal herbs and spice on feed conversion ratio to broiler chickens.

F.C.R.	Weekly age					Treat
	5	4	3	2	1	
0.012 ± 1.77c	0.022 ± 1.94c	0.016 ± 1.75c	0.013 ± 1.64c	0.011±1.49b	0.008 ± 1.12	T_1
0.011 ± 1.68b	0.017 ± 1.86b	0.014 ± 1.66b	0.011 ± 1.57b	0.010 ± 1.44ab	0.010 ± 1.13	T_2
0.010 ± 1.66ab	0.019 ± 1.84ab	0.017 ± 1.63ab	0.015 ± 1.54ab	0.010 ± 1.43a	0.006 ± 1.12	T_3
0.012 ± 1.63a	0.017 ± 1.80a	0.016 ± 1.61a	0.013 ± 1.50a	0.009 ± 1.40a	0.008 ± 1.13	T_4
*	*	*	*	*	N.S	L.s.ig

This results indicated there is significant P<0.05 on feed conversion ration started from third week of treatments.

Table 3: Shows the comparison between different treatments in Biochemistry.

Treatment	Mean ± SE		
	Cholesterol (mg/dl)	Triglyceride (mg/dl)	Total protein (g/dl)
T1:Control	140.00 ± 8.31 a	55.00 ± 2.58 b	3.30 ± 0.09 a
T2:4 ml/L Coriander	90.00 ± 4.58 b	56.00 ± 2.75 b	3.00 ± 0.06 a
T3: 3ml/L Coriander + 1 ml/L Black pepper	120.00 ± 7.08 a	62.00 ± 3.23 ab	3.20 ± 0.11 a
T4: 2.5ml/L Coriander + 1.5 ml/L Black pepper	135.00 ± 7.43 a	75.00 ± 5.07 a	3.40 ± 0.15 a
Level of sig.	*	*	NS

There is significant reduction p<0.05 for cholesterol and P 0.05 >for T.G and No. Sig. for total protein.

Table 4: Effect of medicinal herbs and spice on Liver enzymes.

Treatment	Mean ± SE		
	GOT	GPT	ALP
T1:Control	52.00 ± 2.51 a	14.00 ± 0.55 a	690.00 ± 24.53 a
T2:4 ml/L Coriander	40.00 ± 1.63 b	10.00 ± 0.37 b	695.00 ± 27.74 a
T3: 3ml/L Coriander + 1 ml/L Black pepper	47.0 ± 2.06 a	9.00 ± 0.41 b	680.00 ± 19.47 a
T4: 2.5ml/L Coriander + 1.5 ml/L Black pepper	49.00 ± 2.37 a	12.00 ± 0.68 ab	680.00 ± 25.04 a
Level of sig.	*	*	NS

The Results showed a significant $p<0.05$ **decrease** in GOT and GPT but there is no significant in ALP.

Table 5: Effect of coriander and black pepper on growth and TSH hormones in broiler chickens.

Treatment	Mean ± SE	
	GH-Growth hormone	TSH
T1:Control	0.10 ± 0.02b	0.20 ± 0.03 a
T2:4 ml/L Coriander	0.10 ± 0.02 b	0.21 ± 0.05 a
T3: 3ml/L Coriander + 1 ml/L Black pepper	0.14 ± 0.05 a	0.11 ± 0.01 b
T4: 2.5ml/L Coriander + 1.5 ml/L Black pepper	0.12 ± 0.02 ab	0.23 ± 0.05 a
Level of sig.	*	*

The result showed a significant increase $p<0.05$ for growth and TSH hormones.

Table 6 :Effect of herbs and spice for Immunity in Broiler chickens.

Treatment	Mean ± SE	
	N.D.	I.B.
T1:Control	1504.00 ± 62.48 b	0.00 ± 0.00 a
T2:4 ml/L Coriander	2281.00 ± 94.53 b	0.00 ± 0.00 a
T3: 3ml/L Coriander + 1 ml/L Black pepper	5825.00 ± 135.09 a	0.00 ± 0.00 a
T4: 2.5ml/L Coriander + 1.5 ml/L Black pepper	6715.00 ± 164.74 a	0.00 ± 0.00 a
Level of sig.	*	NS

There is significant $p<0.05$ for N.D. with different treatments compare with control and No. Sig. with infection bronchitis (IB).

Note: All broiler chickens vaccinated against N.D. only .

Discussion

The study was conducted to assessment the effect of watery extraction of medicinal herbs and spices on weekly Body weight gain (B.W.G.), Feed Consumption (FC.) and Feed conversion ratio (FCR).

Body weight gain (B.W.G.), Feed Consumption (FC.) and Feed conversion ratio (FCR). All treatments significant differences $p<0.05$ compared with control, that study Carried out through Table [1 and 2] These results agreed with author[20] who observed that COR.

Supplementation improved BW., BWG, and FCR. As well author[10] who started that COR. Supplementation at a level of 2% improved B.W.and FCR in Japanese quails.

Author[4] observed that BWG, of male broiler during different weeks was no influenced by (BP) Black Pepper (TUR) Turmeric or their Combination.

From this study we observed improved with Biochemical parameters, the result showed a reduction in cholesterol P<0.05 and increase with T.G. P> 0.05 but no significant with total protein, maybe due to active Fatty acid such as oleic acid palmitic acid and essential oils such as Linalool that Lowered cholesterol by hepatocytes. Table 3.

The study showed that a significant reduction for two enzymes of the liver GOT and GPT P<0.05 Compare with the controland no significant with ALP enzyme. Table 4. that medicinal herbs and spice maybecontribute to decrease liver damage.

The resultunagreed with author [18] who observed that TUR supplementation alone was not significant with total cholesterol.

Present study indicated that growth and TSH hormones had significant increased p<0.05 compare with the control.

Growth hormone are protein and contribute to grow the bird to quickly. It is responsible for growth of the body including bones and help for increase metabolic process, as well as TSH hormone are principal hormone responsible for attainment the growth. Table 5.

Result of Table 6 deal with immunity test for chickens treated with different medicinal herbs and spice, and all chickens were vaccinated with N.D. only, and we found a significant differences and increased antibody value against N.D. compare with the control, P<0.05 and no significant antibody against IB. Author [15] observed the chickens immunized with Eimeriaprofilin protein and fed diets supplemented with carvacrolcinamaldehydeand capsicum oleoresin or turmeric oleoresin and capsicum oleoresin had increased body weights and antibody levels compared withunimmunized and infected chickens Feda non Supplementeddiet.

Conclusions

From this project, it is concluded that supplementation of medicinal herbs and spice as watery extraction for Broiler chicken improving Body weight, Body weight gain, Feed Consumption, Feed Conversion ratio and reduction of Biochemical such as cholesterol and as well reduction ofliver enzymes with enhanced the immunity of the birds.

Recommendation: Added medicinal herbs and spice for Broiler chickens enhanced flavor of the Feed and stimulate the digestive enzymes activity that improved B.W., B.W.G., F.C., F.C.R. and reduction the cholesterol, enzymes GOT, GPT.

The Author suggested that used the medicinal herbs and spices contribute for enhance daily body weight gain, gave reduction for liver enzymes and cholesterol as well Author suggest that herbs improving growth and TSH hormones to boost the metabolism and enhance the immunity of the birds .

Conflict of Interest: None of the authors have any conflicts of interest to declare.

Source of Funding: The research was performed independently, there is no funding, influence over study design, analyses, manuscript preparation, or scientific publication.

Ethical Clearance: The project was approved by the local ethical committee (College of Agriculture, University of Sumer(

Parental Style and its Relation to Adolescents' Self-Concept and Depression

Safaa Mohammed Zaki[1], Manal Hassan Abo Elmagd[2], Nagat Farouk Abo Elwafa[3]

[1]Lecturer of Psychiatric and Mental Health Nursing, Faculty of Nursing, Minia University, Egypt, [2]Associate Professor of psychiatric and Mental Health Nursing, Faculty of Nursing, Umm Al Qura K.S.A & Minia University, [3]Lecturer of Pediatric Nursing, Faculty of Nursing, Minia University, Egypt

Abstract

Background: The adolescents' growth and development can be developed by the style of parents. Parenting style has been discussed to influence on psychological status of adolescent in which it may produce depression or decrease self-concept.

The Aim of the Study: Was to assess parental style and its relation to adolescents' self-concept and depression.

Research Design: descriptive correlation research design was used.

Research Question: Is there a relation between Parental style and adolescents' self-concept and depression?

Setting: This study was carried out in Zohra preparatory and El-Fath preparatory schools at Minia City.

Sampling: A convenient sample consisted of 200 adolescent students.

Tools: Three tools were used; Parental style (MOPS), Self-Concept Clarity Scale, and Birleson depression scale.

Results: There was significant negative statistical correlation between self – concept and total parent style.

Conclusion: The current study concluded that most of the studied adolescent pained from depression symptoms. Parents with abusive behavior their adolescent self-concept decreased and become depressed.

Recommendations: Parents training regarding parenthood had a power on self-concept of their children which as a consequently induced the depression.

Introduction

The master component of each society and the smallest public unit is the family. As well, the climate of family is the most significant and initial tool that affect the growth of family individuals[(1,2)]. The basic of developing any individual is resting in the family womb; and the family environment as well its atmosphere is the basic for developing and growing the child's personality.

Parenting is sophisticated and multiplex action that encompasses numerous special behaviors as well as it is working autonomously to impact their children outcomes. Parenting contains two major and distinguishing roles as the mothering and fathering[(3)]. Loving, sympathetic, authoritative, legitimate fathering develops the child autonomous, individualistic, and emotional stability as well establishes their positive attitudes and behaviors toward the society. If mother's anticipation is true, having love, and suitable in caring, ascendancy or punishing; the development of child become more gainful, useful and fanciful. While, ideal and exemplary mother expectation, over protection and

more soldiers like mother's attitude can be seen as the responsible for the modes of parenting problems[4].

At times, self-concept has been defined as an individuality characteristic. Modern researches about personality has been displayed that great five personality features (extraversion, neuroticism, agreeableness, conscientiousness, and openness) are essence and root characteristics that cannot be changed. While self-concept realized as the biddable and tractable characteristics of person. These researches had seen self-concept as changeable personality characteristics because it can be affected by status, situations, events of life, and environment factors. Therefore, self-concept considered as multidimensional structure and it has been specified that the causative impact of personality on one behavior and attitude can be more probably interpose to some scope by self-concept [5, 6].

There are many studies concluded that there is a reverse relation between self-concept and depression. By another way when self-concept dwindling, the average of depression will be excessed [7]. revealed in their study that depression and self-concept had correlation; as well as they displayed a comparable correlation for another variable like ethnic/racial group, physical look, and sex in their study. Also, they revealed that adolescents with Hispanic ethic had low self-concept and high depression level than other ethnic categories.

The negative feelings about own bodies were higher between Hispanic females adolescent than White and African American and these feelings were shared in increasing the depression symptoms as well decreasing self-concept. Self-concept, depressed mood, and body image have a mutual distinction between emigrant and acculturated Hispanic girls. As the negative feelings among Hispanic females for their bodies' image may be directed to marginalization outcome[8, 9].

Therefore, depression which is the most widespread status of emotional problems is more practiced during adolescence; it can be described by feelings of anxiety, anger, fear, sadness, guilt, disrespect, grief, chagrin confused or troubled thinking [10, 11]. Personality features can be explicate as the continual characteristics which can discriminate between persons, and some words that can be used to characterize personality are "passive," "extrovert," "outgoing," and others. On the other hand, personality features or traits refer to how the person can reply to events that is temporary[12].

Depression is utilized as a subscale for determining the clinical and nonclinical citizens of children with the behavior disorders[13].There are many aspects of adolescent's life can be influenced by the presence of depression such as, family and social relationships, self-worth, schoolwork, and decision making. Specially, depression can affect negatively different domains of cognitive function in children and adolescents. Thus, inability to treat depression in adolescents, this can lead to a growing in suicides; as the greatest decisive predictor for suicide is depression [14].

Significance of the study: One of most important aspect of individual is self-concept which is a key of psychological luxury that build in and of itself. Also, self-concept had been evident to have an effect on various and many of critical wellbeing results and outcomes and serve as an influential cornerstone for developing full of one's potential. Also, it was reported from various studies that many of individual who have low self-concept had negative or high psychological disorders such a fear, anxiety, stress and depression. Thus this study was done to assess parents' styles and its relation to self-concept and depression.

Aim of the study: To assess parental style and its relation to adolescents' self-concept and depression

Research question: Is there a relation between Parental style and adolescents' self-concept and depression?

Subjects and Method

Research design: Descriptive correlational research design was used in this study.

Setting of the study: This study was conducted at selected sample of Minia schools in (Zohra preparatory school and El-Fathpreparatory schools) at Minia City.

Subjects:

A convenient sample of 200 adolescent their ages ranged from 12 to 16 yrs. students was recruited in the study. Data collection started from March to May 2017.

Tools of data collection: Three tools were used

1. **Tool one** it contained two parts

First part: Personal data, which covered the following items: age, gender, address, and birth order and family income.

Second Part:

1. **Measure of Parental Style (MOPS)[15];** this self-assessment tool used to assess the perceived parenting styles by parents. This tool comprised of 15 items divided into three styles as: Indifference style contained (6 items), Abuse style contained (5 items)and over control contained (4 items). The sum of the style items scores provides the total score for each style. There is no severance of score; the style total score show to which that parental style was dominated by parents.
2. **Self-Concept Clarity Scale [16]:** This scale was used by researcher to assess the self-concept of adolescent. This scale contained 12 statements measured by five points likert scale ranged from (1 strongly disagree to 5 strongly agree). The scoring system was as follow: low self-concept when adolescent is less than 20, from 21 to 40 is moderate and high self-concept is from 41 to 60. The scale statements are reversed items except statement number 6 and 11.

3. **Birleson depression scale[17]:** This scale was utilized by researchers to determine the depression level among adolescents. It encompassed from 18 statements measured by three point likert scale ranged from (0=never to usually=2). Statements are reversed in 3,5,10,14,15,17and 18.Scoring system was the adolescent who had less than 11= is not depressed; and adolescent who had 12 and more are depressed.

Pilot Study: It was applied on 10% from the study subjects (20 adolescents). Based on the pilot study analysis no modifications were done in the questionnaires .So number of the pilot study was included in the total number of the study sample.

Validity and Reliability: The tools were submitted to a panel of five experts in the field of pediatric nursing and psychiatric nursing at Minia and Assuit University to confirm content validity. Reliability of the tools were done and calculated statistically. The reliability of tools was measured by Cronbach's alpha test and was for tool I (0.87), for tool II (0.90)and for tool III (0.89).

Procedure: A review of related literature was done for covering various aspects of the problem using available journals and books to be acquainted with the research problem and to select the appropriate study tools. Official permissions were granted from the director of schools to conduct the study. The researcher selects these two schools because only these schools agree to participate in the study. The researchers went to El-Fath preparatory school every Sunday from 9am to 11 am and take adolescents in lab room then explain the purpose of the study and then fill in the sheet. Regarding Zohraschoole, it's a village affiliated to Minia city, the researcher went to it by bus, the researchers went to Zohra preparatory school every Wednesday from 9am to 11 am, and the aim of the study was explained by the researcher to adolescents for getting their approval prior starting their participation in the study. The data collection was lasted for three months. Their ages were ranged between 12- 16 yrs, majority of them in class 3 preparatory school, their number was 200 who agreed to participate in the study.

Statistical Analysis: Subjects' responses to each category were analyzed, categorized and coded by investigators then tabulated separately by using the statistical package for social science (SPSS) version 20. Descriptive statistics were calculated as frequency, percentage, mean, stander deviation. T-test and ANOVA test and Pearson correlation were also used among studied values. Probability (p-value) less than 0.05 is considered significant and less than 0.001 is considered highly significant.

Results

Table (1): Distribution of the studied adolescent according to socio-demographic data, shows that, more than two thirds of the study adolescents (68.5%) aged between 14- 16year, with mean age (13.73 ± 0.95). Regarding gender, about three quarter (73%) of adolescents were females and (27%) of them were male. 50.5% of adolescences live in urban area. 50% of adolescences have low family income. Also, it reveals that, the highest percentage of adolescent (36.5%) was ranked as second child in their families.

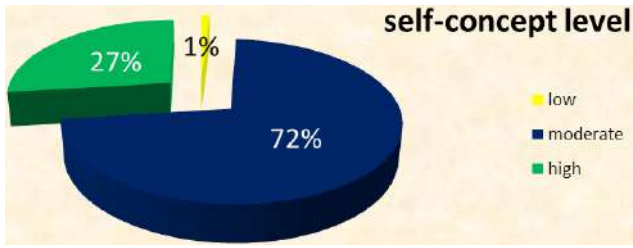

Figure 1: Distribution of Studied adolescent According their self-Concept levels (n= 200).

Figure (1) shows that most of adolescent 72% had moderate self –concept level and more than on quarter 27% had high self-concept level.

Figure 2: Distribution of Studied adolescent According to Presences of depression symptoms (n= 200)

Figure (2) clarifies that the vast majority 98% of studied adolescent suffered from depression symptoms, but only 2% of them not suffered from depression.

As regardmean Score differences of adolescents' Parent style, Self- concept and Depression, According to gender, result shows that, there was statistically significant difference between total parent style and adolescent gender (t=0.96, P=0.03).

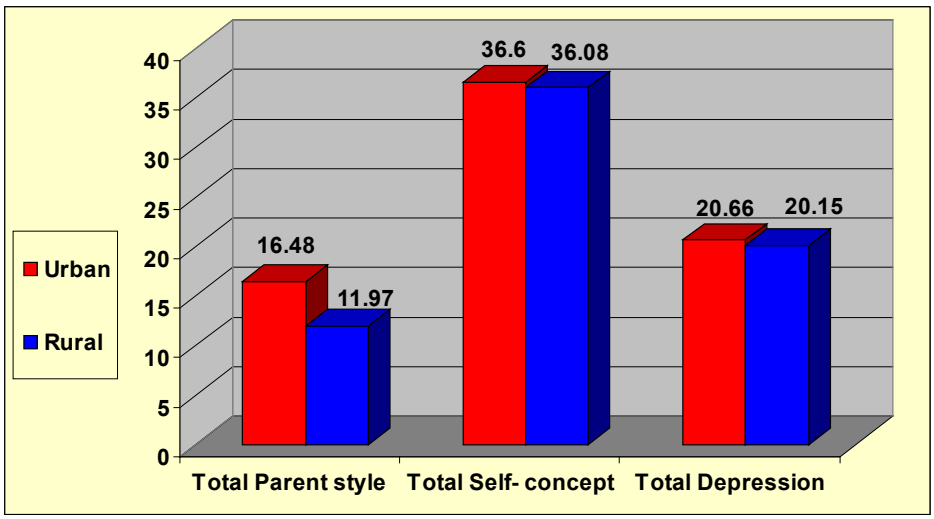

Figure 3: Mean Scores differences of adolescents' Parent style, Self- concept and Depression, According to place of residence (n=200)

Figure (3) shows that, there was statistically significant difference between total parent style as well as total self-concept with place of residence (t=5.01, p=0.00** and t=0.66, p=0.02**) respectively.

Table (1): Relation between adolescents' gender and both depression and self- concept levels (n=200)

Tested Items	Total	Male		Female		X^2 P-value
		No.	%	No.	%	
Level of depression						
• Nnormal non- depressed "less than 11"	5	1	0.5	3	1.5	0.96
• Ddepressed"12 - and more"	195	53	26.5	143	71.5	0.00**
Level of self- concept						
• Llow "≥ 20"	1	1	0.5	0	0.0	2.76
• Mmoderate "21-40"	145	38	19	107	53.5	0.25
• Hhigh "41-60"	54	15	7.5	39	19.5	

Table 1 clarifies that there were 71.5% of female adolescents suffering from depression compared with 26.5% of male adolescents with statistically significant difference between the two groups (X^2 = 0.96/p-value 0.00). Additionally, 53.5% of female adolescents had moderate level of self-concept and no one had high level; compared with 19% had moderate self-concept level and 7.5% had high level among male adolescent with not significant statistically difference between the two groups.

Also, results display that the highest mean scores "16.25 ± 8.09" of total parent style score and its' domains; indifference parent style and over control

parent style "6.00 ± 3.74" and "7.00 ± 2.58" were reported by adolescent's who don't have depression symptoms. Also, it can be noted that the highest mean score was "4.41 ± 3.21" of abuse parent style reported by adolescent's who had depression symptoms.

Table (2): Correlation between Adolescents' Perceived Parent Style and both of self- concept and depression

Variables		Total Parent Style	parent style domain 1	parent style domain 2	parent style domain 3	Total depression	Total Self concept
Total Parent Style	R P-value	1					
Parent style domain 1	R P-value	0.855** 0.000	1 -				
Parent style domain 2	R P-value	0.842** 0.000	0.610** 0.000	1 -	.		
Parent style domain 3	R P-value	0.436** 0.00	0.098 0.166	0.121 .074	1 -		
Total depression	R P-value	-0.146-* 0.039	-0.166 0.019	-0.074 0.300	-0.069 0.332	1 -	
Total Self concept	R P-value	-0.174-* 0.014	-0.123- 0.083	-0.195- **0.006	-0.047- 0.509	0.296** 0.00	1 -

Table 2: Shows that there were statistically significant negative correlations between self – concept and total parent style and its subscale of abuse parent style (R=-0.17, p- value 0.01) & (R=-0.19, p- value 0.00) respectively. Additionally there was a statistically significant negative correlation between depression score and total parent style & Parent Indifference style (R= - 0.14, p- value 0.03) & (R= -0.16 p- value 0.00) respectively.

Discussion

The current study revealed that there was more than two thirds (68.5%) of the adolescents aged between 14-16 year, while there was 31.5% of them had age between 12- < 14 year, with mean age of 13.73 ± 0.95. Regarding gender, there was 73% of adolescents were female and 27% of them were male. Also data revealed that, the highest percentage of adolescent 36.5% ranked the second child in their families.

The current study displayed that most of adolescent 72% had moderate self -concept and more than a quarter 27% had high self –concept. The vast majority 98% of studied adolescent suffered from symptoms of depression, but there only 2% had no experiences or symptoms of depression according to Birleson depression scale. As the adolescent who has low level of self-concept, was in risk to be depressed. This can be explained as result of the strong relation between self-concept and depression.

Actually when there is a support provided from parents and peers to the adolescents, their self-concept will be enhanced and maintained. In the same respect, [18]displayed that there 56% of their studied adolescents had an average level of self-concept and about third 30.75% had good level of self-concept, 8.25% had poor self-concept, and 0.75% had very poor self-concept, while only 4.25 had very good level of self-concept. Thus, it can be consummated that low level of self-concept is linked to the high level of depression; in other words, when the level of self-concept diminished, the level of depression rates excessed. Also, [5]stated in their research study among 77 adolescents, that there was strong negative correlation founded between depression level and self-concept level.

Moreover, in the current study it was revealed that there were statistical significant differences between male and female adolescents in regarding to the perceived parent style. It was noted that the highest mean scores were for the indifference and abusive parent style

"4.22 ± 3.20"and "4.60 ± 2.99" respectively in favor to female adolescent. While, the highest mean score "6.59 ± 2.53" of over control parent style was reported by male adolescent. This result was in agreement with the findings of [19]who displayed that there are two parent styles as indifference and abusive had significant relation with level of depression among adolescents. Also, the result advocates the hypothesis about the significant relation between parent styles and level of depression in adolescents.

It also observed that there were 71.5% of female adolescents had high level of depression compared with 26.5% of male adolescent; indeed 53.5% of female adolescent had moderate self-concept. This result was congruent with the study result of [12]revealed that, the most commonly psychological disturbance among adolescent was depression, in which it was appear that up to one of each three girls and one out of each five boys can had minimally one episode of depression disorder when reach the age of eighteen.

In the same context [20]supposed that the adolescents with high depression level had self-concept with negative view, which can affect negatively on their cognitive capabilities and had an effect on academic ability. Also, this result was consistent with the findings of [21] found that the level of depression is higher and raised more among female (35%) than male (23.1%) adolescent. As well as it was reported that the incidence of depression symptoms is higher in women than in men[22, 23]. Also, in 2010 the annual global incidence of depression mentioned that depression was 5.5% in female and 3.2% in male[24].

The current study also revealed that the highest mean score was "4.41 ± 3.21" for the abuse parent style which was reported by adolescent's who had depression symptoms. [25]Reported that; adolescents with manifestation of depression had the higher mean score for the abuse parent style. Also, [26]mentioned that the abuse parent style was the most common style reported among adolescents who had symptoms of depression.

Moreover, it was reported from different researches that the mostly effective aspect that influence on the establishment and enhancing personality of adolescent was the parents' activities in parenting. Style of parent's parenting can determine the prosperity or dud of the adolescent. The most important issues in parenting style were; the amount of emotion, softness and smoothness that children had; also, the amount of agreement, conformity and monitoring or dominance that utilized by parents[27].

The current study also revealed that, there were statistically significant negative correlations between self – concept and total parent style & its subscale of abuse parent style. As when abusive behavior increases as a parent style, the self-concept of adolescents decreases consequently. The negative self-concept among adolescent can lead them to do not good during their life. Commonly, they not successes in their life as they often do problems and turmoil in their life; as well as they failed to manage effectively their life.

Therefore, the persons who had negative or low self-concept can absolutely be unsatisfied about them in everything as well they cannot be happy about the surrounding. Further [28]agreed that one who has self-concept in negative manner can be easily and permanently gain criticism from the parents, teachers, peers, and friends. This can help adolescent to be further unfavorable and passive, as well they don't realize how to have relations with people who live with; in which this can influenced and effect on them to be more less self-confidence and timid.

Additionally, there were statistically significant positive correlations between depression score and total parent style & parent indifference style. This result was in congruence with the finding of[29] who pointed that, there was negative relation with statistically significance between the parenting style and adolescents' self-concept in favor to indifference style.

Indeed, correlation between adolescents' self-concept and parenting style did not show any statistically significant relations with all the three dimensions. This was not congruence with[27] mentioned that, parenting styles had statistically significant correlation with depression. As there were two styles of parenting had significance correlation; and the parenting style of authoritarian was the most one had positive correlation, while parenting style of permissive was correlated negatively with depression.

It also, found that there was a statistically significant relation between total depression and total self-concept. This finding was in accordance with the finding of[12] displayed that, there was a strong relation with significance between self-concept and depression.

Conclusion

The parents' style has crucial role in shaping their children behaviors, attitudes and outcomes. Therefore, when the abusive behavior increased due to parent style the self-concept of adolescents decreases consequently

Recommendations: According to the findings of the present study, the relation between depression and parenting style is actually significant. Thus, it is recommended that the training of parents for parenthood can influence their children self-concept which has adverse effect on depression. As well there should be suitable attention given to adolescents, as when they have the necessary assistance and proper feelings and emotions they can be more self-concept and be less depressed.

Source of Funding: Self-funding

Conflict of Interest: Nil

Ethical Clearance: An official permission was obtained from the directors of the two schools after explaining the nature of the work. Also, an official permission was obtained from the ethical committee in faculty after explaining the nature of the work, and then the study aim was explored for every interviewed adolescent (males & females). An ethical right to agree or refuse participation in the study was granted to the adolescent. They informed that their information will kept confidential and used only for the purpose of the study and there was no harm for their participation.

Assessment of Exam-related Anxiety among the Students of the High Healthy Vocations Institute at Medical City

Sameer Allawi Khalaf[1], Meaad Kareem Halboos[2]

[1]Assistant Lecturer, Adult Nursing-College of Nursing/University of Tikrit,
[2]Psychiatric Mental Health Nursing, High Healthy Vocations Institute/Ministry of Health

Abstract

The purpose of this study was to assess levels of anxiety among the Students of the High Healthy Vocations Institute, to find out relationship between students' anxiety levels and some socio-demographic characteristics such as (age, residency, marital status and department) of the Students of the High Healthy Vocations Institute. The period of the study was from April 2nd, 2019 to June 2nd, 2019). To meet the study objectives a questionnaire was constructed. This questionnaire consisted of two parts: the first part includes four demographic characteristics: age, residency, marital status, and department; the second part concerning with the test anxiety scale. The scale measures the most important symptoms that characterize the test anxiety. Data were analyzed by applying: descriptive statistical analysis: frequencies and percentages and distribution; and inferential analysis: Correlation Coefficient, Chi-squire. The findings of the study revealed that assessment of exam-related anxiety among the Students of the High Healthy Vocations Institute is moderately to severe level of anxiety. There was a significant relationship between severity of anxiety and age of the students. The present study recommends encouraging the students to learn some coping strategies and stress managements by attending training and relaxation sessions. Advice to regular recreational programs that include trips to reduce stress and to help them to prevent and lessen the stress associated with every-day life events stress.

Keywords: *Exam-Related Anxiety;High Healthy Students; Contributing Factors.*

Introduction

Anxiety is an unpleasant state characterized by feelings of tension and apprehension, worrisome thoughts and the activation of the autonomic nervous system when an individual faces evaluative achievement demanding situations[(1)]. Fear of exams and test situations is widespread and appears to become more prevalent and test anxiety has a negative detrimental effect on test performance[(2)]. If an examination particularly affects the person's carrier selection and future opportunities, it may be stressful. Exam anxiety prevalence has been reported as 10-41% in school aged children. Researchers have estimated test anxiety prevalence rates of between 15-20% for college students[(3)]. Exam anxiety is primarily a concern over negative evaluation, so defined as a subtype of social phobia in DSM diagnostic system. Many studies have reported an association between exam anxiety and anxiety disorders[(4-5)]. Psychological factors which contribute significantly to exam anxiety are negative and irrational thinking about exams, outcomes of exams and feelings of no control over exam situation (e.g., going blank during exam) are reported by many authors[(6)]. Higher anxiety levels in the student community are considered as important indicators for poor mental health[(7)]. The potential negative effects of emotional distress on students include impairment of functioning in classroom performance and clinical practice, stress-induced disorders and deteriorating performance[(8)]. Students in extreme stress need serious attention, otherwise inability to cope successfully with

the enormous stress of education may lead to a cascade of consequences at both personal and professional[9]. Moreover, studies suggest that test anxiety comprises of many negative effects such as low enthusiasm, poor performance, negative self-evaluation viewpoints and low concentration[10-11]. Researches on examination anxiety have the notion that examination anxiety prepares threats for higher institution students. Anxiety symptoms are distributed along a continuum and different symptom levels of anxiety and predict outcomes. Responses consisted of increase heart rate, stress hormone secretion, restlessness, vigilance and fear of potential dangerous environments. Anxiety prepares the body for physical, cognitive and behavioral instincts to detect and deal with threats to students examination survival and then result to students, beginning to be hyperventilate to allow more oxygen to enter into the blood-stream, divert blood to muscles and sweat to cool the skin[12]. Posited that the difference between generalized anxiety disorders and examination anxiety. He explained that general anxiety disorders are characterized by trait anxiety that results to students experiencing higher levels of stresses across a wide range of situations. Contrarily, students that are prone to examination anxiety have a state of anxiety that results to higher levels of nervousness that are specific to examinations. The symptoms of examination anxiety range from moderate to severe anxiety. Students who exhibit moderate symptoms are able to perform relatively well on examinations. On the other hand, students with severe anxiety experience panic[13]; the common physical symptoms include: headache, upset stomach, feeling of fear, feeling of dread, shortness of breath, sweating, pacing or fidgeting, crying, acing thoughts and blanking out. Lyness explained that during the state of excitement or stress, the body releases adrenaline [14]. Adrenaline is known to cause physical symptoms that accompany examination anxiety such as increased heart beat-rate, sweating and rapid-breathing. In many cases, adrenaline is good; it is helpful when dealing with stressful situations, ensuring alertness and preparation. But to some students, the symptoms are difficult or impossible to handle, making them impossible to focus on examinations. The topic of test anxiety has prospered, in part, due to the increasing personal importance of test situations for people inmodern society, making tests and their long-term consequences significant educational, social, and clinical problems formany. Since test results in most academic and occupational settings have important practical implications for a person's goals and future career, test anxiety is frequently reported to be a meaningful factor impacting upon test scores. This study aims to (1) assess levels of anxiety among the students of the High Healthy Vocations Institute; (2) find out relationship between students' anxiety levels and some sociodemographic characteristics such as (age, residency, marital status and department) of these students.

Method

A descriptive analytical design study is applied to assess the anxiety among the students of the high healthy vocation institute at Medical City. The period of the study was from April 2nd, 2019 to June 2nd, 2019. The study included a probability (Stratified random) sample of 70 students. To meet the study objectives a questionnaire was constructed. This questionnaire consisted of two parts: the first part includes the demographic characteristics ofage, residency, marital status, and department; the second part concerning the Sarason test anxiety Scale [16] of 38 item self-report scale that assesses all symptoms of test anxiety. The scale encompasses four domains, each item of scale was rated (1= never, 2= rarely, 3= sometimes, 4= always). By applying the descriptive data analysis of Quartiles which determine the cut-off-points for the levels of anxiety which are Mild (38-103), moderate (104-115, (severe (116-148). Reliability of the questionnaire was determined through pilot study and validity determined through a panel of experts consists of (11) experts. Data were analyzed by applying descriptive statistical (frequencies, percentages) and inferential statistical (Correlation Coefficient and Chi-squire) through the SPSS (Statistical package for Social Sciences) version 21.0.

Results

Table 1: Participants' sociodemographic characteristics

Age		
Year	**Frequency**	**Percent**
≤ 9	19	12.2**%**
20-24	37	23.7**%**
25-29	7	4.5**%**
30-34	2	1.3**%**
35-39	2	1.3**%**
≥40	3	1.9**%**
Total	**70**	**100.0%**

Residency		
Residency		
Baghdad	60	38.5**%**
Outside Baghdad	10	6.4**%**
Total	**70**	**100.0%**
Marital Status		
Marital Status		
Unmarried	60	38.5**%**
Married	10	6.4**%**
Total	**70**	**100.0%**

Department		
Department		
Nursing	40	25.6**%**
Midwifery	15	9.6**%**
Anesthesiology	10	6.4**%**
Emergency	5	3.2**%**
Total	**70**	**100.0%**

Most of the study sample 23.7% are of age 20-24-years, the highest percentage (38.5%) live in Baghdad, more than half (38.5**%)**are single, and the highest percentage (25.6**%)** are from the nursing students.

Table 2. Participants' levels of anxiety

Total No.	Levels of Anxiety							
	Mild		Moderate		Severe		Total	
	F	%	F	%	f	%	F	%
	35	22.4%	16	10.3%	19	12.2%	70	100.0%

There is different severity of Anxiety the students inflicted with; 22.4% have mild level; 10.3% have moderate level and 12.2%with severe level of Anxiety.

Table 3. Distribution of the sample according to the levels of Anxiety

			Levels of Anxiety			Total
			Mild	Moderate	Severe	
Age	≤ 19	F	11	4	4	19
		%	15.7%	5.7%	5.7%	27.1%
	20-24	F	18	6	13	37
		%	25.7%	8.6%	18.6%	52.9%
	25-29	F	3	3	1	7
		%	4.3%	4.3%	1.4%	10.0%
	30-34	F	2	0	0	2
		%	2.9%	0.0%	0.0%	2.9%
	35-39	F	1	1	0	2
		%	1.4%	1.4%	0.0%	2.9%
	≥ 40	F	0	2	1	3

Total		**F**	**35**	**16**	**19**	**70**
		%	**50.0%**	**22.9%**	**27.1%**	**100.0%**

Less than a fifth(18.6%) of the age group 20-24 have severe level of Anxiety while just 1.4% of age groups 35-39 have mild level of Anxiety.

Table 4. Levels of Anxiety according to residency of the students participated

			Levels of Anxiety			Total
			Mild	Moderate	Severe	
Residency	Baghdad	F	32	14	14	60
		%	45.7%	20.0%	20.0%	85.7%
	Out Baghdad	F	3	2	5	10
		%	4.3%	2.9%	7.1%	14.3%
Total		**F**	**35**	**16**	**19**	**70**
		%	**50.0%**	**22.9%**	**27.1%**	**100.0%**

A fifth (20.0%) of the students who live in Baghdad have severe level of Anxiety while just 4.3% of students are living outside Baghdad have mild level of Anxiety.

Table 5. Participants' levels of Anxiety according to the marital status

			Levels of Anxiety			Total
			Mild	Moderate	Severe	
Marital Status	Unmarried	F	32	14	14	60
		%	45.7%	20.0%	20.0%	85.7%
	Married	F	3	2	5	10
		%	4.3%	2.9%	7.1%	14.3%
Total		**F**	**35**	**16**	**19**	**70**
		%	**50.0%**	**22.9%**	**27.1%**	**100.0%**

A fifth (20.0%) of the students group unmarried has severe level of Anxiety while just 4.3% of the married students have mild level of Anxiety.

Discussion

The most important consequence of this study is that the results of table (2) show that the students have different levels of anxiety. This result is supported by Clark and her colleagues (2000) found that the majority of subjects had high levels of test anxiety, as can be inferred from the results of the present study, the high and moderate levels of anxiety are higher than those of studies cited above. This difference may be due to several factors that have an impact on anxiety, such as different course contents, educational environment, test conditions, types of test questions and other factors[17].

The results show that the students are young and being around eighteen years old and of mid- aged and being around forty years old and have different levels of anxiety table (3). In addition, the age groups of (20-24) have more levels of anxiety (52.9%). This result is supported by McDonald (2001); Showed that fear of failing a test increased with age in American and Australian students, in studies that use specific test anxiety scales, anxiety levels typically increase with age, found that test anxiety levels increase through in younger and middle-aged students[18].

The study indicates that the students living in the City of Baghdad have more levels of anxiety 85.7% than the students living in the outside Baghdad table (4). This might be due to the long way those students need to reach to the institute everyday, but the other students live in places around the institute.

Regarding the marital status, this study shows that 85.7% of unmarried female students have more levels of anxiety Table (5). This is supported by Amuda and colleaguesinvestigated the relationship between marital status and test anxiety, academic performance of undergraduate students in the USA, the result showed that the single students more anxiety than married students. This means that marital status influences students' academic achievement and those that are married tend to do better than the single students[19].

Conclusion

The results of present study indicated that most of the students jointed in the study are of age twentieth

and twenty-four; about half of them live in Baghdad; more than half are unmarried; and most of them are of the nursing department students. The study indicates that high percentage of those students have anxiety in different levels; about a quarter of them are with mild level, less than the quarter are with moderate level, and a twelve of the sample have severe level of anxiety. The study describes statistically significant association between age and severity of anxiety.

Recommendations:

The researchers recommend the following:

1. The teachers should acknowledge the existence of test anxiety on the part of students and should take initiatives for its effective reduction. They should identify individuals with signs of stress and anxiety and should apply appropriate strategies to help them counteract these feelings.
2. Teachers should initiate discussions in the class about the feelings of anxiety and should take measures to reduce the sense of competition among them.
3. There should be some specific teachers training courses on managing test anxiety in order to make teachers aware of this complex issue and, hence, alleviate it.
4. Students should seek counselling before doing tests so as to increase their confidence.
5. Building on 2 above, group counselling sessions may be more beneficial. Such sessions enable students to share their personal experiences and copes strategies with others so that they know that they are not alone.

Conflict of Interest: The researchers report no conflict of interest.

Funding: This study did not receive any funding from any agency.

Ethical Clearance: A permission to conduct this study was obtained from the ethical committee in the College of Nursing, University of Tikrit.

Urinary Intestinal Fatty Acid Binding Protein "IFABP" as a Marker for Gut Maturation in Preterm Babies

Samir Tamer Abd-Allah[1], Hanan Mostafa Kamel[2], Madeha Abd-Allah Sayed[1], Yossra Samir Fadle[1]

[1]Department of Pediatrics, [2]Department of Clinical Pathology, Faculty of Medicine, Minia University, El Minia, Egypt

Abstract:

Objective: Formula-fed premature babies have a higher incidence of developing necrotizing enterocolitis (NEC) than breast-fed babies which may be caused by breast milk induced gut maturation. The effect of breast milk on maturation of the gut has been widely studied in animal models and recently in humans.

The aim of this study is to evaluate the effects of breast-feeding on maturation of the intestine in premature babies by measuring the postnatal values of a specific enterocyte marker which is urinary intestinal fatty acid binding protein (I-FABP).

Method: Maturation of the gut was studied in 60 premature babies (<37 weeks of gestation) without gastrointestinal morbidity. 30 of them were exclusively breast-fed and the other 30 were formula-fed. Urinary I-FABP levels as the measure of gut maturation were measured at 7th, 12th, and 22nd post-natal days.

Results: In breast-fed babies, there was a statistically significant increase in urinary I-FABP levels between 7th and 12th days after birth compared with formula-fed babies ($p< 0.01$)

Conclusions: The pattern of postnatal changes in urinary I-FABP levels suggests a delayed physiological response causing significantly delayed gut maturation in formula-fed babies compared with breast-fed ones.

Keywords: *Breast-feeding, formula feeding, intestinal fatty acid binding protein,gut maturation, mucosal damage, necrotizing enterocolitis.*

Introduction

Human milk (HM; milk from the infant's own mother) feedings during the Neonatal Intensive Care Unit(NICU) hospitalization reduce the risk of prematurity-related morbidities in a dose-response manner for very low birth weight babies.(1)

These morbidities include late onset sepsis, necrotizing enterocolitis, chronic lung disease, retinopathy of prematurity, prolonged NICU hospitalization, increased health care costs, and long-term health and educational problems.(2)

Breast milk is a known source of molecules that act synergistically to protect the gut barrier and enhance the maturation of the gut-related immune response. So During the perinatal period, nutrition is the principal contributor for immunological and metabolic development, and microbiological programming.(3)

Breast milk is the gold standard for preterm nutrition and influences the development of intestinal microbiota and immune system through its bioactive components.(4)

Preterm infants altered gut microbiota interaction(2) with an immature immunologic intestinal response triggers proinflammatory and counter-inflammatory cytokine response. Necrotizing enterocolitis (NEC) is

the most common gastro- intestinal emergency in the neonatal intensive care unit (NICU) which is due to excessive inflammatory response against commensal bacteria by the immature intestine following mucosal injury in the postnatal period. (5)

Its prevalence is largely related to birth weight and gestational age (G.A.)with approximately 1 in 10 very low birth weight infants (<1500 g) developing NEC.(5)

Breast-fed newborns are protected against NEC development through improved gut maturation and because there is an estimated 3 to 10 folds risk reduction in infants fed with breast milk compared with those fed with formula milk(6)

Patients and Method

Sixty preterm babies were enrolled in this study, thirty of them were breast-fed preterm babies (Group I) while the other thirty newborns were formula-fed ones (Group II).

All of the babies admitted to the NICU of the Minya University Hospital of children between August 2015 and March 2016 were eligible for participation.

Patients were included if they met the following inclusion criteria: <37 weeks of gestation, first enteral feeding within 7 days after birth, and diet consisting of either exclusively breast milk or exclusively formula milk. The only exclusion criterion was development of significant gastrointestinal pathology during the 30-day study period, defined as disease of the gastrointestinal tract necessitating surgery, antibiotic treatment, cardiopulmonary support, or discontinuation or reduction of enteral feeding.

Initiation of feeding and advancement of feeding volumes were realized according to the local protocol. The standard guidelines consisted of early initiation of oral feeding within few days after birth depending on the infant's gestational age and general condition.

Feeding volume was increased gradually and discontinued if there were signs of feeding intolerance including bilious gastric retentions, abdominal distention, emesis, or bloody stools.

Sample Collection:

1. **Blood samples:** 5 ml of venous blood samples were taken for complete blood count, Total and direct bilirubin, and CRP using fully automated chemical auto-analyzer Dimension-ES, USA.
2. **Urine samples:** Urine samples were collected on the 7th, 12 th, and 22th day after birth.

Samples were collected either from a urine bag connected to an indwelling catheter or from a cotton wool swab placed in the diaper and squeezed through a syringe barrel into a collection tube. Samples were then frozen at -20°C till the time of analysis.

Urinary I-FABP levels were measured by ELISA.

Statistical Analysis: The numerical data were presented as means–standard deviations while non numerical data were presented as percentage. Two tailed-tests were used to analyze differences between the two groups.

P-values less than 0.05 were considered statistically significant. The magnitude of correlations was determined by Pearson's correlation coefficient.

All the data were analyzed by statistical package Prism 3.0 (GraphPad software, SanDiego, CA, USA). Figures were done by Microsoft Office Excel 2007

Results

In the present study, there was a significant statistical difference between breast-fed and formula-fed preterm babies regarding Duration of NICU admission in days ($p< 0.01$**) which was higher in formula-fed preterm babies compared to breast-fed ones,while there was no significant statistical difference between the two groups of patients regarding gestational age (mean±SD33.1 ± 2.2, 32.9 ± 2.1 respectively), sex ($p< 0.01$), and birth weight (mean±SD 0.9 ± 0.7,0.1 ± 0.6,-0.97 ± 0.4 respectively).p ($p< 0.01$ *(Table 1)*.

There was significant higher incidence of Co-morbidities like respiratory distress and sepsis in formula-fed preterm babies compared to breast-fed ones ($p< 0.01$) for both. Seventy three percent of obese children 26.3% of overweight ones were having NAFLD. *(Table2)*

Regarding Signs of feeding intolerance between groups in the form of stopping of feeding, their frequency, and duration, all were significantly higher in in formula-fed preterm babies compared to breast-fed ones ($p< 0.01$) for all. Serum platelets were compared to healthy ones (mean±SD for ALT 71.3 ± 21.4, 41.3 ± 19.1, 30.3 ± 4.4 and Serum TLC(mean±SD for AST

69.8 ± 24.5,36.8 ± 5.5, 30.0 ± 4.4 respectively) (p< 0.01 and 0.05 respectively).staff CRP mean±SD for AST 69.8 ± 24.5,36.8 ± 5.5, 30.0 ± 4.4 respectively) (p< 0.01 *(Table 3)*.

There was negative correlation between BMI,weight, cholesterol, TG and ALT and serum visfatin levels. (p<0.01 for all). *(Table 4)*.

Table (1): Demographic data between groups

Variable		Group (I) Breast fed babies (n=30)	Group (II) Formula fed babies (n=30)	P. value (Sig.)

Discussion

FABPs is a set of widely expressed cytoplasmic proteins with small molecular weight and excellent organ specificity, which are immediately secreted into the systemic circulation upon the damage of cells(7)

As a member of the FABPs family, FABP2, which is a *FABP2* gene encoding protein, accounts for up to 2% of the cytoplasmic proteins in the mature enterocyte, and it is responsible for the intake alongside with the transport of polar lipids like fatty acids from the lumen of the small bowel.(8)

FABP2 is a water soluble cytosolic protein with a small molecular weight of 14-15 kDa, and it is initially located in the mature enterocytes of the small intestine. FABP2 is also named as intestinal-type FABP (I-FABP).(9)

Because of its small molecular size, FABP2 is believed to be delivered to the circulation immediately upon the loss of the integrity of the cell membrane and filtering of the glomerulus with a renal excretion of 28% and a considerable half-life of 11minutes. So, it is supposed to be detectable in urine.(10)

Thus, varying FABP2 expressions in the urine could exactly reflect the severity of the cell damage to the intestinal epithelia, making it possible to use FABP2 as a trustable indicator of the disease progression(11).

This study was carried out to assess the diagnostic utility of the urinary I-FABP levels as a new marker for gut maturation in breast-fed preterm neonates compared to formula-fed ones.

In the present study, breast-fed babies and formula-fed ones showed no significant statistical difference regarding gestational age (p=0.71), sex (p< 0.60)and, birth weight (p< 0.88). These findings agreed with the study of Kostan W2014 who stated that there were no significant differences in GA, birth weight, or sex between the 2 groups; however, there was a trend of lower median GA in the breast-fed group.

Our study shows that Prematurity was the primary reason for admission to the NICU in all of the babies and that the duration of NICU admission in days was higher in formula-fed preterm babies compared to breast-fed ones (p**< 0.01).**

The results of our study show a significant higher incidence of Co-morbidities like respiratory distress and sepsisin formula-fed preterm babies compared to breast-fed ones (p< 0.01) for both . This agrees with the study of (12) who explained the beneficial effects of breast milk and its immunomodulatory and anti-inflammatory effect, and high concentrations of secretory immunoglobulin A, CD14, transforming growth factor-b, erythropoietin, and interleukin-10 in breast milk.

In our study, total volume of enteral feedings was recorded every day to investigate whether the type of feeding correlated with feeding intolerance**.** Feeding intolerance is defined as episodes of discontinuation of enteral feeding or frequency and cumulative amount of gastric retentions.

We found that signs of feeding intolerance including feeding stoppage, number of episodes, and duration of those episodes were significantly higher in in formula-fed preterm babies compared to breast-fed ones (p< 0.01) for all**.** . This could be explained by that early breast milk feedings, especially colostrum, promote the growth,maturation, and protection of the gut epithelial border.

In agreement with our study, (13) explained the mechanisms by which breast-feeding improves intestinal maturation. For example, analogues of growth factors or human milk oligosaccharides. The preterm infant's high need for trophic factors should be taken into account. Added to that, his study underlines the importance of breast milk use in preterm infants.

Our results also agree with the study of (14) who found that human milk feedings have been shown to stimulate healthy gut microflora, reduce intestinal permeability, and interfere with the translocation of bacteria from the gut lumen to the mucosa, and appear to be the most critical as VLBW infants transition from intrauterine (e.g., swallowing amniotic fluid) to extrauterine nutrition in the early post-natal period.

Commercial formulas may have a separate detrimental impact on these processes during these early postnatal exposure periods, via up-regulation of inflammatory processes, GIT epithelial cell toxicity, and other mechanisms.(15)

Ethics approval and consent to participate: The study was conducted according to the declarations of Helsinki and approved from the faculty of medicine scientific committee in Minia University (No: 116-5-2016). Written consents were obtained from patients and/or caregivers.

Source of Funding: None

Conflict of Interest: The authors declare that there is no conflict of interests.

Associations between TNF-α and Interleukin-18 and ADIPOQ Gene Polymorphisms in Iraqi Obese Women Patients with Polycystic Ovary Syndrome

Sarah Ibrahim Hashoosh[1], Asmaa A. Hussien[2], Salah Al Chalabi[3]

[1]College of Biotechnology, [2]College of Biotechnology, [3]Biotechnology Research Center, AL-Nahrain University, Iraq, Baghdad

Abstract

Polycystic ovary syndrome has always been an enigma, and it still continues to be. In addition to an ovulatory subfertility, women with PCOS show an increased danger of pregnancy complications, obesity, so the effect of this issue isn't simply constrained to reproductive age, however all through life. A total of (128) samples (50 normal Weight and 78 obese groups). Those samples was collected from the Kamal Al-Samarraie hospital, Ministry-of Health in Baghdad-Iraq from April 2017- August 2017. The aim of this present study to was to detect association from polymorphism ADIPOQ gene (rs12495941) with risk of Polycystic ovary syndrome for Iraqi women patients and compare between ADIPOQ gene of Iraq population with gene bank of NCBI . Examine Interleukin-18(IL-18), Tumor necrosis factor alpha (TNF-α) of Polycystic ovary syndrome Iraqi women patients. TNF-α, and IL-18 showed significantly change ($p<0.05$) in Obese with PCOS and low weight with PCOS groups when comparing with control group. followed by no-significant change ($p>0.05$) when comparing between Obese without PCOS and low weight with PCOS groups, also shows significant change ($p<0.05$) when comparing between low weight with PCOS and control group. The results show substitution three Transition A>G and G>A, six Transversion T>G, T>A, and C>A, showed 98% identified with a standard in Gene Bank from patients group while having 100% identified with a standard in Gene Bank with the control group.

Keywords: *Polycystic ovary syndrome, Interleukin-18 (IL-18), Tumor necrosis factoralpha (TNF-α), ADIPOQ gene.*

Introduction

Polycystic ovary syndrome is the most well-known endocrinopathy influencing reproductive aged women .While some women may present symptomatic and others asymptomatic, it does affect women physically, psychologically, metabolically, endocrinologically and reproductively [(1).] The status was first portrayed in 1935 by the American gynecologists Irving F Stein and Michael L Leventhal, both working at the Department of Obstetrics and Gynecology, Michael Reese Hospital, Chicago, USA from whom its original name of Stein-Leventhal syndrome was taken, they described the clinical, the macroscopic characteristics and histological features of PCOS for the first time[(2)]. TNFα is a dominant pro-inflammatory cytokine vital for immunity to infections and expressed mainly in monocytes, macrophages and adipose tissue. However, its extravagant production is contributory in chronic inflammation and disease pathology [(3).] Studies on reproductive biology have proven that these pro-inflammatory cytokines promote ovarian function and the processes of ovulation, fertilization, and implantation in women with PCOS [(4).] Moreover, TNF-α can also play an important role in the development of cardiovascular disease. A higher levels of TNF-α were reported to be connected with an

increased risk of future myocardial infarction[5]. IL-18 is a potent pleotropic cytokine, member of the IL-1 family, ambidextrous to induce IFN gamma, GM-CSF, TNF alpha and IL-1 in immunocompetentcells,so as to activate death by lymphocytes, and to up-organize the expressing of chemokine and their receptors [6]. Adiponectin is encoded by the gene ADIPOQ situated in the chromosomal area 3q27. It comprises of three exons and two introns, [7].Human adiponectin is encoded by the 16-kb gene recognized as ACDC (adipocyte C1q and collagen field containing gene). ACDC is situated in a district of chromosome 3 that has been appeared to contain a quantitative trait locus (QTL) connected to phenotypes identified with metabolic disorder [8]. Several single-nucleotide polymorphisms (SNPs) and mutations of the ADIPOQ gene were shown in Japanese and Europe populations to be associated with obesity[9].

Materials and Method

Samples Collection: This case-control study involves of a total (128) samples (50 normal Weight and 78 obese groups). Those samples was collected from the Kamal Al-Samarraie hospital, Ministry-of Health in Baghdad-Iraq from of April 2017- August 2017. Five milliliters of blood was collected from each patient and control then separate 2ml into EDTA tube and 3ml into gel tube after waiting for a minute centrifuged the tube at 3000 rpm for 5 min.

Measurements: Enzyme-linked immunosorbent assay (ELISA) were utilized to estimate the serum level of Human IL-18 ELISA Kit,and Tumor necrosis factor ELISA Kit according to the manufacturer's instructions (bioaimscientific and MabTag) respectively.

PCR Amplification: The DNA was extracted by utilizing (Geneaid DNA Mini Kit) according to manufacturer's instructions, primer used in this study wereADIPOQ gene(rs12495941)sense F: (5′-TAGTGAGCCGAGATTGTGC -3′) and a anti sense primer R:5′-(TCCTTAGGCATGTAGCTTTCC 3′)'obtained from AlphaDNA company (Xian Chang Sun *etal.,* 2017). The PCR amplification is performed in a total volume of 25µl containing 1.5µl DNA, 12.5µl Green Master Mix PCR (Promega, USA), 1µl of each primer 10 pmol then nuclease-free water is added into a tube to a total volume of 25µl. Thermo cycling conditions were as follows: initial denaturationat 4 min at 94°C, followed by 28 cycles of denaturation 94°C for 30 sec, annealing at 62°C for 30 sec, extension at 72°C for 30 sec and a final extension of 72°C for 5min. The PCR products were separated on 1% agarose gel. The gel is left to run for 60min with a 70volt/65 mAmp current. Following electrophoresis, visualization was conducted with a UV trans illuminator after ethidium bromide staining. The sequencing of ADIPOQ gene (rs12495941) gene was performed at Macrogen, utilizing their ABI 3730xl genetic analyzer (Applied Biosystems, US).

Statistical Analysis: The Statistical Analysis System-SAS (2014) program was utilized to impact of various factors in study parameters.. Least noteworthy contrast LSD test (ANOVA) was utilized to analyze between method between various factors in this study.

Result and Discussion

The levels of TNF-alpha, and IL-18 showed significantly change ($p<0.05$) in Obese with PCOS and low weight with PCOS groups when comparing with control group. followed by no-significant change ($p>0.05$)when comparing between Obese without PCOS and low weight with PCOS groups, also shows significant change ($p<0.05$)when comparing between low weight with PCOS and control group. As seen in table (1).

Table (1): Levels of TNF-alpha, IL-18, in PCOS women and healthy controls.

Parameters Groups	TNF-alpha (ng/ml) (mean±SD)	IL-18 (pg/ml) (mean±SD)

Adipose tissue discharges a cytokine called TNF-a which is a key component in mediating IR[10]. This cytokine not only stimulates IR but also causes HA and is present in follicular development. It therefore plays a part in the pathophysiology of PCOS. Development of IR in humans has been linked to hyperexpression of the TNF-a in muscle and adipose tissues through decreasing

tyrosine kinase activity in the insulin receptors. Our test results corroborated those of [11]. In their experiment they found that there were significant differences between PCOS patients in serum TNF-a and insulin. [12]found that TNF-a levels in PCOS patients were significantly higher than those in controlled studies. When[13,14] carried out tests they found that women with PCOS exhibited higher levels of IL18 than controlled groups. In both the aforementioned studies the level of IL18 correlated to the insulin sensitivity index. More recent tests have shown that there is no difference in IL18 between obese PCOS and the obese control group. This reveals that when obesity is controlled, the PCOS effect disappears completely [15] posits that in the future, studies should classify subjects according to BMI classes so as to better highlight the independent association among IL18 and PCOS[16].

One and a half µl of genomic DNA was used for each PCR reaction. A conventional PCR protocol was utilized to analyze simultaneously the presence of ADIPOQ gene (rs12495941). The presence of the ADIPO gene (rs12495941) was identified by 360bp, as shown in figure (1).

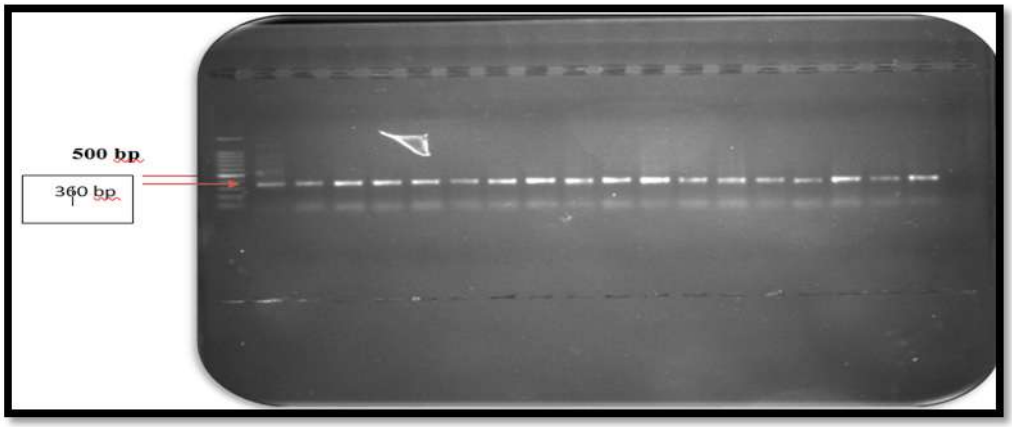

Figure (1): Amplified fragment of Adiponectingene (RS:12495941) after electrophoresis on agarose gel (2%) for 1x TBE buffer for 1:30 hours. M: DNA ladder (100bp).

The repeat of nucleotide the amplified product of ADIPOQ gene (rs12495941) gene by direct sequencing. Our sequences were compared with the reference sequence from in national center biotechnology information(NCBI) Gene Bank.

After alignment of product amplification of ADIPO gene for patients group having three Transition one A>G and two G>A in Locations (15655, 15679 and 15685 nucleotide) respectively, six Transversion T>G, C>A, and four T>A in Locations (15429,15719, 15671, 15713, 15715, 15731 nucleotide) under sequence ID: NG_021140.1, and have number score (685) bits, and expect (0.0). From the Gene Bank, found that part of ADIPOQ gene having 98% compatibility with standard in Gene Bank as shown in Figure (2), and table (2).

C2 Lateral Mass Vertebrae Anthropometry for Evaluating C2 Straight Lateral Mass Screw Fixation

Sarrah Dwiananda Mayasafira[1], Joni Susanto[2], Eko Agus Subagio[3]

[1]Faculty of Medicine, [2]Department of Anatomy and Histology, Faculty of Medicine, [3]Department of Neurosurgery, General Hospital of Dr. Soetomo, Faculty of Medicine, Universitas Airlangga, Surabaya, Indonesia

Abstract

Background: The cervical vertebra is an important vertebra as there are blood vessels in its surroundings from the brain to the entire vertebrae. Cervical injury has the most fatal consequences when it occurs as high as C1-C2. If instability occurs in the C1-C2 vertebrae and atlantoaxial joints, the procedure of surgical techniques include cervical arthrodesis or spinal fusion. C2 straight lateral mass fixation is one technique that can be used for fixation in patients with spinal cord compression and anomalous vertebral artery by inserting shorter screws in the lateral mass of the C2 vertebrae from the posterior direction. There have been not many references similar to the present study of anatomy to discover the screw characteristics needed in this technique.

Aim: This study aimed to identify the length of the lateral mass in the C2 vertebra for the purposes of the C2 straight lateral mass screw fixation technique.

Method: This research was an observational descriptive study with cross sectional design that observed the results of cervical CT-Scan. Observation was made using the RadiAnt DICOM Viewer application and measurements were based on a sagittal cross section. The length was measured from the posterior parallel to the posterior longitudinal ligament (PLL). The initial mean was measured on the right and left side; afterwards, the final mean is the total mean of both sides.

Result: From 10 samples, there were mean long lateral masses of C2 vertebrae on the right side of 13.511 ± 1.081 millimeters, the left side of 13.444 ± 1.396 millimeters, and the final mean of 13.48 ± 1,216 millimeters. It was rounded to an average of 13.5 ± 1.2 millimeters.

Discussion: The line parallel to the posterior longitudinal ligament (PLL) is more posterior than the line parallel to the foramen transversum wall which causes the measured length to be shorter. This is useful for the C2 straight lateral mass screw technique as it avoids the possibility of lesions in the vertebral artery.

Conclusion: The average lateral mass length in the population of Surabaya is 13.5 ± 1.2 millimeters.

Keywords: *Lateral Mass Vertebrae C2, C2 Straight Lateral Mass Screw Fixation.*

Introduction

The cervical vertebrae consist of 7 bone spaces, namely C1-C7.[1] The cervical vertebra has a transverse foramen in each segment through which the vertebral artery passes.[2] The vertebral artery is tasked with vascularizing the brain; hence, cervical vertebrae injuries and failure to identify can cause serious complications.[3] The most fatal consequences can occur in the upper cervical area, both in the crania cervical junction and

e-mail: easnsurg@yahoo.com

in the C1-C2 vertebrae.[4] This is because the anatomical structure of the C1 and C2 vertebrae is unique and has a close relationship with the vertebral arteries.[5] Cases of C1-C2 injuries that have dislocations should be surgically removed.[6] The principles of cervical vertebrae surgery are stabilization and prevention of nerve decompression, optimizing the results of actions, and avoiding complications that may occur if non-surgical measures are performed.[7]

Cervical arthrodesis is a surgical treatment that unites one vertebra with another vertebra.[8] This technique can be performed on any cervical vertebra in accordance with the location of the injury. Fusion of vertebrae as high as C1-C2 is used for fusion due to instability in the C1-C2 vertebrae and atlantoaxial joint.[9, 10]

Because of their unique and biomechanical properties, most cervical vertebrae stabilization studies have focused on modification of fixation in C2 vertebrae.[11] Trans-articular fixation resulted in limitations on flexion and extension movements.[12] Meanwhile, the C2 pedicle technique by Harm further reduces the risk of lesions in the vertebral artery compared to the Magerl technique; however, it is still not possible to be used in patients who have anomalies in the vertebral artery.[13] The C2 laminar screw technique is used to avoid lesions in the vertebral artery[14], but this technique is not recommended for patients who require laminectomy to decompress the spinal cord.[15]

To explore the contraindications to the C1-C2 technique, a study in Japan stated that there were 238 (24.4%) cases accompanied by the incidence of compression of the cervical spinal cord[16] and another study asserted that of 200 patients, there were 66 patients with High-Riding Vertebral Artery (HRVA) and 90 patients with narrow pedicles after being detected using thinly-sliced pedicular-oriented CT (TPCT).[17] The high number of these two numbers makes it possible for both conditions to occur in an individual; consequently, other techniques are needed for patients with the mentioned condition.

C2 straight lateral mass fixation is one technique that can be used for fixation in patients with these two conditions. Fixation is performed by inserting shorter sized screws in the lateral mass of the C2 vertebrae from the posterior direction, as is the case in Korea which reduces the risk of bleeding in HRVA patients with C2 fixation by using shorter screws.[18] To date, there are not many references regarding this technique, therefore further studies on the anatomy of the C2 vertebrae are needed to support this fixation technique. Many modifications have been made to avoid complications. This is carried out by changing the entry point of the screw and the direction of screw installation.[19] These modifications can affect the required screw characteristics, such as length and diameter.

Method

This study aimed to measure anthropometric C2 lateral mass vertebrae from the lateral side for the C2 straight lateral mass screw fixation technique in order to determine the appropriate screw requirements and minimize complications that can occur. An observational analytic with cross-sectional approach was used.

Sample: The research samples were the results of the CT scan taken from the Mitra Keluarga Darmo Satelit Hospital, Surabaya in the period of August-November 2017. The sampling technique was conducted by using total sampling with the inclusion criteria of CT scan results as high as vertebrae C1-C7, while the exclusion criteria included CT Scan results with abnormalities of vertebral anatomy as high as C1-C7 and patients who are not domiciled in Surabaya.

Research Instrument and Data Analysis: The instrument used to measure the CT scan result was RadiAnt DICOM Viewer Application version 4.1.6. The length of the lateral mass of the C2 vertebra was measured at the point of 3 millimeters superior to the facet line, median lateral mass, and anterior-superior direction parallel to the facet until the posterior longitudinal ligament (PLL). The PLL boundary point was initially marked. Afterwards, the length was measured on the slice showing the lateral mass picture from the posterior to the marked point. The initial mean was calculated on the right and left sides; then, the final mean was obtained from both sides. The measurement results were then processed using Microsoft Excel 2016.

Result

The total CT scan results sampled in this study were 10. Observation of radiology results was carried out for 1 week to determine the mean lateral mass in each sample. Lateral mass is the mass located in both right and left lateral of C2 vertebrae. The length of the C2 vertebrae lateral mass was measured from the sagittal cross section at the point of 3 millimeters superior to the facet line,

median lateral mass, anterior-superior direction parallel to the facet to the PLL limit.

Referring to the observation results, it was obtained the mean lateral mass of C2 vertebrae from 10 samples of 13.511 ± 1.081 millimeters with a minimum value of 12.006 millimeters and a maximum value of 15.496 millimeters. Whereas, the mean lateral mass of the C2 vertebrae from 10 samples was 13.466 ± 1.396 millimeters with a minimum value of 11.343 millimeters and a maximum value of 15.630 millimeters (Table 1). The mean left and right lateral mass of the C2 vertebrae obtained a mean total of 13.448 ± 1.216 millimeters with a minimum value of 11.334 millimeters in both sides and a maximum value of 15.630 millimeters in both sides (Table 2).

Discussion

C1-C2 Trans-articular Screw Fixation is the technique that produces the most rigid outcome.[12] The entry point of this technique is at 2-3 millimeters superior-lateral from the facet to the axial isthmus in medial;[12] then, it is forwarded to the C1 lateral mass. C1-C2 joints are very functional in rotational movements

and with a little flexion-extension. Hence, the fixation in this area will cause limitations on flexion-extension movements, lateral swelling, and rotational movements. The screw mounting direction of this technique reduces freedom of movement in all directions so as to achieve a state of high stability. This technique can also prevent slippage between segments.[20] This technique is also an indication for C1-C2 instability due to rheumatoid arthritis, odontoid process fracture, os odontoideum, C1-C2 arthrosis.[12] This technique is contraindicated for the condition of vertebral artery anomalies in segments as high as C1-C2, axial isthmus that is too small, deformities in segments as high as C1-C2, prominent kyphosis in the cervical-thoracic junction, and destruction of the atlas bone lateral mass.

C2 Pedicle Screw Fixation connects the vertebral body with the posterior component of the atlas bone. The screw is mounted obliquely from the pediculus to the vertebral body.[15] The advantage of this technique is that it can protect joints between C1-C2. In addition, it is possible to remove the screw after stability returns to restore movement to C1-C2. Compared with the trans-articular technique, this technique further reduces the risk of injury to the vertebral arteries.[13] The technique is indicated for C1-C2 instability caused by trauma, tumors, and inflammation, for non-fusion odontoid process fractures, unstable Jefferson fractures, and repair in failed odontoid screw fixation.[13] Contraindications are if there are anatomic variations in the vertebral artery.[13]

The entry point of the screw in the C2 Laminar Screw Fixation technique is between the spinous and lamina process, and is directed across the direction of the lamina on the contralateral side.[21] This technique is intended for 20% of patients who have anatomic anomalies that are contraindicated in trans-articular screw or pedicular screw techniques, because there is a risk of vertebral artery injury.[22] If there is a condition that requires decompression of the spinal cord, laminectomy of the axis bone is needed and this technique cannot be performed.[15]

C2 Pars Screw Fixation has the same entry point and direction as the trans-articular technique. The difference with the trans-articular technique is the depth of screw fixation that does not go through the atlas bone.[15]

Based on the results of the study, there have been no similar results from other references to the present study. However, a study with a similar concept was conducted in Los Angeles regarding the lateral mass of the C2 vertebra that used the same entry point and direction as this study and produced an average of 17.0 millimeters on both sides.[23] A case study conducted in Egypt on the evaluation of the efficacy and safety of C2 pars/pedicle screws also has a different number from this study, which used a screw with a size of 16 millimeters for the C2 vertebrae.[24]

The difference in results among studies can be caused by several factors. A factor that may be influential is the anterior border of the measurement. Measurements performed in research in Los Angeles was started from the posterior to the point before the transverse foramen wall,[23] which is different from this study which has a limit to the point parallel to the PLL.

Observation results show that the line parallel to the PLL is more posterior than the line parallel to the transverse foramen wall. This causes the length measured in this study is shorter. This is useful for the C2 straight lateral mass screw technique because it avoids the possibility of lesions in the vertebral artery (Picture 1).

Another factor that might influence differences in results is morphological variation in each different population. A previous study conducted in India has shown that the average antero-posterior length of the right and left C2 vertebrae superior facets were 16.61 ± 1.33 millimeters and 16.70 ± 1.49 millimeters respectively.[5] This result is different from a similar study conducted in Turkey with an average of 17.5 ± 14 on the right side and 17.5 ± 1.5 on the left side.[25] Specific references regarding differences in the lateral mass length of the C2 vertebrae were not found. However, the differences in the results of the two studies above may allow for differences in the lateral mass.

Limitation: There are several limitations in this study. A factor from the author that might be influential is the lack of accuracy in the measurement process. The small number of samples is also a disadvantage in this study. Retrieval of data in only one hospital is presumed to be insufficient to describe the lateral mass length of the entire population in Surabaya.

Conclusion

The mean of C2 vertebrae lateral mass length is 13.5 ± 1.2 millimeters.

Conflict of Interest: The authors declare that they have no competing interests.

Source of Funding: The authors declare that this study was not self-funded.

Ethical Clearance: This study received a certificate of ethical clearance from ethical commission of Faculty of Medicine, Universitas Airlangga Indonesia.

Correlation between Health Locus of Control with Intention to Perform Cataract Surgery in the Area of Public Health Center of Tempurejo Jember

Siswoyo[1], Baskoro Setioputro[1], Kushariyadi[1], Iqbal Luthfi Nauri[1]

[1]Faculty of Nursing, Jember University, Indonesia

Abstract

Cataract is a clouding of the lens in the eye that affects vision. Cataract can be healed by surgery. The number of cataract surgery in Indonesia is still low. The small number of cataract surgery in Indonesia happens because they have low health locus of control. Health locus of control (HLC) is an individual's belief that her or his health is dependent upon her or his own behavior until the person has intention in which the time is correct it causes the person take an appropriate action to do something related with the healthy. This study aims to analyze the relations between HLC and intention to perform cataract surgery in the Public Health Centre of Tempurejo, Jember. Independent variable on this study is HLC and the dependent variable is surgery intention on the cataract patients. The research design was analytic observational with a cross-sectional method. Sampling technique in this research it was probability sampling by simple random sampling. The research sample was 84 people using G*Power 3. The result of the statistic test using Spearman rank showed a positive correlation with weak correlation strength between health locus of control with the intention to perform cataract surgery (p-value = 0,001 and r = 0,396). One must have confidence in the source of its health control in order to improve the intention of performing cataract surgery. Health worker role is to increase HLC and intention of cataract patient so that can improve health degrees.

Keywords: *Health locus of control, cataract, intention to perform cataract surgery.*

Introductions

Cataracts are characterized by the lens of the eye that gradually becomes blurred and eventually results in total blindness[1]. Cataracts often occur at the age of 55 years and above sometimes can occur in infants and young children[2]. The problem of cataract patients at Tempurejo Health Center in Jember Regency is that cataract patients are less able to control the disease. For example, such as not conducting an early examination to detect the disease. Cataract sufferers do not have a high willingness to carry out surgery on the disease. Cataract sufferers are less willing to undergo cataract surgery. This is influenced by various factors such as ignorance of patients regarding cataracts. Patients do not know that cataracts can be treated with surgery. Patients do not have fees for surgery and are afraid to undergo surgery.

The incidence of visual impairment in the world is 285 million[3]. The number of cataract sufferers in the world reaches 22 million people and is expected to continue to double by 2020[4]. Of all the causes of 50% blindness caused by cataracts and 90% found in developing countries such as in Indonesia[5]. Cataract prevalence in Indonesia reaches 1.8% of population[3]. The rate of blindness caused by cataracts in Indonesia is the highest in Southeast Asia at 1.5% or 2 million people[6]. In 2013 the prevalence of cataracts in East Java Province was 1.6%[3]. Data in Jember district on the number of cataract patient visits in 2017 was 5000 visits. In Tempurejo Community Health Center the number of visits to the largest cataract patients in Jember district was 181 patients.

Developed countries have a cataract surgical rate (CSR) rate of 4000-6000 in terms of the number of cataract patients who do not have surgery[7]. If the CSR number is below 500, the country will get red on the WHO blindness map. In 2006 the WHO stated that CSR numbers in Indonesia ranged from 465[8].

Causes of cataracts include congenital abnormalities, aging processes, systemic diseases, trauma, and other eye diseases[9]. The low intention of patients causes the increasing number of cataract patients and the increased number of blindness caused by cataracts. The low intention of cataract patients can be caused by various factors namely low economy, lack of information and knowledge, and the attitude of patients to cataracts[10]. Cataracts can cause interference with blindness. This has become a global health problem that can reduce the productivity and quality of human resources[11].

One of the most effective ways to treat cataracts is cataract surgery[12]. Cataract surgery is a surgical treatment [1]. Cataract surgery in Indonesia can be carried out at a cost that is not too expensive and guaranteed by the Social Security Organizing Agency. In Indonesia the number of cataract patients is still high, this is not balanced with the number of cataract sufferers who have performed surgery[3]. The willingness of patients to undergo surgery must have intention first[13]. Besides that, health locus of control is a belief about health-related events[14].

Materials and Method

Purpose of this study was to analyze the relationship of HLC with the intention of carrying out cataract surgery. The study design used observational analytic research with cross-sectional approach.

The sample of this study were cataract patients in Tempurejo Public Health Center, amounting to 84 respondents. Research from October 2017 to March 2018. The sampling technique uses simple random sampling. Determination of sample size using the application G * Power 3.

The instrument of this study used a multidimensional HLC scale questionnaire and the intention questionnaire underwent a valid and reliable operation[15].

The results of the research data are abnormally distributed so that using the Spearman rank test.

Results

Characteristics of Respondents:

Table 1. Distribution of characteristics of respondents based on age

Variable	Mean	Median	Min-Max
Age (Years)	58.86	60.00	49-68

Table 1 shows that the mean age of respondents is 58.86 years.

Table 2. Distribution of respondents by sex, education level, and the type of work

Variable	f	%
Gender:		
a. Male	27	32.1
b. Female	57	67.9
Level of education:		
a. not school	54	64.2
b. elementary	25	29.8
c. junior	4	4.8
d. high school	0	0
e. college	1	1.2
Type occupation:		
a. Not working	28	33.3
b. Government employees	1	1.2
c. Farmers	35	41.7
d. Entrepreneur	2	2.4
e. Housewives	18	21.4

Table 2 shows that most female sexes were 57 respondents (67.9%). The majority of respondents were not in school (54.2%). Most types of work of respondents are farmers as many as 35 (41.7%).

Health locus of control (HLC):

Table 3. Distribution of respondents based on the HLC category

Variable	Jumlah	%
HLC:		
a. High	0	0
b. Medium	1	1.2
c. Low	83	98.8

Table 3 shows that the majority of respondents' HLC is categorized as low as 83 (98.8%).

Table 4. Distribution of respondents based on the HLC category

Indicator	Mean	Median	Min-Max	Achievement (%)
Internal HLC	14.01	11.00	6-33	38.91
Chance HLC	7.75	6.00	6-32	21.52
Powerful HLC	8.42	6.00	6-22	23.38

Table 4 shows the highest average value of the HLC indicator on the internal HLC indicator, which is 14.01.

Intention to do cataract surgery:

Table 5 Distribution of respondents based on intention category to do cataract surgery

Variable	Jumlah	%
Intention to do cataract surgery:		
a. Height	0	0
b. Moderate	7	8.3
c. Low	77	91.7

Table 5 shows that most of the intention to do cataract surgery in the low category was 77 (91.7%).

Relationship HLC with the Intention to Perform Cataract Surgery:

Table 6. Results of Spearman-rank correlation test of HLC with the intention of doing cataract surgery

Variable	p-value	r
HLC Intention to perform cataract operations	0.001	0.396

Table 6 shows the p-value = 0.001 means that there is a relationship that means HLC with the intention to do cataract surgery. The correlation coefficient of 0.396 means the direction of a positive correlation with weak strength.

Discussion

The Characteristics of Age: That the age range of respondents ranged from 50 to 72 years with an average age of 60.6 years[16]. Senile cataracts occur due to degeneration or deterioration in the quality of lens fibers due to the aging process. This is experienced by elderly patients aged 40 years and over[17].

The Characteristics of Gender: Another study stated that female respondents were 25 people (62.5%)[18]. In developing countries, the number of female cataract patients is greater than that of men[19]. Hormonal problems in menopausal women cause damage to several organs including the eyepiece. This resulted in women being more prone to cataracts than men[17].

The Characteristics of Education Level: Other research shows that the education level of the respondents is mostly not in school or does not complete school by 42 people (63.6%)[20]. Low educational factors have an impact on the knowledge and understanding of cataract patients about the treatment of their diseases[21]. The level of education affects a person's knowledge and understanding to access health services[22].

Health Locus of Control: A person with an internal locus of control will increase with age[23]. This is related to the level of maturity of thinking and the ability to make decisions[24].

Gender influences HLC stating that female diabetics show higher values in all parameters than men[25]. This is because men and women respond differently to certain test items[23]. Culture is one of the factors that influence locus of control such as western and eastern cultures[26]. American culture more towards self-reliance and individualism whereas Asian cultures emphasize the dependence of society and interdependence[23].

HLC is the degree of one's belief whether their health is controlled by internal or external factors[27]. Social learning theory provides an influence on health through the learning process, each individual develops the belief that the results obtained are actions of himself or from outside himself[23]. After someone has a locus of control and has hope that will result in strengthening and knowing the source of reinforcement from internal and external will be motivated to behave as predicted in certain situations[28,27,29,30].

Research on chronic disease patients in Shiraz, Iran showed that the highest scores were at IHLC (M = 23.15), PHLC (M = 17.62) and CHLC (M = 15.25)[31]. Research in type 2 patients in Iran had the highest scores on 26.6 IHLC, 23.2 PHLC, and 9 9 CHLC[32]. Research in DM patients in Croatia shows that most patients have high IHLC[33]. The three studies in Asia showed the highest average scores on the IHLC[31,32]. Research in Europe has the highest average score on the IHLC[13]. This proves that culture can affect HLC. But that does not mean that one's culture always determines the type of HLC[34].

The older the age, the locus of control develops towards the internal and stable in middle age[35]. This

shows an IHLC score higher than the CHLC and PHLC scores because the number of male respondents is less than women[32].

Intention to Perform Cataract Surgery: Other research shows that the majority of respondents have not optimal intention values[16]. A low value of intention means that someone does not have optimal intentions[36].

The intention is a person's tendency to carry out certain behaviors[37]. The intention has a strong relationship with behavior, so intention can be used to predict behavior[13]. Attitude toward the behavior is a person's attitude or evaluation positively or negatively towards certain events or behaviors[13].

Attitude toward the behavior that someone will do behavior based on belief in the behavior. Mismatch of skills, abilities, and information produces problems for behavioral control and means that this problem can be overcome as in compulsive behavior[13].

The Relationship Betwen HLC and The Intention to Carry Out Cataract Surgery: Research shows that HLC affects the self-care behavior of type 2 DM patients and is found to be a positive direction[38]. Locus of control describes a person's view of responsibility for events in his life[39]. When someone considers the locus of control to be in him, it will achieve greater achievement in his life because that potential can be utilized to be more creative and productive[40].

The results of other studies that HLC affects the self-care behavior of type 2 DM patients, the higher the value of HLC, the higher the value of self-care type 2 DM patients[38].

HLC is influenced by the level of education. Internal HLC increases when education levels increase, while chance locus of control decreases with increasing levels of education[32].

Conclusions

The value of HLC in cataract patients is mostly low. The value of intention to do cataract surgery is mostly low. Positive direction shows that the higher the HLC, the higher the intention to do cataract surgery.

Implementation of Tender Loving Care-Based Growth and Development Monitoring by Health Cadres

Siti Asiyah[1,2], Dewi Retno Suminar[3], Ahsan[4], Shrimarti Rukmini Devy[5], Moersintowarti B. Narendra[6]

[1]Student at Doctoral Program, Faculty of Public Health Airlangga University, Surabaya, [2]Lecturer at Health Polytechnic of Ministry of Health, Malang, [3]Lecturer at Faculty of Psychology Airlangga University, Surabaya, [4]Lecturer at Faculty of Nursing Brawijaya University, Malang, [5]Lecturer at Health Promotion and Behavioral Sciences,Faculty of Public Health, Airlangga University, Surabaya, [6]Consultant Pediatrician at Dr. Soetomo Hospital, Surabaya, Indonesia

Abstract

Tender Loving Care (TLC), in providing professional care, is seen as the greatest virtue dedicated to care. It is used to describe how love is shaped and refined to meet the requirements of practice. These are the values of TLC-based care, particularly in growth and development services performed by the cadres in *Taman Posyandu*. This research aims to describe the efforts of TLC-based early childhood growth monitoringin *Taman Posyandu*. It is a kind of quantitative study with a cross-sectional approach. This research was carried out in four districts (cities) in East Java with the great sample of 320 *Taman Posyandu*. The results revealed that most cadres were more optimal in monitoring growth activities while lacking in the ability of TLC-based early childhood development monitoring. Therefore, more effort is needed in approaching and training deeply to provide the knowledge to the cadres about the importance of serving with heart, as an effort to monitor TLC-based child development.

Keywords: *Health cadres, growth and development monitoring, Tender Loving Care (TLC).*

Background

The term Tender Loving Care (TLC) plays an important role for nursing practitioners since it reflects the core goals and essence of care for patients. The feelings are the element of motivation that drives the nurses. The feelings of compassion for others, followed by an empathetic approach, are a requirement of caring about others. What stands out in TLC is the relationship between care and love[(2)].TLC, in providing professional care, is seen as the greatest virtue dedicated to care. It is used to describe how love is shaped and refined to meet the requirements of practice[(3)]. This consideration is the main focus given to everyone as a worthy individual.

e-mail: siti.asiyah-2015@fkm.unair.ac.id

Care is a softer expression than loving. TLC is a routine or habit related to caring, maintaining cleanliness, feeding, and giving attention and affection to children. It plays an important role in the survival, growth and development of children[(4)]. Child growth and development services in Indonesia are implemented in Community-sourced Health Efforts or *Upaya Kesehatan Bersumber Masyarakat* (UKBM) in the form of *Taman Posyandu* (Tapos). Cadres are one of the drivers of the success of health programmes, especially community-based health programme. Cadres who have good competence will be able to better provide good information and deliver knowledge to mothers.

There is a strong evidence showing that cadres can provide better health outcomes, especially in the field of child health[(5)]. They play an important role in determining the success of children's growth and development as well as maternal health, because the mothers get health information first through the cadres[(6)], including the information about care and fulfillment of the needs for children.

Based on the data from East Java Provincial Health Office in 2013, the coverage of detection of child growth in East Java was still 70.34%. In addition, growth and development monitoring carried out at *Posyandu* had also not been encouraging. Only 49.4% of the toddlers who got the growth monitoring in 4 times or more within 6 months, 23.8% of children under five were not weighed, only 30.5% of children under five had Health Services Card or *Kartu Menuju Sehat* (KMS) and only 25.5% of children under five had Maternal and Child Health or *Kesehatan Ibudan Anak* (KIA) book [7].

TLC, in providing professional care, is seen as the greatest virtue dedicated to care. It is used to describe how love is shaped and refined to meet the requirements of practice (3). Feelings of compassion for others, followed by an empathetic approach, are the requirements for caring about others. What stands out in TLC is the relationship between care and love [2].This research aims to describe the efforts of TLC-based early childhood growth monitoring in *Taman Posyandu*

Material and Method

This research is a kind of quantitative study with cross-sectional approach. It was carried out in four districts (cities) in East Java; Blitar, Ponorogo, Surabaya and Jember. The sample was 320 *Taman Posyandu* spread in the four districts or cities. Inferential analysis to obtain the measurement model used a Confirmatory Factor Analysis (CFA).

Findings:

Characteristics of Respondents: The most of *Taman Posyandu* chosen as the research sample was in the optimal category (64.06%). Based on the age of health cadres in 320 *Taman Posyandu*, the majority was ≥ 45 years old, while the least was 30-34 year olds. The age group ≥ 45 years old dominated in each city of the research area. All cadres who became respondents in 320 *Taman Posyandu* were women. There were no male cadres, even though there was no prohibition for a man to become a cadre. The largest ethnic group of *Taman Posyandu* cadres was Javanese (89.06%), while the remaining 10.94% was Madurese. The latter was found in Jember (Pandalungan) and Surabaya. Based on their education, most of the cadres of *Taman Posyandu* was high school graduates. Education with the least percentage was elementary and Diploma or Undergraduate Degree. The majority of cadres in East Java had become the cadres for *Taman Posyandu*for more than five years (63.44%), except in Blitar with the highest percentage of cadre work period 3-4 years.

The special characteristics needed to deeply find out about the cadres of *Taman Posyandu* are the marital status, number of children and length of being the cadres. This is important to analyze in terms of the application of the principles in TLC services of growth and development in *Taman Posyandu*. Most of the cadres of *Taman Posyandu* had marital status (96.3%) and raised the children of 1-2 people (72.5%). Most of them had served as cadres for more than 5 years (63.44%), meaning that they were no longer newly trained cadres yet cadres who had considerable experiences. This was indicated by data implying that most cadres had been training as the cadres of *Taman Posyandu* (82.5%).

Cadres' Ability in TLC-based Growth and Development Monitoring:

Table 1. Ability in Communication and Indicator Validity

Indicator	Median	IQR	Minimum	Maximum
TLC-based communication ability				
1. Knowledge in growth monitoring	4	2	2	4
2. Knowledge in development monitoring	4	2	2	4
3. Ability in growth monitoring	4	2	2	4
4. Ability in development monitoring	3	1.73	2	4
Factor of loading (λ)	**1**			
t-value (tλ)	**11.99**			

Based on Output Lisrel as shown in table 1, it can be concluded that the index composing the competence of the cadres of TLC-based *Taman Posyandu*is a valid index since the value of the factor of loading is ≥ 0.5 and significant since the t-value is ≥ 1.96.

The ability to carry out the TLC-based growth and development monitoring contributed 1 in compiling the competence of the cadres of *Taman Posyandu*. The indicators that make up the ability in growth and development monitoring were arranged from the biggest to the smallest influences such as knowledge in growth monitoring of 0.65, ability in growth monitoring of 0.54, knowledge in development monitoring of 0.53, and ability in development monitoring of 0.48. The overall indicators made a positive contribution.

Table 2. Factor of Loading in Indicator of Communication Ability

Index of Competency	Indicator	Factor of Loading (λ)
TLC-based ability in growth and development monitoring	1. Knowledge in growth monitoring	0.65
	2. Knowledge in development monitoring	0.53
	3. Ability in growth monitoring	0.54
	4. Ability in development monitoring	0.48

The table informs that the implementation of the cadres of TLC-based *Taman Posyandu* monitoring is all valid indicators since it has a value in loading≥ 0.3. Based on the factor of loading value, it can be concluded that the dominant indicator in growth and development monitoring is indicator of knowledge in growth monitoring (0.65). Meanwhile, the lowest ability is the ability to monitor the progress contributing for 0.48 with the overall positive effects.

Discussion

Cadres are part of the children's environment that contributes to give a support to children by playing an important role in providing an appropriate environment, fulfilling children's basic needs, security and helping children prepare for their future, thus it is important for the cadres to have good competence. TLC-based cadre competencies can be improved through care, responsibility, appreciation, and knowledge in conducting guidance and supervision for child development.

1. **TLC in Growth Monitoring:** Growth is an easy-observed condition and can be measured using a measuring instrument. However, in its implementation, a cadre must have knowledge or competencies so that the results of monitoring are more accurate [8]. There are 4 important aspects in implementing TLC in growth monitoring; knowledge, care, respect & responsibility.

   a. **Knowledge,** in growth monitoring activities, can be applied in the form of understanding to monitor the growth of children in *Taman Posyandu.* It is necessary to weigh the weight, measure the body length and head circumference. This means that before weighing the position of the balance must be correct in 0 (zero) position and the cadres have to ask the parents why the children do not gain weight, if they find such a case.

   b. **Care,** in growth monitoring,can be realized in the form of weighing or measuring body height or head circumference gently, seeing the results of measurements carefully, eager to monitor the growth, involving the mother in measurement, taking measurements to completion, and using adequate equipment

   c. **Respect,** in growth monitoring,can be applied to dearly calling children activities when weighing, not comparing growth in each child, not reprimanding publicly about the results of monitoring, but paying attention to complaints from parents

   d. **Responsibility** can be applied in the form of weighing the body weight, or measuring the body height and head circumference carried out in the right way, repeating measurements if there are doubts, reporting the results of measurement to the responsible person, immediately carrying out the data collection for children who do not come in the measurements.

2. **TLC in Development Monitoring:** In line with the growth, children's development can be measured if the cadre has a good knowledge in early detection of child development. The cadres of *Taman Posyandu* can show the form of TLC to children if they have a clear understanding on how to do early detection or monitoring. There are four important aspects in implementing TLC for development monitoring, namely knowledge, care, respect & responsibility.

    a. **Knowledge,** in the duties of the cadres for growth monitoring activities, can be performed by taking SDIDTK training, routinely monitoring the development of children who come in *Taman Posyandu*, understanding how to use a child development card or KPSP

    b. **Care,** in monitoring the progress, can be implemented in a skillful manner to carry out the development monitoring by using KPSP, KKA, TDD, TDL, CHAT, GPPH, right in concluding the monitoring and the results of progress monitoring must be delivered to the parents privately, not by frightening the parents about the results of monitoring, but giving an understanding on how to monitor the progress.

    c. **Respect** can be applied by doing harmless actions, interacting well with parents or children during the development monitoring by using KPSP, KKA, TDD, TDL, CHAT, GPPH, praising the efforts made by the mother, and explaining the problem of child growth secret.

    d. **Responsibility** can be manifested in the form of careful development monitoring, asking other cadres to repeat monitoring if there are suspicious results, monitoring developments, and showing their seriousness to help while monitoring the progress.

The results of the competency of monitoring revealed that all cadres had the lack of ability in TLC-based growth monitoring. Monitoring children's growth and development is not easy to do since it requires good knowledge and abilities in making precise measurements, neat recording, and conducting appropriate follow-up. The cadres of *Taman Posyandu* in the research area were mostly high school graduate and lacking in obtaining SDIDTK training. Both of these factors and their relation to cadre abilities and skills happened due to the lack knowledge which leaded to thelackof monitoring.

The ability in monitoring of TLC-based children's growth and development consists of the elements of care, responsibility, and respect. The form of care is to make gentle measurements and involve the mother. Respect is the act to accept the differences in measurement results and does not label the children. The form of responsibility is to make appropriate measurements and demonstrate commitment in monitoring. Children's growth and development monitoring can be called early detection so that if there are irregularities, it can be immediately addressed. This success must be supported by the active participation of the parents by referring their children to *Taman Posyandu*. Therefore the programme requires an optimal support from the government, community, community leaders and health officers.

Conclusion

The efforts to monitor the growth and development on early childhood are intact unity competencies that must be possessed by health cadres in carrying out their duties in *Taman Posyandu*. TLC-based growth monitoring will improve the quality of services in *Taman Posyandu*, because it prioritizes the aspects of care, responsibility and respect in providing services to children. Unfortunately, the limited levels of education and ability make TLC-based growth and development efforts by cadres in *Taman Posyandu* not optimal. Therefore, it needs further efforts to improve the quality of its services.

Regional Health Care: Does Give Benefits for Poor Communities?

Siti Nuraini[1], Riski Isminar Ardianti[1], Deddy Kurniawansyah[1]

[1]Lecturer of Accountancy Department, Faculty of Economics and Business, Airlangga University, Jl. Airlangga 4-5 Surabaya, Indonesia

Abstract

This research to observe implementation of the regional health care program of Banyuwangi Regency, especially in the implementation of pro poor budgeting in poverty alleviation and the benefits received by the poor. The method used in this research is descriptive qualitative with respondents and the informants are beneficiaries of regional health care, health offices and technical support officers at the village/urban village office. The results of this study indicate that the implementation of public health care in Banyuwangi has been going well. The poor health care program in Banyuwangi is more commonly called the Declaration of Poor Letter (SPM). Problems rise from the implementation of the SPM are convenience for some people who have access to village officials, so that they can have SPM. In addition to the single parent, the difficult rule which states that only family members in a Family Card that can take care of SPM. We suggest for regional goverments to increase human resources at the village level in SPM services. Most of the respondents, 95 percent stated that the regional health care program provides considerable benefits for the community, especially the poor.

Keywords: *Regional health care, Declaration of Poor Letter (SPM), poor community.*

Introduction

Regional autonomy system expects full participation of the community and regional government to be able to realize regional welfare and independence in development. The main problem of development is that poverty and the main goal of the central government and regional governments to reduce it. Poverty is an integrated problem with various other sectors such as health, education, infrastructure and community income. Decresing poverty is expected to improve the quality of development, therefore regional government look for the potential regional to reduce poverty and improve the quality of human development.

Poverty are factor of lack of capital, productivity in poor households so that they reduce spending in the education and health. Low-income people have relatively low spending in the health sector, adequate access to education that informs about health, nutrition and disease prevention.[1,2] Some research states that the health sector has an impact on human resources that has an effect on economic growth and has a positive impact in developed countries. This shows that the role of government in developed countries is greater in the health sector than in developing countries [3–5].

Public expenditure is intended for management to public needs creating public welfare. Welfare is determined by the source of income or adequate income by having jobs according to ability and talent. Besides that, the services needed by the people of his country not only the availability of public needs (water, electricity, health, education, security) but also other public rights to be eligible for life [6].

Pro poor budgeting are (1) a budget that directs the importance of development policies of the poor, (2) the practice budgeting policies that are design aimed at making policies, programs and projects that are pro-

e-mail: sitinuraini@feb.unair.ac.id

poor community, (3) budget policies whose impact can improve welfare and basic needs of the poor people. Pro-poor budget requires support through pro-poor policies which commitment from the government to prioritize poverty alleviation. In general, pro poor policy is a political action carried out with the aim of providing the allocation of rights and resources to individuals, organizations and territories that are marginalized by the market and the state. This can be interpreted that the policies taken by the government must emphasize the improvement that affect the problem of poverty. The realization of the allocation and distribution is to provide basic services in the form of education, health, housing and others[7,8]. Health capital can increase the return on investment devoted to education, because health is an important factor so that someone can attend school for learning. Longer life expectancy can increase returns on investment in education, while better health will lead to lower levels of education depreciation [9].

The human development index in Indonesia is quite low. One of the provinces with low human development index is East Java. East Java from 2010 to 2015 experienced an increase in the human development index even though it only ranged from 0.5 to 0.8. This shows that the efforts of each city/regency are very strong to realize a better community life. As one of the regencys in East Java, Banyuwangi Regency is one thatcommitted to reducing poverty by improving the quality of human development. The commitment of the government can improve the quality of public health, especially the poor. Although indirectly the population's health will improve quickly but government intervention in providing health services or health subsidies will have a good impact both the access of the poor to health services [3,10–12].

Increasing human development index of Banyuwangi Regency shows the commitment of the local government to improve the quality of education, health and community income as three factors making up the human development index. One form of this commitment is an increase in local government expenditure in the education and health sector. One of the policies set out in Banyuwangi Regent Regulation No. 28 of 2016 concerning Guidelines for the Implementation of the Regional Health Care program and Health Services through a Poor Declaration Letter. The regulation stated that the Banyuwangi Regency Government provided the Regional Health Care program (Jamkesda) for participants who were not included as Contribution Beneficiaries (PBI) participants and the National Health Care Program (JKN). With the support of local government programs, it is expected that access to health for the community, especially the poor, will be easy, because the facilities provided are not only for outpatient but also inpatient facilities. It is hoped that the community, especially the poor who need it, will be able to receive benefits from this local government program. For this reason, this study will examine the benefits received by the community, especially people with incomes below the average decent income in utilizing the Regional Community Health Care program, especially in Banyuwangi Regency.

Based on the situation analysis presented, this study looks for the implementation of the BanyuwangiRegency Health Care and its impact on the poor. Several studies on health programs from the government have been carried out such as the results of Wagstaff's (2011) research using the Benefit Incidence Analysis (BIA) in Vietnamese society found that health social care in Vietnam is more enjoyed by the rich than the program's goal to reduce poverty. While the Afghanistan Ministry of Health's research (2013) shows that public spending on health is still concentrated in Afghanistan Central Hospital, so there is still a need for grouping for government programs related to health. In China, Zhao (2019) found that since the adoption of NCMS the rural poor did not delay treatment to the hospital, so that they could receive treatment in a timely manner [10,13,14].

Material and Method

This type of research used in this research is descriptive qualitative research, which is research that emphasizes the quality of the process rather than just the final result. The approach used in this research is a descriptive approach that emphasizes the individual in understanding and creating his daily life. A descriptive qualitative research approach is more likely to explore information from sources and respondents directly and written narrative so that it is easily understood by other communities. The focus of research in qualitative research is useful in providing direction during the research process, especially at the time of data collection, namely to distinguish data relevant to our research goals. The focus of this research is the community receiving health care for the poor in Banyuwangi Regency in 2016. The limitations of the study year are due to the existence of a data system in the BanyuwangiRegency Health Office.

This research was carried out in Banyuwangi Regency within a period of one year with a sample selection in the form of Regencys resulting from random purposive sampling based on Regencys with the largest recipients of health care for the poor. Subjects and sources of information in this study are the Banyuwangi Regency Health Office, Sub-District Officers and Village Heads, Officers at the village/urban level who are in charge of taking care of the Poor Statement and Recipients of Regional Health Care using the method of observation (observation) and in-depth interviews. In 2016 Jamkesmin recipients in Banyuwangi were 506 people, so researchers took samples to conduct in-depth interviews as 84 beneficiary program.

Findings: The health care program for the poor is a national program that is integrated with the regions. There are three criteria for the Jamkesmin program in Banyuwangi Regency, namely financing from the Central Goverment, funding from the East Java Provincial Government and from the Banyuwangi Regional Government. The Health Care Program for the Poor has been legally through Banyuwangi Regent Regulation No. 8 of 2017 concerning Guidelines for Implementing Health Services for the Poor in Banyuwangi Regency. This regent's regulation states that the health of the poor who are not included in the Contribution Beneficiary Participants (PBI) of the National Health Care Program (JKN) will be provided by the Banyuwangi Regency Government. The *Jamkesmin* Program in Banyuwangi is also called the SPM Program. The SPM program (Declaration of Poor Letter) is a letter or identity given to the community outside JKN membership that meets the criteria of being poor. The first process of issuing this letter was a recommendation from a local Household Head (RT/RW) which was strengthened at the Village/ Urban Head and known to the Sub-district Head. The second process is the issuance of SPM by authorized officials in this case the Social Office which has been legalized by the Health Office.

The financing of this health program includes funding for outpatient and inpatient care at health service centers and hospitals in collaboration with the Banyuwangi Regency Government, including Health Center, Blambangan Regional Hospital, Genteng Regional Hospital and East Java Provincial Hospital. Financing of this SPM program is fully charged to the Regional Development Budget of Banyuwangi Regency on condition that there is no duplication from other sources. For people who get a Declaration of Poor Letter (SPM) can receive services free of charge valid for three months and when they have expired can be extended.

The SPM can be issued manually or electronically. SPM issuance is manually issued if the electronic publishing process cannot be carried out. The status of patient participation must be ensured from the beginning of entry to the Advanced Referral Health Facility (FKRTL) and given the opportunity to administer the SPM no later than 3 (three) working days after the patient is admitted to the hospital, if until the specified time the patient cannot show the SPM, the financing is stated as general patient. If the patient is in an emergency condition and has been hospitalized, the Health Center will issue a referral based on the Certificate of Hospitalization from the Hospital. This SPM is only valid for 3 (three) months from the date set. If the SPM is used when it expires, an extension must be made by carrying out all procedures from the beginning.The average time needed for the issuance of the SPM is around 1-2 days. This is in accordance with existing regulations that the opportunity to take care of SPM no later than 3(three) working days after the patient is hospitalized. However, based on the results of interviews with SPM user respondents, the SPM issuance process before 2017 is still done manually.

In accordance with the results of interviews with village officials, that the SPM submission by the applicant is required to bring a referral letter from the Health Center/Hospital after which the applicant completes administration and submits SPM requests to service officers at the village/urbanoffice. The village/ urban official will input data on the online SPM system so that the SPM can be issued.

Discussion

The problem that occurs when interviewing beneficiaries and health providers is that some people who submitted SPM have been treated at the regional hospital so that the village/urban is late in issuing SPM so that patients are not accommodated for financing health services. To anticipate this, some respondents stated that they made SPM without any health problems just in case. Another problem is the incomplete requirements submitted by the SPM applicant. The SPM can be issued even in the absence of a referral letter from the Health Center or Hospital due to the close relationship factor between the applicant and village officials. One of the reasons respondents use SPM as a precaution is because the person who can apply for SPM is the person

concerned or family on a family card, it is quite difficult for respondents, especially single female parents and have children who are still not old enough. Although according to the Health Department this method can reduce brokering practices but for single parents especially women it is quite difficult because besides they have to take care of sick family members, they also have to take care of SPM.

In addition, some respondents felt that not all SPM recipients were poor people. Some beneficiaries are believed to be capable communities, only because of the proximity to village officials, they have easy access to SPM. The lack of socialization in the community about the criteria of the poor and the criteria of SPM recipients also makes the community not fully understand the categories of the poor. On the other hand, the regional government through the Health Service seeks to provide health services to the poor evenly and on target, not to cause double funding in the community. In addition to the SPM beneficiary criteria that have not yet been socialized, one of the obstacles is the area of Banyuwangi Regency. From the 2016 SPM beneficiary data of 506 beneficiaries, 60 percent of beneficiaries are located in areas close to the city, with a radius between 30-40 km. this reinforces the statement from the public that there is a lack of socialization about SPM.

From the positive side of SPM, the implementation of comparisons between the handling of SPM manually and online is very different. Managing SPM online in accordance with the statement of the village head and the health office only requires a maximum of one day. Meanwhile, according to the results of interviews with respondents, online SPM maintenance can take up to three working days, faster than the time needed for manual handling because it takes approximately one week. The differences in SPM maintenance need to be minimized so that all people are able to reach them. Besides SPM service officers at the village level also need to be added so that the task runs optimally. Most of the respondents, 95 percent stated that the regional health care program provides considerable benefits for the community, especially the poor.

Conclusion

From the results of this research it can be concluded that the Poor Public Health Care Program in Banyuwangi Regency from the Local Government Budget is called the Declaration of Poor Letter (SPM). Namely the health care program for the poor with beneficiaries who do not receive health care from the central government and others source. The implementation of the SPM program in Banyuwangi has several constraints, namely the SPM recipients who are not on target because of the tendency of alignments of village/urban officials, lack of human resources in carrying out online issuance of SPM and targets who are able families.

Measures of Modern Society to Limit the Prevalence of Sexually Transmitted Infections

Sizov A.A.[1], Pashina I.V.[1], Lischuk N.G.[1], Alferova M.E.[1], Lyaskovets A.V.[2], Shahbazov R.F.[2], Andreeva N.A.[3]

[1]Kursk State Medical University, [2]South West State University, [3]Regional Open Social Institute, Kursk, Russia

Abstract

Sexually transmitted infections are a group of diseases that include syphilis, gonorrhea, chlamydial and mycoplasma infections, trichomoniasis, herpes and HPV infections of the genital organs. In addition, sexually transmitted human immunodeficiency virus, causing a disease called acquired immune deficiency syndrome. According to the World Health Organization, every year more than 340 million people aged 15-49 suffer from sexually transmitted infections worldwide. The basis for the prevention of the spread of sexually transmitted infections and infection with the human immunodeficiency virus should be considered the presence of internal moral attitudes. The motive for the start of sexual life should be your own conscious decision, and not pressure from a partner, fear of losing him, desire to please him and preserve the relationship. Despite the rather wide spread of sexually transmitted infections and the occurrence of infection with human immunodeficiency virus, the implementation of the simplest recommendations guarantees the safety of intimate life and preservation of health. A clear legal regulation of actions of a sexual nature, associated with the risk of infection or entailing infection with sexually transmitted infections, helps to curb their distribution. It is essential for maintaining the sexual health of people of young and mature age, which is an important resource of any country.

Keywords: *Infections, sexual transmission, inhibition of dissemination, legal basis, sexually transmitted diseases.*

Introduction

The development of medicine, going forward, has provided great progress in understanding the spread, development, course of various diseases[1,2]. Serious long-term studies have allowed to shed light on the features of infectious and non-infectious diseases[3,4]. A great step in medicine was the invention of antibiotics, which put the infectious diseases under serious control[5], including sexually transmitted infections (STIs). However, to completely solve the problems of this group of diseases, which are transmitted mainly through sexual contact from a sick person to a healthy person, has not yet been resolved. STIs include syphilis, gonorrhea, chlamydia and mycoplasma infections, trichomoniasis, genital herpes and papillomavirus infections. In addition, sexually transmitted human immunodeficiency virus, causing a disease called acquired immune deficiency syndrome. In addition, during sexual contact, in addition to STIs and the human immunodeficiency virus, viral hepatitis B and C are transmitted, as well as some other diseases (scabies, pubic lice, molluscumcontagiosum)[6].

According to the World Health Organization, every year more than 340 million people aged 15–49 get STIs worldwide. At the same time on the earth every sixth inhabitant has a sexually transmitted disease. In recent years, the countries of the Union of Independent States have tended to decrease the rates of growth in the incidence of STIs, which is associated with significant health care efforts and the improvement of society as a whole. In the Russian Federation, there is also a decrease in the level of STIs. In particular, the incidence

of all forms of syphilis significantly decreased from 21.2±0.37 (in 2016) to 19.5±0.10 (in 2017), gonococcal infection from 14.4±0.09 (in 2016) to 11.1±0.09 (in 2017) ($p < 0.05$). There is also a decrease in the primary incidence of HIV infection in the Russian Federation from 59.2±0.20 (in 2016) to 58.4±0.20 (in 2017) per 100 thousand population ($p < 0.05$). In addition, the frequency of occurrence of risky sexual behavior – a form of human sexual behavior that increases the risk of contracting an STIs — is reduced: early sexual activity, ignorance of how to protect yourself from sexually transmitted infections, frequent changes and the absence of a permanent sexual partner, casual sex, non-use of condoms and other protection method. At the same time, in spite of improving the method of diagnosis and treatment, today there is still a high level of STIs prevalence in the world, and among those who are sick there are people aged between 15 and 29 years old (60-70%)[7,8].

Diagnosis and treatment of STIs and human immunodeficiency virus: Diagnosis and treatment of STIs is carried out in strict accordance with the clinical guidelines, procedures and standards of care. The diagnosis is made on the basis of the international classification of diseases of the 10th revision (ICD-10), class A50-A64 "Sexually transmitted infections", also B20-B24 "Disease caused by the human immunodeficiency virus"[9].

Confirm or refute STIs and infection with the human immunodeficiency virus is possible only on the basis of laboratory tests. It should be remembered that they become informative not immediately after intercourse, but after some time (for each disease it is different - from 3-5 days to several weeks and even up to 3-6 months with a human immunodeficiency virus) from the moment of infection[10].

It is necessary to know that the information on the presence of an STIs and a human immunodeficiency virus in a patient is not allowed to pass on to the attending physician (except for the investigation and court authorities). And any patient who applied for medical care, regardless of the existing disease, has the right to be treated with respect by medical workers[11].

The historical aspect of criminal liability for infection with venereal diseases in Russia: Already in the Soviet period in Russia, the authorities considered it necessary to criminalize the intentional infection with venereal disease. This was due to the reluctance of a number of people with venereal disease to voluntarily perform the prescribed medical procedures. Therefore, already in the first Criminal Code of the Russian Soviet Federative Socialist Republic, enacted on July 1, 1922, article 155 established criminal liability for "knowingly infecting another person with a serious venereal disease", which was punishable by imprisonment for up to 3 years.

A year later, in June 1923, the First All-Russian Congress on the Control of Sexually Transmitted Diseases was held, the participants of which influenced the introduction of changes in Article 155 of the Criminal Code of the Russian Soviet Federative Socialist Republic of 1922, which excluded the words "notorious" and "heavy", and which now looked like this: "For infecting another person with a venereal disease." Thus, the content of the subjective side of the crime has expanded, which is now formed by the intentional and careless infection of another person with a venereal disease, regardless of the method of such infection and the degree of harm to the victim's health.

Having decided that the existing norms do not fulfill their preventive functions, at the insistence of representatives of the Soviet government on August 6, 1926, the Criminal Code of the Russian Soviet Federative Socialist Republic was supplemented by article 155-a, directed against persons suffering from sexually transmitted diseases and leading sexual habits, in the Criminal Code of the Russian Soviet Federative Socialist Republic of 1926 was amended and merged with Article 155 in Article 150 of the Criminal Code of the Russian Council tion of the Federal Socialist Republic. Changes in the disposition of this article were expressed in the fact that a person suffering from a venereal disease should have been aware of the presence of this disease in him[12].

The Great Patriotic War and the occupation of part of Russia triggered a new outbreak of sexually transmitted diseases, which was one of the prerequisites for changing the criminal law norms of this sphere, reflected in the Criminal Code of the Russian Soviet Federative socialist republic of 1960 in article 115, the sanction of which was stricter and wider than the sanction Part 2 of Article 150 of the Criminal Code of the Russian Soviet Federative Socialist Republic of 1926. 10 years later, in 1971, the elements of the crime envisaged by article 115 of the Criminal Code of the Russian Soviet Federative Socialist Republic of 1960 were expanded, and a new

article 1151 was introduced - "evasion of the treatment of venereal disease", continuing after the warning made by medical authorities.

Convicted under articles 115 and 1151 of the Criminal Code of the Russian Soviet Federative Socialist Republic of 1960, amnesties were not subject to. In Part 3 of Article 115 of the Criminal Code of the Russian Soviet Federative Socialist Republic of 1960, for the first time, criminal liability was established for the qualified types of infection of another person with a venereal disease by a person who knew that he had the disease related to the infection committed by a person who had previously been convicted of similar acts, also with infection of two or more persons or a minor. The rapid development of venereology and the identification of new sexually transmitted diseases caused changes in legislation: in accordance with the Decree of the Presidium of the Supreme Council of August 25, 1987 №7612-11 "On measures to prevent the virus from acquiring acquired immunodeficiency syndrome" any person could be diagnosed with acquired immunodeficiency syndrome. Doctors will consider it appropriate. In addition, with the discovery of the causative agent of the new venereal disease "Human Immunodeficiency Virus", on August 31, 1987, Article 115 was supplemented with Article 1152 - infection with the human immunodeficiency virus (Part 1) and infection of another person with the human immunodeficiency virus diseases (part 2). Changes in criminal law related to infection with venereal diseases were not implemented until the current Criminal Code of the Russian Federation was adopted in 1996, which proves that the criminal policy of that period was effective[13].

Qualification of infection with venereal disease and human immunodeficiency virus: Health protection, enshrined in criminal law, is an important part of the Russian state system of protection of the human right to health. Therefore, in the Criminal Code of the Russian Federation there is a separate chapter aimed at protecting the health of citizens, called crimes against life and health. Depending on the nature of the crime, the chapter divides crimes against life, against health, and crimes that threaten health. One of the important chapters in this chapter is the existence of norms separating infection by the human immunodeficiency virus and venereal diseases. The distinction between the elements of a crime between Article 121 of the Criminal Code of the Russian Federation (infection with venereal disease) and Article 122 of the Criminal Code of the Russian Federation (infection with human immunodeficiency virus) is very important, since the danger of human life and social relations in this case is very different, although the order of infection in some points may be common[14].

Responsibility for both articles occurs if the person was aware of the presence of a sexually transmitted disease or human immunodeficiency virus and concealed this fact when entering into sexual relations. The knowledge of the perpetrator about his illness is confirmed by the warning and other data of the medical institution about the presence of the disease. It should also be noted that, according to article 121 of the Criminal Code, a person may be liable not only during the period of the illness and its treatment at home, but also during the period of hospitalization. It is not a reason for exemption from criminal liability if the victim was willing to put himself in danger of being infected with a human immunodeficiency virus or a venereal infection. From the point of view of the subjective side, infection with the human immunodeficiency virus and infection with a venereal disease are characterized by direct and indirect intent[15].

It is impossible to hold a person accountable for criminal negligence, since the law states that the person should have known that he has a human immunodeficiency virus or a sexually transmitted infection. Criminal frivolity occurs when a person assumes that he has cured himself of the disease himself, and believes that the other person will not be infected by contacting him[16]. The presence of a separate norm on the human immunodeficiency virus in the Criminal Code of Russia is due to the particular danger of this infection in comparison with venereal and other diseases. In order for a crime to be infected with a human immunodeficiency virus it can be considered complete, it is not required that it develop into an acquired immunodeficiency syndrome. Moreover, it is not even necessary for the virus to enter the victim's body because Russian law already provides for the responsibility for creating the conditions for the victim to become infected. The objective side of paragraph 1 of Article 122 of the Criminal Code - knowingly putting another person in danger of being infected with a human immunodeficiency virus, can be equally expressed in inaction and action. The source of the disease in cases stipulated by article 122 of the Criminal Code of Russia are people in whose blood the virus circulates. There are certain features of the legal qualification of a crime in accordance with Article 122 of the Criminal Code of Russia. So, part 1 of the article

provides that responsibility comes at the time of putting in danger. Part 2 and part 3 of the article indicate that liability arises after the act of infection. And part 4 of the article indicates that responsibility occurs if a special subject infects the victim due to negligent performance (or non-performance) of official duties[17].

Conclusion

It must be remembered that the prevention of STIs and infection with the human immunodeficiency virus depends on internal moral attitudes (orientation toward a later start of sexual activity, refusal of premarital and extramarital intimate relations). The motive for the start of sexual life should be your own conscious decision, and not pressure from a partner, fear of losing him, desire to please him and preserve the relationship. In such cases, it is necessary to clearly and clearly discuss the intimate side of the relationship and, in cases of reluctance to begin sex with this partner, refuse.

Despite the fairly widespread STI and the occurrence of infection with human immunodeficiency virus, the implementation of the simplest recommendations guarantees the safety of intimate life and preservation of health. A clear legal regulation of actions of a sexual nature, associated with the risk of infection or entailing infection with sexually transmitted infections, helps to curb their distribution. It is essential for maintaining the sexual health of people of young and mature age, which is an important resource of any country.

Conflict of Interest: No conflict of interest is declared.

Sources of Financing: The study was conducted at the expense of the authors.

Ethics Committee Resolution: The study was approved by the local ethics committee of Kursk State Medical University on January 15, 2019 (protocol №1).

Effect of Non-Computerized Cognitive Remediation and Risperidone to Improve Disability Function in Schizophrenia

Sonny T. Lisal[1], Saidah Syamsuddin[1], Anisa[1]

[1]Department of Psychiatry, Faculty of Medicine, Hasanuddin University, Makassar, Indonesia

Abstract

The aim of the study was to find out the effect of non-computerized cognitive remediation and risperidone therapy to improve cognitive function and disability condition in schizophrenia patients. This study was an experimental research design, with fourteen participants divided into two group as the experimental group and the control group. The experimental and control groups both received Risperidone. In addition, the experimental group was given the non-computerized cognitive remediation (CR).The non-computerized cognitive remediation will be carried out in 12 sessions (3 sessions per week) using mainly paper and pencil tasks and is based on cognitive strategy instruction. Moreover, all samples will be measured for PANSS (Positive and Negative Symptom Scale), WHODAS 2.0 (World Health Organization Disability Assessment Schedule), and SCoRS Vi (Schizophrenia Cognition Rating Scales Indonesian Version) scores. As the results, both experimental and control group showed a significant decrease in the SCoRS Vi and WHODAS 2.0 score (p=0.001). However, the experimental group showed greater improvement compared to the control group. Synergistic effect of Non-computerized Cognitive Remediation and Risperidone can improve disability condition in schizophrenia patients.

Keywords: *Schizophrenia, Non-computerized Cognitive Remediation, Risperidone, Disability.*

Introduction

Schizophrenia is a chronic mental illness characterized by hallucination, delusion and thought disorder(as well as cognitive and psychosocial impairments.[1] Cognitive deficits are core features of schizophrenia, contribute substantially to poor functional outcome of the patients and are likely as important as positive and negative symptoms for clinical treatment of the illness.[2] Schizophrenia is a psychotic disorder that affects about 26 million people around the world. It is typically diagnosed in early childhood and mostly persist through-out people's live. Several long-term follow up studies have challenged the view about schizophrenia poor outcome and proved that varying degrees of improvement is still one of the main causes of disability worldwide.[3] Patients with schizophrenia have difficulty succeeding at school, obtaining or maintaining a job, having social relationship, living independently and even for some taking care of their basic daily needs.[4]

The decline occurring in schizophrenia had been broadly classified as something related to neurocognition and social cognition.[5] While all domains of cognition are affected in schizophrenia, there are selective areas of increased impairment – particularly verbal and visuo-spatial memory, attention, executive function and speed of processing.[6] Antipsychotic drugs can relieve the main symptoms of schizophrenia but have no therapeutic effect on this cognitive impairment and the overall outcome is generally unsatisfying which explains the increasingly widespread use of cognitive remediation for schizophrenia.[7,8] Alternate theories of schizophrenia point to neurodevelopmental abnormalities as a potential cause. Brain-derived neurotrophic factor (BDNF) is a neurotrophic factor essential for development of the

central nervous system and modulation of neuronal connections that may be involved in the pathophysiology of schizophrenia and its associated cognitive impairment, especially immediate memory.[9,10]

In 20 clinical trials for cognitive enhancement, atypical antipsychotic medication moderately improved some aspects of cognitive functioning in patients with schizophrenia. Next, the influence of neurocognitive rehabilitation on neurocognitive functioning come to attract attention. Cognitive remediation was associated with a medium effect size for cognitive performance.[11] Then, are there any synergistic effect of cognitive remediation and antipsychotic that can improve disability in schizophrenia patients? It was generally thought that atypical antipsychotic would improve neurocognitive functioning but some published reports suggest that the magnitude of neurocognitive functioning for antipsychotic is lower than previously expected.[11] Thus, developing medications and cognitive therapies to treat the cognitive deficits associated with schizophrenia is a high priority.[12,13]

According to the WHO-ICF, disability encompasses impairments of body functioning, activity limitations, or participation restriction, arising as interconection result between health condition and contextual factors. A person with schizophrenia, might experience disability due to impairment of thought or perceptual functions.[3] In previous research, showed the significant improvement(p=0,002) in cognitive function after given 12 session of non-computerize cognitive remediation in schizophrenia treated with atypical antipsychotic.[14] However, the study did not link the benefits or impact of cognitive function improvement with disability condition. Therefore, we were interested to conduct further research to determine the effect of non-computerized cognitive remediation and risperidone on disability improvement in schizophrenia patients.

Materials and Method

Location and Time: The study was conducted at the Rumah Sakit Khusus Daerah (RSKD) Hospital in Makassar, South Sulawesi, Indonesia,from April to July 2018.

Ethical Clearance: Ethical approval for the study was given by the Ethics Commission on Biomedical Research in Humans, Medical Faculty of Hasanuddin University, Makassar, Indonesia.

Participants: The participants were diagnosed schizophrenia by psychiatric, in a stable state (PANSS score 50-70), irrespective gender or race, age 18 to 45 years,minimal level of education is elementary school, no evidence of head injury or organic disorder,who were hospitalized in Rumah Sakit Khusus Daerah (RSKD) Hospital. The participants were taken from April 2018 until July 2018 by Consecutive sampling method.

Procedure: All participants gave informed written consent (N=14). All assessments were carried out by medical graduation. Sociodemographic data were collected from case note, nurses and participants. All participants were assessed on the measures of PANSS, WHO DAS 2.0 and SCoRS Vi beforeand 4 weeks postbaseline. Every participant received (TAU) treatment as usual (Risperidone) and randomly assigned to receive non-computerized cognitive remediation. The participants were divided into 2 groups, experimental group (TAU plus CR, n=7) and control group (TAU, n=7).

Interventions: Participants in experimental group have received CR for 12 sessions (3 sessions per week). The intervention should have been performed in a clinical setting by a medical graduation with qualification in CR. The CR was either a paper and pencil format and the length of therapy should be from 45 minutes to 1 hour.

Data Analysis: All data were presented in mean value and statistically analyzed with SPSS computer software. The data were analyzed using Mann-Whitney test and Wilcoxon test, with the significant value was determined if the $p< 0.05$.

Results

The study was conducted at the Rumah Sakit Khusus Daerah (RSKD) Hospital in Makassar, Indonesia, from April to July 2018. In Table 1, most subjects in experimental group were male (57,1%), in contrast with mostly female in control group (57,1%). Most subjects were between 30 – 39 years old (57,1%) in both groups. In the experimental group, the education level was equally for Elementary School and Senior High School (42,9%) and in control group was mostly Elementary School (57,1%). For occupation, unemployed subjects were 57,1% in the experimental group and 85,7% in the control group. For marital status, unmarried were 42,9% in the experimental group and 85,7% in the control group. Moreover, for the diagnosis, schizophrenia unspecified (F20.9) was dominated (57,1%) in both groups.

Table 1. Subjects Profile

Variabel	Experimental Group		Control Group	
	N	(%)	n	(%)
Gender				
Male	4	(57,1)	3	(42,9)
Female	3	(42,9)	4	(57,1)
Age				
≤ 20	0	(0)	0	(0)
21-29	2	(28,6)	1	(14,3)
30-39	3	(42,9)	4	(57,1)
≥ 40	2	(28,6)	2	(28,6)
Education				
Elementary School	3	(42,9)	4	(57,1)
Junior High School	1	(14,3)	1	(14,3)
Senior High School	3	(42,9)	2	(28,6)
Occupation				
Employee	3	(42,9)	1	(14,3)
Unemployment	4	(57,1)	6	(85,7)
Marital Status				
Married	4	(57,1)	1	(14,3)
Unmarried	3	(42,9)	6	(85,7)
Schizophrenia Subtype				
Paranoid Schizophrenia	3	(42,9)	3	(42,9)
Schizophrenia Unspecified	4	(57,1)	4	(57,1)

In Table 2,we conclude the comparison of SCoRS Vi and WHODAS 2.0 scores in the experimental group and control group. In the experimental group, the baseline SCoRS Vi scores was higher than the scores on the fourth week. Meanwhile, WHODAS 2.0 scores decreased on the fourth week of treatment and this was also the same in the control group. Using the Independent sample t-test analysis, the baseline SCoRS Vi scores in both groups, did not show any significant difference (p=0,056), as well as the result on the fourth week of treatment (p=0,831). There was also no significant difference in the baseline of the WHODAS 2.0 scores between the two groups (p=0,094), but there was a significant difference in WHODAS 2.0 scores on the fourth week in both groups (p=0,000).

Table 2. The Comparison of SCoRSVi and WHODAS 2.0 Scores in Experimental and Control Group

Scale	N	Treatment Group		Control Group		P
		Median (Minimum-Maksimum)	Mean ± SD	Median (Minimum-Maksimum)	Mean ± SD	
SCoRS Vi Baseline	7	72 (68-76)	71.7143 2.49762	65 (60-75)	66.1429 6.51738	0.056
SCoRS Vi On the 4th wk	7	63 (55-70)	61.8571 5.36745	62 (55-70)	62.5714 6.77882	0.831
WHODAS 2.0 Baseline	7	37 (30-40)	36.571 3.4572	39 (36-45)	39.714 2.9841	0.094
WHODAS 2.0 On the 4th wk	7	28 (20-35)	27.8571 4.52506	37 (34-40)	37.1429 2.34013	0.000

In Table 3, in the experimental group, there was a significant difference in SCoRS Vi and WHODAS 2.0 scores at the baseline and after fourth week of treatment (p=0,001).

Table 3. The Differences of SCoRS Vi and WHODAS 2.0 Scores in Experimental Group

Scale	n	Experimental Group		P
		Median (Minimum-Maksimum)	Mean±SD	
SCoRS Vi Baseline	7	72 (68-76)	71.71±2.49	0.001
SCoRS Vi On the 4th wk	7	63 (55-70)	61.85±5.36	
WHODAS 2.0 Baseline	7	37 (30-40)	36.57±3.45	0.001
WHODAS 2.0 On the 4th wk	7	28 (20-35)	27.85±4.52	

In Table 4, in the control group, there was also a significant difference in SCoRS Vi and WHODAS 2.0 scores at the baseline and on the fourth week of treatment (p=0.001).

Table 4. The Differences of SCoRS Vi and WHODAS 2.0 Scores in Control Group

Scale	n	Control Group		P
		Median (Min-Max)	Mean±SD	
SCoRS Vi Baseline	7	65 (60-75)	66.14±6.5	0.001
SCoRS Vi On the 4thwk	7	62 (55-70)	62.57±6.77	
WHODAS 2.0Baseline	7	39 (36-45)	39.71±2.98	0.001
WHODAS 2.0 On the 4thwk	7	37 (34-40)	37.14±2.34	

In Table 5, there were an improvement of SCoRS Vi and WHODAS 2.0 scores and were equally significant (p=0,003) in both groups. However, the improvement of SCoRS Vi and WHODAS 2.0 scores in the experimental group was higher than in the control group. It means that the administration of Risperidone in combination with non-computerized cognitive remediation showed a better outcome compared to Risperidone only.

Table 5. The Deviation of SCoRS Vi and WHODAS 2.O Scores in Experimental and Control Group

Scale	n	Control Group		Experimental Group		P
		Median (Min-Max)	Mean ± SD	Median (Min-Max)	Mean ± SD	
Deviation SCoRS Vi	14	3 (2-5)	3,5 (1,39)	8 (5-16)	9,8 (4,37)	0.003
Deviation WHODAS 2.0	14	2 (2-5)	2,5 1,13	9 (3-16)	8,7 (4.11)	0.003

Discussion

Cognitive impairment has emerged as an important new target in schizophrenia therapeutics in light of evidence that cognitive deficits are critically related to the functional of disability that is characteristic of the illness.[15] Schizophrenia has a range of cognitive deficits that may evolve from decreased BDNF.[10] This study showed thatthere was a significant decrease in the SCoRS Vi score, both in the treatment and control groups, as well the WHODAS 2.0 score. However, the improvement in the experimental group was greater than in the control group.

One of the targets, the treatment of schizophrenia is improvement of cognitive function. Cognitive remediation is a therapeutic process to increase or improve the capacity of individuals to process and use information, and enable improvement of daily life functioning.[16,17] Cognitive remediation is a training activity on the cognitive function of schizophrenia patients. By giving cognitive remediation, it will indirectly improve the cognitive function of schizophrenia patients. Thus, it will improve the disability of the schizophrenia patient, especially in the daily life functioning (such as bathing, dressing and participating in other group activities).

Cognitive remediation is the gold-standard practice to address cognitive deficits in schizophrenia.[18]

In this study, it appeared that both the experimental and control group had the improvement of the SCoRS Vi and WHODAS 2.0scores and were equally significant (p=0.005). However, the degree of improvement in the experimental group was greater than in the control group. It meant that the improvement of SCoRS Vi and WHODAS 2.0 scores was better with the addition of remediation compared to risperidone treatment only. The scores of SCoRS Vi and WHODAS 2.0 were improved after 12 sessions of non-computerized cognitive remediation which was given 3 times per week for 4 consecutive weeks. Previous study showed that addition of non-computerized cognitive remediation could influence neurobiological changes.[19] It was reported that patients receiving the non-computerized cognitive remediation showed an increase in BDNF serum levels and activation of the inferior frontal gyrus which was assessed through fMRI examination compared to the control group.[17,18] This result was consistent with the results of other studies, showed that BDNF levels began to increase in the second week,[20] and reached high levels at the end of the third week.[21] Brain derived neurotropic factor (BDNF) is considered to a putative biomarker for cognitive recovery in schizophrenia.[22]

Conclusions

This study concluded that the addition of risperidone, in combination with 12 sessions of non-computerized cognitive remediation was better to improve the disability condition in schizophrenia patient. We suggested that the non-computerized cognitive remediation therapy to be given in addition with risperidone treatment. Limitations in this study are that it is only examined the diagnosed type of schizophrenia which did not represent to all types of schizophrenia and that some participants were not interested in remediation process.

Conflict of Interest: The authors declare that there are no conflicts of interest.

Source of Funding: This research received no external funding.

Ethical Clearance: Ethical approval for the study was given by the Ethics Commission on Biomedical Research in Humans, Medical Faculty of Hasanuddin University, Makassar, Indonesia.

The Effect of Olanzapine on the Improvement of the Clinical Symptom of Schizophrenia

Sonny T. Lisal[1], Saidah Syamsuddin[1], Balgis[1]

[1]*Department of Psychiatry, Faculty of Medicine, Hasanuddin University, Makassar 90245, Indonesia*

Abstract

Administration of atypicalantipsychotics (risperidone, olanzapine and clozapine) can improve cognitive dysfunction which occurs in schizophrenia patients. This study was aimed at analyzing the effect of olanzapine on the improvement of clinical symptom (the positive and negative symptoms) in schizophrenia patients. The study was observational with analytic approach on inpatient and outpatient schizophrenia patients in Wahidin Sudirohusodo Hospital and its networking. Subjects comprised of 30 samples who were divided into two groups: the risperidone group which consisted of 15 subjects and the olanzapine group which consisted of 15 subjects. The positive and the negative Symptom Scale (PANSS) wasused to evaluate the psychopathological symptoms. The results showed that improvement of clinical symptom based on the decrease of the positive symptom of thePANSS was significant ($p<0.05$) since the 2nd week in both groups. However, comparison of the changes of the positive symptom of the PANSS after medical treatment showed that the decrease of the positive symptom of the PANSS was greater in the risperidone group compared to the olanzapine group ($p<0,05$). As for negative symptom of the PANSS between the two treatment groups showed that the decrease of negative symptom of the PANSS was significant ($p<0.05$) since the 2nd week.

Keywords: *Risperidone, olanzapine, clozapine, positive and negative symptoms, Schizophrenia.*

Background

The course of schizophrenia consists of three phases. The first phase is the acute phase, characterized by the emergence of positive and negative symptoms, then followed by a stabilization phase, characterized by the relief of a symptom, and then a stable phase, characterized by reduced symptom severity.[1] Schizophrenia is a chronic, severe, pervasive mental disorder, which is characterized by hallucinations, delusions, and impairments in reality assessment. This disorder has a profound and influential impact on many lives and ultimately affects the quality of life of patients.[5,2] Several studies have been conducted to compare the advantages of atypical antipsychotics, since atypical antipsychotics have a brood effect in reducing psychotic symptoms with lower extra pyramidal side effects, leading to a better quality of life than typical antipsychotics.[3] Until now, schizophrenia was known as chronic disease. At the beginning, the goal of therapy is to control positive and negative symptoms in schizophrenia. A data published in 2013 showed that the prevalence of severe mental disorders in Indonesia such as schizophrenia reached around 400,000 people or 1.7 per 1,000 population, overall there was 1% of the population in the world who suffered from schizophrenia.[7]

Oral atypical antipsychotics are considered as the first line treatment, especially for people with newly diagnosed schizophrenia.[9] Atypical antipsychotics are also referred to as second generation antipsychotic (SGA). Included in this class of drugs are risperidone, olanzapine, quetiapine, clozapine and ziprasidone. SGA can suppress positive symptoms, improve cognitive dysfunction, improvesymptom which are refractory to

typical antipsychotic treatment by blocking more 5HT2A receptor than dopamine inmesocortical pathway. SGA also blocks D2 receptors, resulting in more dopamine being released in the mesocortical pathway and causing an improvement in negative symptoms of schizophrenia. However, the affinity of each drug varies with various types of neurotransmitter receptors which in turn give different therapeutic profiles.[10,11,12]

Risperidone can improve schizophrenia, improve mood in schizophrenia and bipolar disorder. Serotonin has an important role in influencing dopamine but has different effects on each dopamine pathway. Serotonin inhibition occurs in the mesocortex pathway resulting in the release of dopamine in the body cells and axon terminal at post-synapse. This is why risperidone could improve negative symptom.[10]Lately, the use of atypical antipsychotic drugs was more often, with minimal side effect and could improve the positive and negative symptoms of schizophrenia patients.

Previous research[6,8]compared the administration of risperidoneand olanzapine therapy in schizophrenic patients. The results showed improvement for clinical symptoms of schizophrenia patients, especially the negative symptoms of patients who received olanzapine therapy compared to those who received risperidone therapy, meanwhile the administration of risperidone showed improvement in positive symptoms of schizophrenia compare to those who received olanzapine therapy. Since it is importance to determine the right antipsychotic from the beginning of therapy to ensure a good response for the improvement of symptoms of schizophrenic patients, researchers were interested in comparing the effectiveness of the two types of atypical antipsychotics most commonly used in Makassar, which arerisperidone and olanzapine. So far, there had never been any research on the comparison of these two types of drugs based on the positive and negative symptoms of general psychopathology of schizophrenia.

Materials and Method

Location and Time of Research: The study was conducted at Wahidin Sudirohusodo Hospital and its network and from June to August 2018. This study was an analytic observational study. Subjects of the study were schizophrenia patients who were inpatient and outpatient who met the inclusion and exclusion criterias.

Method of data collection: Every schizophrenia patients who met the inclusion criteria was included in the study and data was taken including name, gender, age, last education, occupation,history of the objects previous diseases. The subjects were divided into two groups, risperidone group treatment (group A), and olanzapine group (treatment group B).Each objects from both groups were assessed for PANSS scores before being given therapy with olanzapine or risperidone. The positive symptom of the PANSS and the negative symptom of the PANSS scores were assessed for both groups in the 4th and 8th week.

*All data wa*s processed and analyzed by statistic program.

Results

Thirty subjects joined the study, consist of fifteen subjects who were given risperidone and fifteen subjects who were given olanzapine. The risperidone group was given 2 mg each 12 hours orally and the olanzapine was given10 mg each 24 hours orally. Measurement of PANSS scores for each subject was carried out at baseline, on the 2nd week,on the 4th week and on the 8th week of therapy.

The change of the positive symptom of the PANSS score inrisperi done group (A) andolanzapine group (B) by the Independent T-test showed that the positive symptom of the PANSSwas greater in group A than in group B significantly ($p < 0.05$), which was respectively 14.6% vs 8.5% on the 2nd week, 26.1% vs 19.1%.on the 4th week and 40.1 vs 31.0 on the 8th week. Result of the paired T-test for each group showed a significant decrease of the negative symptom of the PANSS ($p < 0.05$) since the 2nd week, in both groups. The longer the treatment, the greater the changes of the positive symptom of the PANSS which were 14.3% vs 11.5% on the 2nd week, 32.8% vs 24.3% on the 4th week and 48.1% vs 36.1% on the 8th week respectively.

Table 1. Comparison of Positive Symptom of the PANSS and Negative Symptom of the PANSS at Various Lengths of Treatment

Variable	Length of Treatment	Group		P*
		A	B	
		Mean(SD)% Changes	Mean(SD)% Changes	
Positive PANSS	the 2nd week	14.6(8.6)%	8.5(5.7)%	0.029
	the 4th week	26.1(8.4)%	19.1(9.1)%	0.036
	the 8th week	40.1(11.7)%	31.0(8.9)%	0.024
Negative PANSS	the 2ndweek	14.3(8.4)%	11.5(7.1)%	0.318
	the 4th week	32.8(9.3)%	24.3(5.6)%	0.008
	the 8th week	48.1(11.1)%	36.1(6.9)%	0.001

* Paired T-test. A: risperidone group, B: olanzapine group. **Source:** Primary Data, 2018.

Paired T test was used to see change of the positive symptom of the PANSS in the two groups because the data was distributed normally. There was a significant decreased of the positive symptom of the PANSS ($p < 0.05$) since the 2nd week in both groups. The longer the treatment, the greater the changes of the positive symptom of the PANSS, which were 14.6% vs 8,5% on the 2nd week, 26.1% vs 19.1% on the 4th week and 40.1% vs 31.0% on the 8th week respectively.

Table 2. The Effects of Both Treatment Groups on Positive Symptom of the PANSS Changes in Various Lengths of Treatment

Group	Length of Treatment	Decreases of positive PANSS			P*
		PANSS Value	Changes	% Changes	
A	the 2nd week	24.33(8.36)	3.73(3.6)	14.6(8.6)%	0.001
		20.60(6.87)			
	the 4th week	24.33(8.36)	6.67(3.96)	26.1(8.4)%	<0.001
		17.67(5.51)			
	the 8th week	24.33(8.36)	10.07(4.71)	40.1(11.7)%	<0.001
		14.27(4.96)			
B	the 2nd week	21.20(7.89)	2.13(1.51)	8.5(5.7)%	<0.001
		20.87(6.42)			
	the 4th week	21.20(7.89)	4.47(2.48)	19.1(9.1)%	<0.001
		18.53(6.19)			
	the 8th week	21.20(7.89)	7.27(2.99)	31.0(8.9)	<0.001

* Paired T-test. A: Risperidone group, B: Olanzapine group. **Source:** Primary Data, 2018.

Result of the paired T-test for each group showed a significant changes of the negative symptom of the PANSS ($p < 0.05$) since the 2nd week. In both groups the longer the study, the greater the change of the positive symptom of the PANSS which were 14.3% vs 11.5% on the 2nd week, 32.8% vs 24.3% on the 4th week and 48.1% vs 36.1% on the 8th week respectively.

Table 3. Effects of Both Treatment Groups on Negative Symptom of the PANSS Changes in Various Lengths of Treatment

Group	Observation	Decrease of Negative PANSS			P*
		Values	Changes	% Changes	
A	the 2nd week	20.27(6.27)	2.80(2.40)	14.3(8.4)%	<0.001
		17.47(5.95)			
	the 4th week	20.27(6.27)	6.53(2.80)	32.8(9.3)%	<0.001
		13.73(5.04)			
	the 8th week	20.27(6.27)	9.93(4.71)	48.1(11.1)%	<0.001
		10.33(3.58)			
B	the 2nd week	21.20(7.89)	2.40(1.40)	11.5(7.1)%	<0.001
		18.80(7.19)			
	the 4th week	21.20(7.89)	4.93(1.58)	24.3(5.6)%	<0.001
		16.27(6.64)			
	the 8th week	21.20(7.89)	7.60(3.02)	36.1(6.9)%	<0.001

* Paired T-test. A: Risperidone group, B: Olanzapine group. **Source:** Primary Data, 2018

The difference in total PANSS score between the two groups was consistent ($p<0.05$). Comparison of the changes in the total PANSS score in groups A and B by the Independent T-test showed a reduction of total PANSS in both groups ($p > 0.05$).

Table 4. Effects of Both Treatment Groups on Total PANSS at Various Lengths of Treatment

Group	Observation	Decrease in Negative PANSS			P*
		Value	Change	% Change	
A	the 2nd week	105.4(18.8)	12.8(6.3)	11.8(5.0)%	<0.001
		92.6(15.7)			
	the 4th week	105.4(18.8)	23.6(7.6)	21.5(4.9)%	<0.001
		82.3(14.0)			
	the 8th week	105.4(18.8)	32.1(9.0)	30.0(4.3)%	<0.001

		45.8(14.4)			

Discussion

This study showed that risperidone and olanzapine were both effective for the positive symptoms and the negative symptoms, but risperidone was superior in dealing with both positive and negative symptoms. Olanzapine, a thienobenzodiazepine derivative is an atypical antipsychotic drug which shows affinity for D1-D5 receptors, serotonergic receptor (5HT2, 3, 6), muscarinic receptors (subtypes 1-5), adrenergic receptors (alpha 1-2), and histaminergicreceptor (H1). Structurally, this drug resembles clozapine but has little difference in terms of its affinity. This drug is weaker than clozapine as alpha 1 and alpha 2 adrenergic agonists, and is slightly different as D2, D4, or 5HT2A receptor antagonists.[4]

Paired T-test was used to see the changes in the positive PANSS for both groups, and each group showed a significant decrease in positive PANSS ($p < 0.05$)on the 2nd week of therapy in both groups. The longer the treatment, the greater the changes in the positive symptom of the PANSS score,which were 14.6% vs 8.5% on the 2nd week, 26.1% vs 19.1% on the 4th week and 40.1% vs 31.0% on the 8th week of study. Risperidone and olanzapine improved of the positive symptoms inboth groups (risperidone group and olanzapine group) starting from the 2nd week to the 8th week ($p = 0.001$).

When the Independent T-test was used to see the difference of the positive symptom of the PANSS score between the group given risperidone and the group given olanzapine, different results were obtained. The decrease of the positive PANSS was greater in group A (given risperidone) than in group B (given olanzapine) significantly ($p < 0.05$)which were 14.6% vs 8.5% on the 2nd week, 26.1% vs 19.1% on the 4th week and 40.1% vs 31.0%.

The changes in the positive symptom of the PANSS score was higher in therisperidone group since the 2nd week ($p = 0.029$) and there were more clinical changes in the positive symptoms in the risperidone group compared to the olanzapine group onthe 8th week. This finding was consistent with previous study,[5] where risperidone have a greater affinity for D2 than olanzapine.

The paired T-test results for each group along the study showed a significant decrease in the total PANSS scores ($p < 0.05$), seen from the 2nd week for both groups. This suggests that risperidone and olanzapine were equally effective for the negative symptoms. It was seen that the longer the therapy was given, the greater the changes in the negative symptom of the PANSS, which were 14.3% vs 11.5% on the 2nd week, 32.8% vs 24.3% on the 4th weeks and 48.1% vs 36.1% on the 8th weeks.

This finding was not in consistent with the publication results,[6]on which those who received olanzapine was better for the negative symptoms compared to risperidone since the first 3 months of treatment. This might becaused by different sampling method, different subtypes of schizophrenic, where in this study most of the subjects were paranoid schizophrenia with positive symptoms dominated over negative symptoms and simplex schizophrenia with negative symptoms dominated over the positive symptoms thus affecting the assessment results. Another thing that might affect this outcome was the sampling which combined inpatients and outpatients, in where hospitalized patients were more often in acute phase and predominated with positive symptoms compared to the outpatients. In addition, the outpatients had more family attention and support than those who were hospitalized, thus affecting the results of the assessment of the negative symptoms. Due to the limitations of the study, were the author's ability, time of study and costs. There were several weaknesses in this study,the PANSS score was not measured regularly every week due to clinical symptoms of schizophrenia, and this study did not examine the side effects of medication and drug effects that was used to minimize the side effects.

Conclusions and Recommendations

This study showed that risperid one and olanzapine were effective for both the positive and the negative symptoms, but risperidone was better for both positive and negative symptoms. Subject who received risperidone experienced more positive and negative symptoms improvement compared to olanzapine. The researchers suggested that further studies should be carried out with bigger samples size and longer observation times. It was necessary to differentiate the treatment status of patients taken as a subjects whether they were outpatients or inpatients.

Study of Some Virulence Factors of Candida Albicans Causing Intestinal Infection

Sozan Khaled Kadhum

Department of Biology, College of Education for Pure Sciences, Thi-QarUniversity, Iraq

Abstract

The incidence of systemic candidiasis which is caused by *Candida albicans* has increased so the present study sheds light on detecting some virulence factors of *Candida albi*cans like production of phospholipases and proteinases, besides the adherence on epithelial cells (from human mouth) and drug tolerance were concerned. Proteinase enzyme was produced by 20 *C.albicans* isolates (47.62%) out of 42 isolates. On the other hand, 18 out of 42 (42.86%) isolates of *C.albicans* could produce the phospholipase enzyme. The ability of the isolates for attachment onto the surface of epithelial cells was studied and found that 39 isolates of *C.albicans* could adherence epithelial cells and 20 isolates recorded percentage 95- 98%. As the resistance to antifungals concerned, we found that 32 isolates of *Candida* were resistant to nystatin. Amphotericin B was the most effective against all isolates of *Candida*. Microscopic examination results of histological section taken from rats' intestine tissues that artificially infected with *C.albicans* which included degeneration, necrosis, hemorrhage.

Keywords: *Virulence factors, Candida albicans, Intestinal infection.*

Introduction

The fungal infections caused by yeasts has increased over the past several decades. Among them, the imperfect yeast *Candida albicans* and several related *Candida* species are importance as opportunistic pathogens in immuno compromised hosts and may cause life-threatening infections.[1] The ability of *C. albicans* to infect host is supported by a wide range of virulence factors so that *C.albicans* shows various mechanisms that are suggestive of virulence such as ability to form hyphae (germ tube formation and pseudo hyphae), capacity to adhere to mucosal surfaces; produces hydrolytic enzymes; proteinases which hydrolyze peptides and phospholipases which hydrolyze phospholipids [2].*C. albicans* is polyphonic. *C. albicans* grows as ovoid "yeast" cells,when cultured in standard yeast laboratory medium, however, mild environmental changes in temperature and pH can result in a morphological shift to pseudo hyphal growth. When *C. albicans* cells are grown in a medium that closed to the physiological environment of a human host, they grow as "true" hyphae. These structures are often observed in invadingt issue[3-4]. *C. albicans* can cause two types of infections in humans: superficial infections and life-threatening systemic infections[5]. Adherence of *C. albicans* to host epithelial cells is a first step in the infection process, it is essential for colonization and mucosal disease. Colonization of mucosal surfaces is lead to disseminated Candidiasis [6].

Materials and Method

One hundred an of stool samples were taken from patient with intestinal infection during the period of first of June 2015 till the end of April 2016. All samples were inoculated on the suitable culture media including (SDA, MRS, CHROM) agar. All plates were incubated aerobically at 37°C for 24 hr.

Yeast Identification: Single colonies were isolated from primary positive cultures and identified according to the criteria of [7], that were included the following tests: Morphological tests, germ tube test, production of chlamydospore, Gram stain, biochemical test sugar fermentation and assimilation test Chromogenic agar culture, growth at 45°C, API Candida system Diagnostic kit of *Candida*

Virulence Factors Tests:

Detection of protease production: *Candida albicans* isolates were inoculated the medium Trypticase Soya agar, after then the medium was incubated at 37° C for (24-48) hr., positive result it was observed when clear zone around the colony was appeared[8].

Detection of Phospholipase production: Yeast suspension was inoculated the Egg- Yolk agar medium after then the medium was incubated at 37° C for (24-48)hr., positive result it was observed when clear zone around the colony was appeared (8).

Adhesion assay:

1. **Preparation of yeast suspension**

- Apart of yeast culture which growing on SDA in aged 24 hrs was the transferred to test tubes, the test tubes containing SDB and incubated at 30°C for 24 hrs.
- The yeast culture centrifuged at 500 cycle/minute
- The precipitated cells were washed by PBS then centrifuged them and washing three times
- PBS solution was added to precipitate cells until the concentration of cells became 1×10^5 by using heamocytometer[9].

2. **Preparation of epithelial cells suspension**

- By using cotton swabs the epithelial cells which found in buccal cavity endothelial cells were obtained from healthy women after washing their mouth by using sterile normal saline three times, then cotton swabs infused in PBS for 10 minutes
- The solution contain epithelial cells centrifuged at 300 cycle/minute and then washed it with PBS three times
- The PBS was added to precipitate cells to preparation epithelial supernatant with concentration 1×10^4 by using heamocytometer.
- The 0.5ml of candida suspension and 0.5ml of epithelial cells suspension were mixed in test tube and incubated at 37°C for 1h in Shaking incubator 40 rpm.
- The mixture was centrifuged and washing with PBS three times then PBS added to precipitate cells to prepared supernatant.
- The supernatant was centrifuged at 1000 cycle/ minute for 5 minutes, then PBS added to precipitate cells
- Drop of supernatant cells was taken and spread onto clean slid then let to dry and fixed by flame. The percentage of epithelial cells attached by yeast cells were calculated as flow: Adherence percentage = the number of epithelial cells attached by yeast cells/total epithelial cells × 100. (9).

Susceptibility to antifungal agent's tests: It was used for study yeast susceptibility to antifungal agents Disk diffusion method that by transferred part of colony of yeast were grown in SDA by loop to test tube that contained 5 ml of normal saline and count the fungal cells by using Haemocytometerto obtain concentration 1×10^5, and then transferring 0.1 ml of the yeast suspension has been spread on the surface of Emmons medium plate and left to dry. Antibiotic disks have been placed and incubated for 24 hr. at 37°C, Then the zones of inhibition have been measured using a ruler and compared with the zones of inhibition determined by National Committee for Clinical Laboratory standards (NCCLS, 2003) or [10]

1. **Yeast suspension:** *Candida albicans* that contained most virulence factors obtained from a culture on SDB medium and incubated for 24 hrs. at 37 °C, cells were precipitated by centrifuging and the sediment was suspended in normal saline to result $5x10^5$ cell/ml[11].
2. **Intestine Candida inoculation:** Rats were given $5x\ 10^5$cell/ml in drinking water from day 1 to day 15 induce intestine inflammation. Inoculated control rats were oral gavage inoculated with sterile PBS [11].After 24 hr of injection the rats were divided into four groups each group contain 10 rats, group 1,2 and 3 were prepared to study *Candida* infection and group 4 as control group, animal of each group were killed after (5, 10, and15)days.Then the rat scarified after 15 days and removed intestine tissue then fixed with 10% formalin.

Results and Dissection

Isolation and Identification of Candida spp: Out of 100 stool samples,95 isolates of Candida species were isolated from patient with fungal intestinal infection and diagnostic 8 isolates of can did aspp from 30 stool samples as control group. The types and numbers of these isolates, listed in (Table 1), were identified by using the CHRO Magar, Biochemicaltests, API20.The majority of *Candida* species amongst the Candida isolates were

Candida albicans (44.4%) followed by *C. tropicalis*, *C. krusei*, *C. parapsilosis*and *C.glabrata.* The color used to identify the *Candida spp* figure (1). *C. albicans* isolates produced green smooth-type colonies after incubation for 24, 48 and 72 h. the present study found CA to be useful for the identification of non- *C. albicans* species. This agreed with [12] who found that the chromogenic agar medium can be identification of not only *Candida* species but also othere medically important non *Candida* yeast species, based on the development of coloured colonies.[13] Foundthat Chromogenic *Candida* Agar to be the most effective for distinguishing between different *Candida* species. The identification of clinically relevant yeasts by chromogenic medium is highly reliable and can be used as an accurate alternative to conventional identification method[12].

Table 1: Frequency of isolation of important Candida spp.

Types of Candida	Number of Isolates		
	Healthy (%)	FII	%
Candida. albicans	5(62.5)	42	44.2
Candida glabrata	0(0.00)	4	4.2
Candida tropicals	2(25)	20	21.1
Candida parapsilosis	1(12.5)	11	18.9
Candida krusie	0(0.00)	18	11.6
Total	**8 (100)**	**95**	**100**

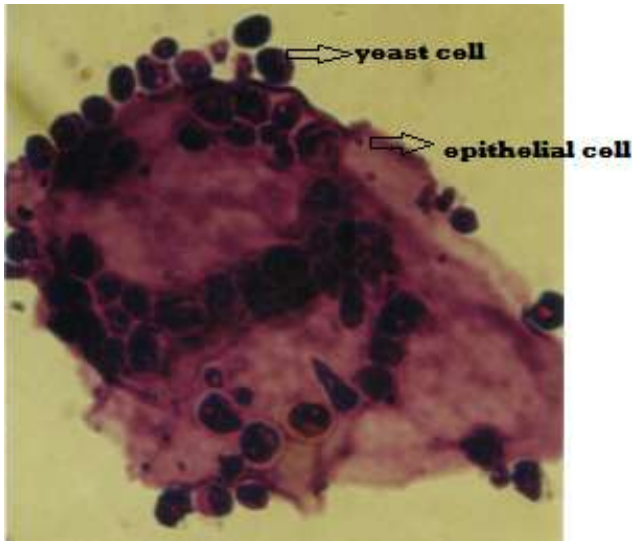

Figure 2: Epithelial cells attached by Candida albicans yeast cells, slid staining by sfranine (Light microscope, 100x).

Resistance of *C.albicans* to antifungal agents: Sensitive test for all isolates of *C.albicans* was done against four antifungal agents (AmphotericineB, Miconazole, Econazole, Nystatine) by cell diffusion method and the results are compared with [10]. *C.albicans* showed the major resistance to Nystatine with percentage 76.19 followed by Econazole 71.43 Miconazole 66.7 and then Amphotericin B 42.86 (Figure,3). The result was close to the result of b[14] who showed that Nystatine had the highest percentage of resistance reached to 57.5% compared with other antifungal agents. The mechanism of resistance will be different depending on the mode of action of antifungal compounds. Cellular and molecular mechanisms supporting resistance against antifungal classes[15-16]. Resistance was probably due to a decrease or lack of ergo sterol content in cell membranes. Mitochondrial dysfunction was one of the possible mechanisms by which azole resistance can occur in *Candida glabrata* and C.*albicans*[17] (Table, 3 A).

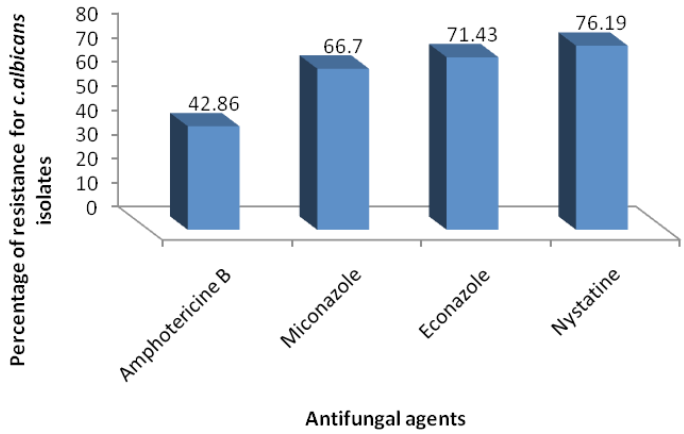

Figure 3: Percentage of antifungal resistance to C.albicans

Production of proteinase and phospholipase enzyme: The results revealed that proteinase enzyme was produced by 20C.albicans isolates (47.62%) out of 42 isolates (Table,3 B). That is similar to the observation[18] who found that proteinase production was also seen in *C.albicans* (82.1%) proteinase activity was detected in *C. albicans,C. tropicalis*, and C. *parapsilosis*[19]. The non-*Candida albicans* produced more proteinase than *C. albicans*. *C. albicans* produced higher levels of phospholipase than non-*Candida albicans* in the study of[19]. The enzyme phospholipase was produced by 18 out of 42 (42.86%) isolates of *C.albicans*. The result is close to the result of [20] who detected Phospholipase activity in 75% (9 out of 12) of the *C. albicans* isolates. Several studies have shown that phospholipase activity is observed only in *C. albicans* strains[21]. However, other researchers described that other *Candida*species such as *C. glabrata*, *C. guilliermondii*, *C. tropicalis*, *C. famata*and *C. inconspicua* secreted smaller amounts of phospholipase[22]. Phospholipase enzyme digests the host cell membrane phospholipid causing cell lysis and changes in the surface features that enhance adherence and consequent infection and hence phospholipase production may be used as one of the parameters to distinguish virulent invasive strains from non-invasive colonies[22].

Table 3: A. Ability of candida albicans to produce proteinase and Phospholipase enzyme. B-Antifungal sensitivity of C.albicans

A. Ability of candida albicans to produce proteinase and Phospholipase enzyme.								
Number	**Amphote-ricin B**	**%**	**Miconazole**	**%**	**Econazole**	**%**	**Nystatine**	**%**
R	18	42.86	28	66.7	30	71.43	32	76.19
S	24	57.14	14	33.3	12	28.57	10	23.81

B. Antifungal sensitivity of C.albicans.				
Types of enzyme	**Positive**	**%**	**Negative**	**%**

Correlation between Protein Intake, Parity and Miscarriage History Anemic Pregnant Women in Sukoharjo Regency, Indonesia with Low Birth Weight Incidence: A Case Control Study

Sufia Fitriani[1], Eti Poncorini Pamungkasari[2], Suminah[3]

[1]Nutrition Postgraduate Student, [2]Public Health Postgraduate Lecturer, [3]Agriculture Department Lecturer, Sebelas Maret University, Surakarta, Indonesia

Abstract

Pregnant women need protein intake during their pregnancy, a lack of protein intake is proven to cause low birth weight (LBW). In addition, the condition of anemia during pregnancy, parity, and miscarriage history in previous pregnancy also increases LBW. This study aims to analyze the correlation between protein intake, parity, and miscarriage history anemic pregnant women in Sukoharjo Regency, Indonesia, with LBW incidence. This study used Case Control design. This research was conducted in the Sukoharjo regency from April until June 2018. The respondents were drawn from the population of anemic pregnant women who had given birth in 2016-2018 in Sukoharjo Regency, with a total of 111 respondents, of which 74 were control groups and groups case of 37 people. Data analyzed used Chi-square test with a significance value of $p < 0.05$. Based on the Chi-square test it was found that there was a significant relationship between protein intake of pregnant women p (0,000) with an odds ratio of 0,063, parity p (0,000) with an odds ratio of 0,119, and miscarriage history in anemic pregnant women p (0,000) with odds ratios at 0,339 with LBW incidence in Sukoharjo Regency, Indonesia.

Keywords: *Protein intake, parity, miscarriage history, anemic pregnant women, low birth weight incidence.*

Introduction

Anemia is one of the health problems in the world especially developing countries, it is estimated that 30% of the world population suffers from anemia. Anemia occurs a lot in the community, especially in pregnant women[1]. Survei Kesehatan Rumah Tangga (SKRT) Indonesia states that the prevalence of anemia in pregnant women is 50,5. The large number of anemia pregnant women is in Sukoharjo Regency, where in 2015 there were 1,773 anemia experienced from a total of 13,419 pregnant women or around 13% of the total number of pregnant women[2].

The incidence of anemia during pregnancy greatly affects the process of fetal growth in the womb and how it will be born later, such as premature birth, low birth weight, and other health conditions[3]. Anemia that occurs during pregnancy can increase the risk of poor pregnancy outcomes or how the condition of the baby is born, such as premature birth, low birth weight, small size for gestational age, fetal death, and anemia in infancy[4].

Women who are pregnant need an increase of protein intake during their pregnancy. Active amino acids will be transported across the placenta to meet the needs of the developing fetus. Protein requirements for pregnant women will increase with increasing

gestational age. Lack of protein intake has been shown to cause low birth weight[5]. Protein is very important and has a high nutritional value because of the amino acids that make it up, where the body must synthesize various proteins and molecules containing nitrogen to support their survival. Each protein is composed of amino acids, according to their patterns and characteristics so they can form a structure. The amino acid will then be absorbed and metabolized in cell[6]. The higher protein intake of pregnant women can prevent LBW[7].

More than 70% cases of LBW in the world due to maternal nutritional intake and environmental factors as external factors, besides that it can also be caused by uterine growth that is not optimal. In developing countries, LBW is one of the biggest causes of rising infant mortality after birth and during its growth period. Infant mortality in the world, recorded 20 times greater in infants who experience low body weight at birth. Babies are said to have a low birth weight if their weight is less than 2,5 kg[8]. Ermawati (2016)'s research showed that there was a relationship between parity and LBW incidence, where the results of the bivariate chi-square analysis showed p (0.01 <0.05)[9]. Impaired fetal growth until the case of fetal death in the last pregnancy is related to the incidence of abortion or a miscarriage history in previous pregnancies experienced by pregnant women. In addition, miscarriage history in previous pregnancy also increases premature birth and LBW[10]. LBW incidence in Indonesia had a percentage of 10,20% in 2013, a percentage of 10% was in Central Java[11] and in 2015 there were 3,90% in Sukoharjo Regency[2], so this study will analyze correlation between protein intake, parity, and miscarriage history anemic pregnant women in Sukoharjo Regency, Indonesia, with low birth weight incidence.

Material and Method

Design of this study used Case Control. Research was conducted in the Sukoharjo Regency in April-June 2018. The sample was taken from the population of anemic pregnant women who had given birth in 2016-2018 in Sukoharjo Regency, then divided into two groups, Control Group was pregnant women who had given birth normal baby and Case Group are who gave birth low birth weight baby.

Total sample is 111 people, control group were 74 respondents and case group were 37 respondents. Sampling method used purposive sampling technique. Data analysis used Chi-square test with a significance value of p <0.05. Authors used several data collection techniques such as the following form filling, where respondents were asked to fill in the forms provided by the author. Like form for pregnant women and informed consent. Then there was an interview to ascertain the correctness of the data filled by respondence to find out parity and miscarriage history based on the MCH Handbook and maternal protein intake during pregnancy with the Semi Qualitative FFQ form.

Findings: Result of the study obtained characteristic data of 111 anemic pregnant women who gave birth in 2016-2018 with criteria for the age of 20-30 years and domiciled in the Sukoharjo regency are:

Table 1. Pregnant Women Characteristic

Characteristic	n (%)	x̄± SD
Age		26,41±3,40

1	12 (10,81)	
Animal Protein Intake (Control)		
Daily	56 (75,68)	
Weekly	8 (10,81)	
Monthly	10 (13,51)	

Characteristic	n (%)	x̄± SD
Animal Protein Intake (Case)		
Daily	2 (5,41)	
Weekly	3 (8,11)	
Monthly	10 (27,03)	
Never	22 (59,46)	

x̄ ± SD = average ± deviation standart, n= sum,% = procentage

About 63 respondents (56.76%) had adequate protein intake and 48 respondents (43.24%) had not adequate. About 56 respondents (75.68%) in the control group consumed high animal protein content (meat, egg, fish, etc) on a daily basis, 8 respondents (10.81%) on a weekly basis, and 10 respondents (13.51%) on a monthly basis during pregnancy. While in the case group there were 2 respondents (5.41%) who consumed high animal protein content on a daily basis, 3 respondents (8.11%) on weekly basis, 10 respondents (27.03%) on mothly basis, and 22 respondents (59.46%) never consumed during pregnancy.

About 49 respondents (44.14%) had their first pregnancy, 36 respondents (32.43%) were second, 16 respondents (14.41%) were third, 6 respondents (5.40%) were fourth, and 4 respondents (3.60%) had more than four times. About 99 respondents (89.19%) have not miscarriage history and 12 respondents (10.81%) had a miscarriage once on their entire pregnancy. There were no respondents who gave birth less months or prematurely.

Based on Chi-square test analysis, it was found that there was a significant correlation between protein intake of anemic pregnant women and LBW incidence indicated by p value (0,000), there was a significant correlation between parity and LBW incidence indicated by p value (0,000), and there was a significant correlation between the miscarriage history and low birth weight incidence indicated by p value (0,000), shown in Table 2 below:

Table 2. Chi-Square Test Correlation Protein Intake, Parity, and Miscarriage History with LBW Incidence in Sukoharjo Regency, Indonesia

Correlation between Variable	Coefficient	P	CI (95%)
Protein Intake with LBW	95,956	0,000	0,016 up to 0,138
Parity with LBW	82,708	0,000	0,049 up to 0,203
Miscarriage History with LBW	31,308	0,000	0,230 up to 0,454

Protein intake of anemic pregnant women and LBW incidence had an odd ratios value of 0,063, which means that anemic pregnant women who consumed less protein intake than Indonesian food consumptions tan dart were risk of 0,063 times greater to giving birth of LBW baby. Parity and LBW incidence have an odd ratios value of 0,119, which means that anemic pregnant women who have greater parity are risk of 0,119 times greater to giving birth LBW baby. Miscarriage history of anemic pregnant women and low birth weight incidence has an odd ratio value of 0,339, which means that anemic pregnant women who have a miscarriage history in a previous pregnancy are risk of 0,339 times greater to giving birth LBW baby, that shown in Table 3 below:

Table 3. Odd Ratio Correlation Protein Intake, Parity, and Miscarriage History with LBW Incidence in Sukoharjo Regency, Indonesia

Correlation between Variable	P	CI (95%)
Protein Intake with LBW	0,063	0,025 up to 0,164
Parity with LBW	0,119	0,062 up to 0,229
Miscarriage History with LBW	0,339	0,248 up to 0,465

Discussion

Between protein intake of anemic pregnant women with LBW incidence has a significant correlation, which means that the greater protein intake affects the baby's birth weight positively. Protein is needed by mothers to fulfill most needs in fetal formation and growth. Protein is the most needed source by the fetus, at 42%, with details of the need for 17% for uterine weight, 14% blood, 10% placenta, and other tissues at 8%[12].

Protein is the one of nutrition that most important for pregnant women during their pregnancy, because protein contributes an important role in fetal growth, placental development, amniotic fluid production, increasing maternal blood volume, and increasing maternal tissue tissueweight. Protein requirements for pregnant women will increase with increasing gestational age. Lack of protein intake is proven to cause LBW[13].

Protein and amino acid components are very useful for improving the nutritional status of pregnant women, especially when mothers enter gestational age in Trimester III, because at that time the fetus experiences growth very quickly so it requires macro nutrient intake, such as protein and energy to increase the value positive fetal growth, and will make the baby born with good physical condition[14]. Protein intake is very helpful in

absorbing iron, because proteins cooperate with protein chains to transport electrons which play a role in energy metabolism[15]. Someone needs to increase iron intake or foods that can help absorb iron to avoid or cure anaemia[16].

Based on the results of interviews with respondents through the FFQ-SQ form, it was found that 22 out of 37 respondents in case group rarely or never consuming foods containing animal protein during their pregnancy. While those who routinely consume foods containing animal protein on a daily basis, 56 of the 74 respondents in the control group. Pregnant women who lack the intake of animal protein (such as meat, milk and eggs), folic acid, and iron are at greater risk of giving birth LBW baby[17].

Dhises consumption contain animal protein are correlate to LBW incidence. This is due to the lack of iron which is abundant in animal protein, such as meat and fish, even though iron is very important for the health of pregnant women and fetal growth in the womb. Consumption of foods that do not have a variety of nutrients in one dish will cause an imbalance in the nutritional intake of pregnant women and fetuses[18].

Factors that cause anaemia is low iron intake[16]. Iron deficiency anemia in pregnant women can affect fetal/infant growth during pregnancy and afterwards[19]. Pregnant women with hemoglobin less than 11 gm/dL were significantly associated with the LBW[20]. The number of low birth weight babies (64%) was statistically significantly higher ($p < 0.001$) in the anemia group than the non-anemia group (10%)[21]. Anemic pregnant women have a higher risk of giving birth to LBW babies than non-anemic, which is 1,25 times[22]. Anemia during pregnancy has 1,51 times higher risk of giving birth to a LBW baby with $P < 0.01$[23].

Between parity and LBW incidence have significant correlation. Where one of the factors that can cause LBW is parity [24]. High parity is when a woman giving birth fourth or more times, that can increase the risk of LBW in a future pregnancy. High parity can cause a serious health problems in both mothers and baby. Closer distance frequency on pregnancy, also can cause uterus more elastic, because uterus does not contract completely so that it causes bleeding after giving birth and giving birth to a LBW baby[25]. Astriana (2017)'s research found that there was a significant correlation between parity and anemia in pregnant women with p value (0.023)[26].

Between miscarriage history of anemic pregnant women and LBW incidence there is a significant correlation. Impaired fetal growth until the case of fetal death in the last pregnancy is related to the incidence of abortion or a miscarriage history in previous pregnancies experienced by pregnant women. In addition, a miscarriage history in a previous pregnancy also increases the occurrence of preterm birth and LBW[10]. Woman who have never experienced abortion or miscarriage have a lower risk of giving birth to LBW babies compared to woman who have an abortion or miscarriage on their previous pregnancies[27]. Wardiyah (2017)'s reasearch found a significant relationship between miscarriage history and anaemia incidence in pregnant women with p value (0,000)[28].

Conclusion

There was a significant correlation between protein intake, parity, and miscarriage history of anemic pregnant women with LBW incidence in Sukoharjo Regency Indonesia. An important suggestion for pregnant women and families, especially in Sukoharjo Regency, is to havea good diet of protein during pregnancy, especially animal protein, to prevent anemia and giving birth LBW baby. In addition, it is also important to plan and maintain the pregnancy, so distance of pregnancy isn't close and also can't cause miscarriage incidence during pregnancy.

Changes in Community Behavior and Keeping the Quality of Drinking Water Based Ranas Models

Sugeng Mashudi[1], Ah. Yusuf[2], Rika Subarniati Triyoga[3]

[1]Doctoral Program Faculty of Public Health Universitas Airlangga Surabaya Indonesia, Faculty of Health Sciences Universitas Muhamma, Diyah Ponorogo East Java Indonesia, [2]Faculty of Nursing Sciences, [3]Faculty of Public Health Universitas Airlangga Surabaya East Java Indonesia

Abstract

Water treatment is an effort to improve the quality of drinking water. The use of Moringa Oliefera can be the first choice besides being safer and easier to obtain in the surrounding environment. However, to improve the ability of water treatment the community needs to consider various factors that influence behaviour change. Empowerment as an intervention concept used by researchers to bring up new behaviours in the management of drinking water treatment. This study aims to explain the model of water treatment to improve the quality of drinking water.

Empowerment will influence various factors that will change people's behaviour. RANAS (risk, attitudes, norms, abilities, and self-regulation) is a formation to create new behaviour based on five blocks related to sanitation and water management. RANAS is based on the psychological theory of health, which postulates that for the formation of new habitual behaviour, five blocks of new behavioural factors include: risk factors, attitudes, normative factors, ability factors, and self-regulation. One of the improvements in water quality can be done by giving Moringa Olivera. New behavioural improvements in water and sanitation management are expected to reduce diarrheal disease in the community.

Keywords: *Water treatment, empowerment, Nursing, RANAS, community.*

Introduction

Pudak Kulon village is one of the villages in Pudak Subdistrict, Ponorogo Regency which is in the highlands and has abundant water resources and good quality[1]. Including Desa Bekring, the area around the highlands that has a fairly good quality water source. Student observations of the 2008 Ners Professional practice show that: 1) the majority of public drinking water comes from natural springs; 2) storage and processing of water for consumption is not fully in accordance with the standard of health; 3) Bekiring Village has not fully implemented Open Defecation Facilities (ODF); 4) the behaviour of the people has not been able to maintain the sanitation of river flows that originate from natural springs[2]. Various risks of health problems can arise, one of which is diarrhoea. The source of drinking water, the distance of the spring to the nearest faeces shelter, the use of defecation facilities, and the type of toilet affect the number of diarrhoea events[3]. Improving the quality of drinking water is one of the main focuses in many countries in the world[3]. The empowerment method is developing a successful intervention strategy for promoting behaviors related to health and water sanitation. However, until now the right method of empowerment is unclear.

Water sources of Indonesian people use protected dug wells (29.2%), pumping wells (24.1%), and tap water (19.7%) that are used to cover all household needs, including drinking. Based on the residence of the people who live in urban areas, they use drill/pump wells (32.9%) and tap water (28.6%), while in rural areas more use of dug wells are protected (32.7%). The use of water per person per day in Indonesia averages 50 - 99.9% litres (28.3%) and between 100-3000 litres (40%) for overall needs. While 273 million Indonesian people consume 8 glasses per day, equivalent to 2 litres of mineral water for drinking. Meeting the needs of mineral water consumption comes from wells[4]. Drinking water

sanitation that is not properly maintained can cause the risk of diarrheal disease. Diarrhoea sufferers in East Java from year to year show more than 500,000 sufferers.

The 9th SDGs: Maintain biodiversity and ensure good management of water, oceans, forests and natural resources. Maintaining the preservation of water resources as stated in the Declaration by the United Nations (UN) that water is a human right; that is to say, every human being on this earth has the same basic rights to water use. In Indonesia, community rights to water use are guaranteed through the 194 Constitution of the Republic of Indonesia, and Law No. 7 of 2004 concerning Water Resources.

The method of community empowerment is an effort to improve people's behaviour, we believe that we can help minimize water pollution to maintain and preserve the quality of water resources. Maintenance of water quality is important to maintain human survival and the preservation of living things in the world. Through the method of community empowerment, it will be able to increase the attention and innovation of the management of quality drinking water.

Method

Writing this scientific paper uses the literature review method. Searches are made, among others, on national journal articles and international journals. National Journal articles come from three main website addresses, namely: a) Journalumpo.co.id; b) google scholar, and c) neliti.com published from 2008 to 2018. The keywords used in this literature review are mineral water, quality, water requirements. In order to strengthen the theory review written, international journals sourced from PUBMED with "RANAS approach" and "quality water Indonesian" keywords.

Concept:

1. RANAS Model:

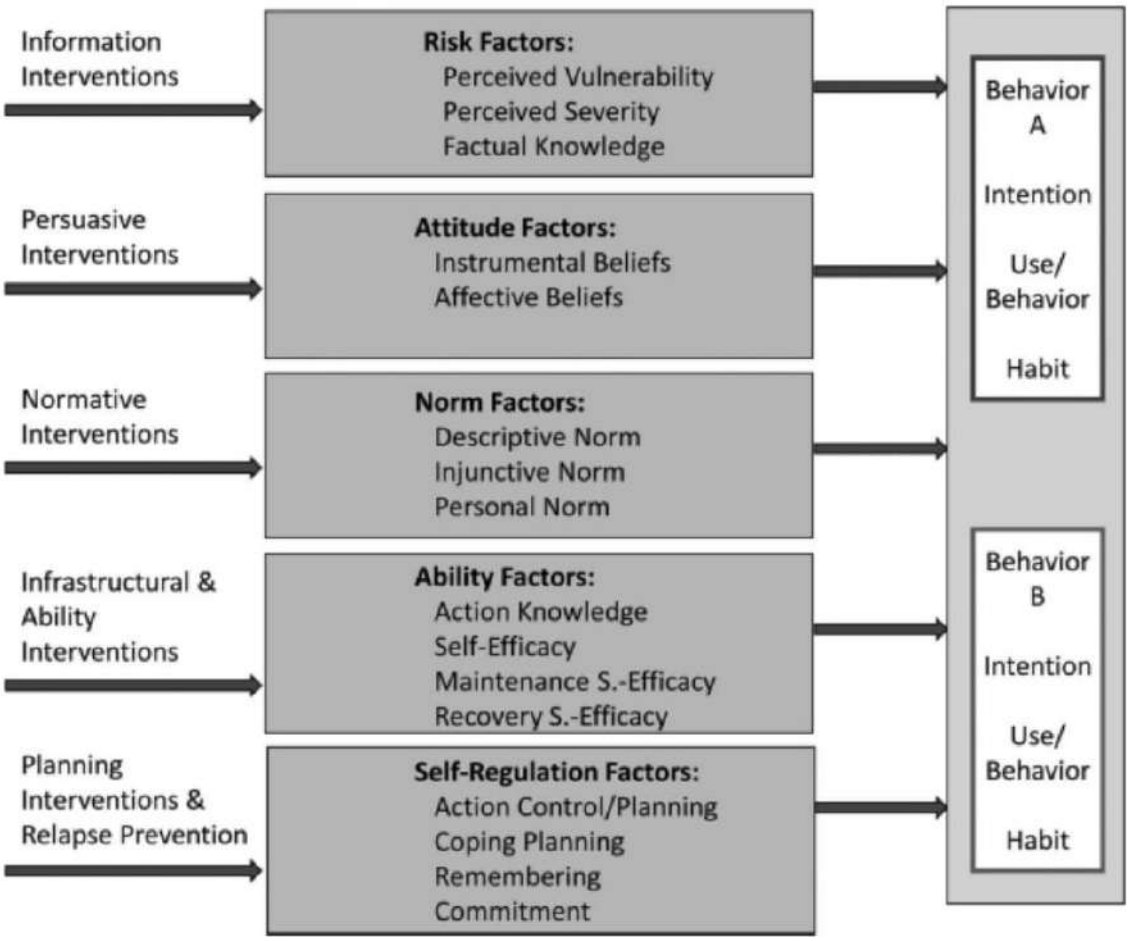

Figure 1. RANAS model of behaviour change (Mosler, 2012)

RANAS model is a formation for generating new behaviours based on five blocks related to sanitation and water management[5]. The RANAS component models are risk, attitudes, norms, abilities, and self-regulation) The proposed model is divided into four different components: (1) block factors, (2) behavioural factors, (3) target behaviour, and (4) behaviour change interventions in accordance with factor blocks (figure 1).

A. Risk Factor: RANAS Model influences behaviour in water management based on the block of risk perception factors through intervention in the form of providing information. The right time to provide information (when given with information), when the person has formed an understanding of health threats. Risk perception can be influenced by personalized risk messages, which focus on the effects of cumulative risk, and by presenting qualitative and quantitative examples[6]. Risk perceptions can also be changed by displaying risk information based on scenarios[6]. Community knowledge can be improved by presenting information about the circumstances and the possibility of contracting the disease[6].

B. Attitudes Factor: Belief can be changed with persuasive interventions, strong arguments or peripheral instructions (around) as explained in the Elaboration Likelihood Model[7]. A persuasive argument is an argument that uses causal explanations; explain functionality; present novels and important information; and high positive expectation values. Instructions for convincing peripherals are competence, sympathy, credibility, well-known, source publicity, and length and number of message arguments[7]. Affective beliefs (feelings) can also be changed through persuasive interventions, but this requires effective persuasion - presenting healthy behavioural performance as happy, or attaching reluctance (eg disgust) to unhealthy behaviour[7].

C. Norm Factor: Normative messages in the form of correct commands about behaviour that are not approved are effective[8]. This unfortunate behaviour can often be less effective because it emphasizes descriptive norms by stating what most people do. Conversely, descriptive norms can be changed by highlighting behavioural norms that are still rare but desirable, or by reducing 'social pressure' to engage in unfavourable behaviour by referring to beneficial injunctive norms[8]. Descriptive norms can be changed by public commitment by showing that there are people who carry out new behaviours. Regret, individuals are encouraged to imagine how they will feel after they behave in ways that are not consistent with their personal norms, can be reinforced by desirable behaviour[5].

D. Ability Factor: The ability to help individuals gain confidence in their ability to perform a behaviour. Resources in the form of finance or support in the form of goods can be given directly to individuals or combined to the requirement that individuals must try to access resources. In addition, help from neighbors, friends, acquaintances, or relatives can support people with material assistance, knowledge of actions, or social[9]. Modeling (seeing someone doing behavior) and strengthening (seeing someone who is valued for behavior) promotes the desired behaviour; individuals become aware of their own competencies and compare their achievements to others[9]. Knowledge of action (certain skills) is enhanced by the transfer of knowledge (education). Self-efficacy can be enhanced by guided training, demonstration of skills, instruction, and feedback[10]. Maintenance (coping) of self-efficacy can be improved by identifying barriers and planning solutions forbehaviour change barriers[11]. Overcoming recurrence will improve recovery self-efficacy. Individuals can overcome it by relapse by identifying risky situations where they may fall back to old behaviors, plan coping responses, and practice these responses until they become automatic[11].

E. Self Regulation: Self-regulation is the ability of a person to change his behaviour [18]. Self-regulation arises when someone motivates and guides their actions proactively according to their expectations. Planning interventions help individuals translate goals into preventive actions, avoids bad habits that inhibit failure[6]. The ability to prevent recurrence can be improved by health education[11]. Individuals can avoid goals that are contrary to considering possible obstacles[11].

A Relevant Concept:

A. Understanding of Water: Water in Biology and Chemistry (H2O Compounds)-water is a chemical compound that is the result of a bond of element hydrogen (H2) which is compounded with an element of oxygen (O) in this case forming H2O compounds. Drinking water is water whose quality meets health requirements and can be drunk directly[12].

While quality drinking water is the following incision 1) Physical requirements, clear temperature (colourless), tasteless, below the temperature of the water outside; 2) Bacteriological requirements, must be free of all bacteria, especially pathogenic bacteria. The way to drink water is contaminated by pathogenic bacteria, by examining water samples. And if there are less than 4 checks, Escherichia coli bacteria, the water there meets health requirements; 3) Chemical requirements, lack or excess of one chemical in water, will cause physiological disturbances in humans.

Escherichia coli bacteria is an indicator of water pollution which can cause diseases of the digestive tract causing diarrhoea. Therefore quality mineral water is found from healthy wells that have the following conditions: 1. Location conditions or distance (note the distance of wells and latrines, wastewater excavation holes and other sources of excrement).

Government Regulation No.82 of 2001 concerning water quality which includes physical, chemical and biological quality standards, namely: (1) Physical Quality, in determining the physical quality of water seen from general parameters which include colour, smell, taste, and turbidity. The smell and taste are usually caused by certain chemicals and bacteria. That "Smell and taste can be produced by the presence of microorganisms in water such as algae and by the presence of gases such as H_2S which are formed under anaerobic conditions and by the presence of certain organic compounds"[19]. (2) Chemical quality, chemical water quality including pH value, chemical compound content in water, residual or residual content, for example, pesticide residues, detergents, toxin or toxic substances, and chemical reactions, which can negatively affect health and other activities related to the use of water. (3) Biological Quality, biological quality is usually most widely used to determine water quality through its microbiological parameters. For example, the presence of microbes, especially coli bacteria.

Discussion

Most of the dug wells and half of the refill bottled water in slums in Indonesia are contaminated with faeces. Faecal contamination is caused by dug wells and springs because the majority of households do not use *septic tanks* and dispose of human waste directly into the river[13]**.** Similar conditions also occur in the community of Bekiring Ponorogo Village. So that the quality of drinking water has decreased.

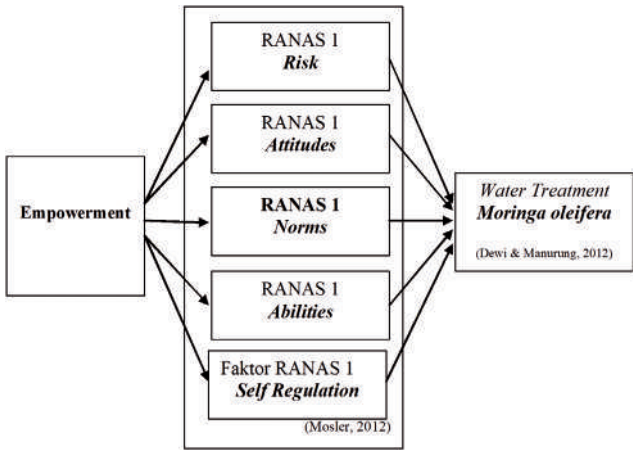

Figure 2. Treatment water model with RANAS-based MODEL

Empowerment as a way of changing people's behaviour preserve and maintain the water quality min um for the continuity and sustainability of life in the neighbourhood specific Retained Earnings illustrated in Figure 2.

Empowerment will affect various factors that will change people's behaviour. RANAS (*risk, attitudes, norms, abilities, and self-regulation*) is a formation for generating new behaviours based on five blocks related to sanitation and water management. RANAS is compiled based on psychological health theory, which postulates that for the formation of new habitual behavior, five blocks of new behavioral factors including : risk factors (*risk*), attitudinal factors (*attitudes*), normative factors (*Norm*), factor of capacity *(ability),* and the factor of self-regulation *(self-regulation)*[6]. One of the improvements in water quality can be done by giving *Moringa Olivera*[14] . New behavioural improvements in water and sanitation management are expected to reduce diarrheal disease in the community.

Empowerment in the *water treatment* model is mediated by *risk* factors*, attitudes, norms, abilities, and self-regulation*. The *water treatment* model initiated by researchers is similar to research[5]. Impact of the campaign on water treatment mediated through differences in health knowledge *(risk),* changes in the norm, and self-efficacy beliefs *(self-regulation).* The findings of this study indicate that water treatment behavior can be successfully promoted using health psychology theory. However, this research provides opportunities for improvement in the design and implementation of campaigns. therefore empowerment is expected to improve the weaknesses of this research.

Treatment water besides using *Moringa oliefera* can be done using the chlorination method and with the *boiling* method. *Moringa oliefera* is the first choice because it comes from natural ingredients and is easier to *obtain*. The results showed that the use of Air RahMad (chlorination) had a lower E Coli content and the incidence of diarrhoea was less frequent than people who used the boiling method[15]. The *Back to Nature* slogan will increase the use of natural ingredients (*Moringa oliefera*) compared to chemicals (chlorination). However, the use of automatic chlorination technology in the future will improve the quality of drinking water[16].

Research on improving drinking water quality by considering knowledge factors, attitudes and behaviours and health risks will improve management of drinking water management in the future[17]. One of the basic human needs for future research. In addition, behavioural research in managing the quality of drinking water is still very rare.

Conclusion and Recommendations

Cleanliness of drinking water that does not conform to standards will threaten health. The community empowerment approach will facilitate health workers with the community and related sectors to change the behaviour of improving the quality of drinking water.

Nurses need to apply the appropriate method of empowerment approach to the Bering Ponorogo village community to improve the drinking water storage and management behaviour so that the risk of diarrheal disease can be minimized.

Conflict of Interest Statement: The authors declare that there is no conflict of interest.

Breast Cancer and Hormonal Level Changes

Suhad Kahdum Ali

Professor, Hammurabi Medical College, University of Babylon

Abstract

Purpose: Study of Surgical procedure used in treating Breast Cancers–Mastectomy, Bilateral Mastectomy and Adjuvant procedures and the rise in the blood hormonal levels of the breast cancer patients. The purpose of the study is to understand breast cancer and to delve into various factors that increase the risk of contracting breast cancer. It describes various surgical procedures like mastectomy, bilateral mastectomy and adjuvant procedures. It also describes the various serums that body secretes that can cause cancer. It sees the genetic factors and other risk factors that can cause cancer.

Method: It studied 30 breast cancer cases from private Clinicat Babylon. Only those patients who had undergone mastectomy or had tumors removed from breast were considered. These patients were in the age group of 25 to 65. Statistical data was arrived at by questionnaires and interviews with surgeons, nurses and patients. The paper also describes changes in the blood hormones of cancer patients. Complete blood tests were done on 30 patients that included the measurement of various serum and blood plasma cells such as Estrogen hormone, Progesterone hormone (Prog. H), Serum total cholesterol, Serum triglyceride, Serum HDL-cholesterol, the concentration of LDL cholesterol and other proteins in serum as IgG, IgM, and IgA.

Interpretations: Cancer if detected at a young age need not lead to mastectomy, but surgically removing tumors will suffice. As the age progresses the incidence of mastectomy and bilateral mastectomy also increases. The blood hormones of cancer patients showed abnormal readings and a conclusion can be drawn that BC can be detected from the abnormal levels of blood hormones.

Keywords: *Blood hormones, breast cancer, tumors.*

Introduction

According to Cancer.Net (2019)[2 & 3] Breast Cancer kills around 42000 women and at least 500 men every year. The number of women who are diagnosed for invasive breast cancer is approximately 268,600 in United States alone and 62000 women have in situ breast cancer. Though there have been many innovations in the medical science, women and to a lesser degree men continue to die or suffer because of this cancer.

According to Holst□Hansson, Idvall, Bolmsjö & Wennick, (2018)[12] say that cancer is gaining attention in Iraq as a significant health problem, this is because there is an increase in the cases of incidence as well mortality. Iraqi Cancer Board also echoes the same concerns. The reasons for the increase in cancer cases is attributed to many factors like improvement of case detection, early detection programs, rising awareness amongst the population and better registration of cases.

Fisher et al (2014)[9] opine that breast cancer (BC) is kind of malignancy that appears in the tissues of the breast. It occurs in both pre-menopausal and post-menopausal women. BC forms in those tissues of the breast that usually carry milk and milk producing glands called lobules. Females with a history of breast cancer are at a risk having breast cancer too. Fisher et al (2014)[9]

Malvia, Bagadi, Dubey & Saxena (2017)[8] opine that breast cancer (BC) starts with a development of tumor in the breast. There are 2 types' tumors benign and malignant.

Malignant tumors are aggressive and cancerous. In case malignancy is suspected the doctor will perform biopsy to understand the aggressiveness and severity of tumor. Coles et al (2017)[13]

Metastatic cancer happens when the cancerous cells of the malignant tumor spread to the other parts of the body via lymph system to form secondary tumors.

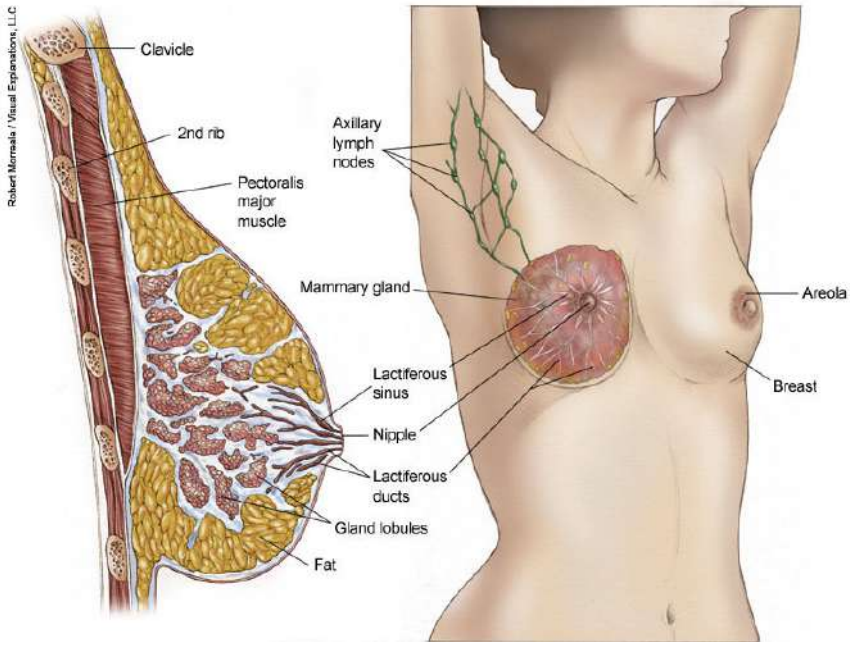

Fig. 1: American Society of Clinical Oncology.

Anampa, Makower & Sparano (2015)[12] say that there is only one cure for advanced breast that is mastectomy, if cancer is detected earlier then only the tumor can be removed with some healthy tissue surrounding it called margin.

Cancer Detection: Hosseini, et al (2016)[13] says that detection of cancer is very difficult as normal hormones and chemicals that are useful to the healthy body go on to fuel cancer cells also. Some of them are listed below.

Estrogen: Estrogen which is essential for growth and normal development of breast and its tissues is known to cause cancer if there is a higher exposure of the hormone. 2 types of cancers can be formed when there is a high exposure to estrogen as genotoxin and mitogen. Samavat, & Kurzer, (2015)[11]

Lipids: It is believed that the changes in the lipid profile also causes cancer. Lipids have an important role in the maintenance of the cell integrity. It is hypothesized that when there are changes in the lipoprotein levels and plasma lipid there is malignant proliferation in the tissues of the breast. It has been further postulated that because of concentration in serum lipid in cancer patients can bring about increase production of tumor necrosis factor. Garg, et al (2016)[11]

HER_2:

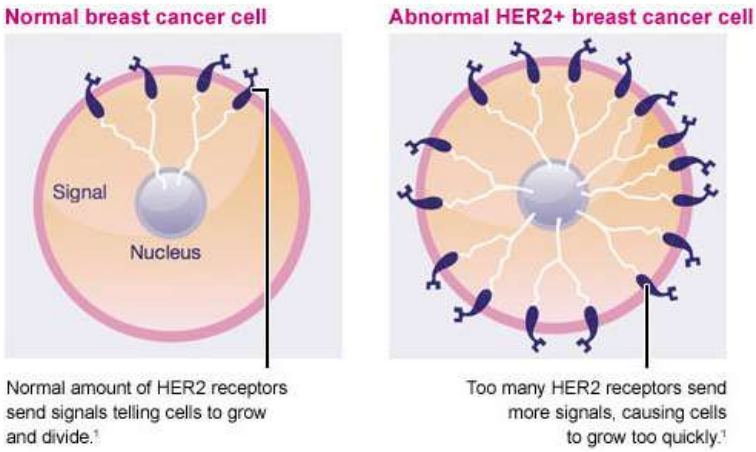

Fig 2. HER_2 (Source Cancer Research UK)

In fig 2. Shown HER_2/neu gene is a growth hormone. Healthy HER_2 receptors are proteins which are put in use when the breast cell grows, divides and in repairs. It was observed that in at least 25% of breast cancer patients this gene is not functioning properly. It makes excessive copies of itself in a process known as "HER_2 gene amplification." These extra cells then make the cells to make many HER_2 receptors. This is called "HER_2 protein over expression." It is because of these processes that breast cells divide and grow in an uncontrollable fashion. Katayama et al (2019)[14]

The Lymph System:

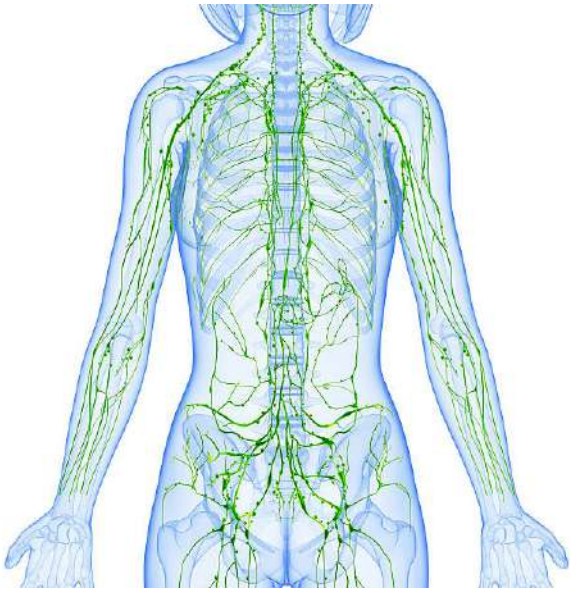

Fig 3. The Lymph Systems
(Source cancer research UK.)

The network of lymph (fig. 3) nodes and lymph vessels run throughout the body and are part of the immune system. Just as the circulatory system of blood which distributes elements across the body. This system transports fluids and disease fighting cells.

Cancer cells typically grown in the ducts, lobules and the lobes within the lymph network. Katayama et al (2019)[14]

Genetic Factors: Lahart, Metsios, Nevill, & Carmichael, (2015)[15] say that the following genetic factors are associated with BC

- **Gender:** *Female*
- **Age:** 55.
- **Race:** Caucasian women are more vulnerable to BC than any other race.
- **Family History and Genetic Factors:** If there has been a case of cancer (either breast or ovarian) in the immediate family such mother, sister then the chances of having cancer increase. If the relative had cancer before 50 then the risk increases.
- **Personal Health History:** If the patient has been diagnosed with BC in one breast, then the chances of having BC in the other breast increases in the future. The risk also increases if abnormal breast cells have been found before (such as lobular carcinoma in situ (LCIS), atypical hyperplasia, or ductal carcinoma in situ (DCIS)).
- **Menstrual and Reproductive History:** Late menopause (after 55), Early menstruation (before age 12) having the first child at an older age, or if a women has never been pregnant also increases the risk for breast cancer.
- **Certain Genome Changes:** Mutations in some genes, like BRCA1 and BRCA2, can increase the risk of breast cancer. This is determined through a genetic test, which patients can consider taking if they have a family history of BC. Those who have these mutations may pass them to their children.
- **Dense Breast Tissue:** Dense breast tissue also increases risk for BC. It also makes the lumps harder to detect.
- Radiation therapy on the chest: If the woman has been given radiation therapy to the chest before the age of 30 then there is risk of contracting BC.
- Combined Hormone Replacement Therapy (HRT): Having combined hormone replacement therapy, as prescribed for menopause, increases the risk for BC and It also increases the risk that the cancer will be difficult to detect in the earlier stages.

Cancer Treatment: Rheinbay et al (2017)[9] opines in case there is BC is found then the surgery is the only effective treatment. In case the cancer is detected in early stages then lumpectomy is done where only the tumour is removed and the rest of the breast is conserved.

Decision to perform mastectomy (removal of the breast) or lumpectomy (removal of the tumour) is done with through consultation and permission of the patient.

Nowadays there are better method to perform mastectomy which preserve the breast skin and allows for a natural breast appearance following the surgery.

When do doctors advise mastectomy?:

- In case of multiple tumours in the breast
- There are widespread or malignant-appearing micro calcifications (calcium deposits) that have been identified as cancerous after biopsy.
- In case of recurrence of breast cancer after radiation therapy
- Even after undergoing lumpectomy; cancer is found on the edges of the operated area.
- The size of the tumour is large compared to the size of the breast
- In case of pregnancy where radiation will harm the fetus. Coles et al (2017)[13]

Material and Method

A cross-sectional of 30 female breast cancer patients both young and old from hospitals and daily clinics in Babylon province were studied. They were presented with questionnaires and the physicians and nurses were interviewed. Their ages varied from 25 to 65 as shown in the table and pie chart below.

Table 1 and pie chart about age of patients

Age	No. of Patients
25-35	1
36-45	5
46-55	11
56-65	13
Gender	All Females

Surgeries and Adjuvant procedures performed on the study group

Table 2.

Age	Mastectomy of single breast	Bilateral Mastectomy	Removal of tumor	Chemotherapy	Radiation Therapy
25- 35	0	0	1	1	0
36-45	4	0	1	1	1
46-55	7	3	1	11	11
56-65	8	5	0	13	13

Discussion on Surgical Procedures

The female aged 25-35 had tumour which was surgically removed, biopsy showed it was malignant in nature and so chemotherapy was prescribed to her. Hosseini et al (2016)[13]

Tumour also removed from 1 patient in the age group 36-45, but radiation was used before surgery to reduce the size of the tumour. Holst□Hansson Idvall, Bolmsjö, & Wennick, (2018) [12]

Tumour was also removed from the age group 46-55. All the patients had to undergo adjuvant procedures to prevent the disease from appearing again. Holst□ Hansson Idvall, Bolmsjö, & Wennick, (2018) [12]

19 females had to undergo single mastectomy and also adjuvant therapy and 8 patients had to undergo bilateral mastectomy and adjuvant procedures to arrest the spread and re-occurrence of the disease.

Study of the blood samples for serum/hormonal imbalance

Blood contains different types of cells in definite proportions in normal human beings, however in case of diseases or infections these proportions change dramatically. The same holds true for cancer patients also. Therefore the hematological and bio-chemical parameters of these 30 women were also studied.

Findings:

Table 3 shows the results of hematological parameters received from 30 BC patients

Test	Patient
ESR mm/hr	17.355 ±6.154*
WBC X103/μL	4.509 ±0.8839*
RBC x106/μL	4.372 ±0.7995*
Packed cell volume (%)	35.206 ±4.105*
Platelets X103/μL	180.27 ±32.158*
Lymphocytes (%)	46.009 ±4.7399*

*Values expressed as Mean +/-SD P value <0.05 was considered as significant.

The mean red blood cell count, packed cell volume, platelets count, white blood cell count, and lymphocytes are lower than what is observed in healthy women. Whereas the mean ESR values of the breast cancer patients were considerably higher than normal healthy women.

Table 4: Biochemical parameters of 30 female BC patients

Test	Patients
Est. H (Pg/ml)	92.286±20.407
Prog. H. (ng/ml)	2.347±0.850
Cholesterol(mg/dl)	182.14±16.868
Triglyceride(mg/dl)	120.77±10.152
H.D.L. (mg/dL)	55.148±20.486
L.D.L. (mg/dl)	74.605±13.050
IgA (g/L)	3.550±0.411
IgM (g/L)	1.685±0.351
IgG (g/L)	18.478±1.834

*Values expressed as Mean +/-SD P value <0.05 was considered as significant.

Table 3 shows the biochemical profile (Mean ±SD) in women with breast cancer. The data indicated higher levels of estrogen and progesterone than normal healthy women. Also total cholesterol, triglycerides level HDL were at higher than normal healthy levels. LDL levels were lower than those found in healthy women. Immunoglobulin's IgG, IgA and IgM were also at higher than normal levels.

Discussion on blood tests: Physicians routinely use complete blood picture in diagnosing various diseases and infections like anemia, hemorrhagic states, cancers, allergic disorders and immunity disorders. Lahart, Metsios Nevill, & Carmichael (2015)[15] In this study the low hematocrit levels show that cancer patients are suffer from anemia. This observation is in sync with other studies of similar nature.

With regards to age BC patients above the age 40 have significant reduction in RBC count and hematocrit level than healthy individuals of the same age. Medicinal Chemistry[12] opine that this could be because these parameters tend to reduce after the 5th decade or it could be that because of cancer also causes immune suppression and bone marrow suppression. It is also found that BC tends to be more aggressive in the younger patients. The low blood counts can also be attributed to side effect of chemotherapies that patients had to undergo as post-operative procedure. Chemotherapy also reduces the lymphocyte and it is considered as an adverse effect of this procedure Anampa, Makower, & Sparano (2015)[12]

There is a significant increase serum estrogen in patients of breast cancer women than normal healthy women. These results are also in sync to those obtained by other investigators.

According to Rheinbay et al (2017)[9] It can be concluded that increased estrogen levels is a good marker in for increasing the risk factor of BC. Estrogen levels play an important role in the development of BC.

The results of table 3 show that there is noticeable increase in progesterone hormone in BC women compared to healthy women. Other investigators have also reported the same results. It is believed that increase in ovarian secretion of progesterone hormone could lead to BC. There is a marked increase in serum cholesterol in BC women than normal levels. However this may be because there is positive correlation between increased cholesterol levels and menopausal status. Rheinbay et al (2017)[9] There is an increase in serum Triglyceride in the BC patients, but this could be attributed to the intake of tamoxifen, which is prescribed for patients having BC Rheinbay et al (2017)[9]

Finally it was observed that there were marked differences in BC women and healthy women in serum immunoglobulin IgA, IgG. However the results also showed that there was marked difference in serum immunoglobulin IgM. Some investigations have reported that the advancing metastatic BC is associated with high serum immunoglobulin levels of IgG and IgA, other investigators believe that a defense reaction against increasing tumor load or the secretion of immunoglobulin by the tumor Garg, et al (2016)[11]

Conclusion

This study shows that all these women had contracted with breast cancer which was in different stages. All had undergone surgery as described above and also adjuvant procedures to arrest the spread of the disease.

Further blood samples were taken from the study group it was found that anemia; thrombocytopenia and leucopenia were usual basic features to be found in breast cancer patients.

This study also measured various biochemical factors like cholesterol, level of estrogen, progesterone

hormones, lipoproteins (HDL, LDL), triglycerides and some immunoglobulin's (IgG, IgA and IgM). The results show that there was a huge increase in cholesterol, level of estrogen, progesterone hormones, lipoproteins (HDL, LDL), triglycerides and high levels were also recorded in immunoglobulin's (IgG, IgA and IgM).

Conflict of Interest: The author would like to state that there was no conflict of interest whatsoever.

Ethical Clearance: The author has obtained ethical clearance from the committee.

Source of Funding: The author has used her own funds to do this research.

Socio-demographic Characteristics and Caregiver's Quality of Life Associated with Suspected Developmental Delay among Early Childhood in Northeast of Thailand

Supattra Boonjeam[1], Rajda Chaichit[2], Benja Muktabhant[3], Suwit Udompanich[4]

[1]Student of Doctoral Program of Public Health, Faculty of Public Health, Khon Kaen University, [2]Department of Preventive Dentistry, Faculty of Dentistry, Khon Kaen University, [3]Deparment of Health Administration, Health Promotion, and Nutrition, Faculty of Public Health, Khon Kaen University, [4]Faculty of dentistry, Phayao University, Thailand

Abstract

The first 5 years was possibly the most critical and extremely important in child development. Development problem of Thai children are not improve to standard.

This research aimed to analyze about association between Socio-demographic Characteristics, Caregiver's quality of life and suspected developmental delay among early childhood. A Cross-sectional analytical study, there are 1,168 sampling groups; caregivers 584 persons, early childhood 584 persons, between April to May 2019. The multivariable analysis was used by multiple logistic regression.

Early childhood aged average 36.1 months, males are 53.1%, and with suspected developmental delay 48.1% . There are 4 factors which are associated with the suspected developmental delay; 1) monthly self-income of caregiver (AOR = 1.9; 95% CI: 1.24 to 2.87; p = 0.003) 2) gander (AOR = 1.9; 95% CI: 1.33 to 2.64; p<0.001) 3) age range (AOR = 2.5; 95% CI: 1.54 to 4.09; p<0.001) and 4) quality of life about social relationship (AOR = 1.6; 95% CI: 1.23 to 2.01; p = 0.020).

Prevalence of suspected developmental delay is quite high, Socio-demographic Characteristics and caregiver's quality of life has influenced to the early childhood development.

Keywords*: Early childhood, Developmental, Quality of life.*

Introduction

Children are important resource in society; therefore, the children should have efficient development so that they can grow up to be good children learn qualities that will help them become happy, and be able to create and do anything benefit to our society in the future. The children are significant to our county which we should invest them to get high number of returns around 6.7-17.6 times[1].

In the first five years of life, it's the most important time at any other time in their lives; their developments will go faster including their brain develop more and faster around 80% comparing to adults. Besides, it's also related to the foundation for children developments and their quality of life. Window of opportunity points us that if we evaluate or notice their delayed development in early before age of 6 years, that can stimulate their development and help them to be their normal developments[2].

A report from World Health Organization found out that the children all around the world 15-20%, their development are not appropriate[3]. In addition, department of health, ministry of public health 2017 has observed that children normal developments for

early children in Thailand are in their rate at 70%, the children in Northeast of Thailand is at only 50-60% [4]. Regarding to family structure, some parents move out from rural area to city and leave their children to stay with grandparents, this situation has occurred so much in Northeast region, the children do not live with their own parents are 30%[5], so family structure are members of grandparents and grandchildren which without parents.

After literature review, there are risk factors which effect to the children developments involve with biological and economic and social. Regarding to biological risk factor composes of health and mothers' nutrition status, complication during intra partum and postpartum periods including health and nutrition status of the children[6]. Relating to economic and social factors compose of age, occupation of mothers, including family income and the way how they raise the children, especially mothers' education level is quite so much affect to the children than fathers[7,8]. In the past, there are many studies related to risk factors which effects to the early children developments which still be problem. A part of this issue might cause of biological and economical and social risk factors. However, there is not any study about socio-demographic characteristics, caregiver's quality of life and early children developments in Northeast of Thailand.

Therefore, this study aimed to analyze about association between socio-demographic characteristics, caregiver's quality of life and suspected developmental delay among early childhood in Northeast of Thailand.

Material and Method

Study Design and Sampling: A cross-sectional analytical study and collect data from April through May 2019. The sample size was calculated following formula to specify sampling size by multiple logistic regression, Hsieh FY [9]. ρ of 0.70, VIF= 3.33. The sampling size of this study is 584 persons.

Using Multi Stages random sampling did in research for 20 provinces in Northeast region. Simple random sampling is used for 5 provinces at 25% out of all provinces in this region, next, for selected 2 districts out of each sampling province. Then, do random sampling group from name list of the early children (0-6 years) from public health department of sampling district (HosxP PCU program), according to proportional to size for 10 districts, get sampling group 58-60 persons each.

Inclusion criteria are Thai nationality children aged 0-6 years and been live in Northeast of Thailand. The caregivers are look after children at least 6 months up, their profiles can be given us completely and they must have the maternal and child health handbook. Regarding to exclusion criteria are disable children from birth which effect to their developments such as down syndromes, autism, cerebral palsy and children with seizure history, children with no cooperative to check development, children with no any age history and children who are not raised by their own blood relatives.

Material: Socio-demographic Characteristics which compose of age, gender, occupation, education level, self-income, family income, income sufficiency, number of children per family and living with their own parents.

Evaluation of Caregiver's quality of life by WHOQOL-BREF[10]: there are 4 domains; physical, psychological, social relationship and Environmental. Divide quality of life in each domain and overall for 3 levels which are poor, medium and good.

Suspected developmental delay test by Denver II is used to screen children's development. Four domains (gross motor, fine motor adaptive, language and personal-social). It consists of 125 items, testing time is around 10-20 minutes. The testing results are divided into 2 levels; Normal, develop a child without a delayed test and no more than one caution tests. Suspected has a test two or more cautions and one or more than one delay tests. This study uses Denver II in Thai[11] to do developmental tests. In addition, assessor has been passed children development training from the National Institute for Child and Family Mahidol University.

Data Analysis: Relating to analysis of association between socio-demographic characteristics, caregiver's quality of life and suspected developmental delay, a simple logistic regression, was used for bivariate analysis to identify individual factors associated with suspected developmental delay. The factors that had p-value <0.25 were processed into the multivariable analysis using multiple logistic regression by backward elimination method which statistical significance is (p-value= 0.05), reported the adjusted odds ratio (AOR), 95% confidence interval (95% CI) and using Stata version 13.1 program (Stata Corp, College Station, TX)

Result

Socio-demographic Characteristics: The total 1,168 sampling; 584 caregivers and 584 childhood found most of caregivers are female 93.3%, average age is 40.4 years with a range of 16-74, their occupation is agriculturist 44.4%. Education level is primary school 46.4%, average monthly self-income 6,394.8 THB, average monthly family income 15,029.8 THB. Early childhood are males 53.1%; average age is 36.1 months with a range of 9-72 months, the children aged 36-76 months is 46.7%. The child living with their own parents is 51.4%. (Table 1)

Table 1: Socio-demographic characteristic

Factors	Number	(%)
1. Caregiver's age (Years)		
16-29	165	28.2
30-59	359	61.5
60-74	60	10.3

Good	387	45.2	1		
Medium	197	53.8	1.4	1.00-1.99	
6. Quality of life in social relationship domain					**0.016**
Good	400	44.7	1		
Medium and poor	184	55.4	1.5	1.18-2.18	

Factors associated with suspected developmental delay: Multiple logistic regression: Multiple logistic regression analysis by Backward elimination indicated that The children who are raised by the caregiver who has monthly self-income lesser than 10,000 THB, tend to be suspected developmental delay more than the ones who are taken cared by the caregiver with monthly self-income over than 10,000 THB for 1.9 times. (AOR= 1.9; 95% CI: 1.24 to 2.87). Boys tends to be suspected developmental delay more than girls for 1.9 times (AOR= 1.9; 95% CI: 1.33 to 2.64)

The child aged 13-35 months has a chance to suspected developmental delay more than the ones aged 0-12 months in double fold. (AOR= 2.0; 95% CI: 1.21 to 3.34). In addition to the children aged 36-72 months tends to be suspected developmental delay more than the children aged 0-12 months in 2.5 times (AOR= 2.5; 95% CI: 1.54 to 4.09).

The children who are raised by the caregiver with social relationship in medium and poor level, it has chance to reflect the children be suspected developmental delay more than the ones who are in good level for 1.6 times. (AOR= 1.6; 95% CI: 1.23 to 2.01). (Table 5).

Table 5: Factors associated with suspected developmental delay: Multivariate analysis

Discussion

This study revealed that the suspected developmental delay among early childhood in Northeast of Thailand were 48.1% . The associated factors with suspected developmental delay were found 4 factors including: monthly self-income, gender, age range and quality of life in social relationship domain.

The association between Monthly self-income of caregivers and suspected developmental delay was consistent with Ozkan et.al[12], they found that economic and social factor effected to the delayed development.

Girls who are in normal development greater than boys were concordant with a study of Bhattacharya and Brito et al[13,14]. They found that boys were suspected developmental delay greater than girls. Nevertheless, it was different from a study of Ozkan et.al[12] reported that there was not difference on gender with suspected developmental delay.

Age range of the early childhood with developmental delay the most was 35-72 months which this result was consistent with problem about developmental delay on language domain which tended to increase up. A part of problem is environmental circumstance was not propitious to support the children development; for example, eating food following advertisement, leaving kids to use electric media alone, so the kid aged 3-5 years were slightly risky greater than the kid aged 0-2 years which were consistent with a study of Brito et al. and Celikkiran et al[14,15]., they found that infant stage had normal developmental better than preschool age.

Regarding to the caregiver's quality of life in social relationship is related to children development which also conformed to a study of Yamada et al[16]., especially mother who was in poor quality of life which her might get lower social support, it also affected to another family members on development, personality and children behavior.

Conclusion

The risky factors affected to the children development issue, biological factor slightly was lowering significant, but the socio-demographic characteristics factor was more important. Therefore, we should closely pay more attention to the risk factors which were biological, social and environmental factors which cause of children development issues. As a result, we should monitor these risk factors which might affect to the children in first five year in order to solve the problem and did any activities to stimulate and do support their normal developmental and being main human resource to develop our country in the future.

Research Ethics approval for this study was obtained from the Khon Kaen University Ethics Committee for human Research (HE622051).

Abstract

It is known that one of the physical fitness factors is a non-modifiable genetic factor, one of which is the ACTN3 gene. The influence of this gene polymorphism on physical fitness response, both aerobic and anaerobic, to intervention is still limited. Sprint Interval Training (SIT) as one intervention factor enhances physical fitness, both aerobic and anaerobic. The research aims at observing whether ACTN3 gene polymorphism influences VO2max and Sprint Speed with SIT intervention. VO2max is a parameter of aerobic physical fitness, while sprint speed is a parameter of anaerobic physical fitness.

Twenty-eight male students of 18-25 years old were taken as the research's subjects from the Student Activity Unit of Sports of Jenderal Soedirman University using the consecutive sampling method. The subjects were divided by genotypes identified using a PCR-RFLP method into three groups, namely RR, RX, and XX. All samples undertake three sessions of SIT per week for five weeks with work to rest ratio (W:R) = (1:8). Before and after undertaking SIT regimen, the subjects were examined for VO2max using a Multi-Stage Fitness Test method and for speed using a Sprint 30 m method. The analysis was conducted using a One-Way ANOVA test at a significance level of 0.05. There was a significant difference at mean value VO2MAX ($p=0.033$) and speed ($p=0.048$) with each genotype group, and the highest change takes place with the genotype group RR. Study concluded that ACTN3 gene polymorphism influences a change in VO2MAX and speed after Sprint Interval Training intervention.

Keywords: *ACTN3 gene, Vo2max, Sprint speed, Sprint interval training.*

Introduction

Physical fitness profoundly influences an athlete's performance. There are two components of physical fitness, namely aerobic fitness, and anaerobic fitness. Each sport requires different physical fitness with each other. The peculiarity of each sport makes the basis for sport practitioners to adjust their physical training and nutrition. The genetic factor is something extraordinary, which are often forgotten. Genetic factor determines about 20-80% of the individual's performance concerning physical fitness dominance [1]. Some individuals are born with aerobic physical fitness dominance and vice versa. ACTN3 gene is a gene which encodes the production of protein α-actinin-3 released by muscle fiber type 2[2]. Protein α-actinin-3 is responsible for the formation of fast and robust movement like a sprint[3]. ACTN3 gene has three polymorphisms, with polymorphism XX, the production of protein α-actinin-3 is less than with polymorphism RR. Previous researches on ACTN3 have proven that RR polymorphism has better anaerobic fitness. However, polymorphism's influence on the outcome of physical exercise has not been studied much, whether specific polymorphism tends to result in better physical fitness with a physical training intervention.

Therefore, we were interested in observing how ACTN3 gene polymorphism influences physical fitness, both aerobic and anaerobic, with particular physical training intervention[3].

One physical training optimally enhances physical fitness, both aerobic and anaerobic, is Sprint Interval Training (SIT). Sprint Interval Training (SIT) is an intermittent physical training with training period (high intensity) followed with break period (low intensity)[4]. SIT is conducted with training period using short, continuous sprint with maximum workload interspersed with break period with light activities like jogging[5]. Constant training with the SIT method may enhance durability performance[6]. Such training shows a change to better muscle performance and adaptation than regular exercise with shorter training time. Study showed that high-intensity training like SIT with individual ration may progressively enhance recruitment of active type muscle fiber[7]. Therefore, SIT is deemed appropriate to be an intervention in observing how ACTN3 gene polymorphism influences physical fitness, both aerobic and anaerobic. Aerobic fitness parameter shall take VO2max, while anaerobic fitness parameter shall take sprint speed parameter.

Method

Research Design: This quasi-experimental research employed pre- and post-test design approach without a control group. The research subjects were classified based on the results of the ACTN3 gene polymorphism examination into three groups, namely RR, RX, and XX groups.

Research Subject: The 28 male of healthy students, aged between 20 to 25 years old, were divided into three groups, namely 10 students with RR polymorphism, 9 students with RX polymorphism and 9 students with XX polymorphism. The subjects were selected using a consecutive sampling technique. They regularly performed physical training with medium to high intensity at least 2-3 times per week for minimum the last three weeks. Subjects had to be a healthy man and pass the physical fitness examination; Physical Activity Readiness Questionnaire/PAR-Q.

Research Intervention: Sprint Interval Training (SIT) was performed for five weeks with a frequency of 3times/week at interval 1-2 days. SIT regimen employs a ratio of work to rest at 1:8, constituting sprint with an active period of 30 seconds, and the rest period of 4 minutes intermittently for four repetitions. The total duration for one session was 28 minutes, consisting of core training of 18 minutes, warming-up of 5 minutes, and cooling-down of 5 minutes. The consistent active period intensity took Borg's Scale of 14-18, regular active rest period brings Borg's Scale 10-13, and consistent warming-up and cooling-down intensity take Borg's Scale 10-13 [8].

ACTN3 gene polymorphism examination: The PCR-RFLP method examined the ACTN3 gene polymorphisms as previous study[9]. PCR was conducted using forward primer 5' CTG TTG CCT GTG GTA AGT GGG 3', and reverse 5' TGG TCA CAG TAT GCA GGA GGG 3'. The DdeI enzyme was used to digest PCR product 60 minutesin 37^0 C. An electrophoresis was conducted with agarose gel 2.5% at 100 volt for 50 minutes.

VO2 max examination: A change to VO_{2MAX} was examined using a Multi-Stage Fitness Test method with a run from one sign to another sign at a distance of 20 meters and in harmony with previously recorded sound. Subjects were required to follow the rhythm as long as possible and the test was ceased when subjects fail to reach the end of the 20m track for 2 stages or get exhausted[9,10].

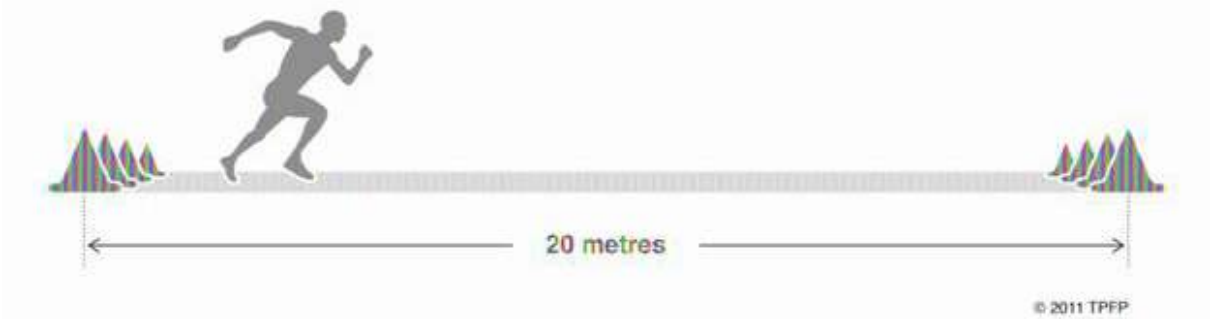

Figure 1. Multi-stage Fitness Test

Sprint Speed Examination:

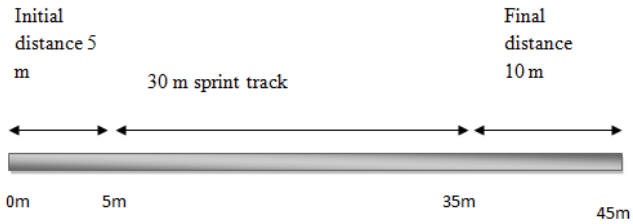

Figure 2. Sprint Speed Measurement Track

A change to sprint speed was examined with a sprint on a 30 meters track[11]. Additional 5 meters of initial distance was given to minimize any reaction time effect at the start of sprint on the travel time of 30 meters sprint. A final distance of 10 meters was given so that subjects may reduce their speed conveniently in prevention of injury risk.

Statistical Analysis: A change to VO_{2MAX} after SIT with all groups of ACTN3 gene was tested with a paired T-Test. The difference in the change to VO_{2MAX} after SIT between the ACTN3 gene groups was tested using One Way ANOVA. A Post Hoc test was employed as an advanced test to One Way ANOVA. The result of $p \leq 0.05$ was deemed significant.

Results

The baseline data of research subjects' age and body mass index (BMI) with each group are presented in Table 1. Table 1 shows that the age and BMI of subjects between groups are relatively equal, with the highest mean age is of RR group (21.10 ± 1.28 years old) and the highest mean BMI is of RR group (23.60 ± 1.24 kg/m^2).

Table 1. Characteristics of Age and Body Mass Index (BMI) among Subjects

Variable Characteristics	RR	RX	XX
Mean Age (years) ± SD	21.10 ± 1.28	20.50 ± 1.58	20.70 ± 1.15
Mean BMI (kg/m^2) ± SD	23.60 ± 1.24	22.44 ± 2.03	23.16 ± 1.95

The Paired T-test results show that there is significant difference in both speed variable and VO2 max before and after SIT intervention variable (Table 2).

Table 2. Paired T-Test results between Speed and VO2max Correlation

Variables	Pre SIT(mean±SD)	Post SIT (mean ± SD)	P Value
Speed	7.24 ± 0.50	7.51 ± 0.59	0.000
VO2max	35.29 ± 4.60	43.39 ± 5.63	0.000

The one way ANOVA test results (Table 3) show that the change to sprint speed and VO2max after SIT is statistically different between the ACTN3 gene groups with p = 0.048 for speed and p = 0.033 for VO2max ($p < 0.05$).

Table 3. One Way ANOVA Test Results comparing the Genotypes and Interventions

Variables	Pre SIT (mean ± SD)	Post SIT (mean ± SD)	Variable Change	P Value
Speed				
RR	7.55 ± 0.35	8 ± 0.37	0.45	
RX	7.12 ± 0.53	7.51 ± 0.56	0.39	0.048
XX	7.04 ± 0.50	7.26 ± 0.47	0.22	
VO2max				
RR	37.43 ± 6.01	47.45 ± 6.46	10.02	
RX	35.37 ± 4.40	34.28 ± 4.15	1.09	0.033
XX	34.28 ± 4.15	42.32 ± 5.32	8.04	

The Post-Hoc analysis to observe polymorphism group with significant difference revealed that significant difference takes place with RR and XX groups for speed (p=0.017) and RR and RX groups for VO2max (p=0.010). The highest improvement of speed and VO2max takes place with RR polymorphism group.

Discussion

This research proves that Sprint Interval Training intervention may enhance speed and VO2max. SIT training is one method of HIIT (High Intensity Interval Training), in which HIIT is defined as a high intensity training consisting of aerobic and anaerobic combination. High intensity training for individual will give benefit of enhancement of muscle mass, while low intensity training will enhance mitochondrial mass and oxidative enzyme activity[3]. A Study reported that HIIT training is correlated with recruitment of type IIa muscle fiber[12]. This theory reflect the informationthat high intensity training will change the composition of muscle fiber, from type I and type IIx muscle fiber to type IIa muscle fiber. Type IIa muscle fiber is muscle fiber with components almost equal to type I muscle fiber, in which the components include number of mitochondria, capacity of oxidative phosphorylation and capillary content[13,14]. The components may support muscle metabolism in a training which requires durability or VO2max. Previous researches also prove that SIT training performed for about 5 weeks shows a change to skeletal muscle metabolism, that it increases creatine kinase enzyme (creatine phosphate catalysis) and myokinase enzyme (resynthesis of ATP from ADP) with phosphate system[15,16]. Such improvement of creatine kinase and myokinase enzymes gives certain benefit to sport which requires speed like sprint. Therefore, performing SIT training will obtain double benefits in the form of enhancement of aerobic performance, in this case with enhancement of VO2max, and also enhancement of anaerobic performance, as shown with enhanced performance of sprint speed.

Furthermore, it proves that ACTN3 gene polymorphism influences speed and VO2max enhancement response with SIT intervention. The best enhancement of speed and VO2max is with RR gene polymorphism. Genotype RR with ACTN3 will encode the formation of protein α-actinin 3 the most. Skeletal muscle with protein α-actinin 3 has type 2 muscle fiber which works faster and is able to make more maximal contraction than muscle fiber without protein α-actinin 3 (XX)[17]. The reason is that protein α-actinin 3 interacts with calcium and calmodulin-dependent protein phophatase calcineurinso that protein α-actinin 3 may make more distribution of type II muscle fiber[18]. More type II muscle fiber causes better speed. In addition, mass enhancement of type IIa muscle fiber causes enhancement of durability in training.

Previous study on the rats to examine the difference in muscle biochemical characteristics found that the activities of Citrate synthase is found higher with type IIa muscle fiber than with any other type of muscle fiber[19]. Itcatalyze acetyl-CoA in krebs cycle of muscle cell oxidative metabolism track. Such enhanced activity of citrate synthase makes type IIa muscle fiber able to have stronger durability than any other type of muscle fiber[20].

It has beenproposed that m TOR and p70S6k phosphorylation are higher with ACTN3 gene R allele after physical sprint training[21]. mTOR and p70S6k phosphorylation serve to regulate skeletal muscle hypertrophy[22]. Therefore, we may conclude that hypertrophy and strength enhancement of skeletal muscle will be higher with individual with R allele after certain period of physical training. Moreover, another study also propose that testosterone level in male and female athletes is higher with individual with ACTN3 gene R allele[23]. This allows individual with R allele to have higher enhancement of muscle strength with physical training intervention, particularly resistance training. Similarly, the same occurs with the influence of ACTN3 on VO2max enhancement during SIT training. VO2 max is higher with genotype XX. However, after endurance training, the highest VO2 max enhancement takes place with individual with RR allele[24].

The influence of ACTN3 gene, particularly RR polymorphism, on the performance makes ACTN3 gene called “a gene for speed”. Researches show that ACTN 3 gene influences training adaptation, which in this case is speed and VO2max enhancement response during SIT. Moreover, ACTN3 evidently influences not only training adaptation, but also recovery speed during training and reduces injury risk [25].

This research is limited that it does not recall respondents’ nutrition, while it is possible that respondents’ energy during measurement may influence the result. Nutrition like high carbohydrate and protein may influence training adaptation.

Conclusion

The ACTN3 gene polymorphism influences a change to speed and VO_{2MAX} after Sprint Interval Training (SIT) intervention. The best response take place with genotype RR group.

Predisposing Factors to Risk of Low Birth Weight in Premature Baby in Bengkulu Indonesia

Susilo Damarini[1], Hadi Pratomo[2], Helda[3], Besral[3]

[1]Doctoral Candidate, [2]Professor, [3]Doctor, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia

Abstract

Introduction: Birth weight is the most important factor which determines the survival of newborns. Low birth weight (LBW) is one of the challenges in maternal and child health and most are caused by preterm labor. Exposure to prenatal or postnatal cigarette smoke has a detrimental effect on fetal and infant health including premature birth. This study was conducted in Bengkulu Province which aims to determine the magnitude of maternal predisposing factors influence on the LBW in preterm birth.

Method: This was research with a cross-sectional design which used a questionnaire on 95 premature babies born in January to October 2018 in the Bengkulu Province, Indonesia. Predisposing factors studied including smokers in family members, mother's age, mother's education level, mother's occupation, gestational age and gender of the baby. Data were analyzed using multivariate logistic regression.

Result: On average, premature babies were born at 32.9 weeks of gestation, 81.1% of babies born with LBW, most of the samples have family member who smokes (85.3%), most mothers participated aged 26-35 years (46.3%), most mother's education level was moderate (45.3%), and most mother's occupation was house wived (70.5%). In the multivariate variable analysis, the predisposing risk of experiencing very low birth weight (VLBW) including smoker in a family member (OR=8.79, 95% CI 1.54-50.35), gestational age (OR=0.63, 95% CI 0.49-0.82), and mother's age of 26-35 years (OR=1.47, 95% CI 1.59-134.73).

Conclusion: Smoker in a family member, Mother's age, gestation age, and Mother's private employee has a significant risk of LBW in premature babies in Bengkulu Province.

Keywords: *Predisposing factors, Low birth weight, Premature baby.*

Introduction

Quality health care before, between and during pregnancy will ensure all women have a positive pregnancy experience. Preventing death and complications from preterm birth begins with a healthy pregnancy. The study conducted by Sheeba et al., (2019) showed that preterm labor and low birth weight (LBW) had an impact on increasing stress on the mother[1]. According to Aryastami et al., (2017) LBW is a stunting-related factor among children aged 12-23 months in Indonesia[2].

Premature birth is the birth of a baby which occurs before 37 weeks of pregnancy. Premature births can be categorized into four subgroups, namely late preterm (34-36 weeks of pregnancy),moderate preterm (32-34 weeks of pregnancy), very preterm (<32 weeks of pregnancy, and extremely preterm (<28 weeks of pregnancy). Premature birth can also be defined as the low birth weight (less than 2500 grams), very low birth weight (less than 1500 grams), and extremely low birth weight (less than 1000 grams)[3].

An estimated 15 million babies born prematurely every year. Around 1 million children die every year due to complications of premature birth[4]. In low-income countries, an average of 12% of babies was born too early compared to developed countries (9%). Indonesia is among the ten countries with the highest number of preterm births and is also one of 10 countries with the highest preterm birth rate per 100 live births[5].

Many factors contribute to LBW and preterm birth. Endalamaw et al., (2018) in a systematic study review and meta-analysis showed that mothers aged <20 years and mothers who did not have formal education were significant factors of experiencing LBW. Female infants were not associated with LBW and gestational age of fewer than 37 weeks was positively associated with LBW[6]. Khurana et al., (2017) study used a cross-sectional method in tertiary care hospitals in Gurugram and found that maternal education, maternal occupation, socioeconomic status, and family type were found to be significantly associated with LBW in multivariate analysis[7].

Mothers involved with the use of nicotine and tobacco burning during pregnancy have a higher risk of experiencing small-for-gestational-age (SGA) births, and products containing nicotine should be avoided during pregnancy[8]. Babies born to fathers who smoke and both parents who smoke >20 cigarettes/day significantly increase the risk of LBW and preterm birth. Fathers who smoke >20 cigarettes/day have a higher risk of having LBW babies than non-smokers[9]. Mothers who smoke have a higher incidence of LBW, SGA, and premature babies, especially when the mothers smoke >20 cigarettes/day. There is a significant relationship between fathers smoking with LBW, SGA, and premature babies born[10].

Prenatal or postnatal cigarette exposure has a detrimental effect on fetal and infant health, including preterm birth and this is very important because it can cause infant death. This study aimed to determine the predisposing factors which influence the LBW in preterm birth.

Method

This study was a cross-sectional study design. Data was collected using a questionnaire filled in by the mother of the preterm baby. The population of this study was preterm babies born less than 37 weeks gestational age and birth weight less than 2500 grams in the Bengkulu Province, Indonesia. The study sample of 95 infants born from January to October 2018 was taken incidentally after discharge from the Regional General Hospital and independent practice midwives. Independent variables in this study were predisposing factors which included smoker family members, mother's age, mother's education level, mother's occupation, gestational age and gender of the baby.

The collected data were analyzed using the chi-square test on gender variables, exposure to cigarette smoke, mother's education level, mother's occupation, and mother's age while gestational age was analyzed using the Mann-Whitney test. All variables found significant ($p<0.25$) were analyzed further with multivariate analysis using logistic regression to estimate odds ratios (OR) and 95% confidence intervals (CI).

Result

Frequency distribution of baby's gender, exposure to cigarette smoke, mother's education level, mother's occupation, mother's age and LBW in the Bengkulu Province can be seen in table 1. On average, preterm baby in this study was born at 32.9 weeks of gestational age, and most of them (81.1%) are LBW babies. Most respondents (85.3%) were exposed to cigarette smoke. Nearly half (46.3%) of the mothers aged 26-35 years, almost half (45.3%) of the mother's education level was moderate, and most (70.5%) of the mother's occupation was a full-time mother.

Table 1. Relationship of predisposing factors (smoker in a family member, mother's age, mother's education level, gestational age, mother's occupation, the gender of the babies with LBW).

Variable	Low Birth Weight		Total n (%)	p-value
	LBW n (%)	VLBW n (%)		
Smoker in a family member				
No	8(57.1)	6(42.9)	14(100)	0.023*
Yes	69(85.2)	12(14.8)	81(100)	

Variable	Low Birth Weight		Total n (%)	p-value
	LBW n (%)	VLBW n (%)		
Mother's age				
≥36 years	8(57.1)	6(42.9)	14(100)	0.045*
26-35 years	37(84.1)	7(15.9)	44(100)	
≤25 years	32(865)	5(13.5)	37(100)	
Mother's education level				
High (bachelor)	15(75)	5(25)	20(100)	0.701
Moderate (high school)	35(81.4)	8(18.6)	43(100)	
Low (elementary school, junior high school)	27(84.4)	5(15.6)	32(100)	
Gestational age				
Mean ± SD	33.5±2.43	30.2±3.39		0.000*
Mother's occupation				
Civil government employee	3(42.9)	4(57.1)	7(100)	0.019*
Private employee	19(90.5)	2(9.5)	21(100)	
Fulltime mother	55(82.1)	12(17.9)	67(100)	
Baby's gender				
Female	35(77.8)	10(22.2)	45(100)	0.440
Male	42(84)	8(16)	50(100)	

*multivariate candidate variables

Table 2. Logistic regression multivariate analysis

Predisposing factors	OR	95% CI	p-value
Smoker in a family member	8.79	1.54-50.35	0.015
Mother's age of 26-35 year	1.466	1.59-134.73	0.018
Gestational age	0.63	0.49-0.82	0.000
Mother's private employee	1.168	1.27-107.89	0.030
Housewife	0.316	0.04-2.47	0.272

The results of the analysis showed that mothers with a smoker in family members had a higher risk of LBW compared to mothers whose family members were not smokers (OR 8.79, 95% CI 1.54-50.35). Gestational age had a risk of giving birth to LBW babies (OR 0.63, CI 95% 0.49-0.82), and mother's age of 26-35 years tends to increase the risk of experiencing VLBW compared to the mother's age of ≤25 years (OR 1.47 and 0.27). These data can be seen in table 2.

Discussion

This study has a significant relationship between smoking families with LBW in preterm infants. Mothers who were exposed to cigarette smoke by their families who smoke are protective factors against the VLBW of babies. Previous research according to Mumbare et al., (2011) found that exposure to cigarette smoke poses a risk of LBW (OR=4.10, 95% CI 1.85-9.06)[11]. Ashford et al., (2011) stated that prenatal exposure to passive smoking puts women at higher risk for premature birth (OR=2.3)[12].

Furthermore, according to Qiu et al., exposure to passive smoking during pregnancy was associated with an increased risk of <32 weeks of very preterm birth (OR=1.98, 95% CI 1.41-2.76)[13]. It is also in line with Nieuwenhuijsen et al., (2013) study which found that there was a statistically significant relationship between environmental exposure such as tobacco smoke, air pollution and chemicals, and pregnancy outcomes, including LBW (OR=1.32) and SGA (OR=1.21)[14]. Cui et al., (2016) found that the significantly increased risk of preterm birth was associated with exposure to passive smoking at home (OR=1.16, 95% CI 1.04-1.30)[15]. Fathers who smoke >20 cigarettes/day have a much higher risk of having LBW babies than non-smokers (OR=2.09, 95% CI 1.38-3.17)[5].

Pregnant women exposed to environmental smoke cigarettes during pregnancy experienced an adverse effect on the mother and fetus such as impaired fetal growth, LBW, preterm labor, and increased fetal and infant mortality, indicating that the number of pregnant women exposed to environmental cigarette smoke is still high due to the high number of families who smoke. However, this finding is different from the study by

Elkin et al., (2018). The study assessed the relationship between exposure to Environmental Tobacco Smoke (ETS) and preterm birth and showed inconclusive results[16].

Gestational age has a significant relationship to the weight of the baby born. The results of another study conducted by Anitha et al., (2009) found that gestational age is one of the risk factors which can affect infant birth weight (R2=141.98, 95% CI 123.74-160.22)[17]. Xia et al., (2016) found that LBW cases were significantly associated with gestational age (OR=1.81, 95% CI 0.90-3.67)[18].

The results of this study are in line with the research of Akanksha et al., (2017) which found that the relationship between maternal age and LBW of the newborns was statistically significant (OR=0.022)[7]. Foto et al., (2016) found that mothers' age of 20-34 years significantly decreased the risk of giving birth to an LBW baby (OR=0.681)[19]. The findings of Cui et al., (2016) showed that mother's age was significantly associated with preterm birth (OR=1.27, 95% CI 1.09-1.47)[15]. This finding is different from the result of Bhaskar et al., (2015) study which found that mother's age has no significant relationship with LBW[20].

In this study, mother's education level showed no significant relationship to the LBW babies because other factors were more influential on the occurrence of LBW such as gestational age, a smoker in family members, and mother's age. This study found that most mothers with moderate education level (45.3%) gave birth to babies with LBW (81.4%) and VLBW (18.6%). This research is in line with Mumbare et al., (2011) study which stated that mother's education level was not significantly related to the birth of LBW babies[7]. This finding is in contrast to the opinion of Akanksha et al., (2017) which stated that there was a statistically significant relationship between maternal education and LBW (OR=0.192). The study also said that educated women should have a better awareness of available health services and information[19].

Mother's occupation showed no significant relationship with LBW, this is consistent with the study conducted by Demelash et al., (2015) which found that the mother's occupation was not a risk factor of LBW[21], but different from the study conducted by Akanksha et al., (2017) which found that unskilled occupation was a risk factor for LBW (OR=0.184)[7].

In this study, the mother's occupation was mostly categorized as other (70.5%), which in this case was housewives. As a housewife, they were not required to do heavy work, and house chores can be done according to the mother's physical abilities; also the mother can rest any time she was exhausted. Mother's occupation does not affect the occurrence of LBW, more likely due to other factors including gestational age.

Pregnant women should always maintain the health of themselves and their fetuses. The LBW is not only caused by diseases during pregnancy such as preeclampsia, anemia, and others but also can be caused by predisposing factors. A pregnant woman should avoid exposure to cigarette smoke and women preferably pregnant in productive age. Besides, mothers and families should avoid the occurrence of pregnancy in those who are too young or too old and alert for the possibility of preterm labor.

Conclusion

The results of this study indicate the predisposing factors which influence LBW, including smokers in family members, mother's age, gestational age and mother's occupation while the variables at risk for VLBW are smokers in family members (OR=8.79, 95% CI 1.54-50.35), gestational age (OR=0.63, 95% CI 0.49-0.82), and mother's age of 26-35 years (OR=1.47, 95% CI 1.59-134.73).

Education and Knowledge Level Analysis of the Teachers Regarding Dental Education Program in Primary Schools

Taufan Bramantoro[1], Titiek Berniyanti[1], Retno Palupi[1], Ninuk Hariyani[1], Fatan Fakihardi[2], Aulia Ramadhani[1], Sarah Fitria Romadhoni[1]

[1]Department of Dental Public Health, [2]Graduate Student of Dental Health Science, Faculty of Dental Medicine, Universitas Airlangga

Abstract

Introduction: The highest caries prevalence occurs in the age group 10-14 which is the age of school children. Increased teacher knowledge about dental and oral health will determine students in behaving to maintain oral health.

Objective: This study aimed to determine the level of education towards the level of knowledge of dental and oral health and School's Dental Education Program for kindergarten and elementary school teachers.

Method: This was an observational descriptive study with cross sectional approach. The population of this study were kindergarten and elementary school teachers in Public Health Center working area in Surabaya with a total sample size of 76 respondents.

Results: Chi-Square analysis of education level did not correlate with the level of dental and oral health knowledge and School's Dental Education Program ($\rho = 0.951$ and $\rho = 0.098$).

Conclusion: There was no relationship between the level of education on the level of knowledge of dental and oral health and School's Dental Education Programfor kindergarten and elementary school teachers.

Keywords: *Dental education, Education status, Knowledge, Oral health,*

Introduction

Data from basic health research (RISKESDAS) in 2013 showed that the national prevalence of oral and dental health problems was 25.9%. East Java Province ranked third with the highest increase in dental and oral problems in 2007 of 20.3% and in 2013 it increased to 28.6%[1]. The highest caries prevalence occurred in the age group of 10-14 years which is the age of school children which is equal to 25.2%[2].

Based on secondary data on visits of children at the Dental Clinic of health center, pulpitis was found to be a common health problem. In July 2017 until May 2018 the diagnosis of diseases ranked first in children was pulpitis. Children with pulpitis in July 2017 until May 2018 were as many as 118 children.

In the study of the caries severity of elementary school students in Surabaya health center in 2017, based on the DMF-T index, it showed mean of 5 of the total range of 0 to 15. According to WHO, this value is categorized as high.

Teachers are parents in school for children because they have a high responsibility for education that their students have to obtain in order to acquire knowledge. Such knowledge can help students and distinguish good and bad habits. In addition, teachers must have proper knowledge so that it can be channeled to their students to

aim the target[3]. An increase in the proper knowledge of teachers about dental and oral health will determine how students behave in maintaining oral health. Teachers have a role to prevent the occurrence of oral problems, such as caries, which in general often occurs in children in school age due to lack of knowledge of children in maintaining dental and oral hygiene and eating habits in schools of cariogenic food[4].

Based on the results of previous research regarding the relationship between education level, age, and years of work with the level of dental and oral health knowledge in elementary school teachers in Tampak Siring, Gianyar sub-district, shows that the more mature the level of maturity and strength a person, the more mature his/her thought and the higher his/her knowledge[5].

In the Health Center Performance Assessment in October-November 2017, the health center had carried out School's Dental Education Program (School Oral Health Program) activities covering 3934 students in Grade 1 of the total target of 3534 students. Students in grades 1-6 receiving treatment were 3505 students from a total target of 1402 students. Whereas, the target for elementary/Islamic elementary schoold with School's Dental Education Program Phase III of 30% of the total SD/MI targets was 9 schools and 8 out of it had been implemented.

The Indonesian government seeks to improve the dental health knowledge of elementary school-age children through the School Dental Health Program. According to the Republic of Indonesia Ministry of Health's Decree of the Director General of Health Care Development no. HK.02.04/II/963/2012, School's Dental Education Programis a public health effort aimed at maintaining, improving the dental and oral health of all students in school.

Based on what has been described above, it is necessary to conduct research on the analysis of education level on knowledge level of dental and oral health and School's Dental Education Programfor kindergarten and elementary school teachers in the working area of health center in Surabaya.

Subjects and Method

This research was carried out by observational descriptive method with a cross sectional approach in the urban area of health center in Surabaya. The population in this study were kindergarten and elementary school teachers in the working area of the urban area in the Surabaya's public health center with a total sample taken in total sampling. The number of samples in this study were 76 respondents.

This research was conducted in June 2018. Data were collected in 4 elementary schools and kindergartens in the coverage area of the Surabaya's Public health center. Before taking the subject of research in total sampling technique, the licensing process was carried out to the authorities at health center and schools, then the researcher collected teachers' data by stating the last name, gender, age, and education.

In this study the level of knowledge and understanding of dental and oral health and an understanding of School's Dental Education Program was carried out by filling out questionnaires by teachers at the kindergarten and elementary school level in health center area. The data obtained were analyzed using Chi Square Test to observe the relationship between variables in this study.

Findings:

Table 1. Respondents' Sex Frequency Distribution Regarding Knowledge of Dental and Oral Health and School's Dental Education Program Knowledge.

Sex	Dental and Oral Health Knowledge			School's Dental Education Program Knowledge		
	High	Low	Total	High	Low	Total
Female	9 (13%)	57 (87%)	66 (100%)	47 (72%)	19 (28%)	66 (100%)
Male	0 (0%)	10 (100%)	10 (100%)	6 (60%)	4 (40%)	10 (100%)

Based on Table 1, it can be seen that the level of knowledge about dental and oral health is high (13%) and low (66%) in female. So does the level of knowledge about School's Dental Education Program is high (72%) and low (28%) in women.

Table 2. Age Frequency Distribution of Respondents on Knowledge of Dental and Oral Health and School's Dental Education Program Knowledge

Age	Dental and Oral Health Knowledge			School's Dental Education Program Knowledge		
	High	Low	Total	High	Low	Total
<35 years	4 (13%)	27 (87%)	31 (100%)	23 (74%)	8 (26%)	31 (100%)
>35 years	5 (11%)	40 (89%)	45 (100%)	30 (67%)	15 (33%)	45 (100%)

Based on Table 3, it can be seen that the level of knowledge about dental and oral health is mostly low at age >35 (89%), and the lowest high value was at age <35 years (13%).The table shows that the level of knowledge about School's Dental Education Program is mostly high at age <35 years (74%) and low at age <35 (26%).

Table 3. Frequency Distribution of Respondents School Status Regarding Knowledge of Dental and Oral Health nad School's Dental Education Program Knowledge.

School status	Dental and Oral Health Knowledge			School's Dental Education Program Knowledge		
	High	Low	Total	High	Low	Total
Public	4 (13%)	26 (87%)	30 (100%)	21 (70%)	9 (30%)	30 (100%)
Private	5 (11%)	41 (89%)	46 (100%)	32 (70%)	14 (30%)	46 (100%)

Based on Table 5, it can be seen that the level of knowledge about dental and oral health is mostly high in public schools (13%) and mostly low in private schools (89%). While the level of knowledge about School's Dental Education Program that the status of schools both public and private have a high level of School's Dental Education Program Knowledge.

Table 4. Frequency Distribution of Respondents' School Level Regarding Knowledge of Dental and Oral Health and School's Dental Education Program Knowledge.

School Level	Dental and Oral Health Knowledge			School's Dental Education Program Knowledge		
	High	Low	Total	High	Low	Total
Kindergarten	5 (11%)	42 (89%)	47 (100%)	36 (77%)	11 (23%)	47 (100%)
Elementary School	4 (14%)	25 (86%)	29 (100%)	17 (59%)	12 (41%)	29 (100%)

Based on Table 7, it can be seen that the level of knowledge regarding dental and oral health is mostly high in elementary school (14%) and mostly low in kindergarten (89%) and the level of knowledge about School's Dental Education Program is mostly high in kindergarten (77%) and mostly low in elementary school (41%).

Table 5. Chi-Square Analysis of Dental and Oral Health Knowledgeand School's Dental Education Program Knowledge based on Respondent's Education Level

Education Level	Dental and Oral Health Knowledge			
	High	Low	Total	ρ -Value(Chi-Square)
Bachelor	8(12%)	60(88%)	68(100%)	.951
Non-bachelor	1(12.5%)	7(87.5%)	8(100%)	
Education Level	**School's Dental Education Program Knowledge**			
	High		**Low**	**Total**
Bachelor	48(71%)		20(29%)	68(100%)
Non-bachelor	5(62.5%)		3(37.5%)	8(100%)

Based on Table 5, it can be seen that the level of knowledge about dental and oral health is mostly high in non-bachelor (12.5%) and mostly low in bachelor (88%). Chi-Square test results show ρ value = 0.951 (>0.05), indicating that there was no relationship between knowledge skills and education level. The table also shows that the level of knowledge about School's Dental Education Program is high in bachelor (71%) and mostly low in non-bachelor (37.5%). Chi-Square test results shows ρ value = 0.098 (>0.05), so it can be concluded that there was no relationship between School's Dental Education Program knowledge and education level.

The results of the test analysis showed the results of the Chi-Square test with ρ results = 0.591 (> 0.05). On the results of the Chi-Square test about the level of School Dental Health Program knowledge on the level of education, ρ results = 0.098 (> 0.05) was obtained. The results of the two Chi-Square tests showed that there was no relationship between the level of education and the level of knowledge of dental and oral health and School Dental Health Program. The level of one's knowledge is not only influenced by education level factors. There are still many other factors that influence it, so the results of the study provide insignificant results between the level of knowledge and the level of education. Similar research shows that there is no relationship between the level of education and the knowledge of women about breast cancer risk factors with ρ results = 0.192 (> 0.05)(6).

In the previous study, it was stated that the factors that affect the level of knowledge are not only from the level of education, but there are still other factors that influence it, including work and information media. Someone who works in a particular profession will have a level of knowledge related to his/her profession. For example, people will be called laymen of having limited health knowledge if they do not involve in the world of health or not work as health workers. Therefore, occupational factors play an important role in measuring a person's level of knowledge and not only from the level of education[6]. A person's occupation is very influential on the process of accessing information needed on an object[7]. The performance and ability of a person's brain in storing (memory) increases when it is often used. This is directly proportional when someone's occupation uses the brain more than muscles. A person's brain or cognitive abilities will increase when it is often used for activities and doing things in the form of puzzles or reasoning[6].

Furthermore, information media factors will also influence the level of knowledge. Even though a person has low education level, but if he/she acquires good information from various information media, for example: TV, radio, or newspapers, his/her knowledge still may increase[6]. In the era of communication and information, the mass media cannot be left behind to participate in conveying important information to the public and adolescents in general[9].

Apart from these two factors, there are other factors that influence the level of knowledge, i.e. experience. A person's experience greatly influences knowledge. The more a perso''s experience about an aspect, the more one's knowledge will increase[7]. The more the age, the level of maturity and strength of a person will be more mature in thinking and working. However, Verner and Davison stated that there are 6 physical factors that can inhibit the learning process in adults, thus making a decline at a time in the power of thinking and working [10]. So, through prior knowledge, personal experience, experience of others, the environment and other intrinsic factors can shape a person's knowledge for a long time and will survive until old age. This is in accordance with previous research which shows that there is a relationship between knowledge and practice among school children in Ajman University of the United Arab Emirates with a significant ρ value = 0.001 (<0.05)[11].

Another factor that affects the level of knowledge is interest. A previous study by Hayati (2007) in Wardani (2014) stated that the higher a person's interest in something, the higher the level of knowledge[12].

Some studies also explain that the age of a person at a productive age has the best level of knowledge or cognition. In addition, at that age, a person also has extensive experience and abilities for activities which will certainly support his/her knowledge in all aspects[13,14]. At the age of 20-35 years, individuals will play an active role in society and social life and prepare more for the success of efforts to adjust to old age. In addition, they will use more time to read more[8]. The age of a person influences one's perception and mindset. Increasing age will also develop the ability to capture and mindset, so that the knowledge gained is getting better[15,16].

Conclusion

There was no relationship between the level of education on the level of knowledge of dental and

oral health and School Dental Health Program for kindergarten and elementary school teachers in the working area of health center in Surabaya.

Revised Trauma Score (RTS) as Outcome Predictor of Head Injury Patients

Tengku Isni Yuli Lestari Putri[1], Ahsan[2], Dhelya Widasmara[2]

[1]Master Program of Nursing, Faculty of Medicine, [2]Lecturer in Medical Faculty, University of Brawijaya

Abstract

Head injury is the condition of brain function changes or pathological conditions in brain caused by the pressure that coming from the outside of brain. The occurrence of head injury is very high in the world followed by the level of death and disability. Therefore, requires initial assessment to predict the impairment of head injury patients by using RTS. This study purposed to determine the accuracy of RTS in predicting impairment of head injury patients. This study used analytical observational design with retrospective approach. Total respondents in this study was 245 medical records of head injury patients. Measurement was conducted by using observation sheet. Data were analyzed using *Receiver Operating Characteristic* (ROC). The AUC values of RTS was 0851, explained that RTS had a good discrimination value. RTS could be used in predicting the outcome of head injury patients

Keywords: *Head injury, RTS, impairment.*

Introduction

Head injury is the condition of brain function changes or pathological conditions in brain caused by the pressure that coming from the outside of brain [1]. Head injury is being one of important problem in the world [2]. In the United States, head injury cases had increased from year to year. A survey conducted in 2001-2010 described the number of injured reached 2.5 million people. The occurrence of head injury caused by fall incident. CDC also explained that on average 138 people died due to trauma in which one of the most trauma cases causing death was head injury [3].

International Brain Injury (IBIA) (2016) explained that head injury being the highest cause of death and disability throughout the world. Head injury that occurs in the world caused by traffic accidents [4]. Traffic accidents caused the deaths of 1.2 million people/year. Traffic accidents also caused permanent disability [5].

The occurrence of head injury in Indonesia had not been recorded properly. The occurrence of head injury can be seen from the high incidence of traffic accidents and the prevalence of patients who have experienced trauma, especially head injuries in the hospital. The occurrence of traffic accident in Indonesia in 2017 reached up to 98 419 cases, with the death toll reached 25 859 people and seriously wounded reached 16 159 people [6]. The high incidence of traffic accidents caused high incidence of traumatic head injury which reached 47.5% of total traffic accidents [7].

The high incidence and mortality in patients with head injury illustrates the need for good management in the form of a quality service. Quality service is a challenge for medical staff in providing services mainly in providing proper medical action in dealing with head injury patients [8]. Handling of head injury patients is very dependent on the accuracy of the initial assessment of patients [9]. Accurate initial assessment of patients is needed to provide appropriate treatment and predict the outcome of the next patient, especially impairment of the patient [10]. With an accurate initial assessment, medical staff can provide the action in accordance with

the patient's condition. In addition, the initial assessment is also the information needed by medical staff and the patient's family in seeing the next patient's prognosis [11]. The initial assessment of patients can be conducted by using scoring system [12].

The scoring system is a tool to predict patient outcome in the future [12]. The scoring system has been developed in the world, one that is commonly used scoring system is revised trauma score (RTS). RTS is a scoring system developed in 1989 by Champion et al and are often used in predicting outcomes in trauma patients [13,14]. RTS has three assessment variables that are GCS (glasglow coma scale), respiratory rate and systolic blood pressure [15]. RTS become one of the scoring system that can be used to predict the impairment of the patient. Research conducted by Kim et al (2017) stated that RTS can predict mortality in trauma patients [16]. This experiment also supported by Jung et al (2016) describes the RTS also excellent in predicting mortality in trauma patients [17].

Preliminary study that carried out by researcher in General Hospital of dr. Slamet Martodirdjo, there was an increasing number of patients with head injuries from 2017 to 2018. In 2017, head injury patients reached up to 281 people and in 2018 the head injury patients reached 352 people. The highest incidence of head injuries caused by traffic accidents. Interviews conducted by researchers with medical staff, stated that they have not implemented the scoring trauma to predict the patient's condition. Based on the above background, the researchers are interested in conducting research by using RTS in predicting impairment of head injury patients.

Method and Material

This study used analytical observational design with retrospective approach. Total respondents in this study was 245 taken from medical records of head injury patients through purposive sampling method in General Hospital of dr. Slamet Martodirdjo Pamekasan on 19 February 2019 to 5 March 2019. The research instrument used was observation sheet. GAP assessment using comparative method of ROC in determining AUC, the cut-off point, the sensitivity and specificity of RTS.

Results

Univariate:

Table 1: Characteristics of Respondents based on RTS Score, Age, Systolic blood pressure, GCS and Respiration

Variables	N	Mean	Median	Min-Max	SD
RTS score	245	10:36	11	7-12	2904
Age	245	49.29	47	25-65	12.73
Systolic blood pressure	245	97.68	95	68-134	21 744
GCS	245	12:31	13	7-15	2,636
Respiration	245	22:04	20	7-36	8:26

Source: Primary Data (2019)

Based on table 1, the highest RTS score was 12 and the lowest was 7 with mean value of 10.36. The oldest respondent was 65 years old and the youngest was 25 years old with mean value of 49.29 years old. The highest systolic blood pressure of patients was 134 mmHg and the lowest was 68 mmHg with mean value of 97.68 mmHg. The highest patient GCS score was 15 and the lowest was 7 with mean value of 12.31. The highest patient respiration rate was 36x/minute and the lowest was 7x/minute with mean value of 22.04x/minute.

Table 2: Characteristics of Respondents based on Impairment, RTS Category, Gender, Head Injury and Head Injury Mechanism

Variables	Category	Frequency	%
Impairment	No impairment	160	65.3
	Impairment	85	34.7
Gender	Man	190	77.6
	woman	55	22.4
Head injury	Mild head injury	138	56.3
	Moderate head injury	81	33.1
	Severe head injury	26	10.6
Mechanism of injury	Fall down	73	29.8
	Traffic accident	172	70.2

Source: Primary Data (2019)

Table 2 explained the most dominant respondents who did not experience impairment with total respondents of 160 people (65.3%). The gender of respondents was dominated by male with total of 190 respondents (77.6%). The respondent's head injury was the most dominant categorized as a mild head injury with 138 respondents (56.3%). The most dominant mechanism of respondent's head injury was caused by traffic accident with total of 172 respondents (70.2%).

ROC Analysis:

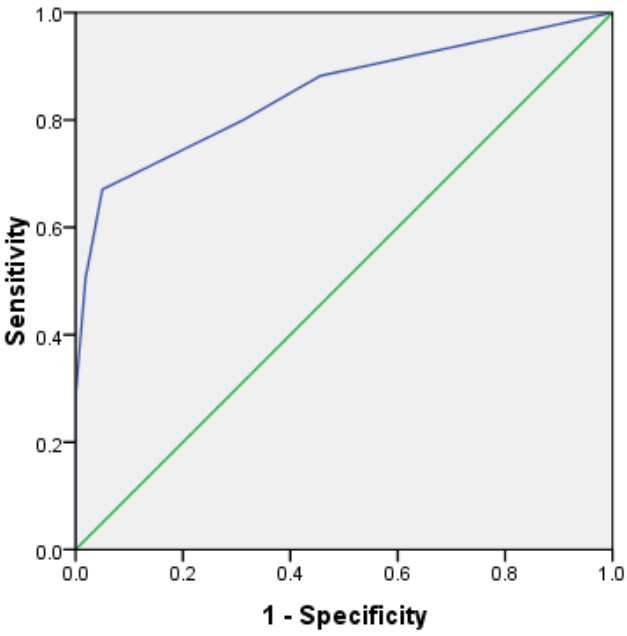

Figure 1: ROC curve of RTS

Table 3: Description of Area Under Curve (AUC) Value of RTS

	AUC	Std. Error	p-value	CI 95%	
				LB	UB
RTS Scores	0851	0029	0000	0796	0907

Source: Primary Data (2019)

Table 3 shown that RTS had a value of p=0.000 and AUC was 0.851 which explained that RTS could be a strong predictor of impairment in head injury patients.

Table 4: Cut off Point, Sensitivity and Specificity of RTS

	Cut off Point	Sensitivity	Specificity
RTS Scores	9.5	0.67	0.95

Source: Primary Data (2019)

Based on table 4, the cut-off point value of the RTS score was obtained at score of 9.5 with sensitivity value of 0.67 and specificity of 0.95. Sensitivity value of 0.67 shown clinically the ability of RTS in producing positive value or impairment in head injury with percentage of 67%. The specificity value of 0.95 shown clinically ability of RTS in producing negative value or no impairment in head injury with percentage of 95%.

Discussion

The results of this study indicated that RTS was a good predictor in predicting impairment in head injury patients in emergency room of General Hospital of dr. Slamet Martodirdjo Pamekasan with the value of AUC=0.851. The results of this study indicated that the

cut off point value of RTS was 9.5 with sensitivity value of 0.67 which explained positive value or impairment of head injury with percentage of 67% and specificity of 0.95 indicating clinically the ability of RTS to produce negative values or no impairment in head injury with percentage of 95%. This study was in line with research conducted by Manoochehry et al (2019) which stated that RTS was scoring system that could predict patient impairment and death in trauma cases including head injury [18].

RTS was trauma scoring first developed by Champion HR et al in 1989 that was widely used as a reference for trauma scoring [14,16]. Variable RTS also used in Trauma Related Injury Severity Score (TRISS), which was one of trauma scoring with anatomical and physiological systems [19]. RTS component consisted of GCS score, respiratory rate and systolic blood pressure [16]. Scoring of this RTS trauma had a weakness in its calculations which was quite complicated and respiratory rate component of RTS had little impact significance because it was influenced by other factors such as patient age, mechanism of injury and mechanical ventilation [20]. However, RTS was still widely used and well enough to predict the outcome of patients with trauma[17].

The advantages of using RTS trauma scoring, namely the RTS trauma scoring system had simple parameters, this system could be generalized, more accurate, the calculation was easy to use both in pre-hospital and hospital conditions (when the patient get in to emergency room) and had the ability to predict equal mortality even better from other scoring trauma systems so that it could facilitate hospital or other health agencies in making decisions for the implementation of patients[17].

RTS had a component in the form of GCS, systolic blood pressure and respiration. GCS was one of the predictors that might affect the impairment of patients with head injuries. According to Rahmani et al (2017) stated that GCS components greatly affect the outcome and mortality in patients with head injury [21]. Research conducted by Josep et al (2015) stated that head injury patients with GCS scoring 13-15 and get intracranial injury such as a fracture of the skull that accompanied intracranial hemorrhage patients was not a barrier for immediate action in the form of neurosurgery. Patients with fractures of the skull bones had ten times greater risk of experiencing neurological deficit and the worse the outcome obtained if the condition was not treated immediately or intervention by a team of neurosurgery. Therefore, GCS was a scale that was very important to assess awareness, clinical status and prognosis of patients with head injury [22].

Research conducted by Kung et al (2011) stated the level of awareness and improvement of the clinical condition after head injury in patients with GCS score of> 10 were more influenced by the value of the verbal component of the GCS score. However, head injury patients with score of 3-7, had the level of awareness and improvement of the clinical condition that was more influenced by the value of the motoric component of the GCS[15].

Another component of RTS that affected the impairment of head injury patients was systolic blood pressure. Systolic blood pressure was one of the predictors that might affect the impairment of patients with head injuries. Zafar et al (2011) stated that the systolic blood pressure in the emergency room was very related to the impairment and death of the patient. The risk of dying patients could be seen the value of systolic blood pressure <90 mmHg and> 160 mmHg [23].

Another component of RTS that affected the impairment of head injury was respiration. Respiration was one predictor of exacerbations and mortality in patients with head injuries. Head injury patients with hyperventilation might impair patient outcomes. The occurrence of hyperventilation was caused by a problem in intracranial due to impact or penetration in head injury patients thus causing increased intracranial pressure. Hyperventilation could decrease arterial partial pressure of carbon dioxide resulting in vasoconstriction, decreased cerebral blood flow and increased intracranial pressure [24].

However, the RR component of the RTS had reliable results which was low compared with GCS (0.9368) and systolic blood pressure (0.7326) in predicting the number of life of patients with severe head injury. Factors could affect the breathing of patients with head injury were age, mechanism of injury and the use of mechanical ventilation[20]. Based on the above, the RTS with component of GCS, systolic blood pressure and respiration rate could predict the impairment in patients with head injury.

Conclusion

RTS could predict impairment of head injury patients. RTS with three components to facilitate

the assessment of medical staff in hospital to conduct screening on patients at risk of impairment. Suggestions for further research, should use more sample and prospective method.

The Relationship between Obesity and Fasting Blood Glucose Levels in High School Teachers

Tri Setyawati[1,2], Muhammad Ikbal[3], Fenny Nur Afny[1], Muhammad Nasir[2,4]

[1]Department of Biochemistry, [2]Center for Research on Health, Wellness, and Sustainability, [3]Medical Study, [4]Department of Public and Environmental Health, Faculty of Medicine, Universitas Tadulako, Palu, Indonesia

Abstract

The prevalence of chronic and non-communicable diseases worldwide sharply increasing as an alarming rate including obesity and high level of glucose on blood which can lead to diabetes. The study aimed to look at the relationship between obesity and fasting blood glucose levels. The study was a cross sectional studies involving 57 teachers in Senior High School 5 Palu. The obesity was measure by BMI and glucose level was measured with Gluco Test. The study found a relationship between obesity and glucose level with $\rho = 0.000$.

Keywords: *Obesity, Hyperglycemia, glucose blood level, teahers.*

Introduction

The prevalence of chronic and non-communicable diseases worldwide sharply increasing as an alarming rate including obesity and high level of glucose on blood which can lead to diabetes.[1]Obesity has been subjected as a leading public health problem worldwide.[2] Obesity is one of risk factors of many diseases including Type-2 diabetes, insulin resistance, [3,4] cardiovascular diseases, hypertension, hyperlipidemia, musculoskeletal overloads, chronic renal disease, heart failure and cancers.[5–8] Obesity occurs because of an imbalance between energy intake and energy output (energy expenditures) so that excess energy occurs and stored in the form of fat tissue. This excess energy can be caused by high energy intake or low energy output. The cause of obesity involves several factors such as genetic, lifestyle and psychological.[9] The prevalence of obesity remains increasing in both developing and developed countries. This condition is followed by a high risk of increasing glucose levels on the blood or diabetes particularly type-2 diabetes. In the last 20 decade, the numbers of obesity have tripled in low-income countries which have imitated western life style.[1,8] In 2016, about 1.9 billion people aged 18 years and above were overweight and 650 million were obese.[10]

High fat concentration on human body can cause insulin retention and impaired glucose tolerance and certainly affect blood glucose levels. Blood glucose is a health term that refers to the glucose content in the bloodstream in the body, so it is at risk of pre-diabetes. Meanwhile pre-diabetes is a condition where blood sugar levels are higher than normal (normal blood glucose is 100-125 mg/dL, but not enough to diagnose diabetes but it can lead to diabetes when not handled properly.[1,9,11] Both obesity and diabetes is highly related to eating behavior. Palu is well known with its spicy and high fat food particularly its traditional foods.

Methodology

The study is an observational analytic study with a cross sectional study. This cross sectional study aimed to analyze the relationship between obesity to blood glucose levels among teachers of High School 5 (SMA 5) Palu City, Indonesia. The study applied total sampling to 57 teachers in the school were involved in the study. The data collected on November 2016 in

e-mail: tridentist@gmail.com

SMA 5 Palu during the school time. In prior to the data collection, we managed legal permission in the study location than conducted primarily induction of the study to all teachers. In the primarily induction, we gave the informed concern to participants for those agreed to participate in the study, we then asked them to fasting (min 8 hours) in the data collection day. The obesity was obtained by measuring Body Mass Index (BMI) using height gauge (Microtoise Statumeter) for body height and Weight Gauge for measuring body height. Additionally, blood glucose level was measured with using Gluco Test. Chi-square test was applied to look at the correlation between obesity and glucose level with 95% of confidentiality ($\alpha = 0.05$).

Results

a. Sample Distribution by Gender

Table 1. Sample Distribution by Gender

Gender	Frequency	Percentage (%)
Male	25	43.9
Female	32	56.1
Total	57	100

Resource: Primary Data. 2016

Table 1 showed the total participants based on their gender. There were 57 teachers participated in the study; 25 (43.8%) male and 22 (56.2%).

b. Distribution of BMI (Body Mass Index)

Table 2. BMI (Body Mass Index)

Variables	Obesity		Normal	
	N	(%)	N	(%)
Sex				
Male	5	31.25	20	48.7
Female	11	68.75	21	51.3
Total	**16**	**100**	**41**	**100**
Age Group (Year)				
26-35	1	6.25	6	14.6
36-45	4	25	20	48.8
46-55	10	62.5	15	36.6
56-65	1	6.25	0	0
Total	**16**	**100**	**41**	**100**

Resource: Primary Data. 2016

The study found that there were 16 (28.1%) obese teachers and 41 (71.90%) non-obese teachers involved in the study. The highest incidence of obesity was experienced by teachers aged 46-55 years old (62.5%) and followed by teachers aged 36-45 years old (25%).

c. Distribution of Blood Glucose Level

Table 3. Distribution of Blood Glucose Levels

Variables	High (Hyperglycemia)		Normal	
	N	(%)	N	(%)
Sex				
Male	8	47	17	42.5
Female	9	53	23	57.5
Total	**17**	**100**	**40**	**100**
Age Group (Year)				
26-35	0	0	7	17.5
36-45	5	29.4	19	47.5
46-55	11	64.7	14	54
56-65	1	5.9	0	0
Total	**17**	**100**	**40**	**100**

Resource: Primary Data. 2016

17 participants of the study suffered high blood glucose levels (hyperglycemia), 47% and 53% were male and female respectively. 64.6% happened among teachers aged 46-55 years old and followed by teachers aged 36-45 years old (29.4%).

d. The correlation Between Obesity and Levels of Blood Glucose

Table 4. The Correlation between Obesity and Levels of Blood Glucose

BMI	Blood glucose level				p Value	Phi Cremmer	Risk Ratio
	High (Hyperglycemia)		Normal				
	N	%	N	%			
Obesity	13	76.5	3	7.5	0,000	0,702	8,3
Non Obesity	4	23.5	37	92.5			
Total	17	100	40	100			

Resource: Primary Data 2016

Table 4 above shows that teachers with obesity are more likely to suffer from hyperglycemia (76.5%) compared to non obese teachers (23.5%). This is also supported by the results of the Chi-Square test where the value of ρ <α is = 0,000 which shows a relationship between obesity and hyperglycemia. Furthermore, to find out the strength of the relationship between the two variables, the Phi test is performed, from the statistical results found the Phi value of 0.702 and is in the range 0.501 to 0.750. This means that obesity has a strong relationship with blood glucose levels. Based on the results of this study there was a 8.3 risk ratio, so obese people were 8.3 times more likely to experience an increase in blood glucose levels compared to people who were not obese.

Discussions

The chi-square correlation test found that there was a relationship between obesity and high blood glucose levels (hyperglycemia). This is based on the value of p <value α which is p = 0,000. A similar result was obtained by Noviara which states that there is a relationship between obesity and increased blood sugar levels. Obesity is a predisposing factor for the rise of blood sugar levels, this is due to several things, namely, beta cells of the island of Langerhans become less sensitive to stimuli or due to rising sugar levels and obesity will also reduce the amount of insulin receptors in cells throughout the body.(12)

According to Septa, the condition of obesity is influenced by the imbalance of excess energy intake rather than the excretion and lack of physical activity. Fat accumulation in fat cells resulting in fat cell hypertrophy (adipocytes) is the process of obesity begins. When adipocytes reach a certain level, there will be stimulation of the formation of new fat cells from the fat cells preadipocytes so that there is addition or hyperplasia and adjacent fat cells undergo hypertrophy. In adults it is proven that fat cell hypertrophy will cause increased inflammatory mediators such as IL-6 and TNF-α which are thought to inhibit phosphorylation of IRS-1 (insulin substrate receptor), so that the mechanism of action of insulin is disrupted and will cause insulin resistance.(13)

The primary research shows that time insulin resistance factors began to be dominant as a cause of hyperglycemia and various tissue damage. The high level of insulin resistance at this stage can also be seen from the increase in fasting blood glucose levels. This is in line with what happens in liver tissue, the higher the level of insulin resistance, the lower the inhibitory capacity of the glycogenolysis and gluconeogenesis processes, and the higher the level of glucose production from the liver. Hyperglycemia that occurs in disorders of glucose metabolism due to impaired insulin performance (deficiency and resistance), then gives various effects of metabolism and other tissue damage directly or indirectly.(14)

Disorders of the mechanism of action of insulin can cause obstacles in glucose utilization and increase in blood glucose levels. This will cause glucose to remain only in the blood so that blood glucose levels increase. Clinically, the disorder is known as diabetes mellitus. (14) An increase in mRNA Lipopolysaccharides (LPS) -induced TNF-α factor (LITAF) and protein levels along with increased BMI indicate a parallel relationship between LITAF and metabolic disorders. According to the study, LITAF is activated in obese patients and contributes to the development of obesity which induces inflammation and insulin resistance, based on the fact that LITAF plays a role in the inflammatory process in regulating the expression of TNF-α, IL-6 and MCP-1 which results in insulin resistance, and TLR4, one of the LITAF receptors in macrophages can also be stimulated by free fatty acids, which can cause an inflammatory process in obese patients.(15)

Lipopolysaccharides (LPS) -induced TNF-α factor (LITAF) is a TNF-α description regulator, which should play a role in the immune mechanism against infection. The LITAF gene is significantly present in the lymph, lymph nodes, and peripheral blood leukocytes. TNF-α is a powerful trigger for proinflammatory adipocytokinin such as IL-6, MCP-1, leptin and PAI-1, and it is very involved in the inflammatory process in obese patients. The increase in TNF-α observed in the fatty tissue of obese patients shows a direct relationship to the emergence of insulin resistance in obese patients. Insulin binds and acts primarily through insulin receptors, as well as receptor insulinlike growth factor-1 (IGF-1). Cellular insulin action has a variable effect on the post-reseptor pathway in target cells.(16)

According to Lee et al. (2007), obesity is the most common cause of insulin resistance associated with a decrease in the number of receptors and failure of post-receptors to activate tyrosine kinase which is a subunit b of insulin receptors activated when insulin binds to subunits a. Activation of this complex will

activate autophosphorylase and insulin-mediated action to control blood sugar levels. Failure to deliver signals to regulate blood sugar levels causes interference with blood glucose levels.[16–18]

Weight loss has a beneficial effect on comorbid obesity. Even a weight loss of 5 to 10 percent of the initial weight can result in significant health improvements. Although no retrospective studies have shown changes in mortality rates with weight loss in obese patients, with weight loss, a reduction in these risk factors is thought to reduce the development of type 2 diabetes and cardiovascular disease. There is strong evidence that weight loss in obese individuals and overweight reduces risk factors for diabetes and cardiovascular disease. Other strong evidence also shows that weight loss can reduce blood pressure in overweight normotensive individuals and hypertension; reduce serum triglycerides and increase HDL-cholesterol and generally result in a reduction in total serum cholesterol and LDL cholesterol. Weight loss can also reduce blood glucose levels in overweight and obese individuals without diabetes; and also reduce blood glucose levels and HbA1c in some patients with type 2 diabetes.[19]

Conclusions

A strong correlation between obesity and high level of blood glucose among teacher in Senior High School 5 Palu. 16 teachers suffered obesity and 13 of them were hyperglycemia with $\rho = 0.000$ or $\rho \leq 0.05$.

Conflict of Interest: I declare that there is no conflict of interest related to the study.

Ethical Clearance: The study has been approved by Ethical Commission of Faculty of Medicine, Universitas Tadulako, No. 1107/UN 28.1.30/KL/2016.

Funding: This study is self-funded.

A Case Study of the Health Adaptation of Former Schizophrenics in Communicating with the Bugis Makassar Community in the South Sulawesi Province

Tuti Bahfiarti[1], Arianto[1], Muhammad Harun Achmad[2]

[1]Departement of Communication, Faculty Social and Political Science, [2]Department of Pedodontic, Hasanuddin University, Faculty of Dentistry, Hasanuddin University, Makassar, Indonesia

Abstract

Objective: This study aims to identify and categorize the cases of health adaptation of former schizophrenic patients in the process of interaction and communication with the community after experiencing a healing phase.

Method: This research uses a qualitative method with the type of case study. The technique of determining informants using non probability sampling is purposive sampling intentionally characterizing former schizophrenics who have interacted and communicated directly with the internal and external environment. Field data collection techniques through primary data, such as participant observation and in-depth interviews with former schizophrenics. The informants selected and analyzed were nine cases of former sufferers who, on average, were aged 34 to 60 years. *Results*. This study found a categorization of health adaptation cases of former schizophrenics who had been cured medically and had initial interactions with the internal and external environment. Based on the analysis of health adaptation cases, four phases are categorized, namely: the healing phase, the interaction phase, the acceptance phase, and the openness phase. After going through these four phases, it was found a pattern of health adaptation of former schizophrenic patients in interacting and communicating with the Bugis-Makassar community. First, the manifest pattern is the ability of former schizophrenics to deal with and overcome internal and external environmental problems. The manifest pattern is characterized by positive self concepts and self disclosure is increasingly open. Second, latent patterns indicate the inability of former schizophrenics to overcome problems in the external environment. This gives rise to negative self concepts and closed self disclosure to communicate with the Bugis-Makassar community. *Conclusions.* Based on an analysis of nine cases of health adaptation of former schizophrenic patients in communicating with the Bugis-Makassar community, it was more dominant in the latent pattern than the manifest pattern. This is due to the higher openness in the internal environment compared to the external environment due to the shame of 'siri' in themselves and the nuclear family. As a result, fear arises when their families who are former schizophrenics suffer from lack or are not accepted in the Bugis-Makassar community.

Keywords: *Health Adaptation, former schizophrenics, Communication, Bugis Makassar.*

Introduction

Schizophrenia is a mental picture due to disharmony in the thought process, feelings and actions so that it affects social behavior. Schizophrenia is a schizophrenic reaction suffered by individuals and is regressive to avoid tension and anxiety in the self so as to cause delusions and hallucinations.[1] In the Bugis-Makassar community, the type of schizophrenia is still considered a psychiatric disease that although it has been declared medically cured from a doctor, people's perceptions of this disease still cause negative stigma. As a result, the nuclear family and community have a fear of schizophrenia.[1,2]

A very interesting factor is that South Sulawesi is in third place with a prevalence of 0.26% after Yogyakarta

on Java and Aceh on Sumatra. Data of the South Sulawesi Special Region Hospital indicates that the data for schizophrenia patients tends to increase every year. This increase was shown by patients from the Toraja area. Medical record data of South Sulawesi Province Special Region Hospital in 2016 of 348 patients recovered with an initial diagnosis of a rage with 240 patients and anxious 108 patients.

Schizophrenia is an interesting phenomenon in South Sulawesi, where the majority of the population is ethnic Bugis-Makassar. Streotype factors and personal prejudice against schizophrenia cause the Bugis-Makassar community to tackle this type of disease through non-medical treatment, such as traditional healers and even 'inclusion'. The term shaman or 'sanro' in the Bugis-Makassar community, is a person who is an expert in treating diseases traditionally.[5,6.8]

The specification of the focus of this research is to find, categorize the process of interaction of health adaptation carried out by former Schizophrenic patients in communicating with the Bugis-Makassar community.

Method

Research Location: The health adaptation case study of a former schizophrenic sufferer in communicating with the Bugis-Makassar community is located in South Sulawesi, namely; Parepare City, Makassar City and Wajo District..

Types and Sources of Data: This type of research uses qualitative method referring to case studies. The aim is to reveal the health adaptation process of former Schizophrenia sufferers in communicating with the Bugis-Makassar community. The technique for determining informants through non probability sampling is purposive sampling based on the terms and objectives of the study. The informant's requirements are first, a former schizophrenic who has interacted directly with the community at least 3 months after being medically recovered from a doctor. Second, former schizophrenics who are willing to analyze their cases sequentially and in detail. Informant cases are based on research data sources, namely direct observation of social life. Indepth interview techniques by collecting individual narratives of former schizophrenics based on medical records, recover, interact and communicate with their environment. This technique can explore deeply the lives of former schizophrenics before and after recovery.

Data Collection Techniques: In analyzing the identification and categorization data of health adaptation cases of former schizophrenic patients in the process of communication and interaction is done through the analysis of Miles.[12] The steps of Huberman's analysis in qualitative research are: data condensation steps (data condensation), presenting data (data display), and conclusion drawing and verification. Data condensation refers to the process of selecting, focusing, simplifying, abstracting, and transforming.

Results

Humans are social creatures who need direct interaction and communication with their environment. The need to communicate with other individuals, such as family, and peers is a basic need that must be met. Former schizophrenics are individuals who need a process of direct interaction and communication with the internal and external environment. Human psychological needs to communicate and need other people in social life.

Research informants are former schizophrenics who have been medically recovered from mental disorders due to physical, psychological and socio-cultural changes. Schizophrenics have a negative stigma in the views of some Bugis-Makassar people. Public perception assumes that Schizophrenia is a curse that must be avoided. As a result, people tend to keep their distance and direct contact with them. This is due to the myth of schizophrenia which is considered a "crazy" disease in which individuals experience hallucinations, illogical thoughts, cause aggressive behavior, and often scream hysterically. Even schizophrenics lose their ability to think, hallucinating causing them to be seen talking to certain objects that are not in front of them.

The results of tracing the case were carried out in three locations in South Sulawesi Province, namely Makassar City, Parepare City and Wajo Regency. In tracking down informants who were willing and open to be observed and interviewed on an ongoing basis found only nine people. This factor is caused by the closure of former schizophrenics when first interacting with the external environment. Shame or known as 'siri' in the Bugis-Makassar community is a barrier to the openness of the causes of the illness. The findings of informant characteristics based on the medical records of former schizophrenics can be seen in the following Table 1:

Table 1. Medical Records of Former Schizophrenics

Informant Number	Informant Former Schizophrenic Patient	Age (Years)	Gender	First Age Category Suffering from Schizophrenia (Years)	Age of Medical Treatment Period (Years)	Alternative Early Treatment
1.	Andi	60	Male	35	37	Shaman
2.	Lia	45	Female	37	37	Medical
3.	Baso	40	Male	30	31	Shaman
4.	Arlina	43	Female	22	22	Medical
5.	Adi	45	Male	21	26	Shaman
6.	Rafi	48	Male	33	33	Medical
7.	Elia	40	Female	35	35	Medical
8.	Ahmad	34	Male	22	29	Shaman
9.	Dani	50	Male	42	42	Medical

Source: Primary Data, 2019.

The data in Table 1, indicates that the informants of former schizophrenic patients had an average age of 40-45 years of age of 5 people. Age 46-60 years as many as 3 people and only 1 person aged 34 years. This condition is different from the results of Dindia's research (2000b: 24) which found women to be more open than men. Dindia found cases that women were more open about expressing themselves to women than men to women; or women are more open about expressing themselves to men than men to women. Then, an analysis of 205 studies assessed gender differences in self disclosure.) find women more open than men.[14] That when women told stories with their friends, they usually involved emotional feelings in expressing themselves.[15]

Analysis of the patient's medical record when first experiencing initial symptoms tends to choose the hospital or medical treatment as many as 5 cases. There were 4 cases that used medical treatment or traditional medicine for 1 to 4 years. Pure schizophrenia is a medical disease that has the potential to affect everyone.

Health Adaptation Phase Process of Former Schizophrenic Patients in Communicating with the Bugis-Makassar Society: The case of health adaptation of former schizophrenics starts with self-concept as a mirror for the individual in seeing himself. Individuals will react to the environment according to their own self-concept. The phase is the healing phase, the interaction phase, the acceptance phase, the openness phase. The characteristics and characteristics of the four phases can be seen in Table 2 below:

Table 2. Health Adaptation Phase Former Schizophrenic Patients

Early Phase of Healing	Interaction Phase	Acceptance Phase	Openness Phase
Passive: Individuals choose to remain silent and less interact and communicate with the external environment.	**Internal:** Individuals tend to be open and interact with nuclear families.	**Reception:** Individuals are personally accepted by the external environment.	**Closed:** Individuals have gone through the process of healing, interaction, acceptance, but still closing themselves with the external environment.
Active: Individuals are active and have their own initiative to open and interact, communicate with the external environment.	**External:** Individuals tend to be closed or silent when interacting with the community in their environment	**Rejection:** Individuals are personally denied the external environment.	**Open:** Individuals have gone through the process of healing, interaction, acceptance, but still closing themselves with the external environment.

Source: Primary Data, 2019

Based on the findings and categorization of health adaptation cases of former schizophrenics in four phases: First, the healing phase. In this phase, former passive schizophrenics remain silent, lack of interaction and communication with the external environment. Passivity is caused by feelings of 'siri' shame in the self so that it affects the negative self concept that is owned. That one's self-concept is oriented towards positive self-concept and negative self concept.[16,17] Former schizophrenics in the passive phase are in the category of negative self-concept. The behavioral characteristics of former schizophrenics consider themselves helpless, diseased and afraid of being ostracized in society.

Second, the interaction phase. This phase is marked by the motivation of former schizophrenics to interact and communicate with the internal and external environment.

Third, the acceptance phase. This phase is marked by the feeling of being accepted or rejected by the Bugis-Makassar people who still believe the myths of the history of schizophrenia.

Fourth, the openness phase. This phase category is characterized after the individual goes through a process of healing, interaction, acceptance. Although, the internal and external environment has been open to receiving former schizophrenics, there are still some who remain closed, especially in the external environment.

Pattern of Health Adaptation Former Schizophrenic Patients in Communicating with the Bugis-Makassar Society: Health adaptation is a way for former schizophrenics to adapt themselves to the internal and external environment to communicate with the Bugis-Makassar community. Based on the analysis of nine cases found two patterns of health adaptation of former schizophrenics communicating with the Bugis-Makassar community, namely the manifest pattern and the latent pattern. The manifest pattern is openness and positive self acceptance..

Furthermore, the latent pattern is marked by the closure of former schizophrenics who do not interact with the Bugis-Makassar community. The reason is that former schizophrenics fear the risk of resistance from the surrounding community. Former schizophrenics prefer to stay at home or do homework activities. Factors of self confidence and embarrassment 'siri' cause them to choose to close themselves with the surrounding environment. Former schizophrenics perceive that mental illness suffered will never be completely healed and must continue to take medication for life. Medical control through drugs makes former schizophrenics feel that the illness can recur. Finally, they have a negative self concept that tends to live in fear and not trust others too much. Based on tracing the cases of former schizophrenics, there were two patterns of health adaptation of former schizophrenics in communicating with the Bugis-Makassar community, as shown in the following Table 3:

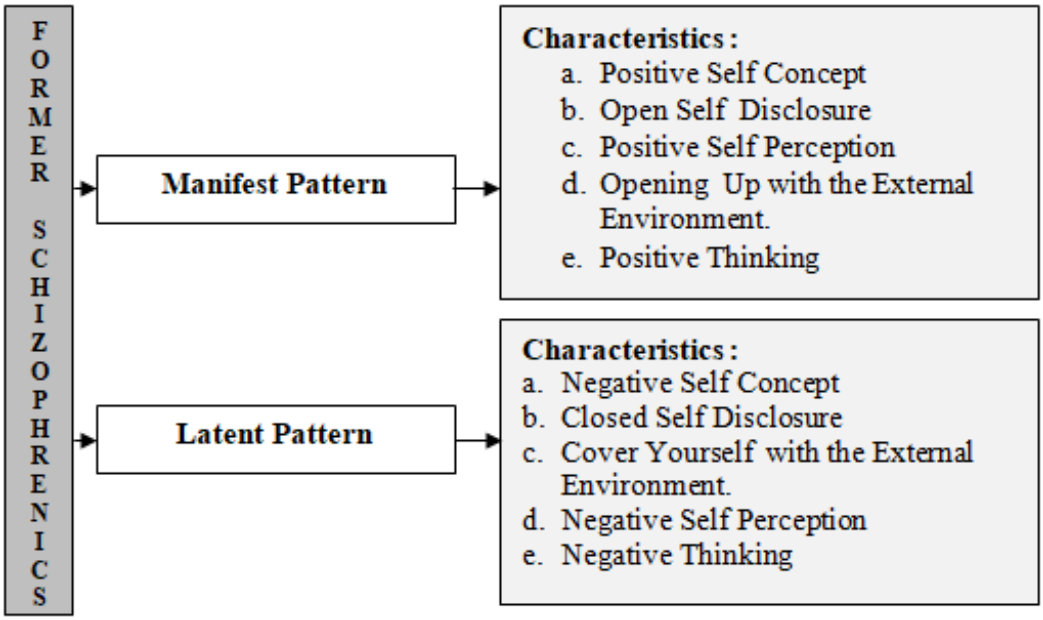
Table 3. Pattern of Health Adaptation Former Schizophrenic Patients

Informant Former Schizophrenic Patient	Pattern of Health Adaptation	Former Schizophrenic Patient
	Manifest Pattern	Latent Pattern
Andi	√	
Lia		√
Baso		√
Arlina		√
Adi		√
Rafi	√	
Elia		√
Ahmad		√
Dani	√	√

Source: Primary Data, 2019

The results found that the pattern of health adaptation cases of former schizophrenics in communicating with the Bugis-Makassar community was more dominant than the latent pattern of manifest patterns. Latent patterns indicate an inability to overcome the problems of self concept and self disclosure in former schizophrenics.

There are only three informants in the manifest pattern category who are able to face and overcome problems to interact and communicate with the internal and external environment former schizophrenics who are in the manifest pattern have had positive concepts and increasingly open self disclosure, such as, Table 4 follows:



Source: Primary Data, 2019

Figure 1. Characteristics of Health Adaptation Patterns of Former Schizophrenic Patients

In the case of former schizophrenics, community acceptance factors become a variable that can cause them to be in manifest or latent patterns. That is, the more positive acceptance of the internal and external environment of former schizophrenics, the more positive self concept and self disclosure they have. Positive self concept can lead to more effective individual interpersonal abilities, intellectual abilities and environmental mastery. The concept of self is not innate but rather through a process of learning and experience of interaction with others. Self concept is a life cycle that can change the mindset, positive outlook, culture, and socialization with the environment. For example, nuclear family, peers, and the community.

Conclusions

This study found the categorization of health adaptation cases of former schizophrenic patients in four phases, namely: the healing phase, the interaction phase, the acceptance phase, and the openness phase. The phase process of the former schizophrenic patient is a different health adaptation for each individual in interacting and communicating with the Bugis-Makassar community. The manifest pattern has the characteristics of a positive self concept and self disclosure is increasingly open. Latent patterns are characterized by negative self concepts and closed self disclosure to communicate with the Bugis-Makassar community. The results show that the health adaptation of former schizophrenics is more dominant in the latent pattern than the manifest pattern. The condition is caused by self concepts and self disclosure of former schizophrenics, nuclear family, and the perception of acceptance of the Bugis-Makassar community.

Acknowledgments: We would like to thank the collaborative research with students of the Communication Studies undergraduate program at Hasanuddin University for trust and funding in 2018-2019. Furthermore, the Bugis-Makassar community in the province of South Sulawesi, in particular, former schizophrenics who participated in the process research. Nurul as a team of enumerators who have contributed in the implementation of research.

Conflict of Interest: There is no conflict of interest in this study.

Risk Factors Associated with HIV Infection among Male to Transvestites in Five Cities in Indonesia in 2015

Udin Komarudin[1], Tri Yunis Miko Wahyono[2]

[1]Master of Epidemiology Student, [2]Department of Epidemiology, School of Public Health, University of Indonesia, Depok, West Java, Indonesia 16424

Abstract

Transgender people are 49 times more likely to live with HIV than common people. In 2015 HIV prevalence in Indonesia increased from 2011. This study aims to determine the risk factors associated with HIV infection in transvestites. This study used a cross-sectional design, using data from the Indonesian Ministry of Health's Integrated Biological and Behavior Survey in 2015, the study population was all transvestites in five cities in Indonesia, the sample was someone who was biologically male but behaved like a woman, aged ≥15 years interviewed and have complete data. We investigate risk factors associated with HIV infection. Data analysis used the SPSS application, for p-value statistical tests <0.05 were considered statistically significant. Results: 64% of transvestites aged over 30 years, 57% had low education, 67% of transvestites had anal sex in the past week, 86% of transvestites used condoms during sex, the results of multivariate analysis showed that factors associated with HIV infection were having sex with male client at last week (OR=1.60, 95% CI: 1.04-2.45); age ≥30 years (OR=1.61, 95% CI: 1.10-2.38) and had a history of symptoms of STIs in the last year (OR=1.88, 95% CI: 1.24-2.85). Risk factors associated with HIV infection among transvestites in five cities in Indonesia are having anal sex with male client in the past week; Age ≥30 years; and have a history of symptoms of STIs in the past year.

Keywords: *Risk Factors, HIV Infection, transvestites, Indonesia.*

Introduction

HIV/AIDS is an infectious disease that is still a major health challenge worldwide. Since the beginning of the epidemic, more than 70 million people have been infected with the HIV virus and around 35 million people have died from HIV. Globally, 36.9 million (31.1-43.9 million) people were living with HIV at the end of 2017. An estimated 0.8% (0.6-0.9%) of adults aged 15-49 years worldwide living with HIV, although the burden of the epidemic varies greatly between countries and regions.[1]

Corresponding Author:
Udin Komarudin
Master of Epidemiology Student, School of Public Health, University of Indonesia, Depok, West Java, Indonesia 16424
e-mail: udinkomarudin7509@gmail.com

In 2016, Indonesia had 48,000 (43,000-52,000) new HIV infections and 38,000 (34,000-43,000) AIDS-related deaths. There were 620,000 (530,000-730,000) people living with HIV in 2016. The key populations most affected by HIV in Indonesia are: Sex workers, with an HIV prevalence of 5.3%. Gay men and other men who have sex with men, with an HIV prevalence of 25.8%. People who inject drugs, with an HIV prevalence of 28.76%. Transvestites, with an HIV prevalence of 24.8%.[2]

Transvestites were one of the groups most affected by the HIV epidemic and 49 times more likely to live with HIV than the general population.[3] HIV prevalence among Transvestites was higher than male transgender.[4] STBP data from the Indonesian Ministry of Health shows that from 2007 to 2015 HIV prevalence among transgender women had fluctuated, from 24% in 2007 to 22% in 2011 and increasing again to 24.83% in 2015.[5-7]

Social, economic and legal exclusion, working as

sex sellers, risky sexual behavior and injecting hormones put transvestites into vulnerable individuals infected with HIV.[8] Various studies from around the world have described the increase in sexual risk behavior among Transvestites. Transvestiteswho have sex with men were more likely to take receptive roles during anal sex than men who have sex with men (MSM), use fewer condoms, and have a higher number of sexual partners.[9-12]

Transvestites individuals throughout the world face very high stigma and discrimination, lack of social and legal recognition of their gender, and exclusion from employment and education opportunities.[13,14] For many Transvestites, sex with men can provide important validation about their gender identity.[15-17] This study aims to determine the risk factors associated with HIV infection among transvestites.

Method

This study uses a cross-sectional design using secondary data from the Indonesian Ministry of Health's Integrated Biological and Behavioral Survey (IBBS) conducted in March-June 2015 in 5 cities in Indonesia, namely DKI Jakarta, Bandung, Semarang, Surabaya and Malang. IBBS is a continuous survey, started in 2007, by taking behavioral data and biological measurements together using questionnaires and blood tests. The survey collects information data on transvestites using multistage random sampling, the first stage is to select survey location samples according to the sample framework that has been made. The choice of Probability Proportional to Size (PPS) sample location, with 'Size' is the number of populations in each location. The second stage is to select samples (respondents) who meet the requirements in each selected location. Sampling is done randomly or directly in accordance with those found.[5,7,18] The sample framework for transvestites is a list of locations for transvestites, both sex workers and those working in salons, which are equipped with estimates of the number of Transvestites populations in each location, information on key people who can be contacted at each location, both names and telephone or mobile, and information about the exact visit time for the interview. The data of the Transvestites were obtained from the results of field inventory and tracking at the time of registration of the sampling location based on the transvestites key population.

The population of this study is transvestites. Transvestites included in the survey are not only transvestites who offer sex but all transvestites including transvestites who work in salons. While the sample is someone who is biologically male who is 15 years of age or older and has lived in a survey city for at least one month, and is recognized by friends of profession, "mami", or NGO workers as a transvestite. The number of samples obtained was 1,003 respondents, 8 respondents refused to do a biological examination, thus the number of samples to be analyzed was 995 respondents.

We investigate the factors associated with HIV infection in Indonesia, we include demographic and behavioral factors. We categorize the level of education completed by respondents to low and high education levels, age is categorized as less than 30 years and more than 30 years, the age of first time having sex is categorized as less than 15 years and more than 15 years. We included sexual behavior such as condom use during sex in the yes and no categories, use of lubricants during sex with no and no, history of selling sex in the yes and no categories, having anal sex in the past week in the yes and no categories. We also include information on the number of different customers served in the past week in the category of 0-1 people and more than 2 people. Besides that, we also included a history of STI symptoms (sores around the genitals and anus, warts around the genitals and anus, fluid coming out of the genitals and anus, pain when urinating and lumps around the anus) in the last year in the yes and no categories. For biological information, HIV status measured by rapid test and Syphilis status was carried out by rapid RPR and TPHA blood tests. Data analysis in this study was conducted to look at the risk factors for the incidence of HIV infection using logistic regression tests with a 95% confidence level. Data analysis was performed using SPSS version 16.0.

Results

In the 2015 Integrated Biological and Behavior Survey successfully interviewed 1003 respondents, 995 respondents were willing to take an HIV test with 24.83% of them HIV positive.

Table 1. Bivariate Analysis of Risk Factors Associated with HIV Infection among Transvestites in 5 cities in Indonesia 2015

Characteristics	HIV		Non HIV		OR	95% CI	P Value

Negative	122	26.3	341	73.7			

From the results of bivariate analysis obtained 8 (eight) variables that have a P value of less than 0.25 which will then be included in the multivariate model, namely: age variable with p-value=0.053; variable had sold sex last year with p-value=0.006; variable Sexual Anal with Male Customer Last Week with p-value=0.084; Variable Number of Different Male Customers Served by Anal Sex Last Week with p-value=0.226; variables Using Condoms When Last Anal Sex with Male Customers with p-value=0.199;

variable has a history of torn condoms in the last month with p-value=0.163; the variable has a history of STI symptoms last year with p-value=0.000; and syphilis status variables with p-value=0.020 (Table 1).

Table 2. Final Model of Multivariate Analysis of Risk Factors for HIV Infection among Transgender in 5 Cities in Indonesia in 2015

Risk Factor	B	Wald	P	OR	(95% CI)	
					Lower	Upper
Having Anal Sex with Male Clients in the Last Week	0.469	4.615	0.032	1.60	1.04	2.45
Age ≥ 30years old	0.476	5.749	0.017	1.61	1.10	2.38
Has a history of STIs symptoms last year	0.629	8.686	0.003	1.88	1.24	2.85

Of the eight variables with p-value <0.25 entered into multivariate analysis, after a likelihood test was obtained, only 3 (three) variables were entered into the final model of multivariate analysis, namely variable Having anal sex with male customers in the past week, age variable and history had history symptoms of STIs in the past year (Table 2).

Discussion

The 2015 IBBS survey among transvestites shows that HIV prevalence is still high. HIV prevalence among Transvestites increased in Indonesia from 21.82% in 2011 to 24.82% in 2015.[18,19] The results of this study illustrate that older age in transvestites and low levels of education are still high among Transvestites groups, this is similar to the results of previous studies conducted by Prabawanti et al.[20,21]

We found a significant association between having had a history of STI symptoms in the past year and the incidence of HIV infection. Transvestites who have had symptoms of STIs for the past year have a three times greater risk of HIV infection than those who have never experienced symptoms of STIs. The existence of warts around the genitals and/or anus indicates that a person suffers from a sexually transmitted infection (STI) condyloma acuminatum (veneral warts), a sexually transmitted infection caused by Human Papillomavirus (HVP), besides this virus can cause lesions in the cervix, vagina, urethra anus.[22] Together with the presence of syphilis infection, once had symptoms of STIs (sores/ sores around the genitals, wounds/sores around the anus, and lumps/swelling around the anus) can increase the risk of transmission of HIV infection because mucosal disorders in the form of anus lesions can facilitate HIV infection.[23]

In addition, having anal sex with male customers in the past week is also a risk factor for getting HIV. Anal sex is a high-risk sexual behavior for HIV transmission when compared to vaginal sex or oral sex. Most transvestites are receptive partners in every anal sex. Receptive anal sex is far more at risk for HIV.[24]

Age also has a very important role in the occurrence of HIV infection in transvestites. Older people are vulnerable to HIV infection due to the immune system in their bodies. Kalayjian et al 2003 revealed that the thymus gland is an important organ involved in the development of the human immune system and serves as the main location for maturing T lymphocytes.[25]

In addition to the three factors above, the occurrence of HIV infection in transvestites cannot be ignored from several other factors. When a transvestite becomes a sex worker, then she will automatically have sex with many different partners alternately. In many Transvestites populations in the world, on average transvestites work as sex workers. Low Socio-Economic level factor encourages transvestites to seek additional income by selling commercial sex services to some people, this will increase vulnerability to HIV infection. The findings of this study are the same as that of Fernandes et.al in Brazil reporting that 75.7% of Transvestites people sell sex.[26,27]

The use of condoms and lubricants and consistent use of condoms during sexual intercourse with male customers also play a role in the incidence of HIV infection in transvestites. The finding that a low proportion of transvestites who reported consistent condom use might be influenced by the role of their sex partners, arguing that the use of condoms could reduce pleasure during sex.[20,27]

The main limitation of the study is that this study may still have a selection bias because disease status can influence subject selection. Information bias is also likely to occur because the information extracted is retrospective based on memory and because respondents may not be fully honest in answering any sensitive questions related to risky behavior.

Conclusion

Risk factors associated with HIV infection among transvestites in five cities in Indonesia are 1) Having anal sex with male customers in the past week; 2) Age ≥30 years; and 3) Have a history of symptoms of STIs in the last year. The most dominant factor is having a history of STI symptoms in the past year.

Abstract

Implementation of the system work in an industry has a system of shift work, where the work shift has consequences that need to be realized by each worker, The production process of the Department of Spinning Winding part PT Bintang Asahi Textile Industry has a system of shift work were divided into three shifts; morning shift (6:00 to 14:00), the day shift (14:00 to 10:00 p.m.) and the night shift (22:00 to 6:00). *Shift* Employers have a negative impact that can affect workers one of them in the form of physiological aspects of circadian rhythms, so it can affect an increase in blood pressure, This study aimed to analyze the relationship between blood pressure shifts with workers exposed to noise exceeding the NAV Department Spinning Winding part PT Bintang Asahi Textile Industry. This research uses a quantitative research design with cross sectional analytic. The population in this study is a part Spinning Winding Department worker with a sample 54 respondents taken with total sampling. Data analysis using Chi Square test. Statistical analysis showed no association with blood pressure shift workers exposed to noise exceeding the NAV Department Spinning Winding part PT Bintang Asahi Textile Industries ($p = 0.043$ and $p = 0.007$).

Keywords: *Shift Work, Blood Pressure.*

Introduction

Implementation of the system work in an industry has a system of shift work, where the work shift has consequences that should be realized by every worker, because of differences in working conditions between the morning shift, day and night. Shift work is defined as work at certain hours of the attempt by the company to maximize the productivity of labor[1]. Shift work does have advantages for workers, can do other activities such as morning and afternoon. However, shift work could increase the risk of health problems for workers due to work schedule that is not balanced, so that workers are more prone to health problems[2].

PT Bintang Asahi Textile Industry or abbreviated to PT BATI is a company engaged in textiles that have some departments. On the Winding, the process of changing spools of thread on the tube to form a cone (yarn shape ready for the market). Department Spinning Winding section has a number of employees by 54 workers and divided into 3 shifts; morning shift (6:00 to 14:00), the day shift (14:00 to 22:00) and night shift (22:00 to 6:00). Work environment for noise after preliminary measurements, it is known that the three points obtained by the average yield on the aircraft engine noise by 87.6 dBA (point 1), then in the middle of the machine of 88.5 dBA (point 2), and at the end of the machine at 86.8 dBA (point 3). The third point is the nearest area workers are doing the job. NAB workplace standards regarding noise should not exceed 85 dBA. The noise generated at the Ministry Spinning Winding section exceeds NAB is

85 dBA, the working environment has a high noise can affect blood pressure[5].

According to research conducted by Anggraini (2017) results indicate p value of 0.000 <0.05 so that it can be concluded there is a relationship between blood pressure of shift work. Based on interviews to 15 workers on the morning shift, day and night average worker complained of excessive headaches, eye dizzy and feel tired.

Material and Method

This research uses a quantitative analytical research with cross sectional approach that is where the data related to the dependent variable or free (shift work) and independent or dependent (blood pressure) that will be collected and observed in the same time. This research was conducted on December 29, 2017. A study of shift work and blood pressure of workers conducted in the Polyclinic PT Bintang Asahi Textile Industry.

The population in this study were all employees of the Department of Spinning Winding part in PT. Save Asahi Textile Industry some 54 workers. The sampling technique used in this study is total sampling, where researchers use the subject of the population of the morning shift, day shift and the night shift. Data retrieval independent variables that shift work using a questionaire with informed consent form, then the dependent variable blood pressure using a tension meter Type digital OMRON HEM 7130. The data analysis is univariate and bivariate analysis.

a. **The Univariate Analysis:** The analysis is used to describe the characteristics of the studied variables, both dependent and independent variables. Analysis conducted to describe each of the variables that shift work and blood pressure. These data generate a frequency distribution and percentage of each variable.

b. **The Bivariate Analysis:** The analysis used to determine the relationship shifts with workers' blood pressure. The results of the statistical test Chi Square test. If the p value <0.05 then Ho is rejected and if the p value> 0.05 then Ho is accepted.

Findings:

a. Univariate Analysis

1. Environmental characteristics

Table 1. Measurement Method Department Spinning Winding part PT Bintang Asahi Textile Industry

Shift	Measuring point	Average Noise (dBA)
Morning	Point 1 (Parent)	88.90
	Point 2 (Central)	90.85
	Point 3 (End)	89.98
daylight	Point 1 (Parent)	89.99
	Point 2 (Central)	90.75
	Point 3 (End)	88.98
Night	Point 1 (Parent)	89.95
	Point 2 (Central)	89.97
	Point 3 (End)	89,90

Noise measurements carried out at three points with 10 measurements. On the morning shift at 07.00 is obtained an average yield of noise at the parent amounted to 88.90 dBA machine (point 1), in the central part of the engine of 90.85 dBA (point 2), and at the end of the machine by 89.98 dBA (point 3). Afternoon shift 13.00 average result of noise in the parent's share amounting to 89.99 dBA machine (point 1), in the central part of the engine of 90.75 dBA (point 2), and in the end amounted to 88.98 dBA machine (point 3). The night shift at 23:00 obtained an average yield of noise at the parent amounted to 89.95 dBA machine (point 1), in the central part of the engine of 89.97 dBA (point 2), and at the end of the machine at 89,90 dBA (point 3).

Table 2. Distribution Characteristics of Respondents In Labor Department Spinning Winding part PT Bintang Asahi Textile Industry

Characteristics of Respondents	Systolic Blood Pressure						Blood Pressure Diastole							
	Increase		Decline		Total		Increase		Decline		Permanent		Total

	120	125	60	83
Average	**118,2**	**127,8**	**68,9**	**77,4**

The results of measurements of systolic and diastolic blood pressure in 54 respondents indicated that the morning shift showed the average systolic blood pressure before work amounted to 120.4, while the systolic blood pressure after work an average of 124.6. Diastolic blood pressure before working an average of 68.5, while the average of 80.5 increased diastolic blood pressure after work.

On the day shift, the average systolic blood pressure before work amounted to 119.3, while the systolic blood pressure after work an average of 131.7. An average of 69 diastolic blood pressure before work, while an average of 83.4 increased diastolic blood pressure after work. On an average night shift demonstrated by 118.2 experienced systolic blood pressure before work, while an average of 127.8 experienced systolic blood pressure after work. An average of 68.9 diastolic blood pressure before work, while an average of 77.4 increased diastolic blood pressure after work.

b. Bivariate Analysis

Table 4. Relationship Test Results Shifts with systolic blood pressure Workers

Shift	Systolic Blood Pressure				p-value
	Increase		Decline		
	n	%	n	%	
Morning	16	29.6	2	3.7	0.043
Daylight	15	27.8	3	5.6	
Night	10	18.5	8	14.8	

Based on test results obtained using Chi Square test p-value = 0.043 <0.05, so it can be concluded that there is a relationship shifts with systolic blood pressure of workers.

Table 5. Test Results Relationship Shift Working with Blood Pressure diastole worker

Shift	Blood Pressure Diastole						p-value
	Increase		Decline		Perma Nent		
	n	%	n	%	n	%	
Morning	17	31.5	0	0	1	1.9	0.007
Daylight	14	25.9	2	3.7	2	3.7	
Night	10	18.5	8	14.8	0	0	

Based on Table 5. based on test results using test *Chi Square* obtained p-value = 0.007 <0.05, so it can be concluded that there is a relationship shifts with diastolic blood pressure of workers.

Discussion

PT Bintang Asahi Textile Industry in the production process to apply rotational working time *(Shift work*), This is because there are machines that operate for 24 hours. Rotating work time (shift work) is also valid for one unit in the PT Bintang Asahi Textile Industry, namely Ministry Spinning Winding section. Working time prevailing among which the morning shift (6:00 to 14:00), the day shift (14:00 to 22:00 GMT), and the night shift (22:00 to 06:00 GMT), wherein rotation of shifts in force in the PT Bintang Asahi Textile Industry is 3 days.

Shift work in addition to having a positive impact is to maximize resources but also have a negative impact such as the physiological aspect. The process of physiological disruption of circadian rhythms derived from the process. Circadian rhythms are the processes that are interconnected experienced by the body to adjust to the changes in time for 24 hours. The results showed that the number of respondents in the Department Spinning Winding section experiencing blood pressure every shift showed different results[4].

Measurement of systolic blood pressure and diastolic blood pressure of workers do Polyclinic room according to each work shift, namely the morning shift, day and night. For the morning shift was measured before work at 06.00 pm, while after work was measured at 13.00 pm. For the afternoon shift was measured before working at 14:00 pm, while after work at 21:00 pm, and on the night shift for the prior work was measured at 05.00 pm and after work was measured at 05.00 pm. Measurements

were made using blood pressure meter Type digital OMRON HEM 7130.

Based on these results it is known that the majority of respondents Ministry Spinning Winding section increased diastolic blood pressure. Chi Square test results show the p-value obtained for systolic blood pressure is p = 0.043 <0.05 and diastolic blood pressure was p = 0.007 <0.05, meaning there is a shift in the blood pressure of workers exposed to noise exceeding NAB Department Spinning Winding part PT Bintang Asahi Textile Industry. These results are consistent with research that has been done, showed a highly significant relationship between work time with the blood pressure in workers exposed to noise at the Weaving (Weaving)[6].

Any complaints regarding blood pressure experienced by the respondent Ministry Spinning Winding section can have negative impacts for the job. So necessary to control, reducing the causes of blood pressure that is by checking the blood pressure on a regular basis, regulating hours of work with adequate rest periods, alternating current job was already uncomfortable, consume foods that contain lots of fiber and create the atmosphere of a healthy work environment, convenient and secure[5].

In an effort to reduce blood pressure PT Bintang Asahi Textile Industry, especially in the Department of Spinning section Winding by way of provision of nutritional supplements for workers, in addition to the provision of space adequate rest, where the break room should be comfortable and safe like having no distance is too close to the workplace where the source of the work environment causes blood pressure.

PT Bintang Asahi Industrial Textiles installs noise absorbers made of thick plastic placed on the road between work units, besides that it also carries out engine cleaning every few hours and the provision of Ear Protective Equipment (APT), but the majority of workers don't want to use it because it's uncomfortable. This effort needs to be evaluated, because the effort cannot control the noise so that during the research, the researchers felt the noise in the Winding Spinning Department was quite loud[3,8]. There are many engineering controls that can be done to reduce noise levels in the workplace such as replacing old, worn or hardened engine components such as rubber seals, gear and time belts, and tightening engine parts that start loose, especially the part that is connected to the bolt connection[7].

Conclusion

Based on the analysis and discussion in this study that showed no association with blood pressure shift workers Spinning Department Winding part PT Bintang Asahi Textile Industry showed a p-value equal to 0.043 <0.05 for systolic blood pressure and blood pressure after work p- value of 0.007 <0.05.

Expected to provide space adequate rest, where the break room should be comfortable and safe from environmental factors work, put a damper such as rubber pads on machines that existed at the Department of Spinning section Winding and perform machine maintenance on a regular basis, especially on machines that already wear and is expected to provide earplug as Ear Protective Equipment (APT).

Is Osteopontine of Value in Diagnosis of Knee Osteoarthritis?

Walaa F. Mohammed[1], Faten Ismail Mohamed[2], Gihan M. Ahmd[2], Rasha A. Abdelmagied[2], Aliaa M. Mounir[3], Mustafa Abdel- Kader[4]

[1]Assistant Lecturer of Rheumatology and Rehabilitation, [2]Professor of Rheumatology and Rehabilitation, [3]Department of Clinical Pathology, [4]Department of Radiology, Faculty of Medicine, El-Minia University, Egypt

Abstract

Background: Osteoarthritis is a painful chronic joint disease characterized by structural changes to the whole joint, including loss of articular cartilage, development of osteophytes, synovial inflammation, subchondral bone changes, meniscal damage, muscle weakness, and ligamentous laxity.

Aim of the Work: To detect osteopontine (OPN) in knee osteoarthritis.

Method: 60 patients diagnosed as primary knee OA fulfilling Arthritis Rheum 1986 OA classification criteria, And 60 healthy control were included. All patients subjected to through history taking and full examination, body mass index, plain x ray knees PA view to assess severity according to Kellgren and Laurence grading, plasma and synovial fluid OPN levels, and plasma OPN for control. Assessment of pain for OA patients by patient pain visual analogue scale (VAS) and for functional status by Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC), ESR,CRP were done.

Results: There was significant difference between both groups regarding plasma osteopontine ($p<0.0001$), OPN levels in OA patients in plasma and synovial fluid was correlated with each other ($p <0.0001$), patient pain VAS, WOMAC score, K-L grading were correlated with plasma OPN levels with p value (0.001, <0.001, <0.001), and with synovial fluid OPN levels in primary OA patients with p value (0.008, <0.001, <0.001) respectively. ESR positively correlated with plasma OPN $p=0.004$.

Conclusion: OPN is higher in OA patients more than control, and it is higher in synovial fluid than plasma in knee OA patients, OPN correlated with markers of systemic inflammation and has impact on functional status so it can be used as a diagnostic and prognostic factor in knee osteoarthritis.

Keywords: *Osteoarthritis–OPN, ESR, synovial.*

Introduction

Osteoarthritis is a painful chronic joint disease characterised by structural changes to the whole joint including: loss of articular cartilage, development of osteophytes, synovial inflammation, subchondral bone changes, meniscal damage, muscle weakness, and ligamentous laxity. It results from a complex interplay of genetic, metabolic, biomechanical, and biochemical factors. At the knee, osteoarthritis most commonly affects the medial tibiofemoral and patellofemoral joint compartments. (1). Biochemical markers can be used to detect the disease and determine its severity. Therefore the extracellular matrix proteins were crucial to the occurrence and development of osteoarthritis. some extracellular matrix proteins such as osteopontin (OPN) was found to play important roles in promoting the inflammatory occurrence of cartilage cells in knee osteoarthritis, As an important extracellular matrix protein, OPN can mediate cellular growth, survival, adhesion and migration in osteoarthritis(2).

Aim of the work: To detect osteopontine (OPN) in knee osteoarthritis.

Patients and Method

The study conducted in Minia university hospital, included 60 patients with primary knee osteoarthritis (group I) and 60 apparently healthy controls (group II), patients in group I was complaining of knee effusion candidate for aspiration for detection of synovial fluid OPN level, both groups also were tested for plasma OPN level. All patients fulfilled criteria for diagnosis of primary knee osteoarthritis[3] were included as (group I). Sixty apparently healthy volunteers were served as a control group (group II).Patients with other rheumatological diseases as rheumatoid arthritis, systemic lupus, gouty arthritis, Other forms of arthritis, cancer or other chronic inflammatory diseases, Secondary knee osteoarthritis, Diabetes mellitus were **excluded** from the study

Statistical Analysis: Analysis of data was done by personal computer using SPSS (Statistical program for social science) version 16.The data of all software patients and controls were fed into an IBM personal computer. Data were expressed as mean ± SD for parametric variables and as number and percent for non-parametric variable. Comparison between groups for parametric data was done by independent samples t-test (unpaired t-test). The difference was considered significant if P <0.05. The Bivariate Correlations procedure computes Pearson's correlation coefficient with its significance levels. Pearson's correlation coefficient is a measure of linear association for parametric variables and Sperman-rho correlation coefficient for nonparametric variables.

Results: Characters of OA patients; demographic data, laboratory investigation, functional status and radiological KL grading in table 1

Table 1: Characters of OA patients

Parameters Mean±SD and/or n (%)		OA patient n.= 60
Age (y)		46-72(56.3±7.95)
DD (y)		2-10 (5.8 ±2.33)
BMI	Over weight	4 (6.7%)
	Obese I	16 (26.7%)
	Obese II	24 (40%)
	Obese III	16 (26.7%)
VAS		5-10 (7.53±1.22)
WOMAC total score		45-96 (74.26±14.07)
KL grading	I	5%
	II	35%
	III	38.33%
	IV	21.67%
Plasma OPN		92-222 (136.67±35.1)
Synovial fluid OPN		162-298 (218.4±37.7)
ESR mm/1st hour		8-36 (23.97±7.4)
CRP		53 (88.3%)

Functional status and severity in group I (OA patients): Table 2 shows that patient pain VAS, WOMAC score, K-L grading were correlated with plasma OPN levels with p value (0.001, <0.001, <0.001), and with synovial fluid OPN levels in primary OA patients with p value (0.008, <0.001, <0.001) respectively. ESR positively correlated with plasma OPN p= 0.004.

Table 2: Correlation between plasma & synovial osteopontine with demographic data, disease functional and severity indices in OA patients

Parameters r (p)	Plasma OPN	Synovial fluid OPN
Age	0.032 (0.730)	0.800 (<0.0001)
DD	0.155 (0.236)	0.390 (0.002)
BMI	0.629 (<0.0001)	0.074 (0.574)
Patient pain VAS	0.431(0.001)	0.338 (0.008)
WOMAC totoal score	0.342 (<0.001)	0.358 (<0.001)
KL grading	0.358 (<0.001)	0.680 (<0.001)
ESR	0.362 (0.004)	0.087 (0.510)
CRP	0.895)) 0.017	0.689 (0.455)

Discussion

Osteoarthritis (OA) is a low-grade inflammatory disease of synovial joints and the most common form of arthritis[4]. It is a leading cause of chronic pain and physical disability in older individuals. OA is one of the most costly and disabling forms of joint disease, being far more common than rheumatoid arthritis (RA) and other forms of joint disease[5].

The increased expression of OPN has been observed in the joints of patients that were reported to be correlated with the severity of joint lesion and inflammatory status in the OA patients[6].

In our study patient pain VAS, WOMAC score, KL grading was positively correlated with plasma and synovial OPN levels.

Plasma osteopontine show statistically significant difference between both groups (p**<0.001**), and synovial fluid OPN was significantly higher than paired plasma level in primary OA patients.

In agreement with[7] who found in a similar study on Plasma OPN (in patients and control) and in synovial fluid OPN (in patients) levels in knee OA patients, that patients had higher plasma OPN concentrations compared to healthy controls (P <0.0001). Also OPN levels in synovial fluid were significantly higher with respect to paired plasma samples (p <0.001).

In another study done by **Qin et al.**[2], who examined the synovial fluid from 42 patients with knee OA and 40 cases of the normal control group had effusion due to traumatic causes as meniscus injury or lower extremity fracture surgery in the hospital at the same period for OPN level and demonstrated that the expression levels of OPN in OA group was significantly higher than those in the control (post traumatic) group, (P<0. 05)

In agreement with **Haider et al.,**[8] who found In their study about OPN in knee OA patients and control, that plasmaOPN level significantly correlated with synovialOPN in OA patients (r =0.806, P < 0.001), a significant difference between patients and controls as regards the plasma OPN levels (t =8.534, P < 0.001), OPN in synovial fluidwas higher with respect to paired plasma. Also, OPN level in bothplasma and synovial fluid was significantly correlated with severity of knee pain (r =0.878, r =0.795, p <0.001).

In Conclusion: this study suggests that OPN is an inflammatory marker that can be used as a diagnostic and prognostic marker in knee OA.

A Prospective Study of Effectiveness of Pre-release Intensive Program for Prisoners in Thailand

Wanna Pajumpa[1], Manop Kanato[2], Kittima Momen[3]

[1]Student of Doctoral of Community Health Development Program, Faculty of Medicine, Khon Kaen University,
[2]Associate Professor, Faculty of Medicine, Khon Kaen University, Khon Kaen 40002, Thailand,
[3]Official, Department of Corrections, Bangkok-11000, Thailand

Abstract

Background: The intensive program for pre-release prisoners has been developed in Thai Correctional System with a prospective cohort study design on the effectiveness of treatment program before releasing prisoners. The samples were 850 prisoners who were drug users. The aim of this was to compare the effectiveness of the pre-release intensive program on the intensive group with the normal group of prisoners in the correctional system.

Method: Data were collected by using questionnaires and interview which were conducted in the areas under Department of Corrections, Thailand. Inference statistics were used for the analysis in this research.

Results: Firstly, it was found that the prisoners who received the intensive Program improved their criminal rate with Hazard Ratio = 0.294 (95%CI, 0.136-0.632) (p-value < 0.05), and the intensive program was applied in group activities to solve the problem of prisoners. Secondly, based on the analysis using Generalized Estimating Equations (GEE) to estimate the distance from criminal rate, it was found that there were no differences among the prisoners who entered the treatment program in the intensive group and the control group that have been released on time with statistical significance (p-value < 0.05).

Conclusions: Our findings indicated that the intensive program was effective for pre-releaseprisoners who aredrug users form the Correctional. The duration of the implementation of the program was 4 monthsand the behavior of the prisoners must be observed constantly.

Keywords: *Pre-release Intensive Program, Prisoners, Drug Users.*

Introduction

UNODC (United Nation Office on Drug and Crime) reveals the epidemic trend of addictive substance, which was shown by comparative analysis of information of asset in dispute in 2017 that more than 271 million people or 5.5 percent of the population aged 15-64 years old used to consume one kind of addictive substance. According to World Drugs Report, we found that most popular drugs were Marijuana, Opium, Cocaine and Amphetamine-Type Stimulants (ATS), which have been spreading in many continents.[1] Continuous Household Survey in estimating addictive substance users within the same period of time in Thailand found that Thai people aged 12-65 years old used to consume one kind of addictive substance approximately for 3.50 million people or 58.2 people per 1,000 people. Moreover, 1,425,342 people used to consume one kind of addictive substance within 1 year.[2] The number of drug users has been increasing accordingly to the increase of treatment rate. The ratio of male and female patients was 90% and 10%, respectively, and there were new patients than current patients about 80%.[3]

Overcrowding in prisons causes many problems such as handling problem, behavior reforming and offence repetition. Updated convict statistic reveals that prisoners with offence against narcotics are the highest proportion in the prison compared to other kinds of prisoners. In addition, more than 50% of them will make the same mistake within the first 3 years.[4,5]

At present,Therapeutic Community (T.C.), which is called "CARE Model" (C=Corrections, A=Addiction, RE=Rehabilitation), has been used for the patients in prisons since 1994 by using knowledge and experiences from Communita in Control Organization (Italy) and Day Top Organization (USA) to adapt and properly apply with the prison's condition, discipline and Thais culture to reform prisoners' attitude, emotion and behavior. The treatment has been widely used in 85 prisons all around Thailand. However, the limit of prison workability, caused by outnumbered prisoners, causes the treatment area unable to be specifically separated up to each type of patients and the patients who have completed the treatment still need to live with other prisoners. As a result, most prisoners do not have enough motivation for drug stoppage and behavior reforming. [6, 7, 8]

The indicator for successful performance and advantage of the treatment has been still vague in quantity and effectiveness for accessibility, harm reduction of drug addict, preparation result before freeing the patient who does not need to be captured in the prison. There are many arguments about performance, worthiness, effect on society, economy, crime, drug users and implementation of concrete procedures for reducing society's fear and congestion inside the prison.[9] An additional study on wellness of mental health of the drug users in terms of recognition, increasing of positive thinking in themselves and life's goal reveals that the drug users stops addicting to drugs and satisfy with their lives and have more self-esteem. So, they are ready to face with daily life's problems and understand how to solve the problems by themselves without using the drugs. [10, 11]

The researcher had an idea to develop the new intensive treatment program for prisoners who could be freed prior to the schedule. This new program contains 2 main components: 1) solving and development procedures that make prisoners can solve their addictive drugs problem in an uncertain circumstance and 2) reinforcing all physical & mental health, emotion, social of the prisoners, mainly focusing on the development of mental health until they can normally live with the society and will not go back to the addiction circle and crime. It is the study to assess the effectiveness of the intensive program for preparing the prisoners who have been captured by offence against narcotics before they are in the Parole process of Department of Corrections. The mentioned program was developed by the researcher who had compared the overall result between normal prisoners and pre-release prisoners. The results will be beneficial for Department of Corrections, Department of Probation, Office of the Narcotics Control Board, Royal Thai Police and Department of Public Health for the remedy of the prisoners with efficient and practical process.

Material and Method

Study Design: This research was a prospective cohort study design to compare effectiveness of intensive program and the normal program which can lead to the fact. Data were analyzed by analytical statistics method.

Population and Sample: The population and sample in this study were from 12 areas in Department of Corrections, which all of type in Thai Correctional were accept into this study.

Subjects Recruitment: A sample of 850 prisoners was recruited from the correctional in Thailand, applying a criterion based selection method as a group of drug prisoners, were selected by the purposive random sampling. According to the selection criteria, about 32,000 people were sent to Department of Corrections for the selection of male-female prisoners. The samples must have a history of drug abuse alone with no other offenses. The sample size was calculated based on Cohen (1992)[12]:the effect size and the confidence level were at 0.05, so the sample size was 2,900 people, who were 850 expected to volunteer to participate in the project.

Experimental Procedures: The intensive program consisted of treatment and rehabilitation procedure for pre-release drug users in prisons. The duration of program was 4 months. It consisted of 4 activities as follows: 1) development of the spiritual condition with religion, 2) development of the behavioral therapy, 3) relapse prevention skill and 4) development of living management skill. The effectiveness of pre-release intensive programwas compared during the process of data collection at baseline, and after the release at 3, 6, 9, 12 months.

Measurement and Instrument: A structured questionnaire was developed based on literature reviews in response to the research questions. The questionnaire consisted of 2 parts: Part 1: Participants' characteristics and Part 2: Distance from Criminal Scale. It was applied for interviews to achieve the research objectives. The context in prison, Department of Corrections/ Correctional Institution for drug users which affected to the effectiveness of pre-release intensive program must be considered. In addition, Content Validity Index (CVI) was 0.98 which passed the quality control of the research instrument. The instrument had high level of reliability with Cronbach's alpha of 0.70, 0.93.

Data Collection: Data were collected from July 2016 to April 2018. The interviews with the participants in operational research were focusing on the content of the intensive program, follow-up results and effectiveness of the program as the context of operational processes.

Statistical Analysis: Research information made the table analysis for data clustering. The assessment of reliability (credibility) was also considered in this research. Data double entry was used to construct the research database. Data exploration was done to correct the out of range, outliers, and missing value problems. Percentage, mean and standard deviation and inferential statistics, including Chi-square and Survival time to criminal event by Hazard ratio (95%CI), Generalized Estimating Equations (GEE) were employed.

Result

The participants' characteristics were shown in Table 1. Among 850 respondents who volunteered in this study, there were 100% of male in the intensive group and 93.25% of male and 6.75% of female in the control group. The mean age of the intensive group was 30.24 years (SD = 7.19) and that of the control group was 32.28 years (SD = 9.23). The mean family income was 24,128.81 baht (ranging 6,000-200,000 baht). Chi-square tests demonstrated the differences in gender, marital status, occupation and relationship in the family.

The comparison of time to criminal event was presented in Table 2. The hazard ratio among the prisoners who were released within the group was 0.294(0.136, 0.632), p-value < 0.05. Among 850 drug users, age, marital status, relationship in the family, and substance currently in use were found to be associated with the program for pre-release.

The effectiveness of the intensive program for pre-release offenders in Thailand was presented in Table 3. The Generalized Estimating Equation of the intensive group was (GEE) 0.054 (-0.000 to 0.100), p-value < 0.05.

Table 1: Characteristics of participants from baseline interview in each group (self-report)(n=850)

Participants' Characteristics	Intensive Group Number (%)	Control Group Number (%)	p-value

Table 3: Description and comparison of Distance from Criminal Scale variables between the intensive group and the control group at baseline, 3rd month,6th month, 9th month and 12th month by analysis of covariance and generalized estimating equations (GEE)

Variable	Group	Baseline	Follow-up afterthe intensive program training				Overall
			3rd month	6th month	9th month	12th month	
Distance from Criminal Scale	Intensive	53.81±0.10	46.70±0.49	44.09±0.57	41.13±0.56	37.88±0.50	
	Control	53.89±0.11	48.79±0.44	45.34±0.54	30.10±0.10	30.41±0.88	
	Mean Difference	NA	-2.09	-1.25	11.02	7.47	-3.98
	95%CI	NA	-3.38 to-0.79	-2.79 to 0.29	9.88 to12.16	6.45 to8.49	-4.71 to-3.25
	p-value	NA	0.00	0.11	0.00	0.00	0.00

*Mean difference (Intensive Program) was adjusted for baseline measurements and each visit using analysis of covariance (ANCOVA) and for overall generalized estimating equations was implemented under generalized linear model frameworks.

Discussion

The intensive program was rehabilitation for drug users in the correctional system. It was a specific program which can classify drug users, drug addicts, and violent offenders or retailers' types. The definition of patient characteristics was also included in the program for prisoners who volunteered or were motivated to change behavior. The technique which was focus-group of therapeutic community program for prisoners can help them to develop themselves to live well in society,which can affect the increase of program efficiency. The prisoners have known their self-worth after being treated with the Intensive Program.[13]

The impunity was one of all measures which can reduce the number of prisoners and the congestion in prisons, save the budget for the prisoners and control them easier according to the Royal Commission on Corrections, 1936, Section 32(5). The prisoners with good behavior endeavor in studying and good effectiveness in working or doing the favor for government officers are considered to get the opportunity to leave the prison and live with family and society before the penalty sentence under the strictly defined conditions. The community also has the opportunity to participate in solving, treating, and modifying the behavior and attitudes of the prisoners so that they are ready to behave as a good citizen and able to work honestly and live well with others after being impunity without returning to commit the same mistake again. Reducing the number of prisoners and overcrowding in prisons can save budget for prisoners and the control of prisoners to a certain extent. [14, 15]

A study on the effectiveness assessment of the program and rehabilitation of drug users has been working effectively during the preparation time before prisoner's release. The assessment must be continually done while the prisoners were in the correctional system.[16,17,18] After the prisoners were sentenced as being impunity, they must be followed up to assess their behavior while living in a community. It must be associated with the integrated cooperation between government and community organizations.[19, 20, 21]

Conclusion

The effectiveness of pre-release intensive program via correctional therapy can modify the behavior of the prisoners with the pattern of group process. The

focus-group process can help the members to express their feelings, emotion and self-confidence as well as to accept the other members' opinions. Therefore, the system of rehabilitation in Department of Corrections must include classification, screening for prisoners in many of drug cases to assess the severity of the problem who have developed habits, Department of Corrections have qualification to meet the criteria for suspension of special cases for pre-release Intensive Program could be released before 2 years after being released that would help drain prisoners and decreased budget of Department of Corrections about 280 million baht in a 2 year period, and also helps improve the quality of life for prisoners due to be released prematurely could live in society as usual.

Acknowledgements: The authors would like to thank Department of Corrections in Thailand for funding support for this research project. Grateful acknowledgment was made to the officers and the prisoners who were the samples for data collection and cooperation.

Conflict of Interests: The authors declare no conflicts of interest.

Source of Funding: Department of Corrections, Thailand.

Ethics Statement: The ethics statement of this study was conducted by the research team. At the stage of data gathering, verbal consent was required. Personal identifiers (names, full addresses) were stripped from the data set. This research project was approved by the Ethics Committee Khon Kaen University (HE591226) based on the principle of Declaration of Helsinki, and ICH GCP standards.

Factors Associated with Behavior Usage of Respiratory Protective Equipment among Sugarcane Factory Workers in Northeast of Thailand

Wipada Panakobkit[1], Pornpun Sakunkoo[2]

[1]Student of Doctoral Program of Public Health, [2]Department of Environmental Health Occupational Health and Safety, Faculty of Public Health, Khon Kaen University, Khon Kaen-40002, Thailand

Abstract

Several sugar industries in Thailand are highly effected to environmental health, including a safety at work, mainly the areas surrounded of bagasse.

This research aimed to study on factors associated with behavior usage of Respiratory Protective Equipment (RPE) among sugarcane factory workers. A cross-sectional study was conducted among 588 workers at 4 sugarcane factories in Northeast of Thailand, between December 2017 to April 2018. Workers were selected by multi-stage random sampling to completed structure questionnaires. The multivariable analysis was used by multiple logistic regressions.

The majority were males (71.94%). Their mean age was 38.28 (±10.56) years old. Financial status was poor (65.65%). Department were juice extraction machine (67.52%). The majority types of RPE usage were cotton masks (94.56%) and their behaviors usage of RPE had good level (64.80%, 95% CI: 60.92-68.67). Additionally, factors associated with good behavior usage of RPE were included age (AOR = 1.65, 95% CI: 1.14 to 2.38; p = 0.007), financial status (AOR = 1.57, 95% CI: 1.07 to 2.29; p = 0.021) and department of work (AOR = 0.66, 95% CI: 0.31 to 1.40; p = 0.017).

Almost two-third of sugarcane factory workers had good behavior usage of RPE. Work safety awareness is important to prevent and promote among sugarcane factory workers to the adaptation their working environment.

Keywords: *Behavior, Bagasse, Respiratory Protective Equipment (RPE), Work-Safety.*

Introduction

In Thailand, 16.8% workers are involved in manufacturing industry, normally the labor in the system preferred to work in factory and machinery operators [(12)]. It's impact has increased due to lack of public awareness, and exposure of workers to inferior air quality at the workplace leads to ill health[(7)]. Personal Protective Equipment (PPE) is worn by workers[(15)]. Nevertheless, Respiratory Protective Equipment (RPE) is not always used, even in situations with high exposure risk[(13)].

Therefore, The occupational health problems in the sugarcane industry had existed in more than 40 countries in the world[(9)]. In 2016 Sugarcane on average accounts for about 80% of global sugarcane production. Production has become increasingly concentrated. The trend of top ten countries of sugarcane producing in 1980 accounted for 56%, whereas in 2016 accounted for 76% respectively. More interestingly, Thailand was third ranked after Brazil and India among top ten of

sugarcane producing in the world[6]. Harvesting occurs in dry season between mid-December and the end of April[8]. Sugarcane industry constitutes one of the big industries, there are 55 plants in Thailand and 20 plants in Northeast of Thailand[2].

The working conditions of the sugarcane industry workers are extremely poor. The occupational health and safety issues in the workplace are significant due to the diversity of occupational safety factors. That the workers are exposed to high concentration of excessive heat, high intensity noise, high intensity of dust in cane yard section, bagasse dust in mill and bagasse baling section are the main causes of respiratory problems among these workers[10]. We found out that the workers at sugarcane factory have faced with health and sanitation problems because there are variety issues which do harm to their health, especially the concentration of bagasse. Inhalation of bagasse dust causes a respiratory disease called Bagassosis[11].

If the workers who work in the environment which are insufficient oxygen or dusty area, the RPE is necessary indeed. It is also reducing any loss and risk to the workers because it is harmful to their health and might cause of lung cancer and respiratory deceases[4]. Wearing RPE could prevent respiratory deceases which be able to reduce the bagasse dust. It is an important preventive measure to their career. Anyway, it is totally safe their health if they do wear them correctly and the equipment have been in good maintenance constantly. However, the strictly usage of the RPE by workers or company or workers themselves are still the main majority issue[14].

Therefore, this study aimed to investigate the factors which relate to behaviors of usage the RPE of workers in sugarcane factory. A sample group was collected from workers within Northeast of Thailand.

Material and Method

Study Design and Sampling: A cross-sectional study was conducted in 4 factories in Northeast of Thailand. Data was collected from December 2017 to April 2018. The sample size was calculated following formula[5]

$$np = \frac{n_1}{1 - \rho^2_{1,2,3.....p}}$$

The approximate sample size was 327 which were further adjusted to control the over-fitting using the rho (ρ) of 0.50 and variance inflation factor (VIF) equal to 2.00. Therefore, the total number of the sample was 588. Data sampling processes: Firstly 4 factories in Northeast of Thailand were randomly selected. Then 3 departments facing with dusts at the working area were drawn. There were 7,965 sugarcane factory workers registered at the department of industrial work. Finally, all participants who met the inclusion criteria were randomly selected proportionally to size of the samples added to the total of 588 samples. (Figure 1).

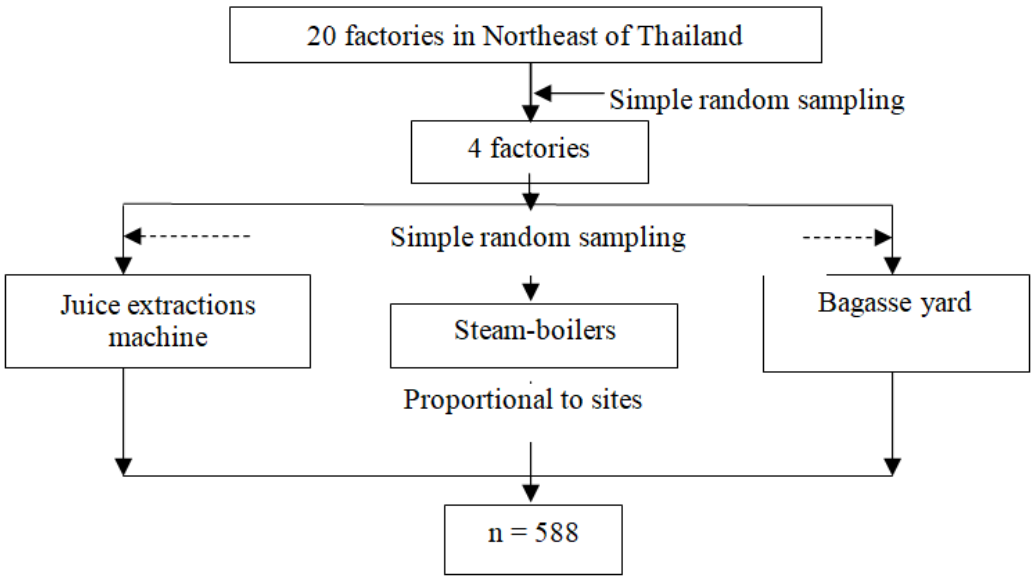

Figure 1. Flowchart of study design and sampling of sugar factory workers

Questionnaires: The questionnaire was modified from reviewed literatures based on research questions. The questionnaire contained 3 parts which were: 1) Demographic Characteristics, 2) Attitude to the usage of the RPE, and 3) The behaviors of usage the RPE. The questionnaire was validated by 3 experts and tested for reliability.

Data Analysis: Descriptive and analytical statistical data were analyzed with STATA® (version.13; college Station, TX, USA: Stata Corp) was used to analyze the data. Demographic characteristics of the participants were described as frequency and percentage for categorical data; mean and standard deviation for continuous data. Inferential statistics, a simple logistic regression, was used for bivariate analysis to identify individual factors associated with good behaviors for usage of RPE. The factors that had *p*-value <0.25 were processed into the multivariable analysis using multiple logistic regression and reported the adjusted odds ratio (AOR) and their 95% confidence interval (95% CI) and *p*-value<0.05 was considered as statistically significant.

Result

Demographic Characteristics: The total 588 sugarcane factory workers in Northeast of Thailand, the majority were males in 71.94% and average age was 38.28 years with a range of 19-69, level of education was primary school, and marital status was marriage, average income each month 10,146 THB. Financial statuses were poor 65.65%. Majority it's in juice extraction department is 67.52%, worked less than 5 years were 42.69%. Most of them get the information how to use the RPE from safety officer were 77.89%. Principally they wear cotton masks while working at factory is 94.56% (Table 1).

Bagasse yard	33	57.58	0.62	0.66	0.31 to 1.40	

Discussion

This study revealed that the good behaviors usage of RPE among sugarcane factory workers were 64.8%. And the associated factors with good behavior of usage RPE among sugarcane factory workers were found 3 factors including: age, financial status and department of work.

The association between age and good behaviors usage of the RPE was consistent with study in Nepalese industrial workers which revealed that increasing of age of workers had associated with good behaviors usage of the RPE[1].

Financial status had associated with PPE[1] where the RPE was one of subset PPE. To the current study, monthly income of workers were about 10,146 THB equal to US dollar about (320$), had received the information how to use the RPE from safety officer were 77.89% that encouraged them using cotton masks of 94.56%.

The department of working, we found that group of worker in steam-boilers department is more likely better behavior usage of RPE than department of Juice extraction 0.59 times. However, sampling group in bagasse yard, they wear the RPE much better than the steam-boilers department at 0.66 times. The reason of did not use RPE maybe from difficulty in breathing, pain in the ear, small size of the face[3].

Conclusion

Behavior usage of RPE can improve occupational health and safety at workplace among factory workers. Besides, it emphasizes them to practice appropriate behavior of health preventive in workplace. This research has been collected the data from only three departments; juice extraction machine, steam-boilers and bagasse yard. Therefore, we suggest next research should collect the data to cover all work-functions in the factory because they also are risky to inhale the dust while working. The current study of cross-sectional design was first a snap of associated factors with outcome being evident. Then the next study will be conducted on evidence-based recommendations promoting to change behavior in the actual workplace situation.

Research Ethics approval for this study was obtained from the Khon Kaen University Ethics Committee for human Research (HE602331).

Conflict of Interest Statement: The authors declare that no conflict of interest.

Re-evaluation of Psoriatic Patients with Metabolic Syndrome: A Case Control Study Searching for the Highly Prevalent Criteria

Wisam Majeed Kattoof

Lecturer, Dermatology and Venerology, College of Medicine, AL-Mustansiriyah University, Iraq, Baghdad

Abstract

Psoriasis is a common chronic inflammatory skin disorder, presented as erythematous plaques with salmon pink color and silvery white scales. The association between psoriasis and metabolic syndrome have recently demonstrated by many studies, and this link suggested by the presence of systemic inflammatory status with the high level of cytokines. The study aimed to evaluate psoriatic patient who have metabolic syndrome with recording of the frequency of the criteria of this syndrome. Sixty two cases of psoriasis involved in this study with age and gender matched controls. Patient was diagnosed as having metabolic syndrome if he has three or more of the criteria depend upon IDF/NHBLI/AHA/World Heart Federation/International Atherosclerosis Society/International Association. This study revealed that metabolic syndrome occur in a higher frequency among psoriatic patients (58%) than the controls (16%). The highly prevalent criteria among psoriatic patients with positive metabolic syndrome was increase waist circumference at the top (100%) and hypertriglyceridemia came next (69%), with low HDL, hypertension, and raised fasting blood glucose came successively. The study reiterates the fact that Metabolic Syndrome and psoriasis do have a close association. Our study shows that central obesity and hypertriglyceridemia occur with high frequency among psoriatic patients with positive metabolic syndrome.

Keywords: *Psoriasis, metabolic syndrome.*

Introduction

Psoriasis is a common chronic inflammatory skin disorder, presented as well defined plaques with salmon pink color and silvery white centrally attached scales. Psoriasis is considered to be a polygenic disorder[1-3]. Recently, many studies demonstrated the association of psoriasis with systemic disorders like metabolic syndrome, cardiovascular disease, osteoporosis, inflammatory bowel disease, cancer, and depression. Systemic inflammation and the presence of interleukin-6 and tumor necrosis factor-α in high levels suggested the link between psoriasis and associated systemic disorders.[4]

With regards to the immunopathogenesis of psoriasis and metabolic syndrome [chronic inflammation mediated by pro-inflammatory cytokines], both may develop "interdependently". Additionally, "insulin-like growth factor 1" have implicated in psoriasis "as a shared mediator in the proliferation of keratinocyte "and the development of hyperlipidemia and diabetes [5-10].

Chronicin flammation (Th-1 and Th-17) with cytokines dysregulation, in addition to promotion of hyperplasia of epidermis in psoriasis, may also antagonize insulin signaling leading to increase risk of obesity and insulin resistance. In addition, both psoriasis and

metabolic syndrome sharing the genetic susceptibility by the existence of pleiotropic "PSORS2-4, CDKAL1, and ApoE4" genetic loci[11,12]. Significant clinical implications may be demonstrated in psoriatic patients with metabolic syndrome, especially those on chronic systemic treatments "use them with caution"because the coexisting metabolic disorders may be adversely affected[13].

Aim of our study was to evaluate psoriatic patient who have metabolic syndrome with recording of the frequency of the criteria of this syndrome .

Patients and Method

This case control study was conducted over a period of nine months from October 2018 till march 2019. Sixty two cases of psoriasis involved in this study collected from Department of dermatology in AL-Yarmok teaching hospital in Baghdad province with age and gender matched controls. Psoriasis was diagnosed clinically and suspicious cases proved by histopathological study .Inclusion criteria are those with plaque psoriasis of at least 3 months, more than 18 years old, and not received any systemic medication for psoriasis for at least three months while Exclusion criteria are pustular and erythrodermic psoriasis, those taking systemic drugs in the three months before enrolling, pregnant women and those complaining from other autoimmune diseases .

Questionnaire was designed to obtain the information age,gender, duration of psoriasis,family history, height, and weight . Waist circumference was measured by placing a tape measure around the abdomen at the level of uppermost part of the pelvic bone. Blood pressure was recorded by taking the average of two separated measurements. Body mass index was measured by dividing the weight in kilogram on the square of height in meter and psoriasis severity evaluated by using the psoriasis area and severity index (PASI). Venous blood samples were taken 12 hour fasting status in the morning to measure fasting blood sugar and serum triglyceride in our hospital laboratories .For diagnosis of metabolic syndrome I depend upon "IDF/NHBLI/AHA/World Heart Federation/International Atherosclerosis Society/ International Association for the Study of Obesity, 2009". Patient was diagnosed as having metabolic syndrome if he has three or more of the following :

- waist circumference [>94 cm in men and >80 cm in women].
- serum triglycerides [≥150 mg/dL] or lipid-lowering drugs.
- serum HDL [<40 mg/dL in male and <50 mg/dLin female].
- Blood pressure [≥130/85 mm Hg]or antihypertensive therapy.
- Fasting plasma glucose [≥100 mg/dL] or pharmacologic therapy .

To clarify the effect of difference factors in this study parameters, the "Statistical Analysis System 2012" program was used and Chi-square test applied to compare the significance .

Results

Sixty two psoriatic patients [34 male (55%) and 28 female (45%) with their matched control] enrolled in this study . Their age distribution : 46 (74.2%) between 21 years and 50 years, 10 (16.1%) above fifty years, and only six (9.7%) between 18 years and 20 years. Metabolic syndrome discovered to be presented in a higher frequency in psoriasis patients [36 (58%)] in comparison with controls [10 (16%)], the result is highly significant and the *p*-value was .000001. The highly prevalent criteria among psoriatic patients with positive metabolic syndrome was increase waist circumference [36 (100%)] with same percent in controls with positive metabolic syndrome. Serum triglyceride in the second place (25 patients 69%) with a nearly equal value in control group (7 control 70%).

There were 12 (33%) psoriatic patients with positive metabolic syndrome found to have low S.HDL while in control group only two (20%) appeared to have low value of S. HDL. Elevated blood pressure was noticed in 22 patient (61%), in control group 6(60%) persons have elevated blood pressure . Sixteen (44%) psoriatic patients had elevated fasting blood sugar, in contrast to control group in which there were only 2 persons.

Regarding PASI score among psoriatic patients with positive metabolic syndrome : 32 (89%) subjects with a score less than 8, while only 4 (11%) subjects above 10 body mass index measurement revealed that 16 (44%) patients were obese, 10 patients (28%) were overweight and the another 10 (28%) patients presented with normal weight .

Table 1: The frequency of metabolic syndrome criteria among psoriatic patients in comparison with controls

Metabolic Syndrome Criteria	PSORIASIS GROUB = (62)					CONTRPL GROUP = (62)

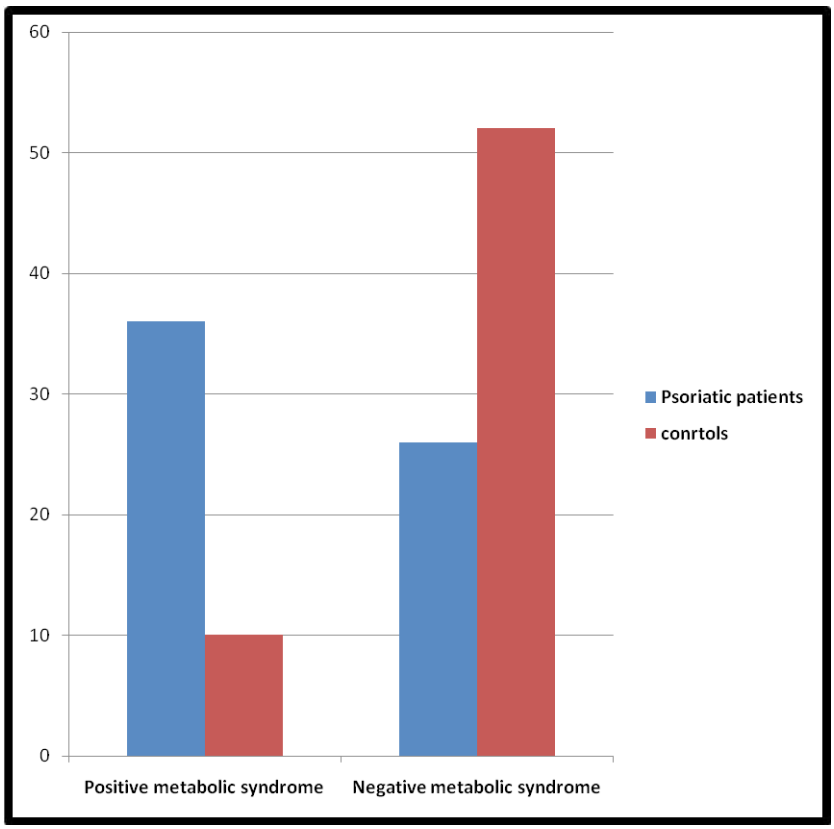

Fig. 1: Prevalence of metabolic syndrome among psoriatic patients in comparison with controls

Discussion

Recently, "the understanding of the role of inflammatory cells and mediators in the pathogenesis of psoriasis" have changed our look to psoriasis from being a cutaneous disease to that of a systemic disorder[14]. Psoriasis and metabolic syndrome are characterized by sharing inflammatory pathways display similar inflammatory profiles with Th1 and over expression of IL-6 and TNF-alpha[15]. Epidemiological link of psoriasis to metabolic syndrome and it's prevalence was suggested by several observational studies (15–25% in the general population)[16].

In this study psoriatic patients examined for the presence of metabolic syndrome in comparison with controls, and data was analyzed to clarify the prevalence of criteria of such syndrome. Males were the predominant sex and maximum number of psoriatic cases (74.2%) was noted in the age group of between 21 years and 50 years. This study revealed that metabolic syndrome occur with a higher percentage inpsoriatic patients (58%) than controls (16%) this appear higher regarding recent case control study by Narendra Gangaiah, NS Aysha Roshin, et al (38% vs. 22%)[17]. Regarding the prevalence of metabolic syndrome criteria among patients :central

obesity (Raised values of waist circumference) was at the top (100%) and hypertriglyceridemia came next (69%), with low HDL, hypertension, and raised fasting blood glucose came successively .

Visceral obesity and type 2 diabetes are the main components of metabolic syndrome. Adipose tissue pathologically has important effects as it infiltrated by macrophages that secrete cytokines in the systemic circulation resulting in a chronic inflammatory state which will lead to the development of numerous diseases associated with obesity[18]. In most international studies obesity appear to be more frequent among psoriatic patients than controls[19]. All psoriatic patients in the present study have increased Waist circumference and visceral obesity could be the possible mechanism that correlate psoriasis with metabolic syndrome and its comorbidities. It was also demonstrated that obesity is a risk factor[more than two times] for developing psoriasis[20]. Middle or older age men with mild obesity are more likely to develop psoriasis as suggested by Naito and Imafuku[21].

Significant elevation in serum triglyceride levels have shown in various studies done in Caucasians[22-24]. In the present study, psoriasis was strongly related with dyslipidaemia. Hypertriglyceridemia represent (69%) in psoriasis group with no difference among controls . Low value of S. HDL was found in 33% of psoriasis group, while it was found to be low in 20% of controls. Similar observations were documented in Lebanon study[25].

Hypertension was documented among 22 cases of psoriatic patients with positive metabolic syndrome, in comparison to controls with metabolic syndrome. Psoriasis patients in regards to the risk of developing hypertension showed modest increase in comparison with the general population[26,27]. No known mechanism explain the relation that link psoriasis tohypertension. Multiple researchers proposed that the major source of angiotensinogen is the adipose tissue and the derived angiotensin II [in addition to its function in salt retention by kidneys] may act asstimulator for T-cell proliferation. Perivascular fat which result from increased visceral adipose tissue "can serve as a reservoir for activated effector T cells" which in turn lead to the promotion of dysfunction in the blood pressure[28].

Regarding the relation between psoriasis and hyperglycemia, there is high risk to develop diabetes in addition to metabolic syndrome[29]. Elevated fasting blood sugar was present in 44% of Psoriatic patients and in 20% of controls. This finding is supported by a study conducted by Samer A Dhaher,and Alaa Abdul Hassen Naif[18,30].

Both hypertension and dyslipidemia cause increase the "systemic inflammatory burden"together with obesity, all of these adds to the comorbidities of psoriasis[31]. PASI score among psoriatic patients with positive metabolic syndrome was less than 8 in nearly 90% of cases, this gave usa negative impression about the relation between the severity of disease and metabolic syndrome. Nisa and Qazi study also found no significant correlation[32].

While studying of body mass index and its association with metabolic syndrome in both groups shows no significance. This comparable with Korean and Norwegian studies were they found a non-statistically significant association with increment in the weight[33,34].

Conclusion: The study reiterates the fact that Metabolic Syndrome and psoriasis do have a close association and showed that central obesity and hypertriglyceridemia occur with high frequency among psoriatic patients with positive metabolic syndrome

Effect of Dragon Fruit (Hylocereus Polyrhizus) Peel Extract on Collagen Fiber Density of Rat Socket Healing

Wisnu Setyari Juliastuti[1], Hendrik Setia Budi[1], Christiana Ayu Maharani[1]

[1]Department of Oral Biology, Faculty of Dental Medicine, Airlangga University, Surabaya-Indonesia

Abstract

Collagen has an important role in wound healing to return anatomy and physiology of tissue structure. Dragon fruit is a natural resource that can be used as a therapy that contains flavonoid, saponin, vitamin A, C, and E useful in wound healing. The aim of this study is to prove the effectivity of dragon fruit (Hylocereuspolyrhizus) peel extract gel towards collagen fibers density after tooth extraction of Wistar rat (Rattusnorvegicus). The randomized post test only control groups design was used for this study. The sample consisted of 40 Wistar rats treated with tooth extraction in the left incisive tooth of the mandible. Dragon fruitpeel extract gel 15%, 30%, 60% was given into the socket except for control group which was given CMC-Na gel. Wistar rats was sacrificed on the fourth and seventh days after tooth extraction and prepared for histopathological examination with Masson's Trichrome staining. The data were analyzed with One-way ANOVA and Tukey-HSD test. There are significant differences in the density of collagen in the treatment group concentration 30%. The result showed that the use of dragon fruit peel extract gel affects the density of collagen fibers at 4 and 7 days after tooth extraction. The finding provides dragon fruit peel extract could promote the healing process through the formation of collagen fibers density.

Keyword: *Histopathology, collagen fibers density, tooth extraction, wound healing.*

Introduction

Tooth extraction is one of the most common treatment in dentistry which is indicated for periodontal disease, carries, trauma, or periapicalinfection. Tooth extraction is a minor surgery treatment which is conducted by dentist to remove the tooth from the socket and cause injury around soft tissue[1,2], then wound healing process will occur.

Wound healing is a complicated pathophysiological process. Wound healing consists of several stages, namely stage of acute inflammation, cell proliferation, and maturation.[3] At the stage of proliferation, cell proliferative activity of fibroblasts in the wound area has a central role in forming collagen fiber to begin the wound healing process. Increasing amount of collagen fiber density showed the healing ability.[4] Wound healing process may be hampered by the presence of reactive oxygen stress (ROS) produced by microbes or neutrophils in the wound area. This fact strengthens the opinion that the existence of local antioxidants and antiinflammations in wound area became crucial factors that have promoted the acceleration of the healing process.[5,6,7]

Several studies conducting the process of wound healing using natural materials have been widely applied. The use of natural materials done because it is easy to use, inexpensive, and has an adequate bactericidal or bacteriostatic effect.[8] Natural product, that have evolved over year by years, have a chemical diversity, which ends up in diversity in their biological activities and drug-like properties. Natural product can bear continual use toward meeting the imperative must

develop effective medication, and that they can play a role within the discovery of medicine for treating human diseases, particularly crucial diseases.[9]

One of these natural materials is dragon fruit (*Hylocereuspolyrhizus*) peel. Dragon fruit is widely spread in Indonesia. Dragon fruit peel contains various compounds including flavonoid, saponin, vitamin A, C, E that are believed to promote wound healing.[10,11,12]

Research on the effectivity gel of dragon fruit peel extract in dosage form in wound healing has not been reported. The extraction is done so that the active substances are needed can be taken optimally. The purpose of this study is to determine the effectivity of dragon fruit (*Hylocereuspolyrhizus*) peel extract gel towards collagen fiber density after tooth extraction of *Wistar* rat (*Rattusnorvegicus*) which was evaluated histopathologically.

Materials and Method

This study is an experimental research laboratory with randomized post-test only control groups design that approved by the Ethical Committee of the Faculty of Dental Medicine, Universitas Airlangga, Indonesia, 278/KKEPK.FKG/KI/2016. The material used is the gel of dragon fruit (*Hylocereuspolyrhizus*) peel extract with a range concentration of 15%, 30%, and 60%. Dragon fruit (*Hylocereuspolyrhizus*) peel that have been dried and used as a powder, then extracted using ethanol solvent and evaporated. The extract was mixed with a gel base material (CMC-Na) and is based on the required concentration. This research used 40 male *Wistar* rats (*Rattusnorvegicus*), aged 2-3 months, and weighing 150-200 grams. Research subjects were divided into 8 groups each consisted of 5 *Wistar* rats. Tooth extraction were performed in the left incisisive tooth of mandible using modificated pliers pull under the effect of ketamine anesthesia by intramuscular inject. Each treatment group was given gel of dragon fruit (*Hylocereuspolyrhizus*) peel extract and control group given only simple gel base CMC-Na using a syringe at a quantity of 2 cc. Then treated in a closed gingival wound sutured with non-traumatic and non-absorbable thread. All *Wistar* rats in each group were sacrificed on the fourth day and seventh day using 10% ether as sedation. Bone biopsies and subsequent histopathological preparation was done using *Masson's Trichrome* (MT) staining, and observed of collagen fiber density.

The data obtained from histopathological examination is quantitative data obtained by scoring the density of collagen fiber under light microscopy performed on one fields of view with 400x magnification. These research data were analyzed with statistical tests of *Kruskal Wallis* and *Mann-Whitney*.[13]

Findings: Data examination of collagen fibers density on the socket healing day 4 and 7 with histopathological preparation using *Masson's Trichrome* (MT) stainingmethod.The collagen fibers showed more density on the socket healing process of day 7 than day 3 after given gel of 30% dragon fruit (Hylocereus polyrhizus) peel extract (Figure 1 and 2).

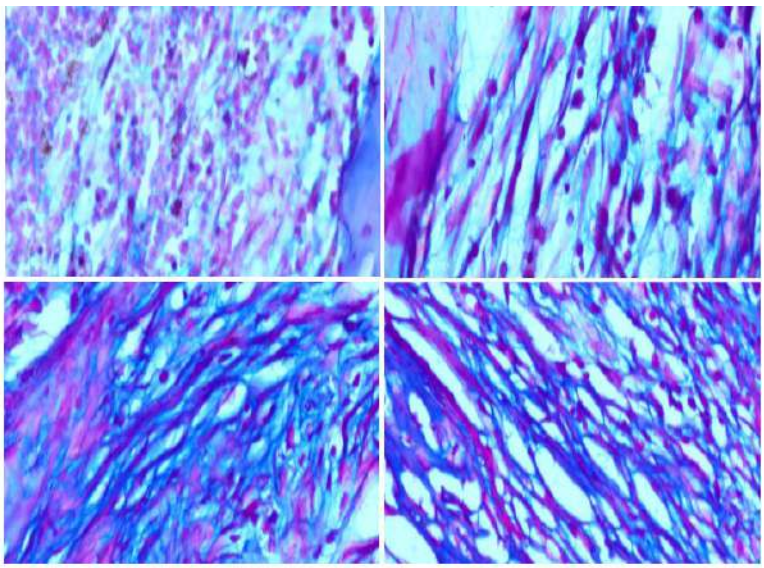

Figure 1. Histopathological image on day 4 MT staining magnification 400x of the groups. A) control group, B group 1 (15%), C) group 2 (30%), D) group 3 (60%)

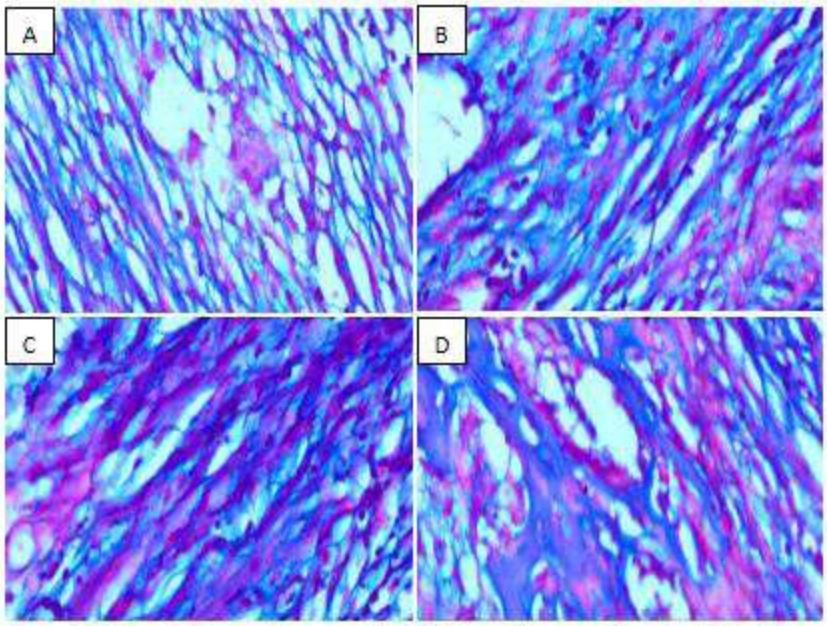

Figure 2. Histopathological image on day 7 MT staining magnification 400x of the groups. A) control group, B) group 1 (15%), C) group 2 (30%), D) group 3 (60%)

The largest score of collagen density present in the sample group which were given gel of 30% dragon fruit (*Hylocereuspolyrhizus*) peel extract, while the smallest score found in the control group. Obtaining data on the score of collagen density in each group performed *Kruskal Wallis* test. Before the *Kruskal Wallis* test, this study shows that the data are normally distributed after the *Kolmogorov-Smirnov* test statistics and heterogenous after *Levene* test. *Kruskal Wallis* test showed significant difference values ($p<0.05$) between treatment and control group. The collagen density of concentration 30% group is more higher than other groups (table 1).

Table 1. Distribution of mean andstandard deviation of collagen fiber density on the fourth and seventh day after treatment

Groups	Fourth day	Seventh day
	X ± SD	X ± SD
Control	0.20 ± 0.447^{a}	1.00 ± 0.000^{a}
G1 (15%)	1.00 ± 0.000^{bc}	2.00 ± 0.000^{bcd}
G2 (30%)	1.80 ± 0.447^{d}	2.60 ± 0.548^{c}
G3 (60%)	1.40 ± 0.548^{cd}	1.80 ± 0.447^{d}

The values with different superscript letters in a column are significantly different ($p<0.05$).

The data of collagen density observation in the fourth day showed significant mean differences in comparisons between the control group with group 1, 2, 3 and group 1 with group 2. Whereas in the seventh day observation, a significant mean differences found in comparisons between the control group with group 1, 2, 3 and between group 2 with group 3.

Discussion

Regeneration process can be seen from the soft tissue that play an important role during the wound healing process such as collagen. Observation of the results of this study was done the fourth and seventh day after treatment for acute inflammatory cells such as PMN, especially neutrophils which will soon be replaced by macrophages on the third day. Socket is filled with granulation tissue and maximum vascularization on the fifth day. The observation of the results on this study was conducted on the fourth and seventh day so that collagen fiber can be seen.[14]

This study used a range of 15%, 30%, and 60% concentration and is a preliminary study using gel of dragon fruit (*Hylocereuspolyrhizus*) peel extract. Extraction of dragon fruit peel was done so the active substances can be taken optimally. Ethanol was used as extraction solvent because it can withdraw the amount of phenolic acids higher than methanol and pure water.[15] The gel used are made of carboxyl methyl cellulosa-natrium (CMC-Na) because CMC-Na is chemically stable.[16]

Wound healing involves several mechanisms, such as inflammatory phase, proliferation phase, and maturation phase. In the inflammatory phase, the objectives are to stop the bleeding and clean the wound area of foreign bodies, dead cells, and bacteria to prepare for the start of healing process. PMN cells migrate into the interstitial area to perform phagocytosis of foreign bodies and bacteria.[17] Flavonoid, saponin, and vitamin A, C, E are contained in dragon fruit peel extract act as antioxidants and antiinflammations. Antioxidants have been reported to have a significant role in the process of wound healing and protect tissues from oxidative damage.[18] Antioxidant mechanism is expected to protect cells that play a role in the process of wound healing and convert free radicals into stable products. In the initial adhesion process, PMN adhere to the endothelium so that PMN ables to exit the endothelial transmigration as it is called an acute inflammatory process.[19]

This phase continues as chronic inflammatory cells into the injured area. T lymphocytes which are activated by interaction with macrophages that present antigen fragments on the surface of cells can produce IFN γ. These cytokines may activate macrophages so that macrophages release other cytokines to activate lymphocytes and causes inflammation where there is a focus of both these cells stimulate each other to destroy the antigen.

The next phase is the proliferative phase which involves the proliferation of fibroblasts, collagen synthesis, angiogenesis, granulation tissue formation, and epithelisation.[20] An important first step in this phase is the improvement of microcirculation to supply oxygen and nutrients needed to fill the metabolic needs of tissue repair. Regeneration of new blood vessels (angiogenesis) is stimulated by hypoxic injury condition as well as several growth factors. At the same time, fibroblasts migrate into the wound in response to cytokines and growth factors produced by inflammatory cells, among which are macrophages.[21] That activated macrophages can stimulate growth fators and cytokines on the injured area.[22] TGF-β plays a role in angiogenesis, reepithelisation, and connective tissue regeneration. TGF-β works by activating its receptor on the cell surface and transducing signl on target genes.[23,24] In the injured tissues, extra cellular matrix molecules (ECM) expressed during the process of tissue repair.[25] Those growth factors and molecules play a role in proliferation and migration of fibroblasts so that the process of wound healing can be achieved.

Fibroblasts are actively moving from the tissue around the wound into the wound area, proliferate and issue some substances such as collagen, elastin, hyaluronic acid, fibronectin, and proteoglycans that play a role in forming new tissue. Collagen is a protein substance that increase the surface tension of the wound.[20] Increase amount of collagen density that add strength to the wound.[21]

Conclusions

The gel of dragon fruit (*Hylocereuspolyrhizus*) peel extract 30% could enhance wound healing process after tooth extraction of *Wistar* rat (*Rattusnorvegicus),* by increasing of collagen fibers density.

Guided Group Investigation, Scaffolding Task Questions and Self-Efficacy in Learning to Solve Social Problems in Inclusive Schools

Wiwik Widajati[1], Punaji Setyosari[2], I Nyoman S. Degeng[2], Sumarmi[2], Mustaji[3]

[1]Postgraduate Doctoral student of Universitas Negeri Malang, [2]Graduate School, State University of Malang-Indonesia, [3]Faculty of Education, State University of Surabaya-Indonesia

Abstract

This study aims to examine the effect of guided investigation group scaffolding questions and assignments on improving learning outcomes in solving social problems in Indonesian inclusive schools. It used a quasi-experimental design and took inclusive junior high school students in Surabaya Indonesia. It used test results and inventory self-efficacy. Data were analyzed using two-way ANOVA. The results showed that the learning outcomes of social problem solving students who studied with guided investigation group scaffolding questions and assignments increased more than students who studied with un guided investigation groups, self efficacy significantly affected the increase in social problem solving learning outcomes, students with high self efficacy learning outcomes are higher than students with low self efficacy, there is an interaction between learning strategies with self efficacy in improving the results of learning social problem solving.

Keywords: *Guided group investigation, task question scaffolding, self efficacy, social problem solving.*

Introduction

Currently, most teachers still rely on textbooks in learning and utilize it as the main source material that must be taught, although sometimes the material presented in the book is not appropriate, it is also not in accordance with the environment of students, some teachers also rarely use problems that exist in everyday social life as a source of learning, students are not given the opportunity to construct knowledge so that learning more often memorizes and the results are less meaningful including learning to solve social problems in social science subject matter.

The success of a learning goal is to train students to use their abilities and intellectual skills to solve problems in life, including social problems in social science subject matter that can be measured from several indicators. According to Johnson(1), indicators of problem solving are formulating and identifying problems, evaluating problems, analyzing and formulating solutions to solve problems, determining the most appropriate solutions, and drawing conclusions.

In the 21st century, various models, strategies, learning method have been developed to keep up with the progress of science and technology and changes in social contexts. It also aims at making it easier for students to construct knowledge and learn about problem solving, including solving social problems in social sciences. The learning strategies include the guided group investigation by scaffolding questions and tasks that encourage students to work and communicate with each other through groups to investigate topics or problems that are studied or resolved.

Problem solving learning is essential in order to encourage students' ability improvement to apply knowledge and experience and work in groups to solve problems faced (2). Problem solving has become an

important cognitive activity in teaching and learning[3]. Problem solving learning in class is useful to evaluate problems and problem solving processes[4]. Problem solving and examples can increase the acquisition of cognitive skills and ability to solve problems independently[5]. The development of problem solving skills is very important in order to succeed in performing various tasks in regulating formal activities (eg schools and jobs) and informal activities (eg activities at home)[6]. Learning about solving important problems in order to be able to show confidence and views on ideas [7]. The application of problem solving interventions based on cognitive strategy instruction succeeded in improving student problem solving performance [8].

Group investigation is a learning strategy that improve student learning outcomes and other aspects. This is in accordance with previous relevant research, including research conducted by Sharan[9], that group investigation as a cooperative learning method guides students to apply cooperative learning skills to planning what they want to learn and how to learn, students work together in doing investigation, planning and integrating and presenting investigative findings also collaborates in evaluating students' academic and interpersonal efforts, giving responsibility for learning to students. But, the teacher must prepare and facilitate project investigations conducted by students. Students' learning ability is significantly higher after group learning[10], group investigations to improve learning outcomes are carried out based on differences in student interests and achievements[11].

Scaffolding is a teaching strategy derived from Lev Vygotsky's socio-cultural theory which is related to the zone of proximal development, describing the distance between what individuals can achieve and what they can achieve with help from others. Scaffolding is temporary support received by individuals from other people who are more knowledgeable during their development[12]. Social interaction is the most important factor to improve cognitive development[13]. Scaffolding is assistance to individuals in the early stages of learning, then reducing the assistance and providing opportunities for responsibility when individuals can do independently. Scaffolding is beneficial for students, for instance facilitating the internalization of knowledge to complete tasks, scaffolding of more competent friends or adults will reduce the cognitive burden when students learn individually. Scaffolding significantly influences cognitive outcomes in problem-based learning[14]. Scaffolding increases students' attention and mastery of the concepts of questions and subject matter so as to improve learning outcomes[15].

Several previous studies related to this present research have affirmed that learning strategy and self-efficacy take a role in influencing students' learning outcomes and students' performance, including learning outcomes and performance of social problem solving. Additionally, it confirm the influence of learning strategies and self efficacy on the outcome of learning social problem solving. Based on the background described above, the purpose of this study is to examine and prove the effect of learning strategies and self efficacy on the outcome of learning social problem solving.

Method

This study was a quasi-pretest-posttest nonequivalent control group design. The influence of the independent variables on the dependent variable was designed using a 2 x 2 factorial design. The subjects of this study were inclusive junior high school students in Surabaya Indonesia, including ordinary students and students with special needs or disabilities. There were two classes or groups chosen randomly and given different treatments. It employed tests which were adapted from Johnson[1]. Self-efficacy inventory was adapted from the scale for the measurement of self-efficacy for learning (SEL) developed by Klobas, Renzi, Nigrelli (16). Data normality test was using Kolmogorov-Smimov technique and variance homogeneity test was using leven's test. Data analysis to test the research hypothesis was using two-way ANOVA with a significance level of 5%.

Results

Hypothesis testing was done to test or prove the effect of learning strategy variables and self efficacy on social problem solving. To obtain the results of hypothesis testing, the research data were analyzed using the two-way Analysis of Varians (Anova) technique. The results of research data analysis with two-way ANOVA based on the 0.05 significance level are presented in table 1.

Table 1: Two-way ANOVA Results Analysis

Tests of Between-Subjects Effects					
Dependent Variable: Social Problem Solving Learning Outcomes					
Source	**Type III Sum of Squares**	**df**	**Mean Square**	**F**	**Sig.**
Corrected Model	1410.424	3	470.141	11.508	0.000
Intercept	348985.559	1	348985.559	8542.394	0.000
Guided Group_Investigation	652.360	1	652.360	15.968	0.000
Self_Efficacy	424.907	1	424.907	10.401	0.002
Guided Group_Investigation * Self_Efficacy	407.230	1	407.230	9.968	0.002
Error	2573.762	63	40.853		
Total	358549.500	67			
Corrected Total	3984.187	66			
a. R Squared = .354 (Adjusted R Squared = .323)					

According to the Two-way Anova analysis results, significance rate of learning strategy is 0.000 which is lower than alpha 0.05. It affirms that null hypothesis is rejected. The hypothesis testing indicates a difference of learning outcomes and social problem solving between students learning with guided group investigation scaffolding task quastions and students learning with unguided group investigation. The significance level of self efficacy is 0.002 less than 0.05. It affirms that the null hypothesis (H0) is rejected. The results of testing this hypothesis is that there are differences in learning outcomes for solving social problems between students who have high self efficacy and low self efficacy. The significance level of interaction between learning strategies and self efficacy 0.002, less than 0.05 means that the null hypothesis (H0) is rejected. The results of testing this hypothesis is that there is an interaction between learning strategies and self efficacy that influences the learning outcomes of solving social problems of inclusive school students in Indonesia.

Discussion

Theoretically and empirically, the findings of this study are consistent with the results of previous relevant research, including research conducted by Sangadji[17], indicating that group investigations carried out correctly can improve student learning achievement better. The use of the group investigation model has a positive effect on students' critical thinking skills hence learning outcomes will increase[18]. According to Damini[19]. The positive effects of cooperative investigation group investigation models cause significant changes in student attitudes and teachers and perspectives on cooperative learning and diversity so that learning outcomes are better. The conceptual knowledge and work skills of students using cooperative learning model group investigation types are better than conventional learning[20]. The application of collaborative learning models to group investigations can improve learning process and learning outcomes[21].

Scaffolding offers students the opportunity to internalize knowledge and complete tasks. Scaffolding from more competent friends or adults will reduce the cognitive burden when students learn individually. It improves student performance and the results associated with complex problem solving, developing problem solving, communication, team work, modeling, and professional skills [22]. Scaffolding is an important element for obtaining problem solving skills, improving student performance in problem solving [23]. Scaffolding is effective for improving verbal intelligence and shared mental and sensitivity development and predicting cognitive outcomes of children[24]. Scaffolding correlates with student performance in class interaction, formative evaluation and summative evaluation[25]. Metacognitive scaffolding can be used to increase students' awareness of the process of continuous thinking, planning actions and doing problem solving tasks[26].

The results are relevant to previous findings and theories about the importance of student characteristics including self efficacy to improve learning outcomes, student performance and other student abilities. Student characteristics are learning conditions that influence learning outcomes[27]. According to Degeng[28], to facilitate the acquisition of learning outcomes, organizing and re-disclosure of new knowledge, it is important to consider the characteristics of students. The positive relationship between self-efficacy and performance

fosters optimal performance[29]. Children with high self-efficacy have the ability to participate, effort and future self-success are higher than children with low self-efficacy[30]. Self-efficacy is an individual belief in its ability to achieve the desired level of performance and is very important in education because it affects the personality and attitudes of individuals to achieve better learning outcomes. Self-efficacy mediates a positive relationship between mindset and solution quality and performance originality[31]. Self-efficacy in learning can improve academic performance and significantly improve thinking skills[32]. Self-efficacy helps students to transform motivation into action learning and influences their ability to complete tasks and learning performance, students with high self-efficacy learning outcomes outperform students who are low self-efficacy[33].

The findings in this study also concluded that self efficacy has an influence on increasing learning acquisition, including the acquisition of learning social problem solving. Learning outcomes for solving social problems are more increasing if students have high self efficacy.

Conclusion

Based on research findings, data analysis and discussion, there is a difference in the increase in learning outcomes of social problem solving, learning outcomes of students who learn using the guided investigation group learning strategy with scaffolding task questions than students who learn to use the non-guided investigation group. In addition there are differences in the increase in learning outcomes of social problem solving between students with high self-efficacy than students with low self-efficacy. In addition, it affirms the interaction effect between guided investigation group learning strategies and self efficacy on improving social problem solving learning outcomes.

Perceptions of Teachers, Parents and Adolescents about HPV, Cervical Cancer and HPV Vaccination

Wiwin Lismidiati[1,2], Ova Emilia[2], Widyawati[2]

[1]Doctoral Student, Faculty of Medicine, [2]Faculty of Medicine, Public Health and Nursing, Universitas Gadjah Mada, Yogyakarta, Indonesia

Abstract

Background: In Indonesia, Human Papilloma virus (HPV) vaccination for children aged 9-13 years has not been widely done for prevention of cervical cancer. Schools contribute to the delivery of information about HPV vaccine. This research aims to explore perceptions of HPV, cervical cancer and the behaviour to ward HPV vaccination among teachers, parents and female adolescents.

Method: This study employed a qualitative design with focus group discussions involving 58 participants. This research was conducted in junior high schools. The inclusion criteria were female students, parents and teachers, while the exclusion criteria were female students have HPV vaccinated. The data was analyzed by content analysis approach.

Results: There were three themes: 1) Limited knowledge about the vulnerability between HPV and cervical cancer, and the lack of familiarity with HPV vaccine, 2) Insufficient insurance and overall cost for HPV vaccination, and 3) Parental involvement in HPV vaccination.

Conclusion: The study showed the importance of HPV-related reproductive health promotion and financial support for increasing HPV vaccination coverage.

Keywords: *Student perception, parent perception, teacher perception, prevention of cervical cancer, HPV vaccination.*

Introduction

The HPV vaccine is expected to prevent up to 70% of HPV incidence in vaccinated females[1]. The HPV vaccination is most effective when administered to 9-13 year-old adolescents and 14-26 year-old non-vaccinated adolescents before they have had sexual intercourse. Recent research shows that the HPV vaccination may achieve a nearly 90% protection rate[2-5].

In Indonesia, the HPV vaccine is available and is still in the initiation process[6]. Low-to middle-income countries face some constraints in introducing the HPV vaccination[4-7]. Parents, health care providers and teachers at school are the main stakeholders in HPV vaccination behaviour for female adolescents in school environment[8-12]. Therefore, this study was undertaken to explore perceptions of HPV, cervical cancer and HPV vaccination among teachers, parents and female adolescents.

e-mail: wiwien_lismidati@ugm.ac.id

Method

Research Design: A qualitative study with focus group discussions was conducted in Junior High Schools at Special Region of Yogyakarta.

Population and Samples: The samples were divided into three groups composed of 21 students, 17 parents and 20 teachers. Inclusion criteria were: female student with parental approval; parents; and female

teachers. Whereas, exclusion criteria were female students who have HPV vaccinated.

Sample type and selection: We invited female teachers and female students in each Junior High School. We also invited parents who have daughters ineach Junior High School.

Instruments: This study used a focus group discussion technique. It consisted of topics about cervical cancer, HPV, HPV vaccine, how to obtain the HPV vaccine and overcome the barriers.

Data Analysis: Data were first collected and transcribed; second,we confirmed the correctness of data and triangulated the data; third,we read all data or transcripts to find general ideas and other necessary information; fourth, data were thematically coded; fifth, we developed the themes; sixth, we developed the data description and themes in a qualitative narration and; seventh,we interpreted the data[13]. This research was approved by Medical Health Research Ethic Commission, Universitas Gadjah Mada no.KE/FK/1100/EC/2017.

RESULTS

The analysis of the focus group transcript allowed us to identify three main themes related perception about HPV, cervical cancer and HPV vaccination among parents, teachers and female students: 1) Limited knowledge about the vulnerability between HPV and cervical cancer, and the lack of familiarity with HPV vaccine, 2) Insufficient insurance and overall cost for HPV vaccination, and 3) Parental involvement in HPV vaccination. Themes of female students' perception were presented in table 1, teacher's perception in table 2 and teachers' perception in table 3. Female students' mean age was 13,09 years, parents' was 40,6 years and teachers was 44,6 years. Most students from grade VIII (76,2%); 58,9% of parents had a senior high school degree, and 70,6% were housewife. All teachers had a bachelor degree. Most teacher had educational background in life sciences and exact (60%).

Table 1. Themes and categories of female students' perception

Theme 1: Female adolescents' limited knowledge of cervical cancer, and HPV vaccine
Category 1.1: Just heard about HPV
Category 1.2: Do not know about cervical cancer
Category 1.3: Not yet exposed to HPV vaccine
Theme 2: Limited sources of information about HPV, cervical cancer and HPV vaccination
Category 2.1: Family sourced information
Category 2.2: Mass media sourced information
Theme 3: Adolescents' various consideration in taking HPV vaccination
Category 3.1: Parents' cost consideration
Category 3.2: Vaccine's safety and side effect consideration

Table 1 shows that female students just heard for the first time about HPV. Most female students cannot explain about cervical cancer.

R18: "Have heard about HPV but don't know what it is"

R2 & R4: "Haven't heard about it"

R7:"Cervical cancer is inside the womb, right? And it may develop to infertility"

Some exposed information heard by female students are derived from close relatives and electronic media like television.

R7: "Have heard about vaccine from my little sister in elementary school that I am to have cervical injection"

R9: "Have heard about it from TV"

Some female students say that they are willing to have HPV vaccination, but it will depend on their parents, since the vaccine is expensive, while there are many other needs to fulfill.

R6: "*It's expensive. I would prioritize other school necessities which also needs fund*"

R4 & R10: "I'm worried about the vaccine's expiry and side effect".

R19: "It is halal/genuine? There are many frauds in vaccination"

Table 2. Themes and categories of parents' perception

Theme 1: Lack of knowledge of vulnerability to HPV infection with cervical cancer and HPV vaccine
Category 1.1: Do not know about vulnerability to HPV infection with cervical cancer
Category 1.2: Just hear about HPV

Category 1.3: Do not know about HPV vaccine
Theme 2: Parents' socio-cultural limited communication in giving their children sex education
Category 2.1: Lack of confidence in giving sex education
Category 2.2: It is taboo to discuss about sex with children Category 2.3: Afraid of being misused
Theme 3: Parents' cost and concern factor to take HPV vaccination
Category 3.1: Cost consideration to take vaccination
Category 3.2: Concern about safety and effectiveness of HPV vaccine
Theme 4: Parents' involvement to administer vaccination to their female children
Category 4.1: There is no health care program which involves parents Category 4.2: Parents are involved in health care program at school

Table 2 shows that the parents can not explain about cervical cancer and they just heard about HPV vaccine

R6: "Yes, I have heard about it, but do not understand it."

R11: "Have not heard about the vaccine."

R2: "I am alright until now, although I did not take vaccine."

Some parents have not given their daughters sex education since they are deemed too young, and are afraid that they will misuse it, and to talk about sex is something taboo.

R17: "It is taboo to talk about sex, too early, and it is fearful to read it. Get interested but afraid."

R10: "This child is yet incapable of understanding what we convey, thus it is difficult"

R12:"How to communicate it?" Will they understand it"

Some constraints revealed by the parents to take for their daughter vaccination:

R6: "In this village, it is too expensive. It is okay that they do not take it. Thus, I think, it is okay until now that I didn't take vaccination."

R3: "The constraint is the cost. If it does not expensive, or if it is given for free, it is okay." Some of them just realize it and it needs fund, but not all of them are aware of it."

Some parents approve of the HPV vaccination and they want to be involved in the vaccination program for their daughter.

R5: "I just agree, but parents must be involved."

R6: "Is there any for parents at school? What if the health department cooperates with cadre for counseling about it?"

Table 3. Themes and categories of teachers' perception

Theme 1: Limited knowledge of vulnerability to HPV infection with cervical cancer
Theme 2: There are constraints for discussion and giving sex education
Category 2.1: Taboo of sex discussion
Category 2.2: Difficulty to give sex education
Theme 3: There are considerations ofhealth belief
Category 3.1: Vaccine's halal consideration
Category 3.2: Religious consideration
Theme 4: Parents' involvement for female adolescents to take vaccination
Category 4.1: Parents' lack of awareness of health
Category 4.2: Giving parents information of vaccination
Theme 5: Limited fund and health insurance to take HPV vaccination
Category 5.1: HPV vaccination has not been taken as a Government's program
Category 5.2: Vaccination costs too high
Category 5.3: Reproduction health has not become the main concern at school

Table 3 shows the teachers can not explain about HPV and HPV vaccination:

R1:"I just know about it in the subject, since reproduction system is given at grade 9, titled reproduction organs for health. And what the parents previously asked is HPV, about genital wart, and condylomataacuminata."

R2 "just heard about HPV today.

R9:"Cervical cancer is a further development for untreated sexually transmitted disease, which leads to cervical cancer or other reproduction disease"

Some teachers state that it is difficult to give HPV vaccination at school because of parent's social economy. In addition, vaccine safety factors are considered in taking vaccination.

R20: "(Parents'social economy) low, as seen from their education and from their employment, 50% of them are the poor."

R9: "No one dares to take it, it is not allowed since it is not from the government, and the fund may be unavailable yet.'

R14: "In case of health, it is about awareness. It is about how it is prioritized, but it is okay for tour study

The teachers also feel the constraints to discuss and teach about sex education to the students:

R1: "It is to introduce to them the disease, but we find it difficult to convey it. It is a big dilemma, but must be conveyed, but how. The warts seem to be like in general, but with its location on genital organ.

R5: "Let me think about it. I don't know it well, about the science."

In relation to HPV vaccination for female adolescents, some teachers stated about parent's involvement.

R13: "Thus, besides socialization, there is also one by the principal proposed in the meeting between parents and the committee, and the parents must be informed in case the students do not understand."

R11: "I think a detailed explanation is needed of the dangers, and what to do next. Maybe many will be interested, including the parents."

discussion

The research results show that the female adolescent, parents and teachers have limited knowledge of vulnerability to HPV infection, cervical cancer and HPV vaccination. This finding is also supported by other researches that found female students, parents and teachers find it difficult to explain about cervical cancer and its causes[14-17]. Female students, parents and teachers also are not exposed to HPV vaccine and the benefits of the vaccine itself. Other research conclusions support this finding that most of mothers and their daughters just hear about HPV, do not know about the benefit of HPV vaccine and there is limited recommendation for the schedule of HPV vaccine[16].

The parental factor is one factor that influences their daughters to not take the HPV vaccine as the result of a lack of sufficient knowledge of HPV, cervical cancer and the importance of the HPV vaccine for health[18-20]. Parents' education and income can be reasons for this consideration. Additionally, their concerns about vaccine efficacy and safety seemed to be associated with their perception that the HPV vaccine had neither been promote in Indonesia nor recommended by their health provider. Provider recommendation is a factor that influences vaccine decision[21]. The teachers said that the HPV vaccination has not been taken as a Government's program. The interview results with the local Community Health Center also showed that HPV vaccinations have not been considered as the Government's program in the prevention of cervical cancer, while the Government has just promoted early detection through visual inspection with acetic acid (VIA)or Pap smear in prevention of cervical cancer. Although, HPV vaccine is very important, but it is not supported with activities which should be made available at the level of primary health services.

In Indonesia, the people lack knowledge about the HPV vaccination due to lack of socialization of the Government's HPV vaccine program. HPV vaccine is not yet considered as the Government program and it is not the community health center's policy to socialize it through caring for teenagers (PKPR). The PKPR program under the community health centers is currently in the form of a mature marriage program, which discusses about early introduction to sex, sexually transmitted disease, HIV and anemia.

In some developing countries, HPV vaccine is also not yet included into the available national health insurance. Without health insurance coverage for HPV vaccination, parents will not be able to afford it[15]. The parents also stated that their willingness to pay for vaccines is low if its price is too expensive, and they expect that the Government will give this vaccination for free or at an affordable price[22]. This isdifferent fromthe developed countries, where the HPV vaccine program has been included into school programs[8]. The interview results with community health center officer confirm this opinion, indicating that they will not offer an HPVvaccine program until it is affordable for the community. Education of HPV, cervical cancer and HPV vaccine for adolescents and their parents are quite necessary to improve the coverage of HPV vaccination in developing countries.

Conclusion

Further research should emphasize more on information needed by adolescents and parents in relation to HPV and HPV vaccine as well as explanation about the HPV vaccine funding mechanism to facilitate parents' access to HPV vaccination for their daughters.

Source of Funding: Indonesian Ministry of Research, Technology and Hihger Education for funding this research

Conflict of Interest: The researchers declare no conflict of interest

Ethical Clearance: All procedures performed in studies involving human participants were in accordance with the ethical standards of the institutional and/or national research committee and with the 1964 Helsinki declaration and its later amendments or comparable ethical standards.

Occupational History as a Predictor of Cognitive Ability in the Elderly

Yudhiakuari Sincihu[1,2], Felicia Sinjaya[1], Edith Maria Djaputra[3]

[1]Faculty of Medicine Widya Mandala Catholic University Surabaya, [2]Student Doctoral Program of Public Health, Airlangga University, Surabaya, [3]Eagles HEAD Medical Centre

Abstract

Cognitive ability is important for the elderly to be able to live independently. Many factors influence this ability in elderly, one of them being occupational history. The purpose of this study was to analyze occupational history as a cause of decreased cognitive ability. An observational analytic study with a cross-sectional approach. 87 subjects who met the inclusion criteria were recruited from Nursing Homes in Surabaya. 71.3% of the subjects have a history of physical-dominated occupation and 28.7% have intelectual-dominated occupation. There were no differences regarding duration of work and perception of workload in both groups. The average cognitive score is 18.57 (SD 5.939). The ANOVA test between occupational history and cognitive abilities shows p=0.001, R Square=0.172, and estimated standard of error of 5.501. This study concluded that occupational history can be used as a predictor of cognitive ability in elderly.

Keywords: *Cognitive ability, Elderly, MoCA-Ina, Nursing homes, Occupational history.*

Introduction

Health development success in Indonesia has an impact on the increasing number of elderly people. The National Socioeconomic Survey reported that the total number of elderly had reached 22,4 millions in 2016 (equal to 8,695 of the total population). This is indeed an achievement, but along with it are the consequences that arise.[1] Health development effort for eldery has been focused on making them live independently and productive.[2] Better cognitive ability is believed to increase the ability of the elderly to do their daily activities, which in turn can increase their quality of life.[3] Productive is to remain and work to produce something, including living income.

Being old is a normal process, butthe problems with cognitive ability and body strength is the focus on elderly because they can impair information processing in the brain that eventually can affect an individual's social function, work, and daily activities.[4]

There are many risk factors of cognitive ability decline that have been well studied including that of age, gender, race and genetic. Other risk factors associated with lifestyle and diseases were also studied frequently such as hypertension, cardiovascular disease, obesity, diabetes, hyperlipidemia, alcoholism, smoking cigarettes, bad dietary habit, lack of B6, B12, and folic acid and also history of trauma.[5] But occupational history as a risk factor for cognitive impairment is still unclear.

Occupation is a set of activities that takes up most of an individual's time. According to Indonesian Ministry of Manpower, there are 10 categories of occupation.[6] When those ten are categorised based on cognitive function, there are two types of occupation: intelectual-dominated and physical-dominated occupation. The former stimulates the cognitive more than the latter does.

'Use it or lose it' is one of aging theories that is widely used in explaining the brain function. This theory stresses on the neurogenesis of the brain cells: the more they are used, the more developed it would be in terms of information processing.[7]On the contrary, 'wear and tear' theory argues that part of the body which is used repeteadly over time would be more likely to wear out sooner.[8] Based on those two theories, this study aims to find out whether occupational history (occupation category, length of working time and perception of workload) influences the cognitive ability.

Methodology

An analytic observational study using cross-sectional approach. This study was conducted from January to May 2018 at four different nursing homes at surabaya. Using purposive sampling technique and obtained 87 respondents. Respondents over 60 years old and could communicate well as inclusion criteria. Respondents excluded are those who had undergone brain surgery, history of brain injury, parkinson, epilepsy, stroke, hypertension, diabetes, depression, and had a history of a long-term psychotropic drugs use.

The data was collected by interviewing subject using a questionnaire. Cognitive ability was measured using MoCA-Ina.The operational definition of occupational history in this study is a set of activities within a profession on which the respondents spent most of their time for a minimum of five consecutive years. This research is part of the research that has received ethical clearance.

Result

Subject Characteristics

Most of the subject were in the age range of 75-90 years (49 out of 87)while there were only 2 who age more than 90 years. The rest of subjects were in the age range of 60-74. Subject were dominated by female, yielding a total of 57 people. This study found that most of the subjects did not finish high school, thus their education level categorised as low (n=52). Only 4 subject who have bachelor degree.

Occupational History: The description of occupation category is depicted in the diagram below:

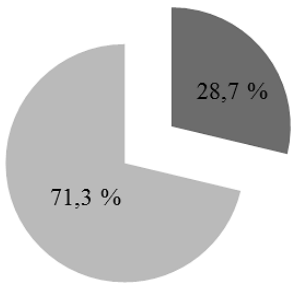

Figure 1. The Subjects Occupational History

Figure 1 showed that most of the subjects had a history of physical-dominated occupation (n=62) whereas fewer of them had an intellectual-dominated occupation (n=25).This study found that the average duration of the physical-dominated work categoryis 20,66 years (SD=10,38) and 18,24 years for the intellectual-dominated work category (SD=8,28). The statistical test showed no significant difference between the two categories (*p=.407*).

Similarly, no difference was found regarding the workload perception between the physical-dominated work group and intellectual-dominated group. 74,2% of the former group perceived their workload as 'moderate' and80,0% of the latter also perceived their workload as 'moderate'.

Table 1. Perception of Workload

Perception of Workload	Intelectual-dominated		Physical-dominated		P=
	n	%	n	%	
Easy	6	9,7	4	16,0	
Moderate	46	74,2	20	80,0	.114
Hard	10	16,1	1	4,0	

The tabel showed no difference on the perception of workload in both groups.

Cognitive Function: The data showed that cognitive function of 73 subject was impaired, indicated that only 14 of them had normal cognitive function.The average score for cognitive function is 18.57 (SD=5,939). Based on each cognitive domain, it was indicated that most of the subjects suffered an impairment of visuoconstruction (n=78), language (n=71) and memory (n=71). The data for each domain is elaborated as follows:

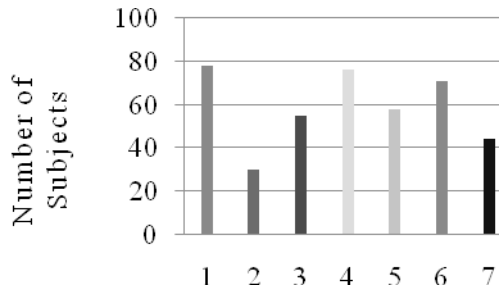

Figure 2. Percentage of Each Domain for Cognitive Function: (1) Visuoconstruction, (2) Naming, (3) Attention, (4) Language, (5) Abstract Thinking, (6) Memory, (7) Orientation

Analysis: The percentage of subjects whose normal cognitive function was higher in the intelectual-dominated work compared to the physical-dominated work. The result duration of work showed no difference between the groups. The percentage of subjects whose

impaired cognitive is range from 73,3%-86,7% in all category of work length.

Regarding the perception of workload, it appeared that the more the subjects perceive their work as 'hard', the more likely it is for their cognitive function to diminish.Despite this, data showed that even when the subjects perceive their work as 'easy', the percentage of those who had impairment of cognitive had already reached 80,0%. The details are shown below:

Table 2. Analysis Between Occupational History and CognitiveFunction

Occupational History	Cognitive Function		p=
	Impaired (%)	Normal (%)	
Occupation Category			**.000**
Physical-dominated	93,5	6,5	
Intelectual-dominated	60,0	40,0	
Duration of Work			**.069**
≤10 years	85,0	15,0	
11-20years	86,5	13,5	
21-30years	73,3	26,7	
>30years	86,7	13,3	
Perception of Workload			**.824**
Easy	80,0	20,0	
Moderate	83,3	16,7	
Hard	90,9	9,1	

Spearman test showed that there is a positive, strong correlation between occupation category and cognitive function (*p=.001*; *Coef. Corelation 0.383***). No specific correlation was found between occupational history with duration of work and perception of workload, respectively.

Regression test resulted in *R Square* of 172, with estimated standard error of 501. This estimation score is smaller than the standard deviation of cognitive function (SD=5,939),. Therefore, this regression model is an appropriate predictor for cognitive function among the subjects.Anova test produced *p=.001,*which means that occupational history is predictive for cognitive function in this study.However, the *p* value for both duration of work and perceptions of workload are not significant.

Discussion

The most of the subject were female with low education level. This finding is in line with what Boedhi-Darmojo stated in his book which argued that elderly population in Indonesia is dominated by female with 3:1 ratio to men and that their education level is low.[9]This number can be caused the life expectancy of female which is higher than that of male.

Households in Indonesia tend to put their elderly who have physical or psychological limitation into a nursing home. This might explain why in this study, more than half of the subjects age more than 75 years. Eastern families actually have had a long-running culture where their parents or grandparents live together in a house. However, this culture seems to shift nowadays since every adult in the family has to work for their living. Thus, no one left in the house to care for the elderly.[9,10]

There are more subject in this study whose occupational history was physical-dominated than those whose occupation is intellectual-dominated with a ratio of 2,5:1. This might be related with the education level. Physical-dominated work, as the name implies, means that physical work is employed more than the intellectual skill. This category of occupation includes salesman, worker of farm, forestry and fishery, handicraft maker, handyman, army and police. Intellectual-dominated work implies that intellectual skill is utilised more than the physical skill. This category includes professionals, professional assistants, manager, technician, administration worker, tool operator, and engine assembler.[6] Considering the economic condition back when the subject were on their productive years, it is understandable that most of them chose the physical work. This type of work was easier to get since it did not require high level of education.

Research by Won in Gyeonggi-do, Korea, showed that 86,4% of elderly suffered from cognitive impairment. Won's finding is similar with the result of this study which showed that 83,9% of the subject had cognitive impairment.[11]He said that the incidence of cognitive impairment increases as the elderly gets older as well as among elderly who have low education level and low income.[11] Sundariyati's research also found that the prevalence of cognitive problemswas the highest in the 75-90 age range and those who did not accomplish elementary school.[12] Similarly, Karp showed that elderly had a history of occupation with low complexity are more prone to dementia.[13]

High prevalence of cognitive impairment in this study can be explained that human body will experience organ function decline by 1% each year starting from

30 years of age. After an individual reaches the age of 30, 100.000 neuron is estimated to decay each year, gyrus shrinks, and brain mass decreases by ≥10%. Furthermore, lipofuscin deposit increases from the brain fatigue, dendrites of neuron slowly decrease, neurons' RNA vanish along with mitochondria and cytoplasm, inclusion of dialin eosinophil and levy body increase, corpora amylacea forms within brain tissue, and blood supply for the brain decreases.[14] This condition is a decrease in physiological brain organs.

In this study, the highest prevalence of cognitive problems was visuospatial domain, language, and memory. One of diagnostic criteria for Mild Cognitive Impairment is the presence of memory deficit. Therefore, memory is considered as the first cognitive function to impair in a physiologic process of brain ageing. Memory function of 75 years old individual is believed to decrease by 25% comparedto someone who ages 20. In elderly, type of memory which deteriorates is short-term memory, whereas long-term memory tends to stay intact or mildly declines.[15]

The association of Indonesian's neurologists (PERDOSSI) in their book 'Neurobehavior' explained about clinical condition in a frontal circuit of the brain as frontal syndrome – an impairment of attention, language, memory, and visuospatial. According to this explanation, this study believes that the frontal lobe is the first to show impairment in a physiologic decline of cognitive function.[16]

6 out of 10subjects in this study whose work was intellectual-dominated showed impaired cognitive function. This can be due to other risk factors that was not excluded yet in this research such as different age range, different level of education, amount of income, anxiety, smoking, and alcoholism. However, the findings on the intellectual-dominated group are better compared to its counterpart where only 1 out of 15 subjects showed normal cognitive function. The statistical test indicated that there was a strong correlation between occupation category and cognitive function.

PERDOSSI argued that working may accelerate an individual's ageing process, especially for physically demanding work such as farmer or handyman.[16] This argument is reinforced by Monginsidi who stated that school teacher is more likely to prevent cognitive function decline than the farmer.[17]Similarly, Pauran in his study stressed that elderly who is passionate in playing chess exhibited better average score of MoCA-Ina than those who are not playing.[18] It can be construed that the theory 'use it or lose it' was perceptible in Pauran's study. He also added that chess players are more preeminent on domains like visuospatial, memory, attention and language. These functions are performed chiefly by the frontal lobe of the brain.

The results in this study revealed that occupational history can be used as a reference in predicting the cognitive disorder in the future. This argument is supported by Stern who stated that education, intellectual job,behavioural factor and life experience enhance the Cognitive Reserve (CR) in the brain so that the brain may survive from the physiologic and pathologic ageing.[19] CR is one of the brain's ability to recover from any cerebral damage so that the clinical manifestation can be minimalised. CR enables nervous system to perform better efficiency, enhance the system's capacity, and make it compensate better to any expansion of the brain function.

Stern explained that CR is also determined by 'Brain Reserve' (BR). BR is defined as the resilience of the brain or the brain's capability in compensating any damage where it can still function sufficiently. Cerebellum is believed to contribute for BR since it is a structure that stores most of the brain neurons. Brain mass and number of neurons are to be called as cognitive saving capacity. An individual with greater cognitive saving capacity is favored to show mild clinical manifestation of Alzheimer.[20]

As an individual grows older the CR is diminishing. Higher education level, intellectual job, healthy lifestyle, relaxed state of mind, and certain genetic pattern may enhance the CR and BR capacity so that cognitive function may perform better. However, at a certain point of time, this capacity too will eventually runs out.[21]

Conclusion

Occupational history, especially the category of occupation, can be used as a predictor of cognitive ability in elderly. Intellectual-dominated occupation category which employs the intellectual skill more showed lower prevalence of cognitive impairment compared to that of the physical-dominated occupation category.

The Effect of Employment Time with the Low Back Pain Disorders on Workers in the 'X' Carpet Fitting Work Unit Pasuruan

Zikri Fathur Rahman[1], Nur Lailatul Masruroh[2], Noeroel Widajati[3], Abdul Rohim Tualeka[3]

[1]Student Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, 60115 Surabaya, East Java, [2]Department of Nursing, Faculty of Health, Muhammdiyah University Malang, 65144 Malang, East Java, [3]Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, 60115 Surabaya, East Java, Indonesia

Abstract

Research Background: Low Back Pain is a musculoskeletal disorder in the lower back area that many complained of patients who visited the doctor. The exact incidence of low back pain in Indonesia varies from 7.6% to 37%. The problem of low back pain on workers is generally influenced by the period of work. Research Objectives: To know the influence of the working period on the low back pain of the employees in the sewing unit of the 'X' carpet factory Pandaan subdistrict, Pasuruan district.

Research Methodology: The research design used in this research is observational analytic with the cross-sectional approach with a big sample of 30 respondents that is patient of low back pain disorder. Data analysis using simple linear regression statistic test $\alpha = 0{,}05$.

Findings: From the result of the significance test of the regression equation got result $p \leq 0{,}05$ so H0 rejected. Thus the regression line equation formed by the function of the effect of the working period with the occurrence of low back pain is significant. In simple linear regression test statistic test the value ($p = 0{,}000$), value ($R = 0.847$).

Discussion: There is significant influence between the working period with low back pain complaints to workers in the sewing unit of 'X' carpet factory Pandaan subdistrict, Pasuruan district.

Keywords: *Worker, Work Period, Low Back Pain.*

Introduction

Low back pain is a pain syndrome that occurs in the lower back region and is a work-related musculoskeletal disorder. The most common causes of LBP are muscle tension or improper posture. Things that can affect the onset of LBP are sitting habits, working bent in a relatively long time, lifting and carrying loads with non-ergonomic attitudes, abnormal spine, or due to certain diseases such as degenerative diseases[1].

In Indonesia, LBP is more often found in the age group of 40 years. Overall, LBP is the most common complaint with a prevalence rate of 49%. However, around 80-90% of those with LBP stated that they did not make any effort to deal with these symptoms. In other words, only about 10-20% of those who seek medical care go to health services[2].

Occupational illness arises because of work relationships or caused by work and work attitudes

as an example is low back pain [3]. Low Back Pain is a complaint that can reduce human productivity, 50-80% of workers around the world have experienced low back pain so that it has a negative impact on socio-economic conditions with reduced workdays as well as decreased productivity[4]. In 2003, 3.2% of the total US workforce suffered a loss of productive time due to low back pain [5].

In 2012, the prevalence of lower back pain in the past year was 15% to 20%, as many as 90% of cases of back pain were caused by errors in body position in work, such as work attitude in sewing activities.[6]

The profession as a tailor will face the risk of work. According to OSHA in the work of tailors have a variety of risks, namely the risks posed by work designs in sewing work for example: chair design, sewing table design, and sewing table pedals. Tailors have the risk of getting work-related musculokeletal disorders, related to body postures that occur in daily work activities.

Pandaan X Carpet Factory Is a company engaged in and producing textiles and garments. For the garment consists of departments, from some of them: patter/ marker, cutting, sewing/knitting, finishing, pressing, quality control, packing, and deliveries. Workers at the X Pandaan Carpet Factory, work a day for 8 hours starting at 07.30 to 16.30 and resting at 12.00 - 13.00. Within a week they work for 6 days and 1 day off. During their work they are sitting and bending when operating a sewing machine. The majority of workers in the factory have tenure of over 5 years and above. Implementation of work that is not in accordance with ergonomic rules causes complaints of low back pain and affects the performance of workers.

Based on the results of interviews conducted on several female and female workers who experienced pain complaints and complained that they worked in a sitting attitude that was too long. So that the designer's research is to do research on "The Effect of Work Period on Low Back Pain Complaints on Sewing Parts Workers at the X Pandaan Carpet Factory which is engaged in processing East Java carpets.

Material and Method

The type of research used was observational analytic with a cross sectional approach, namely research in which the variables examined, both independent and dependent variables, were simultaneously measured at one time, so there was no follow-up. The independent variable is the period of work. The dependent variable in this study is a complaint of low back pain. The population in this study were 32 carpet factory workers in the sewing unit in Pandaan district, Pasuruan district. Data collection techniques are interviews and observations.

Discussion

Based on research conducted on 32 workers in the Carpet Factory X Pandaan sewing unit, East Java, the results of all respondents were 30 respondents, there were respondents who had a majority working period above 5 years (73%) compared to the lower working period 5 years (27%). Based on the research conducted, the description of the incidence of low back pain disorders in workers in sewing work units at carpet factories 'X' Kec. Pandaan. Kab. Pasuruan obtained total data of all employees of 30 respondents. The description of the events at the research site is seen from the severity divided into 2 categories, namely low risk and high risk. Where the higher the working period of the worker, the higher the severity of the low back pain disorder. In the results obtained from the data of respondents as many as 21 respondents were in a high risk condition indicated by complaints felt by respondents is a sense of pressure and anxiety when doing physical activities both daily and at work. This is caused by several factors, namely age, work period, and work activities when doing work activities at the factory. Factors that can influence the occurrence of low back pain disorders are age. The results obtained from resonden data are from 30 respondents aged 40-50 years being the largest group with 12 respondents (40%), 31-40 years as many as 8 respondents (27%) 21-30 years as many as 7 respondents (23%), and above 50 years as many as 3 respondents (10%). Based on the results obtained, 23 respondents who

Simple linear regression test results in the table below:

No.	Event	Frequency	Percentage
1	Low Back Pain	30 Respondents	100%
2	High Risk of Acute Low Back Pain	21 Respondents	70%
3	Acute Low Risk Low Back Pain	9 Respondents	30%

The results of a simple linear regression analysis using SPSS version 21 for windows were obtained in the form of a significance value of 0,000 <0,05, from the significance value, from the value it was understood that there was a significant effect. Obtained linear regression

equation: $\hat{Y} = A + BX$ Becomes: Work Period = 77,968 + 6,690 low back pain. So, if the work period of a worker has increased by 1 unit, then complaints of low back pain will increase by 6,690 units.

Conclusion

Based on the results of research that has been done on the effect of working period on complaints of low back pain in unie workers working in the X Pandaan Carpet Factory in East Java, the results show there is an influence between Work Period and Low Back Pain interference in workers in carpet factory sewing units' X 'kec. Pandaan. Kab. Pasuruan. From the results of the test of the significance of the regression equation, the results obtained $p \leq 0.05$ so that H0 is rejected. So that the regression line equation formed by the function of the influence of the working period on the occurrence of low back pain is significant. In the results of a simple linear regression test the value is obtained (p = 0,000), the value (R = 0.847).

Lived Body Principle of a Nurse's Experience in Emergency Treatment at Remote Area Kokonao, Papua, Indonesia

Zulkifli[1], Indah Winarni[2], Asti Melani Astari[2]

[1]Student, [2]Lecturer, Nursing Master Program, Medical Faculty of Universitas Brawijaya

Abstract

Introduction: Medical service at remote places, far from complete medical facilities, provides different challenges for medical workers, especially nurse, they need to prepare themselves both physically and mentally to get their job done properly. By any limitation, it is needed a tough medical worker.

Objective: It is to explore the meaning of physical and mental experiences (lived body) of a medical worker in committing emergency treatment at remote place, Kokanao, Western Mimika, Papua.

Method: The method are qualitative by using phenomenology interpretative approach and Van Manen data analysis.

Results: The emerging themes based on lived body principle are two: physical difficulties in facing limited nature conditions and society's cultures and mental fatigue in facing negative action of society.

Conclusion: A nurse commences task at remote place, especially Kokonao, Papua, Indonesia, experienced both physical and mental abuses. Any faced limitation at remote place will not hinder them to unlimitedly serve.

Keyword: *Nurse, Remote area, Lived body, Emergency Treatment.*

Introduction

Papua is the largest island, located eastern area of Indonesia. As a large island, the numbers of its people is still a few. The data of Central Bureau Statistics[1], about 57.49% of Indonesian people live in Java and Madura islands, with are only 6.96% of whole land large of Indonesia about 5.8% from the number of Indonesian people. Papua, with area 22.83% of Indonesia, is inhabited by less than 2% of Indonesian people. Papua attracts world's attention related to health problem. Low health levels of Papua cover four matters, such as mother-kid health and nutrition of society, infectious disease – malaria, tuberculosis (TB), and HIV – Aids. Besides that, due to its area, Papua is surrounded by complete and various environmental conditions, started from natural mountains and resourceful shores, making Papua as full of potential place. However, variety and topography resources of Papua have their own difficulties of health service development in Papua. The people randomly inhabit on mountains, shore, or even valley, entailed by strong local custom about social life and belief, cause field of health cannot develop and grow[2].

Based on previous studies done in July 2018, it was gained result in Western Mimika district, Kokanao, Mimika Regency, Papua, in which is research location – a remote place inside of shore. This district has inhabitants about 2215 people and only has one main health center with distribution of medical workers only consists of 1 doctor, 12 nurses, 5 midwiferies and one analyst. The transportation is only able to reach Western Mimika district from the center of the regency via air (airplane) twice a week and via river (boat) with distance coverage 4-6 hours[3]. Emergency services at remote place is proven difficult due to limitation of facility and equipment. Besides that, doctor who is not always in the house becomes a problem in giving service. The absence of doctor when there is an emergence causes the nurses to be less confident in giving service.

In this phenomenology study, people is seen

holistically and acknowledged their existence in interacting with themselves, other people, or to surrounding environment[4]. Initial statement developed by this phenomenological study is what most essential thing can be taken from an individual human life and what it means. According to Marleau Ponty (5), four aspects of human life experience to be investigated are lived space/spatiality, lived body/corporeality, lived time/temporality, and lived human relation/relationship. Lived body means reality where human lives physically in this world. The existence of physics reveals something about ourselves and hides something at the same time. Lived body includes emotional, psychology, and physiology dimensions.

Method

The method is qualitative with phenomenological-interpretative approached developed by Heidegger in 1962. Philosophy followed by Heidegger is not only human life description but it emphasizes on understanding and interpretation(4). Sample selection is done by using purposive sampling after meeting determined inclusive criteria. There are six nurses whom actively willing to involve. Data collection is done by using *in-depth interview*. This research uses Van Manen data analysis because the method can represent interpretive and hermeneutic phenomenology research design(4).

Findings: Thematic aspect, such as mental or psychological meaning of experience, can be found separated from description of participants' experiences by using 3 method: The detailed or line-by-line approach, allows researcher to carefully read and analyze each sentence to find the essence or meaning of participants' experiences. The selective or highlighting approach, allows researcher to highlight or express statement of phrases in which are considered important and interesting from the investigated experiences. The holistic approach, allows researcher to see the whole text and try to find the meaning from the text. The findings of analysis of six participants related to lived body toward nurses' experiences to provide emergency treatment at remote places, Kokanao, get these three themes:

Physical Difficulties to Face Limitations of Natural Condition and Local Custom

This theme is built up from those two subthemes: life limitation at remote places and physical abuse experience while doing task. Life limitation at remote place can be grouped into several categories: takingto patients' problems of tidal wave, absence of electricity at remote health care, uncomfortable place of health workers' living places, bringing personal meals from city, having difficulty to get clean water, taking patients by rowing boat, being difficult to get transportation into remote places, having communication difficulties at remote place. Those categories describe difficulties experienced by the nurses while doing their tasks at remote place. Here are statements of the participants stating difficulties physically at remote places:

"the lights (electricity) have not been provided since last year"(p4)

"With the numbers of the workers and seen from their houses which are not well appropriate"(p4)

"for drinking, I need to buy water. Then to take a bath, no matter how I like or dislike it, I need to use that salty water. It feels itchy and slimy" (p5)

The participants also experienced physical abuse while doing their tasks. The abuse is punching done by family of the patient and causes one of the parents of the participants get injured as stated below:

"they were coming to my house. I was punched by using log when there was an infusion attached to me, luckily there was my mom defending me. Then, my mom got injured. It is my experience being punched by patient"(p1)

Mental Fatigue while Facing Negative Actions of the Society: Mental fatigue in English is known as tiredness not only physically but also mentally. This fatigue is feeling of being overwhelmed or emotionally drained continuously. This theme appears from several subthemes faced by participants, such as: experiencing verbal abuse and threat while doing emergency task at remote place. The verbal abuses are experienced while the participants get vituperation and becoming a target of impingement of patient's anger because the patients does not satisfy with the service. Meanwhile, threat is in the form of terror which makes participants afraid or frightened. Here are the statements:

"(patient's family) they only get angry to us (nurses)"(p3)

"I even ever threated to be punched by patient's family. Even they sometimes came to my house and terrorized to make us afraid" (p1)

Subthemes of feeling not appreciated by patients and their family. This feeling appears as disappointment of the participants after struggling so hard to help the patients from emergency state but they got threats and harmful reaction from patients' families. The participants below say:

"If it is about angry, yes it is. Since we had helped to provide services without thinking the risk upon us but they inappropriately repay us so" (p2)

The difficulties and fatigue mentally are also experienced by nurses of the remote area could be also triggered by social relationship. It deals with the participants' feelings when they needed to leave their families at town. Here are the statements:

"what else can I do? I am sad because I lost contact (communication) to my family" (p1)

"Each time I need to go to the remote place, I feel so sad, so burden to go there (the remote place). First thing first, I need to leave my family in Timika" (p5)

Problems related to working environment where the nurses do their tasks may cause mental fatigue. One of them is inappropriateness of the nurses' education to their responsibility at remote places, different treatment experienced by the nurses whom majorly are civil servants, unclear health care management will lead to mental fatigue of the nurses.

"May be, whom feeling like this (recklessly working) because he is a civil servant. So he can do anything up to him to come and go from Timika. And he has juniors whom are not civil servants, so it do not bother him" (p1)

"surely the management of remote area health care has not been well organized" (p4)

Emergency treatment at remote place insists nurses to do several actions which are not their authorities. It is done only to save patients so medical action which should have been done by doctor must be done by them when the doctor is absence. It makes them afraid and worried for nurses since they feel threatened to get punishment when they breach the authority.

"actually, I feel afraid to do that treatment (medical treatment without doctor's presence) if they patient do not recover, the family will get angry and we will be blamed again" (p6)

Self-Reflecting: This theme is built from three subthemes, started from thinking about self-limited ability. The participants introspect themselves dealing with their abilities to provide emergency state service. Here are the statements:

"Later, after finishing the treatment, I will sit and think what I have done to the patient? May he be saved? Will he or his family get angry? I do this to his family? Yeah, those are feelings I need to forget. The most important is to do it"(p1)

Besides questioning their own abilities while committing the services, the participants also think remote condition when it is left, they will feel guilty when they go home and leave the remote place.

"I am feeling guilty but I will not go home for long. It is just a moment. Ummm I feel guilty for not servicing the patients (working). So, I need to go back there" (p3)

Embracing on professional pledge becomes the subsequent subtheme, the participants try to keep working because they remember their pledge when they were graduated.

"I am feeling guilty but we have pledged when we graduated anywhere we are deployed we must serve them with heart although they are angry they are our patients and we need to keep servicing them" (p6)

Discussion

Physical difficulty contextually in this research is when the nurses get difficulty which has influences their physical condition. This difficulty is experienced by participants in physical difficulty theme takes form such as physical abuse done by patients or their families. It is such as punching, triggered by various sources, one of them is feeling not satisfied toward the given service. This finding is in line with Shields and Wilkins[6] study. It reveals that most of the patients in Canada got physical and emotional abuse by the patients. It is caused because of poor working climate. It is included sufficient employments and sources, and also poor interpersonal relationship among health and medical workers. Shield and Wilkins[6] also says this study provides evidence of a relationship between physical violence from a patient and errors in the provision of nursing care. This shows that the role of nurses in providing nursing care can be compromised as a consequence of the violence. This statement was in accordance with what was experienced

by one participant while carrying out an assignment in the remote area Kokonao, where the participant was beaten from the patient's family because of a misunderstanding in which participants were suspected of not carrying out their duties properly.

Subsequent physical difficulty happens on the participants is about limitation they experience dealing with their own social own life at remote area. Health care center which has been providing medical service, does not have any electricity so it makes the participants difficult to provide better services when the patients come at night. Emergency state service in low-light places will make medical services cannot be maximized and caused the participants have physical difficulty visually. At remote area of Kokonao also provides opportunity for participants in taking patient process where they need to take boat through the river or seas for 4-5 hours which causes physical fatigue for both patients and the nurses.

The theme – mental fatigue – contextually in this research means psychological and mental conditions of participants whom are shocked due to actions of the patients, the patients' family, and society during doing their task. Mental fatigue experienced by participant in this research is caused by many things, one of them is working environment where participants often verbally abused by vituperating and being target of patients' anger due to their dissatisfaction and lack of understanding about the given treatment. It is in line with Dlamini and visser[7] where nurses of their study stated that their working environment are frequently attacked and insulted by patients. It makes the nurses frustrated and lost their pride as nurses. Although unavailability of sufficient working resources are still expected to be able to solve problems and to be responsible beyond their own role. It causes them to have inappropriate psychological experience. Furthermore, Dlamini and Visser(7) stated that the nurses frequently needed to work out of their job description. According to the nurses, they need to work for whole day and have not sufficient time to rest because their leaves are denied due to lack of staff. It causes fatigue which makes them easily commit mistakes while working. It is in line with categories which create subthemes of the problems in the working environment – that is the participants are not in line with their education and are forced to do some medical action out of their authority for the sake of patients.

The nurses also state that they are disappointed by management of health care center and feel like they are differently treated as non-civil servants. The participants also tell that they used their own money with expectation to get some replaced money after taking the patients but they did not get it. It causes them to get disappointed by the management. This finding is in line with Dlamini and Visser(7). In their study, the nurses stated that they are disappointed by management, especially when it deals about their wellbeing. They described that the nurses were disappointed as impacts of unfair action upon them from the management. The nurses in this research often faced challenges about their psychological wellbeing which is not respected and acknowledged as professional worker.

Self-reflection of what participants have done in this research as results of worry and their thought while finding many difficulties in providing emergency state service at remote area. The participants found that their knowledge and skills are still limited so it leads to anxiety while providing treatment action or medical action. The nurses struggle to find and think again what they could use and fix to provide better service.

Bertero(8) stated that nurses reflected their relationship to patients and close family, their interaction to patients and close family, providing needs and feeling frustrated. They identified and described the situation, realizing their feeling, evaluating the situations and creating some analysis and thought if they can act more quickly with other actions. It is in line with what participants show in the subthemes by evaluating their own limited abilities while providing service and thinking remote place condition when they leave it to go home. Findings of Bertero[8] also shows that reflection in nursery practices can be identified as action reflection, reflection inside of action and reflection as self-discovery. Sometimes, the nurses intuitively do their jobs. They do it according to their experience which is considered to be functional. However, they sometime get difficulties to express it. In another word, they have what is said to be silent knowledge. Reflection as self-discovery, in line to what participants experienced in the subthemes, is adamant to commit their professional pledge where the participants must keep working to society although they get inappropriate reaction. They found themselves as persons to commit their own professional pledge they said after graduation.

Conclusion

Live body principle from four existential phenomenology on the nurses' experiences in providing

emergency state service at remote place, Kokonao, Papua result to physical difficulty theme to face limited natural condition and social cultures, mental fatigue to face negative reaction of the society, and then to do self-reflection. Those three themes appear because many limitation they faced in providing emergency state treatment. The limitation is not only from facility but also social cultures of the remote place.

Biliary Atresia Outcome in Egypt: A Descriptive Study

Omar N. Abdelhakeem[1], Gamal H. Eltagy[2], Alaa A. El. Sayed[2], M.M. Khedr[2]

[1]Lecturer, [2]Prof., Minia University Hospital, Minia, Egypt

Abstract

Biliary atresia is a rare disease that affects children and neonates, nowadays the current management of BA is portoenterostomy with or without liver transplantation, in this study we described the outcome of BA in single center .

We included 48 patients in this study with type 3 BA and measured the incidence of clearance of jaundice and cholangitis the incidence of clearance of jaundice was 43% and cholangitis was 20% also the mean age was 74.6±21.8 days which is quiet high.

We concluded that early diagnosis and centralization is the key point for getting best outcome for patients of BA.

Keywords: *Biliary Atresia, Porto entersostomy, Jaundice clearance, cholangitis.*

Introduction

BA is an obstructive cholangiopathy, an inflammatory process that affects both intra and extra hepatic bile ducts causing obliteration of the bile ducts ends up to cirrhosis and liver cell failure if left untreated(1).

Although it is an uncommon disease occurring in 1/10000- 1/15000 live births world wide it It is rare but with obvious geographical variation as in Europe and North American for example it has an incidence of 1 in 15–,20,000 live births and by contrast can be seen in up to 1 in 5000 live births in Taiwan and presumably mainland China. It is not a homogenous, uniform disease and within the umbrella term are several variants which have separate and distinct causes and different outcomes. These make comparison of treatment options difficult but not impossible(2).

Contact No.: 00201002873241

The etiology of BA I unknown but thought to be multifactorial, currently there is 3 main types of BA; cystic type of BA, isolated BA and syndromic BA which is thought to be congenital in nature(3).

The first porto enterostomy was done by Prof Moro Kasai 1953 by chance while he was dissecting in the porta hepatis and noted bleeding then he put the dudenum for hemostatsis then the patients stool got coloured since then many modifications has been done to this operation and became the first line of treatment of BA with or without liver transplantation(4).

There are many factors that affects the outcome of Kasai procedure, the most important factor is patients age at time of operation, the second is the type of BA the best in prognosis is cystic type of BA while the worst is the syndromic BA, attacks of cholangitis also affects the outcome also adjuvant therapy may play a role in improving the outcome(3).

The prognosis of BA has dramatically changed in the last decades: before the Kasai operation most BA patients died, while nowadays with the sequential treatment with Kasai operation, with or without liver transplantation, BA patient survival is close to 90%. Early diagnosis is very important since the chances of success of the Kasai procedure decrease with time(5).

In Egypt and due to limitation of liver transplant in patient with BA below one year of age we have to do our best to increase the success rate of the porto- enterostomy in patient with BA including both clearance of jaundice and the percentage of native liver survival

Patients and Method

48 patients were included in this trial we included all cases of BA type 3 after investigations were done including Lab investigations which showed direct hyper bilirubinemia, elevated GGt and Alkaline phosphatase,ultrasound showed absent or non contractile gall bladder, liver biopsy showed marked inflammation and bile duct proliferation .

All cases were operated and managed at Cairo University Children Hospital (CUPSH) and after referral to the surgical department the case is admitted 48 hours before surgery and preoperative labs were done, blood crossmatching and preoperative antibiotics were given .

On the OR patients were anasthesized supine with endotracheal intubation and sonar guided CVL .

The infant was positioned supine to ensure a non obstructed view for cholangiography,which was not routinely required .surgical exploration commenced through an extended kocher`s incision centered to the right ..this incision could be extended across the midline if biliary reconstruction was required . he the left upper quadrant was examined to determine splenic anatomy .

Liver consistency was noted and the porta hepatis inspected.. Cholangiography has a distinct role in this patients.

If the gallbladder had a lumen, diluted contrast material (diatrizoate Hypaque) was injected to determine the continuity of the biliary tree between the liver and duodenum. Complete extrahepatic duct patency was confirmed when contrast appears distally in the duodenum and proximally in the liver radicles. The size of the ducts is assessed by cholangiography to determine whether biliary hypoplasia or obstruction to bile flow from inspissation was present. If the contrast material moved only distally into the duodenum and not into the liver, gently occluding the distal common bile duct while reinjecting the gallbladder to encourage proximal ductal filling, although this maneuver rarely succeeded. If extrahepatic biliary patency is demonstrated, regardless of whether the ducts were of normal caliber or diminutive, a liver biopsy is performed and the incision closed.

If ductal patency was not confirmed, portal dissection and biliary reconstruction was performed (the Kasai procedure).

According delivery of the liver some surgeons preferred to deliver the both lobes of the liver from the abdominal cavity after dividing both triangular ligaments, some preferred to deliver the left lobe only and minority prefer not to deliver either lobes and doing the portoenterostomy insitu.

Figure 1: Liver delivery before dissection

The fibrous common duct was ligated distally with nonabsorbable suture and transected. Gentle traction applied to the remnant facilitates dissection toward the porta, where a cone of fibrous tissue anterior to the bifurcating portal vein is encountered.

When there was discontinuity of the biliary tree, exploration of the tissue overlying the portal vein bifurcation will almost invariably reveal the fibrous cone. Placing a suture in this fibrous tissue will facilitate establishing the plane above the portal vein.

Once dissection was complete, fine stay sutures were placed at the lateral margins of the fibrous cone. While maintaining moderate tension, the fibrous cone was sharply transected,

The resected biliary structures with attached gallbladder remnant are sent for pathologist to measure

the size of the biliary ductules for later prognostic evaluation.

Recently we standardized our technique by making wide portal plate extending from Rex fossa to the gall bladder fossa (innominate fossa) for allowing maximum drainage of bile through the porto-enterostomy .

The porto-enterostomy was done retro colic through an incision in the transverse mesocolon just to the right of the middle colic artery.

The prto-enterostomy was done end to side by making an incision of the anti-mesentric border of the roux limb 1-2 cm of its distal end to avoid blind pouch and then the anastomosis is done using parachuting technique for the posterior wall which allows better vision.

After completing the porto-enterostomy the roux limb was sutured to the glisson`s capsule and transverse meso colon to decrease the tension on anastomosis.

Drain was usually inserted and removed on the 5th day post operative.

Regional anaesthesia (TAP block) is injected at the lateral border of rectus sheath to decrease postoperative pain, the dose was calculated through the anesthesia team.

Abdomen was closed in 2 layers and Subcuticular closure for the skin was done.

Postoperative Management: Patient was kept on the ICU on nasal oxygen if needed with proper analgesia, Iv fluids and post operative CBC was done routinely to detect any need for blood transfusion.

Gradual feeding was introduced once intestinal motility was regained

Patient was followed up through CBC with differential and CRP to detect early sepsis and upgrade antibiotic line accordingly.

Discharge: Patients was discharged when they reached their full feeding with no fever and no laboratory signs of sepsis.

Outpatient follow up: After discharge Patients were followed up regularly at the hepatology clinic for follow up.

At day 12 post operative, 1,3 and 6 months postoperative.

General medical examination was done, jaundice is detected recording of any complication such as cholangitis, etc.

The following data were recorded: Hepato splenomegaly, Presence of jaundice, Colour of stool, Fever and cholangitis.

Results

Concerning our patients the range of age was **(30-118)** with a mean age was **74.6±21.8** . 25 were males (52%) while 23 were females (48%)

In our study 25 cases were male (52.1%) and 23 cases were female (47.9 %)

In our study 21 cases (43.8%) were jaundice free within the first 6 months postoperative .

27 cases **(56.3%)** were still jaundiced at 6 months postoperative . 35 cases (72.9%) has coloured stool while only in 13 cases (27.1%) clay coloured stool have persisted.

The median preoperative bilirubin was 9.8 mg/dl while the median bilirubin after 6 months were 5.1 mg/dl.

Discusson

Although our study seems to be intermediate in number of cases and this limits the presence of statistical significance of the data but this happened however this happened due to relatively short duration of the study which was only 2 years, Davenport made his trial over 11 years and the START trial was done over 6 years[(1)].

Concerning age in our study the mean age was74.6±21.8 (30-118), 14 cases were less than 60 days (29.2%),23 cases were 60-90 days (47.9%) and 11 cases were 90-120 days (22.9%).

By comparing the mean age with the mean age of the similar studies that discuss the use of steroids the mean age of this study is the oldest age, in the study of Tyraskis and Davenport 2016 the mean age was reaching 46 days (12-70) days[(1)]. while In the START trial done be Bezzera 2014 the mean age was 69 days[(6)], also at the study of Escobar 2006 the mean age was 43 days[(7)], the mean age of the study of Petersen 2008 was 62 days[(8)]. Chung 2008 also at has a mean age of 70 days[(9)].

From the previous data we can conclude that the youngest age was at Davenport study (45 days (12-70)) and we think that this could be achieved by the centralization system that the NHS provide to allow early detection and management of those cases and due increased awareness of this disease among pediatrician[1].

On the other hand in EGYPT and due to lack of awareness of this disease among pediatrician and due to lack of ability of differentiation between BA and physiological jaundice there is a delay in the management of these cases, In our study we excluded the cases aged above 120 days due to controversy about benefit of porto-enterostomy for those patients and if we didn't exclude those cases the mean age would be much higher .

Conclusion

For achieving best outcome for patients of BA two main factors should be present the first is early diagnosis and management of biliary atresia either by screening or increasing awareness of this disease between pediatricians the second factor is centralization which should increase surgical success.

Improvement of Women's Skills toward their Children with Hemophiliaat Hereditary Blood Disease Center in Al-Nasiriya City, Iraq

Oday Faris Washeel[1], Radha. M. Lefta[2], Ali Hussein Abbas[3]

[1]Pediatrics Nursing Department, College of Nursing, Al-Muthanna University, Iraq, [2]Ph.D., College of Nursing, University of Al-Ameed, [3]M.Sc., Community Health Nursing Branch, College of Nursing, Al-Muthanna University, Iraq

Abstract

Background: Hemophilia refers to a group of bleeding disorders in which there is deficiency in one of the factors necessary for coagulation of blood such as factor VIII, IX or XI. The study was aimed to assess and improve women's skills toward their hemophilic children. Method: A descriptive study was conducted on a sample consisting of (70) women having hemophilic children who were selected randomly from Hereditary Bleeding Disease Center in Nasiriya City, Iraq from June 2018 to November 2018.

Results: The results revealed that differences were found between the study and control groups (P<0.01). With regard to practice of women in post-test, there was significant difference between practice (P<0.01) after the application of the education program in post-test conducts with relative comparison to the pre-test occasion in the study group.

Conclusion: Most of the women in the study group got benefit from implementation of programme about their skills concerning hemophilic disease.

Keywords: *Hemophilia, Practice, Children,Women, educational programme.*

Introduction

Hemophilia is a mostly inherited genetic disorder that impairs the body's ability to make blood clots, a process needed to stop bleeding.[1,2]. As a consequence, people bleed longer after an injury, easy bruising and an increased risk of bleeding inside joints or the brain[3]. Those with a mild case of the disease may have symptoms only after an accident or during surgery[3]. Bleeding into a joint can result in permanent damage, while bleeding in the brain can result in long-term headaches, seizures or a decreased level of consciousness[3].

Method

Non–probability (purposive) sample application was conducted on a sample consisting of (70) women having hemophilic children who were selected from Hereditary Blood Disease Center in Nasiriya City, Iraq. The assessment was conducted from 1st, June until 13th, November 2018.

Results

Table (1) showed the criteria of study groups. The highest percentage of women were within the age range (36-40) years who represented (28.6%) of the total study group, while the control group age range was (26-30) years who represented (28.6%). With regard to the level of education of women, the highest percentage of the study and control groups were primary school graduate who represented 28.60% and 35.20%, respectively. In addition, the majority in the study and control groups were unemployed (65.70% and 71.60%), respectively. In respect to the residential areas, the majority of women in the study and control groups came from rural areas (51.40% and 62.60%), respectively. Moreover, table 2 showed that there was no significant association between

women's skills and their educational level at the pre-test and post-test occasions in the control group. However, there was no significant association between women's skills and their educational level at the pre-test occasion, but there was significant statistical association between women's educational level and their skills at the post-test occasions in the study group**.** Furthermore, table (3) indicated that there was no significant association between women's skills and their occupation at the pre-test occasion, but there was highly significant statistical association between women's occupation and their skills at the post-test occasions in the study group. However, there was no significant association between women's skills and their occupation at pre-test and post-test occasion occasions in the study group.

On the other hand, table (4) indicated that there was no significant association between women's skills and their residential area at the pre-test and post-test occasions in the control group, however, there was no significant association between women's skills and their residential area at the pre-test occasion, but there was highly significant statistical association between residential area and their skill at the post-test occasions in the study group. Also, table (5) showed that there was no significant difference between the pre-test and post-test and follow up 1 and 2 within the group as well as relative to women's skills in the control group. There was significant difference between the pre-test and post-test and follow up 1 and 2 within the group as well as relative to women's skills in the study group.

Discussion

Adequate practice has been recognized as a necessary ingredient in women's' ability to lead normal and productive life for their children[6]. The latter found out that women's practice in children with hemophilia care is considered one of the essential tools in raising the standard of hemophilic childcare given by women and nurses. Women must have sound understanding of scientific principles underlying each step of any procedure in order to prevent possible risk factors. So they become able to apply their practice into effective care[7].

HFA[7] indicated that hemophilia is a hereditary disorder of blood clotting mechanism primarily affecting males, being transmitted through unaffected females, while the HFA[8] stated that one quarter to one third of all occurrences appear in families with no previous history of the disorder. This is in agreement with present results were (25.7%) of the study group and (17.1%) of the control group were new cases without family history.

It had been shown that (22.8%) having bruising at age >6 months in the study practice and attitude of mothers in reproductive age about family planning group and (28.6%) having it at age <6 months) in control group (Table 2).

The present study agreed with HFA[9] that indicated the first sign of bleeding problem is likely to occur in nearly infancy when crawling and walking are first attempted, these activities will produce the inevitable knocks and twists and could result in bruises. Moreover,[7] reported that bruises are common, but are usually superficial and not painful. As babies with

hemophilia start to become more mobile, some women like to reassure themselves by padding, the knees of long trousers and sometimes sleeves to protect elbows from bruising and bleeding at baby age usually occurs as a result of a bang or a fall. Superficial bruising is the most common form of bleeding.

Relationship between women's practice with their demographic characteristics in pre- and post-test occasions: It had been found that there were significant differences between women's practice and their age, at pre- and post-test occasions in the study group, while in the control group there were no differences between women's practice and their age, at pre and post-test occasions (Table 2). This meant that women of study and control groups did not experience any information or gained any practice concerning hemophilia when they exposed to the pre-test, besides, this result was in agreement with [11].

Significant difference was noticed between women's practice and pre and post-test occasions in all educational levels in the study group, (Table 2), while in the control group there was no significant difference between women's practice and pre-and post-test occasions in all educational levels (Table 2). This indicated that all women form different educational levels gained practice concerning their children's illness only after the implementation of the educational program in the study group. The present result was consistent with that of [7].

In the present study, the researcher tried to introduce the information and items of the educational program in a simple and clear language. So that to be more appropriate and sufficient for all educational levels of women for better understanding.

Significant difference was found concerning practice in the study group at pre- and post-test occasions for employed and unemployed women (Table 3). That meant both employed and unemployed women experienced significant increase in their practice after implementation of the educational program, while in the control group there was no significant difference relative to women's practice at pre- and post-test occasions in respect to women's occupation (Table 3). The result of [8] indicated that occupational status has significant effect on women's hemophilia practice and their children condition which was in agreement with the finding of the present study. Significant difference was noticed concerning practice at pre- and post-test occasions in the study group in respect to residential area (Table 4)that meant both rural and urban women in the study group had improved their practice after the implementation of the educational program. However, there was no significant difference concerning women's practice at pre- and post-test occasions in the control group in respect to residential area(Table 4). That meant women (rural and urban areas) in the control group were not practicable. In a study done by [9], it was indicated that rural people have poor information about disease, genetics, signs and symptom, prevention, how to manage their child before and during episode of bleeding and how to recognize the dangerous signs of bleeding. They also found that urban people have lack of information.

Relation of women's characteristics in pre- and post-test occasions: In the present study, it was found that significant difference between women's skills at pre- and post-test occasions in the study group and their ages (Table 5). That meant that women's skills were improved after implementation of the educational program in the study group, while in control group there was no significant difference between women's skills at pre- and post-test occasions and their ages (Table 5). This indicated that women in control group did not experience any changes in their skills when they were exposed to the pre- and post-test[10]. On the other hand, significant difference was noticed between women's skills at pre- and post-test occasions in the study group according to their educational level (Table 5), while in control group there was no significant difference between women's skills at pre- and post-test occasions according to their educational levels (Table 5). That meant that women from different educational levels gained better skills concerning their hemophilic children after implementation of the educational program in the study group.

This result was supported by work of[11] who found that educating women about bleeding information and skills "what to look for and what to do", information concerning first.

In this study, it was found that it's useful when a follow up is applied in two and four months after educational program implementation. This indicated that the amount of information acquired by these women were sufficient and effective after educational program so they had greater benefit than those in control group. So that the present study showed significant difference between the pre-test, post-test and follow up 1 and 2 of

the study group when hemophilia educational program was applied, while there was no significant difference found in pre-test, post-test and follow up 1 and 2 of the control group (Table 5). These finding were supported by[5] who reported that education about hemophilia is a primary requirement for affected families and their doctors. Morbidity and mortality are reduced by retraining from necessary intervention as well as by treating bleeds appropriately.

Conclusion: Most of the women in the study group got benefit from implementation of programme about their skills concerning hemophilic disease.

Ethical Clearance: The research Ethical Committee at scientific research by ethical approval of both environmental and health and higher education and scientific research ministries in Iraq.

Conflict of Interest: The authors declare that they have no conflict of interest.

Isolation and Distribution of Microorganisms Causing Wound Infections in Diabetic Patients in Kirkuk City, Iraq

Aydin S. Ahmed[1], Pinar H. Tahir[2], Burhan A. Mohammed[1]

[1]Northern Technical University/Technical College/Kirkuk/Medical Lab. Techniques Dep./Iraq,
[2]Babagurgur Center of Diabetes, K1 Hospital, Kirkuk, Iraq

Abstract

Background: Diabetic wound infections are considered one of the main life-threatening diseases among diabetic patients. Foot ulcers are accounting for up to twenty of diabetes-related hospital admission. If leaved untreated, they might result in amputation of feet and legs. The aim of current study was to investigate the isolation and identification of pathogenic microorganisms in wounds of diabetic patients in Kirkuk district, Iraq.

Method: Forty diagnosed diabetic patients, (18 males and 22 females)presented with wound infection at Azadi Teaching Hospital, were selected for the study. Swabs of pus and wound exudates were obtained from infected region for bacteriological studies. Then these swabs cultured on blood agar and MacConkey agar for facultative organisms and incubated at 37°C for 24 hours. All cultured isolates were investigated and identified by standard bacteriological and analytical profile index laboratory techniques.

Results: Data from current study revealed that single etiology was observed in 24(60%) of isolates. Polymicrobial infections were observed in 4(10%) of patients and 12(30 %) isolates were negative. Also, *Staphylococcus aureus* was the most common cause of infection which comprised 20% of isolates followed by Pseudomonas aeruginosa (15%) isolates. Moreover, it was found that 12 isolates were due to *Pseudomonas spp*. constituting 30% of isolates followed by *Staphylococcus spp*. accounting 25%.

Conclusion: There is no definite etiology in diabetic wound infections and *Pseudomonas spp*. were responsible for most of wound infections in diabetic patients.

Keywords: *Diabetic foot, wound infection, bacterial isolates, wound swab, Pseudomonas spp.*

Introduction

Diabetes mellitus (DM) is a clinical metabolic syndrome in which there's an increased blood sugar higher than the normal values due toto defects in insulin secretion and/or decline in the effectiveness of insulin(1). Prevalence of Type 2 DM (T2DM) has been increasing steady all over the globe and quickly turning into an outbreak in some countries of the globe, particularly in poorly developed countries. The number of individuals affected is expected to be twice the current number every decade alongside raised ageing population, thereby adding to the already existing load for healthcare suppliers. Untreated DM can cause serious long-term complications including peripheral vascular disease, stroke, chronic renal disease, foot ulcers and eye damages(2). Impaired life quality, entails high price and prolonged hospitalization are major health issues of diabetic foot (DF) disease (3). the latter is one of the foremost feared complications of diabetes. Foot ulcers are accounting for up to twenty of diabetes-related hospital admission. If leaved untreated might

result in amputation of feet and legs due to secondary infection of those ulcers which might develop in the skin, muscle or bone of the foot as a results of the high glucose level, suppressed immunity, poor circulation and neuropathy[4,5]. It's currently appreciated that about 20% of the patients with such foot ulcers continue to need associate amputation. Nearly 85% of foot amputations are due to diabetic foot ulcers [6,7]. Usually such foot ulcers were infected by multiple organisms where anaerobic microorganism co-exist with aerobic organisms [8]. In such cases, anaerobic microorganism typically complicate chronic ulcers by producing daed materials and foul odor [9,10]. The purpose of the present study was to characterize microbial prevalence among wound infections of diabetic patients.

Patients and Method

Forty diagnosed diabetic patients (18 males and 22 females)presented with wound infection at Azadi Teaching Hospital from 10th, September 2018 to 15th, April 2019, were selected for the study. Their ages ranged from 44 to 73 years with mean±SD age of 56.47±9.77 years. Laboratory tests for evaluation of diabetes; fasting blood glucose (FBG; mmol/l) and hemoglobin A1c (HbA1c %) levels were collected from patients' laboratory data. A total of forty swabs were obtained from wounds of both inpatients and outpatients, screened for detection of pathogenic microorganisms by examination of swabs from wounds of diabetic patients. Complete information including age, gender, and type of diabetic, of both male and female individuals recruited in current study, also obtained.

Sample Collection: Samples were collected by means of rotation of sterile swabs (transport swab) from diabetic wounds. The swabs were transported to microbiology laboratory of the department in a transport media which prevent drying within 24 hours after collection. The swabs were inoculated onto blood agar, nutrient agar and MacConkey agar plates for isolating pathogenic bacteria. Then plates were incubated for 48hr at 37°C. After the incubation period, the plates were examined for growth and the isolated colonies were identified by morphological characteristics and bacterial morphology was observed from Gram-stained smears and biochemical investigations. The tests performed included Gram-staining, Catalase, Oxidase, API 20E and API Staph that included 20 tests of enzymatically and biochemical reactions such as (Urease, Voges Proskauer, citrate utilization production, mannitol and phenylalanine, Indole, cytochrome oxidase test... etc).

Statistical Analysis: Data obtained were analyzed using the Excel program version 10 package. The significance of invariant differences was assessed by student's *t*- tests and all values were two-sided. A *P*-value <0.05 was considered statistically significant.

Results

The present study included 40 diabetic patients, of whom 18 were males and 22 were females. The age ranged from 44 to ≥74 years. Different diabetic wound infections were highest among the age group of ≥74 years, followed by the 54–63 years age group. Statistically,results revealed that age and gender did not show significant relation with wound infections (P > 0.05; Table 1).

Table (1): Bacterial infection distribution according to patient's gender and age

Age Group/Years	No. Tested	Male No.(+ve%)	Female No.(+ve%)	Total (+ve%)
44 – 53	18	4(22.2)	10(55.6)	14(77.8)
54 – 63	10	2(20)	6(60)	8(80)
64 – 73	10	4(40)	2(20)	6(60)
≥74	2	0(00)	2(100)	2(100)
Total	40	10(25)	20(50)	30(75)

$X^2 = 4.507$. *P*=0.211; *P*>0.05 (Non-significant).

Bacteriological study of 40 patients with diabetic wound infections revealed that the total number of isolates was 32 representing five different bacterial genera. Isolated organisms were *Pseudomonas spp.* (30%), *Staphylococcus spp.* (25%), *Acinetobacterbaumannii* (10%), 5% for each of *Proteus marbles, Escherichia coli* and *Bacillus subtilis* and 4 isolates were mixed infections (Table 2).

Table (2): Types of bacteria isolated from patients with diabetic wounds

Bacterial Isolate	Number of Isolates	Percentage
Pseudomonas spp.	12	30
Staphylococcus spp.	10	25
Acinetobacterbaumannii	4	10
Proteus marbles	2	5
Escherichia coli	2	5
Bacillus subtilis	2	5
Total	32	80

The study revealed that polymicrobial infections were found in 4(10%) patients who were infected with two types of bacteria, while single etiology appeared in 24(60%) patients and 12(30%) cases showed no bacterial isolates (Table 3).

Table (3): Polymicrobial isolations from diabetic foot infections

Isolation Type	No. of Patients	%
Single bacterial isolate	24	60
Two bacterial isolates	4	10
No bacterial isolate	12	30
Total	40	100

Regarding distribution of bacterial isolates according to patients' gender, results of current study showed that bacterial isolates were distributed equally among males, while some variance among isolates distribution occurred among infected wound samples obtained from females (Figure 4) with a prominent frequency of *Staphylococcus epidermidis* among females which comprised 15% of positive cases followed by *Pseudomonas aeruginosa* with 10% of positive cases.

Table (4): Frequency and percentage distribution of bacterial isolates according to patient's gender

Isolate	Males No. (+ve %)	Females No. (+ve %)	Total No. (+ve %)
Pseudomonas aeruginosa	2(5%)	4(10%)	6(15%)
Proteus marbles	0	2(5%)	2(5%)
Staphylococcus aureus	2(5%)	6(15%)	8(20%)
Acinetobacterbaumannii	2(5%)	2(5%)	4(10%)
Pseudomonas stutzeri	2(5%)	2(5%)	4(10%)
Pseudomonas luteal	2(5%)	0	2(5%)
Staphylococcus epidermidis	0	2(5%)	2(5%)
Escherichia coli	2(5%)	0	2(5%)
Bacillus subtilis	0	2(5%)	2(5%)
Total	12(30%)	20(50%)	32(80%)

$X^2 = 6.458$. P=0.596; P>0.05 (Non-significant).

Discussion

According to official statistics issued by the Iraqi Ministry of Health in its annual report for 2013 that 2.9% of deaths in that year were due to diabetes disease and was expected to have, in that year specifically, more than 1.5 million cases of the disease. On the other hand, Iraq ranks 9th in the Arab world and 30th in the world with injuries up to 10.2% of the total. Iraq has a large population of Diabetic Foot Infection (DFI) and patients with a vast geographical distribution and significant variations in the types of bacterial infections found in DFI wounds from different regions[11,12]. Impaired life quality and prolonged hospitalization are the major health problem caused as a result of diabetic wounds infections[3]. Several factors including high blood sugar level, suppressed immunity, inadequate blood supply and neuropathy were contributed to enhance the infection of wounds of diabetic foot. The prevalence of DM in adults (T2DM) is predicted to have continuous increase in the next two decades especially in developing countries where the majority of patients are aged between 45 and 64 years [13]. The mean age of current study's participants was about 56.47 years and most of the diabetic patients with foot ulcer were within fifth decade of age. This finding was comparable with the results of retrospective

group study among Saudi population reported by[14] who demonstrated that 45 years age or older is a risk factor for developing diabetic foot ulcers. In agreement with most studies[15,16] DFI patients were often elderly males with multiple complications, possibly due to the improper blood sugar control, burdens of life and exercise habits. Regarding the relation of patient's gender with DF disease, data are controversial [17]. Although previous studies found that male gender was predominant in DF patients[18,19], current study showed that two-thirds of the cases were female patients. In another study[20], which included 248 type II patients with diabetic foot, the authors found that sex may imply a significant risk factor for the development of diabetic ulcers. The authors cannot exclude the impact of gender rules on women's health in the local area. Comparable to the paragraph mentioned by[21], women may find that health services are inaccessible or conditioned on certain cultural grounds or gender rules, such as restrictions imposed by the male guardianship system; religious norms may affect access, quality and outcomes for women. These factors can also be responsible for higher frequency of DF-related manifestations observed among women than men. Among common Gram-positive organisms, Staphylococcus aureus was the most common. However, the percentage of Staphylococcus aureus decreased with prolonged duration of the ulcer, while Enterococci proportion gradually increased. A previous study [22] indicated that enterococci often appeared in patients with immune deficiency and could participate in the formation of biofilms[18]. In the present study, the most frequent bacterial isolates were Pseudomonas aeruginosa (30%) and Staphylococcus aureus (25%). These findings were comparable to the findings of [16] who reported that Staphylococcus aureus and Pseudomonas aeruginosa were the most common causes of diabetic foot infections in India. Further analysis showed that the most common gram negative organism types among patients with long-standing foot wounds were Pseudomonas aeruginosa which accounted for 16.6%.[15]. Findings of many studies showed that HbA1c was a contributory factor for DF ulcer [23-25]. This may be due to raised blood sugar, which has been considered a risk factor for the development of diabetic foot ulcers because of its contribution toward the development of peripheral neuropathy and microvascular complications[26]. Our study reported that older age and poor glycemic control are important risk factors related to diabetic foot development in the current T2DM population. Most of these factors can be corrected or at least controlled with a large opportunity for early prevention and treatment with the subsequent decrease in patients with diabetic foot and its ending sequel of amputation.

Conclusion

There is no definite etiology in diabetic wound infections and *Pseudomonas spp*. were responsible for most of wound infections in diabetic patients.

C-Reactive Protein and Soluble Intercellular Adhesion Molecule-1 in Helicobacter Pylori Infection Associated with Chronic Renal Failure

Sahlah Kh. Abbas[1], Najdat B. Mahdi[2], Aseel Sh.Abdulla[3]

[1]Department of Biology, Collage of Science, [2]Department of Biology, Collage of Education for Pure Sciences, [3]Environmental Research Unit, Collage of Science, University of Kirkuk, Iraq

Abstract

Background: Patients with chronic renal failure have higher risk of *Helicobacter pylori* infectionas a result of chronic systemic and local circulatory failure, hypergastrinemia, high ammonia and the developed inflammation. Infection with *Helicobacter pylori* may lead to changes in some inflammatory markers. This study was aimed to investigate the influence of *Helicobacter pylori* infection onserum levels of C-reactive protein, soluble intercellular adhesion molecule-1 and lipid profile in Iraqi patients with chronic renal failure.

Method: The study included 56 individuals who attended Kirkuk General Hospital to receive hemodialysis. They were divided into 2 groups; chronic renal failure patients with *Helicobacter pylori* seropositive (Group 1) and seronegative (Group 2) infections. Group 3 included 30 apparently healthy subjects as control group who were age- and gender-matched to patients groups. Lipid profiles were measured by enzymatic analytical chemistry. C-reactive protein, soluble intercellular adhesion molecule-1 and anti *Helicobacterpylori* IgG were assayed by ELISA technique.

Results: When we compared chronic renal failure patients with *Helicobacter pylori* seropositive and seronegative infections to healthy normal renal function subjects,we found significant increase in C-reactive protein and soluble intracellular adhesion molecule-1 levels, whilst there were no significant differences between *Helicobacter pylori* seropositive and seronegative chronic renal failure patients (P>0.05). In this regard, lipid profile results showed a significant reduction in total cholesterol and High density lipoprotein levels inpatients. Also, linear correlation was found between soluble intracellular adhesion molecule-1 level and creatinine.

Conclusion: The result of this study concluded that impaired renal function is associated with endothelial dysfunction and raised inflammatory activity as assessed by serum levels of soluble intracellular adhesion molecule-1 and C-reactive protein as well as urea and creatinine levels, yet these patients had reduction in lipid profile as a result of malnutrition. However, *Helicobacter pylori* infection didn't induce significant changes in the levels ofstudied parameters which are considered important risk factors for atherosclerosis.

Keyword: *Chronic renal failure, Helicobacter pylori infection, C-reactive protein, Soluble Inter cellular Adhesion Molecule-1, lipid profile.*

Introduction

Chronic renal failure (CRF) patients receiving hemodialysis (HD) treatment for long period are often encounter to heart failure, hypertension, renal anemia, parathyroid-related disease and suffer from gastrointestinal troubles including peptic ulcer, abdominal symptoms, diarrhea, hemorrhage and constipation[1,2]. *Helicobacterpylori* (*H. pylori*) are Gram-negative bacteria transmitted from human to human and colonize the stomach. Its infection is associated with the development of gastrointestinal disease such as peptic ulcer disease (PUD), mucosa-associated lymphoid tissue (MALT) lymphoma and gastric cancer both in patients

with CRF receiving hemodialysis and in individuals with normal renal function[3-5]. Its infection is prevalent in about 50% of the population in developed countries and colonizes 70-90% in developing countries[6]. As a result of the increase in both of prevalence of *H.pylori* and their resistance to antibiotics, this bacterial species is recognized as a high-priority pathogen by World Health Organization in 2017[7]. Raised levels of C-reactive protein (CRP), intercellular adhesion-1 (ICAM-1) and dislipidemia were reported by previous studies in chronic renal failure patients with *H.pylori* infection[8-10]. These parameters considered as risk factors for cardiovascular events.-CRP is a nota specific marker, increased level of this protein might indicate acute inflammation and increased risk of suffering from a heart attack[11,12]. Previous results reported significant association of *H. pylori* infection with elevated serum CRP[13,14]. In addition, expression of ICAM-1 was higher in atherosclerotic plaques containing *H. pylori* infection than in those without it [15] as well as hemodialysis treatment enhances elevation of ICAM-1 level in chronic renal failure patients[16]. Accordingly, the present study was aimed to investigate the influence of *H.pylori* infection on serum levels of CRP, soluble ICAM-1 and lipid profile in chronic renal failure patients.

Materials and Method

This study was performed on 86 subjects divided into three groups. Group 1 included 26CRF patients with *H.pylori* seropositive infection, their age range was 30-79 years. Group 2 included 30 CRF with *H.pylori* seronegative, their age range was 46-70 years. Group 3 served as control group; included 30 apparently healthy individual who were age- and gender-matched to patient groups. Allpatients were recruited for dialysis unit at Kirkuk General Hospital during the period from October 2018 to March 2019. Five milliliters of venous blood sample was collected from each participant, centrifuged for 10 minutes at 1000rpm, then frozen and stored at -20º Cuntil the time of assessment. To determine serum levels of urea, creatinine, total cholesterol (TC) and high-density lipoprotein (HDL-C), we used kit from the British company Randox according to instructions provided by the company. On the other hand, serum level of triglyceride was measured using the CTM (UK) kit, according to instructions of the supplied company. The level of CRP and sICAM-1 were measured with sandwich enzyme immunoassay technique (ELISA) kits, (LABOR DIAGNOSTIKA NORD (LDN)/Germany for CRP and Mybiosource/USA for sICAM-1).To detectanti *H.pylori* IgG, we used Trinity Biotech/Ireland ELISA kit.

Statistical Analyses: All data were given as mean±SD and analyzed using Statistical Package for Social Sciences (SPSS, version 13). The differences between means,with regard to biochemical tests, were assessed by Duncan's test, while differences between means of CRP and sICAM-1 were assessed by student's *t*-test. Pearson rank correlation was used to detect the correlation between parameters. The probability value less than 0.05 considered statistically significant.

Results

Out of the 125 patients with CRF recruited in current study, 26(21%) were seropositive and 99(79%) were seronegative to *H.pylori* infection. Out of 26 seropositive patients, 17 were males whose age ranged between 30 and 79 years and 9 were females whose age ranged between 46 and 70 years. The study showed statistically significant increase in serum levels of urea and creatinine in both group 1 and group 2 patients compared to control group. On the other hand, there was significant decrease in serum levels of TC and HDL-Cin patients rather than control group. Also, LDL level significantly decreased in *H.pylori* seropositive infection rather than control group. Serum levels of TG and VLDL were approximate among studied groups (Table 1).

Table 1: Comparison between studied groups with regard to biochemical parameters

Parameter	Group 1 (n=26)	Group 2 (n=30)	Group 3 (n=30)
Urea (mg/dl)	124.5^{A}±6.11	118.83^{A}±4.33	26.5^{B}±1.32
Creatinine(mg/dl)	3.89^{A}±0.05	5.518^{A}±0.04	0.62^{B}±0.02
Cholesterol(mg/dl)	136.87^{B}±6.11	142.72^{B}±7.65	182^{A}±3.51
Triglycerides(mg/dl)	134.12^{A}±40.7	106.75^{A}±8.22	123.85^{A}±7.2
HDL-C (mg/dl)	33.37^{B}±2.04	31^{B}±0.71	41.45^{A}±1.22
LDL(mg/dl)	80.8^{B}±4.53	91.07^{AB}±5.54	118.2^{A}±3.33
VLDL(mg/dl)	23.97^{A}±1.57	21.97^{A}±1.4	24.91^{A}±0.05

Data were presented as mean ± SD. Different letters represented a significant difference (P≤ 0.05) between means of rows, while similar letters referred to non-significant difference (P≥0.05) between these means.

Using ELISA technique, serum level of CRP was significantly increased in groups 1 and 2 compared to control group. Also, this study revealed that serum levels of CRP were markedly increased in *H.pylori* seropositive patients than *H.pylori* seronegative patients. However, they were not statistically significance (Table 2 and Figure 1).

Table 2: Comparison of serum CRP levels between study groups

Study group (Serum CRP level in ng/ml)	***P* value**		
Group 1 (9892.5±722.21		*P*>0.05**	*P*<0.0001***
Group 2 (7646.25±642)	*P*>0.05*		*P*<0.001***
Group 3 (500±70.19)	*P*<0.0001*	*P*<0.001**	

*Comparison between group 1 and other groups. **Comparison between Group 2 and other groups. *** Comparison between Group 3 and other groups.

Regardind serum levels of sICAM-1, there was a reduction in soluble form of ICAM-1 level in *H.pylori* seropositive patients more than in *H.pylori* seronegative patients, but didn't reach statistical significance (P>0.05; Table 3 and Figure 2).

Table 3: Comparison of serum levels of sICAM-1 (ng/ml) among studied group

Study group (Serum sICAM-1 level in ng/ml)	***P* value**		
Group1(126.5±22.1)		P>0.05**	P< 0.01***
Group2(169.40±11.3)	P>0.05*		P< 0.0001***
Group3(47.2±1.4)	P< 0.01*	P< 0.0001**	

*Comparison between group 1 and other groups. **Comparison between Group 2 and other groups. *** Comparison between Group 3 and other groups.

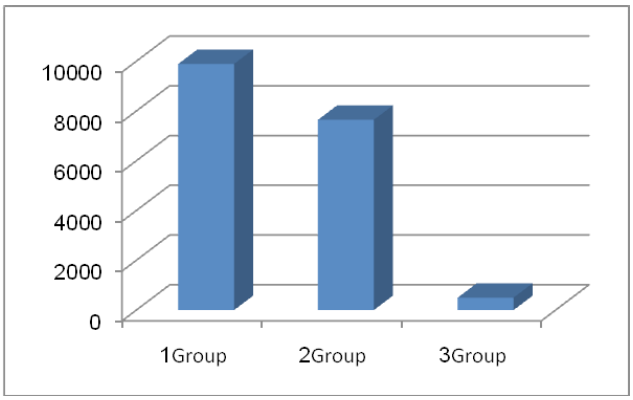

Figure 1: Mean serum CRP levels (ng/ml) in study groups.

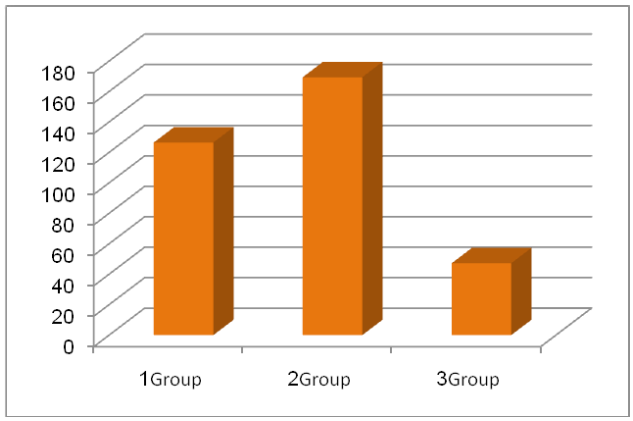

Figure 2: Mean serum levels (ng/ml) of sICAM-1 among studied groups.

When we studied the correlation between serum levels of CRP, sICAM-1 and urea, creatinine, TC, HDL-C, LDL-C and VLDL-Cin*H.pylori* seropositive patients by using Pearson rank correlation, data showed significant direct correlation between sICAM-1 level and creatinine level (r= 0.859, *P*=0.013; Table 4).

Table 4: Correlation and predictive value for the parameters in CRF patients with H.pylori seropositive infection

Parameter	CRP		sICAM-1	
	r	*P*- Value	r	P-Value
Urea (mg/dl)	0.138	0.769	-0.172	0.713
Creatinine (mg/dl)	-0.112	0.811	0.859	0.013
Cholesterol (mg/dl)	-0.274	0.551	-0.120	0.797
Triglycerides (mg/dl)	0.220	0.635	0.422	0.346
HDL-C (mg/dl)	-0.234	0.613	-0.449	0.313
LDL (mg/dl)	-0.293	0.524	-0.220	0.636
VLDL (mg/dl)	-0.176	0.705	0.236	0.610
sICAM-1 (ng/ml)	-0.271	0.557	-	-

r: Correlation coefficient

Discussion Chronic inflammation triggers release of proinflammatory cytokine such as IL-1,IL-6 and TNF-α,which contribute to atherosclerosis events and endothelial dysfunction[17,18]. Chronic inflammationis a common feature of end-stage renal disease[19] as well as chronic *H. pylori* infectionmay lead to chronic gastritis, gastric cancer and peptic ulcer. Also, alteration in lipid profile is another consequence to systemic inflammatory status[20].

Our result denoted that serum levels of total cholesterol (TC), low density lipoprotein (LDL) and high density lipoprotein(HDL) were decreased significantly in systemic circulation of groups 1 and 2 patients compared to control group, while there were no change in serum levels of triglycerides (TG) and very low density lipoprotein(VLDL). A previous study[20] reported that *H.pylori* infection is associated with high TC, LDL and TG, yet lower HDL-C serum levels. Another study[21] reported an increase in TG serum level in *H.pylori* patients. Decreases in serum levels of lipid variables in chronic renal failure patients may be due to malnutrition as a result of multiple pathophysiologic alterations including decreased appetite and nutrient intake, metabolic imbalances, hormonal derangements, increased catabolism, inflammationand dialysis-related abnormalities[22,23].

Our results showed a statistically significant increase in CRP level, which indicated an acute inflammatory status. The production of this proteinis regulated by proinflammatory cytokine, such as IL-6, this cytokine is modified by other cytokines, growth factors and hormones such as insulin and cortisol[24]. Another study[25]associated the raised concentration of CRP with other conditions such as increased age, smoking, *H. pylori* and symptoms of chronic bronchitis as well as *Chlamydia pneumonia* infection and BMI.

In our study we found that chronic renal patients with *H.pylori* seropositive and seronegative infections had significantly higher levels of sICAM-1 than healthy controls. This finding was similar to[11] who reported that the expression of adhesion molecule (sICAM-1) was elevated in plaques containing *H.pylori* than in those without it and mentioned that *H.pylori* was detected in atherosclerotic plaque in addition to gastric mucosa [15,25]. In addition, hemconcentration of sICAM-1 in chronic renal failure may be due to shedding of this molecule from surface of lymphocytes and monocytes and releasing it into circulation stimulated by hemodialysis membrane[26] as well as decreased elimination by the impaired kidney which plays an important role in their catabolism[27]. Elevated serum levels of soluble ICAM-1 were directly correlated with the level of creatinine reflecting glomerular filtration rate (GFR). Renal dysfunction diminishes the ability to filter creatinine and serum creatinine rises. The glomerular filtration rate is clinically important because it is a measure of kidney function.

Conclusion

The results of this study concluded that impaired renal function is associated with endothelial dysfunction and raised inflammatory activity as assessed by serum levels of sICAM-1 and CRP. Also, these patients had reduction in lipid profile as a result of malnutrition.

Moreover, there was significant positive association between the levels of ICAM-1 and creatinine. In contrast *H.pylori* infection showed no significant differences in the levels of studied parameters when compared with its seronegative cases. These are considered risk factors for cardiovascular disease.

Gonial Angle as a Determinant of Gender, a Panoramic Study in a Sample of Saudi Population

Ahmed Ali Alfawzan

Department of Preventive Dentistry, Alrass Dental College, Qassim University, Saudi Arabia, Qassim, Saudi Arabia

Abstract

Introduction: Sex determination is a valuable factor in forensic dentistry. The present study aims to assess the possibility of using gonial angle as a determinant of gender through a retrospective panoramic study, in a sample of Saudi population.

Materials and Method: A 342 digital panoramic radiographs (179 males and 163 females) of adult dentulous Saudi patient attending university dental hospital, Qassim university, KSA were assessed in this studywere assessed in this study. Gonial angle measurements were calculated bilaterally.

Results: The mean values were calculated and compared between male and female subjects using SPSS (V. 22). Level of significance was set at 0.005. The mean values of the external gonial angle measured using the panoramic radiographs were 125.50±5.95° and 127.45±6.77°, respectively.

Conclusion: In the present study, statistically significant difference was observed between the gonial angles measured in between males and females using panoramic radiographs. Gonial angle can be considered reliable for gender determination.

Keywords: *Gonial angle, Gender, Retrospective, Sex determination, Panoramic.*

Introduction

In dental practices diagnosis and treatment planning can be formulated by utilizing the gathered data from the case history and diagnostic aids such as clinical examinations, study models, and the relevant radiographs. Dentofacial radiography has become a critical procedure in the dental, medical, and hospital clinics. Similarly,lateral cephalogram and panoramic radiograph are essential for diagnosis and treatment planning in orthodontics.[1]

The gonial angle in cephalometric x-rays is an important parameter for determining the growth pattern of an individual, assessing the rotation of the mandible[1] and the extraction pattern in class II patients,[2] making decisions regarding whether to perform surgery in class III skeletal base patients,[3] and estimating age in forensic medicine.[4,5]

Panoramic radiography, which is considered the gold standard of care for dental screening, diagnosis and treatment planning, is used by dentists from other specialties and orthodontists alike. It provides a significant amount of information about the dentation and the supporting bone, and also is used for screening of pathological and developmental problems such as cysts, tumors, cancer,supernumerary teeth, the congenital absence or premature loss of teeth, fused teeth to the bone, abnormally retained teeth, tooth eruption path especially of third molars, bone pathology, and mandibular asymmetry.[6,7] Panoramic radiography are useful for measuring the gonial angle with accurate performance than lateral cephalography, as the superimposed gonial angles in cephalography can affect their tracing.[8,9]

A panoramic radiograph provides adequate information about both left and right sides; hence, it would be reasonable to assess them equally.[10,11] Determination of gender is an important part of forensic science and anthropology and in medico-legal issues.

Among various other measures, gonial angle can be used to differentiate between male and female strongly to express univariate sexual dimorphism. When skeletal sex determination is considered, angular and metric analyses on the radiographs are often found to be of greater importance because of their, reliability, reproducibility, accuracy and objectivity.[12,13]

Determination of sex becomes more appropriate after attainment of puberty as the differences are well marked well in skull and bony pelvis.[14] After both these bony areas, mandible remains the next best in the human beings which will help us in the identification of age, sex, and race.[14] Therefore, mandibular condyle and ramus, in particular, are generally the most sexually dimorphic.[12,13] There by among various radiographic technique the orthopantomography (OPG) is still best used as a measure in determination of sex wherein, the morphology of mandibular ramus is researched. Changes in gonial angle (mandibular angle) are of important value in age and sex determination. Very few studies have been carried out to study the changes in the mandibular angle with age, sex and dental status. One of the choices for gonial angle measurement is panoramic radiograph. Hence, this study was taken to understand gonial angle as adeterminant of gender in a panoramic study in a sample of Saudi population.

Materials and Method

Ethics approval (#DRC/002FA/19) for the study was obtained from the Dental Ethics Committee, Alrass Dental College, Qassim university, KSA. Digital panoramic radiographs (OPG) of 324 patients (163 females and 179 males; mean age of 29.05±7.93 years) were obtained from the department of radiology, university dental hospital, Qassim university, KSA. The inclusion criteria for the OPG were:patient in permanent dentation stage, the OPG had to be of high image quality and sharpness and all OPGs had to be taken using the same machine. The exclusion criteria were a recorded history of facial trauma, previous facial/mandibular surgery, and congenital syndromes affecting the face or jaw, and asymmetry of face. The gonial angle was drawn with a tangent to the lower border of the mandible and another line tangent to the distal border of the ascending ramus and the condyle on both the sides then the gonial angle was measured at the point of intersection of the plane tangential to the lower border of mandible and to the distal border of the ascending ramus and condyle (Figure 1).

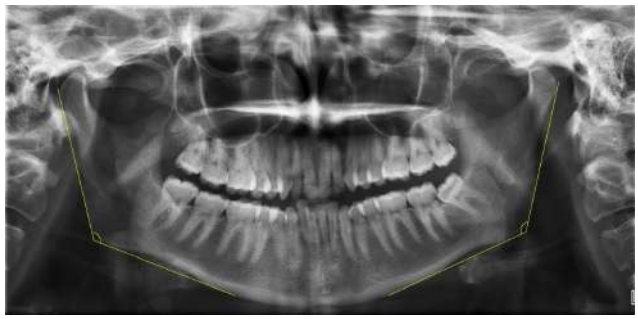

Figure 1: Gonial angle measurementon the digital panoramic radiograph

The gonial angle was measured using Digora software. Paired t-test was used for evaluating the difference between the gonial angle in the panoramic OPG, and Student t-test was used for assessing the difference in the gonial angle with respect to sex. The analyses were performed using SPSS version 22.0; a P-value of < .05 was considered to indicate statistical significance.

Results

Statistical Method used was descriptive and inferential statistical analysis has been carried out in the present study. Results on continuous measurements are presented on Mean ± SD (Min-Max) and results on categorical measurements are presented in Number (%). Significance is assessed at 5 % level of significance. The following assumptions on data are made, Assumptions: 1. Dependent variables should be normally distributed, 2. Samples drawn from the population should be random, and cases of the samples should be independent. Student t test (two tailed, independent) has been used to find the significance of study parameters on continuous scale between two groups (Inter group analysis) on metric parameters. Leven`s test for homogeneity of variance has been performed to assess the homogeneity of variance. Chi-square/Fisher Exact test has been used to find the significance of study parameters on categorical scale between two groups, Non-parametric setting for Qualitative data analysis. Fisher exact test used when cell samples are very small.

The study sample consisted of retrospective panoramic radiographs of 324 patients (163 females and 179 males; mean age of 29.05±7.93 years as seen in Figure 2). The mean value of the gonial angle measured using the panoramic radiographs was 126.43±6.42 with a standard deviation of 0.90°, The mean value of the right gonial angle measured using the OPG in females was

127.68±6.69°, and 125.64±5.91 in males; the P-value was .003. Further, the mean value of the left gonial angle was 127.23±6.86° in females, and in 125.35±6.02° inmales; the P-value was .007. The mean gonial angle was 126.43±6.42° and the P-value was .005, which was also statistically significant (Table 1 and Figure 3).

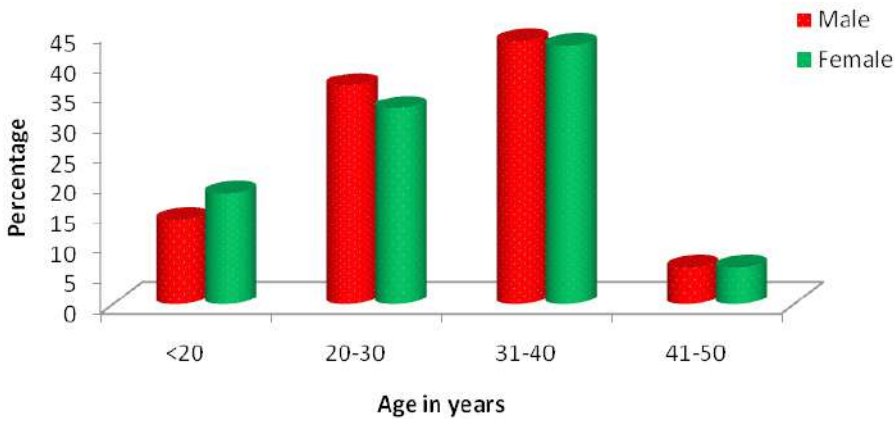

Figure 2: Age distribution of patients studied

Table 1: Comparison of Gonial Angle according to Gender

Variables	Gender		Total	P value
	Male	Female		
Right Gonial Angle	125.64±5.91	127.68±6.69	126.61±6.37	0.003**
Left Gonial Angle	125.35±6.02	127.23±6.86	126.24±6.49	0.007**
Mean Gonial angle	125.50±5.95	127.45±6.77	126.43±6.42	0.005**

Discussion

The gonial angle reflects the morphology of the mandible and has a very important role in growth pattern prediction and estimating age in forensic medicine and forensic dentistry.[15] It is also an important parameter for evaluating the symmetry of the facial skeleton.[1,2] According to Mattila et al.[10] and Dahan et al,[11] the size of the gonial angle depends on the method of measurement used. These measurements can beformed through a line tangent to the lower border of the mandible or be based on a line passing through the gnathion. On a panoramic radiograph, the determination of the gnathion can sometimes be difficult and might result in an inaccurate measurement of the gonial angle.[15] Therefore, in this study, to avoid any inaccuracies in measurement, the horizontal plane of the gonial angle in both the panoramic radiograph and the lateral cephalogram was formed by a line drawn tangentially to the lower border of the mandible.

The mean values of male and female external gonial angle measured using the panoramic radiographs were 125.50±5.95° and 127.45±6.77°, respectively. Further, statistically significant difference was observed in the gonial angle measured using this diagnostic tool. Mattila et al.[10] measured the gonial angle using panoramic radiographs and lateral cephalograms, compared the values with those found using dry skulls, and concluded that the measurements made using the panoramic radiographs were more accurate. Shahabi et al.[16] compared the external gonial angle determined using panoramic radiographs of patients and concluded that panoramic radiography could be used for determining the gonial angle as accurately as a lateral cephalogram. Arakiet al,[17] in 2015, compared the gonial angles measured using 49 panoramic radiographs with the gonial angle estimated using lateral cephalometric radiographs taken from 2 dry mandibles and found that the gonial angle measurements were slightly smaller on the panoramic radiographs than on the lateral cephalometric radiographs. Alhaija et al.[18] evaluated the potential of panoramic radiographs to measure mandibular inclination and steepness; they observed a high correlation between the measurements taken using both types of radiographs. Thus, according

to their study, panoramic radiographs are a useful tool for the measurement of the gonial angle, which is an indicator of mandibular steepness and, subsequently, the mandibular growth direction. In a previous study, the reliability of cephalometric measurements made using panoramic radiographs was compared with that of the actual measurements collected from dry skulls.[17] The results recorded the highest correlation between orthopantomography and cephalometric radiograph with respect to the measurement of the gonial angle, whereas the least correlation was observed for the length of the mandibular body. Further, in the case of different growth patterns, the gonial angle and the ramus height showed the closest correlation between the 2 types of radiographs.[10] Thus, the ability to determine the growth direction from a panoramic radiograph is useful because most dentists request a panoramic radiograph for patients during routine dental examinations.

In lateral cephalometric radiograph, gonial angle measured between atangent line with the inferior border of the mandible and along the posterior border of the mandibular ramus of superimposed mandibular halves. According to Nohadani and Ruf,[19] angular values from panoramic radiographs are more reliable, as the angular values in the posterior and the lateral aspects of the mandible for determining the gonial angle.

Sex estimation is very important from a forensic point of view. Mandibular condyle and ramus in particular are most sexually dimorphic as they are the sites associated with the greatest morphological changes in size and remodeling during growth.[20] Therefore, in the present study, mandibular ramus was selected for sex estimation as it is a part of gonial angle.

As regards the gonial angle, males showed statistically significant lower mean gonial angle values than females (125.50 º and 127.45 º respectively). This was in agreement with many researchers.[21,22.23] Conversely, other researchers found that males showed statistically significant higher mean gonial angle values than females,[24] whereas others did not find any statistically significant differences between both sexes.[16,25] It was found that females had a downward and backward rotation pattern in mandible while males had a forward rotation in mandible therefore the gonial angle values found in females are higher than in males.[26]

To sum up, our results support previous research on other populations that the gonial angle showed a sexual dimorphism and proved to be beneficial in sex estimation and Hence, the use of gonialangle is recommended as an aid for sex estimation in forensic analysis. However, further studies using larger sample size from diverse Saudi Arabian regions and different imaging modalities are recommended to set our population standards for sex estimation.

Conclusion

In the present study, statistically significant difference was observed between the gonial angles measured in between males and females using panoramic radiographs. Panoramic radiography can be considered reliable for measuring the gonial angle. In the selected Saudi Arabia population sample, the gonial angle showed a high sexual dimorphism and proved to be beneficial in sex estimation.

Determinants of Under-Five Mortality in Southern Asia

Ankika Dutta

M.A., M.Phil, Dibrugarh University, Assam, India

Abstract

Under-five mortality is one of the important indicators for measuring the overall child health status of a country or region. One of the sub-goals of the Sustainable Development Goals (SDGs-2015) is reduction of under-five mortality rate to at least as low as 25 deaths per 1,000 live births by 2030. The present study aims at investigating the determinants of under-five mortality in Southern Asia. The results of the GLS Random Effects regression found adolescent fertility rate, measles immunization, basic drinking water services, prevalence of anemia among children and current health expenditure to be significant determinants of under-five mortality.

Keywords: *Southern Asia, Sustainable Development Goals, Under-Five Mortality.*

Introduction

The under-five mortality rate is the probability of dying between birth and exactly five years of age expressed per 1,000 live births (UNICEF). The Sustainable Development Goals (SDGs-2015) under its Goal-3 (ensure healthy lives and promote wellbeing for all at all ages) proposed the sub-goal of reducing under-five mortality rate to at least as low as 25 deaths per 1,000 live births by 2030. Globally, the total number of under-five deaths has dropped from 9.8 million in 2000 to 5.4 million in 2017.[1(p27)] According to the Sustainable Development Goals Report 2019[1(p27)], "if the SDG target for under-5 mortality is met, the lives of an additional 10 million children will be saved by 2030". This makes under-five mortality an important area of concern as well as an essential indicator for measuring a country's or region's child health status. Although there has been tremendous progress in reducing under-five mortality over the past decades, yet the progress differs across countries and regions.[2(p12)] The present study aims at investigating the determinants of under-five mortality in Southern Asia countries. Currently, Southern Asia experience around 28.1 per cent share of global under-five deaths.[2(p13)] It is further projected that if the same trend continues, about 52 million children under-five years of age will die between 2019 and 2030, and around 26 per cent of these deaths will occur in Southern Asia.[2(p15)] Thus a study on the determinants of under-five mortality will be helpful in understanding the important areas that needs attention in the Southern Asian countries in reducing under-five mortality.

Review of Literature: Koenig et al. (1990) found that in rural Bangladesh measles vaccinated children experienced a reduction in mortality risk by 46 per cent.[3 (p444)] Emamgholipour and Asemane (2016)[4] used panel data from 1996 to 2012 to study the effect of governance indicators on under-five mortality rate in 27 Organization for Economic Co-operation and Development (OECD) countries using the Generalized Method of Moments (GMM) model. Their study found a significant positive effect of previous period's under-five mortality rate and total fertility rate on current under-five mortality rate and a significant negative effect of GDP per capita, public health expenditure per capita, control of corruption and rule of law on current under-five mortality rate.[4] Sohail and Neupane[5] (2018) used Demographic and Health Survey (between 1999 and 2014) data to study the prevalence and the factors associated with under-five mortality in five South Asian countries (Bangladesh, India, Maldives, Nepal and Pakistan). They studied the relationship between

outcome variable (under-five mortality) and the socio-demographic, maternal and child variables and found the age of the mother, mother's employment status, level of education of mother and her husband to significantly influence under-five mortality among children.[5] Waziri et al.[6] (2018) conducted a study on the effect of access to safe drinking water and good sanitation on under-five mortality rate in 81 developing countries using the Generalized Method of Moments (GMM) method for panel data from 2008 to 2016. According to their analysis access to safe drinking water (–0.138) and good sanitation (–.065) were found to be negatively associated with under-five mortality.[6] Ghimire et al.[7] (2019) analyzed the factors associated with under-five mortality in Nepal using Cox proportional hazard models on Nepal Demographic and Health Survey (2001, 2006, 2011 and 2016) data. Their study found under-five mortality to be significantly associated with mothers with a history of previous child death, mothers who did not receive TT vaccine during pregnancy and mother's who were not using contraceptives at the time of the survey.[7] Rahman et al.[8] (2019) found that in Bangladesh the under-five mortality was higher among children whose father's had no education and primary level education (compared to those whose father's had higher education), who did not take vitamin A dose in the first two months and those with multiple birth (compared to the single birth child).

Methodology

The study uses balanced panel data from 2002 to 2016 for the eight Southern Asia countries, namely, Afghanistan, Bangladesh, Bhutan, Maldives, Nepal, India, Pakistan and Sri Lanka. The data are gathered from the World Bank open data. In order to choose between the Fixed Effect Model and the Random Effect Model, the Hausman test is applied. A series of diagnostics test is also used for checking Autocorrelation [Wooldridge test] and Heteroskedasticity [Breusch-Pagan/Cook-Weisberg test] before proceeding for final analysis. Table 1 shows the measurement of the variables used in the study.

Table 1: Measurement of the Variables

Type of Variable	Name of the variable (Abbreviation used in the study)	Measurement
Dependent Variable	Under Five Mortality Rate (UFMR)	Mortality rate, under-5 (per 1,000 live births)
Independent variables	Adolescent Fertility Rate (AFR)	Adolescent fertility rate (births per 1,000 women ages 15-19)
	Current Health Expenditure (CHE)	Current health expenditure (% of GDP)
	Measles Immunization (MI)	Immunization, measles (% of children ages 12-23 months)
	Basic Drinking Water Services (DWS)	People using at least basic drinking water services (% of the population)
	Prevalence of Anemia among Children (PAC)	Prevalence of Anemia among children (% of children under 5)

Findings and Discussion

Table 2 shows the descriptive summary (mean, standard deviation, minimum and maximum value) of the variables used in the study for the period 2002-2016. The total number of observations is 120.

Table 2: Descriptive Summary of the Variables

Variable	Observations	Mean	Standard Deviation	Minimum	Maximum
UFMR	120	53.35	29.87072	8.2	121.2
AFR	120	56.88448	36.43798	8.4072	146.433
CHE	120	4.934217	2.59498	2.151902	11.47104
MI	120	81.59167	16.37301	35	99
DWS	120	84.42485	15.78563	29.90076	99.23921
PAC	120	48.60333	11.19451	25.2	69.5

Source: Authors calculation

In the next stage of the study, the Hausman test is used to select the appropriate model (between the Fixed Effect Model and the Random Effect Model) for the analysis. The Hausman Test is based on the null hypothesis (H_0) that 'Random-effect model is appropriate' against the alternative hypothesis (H_1) that 'Fixed-effect model is appropriate'. If the p-value is less than 5% ($p<0.05$), the null hypothesis is rejected or in other words, the alternative hypothesis is accepted and vice versa. Table 3 shows the result of the Hausman Test. Since the p-value (0.1097) is greater than 0.05 (or 5%), the null hypothesis cannot be rejected and we can infer that the Random Effect Model is appropriate for our analysis.

Table 3: Hausman Test

Chi^2 (5)	p-value
8.98	0.1097

Source: Authors calculation

Further Table 4(a) and 4(b) shows the results of the diagnostics tests used for checking Autocorrelation and Heteroskedasticity in the regression model respectively.

Table 4(a): Wooldridge Test for Autocorrelation in Panel Data

H_0: no first-order autocorrelation	
F	1.305
Prob > F	0.2909

Table 4(b): Breusch-Pagan/Cook-Weisberg Test for Heteroskedasticity

H_0: Constant variance	
$Chi^2(1)$	23.16
Prob > Chi^2	0.0000

Source: Authors calculation

As shown by Table 4(a), the results of Wooldridge Test for Autocorrelation shows that the probability value (0.2909) of the F-statistics is greater than 5% (0.05) and as such we accept the null hypothesis (H_0= no first-order autocorrelation) and can infer that the model does not suffer from the problem of autocorrelation. As shown by Table 4(b), the probability value (0.000) of the Breusch-Pagan/Cook-Weisberg Test for Heteroskedasticity is less than 5% (0.05) and as such we reject the null hypothesis (H_0= constant variance) and can infer that the model suffers from the problem of heteroskedasticity. Thus we use the Generalized Least Squares (GLS) Random Effects (robust) regression model which helps in eliminating the effects of heteroskedasticity in panel data.

Table 5: Random-effects GLS regression

Variable	Coefficient	Robust Std. Err	p-value
AFR	.2871944	.0797656	0.000
CHE	-1.162038	.653848	0.076
MI	-.6520925	.136066	0.000
DWS	-.4783821	.1437625	0.001
PAC	.6750055	.2249481	0.003
Constant	103.532	28.2566	0.000
Overall R-square = 0.8863, Prob > Chi^2 =0.0000			

Source: Authors calculation

Table 5 shows the result of the regression. The overall R-square value is significantly large indicating the model explains around 88 per cent goodness of fit. Based on the p-value we can infer the Adolescent Fertility Rate (AFR), Measles Immunization (MI), Basic Drinking Water Services (DWS) and Prevalence of Anemia among Children (PAC) are significant at 1 per cent while Current Health Expenditure (CHE) is significant at 10 percent. Adolescent Fertility Rate (AFR) has positive association with Under Five Mortality Rate (UFMR). That is with increase in adolescent fertility under five mortality increases. Adolescent mothers are often exposed to the risk of unwanted pregnancy, premature births, and low birth weight of children etc. which may increase the risk of child mortality. Current Health Expenditure (CHE) has negative association with Under Five Mortality Rate (UFMR), that is with increase in current health expenditure (% of GDP) under five mortality decreases. Measles Immunization (MI) also has negative association with Under Five Mortality Rate (UFMR), that is increase in measles immunization(% of children ages 12-23 months) decreases under five mortality. Basic Drinking Water Services (DWS) has negative association with Under Five Mortality Rate (UFMR), that is increase in people (percentage of the population) using at least basic drinking water services decreases under five mortality. Prevalence of Anemia among Children (PAC) has positive association with Under Five Mortality Rate (UFMR), that is increase in prevalence of anemia among children (% of children under 5) increases under five mortality.

Conclusion

The under-five mortality rate is the probability of dying between birth and exactly five years of age

expressed per 1,000 live births (UNICEF).Globally, although the total number of under-five deaths has dropped in recent time, yet the progress differs across countries and regions. Currently, the Southern Asian countries experience around 28.1 per cent share of global under-five deaths.[2(p13)] This makes under-five mortality an important area of concern in the region and the present study aims at investigating the determinants of under-five mortality in Southern Asia. The results found adolescent fertility rate and prevalence of anemia among children to be positively associated with under five mortality and measles immunization, basic drinking water services, and current health expenditure to be negatively associated with under five mortality. Policies should strive to direct funds and resources towards increasing the availability of educational and health facilities, especially for the adolescents; increase access to improved drinking water and sanitation through various programmes as well as promote research and development to explore better ways of tackling the incidence of under-five mortality .

Can Better Infrastructure Ensure Better Healthcare? The Dialectic of Assam's Health Sector Scenario

Kasturi Goswami

Assistant Professor, Department of Economics, Assam Don Bosco University, Tapesia Gardens, Kamrup, Assam

Abstract

Health is considered as a basic asset because ill health disables us from fulfilling our responsibilities both on social and personal grounds. The objective of the paper is to access the status of health infrastructure, health facilities and expenditure pattern on health sector in the state of Assam. It tries to answer the question if the increase in the number of health care facilities is enough to ensure good health and well being of the people. The objective is fulfilled through the analysis of the secondary data collected from Statistical Hand Book of Assam on various Medical and Public Health is compared and analysed for the period mostly through tabular method. It was seen that the percentage share of Revenue Expenditure of the Government of Assam on Medical and Family Health to Revenue Expenditure of the State Govt has increased from 7.58% in 2011-12 to almost twice to 14.75% in 2017-18. Similarly the health care facilities, in terms of the number of medical institutions, medical staff and number of beds in different institutions have increased. There was a nominal decline in the birth rate as well as the death rate can be due improvement and availability of better health care facilities to the people. It was also seen that there was a decline in the fertility rates in the state of Assam. However, health is not just the physical wellbeing of an individual but also the social, emotional and cultural wellbeing of the whole community. So it's not just the health care services and expenditure on health care services that leads to good health and well-being, but also other factors like general socio-economic, cultural and environmental conditions that highly influences good health and well being of the people in a country or a nation.

Keywords: *Health Care Facilities, Health Status, Well-Being, Assam.*

Introduction

Health is perceived as one of the most important indicators of the standard of living of a country. Good health is perceived as absence of illness and is mostly associated the availability of health care facilities available in a country. Health is considered as a basic asset because ill health disables us from fulfilling our responsibilities both on social and personal grounds. It also leads to loss of man-days in jobs that will not only have an effect on the production process but will also affect the output level. As such acquiring health developments are of prime importance for the countries. Right to good health forms one of the fundamentals right and was first articulated in the Constitution of the World Health Organization in the year 1946 and also in 1948 Universal Declaration of Human Rights where health was mentioned as an important component to adequate standard of living. In the year 1966, International Covenant on Economic, Social and Cultural Rights recognized right to health as a basic human right. Thus right to health forms an elemental part of human rights which allows one to live with dignity and enjoy better standards of physical and mental health. But most often health is considered in terms of absence of illness and the availability of health care infrastructure in a country. The paper tries to show the status of health infrastructure,

health facilities and expenditure pattern on health sector in the state of Assam. It tries to answer the question if the increase in the number of health care facilities is enough to ensure good health and well being of the people.

The paper has four sections. Section one introduces the subject matter while the second section discusses the methodology. The third section deals with the findings and discussion and the fourth section concludes the paper.

Method

The objective of this paper is sought to be fulfilled through the analysis of the secondary data collected from Statistical Hand Book of Assam. The unit of the study is the state of Assam and data on various Medical and Public Health is compared and analysed for the period mostly through tabular method.

Findings and Discussion

For the present study data on various health care facilities are discussed and compared for two years 2011-12 and 2017-18 and are presented in tabular form. But for Table 5 indicating Birth, Death, Infant Mortality Rates and Fertility Rates the data for the years 2011-12 and 2016-17 has been used due to non-availability of data for the year 2017-18.

Table 1: Outlay and Expenditure in Assam

Heads	2011-12	2017-18
Gross State Domestic Product (GSDP),At Current Price (in crore)	126,544	278,710
Net State Domestic Product (NSDP), At Current Price (in crore)	114,695	246,151
Revenue Expenditure of the State Govt., (Budget Estimate.) (in Lakh)	3,629,886	7,132,937
Capital Outlay of The Government of Assamon Medical and Family Health (in lakhs)	21,210	263,249
Revenue Expenditure of The Government of Assamon Medical and Family Health (in lakhs)	275,278	1,052,475

Source: Statistical Hand book of Assam, Directorate of Economics and Statistics Government of Assam, 2012 and 2018

As seen from Table 1 that the revenue expenditure on medical and public health in Assam is greater than the capital outlay of the government in both the years, Further it is seen that both the allotted outlay and the revenue expenditure has increased in a period of 7 years. This signifies that the health expenditure as a share of the expenditure of the Government of Assam on various heads has increased over the years. Further, the percentage share of Revenue Expenditure of the Government of Assam on Medical and Family Health to Revenue Expenditure of the State Govt has increased from 7.58% in 2011-12 to almost twice to 14.75% in 2017-18.

Table 2: Total Number of Health Care Facilities in Assam

Items	2011-12	2017-18
Civil Hospital	22	25
S.D.C.H	13	14
P.H.C.	844	946
F.R.U.	38	15
C.H.C.	103	172
Sub- Centres	4592	4644
Clinic/Poly Clinic/Nursing Home	457	257
No. of Diagnostic Centres	221	398
Tuberculosis Hospital	3	3
Leprosy Hospital	3	3
Cancer Hospital	1	1
108 (Mritunjoy) Emergency Response Service	208	380
Performance of Boat Clinic	15	15

Source: Statistical Hand book of Assam, Directorate of Economics and Statistics Government of Assam, 2012 and 2018

N.B.: S.D.C.H. = Sub Divisional Civil Hospital, P.H.C. = Primary Health Centre, F.R.U. = First Referral Units, C.H.C. = Community Health Centres

From Table 2 that the number of Civil Hospitals, S.D.C.H. and P.H.C has increased from 22 to 25, 13 to 14 and 844 to 946 respectively during the period of 7 years. Similarly, the number of C.H.Cs, sub-centres, Diagnostic Centresand 108 emergency response services has also increased during the same period of time. However the number of F.R.Us and Clinic/Poly

Clinic/Nursing Homehas fallen from 38 to 15 and 457 to 257 respectively during the same period. But the number of Tuberculosis Hospital, Leprosy Hospitaland Cancer Hospital has not increased during this period. But these diseases are of critical importance and it is more of these special care treatments come so that more people has access to these facilities.

Table 3: Total Number of Medical and Paramedical Staff in Assam

Position	2011-12	2017-18
MBBS Doctors	1568	3097
Specialist Doctor/Post Graduate Doctors	809	1125
Ayurvedic Doctor/BAMS	574	811
Dental Surgeon	101	279
Homeopathic Doctors	61	297
MBBS Doctors for 1 year rural posting	808	402
ANM	10232	12251
GNM	3759	12251
Pharmacists	1287	2089
Lab. Technician	1224	1647
Radiographer	132	155
Rural Health Practioner	157	562

Source: Statistical Hand book of Assam, Directorate of Economics and Statistics Government of Assam, 2012 and 2018

N.B.: ANM = Auxiliary Nurses Mid Wives, GNM = General Nurses Mid Wives

It is seen from table 3 that the total number of Medical and Paramedical Staff in Assam has increased in Assam from 2011-12 to 2017-18. However, the number of MBBS Doctors for 1 year rural posting has decreased during from 808 in 2011-12 to 402 in 2017-18.

Table 4: Total Number Beds in Different Health Institutions of Assam

Items	2011-12	2017-18
Civil Hospital	3030	3630
Block Primary Health Centre (BPHC)	900	900
Mini Primary Health Centre (MPHC)	2104	3460
Community Health Centres (CHC)	3330	4860
Sub-Divisional Civil Hospital (SDCH)	735	915
Medical College Hospital (MCH)	NA	5121

Source: Statistical Hand book of Assam, Directorate of Economics and Statistics Government of Assam, 2012 and 2018

From table 4 it is evident that the total number of beds in various health institutions has increased from 2011-12 to 2017-18. However the same cannot be said for the Medical College Hospitals as the data for the year 2011-12 was not available.

Table 5: Birth, Death, Infant Mortality Rates and Fertility Rates

Indicators	2011-12	2016-17	2017-18
Birth Rate	22.8	21.7	NA
Death Rate	8	6.7	NA
Infant Mortality Rate (IMR) (Per 1000 live birth)	55	44	NA
General Fertility Rate (GFR) (Per 1000 live birth)	82.8	78.2	NA
Total Fertility Rate (TFR) (Per 1000 live birth)	2.4	2.3	NA

Source: Statistical Hand book of Assam, Directorate of Economics and Statistics Government of Assam, 2012 and 2016

From table 5 it is seen that birth rate has fallen from 22.8 in 2011-12 to 21.7 in 2016-17 indicating that the birth rate has fallen nominally which could be indicative of a achievement of family welfare programme and people adopting like sterilization, usage of I.U.D etc. The death rate has also fallen during the same period from 8 to 6.7 indicating an improvement in better health care facilities available to the people. During the same period the Infant Mortality Rate has also declined from 55 to 44. The General fertility rate has also declined during the same time. But the total fertility rate during the same period has remained more or less the same indicating a reduction by only 0.1.

From the discussion it is seen that The percentage share of Revenue Expenditure of the Government of Assam on Medical and Family Health to Revenue Expenditure of the State Govt has increased from 7.58% in 2011-12 to almost twice to 14.75% in 2017-18. Similarly the health care facilities, in terms of the number of medical institutions, medical staff and number of beds in different institutions have increased. A nominal declined birth rate could be indicative of an achievement of family welfare programme and people adopting like sterilization, usage of I.U.D etc. The fall in the death rate can be due improvement and availability of better health care facilities to the people. A decline in the fertility rates could be an impact of the level of education of women in the state of Assam. Women who are more educated, o an average, will tend to have fewer children than women who are not.

Conclusion

However health in its broadest sense means a

person's level of good physical and mental health, which individuals in a society to live healthy and flourishing lives. According to Aboriginal Health and Medical Research Council of New South Wales, Australia, "Health is not just the physical wellbeing of an individual but also the social, emotional and cultural wellbeing of the whole community, in which each individual is able to achieve their full potential as a human being, thereby bringing about the total wellbeing of their community". So it's not just the health care services and expenditure on health care services that leads to good health and well-being. But according to Dahlgren and Whitehead other factors like general socio-economic cultural and environmental conditions like age, sex, unemployment, water and sanitation, housing, agriculture and food production, education, work environment, living and working conditions, social and community networks that highly influences good health and well being of the people in a country or a nation.

Study the Link between Laparoscopic Cholecystectomy and Abdominal Wall Paraumbilical Hernia

Mohammed Mohammud Habash

M.B.Ch, B - F.I.C.M.S, Assistant Professor in General Surgery, College of Medicine, Diyala University, Diyala, Iraq

Abstract

A laparoscopic cholecystectomy is a surgery which includes the removal of gallbladder. It is a minimally invasive cholecystectomy wherein inside of the abdomen is visualize with the help of camera introduced through 4 small incisions to remove the gallbladder by using long tools. The aim of the present study is to evaluate the correlation between abdominal wall hernia (paraumbilical hernia) and laparoscopic cholecystectomy in the Iraqi patients (n=100). The age of the patients was 25 to 36 years. Before surgery, the red blood cells, white blood cells and serum urea were found to be 105.67±3.00; 13731±1940.4 and 33.48±0.47, respectively. After surgery, the red blood cells, white blood cells and serum urea were found to be 117.95±4.21; 10307.9±1057.7 and 35.25±0.46, respectively. The laparoscopic cholecystectomy with previous abdominal wall hernia is the easiest operative procedure. However, it required good experience and careful dissection.

Keywords: *Abdominal wall paraumbilical hernia, Surgery, Laparoscopic cholecystectomy.*

Introduction

Various factors such as alterations in medications, hormones, diet, or rapid weight gain or loss results in changes in concentration of bile; which helps in the digestion into the small intestine and produced by the liver. Formation of gallstones occurs if the bile composition and concentration is changed. If this formed gallstones migrate out of the gallbladder then it blocks bile normal flow and develops infection and inflammation. This is known as cholecystitis and its symptoms are constant abdominal pain, vomiting, fever and nausea[1]. The incidence rate of gallstones is 10-15%. Out of these, about 35% of patients display lifetime recurrence rate of symptoms or complications. Gallstones are three times more common in women than men[2].

Corresponding Author:
Mohammed Mohammud Habash
M.B.Ch, B - F.I.C.M.S, Assistant Professor in General Surgery, College of Medicine, Diyala University, Diyala, Iraq
e-mail: dr_mohamad1977@yahoo.com

To prevent associated inflammation complications, administer conservative therapy is used which is a first line of acute cholecystitis treatment. If patients do not respond to medication after 6 to 8 weeks of treatment, laparoscopic cholecystectomy is performed. About 70% of such patients respond to medical therapy within the first 24 to 48 hours; still laparoscopic cholecystectomy is the preferred treatment for symptomatic gallstone disease[1].

In rare cases, complications after laparoscopic cholecystectomy are observed and could become serious if structures near the gallbladder are damaged. Common bile duct is one of situated near gallbladder; which pores bile from the gallbladder and liver into small intestine. Biliary ducts damage or leakage leads to the barrier of bile flow and develops symptoms of fever, abdominal pain, and yellowing of the skin. This is known as jaundice. Gallstone disease also showed similar symptoms along with the bleeding from a blood vessel. Generally, bleeding stops after some time. However, if it's persistent for a long time, then intervention isneeded. Post cholecystectomy surgery, fever, nausea, worsening pain, chills, vomiting, or jaundicealso reported by some authors[1].

Another complication of laparoscopic cholecystectomy is the occurrence of port site hernia. The incidence rate of it deceits between 0.38% to 5.4% with an overall frequency of 1.7%. The incidence rate is increasing with size of the trocar. The incision enlargement, connective tissue disorders, diabetes mellitus, wound infection, type of trocar used, obesity, and defective closure of the fascial defect. These are the major risk factors involved in the development of port site hernia[2,3]. Sometimes, peritoneal defects below the repaired fascial layer could lead to herniation. Therefore, it is important to safely repair the port sites; fascial as well as the peritoneal. With this background, we aim to evaluate the correlation between abdominal wall hernia (paraumbilical hernia) and laparoscopic cholecystectomy.

Material and Method

Patient Enrollment: In the present study, the patients (n=100) visited to the Baqubah teaching hospitalduring July 2018 to July 2019 were enrolled. The age of the patients was 25 to 36 years.

Inclusion Criteria:

1. All cases with symptomatic gall stone disease
2. Acute cholecystitis after conservative treatment
3. Diabetics patient with gall stone
4. A calculus cholecystitis

Operative procedure: All operations are done under general anesthesia, in supine position and insufflation with CO_2 by using Veres needles or Hason method in patient with complicated previous abdominal surgery. Dissecting the calot triangle and identification and clippings of both cystic artery and duct.

Blood Collection: The blood was collected for the various biochemical assays such as hematogram analysis and serum urea by commercially available kits.

Statistical Analysis: Results were presented as mean ± standard error (SE). Dunnett multiple comparison test and one way analysis of variance (ANOVA) was done to estimate the statistical significance.

Results

In the present study,we examined the hundred patients visited to the Baqubah teaching hospital during July 2018 to July 2019 period. The age group of the patients was 25 to 36 years.

Before surgery, the red blood cells, white blood cells and serum urea were found to be 105.67±3.00; 13731±1940.4 and 33.48±0.47, respectively. After surgery, the red blood cells, white blood cells and serum urea were found to be 117.95±4.21; 10307.9±1057.7 and 35.25±0.46, respectively (Table 1).

Table 1: Blood parameters before and after surgery

Blood Parameter	Before	After
Red Blood Cells	105.67±3.00	117.95±4.21*
White Blood Cells	13731±1940.4	10307.9±1057.7
Serum Urea	33.48±0.47	35.25±0.46

Discussion

Various studies have investigated laparoscopic cholecystectomy and associated complications such as incisional hernia from umbilical port[4-12]. In the present study, we have evaluated the hematological parameters and serum urea before and after hernia surgery. In a case study of 55 year old female reported by Sharma et al.[13]an anterior abdominal wall hernia was diagnosed after two days of laparoscopic cholecystectomy through the umbilical port. Authors have reported hernia reduction, fascial anatomical repair and peritoneal defect over the midline laparotomy incision[13].

Umbilical hernia is another type of hernia constituting 6% of all abdominal hernias in adults[14,15]. Treatment options for umbilical hernias includes several surgical method. During laparoscopic cholecystectomy; the simultaneous occurrence of umbilical hernia and cholelithiasis may cause technical problems in CO_2 insufflations and trocar insertion. Kamer et al.[16]has explored ideal repair method among primary repair, mayo repair and flat mesh hernioplasty for incidentally encountered umbilical hernias after laparoscopic cholecystectomy. The study reported improved outcomes of the umbilical defect repair with mesh after laparoscopic surgeries and a better technique for either obese or non-obese patients than primary suture techniques in terms of recurrence rates[16].

In a case control study by Uslu et al.[17], female gender, older age, higher BMI along with increased surgery duration was found to be associated with increased probability of a trocar site hernia formation. Thus, authors conclude that closure of trocar sites in obese patients above 60 years, and a longer operation duration could result in prevention of port site hernia following laparoscopic cholecystectomy[17].

Thus, during the follow up of patients who underwent laparoscopic cholecystectomy; after this surgery, the probability of development of port site hernia can occur. These considerations of hernia could help in providing early intervention to reduce sepsis and strangulation. In addition, repair of both peritoneal and fascial layers at the port site should also be considered to avoid such unfavorable condition at a future date.

Conclusion

The laparoscopic cholecystectomywith previous abdominal wall hernia is the easiest operative procedure. However, it required good experience and careful dissection. The red blood count gets increased after surgery along with serum urea.

Acute Head Injury with Pregnancy

Ajaydeep Singh[1], Arvinpreet Kour[2], Unmesh S. Santpur[3]

[1]Assistant Professor, Department of Neurosurgery, [2]Assistant Professor, Department of Anaesthesia, [3]Professor, Department of Department of Obstetrics & Gynaecology, Maharishi Markandeshwar Institute of Medical Science and Research, Mullana, Haryana, India

Abstract

Introduction: Trauma affects 7-8% of all pregnancies. A multidisciplinary management of pregnant patients with traumatic brain injury is required, The efforts of the Neurosurgeon, Gynaecologist and Anaesthetist/ Intensivist is mandatory. The management is individualized as per the foetal status, gestational age, and maternal injury score.

Materials and Method: We studied 8 patients who were operated for severe head injuries with pregnancy. The main aim of the study was to know the outcome of pregnant females and the neonate in head injury.

Results: The maternal outcome depends solely on the grade and type of the head injury, the fetal outcome depends upon the age of the pregnancy and maternal GCS.

Conclusion: Best management of the maternal and the foetus is achieved with multidisciplinary approach of team. The utmost important is the decision which needs to be taken as early for the low to moderate GCS patients.

Keywords: *Caesarean section, craniotomy, pregnancy, traumatic brain injury.*

Introduction

Trauma affects 7-8% of all pregnancies[1,2] and is becoming the most frequent cause of maternal mortality in the underdeveloped and the developed countries, Head injury is the main cause of the maternal death[3,4,5,6.] Indian stats points that, Assam with the highest [237] MMR and the Maharashtra with the minimum MMR [61] with MMR in India as 130 in the year 2014-2016. Traumatic brain injury is the major contributing factor in non-obstetric mortality in developing countries. Approximately 20% of maternal mortality is directly correlated to such injuries. Road traffic accidents and domestic violence are the most common nonlethal injuries that can threaten either the maternal or foetal life, and such events occur in 1 out of every 12 pregnancies.[3,4] The physiological changes in pregnancy progresses needs several specific considerations in the management of severe traumatic brain injury Head injury causes rapid rise of intracranial pressure which leads to hypotension resulting in the poor fetal outcome[5,6]. The team approach is required for successful outcome of both mother and neonate. Because the most common cause of fetal death is maternal death, so the mother must be resuscitate firstly. Any trauma victim of childbearing age must be considered pregnant until proven otherwise. This is important because most of severely injured patient may not be able to communicate. It is recommended that pregnancy test should be performed in all patients.[7] Pre-hospital Care is utmost important as oxygen supplementation is essential for both the mother and

foetus for the prevention of hypoxia. Prompt positioning the patient in the left lateral decubitus position should be done to avoid compression of the venacava, resulting in hypotension. Hypoxia and hypotension have detrimental effects on both lives, as these conditions are associated with approximately 50%–75% of mortalities. In general, treatment that is good for the mother is good for the foetus. In cases of major trauma, the assessment, stabilisation and care of the pregnant women is the first priority; then, if the foetus is viable (≥ 24 weeks) foetal monitoring is initiated. The standard guidelines for the management of traumatic brain injury can be applied to pregnant patients. If neurosurgical intervention has been performed in early pregnancy (< 24 weeks), the decision about subsequent foetal management can be based on obstetric considerations Based on the Brain Trauma Foundation 2016 guidelines, a variety of measures to control intracranial pressure can be administered, such as a *slight head-up position, low tidal volumes during intermittent positive pressure ventilation and avoidance of vomiting*[8]. Administration of mannitol in pregnant women should involve caution, as it slowly accumulates in the foetus, causing foetal hyperosmolality; this will lead to physiological changes, such as reduced fetal lung fluid production, reduced urinary blood flow and increased plasma sodium concentrations.[9,10] However, in individual case reports, mannitol in doses of 0.25–0.5 mg/kg has been used and appears beneficial. Post-operative care in the intensive unit for pregnant women involves maintaining neurological and systemic homeostasis. There is an increased risk of both deep venous thrombosis and pulmonary embolism due to alterations in clotting factors in pregnancy, as well as endothelial injury secondary to trauma and susceptibility to infection.

Materials and Method

The study was conducted at medical college for a period of 2 years and the patients belonged mainly from Amballa, Yamunanagar and Saharanpur districts. Only the patients with severe head injury with pregnancy in the third trimester were included in the study. 8 patients with third trimester pregnancy of severe head injury were operated. Different variables were studied. The main aim of the study was to know the outcome of head injuries in the pregnant females and fetal outcome.

For all the patient we formulated multidicipilinary approach which consisted of neurosurgeon, obstetrician, intensivist, neonatologist and Anesthetist. All the patients underwent primary survey then were stabalised with oxygen and fluid resuscitated, basic investigations and NCCT head with lead apron was done, Focused assessment with sonography for trauma examination and cervical spine radiography were done Obstetric examination utilizing ultrasonography and cardiotocography were done. After discussing the risks and benefits with patient's family, the patients were immediately taken up by the gynaecologist for C section, and subsequently operated by us for craniotomy and postoperatively the patient was kept on ventillatory support and subsequently managed accordingly. The baby was handed over to the neonatologist with the view that neonates born by CS with general anesthesia are at increased risks with 1- and 5-minute Apgar scores of less than 7 and needs resuscitation.

Observations and Results

The mean age of the patients was 31 years (22-41 years .Three patients were primigravida and five were multigravida. The GCS of the patient ranged between 5/15 to 12/15

Three patients had anisocoria at the time of presentation. All the patients were taken up for C section and APGAR score was assessed The APGAR score of the patients were low in our study calculated a 1 min and 5 min {Table 1}. The weight of the babies was assessed and was managed accordingly, one patient with 28 weeks of the pregnancy had GCS of 6/15 whom presented with abruptio placenta, the weight of the baby was only 1100 grams.(The baby could not be resuscitated). The average time taken from the trauma to the surgery was 78 min {45min-180 min}. Over all the blood loss in the craniotomy {pregnant patients } was more than usual craniotomies (non-pregnant patients) which was assessed with assessed with blood transfusion and blood loss blood.

In our study out of eight patients two (25%), these patients presented with acute SDH and had low GCS of 5 and 6 out of 15.

Four (50%) babies out of eight had died, their weight were 1100 grams, 1600 grams, 1628 grams and 2720 grams, the patient with fetal weight of 2720 presented and operated late after 3 hrs of injury and had lowest GCS of 5/15 she was multigravida and maximum age of 41 years in the study, she also died on the 3rd postoperative day.

2 patients developed deep venous thrombosis, they were managed conservatively and had good outcome later on. One patient had abruptio placenta .

Two of the eight patient had a poor outcome and died, all the 6 patients were kept in the neuro icu and was managed and had good out come with min morbidity and were functional.

Description of the patients are listed in the table no 1:

Case 1: Thirty two years female G2P1, 34 weeks of pregnancy presented, On examination, she was breathing spontaneously (respiratory rate of 30 breaths/min.) Her BP was 120/80 mmHg, heart rate was 98 beats/min, Glasgow coma score was 7\15 (E1, V1, M5) The patient was intubated in view of low GCS . NCCT head done revealed large acute left frontotemporal SDH with midline shift of 8 mm with right temporal bone fracture. No other injuries were clinically detected. FAST and C SPINE radiography were normal. Obstetric examination utilizing ultrasonography and cardiotocography revealed a 34 weeks viable fetus with good biophysical profile, with no signs fetal distress. After discussing the risks and benefits with patient's family, we decided to perform caesarean delivery followed by craniotomy. 200 ml of mannitol was infused after which the GCS improved to 10/15. The patient was immediately taken up by the gynaecologist for C section,{earlier history of C-Section because of foetal distress} and subsequently operated by right frontotemporoparietal decompressive craniotomy with removal of the hematoma with lax duraplasty, postoperatively the patient was kept on ventillatory support and subsequently was weaned off on the 5th postoperative day. The baby's weight was 2,380 g and Apgar score at 1 min was 7 and at 5 min it was 8. Female was kept on the ventillatory support for 9 days and weaned off and was managed in the NICU for 3 weeks and was later discharged and was healthy.

Case 2: Twenty seven years female G1P1 with 36 weeks of pregnancy presented with GCS of 9/15, On examination, she had shallow breathing (respiratory rate of 40 breaths/min irregular.) Her BP was 90/46 mmHg, heart rate was 118 beats/min urgent. NCCT revealed large right FTP acute SDH with effacement of the ventricles, Obstetric examination utilizing ultrasonography and cardiotocography revealed bradycardia. Immediately the patient was intubated, after discussing the risks and benefits with patient's family and the gynaecologist, Urgent C-Section was taken up by gynaecologist The weight of the baby was 2.700 gms and had an APGAR score of 9 at 1 min and 10 at 5 min, the baby was shifted to the NICU and simultaneously decompressive craniotomy was done on the right frontotemporoparietal region, a large hematoma was evacuated and the hemostasis was achieved, closed with lax duraplasty, the bone was kept in the left side of the abdomen subcutaneously, postoperatively the mother was kept on ventillatory support for 24 hrs and then weaned off and the baby did well without any support.

Case 3: Twenty two years female, G1 P1 with 37 weeks of pregnancy had head injury when she fell off from the bike, on examination her pulse was 66/m, BP was 110/70 mmHg with 10cm x 2 cm lacerated wound on the left temporal region with GCS of 12/15 with labour pains, on examination the patient had anisocoria with left pupil 3mm reacting and right pupil 2 mm reacting to light. Foetal USG done for foetal well being was normal with good biophysical profile, with no signs fetal distress. NCCT revealed large acute left temporoparietal SDH. Maternal examination revealed cervical dilatation of 4 mm and gynaecologist in consultation with neurosurgeon opted for early C-section. The patient was operated, the mother was off ventillatory support on the 2nd postop days and the baby did well with APGAR score of 10.

Table 1. Description of the patients showing their age, gravida, tenure of pregnancy, GCS, weight of baby, APGAR score and the outcome

No	Maternal Age (Years) and Gravida		Gestation age (weeks)	Type of head injury	GCS on arrival	Pupils	Weight of baby (grams)	APGAR score at		Timing between injury and surgery (min)	Baby admission to NICU	Maternal Outcome	Outcome of baby
								1 min	5 min				
1	32	G2P1A0	34	Left FTP SDH with temporal contusion	7/15	Anisocoria	2380	7	8	45	Yes	Good	Good
2	27	G1P1A0	36	Right FTP SDH	9/15	Normal	2700	9	10	60	Yes	Good	Good
3	22	G1PlA0	37	Left Temporoparietal SDH	12/15	Anisocoria	2830	8	10	70	No	Good	Good

8	36	G3P2A0	39	Right FT SDH with occipital contusion	7/15	Anisocoria	2742	10	10	40	No	Good	Good

Discussion

Severe head injury in the pregnancy is common ranging between 7-8 %, most common the patients are the pillion riders. An intensive multidisciplinary approach are required for survival of mother and neonate. The higher chances of mortality are associated with pregnancy as the physiology of the body is changed. There is increase in the blood volume by 40% and inspite of that there is dilution as the RBC increase only by 25% which lead to physiological anaemia resulting increased loss of the blood without showing the features of shock, endangering risk of life to mother and the neonate. The position of the uterus in supine position can cause hypotension. Sudden hypotension in the patient can lead to decreased fetal circulation and leading to poor fetal outcome. Increased levels of coagulation factors may improve hemostasis after trauma; whereas two of our four 2 patients developed DVT because pregnancy causes increased risk of thromboembolic complications during periods of immobilization.

When neurosurgery is indicated urgently during pregnancy, general anesthesia is almost always indicated which have deleterious effects on the neonatal oucome and the APGAR score. During the third trimester, patient may be suitable for initial cesarean delivery, followed by the neurosurgical procedure, using an appropriately modified anesthetic technique.[12] Positioning needs head elevation for the neurosurgery, whereas a lateral tilt is required for the avoidance of aortocaval compression and reduced venous return. The presence of a potentially full stomach, pregnancy induced changes in the airway and enlarged breasts, which increase the incidence of a difficult intubation.[13] A rapid sequence induction with cricoid pressure is advocated despite airway management being more difficult. A pregnant woman is no more pre-disposed to head injury than a non-pregnant one. However, because of the physiological, hormonal, hemodynamic and anatomical changes associated with pregnancy, certain standard neurosurgical practices may be challenged. Thus, close communication and constant discussion between the neurosurgeon, Neuroanesthetist, obstetrician and the patient's family is essential. The average blood loss using visual estimation in the C section is around 470±221 ml with a range of 200-1100 ml[14,15]. In our study the average loss at the time of C section was 592±222ml which slightly higher than some studies and was within range of most of the studies[16] . Our study showed that the total blood loss per patient was 3.6 units to 4.4 units Estimated blood loss is the approximate amount of blood loss after craniotomy surgery, calculated by the formula:

Estimated blood loss = Hb(pre-op) - Hb(post-op) + blood transfusion unit used during surgery.

Most of studies showed average loss of blood in craniotomies[17,18] of around 4 units, our study is consistent with the same. Above all, it is a challenge in team work and communication between all parties concerned in the patient's care.The decision for the conservative management is unlikely to have the better outcome as in case of the maternal mortality, the time span for C-Section is very less {4 minutes}. The patient is thoroughly examined by The Rapid Assessment Several cases have reported of successful pregnancy outcomes after severe brain injury during pregnancy if managed conservatively, where mother could not be saved or she continued to be in comatosedor in vegetative stage.

Conclusion

Best management of the maternal and the foetus is achieved with multidisciplinary approach of team. Advances in neonatology, neurosurgery, critical care, easy approach to the tertiary hospital enhance the chances for maternal her fetus to survive. The utmost important is the decision which needs to be taken with the consent with the family informing all the risks to the patient and the neonate.

Effectiveness of Deep Brain Stimulation in Parkinsonism

Ajaydeep Singh[1], Arvinpreet Kour[2]

[1]Assistant Professor, Department of Neurosurgery, [2]Assistant Professor, Department of Anaesthesia, Maharishi Markandeshwar Institute of Medical Science and Research, Mullana, Haryana, India

Abstract

Introduction: Deep brain stimulation (DBS) is a neurosurgical procedure indicated for patients with advanced Parkinson's disease (PD).This study aimed to investigate the relative efficacy and safety of DBS when medical therapy is ineffective in advanced PD.

Material and Method: 50 patients whom were on medical treatment for long and started to have side effects of the drugs were the part of the study to find the improvement in the status in terms of tremors, dyskinesia and rigidity.

Results: Preoperatively and postoperatively comparison in the improvement was done which revealed, improvement was 75%, 61.5% and 58 % respectively in tremors, rigidity and dyskinesia. There was statically significantly improvement rigidity, tremor and the dyskinesia, the patients needed smaller doses of the medications and showed less signs of distress.

Conclusion: Our results clearly suggested that with Deep Brain Stimulation patients showed significant improvement with decreased dose of medication.

Keywords: *DBS; Parkinsonism rigidity, dyskinesia and tremors, response of DBS on STN.*

Introduction

Parkinsonism is the detected in early 19th century, In the 1970's it became evident that long term levodopa treatment eventually could have disabling complications such as levodopa induced dyskinesias[1] . Hence, there was a need to find an alternative method to ablative surgical method, without irreversible side-effects. This resulted in the reappearance of DBS in the treatment of movement disorders. The pioneering work started in 1987 and was led by Alim-Louis Benabid and Pierre Pollak[2]. Deep brain stimulation (DBS) for Parkinson's disease, started in 1987 when two group[2,3] reported results of chronic thalamic stimulation for parkinsonian tremor with nearly all patients having significant tremor suppression. The aim of this study was to compare the clinical outcomes of advanced PD patients following bilateral STN DBS,Electrode was passed The final positioning of the electrode checked by impedance monitoring, depth recording, and elicitation of evoked potentials and stimulation of presumed target. Parkinson's disease (PD) is a progressive and debilitating neurodegenerative disorder that affects 0.1 - 0.2% of the population at any time and 1% of the population over 60 years old, with the prevalence increasing in an age-dependent manner, Clinically, it is characterised by motor (tremor, rigidity, and bradykinesia), autonomic(constipation and orthostatic), and neurocognitive impairment (depression or sleep disorders.).

Materials and Method

This treatment was carried out at the Neurosurgery department. 50 patients of Parkinsonism were studied.

Inclusion criteria were: a diagnosis of idiopathic Parkinson's disease, age 30-75 years, good levodopa response, severe drug induced dyskinesia, Exclusion criteria were patients with pacemaker; patients with significant depression, and psychotic symptoms. The final targets achieved MRI brain were finalised with MER. ***Study design.*** For calculating the co-ordinates, MRI of the brain in stereotactic format was performed,later applied the frame and then CT brain was performed. Well-established Cartesian (x, y, and z) target coordinates, relative to the mid-commissural point were used for planning electrode placement by frame link by Brain lab software Figure 1. Stereotactic target coordinates were discerned from frame link software that merges the MRI of the patient's brain with a brain atlas using plain CT.[figure 2] Positioning of the electrodes in the brain and final position of the target is checked by electrode checked by impedance monitoring, depth recording, and elicitation of evoked potentials and stimulation of presumed target. [Figure 3 and 4].

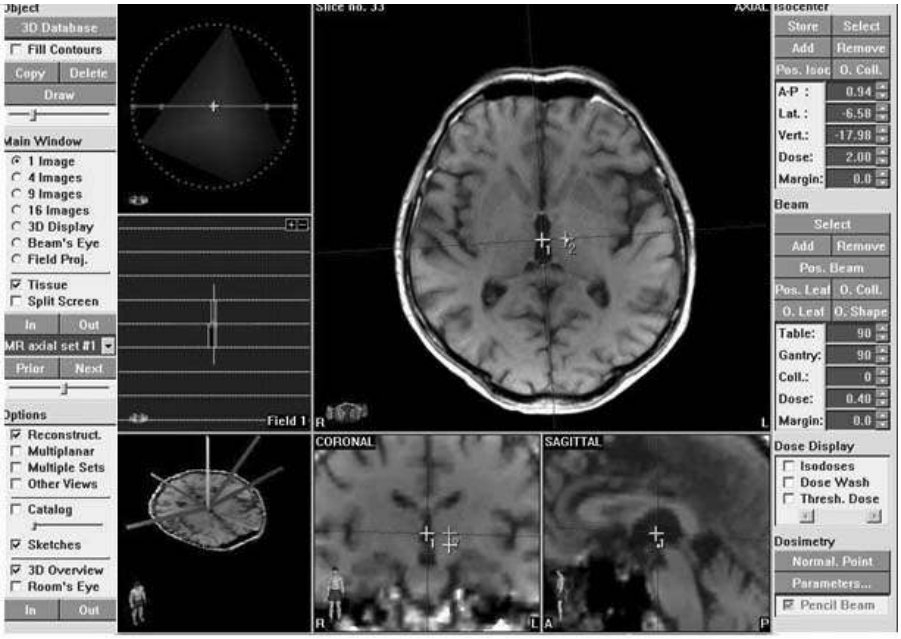

Figure 1. Localising the target and getting the coordinates with MRI brain.

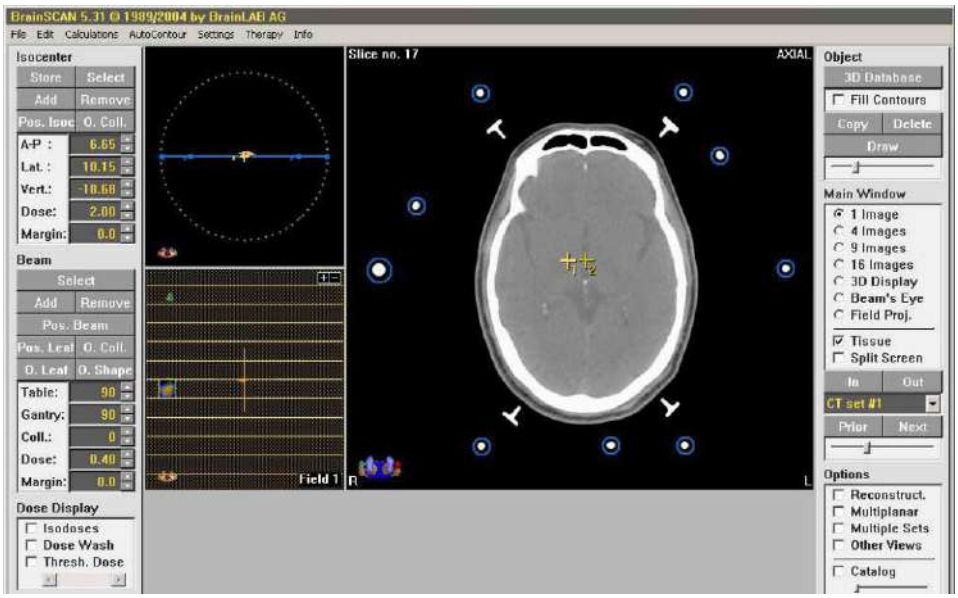

Figure 2 CT scan images used for merging in the frame link software

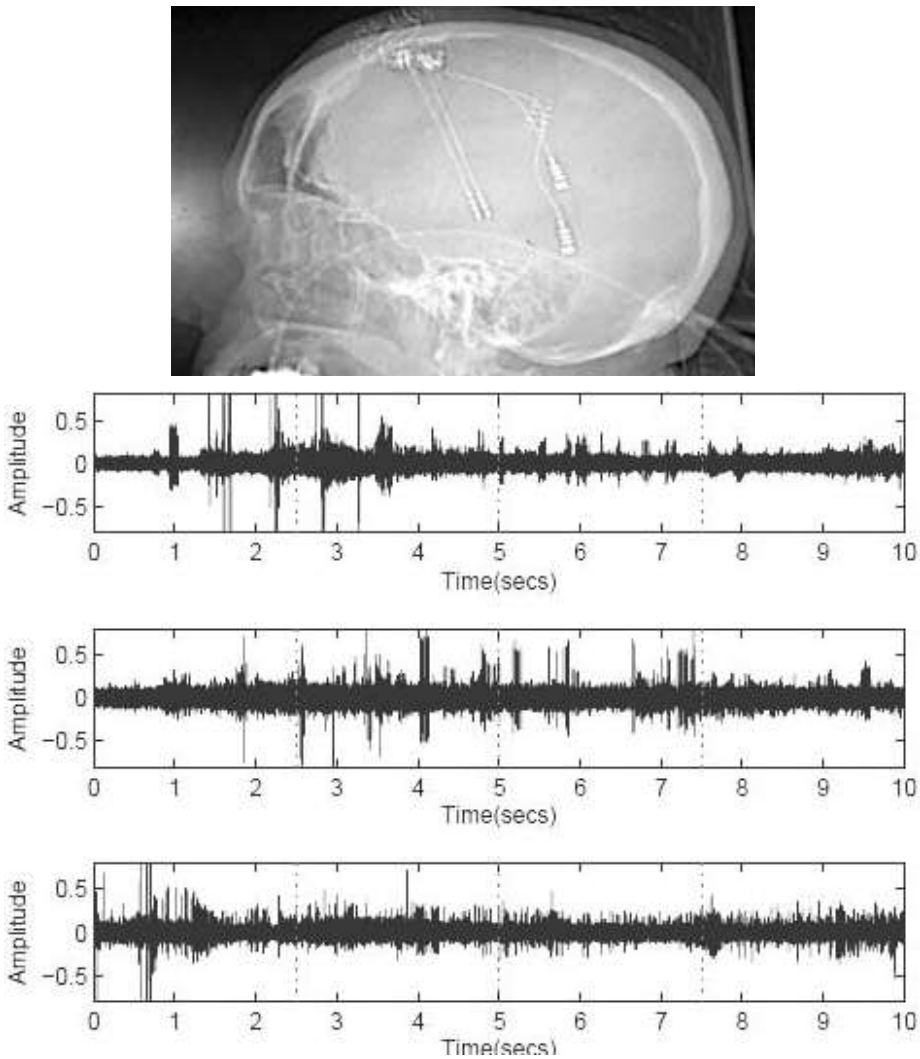

Figure 3 & 4 Positioning of the electrodes in the brain and final position of the target is checked by electrode checked by impedance monitoring, depth recording, and elicitation of evoked potentials and stimulation of presumed target.

STN stimulation: Out of 50 patients in the 36 patient were bilaterally stimulated and 14 patients were unilaterally stimulated assessing the side of the disease. In total 86 targets were stimulated.

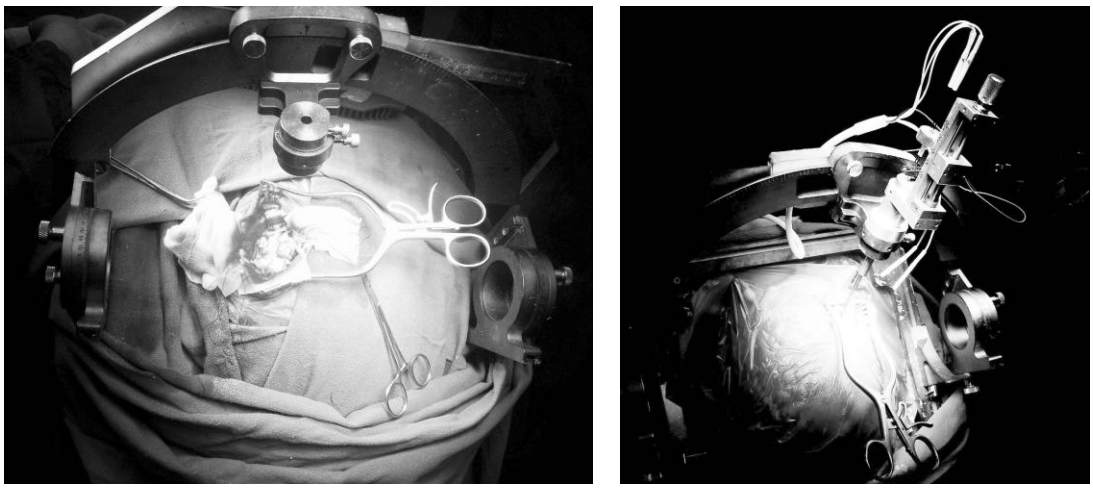

Figure 5 Intraoperative electrodes placement

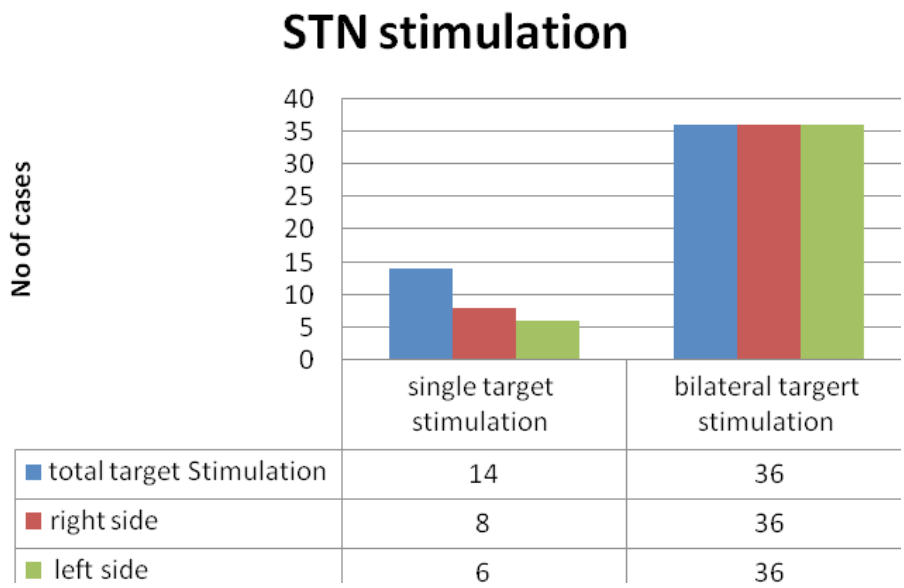

Gender: Out of 50 patients 10 (20%) were female and 40 (80%) patients were males. The frame used is fixed to the patient under local anaesthesia.

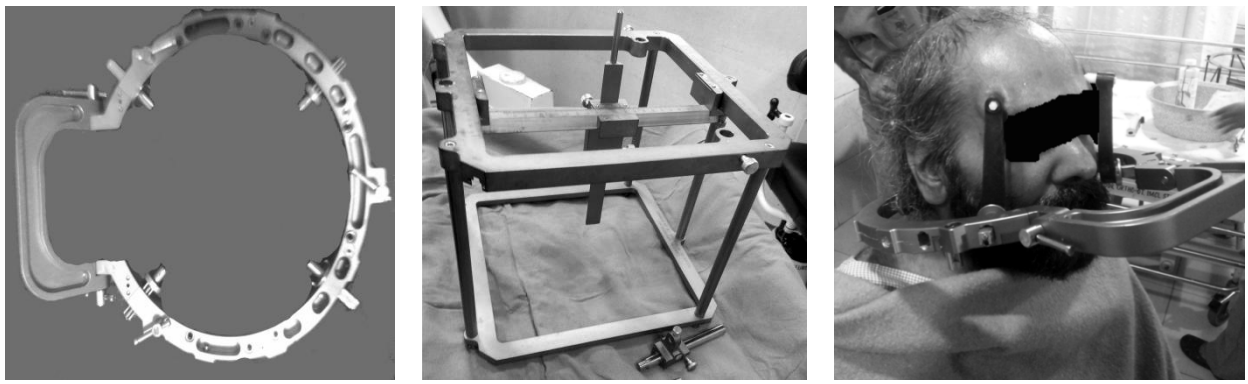

Figure 6 shows . Arc of the frame with phantom base and picture of the frame fitted to the patient

Clinical rating scales. The clinical improvements of the patients were studied preoperatively and postoperatively accordingly to the UPDRS score. The Unified Parkinson Disease Rating Scale (UPDRS) is designed to monitor Parkinson Disease disability and impairment[3].

The Unified Parkinson Disease Rating Scale (UPDRS) is designed to monitor Parkinson Disease disability and impairment.

It measured the following levels:

0 = Absent.

1 = Slight and infrequently present.

2 = Mild in amplitude and persistent. Or moderate in amplitude, but only intermittently present.

3 = Moderate in amplitude and present most of the time.

4 = Marked in amplitude and present most of the time.

The UPDRS consists of 4 different parts:

1. **Mentation, Behavior and Mood**
    1. Intellectual Impairment
    2. Thought Disorder
    3. Depression
    4. Motivation/Initiative
2. **Activities of Daily Living** (for both "on" and "off")
    1. Speech
    2. Salivation
    3. Swallowing

4. Handwritting
5. Cutting food and handling utensils
6. Dressing
7. Hygiene
8. Turning in bed and adjusting bed clothes
9. Falling
10. Freezing when walking
11. Walking
12. Tremor
13. Sensory complaints related to parkinsonism

3. Motor Examination

1. Speech
2. Facial Expression
3. Tremor at rest
4. Action or Postural Tremor of hands
5. Rigidity
6. Finger Taps
7. Hand Movements
8. Rapid Movements of Hands
9. Leg Agility
10. Arising from Chair
11. Posture
12. Gait
13. Postural Stability
14. Body Bradykinesia and Hypokinesia

4. Complications of Therapy (In the past week)

1. A. Dyskinesias

1. Duration: What proportion of the waking day are dyskinesias present?
2. Disability: How dialing are the dyskinesias?
3. Painful Dyskinesias: How painful are the dyskinesias?
4. Presence of Early Morning Dystonia

2. B. Clinical Fluctuations

1. Are "off" periods predictable?
2. Are "off" periods unpredictable?
3. Do "off" periods come on suddenly, within a few seconds?
4. What proportion of the waking day is the patient "off" on average?

3. C. Other Complications

1. Does the patient have anorexia, nausea, or vomiting?
2. Any sleep disturbances, such as insomnia or hyper somnolence?
3. Does the patient have symptomatic orthostasis?

Complications: Complications were classified into operation-related, hardware-related and stimulation-related.

Operation-related complications included:

1. Intracranial hemorrhages,
2. Neurological deficits,
3. Venous infarct,
4. Venous air embolism,
5. Seizures
6. Electrode malposition,
7. Pulmonary embolism.

Hardware-related complications included

1. Fracture of electrodes,
2. Electrode migration,
3. Infection,
4. Erosion.

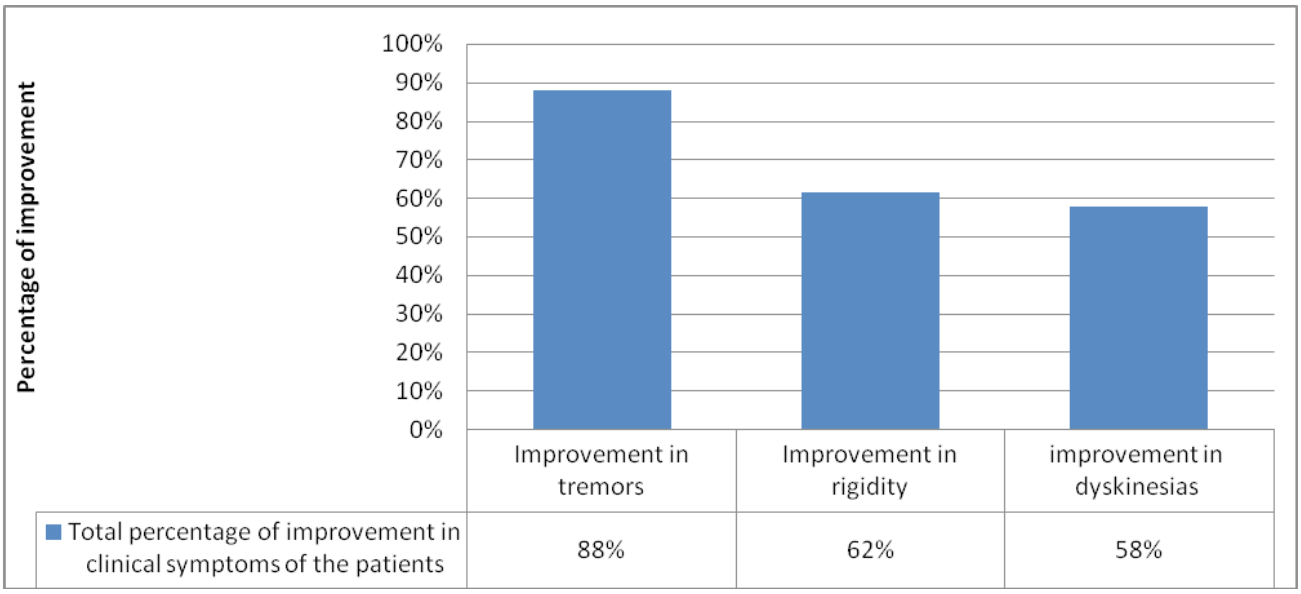
Stimulation-related complications included

1. Sensorimotor conditions,
2. Psychiatric conditions,
3. Life-threatening conditions.

Statistical significance: Statistical analysis of the data was performed by using Statistical Package for the Social Sciences Version 20 SPSS version 20, Paired T Test, Wilcoxon signed rank test and by R software with KW Test, Mann Whitney and t-stat,To indicate statistical significance p value<0.01 for paired t test and <0.05 for Wilcoxon signed rank test, KW Test, Mann Whitney and t-stat was taken.

Results

Comparisons of the results were done on the basis by grading the tremors, rigidity and dyskinesias with grade of 0-4 on clinical examination pre and postoperatively. The score obtained was calculated was calculated in percentages and was correlated with scoring system and the outcome was measured.



Comparison of tremors in the patients preoperatively and postoperatively

Discussion

The improvement in the clinical symptoms of the patients of DBS at subthalmic nucleus were studied in 50 patients, Overall the surgery was well tolerated, with the exception of three patient developed bleed {one thalamic bleed and 2 cortical }; the patient was managed with conservative treatment with medications and mannitol was given in one. The target of the subthalamic nuclei[4-6] were the closest to the final target, confirmed by microelectrode recording[5, 7], as similarly reported, visual target as possibly more accurate [7-10] An accuracy of 84.76 % was achieved in localising the subthalamic nuclei, confirmed with microelectrode recording. Patients achieved the best results in Unified Parkinson's Disease Rating Scalescores in both "on and off" state[11]. The improvement in rigidity, tremor and the dyskinesia due to subthalamic nuclei stimulation correlated well with the improvement of the other sensory and motor parkinsonian symptoms[13]. A trajectory of 50˚-60˚was used[13], which correlated with the alignment of the subthalamicnuclei. The best results were achieved in the dorsolateral portion of the subthalamic nuclei[14,15,16]. The ventral portion of subthalamic nuclie which was better visualised in the magnetic resonance imagingis associative areas and has connections with the limbic system[17].

It is likely that there were several unavoidable errors in this study e.g positions of the electrodes while fusing magnetic resonance imaging/computed tomography, direct visualisation of subthalamic and inter-evaluator errors, and errors in plotting the electrodes in the brain atlas based on the fused images[18,19]. Secondly there are distortions in the magnetic resonance imaging which may lead the displacement of the targets[18]. Thirdly it is rare that all the borders of the subthalamic nuclei are not visualised with precision, Systematic reviews and meta-analyses of randomized controlled trials comparing DBS to the best medical therapy are limited. Perestelo-Pérez et al.[20] showed that DBS was superior to BMT for improving motor control, QoL, and medication doses in PD patients. Finally, the long-term outcome of the patients who underwent programming after subthalamic nuclei deep brain stimulation needs to be assessed. Hitti FL et al in their study of DBS for PD showed 10-year survival rate of 51%. Survey data suggest that while DBS does not halt disease progression in PD, it provides

durable symptomatic relief and allows many individuals to maintain ADLs over long-term follow-up greater than 10 years[21].

Conclusions

There has been Substantial improvement in the quality of life in the patients who had DBS with medical therapy, we found that tremors and rigidity had significant improvement the compliance was better and significantly decreasing medication costs. The only drawback in the developing country was that the expense of the procedure (10-15 lakh) makes the procedure unreachable to the middle class patients . The efficacy of DBS has been established.he efficacy of DBS has been established, yet the question remains as to whether DBS should be considered as a treatment option at an earlier stage than the current recommendations.

Abstract

We aimed in this study to detect the correlation between PD-L1 and TILs, and their relationship with clinical outcome and survival in Egyptian patients with HGSOC.

Immunohistochemical expression of PD-L1, CD4 and CD8 was investigated in 94 HGSOC Egyptian patients. PD-L1 immunoreactivity was detected in 24% of the cases. The lack of tumor PD-L1 expression proved to be an independent predictive factor for better overall survival (OS) (p= 0.01). Moreover, high stromal CD8+ TILs density had a significant impact on better disease-free survival (p=0.007). Patients who showed negative expression of PD-L1 and high intraepithelial CD8+ TILs density lived significantly longer than other patients (p- 0.021).

Keywords: *PD-L1, HGSOC, TILS, CD4, CD8, Survival, Egypt.*

Introduction

In developed countries, ovarian cancer (OC) is the fifth most common cancer-related death(1).High grade serous ovarian cancer (HGSOC)constituted the majority amongovarian cancer subtypesand the deadliest. OCis usually diagnosed at late stage due to the few and unspecific early symptoms(2). The outcome of the patients who diagnosed with late stage disease is poor, where they usually develop treatment resistance(3). Hence, new effective therapeutic strategies are needed to overcome drug resistance and to improve long-term prognosis.

In the last few years, scientists provided evidences that immunotherapy is a promising treatment approach in OC(4-6). The programmed death 1 (PD-1)/PD-L1 pathway has an important role in the immune system downregulation. PD-1 is a cell surface receptor expressed by the activated CD4 and CD8 T cells and other immune cells. PD-L1, a ligand for PD-1, is expressed by tumor cells, tumor-associated macrophages, dendritic cells, T and B cells(7). Interruption of the PD-1/PD-L1 interaction using specific antibodies to either molecule can reactivate T cell function to work against tumor cells(8).

The expression of PD-L1, together with the abundant CD8+ tumor infiltrating lymphocytes (TILs) in the pretreatment tumor microenvironment proved to be a predictor to PD-1/PD-L1 blockingtherapy response in different tumors,including non-small cell lung cancer (NSCLC) and melanoma. In ovarian cancer, clinical data show moderate efficacy of anti PD-1/PD-L1 therapies with some durable responses(9).

Patients and Method

This is a retrospective study included 94 primary HGSOC specimens of Egyptian patients diagnosed between 2011 and 2017. Cases were collected from National Cancer Institute (NCI), Cairo University. Follow up time was up to 84 months with a median period of 24 months. High histologic grade was confirmed based on the criteria of the World Health Organization classification system[11]. The clinic-pathologic characteristics are detailed in Table 1.

Immunohistochemistry: Sections at a thickness of 4 μm were obtained from the paraffin-embedded tissues and placed onto X-tra adhesive slides. Standard immunostaining was done using BenchMark XT (Ventana) autostainer according to the protocol instruction. Ready-to-use primary monoclonal antibodies were used under specific incubation temperature and time as follows: Rabbit monoclonal antibodies against PD-L1 (MD21R), Cat No (RM0324RTU7), anti-P53 (DO-1), Cat noMA5-12571 (Thermo Fisher), rabbit monoclonal antibodies (Roche) for both CD4(SP35), cat no790-4423 and CD8 (SP57), Cat no790-4460. Tissue sections from normal tonsil was included on each slide as a positive control.

PD-L1 and P53 immunohistochemical analysis: Tumor cells with a membranous (complete circumferential or partial) staining and/or cytoplasmic staining in ≥ 5% of tumor cells were considered to be positive[7]. According to the type of mutation, missense or nonsense mutations, antibody against P53 will show two patterns of staining [10].High grade serous carcinoma was confirmed when either a diffuse or strong p53 staining in 75–100% of tumor cell nuclei (diffuse pattern), or a completely negative reaction (null pattern), are detected.

Quantitative analysis of CD4 + and CD8 + TILs: Both CD4 and CD8 were assessed in tumor microenvironment and counted at high-power fields (HPF) (40x magnification). T lymphocytes infiltrating into cancer cell nests, designated as intraepithelial T lymphocytes, while T-cells present in the perivascular spaces and/or tumor-associated stroma, designated as stromal T lymphocytes. Five fields with the highest positive cells density (hotspots) were selected, and the average count was calculated. According *Wang and colleagues study* scoring protocol; CD4 and CD8 protein expression less than/equal to 5 designated as score 1, 6-20 (score 2), and > 20(score 3)[7].

Statistical Method

Data was analyzed using IBM SPSS advanced statistics (Statistical Package for Social Sciences), version 24*(SPSS Inc., Chicago, IL)*. The association between categorical variables was determined by the standard chi-squared (Fisher's exact) test. Multivariate analysis was done for variables statistically significant on univariate level to indicate independent prognostic factors and to obviate the effect of confounders using logistic regression model. The hazard ratio (HR) and its 95% confidence interval were determined via a Cox regression model and survival curves were plotted from Kaplan–Meier estimates.DFS and OS were used for survival endpoints. A p-value less than or equal to 0.05 was considered statistically significant.

Results

Expression pattern of P53 in all selected HGSOC cases: P53 expression pattern showed a strong diffuse pattern in 59/94 cases (63%) (figure 2), while in rest of cases, it showed a complete absent expression (null pattern). Both patterns of expression together with the morphologic features confirmed tumor high grade.

Negative expression of PD-L1 in tumor cells is associated significantly with better OS: Using a 5% threshold[7], positive PD-L1 expression was observed in both tumor cells and TILs. It showed patchy pattern of distribution as membranous/cytoplasmic staining in majority of cases. The positive tumor PD-L1 immuno-reactivity was detected in 23 (24%) patients (figure 2). The expression of PD-L1 in TILs, mainly in stromal TILs, was detected in 26 cases (27.6%).

Kaplan-Meier curve analysis was performed to investigate the effect of PD-L1 expression of tumor cells on survival. Univariate analysis revealed a significant correlation between longer overall survival (OS) and negative PD-L1 expression in tumor cells (p=0.025) (Figure 1). On multivariate analysis (Cox regression model), negative PD-L1 expression in tumor cells proved to be an independent prognostic factor affecting overall survival (p= 0.010).

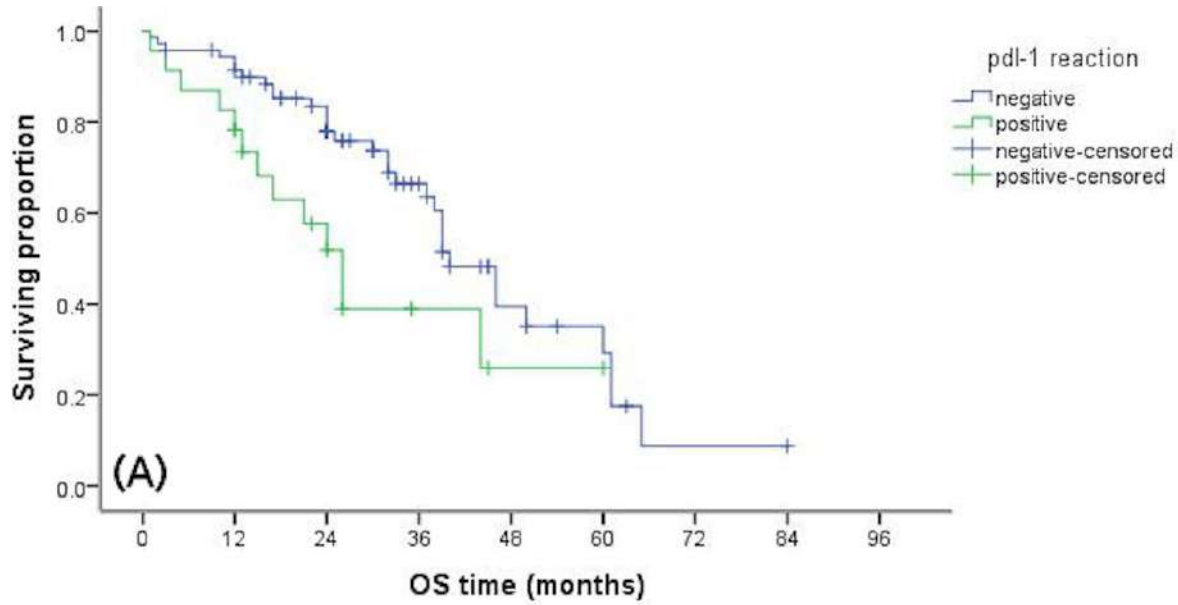
A combined high CD8 expression with negative PD-L1 affects the OS significantly: Both CD4 and CD8 were expressed in TILs, within cancer stroma and intraepithelial tumor cells. Most TILs were peritumoral rather than intra-tumoral and the numbers of intra-stromal TILs were higher than intraepithelial

TILs in majority of cases. Representative examples of immunohistochemical patterns and scores of CD4 and CD8 are illustrated in figure 3.

A significant correlation was found between PD-L1 expression in tumor cells with intraepithelial CD8+ TILs (p= 0.003): In a Univariate analysis, cases that showed both negative expression of PD-L1 in tumor cells and higher density of intraepithelial CD8+ TILs (score 2 & 3), lived significantly longer than all other groups (p= 0.021). On the other hand, a Univariant analysis revealed that higher numbers (score 3) of stromal CD8+ TILS alone, had a significant correlation with better DFS (p= 0.007). Moreover, high CD8+ stromal TILs proved to be an independent prognostic factor for DFS (p= 0.021).

Table 1: The clinicopathologic characteristics of the studied patients (n=94).

Clinicopathological Variable		Frequency	Percentage
Age (Years)	≤55	44	47%
	>55	50	53%
Tumor histology	- Papillary serous adenocarcinoma	93	99%
	- Mixed papillary serous adenocarcinoma and transitional cell carcinoma	1	1%
FIGO Stage	I	19	20%
	II	7	7%
	III	63	68%
	IV	5	5%
Debulking data	Presence of residual disease	39	41.5%
	No residual disease	51	54.35
	No available data	4	4.2%
Response to first line chemotherapy	Platinum-Sensitive	39	42%
	Platinum-Resistant	50	53%
	No available data	5	5%
CA125 level	High	91	97%
	Normal	3	3%



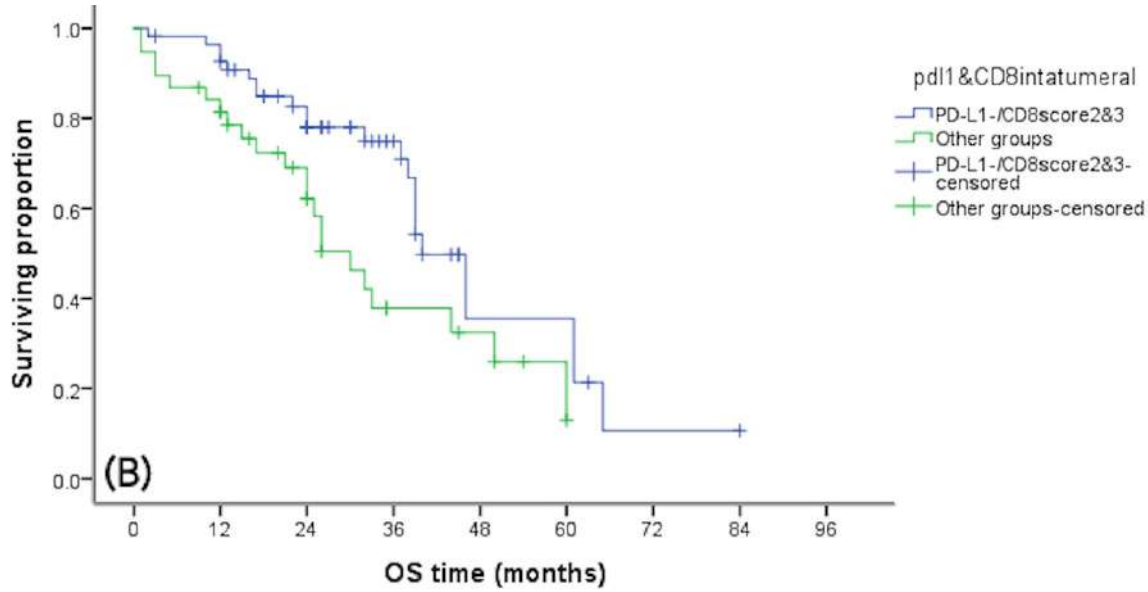


Figure 1: Kaplan-Meier survival analysis for HGSOC cases expressing negative/positive PD-L1 protein. (A) Negative PD-L1 expression correlates with better OS in HGSOC patients (p= 0.025). (B) Patients with negative PD-L1 expression in tumor cells associated with higher numbers of intraepithelial CD8+ TILs (score 2 & 3), lived significantly longer than other patients (p= 0.021).

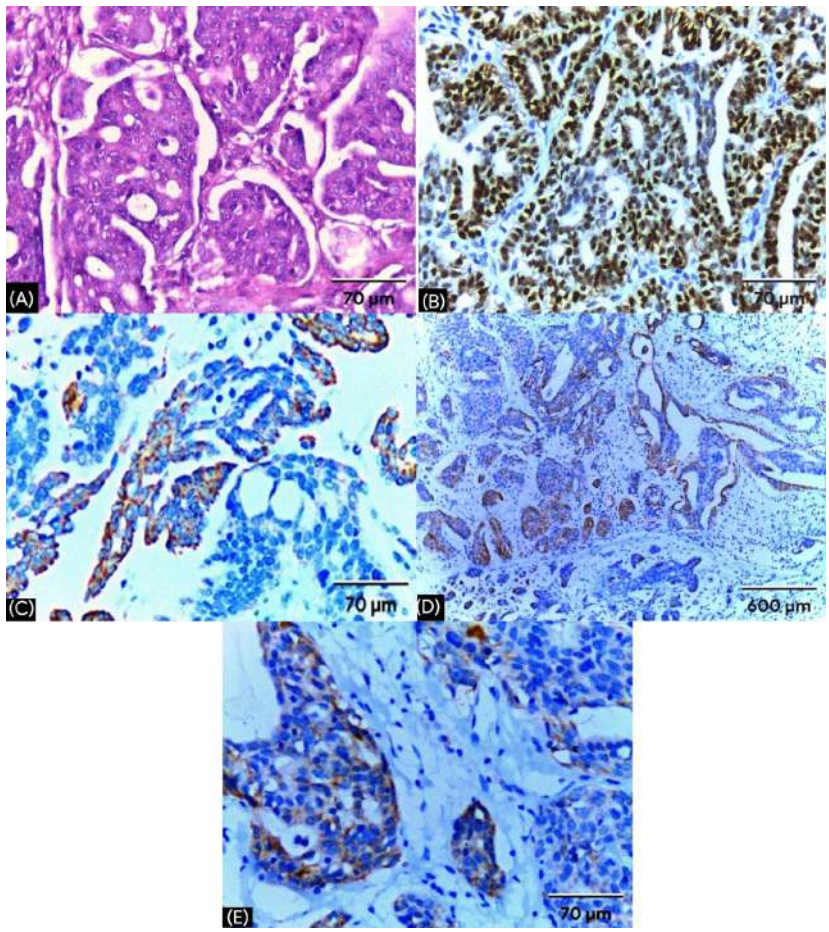

Figure 2: (A) A representative example of HGSOC case (H & E, x40)(B) P53 expression in HGSOC showed strong nuclear reaction in the majority of tumor cells (x40). (C, D & E) Representative cases of positive membranous expression of PD-L1 in the tumor cells (x40, x10 & x40).

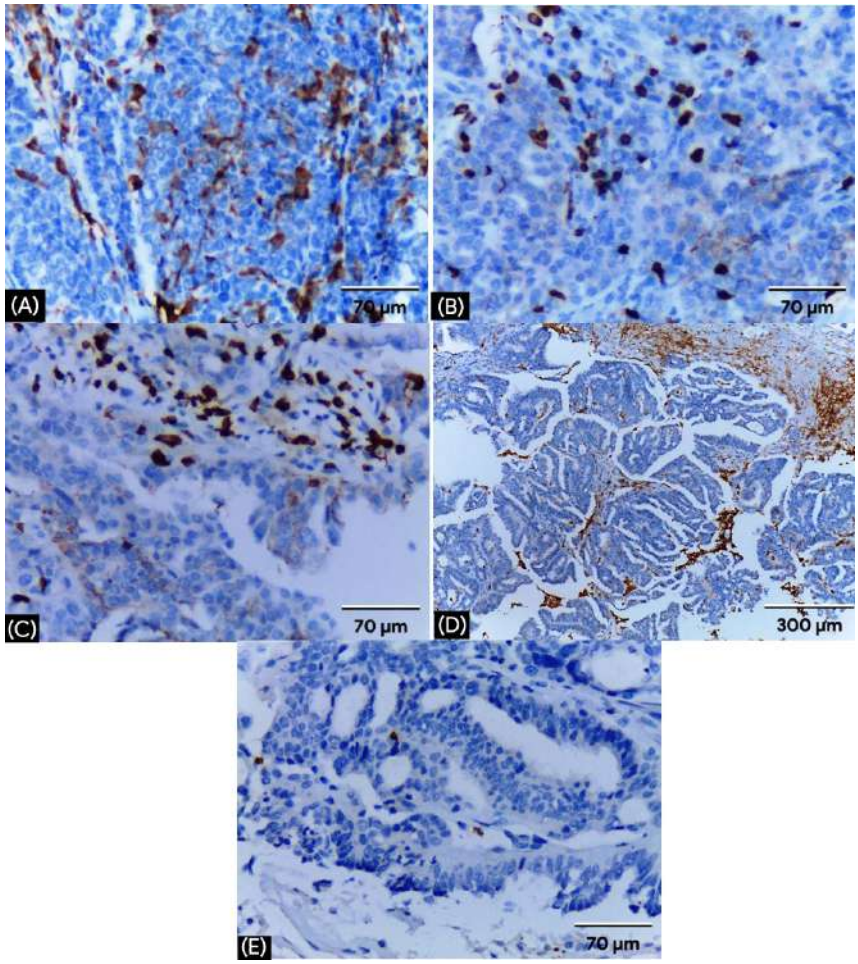

Figure 3: Immunohistochemical staining to demonstrate the expression pattern and different scoring of CD4+ and CD8+ TILs. (A) Intraepithelial CD4+ TILs (score3) (x40). (B) Intraepithelial distribution of CD8+ TILs (score2) (x40). (C) Stromal CD8+ TILs (score3) (x40). (D) A representative example of stromal CD8+ TILs (Score3) (x20). (E) Intraepithelial CD8+ (score1) (x40)

Discussion

In the last few years, immunotherapy has become the most attractive strategy of cancer treatment, due to its therapeutic efficacy in improving tumor prognosis and clinical outcome. Malignant tumors evade the immune system through PD-1/PD-L1 inhibition pathways[12]. Disruption of this axis using specific blocking monoclonal antibodies can induce durable remissions in different cancer types including melanoma, lung cancer and urothelial carcinoma[13].

Here, we aimed to investigate the expression level of PD-L1 together with CD4 and CD8 +TILs density, and their relation to outcome in HGSOC Egyptian patients. To the best of our knowledge, no such study has been yet reported in HGSOC Egyptian patients.

We used 5% as a cut-off for PD-L1 expression by IHC, as it has been proved to be a predictive for many immunotherapeutic drugs as Nivolumab and Pembrolizumab. The 5% threshold value was also used in most of previous studies for other types of tumors[7,14].

Based on our finding; 23/94 (24%) patients had patchy positive tumor PD-L1 (cytoplasmic/membranous) staining pattern. PD-L1 expression was also detected in stromal TILs (26 cases, 27.6%). PD-L1 expression rate and pattern in our study were in concordance with that found in Wang and colleagues' study[7]. They used the same cut-off value of 5%, and they also found similar PD-L1 positive rate (24.30% of their studied cases).

Some other studies reported different expression rate and localization. In one study, no cases exceeded 10% of staining in tumor cells[15]. In other reports, PD-

L1 primarily expressed in TILs and macrophages rather than tumor cells[8,26]. The explanation for that isthe use of different PD-L1 antibodies with different staining protocol, also the use of different cut-off value for PD-L1 positivity.

Consistent with other previous reports[7,16,18], our study revealed that lack of PD-L1 expression in tumor cells correlates better with OSInboth univariate and multivariate analysis. Other reports stated that positive PD-L1+ tumors are associated with increased overall survival and progression- free survival[19]. These studies performed immunostaining for PD-L1 using different anti-PD-L1 clones. In other studies, where expression of PD-L1 was interpreted in TILs and tissue associated macrophages, its expression was also associated with better survival[8,17] . In a recent meta-analysis study done by Huang and colleagues, they indicated that PD-L1 expression may be a negative predictor for prognosis of OC patients from Asian countries, while it is a good predictor for favorable prognosis of OC patients from non-Asian countries[20].

PD-L1 expression should be best interpreted in the context of intra-tumoral T cell infiltration for therapeutic purposes[21].We found that positive tumor PD-L1 expression was more commonly observed in patients with high intraepithelial CD8+TILs density (p=0.003). This finding is consistent with the result of Wang and colleagues' study[7]. They suggested that the expression of PD-L1 in HGSOC is due to the adaptive immune resistance. In this mechanism, IFN-γ expression by TILs leads to local PD-L1 expression by the tumor cells, which allows it to "escape" immune surveillance[22]. Teng and colleagues have proposed 4 different patterns of tumor: Type I tumors with adaptive immune resistance (PD-L1 positive/TILs present), type II with immune ignorance (PD-L1 negative/TILs absent),type III with intrinsic induction (PD-L1 positive/TILs absent) and type IV immune tolerance (PD-L1 negative/TILs present)[23].

In the present study, cases which showed PD-L1-ve/intraepithelial CD8+ TILs (score 2 & 3), lived significantly longer than other patients. This support the importance of studying both PD-L1 and CD8+TILs together for the purpose of survival and immunotherapy prediction.

The localization of TILs seems to be of major relevance to their prognostic impact[7]. In our study we found on a univariate analysis that higher numbers of stromal CD8+ TILS (score3) was significantly associated with longer DFS, which remained a significant factor in multivariate survival analysis. This was further supported by other studies[24,25]. They found that the presence of intraepithelial $CD3^+$ or $CD8^+$ T-cells is correlated with improved disease outcome.

In conclusion, results of our study indicated that lack of PD-L1 expression in HGSOC Egyptian patients is associated with better overall survival. Higher number of stromal CD8+ TILS is significantly associated with longer DFS. The combined negative PD-L1/higher score intraepithelial CD8+TILs, can predict better OS and can be used in stratifying HGSOC patients for PD-1/PD-L1 blockade therapy.

Association between Jordanian Ostomates' Knowledge about Intestinal Ostomy Care and their Ostomy Health-Related Problems

Rami A. Elshatarat

Assistant Professor, Department of Medical and Surgical Nursing, College of Nursing, Taibah University, Madinah, Kingdom of Saudi Arabia

Abstract

Introduction: Patients with intestinal ostomy (IO) have several health-related problems and complications. This research is conducted to determine the correlation between the subjects' knowledge about IO care and the frequency of health-related problems and complications.

Method: A cross-sectional design and convenience sampling method were used to investigate 174 patients with IO (ostomates).

Results: Almost all of the subjects had at least one IO health-related problem. About half of the subjects had more than three IO health-related problems. The subjects' had low (poor) knowledge about IO care and management (mean±SD = 52.2±16.4, out of 100). The results showed negative correlation between ostomates' knowledge about IO care and their frequency of IO health-related problems and complications (r = -0.54, p = 0.03).

Conclusion: Continuing health eduaction and training programs are recommended to all patients with IO to imorove their knowledge about IO care and to prevent the negative health events and complications which are related to IO.

Keywords: *Intestinal ostomy, ostomates' knowledge, ostomy health-related problems.*

Introduction

Colorectal cancer is considered the third most common type of cancer[1,2] . Worldwide, the surgical intervention rate for insertion of intestinal ostomy (IO) is also increasing about 3% every year [2-4]. Previous studies have showed negative impact of IO on ostomates' quality of life (QOL). Also, most of the ostomates may have several ostomy-health related problems [4].

Previous studies have showed negative relationship between patients' knowledge and their skills to care and manage their IO, and ostomy health-related problems. Also, the patients with IO who had high knowledge about caring for IO, they are more capable of managing their IO and prevent further health-related problems and complications[4]. Therefore, all patients are required to obtain health teaching and training about IO care and management and provide them pre-discharge instructions to prevent the negative health events and complications that related to IO [5,6]. Healthcare providers, specifically nurse educators, have a major role in providing health

teaching about caring of IO and managing of IO health-related problems [7].

Up to researcher knowledge, there is no published literature that investigate the Jordanian ostomates' knowledge about caring for their IO. Therefore, this current study was conducted to investigate the Jordanian ostomates' health-related problems and their knowledge about management of their IO. This important clinical research topic will be a baseline information for further research and for developing clinical guidelines for caring of IO and prevent its complications.

Study Objectives: This current study is aimed to identify: 1) the subjects' health-related problems of their IOs; 2) the subjects' exposure to health education and training about IOs caring 3) the subjects' knowledge about the characteristics and caring for IOs; and 4) the correlation between the subjects' knowledge about caring for their IOs and the frequency of having ostomy health-related problems.

Research Method

Research Design: This cross-sectional study was conducted to address the objectives of this study.

Research Sample and Setting: A convenience sampling method was utilized to recruit the 174 patients with IOs. All the subjects in this study were recruited from two private hospitals in Amman city, Jordan. The subjects of the current study were adult patients with IOs for at least one year, admitted to the selected hospitals for medical care or follow up appointment, and Arabic language speaker.

Data Collection Procedure and Ethical Considerations: Before conducting this study, official approval was obtained from the ethical committee for health research at Al-Ghad International Colleges for Applied Medical Sciences. A written consent form was signed by all the eligible subjects who decided to participate in this research. The subjects were noted that their participation in the current research is voluntary and their personal information will be confidential and anonymous. The participants took between 10 to 15 minutes to complete filling the adopted questionnaire.

Instruments: A structured self-report questionnaire was used to address this study's objectives. The subjects' medical record was checked to identify their clinical data (e.g. types of stoma). The subjects' were asked to report their IO health-related problems and the complications by answering either "yes" if they have any of the listed IO health-related problems or "no" if they have not. These IO health-related problems include 13 health problems such as abdominal gases, abdominal pain, and odor from the IO. This tool was adopted from City of Hope QOL–ostomy questionnaire (specifically physical well-being subscale), which is published in a previous study that investigated the QOL among the patients with abdominal ostomies [8]. The validity and reliability of this subscale is documented and used in several previous international studies.

The participants were asked to report any exposure to previous health education or/and training about caring for IO in a prior year of data collection. Also, they were asked to report their intention to have continuing health education or/and training program in the future about IO care and management of IO health-related problems and complications. This tool was adopted and modified based on the previous studies [9,10].

A Stoma-related Knowledge Scale was adopted from a previous Chinese study[11]. This tool is used to identify the perception of the subjects' knowledge about their IO care and management of its complications. The original tool was consisted of 14 items [11]. Six items, which are related to the characteristics of IO and management of IO health problems and complication, were added to this tool. The subjects' responses on this 5 points likert scale [11] were ranged between (1=not at all know) and (5=totally know). The highest total score of this scale (100) indicates the highest knowledge about caring of IO and management of its complications. Based on the previous Chinese study, the subjects' total score between 81 and 100 indicate a high (excellent) level of knowledge, subjects' score between 61 and 80 indicate middle (good) level of knowledge, subjects' score between 41 and 60 indicate low (poor) level of knowledge, and scores below 40 indicate very low (very poor) level of knowledge about IO care.

Data Analysis: SPSS software program was used for statistical analysis. Frequencies and descriptive statistics were used to identify the proportions and the averages of the collected data. Pearson's correlation test was also carried out to determine the correlation between the subjects' knowledge about caring for their IOs and the frequency of having ostomy health-related problems. The significant p value was preset as < 0.05.

Results

Approximately, three fourth of the subjects had permanent IO (73%). The majority of the subjects had colostomy (67.2%). Approximately, 32.8% of the subjects had iliostomy. Reviewing the subjects' record showed a diagnosis of cancer in colon or rectum was the major (54.6%) reason for insertion of IO. Almost all of the subjects (97.1%) had ostomy-related health problem. High frequency of the subjects (48.3%) had four or more ostomy-related health problems. The mean of the subjects' ostomy health-related problems, prior two weeks of hospitalization, was 8.83 (out of 13 health problems) (Table 1).

Table 1. Participants' Clinical Data and Ostomy Health-Related Problems

Variables	n	%
Types of stoma		
Permanent intestinal ostomy	127	73.0%
Temporary intestinal ostomy	47	27.0%
Location of ostomy		
Colostomy	117	67.2%
Ileostomy	57	32.8%
Reasons of ostomy insertion		
Cancer colon or rectum	95	54.6%
Intestinal obstruction	22	12.6%
Inflammatory bowel disease	30	17.2%
Others*	27	15.5%
Number of ostomy-related health problems during the last two weeks of hospitalization	n	%
No ostomy-related health problem	5	2.9%
One ostomy-related health problem	12	6.9%
2-3 ostomy-related health problems	73	42.0%
≥ four ostomy-related health problems	84	48.3%
Total score of the participants' ostomy-related health problems (ranges from 0 to 13 ostomy-related health problems)	**Mean** 8.83	**(±SD **)** ± 2.41

* Trauma, infectious enteritis, colonic polyp,.. etc., ** SD: Standard deviation

The findings showed that about 59% of the subjects had exposure to previous health education and training about IO care prior one year. Among them, about 63% of the subjects received their health education or training about IO care by nurses. Whereas about 37% of the participants received the heath education and training by physicians. The majority of the subjects (82.2%) were intended to participate in continuing health education about IO care in the future (Table 2).

Table 2. Participants' Exposure to Health Education and Training Program about Ostomy Care

Variables	n	%
Exposure to previous education or training about ostomy care during the last 12 months		
Yes	102	58.6%
No	72	41.4%
Sources of previous education or training about ostomy care during the last 12 months (n = 102)		
Nurses	64	62.7%
Physicians	38	37.3%
Willing to participate in continuing health education and training program about ostomy care in the future		
Yes	143	82.2%
No	31	17.8%

The subjects believed that they were more knowledgeable about the definition of the stoma (Mean±SD= 3.8 ±1.2), the purpose of the stoma (Mean±SD= 3.6±0.9), and the amount of daily fluid intake (Mean±SD= 3.5 ±9) than other items regarding IO care and management (Table 3).

Table 3. Perception of the subjects' knowledge about their intestinal ostomy care and management

Variables		Mean (±SD)
How do you rate your knowledge about the following items: (Mean out of 5)		
1.	Anatomy and physiology of the gastrointestinal tract	2.2 (±0.6)
2.	Definition of the stoma	3.8 (±1.2)
3.	Indication and purpose of the stoma	3.6 (±0.9)
4.	Components of a pouching system and stoma care products	2.6 (±0.7)
5.	Amount of daily fluid intake	3.5 (±0.9)
6.	Proper foods to eat with a colostomy	2.8 (±0.8)
7.	How to control gases	2.6 (±0.6)
8.	How to control odor	2.7 (±0.8)
9.	Bathing and personal hygiene	3.1 (±0.9)
10.	Normal appearance of stoma and peristoma skin	2.8 (±0.8)
11.	How often to change colostomy pouch	2.4 (±0.6)
12.	Monitoring and managing of potential stoma complications	2.1 (±0.4)
13.	Clothing style change	3.0 (±1.3)
14.	Daily life change	3.1 (±1.2)
15.	When should contact, follow up, and visit healthcare provider as instructed	3.4 (±1.5)
16.	How to measure stoma	2.4 (±0.7)
17.	Changing the stoma appliance	2.5 (±0.8)

Variables		Mean (±SD)
18.	Ostomy irrigation	1.9 (±0.3)
19.	Applying the clean pouch	2.7 (±0.6)
20.	Peristomal skin care	2.3 (±0.9)
Mean for the total score of the subjects' perception about IO characteristics and management (Mean out of 100)		52.2 (±16.4)
Overall mean of the subjects' perception about IO characteristics and management (Mean out of 5)		2.64 (±0.8)

The results of the correlation analysis also showed there is significant negative correlation between the perceived subjects' knowledge about IO care and their IOs health-related problems (r = -0.54, p=0.03).

Discussion

Unfortunately, almost all (97.1%) of the subjects reported that they have at least one IO health-related problem. Among them, slightly less than half (48.3%) of the subjects have more than three IO health-related problems. The subjects of this current research reported that odor and gases from IO and abdominal discomfort and pain are the most IO health-related problems that they were complaining prior two weeks. These findings regarding to IO health-related problems were reported in many studies[12-14]. The previous literature also showed that patients with IO had several ostomy health-related problems and complications. Moreover, the literature documented that these health problems have negative effect on ostomates' QOL, including social, psychological, physical and spiritual health status[6].

The results of this study and previous studied showed that the patients with IO had lack of exposure to previous health education and training about IO care and management of ostomy health-related problems and complication[5,9,15]. While the majority of the ostomates in this study and the previous study reported that they are intended to participate in health education and training programs about IO care and management in the future[9]. So, the ostomy nurse specialists and/or nurse educators should provide continuing health education programs for ostomates to improve their knowledge and skills to care of IO and prevent further health problems and complications.

The result of this study showed that the mean for the total score of the subjects' perception about IO characteristics and management is low (52.2±16.4) (mean out of 100).

In the previous Chinese study, the mean of the subjects' level of knowledge about IO care is good (45.1±13.3) (mean out of 60)[11]. These results indicate that the subjects of this study have lower level of knowledge about IO care and management than the patients with ostomies in the previous Chinese study [11].

The results of this study and the previous Chinese study[11] showed that there is significant correlation between ostomates' low level about IO care and high frequency of having IO health-related problems and complications. Moreover, many previous studies revealed negative association between the ostomates' level of knowledge about IO care and the level of QOL[5,6,16]. Therefore, improving the ostomates' knowledge and skills about IO care and management of its complications is very important. Distributing written materials such as handout, and utilizing multimedia and online resources about ostomy care is recommended for all the ostomates before they are discharged from the hospitals or when they visit the physicians clinics or other health care settings[5,17].

Study Limitations: Conducting cross-sectional design is limited to determine cause and effect relationship and it dose not help in studying the subjects' perception and health-related problems over a period to time. Also, using convenience sampling method may lead to limit the generalization of the findings to Jordanian people in different regions.

Conclusion

Patients with IOs have several health-related problems. The findings of this and previous literature revealed that there is significant negative association between lack of ostomates' awareness and knowledge about IO care and proportion of IO health-related problems and complications. Patients with IO should be provided with teaching and training about IO care management.

Acknowledgment: The author would like to thank the chairman of health research ethics committee in the selected hospitals to provide the author the formal approval to conduct this study. Also, the author thanks the directors of nursing and chief medical officers of selected hospitals who facilitated the conduct this study in their settings. The author extends his thanks to Dr. Omar A. Al-Smadi for English editing of this paper. The author also thanks all the patients who participated in this study.

Ethical Clearance: Taken from ethical committee for medical research at Al-Ghad International Colleges for Applied Medical Sciences.

Source of Funding: This research received no specific grant from any funding agency.

Conflicting Interest: The authors have disclosed no potential conflicts of interest.

Comparison between Lord Dilitation Versus Lateral Internal Sphincterotomy for Management Post Hemorrhoidectomy Pain and Stenosis

Raisan Mahdi Shoramah Aljabery

M.B.Ch.B., F.I.C.M.S., General Surgery, Iraqi Council for Medical Specialization, Al Fayhaa Teaching Hospital, Kutalhjaj, Basra, Iraq

Abstract

Hemorrhoidectomy is usually associated with significant pain during the postoperative period. The spasm of internal sphincter seen to play an important role in the origin of pain. This study was designed to evaluate the effectiveness of lateral internal sphincterotomy or Lord dilatation of anal sphincter after hemorrhoidectomy in regarding the maximum resting pressure of the anal canal, accelerating wound healing and decrease postoperative pain when resting and defication. The patients with profound or diagnosed hemorrhoid (n = 79), visited to the Alfayha teaching hospital during April 2016 to June 2017 were enrolled in the present study. The informed consent was taken from each patient before enrollment. Seventy nine patients were admitted in the hospital complaining from anal stenosis and pain after different method of hemorrhoidectomy. The patients underwent hemorrhoidectomy with unhealed wound and severe pain after defication one month ago. They were divided into the two groups *viz.* patients treated with lateral internal sphincterotomy (n = 40) or lord dilatation surgery (n = 39). In the present study the ratio of lateral internal sphincteroctomy to lords dilatation surgery were found to be 2.761. The occurrence of the hemorrhoid was found to be higher in male than females (2.95:1). The higher number of patients were from 21-30 age group. About 69.2% of male patients ere operated by lord dilatation, while 33 (82.5%) of male patients managed by lateral internal sphinctertomy. Around 12 females (30.8%) managed by lord dilatation and 7 (17.5%) female patients managed by lateral internal sphincterotomy. Out of total patients, 43 were suffering from diabetes mellitus where, 16 were operated by the lard dilation and 27 were operated with lateral internal sphincterotomy. Around 22 suffering steroid problem out of which 17 were operated by the lard dilation and 5 were operated with lateral internal sphincterotomy. About 3 patients were suffering malignancy (2 in lard dilation and 27 in lateral internal sphincterotomy surgery). The present study concluded that the lord dilatation is significant improve wound healing after hemorrhoidectomy and decrease pain.

Keywords: *Hemorrhoids, Lord dilatation, Lateral internal sphincterotomy, Stenosis.*

Introduction

Hemorrhoids are the dilated or enlargement of veins in the walls around the rectum and anus due to prolong and untreated constipation[1]. However, it sometimes linked to chronic diarrhea and also known as “piles”. Sever blooding is the first symptoms of it. If untreated, then it can become worsened, protruding from the anus. Around 50% of the peoples are having hemorrhoids by the 50 years age. It is roughly calculated that about 58% people over 40 year age are having the disease in USA and almost one third patient goes to surgeons for the treatment[2]. At any age the hemorrhoids can occur, and

Corresponding Author:

e-mail: raisan_aljabery@yahoo.com, raisandr7@gmail.com

affects both women and men. In developing countries, the exact incidence is unknown, but the hemorrhoids are more frequently being encountered. Hemorrhoids are thought to work as continence mechanisms part and aids in anal canals complete closure at rest[3]. Proposed etiological factors of hemorrhoidectomy includes absent valves in the portal vein, weak blood vessels, internal anal sphincters derangement hereditary, ageing, obesity, pregnancy, prolonged straining and constipation. In spite of various studies, the hemorrhoids pathogenesis remains still unclear[4].

Perhaps, for the treatment of hemorrhoids prevention is the best. Treatment involves changing the diet to prevent constipation and avoid further irritation, the use of topical medication, and sometimes surgery. Once the disease is established, over the time it tends to get worse[4]. For hemorrhoids the mainstay treatment is therefore surgical, but unluckily operative hemorrhoidectomy is generally connected with important postoperative complications involving anal stricture, bleeding and pain, which may result in a convalescence protracted period[5]. The Hemorrhoidal treatments recent meta-analysis has concluded that initial mode of therapy was rubber band ligation for the hemorrhoids of first to third-degree[2].

Anal dilatation is done as described by the Watt's et al[6]. The proctoscopy and 1st digital rectal examination is carried out to rule out other bleeding causes and to confirm clinical findings. After that right hand completely lubricated index finger is inserted and a band of constriction was palpated corresponding to anorectal line. After the constriction bands complete palpation, each hand completely lubricated index finger was introduced into the anal canal. A process continued till anal canal was enough relaxed to accept four fingers without much force.

Manual dilatations lord's procedure of the anus is mostly used over last 10 years, and at 5 years follow-up two small series have reported very good results[7]. The factors determining satisfactory outcomes are not defined. Early studies have indicated that patients having hemorrhoids area having higher anal pressure than controls and there the lords procedure have significantly reduced the pressure[8]. Hemorrhoidectomy is usually associated with significant pain during the postoperative period. The spasm of internal sphincter seen to play an important role in the origin of pain. This study was designed to evaluate the effectiveness of of lord dilitation versus the lateral internal sphincterotomy as a treatment of post hemorrhoidectomy pain and stenosis.

Material and Method

Patient Enrollment: The patients with profound or a diagnosed hemorrhoid (n = 79), visited to the Al Fayhaa teaching hospital during April 2016 to June 2017 were enrolled in the present study. The informed consent was taken from each patient before enrollment. The patients underwent hemorrhoidectomy with unhealed wound and severe pain after defication one month ago. They were divided into the two groups *viz.* patients treated with lateral internal sphincterotomy (n=40) or lord dilatation surgery (n=39).

Surgical Procedure: All patients were prepared for elective surgery. All surgery done under general anasthesia and lethiotomy position. In a lord dilitation surgery group, four fingers dilated anus was done while in the lateral internal sphincterotomy group, small incision was made at 3 o'clock, delivery of internal sphincter to the wound and cutting using electrocutery, skin closed with 3/0 vicryl.

All patients remain in hospital for 24 hours for postoperative observations. They were given antibiotic and NSAID as a medication. All patients were followed for six months for complications, if any.

Statistical Analysis: Results were presented as Mean ± standard deviation (SD). Dunnett multiple comparison test and one way analysis of variance (ANOVA) was done to estimate the statistical significance.

Results

Present study involved total 79 patients, out of which 39 were operated by lard dilatation and 40 were operated by lateral internal sphincterotomy. Here, higher number of patients were from 21-30 age group.

Table 1: Age groups of patients involved in the present study

Patient Age	Lard Dilatation	Lateral Internal Sphincterotomy	Total
11-20	07	03	10
21-30	20	22	42
31-40	07	05	12
41-50	04	07	11
51-60	01	03	04
60<	00	00	0
Total	39	40	79

Table 2 shows the number and percentage of male and female. About 69.2% of male patients ere operated by lord dilatation, while 33 (82.5%) of male patients managed by lateral internal sphinctertomy. Around 12 females (30.8%) managed by lord dilatation and 7 (17.5%) female patients managed by lateral internal sphincterotomy.

Table 2: gender vise distribution of enrolled patients

Gender	Lord Dilation	Lateral Internal Sphincterotomy
Male	27 (69.2%)	33 (82.5%)
Female	12 (30.8%)	07 (17.5%)
Total	39 (100%)	40 (100%)

All patients were arranged in Table 3 according to cause of post hemorrhoidectomy pain and stenosis in form of chronic illness (diabetes mellitus, steroid and malignancy). Out of total patients, 43 were suffering from diabetes mellitus where, 16 were operated by the lard dilation and 27 were operated with lateral internal sphincterotomy. Around 22 suffering steroid problem out of which 17 were operated by the lard dilation and 5 were operated with lateral internal sphincterotomy. About 3 patients were suffering malignancy (2 in lard dilation and 27 in lateral internal sphincterotomy surgery).

Table 3: Type of delayed wound healing

	Lard dilation	Lateral internal sphincterotomy	P value
Diabetes mellitus	16	27**	0.01
Steroid	17	5***	0.001
Malignancy	2	1	--
No chronic illness	4	7*	0.05
	39	40	

The results are presented as Mean ± standard deviation (SD). ***p≤0.001, **p≤0.01 and *p≤0.05 when compared between lord dilatation and lateral internal sphincterotomy (Dunnett multiple comparison test).

After three days of the procedure, patients showed decrease in pain, improvement of wound healing in the lord dilitation surgery group as compared to the patients with lateral internal sphincterotomy. Five patients developed fistula in ano, one has anal fissure, and three patients remain with unimproved wound. On the other hand, patients operate with lord dilitation showed noticeable improvement in the above parameter except one patient.

Various types of complications are observed in lateral internal sphincterotomy and lord dilatation. Fistula in ano observed in 5 patients, all were treated by lateral internal sphincterotomy, recurrent anal fissure was observed in 1 patient, which was treated by lateral internal sphincterotomy, delayed wound healing was observed in 4 patients out of which 3 were treated by lateral internal sphincterotomy and 1 by lord dilatation.

Table 4: Complications in various types of procedures

Type of procedure	Fistula in ano	Recurrent anal fissure	Delayed wound
Lateral internal sphincterotomy	5***	1**	3*
Lord dilitation	0	0	1

The results are presented as Mean ± standard deviation (SD). ***p≤0.001, **p≤0.01 and *p≤0.05 when compared between lord dilatation and lateral internal sphincterotomy (Dunnett multiple comparison test).

Discussion

Anal dilitation is related to the uncontrolled damage of internal sphincter fibers which extent to the external sphincter[6,9,10] and it's a most common couse of extensive anal pain[11]. Due to internal sphincter hypertonia, chronic anal pain and stenosis was occurred which forms the surgical treatment basis[9] which can be either lord dilatation or lateral internal sphincterotomy. The resting anal pressure is reduced by lord dilatation and lateral internal sphincterotomy[6]. In the present study, we compared both the method. The ample amount of research is published regarding both the techniques. They are effective heal the ulcer and quickly reduce pain. Previous studies reported that about 95% anal dilatation treated patients showed satisfactory relief[12]. While, about 93% patients showed fairly less pain relief in 1 week after lateral internal sphincterotomy surgery (Hoffmann). The present study, both the groups showed rapid improvement in symptoms and ulcer healing in both groups. However, lord dilatation was found to be effective in some aspect, such as recurrence anal fissure, wound delayed etc. than lateral internal sphincterotomy.

In the treatment of hemorrhoids two surgeries are widely performed involving lateral internal sphincteroctomy (LIS) and lords anal dilatation (LAD). LAD is a simple, ancient surgical technique, having high incontinence and recurrence rate[13]. Now a days, LIS is the favored surgical technique, nevertheless with incontinence high incidence. Hence, the aim of

present study is to compare LIS with LAD in the anal fissure treatment, recognizing recurrence, post-operative complications and symptoms. When compared the postoperative complications and symptoms and their recurrence among both, the LAD and LIS group, the LAD was found to be more significant than LIS. However, some studies reported the contradict reports[14,15].

In the present study, the ratio of lateral internal sphincteroctomy to lords dilatation surgery were found to be 2.761. The occurrence of the hemorrhoid was found to higher in male than females (2.95:1). The results are according to the earlier reports[11,16]. The male to female ratio were reported by several authors. Around 2.3:1, 1.7:1 and 1.4:1 of male to female ratio were reported by Nahas et al.[16], Kumar et al.[17] and Gupta et al.[11], respectively. In the hemorrhoid, blooding through the rectum and constipation are very common[18,19]. Lateral internal sphincterotomy surgery showed fistula in ano, recurrent anal fissure and delayed wound as compared to the lord dilatation. Kumar et al.[18] reported sentinel tag at 6 o'clock, while in the present study we have done at 3 o'clock. He reported no statistical difference ($p=0.565$) in the LAD and LIS. However, our study contradicts to this report. The study reveals significant ($p<0.001$) variation in the fistula in ano, recurrent anal fissure and delayed wound between LAD and LIS.

Diverse reports are available for the comparison between anal dilitation and lateral internal sphincterotomy[10]. Through the study is well planned, still there are some limitations. There are the enrolled patients are relatively low. Lateral internal sphincterotomy surgery showed consistency while dilitation technique showed variation regarding the number of employed. Lack of provisional anal manometer to moniter anal pressure is also one of the lacuny. Despite of these limitations, the present study demonstrate significant benefits of lateral internal sphincterotomy overlord anal dilatation.

Conclusion

The ratio of lateral internal sphincteroctomy (LIS) to lords dilatation surgery (LAD) was found to be 2.761. The occurrence of the hemorrhoid was found in higher in male than females (2.95:1). Significant ($p<0.001$) variation in the fistula in ano, recurrent anal fissure and delayed wound between LAD and LIS. The study can be concluded as, lord dilatation (LAD) is significant improve wound healing after hemorrhoidectomy and decrease pain.

Competency-based Assessment of Public Health Professionals in the Northeastern Region, Thailand: An Exploratory Factors Analysis

Wilawun Chada[1], Songkramchai Leethongdee[2], Supa Pengpid[3], Sangud Chualinfa[4]

[1]Doctor of Public Health Program Student, Faculty of Public Health, [2]Faculty of Public Health, Mahasarakham University, Mahasarakham, [3]ASEAN institute, Mahidol University, Nakhon Pathom, [4]Public Health Official, Mahasarakham Provincial Public Health Office, Thailand

Abstract

Competency-based assessment of health professionals is important required for human resource for health development in Thailand. There are various efforts to improve a professional standard in public health professionals, but there is a lack of understanding of the competency of public health professionals, especially the competency-based assessment suitable for public health professionals. This study aimed to investigate the competency of public health professionals at the primary care service level in Northeastern, Thailand.

This research is a quantitative cross-sectional survey. Data collected by a questionnaire was conducted in 862 public health professionals in the northeast of Thailand. The exploratory factor analysis (EFA) method was applied to analyze the correlation effects of the 30 estimating competency-based assessment.

The results were revealed that their competency-based assessment as three aspects following: (1) Health care analysis and management (2) Public Health Professional Sciences (3) Basic Health Sciences. Additionally, The 3 groups of competency-based assessment were included 30 items suitable for the current sample. These factors accounted for 66.60% of the variance.

In conclusion,this finding is significantly recommendations to policy makers to improve and initiate a new policy or guidelines for public health education and human resource for health production and management in Thailand on the basis of their specific needs. Especially, the competency-based assessment from this research provide an excellent framework for developing a public health curriculum in the future in Thailand.

Keywords: *Public Health Education, Health Professional, Competency-based assessment, Primary health Care.*

Introduction

A Competency-based comprised as knowledgeable, skilled and motivated of health workforce is critical aspects for reaching universal health coverage. Health workforce includes that provide health services and those support the health services such as public health professionals. World Health Organization is supporting countries in achieving national and international golds to strengthen their health workforce and find sustainable solutions to health workforce issues as the education of health workers, planning and to produce information for policy makers to take evidence-based decisions. The recommendations of United Nation Commission on health employment and economic growth is emphasized on education, especially scale up trans formative, high quality education and lifelong learning so that all health workers have skill that the health needs of populations and can work to their full potential(1).

For over four decades now, competency models have become an inseparable part of human resources management and have been widely used as a means for increasing personal and organizational efficiency.

Competencies include the collection of success factors necessary for achieving important results in a specific job or work role in a particular organization. Competency refers to the intellectual, managerial, social and emotional competency[2]. In 1973, McClelland argued that the best predictors of outstanding on-the-job performance were underlying, enduring personal characteristics that he called competencies[3]. Klemp (1980)defined competency as, an underlying characteristic of a person which results in effective and/or superior performance on the job[4]. In 2006, Caupin Gilles et al., came out with their paper defined a competence is a collection of knowledge, personal attitudes, skills and relevant experience needed to be successful in a certain function[5]. In the recent years, many meanings and new labels have evolved through common usage for the term 'competence' and 'competency'.

Many health care organizations have proposed standards for competence in their fields, but the acceptance of a unique definition for all professionals is difficult. There is no agreed definition of professional competence in health care activities that encompasses all important areas of practice. There is a lack of consistency in the terminology regarding competence. The assessment of competence is nevertheless an important factor in developing an ambitious policy of continuous quality improvement in health care[6] The low- and middle-income countries seeking to achieve universal health coverage face human resource constraints. These countries encounter a human resource crisis in the health sector in the form of education and training capacities and it is difficult to narrow the gap between the demand for health workers ability to supply[7].

The public health professionals were significant for primary care services in Thailand,especially serviced for health promotion, health prevention, and disease control in the community. Currently, Thailand is developed regarding expertise and professionalism in the health workforce; especially develop in public health professionalism. This was announced by the Professional Act of Public Health in Thailandin 2013[8]. However, the Office of the Civil Service Commission is determined as to set and formulate specification qualification for work position[9]. Although there are efforts to create professional standards, these have not yet been outlined and not yet been officially announced. There is a lack of understanding of what the core competency of public health professional, should be.

The objective of this study is to investigate the competency-based assessment of public health professionals at the primary care service level in Northeastern, Thailand.

Material and Method

Sample and Procedure: This research is a quantitative cross-sectional survey. The quota sample survey was conducted the public health professionals in primary health care services from health promoting hospitals and used quota sampling to select 1,000 respondents (50 respondents/province) from 9,424 public health workers in 20 provinces of Northeastern Thailand. This survey had a response rate of 86.20 per cent (862 respondents). A public health professional is defined as a person who is responsible regarding overseeing aspects related to support health promotion, basic patient treatment, health policy, environmental health and occupational health in the community, work position as public health scholar in Thailand. Data were collected by a questionnaire survey during October-December 2017.

Ethical Consideration: The study was approved by the Mahasarakham University Ethics Committee for Research Involving Human Subjects, (053/2017). Written informed consent was attained from all study participants.

Instrument and Instrumentation: The questions developed from the literature review and synthetic review approach from previous topic from 6 sources. The comparison of competencies of public health professionals demonstrates the different standpoints concern in the competencies. The standpoints were classified into 2 groups: Group 1 educational institutions constitute 1) The Council on Linkages Between Academia and Public Health Practice (10) and Group 2 consisted of the following public health organizations comprising 1) World Health Organization Regional Office for the Western Pacific (11) 2) WHO Regional Office for Europe (12) 3) Centers for Disease Control and Prevention: CDC (13) 4) The Professional Act of Public Health in Thailand (8), and Ministry of Public Health, Thailand (14).

A framework for competency-based assessment of public health professionals were therefore constructed containing the following domains: Epidemiology and surveillance, Health promotion and control, Public health administration and health system, Disease diagnoses and

basic treatment, Biostatistics and public health research, Social determinant of health, and environmental health and occupational health and safety.

The questionnaire was tested for content validity by 5 experts, with a straightness of 0.845 and tested for reliability by using 30 tools,with the Cronbach alpha coefficient equal to 0.992.

The final version of the questionnaire was divided into two parts including:

Part 1 demographic data, including sex, age, marital status, education, work position, work experience, and workplace.

Part 2 competency-based assessment of public health professionals using the 30 items.

Data Analysis: Descriptive statistics were used to analyze demographic data. An exploratory factor analysis (EFA) using principal component method was performed on the inter correlations among the means of the competency-based assessment items. To extract the number of factors, I submitted the original 30 items. A Principal Component Factor analysis using Varimax rotation was completed to investigate the competency-based assessment of public health professional. Kaiser-Meyer-Olkin (KMO) was 0.976 and Bartlett' s Test of Sphericityis significant. Analyzing factor loading, that shows the variance explained by the variable on that particular factor. We determined the factor loading more than 0.3. following Field[15] recommend suppressing factor loadings less than 0.3.

Finding:

Demographic Characteristics: Among the 862 public health professionals, as public health practitioners 582 (67.50%) were females, and 280 (32.50%) were males. Ages ranged from 21 to 59 years with an average age of 37.72 years (SD=10.833). The majority of sample (62.10%) had abachelor degree in public health. The work experience more than 20 years was 31.19%, about a half was working at a health promoting hospitals as a primary health care service (55.00%).

Competency-based assessment of public health professionals

There have 30 items for competency-based assessment of public health professional. Data analysis used an exploratory factor analysis. Analyze the suitability by Kaiser-Meyer-Olkin (KMO) is 0.976 and Bartlett's Test of Sphericity is significant.

The analysis reveals three factors accounting for 66.60% of the variance. Factor first, which included 11 items,accounted for 24.62% of the variance. The second factor,which included 11 items, accounted for 24.07% of the variance. The third, which included 8 items, accounted for 17.91%. In addition, the eigenvalues for the factors were 57.92 (factor 1), 5.12 (factor 2), and 3.56 (factor 3) show in Table 1.

Table 2 shows each item's loading on the three extracted factors. Factor 1, namely "Health care analysis and management" were included 11 items. As noted in Table 2, items K11-14, K16, K18-23 loaded on factor 1. Factor loadings ranged with a high of 0.76 on item K19 ("Biostatistics") and factor loadings ranged with a low of 0.55 on item K16 ("Public health laws"). Each of these items refers to competency of public health professionals related to analytical science and management on public health area including statistical, information management, technology, policy, system, and laws.

Factor 2, namely "Public health professional sciences" were included 11 items. As noted in Table 2, items K1-15, K16 loaded on factor 2. Factor loadings ranged with a high of 0.82 on item K2 ("Health surveillance") and factor loadings ranged with a low of 0.51 on item K15 ("Professionalism and ethics in public health"). The items in this group presents specific competencies in the public health profession, including health promotion, epidemiology, disease prevention and control, health education, health monitoring, and professionalism and ethics in public health.

The last factor, namely "Basic health sciences" were included 8 items. As noted in Table 2, items K17, K24-30 loaded on factor 3. Factor loadings ranged with a high of 0.77 on item K29 (''Referral systems in health care'') and factor loadings ranged with a low of 0.48 on item K17 ("Basic treatment for patient"). The group of items indicates basic competency in health sciences, including health sociology, anthropology, social determinant of health, primary care management, occupational health and safety, and environmental health.

Discussion

The results present competency-based assessment to support that all area of public health education context

in Thailand. The first factor (Health care analysis and management) regarding issues of public health administration, policy, management, and laws. This studyis similar to Foldspang (16) and Ministry of Public Health of Thailand identify the role of public health professional in primary care cluster are managed a public health service delivery and supporting health service(14) and public health administration dimensions[17].

The second factor (Public health professional sciences), that reflects the professionalism and role of public health professionals in Thailand, whose primary role is health promotion, disease prevention, and disease control in the community both individuals, families, communities. Which corresponds to the scope of the health profession in the Professional Act of Public Health in Thailand in 2013, which specifies the role of support health education and consultation to health promotion, disease prevention, health control, basic treatment, and rehabilitation for patient[8] and similar to Health promotion, health protection and disease prevention in Foldspang[16].

The last factor (Basic health sciences) regarding basic competency in health sciences, including health sociology, anthropology, a social determinant of health, primary care management, occupational health and safety, and environmental health. As previous studies have similar findings as this research in aspect the list of public health generic core competencies for the public health professional identify in competencies of population health and its social and economic determinants[16].

Although in academic institutions in many countries, there is a widespread study of the performance of public health professionals, but in Thailand, in terms of the development of competencies of public health professionals, there are still limitations and the status is in the initial stage only. Next steps could include using these identified 3 knowledge competencies and 30 items as knowledge basis for public health professional to develop the policy option in producing and developing public health professionals, including an update of curriculum of public health programs in Thailand.

Table 1: Factors, Eigenvalue, Percentage of variances, Accumulative percentage of variances and Number of Items

Factors	Eigenvalues	Percentage of variances	Accumulative percentage of variances	Number of Items
1	57.92	24.62	24.62	11
2	5.12	24.07	48.69	11
3	3.56	17.91	66.60	8

Table 2 Items Loading on Three Factors

Item Loading on Five Factors		
Items	**Components**	**Items Loading**
Factor 1 Health care analysis and management		
K19	Biostatistics	0.76
K20	Health information management	0.75
K21	Health technology	0.75
K22	Health innovations	0.68
K18	Public health research	0.67
K12	Evaluation of health policy	0.66
K23	Evaluation of health status	0.64
K14	Health policy	0.64
K13	Health risk assessment	0.62
K11	Public health administration and health systems	0.61
K16	Public health laws	0.55

Item Loading on Five Factors		
Factor 2 Public Health Professional Sciences		
K2	Health surveillance	0.82
K4	Health investigation	0.81
K1	Epidemiology	0.79
K10	Disease prevention and control	0.68
K5	Public health Emergency response	0.68
K3	Health Diagnosis	0.67
K8	Health literacy	0.62
K6	Health promotion	0.58
K7	Health education and behavioral sciences	0.58
K9	Health monitoring	0.54
K15	Professionalism and ethics in public health	0.51
Factor 3 Basic Health Sciences		
K29	Referral systems in health care	0.77
K27	Health sociology and anthropology	0.73
K28	Health literacy	0.69
K26	Social determinant of health	0.66
K30	Primary health care management	0.64
K25	Occupational health and safety	0.57
K24	Environmental health	0.53
K17	Basic treatment for patient	0.48

Conclusion

The research found that competency-based assessment of public health professionals comprised of 3 core competencies and 30 items. The first: health care analysis and management competencies, consists of 11 items regarding management and analysis in public health area. The second,public health professional competencies consists of 11 items regarding knowledge identify public health professional and ethics. The third, basic health sciences competencies consist of 8 items regarding basic sciences for health. The core competencies from this research provide an excellent framework for the research in the future. Which competency-based assessment that can be synthesized from the analysis by EFA from the opinions of the workers, these clear connections to practice moves public health professional closer to valid competency-based on population need and consistent with the actual work.

Implications for their practices including 1) to provide information for both practitioners and policy makers about the competency of public health professionals and propose policy options to producing and developing public health professionals in Thailand and 2) to reflect the development of public health professional in terms of the development of work potential and education management guideline in the future and 3) provide information for public health program curriculum development in Thailand.

Does Vertigo Predict Hypertension in Cervical Spondylosis Clinical Trail Study

Talib Kadhim Akar

Assistant Professor of Internal Medicine, Department of Internal Medicine, College of Medicine, University of Basrah, Iraq

Abstract

Background: Both cervical spondylosis and hypertension are common medical conditions. That is whether spondylosis leads to hypertension and whether vertigo could predict hypertension is not clear.

Objective: To identify the relationship between cervical spondylosis & systemic hypertension through identification of probable predictors .

Patient and Method: All patients were seen in AlMowasat outpatient clinic from January 2017 to August 2019 with symptomatic cervical spondylosis. All of them were evaluated for presence of hypertension along with signs and symptoms of cervical spondylosis. Diagnosis of cervical spondylosis was based on clinical criteria and radiological findings.

Result: A total of 50 patients(31 males and 19 females) were studied. Hypertension was ascertained in 29(58%).Common signs and symptoms of cervical spondylosis were evaluated including headache in 89.4%, vertigo in 83.7%, chest pain in 55%, shoulder pain in 61.9%, numbness in 65.1%,abnormal reflexes in 44.7%, Babiniski sign in 17% and Body Mass Index ≥30 in 60.4%).Logistic regression analysis indicated that vertigo is significant independent predictor of hypertension in cervical spondylosis patients.

Conclusions: Vertigo was a predictor of hypertension in spondylotic patients.

Keywords: *Cervical Spondylosis, Hypertension, Vertigo.*

Introduction

Cervical spondylosis is a degenerative disease affects intervertebral disc at different levels with osteophytes formation.[1] Symptoms of cervical spondylosis are variable including headache, numbness, weakness of extremities[1] and others but vertigo is most common symptom.[2] Surprisingly cervical spondylosisis common among patients complaining of vertigo. [2] but the links between the two conditions are unclear. The disease is age related disorder increasing with age where it is about 13%, 34%, 58% in the fifth,sixth, and seventh decades in that order[3], yet many individuals above 30 years, show significant abnormalities on plain x ray[4]. Hypertension is common worldwide problem.[5]

About 95% of hypertensive patients have no identifiable causes[5] obesity is one of common cause of secondary hypertension[6]

Hypertension is often asymptomatic[5], the overall prevalence of hypertension in nearby cities or countries is around 26.5%[7] 10%[8], 10.3%[9] and 22%[10] in ThiQar (north of Basrah city), Saudi Arabia,Kuwait & Iran respectively

The aim of this study is to evaluate the association between cervical spondylosis and systemic hypertension through probable mediators such as vertigo.

Patients and Method

This was a cross-sectional study carried out in one major private hospital in Basrah city (Al Mowasat hospital)lasted for twenty months. Patients who met the criteria of having cervical spondylosis both clinically and radiological were included in the study. The study started from January 2018 until August 2019. Diagnosis of cervical spondylosis depended on radiological changes on cervical x- ray and signs and symptoms. Each patient was analyzed for symptoms of cervical spondylosis which including headache,vertigo, numbness shoulder pain, chest pain plus signs like abnormal tendon reflexes, Babinski sign, Lhermitte's sign .Both compression and traction tests were elicited. Body mass index was evaluated at same time. For each patient, blood pressure was measured with mercurial sphygmomanometer after patients waited for at least five minutes prior to each record. Recorded blood pressure often needed two separated occasions.

Hypertension was defined as blood Pressure ≥140/90 mmHg[5] or patients on anti- hypertensive medication

Vertigo was defined as rotatory movement either bodily or environmental or according to clinical examination compression tests were performed either by axial compression on the head with neutral head position or rotational movement on extended head, symptoms made worse by these movement indicated a positive test[11] traction test provoked by head traction, symptoms relief signified a positive test[11] diabetes mellitus diagnosed by history of diabetes mellitus, the use of insulin or other hypoglycemic agents or measurement of fasting blood sugar ≥126mg/dl or random blood sugar ≥200mg/dl.

Body Mass Index (BMI) is the value derived from weight and height as Weight in kg/Height inM2). 12 Underweight patients, considered when BMI under 18,5 kg/M2 while BMI between 18,5 kg/M2 to 24.9 kg/M2 considered as normal, Overweight patients considered when BMI is 25 to 29.9 & BMI ≥ 30 is indicating obesity.

Babinski sign defined as dorsiflexion of big toe or fanning of the other toes upon stimulation of lateral planter aspect of the foot[12]

Lhermitte's sign is a sense of electric shock in extremities provoked by neck flexion[13] radiological finding of cervical spondylosis are including narrowing disc space & marginal osteophytes[14], opinion of radiologist was obtained in controversial instances.

SPSS version 21 was used.,Chi-square with significant value of <0.05 adapted to assess the predictors of hypertension in cervical spondylosis. In addition logistic regression analysis was used to identify significant predictors of hypertension

. Of the 50 patients with cervical spondylosis, 31 (62%) patients were males, and 19 (38%) were females, thus the male to female ratio was 1.6:1. The mean age was 51.2 ±10.1 years with a range of 32-72 years .

The hypertensive patients were distributed as 29 males and 9 females .The majority of patients complained of headache which was observed in 42(89.4%). Others symptoms with relatively higher frequency were vertigo seenin 36 (83.7%). Numbness was seen in 28(65.1%)

While Chest pain was seen in 22 (55%). BMI analysis showed that Obesity was prevalent in 29(60.4%).

Evaluations of signs concerning cervical spondylosis were shown also. Abnormal reflexes were,observed in 17 (44.7%), Lhermitte's sign observed in 13 patients, Babinski sign elicited in 7 patients(17%).Diabetes was ascertain in 9 patients.

Logistic regression analysis to predict hypertension shows that only vertigo is independent and significant predictor of hypertension with p value of 0.026 (Table 1).

Table 1: Logistic regression analysis predicting the hypertension in Cervical spondylosis

Variable	B	S.E.	WALD	DF	SIG	EXP(B)
Sex	1.027	1.748	.345	1	0.557	2.793

Discussion

The correlation between cervical spondylosis and hypertension had been studied since few decades in different aspects.

50 years ago Al Badran et al, reported that headache in hypertensive patients if not relieved by reduction of elevated blood pressure, is likely attributable to cervical spondylosis[15]

Liu & Ploumis in study published in 2012 reported that cervical spondylosis could be a possible cause of hypertension, they found more than one third of hypertensive patients are no longer need antihypertensive medicine after decompressive cervical surgery and created a term cervicogenic hypertension [16]

A Chinese study[17] by Peng B et al (2015) described some association between hypertension and cervical spondylosis, they found also that surgical treatment of cervical spondylosis had successfully controlled hypertension, This study was, however, with limited number of patients(two patients only) but, interestingly they reported important point,whichis,surgical decompression of degenerative disc that contributing to cervical spondylosis is relieving hypertension as well as vertigo.In these two patients.

Our observations showed vertigo is independent predictor for hypertension .but vertigo is commonly seen in patients with cervical spondylosis[2]. On the other hand, studies of vertigo in hypertensive patients did not indicate that elevated blood pressure was causing vertigo,(but if existed together) it commonly attributable to other concomitant causes like central nervous system or vestibular diseases.[18]

Marchiori L,et al found that incidence of vertigo in hypertensive and non hypertensive patients were similar and concluded that no correlation of vertigo with hypertension could be ascertained.[19] In the present study and according to the logistic regression analysis to predict hypertension, vertigo was the only significant (P=0.021) and independent predictor .in spondylotic patients. Such results clearly denoted that vertigo carried significant impacts in hypertensive patients in complex mechanism need further evaluation or indeed the presence of vertigo could be accidental or possible explanations are the hypotension provoked by antihypertensive medications[18] or concomitant vertebrobasilar insufficiency due to atherosclerosis in hypertensive patients . It remains plausible however to conclude that the presence of vertigo in cervical spondylosis patients strongly suggests coexistent hypertension.

Conclusions

The presence of vertigo was strongly predict the systemic hypertension in patients with cervical spondylosis

Abstract

Background: Attention deficit hyperactivity disorder (ADHD) is a neurobiological disorder with a prevalence of 5%-10% in the world that negatively impacts school behavior and achievement. There have been many studies reveals that attention disorders are caused by the decreased levels of dopamine and norepinephrine neurotransmitter. However, particular concern nowadays are the emotional and behavioral problems. The emotional and behavioral problem is suspected to be caused by the decrease in serotonin level. The aim of this study was to determine the difference in serotonin level between ADHD and non-ADHD children.

Method: This study was an observational case-control study design using random sampling method. Subject of this study was children in Bina Karya Elementary School Surabaya. ADHD severity was assessed using Conners Abreviated Rating Scale. Examination of serotonin levels in blood was done by ELISA method. Informed consent was signed by parents before the study. Data was analyzed using independent T-test.

Results: 44 (23 ADHD and 21 non-ADHD) children from grade 1 to 6 was included in the study. Based on the gender, 13 children were girls and 31 children were boys. Serotonin level in ADHD children was significantly higher than non-ADHD children (2.148 ± 0.94 vs 2.006 ± 0.115 μmol/L; p = 0.0001).

Conclusion: Serotonin level in ADHD children was significantly higher than non-ADHD children.

Keyword: *Serotonin, ADHD, Abbreviated Conners Teacher Rating Scale.*

Introduction

Attention deficit hyperactivity disorder (ADHD) is a neurobiological disorder with a prevalence of 5%-10% in the world that negatively impacts school behavior and achievement. The onset of this disorder usually appears in the school-age[(1)]. Many parents feel disconcerted in nurturingtheir children with ADHD since they often opposed, haphazardly behave,and disobey the rules[(2,3)] Parents, especially mothers, often have to lose their jobs because they have to take care of their ADHD children[(4,5)]. Teachers at school also often complain of being confused and discouraged in educating children with ADHD because they need extra attention while there are limited teachers available and a lot of students to be supervisedat one time[(6–8)] ADHD often coexist with other disorders, such as anxiety, depression, and learning disorder due to short spans of attention, hyperactivity, and impulsive behavior[(9–12)]. Management of ADHD is multimodal, including pharmacotherapy and psychotherapy. Psychosocial therapy is also considered for parents that refuse pharmacotherapy[(6,9,13–15)]

There have been many studies reveals that attention disorders are caused by the decreased levels of dopamine and norepinephrine neurotransmitter[(16)] However,

particular concern nowadays are the emotional and behavioral problems. It is more severe than the communication difficulties in the family, as emotional and behavioral disorders will adversely affect the entire life span of an ADHD children[17]. The emotional and behavioral problem is suspected to be caused by the decrease in serotonin level. However, study about the effects of serotonin is very limited and the results are still controversial[18,19].

Considering that the study about the effect of serotonin is very limited and the result is still controversial, authors conduct this study to determine the difference in serotonin level between ADHD and non-ADHD children.

Method

This study was an observational case-control study design using random sampling method. Subject of this study was children in Bina Karya Elementary School Surabaya. The inclusion criteria for the case group was ADHD children in class 1 to 6, the mothers were not experiencing any psychosocial stressor during the study period, and both the mothers and the children were able to communicate using Indonesian language and being cooperative during the study. The inclusion criteria for the control group was non-ADHD children in class 1 to 6, and both the mothers and the children were able to communicate using Indonesian language and being cooperative during the study. The exclusion criteria for the study was children with the others mental health condition.

ADHD scores was assessed using Abbreviated Conners Teacher Rating Scale in Indonesian version. Social Readjustment Rating Scale by Holmes and Rahe was used to assess psychosocial stressor of the mother (Holmes & Rahe, 1967). Serotonin serum level was measured using ELISA method.

Shappiro-wilk test was used for the normality test. Independent T-test was used to analyze the difference between serotonin level in ADHD and non-ADHD children. SPSS 17.0.0 for windows software, 2007, SPSS Inc. Chicago, IL, USA and Microsoft Office 2013 was used for the statistical analysis test.

This study follows the principles of the Declaration of Helsinki. This study has received recommendation from Surabaya city government office before the study begins (Recommendation Number 070/1574/436.8.5/2018). Parents were given information for consent and signed the informed consent regarding the study prior to their involvement in the study. Details that might disclose the identity of the subjects under study were omitted.

Results

Table 1: Characteristic of the Subjects' Family

		Non ADHD N (%)	ADHD N (%)	Total
Highest Education Background	Junior high school	11 (50)	11 (50)	22 (100)
	Senior high school	7 (41.2)	10 (58.8)	17 (100)
	university	3 (47.7)	2 (52.3)	5(100)
Occupation	Not work	16 (51.6)	15 (48.4)	31 (100)
	Work	5 (38.5)	8 (51.5)	13 (100)
Sufficiency of monthly income	Not sufficient	5 (50)	5 (50)	10 (100)
	Almostsufficient	6 (37.5)	10 (62.5)	16 (100)
	Sufficient	9 (56.2)	7 (43.8)	16 (100)
	Very sufficient	1 (47.7)	1 (52.3)	2 (100)
Parents relationship	Poor	0	3 (100)	3 (100)
	Good	21 (51.2)	20 (48.8)	41 (100)
Relationship among family member	Poor	0	5 (100)	5 (100)
	Good	21 (53.8)	18(46.2)	39 (100)
Family Member Social interaction	Poor	2 (66.7)	1 (33.3)	3 (100)
	Good	19 (46.3)	22 (53.7)	41 (100)

Characteristic of the subjects and the family: 21 non-ADHD children and 23 ADHD children was included in the study. Based on the gender, there were 13 girls (6 in non-ADHD group and 7 in ADHD group) and 31 boys (15 in non-ADHD group and 16 in ADHD group). From the mother highest education background, 22 parents had graduated from junior high school, 17 had graduated from senior high school education background, and 5 had graduated from university education background. Based on the occupation, 13 children had their mother worked, while 31 children had their mother not worked. From the sufficiency of the monthly income, only 18 family had sufficient monthly income. 3 family had a poor mother-father relationship, whilst 5 family had a poor family relationship (table 1).

Table 2. Serotonin Level in ADHD and Non-ADHD Children

Variable	Mean	P
ADHD	2.148 ± 0.94 µmol/L	0.0001
Non-ADHD	2.006 ± 0.115 µmol/L	

Results Table 2. The mean serotonin level in ADHD children was 2.148 ± 0.94 µmol/L, while the mean serotonin level in non-ADHD children was 2.006 ± 0.115 µmol/L. Normality test showed that the data distribution was normal. Using independent T-test, it was found that serotonin level in ADHD was significantly higher than non-ADHD children (p = 0.0001, 95%CI = 0.780-0.206).

Discussion

From the demographic data of the subjects, there were 16 boys and 7 girls with ADHD. This result is consistent with the results of previous studies which found that the prevalence of ADHD was greater in boys[6,20,21]. Psychostimulant methylphenidate (MPH) and amphetamine (AMPH) are the first-line ADHD drug choice[22–25] Both of these drugs primarily work on dopamine (D2) and noradrenaline (NA) system, but not on the serotonin system[8,26]. More than half of the subjects did not respond positively to the administration of this psychostimulant[6,27] Not all parents agree with methylphenidate that affects appetite and inhibits growth when given to their children and also the risk of drug dependence or abuse on long-term use with adolescent subject[28].

Serotonin selective reuptake inhibitors (SSRIs) that working in the serotonin system are the second-line treatment in ADHD management[13,29–33]. This fact becomes the basic etiologic hypothesis of serotonin to ADHD. Based on these results, hypotheses suggest that chronic serotonin deficiency causes hyperactivity and impulsivity symptoms in ADHD (19). The etiology of serotonin in ADHD up to now is not clearly known on brain imaging studies it was found that serotonin especially in the prefrontal area of the cortex contributes to the clinical symptoms of ADHD[6,32] Prefrontal cortex plays a role in regulating attention, cognitive function, emotional regulation and motivation(34,35) Serotonin plays an important role in the development of the nervous system in early child development and has a different role with serotonin in adulthood Serotonin affects the symptoms of hyperactivity and impulsivity but has no effect on[34,35]. The statistical analysis of serotonin revealed a significant differences between ADHD and non-ADHD subjects. These new findings may provide input for alternative pharmacotherapy management other than methylphenidate because not all parents agree with the administration of these drugs that have side effects on decreased appetite and inhibit the growth of the child.

Conclusion

Serotonin level in ADHD children was significantly higher than in non-ADHD children.

Different Grades of BMI is Correlated with Left Atrium and Ventricle Structure in Patients with Hypertensive Heart Disease

Meity Ardiana[1], Rofida Lathifah[2], Makhyan Jibril Al-Farabi[1,3], Muhammad Satya Bhisma[1]

[1]Department of Cardiology and Vascular Medicine, Faculty of Medicine, University of Airlangga, Surabaya, Indonesia, [2]Department of Health Policy and Administration, Faculty of Public Health, University of Airlangga, Surabaya, Indonesia, [3]Postgraduate School, University College London, Gower St, Bloomsbury, London WC1E 6BT, UK

Abstract

Background: Hypertensive Heart Disease (HHD) is usually followed by cardiac remodeling. Different grades of Body Mass Index (BMI) also influence the cardiac structure. Hence, we evaluate the cardiac structure of HHD patients with various BMI grades.

Materials and Method: This cross-sectional study involves 50 consecutive patients with HHD (hypertensive heart disease) from the Cardiology and Vascular Medicine Departement, Soetomo General Hospital Indonesia. Echocardiographic examination was done using GE vivid 7. Statistics were evaluated with SPSS 25.0.

Results: The research showed that the grades of BMI (body mass index) was positively correlated with LA major (r=0.335), RA Major (r=0.371), LVD Mass (r=0.341), LVS Mass (r=0.303), LVPWD (r=0.369), LVPWS (r=0.391), and inversely correlated with LVSI Dopp (r=-0.376). Obese (BMI>30) patients have significantly lower ejection fraction compared to normoweight (BMI<25) patients (64.3±3.67% vs 62.12±0.98%, p=0.046).

Conclusions: The grades of BMI in the HHD patient is associated with an increased volume of the left atrium and ventricle. This suggested that obese patient with HHD should be assessed carefully for atrial and ventricle enlargement.

Keywords: *Cardiac Structure, Echocardiography, Hypertension, Obese, Remodelling.*

Introduction

Hypertensive heart disease (HHD) can be manifested as asymptomatic cardiac hypertrophy to clinical heart failure. Alteration of blood vessel and cardiac structure in the HHD was caused by the chronic elevation of the blood pressure.[1] This remodelling subsequently contribute to the pathophysiology of circulatory disorders in the HHD patient.[2] The progression of cardiac structure remodelling in the HHD patient is influenced by various factor such as type of overload, neurohormonal activation, co-existence with other diseases and genetic factors.[3]

Obesity rates are rising worldwide. Obesity is defined as abnormal or excessive fat accumulation that may impair health, including increased risk of cardiovascular disease and hypertension that may

induce some changes in cardiac structure and function. World Health Organizations (WHO) and National Institute of Health defines Normal weight as BMI 18.5-24.9, Overweight as BMI 25-29.9, Obesity as BMI $\geq$ 30 kg/m^2, severe obesity as BMI $\geq$ 40 kg/m^2, and super obesity as BMI $\geq$ (50 kg/m^2).[4] Obesity may also induce several modifications in cardiac structure and function in the absence of other atherosclerotic risk factors, to the extent that some authors have suggested the specific form of "obesity cardiomyopathy," which resulted in left ventricular (LV) structural and functional abnormalities.[5] Obesity is well known to imply some cardiac consequences with the inducement of several modifications in cardiac structure and function, which are associated with hemodynamic volume overload. Atrial and ventricular remodeling is common in obese patients, and this pathophysiological change plays a pivotal role in atrial and ventricular dysfunction.[6]Hence, it is hypothesized that different grades of BMI may contribute to the cardiac remodeling progression in the HHD patient. This research investigates whether different grades of BMI status is correlated with echocardiographic findings in HHD patient.

Materials and Method

Research Design: This retrospective study consisted of subject $\geq$ 18 years old with hypertensive heart disease evaluated at the Echocardiography Laboratory of the Department of Cardiology and Vascular Medicine Dr. Soetomo General Hospital, Surabaya, Indonesia between January 2018 and January 2019. Eligible patients required to have LV Ejection Fraction (EF) $\geq$ 50%. Normal weight, overweight, and obesity were defined according to body mass index (BMI) established criteria.[4] Diabetes mellitus and hypertension were defined according to current recommendations.[7-8]Patients were excluded if they had a history of acute coronary syndromes, angina, or revascularization procedures or evidence of segmental wall motion abnormalities at echocardiography, or a history of heart failure. Other exclusion criteria were significant aortic or mitral valve disease, severe mitral annular calcification, hypertrophic cardiomyopathy, secondary forms of cardiomyopathy, stroke, peripheral artery disease, and chronic kidney disease.

Doppler Echocardiography: Transthoracic two-dimensional and Doppler echocardiographic examination was carried out by Vivid S6, Logic E9, and Vivid S60 Ultrasound instrument (General Electric) with 2nd-harmonic imaging and a 3.5-MHz transducer. Patients were examined in the left lateral decubitus position, and data were acquired in the parasternal (long-and short-axis views) and apical views (two chambers (A2C) and four chambers (A4C) and apical long-axis views). In every echocardiographic evaluation, all parameters were derived according to current indications and considered in relation to their established reference ranges. Left ventricular volumes and EF were calculated from apical A2C and A4C views using the TEICH and Modified Simpson's Biplane rule. LV mass was calculated and indexed according to body surface area and height. Left atrial (LA) and Right atrial (RA) size were also measured by major and minor dimension. Relative wall thickness (RWT) was derived as the ratio between 2 multiplied posterior wall diastolic thickness and end-diastolic diameter. Pulsed wave Doppler mitral velocity curves were obtained from the A4C view by positioning sample volume between the tips of the mitral valve leaflets in diastole. From mitral velocity tracings, peak early (E) and late (A) transmitral flow velocities, their ratio E/A, and E-wave deceleration time (EDT) were measured accordingly. From A4C view, tissue Doppler longitudinal velocities were recorded with the sample volume placed at the junction between LV wall (medial and lateral) and the mitral annulus. The ratio of mitral E peak velocity and averaged ratio of mitral to myocardial early velocities (E/e′) was calculated. The peak tricuspid regurgitation (TR) velocity was measured from the maximal velocity of tricuspid Doppler regurgitant jet. To derive stroke volume and cardiac output using Doppler method, continuity equation at LV outflow tract and velocity time integral were used.[7,9,10]

Statistical Analyses: Statistical analyses were performed using IBM SPSS Statistics 25.0. Data are considered significantly different if $p<0.05$. Continuous variables, presented as mean±SD, were evaluated for normal distribution and compared using the ANOVA test, as appropriate. The correlation was evaluated with Spearman Rho analysis followed by multiple stepwise linear regression test to determine Beta Coefficient and R-square.

Findings:

Demography of HHD patients: The echocardiographic finding was obtained from 50 HHD patients with demography as follow:

Table 1. Characteristic of the HHD patients

No.	Description	n (%) or mean±SD
1.	Age (Years)	60.34±9.83
2.	**Gender**	
	a. Male	13 (26%)
	b. Female	37 (74%)
3.	Body Height (cm)	155 ± 6.24
4.	Body Weight (kg)	62.63 ± 11.88
5.	**Weigh Classification**	
	a. Normoweight	24 (48%)
	b. Overweight	18 (36%)
	c. Obese	8 (16%)
6.	Systolic Blood Pressure	137.5 ± 24.35
7.	Diastolic Blood Pressure	80.0 ± 7.56

Echocardiographic Findings from HHD Patients

Table 2. Significant Difference in Echocardiographic Findings of HHD patients

No.	Description	BMI < 25	25 ≤ BMI<30	BMI >30
1.	LA Major	4.55±0.71[b]	5.10±0.69[a]	4.93±0.29
2.	RA Major	3.92±0.69[b,c]	4.35±0.59[a]	4.52±0.25[a]
3.	Ejection Fraction	64.3±3.67	66.51±4.01[c]	62.12±0.98[a,b]
4.	LVD Mass	140.21±36.58[c]	161.59±39.61	194.93±58.05[a]
5.	LVS Mass	126.02±29.39[c]	140.77±41.91	173.68±46.29[a]
6.	LVSI Dopp	50.36±6.76[b]	44.15±10.32[a]	44.30±7.54
7.	LVPWD	1.00±0.14[c]	1.11±0.21	1.29±0.35[a]
8.	LVPWS	1.39±0.15[c]	1.49±0.22[c]	1.71±0.36[a,b]

Comparison of the echocardiographic finding of normoweight (BMI<25), overweight (25 ≤ BMI<30), and obese (BMI >30) patient with HHD. Different annotation showed a significant difference ($p<0.05$) if compared with normoweight (a), overweight (b), obese (c).

As shown in Table 2 above, Significant difference was observed between normoweight and overweight patient in LA Major, RA Major, and LVSI Dopp ($p<0.05$). Comparison between normoweight and the obese patient showed a significant difference in RA Major, LVD mass, LVS mass, LVPWD, and LWPWS ($p<0.05$). Comparison between overweight and obesity only showed significant difference in Ejection Fraction and LVPWS ($p<0.05$).

Table 3. Correlation Between BMI with Echocardiographic Findings of HHD patients

No.	Description	Correlation	Beta Coefficient	R-Square
1.	LA Major	0.335*	0.310*	0.055
2.	RA Major	0.371*	0.359*	0.111
3.	Ejection Fraction	-	-	-
4.	LVD Mass	0.341*	0.393**	0.137
5.	LVS Mass	0.303*	0.362*	0.113
6.	LVSI Dopp	-0.376*	-0.313*	0.079
7.	LVPWD	0.369**	0.403**	0.145
8.	LVPWS	0.391**	0.401**	0.143

Annotation * showed significance at $p<0.05$ and ** showed significance at $p<0.01$

As shown in table 3 above, Positive correlation was shown between different grades of BMI with LA Major, RA Major, LVD Mass, LVS Mass, LVPWD, and LVPWS. Inverse correlations can be observed only on LVSI.

Discussion

Obesity induces several modifications in cardiac structure and function, which are associated with hemodynamic volume overload. Atrial and ventricular remodeling is common in obese patients, and this pathophysiological change plays a pivotal role in atrial and ventricular dysfunction.[6] In this research, we found that comparison between obese patient has significantly higherRA Major, LVD mass, LVS mass, LVPWD, and LWPWS. Previous longitudinal research has demonstrated that increasing BMI for 5 units from normoweight patient in the 4 years, can significantly increase the LA and LV compared to patient without increased BMI.Other cross-sectional studies also demonstrated that obesity and greater BMI are correlates with the larger LA dimensions.[11] Previous research also showed that patient with lower BMI (BMI <18.5) will also followed by significantly lower LVMI and smaller LV mass.[12] This suggested that atrial and ventricular dimension are increased in the HHD patient as BMI grades increased.

Correlation test also showed that different grades of BMI are positively correlated with LA Major, RA Major, LVD Mass, LVS Mass, LVPWD and LVPWS, suggesting that higher BMI grades will affect the volume of the left atrium, right atrium and left ventricle. Aditionally it will also affect the systolic and diastolic function of left ventricle. Previous research also showed similar finding, which found a linear correlation between increased LV mass (g/m2) with BMI.[13] It was also shown that increased BMI is related to both LV systolic and diastolic dysfunction.[6] However, another study showed that obesity might not follow by increasing the LV Mass if the obesity is followed by confounding disease, which can alter the hypertrophic progression such as myocardial infarction. [14] This suggested that in the patient with HHD, increasing BMI is associated with atrial and ventricular enlargement and HHD may not alter the hypertrophic progression of the heart muscle.

There are several limitations to our findings. Firstly, obesity was only measured through BMI rather than the direct measurement of central obesity, such as abdominal circumference or waist and hip circumference. While many studies have shown that central obesity measurement is more robust predictors of cardiovascular outcomes, this suggested that more detailed metrics of central adiposity will be important to be considered in future studies.

Secondly, our sample size was limited and not equally distributed between underweight, normoweight, overweight, and obese which might affect lack of significance in cardiac dimension measured through echocardiography. More samples with better distribution among the BMI grades would be beneficial for future research. Thirdly, as the data only derived from single cardiology center in urban area, the data may not be representative or generalizable to other populations

Conclusion

BMI grades is associated with the functional and structural changes such as LA Major, RA Major, LVD Mass, LVS Mass, LVPWD and LVPWSin the heart of HHD patients.

Conflict of Interest: The authors declare no conflict of interest

Source of Funding: This research received no external funding

Ethical Clearance: The research was conducted in accordance with the Helsinki declaration of 1975 as revised in 2000. All participating patient has signed written informed consent. The study protocol has been approved by the local ethics committee. Data which shows patient personal information was omitted.

Herbal Dental Products: The Impact of Social Media on Consumers' Behaviour

Manar E. Al-Samaray[1], Humam M. Al-Somaiday[1], Ali Mahmoud Al-Samydai[2], Rudaina Othman Yousif[3]

[1]Assistant Lecturer, Department of Prosthodontics, College of Dentistry, Mustansiriyah University, Baghdad-Iraq, [2]Ph.D. Student, Department of Pharmaceutical Sciences, Faculty of Pharmacy, University of Jordan, [3]Professor, Department of Marketing, Faculty of Economics and Administrative Sciences, Zarqa University

Abstract

The increasing demand for having an attractive smile becomes one of the life essentials. Oral hygiene maintenance plays a key role in maintaining oral health (healthy teeth and gum) and as a result, having an attractive smile. Thus, using routine dental cleansing through brushing, flossing and mouth rinsesis mandatory.

This study aims to evaluate the role played by social media on consumers' behaviour to use dental products manufactured essentially from herbal products rather than the well- known chemical formula. The analyzed data were collected by using a face-to-face approach (unstructured interviews). At first, dentists and pharmacists were asked about their opinion regarding using herbal products and their response to social media campaigns. Then,a random sample of the audience was interviewed.

Results showed that most of the Iraqi peoples are familiar with herbal products (68.6%) of them indicated social media has an impact on individuals.

The awareness of the importance of using toothpaste and mouth rinses made from herbal products can be increased through introducing their effectiveness, reduced side effect and their importance as green substrates…etc. This can be done by organized campaigns by a pharmaceutical company or nonprofit organization.

Keywords: *Herbal, dental products, social media, behaviour, influencers.*

Introduction

Potent therapeutic agents may be developed from medicinal plants through its active substances[(1)]. Ancient civilizations have used plants to cure a variety of human ailments[(2)]. Nowadays, over 50% of the modern drugs industry focuses on natural products which play an important role in drug development[(3,4).]

Many of these plants have dental care properties like *Azadirachta indica* (Neem), *Melaleuca alternifolia* (Tea Tree Oil), *Grita Kumari* (Aloe Vera)… etc[(5,6)]

Corresponding Author:
Manar E. Al-Samaray
e-mail: manaralsmaray@uomustansiriyah.edu.iq
Mobile:+9647708231788

Historically, herbal products have been used as an oral hygiene maintenance routine. The chewing stick (Miswak or Siwak) is a tradition inherited from prophetic medicine [(7)].

Furthermore, in Asia, Africa, the Middle East, and the Americas, for thousands of years, chewing sticks prepared from twigs, stems or roots of a variety of plant species have been practiced despite the widespread use of toothbrushes and toothpaste[(8).]

As the side effect of allopathic medicines has increased, studying medicinal plants is also increased in different parts of the globe. Health professionals are often challenged to explore relevant information to advise their patients about using these over-the-counter products safely. The use of herbal extracts in various

forms is entirely consistent with the primary health-care principles because these ingredients work more in harmony with the body instead of fighting against it as seen in other conventional versions of the same herbal products [9].

Consumer behavior defined as a sequence of physical, mental and emotional activitiesdone by humansduring selecting, purchasing, using, deciding and disposing of goods and services to satisfy their needs [10].Marketing campaigns can be considered as leading factors affecting consumer behavior which helps companies and nonprofit organizationsto predict consumer personal preferences and purchasing power[11].

Social media nowadays play an essential role in improving consumers' satisfaction starting with the initial stages of information search, alternative evaluation, purchase decisions and ending with changing consumers' opinions and interest [12]. Thus, understanding the impact of social media inclarifying the benefit of herbal dental products over the chemical formula will help in increasing awareness of the people about the importance of using these products. This knowledge may end with reducing side effects that came from chemical products and substantially saving more money.

Methodology

Study Design: This study based on individuals' opinions obtained from face to face interviews with a random sample of dentists,pharmacists, and consumers to draw an image oft heir opinion about herbal dental products and to identify the role played by the advertising campaigns on social media to affect their purchasing behavior.

20 questions with 'yes' or 'no' closed-ended responses were designed and asked three hundred peoples; these questions were build based on literature review.

Study Samples: Face to face interview was conducted from February 2019 to May 2019 in Baghdad/ Iraq at two stages; the first stage included 100 dentists and 100 pharmacists. While the second stage was with 100 consumers asking them about their opinion about herbal dental products.

Results

Descriptive statistics were used to analyze the results of this study using Version 21, SPSS software.

The chemical dental products show the highest rate of use among dentists (38.3%), while the herbal products used more by the other customers (58%) (Fig.1).

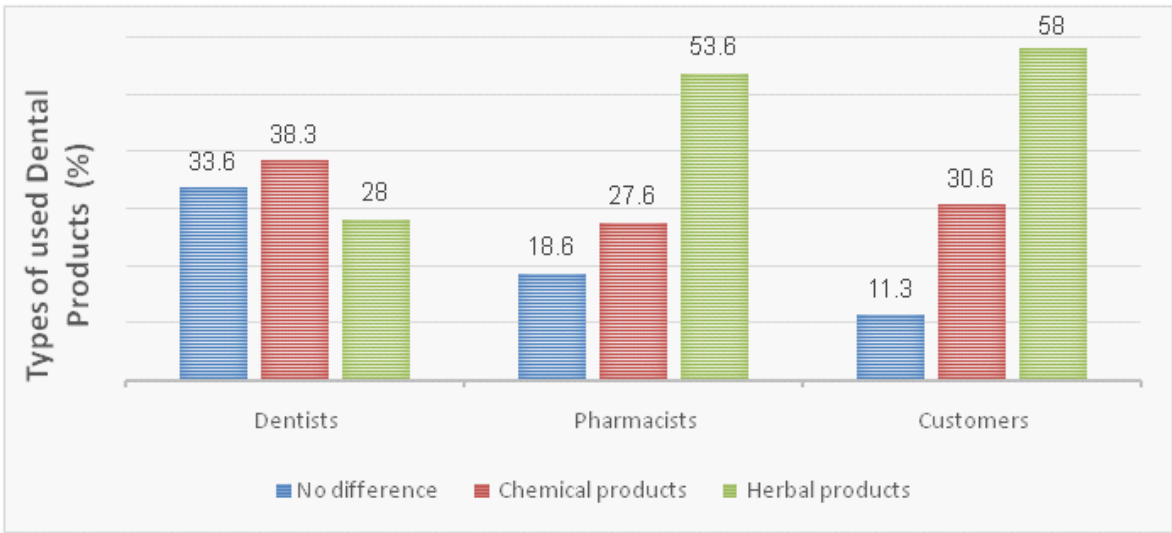

Figure 1: Types of used dental products

In (Fig. 2 and 3), reasons behind preferring herbal products over the chemical product and vice versa. Safety (47.6%) was the major reason behind using herbal dental care by the dentists. Whereas manufacturer reputation (brand) (63.3%) reported being the reason behind using chemical dental care products.

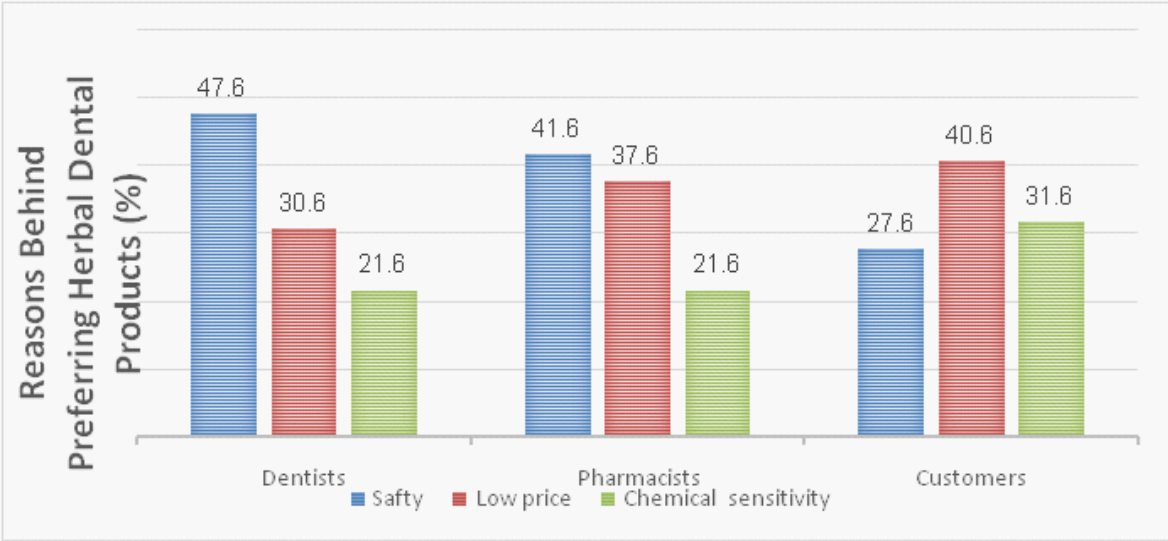

Figure 2: Reasons behind preferring herbal dental products

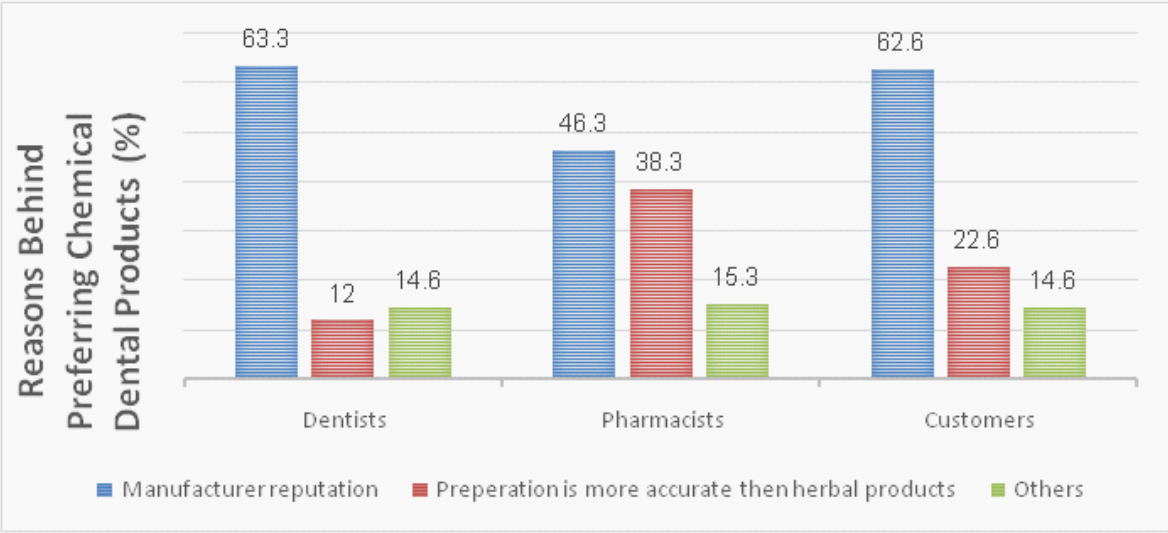

Figure 3: Reasons behind preferring chemical dental products

The majority of the sample were females (57%). The age of the majority of the sample was between 18-30 years old (28.6%) (Fig. 4).

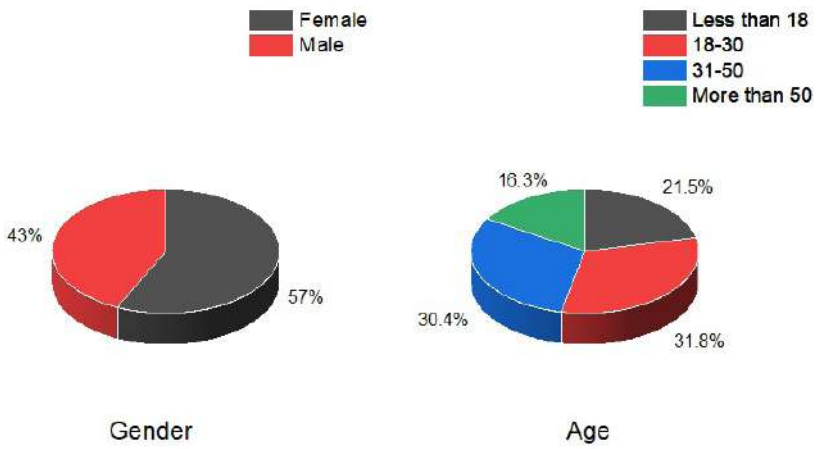

Figure 4: Gender and age of the study sample

Results reported that social messages via social media have played an essential role in changing the consumers' thoughts to use the herbal products by (68.6%) mostly via Facebook (31.6%) Where Twitter reported to be the least social media visited by people in Baghdad-Iraq (8.6%). These social sites were viewed daily by the majority of the study sample (58.6%) (Fig.5 and 6).

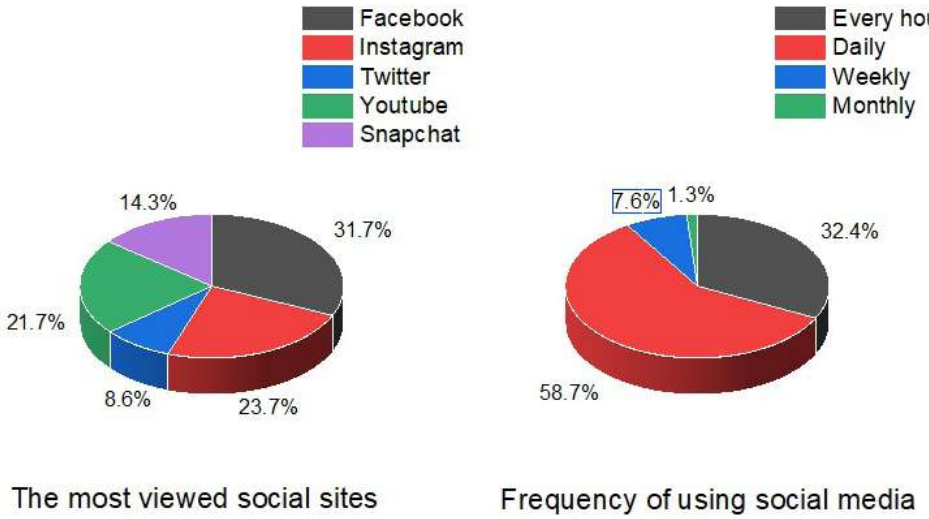

Figure 5: Most vied social media and the frequency of usage

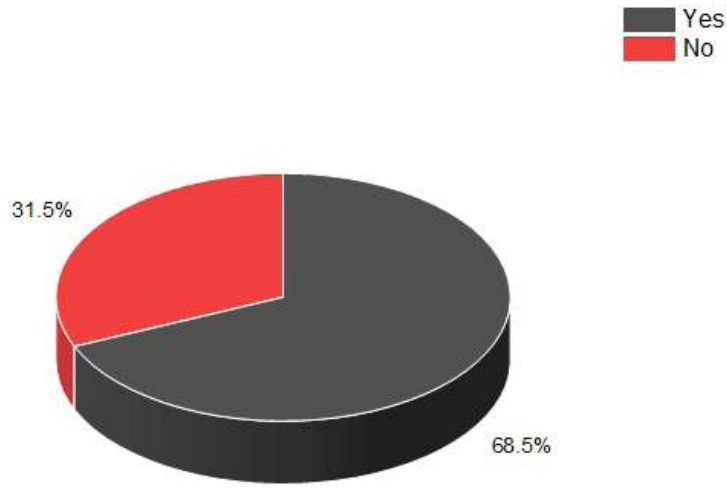

Figure 6: Social sites role in changing the consumers' thoughts to use herbal dental products

Discussion

As stated in the literature, medicinal herbs are a potential source of therapeutics aids in health systems all over the world in the diseased condition or as potential material for maintaining proper health. Therefore, the herbal product's popularity has increased[5].

This research focused on understanding the general orientation of people in Baghdad-Iraq toward herbal dental products and the reasons behind these beliefs. The collected data from dentists, pharmacists, and other consumers reported that herbal dental products are used frequently mainly because of its safety, low price and finally as a substitute to the chemical products as there is an idea that chemical compounds may be cause sensitivity. Furthermore, the data reveals a percentage of people that use both chemical and herbal products. While some peoples use the chemical formula as a result of the manufacturer's reputation. (Fig. 1,2 and 3)

Generally, women are more interested in their appearance then men, that is why most of the study sample were females between 18-30 years old(Fig. 4).

The second aspect of this study deals with the impact

of social media on consumers' behavior toward herbal dental products; therefore, the frequency of using social media and which media is most visited is important. Data regarding these questions revealed the majority of the study sample used social mediaon a daily basis. Facebook and Instagram reported being the most visited social sites (Fig. 5 and 6).

Recent studies mentioned social media as a vital tool for people between 18 to 40, as they enter young adulthood,focus on the future and aware of how others see them. They feel more pressure to be "the best", are more worried about what others think about them, and are more concerned about what making their family and friends proud, as known up to 91%of social media account are in this age group with the most social media connections. These groups are the most affected by social media's on their lives[13].

Conclusions

1. Herbal dental products used widely by peoples regardless of their levels of education.
2. Social media can direct the audience toward a specific product when used correctly towards the targeted audience via the proper social site.

The Effect of Moringa Oleifera Flour Given for Mothers Breastfeeding Against Morbidity of Baby Ages 0-6 Months in Jeneponto District

Suhartatik[1], Veni Hadju[2], Masyita Muis[3], Hasanuddin Ishak [4], Merryana Adriani[5]

[1]Doctoral Student in Public Health, Hasanuddin University of Indonesia, Poltekkes Kemenkes Makassar [2]Department of Nutrition, [3]Department of Occupational Health and Safety, [4]Department of Environmental Health, Public Health Faculty of Hasanuddin University, Indonesia [5]Department of Nutrition, Faculty of Public Health, Airlangga University, Indonesia

Abstract

Background: Moringa oleifera is one of the vegetable food sources which has many nutritional content (minerals, vitamin A, vitamin C and vitamin B, sources of calcium, protein, potassium, and iron, amino acids such as methionine and cystine) which are very important to prevent disease.

Aims: To assess the large difference in infant morbidity from groups of mothers who received Moringa oleifera flour and groups who received iron tablets.

Method: : Experimental with Randomized Double Blind design, Controlled design. The population in this study were community groups of pregnant and lactating women, a large sample of 20 pregnant women each group (Moringa Oleifera flour (GTK, n = 20) and received iron folate capsules (GBF, n = 20)). Bivariate analysis uses chi-square and multivariate logistic regression to see the value of OR.

Results: There is a significant effect of moringa flour intervention on Morbidity of Infants aged 3 months ($\rho = 0.018$) and 6 months ($\rho = 0.006$). Based on the Odds Ratio test, the use of Moringa flour 5,500 times better for infant morbidity compared to the use of iron (Fe) tablets at 3 months of age and the use of Moringa flour 7.857 times better for infant morbidity than the use of iron (Fe) tablets at the age of infants 6 months are measured based on the morbidity of children in the last 3 months.

Conclusion: There is an effect of the intervention of Moringa flour on infant morbidity, the use of Moringa flour is better than the use of iron tablets (Fe). Moringa flour provides the same benefits as Fe and can be an alternative fulfillment of nutrition to maintain the health of children in order to avoid disease.

Keyword: *Moringa Oleifera, Iron Tablets, Morbidity.*

Introductions

Morbidity and mortality due to childhood illnesses remain a major global concern. Malaria, respiratory infections, and diarrheal diseases are the main causes of child morbidity and mortality. Preventable infections are a major cause of morbidity and mortality in CHER and children <5 years are generally affected[1]). occurrence of adverse health outcomes in children, defined as the incidence of validated morbidity (diarrhea, acute respiratory infections, or malnutrition) or severe events (hospitalization or death)[2].

Acute respiratory disease is one of the main causes of poor health in children. This includes a variety of effects, including viral and bacterial infections in the lungs and respiratory tract. This can also be caused or triggered by various risk factors, especially exposure to air pollution. Low birth weight, malnutrition and population density are also important risk factors. In developing countries, all of these risk factors continue to affect a large portion of the population, with acute respiratory disease continuing to be a ubiquitous form of childhood morbidity and one of the leading causes of

death. Upper respiratory tract diseases, such as asthma, wheezing, fever, and allergic rhinitis, have increased in many countries[3].

Progress towards nutritional goals requires high level policy commitment and broad community support. Existing food and nutrition policies need to be reviewed so that they comprehensively meet all major nutritional challenges and address the distribution of these problems in society. A further aim of the review is to ensure that nutrition is placed centrally in other sectoral policies and in overall development policies. Important factors for the successful implementation of this policy are official responsibilities by relevant government agencies, the establishment of cross-sectoral governance mechanisms, the involvement of development partners, the involvement of local communities[4].

Moringa oleifera extract is able to maintain a decreased level of serum ferritin up to 50%[5]. The administration of moringa oleifera increases the hemoglobin of pregnant women which is the same as the effect of iron/folic acid tablets. In addition, moringa oleifera can increase antioxidant levels and reduce MDA, and 8-OhdG[6]. Moringa oleifera can increase the number of PCV, HB and RBC, its use can increase the number of WBC, possible toxicological responses[7]. Micronutrient supplementation is widely used to prevent anemia during pregnancy and proves that pregnancy results are better and Moringa leaves are local plants, considered to contribute to anemia prevention [8]

Referring to the background above looking at the occurrence of conditions and based on research related to the use of moringa oleifera to support government programs on the implementation of a healthy Indonesia program with a family approach to reduce the prevalence of stunting and monitoring infant growth, it is necessary to conduct research on the "effects of Moringa flour Oleifera in pregnant women against morbidity of infants aged 0-6 months in the working area of the Tamalate health center in Jeneponto district, South Sulawesi. "

Materials and Method

This study uses an experimental method with a Randomized Double Blind design, Controlled design is part of an intervention study that began in 2017. This study was conducted in the area of Tamalatea Health Center, Jeneponto Regency, South Sulawesi. The population in this study is the community groups of pregnant and lactating women who are scattered in Tamalatea sub-district, Jeneponto regency, the number of samples followed since pregnant women is 20 pregnant women each group, the number of babies born followed by 40 with the assessment of the first group receiving Moringa Oleifera flour capsules (GTK, n = 20), the second group received iron folate capsules (GBF, n = 20). Bivariate analysis uses chi-square and multivariate logistic regression to see the value OR.

This research was carried out after obtaining approval from the Ethics Commission of the Faculty of Public Health, Hasanuddin University number UH2908199017. Before the implementation of measurements and interviews will be given an explanation of the actions to be taken for each respondent (Mother and baby). After the explanation, the respondents were asked for approval to participate in this study by signing an informed consent.

Results

Data shows that the characteristics based on (Maternal Age, Education, Maternal Occupation, Home Smoking, Child Gender, Breastfeeding, Breastfeeding Pattern).

Table 1. Characteristics of Respondents

Variable	Iron Tablet		Moringa capsules		Total		P Value
	n	%	n	%	N	%	
Mother's Age							
<26 years	5	27.8	7	38.9	12	33.3	0.728
≥ 26 years	13	72.2	11	61.1	24	66.7	
Education							
Low <12 Years (elementary or non-primary)	11	61.1	14	77.8	25	69.4	0.469
Height ≥ 12 years (SMP, SMA and PT)	7	38.9	4	22.2	11	30.6	

Variable	Iron Tablet		Moringa capsules		Total		P Value
	n	%	n	%	N	%	
Mother's Job							
Does not work	17	94.4	16	88.9	33	91.7	1,000
Work	1	5.6	2	11.1	3	8.3	
Smoking in the House							
Yes	14	77.8	15	83.3	29	80.6	1,000
Not	4	22.2	3	16.7	7	19.4	
Child Gender							
Man	9	50.0	11	61.1	20	55.6	0.737
Women	9	50.0	7	38.9	16	44.4	
MP-ASI							
<6 months	4	22.2	1	5.6	5	13.9	0.338
≥ 6 months	14	77.8	17	94.4	31	86.1	

Table 1 Shows a description of the respondents were mothers with age ≥ 26 years with a total of 24 people (66, 7%), had low category education with 25 people (69.4%), mothers with unemployed status 33 people (91.7%), there were people who smoked at home with 29 (80.6%) and still found MP-ASI <6 months 5 people (13.9%).

Table 2. Analysis of differences in morbidity of 3-month infants from groups of mothers who received moringa oleifera flour and groups who received iron folate

Morbidity of 3-Month Infants	Moringa Oleifera Flour		Iron Folate Tablets		Total	
	n	%	n	%	n	%
Never Sick Last 3 Months	14	77,8	7	38,9	21	58,3
Have been Sick the Last 3 Months	4	22,2	11	61,1	15	41,7
p = 0,018						
Odds Ratio = 5,500						

Table 2. From the statistical test results obtained ρ = 0.018, this means that there is a significant influence of the intervention of Moringa flour on Morbidity of Infants aged 3 Months. Based on the Odds Ratio test, the use of Moringa flour 5,500 times better for infant morbidity than the use of iron (Fe) tablets at the age of 3 months of the baby is measured based on the morbidity of children in the last 3 months.

Table 3. Analysis of differences in the morbidity of 6-month infants from groups of mothers who received moringa oleifera flour and groups who received iron folate

Morbidity of 6-Month Infants	Moringa Oleifera Flour		Iron folate tablets		Total	
	n	%	n	%	n	%
Never Sick Last 3 Months	15	83,3	7	38,9	22	61,1
Have been Sick the Last 3 Months	3	16,7	11	61,1	14	38,9
p= 0,006						
Odds Ratio = 7,857						

Table 3 From the statistical test results obtained ρ = 0.006, this means that there is a significant influence of the intervention of Moringa flour on Morbidity of Infants at 6 Months. Based on the Odds Ratio test, the use of

Moringa flour is 7.857 times better for infant morbidity compared to the use of iron (Fe) tablets at the age of 6 months of the baby is measured based on the morbidity of children in the last 3 months.

Discussion

Morbidity or illness in infants is something that must be avoided, because this can affect the nutritional status of the baby which can ultimately have an impact on the baby's growth. The most common cause of morbidity in young infants is infection. Infectious disease itself will be able to cause the baby to have no appetite so that it can affect its growth. Based on the results of this study, there was a significant effect of moringa flour intervention on Morbidity of Infants aged 3 months and 6 months. The use of moringa flour 5,500 times better for infant morbidity in usa 3 months and the use of Moringa flour 7.857 times better for infant morbidity compared to the use of iron (Fe) tablets at the age of 6 months of infants measured based on the morbidity of children in the last 3 months.

Morbidity of children is a leading cause of death of children in developing countries, especially in Ethiopia. Despite the marked increase in reducing infant mortality in Ethiopia, diarrhea and fever in children are still the main causes of death. In Ethiopia, the burden of child mortality is alarming and calls for decisive efforts to combat these health problems. On research[9]. Showed that the child's sex, age of the child, level of anemia, level of education of the husband, mother's employment status, marital status, breastfeeding status and area were all selected as significant risk factors associated with childhood diarrhea and fever and significantly associated with opportunities Higher morbidity in Ethiopia.

Word Health Organization (WHO) named the Moringa tree as a miracle tree, after discovering the important benefits of Moringa leaves [10]. In the results of research in the third month the use of Moringa flour 5,500 times better for infant morbidity than the use of iron tablets. This can be explained that Moringa leaves contain high iron which can optimize the growth and development of children, iron serves to help red blood cells carry oxygen throughout the body so as to maintain health. If a child becomes ill, the metabolism in the body will immediately go down. Food is needed which contains a lot of fiber, especially in children who have impaired exposure or diarrhea. Moringa leaves contain high anti-infectious, toxins and bacteria in the child's body can be overcome by consuming Moringa leaves Moringa leaves can help smooth digestion in children. When a child is sick, this anti-inflammatory will detoxify the child's body. So the child will recover quickly and be healthy again [10].

Breast milk besides being able to help in the growth process, it can also protect babies from various infectious diseases such as diarrhea and ARI. However, the results of the study found, there are infants who have been sick for the last 3 months despite being given the intervention of moringa oleifera flour capsules and Iron Tablets, this is in line with the research conducted. [11], that there is no effect of breastfeeding on the growth status of infants, the incidence of respiratory infections, and diarrhea in children aged 7-12 months.

Based on research conducted by [12]. Chronic exposure to arsenic, strong and toxic carcinogens through drinking water is a public health problem throughout the world. Because little is known about the effects of arsenic in early life on immunity, we evaluated the impact of exposure in utero on infant immune parameters and morbidity in a pilot study. The effect of arsenic exposure on the incidence of respiratory infections is only seen in boys. The findings suggest that exposure to arsenic in the uterus interferes with the development of the child's thymus and increases morbidity, possibly through immune suppression. The effect seems to be partly dependent on gender. Arsenic exposure also affects breast milk levels from trophic factors and maternal morbidity

On research[13], shows the need for integrated interventions directed during the prenatal and postnatal periods, using multi-sectoral approaches to address various factors from the community to the individual level. There is a strong need for efforts to increase adequate food intake during pregnancy accompanied by educational interventions. encourage pregnant women to receive adequate antenatal care, optimal infant and child feeding practices for growth and development, exclusive breastfeeding to prevent infections and diseases that can ultimately affect growth.

Research conducted in Malawi shows that babies who get complementary food at the beginning of 3 months of birth have an impact on infant morbidity [14]. In addition when the baby started to eat or consume solid foods, infants are particularly vulnerable to digestive problems, especially diarrhea, this happens because

of the preparation or storage of solids which are not hygienic, potentially as an intermediary for the entry of bacteria and viruses into the body of the baby and the baby's activity began to explore its environment. However, the results of research in the UK did not show a significant difference in the early age of introduction of solid food to diarrhea [15].

Research conducted by[16] comparing hygiene in urban and rural areas in Bangladesh that is that more samples from urban areas are contaminated than rural areas, urban caregivers are more likely than rural caregivers to practice hygiene, especially washing hands with soap after defecation and beforehand, giving eat children. Poor socio-economic status and dense housing, use of public toilets, use of contaminated water for drinking and washing, low levels of education or lack of proper knowledge and hygiene practices may be related to higher levels of food contamination in urban areas.

Conclusion

Morbidity or illness in infants is something that must be avoided because this can affect the nutritional status of the baby which can ultimately have an impact on the baby's growth. In this study, there was a significant effect of the intervention of Moringa flour on Morbidity of Infants aged 3 months and 6 months. Based on the Odds Ratio test, the use of Moringa flour was 5,500 times better at 3 months of age and the use of Moringa flour was 7,857 times better for Morbidity of infants compared to tablet use. iron (Fe) at the age of 6 months of the baby is measured based on the morbidity of children in the last 3 months. Moringa flour provides the same benefits as Fe and can be an alternative fulfillment of nutrition to maintain the health of children in order to avoid disease.

Conflict of Interest: None.

Evaluation of an Experimental Poly-Methyl Methacrylate/Nano Graphene Oxide Composite

Reem Gamal[1], Yasser F. Gomaa[2], Ashraf Mahroos[3]

[1]Biomaterials Department, Faculty of Dentistry, [2]Professor of Dental Materials,
[3]Bio-Medical Engineering Department, Faculty of Engineering, Minia University, Minia, Egypt

Abstract

Aim: This study was conducted to establish a standard mixing protocol of nano graphene oxide (GO) incorporated into poly-methyl methacrylate (PMMA) to form GO/PMMA composite. Different concentrations of these composite were evaluated for biocompatibility.

Method: Three different mixing protocols were done to select optimum one to incorporate GO into commercially available PMMA. In the first protocol GO powder incorporated into PMMA powder. In the second protocol GO powder incorporated into methyl methacrylate (MMA) monomer. While in the third protocol PMMA powder incorporated into GO water dispersion. The most homogeneous protocol was the third one which was used to formulate GO/PMMA composite in a five concentrations 0%, 0.05%, 0.1%, 0.15% and 1% to form groups I-V respectively. For biocompatibility determination rabbit hemolysis test was used.

Results: The percent of hemolysis were less than 5% for all groups tested in rabbit hemolysis test.

Conclusions: GO/PMMA composite is biocompatible.

Keywords: *Graphene oxide, PMMA, mixing, hemolysis.*

Introduction

Poly-methyl methacrylate (PMMA) is an optically transparent synthetic polymer made of methyl methacrylate monomer (MMA). It has been used in dental field since 1937 till now[1]. It's used as bone cements, denture base, denture teeth, denture liners, obturators, splinting materials, temporary veneers, special trays and provisional crowns[2]. PMMA has adequate compressive strength, good color stability for a few weeks, low cost, easy manipulation and easy repair[3]. However, it has drawbacks such as low mechanical properties[4].

Numerous approaches have been proposed to enhance the properties of PMMA. One of them is adding nanoparticles. Nano graphene oxide (GO) is one of graphene family. It's a two-dimensional carbon nanomaterial formed of a layer of single atom thick. It's closely packed into a hexagonal crystal structure that contains functional groups on the surface and at the edges[1,5]. GO has highly chemical, physical and mechanical properties that motivate extensive scientific interests.[5] Ability of graphene and its family in enhancing polymers properties is determined by many factors such as surface area of the nanosheets, homogeneity of the distribution of the nanoparticles in polymer matrix without agglomeration and strength of binding between graphene and polymer matrix. Homogeneity of distribution of nanoparticles and specifically GO in PMMA are a great challenge[6] as nanoparticles have very large surface to volume ratio lead to increases particle/matrix interface, thus increasing the effects of the nanoparticles on the overall

material properties. Agglomeration of nanoparticles leads to declination of the material properties attributed to the inclusion of voids.[7] For obtaining homogenous GO/PMMA composite many studies were done using multiple mixing protocols[8-11]. In this study three different mixing protocols were used and tested for homogeneity.

Biocompatibility is one of the important aspects considered during developing a nanomaterial polymer composite for biomedical applications. Biocompatibility is essential to avoid any adverse effect of a material on human body[12]. Considering American National Standard Institute/American Dental Association (ANSI/ ADA no 41), Rabbit hemolysis test is one of the effective initial tests of assessment of biocompatibility.

Few studies were found discussing the challenge of incorporating GO in self-cure PMMA to form homogenous GO/PMMA composite and the effect of adding different concentration of GO in PMMA on biocompatibility. Therefore, this study was conducted to evaluate the homogeneity of mixing protocol and the implication of different concentrations of GO in GO/PMMA composite on blood hemolysis. The first null hypothesis to be tested was the probability of production of nonhomogeneous GO/PMMA composite by all mixing protocol. The second null hypothesis to be tested was addition of GO in different concentrations to PMMA increase blood hemolysis.

Materials and Method

The main materials used in this study were GO and PMMA. Nano GO was prepared by improved Hummer's method according to Abdel-Motagaly *et.al* 2018[13] at Materials Science and Nanotechnology Department, Faculty of Postgraduate Studies for Advanced Sciences, Beni-Suef University, Beni-Suef, Egypt. The average thickness of GO was 1.2nm and the lateral size around 800nm. Commercially available PMMA was supplied from Acrostone Dental Manufacturer, Egypt, in the form of PMMA powder and MMA liquid monomer.

Incorporation of GO in PMMA: Three different protocols were used to select the optimum one to establish a homogeneous mix. The first protocol referred to protocol (A) was done regarding to Pahlevanzadeh *et.al*, 2019[11]. One gram of GO powder was weighted by digital balance (Electronic balance ATY224, Kyoto, Japan with 0.0001g accuracy) and added to 99g of PMMA powder in glass jar and vigorously stirred using ceramic rod. Then the jar was tightly closed and shaked for 5 minutes.

The second protocol referred to protocol (B) was done regarding to Lee *et.al* 2018[10]. One gram of GO was added to 99g MMA monomer in tightly closed glass jar. To ensure the homogenous dispersion of GO to MMA, the jar was placed in water bath in ultrasonic cleaner (Digital Codyson Dental Ultrasonic Cleaner CD4820, Henan, China) at a power of 170W and frequency of 42KHz for 64 minutes. Sonication was done in 8 intervals. The duration of each one is 8 minutes sonication and 10 minutes rest with changing the water in the water bath after each interval.

The third protocol is referred to protocol (C) was done regarding Kee *et.al* 2017[14]. The size range of PMMA powder beads was determined through manual sieve with 45μ stainless steel wire woven mesh. One gram of GO was added to 100ml deionized water in tightly closed glass jar. The jar was sonicated as mentioned before in protocol B to obtain a stable GO dispersion. Then 99g of PMMA powder was gradually added to the dispersion and vigorously stirred using ceramic rod. After that the mixture was inserted in a glass vacuum desiccator that contains calcium chloride anhydrous at room temperature for 24 hours to obtain a dried powder. The drying process was repeated till the powder weight reached 100±0.05g. After that the dried powder was crushed into a fine powder using a mortar and pestle and sieved again.

Thereafter, the produced powder and monomer from each mix (A,B and C) were used to prepare specimens used for homogeneity evaluation. Specimens of GO/PMMA composite were prepared according to manufacturer's instructions and packed in a specially constructed disc shaped split Teflon molds (0.5±0.1mm height and 15±0.1mm diameter), then covered by glass slide from one side and glass slide cover from the other side. The specimens were left to set under constant load of 5Kg at room temperature.

Homogeneity was evaluated by stereomicroscope (Leica, Microsystems, GmbH, Germany) at a magnification 40X and 80X. The most homogenous mix found was to be mix (C) and so it was used for preparation of the other concentrations used in this study.

Rabbit blood hemolysis test: The test was conducted according to ANSI/ADA no. 41. Fresh oxalated whole rabbit blood was collected from three healthy adult male

New Zealand rabbits (*Oryctolagus cuniculus*, supplied from animal house, CID Company for Pharmaceuticals and Biotechnology Research, Cairo, Egypt) with no medications and normal diet after merciful sacrificing of them (For each10ml of blood, 0.5ml of 2% sodium oxalate solution was added as anticoagulant). The blood was diluted by the addition of 8ml blood to 10ml saline and referred to diluted rabbit blood.

Five different concentrations (0%, 0.05%, 0.1%, 0.15% and 1%) were made from GO/PMMA composite to form groups (I-V) respectively. A disc shape specially constructed split Teflon molds (15±0.1mm diameter 1±0.1mm height) were used for specimens preparation.

Specimens of each group were crushed to small pieces after their setting. Sixty two (16x150ml) stoppered centrifuge test tubes (10 for each group, 10 for 1% GO dispersion, and two tubes for positive and negative control) were used. Each tube was filled by 10ml saline and 0.5g of crushed specimens from each group (for 1% GO dispersion group 0.5g of vortexes dispersion used).

Positive control (absolute hemolytic) was obtained by adding 10 ml of a freshly prepared solution of 0.1% sodium carbonate to test tube. Negative control (absolute non-hemolytic) was obtained by adding 10ml of normal saline to test tube. Then all tubes were placed in a 37°C water bath microprocessor (Digiqual-water bath DQ-WB-01, Tamil Nadu, India) for 30 minutes to provide temperature equilibrium. After that, test tubes were removed from the water bath and 0.2ml of the diluted rabbit blood was added to every tube, and mixed gently. Then all tubes were incubated (Precision incubator, Ohio, USA) for 60 minutes at 37±1°C.

Tubes were centrifuged with a centrifugal machine *(*Hetich, EBA8, Germany) for 5 minutes at 500xg. Then tubes were carefully removed from the centrifugal machine to prevent disturbing the precipitate. After that the supernatant of each tube was tested by spectrophotometry (Turner, UV/VIS, 390, Canada) to measure its optical density (O.D) under a visible light with 546μm wave length (green color). The percent of hemolysis was calculated using the following equation

Percent of Hemolysis = [(O.D test samples – O.D negative control)/(O.D positive control – O.D negative control)] × 100

Statistical analysis: Data was statistically analyzed and significance between groups was calculated by ANOVA (Post Hoc Tukey HSD) test, using SPSS 25.0 for Windows (SPSS Inc., Chicago, IL, USA). A value of $p<0.05$ was considered significant.

Results

For homogeneity evaluation, A and B mix (Figures 1 and 2, respectively) showed aggregation and inhomogeneous distribution of GO in PMMA matrix. Mix A showed higher aggregated particles number than B mix. The mix C showed no apparent GO particles in both magnifications Figure 3 and so mix C was considered as the most homogenous mixing protocol and was used to produce the GO/PMMA.

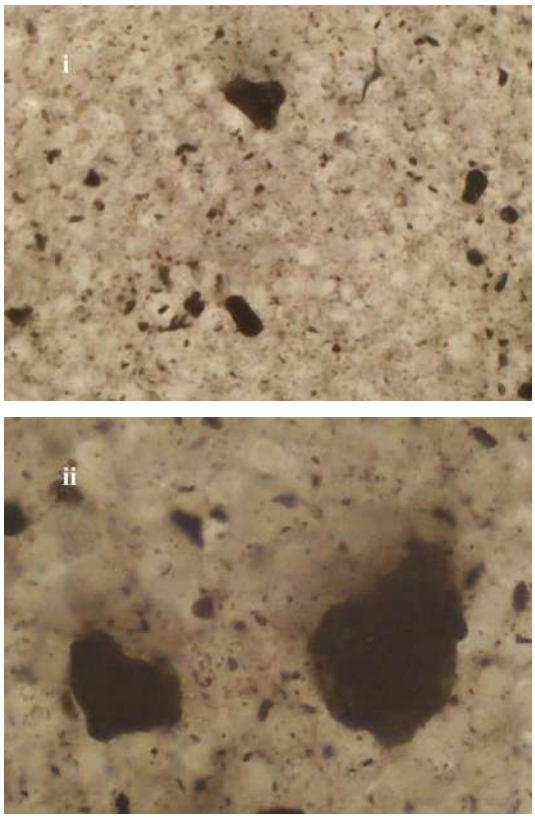

Fig. 2: Stereomicroscope evaluation of 1% GO/ PMMA composite under transmitted light for mix B (GO powder mixed with liquid MMA), (i) magnification 40X, (ii)magnification80X

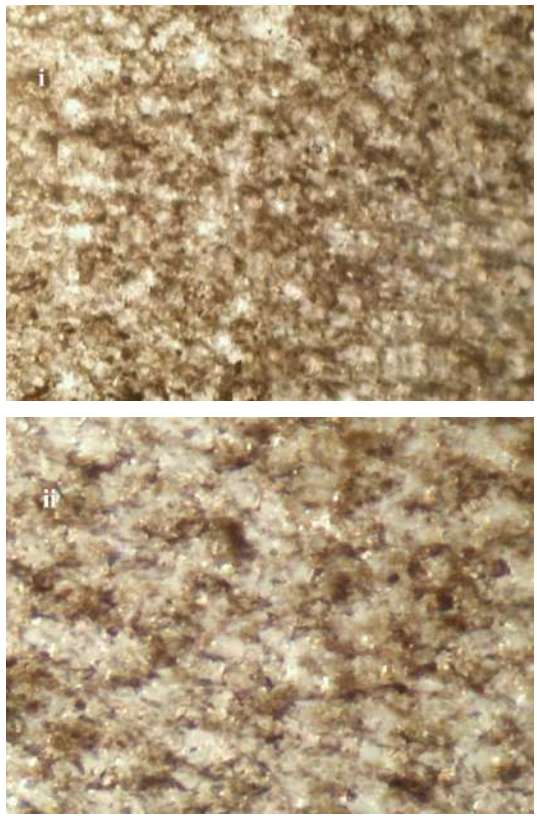

Fig. 3: Stereomicroscope evaluation of 1% GO/ PMMA composite under transmitted light for mix C (GO dispersion mixed to PMMA powder), (i) magnification 40X, (ii)magnification 80X

For rabbit hemolysis test results the 1% GO dispersion showed highest mean (2.79±0.27) among all groups. It was statistically significant to groups I (1.97±0.41), II (1.48±0.46), and III (1.72±0.45). Group II showed the lowest mean among all groups and it was statistically significant to groups IV (2.08±0.43) and V (2.19±0.3). The means of percent of hemolysis for different groups are represented in Figurer4.

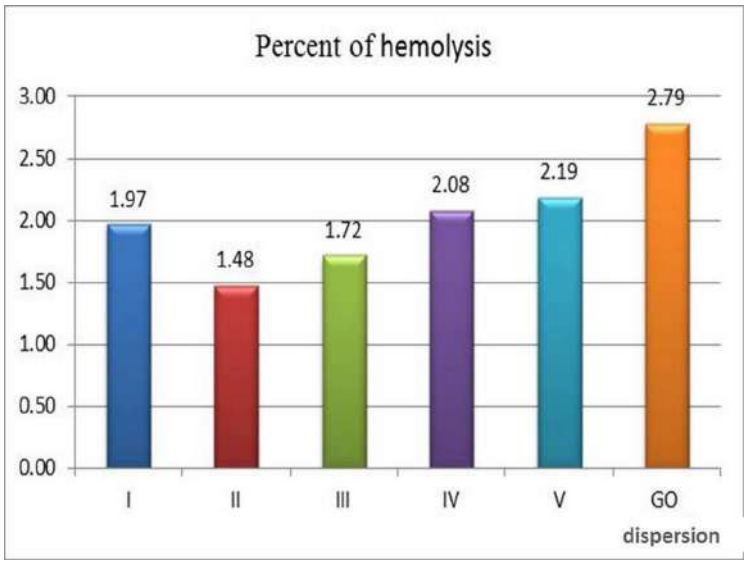

Fig. 4: Column chart show means for rabbit hemolysis test in % of different tested groups.

Discussion

This study was conducted to find a way to incorporate GO homogeneously into PMMA to form GO/PMMA composite and confirm that this formulation has no adverse effect on biocompatibility. Nano GO was selected for its documental highly physical and mechanical properties[1].The max loading GO was 1% to avoid aggregation during mixing with resin in higher concentrations.[15]

The inhomogeneous mix of mixing protocol A was attributed to high aggregation tendency of GO in powder form[16]. In mixing protocol B, sonication was done for 64 minutes in intervals reciprocating between sonication and rest to prevent over heating which might induce MMA polymerization. Longer sonication period was avoided because it can significantly introduce defect which undermined the properties of GO[17]. In the mixing protocol C, deionized water was used as dispersion media for GO, then the dispersion was mixed to the PMMA powder and dried. This protocol resulted in the most homogenous mix. This might be explained by the higher polarity of the water and presence of epoxide, hydroxyl, carbonyl, and carboxylic functional groups on surfaces and edges of GO nanoparticles [1,17,18]

According to ANSI/ADA specification no.41, all groups tested for rabbit hemolysis test considered non hemolytic as their results were below 5%. High mean of percent of hemolysis for 1% GO dispersion may be attributed to interaction between the GO and RBC. This finding was in agreement with the previous studies[18-20] and could be explained by many explanations. The first explanation was based on chemical interaction of GO with proteins presence in the blood via charged surface of GO. The second explanation was based on generation of reactive oxygen species (ROS) by GO which induced oxidative stress disrupt the cell membrane [18-20]. The third explanation was based on physical action of sharp GO edges which can cut through the cell membrane[21]. Increasing the percent of hemolysis by increasing the GO concentration in GO/PMMA composite could be explained by increasing the amount of unreacted residual monomer (MMA) by increasing the GO concentration in GO/PMMA composite based on Paz et.al 2017[9] finding. The MMA monomer may cause RBCs to become fragile, and may cause RBC damage [22] and enhanced ROS formation.[23]

Conclusions

This study focused on producing different concentrations of a homogenous GO/PMMA composite and evaluated this composite for biocompatibility. The following findings were concluded from this study; first mixing of GO water dispersion to PMMA powder produces a homogenous distribution of the nanoparticles in the final polymer matrix. Second, GO/PMMA composite in concentrations of 0.05%.0.1%. 0.15 and 1% are biocompatible and can be used in dental and medical applications.

Abstract

Manipulative movements are a series of movements that involve members of the body as a form of action to control an object using energy so that they can engage in movement activities that have a target or goal. Games are movement activities that are loved by all groups of children. Which involves feeling happy, carefree or happy. Information technology is a set of hardware and software that is important in improving the quality of information quickly and with quality. Therefore it is very good and effective if the development of information technology is implemented in the world of sports, one of which is in the form of games for schoolchildren aged 10-12 years so as to facilitate the stages of the learning process in carrying out a variety of good and correct basic motion activities. The purpose of this study is to determine the basic manipulative movement skills in games and the effectiveness of available information technology. This research method uses Borg & Gall research and development with qualitative and quantitative approaches for One-Group Pretest-Posttest Design. So the results obtained through Information Technology in the game will be able to improve basic movement skills that are good and right. It was concluded that the model developed in an information technology-based game can enhance symmetrical manipulation of multilateral basic movements, good and right, especially at the age of 10-12 years and the formation of emotional maturity, a sense of togetherness and effective communication among others and efficiently.

Keywords: *Manipulative Basic Motion Skills, Games, Information Technology.*

Introduction

Learning motion skills is one part of physical education learning in schools aimed to achieve learning goals so that children have adequate movement skills and the ability of movement as a provision in their daily lives[1]. Physical education is an integral part of the education system as a whole. Education as a process of human development in lifetime[2], has a very important role by which it provides opportunity to students to be directly involved in various learning experiences through physical activity. Remembering the importance of motion patterns that form the basis of a movement in student education, various movements which are more attractive and encouraging students need to be developed. Then, the advancement of information technology in all aspects can be utilized to develop education[3]. The basic movement is a level of quality mastery in carrying out body movements as the foundation of a movement process which involves coordinating several body parts or all parts of the body to function properly[4,5]. The degree of coordination of the body parts needed to carry out movements is relatively high. To reach a basic level of motion, it takes a learning process and practice for a certain period of time. As a teacher or educator of physical education and health, they should understand and mastery science both in the form of theory, concepts, and principles from the scientific foundation to carry out

Post Graduate Sports Education, Jakarta State University, Indonesia
e-mail: nevihardika@gmail.com

scientific tasks especially with regard to basic motion[6]. The benefits of motion skills are to: (1) the development of motion for children's health in increasing muscle tone, strengthening bones, maintaining healthy blood pressure, increasing heart performance, introducing healthy lifestyle[7] (2) development of motion in children's motor growth; increase muscle strength, flexibility, body coordination, balance, increase body awareness, develop more complex movements such as running, jumping, throwing (3) cognitive development of children, increasing brain connections, stimulating the ability to spend, improving memory and concentration, increasing creativity and ability to overcome problems, improve abstract thinking (4) developments in children's social abilities; encourage cooperation, establish friendships, enhance learning consequences of behavior. (5) development of children's emotions; build self-confidence, overcome depression and anxiety, improve discipline and self-control, reduce aggressive habits and be able to express feelings well[8].

Through playing activities, it is appropriate to develop basic children's movement skills in elementary school, because basically children's world are to play. Games are one type of activity that is very popular to children[9]. The game provides greater pleasure, according to Patty (2008) there are six types of games, namely: (1) introductory games, (2) individual games, (3) team games, (4) games at party ceremonies, (5) in-game water, (6) scout games.

Therefore, in learning activities, it is not surprising that there are some students who do not participate in learning for a number of reasons as: bored, tired, don't like learning material. It turns out that elementary school students experience obstacles or difficulties, because in childhood locomotor motion abilities development.

Literature Review: The development research is an attempt to develop an effective product in schools[10]. This model is one of the most popular models of education research and development which explains educational research and development [11] is a the process used to develop and validate educational production[12]. Then, the reasons of researchers in closing the model from [13]are as follows: able to overcome real needs through developing solutions to a problem while producing knowledge that can be used in the future and able to produce a product model that has a high validation value because through a series of field trials and validated by experts;[14]. Based on the results of research (Wahyuningtias Puspitorini, James Tangkudung, 2017) similar research results: Through water games in Learning basic motion skills for Children 5-6 years

proven to improve basic movement skills and help build confidence and courage. Followed by other research results, (Hidayat, 2017) with the similarity of research results: an activity in a game can improve the basic locomotor, non-motomotor and manipulative motion techniques. Strengthened from the results of the study (Aji Zaenal Mutaqin, Sufyar Mudjianto, 2017) with the similarity of research results: through the game like games can improve the basic motion patterns in throwing the ball.

Methodology/Materials

This research methodology stage uses development research.

Results and Findings:

Table 1. Preliminary Research Results to Sports Teachers

No	Schools	Grade	Score	Completeness (%)	Classification
1	School A	4	12	80	Good
2	School B	5	10	67	Enough
3	School C	6	10	67	Enough
4	School D	4	11	73	Enough
5	School E	5	10	67	Enough
6	School F	6	9	60	Less
7	School G	6	12	80	Good
8	School H	4	11	73	Enough
9	School I	5	11	73	Enough
10	School J	4	10	67	Enough

Total	**49**	**106**	**706,63**	
Average	4,9	10,6	70,663	Enough
Min	4	9		
Max	6	12		
Very Good	0			
Good	2			
Enough	7			
Less	1			
Very Less	0			

From the results of the analysis as a preliminary study conducted that: the minimum value obtained is 9 while for a maximum value of 12 so the total number of each school with an average value of 70,663% is categorized enough.

Table 2. Results of Analysis of Needs for Students During Learning Physical Education

No	**Teachers**	**Grade**	**Score**	**Completeness (%)**	**Classification**
1	A1	4	264	80,00	Good
2	A2	5	199	60,30	Enough
3	A3	6	217	65,75	Enough

Maximum		26	25	1	26	25	1
Sum		526	514	12	526	509	17

Based on the results of the 22 pretest and posttest samples, it can be interpreted that there are significant differences and values increase.

Based on the results of the 22 pretest and posttest samples, it can be interpreted that there are significant differences and increases in value after receiving treatment.

Table 4. Score Distribution Frequency of Tennis Ball Throw and Catch (Pretest and post test)

No.	Interval Score	Category	Pretest		Control	
			Absolut Frequency	Relative Frequency (%)	Absolute Frequency	Relative Frequency (%)
1	20.00-21.25	Very good	0	0	0	0.00
2	21.26-22.50	Good	12	54.55	11	50.00
3	22.51-23.75	Moderate	10	45.45	11	50.00
4	23.76-25.00	Less	0	0	0	0.00
	Total		**22**	**100**	**22**	**100**

No.	Interval Score		Posttest		Control	
			Absolut Frequency	Relative Frequency (%)	Absolut Frequency	Relative Frequency (%)
1	20.00-21.25	Very good	1	4.5455	0	0.00
2	21.26-22.50	Good	19	86.364	19	86.364
3	22.51-23.75	Moderate	2	9.0909	3	13.64
4	23.76-25.00	Less	0	0	0	0.00
	Total		**22**	**100**	**22**	**100**

Based on the results of the Distribution of the Frequency of Tennis Ball Throw and Catch that there is a comparison of the results of the Relative Frequency value between pretest and control of 1 person with a good category of 4.55% while for the Moderate category of 4.55%.

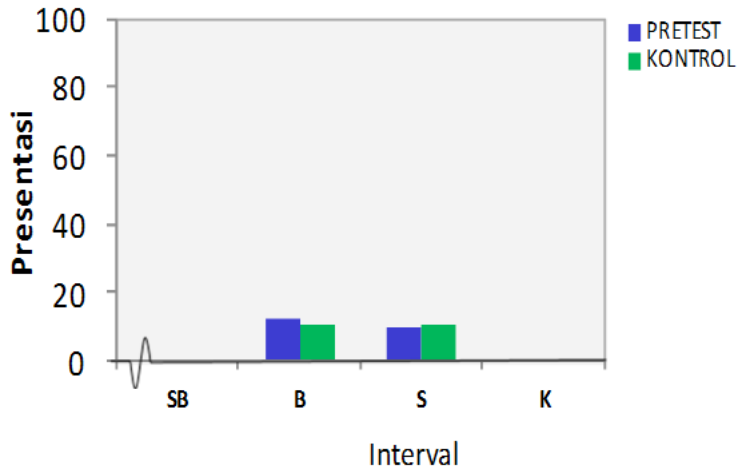

Chart 1. Score Distribution Frequency of Tennis Ball Throw and Catch

Based on the results of the Distribution Frequency Distribution Value of Throwing Tennis Ball that there is a comparison of the results of the Relative Frequency value between the posttest with control of 1 person with a very good category of 4.54% while for the good category of 19 people both from the posttest and control groups or the same, while for Moderate category as much as 1 person is 4.54%.

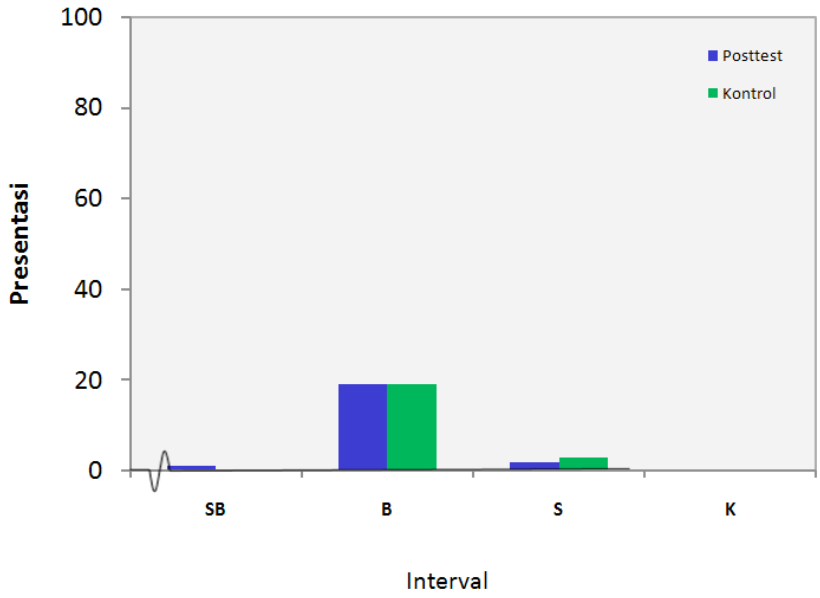

Chart 2. Frequency Distribution Value of Throwing Tennis Ball

Discussion

This effectiveness of the test was the results of a concept that was developed and could be generalized, especially in games for children aged 10-12 years, which could improve multilateral skills of manipulative basic motion. Therefore it is also quite clear that by reinforcing the results of research (Arif Hidayat, 2017) results of the research conducted are able to increase activity, ability and locomotor, non-locomotor and manipulative basic technical skills of students at State Primary School using the game model. While the results of research from (Wahyuningtias Puspitorini, 2017) results in the effectiveness of a fundamentally oriented learning model with games for children 5-6 years.

Conclusion

The results of the concept model developed in a multilateral game based on information technology can support the process of improving the results of basic movements of manipulative harmonious (symmetrical), good and right and the formation of an emotional maturity, sense together and communicate with each other effectively and efficiently.

Acknowledgements

In this valuable opportunity, researchers intend to express their gratitude and appreciation to all of them. First, the deepest appreciation of the researchers was given to my beloved parents, my mother Hadimas, for endless love, praying and supporting, and my father Asbahani, for telephone calls every week to remind me to keep my spirits up, keep going and never give up.The researcher expressed his sincere appreciation to FirmansyahDlis as the coordinator of the S3 Postgraduate Sports Education study program, Jakarta State University for providing motivation, advice, and support for me.

It would not have been possible without the help, support and patience of my first advisor, Moch. Asmawi for his supervision, advice, and guidance since the early stages of this research and gave me extraordinary experience in motivation, advice, and support. Then to his second counselor James Tangkudung who helped him patiently provide advice, guidance, and correction and to the principal to enable me to conduct research there. Also for my two children, Kissa and Sultan and my beloved wife Nana Efita who never stopped asking about the completion of my studies. Their text messages upset me but magically gave me a reason to be focused on completing my studies as quickly as possible, for that I was truly grateful to have you two in my life.

Finally, I would like to thank all the people in this engagement who have helped so that it went well and was completed on time.

The Influence of Job Stressor on Organizational Loyalty and Intention to Quit among Health Care Staff

Mohammad Saipol Mohd Sukor[1], Siti Aisyah Panatik[2], Wan Mohd Azam Wan Mohd Yunus[3]

[1]Senior Lecturer, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia, [2]Associate Professor, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia, [3]Senior Lecturer, Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia

Abstract

Job stressor has been taken seriously by the health care organizations because of its effect on employees' behaviours at the workplace. This study was conducted to identify the influence of job stressors on organizational loyalty and intention to quit. This study approach was quantitative with cross-sectional research design. The instruments used were Job Content Questionnaires, Organizational Loyalty Questionnaires, and Intention to Quit Questionnaires. A total of 340 health care staffs in several public hospitals and clinics in Malaysia were involved in the study. Descriptive statistic and multiple regression were used to analyse the data. It was found that job stressors have significant influence on organizational loyalty and intentions to quit. The findings proposed that the management of health care organizations should focus more on managing job stressors in order to increase organizational loyalty and reduce employees' intentions to quit among public health care staffs.

Keywords: *Job demand, job control, organizational loyalty, intention to quit.*

Introduction

Nowadays, the intention to quit and the lack of organizational loyalty are among the critical issues in human resources management[1]. Every large organizations have tendency to lose an average of 20 employees a year[2]. That means most of the employees in various industries and organizations especially in health care sector have a tendency to quit their current job and looking for another job. It is expected to be almost 76 percent of employees in various industries and organization will tend to look for another job and will leave the organization when better job opportunities are available[3].

Corresponding Author:
Dr. Mohammad Saipol Mohd Sukor
Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia
e-mail: msaipolm@gmail.com

Although employees quit their work due to many factors, research evidence indicates that the intention to quit and the lack of loyalty are important indicators for the loss of workers in an organization[4,5]. This problem will cause organizations to spend a lot of money to find,recruit and train new employees. The estimated costs could be double the amount of the employees' annual salary[6]. It will undermine the organization overall performance and productivity, thus contribute to the low morale and motivation among the colleagues[7,8].

The intention to quit refers to the tendency of workers to think and plan to leave the organization for a variety of reasons. Whereas, the organizational loyalty refers to the employees' tendency to stay in an organization. Many studies have been conducted to identify the causes of employees' problematic behavior, which characterized by high intention to quit and low organizational loyalty as it could interfere with overall achievement of an organization.

One of the main reason for organizations to lose their employees is job stressor[9,10]. The United Nations has

labeled job stressor as a "worldwide epidemic" as it has been recognized as one of the major global challenges of the 21st century[11,12,13]. All employees experience stress and there is no way for them to avoid job stressor at workplace[14,15].

Previous researchers studied the association between job stressor and intention to quit[16,17]. However, mostpast studies only focused on general effect of job stress and lack of explanations on the effect of specific job stressor towards the workers' intention to quit especially in the context of public health care staff.

Other than that, there is also limited research on the causal relationship between job stressor and organizational loyalty[18,19]. Despite loyalty can contribute to the organizational achievement, but it is often overlooked by most organizations because they focused more on the quality of service which is expected to influence customer loyalty[20,21].

Therefore, this study conducted to fill the research gapin the context of health care organization as it striving to increase loyalty and reduce intention to quit among employees[22]. There are two objective of this study, first to identify the influence of job stressor on organizational loyalty and second to identify the influence of job stressor on intention to quit.

Literature Review: The concept of organizational loyalty and intention to quit can be understand through the Social Exchange Theory which proposes the element of retention (loyalty) and dissolution (quit) as a process that occurs in the social exchange relationship between employer and employees[23,24]. The theory also explained that the social exchange imbalance could create job stress, which in turn reduces employees' loyalty to the organization. It indicates that there is a connection between job stress, organizational loyalty and intention to quit.

Job stress exists due to the combination of job demands and job control[25]. High job demand with a combination of low job control creates a high stress work environment. Job control refers to the potential and the ability of the employee to control and make decisions about the task they performed[25]. Whereas, job demands refers to the burden such as unexpected tasks, time pressures, physical and psychological workloads[24].

Past researchers support the relationship between job stressor and organizational loyalty in the context of health care staff[26,27,28]. Previous study also support the association between job stressor and intention to quit[29,30,31]. Excessive workload and low authority to make decision will contribute to the increased intention to quit among health care staffs[32,33,34]. Based on the support from previous studies, this study will test four hypotheses.

H1 There is a significant negative influence of job demand on organizational loyalty

H2 There is a significant positive influence of job control on organizational loyalty

H3 There is a significant positive influence of job demand on intention to quit

H4 There is a significant negative influence of job control on intention to quit

Material And Method

The population of this study were public health care staff which consist of trained nurses and medical assistant officers in several public health clinics and hospitals in Malaysia. Previous study showed that employment in the health care sector is among the high stress occupations in Malaysia[34]. In addition, past researchers also often associate health care staff with a high desire to leave the organization[10,36].

The respondents were chosen using simple random sampling technique. The total samples obtained in this study was 340 public health care staffs. Overall, the majority of respondents were nurses (76%), female (66%), between 20 and 29 years old (49%) and have less than 5 years working tenure (42%). This study uses cross-sectional research design with quantitative data approach.

The Job Content Questionnaire used in this study to measure job stressor[37]. It has high reliability with Cronbach's alpha value of 0.71 to 0.86. Furthermore, the Organizational Loyalty Questionnaire used to measure organizational loyalty[38]. The 7 items questionnaire have high reliability with Cronbach's alpha of 0.84.

As for the intention to quit, this study used 3 items from Intention to Quit Questionnaire[39]. The instrument have high reliability with Cronbach alpha 0.92. All of the questionnaires were measured using 5 point Likert scales ranging from 1 "strongly disagree" to 5 "strongly agree". Simple linear regression analysis was conducted to identify the influence of job stressor on organizational loyalty and intention to quit.

Findings: This study found that there is a significant influence of job stressors on organizational loyalty. Both job stressors explain 14% variance of organizational loyalty among health care staffs. Specifically, the findings showed that job demands negatively influence organizational loyalty. On the contrary, job control was found to be positively influence organizational loyalty. Therefore, the findings of this study accept hypotheses H1 and H2.

This study also found that job stressors were significantly influence the intention to quit. Both job stressors explain 13% variance of intention to quit among health care staffs. Specifically, it was found that job demand influence the intention to quit positively, whereas job control predicts the desire to quit negatively, thus accepting hypothesis H3 and H4 in this study.

Table 1: Regression Analysis

Model	Organizational Loyalty		Intention to Quit	
	β	t	β	t
Job Demand	-0.29**	-3.69	0.75**	5.89
Job Control	0.42**	7.01	-0.51**	-5.21
R	0.37		0.37	
R^2	0.14		0.13	
F	27.21**		25.90**	

**Significant at the level of two-tail($p< 0.01$)

Discussion

This could be one of a very few study that examine the causal relationship between job stressors and organizational loyalty especially among health care staffs in Malaysia. Based on the results of regression analysis, this study found that the presence of job stressors in the workplace can cause changes in the workers' intention to stay in the health care organization. The findings of this study was consistent with the findings of previous research[,40].

Specifically, this study shows that higher job demands will contribute to a lower organizational loyalty. The finding is in line with previous study which shows the negative association between job demands and organizational loyalty[42,43]. Health care staffs who are often overworked and overwhelmed with task will tend to leave the organization.

On the contrary, this study found that job control will increase the organizational loyalty. The results support previous study which found that job control positively related with organizational loyalty[26,28]. Hence, when a health care staff is given freedom to make decisions about his appointed tasks, the staff tends to help organizations to succeed and continue to stay in the organization in the future. This is probably because the staff felt that the authority given to them reflects the employers' trust in them, so they tend to be more committed in their work.

Other than organizational loyalty, this study also found that job stressors influence the intention to quit among health care staffs. Specifically, this study found that the increase in job demand will increase the employees' intention to quit. This finding supports previous studies that positively associated job demands with intention to quit among health care staffs[10,31,36].

The findings also showed that the health care staffs who often work hard to complete their task within a limited time will tend to think of quitting their current job. Basically, high job demands can increase employees' emotional, mental and physical fatigue. Therefore, to avoid being constantly confronted with the situation, the employees tend to think about leaving the organization in the future.

Furthermore, this study found that employees who have higher job control, will less likely to quit their job. This finding supported previous studies that found significant association between job control and intention to quit[10,31,34]. When employees are given less freedom to make decisions regarding their assigned task, they will feel dissatisfied with their work and as a result, they tend to think about quitting their current job. It is because individuals' perceptions of their ability to manage and controlling their work is what predicts their actions to quit.

Conclusion

This study provide the additional value in literature by expanding the causal relationship between job stressor, organizational loyalty and intention to quit in the context of health care staffs. However, it would be beneficial for future researcher to expand the research among health care staffs in the private sector too. Job demand and job control was found to be significantly associated with the employees' workplace behaviour. The findings of this study revealed that managing the job stressor would be beneficial to prevent the loss of employees in the health care organization.

Emotional Intelligence and Conflict Management Style among Staff in a Bank

Maisarah Mohd[1], Halimah Mohd Yusof[2]

[1]Under Graduate Student, [2]Senior Lecturer, School of Human Resources Development and Psychology, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia

Abstract

The purpose of this research is to identify the relationship between emotional intelligence and conflict management style among staff at a Bank Headquarters in Kuala Lumpur. A total of 75 staff were involved in this research. The questionnaires distributed in this research were adapted from Wong and Law EI Scale (WLEIS) (2002) based on Mayer, Salovey and Caruso's EI Model (2004) and Rahim's Organizational Conflict Inventory-II (ROCI-II) (1983) based on Rahim's Organisational Conflict Model (2011). The relationship between EI and CMS was identified based on the Pearson's Correlation analysis. It was found that there are significant influences between EI and integrating, obliging, dominating and compromising style while EI does not show any significant influence on avoiding style. The findings also showed that the staffs have high EI based on the mean score. Implications of these research suggested that organisation should be more aware of the employees' potential and abilities as well as their style of handling conflict in order to create a positive work environment. In addition, these research findings could add up to the literature of emotional competence and conflict management field.

Keywords: *Emotional Intelligence, Conflict Management System.*

Introduction

Emotional intelligence (EI) is one of the important aspects or traits of an individual because it could promote stability in creating better relationship between one another by projecting trust, sensitivity and understanding towards their emotions and feelings. The concept of EI in the organisation is when excellent employees are able to utilise their EI competencies for the satisfaction, commitment and outstanding performance in the organisation[1].

The usage ofEI competency could aid conflicts that arise in the organisation. Conflict is inevitable in our context of living. Conflict can be defined as the internal or external discord between individuals or groups that results from the differences in attitudes, ideas, values and feelings[2]. Likewise, there are two distinct ways to handle conflict[3]. Firstly, respond to it in a productive manner where the employees develop and learn from the disagreements while secondly is the employees demonstrate negative response towards the conflict but it will lead to further difficulty and tension.

Positive linkage or relationship between EI and CMS can lead to successful interaction and effective performance[4]. Those who possess higher EI level will have better capacity in handling conflict in effective way[5]. In fact, EI has high importanceon integrating, compromising and dominating styles because those styles required higher sense of understanding and judgement[6, 7]. Hence, the purpose of this research is to identify the relationship between EI and CMS among staff at XY Bank Headquarters.

Conceptual and Operational Definition: For the purpose of this research, the definition of EI was administered from Mayer, Salovey and Caruso[8] that

Corresponding Author:
Dr. Halimah Mohd Yusof
Universiti Teknologi Malaysia, 81310 Skudai, Johor, Malaysia
e-mail: halimahmy@utm.my

defined EI as the ability to perceive emotions, to access and generate emotions in order to understand emotions and emotional meanings, to assist thought and to reflectively regulate emotions to promote better emotions and thought. Thus, for this research the operational definition was based on the four dimensions ofthe EI theory from Mayer, Salovey and Caruso[8].

Conflict management is the used of effective style or strategies designed to minimize dysfunctions of conflict as a result to enhance effects of constructive conflict for organization effectiveness and learning[10]. There were five dimensions to represent the theory in this research. The dimensions are dominating, obliging, compromising, integrating, and avoiding.

Literature Review: The term EI came into research when Mayer and Salovey[8,12] first introduced it as a type of social intelligence which carries the meaning of the ability to monitor one's own and others' emotions, to discriminate among them, and to use the information to guide one's thinking and action. EI is an important aspects in every organization as human are creatures of emotions, hence, EI capability is well sought after[13].

Meanwhile, conflict management style (CMS) is way to control conflict in appropriate manner; rational, just and effective supported by effective communication, problem solving and negotiation skills[14]. Rahim[15] has constructed a conflict model that comprises of five styles which are dominating, obliging, compromising, integrating and avoiding.

Based on empirical studies, there were linkages between EI and CMS. The selection of CMS is different from one person to another person depending on their EI[16]. According to Schlaerth*et al*.[17] those who possessed higher level of EI tend to be more collaborative and problem-solver when facing the conflict because they could control their emotion to solve the conflict rationally and satisfy both concerns.

Furthermore, Goleman[18] indicates that higher EI leads to positive behaviours in handling conflict such as open to discussion, convey convincing messages and keeping calm. When they are able to channel the positive behaviour in the organising, it will be easier from them to handle the conflict effectively. They are willing to exchange information with each other and sit down together to discuss for desirable solution. Thus, integrating and compromising styles are frequently used to resolve conflict because it could harmonise the situation.

On top of that, higher EI person will usually avoid the usage of avoidance and dominating style because they are less inclined to cause grievance to other party involved in the conflict. They will not supress and disregard the situation because it will not resolve the conflict and benefit any party[19]. Person with higher EI will have higher sensitivity and deep empathic that made them willing to discuss and think for possible solution to solve the conflict[16].

Next, those who possessed low level of EI have the tendency to take charge or steer away from the conflict[20] because either they are insensitive or incapable. People tend to take charge or dominate in handling the conflict because they have low concern on others[21] and wanted to win by utilizing the concept of win-lose resolution. Lower in EI tend to make people to be aggressive when engaging in conflict[22]. They will ignore the relationship because they are insensitive to others feeling and emotion[14]. Unlike avoidance, people with lower EI will steer away from the conflict because they are incapable to resolve it or they believed that the conflict it not an important matter to be considered[23].

Methodology

Research Design: This research used a non-experimental design and the quantitative method. This method helped to measure the level of EI and CMS. The data was analysed based on descriptive and inferential statistics.

Population and Sampling: The sampling method used was convenience sampling as it was selected based on accessible population due to the permission given by the authority of XY Bank Headquarters which the research can be conducted towards the 85 staff in Human Capital Department only. However, the response rate was only 88.2% with only 75 staff responded to the questionnaire.

Data Collection Method: The research instruments were based on questionnaire derived from Wong and Law; WLEIS[9] for EI and Rahim[11] ROCI-II for CMS. The questionnaires were distributed to the population of 85 staff and only 75 responses were managed to be collected back to analyse.

Findings:

Level of Emotional Intelligence: From Table 1, it can be concluded that the dimensions are at high level except for perceiving and expressing emotion which falls at moderate level (M=3.66). The overall EI among XY Bank staff is at high level of 3.81.

Table 1: Level of EI Dimensions

Dimension	Item	Mean (N=75)	Level
Understanding Emotions	4	4.00	High
Perceiving and Expressing Emotions	4	3.66	Moderate
Facilitating Emotion in Thought	4	3.87	High
Managing Emotions	4	3.71	High
Total		**3.81**	**High**

Style of Conflict Management: Table 2 shows that the staffs mostly used integrating style (M=3.91). The overall mean score for CMS is at moderate level (M=3.52).

Table 2: Level of Conflict Management Styles

Dimension	Item	Mean (N=75)	Level
Integrating	7	3.91	High
Obliging	6	3.46	Moderate
Dominating	5	3.10	Moderate
Avoiding	6	3.31	Moderate
Compromising	4	3.74	High
Total		**3.52**	**Moderate**

Relationship of Emotional Intelligence and Conflict Management Style: From the findings it can be concluded that EI and CMS have a positive moderate relationship (r=0.500*). However, for the overall EI score does not show any significant influence on the selection of avoiding style (r=0.49, p>0.05). Table 3 depicts that all of EI dimensions has a relationship (p<0.05) with integrating and compromising style.

Table 3: Pearson's Correlation Analysis of EI and CMS

Emotional Intelligence	Conflict Management Style				
	IG	OB	DM	AV	CM
Understanding Emotions	.534*	.176	.070	-.010	.510*
Perceiving and Expressing Emotions	.273*	.317*	.153	.148	.254*
Facilitating Emotion in Thought	.438*	.161	.205	-.023	.400*
Managing Emotions	.522*	.259*	.378*	.003	.478*
Overall	.620*	.335*	.304*	.049	.574*

* Correlation is significant at 0.05 level (2-tailed).
Note: IG = Integrating, OB = Obliging, DM = Dominating, AV = Avoiding, CO = Compromising, N = 75, *p<.0.05

Discussion and Recommendation

The results show that the overall EI has moderate positive relationship towards the overall CMS. Based on the dimensions of both variables, all of EI dimensions have emerged to be significant influenced on the selection of integrating and compromising style among the staff. Firstly, understanding emotions has shown relationship with integrating and compromising style whereas obliging, dominating and avoiding style have no significant towards the dimension. This indicated that, the staff tends not to oblige, dominate or avoid the conflict because those who have high understanding emotions would know why they act in certain ways and have a good sense of why they have certain feelings to satisfy their own concerns and ensure smooth discussion. Individuals with high EI are more inclined to listen others viewpoints to seek for alternatives that will not inflict any harm to other party and to avoid wrong decision that will affect them[24].

The emotional dimension of perceiving and expressing emotions only shows relationship with integrating, obliging and compromising style. It has no significant with dominating and avoiding style. The highest relationship of perceiving and expressing emotions is portrayed from obliging style. Good in perceiving and expressing emotions indicates that the person has good social skill and high empathy which makes them easier to communicate and share feedbacks with others[23]. Therefore, it shows that the staffs have good social skill, which encourage them to share their concerns and try to understand their colleagues. At the same time, they will not dominate and avoid the situation because they are sensitive to others' concern and try to fulfil their concerns too. A research had also found that, individuals with good ability to understand other's emotions would choose integrating and compromising style because they will deal with others' opinion and acknowledge their rights to achieve a win-win solution[24].

Next, the finding revealed that dimension of facilitating emotion in thought has relationship with integrating and compromising style which shows that the staff have high ability in facilitating emotion in thought that because they have the motivation for moving and directing themselves towards reaching their goals. So, obliging, dominating and avoiding style would not be a contributor for them to move forward but as a stumbling block because those styles are about winning or letting go their aim in which is not ideal to achieve their goal and to keep the relationship steady. Shamoradi et al.[25]found that self-motivation has a relationship with compromising but not with integrating style. This is probably because of the cultural aspect, in which,the Iranians are inclined in a give and take situation and willing to sacrifice their interests to sooth other party because they would not let dispute among colleagues preventing them from moving forward.

Managing emotions shows the most significant relationship with most of CMS except for avoiding style. The strongest relationship pointed to the integrating style and it is the only dimension that has significant with the dominating style. From the findings, it can be concluded that the staff is capable of controlling their emotions, anger and able to handle conflict rationally. This is probably because when facing with a conflict, the situation could be tense and those who are able to control their temper and think rationally throughout the discussion could win it as people are more inclined to listen to those who can use logic and provide evidence in solving conflict. This can be supported from the research by Ashkan[26] who claimed that people usually feel injustice during conflict and if they let it consume their feeling then it will distract them from resolving the conflict.

It has found that EI has positive relationship with integrating style and compromising style. This shows that the staffsare highly collaborative. They are ready to share and communicate with each other to resolve conflict in the most desirable way for all parties. They looked into the concerns of others when finding for the solutions. These results are in accordance with prior research which revealed that high EI person is expected to use integrating and compromising style in managing conflict[6,7,17]. They utilised the concept of win-win situation by taking others' concerns into account when constructing solutions. Other than that, they are able to control and facilitate their emotion when communicate with other party and remain rational throughout the process.

The findings shown thatEI has a relationship with dominating style which indicated that the staffs were less likely to use dominating style because higher EI person would not control and disregard other parties' opinion because they would discuss the matter in constructive way to achieve acceptable solutions between both parties. Highly emotional competence person have higher sensitivity and deep empathic towards others that made them willing to sit and work together in order to find possible solution[16]. Moreover, high EI person would not suppress others because it would not bring any advantage to the parties involved[19].

Furthermore, it can be seen that the staff have high EI, hence, contributes to good CMS which they commonly use integrating and compromising style in handling conflict. These styles are unlikely to cause further disputes between the staff because they tend to be sensitive and considerate of others' opinion in the discussion. They are also willing to share information with their peers in order to reach mutually acceptable solutions. Hence, the relationship between EI and CMS is positively significant from this research

Recommendations: As recommendations, future researcher can replicate this research but by extending it to a different sector with different and more diverse sampling size to have more accurate results. Lastly, future research can administer qualitative research method.

Conclusion

The findings show a positive relationship between EI and CMS among the staff. The EI shows significant relationship with integrating, compromising, obliging and dominating style. Hence, the findings provide some contribution to the body of knowledge related to EI and CMS.

Trend on Drink Drive and Road Accident Across Asian Region: A Review Study

Siti Hawa Harith[1,2], Norashikin Mahmud [1]

[1]Senior Lecturer, Faculty of Social Sciences and Humanities, Universiti Teknologi Malaysia,
[2]Ph.D. Scholar, School of Business Management, Universiti Utara Malaysia

Abstract

Road accident is a distressing issue that has been faced by all countries worldwide. Asia contributed more than one fourth of the total of road accident rates every year. One of the leading road accident factors that have been reported by most scholars is the drink drive problem. Therefore, this review was conducted with an aim to systematically study the trend on the drink drive and road accident. Searches were performed in Wiley Online Library, Emerald, Scopus, Science Direct and Web of Science. A total of 2462 findings have been yielded and after the screening and reviewing process, only 23 studies were included in this review. In overall, most of the included studies were published in Accident Analysis and Prevention journal within the years of 2000 onwards. The scholars mostly have undertaken their studies using the case series research design and using the accident data cases as their sample. Finally, most of the studies were undertaken in China.

Keywords: *Road accident, drink drive, Asian Region, systematic review.*

Introduction

Road accidents contribute most of the global fatalities statistics in the world with approximately 1.35 million deaths every year. Further report by World Health Organization (WHO) reveals that about 20 to 50 million victims suffer from disabilities and other non – fatal injuries due to the road accident[1]. Statistic shown that more than 90% of the accident occurrences globally happened in the low and middle income countries, which indicates that the level of socioeconomic d plays a role in influencing the road accident statistics. Less developed countries especially the African region recorded among the highest death rates due to the road traffic injuries[1].

Asian region also been reported facing a critical road accident problem with Thailand tops the fatalities statistics followed by Malaysia and Vietnam. Meanwhile, Singapore and Japan reported the lowest road fatalities[2]. There are three main factors that lead toward the occurrence of road accident which are human factors, technical factors and environmental factors. Among these, human factors lead the most of the accident occurrences with approximately 90%, whereas the remaining is due to the technical factors and environmental factors[3,4]. Nevertheless, in certain country like Malaysia, it has been reported that 80% of the road accident happened due to the human factors contradict to other countries worldwide[5].

The most common human factors that significantly lead toward the occurrences of road accident are the drivers' intentional behaviour of breaking the traffic rules and regulation or also known as the traffic violation behaviour. Literatures reported that some of the traffic violation behaviour that commonly been committed by drivers are drink drive, illegal use of mobile phone while driving, tailgating or close following, run over red light, dangerous overtake, speeding, fail to turn the turning indicator and even driving during drowsiness[6,7]. Among these violation behaviour, drink drive is been reported

e-mail: sitihawaharith@gmai.com

as one of the leading accident causation[6,7]. According to WHO, alcohol has cause one in every 20 deaths around the world and responsible for three million deaths every year[8]. Due to this alarming fact, this paper is been constructed to systematically review the trend of the drink drive and road accident which specially been conducted in the Asian region.

Material and Method

A search has been conducted in five academic databases such as Wiley Online Library, Emerald, Scopus, Science Direct and Web of Science. The research timespan has been set within the year of 1951 until December 2018. The search also has been limit to research papers published in peer-reviewed journal as well as written in English language only. The researchers has outlined several keywords such as "determinant", "factor", "cause", "road accident" and "traffic crash" in order to undertake the searching process. Apart from that, several Boolean Operators such as "OR" and "AND" also been used in order to assist the searching process. Moreover, the researchers also outlined several inclusion and exclusion criteria which used as the guideline in selecting the most appropriate research papers to be included in this review study. Finally, upon the completion of the search process, the researchers export all the related findings into the EndNote X7 for further reviewing process. The information on the inclusion and exclusion criteria is as below:

Inclusion Criteria:

1. Type of study: Any type of cross-sectional study either survey or interview or observation, case series and case control study.
2. Participant: All types of participant or sample (all vehicle drivers or rides) who either already involved in a road accident or not as well as accident data from authorities.
3. Outcomes: Any studies that investigate on the drink drive and road accident. The outcome of this review were explained in term of the year of studies been published, type of journal the studies been published, country or location were the studies been undertaken (specifically in Asian region only), participant or research sample used the studies and type of study design.

Exclusion Criteria:

1. Type of study: Any studies which categorised as review study, meta-analysis study, governmental report or any non-profit organization report, student dissertation or thesis.
2. Research focus: Any studies that investigate on the other factors that lead toward road accident either other human factors, technical factors and environmental factors.

Results

In overall, a total of 2462 findings were gathered from the five databases during the search process. Details information regarding the gathered findings was tabulated in Table 1. After all the findings were exported into EndNote X7, the researchers undertook the first screening and reviewing process to detect duplicate. In this process, the EndNote X7 filtered all the findings and deletes any duplication findings which found from all databases. A total of 271 duplicate articles were removed during this process. Next, the remaining 2191 findings have undergone the title screening process. During this process, the reviewers delete another 1344 unrelated title. After that, the reviewers read each abstract of the remaining 847 related title and 579 unrelated abstracts were deleted. Then, the reviewers retrieved the full text for the remaining 268 related abstracts through the EndNote X7 function. For certain abstracts that cannot be retrieved by the EndNote X7, the reviewers formally requested the full texts from the original authors either through their Research Gate account or their personal e-mail address. After all the full texts were gathered, the reviewers finally read all the full texts and only select papers which fulfil the inclusion and exclusion criteria. As a result, only 23 papers were included in this review study. Detail information on the overall screening and reviewing process can be referred to the PRISMA flow diagram as shown in the Figure 1.

a. Type of Journals and Years of Publication: All included studies were published in 20 journals. Majority of the studies (n = 8) were published in Accident Analysis and Prevention, followed by four studies were published in PLoS ONE, three studies were published in Journal of Safety Research and two studies were published in ITE Journal (Institute of Transportation Engineers) and American Journal of Public Health respectively. Whereas, the remaining 15 studies were published in International Journal of Epidemiology, Safety Science, Journal of Traffic and Transportation Engineering-English Edition, SpringerPlus, British Medical Journal, New England Journal of Medicine, Tzu Chi Medical Journal, Psychiatry Research, Chinese Journal of Traumatology (English Edition), Procedia Engineering, Journal of Adolescent Health, Canadian Journal of Civil Engineering, Journal of Transport & Health, Planning Malaysia and Acta PolytechnicaHungarica. Meanwhile, regarding on the years of publication, majority of the studies (n = 5) were published in the years of 2011, 2013 and 2017 respectively, followed by four studies were published in the years of 2014 and 2016 respectively.

Next, three studies were published in the year of 2007 and two studies were published in the years of 2015 and 2018 respectively. Finally, one study was published in the years of 2003, 2006, 2010 and 2012 respectively. Overall, the results reveal an increase in publication over time.Detail information on the type of journals and years of publication can be found in Table 1.

b. Research setting: Diagram 1 shows the summary of the list of countries where all the included studies were conducted. In overall, the included studies were undertaken in 10 different countries across the Asian region. Most of the studies (n = 6) were undertaken in China followed by four studies in Turkey. Three studies were undertaken in Taiwan and two studies in India, Iran and Malaysia respectively. Finally, the remaining four studies were undertaken in Hong Kong, Thailand, Vietnam and United Arab Emirate (UAE).

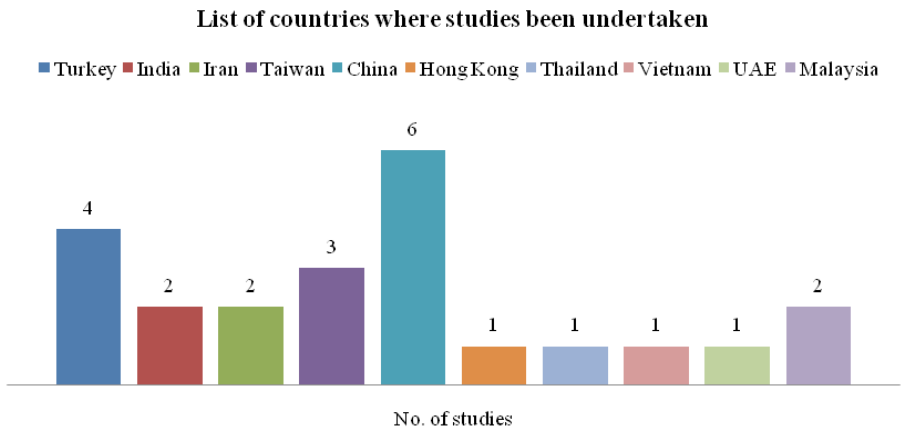

Diagram 1. Detail on list of countries where studies been undertaken

c. Research Participant/Sample: All the included studies were conducted using several type of research sample of participant. Majority of the studies (n = 14) use the sample of accident data cases which gathered from the authorities. Four studies use the sample of actual accident victims followed by two studies that include students/young drivers as participants. Finally, the remaining three studies use the sample of professional and amateur drivers, general drivers (author did not provide the detail) and the combination of various participants such as bus drivers, motorcycle users, bus passengers, bus company manager, traffic policeman and local authorities. Diagram 2 shows the detail information on the research participant/sample.

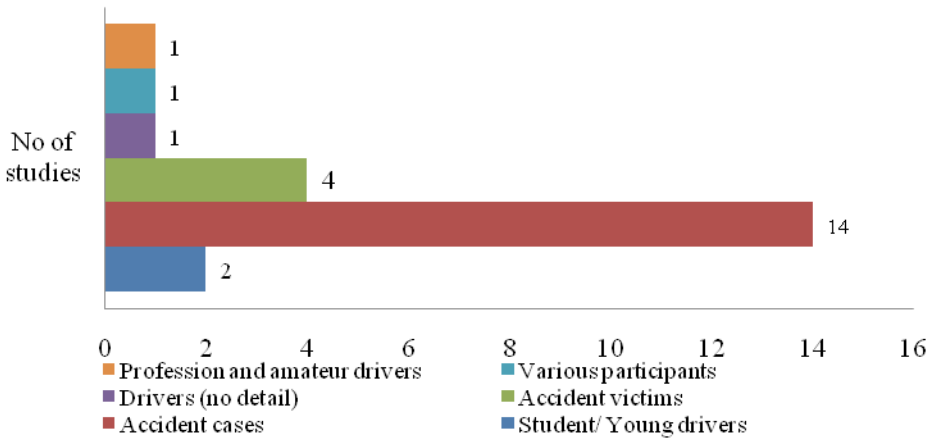

Diagram 2. Detail on research participant/sample

d. Type of Research Design: All 23 included studies applied five different type of research designs with majority of the studies (n = 16) used case series. In the case series study, the information was gathered from the authorities. Four studies were cross sectional studies, which three of them using questionnaire and one study using interview method. Meanwhile, two studies were case control study (data gathered from the accident victims' intoxication result) and finally one study used the in-depth analysis of accident case to collect the data. Detail information on the type of research design can be referred to Diagram 3.

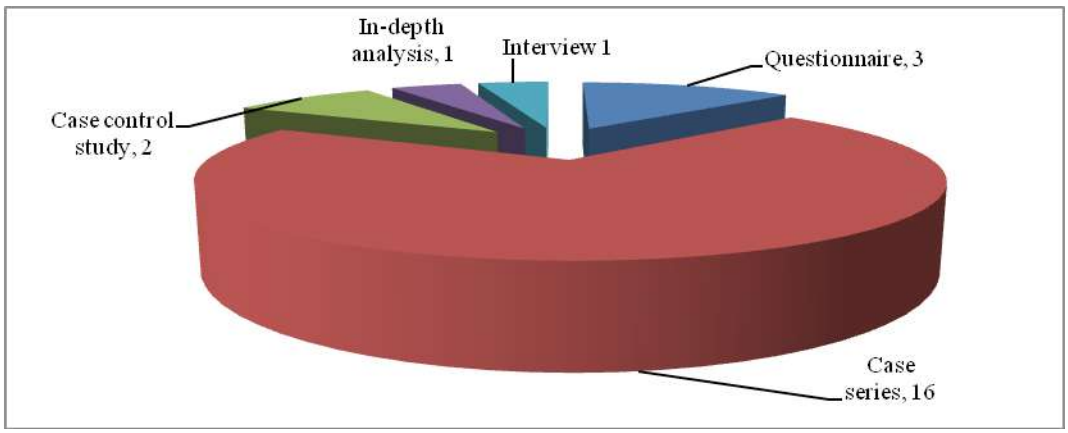

Diagram 3. Detail on type of research design

Conclusion

In overall, there has been an increasing of interest among researchers to explore the drink drive and road accident within the Asian. Majority of the included studies were published in the Accident Analysis and Prevention journal which is one of the high impact factor journals listed under the Scopus and Web of Science databases. Next, it also can be summarized that all included studies on drink drive and road accident in Asian region were been published on 2000 onward although the search process was conducted from the year of 1950 onward. Most of the included studies were published after 2013. Moreover, although there are 50 Asian countries across the region, only 10 countries were reported to undertake the study on drink drive and road accidents with majority of the studies were conducted in China. Finally, in term of the type of research design and research participant/ sample, most of the included studies undertaken their research using the sample of accident data cases which been categorised as the case series research design. This data can be accessed or provided by the authorities or other related bodies.

Based on this review, it can be concluded that drink drive is one of the critical topics as factors leading to road accident. This topic also among the common research area that been studies by scholar not only within the Asian region but also all around the world. Due to this facts, it is suggested to any future researchers who are interested to undertake this study to explore more on this area, not only on the impact of drink drive toward road accident but also looking on the effectiveness of the legal enforcement that been established by the government to curb this issue. Subsequently, from this review, it can be identified that most of the included studies using the research design of case series to summarized the accident leading factors. Thus, it is suggested to the other researchers to use face to face interview because this method will help the researchers to gathered even richer information. The drivers' perception toward road accident issue indeed crucial because they are the one who really know what is the best solution which is applicable to them in order to avoid the incident of road accident. As a result, more comprehensive countermeasure can be outlined when all the related parties involved in resolving this issue.

Obesity and Job Performance among Teachers in Malaysia

Mohd Hakiki Md Tohid[1], Zulkifli Khair[2]

[1]Master of Human Resource Development, [2]Senior Lecturer,
Faculty of Social Sciences and Humanities, University Technology Malaysia

Abstract

Despite the growing interest of teacher performance in relation to factors such as leadership, work and/or family conflict or stress, studies which linked teacher with overweight or obesity with job performance and productivity are insignificant. Moreover, Malaysia is Southeast Asia's "most obese" nation with an obesity incidence of 17.7% and an overweight of 30%. Data is a review of newspapers and official reports as well as academic journal articles and theses from established databases such as Wiley Online Library, Taylor and Francis, ScienceDirect and ProQuest. The scope is obesity or overweight experiences which may affect performance or productivity at workplace taken from 2010 onwards including the level of non-communicable disease, productivity assessments and annual reports. Study about obesity and its impact towards teacher's performance or productivity is almost none. The impact of obesity on job performance can be seen from its impact on individual, social and economy. The impact towards economy and individuals are discussed with focusing more on Malaysian context. Evidence used in this study come solely from the mentioned resources. Conclusions reached are thus qualified by that limitation. Further studies should be conducted on the exact obesity trends among teachers and the impacts on performance or productivity. More in-depth studies are needed specifically on the definite and diversified factors and the effective ways to tackle this issue among adult especially teachers.

Keywords: *Obesity, overweight, job performance, productivity, teacher.*

Introduction

Study which relate obesity and job performance among teachers are still new especially in Malaysia. Overweight and obesity, usually measured using Body Mass Index (BMI) are defined by World Health Organisation (WHO) as unusual or excessive accumulation of fat posing a health threat[1]. Another indicator used is abdominal obesity (AO) measured in the waist circumference (WC) which appears to be more closely related to a high morbidity and death, as well as an increase in the risk of cardiovascular (CVD) and diabetes mellitus compared to BMI[2].

Corresponding Author:

e-mail: mohdhakiki@graduate.utm.my

National Health and Morbidity Surveys (NHMS) findings from 1996-2015 in Malaysia show noticeable increases of average BMI and WC among Malaysian adults and children[3]. All ethnic groups displayed an upward trends of obesity with obese Indians (43.5 %), married adults (33.8 %) and those with only secondary education (32.1 %). The most significant increases in average BMI and AO were observed in women and people in the rural population[3]. The highest gain in overweight incidence was also seen in males and the elderly[4,5].

For job performance, there are studies about the level and its association with some determining factors like leadership style, motivation, job stress, emotional intelligence, workforce diversity, work environment, teacher characteristics, personality traits and work passion[6,7,8,9,10,11]. Teacher plays a major role as the people who cultivate and educate the future generation of a nation by their great influence. Beside mothers,

teacher's BMI, education level as well as teacher's satisfaction with children's weight have significant impact on children weight and health[12]. A study also shows that teacher's body image has influence the children[13]. Thus, the performance of teachers is linked to the growth of students[14,15]. This scenario is quite alarming as recent research shows 19.9% or one in five children ages 7-12 in Malaysia suffer from overweight and obesity[16].

Level And Condition: The Malaysian job performance rating has declined considerably from 2015 to 2017, according to the Global Competitiveness Report (GCR) 2015-201817,18,19. As below, Table 1 shows that Malaysia is currently placed at 25th position out of 140 countries 19. In 2016, however, it was listed 18th 17. It shows that employee efficiency in Malaysia, including teachers, has decreased.

Table 1: Malaysia's Competitiveness Rankings

Year	Performance Score	Ranking
2015	5.23	20th
2016	5.16	18th
2017	5.17	26th
2018	74.4 (new format: Global Competitiveness Index 4.0)	25th

Malaysia currently has about 32 million people and around 1,7 million are in public service which made them the largest public service number in South East Asia. Of the groups, 39 % work in the General Federal Public Service, 14 % work in the health sector and nearly one third work in the education services alone[20]. The total wage deployment for public service people is around 11.4 % of the overall salary spending in Malaysia[20]. Although Malaysia's Competitiveness Ranking is getting lower, the number of teachers in Malaysia's education sector is increasing every year. It brings negative impact towards the education system and some correction measures are needed to tackle the issue. Table 2 shows the total number of teachers in Malaysia from year 2014 until 2018.

Table 2: Total Number of Teacher in Malaysia

Year	Total Number of Teacher in Malaysia
2014	420854
2015	421379
2016	421828
2017	422505
2018	423566

The findings from NHMS 2015 indicate that the government's administrative officials had a 35-37% likelihood of overweight while obesity stood at 43%[21]. If by taking the same percentage of 43% for obesity rates, the prevalence of teachers who might be fallen into the overweight and obese group are estimated around 181000. The findings put the administration in a disgraceful state, since the number of Malaysia overweight and obese people were not reduced[22]. This scenario is a clear signal that obesity crisis, which has already overwhelmed our health care services, will also cripple our economy and the growth of the younger generations if no decisive action taken[23].

Impacts on Economy:

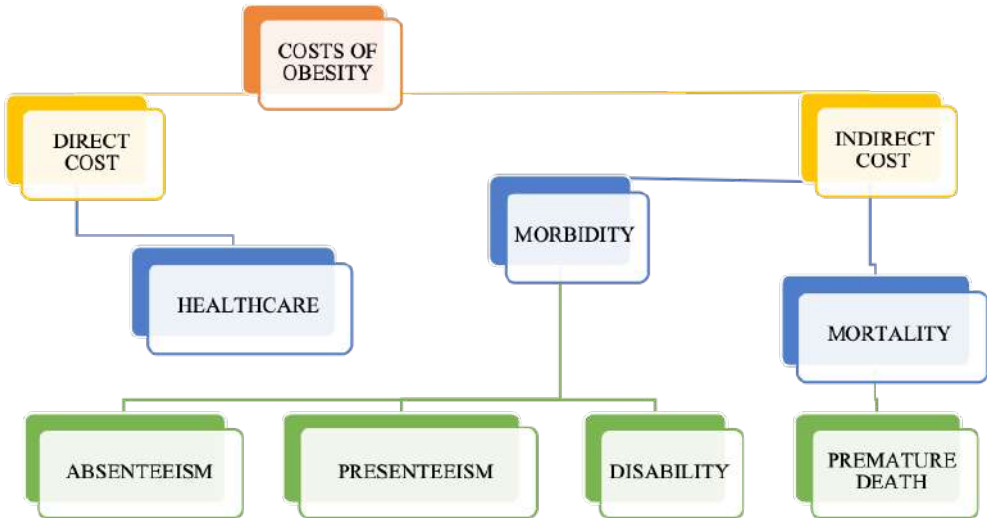

Figure 1: Economic cost of obesity framework

Figure 1 above shows the cost of obesity from an economic point of view. It can be divided into two categories; direct and indirect. The Economist Intelligence Unit[24] reports that direct costs are associated with medical expenditure from diagnosis, therapy and also from prevention on obesity associated illnesses. In Malaysia, Total Expenditure on Health (TEH) in year 2013 has been recorded as RM 44.748 million, which is equal to 4.53% of Gross Domestic Product (GDP)[25]. The TEH is increasing each year, with RM 53.110 million registered in 2015 and RM 57.361 million registered in 2017[25]. Despite health expenditure is being highly subsidized, the spending remained largely expended on government and public needs[26].

Absenteeism is defined as time off from work because of obesity and overweight. Due to the ease of estimation, absenteeism was likely the most frequent indirect cost measurement. In Malaysia, the Malaysian Employers Federation (MEF) Medical Benefits & Man-Days Loss (Including Absenteeism) Survey 2015 has projected that for 6.6 million workforce, companies need to pay out RM1.18billion in medical costs for hospitalized employees and RM46.3million in non-hospitalization medical costs[27].

Presenteeism at workplace or showing up for work during sickness, now appears more common than absenteeism. It may constitute physical and mental absence[28]. Presenteeism is present in most fields, but is particularly high in education[29]. Presenteeism is frequently associated with severe losses in productivity and has a number of symptoms such as migraines, allergies, sinus problems, asthma, acid reflux disease, dermatitis, anxiety and depression[29]. Many studies have shown that presenteeism contributes to depersonalisation and fatigue[30].

In terms of disability, the decreased executive role was linked to obesity but not overweight in some researches[31,32]. Further, it is shown that some facial emotional decoding problems occur in overweight and obese kids in comparison to normal weight kids[33]. Low conscientiousness have also been associated with higher BMI[34]. Three cross-sectional studies confirmed favourable obesity connection with falls and older adults[35,36,37]. Furthermore, a study suggest that obesity, even if metabolically healthy, accelerates age-related declines in functional ability and poses a threat to independence in older age[38].

In Malaysia, Non-Communicable Diseases (NCDs) are estimated to account for 73 percent of total deaths with 35 percent of these deaths occurring in those people under 60 years[39]. Premature mortality occurs in 4 major groups of NCDs such as cardiovascular disease, cancers, diabetes, and chronic respiratory diseases. The probability of dying between ages 30 and 70 years from these 4 main NCDs is 20 percent[39].

Impacts on Individuals:

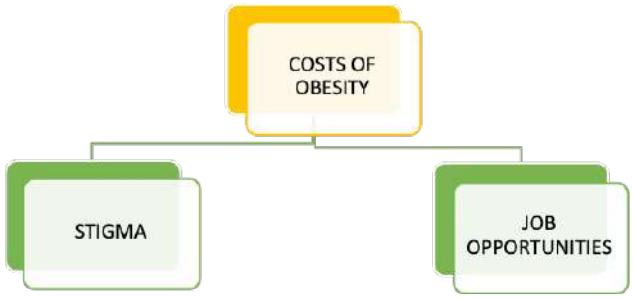

Figure 2: Cost of obesity on individuals

Individuals have greater likelihood of unemployment and are likely to receive lower salaries as a result of obesity[40]. Loss of productivity due to work injury and longer recovery time will make them unpreferable worker. In addition, demand for support services and disability management is likely to increase because of obese conditions that limit their basic physical abilities[41]. When gender is taken into account, the impact of obesity on salary varies between man and woman, whereas the obese woman receives lower earnings than the non-obese counterparts[42]. On the contrary, their non-obese counterparts are getting high pay customer related jobs which require attractive personalities like representatives of sales and customer relationships[43].

Study[44] in Malaysia found that about 30% of the students agreed out of 93 obese participants that the body weight limits their ability in every type of work. Approximately 50% said their work was linked to sedentary behavior and poor mobility. 63% of respondents believed they were treated differently because of their weight. Moreover, 73 of them felt that their supervisors should take account of their weight in delegating jobs. Altogether, most participants accept that the body weight impacts and reduces their performance.

In contrast, study[45] indicates that employee recruitment does not consider the appearance and gender of employees since performance, background and age are more concerned. Nevertheless, physical fitness and

health in the public sector are one of the requirements used during the new recruitment staff's interview and selection[46]. Obesity are perhaps overlooked in the workforce due to the physical and wellness lack of evaluation. On top of that, salaries and performance are not a consideration because the wage system for civil workers is rather sticky to seniority and education background[47].

Conclusion

In summary, obesity has grave implications for economic growth and individuals productivity because it ties with many NCDs. This study aims to propose additional research for a group with great influence over future generations such as teachers, so that they can give more insight and support the development of multidisciplinary teams, equipped to address the problems associated with various types of interventions.

Does Instagram's Like Affected Teenager Self-worth?

Hayinah Ipmawati[1], Wiwien Dinar Pratisti[2]

[1]Student, [2]Lecturer, Psychology Department, Universitas Muhammadiyah Surakarta, Indonesia

Abstract

This literature review was conducted to identify that instagram's like affected teenager self-worth. We know that instagram has become a phenomenal social platform with 800 million user around the world. While, Indonesia has become the big 3 instagram's user, after America and Brazil with about 60 million user. Instagram was super phenomenal among teenager, like every teenager are active instagram users, and while teenage is an age to search identity, so it's so much important to know that teenage self is worth it. Well we know that instagram provides picture, followers, comments, likes, direct message etc. which make people get in touch easily with other people, building a good relationship, make us feel happy while receiving likes, comments and other responses from others. Besides that, there are a pressure for someone to get likes, some comments and followers that can produce a high anxiety, social pressure and it can make our self-feel unworthy. These phenomena correlated with a part of self esteem, called self-worth. Self-worth is how someone see their own value or worth as a person. While knowing source of self-worth, achieve something, approval and acceptance from others, virtue or one's judgment of moral adequacy are sources of self-worth which can easily gained by instagram's like, means that we can also get self-worth by instagram's like. The result of this study found that, instagram's like is affected self-worth.

Keywords: *Instagram, teenager, self-worth.*

Introduction

Nowadays, people use social media, every people, everyone from kids, teenage, till adulthood even late adulthood. It just like something that all of us should have, since we can do everything on social media, we can doing interaction, chatting, calls, we can trading, doing virtual shopping, everything we need, social media serve us. Theres so much kind of social media, the most popular is facebook, twitter, and instagram. Wiederhold[1] said that social media is a revolution, it presented people with an opportunity to express themselves and interacted with others in an interesting way. However, while social media provide friendship sharing and interaction, social media also have some negative vibes and few are quite as detrimental to a person's health and well-being as Instagram. While Wiederhold[1] said, instagram was noted as the most destructive platform for disturbing time and quality for sleep, shaping an body image, and fear of missing out from a circle if we don't follow others movement. If we compare instagram to other social networks, instagram could lead us to thinking about unrealistic expectations, feeling worst, and low having a low self-esteem.

Talking about self-esteem, there's a part of self-esteem which is important yet so risky influenced by instagram, that is self-worth. Words by words, *self-worth* defined as taste of someone's value as a person[2] Self-worth is important for teenager, according to Ericson psychosocial stage, teenager is on the fourth stage of whole life. In this transition age, teenage energy was transformed to get knowledge and intellectual ability. This stage called identity vs identity confusion, where someone faced on a needs to find identity and what teenage will do on their life[3]. On this "finding identity" stage, it's so much important to know that teenage self is worth it, while we know that instagram is suspected can affect teenage self-worth, we have to make sure that teenage get their super good self-worth so they'll feel worthy and get positive image of their self on finding identity stage, if teenager didn't have self-worth so they can't find their identity till they can't living their live because teenager doesn't know who they are, teenager

don't know what supposed to do, don't know their self well, and this self-worth can be affected of instagram's like so this research is super important to do.

Literature Review:

Instagram: Instagram ia an application for everyone, especially those who have proper devices, because its application require some term which is fit to photos in a high pixels[4]. Through Instagram, someone can upload photos or videos, publish them, and showing them on others timeline. People who use instagram called instagrames. Instagramers can easily share photos and videos with others on their timeline with caption and hashtag to receive comment and likes on their timeline posts by their followers.

Instagram has become a phenomenal social platform with 800 million users per January 2018. Indonesia has become the big 3 instagram user after America and Brazil with amount 60 million users[5]. According to Lee et al[6]. people have five social and psychological motives when using instagram, they are archive or collecting moment, social interaction, expressing their self, escapism, and peeking, but these motives are not always without negative consequences. By uploading different photos and videos, people can choose what they want to show on Instagram. This is absolutely just to get positive thing from like or comment from their followers[7].

Every instagram post consist of like and comment button, so its users can clickingthe like button to show their approval and tap the comment button to express their thought of a content on the photo/video. Ting Ting[8] beside that fun thing, people tend to get like or followers on instagram, meanwhile, there is a pressure to receive comment followers and likes which can culminate social pressure and also high anxiety. In fact, an account on instagram can detect someone on mental illness. Current study shown that computer script can be used to detecting depression by knowing its dominate color and with who they socialize[1].

In Indonesia, some people offering follower needs, likes and comments on social mediaslike youtube, instagram, even twitter, in addition to website visitor services.Other services that can be chosen by clients are auto-followers and likes. Especially for follower services, there are three types of needs: active, passive, and mixed. Saptaji (the seller) said he served clients from various circles, ranging from ordinary people, celebrities, celebrities, celebrity agencies, companies, fashion brands, to political figures.The process of purchasing services is easy. Buyers need to provide a username without a passcode so it can be processed for 30 minutes to 24 hours, by various price[9].

For millennials, having so much followers and 'like' seems like quietly important, it define their social status, when you have so much followers and like, you sit on the high class of social status. Usually, people who used to buy followers and likes are coming from personal accounts, that is, those who want to become"selebgram" celebrity on instagram. It means that for the sake of popularity in social media, a lot of people are willing to spend on buying followers and 'like[10].

Self-worth: Self-worth is a value, it's the appraisal that our brain us importance and significance as a person Selby[11], Words by words self-worth defines as the taste of someones value as a person[2].

Lots of things affect Self-worth, they are the environments in where we live, study, and socialize, how we believe in our performance in different settings, what other people say to us, and the ost important is what we say to ourself. Of all the things that affect our sense of self-worth, self-talk is the most powerful way to increase our self-worth. That means it is very important to get into the habit of replacing unhelpful thoughts like 'I am a fool' or 'No one love me' with helpful ones like 'Im great' and 'At least my parents love me'. That is, it appears that people's general sense of self-worth is determined by three distinct factors; first, their positive and negative feelings about themselves, second, their specific beliefs about themselves, and the last is the way that they frame these beliefs[12].

There also another sources of self-worth, they are: outdoing others in competition, others approvals, academic competence, physical appearance, family love and support, being a virtuous or moral person, and God's love[13].

Kabir[14] said that, we have to know these things to get our true self-worth. First of all we should know our sources of self-worth. Knowing what we love, what we interested in and doing some positive things that make us feel alive. The second is recognize our inner critic, it's our ego, feeling of worried if someone disapprove ourself. And then see a different perspective of self-care from self-consciousness. Self-care is a part of our self-worth. The last is be aware on social media. nowadays, social media is a source of approval from others, yet

also source of envy and jealous of others, based on likes, followers and comments.

Teenager: Teenager or adolescence is an transition age from children to adulthood[15]. According to the theory of psychosocial stages by Erikson, adolescence is included in the fourth stage of all stages of human development. In the transition phase from children to adult, teenage's energy has diverted to gain intellectual knowledge and abilities. This stage is the development stage of the ego identity vs. identity confusion, where the individual is faced with the need to find his identity and what he will do in life. Important thing in this stage is to explore alternative solutions to the role of individuals in life[3].

A study by Kaiser Family Foundation said that, teenager (11–18 years) spend their 27 minutes spending on social media each day[16]. Previous study show that motives for why people using instagram were positively related to Instagram usage and self-presentation, and the number of Followers was also positively correlated with Instagram usage and self-presentation[8].

Methodology/Materials

This literature study was conducted by looking for references that relevant to this study case, they are instagram, self-worth, and teenager. We used theoretical references from book, journals and other scientific literature which is used as sources of data to be reviewed.

Results and Findings

A well-known social media platform which is evolved nowadays is instagram. Instagram has become a phenomenal social platform with 800 million users per January 2018. We can do anything on instagram, like communicating with other, selling something, branding, knowing current activities of our friends, and so on. Those activities can be done by uploading photos, videos, giving like, comment, follow and unfollow. People try to upload good picture of their self, their moment to gain much instagram's like. besides, there is a pressure to receive comment, followers and likes which can lead us to hing anxiety problem and also social pressure[1] Gaining instagram's like activities are addictive. People will feel loved, worthy if they get more like, otherwise, they will feel unworthy if they don't get much like. These phenomena caused a lot of instagram's like seller in Indonesia. People tend to buy like from seller just to show that there's so much people who liked their post, it make them feel worthy, even they buy it. This is correlated to an opinion from Rozi[10] that for millennials, having so much followers and 'like' seems like quietly important, it define their social status, when you have so much followers and like, you sit on the high class of social status. Usually, people who used to buy followers and likes are coming from personal accounts, that is, those who want to become"selebgram" celebrity on instagram. It means that for the sake of popularity in social media, a lot of people are willing to spend on buying followers and 'like[10].

Indonesia has become the big 3 instagram user after America and Brazil with amount 60 million users[5]. While the most of the user is teenager. Teenager or adolescence is a transition age from children to adulthood[15]. According to the theory of psychosocial stages by Erikson, adolescence is included in the fourth stage of all stages of human development. In the transition phase from children to adult, teenage's energy has diverted to gain intellectual knowledge and abilities. This stage is the development stage of the ego identity vs. identity confusion, where the individual is faced with the need to find his identity and what he will do in life. Important thing in this stage is to explore alternative solutions to the role of individuals in life[3]. On this finding identity stage, adolescence need a good insight which can make them know who they truly are, and they know whats the best for their self. Theres so much things that distract adolescence/teenager on this stage, some teenager choose to be a diligent student, some of them choose to be mischievous student, some of them choose to be confidence, some of them choose the opposite. It depends on what they know and what they want to be, it also depends on what they see their self as a human being, like they know the value of their own self. So teenager on this stage actually need a self-worth. We know that self-worth is the value that you placed on you, it's the appraisal that our brain makes of your importance and significance as a person[11] if we don't gained self-worth we'll feel unworthy, we don't know the value of our self, we don't know who we are, so we can't define our identity.

There are so many things that affected self-worth, while some points of sources of self-worth are correlated with gaining instagram's like among teenager, as we know that Wiederhold[1] said that social media provide friendship sharing and interaction, while we know that teenager is a stage where we have to find our identity yet also time for having intense hangout with friends,

that's why teenager need to be approved on their peer group, this is how self-worth play an important role on this stage, and the source of self-worth which highly correlated to instagram's like are others' approval, what other people's and what we say to us. We started from "what others approval" as we stated above, people feel loved, worthy, feel getting a high social status when they get much instagram's like, it feels like theres approval from other people. When we know we've been approved by others, we start to think what other people say to us, and we say it to our self, we ask our self. We'll like to say "omg, I gained so much like, I know they love me" or "omg, theres no one like my instagram photos, does anybody hate me?" besides, Kabir[14] said that, to gain the best self-worth we should be aware on social media. Social media is a source of approval from others, yet also source of envy and jealous of others based on likes, followers and comments.

Conclusion

Based on the result and finding above, we know that there is a social media platform which become a place for gaining approval through "like" among teenager and it can affected teenager's self-worth on finding identity stage, that was instagram. When we gained so much like on instagram, we'll feel approved, we feel loved, worthy, so we start to think and say to our self that people like us, people loved us, and we'll feel worthy.

The Application of MOPSI Module Forbreast Cancer Patients

Norhafizah Musa[1], Azahar Yaakub Ariffin[1], Siti Suhaila Ihwani[2], Adibah Muhtar[3], Abdul Hafiz Abdullah[2]

[1]Senior Lecturer, Faculty of Social sciences and Humanities, [2]Senior Lecturer, Faculty of Social Sciences, [3]Lecterur, Faculty of Social Sciences, University of Technology Malaysia, Kuala Lumpur, Malaysia

Abstract

Pressure or stress is a common occurrence or experience in every individual's life, especially to those that are afflicted with an illness, However, what distinguishes it is the patient's perception of the pressure itself. There are numerous events or situations that occur in life that trigger the existence of stress on the patient. These trigger factors arise in many forms such as physical, behavioral, social, emotional, and their own thoughts. The effect of stress on the patient is related to the attitude, character and the perception derived from the pressure. This article intends to identify stress changes in breast cancer patients after the apllication of MOPSI module. This study was carried out on two breast cancer patients using a detailed interview method and observation. Data was analysed using Nvivo11 and triangulation. The findings show that patients that consistently applied MOPSI experienced positive physical, psychological and social changes. The application of the MOPSI module significantly changes daily routines to become healthier and reduces the pressure or stress experienced.

Keyword: *Application, Pressure, Breast cancer.*

Introduction

Stress in breast cancer patients is the highest compared to other cancers. It is evidenced by 2011 statistics that show 2.72% of cancer patients become stressed from the pain they suffer[1] Cancer can easily spread if the patient experiences emotional stress, extreme stress, trauma, loss and depression, thus disturbing the patient's mental health and hormones that can weaken the body's immune system of breast cancer patients. The psychological effects that can be seen are difficulty in accepting reality, anger, fear, worry, sadness, hate, irritation and shame. Thus, the stress faced by the patient should be fully treated and every cancer patient should be asessed by supporting them physically, financially and morally with love and affection[2]. To help reduce the stress of breast cancer patients, this research designed a module based on Islamic concepts and practices sourced from the Qur'an and Sunnah that can be practiced by patients as part of their daily routine.

MOPSI Module: MOPSI module is a module that helps breast cancer patients manage the stress that they face. This module is designed based on Islamic concepts and practices sourced from the Quran and Sunnah that the patients can perform as part of their daily routine [3]The practices selected were not only supported by their advantages in the Quran, but also acknowledged by science and members or experts of the medical field.The main purpose of this module is to propose method and to remind patients of the importance of preserving the relationship with the creator of all creations i.e. Allah S.W.T.The design of the module also aims to guide the patient to be more positive and to have good thoughts of Allah's predesination.

This module consists of five main sections[4] i.e. :

i. Therapy module

ii. Therapist

iii. Client or receiver

iv. Therapy methodology

v. Observation and assessment

Methodology

This study is based on a qualitative methodology using a case study approach to explore the changes experienced after applying MOPSI modules. Data collection was made using face-to-face interviews and observation method. The interviews and observations were conducted in 12 sessions. The data were analysed based on thematics using Nvivo 11 software and data triangulation processes. In order to ensure the information obtained is accurate and reliable, different sources were referred for the same thing. This study was carried out on research subjects that were selected using purposive sampling technique. This sampling technique is a selection pattern that is simple and purposeful. The subject is able to provide the value of data required by the researcher based on the situation and behaviour of the invidual that is being studied [5]. Researchers found the subjects through *'snow ball'* method or information from one party to another about individuals suffering from breast cancer [6].Therefore, two breast cancer patients were selected by the researcher as subjects based on experience of suffering breast cancer.Total of four experts were selected to evaluate the validity of the module and provide assessments.The experts were given a month to evaluate the module.This method is in line with the method highlighted by [7], that recommends the enlisting of expert asessors to determine the validity aspects of the contents.The response received by the expert asessors were used as a guide by researchers in improving the module.Improvements were made to enhance the module's contents that were practiced on breast cancer patients.

Examples of interview questions are as follows:

1. Does the contents of this module fulfill its target population?
2. Does the contents of this module work perfectly?
3. Does the contents of this suit the time allocated?
4. Does the contents of this module improve performance?
5. Does the contents of this module changing attitude towards a more positive one?

Research Findings and Discussion

Research findings showed that patients changed towards a more positive attitude after applying the MOPSI module. Changes in stress can be seen from physical, psychological and sosial aspects. Findings were analysed through interviews with researchers to see the effects on the patients prior and during breast cancer.

Based on observations and patient response, it can be noted that patients were able to cultivate positive values within themselves. It was notable that the patients had undergone positive changes physically, spiritually, psychologically and socially.

i. Physical: The movements of Research Subject 1 and Research Subject 2 were limited even in their own home, due to immense physical pain. After comsuming health foods such as bee honey, Research Subject 1 and Research Subject 2 admitted that their breasts felt lighter, compared to previously feeling very heavy due to cancerous lumps. After several sessions were conducted,the researcher observed that they were still mobile and able to attend lectures such as mid-morning lectures. The researcher witnessed in person Research Subject 2 attending lectures at Saidina Hamzah Mosque. Subsequently, meetings between the researcher and Research Subject 2 were held Saidina Hamzah Mosque. This can be linked to the course of treatment recommended for the patients i.e. to take the medication prescribed by medical doctors and consume health foods to improve their well being, which caused the patients to feel lighter and made it easier for them to move and perform indoor and outdoor activities. Research Subject 1 was unable to meet with the researcher at the beginning ofthe seesion due to chronic pain, but was able to do so after feeling better.

Research Subject 2 commented;

"Feels lighter after taking UNIPEQ UKM bee honey . My breasts no longer feel heavy, it feels different. I am confident that there is a cure for every illness, as mentioned in the Quran".

Whilst Research Subject 1 commented:

"Feels lighter after consuming bee honey.."

They became more confident after finding a translation of the Quran that describes bee honey colours

as black, brown, dark yellow and clear.In addition to being aware of the benefits of bee honey, Research Subject 1 also commented that when in pain,she is unable to attend congregational dawn prayers at the surau. She performed soul therapy and prayed to be granted good health to be able to perform acts of worship especially congregational dawn prayers. As a result, Research Subject 1 is currrently able to go to the surau as usual.

ii. **Spiritual and Psychological:** From a spiritual and psychological point of view, it was observed that the patients had undergone good behavioral changes such as avoiding arguments and overthinking problems.The Islamic psychotherapy module encourages the patients to follow the personality traits of Prophet S.A.W[8,9]

" no longer feel like going to my brother's house, because it will just make me upset. Even my children said to just spend Hari Raya here in Kuala Lumpur. Going to my brother's house would just make me upset and stressed.."

After frequent visits to her brother's house, Research Subject 2 decided to stop going to his house to avoid any disagreements and being disrespectful while being there.

Research Subject 1 said;

" I acted deaf. I kept quiet. I just gnored it, if I answered back I would just feel hurt and sad, so I ignored it, keep quiet. I didn't care before, because my body was strong. Now, I don't want to fight back, since I am ill. So I just keep quiet. The matter gets solved by keeping quiet. Then I do it,for example ironing clothes. My husband said, "The clothes are crumpled, why didn't you fold the?" Subject 1 answered " I've been folding them for years and there haven't been any problems". Then, I asked my child to help iron them, since I'm unable to stand for long, so I asked my child to help. " Take this shirt quick and iron it, your father is stressed, when I'm stressed too, keep pressuring me. Sometimes I cry whilst ironing, at 3 o'clock in the morning I'm still not finished. I want to sleep. In the end I called my child, " Take this, your father's shirt, I'll give you money later".

From a religious prespective, they perform the compulsory and optional acts without being told or forced by anyone.In fact, they read the Quran and it's translation with the purpose to understand and relate to the words and commands of Allah S.W.T.From the point of practice and appreciation therapy, as well as soul therapy it is evident that it is practiced by the patients throught the patients speech as follows:-

Research Subject 1 said:

"Dhikr, reading the Quran and prayer are done abundantly. I continually recite dhikr, al-Ikhlas, I go to sleep holding the prayer beads whilst reciting al-Ikhlas. Illness brings closeness with Allah. Oh Allah, I know you are with me, with the blessings from dhikr, blessings from reading the Quran, blessings from giving alms and charity, getting closer to Allah, this illness has been for too long and I've never felt so much pain in my life . Just confide in God..."

Researcher observed that Research Subject 1 tone of voice changed and became teary.

Research Subject 2 said:

" Before the break of dawn, during pre-dawn meal, is the time to recite istighfar 70 times. I do it 70 times, didn't Allah say to remember Him when lying down, sitting, sleeping, remember Allah to calm the heart. I'm telling you this not to show off, I've read 12 chapters of the Quran's translation . Usually we read the Quran in arabic, but don't read it in Malay. So, we don't understand. When we don't understand it, the devil can overpower us. The devil is unafraid. The devil becomes afraid when we understand the Quran. So that we don't fall prey to the tricks of the devil"

Besides that, the patients also implemented alms and charity therapy[10]and social therapy[11, 12]as outlined in the module. Apart from attending lectures, Research Subject 2 admitted that:

" there have been emotional changes and I can control my emotions, happiness, fun, I don't think of tensions when preparimg food, when making ketupat palas for the masses during Hari Raya celebrations at the surau, visiting relatives, meeting people, I enjoy it when people visit my home, when the students from Darul Quran come to my home, I feel happy'.

Research Subject 1 on the other hand prepared food for the congregation at the surau and said:

"During Ramadhan, I prepare for 20 people a day. In a week, for 5 days, 100 people. My interaction with my children have become closer, even with outsiders. I haven't seen you for a while, where have you been? They ask my husband about my wherebouts. When they

know that I'm unwell, they come for a visit. I hope for a loving relationship with my neighbours. I want friends that would visit and pray for me when I die, when there are three rows, the prayers would be accepted. Pray for entry into heaven. Alhamdulillah".

Therefore, the researchers see that habits and appreciation are related to psychotherapy. The creation of this therapy leads the society to become more grateful in order to relieve themselves from problems faced, thus achieving contentment in life and the hereafter. Islamic psychotherapy treatment has long been used in treating patients with emotional stress, as well as effecting them positively physically and mentally. A form of therapy that can have a great impact on patients especially illnesses that lead to stress and mental stress[13,14].

In Islamic psychotherapy, spiritual values are a key aspect of solving human psychology problems because they are closely related to the heart and are more likely to affect human life[15.]Although humans comprise of two components, namely physical and spiritual, the spiritual aspect greatly affects the individual because the heart is like the king and the human body is submissive to the heart. It is also a major driver of actions, and actions of the human body known as behaviour in the form of self-sacrifice or `ubudiyyah to God through the abandonment of all efforts and planning due to seeing every occurrence as Allah's fate [16].

iii. **Social:** Participating in a community that enjoys seeking knowledge helps to prevent stress by recognizing the importance of human relationships as well as the relationship with God. This helps in overcoming emotional stress disturbances more effectively with the presence of a good friend or society of good morals. This activity is held once a week and aims at improving mental and physical health[17].

Both breast cancer patients were more motivated after gradually practicing psychotherapy. They were able to overcome their bad habits such as impatience, irritable, difficulty relaxing, sadness, easily offended, worrying, feeling anxious and being sensitive[18, 19].This Islamic psychotherapy module proves that a relation exists between religious influence and spirituality on patient behaviour and morals. Relief from problems through concept comprehension therapy, practice and appreciation therapy, soul therapy, social therapy and personality therapy of Prophet S.A.W can help manage stress faced by breast cancer patients. Implementing these therapies with discipline, persistence, consistency and patience has proven to create new habits through actions, speech and new behaviour. They realize that prohibited traits are bad and should be avoided, and to fill the heart with commendable traits such as presevearence, patience, self-reflection, submissiveness and moderation in wordly matters. When faced with a problem, they return to Allah SWT[20].

Conclusion

In conclusion, the stress experienced by patients had a positive change after applying the MOPSI module. The module was designed based on Islamic concepts and practices that are sourced from the Quran and Sunnah as well as views by Muslim scholars as their daily routine. The results show that the changes can be seen from physical, psychological and social aspects. This module emphasizes spiritual aspects as the internal effects gives impetus to the actions of the human body.

A Study on Consumers Perception on Halal Certification of Dietary Supplement Products

Norazlinabinti Abdul Aziz[1], Hartini Saripan[2], Farizah Mohamed Isa[1], Mardiah Hayati Abu Bakar[1]

[1]Senior Lecturer, [2]Associate Professor, Faculty of Law, Universiti Teknologi MARA40450, Shah Alam, Selangor, Malaysia

Abstract

The global health industry market perceives anenormous potential of profit within the dietary supplements business. Contributed by the changes in consumer perception in accepting that supplements aids in prevention of diseases, the number of supplements available to consumers has seen tremendous growth. As the supplements industry expanded with new innovations and advanced of technology, the consumers lose transparency in knowing the process, composition and ingredients of the dietary supplement products. They are expose to many risks of the dietary supplement products that includes the safety, efficiency and quality aspects. Certifying the supplements as halal may safeguard the safety, efficiency and quality of the products as halal is attached to the concept of 'thoyibban' that upon compliance will accord assurance on the safety, efficiency and quality of the product. In suggesting for the reformation of current consumer protection on this area, the study intends to analyse the effects of halal certification on dietary supplement products to the consumers. The ultimate aim of the study is to answer questions whether there is a significant effect attaching halal certification on the dietary supplement products to boost the confidence of the consumer on the safety, efficacy and quality aspect of the products. This will assist in the direction of reformation over the current consumer protection framework. The study adopts a mix method of qualitative and quantitative method. The qualitative method embarks onanalyzing the fundamental principle of 'halalanthoyibban" and its relation to the assurance of safety, efficiency and quality of dietary supplements products. The analysis of data acquired through qualitative method involve content analysis approach on traditional and contemporary sources of Islamic laws. The data acquired through content analysis is supported by semi-structured interviews with respondents that has been selected through purposive approach. The second part of the study uses quantitative method by distribution of questionnaires to selected consumers of dietary supplement products. The findings to the study disclose the effects of halal certification on dietary supplements product that may assist the policy maker and industry to make appropriate reformation to the consumer protection framework within this industry.

Keywords: *Halal certification; Dietary supplement products; Thoyyibban concept; consumer protection.*

Introduction

Globalization has transformed many industries from the traditional/conventional ambiance to a modern and a technology based industry. Among the transformed industry are the food, pharmaceutical and dietary supplements industry. Dietary supplements are products that are labeled as *dietary supplements* and are not represented for use as a conventional food or as a sole item of a meal or diet. Supplements can be marketed for ingestion in various forms such as capsule, powder, soft gel, tablet, liquid, teas, or any other form. Although dietary supplements have aided in the maintenance of the quality of life, yet the market is flooded with dietary supplements that are associated with many risks that includes the safety, efficiency and quality aspects. In addressing this issue this study intent to

e-mail: mhabphd2017@gmail.com

explore the usability of the *halalanthoyyibban* concept in safeguarding the rights of the consumer involving safety, efficiency and quality. To what extentwould the consumer know that a dietary supplement product that is certified halal provides an assurance of these three aspects. The knowledge of the consumer may become the guideline in the reformation of the current practice in bridging the *halalanthoyibban* concept to the dietary supplement industry.

Literature Review: There are diverse products of dietary supplements that are also termed as health supplement or nutritional product and may range from foods modified or pure forms of vitamins and minerals to extract of various botanical or animal products[1-2]. In a study[1] the researcher disclosed that the dietary supplement products are commonly for medical problemsincluding sexual enhancement, weight loss and sports performance. These products are freely available atnumerousoutlets. The marketing trend of this product sees the producers claimingthat they areideal for the maintenance, prevention and even treatment of chronic diseases.According to Sauer[2]dietary supplements encompass a wide spectrum of products, including vitamins and minerals, such as folate and calcium; herbal therapies and botanical agents, such as ephedra and ginkgo biloba; and enzymes or extracts from organs or glands, such as some "hormone" preparations.

Most authors[2-3]agreed that dietary supplementfunctions as a booster to the immune system, supplements the diet,reduce the risks of illness and age-related conditions, and improve performance in athletic and mental activities as well as to support the healing process during illness and disease.

Writings on the area of halal have started since the 1980s when the Prime Minister at that time, insisted on the setting-up a proper institutionalize management system of Islamic matters that include a proper management of halal related issues [4]. Since then, several studies were conducted on numerous areas and scope of halal particularly from the social perspectives.

The writings that were focused on the consumption behaviours [5-7]and medication behaviours[8-11] agreed that halal rulings have contributed to the shaping of the consumption and medication behaviours of many consumers. Even though there were observations on the effects of halal consumption behaviours on the formulation of government policies but studies on appropriate tools and mechanism to execute the halal policies were not addressed[12].

Substantial literatures [13]were based on the theological study of halalas a background to the concept of halal pharmaceuticals. This includes the study on Shari'ah rulings which also serve as relevant determinants of the halal status of any pharmaceutical product. These studies [14-18] discussed the Shari'ah principles relating to halal such as Istihalah[19-20] (transformation), Istislak (assimilation), Dharuriyat (necessity), Maqasid Shari'ah (for the public interest), the scope of halal, [21]the underlying reasons for the command to consume halal, the connection of halal and *thoyibban*and the common usage of halal in daily life. Al-Qaradawi[18]in his book Al Halal Wa al Haram fi al *Islam,* focused on the Islamic legal approaches which aim to offer better understanding on the operation of halal rulings in societal life including the application of rulings on halal in seeking for medication.

There are various writings[16,22,23]on halal pharmaceutical that includes the growth of halal pharmaceutical industry [24-26] and the issues that surround the issues of halal certified products mixed with non-halal derived genes to enhance the growth process, reports on manufacturers who were not adhering to labelling requirements, the need to have proper and transparent labelling for halal products [27]the complex composition of modern drugs and medicine [28,29]that requires the switch of the old rule [11,2131-32]from *caveat emptor* to *caveat venditor,* the discovery of non-halal ingredients in drugs, [33-36]and the doubtful status of some medication and drugs [37,38]. Even though there are abundant literatures on halal, these literatures did not specifically address the issues surrounding the developing industry of dietary supplement in connection to the possible assistance of adopting halal concept in the administration of safety, efficacy and quality.

Problem Statement: Supplement production flood the modern market due to the demand of consumers. Consumer demanded supplementary product due to increase of awareness and changes in lifestyle. Lately supplementary product is attached to issues of safety, efficacy and deterioration of quality. Halal assurance can be one of the solution to assure the safety, efficacy and quality of supplementary products. However, not many consumers understand the concept of *halalanthoyyibban*. Though there are many studies conducted on supplementary products and halal based

research, the studiesonly focuses on the theological study, marketing and business strategy, financial impact, health related issue and economic discussion. To date there is an absence of studies that relates the understanding of consumers on the ability of halal certified product to assure and safeguard the safety, efficacy and quality of a product. Hence it is the aim of this research to undertake the study in this particular area.

Methodology

The study adopts mix method of qualitative and quantitative method. The qualitative method embarks on the analyzing the fundamental principle of '*halalanthoyibban*" and its relation to the assurance of safety, efficiency and quality of dietary supplements products. The analyzing of data acquired through qualitative method involve content analysis approach on traditional and contemporary sources of Islamic laws. The second part of the study uses quantitative method by distribution of questionnaires via online forms and consumers who visit the pharmaceutical stores.The following are the charts representing respondents:

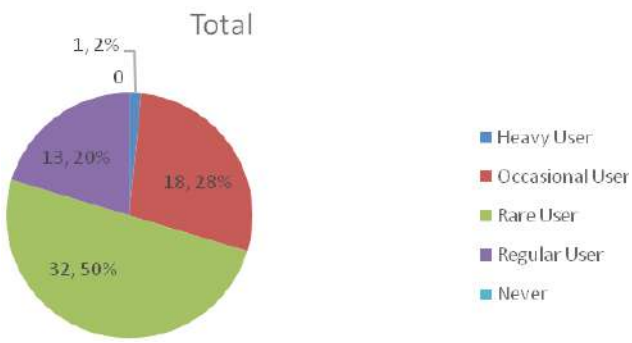

Figure 1

Majority of the respondents are Muslim female who are rare users of dietary supplement products.

Discussion

Knowledge on Dietary Supplement:

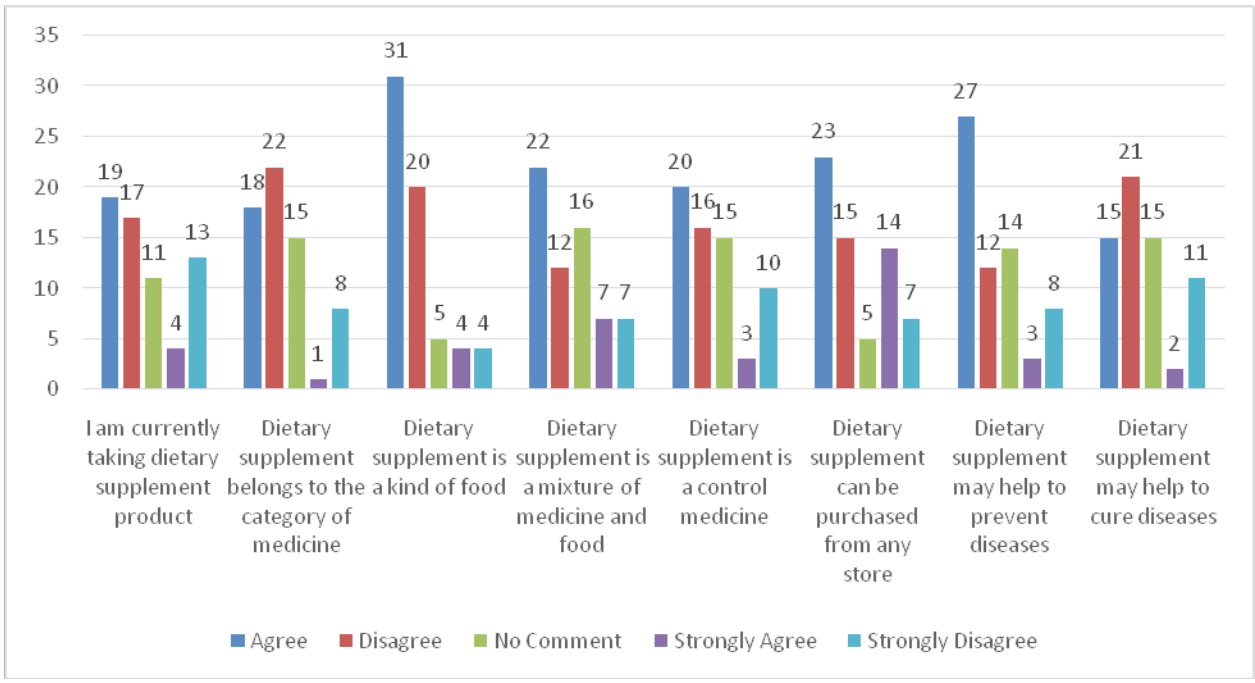

Figure 2

The analysis showed thata majority of the respondents were aware of the existence of dietary supplement products in the market as a majority of them are currently consumers of dietary supplement product. Questions aiming at testing the ability of respondents to classify dietary supplement product into the group of food or medicine received a majority answer that the dietary supplement product is more of a food product rather that medicinal product. However, when posted with questions of the possibility that a dietary supplement product is a mixture of medicinal and food component, many are uncertain as to this possibility. It is also discovered that

the respondents believe that the function of a dietary supplement product is to prevent diseases rather than to cure diseases. In summary it can be said that most of the respondents have a profuse understanding of the actual concept of dietary supplement product.

Knowledge on Halal Concept:

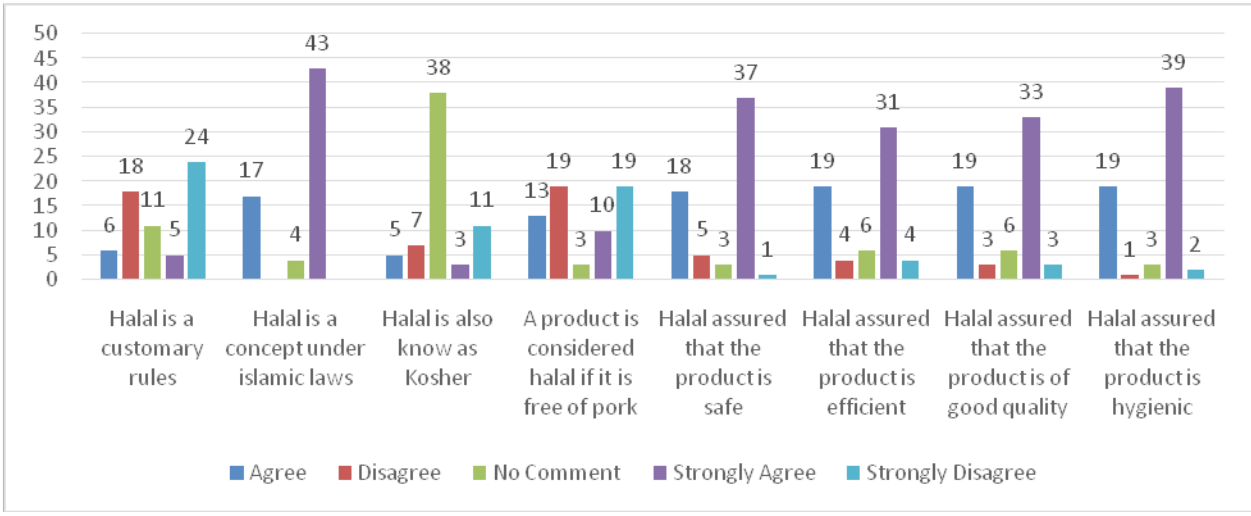

Figure 3

The analysis of this theme showed that not many consumers have sufficient knowledge on halal and its association to dietary supplement products. A majority categorised halal as a branch of Islamic law, whereas halal is a dietary concept and guideline for Muslim and not a component of Islamic law. A Muslim who consumes non-halal is a sinner and not a criminal. When asked on whether halal is a part of Customary law or a Kosher Dietary guideline, majority answered in denial showing that they are certain halal belongs to rulings of Islam. When the question tested them on the actual understanding of *halalanthoyibban* concept, the respondents showed that they understand well that to get a product to be certified halal it must not only be free from any pork- based substances but there are other guidelines to be complied with. A majority of the respondents strongly agreed that halal may assure the safety, efficacy, good quality and hygienic aspects of the products.

Associating Dietary Supplement With Risk:

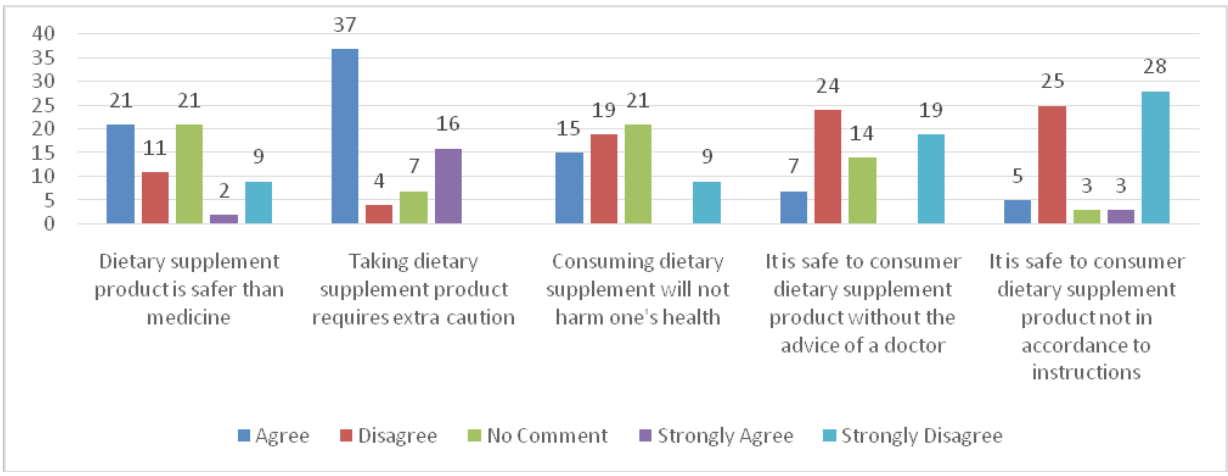

Figure 4

The analysis on this theme disclosed that a majority of the respondents are cautious consumers. Even though a majority agree that consuming dietary supplement products exposes them to a lesser risk than a medicinal product, they agreed that the normal rule in taking medicine (such as it has to be taken with doctor's prescription) and consumers must take the dietary supplements according to the instructions attached to the product.

Desire to Purchase Dietary Supplement:

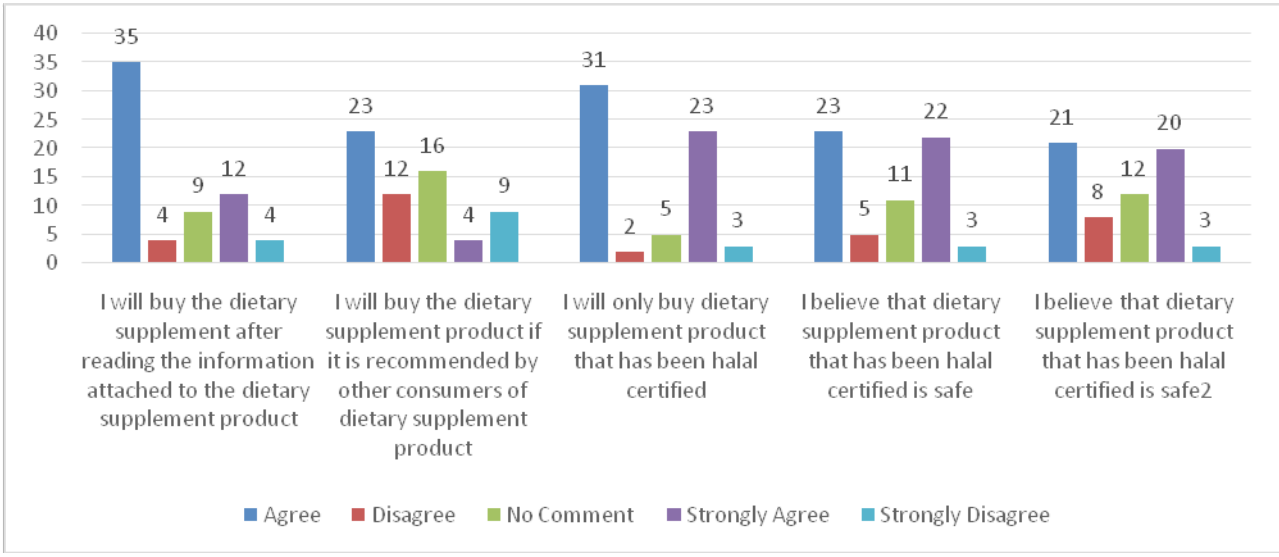

Figure 5

From the analysis it can be summarized that the desire of respondents to purchase dietary supplement products were very much affected by information attached to the packaging and recommendations by others. As a majority of the respondents were Muslims, the findings showed that a majority of the respondents strongly agreed that they will only purchase dietary supplement product that has a halal certification. They believe that halal label assures the safety, efficacy and quality of the product.

Conclusion

The findings of this research show that a significantly high number of respondents understand the *thoyibban* concept insofar as the quality of products, but not to the safety and efficacy aspects. Most respondents agree that dietary supplements need to be halal certified as an assurance that the ingredients are halal so as to cast aside any doubts. With many cases of people affected by the side effects of certain dietary supplements, it is hoped that the outcome of this aspect of the research would help in the policy making, awareness and formulating a standard operating procedure for manufacturers of dietary supplements to ensure the sustainability of this industry.

Abstract

Student-athletes who are enrolled at the undergraduate level in higher educational institutions in Malaysia have the challenge of raising their academic achievement. Preliminary survey shows that nearly 40 percent of student-athletes have cumulative grade point average (CGPA) below 3.00. This study aimed to develop an academic enhancement support framework for student-athletes in Malaysian Public Universities. Problems, in order to improve academic achievement among student-athletes, are due to factors of environment that do not support the improvement of academic achievement student-athletes during their study sessions. As a result, student-athletes could not be maintained in the session of study, scholarship, and the implications from the result are they are not allowed to participate in training and also competition. Therefore, the purpose of this study was to identify elements of support enhance academic achievement to student-athletes in aspects of the environment. Qualitative research approach involves 12 respondents representing academia, management institutions and the management of student-athletes to explore elements of support enhance academic achievement in aspects of the environment for student-athletes. A total of 12 experts representing academia, management institutions and the management of student-athletes were selected to analyze the fuzziness consensus of experts. All collected data were analyzed using the fuzzy Delphi method. The result of the analysis found that there are 9 elements in aspects of the environment that fulfill the requirement consensus of experts, which threshold value is equal and less than 0.2, the percentage of the expert group is more than 75%. Therefore, 9 elements of support to help undergraduate student-athletes at public universities to improve their academic achievement.

Keywords: *Academic Enhancement Support, Student- Athlete, Environment, Public Universities, Fuzzy Delphi Method.*

Introduction

Students are the main asset of each institution of higher education in which students academic achievements plays an important role in producing high-quality graduates to transfer on the social and economic growth of the country forward [1]. It is important for the administration and lectures in higher education institutions to focus on the academic achievement of students in which even companies and industries are also interested to have for their company. Academic achievement is one of the factors that highly considered by employers in recruitment, especially for fresh graduates. Academic achievements of students are assessed with a cumulative grade point average (CGPA). CGPA shows the average grades of all examinations for all semesters in the University [2]. Unlike ordinary students in Higher Education Institution, student-athletes are the small part of the student population at each educational institution with roles within the campus, have patterns of life and the different needs in their study sessions [3]. As such, most student-athletes earn low academic grades and average score due to the amount of time mostly assigned to give commitments to physical exercise, where at the same

Dr. Saifullizam Puteh
Assc. Professor, University Tun Hussein Onn, Malaysia
e-mail: saifull@uthm.edu.my

time as a student where they have the responsibility to meet the requirements of academic (attending lectures, complete assignments, pass exams) during the study session[4].

Literature Review: Most of the Higher Education Institution aims to produce students who earn good academic achievement but the environment of competition in sports and also their participation has resulted in the formation of a branch of cultural intellectual, poor academic performance among student-athletes and too dependent on other individuals from particular support in order to increase motivation for enhanced achievements in the academic and community environment [5,6]. They just enrolled into study sessions at the university or college to cultivate their careers in sports. They achieved a CGPA of low dropout rate, the higher education level and the low percentage of study. According to [7-9],have the opinion that, the student-athletes at the university achieve lower academic standards compared to students who do not involve in active sports. The result of the findings by [6] found that the university administration and the role of coach didn't help in developing student-athletes' academic performance in Higher Learning Institution in Malaysia.

Student-athletes are individuals who are experiencing stress in discharging its duties as an athlete and a student in an institution of learning [10]. This is because, the student-athletes are individuals who serve as full-time students at educational institutions and actively involved in sporting activities [11]. By such, the student-athletes involved actively at the university level or the international level should be given special attention and support as they need to cope with various forms of challenges and requirements during sessions of study [12]. Student-athletes in Higher Education Institution have to learn how to balance their responsibilities in terms of sports and also academic in ensuring balanced academic achievements such as the needs of the institution complied. As such, they should streamline the number of hours in the following sports training activities to ensure that they stay fit and at the same time committed to the academic regulations set by the institution.

A study conducted by [13] mentioned that applicable program requirements academic support for student-athletes at educational institutions which found that there was a problem in the academic performance of student-athletes for individuals involved in sports that are more popular which was because of the lack of academic support from the institutions. In addition, the influence of parents, socioeconomic status and family support structure affect academic achievement student-athletes [14] however mentioned there are any findings of the effects of socio-economic status of parents of students' academic achievement. As such, it is important for education institutions' role in providing financial support to the student-athletes, which could help enhance their motivation to improve academic achievement [10] .

Student-athletes are individuals who are experiencing stress in discharging its duties as an athlete and a student in an institution of learning [10]. This is because, the student-athletes are individuals who serve as full-time students at educational institutions and actively involved in sporting activities [11]. Student-athletes in Higher Education Institution have to learn how to balance their responsibilities in terms of sports and also academic in ensuring balanced academic achievements such as the needs of the institution complied. As such, they should streamline the number of hours in the following sports training activities to ensure that they stay fit and at the same time committed to the academic regulations set by the institution. According to [11], sport in colleges and universities of the United States is hoped to be a part of student life, which sports could be given the same priority as academic needs for students to be able to involve in outdoor activities and to ensure that students can train their physical ability after undergoing routine and daily academic load.

Without a clear understanding of the issues that can affect academic achievement of student-athletes, the sports administration and the Student Affairs was unable to formulate and provide services in support of student-athletes education sessions in education institutions in ensuring success in academia as a whole [1]. However, predicting academic achievement student-athletes is a challenge because this individual sessions study the same as ordinary students but have the burden of commitment and academic and sports at the same time.

Methodology

Fuzzy Delphi Technique was used to explore the support element in environment aspect to help student-athletes at public universities to enhance their academic achievement which a set of questionnaire was developed by the researchers based on findings from the expert interviews. The interviews were conducted with 12 experts specialized in the field of student-athletes. In the second phase, a total of 12 experts were selected to

answer the questionnaire. According to [15] the number of respondents for Delphi technique is usually from 10 to 50, therefore, 12 experts were sufficient for this research. Researchers have set the rationale for the selection of the sample for this face interview based on where (i) the expert is a person who is knowledgeable and expert in a matter of study and field of study as well as know about why and how to implement a thing in these areas (ii) work and have experience in the field for more than 5 year (iii) hold office in dealing with student-athletes for more than one term of study (iv) have the knowledge and are involved in managing the student-athletes in Malaysian public universities. The elements of environment aspects were identified by obtaining the consensus from the participating experts. Table 1 shows the simple Fuzzy Delphi procedures used in determining the elements of environment aspects.

Table 1. Fuzzy Delphi Technique

Phase	No. of Expert	Instrument Design
Phase One	12	Semi-Structured Interview
Phase Two	12	Survey Questionnaire

Fuzzy Delphi Technique: According to[16], the Fuzzy Delphi procedures are composed of six basic steps as follows:

Step 1: Determination of Expert: A total of 11 experts were involved in answering the questionnaires. The experts were chosen based on their working experiences in the related field of expertise.

Step 2: Linguistic Scale Selection: In this research, the linguistic scale comprised five-point scale, ranging from (1) strongly disagree, (2) disagree, (3) moderately agree, (4) agree, (5) strongly agree. The triangular fuzzy numbers (TFNs) are more proper to utilize as compare to the crisp numbers in the sense that it can represent the information more rigid in the real situation (Mohd Jamil, Siraj, Hussin, Mat Nor, and Sapar, 2014). Table 2 shows the linguistic five-point scale:

Table 2. Five-Point Linguistic Scale

Five-Point Linguistic Scale				
Linguistic Variable		Fuzzy Scale		
1	Strongly Disagree	0.0	0.0	0.2
2	Disagree	0.0	0.2	0.4
3	Moderately Agree	0.2	0.4	0.6
4	Agree	0.4	0.6	0.8
5	Strongly Agree	0.6	0.8	1.0

Step 3: Calculate the Average Value: The average value was calculated based on the total of linguistic scale number of each item and then divided by the number of experts.

Step 4: Determine the Threshold Value (d): If the value of threshold (*d*) is equivalent to or smaller than 0.2, it indicates that the consensus and agreement from all experts are achieved. When threshold value is larger than 0.2, second round of data collection has to be conducted in order to fulfil the requirement for Fuzzy Delphi.

Step 5: Consensus of Expert: In this stage, the percentages of consensus of each item and overall item have to be determined. If the consensus of experts is equal to or more than 75%, it indicates that the group has reached an agreement. The procedures have to be repeated to ensure the participating group has come to agreement provided the consensus percentage is less than 75%.

Step 6: Defuzzification Process: The main function of defuzzification process is to determine the ranking and score of item by using one of the three formulas as follows:

i. Amax = 1/3 * (m1 + m2 + m3)

ii. Amax = 1/4 * (m1 + m2 + m3)

iii. Amax = 1/6 * (m1 + m2 + m3)

For the case of this research, the researchers have chosen formula (i) to obtain the defuzzified values as well as to determine the ranking and score according to the consensus of experts.

Data Analysis: The analysis outputs is based on the consensus from the participating experts indicated that there were nine support elements of environment aspects important for student-athletes at public universities to enhance their academic achievement. The nine support elements were financial support, family support, peer support, institution, faculty, management of student-athlete, sport science services and welfare are state in Table 3.

Table 3. Data Analysis

Element	Item	Score Value		Threshold Value, d	Consenfusus of Expert (%)
		Fuzzy Evaluation	Average of Fuzzy Number		
Financial Support	1	9.00	0.75	0.0125	88%
	2	8.60	0.72		
	3	8.40	0.70		
Peer Support	4	8.60	0.72		
	5	8.20	0.68		
	6	7.40	0.62		
Family Support	7	8.80	0.73		
	8	8.40	0.70		
	9	7.20	0.60		
Institution	10	8.60	0.72		
	11	8.40	0.70		
	12	8.20	0.68		
	13	8.20	0.68		
	14	7.80	0.65		
	15	7.80	0.65		
	16	8.60	0.72		
	17	8.20	0.68		
Faculty	18	8.60	0.72		
	19	8.00	0.67		
	20	8.80	0.73		
	21	9.00	0.75		
	22	9.20	0.77		
	23	9.00	0.75		
Management of Student-Athlete	24	8.00	0.67		
	25	7.20	0.72		
	26	7.40	0.62		
	27	9.00	0.75		
	28	8.60	0.72		
	29	7.80	0.65		
	30	7.20	0.72		
	31	8.60	0.72		
	32	8.60	0.72		
	33	8.60	0.72		
Sport Science Services	34	7.20	0.72		
	35	7.40	0.62		
	36	7.40	0.62		
	37	9.20	0.77		
	38	9.00	0.75		
	39	8.00	0.67		
	40	9.00	0.75		
Welfare	41	7.40	0.62		
	42	8.60	0.72		
	43	8.80	0.73		

Specifically, the results of analysis showed that the percentages of consensus for the nine support elements were larger than 75%, which is 88%. These nine support elements were financial support, family support, peer support, institution, and faculty, management of student-athlete, sport science services and welfare. This data consists of the threshold value, overall item percentage, average of response and fuzzy evaluation.

Conclusion

As a conclusion, Fuzzy Delphi Technique can be considered as an effective method to determine the constructs of a variable that based on the level of consensus among the experts. Fuzzy Delphi Technique consists of six basic steps, namely, selection of experts, linguistic scale selection, compute thee average value, calculate the threshold value, and determine the consensus of experts and lastly defuzzification process. The most important is the use Fuzzy Delphi Technique may significantly reduce time consumption on the questionnaire and save cost. In the other result aspect, the importance of element supports from environment aspects in providing support in order to enhance academic achievement on student-athlete's public institutions of higher education cannot be denied. Academic achievement become the benchmark to rate of dropout students in Higher Education Institution. This study is important to the top management of university in addressing the problems of academic achievement student-athletes in an institution of higher learning.

Non-Muslim Consumer Perspective on Cosmetics and Personal Care Products

Nusaibah Mansor[1], Nurul Ajmal Mohd Shukri[2], Siti Norbaya Yahaya[1]

[1]Senior Lecturer, [2]PhD Scholar, Fakulti Pengurusan Teknologi Dan Teknousahawanan, Universiti Teknikal Malaysia Melaka, Malaysia

Abstract

Majority of non-Muslim society believes that Halal is meant for Muslim only. Since they don't have sufficient knowledge and awareness about halal products, the benefits of it is not well appreciated. After all, most of the company didn't focus on non-Muslim market. The aim of this paper therefore is to determine the factors affecting purchase intention of Halal personal care products among non-Muslim consumer. Data was collected in Penang of 240 non-Muslims via structured questionnaire to gather information on their perspective towards Halal personal care products. Multiple Regression Analysis is applied to determine and assess the strength of relationship between variables. The factor that influences the purchase intention of Halal cosmetics and personal care products is halal awareness, religiosity, halal certification, attitude and brand trust. The result of the study suggest that brand trust strongly influences the purchase intention of Halal cosmetics and personal care products. Companies targeting non-Muslim markets are therefore are encouragedto tailor their marketing activities based on a behavioural perspective which increases and benefits social expectations and awareness which in turn would enhance their competitive advantage. By strengthening the brand trust through Halal process standard in production of guaranteeing hygiene and quality will allow products to penetrate into new market of non-Muslim consumer.

Keywords: *Personal Care, Purchase Intention, Halal.*

Introduction

When it comes to Halal, food is always associated with it. However, the scope of Halal covers a lot more than just food. From banking to health care, tourism to cosmetics and personal care products, there is a whole lot more of halal products or services offer in the market. Perhaps the misconception of Halal is when products or services offers misunderstood as it servessolely for the use of Muslims consumer. Nowadays, Halal is not limited only to Muslims, but non-Muslims also adapt and practice in their everyday lives.Halal is not limited to Muslim only but it also a choice for non-Muslim worldwide[1].

Halal is an innovation to all products because it is way more hygiene and safe to be used. The Halal product contains no dangerous and harmful ingredient. To manufacture halal products, manufacturer has to adhere with stringent manufacturing process standard which follow the Islamic rules. The process must comply with the standard quality and hygiene aligned with Good Manufacturing Practice (GMP). From selecting raw ingredients, the process of making the products, storage, display and delivering the products must conform with the Islamic law. Therefore, for non-Muslims, Halal can become a mark of unquestioned conformance and quality in trade dealings with Muslims[2].

The Halal industry in Malaysia had a rapid growth in not only healthy lifestyle but also in other life activities. Therefore, manufacturer and entrepreneur must come out with a fresh and new idea in developing a variety

Corresponding Author:
Nusaibah Mansor
Senior Lecturer, Fakulti Pengurusan Teknologi Dan Teknousahawanan, Universiti Teknikal Malaysia Melaka, Malaysia
e-mail: nusaibah@utem.edu.my

of Halal products that can be used not only Muslim but also non-Muslim. In order to ensure non-Muslim also buy a Halal product, the companies need to convince and create awareness in their community.

In Malaysia Budget 2019, the government has stated that they will focus more on halal industry where the government will allocate 100 million ringgit to improve the capacity of small and medium-sized enterprises in the halal industry through different programs to increase exports and make Malaysia as a global halal hub by 2020.

Non-Muslim society has yet to appreciate the underlying benefits of Halal products that include a hygienic process[1]. Before reaching the market, Halal products must be subjected to them. Today, the trends in the purchase of cosmetic and personal care products are increasing every day. Consumers nowadays are expecting products that are not harmful to them. Therefore, the market can be expanded to new market category by tapping into non-Muslim market as their awareness of Halal is high[3].

Literature View: Halal in Cosmetics and Personal Care: The word Halal originated from an Arabic word "HALLA" which indicate "allowable" and "not forbidden" to all Muslims to consume or practicein their daily lives. In general, halal products do not contain pork, alcohol, blood or additives of animal origin and throughout the entire production process, they are not contaminated with said ingredients. Halal nowadays is a universal concept[1]. Non-Muslims also believe they should not buy or use an animal-based product due to concern over animal abuse and harmful effects. The cosmetic and personal care products segment has emerged as one of the leading market segments. Halal beauty industry has grown tremendously especially in the halal pharmaceuticals and cosmetics sectors which continue to expand[4].

Halal Awareness: Awareness is the ability to perceive events and objects, to feel and to know. It is a concept of understanding and perceiving events and subjects[5]. Awareness was assumed to be an important part of determining the intention to choose halal product and personal care.

One of the main issues for consumers is the difficulty in securing legal status for imported cosmetics because they do not have halal certification where these halal cosmetic products are generally welcomed by Muslims and attract non-Muslims to consume of cosmetic products[6]. The growing awareness of non-Muslim users about their religious obligations calls for personal care and Halal cosmetics. Some consumers are aware of cosmetic products, so they bought more reliable and safer cosmetic products[7,8].

Religiosity: Most people in this world have shown that religions are one of the most influential roles in shaping the choice of food among the members of societies.Religion is not an important factor in consumption of the product, but someone religious known as religiosity is vital on shaping one's purchasing behavior.Such religious commitments and beliefs would certainly have an effect on people's feelings and attitudes to buy and consume[9,10].

Halal Certification: Halal certification means the official recognition by the established body of the orderly preparation, slaughter, cleaning, handling and other relevant management practices[5]. Interestingly, the principle of halal is more than it was, because both Muslims and non-Muslims accepted it broadly. The Halal concept is considered the preferred standard for these two groups globally[1].There is no other way to determine the "halalness" of a product except by using a credible Halal logo[11]. This is because the halal certificate is only issued if it complies law and proper requirements and these organizations have the authority to certify that the products are halal and have the infrastructure[12].

Attitude: It is worth noting that the product focuses not only on halal status but also on safe and clean products that are used as ingredients in the production of the cosmetic and personal care product based on natural resources[7]. Consumers place their trust in information obtained from sources, especially when it comes to religious authorities. With a wide variety of beauty products, consumers may not know what they have taken or used on their skin and some will mislead the consumers[13]. Furthermore, theaccessibility of a product in some places may alter its attitudes towards buying a good cosmetic product[8].

Brand Trust: Brand trust refers to the feeling of being secure between consumers with their trust in certain brand. Consumer belief the brand can be dependable and accountable for their well-being[14]. Through the Islamic belief system, product strength is associated with the production process, quality control and environment can attract the interest of consumers to purchase and use

Halal cosmetic and personal care as non-Muslim start to put their confidence on that brand[15].The trust level was low if the brand was not known[16]. This also applies to non-Muslim Malaysian consumers, where trust in the brand determines the level of trust in the product's halal status[5].

Theoretical Framework: Consumer tends to make a presumption before deciding to make prior to decide when making a purchase. Organization doing internal audit function will be more effective to detect and to report that there is fraud in organization[9], and accountancy fraudulence tendency can be led down by to increase an internal controlling effectiveness, accountancy role loyalty, management morality, and to eliminate information asymmetry[4].

Based on the above, the research framework adapted from can be described as:

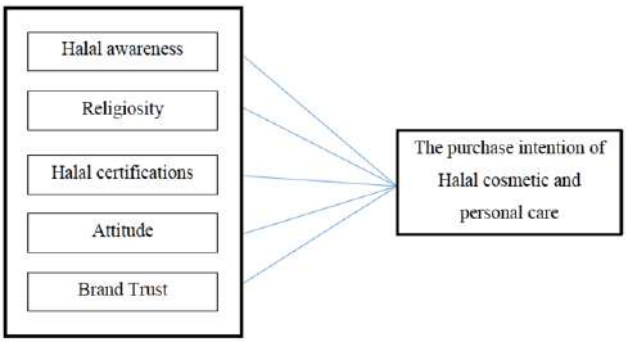

Figure 1: Research framework

Methodology

To achieve the aim of this research, explanatory method is chosen. Questionnaire is constructed based on research framework. About 240 non-Muslim participated in the survey to collect relevant data. The statistical tool used in the study is multiple linear regression to test the relationship between variables.

Results and Discussion

The R^2 is valued at 0.634, which the purchase intention is explained by 63.4% by all five independent variables. In this study,four independent variables (religiosity, Halal certification, attitude and brand trust) are making a statistically significant contribution to equation ($p<0.05$) with p-value 0.000, 0.000, 0.021 and 0.00 respectively.From the analysis it is found that out of the five variables, all are significant except for Halal awareness.

The p-value of Halal awareness resulted a 0.778 valueoutput which is not significant. This result is supported by another research which stated that among Muslim women in Klang Valley, the level of Halal awareness towards Halal cosmetic is still low which also shows that non-Muslim level awareness is low as well. Halal awareness is a major factor in explaining in non-Muslim societies the interest to buy halal product[5,17].

Conclusion

In this research, brand trust variable is the most influential towards purchase intention on Halal cosmetic and personal care rather than other variables which is Halal awareness, religiosity, Halal certification and attitude. The customer will choose the product that they have trust on it. By means of trust, they will purchase a product that have the best advertising or might be influence from their family and friends who has been a loyal customer towards certain brands. Therefore, the Halal companies and government should focus on designing a good product that include safe ingredient and trusted manufacturer so that it can attract the interest of non-Muslim to purchase and used the Halal product.

Next, implication of the research is Halal awareness which has the least influential towards purchase intention on Halal cosmetic and personal care. This research shows that majority of the respondent being ignorance about the Halal when purchasing a cosmetic and personal care. For them, Halal is not the priority when choosing the product. This also shows that the level of Halal awareness is still low among non-Muslim. Therefore, the companies and government must implement many activities and program such as talk, Halal exhibition by spreading the benefit of choosing Halal cosmetic and personal care. From that it will increase the exposure of Halal and attract their interest to get know more about Halal product.

Recommendations: To overcome the limitation of this study, there are some recommendation proposed by the researcher. This study covered respondents from a state in Malaysia only, because of that it is recommended for further study to collect the data from all states. From that, it will help the researcher to make a comparison on the behaviour of the consumer in intention to buy Halal cosmetic and personal care. The researcher also needs to cover the sample towards all areas in Penang to ensure be comprehensive and represent more population.

Lastly, this research only used five variables in

measuring the intention of non-Muslim in purchasing the Halal cosmetic and personal care. It is suggested to future researcher to used additional variable such as knowledge and quality that will provide more information about this study.

Students' Pro-Eco Behavior Related to Healt Based on Environmental Big-Five Personality and Self-efficacy

I. Made Putrawan[1], Lisa Dwi Ningtyas[2]

[1]Professor at Biological Education Department, [2]Master Student in Educational Evaluation & Research, State University of Jakarta

Abstract

This research was aimed at finding out whether students' pro-eco behavior could be predicted by their personality and self-efficacy interms of a correlational study. A survey method was used involving 200 senior high school students in Jakarta. The reliability of three instruments were respectively 0.75 (pro-eco behavior), 0.87 (big-5 environmental personality), and 0.66 (self-efficacy). Regression and correlation analysis were used. Results revealed that both personality and self-efficacy have a positive and highly significant correlation with students' pro-eco behavior, even for first-order correlation. Multiple regression model for those variables was also found highly significant. Therefore, it could be concluded that student's pro-eco behavior could be strongly predicted by personality and self-efficacy and in strengthening students' pro-eco behavior, their personality and self-efficacy could be taken into account. Considering the results obtained, it was suggested to teachers, who held an important role in the learning process, to understand students' personalities by paying attention to identifying students' personalities. It is important also to spontaneously carrying out a kind of parents, society, teacher collaboration. In improving students' self-efficacy, teachers were supposed to appreciate students which finally would strengthen students' pro-eco behavior to be more positive and students healthy could be achieved effectively.

Keywords: *Personality, self-efficacy, pro-eco behavior, reliability, and first-order correlation.*

Introduction

Environmental issues have been the most influential topics in any country. It has an effect also on economic development where most countries should prepare a green trade by adopting eco-labeling products. Sustainable development is not the answer since it is still admitted that in some places, environmental destruction, degradation, deforestation, and even global warming are not an illusion. Talking about the environment, we also talk about human health which of course influenced directly by the environment. If we love our-self meant that we should also our healthy and automatically we love our environment as well. These phenomena called pro-ecological behavior.

The ecosystem consists of producers, consumers, and decomposers (Barrow, 2006).[1] Chiras (1991)[2] called a sustainable society characterized by human behavior which might be more concerned with the environment (Putrawan, 2015).[3]

Environmental behavior,which specifically called pro-environmental behavior or pro-ecological behavior (PEB), was a similar term used interchangeably, however, according to Kollmuss & Agyemen (2002),[4]it was a complex concept which still questionable what factors shaped pro-environmental behavior. It has been identified some factors such as demographic factors, external factors (e.g. social, cultural, institutional, or economic) and internal factors (e.g. knowledge, attitudes, locus of control,awareness, emotion, values, responsibility) might be used in visualizing its framework.

That is why, this research is so important in predicting pro-ecological behavior,by questioning whether student's personality and self-efficacy could be beneficial contributions in framing scientifically the concept of pro-ecological behavior.

Literatures Review: The behavior will influence the environment and conversely, the environment affects

behavior (Bennett, 1974, in Putrawan, 2017).[5]Study about behavior is surprising because of many factors that should be considered in finding out why and how human behavior could be changed. Those factors arecalled the interactionistperspective (Greenberg, 2010)[6] which consisted of personal qualities and situational (setting, context, environment) influences.

In the context of research, human behavior should not be directed to thementality frontier, a term borrowed from Chiras (1991).[2] It should be directed to behavior that has perception toward the environment by protecting the ecosystem from destruction for future generations (Blackwell, 2007)[7] This type of behavior belongs to Chiras (1991)[2] was called a sustainable society.

According to Baker (2012),[8] environmental behavior is indicated by energy used efficiently, as well as water and other resources, and reducing waste, pollution, and environmental degradation. Garrod & Wilson (2003)[9] stated that human environmentally sound behavior was characterized by conservation, recycling or use-reuse,utilizing more renewable energy resources, and limiting growth. Related to these indicators, Marcinkownski (1989)[10] described that human behavior should be directed to the utilization of natural resources rationally.

A more detail model contributed by Hines, et.al. (1986)[11] wasmodified by Blaikie (1993, in Oram, 1994, p.32)[12] in which human behavior called Responsible Environmental Behavior (REB).It hypothesized that REB was affected by factors such as attitudes, locus of control, personal responsibility, knowledge, personality, situational factors, and intention to act. In addition to this, Wayne (2006)[13] added that there were three types of responsibility, personal, social and environmental responsibility

Related toREB, the Hines' model, quoted also by Kollmuss & Agyemen (2002)[4] elaborated into a complex model called citizenship behavior (Hungerford, 1990)[14] affected by entry-level variables, ownership variables, and empowerment variables.

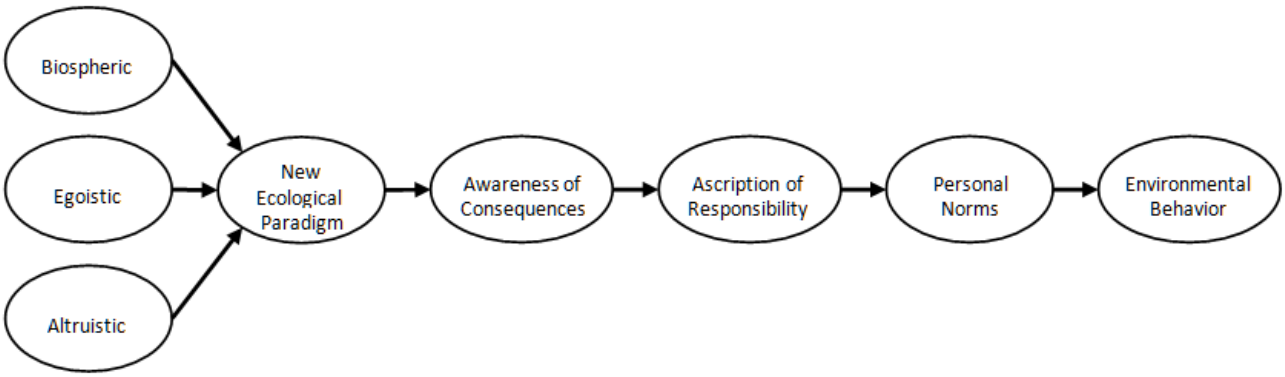

Fig 1. VBN model for environmental behavior (Stern, 1999 & 2000 & Bronfman, et.al., 2015)[15,16,17]

The Values-Belief-Norm (VBN) model was also widely used for the study about the relationship between as many as independent variables with environmental behavior which those relationships kept remaining statistically significant (Bronfman, 2015).[17]

According to Stern (2000),[16] "Pro-environmental behaviors are generally defined as behaviors that reduce the environmental impact caused by human beings." Such behaviors are covering e.g. saving energy and reduced consumption of resources, the efficient use of motor vehicles, and natural conservation (Steg & Vlek, 2009).[18]

Eventhough "an individual's pro-environmental behavior might create only a small impact on easing environmental destructions (Stern, 2000, in Kaida & Kaida, 2017).[19] That is why, this research is very urgent to be carried out, whether student's pro-ecological behavior (PEB) could be predicted by their personality and self-efficacy.

With that perspective in mind, students' personality contributes to the responses shown in the learning situation.Working together in a group needs the ability to communicate, share ideas, and transfer knowledge and skills, and to maintain a strong pro-eco behavior.

The motivation as indicated by self-efficacy must be driven by conscientiousness traits. As stated by Judge and Ilies (2002)[22] that conscientiousness is associated positively with the motivation to achieve.

Self-efficacy is another factorrelated to pro-eco behavior. Self-efficacy is the confidence to execute the assignments given to someone. According to Santrock (2011),[23] self-efficacy is the confidence to say "I can."

This statement has been previously supported by Hines, et.al. (1986/1987)[11] which found out that there were six studies specifically dealt with relationship between individual locus of control that was an individual's "efficacy perception,"with responsible environmental behavior.

Researchconducted by Werff, Steg & Keizer (2013)[24] suggested that "strengthening environmental self-identity may be a cost-effective way to promote pro-environmental actions, because environmental self-identity is closely related to self-efficacy.

Reported by Tabernero & Hernandez (2011)[25] that "the was arelationship between self-efficacy and recycling. In this study, recycling is part of individual's pro-ecological behavioror just citizenship behavior asused by Hungerford & Volk (in Putrawan, 2017).[5]

Fransman & Timmeren (2017)[26] foundthat pro-environmental behavior could be predicted from behavioral control, behavioral norm, and place identity, explaining 40% of the total variance in pro-environmental behavior.

Gifford & Nilsson (2014)[27] stated that to understand pro-environmental concern and behavior is very complex and complicated than previously thought. They have successfully identified around 18 factors that were assumed to be factors that could be used in predicting individuals' pro-ecological behavior such as "the personal factors include childhood experience, knowledge and education, personality and self-construal, sense of control, values, political and world views, goals, felt responsibility, cognitive biases, place attachment, age, gender, and chosen activities.

Research Methodology: This research was aimed at finding out whether there was a relationship between personality and self-efficacy with pro-eco behavior. The survey method used by involving 200 senior high school students in Jakarta.

There were three instruments developed to measure personality with reliability was 0.87, reliability for self-efficacy was 0.66 and for students' pro-eco behavior was 0.75. Data analyzed by simple and multiple regressions, and t-test for correlation after followed by calculating its second-order correlation through ANOVA.

Results and Discussion

Analysis has been conducted by computing simple regression model which found that the model between personality and student's pro-eco behavior was $\hat{Y} = 28.45 + .43X_1 (p < .001)$.

Table 1: ANOVA Table for Regression

Source of Variances	df	SS	MS	F_{cal}	F_{table}	
					.05	.01
Reg (a)	1	49956.08	49956.08		3.84	6.63
Rg (b/a)	1	3693.55	3693.55	44.88**		
Error	198	16295.16	82.29			
Total	200	519584.08				

** p <0.01

Based on the table 1, it could be interpreted that the strength between personality (X_1) with pro-eco behavior (Y) was shown by the correlation coefficient was 0.816 (p <0.001).It meant that the more accurate personality, the stronger pro-eco behavior would be.

The determination coefficient was (0.816^2) meant that 66.61% of pro-eco behavior variance could be explained by personality variation. By controlling another variable was to determine the level of relationship between given predictor variables (while another predictor variable was

controlled). The result of the partial correlation between personality and pro-eco behavior (first-order correlation) while self-efficacy was controlled, was0.629 ($p < .001$).

Luthans, et.al. (2011)[21] stated personality was how someone influenced other people and how he viewed and understood himself, including the pattern of traits which could be measured from how he interacts with people and situation around him. Personality can be divided into five dimensions. Extraversion, agreeableness,cons cientiousness, emotional stability, and openness to new experiences (George & Jones (2012).[20]

Regarding neuroticismstudents could be stress-out, tense, and depressed in different situations. It makes students face difficulty to maintain their pro-eco behavior. This unstable can cause the feeling to give up (McShane & Glinow, 2018).[28]

Conscientiousness will reflect the persistence to achieve the goals. Proved by an international journal regarding predicting pro-eco behavior based on personality that each dimension of personality contributes to pro-eco behavior. However, her research result showed the different coefficient correlation between each dimension with pro-eco behavior. This fact proves that it is undeniable that personality contributes positively to pro-eco behavior (Ariani, 2013).[29]

Personality's contribution to pro-eco behavior found was 0.66. Statistically, this value meant that 66.61% of pro-eco behavior variation could be explained by personality variance. Therefore, personality was a factor that was essential in strengthening students' pro-eco behavior. Partial correlation between personality and pro-eco behavior, self-efficacy was controlled 0.629 meant that its determination coefficient was 0.395. The result showed that 39.56% of pro-eco behavior variationcould be explained by personality variances by controlling self-efficacy.

Another finding was the regression model of $\hat{Y} = 39.39 + 0.21X_2$ ($p < .01$) between self-efficacy (SE) with pro-eco behavior (PEB).

Table 2. ANOVA Table for Regression

Source of Variances	Df	SS	MS	F_{cal}	F_{table}	
					0.05	0.01
Reg (a)	1	499947	499947		3.84	6.63
Rg (b/a)	1	905	905	9.41**		
Error	198	19048.67	96.21			
Total	200	519900.7				

**$p < 0.01$

Based on the table above that the regression model pro-eco behavior (Y) with self-efficacy (X_2) was linear. In other words, there was positive relationship between self-efficacy and pro-eco behavior. This regression model meant that if self-efficacy was increased a point of pro-eco behavior will rise .21. The strength of relationship between self-efficacy (X_2) with pro-eco behavior(Y) was shown by correlation (r_{x2y}) = 0.674 ($p < .001$). In other words, the higher the students' self-efficacy, the more positive students' pro-eco behavior would be. Determination coefficient was (0.674^2) meant that 45,40% of variance occurs in pro-eco behavior could be explained by self-efficacy.

Self-efficacy, which is the center of Albert Bandura's social theory, is the individual's confidence to execute a task efficiently (Campbell & Nelson, 2013).[30] Self-efficacy is gained from personal experiences when an assignment can be fulfilled effectively or being able to get back up from failures.

In this research, the partial correlation between self-efficacy and pro-eco behavior was0.111 and the determination coefficient was 0.0123. This meant that only 1.23% of pro-eco behavior variation could be explained by self-efficacy when the personality was controlled. These findings aligned toZimerman, Bandura, and Martinez-Ponz's (1992)[31] findings which self-efficacy will motivate academic achievement by affecting personal goal setting. Statistical test analysis showed that self-efficacy contributes significantly to pro-eco behavior, where the higher self-efficacy, the more positive of students' pro-eco behavior would be.

The multiple relationship strength found between personality and self-efficacy with pro-eco behavior was 0.819 ($p<0.001$), indicated by the correlation coefficient of personality and self-efficacy with pro-eco behavior. The determination coefficient was (0.819^2)which meant 67.03% of students' pro-eco behavior variances could be explained by personality and self-efficacy. It was around 67.03% asthe percentage of personality and self-efficacy contributed to pro-eco behavior, the rest would be determined by other variables.

This conclusion meant that the relationship between both personality and self-efficacy with pro-eco behavior was positive, which meant that the more accurate personality and the higher self-efficacy, the more positive students' pro-eco behavior would be.

Conclusion

Based on the research findings, it could be concluded that, first, there was a positive relationship between personality and student's pro-eco behavior. Second, there was a positive relationship between self-efficacy and students' pro-eco behavior. Finally, there was a relationship between both personality and self-efficacy with students' pro-eco behavior.

Therefore, the more accurate the students' personality and the stronger self-efficacy then the more positive pro-eco behavior would be. In other words, students, in this study students' pro-ecological behavior could be predicted by their environmental personality and self-efficacy, Therefore, if students' pro-ecological behavior would be improved to be more positive in facing global environmental problems, their personality and self-efficacy could not be neglected. It would be suggested that environmental education is very vital required to be implemented urgently and could be integrated into several subject matters by intervened with morale messages.

Visualization Program of Practical Work Manual for Biology Concepts on Health Education Topics

Amalia Sapriati[1], Mestika Sekarwinahyu[1], Ucu Rahayu[1], Suroyo[1]

[1]*Lecturer, Faculty of Education, Universitas Terbuka, Indonesia*

Abstract

Science practical work has to be carried out with due regard to the availability of resources and has to facilitate student learning, but in accordance with the instructional goals. A practical work manual need to be supplemented with relevant visualization programs in order to improve students' understanding of practical work on health education topics. The objectives of the research were to identify practical topics that need visualization programs and to develop an example of a visualization program for the practical work. The results of the research were models of visualizing practical work procedures in biology on the topics of health education. The study carried out using the design of qualitative research method. The source of data and information consisted of five lecturers and sixteen students of the Biology Education Program. The instruments consisted of focus group discussion, interviews, document analyses, questionnaires, and test. The results indicated that practical works manual require programs to visualize practical instructions that students must undertake. The visualization programs are to provide a more detailed explanation of the components of the topic discussed, such as in the respiratory system, to provide a detailed description of the procedures that must be carried out, for example in practicums of measuring respiration rates, and to detail observations, for example in practicums of the sex determination of fruit flies. In addition, the results specified that in the development of programs that visualize practical instructions and biological concepts could use the Dick & Carey Systems Approach Model for Designing Instruction. The programs are to increase students' understanding of practical work and towards the content discussed. However, further researchs need to conduct in order to explore and analyze the level of student understanding.

Keywords: *Visualization, practical work, practicum manual, biology-concepts, health education topics.*

Introduction

The main objectives of practical work in biology, espeially on health education topicts, are: to teach science concepts, subject materials, and the nature of science; to develop skills and techniques for scientific procedures; to enhance scientific literacy; to increase motivation and interest; to develop social skills, and; to provide support in applying the knowledge in everyday.[1, 2,3]Practical skills among others, can be in the form of physical skills, such as measuring, observing, experimental design, data management, and other psychomotor skills; as well as the skills to think and use logic, such as making inferences, choosing appropriate method and identifying regularities of nature, and problem solving.[4] Concerning the types of activities, practical work that could be carried out, includes practical observation, experiment, and investigations.[5,6]

Practical work is still considered to face some problems in terms of task and activity characteristics, relevancy of assessment, implementation support, and adequacy of resources, time, and facilities.[7,8,9] Open and Distance Education copes with similar issues.[10,11] Improved learning outcomes in science, including biology concepts on health education topisc, can be achieved by: creating learning materials that are more concrete; placing learning materials in a realistic context;

Lecturer, Faculty of Education, Universitas Terbuka, Indonesia
e-mail: lia@ecampus.ut.ac.id

providing practical experience in the method of science and with scientific instruments; improving observation skills; fostering cooperation and roles in the team; developing a positive attitude about the outside world, and; gaining knowledge of the natural relationship with the community, especially with regard to the use of resources.[1]

In order to promote learning and understanding and to aid in analysis and problem solving in science, Vavra, *et.al* proposed recommendations for providing visualization objects, interpretive visualization, and animations and computer-based visualizations.[12] Scientific visual and visualizations include dynamic multimedia demonstrations of principles, animated explanations and manipulable three-dimensional images.[13,14] Vavra, *et.al* indicated that the visuals are used as a supplement to text, in addition animations are used to explain concepts that can't be seen, to explain movement, to figure three-dimension concepts.[12]

The Undergraduate Program of Biology Education at Universitas Terbuka (UT), the Open University in Indonesia, considered that the existing Practical Work Manual needed to supplement visual programs, especially in order to enhance student understanding in conducting practical work in health education topics. An alternative form of supplements is a visual of the explanation that describe and discuss in the Practical Manual. The visual program refers to the process of creating a graphical representation or is a synonym for visual imagery.[12]

The research problems consisted of (1) what are the topics of practical work procedures that most need visualization supplement, (2) what are the topics of practical work procedures that are most likely to be developed, (3) what are the steps required for program development, and (4) how do students perceive the visualization program. The objectives of the research were to identify practical topics that need visualization programs and to develop themodel of visualization program.

Reaseach Methodology: The research design was based on qualitative research method, and Research and Development (R & D).[15] Procedures of product development followed the Dick, Carey & Careymodel.[16]

The study carried out in Tangerang Selatan, Indonesia. The sources of information were 5 experts in biology education and 16 students of the biology education program who did practical work in. Data collection consisted of focus group discussion, interview, document analysis, a questionnaire and a test. Focus group discussions and interviews to experts and students were carried out in order to identify topics of practical work manuals that require visualization programs. The researchers developed visualization programs of respiration rate, fruit flies sex determination, and flower diagram model. The experts expressed their oppinion regarding content of the visualization programs. The students filled questionnaire, took the test and gave their oppinion reagrding the content and quality of the program and their understanding. Collected dataand information were analyzed descriptively.

Results and Discussion

The results of student focus group discussions and the results of experts' reviews indicated the practical work manual required additional visualization for the procedures, and additional explanation. Both the students and the experts determined that visualization was needed for the topics of: (1) measuring respiration; (2) osmosis and plasmolysis; (3) photosynthesis; (4) identification of bacteriaand fungi; (5) blood type examination, (6) reproductive system, (7) fruit flies sex determination, (8) microorganisms in life (e.g rhizopus, aspergilus), (9) desinfectants in environment, (10) diagrams of flowers, and (11) motion of heart tendons.

The results showed generally that practical work that needs lab equipment and the guidance of the instructor requires additional explanation or visualization. Some practical work was considered to be able to be simulated through a drylab program. The experts recognized the most suitable practical work that could be substituted with simulation programs. However, the students argued that they have to do all the practical work and thus they recommended that it not only be demonstrated through simulation. Furthermore, the practical work topics of frog cardiac muscle motion, and determining male and female fruit flies could be given to students as simulations (drylab program).

Development of visualization programs follow the procedures of the Dick, Carey & Careymodel.[16]The initial idea of the study was to consider the need for other media provided to clarify the practical procedures listed in the Manual of practical work in biology. Students and experts have reviewed and analyzed the topics that required additional explanation.

The prototype consisted of a visualization program in the form of an interactive power point. In order to improve the programs, through a Focus Group Discussion, five experts assessed the prototype visualization programs. The expert assessment indicated that the program neededrevision, especially for (1) instruction, illustration, and proceduresof measuring animal respiration program, (2) illustration, feedback, and discussionof fluit flies sexdetermination program; and (3) images and consistency of terms for flowerformulas anddiagram program.Results of the *one to oneevaluation* showed that the draft prototype needed to be refined in terms of procedures and explanations of the practical results and the assessment, especially for the topic of measuring respiration rate of animals, and the symmetry and formulas of flowers.

The next stage was to evaluate and try out the draft of prototype by a small group of nine students. Students' perceptions regarding the practical work of measuring respiration rates showed that program animation or simulation were insufficient to support their work in carrying out observations and writing reports. Content and display programs hadtorevise. Furthermore, students can conduct the practical work of determination of fruit flies sex. The content and appearance of the program is good enough so that the program does not need to revise. The students consider that animation program of the flowers diagrams had to revise, especially concerning the explanation of content and the images of program. Students stated that to providebetter, attractive, and natural photographs of flowers.

After reviewingthe practical work Manual and watching the program, students have had the test to measure their understanding of the practical work and the content. The analysis showed that the students have a good understanding of the procedures and content delivered via the visualization program practical work for determining fruit flies sex, and show sufficient understanding of the procedures and content of the practical work for animal respiration rate and flower diagrams.

Visualization is required to convey complex concepts or data, abstract concepts, interrelationships in a system, a scientific explanation that cannot be found in everyday life, and certain processes that occur at the microscopic level.[13,1,14]Conceptually, visualization can be visualization objects and introspective and interpretive visualizations. Thus, visualization can be physical objects, mental objects, and cognitive processes that involve the interpretation of physical or mental visualizations.[12]A visualization laboratory considers tosupport explain, develop and teach the concepts being studied. For example, clarification of practical procedures, clarification of how to manipulate the equipment, observation techniques and types of recording results. The visualization could be a representation or description of a process or activity or skill or results or object or shape of the image, and then the object can be image visualization, three-dimensional models, schematic diagrams, geometric illustrations, through computer modeling, simulation, animation, video.[13,1, 14, 12]

Program visualization of practical work becomes important for students who are learning in the open and distance education system. In this learning system, the learning process will run more smoothly and significantly when utilizing a variety of instructional media. In terms of practical activity, distance education learning tends to use a variety of technologies and media and it is an attempt to restructure the relationship of students with learning resources.[17]Distance education learning leads to the use of computer and computer -based learning.[18,19]The effects of computer simulations in science education are caused by interplay between the simulation, the nature of the content, the student and the teacher.[20]

In this research, the visualization program created as an additional explanation is not in the form of practical simulations or replacements. Kennepohl argued that the types of practical work for distance education systems could be both wet and dry lab practical work.[10] The type or form of practical work could be hands-on, simulation programs, remote labs, virtual labs, and real practical work (practical work in labs or the field).[1,2]

Indeed a visualization program is not a solution to everything. However, the effort and method to provide visualization are expected to enhance students' understanding, the quality of teaching, and student learning.[21]. A visualization program consider to enhance the students' understanding of practical work that ultimately mayimprove various things like understanding of concepts, problem-solving skills, scientific thinking habits, skills, attitudes, interests and motivation of students. In line with the opinion of Rundgren & Bao-jun[21], the determination of the visualization should be linked to the characteristics of the content and not give rise to misconceptions.

Conclusion

The visualization program for practical work is required in order to clarify the description in the practical work manual. The program would provide a more detailed explanation of the components of the topics discussed, for example in the practicum of the respiratory system, reproductive system, and flower diagrams. In addition, the programs could provide detailed description of the procedures, for instance in practicum of respiration rate, osmosis and plasmolysis, heart muscle motion. Furthermore, the programs could provide detail observations, on the case of practicums of bacteria and fungi identification and disinfectant levels in the environment. Development of visualization programs could use the Dick & Carey Systems Approach Model for Designing Instruction. The programs should be attractive and could facilitate student learning. Relevant studies are required to analyze the level of students' understanding by involving more students in the study.

Effects on Memorized Information Quantity in Web Pages Using Bicolor Design-from the Perspective of Color Blind People and Non-Color Blind People

Kohei Sakamoto[1], Chieko Kato[2]

[1]Master Student, [2]Professor, Toyo University, Japan.

Abstract

In Japan according to the Japanese Ophthamlogical Society, people with color blindness make up about 5% of men and about 0.2% of women. Colorblind people often experience inconvenient situations in their lives because they cannot distinguish colors. Web pages are no exception. Companies and governments use web pages to transmit information to people. In this study, we created a web page with a color scheme obtained from previous research. This study confirmed that colorblind people, after viewing such a web page, remembered its contents better. From these results, this study analyzed the role of information transmission on the web page. As a result, the viewers color vision and hue of colors on the web page had no effects on their memory. The result also showed that the color of high chroma on the web page had no effects on their memory. The result also showed that the color of high chroma had bad effects on their memory.

Keywords: *Web Page, Color, Memory.*

Introduction

Society of Web: The Internet is one of the most pervasive media. On the Internet, Web sites play a major role in information technology. Web sites are pervasive in modern society. Producing a widely accepted Web site leads to the smooth transmission of information to many people. By improving the quality of the website, you can communicate your information more widely and accurately, and at the same time, you can show improvement in the evaluation from others.

The purpose of creating a website is to communicate. When websites are used, first they are read by readers. Next, the information on the websites is fixed as memory. Finally, people output it as information. We get a large amount of information. People judge that information is important to them, and consciously interpret and remember information. We can quantify communications from the internet to measure the amount of memory.

e-mail: smakchi78@gmail.com

Existence of Color Blindness: Webpages transmit information through the viewer's vision. Therefore, we mustn't forget the existence of colorblind people when we design webpages. Colorblind people are those who have difficulty recognizing certain colors. The crystalline lens is in the eye. The light from the lens is reflected onto the retina, which acts as a screen. The cells of the eye recognize the color. It has three cone cells: red, blue, and green. Colorblind people do not have these cones, or their cones don't function normally. As a result, they can't discern colors. The Japanese Ophthalmological Society classifies Common, Protanope, Deuteranope, and Tritanope depending on which cell cone doesn't function. Protanope accounts for about 25% of colorblind people in Japan, while Deuteranope accounts for about 75%. Tritanope are colorblind accounts for less than 1%. Around 1 out of 20 males are colorblind, and around 1 out of 500 females.

Color Universal Design: Color universal design is used when we make products for both colorblind and non-colorblind people. Guidelines have been published

by various municipalities to people who make use of color universal design. Major examples include the "Tokyo color universal design guidelines" published in Tokyo, and the "Guidelines for using colors that consider people with color blindness" published in Osaka. The social opportunity promoting the consideration for colorblind people increases year by year. Websites are also similar. According to the "Tokyo universal design guideline", they recommend adjusting brightness, saturation, and so on. According to the "Guidelines for using colors that consider people with color blindness", they recommend only to make adjustment in brightness. It is also indicated that we should consider the colors of letters and backgrounds. Zhanget al.[1,2] studied the impressions of colorblind and non-colorblind people as they view websites. They made websites using a bicolor design. As a result, the hue reveals differences between the impressions of colorblind and non-colorblind viewers.

The Purpose of This Study: Websites are a medium viewed by an unspecified number of people. We should make websites that consider both colorblind and non-colorblind people, because websites are a form visual information. And the viewer consciously remembers information after viewing it. Previous studies have examined relationships from each aspect of universal color and memory. But there are few studies about websites from the perspective of both universal color and memory. In this study, our purpose is to examine the influence of color websites on the memory capacity of the viewer. We evaluate color universality in the context of Common, Protanope, Deuteranope types of colorblindness.

Experiment 1:

Procedure of Experiment 1: Research participants are third- or fourth-year undergraduates, 38 males and 18 females. They viewed 8 webpages that have different color schemes. They solved a test of webpage contents. The procedure of the experiment is as follows. First, we gathered research participants in one place. Then we divided them into six groups. The research participants who played the role of being colorblind wore glasses that simulated Protanope or Deuteranope. Next, all participants opened the first page of the webpages. They familiarized themselves with the test form by viewing the sample page. After that, participants viewed experimental webpages, solved memory tests, and took breaks in between, repeating this process several times. So as not to allow participants to become influenced by the order of the test, random switch operations were also included.

Experiment 1 Environment and Equipment: This experiment was conducted by collecting research participants in a computer room at A University. Computers and displays are all the same in the room. The screen brightness of displays is also the same. We used Google Chrome to view experiment pages. The site was tested in full screen view. Also, the screen was viewed from the front. In order to simulate colorblindness, Variantor, manufactured by Ito Optical Industry Co., Ltd. was used. These glasses, which may be worn on top of ordinary glasses, can be used by non-colorblind persons to experience vision. We used Variantor glasses that simulated Protanope and Deuteranope colorblindness.

Making Webpages: We used original webpages in the experiment that were produced by us. We did not use a webpage creation tool for production. We created source files such as HTML and CSS directly. We used the source code editor Visual Studio Code for coding and the hosting services GitHub and Netlify as servers. The design of each page on the webpages was the same layout and content, but different in color scheme. One hue was used per page. Webpages change only the tone and clarify the influence of the tone. Therefore, we used the color scheme using two colors as background color and text color. The main hues of the experiment page were red and blue. Red is a color in which a non-colorblind and a Protanope vision and a Deuteranope vision person perceive differently.On the other hand, in blue, the perception of normal participants and those of Protanope vision and Deuteranope vision are performed similarly.

Test: The experimental flow was first determined by random switches. Next, participants viewed the sample page. Then, the experiment page was viewed, followed by the interval, and the memory test, in this order. This flow was performed a total of four times for each participant. The time of viewing each webpage was 2 minutes. The average reading speed of university students is 653 characters/minute with Japanese words[3]. Based on this, in the case of the sentences used in this experiment, it is possible to read each webpage about 5 to 6 times. The interval time was 30 seconds. This was based on the understanding that short term memory can hold information for roughly 15 to 30 seconds[4]. The contents of webpages were a summary of other studies

at A University. Also, we anticipated that familiarity with the order of activity would affect participants' viewing of similar layouts. Therefore, we programmed random switching of tasks for the participants. We made a program to rearrange the "1, 2, 3, 4" sequence with random numbers. Each participant is presented with a random order by clicking on the random switch button on the website. And they answered the test according to this order. The response time of each test was 3 minutes. In the test, important words of the sentences posted on the Web page are extracted. In this format, words are written in blank spaces. The number of questions per test was 20-23. The scoring standard for the test was 1 point for a perfect match to the answer.

Mistakes in Kanji writing, differences in predicate tense, and inconsistencies in the order in which the questions can be answered in an unordered manner are given 0.5 points. In orderto take into consideration whether participants had read the entire sentence and grasped the contents, a scoring standard of 0.5 was made. The score was converted to a score rate before analysis. We created and used content which doesn't overlap with the sentences.

Analysis Method: Concerning the score rate of each obtained page, the analysis of variance of three factors which made color perception, hue, and the tone a factor was performed.The statistical analysis software SPSS Statistics was used for analysis, and the significance level was set to 0.05 or less.

Results of Experiment 1

The results of the analysis of variance of three factors with color perception, hue and tone indicated that the main effect of the tone was significant ($F (3, 150) = 2.817$, $p < .05$), and the interaction between hue and tone was significant.

In the simple main effect test, the simple main effect of the tone on the page of the blue phase was significant ($F (3,150) = 4.47$, $p < .05$).

As a result of multiple comparison using the Bonferroni method, the score rate of Page 2 is significantly higher than the score rate of Page 3 on the blue page, and the score rate of Page 2 is significantly higher than the score rate of Page 4 on the blue page.

Experiment 2

Method: The text put on the webpages and test are different for each webpage, for the convenience of the experiment. We researched how the rate of scores were influenced because of the text put on webpages and the questions on the test. We measured the relative degree of difficulty of test questions on each webpage when color was eliminated. We constructed pages 1 to 4 in white (N9.5) and dark grey (N4). The contents of each page are identical with Experiment 1. Environments were identical with Experiment 1 and Experiment 2 . And research participants are 8 persons.

Analysis Method: Since the texts and test questions for each of the pages 1 to 4 that we made differ from each other, we performed a one-way analysis of variance with the page (Page 1 to 4) as a factor for the score rate of each page.We examined the difference in the score rate due to the text and test questions.The statistical analysis software SPSS Statistics was used for analysis, and the significance level was set at 0.05 or less.

Results of Experiment 2: As a result of the one-way analysis of variance with the page as a factor, there was no significant difference in the score rate depending on the page difference ($F (3, 28) = 0.130$, $p = 0.941$).

Examintions: In this study, we verified how changes in hue and tone of webpages influenced the memory of non-colorblind people and colorblind people. According to our results, the influences on memory depending on differences in the contents of webpages and test questions caused no statistical difference. In addition, the differences in the amount of memory by non-colorblind viewers demonstrated no statistical difference. From results and analyses, the rate of testing between page 2 and page 3 on the blue hue pages is statistically different. And the rate of testing between page 3 and page 4 on the blue hue pages is statistically different on the blue hue pages. First, we focus on these two points. We examine from differences in Munsell value. On page 2 of the blue hue, brightness difference is 4.5, and chroma saturation difference is 5. It's almost the same as brightness difference and chroma saturation difference. It is tone difference is medium. On page 3 of blue, brightness difference is 3, chroma saturation difference is 9.5. It has a color scheme of contrasting chroma saturation. In the comparison between these two pages, the chroma saturation difference of two colors is predicted to influence memory because there is contrasting chroma saturation.The hue of Page 4 in blue is 3 PB. The lightness difference is 3.5, the saturation difference is 7.5.The coloration is of a somewhat

higher degree of saturation. Color saturation tends to be lower on Page 4 than on Page 2.Similar to Page 3, the magnitude of the saturation difference is considered likely to adversely affect the storage capacity.

On the other hand, we thought that other factors intervene by changing the tone and the result reflected in the ease of memory.A possible issue is visibility: the change in the appearance of the reader alters the character's visibility, and as a result the reader's reading frequency may increase or decrease, and the memory retention rate may differ.

Nakayama et al.[5] found that the sense of saturation of the Munsell color system and the color difference perceived by humans are uniformly located at 2.5 PB, in consideration of the saturation difference.The same phenomenon is considered to occur because the blue used in this study is 3 PB.

In addition to this, the perceived color difference as the actual saturation interval in 5R tends to show that the perceived color difference becomes relatively small, from around 9 to high saturation, and this tendency is a region of high saturation of 9 or more. It is suggested that the equal pace characteristic breaks down.

Sasa et al.[6] state that on a three-color display screen, not increasing the saturation of any color suppresses the perception of unnecessary areas of color and makes the screen easier to see.

In other words, we thought that if the presence of a highly saturated color is placed in the background, it will interfere with the perception of the character part that needs to be memorized and the page will be difficult to see.

Saito et al.[7] show that in the case of a white background, the larger the contrast between the text color and the background color, the higher the visibility.

However, they said that even if there is too much contrast, it should be taken into consideration that eye fatigue is likely to occur.

Katayama et al.[8] suggest that a high saturation background color and negative image display may reduce visibility and readability when viewing a screen, even in color schemes that have differences in lightness that conform to international standards.

From these facts, there is a possibility that the saturation difference affects the memory capacity of the reader of a web page with a two-color scheme where the text color and the background color are mutually different.

At that time, it is conceivable that the change in visibility affects readability by interposing a high saturation color, so except for the high saturation color, by setting the color saturation difference to be moderate, a healthy person can realize easy-to-see Web pages for people with color weakness.

Conclusion

We examined the influence of the color scheme of the Web page on the memory capacity of the reader from the viewpoints of those who can see colors, and those who have trouble seeing them. There are few research examples focusing on both the color scheme and the memory capacity on Web pages. We confirmed the value. We made a page of the same hue color arrangement. The hue was red and blue, and the tone of the page was selected based on the previous research of Zhang et al[1,2]. It was hard to see the page including colors with high levels of saturation, while the page with a saturation difference between the 2 colors of about 4.5 was easily remembered. We thought that the visibility intervention and the color of high saturation influenced the memory amount in the reader. In the future, it will be necessary to investigate the readability of characters when perceiving high saturation colors on the display.

The Effect of Work Loads on Work Satisfaction with Work Structure as a Variable of Mediation

Isworo Pujotomo[1], Sasmoko[2], A. Bandur[2], Nugroho J. Setiadi[2]

[1]Student of Doctor of Research in Management Bina Nusantara University and Lecturer of Sekolah Tinggi Teknik-PLN, [2]Lecturer of Doctor in Research Management Bina Nusantara University

Abstract

Job satisfaction is one of several factors that is very important to get results maximum. Satisfaction can be influenced by several factors, organizations need to pay attention these factors to increase employee job satisfaction. The purpose of the research to find out the influence of workload on job satisfaction with work stress as a variable mediation. This research was conducted at the University. Number of samples 55 employees were taken, using the saturated sample method. Data collection method with survey with a questionnaire as a tool and interviews. Path analysis is used to get results so that the workload is found to have a positive effect on work stress, if the workload Employees increase employee work stress will increase. Workload has a negative effect on job satisfaction, when workload increases, job satisfaction decreases, and vice versa.

Job stress has a negative effect on job satisfaction. Job stress increases, job satisfaction decreased, and vice versa

Keywords: *Work load, job satisfaction, work stress.*

Introduction

The factors involved in job satisfaction are essential to improve worker happiness. One of those psychological problems most often encountered in recent years are stress and related illness with stress, because the ever-changing world, everyone is affected by stress regardless of age, gender, profession, social or economic status[26]. The consequence of globalization for employees is change with certain demands, if the employee can not adapt then the old it will be regarded as a source of stress.

Subject of this research is lecturer of University, this company move in some fields, initially this company stands just move on field of ship and oil agency. The company has been able to expand to several divisions to date, The company has a very growth rate both of which are believed to be the number of newly formed subsidiaries and the widespread branch of subsidiaries. Number of employees on duty at the headquarters is 55 people. Organizational job satisfaction is indicated by several attitudes among others attitudes of members of the organization, absenteeism or absenteeism, delays[4]. Lecturer University mentioned, many employees who arrived late or go home ahead without the knowledge of superiors. Attendance of University in Jakarta. There are some lecturers who do not come to work for no reason. The personnel department says there are often employees who permit a few hours or several days to attend religious ceremonies. Problems that occur, the widening of the division and the increase of the subsidiary makes the focus the director is divided into several divisions. This will decrease the spirit, work motivation, increased work stress so that job satisfaction decreased. Employees who used to be at the maturity division felt little attention director.

The heaviest burden is felt today permit, this will make employees feel the work is too heavy coupled with deadlines deposited monthly reports to superiors. Job satisfaction is the opinion of the employee fun or not about his job, the feeling is visible from the behavior both employees to the job and all the things that dialamidi work environment[11]. According to the conclusion[8] mentions the workload is a number of activities that require expertise and must be done in the run time in a

physical or psychic form. States workload is a job task yag be a source of stress like work requires working quickly, producing something and concentrating from stress work. According the period of time in doing job activity in accordance with the capabilities and employee capacity by not showing signs of fatigue.

Stress that occurs in the workplace causes organizations bear the burden: low quality of service, staff turnover high, corporate reputation becomes bad, corporate image becomes bad, workers' discontent. The impact of job stress can be grouped into three category are physiological symptoms, psychological symptoms, behavioral symptoms. Sources of work stress include, sources stress outside the organization, the source of stress from the organization, the source of group stress, the source individual stress[17]. Mentioned several causes of stress in the workplace are life changes, hassles, work stress, career and development workload directly related to how the workload of employees .

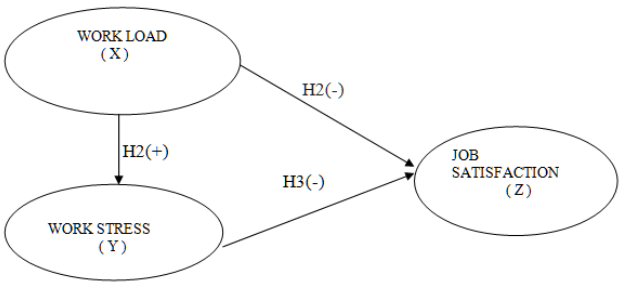

Figure 1: Conceptual Model of Research

H1: work load positively affects work stress: Found that the workload is high have a negative effect on job satisfaction[2]. Give results, there is a significant negative relationship between work load and satisfaction work[23]. In the study, states that job satisfaction affected by the day-to-day workload, employees are more satisfied when they are given a lower workload. Lower job satisfaction found in higher workloads[20]. Find nursing staff which have an objective workload tend to have a degree of satisfaction work greater than the high objective workload.

H2: Workload negatively affects Job Satisfaction: Find job satisfaction is negatively affected by work stress. Working stress has negative effect on job satisfaction. Stress work including factors that affect job satisfaction. Stress and job satisfaction is negatively related. Research conducted states there is a strong relationship of job stress to job satisfaction[6]. Suggest that increased stress is linked with decreasing job satisfaction[21]. States exist a significant relationship stress with job satisfaction[22]. Found that there are many stress factors which is related to work which leads to decreased satisfaction between pharmacist. Job stress negatively affect Job Satisfaction. By statistics can be shown that job stressor has a significant negative effect against job satisfaction .

H3: Job Stress negatively affects Job Satisfaction: The research hypothesis is summarized in Figure 1.

Method

This research is associative, research method using method quantitative research instrument using Likert Scale, collection technique data using interviews, questionnaires and observations. Satured samples are used ie as many as 55 people. Data analysis using Path Analysis. University is chosen because job satisfaction is considered very important in progress company to date. object of research that is work load, job satisfaction and work stress. Workload (X) as an exogenous variable, work stress (Y) as variable of job satisfaction mediation (Z) as endogenous variable.

Test Validity using Pearson correlation test with the provision if the value greater than 0.3 means valid, reliability test using Cronbach Alpha provided that a value greater than 0.6 means reliable.

Data analysis techniques use path analysis to analyze an unherual causal relationship between variables that are arranged accordingly temporary order. The steps taken create a diagramthe pathway of the research model, building structural equations, calculating the theory trimming, partial effect test, test sobel, summarize and conclude.

Results and Discussion

Characteristics of respondents based on 4 aspects, namely age, gender, duration work (year) and education level. The questionnaire distributed was 55 and back as many as 55 questionnaires. Respondents with age above 35 years, type male sex, long working 0 to 5 years san level and diploma education bachelor who dominated as much as 54.55 percent, 83.63 percent, 47.27 percent, 54.54 percent.

Assessment of respondents to the workload is good, seen from the average score of total score of 3.34. Assessment of respondents to work stress is good, seen from the average score of total score of 3.36. Assessment of respondent to job satisfaction variable is good seen

from the average score of the total score is 3.77.

Affects workload on job satisfaction, seen H0 denied and H1 is accepted. Because there is an influence between the two variables, the magnitude known effects of standardizied coefficient betasebesar - 0,237 or - 23,7 percent which means workload has a negative effect on job satisfaction of 23.7 percent. The effect of this magnitude is significant because of the significant value of 0.00.

The effect of job stress on job satisfaction is seen this denied H0 and H1 be accepted. Because there is an influence between the two variables, the magnitude of influence known from standardizied coefficient beta - 0.846 or - 84.6 percent of which mean work stress negatively influence to job satisfaction equal to 84,6 percent. The effect of this magnitude is significant because of the significant value of 0.00.

Conclusion

Workload has a negative effect on job satisfaction with job stress as a mediation variable. Work load positively affects the work stress on Univversity in Jakarta. Workload negatively affects satisfaction work at University in Jakarta. Job stress has negative effect on job satisfaction at University in Jakarta. The company should give notice before giving assignment for employee workload not heavy. Companies should not set too high a target and task demands to reduce employee stress. The boss needs to give positive feedback to improve employee job satisfaction. Company is expected to maintain and improve the provision of sufficient time to complete an assignment to smooth the workload, pay attention to rising positions in work and pay attention to the position accordingly with the employee's ability to reduce job stress and the salary provided must be fair in accordance with the work that employees do.

Lecturers' Knowledge About Environmental Issues, Personal Responsibility and Personality: Its Effect on Lecturers' Intention to Act in Saving our Environment

Agus Priadi[1], I. Made Putrawan[2], Guspri Devi Artanti[3]

[1]Doctoral Student, [2]Professor, [3]Lecturer, State University of Jakarta.

Abstract

This research was aimed to find out the causal study on the factors that affect intention to act: knowledge of environmental issues, personal responsibility and personality. The research method used survey with a causal approach and characterized by a data analysis technique using path analysis. The data were collected using the instruments. This research used 120 lecturers as sample. There are four instruments for measuring knowledge about environmental issues (20 items, rel .847), personal responsibility (20 items, rel .823), personality (20 items, rel .742), and intention to act (20 items, rel .713). The research finding showed there was a direct and significant effect between knowledge about environmental issues and intention to act, there was a direct and significant effect between personal responsibility and personality, there was a direct and significant effect between personality and intention to act, and there was an indirect and significant effect between personal responsibility and intention to act through personality.Based on those findings, it could be concluded that knowledge about environmental issues, personal responsibility, and personality had direct and indirect effect on intention to act of lecturers at University of Bina SaranaInformatika Jakarta.

Keywords: *Knowledge about Environmental Issues, Personal Responsibility, Personality, and Intention to Act.*

Introduction

Environmental problems are the most vital problems all mankind face today. The reasons of environmental problems are generally described as industrialization, over population, developments in science and technology, increasing needs and globalization (Davis,1998)[1] while mankind is considered as the most effective factor in environmental problems in terms of their thinking and way of behavior (Watson & Halse, 2005)[2].

The aim of environmental education is to develop a world population with knowledge, skills and attitude as well as individual and social tasks and responsibilities to provide contribution to solutions of present environmental problems and to prevent possible future ones (Kim,2003)[3]. Most of research revealed the relation between environmental knowledge and environmental behavior (Dillon & Gayford, 1997)[4], however, it is highlighted that environmental knowledge is not an enough component for positive environmental behavior (Hungerford & Volk,1990)[5]. Knowledge about environmental issues, personal responsibility, and personality related to a strong intention to act from the lecturer will be seen through various experiences. People who have knowledge aboutenvironmental issues, personal responsibility and personality and a strong intention to take action to conserve biodiversity. Based on these descriptions, researchers are interested in conducting research on the influence of knowledge about environmental issues, personal responsibility and personality on the intention to act of the lecturer at University of Bina Sarana Informatika.

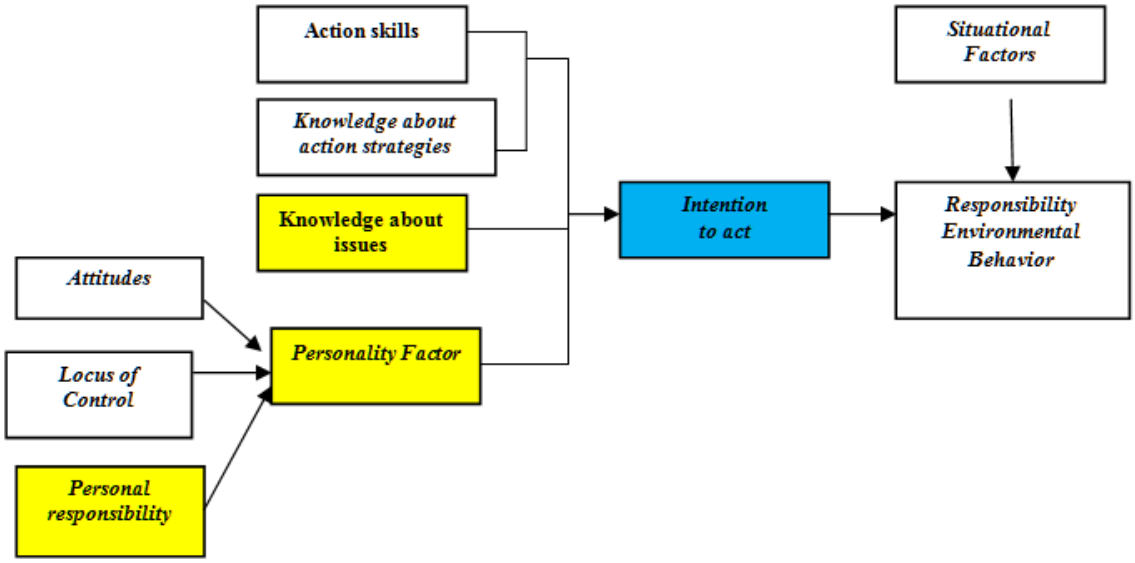

Figure 1

Hines Model related to Factors Affecting Environmental Personality: Based on the picture above, a person also has knowledge about strategic actions (knowledge about action strategies) to give a contribution in solving problems that occur, as well as having skills in performing an effective and efficient action in dealing with certain conditions (action skills). Besides one's tendency to act (intention to act) is also predicted by variables or personality factors, such as attitude, internality and externality of locus of control, and also personal responsibility.

In Theory of Planned Behavior (TPB), intention is a cognitive representation of one's readiness to perform certain actions, and this intention can be used to measure one's actions (Ajzen,2002)[6]. That is, a person's actions will be realized if there is his intention to behave act. The concept of intention outlined above, it can be said that one's work life will be very dependent on intention. This means that every effort or work will be realized if there is an intention in working. And if the intention in working is good, it will have a good impact on work life or vice versa, because the good and bad of a person's work life is a concrete implementation or manifestation of his intentions.

Knowledge about environmental issues stated everything that someone knows in mastering material about environmental issues such as overpopulation, resource depletion, and pollution, which were learned through the dimensions of Knowledge about specifics, Knowledge about ways and means of dealing with specifics (Knowledge about ways and means related to specific), Knowledge about universal and abstract in a field (Jennifer & Garreth,2005)[7].

People who have responsibilities display a number of abilities in carrying out certain actions (Marie,2009)[8]. These capabilities include the ability to set realistic goals, perseverance, and flexibility. Personal responsibility as the responsibility that exists for each individual who makes him responsible for actions, emotions and behavior (Hergenhahn & Matthew,2005)[9]. Personal responsibility towards the environment can be synthesized into a conceptual feeling that is someone's feelings in taking responsibility for actions, without expecting and denouncing what has been done in relation to various environmental issues with the aim of protecting the environment sustainably.

There are five dimensions that underlie human personality, namely conscientiousness, agreeableness, neuroticism, openness, and extraversion (Colquitt & Wesson, 2009)[10]. The five dimensions of personality can be measured through indicators: Conscientiousness (reliable, organizational, trustworthy, ambitious, hardworking and persevering), Agreeableness (kind, like working together, sympathetic, helpful, polite and warm), Neuroticism (moody nervous, emotional, alert, restless, easily offended), Openness

(inquisitive, delusional, creative, inferior, polite, smart) andExtraversion(talkative, sociable, passionate, resolute, brave, powerful).

The strength of the lecturer's motivation depends on his/her personality (Harun,2019)[11]. Lecturers with friendly personalities will have the desire to be able to communicate well with students, as well as creative lecturer will always have a desire to innovate with a variety of learning techniques appropriate to the situation and conditions of the students, so that learning objectives can be achieved. Personality is what encourages lecturers to determine the attitude and achieve the desired goals.

The lecturer's personality will shape the patterns of lecturer behavior which means the response shown by every individual to situations closely related to personality of the individual (Raza & Shah, 2017)[12].

Material and Method

This research is quantitative research that uses survey method with a causal analysis approach and the data analysis technique used is path analysis to examine the direct effect and indirect effect between exogenous and endogenous variables. This study involved 120 English lecturers at Faculty of Communication and Language, University of Bina Sarana Informatika Jakarta as respondents with a composition of 20 English lecturers as respondents for instrument testing and 115 English lecturers selected in research samples using Simple Random Sampling (SRS). There were four instruments used to measure knowledge about environmental issues, personal responsibility, personality and intention to act which validity have been measured using Pearson Product Moment and reliability using Cronbach Alpha.

Result

The results for each variable were intention to act (20 items rel .713), knowledge about environmental issues (20 items rel .847), personal responsibility (20 items, rel .823), and personality (20 items, rel .742). The results of the calculation of the path coefficient in this study can be seen in the table below:

Table 1. Calculation of the Path Coefficient

Path	ρ	Causal Effect			Total	t-count	t-table α = .05
		Direct	Variable being passed X3	Indirect			
X1 on X4	ρ41	.161	-	-	.161	2.102*	1.97
X2 on X3	ρ32	.378	-	-	.378	5.111*	1.97
X3 on X4	ρ43	.335	-	-	.335	4.056*	1.97
X2 on X4	ρ42	.217	.126	.126	.343	4.842*	1.97

* $p < .05$

Data which presented including direct and indirect effect from knowledge about environmental issues

(X1), personal responsibility (X2), personality (X3), and intention to act (X4).

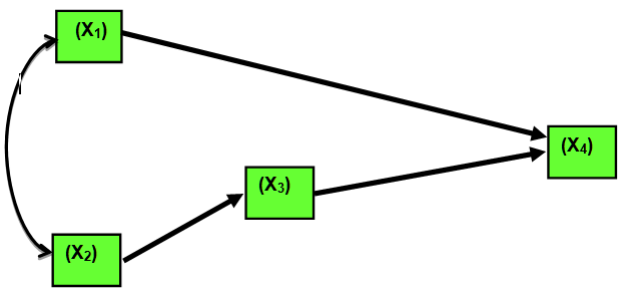

Figure 2: Causal Effect between X1, X2, X3, and X4

The results of hypothesis testing show that: (1) there is a direct and significant effect of knowledge about environmental issues on intention to act; (2) there is a direct and significant effect of personal responsibility on personality towards the environment; (3) there is a direct and significant effect of personality towards the environment on intention to act; (4) there is an indirect and significant effect of personal responsibility on intention to act through personality towards the environment. This means that intention to act of lecturers is affected by variations in knowledge about environmental issues, personal responsibility and personality towards the environment.

The results of this study were supported by other

studies which expressed that awareness of responsibility and agreeableness are positively correlated with health awareness and environmental awareness (Ramazan & Seygi, 2014)[13].

Discussion

Individuals who care about environmental issues such as limited natural resources and the well-being of all species have social responsibility attitudes towards consumption culture, while population differences in basic personality traits related to national differences in environmental sustainability (Hirsh, 2014)[14]. Xu (2017)[15] revealed that Personality traits and cognitive abilities can be used as markers for financial groups at risk because they are high in neuroticism and low in ability to experience greater financial difficulties. Internal locus of control can bring a person's level of positive attitude, but attitudes do not affect intention to act (Hwang,et.al.,2000)[16].

Personality factor determined someone to act and take a role in protecting and preserving the environment (Adams,2003)[17]. The desire to act someone became a determinant in behaving environmentally responsible (Ajzen & Manstead, 2007)[18]. Personality factors that play an important role in the decision include experience in childhood, level of knowledge and education, gender, age, and daily activities are undertaken (Gifford & Nillson, 2014)[19]. Changing the behavior of consumerism is more environmentally friendly, sensitive to issues of changing ecosystem functions, and other behaviors which is specifically related to their daily activities (Hines, et.al. 1987)[20].

In the research done by Pratiwi (2019)[21], it was told that efforts to induce environmental responsibility have been carried out including by implementing the good sustainability campaign (Font & McCabe,2017)[22], environmental and social responsibility education (Aguado & Holl, 2018)[23], and Adiwiyata school program (Desfandi, 2015)[24]. Community involvement is a strategic effort to create a mutually supportive and sustainable environment (Kvasova, 2015)[25]. On the other hand, this effort is indicated to be able to improve socio-cognitive which has an essential role in determining the desired environmental responsibility (Sawitri & Hadi, 2015)[26]. Social aspects are very fundamental because in some studies it was reported that the appearance of attitudes is not directly influenced by behavior but rather on intentions that end at the norms that apply to the community (Kollmus & Agyeman, 2002)[27].

Therefore, the results of this study can be used as reinforcement of the concepts that have been believed to integrate learning and teaching process that can grow and harmonize the personality and intention to act responsibly.

Lecturers who have a high personal responsibility can learn how to respect the rights and feelings of others, decide their own desires and the importance of being responsible (Ahsanul, et.al.,2019)[28]. It is relevant to lecturers who have higher personal responsibility can develop sensitivity to others (including compassion, empathy and interpersonal skills) and the ability to apply teaching throughout programs into wider life (eg. universities, homes) (Ernst & Beery, 2015)[29].

Lecturers who have higher personal responsibility are able to become independent educators, able to play an active role in teaching and their desires more responsibly. Lecturers with higher personal responsibility are able to become confident individuals, more responsible and creative desires including the ability to make rational and informed decisions about their lives and accept responsibility for their actions (Mergler & Patto, 2007)[30].

Personal responsibility for the environment had an influence on one's desires which had an effect on the behavior of the environment itself (Pan,et.al.,2018)[31].

Conclusion

Based on the findings, it can be concluded that if you want to increase the intention to act, the predictor variables of knowledge about environmental issues, personal responsibility, and personality need to be considered. So that environmental education activities can sustain the objective of forming knowing intention to act, these activities should pay attention to strategies for building the knowledge about environmental issues, personal responsibility. Knowledge aboutenvironmental issues and personal responsibility will influence personality as mediator variable and will ultimately increase lecturer's intention to act.

To develop knowledge about environmental issues, personal responsibility and personality, the environmental education activities carried out need to provide opportunities for lecturers to actively take part, learn various environmental issues through explorative activities, talk over about environmental attempts and provide lecturers to held activities with the community. Lecturers are people who give education either for

academic or morale and play as role models for future lives.

Biological Teachers' Citizenship Behavior: A Confirmatory Study Involving the Effect of School Leadership and Integrity

Astuti Esti Zharroh[1], I. Made Putrawan[2], Diana Vivanti Sigit[3]

[1]Master Student in Educational Biology, Postgraduate Studies, State University of Jakarta, Indonesia, [2]Professor at State University of Jakarta, Indonesia, [3]Associate Professor at State University of Jakarta, Indonesia

Abstract

Teachers' integrity pays important role in school organization which include honesty. To be honest is difficult for some people including biological teachers in teaching the truth of biological concept. How integrity could be used as mediated factor between school leadership and teachers' citizenship behavior (CB) was a research problem. A causal survey, therefore, used on this research by taking 100 senior high school biological teachers. Data collected by administrating three instruments which measured teachers' CB, school leadership and integrity and data analyzed by applying path analysis. Research findings showed that teachers' CB directly and significantly affected by school leadership, in this case, integrity was not positively found to be good as mediated variable between school leadership and teachers' CB. Therefore, when teachers performance would like to be well managed then factors such as school leadership could be improved as part of doing continuous improvement for increasing school quality by considering biological teachers' performance.

Keywords: *School Leadership, Integrity, Honesty, Citizenship Behavior, Path Analysis.*

Introduction

In the current era of globalization, the need for human resources who are able to think critically, creatively, innovatively and compete nationally and internationally continues to increase. The progress of science and technology which is rapidly increasing resulting in competition for human resources is also increasingly high.[1] Therefore, the development of the quality of human resources must continue to be done through various aspects.

One of them is the quality of human resources can be developed through education. Education is defined as a complex and planned process with the aim of developing individual potential to possess good personality, intelligence, and special skills.[2] The educational objectives will not run optimally without the support of educational organizations that contain professional workforce. Educational organizations that are in line with educational goals are schools. School is defined as an educational organization that creates outstanding human and academic resources.Described the current state of schools, competitive and dynamic schools that require excellence in academics.[3] Thus, achieving superior and effective in the academic and non-academic fields requires competent school components, especially teachers.

Most teachers cannot carry out their duties and obligations to the maximum.[4] The decline in the quality of teachers in these schools can cause low quality schools and not run effectively. Teachers are said to be the main key in the whole education process because the performance produced by the teacher will determine the quality of an educational organization. Therefore, educational organizations such as schools can run effectively, efficiently and productively if the teacher can give more performance to the school.

Corresponding Author:
I. Made Putrawan
Professor at State University of Jakarta, Indonesia
e-mail: putrawan.imade@yahoo.com

The teacher does not only carry out the main task but also does the task outside of his formal obligations. Employees who work outside the job description will be able to increase the effectiveness of the organization.[5] A person's behavior in doing work outside of formal obligations can be called citizenship behavior. CB is the wise behavior of individuals who always want to do more work than their demands.[6] CB optimization can be supported by 2 factors, namely school leadership and integrity.

In this regard, school leadership has a great involvement in CB. The principal as the highest leader in the school in optimizing the citizenship behavior of the teacher can be through ideal influence (charisma), inspiration, and intellectual stimulation. Providing motivation from leaders can also lead to the willingness of subordinates to contribute to the goals of the organization, without expecting immediate personal and tangible rewards. In addition to school leadership there is integrity to optimize CB. Integrity is someone who is honest and the words spoken according to actions.[7] With the integrity of the teacher, the goals set are more directed so that they are able to optimize the teacher's CB in schools.

Thus, the research problems of this research are whether the theoretical model about school leadership along with CB through integrity confirmed by an empirical finding model.

Before solve this research problems, it necessaries to explain in advance what is meant by Citizenship behavior (CB) which part of performance, leadership and integrity as well as part of trust.[8] CB is that individuals who do more voluntary work in an organization will feel satisfaction at the performance they produce.[9]

CB that played by the teachers are very.[10] Teachers who have citizenship behavior could give positive values toward tcolleages and stakeholders in school. The existence of teachers' citizenship behavior in school could give significance transformations. Among of the transformation experienced by the school is it could be reached its purposes and school management becomes more innovative, productive and responsive.

CB owned by individual are as follows,[11]:

a. Altruism. These dimention refers to give rescue which is not their obligation.

b. Conscientiousness means loyal individual behavior toward organization's rules and act more than minimum duties.

c. Sportsmanship, it means being tolerance toward unsatisfy situation in a company without raise objections.

d. Courtesy, can be said that it has meaning to keep good relation with colleagues in order to get off from interpersonal problems.

e. Civic virtue, it can be considered as behavior that indicated responsibility in company life.

In an organization such as school which is conduct leadership act as principals.[12]Leadership is applied by the principals has some impact for school's progress. Therefore, the principals' behavior must be positive in order to give good influence for tecahers and the others.

Two leadership style, such as transformational and transactional leadership.[13]Transformational leadership is based on increasing the level of awareness follower about output value and success of subordinates. In contrast with transactional leadership based on expected reward for the obedience followers appropriate to the effort and loyality toward the school.

Each individual has different behavior, positive and negative behavior. However, there must a people behavior has by an individual in an organization. One of that was integrity, integrity was behavior embed mutual trust and confident, created cultures which are supporting high ethic standard, fair and had some ethics to others; then showed responsibilities and commitment in conduct an act.[14]

Integrity has five dimensions that refer to the concept of trust as follows: a) integrity refers to honesty, honorable and truth in conduct everything, b) competencies based on people's knowledges and skills interpersonally, c) consistency, individual's skill could be count on, d) loyality means immolate personal needs to protect others, e) openness, accepts others' advices and work together.[15]

Research Methodology: This research objective was to get the information about the direct and indirect effects of school leadership on integrity, integrity on CB, and school and CB leadership through integrity. The causal survey method used to selection of 100 biologicals' teachers. There are three research instruments that measure (CB = X3) with 36 items, (school leadership = X1) 51 items and (integrity = X2) 34 items. Data analyzed by path analysis.

Result and Discussion

Based on statistical calculation used by SPSS, it found that school leadership had been directed influence toward integrity. It is showed by phi-coefficient 0,139. Leadership had been eight dimension such as idealized influence, inspirational motivation, intellectual stimulation, individualized consideration, contingent reward, management by exception (active), management by exceptions (passive), laissez-faire, proved be able to influence integrity. However, there were a lot of research which did not know what are the dimension of leadership. Leader who give good example towards in their behavior would followed by their employee. A leader who has honesty and consistency could build employees' integrity.[16]

Meanwhile, school leadership and CB had direct and significance influences by phi-coefficient 0,184. Leadership could be influence employees' CB.[17] There were two leadership style might be influence CB, such as transformational and transactional. Both of those style, transactional style is the highest which had influence CB because giving rewards could given motivation to the employee.

In the case, integrity and CB had directed and significance influence.[18]However, in this study, integrity did not have directed and significance influence by phi-coefficient 0,062. Among three dimension of integrity, such as honesty, consistent, trustworthiness. Meanwhile, school leadership has directed and significance influence toward CB. It represented by phi-coefficient 0,184. Although, integrity did not has significance and directed influence. It described. Those dimension were not known yet which could give influence to CB. It needs continuing research.

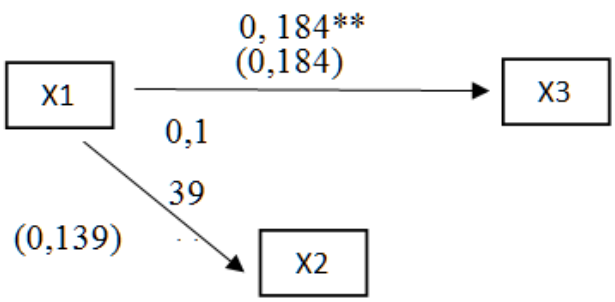

Fig. 1: Empirical Model, X1 = School Leadership; X2 = Integrity; X3 = Citizenship Behavior, **p < 0,05

Conclusion

Based on the findings, school leadership has stronger influence directly and significantly than citizenship behavior for biologicals' teacher. Meanwhile integrity did not have directed and significance influence. Those results are represented by phi-coefficient which leadership placed in the first. Then following by citizenship behavior and finally, integrity in the last.

Acknowledgment: This research has been conducted without sponsored by any institutions and purely by the reseachers along with financial supporting from Mr. Kaspo and Mrs. Kamiyati. Then, I would like to thank administration staff in state University of Jakarta who has helped the licencing of this research.

Biological Teachers' Personality and Task Performance Mediated by Procedural Justice

Ilena Amalia Luthfi[1], I. Made Putrawan[2], Mieke Miarsyah[3]

[1]Magister Student, [2]Professor, [3]Biological Education Lecturer, State University of Jakarta, Indonesia

Abstract

In any organization, especially in school system, justice is among other things discussed by teachers and school principal. Question about how teachers will well performed, theoretically influenced by how their personality and how they treated with full of justice, procedurally. The objective of this research, therefore, tried to find out whether biological teachers' task performance affected by personality and procedural justice as well. A causal survey used by involving 90 senior high school biological teachers. There were three instruments developed for measuring big-five factors-personality (P), procedural justice (PJ) and task-performance (TP). Data analyzed by using path analysis after analyzed by regression and correlation. Research findings revealed that personality and procedural justice directly and significantly affect teachers' task performance. Moreover, procedural justice was a good mediated factor connecting between personality and task performance. It could be concluded that if teachers' task performance would like to be improved positively, teachers personality and procedural justice could not be neglected due to teachers' task performance variation affected by those two factors, in order to build a high biological teachers quality.

Keywords: *Big-five Personality, Procedural Justice, Task Performance, Path Analysis.*

Introduction

Schools are formal educational institutions whose role was to achieve educational goals. The purpose of national education includes making students have knowledge, skills, and character. Quality of human resources is a benchmark of the progress of a country. Teachers are one of the determinants of the high and low quality of education. The role of the teacher was very important in the education. In achieving good quality education is strongly influenced by the performance of teachers in carrying out their duties so that teacher performance becomes an important demand for achieving educational success.

Teacher competence was the main requirement for achieving quality education because teachers interact directly with students through learning in class. In learning, teacher interaction with students will largely be determined by the personality characteristics of the teacher concerned. Teachers who master personality competencies will greatly help efforts to develop student character and create an interesting and innovative learning processes.

At school, teachers have large moral duties and responsibilities towards student success. Teacher performance is a collection of various tasks to achieve educational goals. In an organization, one of the factors supporting the increase in performance was procedural justice. Procedural justice is a person's assessment of decision making in accordance with the procedures performed by the leadership of members of the organization.

Hoy & Miskel[1] explained the reasons why one high school was so productive and the teacher was eager to work.[1] Hoy explained that, principals were open and friendly and treated teachers fairly and treated them as colleagues, while at the same time asking them to implement high performance standards. Therefore, the

Prof. Dr. I. Made Putrawan
State University of Jakarta
e-mail: putrawan.imade@yahoo.com

procedural justice factor that supports the teacher to work as well as possible was very important.

Personality can affect the assessment of the organization, personality was needed such as conscientiousness, agreeableness, and emotional stability in assessing procedural fairness received by the teacher. Therefore in this research, research problems were whether biological teachers' task performance was affected by personality and procedural justice as well.

Before solving those problems, it should be made clear what actually meant by task performance was part of job performance, personality and procedural justice. Colquitt, LePine and Wesson[2] described job performance was formally defined as the value of the set of employee behaviors that contribute, either positively or negatively, to organizational goal accomplishment.[2] Behaviors that make a positive contribution consist of two behaviors, namely task performance and citizenship behavior. Whereas behavior that contributes negatively to the achievement of organizational goals is counterproductive behavior. Performance is behavior related to the expected completion of work, specific or formal by each member of the organization.

McShane explained that task performance refers to behaviors directed at goals under individual control that support organizational goals.[4] This means that the performance of the task aims to achieve organizational goals through the tasks given by a leader that leads to the achievement of organizational goals.

Task performance is divided into three, namely routine task performance, adaptive task performance, and creative task performance. Routine task performance involves employee responses to demands that occur normally, routinely, or in other predictable ways. Whereas adaptive task performance involves employee responses to task demands that were unusual, or, at the very least, unpredictable.

All types of performance relate to core tasks and job responsibilities and often relate directly to functions listed in formal job descriptions. These statements reveal that the performance of the task can be measured by the quality and amount of production or the results of the work done by someone, besides that the assessment of the performance of the task can be done through monitoring the extent to which the level of effectiveness and efficiency of someone in doing the task, then the performance is inseparable from core tasks, responsibilities, related to job descriptions.

An individual's personality can be seen from everyday behavior that radiates from within someone. Each individual can interact with other people because they have the uniqueness of each individual. The uniqueness is seen from emotions, thoughts and behavior patterns. Bruce Dyck and Mitchell J. Neubert defined personality as a unique and relatively stable pattern of behavior, thoughts and emotions exhibited by individuals.[5] George & Jones described personality is a person's permanent pattern in thinking, feeling and behaving.[6]

From the opinions of some experts, it can be concluded that personality is a relatively fixed behavior that reflects individual behavior in seeing, thinking, feeling and acting on the problems they face. Personality contains several elements, indicators, dimensions, or characteristics. The best known personality dimension model is Big Five Personality which consists of five basic dimensions, namely extraversion, agreeableness, conscientiousness, neuroticism and openness experience.

Robert Kreitner and Angelo Kinicki defined procedural justice as procedural justice is defined as the perceived fairness of the process and procedures used to make allocation decisions.[7] Procedural justice is a view of justice from every process used to produce an award.[8] Fair treatment has been proven to reduce stress levels and can improve performance and job satisfaction, commitment to the institution.

There were several dimensions in procedural justice according to Colquitt, namely the treatment of impartial leadership, justification in solving problems, consistent in the application of rules, neutral and unbiased information.

Research Methodology: This research is quantitative approach, a causal type with survey method. The objective of this research was to get information about whether biological teachers' task performance affected by personality and procedural justice. The populations in this research involved 96 biological teachers in State Senior High School Teachers (SMA) in East Jakarta. Based on the Simple Random Sampling (SRS) technique and McClave formulae, 90 biological teachers selected as sample in this research.

The instruments in this research measured by opinionnaire containing several statements. Validity of instruments has been measured using Pearson Product Moment and reliability using Cronbach Alpha. Data were analyzed by path analysis. The list of statements distributed must be fulfilled by the respondent to get information about the effect of personality (X1) and procedural justice (X2) as exogenous variable on task performance (X3) as endogenous variable.

Results and Discussion

Considering statistical computation results by applying SPSS, found that personality was directly and significantly affect procedural justice with phi-coefficient was 0.625. Procedural justice also directly and significantly affect biological teachers task performance with phi-coefficient 0,499. Then, personality was directly and significantly affect biological teachers task performance with phi-coefficient 0,706.

Personality which consists of five main dimensions, agreeableness, extraversions, conscientiousness, openness, and emotional stability proved to have high contribution in affecting procedural justice. Personality reflects the attitude of awareness that is owned by each person in accepting decisions fairly, and is able to carry out work with full responsibility, through, tenacious and persistent.

This result also supported by Nasution, Putrawan & Vivanti S which found when procedural justice would be improved, factors such as school leadership and personality could be taken into account.[9] When teachers are treated unfairly, personality and performance often decrease, even disserve to the organization. In term of teachers' personality which measured by big-five personality, found affected directly on employees' performance.[10] Robbins and Judge described the relationship of 5 personality traits and task performance, that of the 5 personality traits, there were 3 traits that have an effected on task performance, namely extraversion, adaptability, and seriousness.[11] The personality traits of the three were the ability to interact with other individuals, much preferred because they were easy to adapt, and have a large and diligent effort so as to produce high task performance.

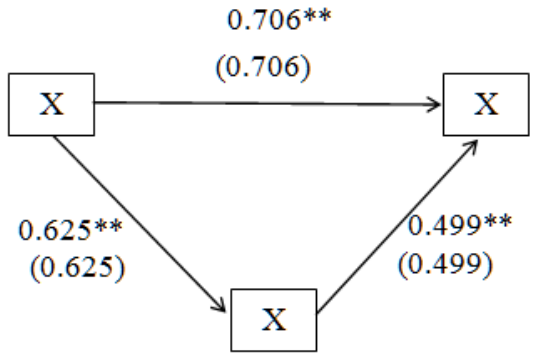

Fig. 1 Empirical Model X1 = Personality; X2 = Procedural Justice; X3 = Task Performance

Conclusions

Based on the analysis of data and findings that have been described previously, it can be concluded that: 1) Personality has a direct significant effect on procedural justice; 2) Procedural justice has a direct significant effect on task performance; 3) Personality has a significant direct effect on task performance; 4) Personality has a significant indirect effect on task performance through procedural justice. Therefore, to improve teachers task performance, personality and principals procedural justice need to be considered. In this study, procedural justice is proven to be a good mediator variable for personality and task performance.

How is Students' Personality towards the Environment Predicted by Students' Attitude and Locus of Control?

Damianus Daikoban[1], I. Made Putrawan[2], Diana Vivanti S.[3]

[1]Doctoral Student, [2]Professor, [3]Associate Professor, State University of Jakarta.

Abstract

The objective of this research is to find out whether there is a correlation between Students' Attitude and Locus of Control with Personality towards the Environment. For these purposes a survey method has been applied by involving 120 primary school students, in Jakarta which was selected randomly. There were three instruments developed on this research namely instrument for measuring Personality towards the Environment, Students' Attitude and Locus of Control. Hypotheses have been tested by applying F-test through ANOVA for simple and multiple regression, and correlation as well. Research results show that there is a positive a significant correlation found between Students' Attitude and Locus of Control with Personality towards the Environment. Moreover, there is a positive and still significant found between those variables after each of those independent variables were controlled by calculating partial correlation. It is also found a positive and significant multiple correlation between those variables. It should be concluded that if students' personality towards the environment would be improved therefore, students' attitude and locus of control could be taken into account.

Keywords: *Personality towards the Environment, Students' Attitude, Locus of Control.*

Introduction

The decreasing quality of the environment in Indonesia is largely due to human attitudes towards the environment. The decline in the quality of the environment will threaten the survival of future generations. Based on this, it can be indicated that human error in behaving as well as mistaken human assessment of a phenomenon (locus of control), especially to the environment will cause problems in the form of environmental crisis. Frontier mentality in this modern era is a personality trigger that is not environmentally sound in which its characteristics: 1) view that the source of natural wealth is unlimited; 2) humans are not part of nature; and 3) holds that nature exists to be mastered and used in meeting the needs of human life (Chiras, 1991).[1]

Rhodewalt (2008)[2] explains that personality is a complex organization of cognition influencing behavior to provide direction and patterns of one's life, personality consists of structures and processes, both natural (genes) and experience. While Luthan (2008)[3] defines, "personality will mean how people affect others and how they understand and view themselves, as well as their patterns of inner and other measureable trait and person situation interaction". Brands tatter (2011)[4] describes personality traits including abilities (for example, general intelligence as well as numerical, verbal, spatial, or emotional intelligence), motives (for example, the need for achievement, power, or affiliation), attitudes (including values), and temperament characteristics as a holistic style of one's experience and actions (Openness to experience, Consciousness, Extraversion, Agreeableness, and Neuroticism). To explain a person's personality to the environment, Hines (1986)[5] developed a model of environmentally responsible behavior, wherein the model can be observed various predictors that affect one's personality such as attitude and locus of control. For more details, such variables can be seen through the figure below:

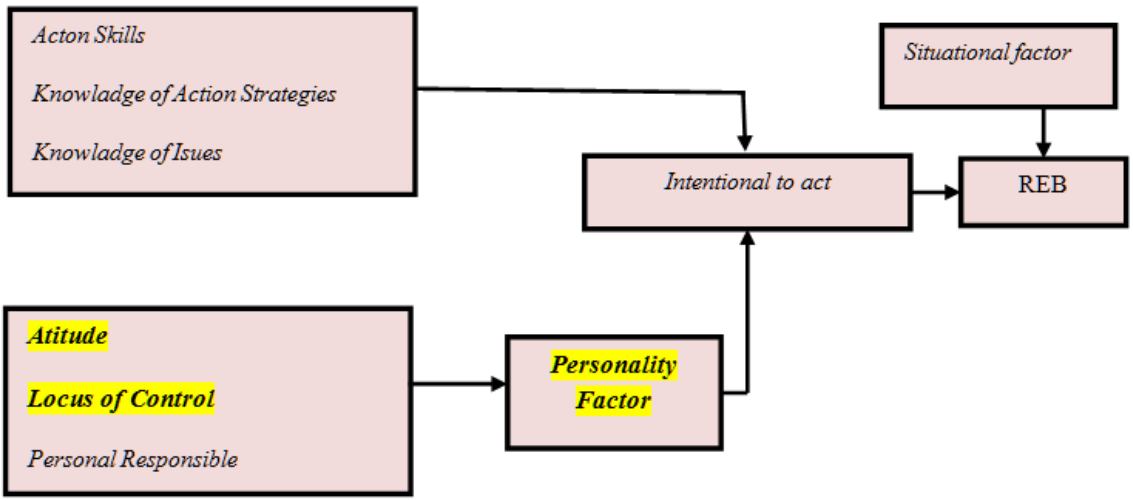

Figure 1: Environmental responsible behavior model adapted by from the model of Hines, et al. (1986)[5]

Based on the model above, it can be seen that predictors of personality variables towards the environment include attitudes and LOC. A positive attitude that is formed will then change a person's behavior. According to Schwartz (1992)[6], attitude is generally a belief that is translated into action on the desired object. Based on Azjen's (1988)[7] research on The Theory of Planned Behavior and about the Motivation and Opportunity as Determinants model, it has been widely studied that the relationship between explicit and implicit attitudes can influence a person in processing information so that behavior changes occur. Based on TPB, there are several variables used to explain pro-environment behavior, namely attitudes toward behavior, subjective norms, perceived behavioral control, and intentions (Macovei, 2015)[8]. According to Azjen (1989) in Schröder & Wolf (2015)[9] attitudes consist from cognitive, affective, and conative aspects.

Putrawan (2014)[10] explains that attitude based on the Bannet model is one's disposition before acting based on the dimensions of knowledge, feeling, and action tendency.

Locus of control is one of the personality variables that is defined as an individual's belief in being able to control his own destiny.[11]According to Morhead and Griffin (2012)[12], locus of control is the extent to which people believe their current circumstances are determined by their own actions or factors externally out of control and locus of control plays an important role in their behavior and has a real effect on what happens to them. Kreitner & Kinicki (2008)[13]states that the results achieved by the internal locus of control are ascribed to his activities. Whereas individuals with external locus of control assume that the success achieved is controlled by their surroundings. The state of the art in this study is related to the issue of contemporary personality on the environment by various predictors such as attitude and locus of control based on the Hines (1986)[5] model.

Material and Method

The method used is a survey method with correlational techniques. This research is concerned with collecting data to determine whether there is a correlation between variables and how much strength the correlation has (correlation coefficient). The inter-correlations between variables in this research are described in the hypothetical model of the study as follows:

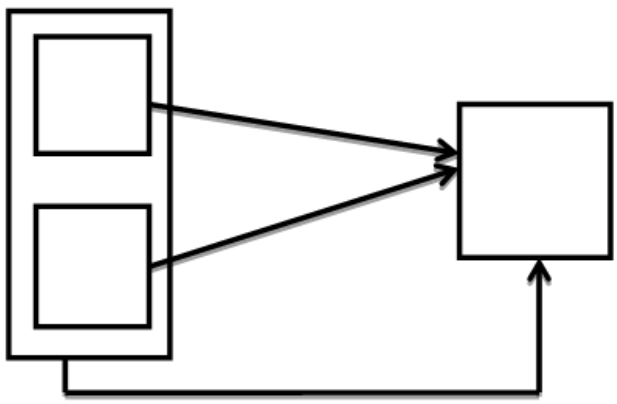

Figure 2: Hypothetical Research Model

Note: X1 = Attitudes of students towards the environment, X2 = Locus of control, Y = Environmental Personality

There are four instruments in this study, namely to measure environmental personality, attitudes, and LOC. The population of this study is all private high school students in DKI Province. The sampling technique using multistage random sampling involving 110 private high school students as research samples. Data analysis techniques using regression and correlation tests. Prior to data analysis, normality tests were performed using Liliefors. Homogeneity test uses Bartlett test. the description of the contribution of the independent variable to the variation in the dependent variable is calculated by the value of good of fit (R2) or the index of determination. The analysis program for processing data in research uses Microsoft Excel and SPSS Version 20.00 software.

Discussion

This research was carried out according to the steps of scientific procedures and a thorough analysis process was undertaken. The results obtained in this study are tested hypotheses. Analysis of the data in the previous section, the findings can be explained there is a correlation between X1, X2, and Y variables. The first hypothesis proposed in this study is that there is a positive correlation between students' attitudes and environmental personalities. The magnitude of the correlation coefficient between attitude variables with environmental personality can be figured out in the following table:

Table 1: Correlation between Attitude and Environmental Personality

Correlation	n	r_{xy1}	t_{cal}	t_{table}	
				α = 0,05	**α = 0,01**
Attitude and Environmental Personality	110	0,612	8,05**	1,98	2,62

** p< 0,01

From the results of calculations between students' attitudes with personality towards the environment indicated a correlation coefficient of rx1y = 0.612 and $t_{cal}>t_{table}$ can be concluded that H0 is rejected. The pattern of relationships between these two variables is expressed by the regression equation $\hat{Y} = 68.96 + 0.793$ X1. This finding concludes there is a positive correlation between students' attitudes with personality towards the environment. In other words, the more positive the attitude of students, the more accurate their personality on the environment. The second hypothesis proposed in this study is that there is a positive correlation between LOC and personality towards the environment. The magnitude of the correlation coefficient between LOC variables with personality to the environment can be seen in the following table:

Table 2: Correlation Between LOC and Environmental Personality

Correlation	n	r_{xy1}	t_{cal}	t_{table}	
				α = 0,05	**α = 0,01**
LOC and Environmental Personality	110	0,535	6,21**	1,98	2,62

** p< 0,01

From the results of calculations between LOC with personality to the environment indicated a correlation coefficient of rx2y = 0.535 and $t_{cal}>t_{table}$ can be concluded that H0 is rejected. The pattern of relationships between these two variables is expressed by the regression equation $\hat{Y} = 54.01 + 0.518X2$. This finding confirms that there is a positive correlation between LOC and personality on the environment. In other words, the more internal the LOC, the more accurate the personality on the environment. The third hypothesis proposed in this study is that there is a positive correlation between student attitudes and LOC together with personality towards the environment. The magnitude of the correlation coefficient between the variables X1 and X2 with Y can be seen in the following table:

Table 3: Calculation Result of Significance of Double Regression Coefficient of Positive Correlation X1 and X2 with Y

Variable	Regression Coefficient	F_{cal}	F_{table}	
			α = 0.05	**α = 0.01**
Y on $X_1$and X_2	0,714	31,56**	3,09	4,82

** p< 0,01

From the calculation of the significance of the multiple regression coefficients in the table above, an F_{cal} of 31.56 was obtained. While based on a significant level α = 0.01 obtained F_{table} at a price of 4.82. The pattern of relationships between these two variables is expressed by the regression equation $\hat{Y}$ = 27.05 + 0.431X1 + 0.428X2. Because the value of $F_{cal}>F_{table}$, it is concluded that H0 is rejected. This finding concludes that there is a positive correlation between student attitudes and LOC together with personality towards the environment, in other words the more positive the student's attitude and the more internal the LOC, the more accurate the personality towards the student's environment.

The results of correlational analysis indicate that the hypothesis testing that has been done shows that the three hypotheses proposed in this study, are accepted and are very significant. The test results can be reaffirmed as follows: (1) there is a positive correlation between students' attitudes with personality towards the environment); (2) there is a positive correlation between LOC and personality on the environment; and (3) there is a positive correlation between student attitudes and LOC together with personality towards the environment.

Discussion

Related to this attempt, Cristina (2015)[14] states Positive attitude towards work has high and positive correlations with all typological dimensions of personality, except helpless type which lowly correlates only with negative attitude towards work. Since the respondents are teachers who positively perceive work as an important condition of achievement and self- development tend to be more generous, claimed, involved, selfishness and have an internal locus of control, the effect sizes are high in the cases of the correlations between positive attitude towards work and typological personality dimensions. Concerning typological dimensions of personality, teachers with an internal locus of control are more generous and inclined to involve and to act on behalf of others, more ready to immediately react, to endorse their position in front of colleagues or principals and solve common problems, while Fabio (2019)[15] discusses about these variables using 2 kinds of levels regarding personality and attitudes; distal level and proximal level. Here is the explanation :

At a distal level (i.e., linking personality traits with attitudes toward traffic safety), anxiety and hostility predicted drivers' attitudes toward traffic safety (positively and negatively, respectively) only in older drivers. Excitement-seeking and normlessness predicted attitudes in all the three samples, even if to a different extent depending on the age.

At a more proximal level (i.e., linking drivers' attitudes with risky behaviors at the wheel), differences were slightly lessened. In fact, although attitudes didn't impact lapses significantly in older drivers and they impacted violation more relevantly in older than in adult drivers, positive attitudes toward traffic safety were globally related to less violations and errors in the three age groups.

Meanwhile, according to Darshani's research (2014)[16], it is said that the coherence between personality and locus of control can be done by balancing A and B type personality traits and locus of control situations rather sticking to extremes. According to Rotter none of the personality types or type of the Locus of control is not right or wrong. They are only psychological states. The needed factor is maintaining a balanced behavior rather expecting too much, being over estimated or being depend on fate, being too much easy going. In another side, According to Tansu (2010)[17], the research data was found that hopeless students are more internal controlled than hopeful students. Consistent with this perspective, numerous studies have found correlations between internal locus of control and hopeless.

Another opinion from Paisi (2013)[18], says The analysis of the variable gender underlined the fact that

there are no significant differences as regards creative attitudes between female students/teachers and male students/teachers. The correlational analysis of the variables of locus of control and creative attitudes has been achieved by the calculus of the correlation coefficient r = - 0, 39, which signifies the fact that the persons with an internal locus of control have an innovative style in solutioning the situations, which coincides with the results of other researches which observe that the increase of creativity through training implies a rise in internal. While Renn (1991)[19] reveals The present study's results suggest, therefore, that reported I-E differences on some employee attitudes and personality may not be as valid as suggested by past studies. Moreover, the results suggest a need for a meta-analysis of the organizationally-relevant LOC literature to determine which differences in employee attitudes and personality are due to true differences on the LOC construct and which are due to statistical artifacts. Further implications of the present study's results and recommendations for future LOC research are discussed.

Conclusion

Regarding with the problems in this study, and based on statistical calculations and the results of data analysis that have been described previously, it can be concluded the results of the study as follows; to improve personality towards the environment, we need to improve variables such as attitude and LOC. Based on the environmental personality development model by Hines (1986)[5,] attitude and locus of control are good predictor variables for predicting one's personality on the environment. For other researchers, further research can be done about personality towards the environment associated with other predictor variables based on other theoretical models.

The Effect of Personality and Motivation on Junior High School Biology Teacher's Citizenship Behavior

Tri Ayu Astuti[1], I. Made Putrawan[2], Rusdi[3]

[1]Master, [2]Professor, [3]Lecturer, Biology Education, Universitas Negeri Jakarta

Abstract

Adopting to development of technology at the era of globalization, quality of human resource has a vital role in improving the quality of education which mostly depend on teachers' quality as well. This research, therefore, aimed at finding out whether teachers' personality (big-five personality) and motivation affected on teachers' citizenship behavior/CB (performance). A causal survey used by selecting 81 teachers randomly. Three instruments developed to measure personality with reliability of .930, motivation (.918), and citizenship behavior with reliability of .884. Data was analyzed by regression, correlation and path analysis. Research results showed that teachers' motivation was good and non significant as mediated factor between personality and teachers' CB, personality directly and significantly affect teachers' CB, and motivation directly and significantly affect teachers' CB. Based on these findings, it could be concluded that variation of teachers' CB or in more specific, teachers' performance, influenced by teachers' personality and motivation variation, so when biological teachers' performance would be improved, the role of teachers' personality (big-five factors) and motivation should be taken into consideration, especially in making decision in improving continuously the quality of junior high school, particularly biological teaching and learning.

Keywords: *Big-five personality, citizenship behavior, regression & correlation and path analysis*

Introduction

Globalization is accompanied by developments in science and technology. This must be balanced with increasing human resources with quality education. One of the determinants of the quality of education is the teacher. One of the teacher's competencies is social competence. Teachers are social beings who must have empathy for others and have citizenship behavior or wise behavior. Colquitt, Lepine, and Wesson (2015)[1]defined that citizenship behavior is someone's wise behavior at work that prioritizes the interests of the organization and contributes to improving the overall quality of the settings in which work takes place that has an interpersonal dimension with the helping, courtesy, sportsmanship and organizational dimensions with the voice, civic virtue, and boosterism dimensions. Maftuhah, Putrawan, and Suryadi (2018)[2] explained thatcitizenship behavior is needed because of the lack of extra role behavior, it can be indicated from a lack of sense of responsibility in completing work, not on time at work such as arriving late and returning early and avoiding additional assignments. Robbins and Judge (2013)[3]explained that factors in personality are the ability to interact with other individuals, are easy to adapt, and have great effort and perseverance so that it can produce high citizenship behavior.

Personality influences teacher's behavior citizenship. Colquitt, Lepine, and Wesson (2015)[1] defined that personality is a tendency in someone who explains the characteristic patterns of thoughts, emotions, and behaviors that have factors of conscientiousness, agreeableness, extraversion, emotional stability, and

Professor, Biology Education, Universitas Negeri Jakarta
e-mail: putrawan.imade@yahoo.com

openness to experience. Putrawan (2013)[4] explained that big-five personality can be implemented to measure personality. Fan, Javed and Akhtar(2014)[5] explained that personality especially conscientiousness has a positive effect on citizenship behavior. In addition, personality also affects a person's motivation for doing work. Gibson, Ivencevich, Donelly, and Konopaske(2012)[6]explained that personality is strongly associated with motivation.

Motivation influences teacher citizenship behavior. Andre (2009)[7] defined that motivation is the direction, intensity, and perseverance of a person in achieving his goals that have dimensions of direction, intensity, and persistence. A significant level of motivation contributes to extraordinary performance. Wahyuni, Putrawan, and Sari (2019)[8] explained that the lack of motivation of teachers can affect performance. Based on this description, the formulation of the problem of this research are: 1) Does personality directly effect citizenship behavior?; 2) Does motivation directly effect citizenship behavior ?; 3) Does personality directly effect motivation; and 4) Does personality have an indirect effect on citizenship behavior through motivation?. Based on this description, the purpose of this study is to determine the effect of personality and motivation on the citizenship behavior of junior high school Biology teachers in East Jakarta.

Research Methodology

The objectives of this researchwas to find out the direct effect of personality and motivation onbio-teachers' citizenship behavior.A causal survey used by selecting 81 junior high school biological teachers, in East Jakarta.Three instruments developed to measure personality with the reliability of .930 (38 items), motivation with the reliability of .918 (23 items), and citizenship behavior with the reliability of .884 (26 items).Data analyzed by path analysis after regression and correlation.

Results and Discussion

Based on the table below, it can be seen the result of significance and linearity of the regression model $\hat{X}_3 = 90.928 + .261\ X_1$; $\hat{X}_3 = 97.918 + 0.311\ X_2$; $\hat{X}_2 = 54.328 + .344\ X_1$ significant of the relationship was linear.

Table 1: ANAVA Table for Regresion Model $\hat{X}3 = 90.928 + .261\ X1$

Model	Unstandardized Coefficients		Standardized Coefficients	t_{cal}	t_{tab}	Correlations		
	B	Std. Error	Beta			Zero-order	Partial	Part
(Constant) Personality	90.928 .261	8.181 .052	.489	11.115 4.988*	1.99	.489	.489	.489

*p < .05

Based on the Table 1. personality has a direct effect and significantly on citizenship behavior with $phi_{31} = .489$, using t-test, $t_{cal} = 4.988$ more than $t_{tab} = 1.99$.

Table 2. ANAVA Table for Regresion Model $\hat{X}_3 = 97.918 + .311\ X_2$

Model	Unstandardized Coefficients		Standardized Coefficients	t_{cal}	t_{tab}	Correlations		
	B	Std. Error	Beta			Zero-order	Partial	Part
(Constant) Motivation	97.918 .311	9.151 .084	.383	10.700 3.689*	1.99	.383	.383	.383

*p <.05

Based on the Table 2. motivation has a direct effect and significantly on citizenship behavior with $phi_{32} = 0.383$, using t-test, $t_{cal} = 3.689$ more than $t_{tab} = 1.99$.

Table 3. ANAVA Table for Regresion Model $\hat{X}_2 = 54.328 + .344\ X_1$

Model	Unstandardized Coefficients		Standardized Coefficients	t_{cal}	t_{tab}	Correlations		
	B	Std. Error	Beta			Zero-order	Partial	Part
(Constant) Personality	54.328 .344	9.831 .063	.524	5.526 5.471*	1.99	.524	.524	.524

*p < .05

Based on the Table 3. personality has a direct effect and significantly on motivation with phi_{21} = .524, using t-test, t_{cal} = 5.471 more than t_{tab} = 1.99

Based on table 1,2, and 3the empirical models can be seen as follows:

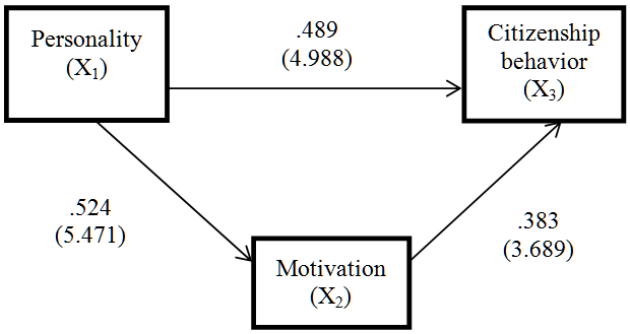

Figure 1. Empirical Model

The result of this research were (1) personality has a direct effect and significantly on citizenship behavior with phi_{31} = .489, using t-test, t_{cal} = 4.988 more than t_{tab} = 1.99; (2) motivation has a direct effect and significantly on citizenship behavior with phi_{32} = 0.383, using t-test, t_{cal} = 3.689 more than t_{tab} = 1.99; (3) personality has a direct effect and significantly on motivation with phi_{21} = .524, using t-test, t_{cal} = 5.471 more than t_{tab} = 1.99; and (4) personality has an indirect effect on citizenship behavior through motivation with$phi_{31.2}$ = .200, using t-test, t_{cal} = 1.804 more than t_{tab} = 1.66.

Based on the results of the research which states there was a direct effect between personality on citizenship behavior so it is proven that personality can effect citizenship behavior. The results of this research were in line with the results of Fan, Javed & Akhtar's (2014)[5] explained that personality especially conscientiousness contributes positively and significantly to organizational citizenship behavior (OCB). The same thing was stated by Patki & Abhyankar (2016)[9]explained that conscientiousness has a direct effect on OCB, a person who has a high conscientiousness factor also has good organizational citizenship behavior.

There were agreeableness factors that influence citizenship behavior as stated by Bourdage, Goupal, Neilson, Lukacik & Lee (2018)[10] stated that the agreeableness factor influences organizational citizenship behavior. In addition to the agreeableness factor, emotional stability also influences citizenship behavior as stated by Leephaijaroen (2016)[11]explained that the agreeableness, conscientiousness, and emotional stability factors have a significant positive effect on organizational citizenship behavior. The same thing was stated by Mushraf, Al-Saqry & Obaid (2015)[12]explained that emotional stability factors affect OCB service provider employees. Another study by Putrawan (2019)[13]explained that emotional stability is one of big five personality's factor that the most vital in predicting school principals' citizenship behavior and personality should be taken into consideration to improve school principals' performance.

There was a difference between some of the results of previous studies that are relevant to the results of this study even though all results state that personality influences citizenship behavior. Previous studies examined each of the factors for citizenship behavior while this study examined the overall model of the five major personalities. Citizenship behavior is not only influenced by personality but also influenced by motivation. This is consistent with the second testing in this research.

The results of the second testing show that there was a direct effect between motivation on citizenship behavior, so it is proven that motivation influences citizenship behavior. This is consistent with Shaaban's (2018)[14] explained that motivation is related to organizational citizenship behavior, motivated employees will increase OCB. Another study by Hemakumara (2018)[15] stated

that intrinsic motivation and extrinsic motivation have a significant positive effect on organizational citizenship behavior but extrinsic motivation has a stronger relationship with organizational citizenship behavior. In addition to extrinsic motivation, intrinsic motivation also influences organizational citizenship behavior as stated by Ibrahim & Aslinda (2014)[16]stated that intrinsic motivation gives a greater direct effect on organizational citizenship behavior than extrinsic motivation. Similarly, Ghazi & Jalali (2017)[17] stated that intrinsic motivation influences organizational citizenship behavior and increases one's work productivity. Another study by Kim (2018)[18] stated that intrinsic motivation significantly influences employee turnover, employees with greater intrinsic motivation will reduce turnover intentions.

There was a difference between some of the results of previous studies that are relevant to the results of this study even though all the results state that motivation influences citizenship behavior. Previous studies examined each of the intrinsic and extrinsic motivational factors for citizenship behavior while this study examined motivation in terms of dimensions of direction, intensity, and persistence. A person's motivation is influenced by his personality. This was in accordance with the third testing in this research.

The results of the third testing have a direct effect between personality on motivation so it is evident that personality influences motivation. This was consistent with Nuckcheddy's research (2018)[19]stated that emotional stability and extraversion factors have a significant effect on motivation. In addition, research conducted by Hazrati-Viari, Rad & Torabi (2012)[20] stated that the conscientiousness factor influences both intrinsic and extrinsic motivation. The same thing was stated by Roberts, Rogers, Thomas & Spitzmueller (2018)[21]explaind that the conscientiousness factor influences motivation. Research conducted by Kelsen & Liang (2018)[22]stated that Extraversion and Conscientiousness factors significantly influence work motivation. There were other studies conducted by Mahlamäki, Rintamäki & Rajah (2018)[23]explained that the factors of extraversion, agreeableness, conscientiousness, emotional stability have a significant relationship with motivation. Another study by Hidayati, Putrawan, and Mukhtar (2019)[24] explained that to improve teachers' personality the school must be increase teacher's motivation. Another study conducted by Harun, Putrawan, and Miarsyah (2019)[25] explained that big-five personality factor could be consider to strengthen teachers' motivation.

There was a difference between some of the results of previous studies that are relevant to the results of this study, namely the previous findings that discuss the relationship of motivation with each factor of personality while this study examines the overall five personality factors. Despite differences, the overall results of the study concluded that personality has an influence on motivation. Therefore, motivation is a good intervening variable between personality variables and citizenship behavior. This was in accordance with the fourth testing in this research.

The results of testing the fourth indicate that there was non significant indirect effect between personality on citizenship behavior through motivation. Based on these results it can be concluded that citizenship behavior was directly affected by personality and motivation, so motivation is not proven mediator variable that significantly mediates between personality and citizenship behavior.

Conclusion

Based on the results of the study it can be concluded that personality have adirect effect on citizenship behavior, motivation have adirect effect on citizenship behavior, personality have adirect effect on motivation and personality have an indirect effect on citizenship behavior through motivation. Therefore, if biological teachers' citizenship behavior or teachers' performance would be positively improved, factors such as personality (big-five personality) and motivation could not be neglected, especially in enhancing school management quality.

Connecting Biological Teachers Self-Efficacy with Organizational Commitment Mediated by Motivation

Fera Puji Astuti[1], I. Made Putrawan[2], Ratna Komala[3]

[1]Magister Student, [2]Professor, [3]Biological Lecturer, State University of Jakarta, Indonesia

Abstract

When people believe that they are able to do anything assigned to them, their motivation to work harder and they feel that the work place perceived like their home in term of high in organizational commitment. So, when it would be generalized to school as an organization, then it could be a problem for this research. Considering this problem, a causal survey used by selecting 100 senior high school biological teachers as sample. Teachers self-efficacy, motivation and organizational commitment measured by instruments which have been validated. Data analyzed by apllying regression, correlation and path analysis. Research results indicated that the connection between self-efficacy and organizational commitment (OC) has been significantly supported by empirical data and significantly mediated by motivation as well. If it was discussed or talked about motivation, the factor such as self-efficacy could not be neglected rather each of these, such as self-efficacy and motivation directly affect teachers OC. That is why when school system would like to reduce the number of teachers withdraw intention, therefore, teachers OC should be strengthened by considering that teachers' self-efficacy and motivation to be well managed for improving biological teachers quality, in particular.

Keywords: *Organizational commitment, self-efficacy, withdraw intention, path analysis.*

Introduction

In the world of education, human resources must have increased quality that can compete, survive and develop in an era of globalization which is increasingly competitive. Therefore, technological innovation always increases development in an effort to win the competition. In addition, human resources are very important in an organization because the effectiveness and success of an organization is highly dependent on the quality and performance of existing human resources in the organization. In this case the teacher plays a role as human resources in the field of education that can affect the success of an organization that is the school.[1]

The teacher is the key to success in the teaching and learning process, as well as being an initiator who plays a role in the effort to form potential human resources in the development field. In this case the teacher is not solely as a teacher who transfers knowledge, but also as an educator who transfers values as well as a guide who provides instruction and guidance to students in learning according to current era.[2]

The success of an organization is inseparable from how committed a teacher is at the school where he/she teaches. Commitment refers to the willingness of employees to work positively in an organization and their continuation to continue working.[3] Without commitment, the influence will not be maximized, obstacles cannot be penetrated, and passion, impact, and opportunities can be lost.[4]If the commitment of the teacher organization is high, it will encourage motivation, the level of involvement in the organization, loyalty, work performance, and social behavior of the teacher will be high too.

Another factor that can increase organizational success is the development of work motivation.

Teachers' work motivation will certainly increase if they feel trusted, get recognition from their work, they feel there is fairness in the workplace and get challenges to show their abilities.[5] Fokkens & Canrinus argues that motivation to become a teacher is related to involvement and commitment to their profession. If the organizational climate is conducive to the atmosphere of a familiar work environment, it will make teachers motivated because teachers are satisfied with the organization.[6]

Aside from teacher motivation factors, a teacher's self-efficacy also positively changes teaching behavior to always do the best for students.[7]According to Skaalvik & Skaalvik, the strength of motivation influence on a person's performance depends on how much self-efficacy the teacher has. The higher self-efficacy of a teacher, the more passionate he/she could be.[8]

Given the important role of teachers in increasing the success of an organization in this case is the school, which is based on the foundations stated above, so research is needed on the effect of self-efficacy and motivation on teacher organizational commitment.

Mowday, Porter & Steers describe organizational commitment as behavior related to the process by which individuals become locked into a particular organization and how they maintain their membership in this organization[9].According to Pinho, Rodrigues & Dibb, highly committed employees will view work not as a burden or obligation but as a means of working and developing themselves, because an employee is expected to be able to ensoul his/her work as well as working with the mind and heart.[10]Meyer and Allen have identified three types of organizational commitment, namely affective commitment, continuance commitment, and normative commitment.[11]

Corsun & Enz said that self-efficacy is defined as the belief of individuals to explore their potential so that they can be developed further, so they can carry out work better.[12]According to Schunk & Dibenedetto, the higher self-efficacy will cause individuals to dare to make behavioral changes such as harder efforts and higher concentration to achieve goals. Self-efficacy is one of the factors to generate positive efforts in carrying out work.[13]According to Bandura, self-efficacy is influenced by four important sources of information: mastery experience (performance accomplishment), vicarious experience, verbal persuasion, and physiological and emotional state.[14]

According to George & Jones, work motivation can be defined as a psychological drive to someone who determines the direction of one's behavior in the organization, the level of effort, and the level of persistence in facing an obstacle or problem.[15]Motivation theory is based on the theory put forward by Maslow namely Maslow's Hierarchy of Needs, where the motivation of human needs will be: (1) Physiological Needs, (2) Safety and Security Needs, (3) Love and Belonging Needs, (4) Self-Esteem and Needs Self-Esteem, (5) Need to Know and Understand, (6) Aesthetic Needs, and (7) Self-Actualization Needs.[16]

Research conducted by Lunenburg shows the results that self-efficacy affects employee motivation and perseverance in completing difficult tasks.[17]In line with the results of Cherian & Jacob's research which states that self-efficacy affects the efforts of employees in improving their performance and motivation.[18]

Based on the results of research Meysam & Jamali stated that work motivation has a significant positive effect on employee organizational commitment.[19] Tentama & Pranungsari's research also stated that there was a significant positive correlation between teacher work motivation and organizational commitment. The stronger the teacher's work motivation, the higher the organizational commitment would be. Otherwise, the lower the teacher's work motivation, the lower the organizational commitment would be.[20]

Akhter, Ghayas & Adil's research also shows the results that self-efficacy is positively correlated with organizational optimism and commitment. An employee with positive beliefs about himself becomes confident about the work assigned to him, shows good performance and has satisfaction with his work, so the level of commitment is higher for the organization.[21]This is in line with the results of research by Klassen et. al. which states that teachers with high self-efficacy have strong ideals and commitments to their profession thereby increasing their work commitment.[22]

Research Methodology: The purpose of this study was to obtain information about the direct and indirect effects of self-efficacy (X1) and motivation (X2) on the organizational commitment of Biology teachers (X3). This research was a quantitative study using a causal survey method. Respondents were collected with a total of 100 Biology teachers in the Bekasi area, researchers took a sample of 91 teachers with simple random

sampling technique. There were three instruments that measured self-efficacy, motivation and organizational commitment that each amounted to 30 items. Data were analyzed using path analysis.

Results and Discussion

Based on the results of statistical calculations using SPSS, that (1) there was a significant direct effect of self-efficacy on motivation with a phi-coefficient = 0.604; (2) there was a significant direct effect of motivation on organizational commitment with the phi-coefficient = 0.462; and (3) there was a significant direct effect of self-efficacy on organizational commitment with a phi-coefficient = 0.508.

The results of the first hypothesis testing show that there was a direct effect of self-efficacy on motivation. This result was supported by Tabernero & Hernandez's study which states that there was a positive relationship of self-efficacy with individual intrinsic motivation.[23] White also states that self-efficacy was strongly affectthe intrinsic motivation.[24]

The results of the second hypothesis testing show that there was a significant direct effect of motivation on organizational commitment. This result was supported by Hayati & Caniago's research which states that employees who were more intrinsically motivated by their work will feel more committed to their organization.[25]The results of Trivellas's research also show that motivation significantly affect the level of commitment that employees instill in the workplace.[26]

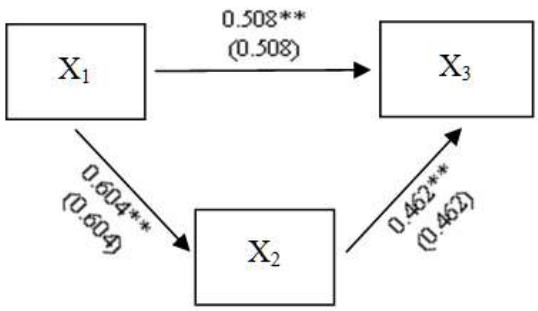

Fig. 1. Empirical Model X1=Self-Efficacy; X2=Motivation; X3=Organizational Commitment; p < 0,05

The results of the third hypothesis testing show that there was a significant direct effect of self-efficacy on organizational commitment. This result was supported by Tsai, Tsai & Wang's self-efficacy research having a significant positive effect on organizational commitment.[27]Yousaf & Sanders in his research also stated that there was a direct effect of self-efficacy on organizational commitment.[28]

Conclusion

Based on those findings and interpretation, compared to other findings, it could be concluded that the connection between self-efficacy and organizational commitment has been significantly supported by empirical data and significantly mediated by motivation as well.

The Effect of Personality and Gender on Green Consumer Behavior

Cholilawati[1], I. Made Putrawan[2]

[1]Student, Department Fashion Design, [2]Professor, Department of Biological Education, Universitas Negeri Jakarta

Abstract

The difference in the consumer's personality will affect his behavior in choosing or buying a product, because consumers will buy goods that are in accordance with his personality. This study aims to look at the effect of personality and gender on green consumer behavior (GCB). This research uses quantitative, survey method and ex-post facto techniques. The population in this study were all students of the Jakarta State University, the outreach study participants were students of Catering, Clothing, Makeup and Family Welfare Education increasing 600 students. The results showed that personality had a significant influence in describing GCB and GCB differences were found in male/female student groups who had accurate personalities, better than GCB in male student groups who had inaccurate personalities. However, personality is not influenced by gender, which means that differences in GCB are influenced by interactions between personality and gender

Keywords: *Personality; Gender; Consumer; Green Consumer Behavior.*

Introduction

As written by tempo.co, Jakarta that millennial generation apparently has a high concern for the environment. This can be seen from their daily habits, one of them is their behavior when shopping. Many of those who refuse to use plastic bags and switch to using reusable bags or cardboard[1].

The above activities include environmentally friendly consumer behavior where the individual tries to make a decision in obtaining an item or service that they need without damaging the environment. Those who do not care about environmentally friendly products describe that they are people who do not understand about the environment.

Consumer behavior includes many things such as how the process of finding products and services, buying, using, evaluating, to the final activity of disposing of the products and services they expect. While the study of consumer behavior explains what products and brands are bought by consumers, why they buy the product, when they buy the product, where they buy it, how often they buy it, how often they use it, how they evaluate the product used after purchase, and whether they don't buy it repeatedly.

No two people are exactly the same in their nature or personality, each with unique characteristics that are different from each other. This is what is called human personality. The difference in the consumer's personality will affect his behavior in choosing or buying a product, because consumers will buy goods that are in accordance with his personality. In some societies gender can influence consumer behavior in terms of the roles of men and women. One dimension that makes gender-based segmentation so interesting is that male/female behaviors and tastes continue to develop. Gender also has an important role in consumer behavior. Because, the differences between men and women regarding hopes, desires, needs, lifestyle and others reflect their consumption behavior. Gender also affects consumers in decision-making behavior. Based on the background description that has been written, this study focuses on

green consumer behavior (GCB) which is influenced by personality and gender.

Literature Review:

Green Consumer Behavior: Sciffman and Winsenblit[2] define consumer behavior as the study of consumer actions while searching, buying, using, evaluating, disposing of products and services they expect for their needs[2], whereas according to Malcnis, that consumer behavior involves an understanding of whether, why, when, where, how, how much, how often, and for how long consumers will buy, use, or discard[3].

According to Frank R. Kardes, Maria L. Cronley and Thomas W. Cline[4], consumer behavior (usually called buyer behavior) involves a study of how consumers decide to buy a product. The scope of consumer behavior activities starts from activities before buying, during buying and after consuming. The contemporary definition is far broader and tries to capture a variety of consumer activities. Consumer behavior involves all consumer activities related to the purchase, use, and disposal of goods and services, including consumer emotional, mental, and behavioral responses that precede, determine, or participate in these activities[4]. Frank R. Kardes, Maria L. Cronley and Thomas W. Cline[4] also wrote, purchasing activities are the activities of consumers in obtaining goods and services. Buying activities also include everything after completing a purchase, such as gathering, evaluating information about a product or service and choosing where to make a purchase.

After consumers make purchases or obtain products and services, it will usually be followed by a process of consumption or use of the product. Usage activities describe where, when and how consumption occurs. For example, do consumers consume products immediately after purchase, or do they delay consumption, such as when buying new clothes for future opportunities.

During consumption of products and services, consumers are expected to have a good way, especially thinking about the impact afterwards on the environment. This kind of consumption process is called a continuous consumption process. Sustainable consumption behavior as defined by Williams and Dair, is the behavior of individuals or groups that basically contribute to reducing consumption of resources, waste and pollution. Proses konsumsi berkelanjutan seperti yang dituliskan oleh Myers dan Kent adalah penggunaan barang dan jasa yang merespon kebutuhan pokok, membawa kualitas hidup yang lebih baik, meminimalkan penggunaan sumber daya alam dan bahan beracun serta emisi limbah dan polutan lebih pada siklus hidup barang dan jasa agar tidak membahayakan kebutuhan generasi mendatang[5].

Various terms have also been used to refer to consumer behavior that reflects the wider and long-term impact of consumption on society on the environment. Sciffman and Winsenblit[2], identified three types of green consumers including: first, environmental activists: "green" enthusiasts and people who adopt lifestyles and focus on health and sustainability. They look for food from farms that not only produce organic products, but also reduce water use, electricity usage, and waste. Second, Organic Eaters: concerned about looking after their own health and not so much protecting the planet. Third, economizers: experiment with buying environmentally friendly products to save money[6].

Personality: Personality according to Leon G. Schiffman and Joseph L. Wisenblit[2] consists of inner psychological characteristics that determine and reflect how we think and act[6].The inner characteristics that constitute a person's personality are a unique combination of personality factors, no two individuals are exactly the same. However, many individuals can have one or even several personality characteristics, but not others. The description can be explained that personality shows the deepest characteristics in a person and is a combination of many unique factors. Therefore, no two individuals are exactly the same characteristics. However, many individuals can have one or even several of the same personality characteristics, but the other characteristics may be different. Different personalities can be observed with different behavior from one person to another. However, marketers can identify what characteristics in consumers who influence it in buying a product. Although personality is generally permanent and consistent, in certain circumstances, personality can change.In line with the description above Frank R. Kardes, Maria L. Cronley and Thomas W. Cline also stated Personality is a set of unique psychological characteristics that influence how a person responds to his or her environment, including cognitive, affective, and behavioral tendencies[4].

Personality traits are functions of genes and the environment. An important part of the environment is the cultural equality in which you grew up. Cultural values are defined as beliefs about the desired end of a country or the manner of behavior in a particular culture.

Colquitt, LePine and Wesson in The Big Five Personality Model explains that there are five dimensions that underlie human personality, namely conscientiousness, agreeableness, neuroticism, openness, and extraversion. The five dimensions of personality can be measured through indicators: Conscientiousness (reliable, organizational, trustworthy, ambitious, hardworking and persevering). Agreeableness (kind, like to work together, sympathetic, helpful, polite and warm). Neuroticism (nervous, moody, emotional, alert, restless, irritable). Openness (inquisitive, delusional, creative, inferior, polite, smart) and Extraversion (talkative, sociable, passionate, resolute, brave, powerful)[7].

Big Five Personality is an approach used in psychology to see human personality through traits that are arranged in five personality domains that have been formed using factor analysis. The five personality traits are extraversion, agreeableness, conscientiousness, neuroticism, openness to experiences.

Gender: Gender is "A concept that refers to the social differences between women and men that have been studied, which change over time and have wide variations both within and between cultures." Gender refers to the rules, norms and practices in which biological differences between men and women, boys and girls, are interpreted so that it results in unbalanced judgments, possibilities and opportunities in life[8]

Talking about gender cannot be separated from sexual identity, and the development of gender roles also departs from sexual differences. Men and women are already different and distinguished from the beginning of their lives. Since the baby was born to earth, almost all the questions asked by parents and relatives are, first of all, "male or female?" Even before birth even parents want to ascertain the sex of their children via ultrasonography.[9].

According to Crawford, gender is a set of characteristics and traits that are socio-culturally attached to men and women. Blakemore, Berenbaum, and Liben define gender as a distinguishing characteristic between men and women that is not based on biology, and is not natural, but based on the habits or sociocultural characteristics of the societies that shape it[10].Gender is not natural, can be changed and can be exchanged from human to human depending on local time and culture. The attached characteristics or characteristics are created by the surrounding social or culture. Examples of these characteristics include; men are strong, mighty, not whiny, rational, logical, and so on. While women are weak, emotional, whiny, motherly, gentle, empathetic, caring and so on.

Methodology/Materials

This study uses survey method and ex-post facto techniques with a 2 x 2 design. The population used in this study is all students of the Jakarta State University, and the determination of faculties will be selected by purposive sampling. Whereas the outreach population is students of Food, Fashion, Makeup and Family Welfare Education Study Programs who are still registered in the even semester (104) and have graduated from the Consumer Science Course, totaling 600 students. Data analysis techniques in this study used descriptive analysis and inferential analysis. Testing the requirements analysis is done before testing the hypothesis. Hypotheses one, two and five were tested using two-way Variant Analysis (ANAVA) and hypotheses three and four were tested using the Tukey test. Before being used to test the interrelationships between variables, the data must meet the requirements of normality test and variance homogeneity test. The normality test uses the Kolmogrof Smirnov test and the variance homogeneity test uses the Bartlett test.

Measurement: Green Consumer Behavior (GCB). The instrument used to collect GCB data was measured using a Likert scale instrument with 5 answer choices: Always, Often, Sometimes, Rarely, and Never with the answer scale: Always = 5, Often = 4, Sometimes = 3, Rarely = 2, and Never = 1 for positive statements. And the scale of the answers: Always = 1, Often = 2, Sometimes = 3, Rarely = 4, and Never = 5 for negative statements.

Personality. The instrument used to collect personality data uses a Likert scale instrument with 5 answer choices. Very Accurate, Accurate, No Opinion, Inaccurate, and Very Inaccurate. Giving a score if the statement is positive then the value is 5, 4, 3, 2, 1 and if the negative statement evaluates 1, 2, 3, 4, 5.

Results and Discussion

Homogeneity variance test results using the Bartlett test showed that Ho was accepted at a significance of $\alpha = 0.05$. This means that the data variance in this study is homogeneous. From the results of testing the analysis requirements, the hypothesis testing is carried out using

two-way ANAVA. (Description of Homogeneity Test results using the Bartlett test on the A1B1, A1B2, A2B1 and A2B2 data groups

Average/correction (R)	1	1312085,33	1312085,33	-		-	-
Total (T)	108	1317594	-	-		-	-

First Hypothesis: Based on the results of the first hypothesis testing, it was obtained that the null hypothesis was rejected stating "there is a difference between GCB students who have Accurate Personality and Inaccurate Personality. This means that the hypothesis proposed by the researcher is accepted or there is a significant difference between the GCB of students who have Accurate Personality and Inaccurate Personality.

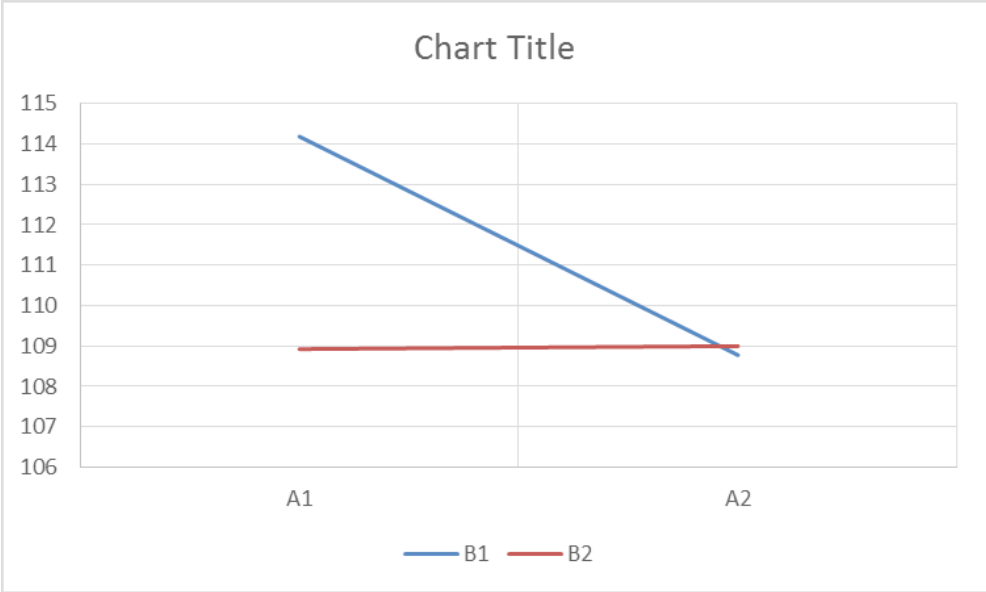
Second Hypothesis: Based on the results of testing the first hypothesis, the test results obtained that the null hypothesis was rejected stating "there is a difference between GCB for male students and female students". This means that the hypothesis proposed by the researcher is accepted or there are differences in the GCB of male students and female students.

Third Hypothesis: Ho was refused and accepted H1 or accepted the hypothesis proposed by the researcher. So it can be concluded that for male GCB students who have accurate personality are better than inaccurate personality.

Fourth Hypothesis: That Ho is rejected and accept H1 or accept the hypothesis proposed by researchers. So it can be concluded that "there is a GCB between female students who have accurate Personality better than female students who have inaccurate Personality."

Fifth Hypothesis: Ho was refused and accepted H1. This means that the hypothesis proposed by the researcher is accepted or there is an interaction between personality and gender on the behavior of green consumers (Green Consumers Behavior) students.

Picture 1. Simple Effect Graph (Simple Effect) interaction between personality and gender on green consumer behavior (Green Consumers Behavior behavior) students.



Based on similar research that is relevant that female consumers have greater environmental concern than male consumers and female consumers have a greater green product purchasing behavior on all environmental variables than men[11]. Gender factors play a very important role in purchasing decisions. Women and men exhibit both completely different behaviors when buying goods or services, whereas women are more subjective and intuitive men tend to be more analytical and logical[12]. In this study there are gender differences in men/women with GCB who have an accurate personality better than an inaccurate personality. But here personality is not influenced by gender, which means that differences in GCB are influenced by the effects of the interaction between personality and gender.

Conclusion

This study uses survey method and ex-post facto techniques with a 2x2 design that aims to obtain information about the influence of personality and gender on GCB. Based on the results of hypothesis testing can be summarized as follows: First, there is a significant difference between GCB students who have Accurate Personality and Inaccurate Personality. Second, there are differences in GCB male and female students. Third, for GCB students, male students who have accurate personality are better than those who have inaccurate personality. Fourth, there are GCB among female students who have accurate Personality better than female students who have inaccurate Personality. Fifth, there is an interaction between personality and gender on the behavior of green consumers (Green Consumers Behavior) students. Based on the above findings, in this case it can be concluded that the results indicate that personality has a significant influence in shaping GCB and found differences in GCB in male/female student groups who have accurate personality. However, personality is not influenced by gender, which means that differences in GCB are affected by the interaction between personality and gender.

Keeping Teachers' Organizational Commitment High By Considering the Role of Teachers Leadership and Trust

Risky Hasanah[1], I. Made Putrawan[2], Diana Vivanti S.[3]

[1]Magister Student, [2]Professor, [3]Associate Professor, State University of Jakarta, Indonesia

Abstract

The problem that school often faced is how to keep low or zero teachers' turn over rate meant that their organizational commitment should be maintained. It presumably was brought about where there was no trust anymore and confused teachers leadership. So, that was why this research conducted is to solve the problem, whether teachers' task performance affected directly or indirectly by leadership and trust. Around 100 senior high school biological teachers used as sample and causal survey applied. Instruments developed to measure organizational commitment (OC), teachers leadership (TL) and trust (T) and data analyzed by path analysis. Research findings showed that both of those exogen factor, teachers' leadership and trust were found to be significantly and directly affect on teachers' organizational commitment. Besides, trust was found to be good mediated factor as well. Therefore, these findings implied that in reducing teachers turn over rate in term of teachers organizational commitment would be scientifically, the role of teachers leadership and trust could be taken into account.

Keywords: *Organizational commitment, teachers leadership, trust, path analysis.*

Introduction

In 21st Century education requires students to have meaningful learning experiences. Meaningful learning in the form of scientific processes such as observing, asking questions, gathering information, associating, and communicating, in biology subjects were guided by biology teachers as facilitators in student centered learning. Teachers must meet four competencies, namely pedagogic, personality, professional, and social in realizing educational goals. Internal factors such as teacher competence were needed so that teachers can create meaningful learning opportunities for students. But other internal factors such as organizational commitment in its realization can maintain the professionalism of a teacher.

Organizational commitment was a condition of someone to side with a particular organization with the aim and desire to maintain membership in the organization[1]. Organizational commitment for a teacher has an impact on performance such as doing school work, trying to improve work performance, discipline, and creative[2]. For biology teachers, organizational commitment illustrates loyalty to the teaching profession so that actions taken by teachers aim to condition the classroom situation so that learning activities take place efficiently[3] through learning method, learning models and learning media that can motivate students. High organizational commitment to a teacher was affect by several factors including teacher leadership and trust.

Leadership was an ability to affect a group or other people to achieve the vision and goals[4]. A teacher was said to have good leadership if it can affect, direct, guide, and motivate students to be able to learn with targets meeting learning objectives[5]. Teachers who have the ability to lead (good teacher leadership) allow the emergence of a desire to contribute to the progress of an organization, so that it has a high level of organizational commitment[6]. The high level of organizational commitment was also related to the trust that teachers have.

Corresponding Author:
Prof. I. Made Putrawan
Professor, State University of Jakarta, Indonesia
e-mail: putrawan.imade@yahoo.com

Trust was a mutual belief[7] in one's intentions and behavior[1]. A teacher can sacrifice all energy, thought, and time if an organization gives reciprocity to the things that have been given by the teacher, so that trust arises. The trust of the principal, coworkers, and students to a teacher will arise along with the teacher's leadership abilities[8]. Trust was realized by actions, not just words[9,10]. Teachers who have good trust allow the emergence of a desire to contribute to the progress of an organization, so that it has a high level of organizational commitment.

The two factors namely teacher leadership and mutual trust have an affect which impacts on a teacher's organizational commitment. Basically humans have different characteristics and characteristics. So for schools as an organization it was important to manage management in order to produce organizational commitment for its employees[11].

Therefore, research problems was whether teacher leadership directly affects organizational commitment through trust.

Literature Review: Before solving those problems, it should be made clear what actually meant by organizational commitment, teacher leadership, and trust.

Robbins & Judge described organizational commitment shows the partisanship of employees in certain organizations along with the goals and interests they have to maintain membership in the organization[4]. The active participation of a teacher to stay afloat in a school agency by carrying out tasks, being involved in organizational obligations, and being loyal to the organization shows the nature of organizational commitment. Form of loyalty in the form of a sense of willingness and involvement will be carried out by members of the organization[12,13].

Organizational commitment has three factors, first, there was confidence in the goals and values of the organization; second, there was a desire to do business on behalf of the organization; and thirdly, there was a desire to remain a member of the organization[14,15]. Through the factors that affect organizational commitment, divides it into three levels of organizational commitment, namely: affective commitment, normative commitment, and continuance commitment[1].

Affective commitment, referring to the wishes of members (want to do), continuance commitment, referring to the need to do it (need to do), and Normative commitment, referring to guarantees to keep working in the organization[1,16].

A teacher has a duty other than as a teacher, the teacher must also act as an educator in a school (organization). A teacher like to have the nature of a leader in himself that was useful for influencing, directing, guiding, and motivating students. Leadership was the ability to affect a group towards achieving its vision and goals[4]. Colquitt states that power and affect will create a positive relationship with organizational performance and commitment[1].

Teacher leadership can create positive relationships, thereby encouraging organizational commitment to realize organizational goals. An illustration stated by Yukl, a leader (school principal) will affect leadership behavior (teacher), thus also affecting the organizational commitment in forming an organizational integrity (school)[17].

In addition to teacher leadership, trust also has a positive affect on organizational commitment. In this case, trust refers to a person's positive expectations of others in a situation that involves risk[18] Similarly, teachers who already have the trust of the principal, fellow teachers, and students to carry the burden of responsibility and risk in providing education in schools.

Colquitt states that trust has a positive affect on commitment. Employees (teachers) will easily accept authority and have a high tendency to increase affective and normative commitment[1]. A teacher who was trusted by the principal in reality can easily have the burden of teaching responsibilities in class. This can lead to a sense of responsibility for the teacher class (affective commitment), and the feeling of a job that can guarantee the life of the teacher (normative commitment).

The leadership attitude for teachers that was manifested in reality gives birth to new responsibilities as a form of trust. Robbins & Judge states that trust was a primary attribute associated with leadership. Trust and trust-worthiness modulate the leader's access to knowledge and cooperation[4]. For a teacher, trust will arise due to the ability possessed by the teacher (teacher leadership).

Research Methodology

This research objective was to get the information about the effect of teacher leadership and trust on organizational commitment. A causal survey used by selecting 97 of biology teacher in Bekasi. There were three instrument which measured teacher organizational commitment (48 items), teacher leadership (48 items), and trust (48 items). Data analyzed by path analysis.

Results and Discussion

Considering the results of statistical calculations by applying SPSS, it was found that teacher leadership directly and significantly affected organizational commitment with a ph-coefficient of 0.688. Teacher leadership which consists of eight dimensions namely Idealized Affect, Inspirational Motivation, Intellectual Stimulation, Individual Consideration, Contingent Reward, Management by Exception (Active), Management by Exception (Passive), and Laissaze-Faire have a high contribution in influencing organizational commitment of biology teachers .

The leadership that was owned by the teacher makes the teacher can contribute both in the classroom and outside the classroom for the benefit of the school. Teacher leadership can create positive relationships, thereby encouraging organizational commitment to realize organizational goals. This result is also supported by Colquitt which found that power and if have moderate positive relationships with job performance and organizational commitment[1]. In addition, there is a relationship between teacher leadership and behavioral commitment found by Robbins & Judge and Hamzah[4,19].

In terms of organizational trust and commitment. Trust directly and significantly affect organizational commitment with a pH-coefficient of 0.727. Trust which consists of three main dimensions namely Ability, Benevolence, and Integrity has a high contribution in influencing the organizational commitment of biology teachers.

Trust built by someone can open up opportunities for various tasks and responsibilities that can be imposed, so that a person can reach the highest level of his organization and have an impact on organizational commitment[1]. This result was also supported by Rae Andre that the basis of effective communication is trust, with the trust of every individual involved in the organization will be able to form a harmonious relationship within the organization so that achieving organizational goals becomes easier[20]. In addition, there was a relationship between trust and commitment to behavior through good relations as the foundation of organizational commitment found by Buhler and Cunningham [21, 22].

Then teacher leadership directly and significantly affects trust with a ph-coefficient of 0.692 (see figure below). The leadership attitude for teachers that was manifested in reality gives birth to new responsibilities as a form of trust. This result was also supported by Robbins & Judge that trust was important for leadership[4]. For a teacher, trust will arise due to the ability possessed by the teacher (teacher leadership). If teachers cannot be trusted, it will have an impact on group and school performance.

Conclusions

The conclusions of the findings of this study were directed at increasing organizational commitment that can be empowered by considering how teacher leadership views leadership behavior, whether transformational direction or vice versa by transactional tendencies or laissaze-faire and trust, in terms of providing working hours, teaching assignments, and committees in schools. Therefore, teacher leadership and trust cannot be ignored when the performance of organizational commitment can be improved and developed by the school.

School Culture and Job Satisfaction: Its Effecton Biological Teachers' Task Performance

Dewi Robiatun[1], I. Made Putrawan[2], Rusdi.[3]

[1]Magister Student, [2]Professor, [3]Associate Professor, State University of Jakarta, Indonesia

Abstract

School culture has been viewed as a vital variable in building school climate to be more condusive. Whether this factor will affect biological teachers job satisfaction and finally affect teachers' task performance was the problem of this research. A causal survey used by selecting randomly 90 senior high school biological teachers as sample. There were three instruments developed to measure teachers' task performance, school culture and job satisfaction which has been already validated. Data analyzed by regression, correlation and path analysis. Research findings showed that teachers task performance directly and significantly affected by school culture and job satisfaction as well, and based on this finding, job satisfaction was good mediated variable in connecting school culture and teachers' task performance. It was logic findings when teachers' performance expected to be more positive, all of teachers, especially biological teachers, require a positive atmosphere reflected by school culture and also to what extent teachers felt satisfied treated by the school system. Therefore, educational policy makers should pay more attention on how to improve school culture to be more conducive, teachers felt more satisfied then will have an impact on school quality reflected by teachers' task performance.

Keywords: *Task performance, school climate, school culture, path analysis.*

Introduction

Problems in the world of education in Indonesia are still quite a lot, including the quality of education. The low quality of education is indicated by an uneven education system. Many aspects support the statement, for example limited internet access, lack of cooperation between teachers, payment systems that are still far from sufficient, places to learn that are less comfortable and so on.

The quality of education is related to teacher performance. The teacher has the task to be able to change behavior and provide insights broad knowledge to students. This main task is to connect teachers with the quality of education therefore performance is related to teacher professionalism. To test the level of teacher performance the government conducts a series of tests. This test is reasonable to monitor the level of teacher quality and education quality.

Teachers are expected to have good quality performance to improve the quality of education. this can be done if there is a sense of satisfaction or pleasure of a worker from the workplace. a comfortable place to work, income suitability, colleagues and leadership regulations that are able to create a comfortable atmosphere can support the quality of work of someone.

Sometimes problems arise from the workplace. thus affecting the quality of performance. in terms of meeting job satisfaction is not only always focused on income. but other things such as rewards for job performance, assessment of objective supervisors, communication between friends or from superiors in accordance with procedures and the nature of work that makes teachers happy in carrying out their duties are considered able to improve the quality of teacher performance.

Corresponding Author:
I. Made Putrawan
Professor at State University of Jakarta, Indonesia
e-mail: putrawan.imade@yahoo.com

Values and norms contained in the workplace also become an important aspect to consider. the values and norms that have been mutually agreed upon and ultimately become the hallmark of an organization are called culture. the intended organization relating to teacher performance is the school. The culture formed at school will create a climate that influences teacher performance.

Therefore, in this study, the research problem is whether the theoretical model of the effect of teacher performance (TP) on school culture is mediated by job satisfaction which is confirmed by the empirical findings model.

Before solving those problems,it should be made clear what actually meant by task performance (TP)is part of job performance, Before solving those problems. Sabine described performance as what organizations did, and did it well.[1] Thus, performance is not determined by the action itself but by the process of assessment and evaluative. In addition, only actions that can be scaled (measured) are considered performance. Colquitt, LePine and Wesson defined Performance in general as a series of employee behaviors that contribute, both positively or negatively to organizational achievement.[2] Linda performance can be defined as the skills (competencies) of someone doing central work tasks.[3]

Cook and Hunsaker[4] stated that performance is the result of research on a person's behavior as measured by his contribution to organizational goals. Furthermore, James said that a person's performance is determined by the ability and motivation to carry out the work.[5] Dale defined performance is determined by environmental factors and management behavior.[6]

Task performance is divided into routine performance and adapted performance. Known responses that occur under normal, routine or predictable ways include routine performance. Instead the employee's response to fulfilling unusual or unpredictable tasks is an adaptable performance.

Culture can be defined as a combination of values, devices, beliefs, communication, and simplification of behavior that gives direction to people.[7] Schein described culture is a collection of various values and behaviors that can be considered as a guide to success. Colquitt stated the organizational culture is the development of social knowledge in organizations concerning the rules, norms, values, attitudes and habits of employees.[1]

Djamaludin found from his research that significant relationship between organizational structure and organizational culture to teacher performance in Pesantren education system.[8] The correlation between the organizational structure with teacher performance is 0.683, and organizational culture with teacher performance is 0.749. When both variables are together correlated by teacher performance result is 0.764, and contribute to 58,4 % to teacher performance.

Thiagarajdescribed that Highly satisfied employees will exert extra effort and contribute positively to the effectiveness and efficiency of their organizations.[9] Job satisfaction will lead to better performance and the employees will be more committed towards their organization.

Mashalahmed research about organizational culture showed that Hofstede culture dimensions affect the organizational performance in telecom companies.[10] Heather R eubank found that a healthy school culture is cornerstone to successful school reform.[11] School leaders should work towards creating schools which have collaborative professional learning communities, distributed leadership models, and a high level of trust among all stakeholders in the organization.

Michael morcos (2018)[12] described that Culture-focused organisations increased their income as research showed over an 11-year period, by 682% versus 166% for organisations who did not focus on their culture. Organisations culture requires focus and attentions from leadership and should be consciously embedded in the organizational structure.

Material and Method

This research objective was to get the information about the mediated affect of task performance (TP) in influencing directly job satisfaction (JS) as mediator based on the effect of school culture (SC). A causal survey used by selecting 90 of teacher senior high school in East Jakarta. Instruments developed to measure TP (40 items), SC (30 items), and JS (30 items). TP has been measured by applying 2 dimention of task performance, such as routine task and adaptive task.

Data analyzed by correlation for items validity, alpha Cronbach for reliability and exploratory factor analysis by oblique rotation for instruments construct validity and path analysis for finding the empirical path model.

Result and Discussion

Analyzing the results of statistical calculations by applying the SPSS statistical calculation application, found that Task Performance (TP) was directly and significantly influenced by culture with a phi-coefficient is 0.290. Culture also affects job satisfaction with a phi-coefficient of 0.445 and task performance is directly influenced by job satisfaction with a phi of 0.280 (see figure 1). Task performance consists of two dimensions namely routine and adapted performance.

The variety of teacher's task performance must be seen logically from this dimention if a culture and satisfaction need to be improved towards a better which is an inevitable factor in the program to achieve organizational goals.

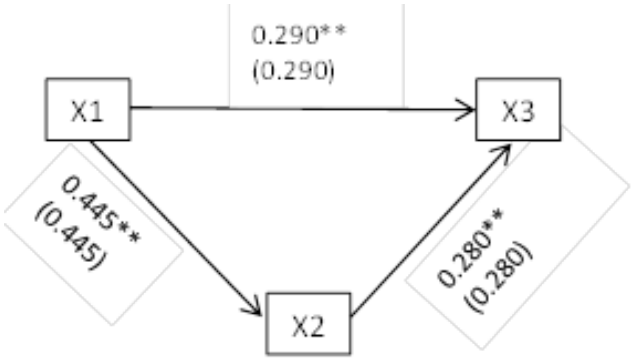

Fig. 1. Empirical model

X1 = school culture

X2 = job satisfaction

X3 = Task Performance

Genelyn R baluyos (2019)13 supported this statement with his research, The findings revealed that teachers were very satisfied with their type of work sot heir performance was very satisfying the principal's principal duties regarding supervision and job security have a significant influence. Schools must bee quipped with special waiting rooms so teachers can talk freely about their well-being. principals who were did actor were favored by the majority of teachers.

Ainun found that there was an influence on satisfaction preceded by an increase in teacher performance.[14] So it can be interpreted that the culture of school organizations has a positive influence on both the criterion variables (performance and satisfaction).

Conclusion

The conclusion of the finding of this study is directed towards improving teacher performance *(Task Performance)* which may be empowered by considering how schools culture that supports the teacher's job satisfaction. In this case there are several aspects of school culture that are mediated both by job satisfaction. Therefore school culture and job satisfaction are seen as important for improving teacher performance.

Strategies Overcome Barrier between Doctor and Patient Communication at National Heart Institute, Malaysia

Vimala Govindaraju[1], Aizai Azan Abdul Rahim[2]

[1]Lecturer, Faculty of Languages and Communication, University Malaysia Sarawak,
[2]Chief Executive Officer, Institut Jantung Negara (IJN) Kuala Lumpur, Malaysia

Abstract

The relationship between doctors and patients is broadly concerned and discussed in health care aspect. The objective of this study focused on the strategies how cardiologists overcome the barrier during communicate with patients using interpersonal communication (IPC) skills. Qualitative research methodology and a phenomenological approach was applied in this study through in-depth interview and observation sessions with 8 cardiologists. The gathered data were transcribed verbatim and analysed it using ATLAS.ti7 software in the way to identified the key themes, sub-themes and inter-relationships on the quotes. The results of the study showed it is recommended a doctor should be trained on managing time while the consultation session take place with patients and for doctors' time limitation really challenge to serve the patients. Through time management training it is possible for the doctors may more effectively and efficiently communicate with patients during the consulting session.

Keywords: *Strategies, interpersonal communication skill, communication barrier, overcome, training, time.*

Introduction

Malaysia providing dual health care services through public and private health sectors. Yusuf [15] stated there were 80,691 death cases caused by heart disease in 2015 and in 2016 it was increased to 85,637 death cases reported in Malaysia. National Heart Institute (IJN) is among the leading medical institution within Malaysia which delivers advanced treatment with experienced and skilful team of cardiologists in a broad range. interpersonal communication skill becomes

an important element in health care especially as a connector between doctor-patient communication. The research took place at IJN focused on strategies to overcome barrier during cardiologists communicating with patients'. This study also looks at cardiologists' ability in conveying reliable health care information to patients in order to save and relieve patients from chronic disease.

Literature Review:

Doctor-Patient Communication: Bredart[1] & Duffy[3] explained the doctor-patient communication is significant in health care as doctor's communication skills reflects the proficiency on collecting information to support and deliver proper health care instructions, and create concerned relationships with patients. Literature showed Street[12] doctor-patient communication is a process of exchanging information, being supportive on self-management of patients' insecurity and feelings, make decision and improving doctor and patient relationship. Undeniably, Neo[10] described communicate and building relationship with patients is one of the doctor's job scopes besides make decision on illness, therapy and treatment matter bring to the approach for a positive and efficient health care structure. Furthermore, Martin [10] stated in literature communication between doctor-patient resolve the doctors identify the patient's health issue and constructs a helpful bond between necessary for its management, possible and solution. Vermeir[13] described a well-organized communication

between doctor-patient always support patients to reach their healthcare objectives and offer them appropriate information, making significant decisions on health. Scholar Epstein[4] pointed on patient-physician relationships and the communication has given a helpful effect on the results, such as satisfaction on patient's, loyalty on suggested treatment, and self-management of prolonged illness. Scholar Levinson[8] highlighted doctor-patient communication rise doctors understanding on patients' illness wants, perceptions and principles; provide information the patients want and create confidence and understanding between doctors and patients. Kreps[6] figured out a wagon wheel with many diverse spokes represent as the characterize reliant health-care professionals and supporting staff, however the hub of the wheel symbolizes the health-care consumer, representing how the modem health-care system rotates around the consumer. Kreps [6] developed the Relational Health Communication Competence Model primarily to observe the levels of communicating proficiency between doctors-patients in health-care perspective.

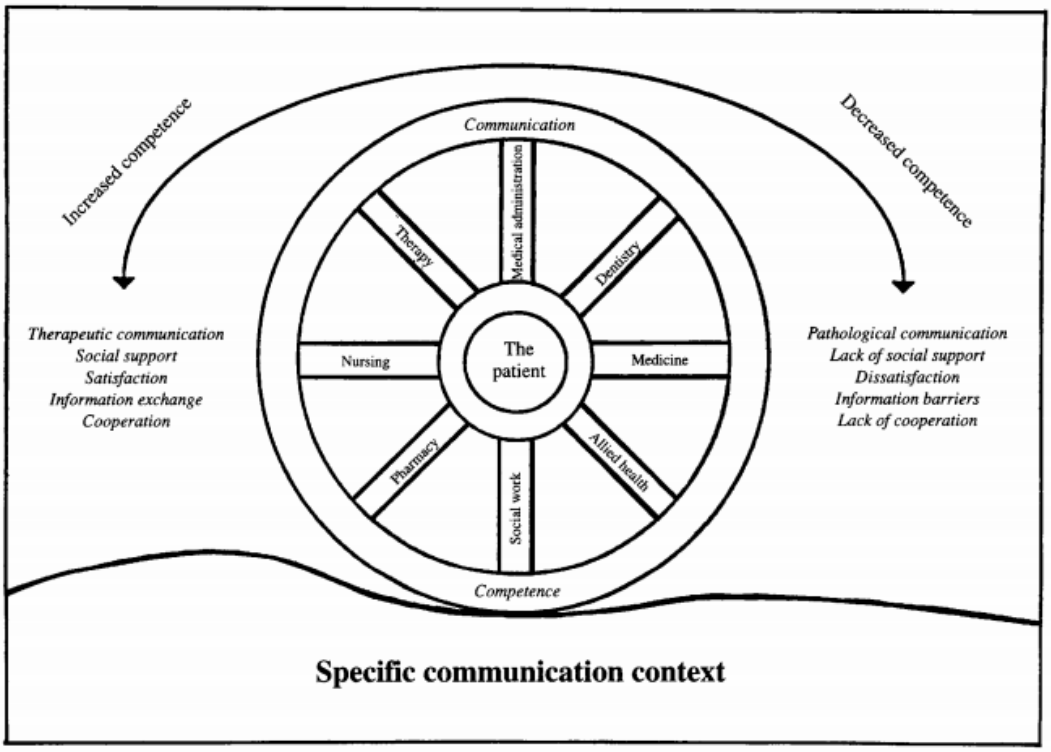

Figure 1: Relational Health Communication Competence Model (Kreps, 1984)

The model demonstrates the interdependent connections which happen among health care professionals and patients in healthcare system. Relational health communication competence is described by the example of particular provider and consumer knowledge and skills, such as empathic listening, verbal and non-verbal sensitivity, coding and interpreting skills and manage communication. In this study, the wheel rolls represent doctor–patient communication in using interpersonal communication skills in healthcare with improved personal fulfilment, therapeutic communication, support between doctors and patients, community health education, support and health-risk reduction.

Methodology

Research Design: Qualitative research method was adopted in this research via aiming on strategies to overcome barrier by cardiologists during communicating with their patients. Creswell[2] pointed qualitative research as procedure of understanding based on different methodological customs of inquiry that discover human experience. A phenomenological method was applied in

this research to illustrate occurrences in order to study a cardiologists of lived experience specifically during they communicate with patients in while talk about their diagnosed disease. Total of 8 cardiologists selected as informants and they were in-depth interviewed individually. Besides interview session, observation and audio tape recording used as triangulation method. The selection of the informants was based on purposive sampling technique with criteria of they must be cardiologists whom have several years of working experience in their field. Moreover, the cardiologists also communicating with patients and emphasis on career life experience of the cardiologists apply interpersonal communication skills during communicating with their patients.

Table 1: Summary of informants

No	Doctor's Name	Age	Race	Gender	Specialize	Working Experience (Years)
1.	Dr A	39	Indian	Male	Cardiologist	12
2.	Dr B	46	Indian	Male	Cardiologist	14
3.	Dr C	43	Chinese	Male	Cardiologist	21
4.	Dr D	37	Indian	Male	Cardiologist	15
5.	Dr E	45	Indian	Male	Cardiologist	13
6.	Dr F	42	Indian	Male	Cardiologist	13
7.	Dr G	44	Chinese	Male	Cardiologist	12
8.	Dr H	43	Malay	Female	Cardiologist	11

The interview process involved face-to-face in-depth interviews and throughout the researcher involved with informants by asking questions in unbiased and impersonal manner, listening carefully to their answers, follow-up questioning and analytical based responses. Besides interview session observational approach used to visualise and witnessed the interpersonal communication practices experiencing by the informants such as communicating with patients in terms of welcoming patient, use positive verbal and non-verbal communication, listen to the patients, show empathy, encourage discussion, counselling on patients' health related issues and recommendation on the appropriate treatment and medication process. Literature Creswell[2] supported the observation session might create deep understanding than interviews alone, as it provides facts of the context in which actions happen, and may support the researcher to observe events that participants themselves are not aware of, or that they are reluctant to discuss. All the 8 informants were interviewed and observed with average time of each session took about one to two hours in the cardiologist's clinics.

Results and Discussion

The strategies to overcome the barriers in doctor-patient communication: Communication barrier defined as whatever that blocks from effective communication process takes place. In a medical environment, there are some barrier happened in line with communication skills and patient care. The researcher identified the barriers in her previous article. This article highlighted the strategies doctors overcome the barriers during the consultation session with their patients for example, the doctor's positive response towards the patient's need on their health issues. The process of overcoming the barrier in doctor-patient communication by cardiologists is to avoid misinterpretation on the patients diagnose.

Based on the interview, the result shows that there are 8 informants that have agreed to participate in this study. Out of 8 informants there were 7 males and 1 female informants, 1 Malay, 2 Chinese and 5 Indian cardiologists participated in this study. The age group of the informants were 30-45 years old. These informants have 10 to 25 years of working experience as cardiologists. The following discussion will be on strategies the cardiologists overcoming the barriers in using interpersonal communication skill with the patients. The researcher developed the steps in overcoming the barriers through some relevant strategies such as i) communication skill; ii) communication training and iii) time management. The following discussion will be based on the general techniques for adjusting to potential barriers.

i. **Communication Skills:** This study focused doctor-patient communication specially on interpersonal communication skills used by cardiologists. Doctor's interpersonal communication skills involve the capability to collect information in order to assist defined diagnosis, appropriate counselling, deliver therapeutic guidelines, and create caring relationships with patients[1,3]. Doctors who received coaching personally are most passionate and regularly form of doctors' training and education, accomplished the greatest improvements in patient view of "excellent" associated behaviours[5]. Scholar Ranjan[11] suggested communication skills training will improve the doctors communicate well and make the patient satisfy for example listening, explanation, respecting, spend sufficient time, involving the patient in care and making decisions on the treatments procedures. Dr. B stated that communication skills should be exist within ordinary way in the way showing humanity to the patients in the way of helpful, respect, appreciate, listen to patients and have a clear understanding on what should deliver to the patients. Based on researcher's understanding, communication skills can be trained to create better doctor-patient communication which is very important to achieve successful health outcome. Training can make the cardiologists be more motivate towards the patients by following treatment recommendations and support patient's decision to be healthy and confident.

Well…. communication skills should be come in the ordinary way in terms of showing sympathy to the patients for example, feel kind, valued, understanding, listen to patients and have a clear understanding on what we should deliver (Dr B)

Another informant pointed doctor-patient communication skills can be trained in the way reflect their ability to gather information on the diagnosis and treatment (Dr H). The literature Lewin [8] supported the effective communication skills are recognized as a crucial condition for providing high excellence healthcare and person-centred care. Researcher understood that communication skills training is one of the strategy to overcome the barrier as well as it can be used to understand patient's life circumstances.

Doctor's good communication replicating their skills used for information gathering, diagnosis, treatment, and patient education. This communication skill can be effectively trained (Dr H)

Good communication skills between doctor and patient are essential for high quality, active and safe medical practice. These skills are used for gathering information, diagnosis, treatment and patient education. Dr D shared his experience that doctors' communication skills are an ability to explain and listen to patients' health outcomes. The informant also emphasized doctors need to be trained more skilful in the way to understand patients' health condition. Researcher understood that good communication skills of a doctor is a professional ethics as the nature of doctor's work and need to be competent in recognizing patients' health care concerns.

Doctors' communication skills are a capability to explain and listen on the patients' health outcomes. Doctors must be skilled to be skilful to understand patients' health condition (Dr B).

ii. **Communication Training Programs:** Communication training programmes are effective to improve doctor-patient communication of healthcare professionals. Dr G perceived communication training program can be an approach focus and train doctors to communicate well with patients. Literature Zoopi & Epstein[14]pointed communication training focus on active listening while patients tell their health history, decreasing the biomedical focus of the interview, and increasing patient participation in decision making. Based on the observation, the researcher perceived most of the cardiologists using general communication skills and the researcher also agreed with informants that appropriate communication skill training will make the doctors aware on communication skills that they use to their patients.

Communication skill training program... yes it is an approaches and it is focus on how doctors communicate and patient care. Frequent training programs have been created to make the doctors able to interact with patients using communication skills. (Dr G)

Dr C stated that communication skills can educated to the medical students as the it is a basic skill which should be included and combined in the curriculum. Furthermore, the purpose of training is to prevent misinterpretations happen in the health care practices. Research Zoopi & Epstein[14] showed doctor-patient consultation session it is highly suggested the medical professional's especially doctors would progress the

ability of understand patient's need in order to support them identify the indirectly conveyed sentiments of their patients.

Communication skills can be learned. I believe that having some basic "people skills," combined with specific interpersonal communication training; can prevent misunderstandings and malpractice suits in the career of any future doctor. (Dr C.)

From the interview session, Dr A, pointed doctor's communication skill training is strongly recommended for doctors to be more skilful in showing empathy and help to be positive emotions to their patients. Dr A also believed communication training program will be more useful for a doctors if its provided as they were a medical student. The informant also agreed communication training program trains doctors to give positive emotions towards their patients. Based on the observation, the researcher observed that cardiologist use general communication skills where listening and deliver health care information to their patients during the consultation session.

As a doctor we are trained to improve the skill such as showing empathy, help patients to be positive and identify the positive sentiments of patients. I think this will be more effective for a doctors if they learnt or trained when they as a student. (Dr A.)

iii. Time Management: Time is one of the limitation in doctor-patient communication and it includes doctor's appointment with patients such as scheduling lab tests, surgical procedures, counselling and other relevant procedures. Dr G shared his experience that he always aware on the treatment, medication and consulting session. He said with limited time he has to look up the history, chart and lab test results. He picked some specific signs from the patient and identifies them in the first few minutes and save time. Dr G thinks this comes from capability and it comes from practice and training.

I aware about patient's health condition, patient's medication and treatment process. This saves time in spending on following all extra information. I focus on certain cues from the patient and recognize them in the first few minutes. I think this comes from experience and practice. (Dr G)

Dr F identified the health information is important and he reduces disruption and forwards the questions to patients courteously. This skill is supported by self-knowledge of working with patients, comprehensive information of patients, and by medical knowledge.

Time limitation slows me down because sometimes patients want to keep ask questions about their health. When this happens, I listen to the patient's questions and response. But then sometimes yes we need to end the conversation due to time limitation. (Dr F).

Dr B shared he manage time with patients through multitasking and make his task ease such as gives medical advice, answered last questions and write prescription. Based on observation, the researcher identified the communication competent as an effective element as the doctors interact with patients with sufficient time and respond to patients' needs and concerns. Researcher observed to assess doctors' activities and time management skill was applied in their daily consultation session with their patients.

When patients leave my clinic after the consultation session, I'll make appoint walk with them until the door steps. I practice this to all my patients especially old (senior citizens) as I've developed and it allows me to get some precious times in reinforcing instructions, give guidelines, and advise the patient. For me, I manage spending quality time with my patients'. This is based on my own initiative. (Dr B)

Conclusion

The researcher identified and discussed few strategies to overcome the barrier in using interpersonal communication skill by the cardiologists with patients at IJN Malaysia. Those themes are communication skill, the communication skill training, and time management skill training for cardiology doctors. The discussed results recommended a doctor should be trained on managing time while the consultation session take place with patients and for doctors' time limitation really challenge to serve the patients. Through time management training it is possible for the doctors may more effectively and efficiently communicate with patients during the consulting session.

The Character Education Concept for Prospective Parents: Societal View

Mita Septiani[1], Basuki Wibawa[2], Robinson Situmorang[2]

[1]Ph.D. Student, [2]Lecturer, State University of Jakarta

Abstract

Having a strong concept of character education for prospective parents will make it easier for them to instill character education in their children later. This study aims to determine how the concept of character education that is owned by prospective parents. This study uses a survey method, which is to collect data by distributing questionnaires to prospective parents, both single and married but have no children, a total of 38 respondents are scattered in various regions in Indonesia. The results showed that (1) most prospective parents assume that character education is a family responsibility; (2) almost all prospective parents state that character education should begin at an early age; (3) most prospective parents do not yet know how to instill character education in children; (4) in general, the character values that are considered necessary are religious, honest, responsibility, and discipline; and (5) character values that are considered essential to be instilled in families in early childhood are honest, religious, and disciplined. The conclusion of this study is that prospective parents do not have a strong concept of character education. The character education model is needed by prospective parents to instill the character of children later in their family.

Keywords: *Education, character education, prospective parents.*

Introduction

Character education is essential to highlight the answers to the moral crisis problems that have occurred lately, especially in Indonesia, such as acts of intolerance, corruption, drug abuse, immorality, and other violence[1]. Moreover, Indonesia is predicted to experience a demographic bonus period in 2030-2040, namely the number of productive age population (aged 15-64 years) is higher than the population of unproductive age (under the age of 15 years and above 64 years)[2].

The character can be defined as the values of life. There are two kinds of values in life, namely moral and non-moral[3]. Moral values that are required in life are categorized as universal moral values. Based on these explanations, the character can be said to be the value or moral of life

Character education is an effective way to enhance students' social/moral/emotional development and academic achievement[4]. Also, the results showed that there was a relationship between character education and Student Achievement and Behavioral Outcomes[5]. Character children have good tendencies for Student Achievement and Behavioral Outcomes. The importance of character education can also be seen from various studies that have been conducted, including that character education can improve social competence[6] and academic independence[7].

A study of effective character education programs shows that full parent involvement is a must[8]. Other studies have shown that parenting and parenting styles have more influence than the nonphysical environment of the school[9]. These findings reinforce the role of the family as a key to the development of children's character. Instilling character values in the family is very dependent on the ability of parents to teach these values to their children. Failure of the family in shaping the character of children will result in the growth of society that is not characterized. Thus a mature concept is needed for parents and prospective parents.

Various studies have been conducted highlighting how the efforts of parents, teachers, and schools instill character education to their children [10-14], but there are no studies that examine character education from the point of view of prospective parents, both those who are not married or those who have been married but have not been given offspring. The concept of character education for prospective parents is fundamental as capital to build character education in the family. This study provides an overview of the concept of character education for prospective parents today.

Research Method

This research uses survey method. This research was conducted in August 2019. The population of this study was prospective parents in Indonesia, while the sample used was 100 prospective parents residing on the islands of Java and Sumatra because they were considered to have represented prospective parents in Indonesia . The sampling technique used is random sampling.

To answer this research question, the data needed include (a) character education responsibilities, (b) when character education begins, (c) how to instill character education in the family, and (d) what character values are considered important to be instilled in family. The data collection technique used is by distributing questionnaires. The respondents were asked to fill in the questionnaire provided using the google form. The data received is then processed and analyzed using simple statistics, which are looking for an average of each item or indicator and described in a descriptive qualitative to interpret the data obtained.

Result and Discussion

Whose responsibility the character education?:

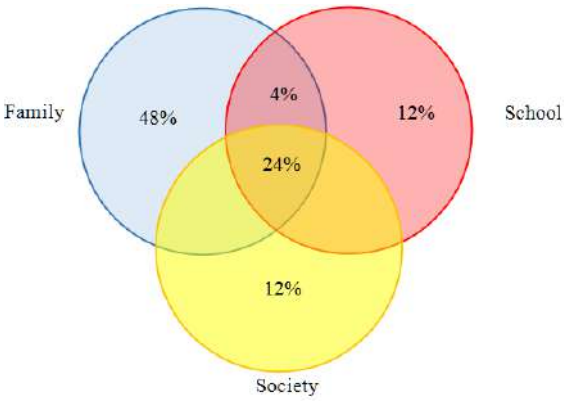

Figure 1. Diagram of the character education ersponsibility

Respondents were asked the question: "Whose responsibility of the character education?" Which was then given a choice of family, school, and/or community answers. The results showed that the majority (76%) of prospective parents consider that character education is a family responsibility, which is then followed by choice of character education answers are the responsibility of the school, family, and society (24%).

Which is interesting, some prospective parents state that character education is the responsibility of the school or community.Although the school has a central role in developing students' character, the most profound impact on students' development comes from their families[8]. Furthermore, the children's acquisition of literacy depends on a variety of strategies for working with families that are appropriate for the home environment[15].

When should the character education begin?:

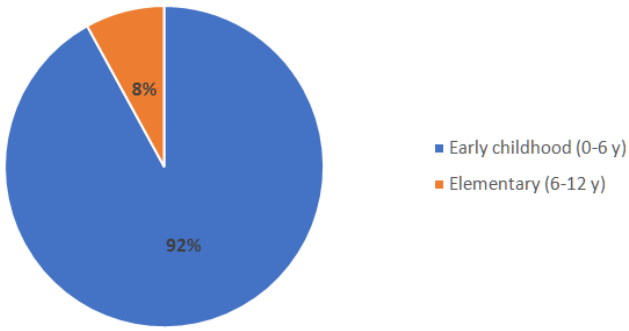

Figure 2: Diagram of the character education begin

Based on the diagram above, the results of the study showed that almost all (92%) of prospective parents stated that character education should begin at an early age, only a small proportion (8%) stated that character education should be carried out at elementary school age (6-12 years), and none of the prospective parents who stated the age of teenagers or teenagers.

These results contradict the results of a survey conducted by Primrose School, saying that nearly 50 percent of parents surveyed did not know when they could and should start helping their children develop positive character traits. Children's moral development begins in their first year of life, and brain development research shows that the first five years are a critical period to build a foundation for children's social-emotional well-being[16]. Character education indeed needs to be started as early as possible and starts from the immediate environment, namely the family. Prospective parents

in Indonesia have realized the importance of character education starting as early as possible.

How will prospective parents instill character education in children?: Although most prospective parents realize that character education is essential as early as possible, the results of the study show that most prospective parents do not yet know how to instill character education in their children later. This may be due to some prospective parents who are not married and have not thought about the concept of the family that will be built. This can also be related to the answer to the previous question which considers that character education is the responsibility of the school and/or community.

There are at least two strategies that can be done in building character education, namely: more emphasis on "stealthy" practices and more emphasis on master virtues like self-control and humility [17].Furthermore, storybooks useful and effective in terms of character education, believe that teachers should be a role model in character education, and method like drama, play, question-answer, and brainstorming are much preferred for a compelling character education[18].In addition, the provision of various learning resources that are in accordance with the conditions, styles and patterns of learning of children are needed to improve the quality of the learning process, in this case helping parents instill character in children[19]

What character values are considered essential to be instilled in the family?:

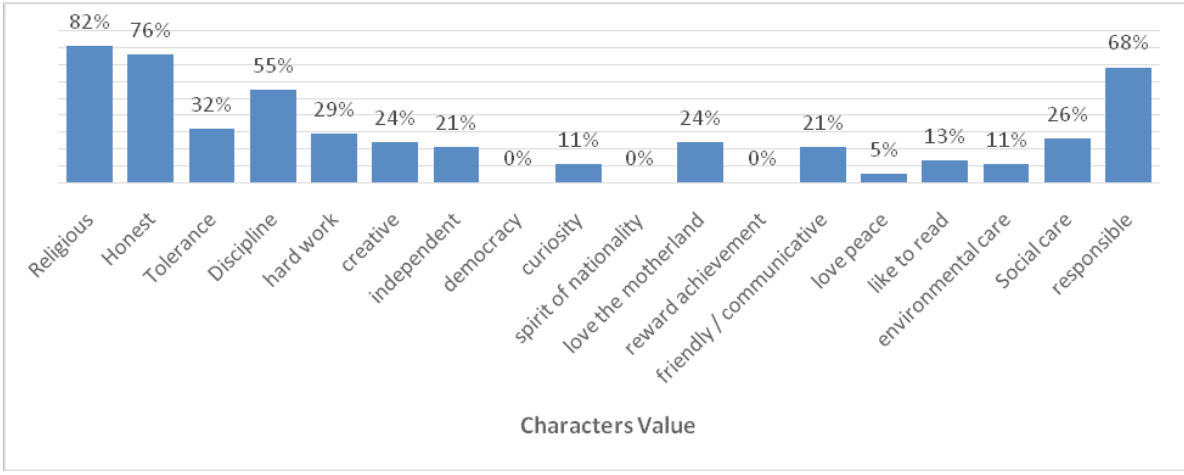

Figure 3. Characters value are considered essential to be instilled in general

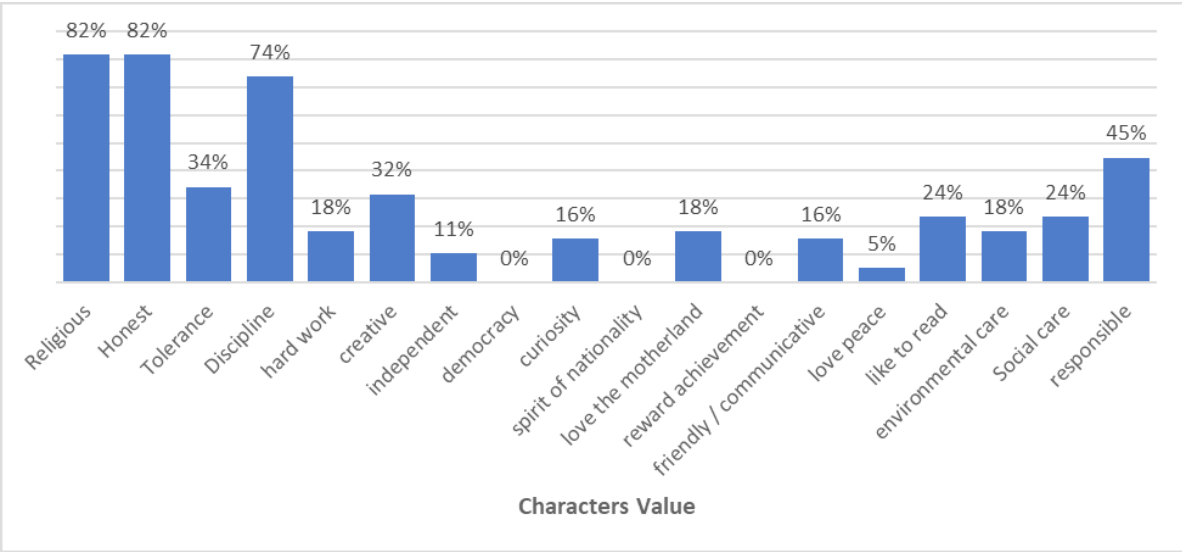

Figure 4. Characters value are considered essential to be instilled in the family

In general, the results of the study indicate that the character values that are considered necessary by prospective parents are religious, honest, responsibility, and discipline (see Figure 3). If referring to the character values that are considered essential to instill early childhood in the family are honest, religious, and disciplined (see Figure 4). Nevertheless, that does not mean that the character values other than those mentioned are not necessary, but are seen from the majority chosen. These results are in line with research conducted by Wati & Sundawa (2008) that character values that can be instilled by parents in the family are religious, honest, independent, responsible, and disciplined [20].

Conclusion

Most prospective parents state that character education is the responsibility of the family, school, and community. However, there are still a small number of prospective parents who claim character education is the responsibility of the school or community. Most prospective parents have realized that character education is essential to do from an early age, but what and how to instill character education in the family is still unclear. All of these things indicate that most prospective parents do not have a strong concept of character education. Thus, to facilitate prospective parents, an appropriate character education model is needed in the family.

Effective Communication and Collaboration Training Evaluation for Employee Performance Improvement at National Nuclear Energy Agency

Shinta TD Nawangwulan[1], Achmad Hufad[2], Jajat S. Ardiwinata[3], Iip Saripah[3], Dadang Yunus L.[3]

[1]Doctoral Student, [2]Professor, [3]Lecturer, Community Education Department, Universitas Pendidikan Indonesia, Bandung, Indonesia

Abstract

One of the efforts done by Training and Education Centre of National Nuclear Energy Agency in improving the human resource competency is through Soft Competency Development Program that is related to the main values of BATAN. This study was aimed at describing the conceptual model of effective communication and collaboration training evaluation to improve the performance of National Nuclear Energy Agency employees. This study applied qualitative and quantitave approaches with educational research and development. The data were collected through observation, interview, and documentation study. They were applied to 25 respondents who were participants, committee, and training manager. The result showed that Effective Communication and Collaboration Training Model used management approach, which were planning, implementation, and evaluation. The things done in the planning phase were identifying the needs, determining the curriculum and training material, time and place, facilitator and training participants. In the implementation phase, four levels to be developed were reaction level, learning level, behavior level, and result level. In the evaluation phase, there were some assessments based on the indicators of Effective Communication and Collaboration to measure the performance improvement.

Keywords: *Training Evaluation, Communication, Collaboration, Performance*

Introduction

Human resource is the main key of successful nation's development. Therefore, developing the nation is a lifelong comprehensive process involving the development of every aspect and dimention of human development in many ways, especially education. Education is expected to equip every aspect of life based on the valid value and applicable norm. This is in accordance with the national education fuctions and goals as in the Indonesian Law UU No. 20 tahun 2003 about National Education System:

National education serves to develop the capability and shape the nation's chacarter and civilization to be dignified in order to educate the national. Education goal is to develop the students' potential to be religious, has noble moral, be healthy, knowledgable, competent, creative, independent, democratic, and responsible.[1]

In accordance with the definition, Zainul and Nasution (2001) stated that evaluation is a process in making a decision by using some informations attained from learning outcome measurement, whether it was by test or non-test.[2,3]

Evaluation should be carried out continuously in line with the process, result, and impacts of the non-formal education by applying systematic measurement standard.

An evaluation can utilize various approaches, method, and techniques in collecting the data to be reported to the program organizer, manager, executor, and other involved parties. It will be an input in taking a decision related to the termination, expansion,

Corresponding Author:
Shinta TD Nawangwulan
Universitas Pendidikan Indonesia, Bandung, Indonesia
e-mail: nawangwulang@upi.edu

improvement, and the development of education program (Sudjana, 2012).[4]

Evaluation goal is to measure the training program effectivity. If the evaluation occurred, we can expect that the result will be positive. It will be the base for the leader in making some decisions. Hence, the program needs some reasoning and plans in order to be effective. The significant things in training program evaluation are reasons of evaluation and the presentation of the descriptions, guides, evaluation techniques, and suggetions about the evaluation and program implementation.

Conceptual model of effective communication and collaboration training evaluation is one of the evaluation model developed by researcher in order to improve the performance of BATAN employee.

Literature Review:

A. Concept of Evaluation: Evaluation according to Kumano (2001) is an assessment of the attained data. Zainul and Nasution (2001) stated that evaluation is a process in making a decision by using some informations attained from learning outcome measurement, whether it was by test or non-test. Therefore, evaluation is a systematic process to determine or to make a decision to what extent the teaching objectives have been achieved. [2, 3, 5, 6]

Meanwhile, Arikunto (2003) said that evaluation is a series of event that is intended to measure the education program success. He defined the evaluation as an assessment process of what extent the teaching objectives have been achieved.[7, 8]

B. Training Concept: Kllatt, Murdick & Schuster defined training as a systematic way of altering behavior to prepare an employee for a job or to improve the employee's performance on the present job, and development is preparing an employee for improving the conceptual, decision making, and interpersonal skills in complex, in structured situation. The other opinion about training is from Smith. He said training is a planned process to modify attitude knowledge or skill behavior through learning experience to achieve effective performance in an activity or a range of activities.[9,10]

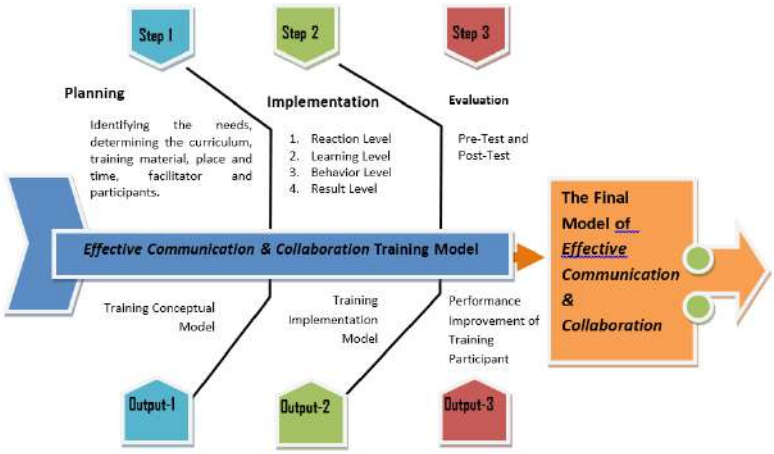
Method

The development training evaluation model was done by applying qualitative descriptive and quantitative approaches with *educational research and development* written by Borg and Gall (1983). The data were collected through observation, interview, questionnaire, and documentation. The research procedures were: 1) preliminary study. 2) Formulating the conceptual model, 3) model validation and revision, 4) limited trial (small scale), 5) Model revision, 6) model testing (field), 7) model completion/validation, 8) establishment of training model final product.[11]

In the implementation, Borg and Gall research was modified by using eight developments steps in improving the performance of BATAN employee.

Result and Discussion

Conceptual model of effective communication and collaboration training evaluation to improve employee performance of national nuclear energy agency



Source: Researcher's document (2019)

Graph 1: Conceptual Model Figure (Effective Communication & Collaboration training evaluation)

Conceptual model of effective communication and collaboration training evaluation to improve employee performance of National Nuclear Energy Agency (BATAN) was divided into three steps, which were planning, implementation, and evaluation. In association with the existing theory conception, those three steps refered to management approach as the figure explained below:

For more details, the implementation of those three steps can be explained as follows:

Planning: In the planning phase, things to be prepared were curriculum/material, theme, time (schedule), facilitator, and training participant.[12]

a. **Curriculum/Training Material:** Training were divided into two parts; main material and self-assessment material. The former consisted of: 1) *Personality Strength and Weakness*, 2) *Human Interpersonal Skill*, 3) P*erception and Communication*, 4) *Developing Productive Communication Skill, 5) Effective Team Role and Supportive Team Work*. While, the latter consisted of: 1) Personal motive analysis, 2) work motive analysis, 3) *Personality Profile DISC, 4) Belbin Team Roles.*

b. **Time:** Training was conducted on April 29th 2019 to April 30th 2019 at Pusat Pendidikan dan Pelatihan BATAN (BATAN Training and Education Centre), *Jalan Lebak Bulus Raya, Pasar Jumat*, South Jakarta.

c. **Facilitator:** Facilitator and *teaching team* of training were chosen from Animous Consulting (PT. Solusi Kinerja Prima).

d. **Training Participants:** Participants of training were the 25 employees of National Nuclear Energy Agency (BATAN) from various departments.

Implementation: Substantially, this kind of model implementation was divided into four levels. These four levels described a series of ways to evaluate the programs. Each level was important and affected the next level. As the level moved from one to another, every level became more difficult and needed more time, but that also gave some valuable information. Those four levels are:

Level 1: Reaction

Level 2: Learning

Level 3: Behavior

Level 4: Results

Reaction: In this phase, the reaction was in form of participation of BATAN employees to join the training program. There were about 25 participant taken part in this training from various departments in BATAN.

Learning: Learning was defined as educational interaction between the training participants and instructors or trainers where the participants experienced the learning process to improve their knowledge and skill as the outcome of the program.[4]

In this stage, the materials given were main material and self-assessment material. The former consisted of: 1) Personality Strength and Weakness: the participants were asked to analyse about their motive profile related to Personal Motive Analysis and Work Motive Analysis. Thus, they would understand their strengths and weakness to make an improvement and balance. 2) Human Interpersonal Skill: the participants were expected to understand about personality types of human to be able to comprehend how to give an information effectively to the listeners or interlocutors with various types of personality. 3) Perception and Communication: the participants were trained to understand someone's persception and deliver the information empathically to others. 4) Developing Productive Communication: the participants were expected to be able to improve their skill in delivering information well, understand the cause of communication failure, and overcome the different perception without causing any conflict. 5) Effective Team Role and Supportive Team Work: the participants were given some comprehension about the importance of understanding the personal and others' role in the company in order to improve the effective and condusive collaboration/cooperation. In the other side, self-assessment materials consisted of: 1) Personal Motive Analysis, 2) Work Motive Analysis, 3) Personality Profile DISC, and 4) Belbin Team Roles.

In this learning stage, Andragogy was developed because the participants were all adults. Knowless[4] explained that Andragogy was a method used for the adult learners based on their learning assumptions, experiences, learning readiness, and learning orientation. Besides, most of method used in this study were the method based on education for adult learners as follows: l*ecture, learning insight, group discussion, self test, personality profile, group profiling; and role-playing.*

Moreover, adult education (andragogy) had an important role, especially in adult learning programs

required to recognize change. Learning citizens were required to learn to recognize the changes and developments and at the same time to be able to open the opportunity to create a conception of learning based on "learning how to learn, learning how to think, learning to be, and learn revolution".[13]

This is because the adult education principles are referenced in training standards but depart from original theoretical frameworks.[14,15]

Behavior: This program had tree requirements. The first was to form the positive behavior towards the expected changes. The second was to teach the needed knowledge and skill. The third condition, the suitable scene, was related to the direct supervision to the participants. Five kinds of difference scenes were described as follows:

a. Prevension: The leader forbade the participants from doing what they considered to do related tp the training program..

b. Frightening: The leader did not say, "you cannot do it," but he made it clear that the participants should not change their behavior for it made the leader disappointed or the leader did not form the behavior as how it should be in the program.

c. Netral: The leader ignored the fact that the participants participated in a training program.

d. Supporting: The leader supported the participants to learn and apply the learning on heir work.

e. Demanding: The leader knew what the employees learned and ensured its application to their job. In many ways, learning contract had been prepared which the employee stated their agreement. This contract could be prepared in the last meeting of training and the copy was given to the leader. Leader observed that the contract had been done.[16]

The fourth condition was the appreciation. That could be intrinsic, extrinsic, or both. Intrinsic appreciation consisted of feeling satisfied and proud about the accomplishments occurred. Extrinsic appreciation was the compliment from the leader, recognition from others, and some additional bonus.

This was important for the trainer to understand these kinds of scene faced by the participant after the training. This was also significant for them to do something to know that the scene was netral or better. Conversely, there were few opportunities or there was absolutely no chance that the program would be able to complete the behavior and achieve the goal, because the participants did not try to use what they have learned. When the changes did not happen, both the participants and the leader would be disappointed.

Results

The result of the pleriminary study was defined as the final result because the participants particapted in the program. The final result can included work productivity and work improvement, quality improvement, and costs reduction. In this training, the results to be achieved were effective communication and collaboration within the company. The communication and collaboration should be able to become a culture in the workplace. The specific results to be achieved from this training were as follows:

a. Undertanding the strengths and the weaknesses through personal profile mapping related to the social motive to adapt with the work demands.

b. More understanding these aspects: perception and the nature of paradigm in interacting with other people

c. Improving communication skills in their roles and functions within the Department and between Departments in the company to facilitate the implementation of tasks.

d. Imrove the persuasion skills (to influence and to persuade) towards the others.

e. Improving the sensivity in understanding the others' *inner state* as partner in developing the effective communication and collaboration.

f. Improving the understanding and competency in i *Human Interpersonal Skills* through mastering effective communication and cooperation.

g. Understanding the role as part of organization and actualizing the role in the effective cooperation in order to build up positive and condusive collaboration.

Evaluation: Assessment phase in a training program gad a strategic position in measuring the objective achievement and it was measured with tools or instruments. Based on the evaluation results, the evaluation developed in this phase was the evaluation highlighted in e*ffective communication & collaboration.*[17,18] They

were: 1) personality strength and weakness, 2) human interpersonal skill, 3) perception and communication, 4) developing productive communication skill, 5) effective team role and supportive team work. 6) personal motive analysis, 7) work motive analysis, 8) personality profil DISC, 9) belbin team roles. Nine indicators develop in the assessment phases was elaborated into pre-test and post-test evaluation.

Based on the pre-test and post-test, the researcher obtained the data as follows: the lowest score in pre-test and post-test were 10 points and 80 points. It meant there were 70 points increase. Whilst, the highest score in pre-test and post-test were 80 points and 100 points. It showed 20 points increase. Calculating the results, the average increase in the ability of students was 27.2 points; the average of the pre-test results was 57.6; and the post-test average was 84.4 points. For more details, pre-test and post-test results can be seen in the following table:

Table 4: Pre-Test and Post-Test Results Training Effective Communication & Collaboration

Source: Researcher's document (2019).

Conclusion

Development of evaluation in this model was divided in three stages, which were planning, implementation, and evaluation. At the planning stage, there were need identification, determination of training materials, time and place of implementation, determination of resources (facilitator and training participants). At the implementation stage, there were four levels developed, namely the reaction level, learning level, behavior level, and result level. Finally, in the evaluation stage, there were assessments based on effective communication & collaboration indicators that were packaged into pre-test and post-test and showed effective results in improving the performance of training participants.

Acknowledgement: The researcher expresses her gratitude to National Nuclear Energy Agency Jakarta for the opportunity to conduct preliminary research activities on skills learning programs for training participants. Furthermore, the researcher also expresses her gratitude to Prof. Dr. H. Achmad Hufad, M.Ed., Dr. Jajat S. Ardiwinata, M.Pd., and Dr. Iip Saripah, M.Pd for the guidance in finishing this research.

Impacts of Date Palm Seeds (Phoenix Dactyliferous L.) on Common Carpcyprinus Carpio L. Biological Indices and Blood Pictures

Lecturer Nasreen Mohi Alddin Abdulrahman

College of Veterinary Medicine, University of Sulaimani, Iraq

Abstract

This study was carried out to study the effect of using date palm seeds powder as feed ingredient in fish laboratory of Animal Production Department, College of Agricultural sciences of Sulaimani University, Iraq, Using 75 common carp fingerlings weight 62±2 gm, to test the effect of three different levels of the date palm seed. The control treatment T1 with 0 gm date palm seed., (T2) with 2.5gm date palm seed, and (T3) with 5 gm date palm seed. At the end of experiment a dissection of all fish were done for study some blood parameters of tested fish showed that T1 has significant differences in Red blood cells count 2.113, hemoglobin values were high significantly in T1 and T3 with 11.575 and 11.000 respectively. Hematocrits was higher in T1 46.750 while no significant differences observed in Platelets. No significant differences were in monocytes, lymphocytes and granulocytes count among treatments. Some biological parameters studied such as Hepatosomatic index in which T2 was higher significantly 1.515, no significant ($P<0.05$) differences obtained from Spleenosomatic index, Intestine length and Condition factor, T3 was higher in Gill index and Kidney index with 3.874 and 0.576 respectively.

Keywords: *Date palm seed, Hepatosomato index, Spleen index, Intestine length index, Condition factor, Gill index, Kidney index, blood pictures, common carp*

Introduction

The proportion fish can exceed 50% of animal protein in the poorest countries, especially where other sources of animal protein are scarce or expensive[(1)]. Like other meat protein, fish protein is easily digestible and complements dietary protein (amino acids) provided by cereals and legumes consumed in many developing countries, in combination with a vegetable-based diet, fish provides a complementary effect to the essential amino acids that are present in low quantities in vegetarian diets, the beneficial effect of improved protein balance on health is obvious even when a small quantity of fish is consumed[(2)].

The results of Cerezuela et *al*., (2015) demonstrated the 35 significant alteration of the terminal carbohydrate abundance in skin mucus[(3)]. Carbohydrates more affected by experimental diets were N-acetyl-galactosamine, N-acetyl-glucosamine, galactose, mannose, glucose and fructose. IgM, peroxidase activity and protease were also significantly higher in fish fed enriched diets.

Fish fed diets contain up to 200 g kg-1 DF had similar growth Parameters in the study of [(4)]. Further increase in dietary DF to 300 g kg-1 resulted in significant retardation in all parameters. Body fat was reduced while protein, ash and moisture were increased by increasing DF level. Increasing dietary DF level caused changes in tilapia's intestinal villi, reduced dietary microbial activity and bacterial population of selected species, and produced stronger pellets.

On contrast, Yousif*et al*., 1996 [5]reported that the growth and feed efficiency of blue tilapia (*O. aureus*) fed dates -based diets were very poor. They suggested that those ingredients are not recommended as a carbohydrate source for tilapia because they are almost entirely simple sugars, whereas tilapia is known to assimilate complex sugars more efficiently than simple sugars [6].

Materials and Method

At the end of the experimental period, all fish samples were weighed individually.

The blood samples from each fish of the different groups were collected by suction of the caudal peduncle. Whole blood samples were collected in small plastic vials containing heparin for determination of hemoglobin (Hb). The hemoglobin (%) concentrations were determined by using the hematology analyzer BC-2800 is a compact, fully automatic hematology analyzer with 19 parameters for complete blood count (CBC) test.

RBC (Red Blood Cell; 10^{12}cells/l); WBC (White Blood Cell; 10^{9}cells/l); Hb (Hemoglobin; g/l); MCH (Mean Corpuscular Hemoglobin; pg); MCHC (Mean Corpuscular Hemoglobin Concentration; g/l); MCV (Mean Corpuscular Volume; fl); GRAN (Granulocyte; %); Lymph (Lymphocyte; %); Mid (Monocyte; %); PLT (Platelet; 10^{9} cells/l).

After blood samples collection, all the fish samples were scarified and soon the abdominal cavity was opened to remove, gonads and liver and other organs to be weighed at once. The gonad and liver indices were calculated as follow according to (Lagler, 1956):

Hepatosomatic index % = liver weight (g)/body weight (g) x 100

Gonadosomatic index (GSI) % = Gonads weight (g)/Body weight (g) x 100

Spleenosomatic index= Spleen weight/body weight (g) x 100

Gill index= Gill weight/body weight (g) x 100

Kidney index= kidney weight/body weight (g) x 100

Condition factor= Fish weight/Total length3

Intestine index % = Intestine weight (g)/body weight (g) x 100

Intestine length index= Intestine length weight/body weight (g) x 100

Analysis of variance was conducted using the general linear models (GLM) procedure of XLSTAT. Pro. 7.5 One way (ANOVA). Fisher's L.S.D test's was used to compare between means of the control and experiment treatments.

Finding: The results in table (1) showed that the adding of date seeds powder in common carp diets were significant differences than control, by altering the level of date seed powder, the counts of RBC was increased. The control and the third treatment with 5gm date seed/kg diet were higher significantly than the second treatments. The HCT was higher significantly in control than other treatments. No significant differences observed in MCV and platelets counts.

Table 1: Effect of adding date seeds in common carp diets on some blood parameters

N	RBC	HGB	HCT	MCV	Platelets
T1	2.113 ±0.096a	11.575 ±0.024^{a}	46.750 ±0.065^{a}	221.850 ±0.036^{a}	46.000 ±0.432^{a}
T2	1.773 ±0.064b	9.900 ±0.077^{b}	38.150 ±0.087^{b}	215.025 ±0.037^{a}	34.250 ±0.451^{a}
T3	1.855 ±0.054b	11.000 ±0.058^{a}	40.533 ±0.026^{b}	213.400 ±0.032^{a}	41.250 ±0.293^{a}

Mean values with different superscripts within a column differ significantly (P≤0.05).

No significant differences indicated in some differential WBC counts by adding date seeds in common carp diets that showed in table (2).

Table 2: Effect of adding date seeds in common carp diets on some differential WBC counts.

	WBC	Lymphocytes	Monocytes	Granulocytes
T1	103.300 ±0.028[a]	73.400 ±0.039[a]	13.225 ±0.058[a]	13.375 ±0.158[a]
T2	106.725 ±0.029[a]	74.250 ±0.016[a]	12.775 ±0.032[a]	12.975 ±0.059[a]
T3	102.525 ±0.030[a]	74.200 ±0.060[a]	12.550 ±0.077[a]	13.250 ±0.266[a]

Mean values with different superscripts within a column differ significantly (P≤0.05).

The percent results indicated a significant increase in intestine weight index in second treatment as compared with other treatments, no significant differences observed in both intestine length index and condition factor as shown in table (3).

Table 3: Effect of date seed on some biological parameters of common carp during 70 day of rearing

	Intestine index	Intestine length	Condition factor
T1	2.735 ±0.041b	30.397 ±0.222a	1.461 ±0.041a
T2	3.167 ±0.166a	31.346 ±0.096a	1.390 ±0.063a
T3	2.799 ±0.259b	30.084 ±0.152a	1.435 ±0.032a

Mean values with different superscripts within a column differ significantly (P≤0.05).

Table (4) showed significant differences in Hepatosomatic, gill and kidney index in the additives treatments than the control, no significant observed in Spleenosomatic index among the different treatments.

Table 4: Effect of adding date seeds in common carp diets on some biological parameters

	Hepatosomatic index	Spleenosomatic index	Gill index	Kidney index
T1	1.276 ±0.112 b	0.380 ±0.336 a	3.229 ±0.085 b	0.413 ±0.205 b
T2	1.658 ±0.143 a	0.358 ±0.178 a	3.570 ±0.105 ab	0.443 ±0.320 ab
T3	1.515 ±0.182 ab	0.470 ±0.361 a	3.874 ±0. 172 a	0.576 ±0.217 a

Mean values with different superscripts within a column differ significantly (P≤0.05).

It has been suggested that the increased fiber content of date pits may reduce their quality for fish and decrease fish growth. In monogastric animals, the high fiber content of date pits was reported to cause decreased weight gain[7] . However, the low fiber content of the DP-based diets in the present study (4.3-5.7%) may exclude this assumption, since tilapias have been shown to grow extremely well at up to 5% supplemental fiber.

The date pit carbohydrates may contain amylase inhibitors, or other anti-nutrients that would reduce their utilization by tilapia. For example, [8] El-Sayed *et al.* (2000) found that wheat bran contains protease inhibitor, the activity of which may negatively affect food digestibility. Therefore, proper processing of carbohydrate sources may improve their quality for tilapia. In support, El-Sayed (1991) found that cooking sugar cane bagasse slightly improved its utilization by *T. zillii,* More recently, fermented water hyacinth was better utilized than fresh water hyacinth when incorporated in Nile tilapia diets at 20% levels, while at 10% inclusion level both fermented and fresh hyacinth were utilized equally. These results suggest that proper processing of date pits may improve their quality for tilapia[9].

A number of studies have considered the effects of processing of date pits on their quality for fish and land animals. Yet, the results have not been not encouraging. Al-Darmaki (2003) found that treating date pits with sulfuric acid, or supplementing date pits-based diets with exogenous enzymes did not improve their quality for Nile tilapia[10]. Similarly, acid treatment of date pits with sulfuric acid had no significant effect on growth performance and feed

utilization of broilers[11] or rats [12]. It is evident that other treatment and processing method must be tested.

Conclusion

Hemoglobin values were high significantly in T1 and T3 with 11.575 and 11.000 respectively. Hematocrits was higher in T1 46.750 while no significant differences observed in Platelets. No significant differences were in monocytes, lymphocytes and granulocytes count among treatments. Some biological parameters studied such as Hepatosomatic index in which T2 was higher significantly 1.515, no significant ($P<0.05$) differences obtained from Spleenosomatic index, Intestine length and Condition factor, T3 was higher in Gill index and Kidney index with 3.874 and0.576 respectively.

Evaluation of Maternal and Child Health Care Services in Health Care Centers with High Maternal and Infant Mortality Rate in Wassit Governorate, Iraq

Ahmed Thani Sadoon[1], Basim Hussein Bahir[2]

[1]Master Student, Master of Community health Technology, College of Health and Medical Technology Baghdad, [2]Ph.D. Community health, Department of Community health, College of Health and Medical Technology Baghdad, Middle Technical University, Iraq

Abstract

Background: Maternal and infant mortality is considered an important indicator of socioeconomic and for society's level of development, as well as, an important indicator for assessing the level of health services provided system. This study aims at evaluation of maternal and child health program in health care centers with high maternal and infant mortality rate in Wassit governorate and to determine the availability, acceptability and utilization of maternal and child health care.

Material and Method: A cross-sectional study, were conducted at three health sectors in Wassit governorate that recorded the highest maternal and infant mortality rate for the last three years (2016, 2017 and 2018). Data were collected through the period starting (December 2018 -March 2019).

Results: The evaluation of MCH revealed that the level of the overall practice of antenatal care services in PHCs was fair 78.6%. Poor postpartum care was provided in 92.9% of health care centers. Poor health care services for children were provided in 67.9% of health care centers. Fair level, for immunization activities in 67.9% of health care centers and poor level concerning the practice of health education services in 85.7% of health care centers.

Conclusion: There is a shortage in the health care services provided for maternal and child at the MCH unit in the health care centers with high maternal and infant mortality rate, involved in the study.

Keywords: *Evaluation of MCH, Maternal and infant mortality, Health care centers services.*

Introduction

After the Alma-Ata Conference that held in 1978, the Mother and child care services have been announced as a key component of primary health care (PHC) [(1)]. In the arena of Public Health, the maternal and child health care services were declared as one of the most important components for saving and improving the health of mothers and child in developing and developed countries [(2)]. In the developing countries, the maternal and child health care services remain a greater challenge to the global and public health system [(3)]. Poor health practices and Lack of health care services during pregnancy and childbirth are the leading causes of maternal and infant morbidity and mortality. Complications after the obstetric period are responsible for most deformity and deaths for babies and mothers in developing countries. These constitute one of the most intractable and difficult health problems in the worlds [(4)]. According to WHO estimates in 2015, maternal mortality in Iraq fell by 53.3% over the past 25 years, with a mean annual decrease of 3.1%between 1990 and 2015. The Global Burden of Disease (GBD) estimates in 2015, under 5 years child mortality in Iraq fell by 33.5% over the past 25 years, with a mean annual decrease of 2.7% between 1990 and 2015. This indicates that Iraq has also made progress in reducing maternal and child mortality [(5)].

In Iraq, maternal care services face some obstacles common to the primary health care (PHC) system. These obstacles are mainly related to inappropriate health care service delivery including; inappropriate use of health services, poor infrastructure, poor referral system, poor hygiene and lack of management guidelines. In addition, other obstacles include workforce challenges, like the poor knowledge and qualification of health care providers, lack of continuing education training, and shortage in resources, including; low in quality of medical supplies, and shortage in resources. poor leadership and Poor information technology are also important obstacles to maternal care services [(6)].

Aims of Study: Evaluation of maternal and child health program in health care centers with high maternal and infant mortality rate in Wassit governorate, to identify the maternal health care (Antenatal and Postnatal) services.

Material and Method

The Wassit governorate is about 180 kilometers south of Baghdad city the capital of Iraq and has an area of 17,153 square kilometers, and accounts for four percent of the total area of Iraq 441,000 square kilometers. Census conducted by the central authorities in 2014 the total population of the Wassit governorate was 422 thousand inhabitants.

A descriptive, cross-sectional study was conducted in three primary health care sectors which include 28 PHC centers were selected according to its high maternal and infant mortality rate during the years 2016, 2017 and 2018.

Data collection technique: Data for PHC activities were collected by direct observation using a structured questionnaire that was adopted from Basic Health Services Package for Iraq from the Ministry of Health[(7)] and after reviewing previous studies with minor modifications.

Score for evaluation of maternal and child health care services: Assessment score of antenatal care for pregnant women consists of 18 questions was determined according to the quartile status (second, third and fourth) where those below second quartile (<36) as poor services, on third quartile (36-44) as fair and above third quartile (≥45) as good services. Scoring of the scale as (3) for always, (2) for sometimes and (1) for no.

Assessment score of postpartum care consists of nine questions the score assessment was determined according to the quartile status where those below second quartile (<18) as poor services, on third quartile (18-22) as fair and above third quartile (≥23) as good services. Scoring of the scale as (3) for always, (2) for sometimes and (1) for no.

Assessment score of the Care for children less than 5 years of age it consists of 15 questions and these score was determined according to the quartile status where those below second quartile (<30) as poor services, on third quartile (30-37) as fair and above third quartile (≥38) as good services. Scoring of the scale as (3) for always, (2) for sometimes and (1) for no.Assessment score of the Immunization activities consists of seven question the score was determined according to the quartile status where those below second quartile (<14) as poor activity, on third quartile (14-17) as fair and above third quartile (≥18) considered as good activity. Scoring of the scale as (3) for always, (2) for sometimes and (1) for no.Assessment score of the Health education Services consists of eight questions the score was determined according to the quartile status where those below second quartile (<16) as poor Services, on third quartile (16-19) as fair and those above third quartile (≥20) as good Services. Scoring of the scale as (3) for always, (2) for sometimes and (1) for no.

Statistical analysis: Data analysis was carried out by using the Statistical Package for Social Science (SPSS/version 25).

Findings:

Table 1: Evaluation of antenatal activities in studied PHC centers

Antenatal care activity	Always		Sometimes		No	
	No	%	No	%	No	%
Pregnancy test is done for each pregnant women (diagnosis of pregnancy)	2	7.1	19	67.9	7	25
When a pregnant woman visits the health center, does her weight and height measured	26	92.9	2	7.1	-	-

Antenatal care activity	Always		Sometimes		No	
	No	%	No	%	No	%
Is the pregnant woman vaccinated with due tetanus toxoid vaccine	28	100	-	-	-	-
Continue to give prophylactic doses of iron and folic acid tablets	5	17.9	12	42.9	11	39.3
Oral and dental examination in (first, second and third trimester) of pregnancy	11	39.3	7	25	10	35.7
Blood pressure measurement	25	89.3	1	3.6	2	7.1
Blood glucose measurement	3	10.7	8	28.6	17	60.7
Urine analysis	17	60.7	10	35.7	1	3.6
Screening for pregnant women such as hemoglobin, Blood Group	8	28.6	18	64.3	2	7.1
Treatment of hypertension in pregnant women	-	-	2	7.1	26	92.9
Health education about place of births, deliveries by skilled trainers.	-	-	2	7.1	26	92.9
Health education on personal hygiene and appropriate clothing during pregnancy	1	3.6	9	32.1	18	64.3
Educating pregnant mothers about proper nutrition and exercise	1	3.6	23	82.1	4	14.3
Schedule your next visit	28	100	-	-	-	-
Detection of risk factors for pregnant women and referral if required	26	92.9	2	7.1	-	-
Availability of high risk pregnant women poster	21	75	-	-	7	25
Monitoring of pregnancy during the expected delivery period	-	-	8	28.6	20	71.4
Documentation and recording	23	82.1	5	17.9	-	-
Overall evaluation of antenatal care/PHC centers (%)	Good (≥45)		Fair (36-44)		Poor (<36)	
	1(3.6%)		22(78.6%)		5(17.9%)	

Table 1 showed that all of PHCs were always vaccinated pregnant women with due tetanus toxoid. While 92.9% were always checking for weight and height. Measuring blood pressure was done by 92.9% of PHCs. The result of this study showed that the level of overall practice of antenatal care services of PHCs was fair (78.6%).

Table 2: Evaluation of postpartum maternal care in studied PHC centers

Postpartum care activity	Always		Sometimes		No	
	No	%	No	%	No	%
Giving ferrofol capsule	2	7.1	10	35.7	16	57.1
Diagnosis of anemia (laboratory) In addition to clinical diagnosis	4	14.3	8	28.6	16	57.1
Treatment of anemia	2	7.1	5	17.9	21	75
Explaining the best way to breastfeed	2	7.1	0	0	26	92.9
Postnatal check-up for baby	2	7.1	0	0	26	92.9
Care of the umbilical cord of the newborn	2	7.1	0	0	26	92.9
Provision of family planning services (contraception) and increasing awareness about using it.	0	0	16	57.1	12	42.9
Clinical examination of the mother after a week of childbirth and her discharge from hospital	2	7.1	1	3.6	25	89.3
Clinical examination of the mother after 30 or 40 days of childbirth to follow the period of puerperium	3	10.7	3	10.7	22	78.6
Overall evaluation of postpartum care/PHC centers (%)	Good (≥23)		Fair (18-22)		Poor (<18)	
	2(7.1%)		-		26(92.9%)	

Table 2 demonstrated the evaluation of postpartum care. The study showed that postnatal check-up for baby, and care of the umbilical cord of the newborn in the postpartum period were done by 7.1% of PHCs. The study showed that from 28 PHCs consisted in current study, 92.9% of PHCs were provided poor services of postpartum maternal care.

Table 3: Care for children less than 5 years of age

Postpartum care activity	**Always**		**Sometimes**		**No**	
	No	**%**	**No**	**%**	**No**	**%**
Monitor the growth and development of the newborn and record the data in the baby card	24	85.7	4	14.3	-	-
Child weight and height Monitoring and registration	25	89.3	3	10.7	-	-
Measuring the circumference of the head and arm circumference of the newborn	-	-	13	46.4	15	53.6
Measuring respiratory rate count for the child	-	-	1	3.6	27	96.4
Measuring temperature for the child	-	-	18	64.3	10	35.7
Baby Teeth Care	3	10.7	2	7.1	23	82.1
Checking for congenital malformations	1	3.6	15	53.6	12	42.9
Referral of severe cases of neonatal jaundice to the hospital	13	46.4	14	50	1	3.6
Monitoring of cases at risk from children	20	71.4	8	28.6	-	-
Integrated management of Childhood illnesses	7	25	17	60	4	14.3
Referral of cases of severe pneumonia to the hospital	9	32.1	18	64.3	1	3.6
Advise mothers about time to return their child immediately	-	-	2	7.1	26	92.9
Management of cases of diarrhea in children	2	7.1	21	75.0	5	17.9
Classification of dehydration	-	-	11	39.3	17	60.7
Provision of dextrolyte and zinc tablets	-	-	27	96.4	1	3.6
Overall evaluation of Care for children less than 5 years/PHC centers (%)	Good (≥38)		Fair (30-37)		Poor (<30)	
	1(3.6%)		8(28.6%)		19(67.9%)	

Table 3 shows evaluation of health care services for children ≥5 years, so 96.4% of PHCs were did not count respiratory rate for the child. Almost all PHCs 92.9%, 82.1% were did not advised the mothers for immediate return of their baby and not provided baby teeth care respectively.

Table 4: Evaluation of immunization activities in the studied PHC centers

Immunization activities	**Always**		**Sometimes**		**No**	
	No	**%**	**No**	**%**	**No**	**%**
Ensure vaccine availability	14	50	14	50	-	-
Routine vaccination sessions according to the Expanded Programme on immunization plan	27	96.4	1	3.6	-	-
Vaccination of high-risk groups (mothers and child).	5	17.9	16	57.1	7	25
Giving vitamin(A) capsules according to the routine vaccination schedule	27	96.4	1	3.6	-	-
Follow-up of defaults from the expanded programme on immunization	11	39.3	13	46.4	4	14.3
Follow-up immunization of pregnant women against tetanus	-	-	5	17.9	23	82.1
Documenting, monitoring and documenting vaccines in special registers	23	82.1	4	14.3	1	3.6
Overall evaluation of Immunization activities/PHC centers (%)	Good (≥18)		Fair (14-17)		Poor (<14)	
	8(28.6%)		19(67.9%)		1(3.6%)	

Table 4 represents the evaluation of immunization activities. This study showed that among the 28 PHCs, 67.9% of them have fair level, 28.6% of them have good level, and 3.6% of them have poor level.

Discussion

The overall design and strategies of MCH care programme in PHC centers in Wassit governorate was evaluated by this study.

Antenatal care services provided for pregnant women in current study were fair 78.6%, this result agree with another survey that was done in Al-Hilla City [8], which showed that the antenatal care provided for pregnant

women was fair 73.3%. A possible explanation might be due to a shortage in the females medical staff, absence of gynecologist's, long waiting time, poor attention to pregnant women, weak supervision, substandard facilities, shortage of necessary medications, shortage of equipment, device and supplies.

The current study demonstrated 92.9% of PHCs provided poor postpartum health care services for mothers. This result is agreed when compared with the finding of previous studies done in Ethiopia [9] and in Malawi [10], but there were disagreement with other published studies that were conducted in Jordan [11] and in India [12], which found that the provided postpartum services were 90.6% and 79% respectively.

High percentage (96.4%) of PHCs did not count respiratory rate for the child. These results disagreed with the finding of other study done in Salah al-Din [13], which showed that 80.4% of PHCs were count respiratory rate.

Advice of mothers is an important aspect for PHCs but in the current study demonstrated that 92.9% of PHCs did not advise the mothers to return their children immediately to the PHC, Which in line with the study that done in Baquba City [14].

The results of this study indicated that 67.9% of PHCs were fairly provided immunization activities, which seem to be consistent with other research that done in Karnataka, India [15], which found 66.6% of PHCs fairly provided immunization activities. This result differs from other published studies that were conducted in Al-Basrah [16] and in Baghdad City [17], which found 80.7% and 81% of PHCs respectively provided good immunization activities.

Conclusion

Affect the performance of the healthcare providers, either by motivating them to perform better than usual or by making them nervous, hence it may affect the results.

Estimation of Interferon Gamma and Zinc Concentration in Serum of Cutaneous Leishmaniasis Patients in Tikrit City

Ghaydaa Abdulwahed Awadh AL-Tikrity

College of Medicine, University of Tikrit

Abstract

Background: Interferon-gamma is one of the important cytokines, that has a role in the immune system of the body. Also zinc has optimal activity on the immune system and is involved in cell and tissue growth. The aim of this study is to evaluate IFN-γ and Zn concentration in the serum of CL patients and compare to control groups.

Patients and Method: A total of 96 persons were included in this study, during the period from January/2018 to the end of June/2018 in the outpatients of Dermatology Department of Tikrit Teaching Hospital. Forty eight patients with CL were included in this study, 43.75% were males and 56.25% were females. Assessment of zinc concentration by using spectrophotometer, so interferon gamma by ELISA.

Results: There was low serum zinc in CL patients comparing to control, since mean zinc concentration in patients was 9.6 µmol/I and in control was 11.4 µmol/l. Also this study revealed that there was decrease serum zinc in CL patients in contrast to control groups aged >15 years old, since mean zinc concentration in patients was 9.7 µmol/l while in control was 10.9 µmol/l. Mean zinc concentration in male patients and control were (10.0 and 11.6) µmol/l respectively . Mean zinc concentration in female patients (9.4) µmol/l while in female control is higher (10.8) µmol/l. mean serum interferon gamma is significant increase in serum patients ($P<0.01$) than control groups aged < 15 old. Since mean of IFN-γ was 0.8 IU/ml in patients and 0.5 IU/ml in control. Also serum IFN-γin patients and control groups (aged > 15 years old) were (1.0 and 0.6) IU/ml respectively. In addition to that it was found that there is significant increase in IFN-γ concentration ($P <0.01$) in male patients which was (1.1) IU/ml in comparison with the male control which was (0.6) IU/ml. Also the same thing is noticed in females. Mean IFN-γ in female patients and control were (0.7 l and 0.5) IU/ml Respectively.

Keywords: *Interferon Gamma; Zinc Concentration; Cutaneous Leishmaniasis; Tikrit City.*

Introduction

Leishmaniasis is a disease caused by protozoan parasites that belong to the genus Leishmania and is transmitted by the bite of certain species of sandfly, including flies in the genus Lutzomyia in the New World and Phlebotomus in the Old World. The disease was named in 1901 by the Scottish pathologist William Boog Leishman.[1] This disease is also known as Leishmaniosis, Leishmaniose, Baghdad boil, Oriental sore, Leishmaniasis tropica, Biskra button, Delhi boil, Aleppo boil, Kanadahar sore, black fever, Kala-azar fever, Sandfly disease, and Lahore sore.[1, 2]

Most forms of the disease are transmissible only from animals (zoo- nosis), but some can be spread between humans. Human infection is caused by a bout 21 of 30 species that infect mammals. These include *L. donovani* complex with three species (*L. donovani, L. infantum, and L.chagasi*); the *L. mexicana* complex with 3 main species (*L. mexicana*, *L.amazonensis*,

e-mail: drnihadkhalawe@gmail.com

and *L. venezuelensis*); *L. tropica* complex with three species (L. *tropica*, *L. aethiopica*, and *L. major); L. braziliensis* complex with three species (L. *braziliensis*, L. *guyanensis*, L. *panamensis*). The different species are morphologically indistinguishable, but they can be differentiated by isoenzyme analysis, DNA sequence analysis, or monoclonal antibodies.[1] Leishmaniasis is endemic in 88 countries throughout Africa, Asia, Europe, and North and South America.[3] There are an estimated 12 million cases world wide, with 1.5 to 2 million new cases of cutaneouse leishmaniasis (CL) and 500,000 cases of visceral leishmaniasis (VL).[4]

Leishmaniasis is spread by the bite of some types of phlebotomine sandflies. Sandflies become infected by biting an infected animal or man. Leishmaniasis also can be spread by blood transfusion or contaminated needles and rarely spread from a pregnant women to her baby.[5]

Infection with leishmania initiates complex cascades of events in macrophages that influence the ensuing immune response. One of the most important initial signaling events is the release of cytokines by the infected macrophage, leading to subsequent priming of Th_1 response and production of gamma interferon (IFN-γ), Interferon gamma has a pivotal role in the activation of macrophages to kill pathogens and protect the host cell from infection[6] The delayed type hypersensitivity reaction developed through infection by CL in which the ultimate effectors is activated macrophage[7]

Aim of the Study:To asses serum interferon gamma (IFN-γ) and zinc (Zn) in patients with cutaneous leishmaniasis (CL).

Materials and Method

This cross-sectional study was conducted in Tikrit Teaching Hospital in Tikrit city, during the period from January/2018 to the end of June/2018. About 96 persons were included in this study from both genders. Their ages were ranged from 3 months to 55 years. A total of 48 patients were included in this study. The patients were divided into two main groups according to their ages. First group was 15 years old or below, and the second group was more than 15 years old, 21 patients were males and 27 were females. Also Forty eight healthy individuals were taken as a control group .

Estimation of Serum IFN-γ Concentration: The ELISA technique was used for measurement of cytokines levels.[8] The kit that is used for screening human IFN-γ manufactured was provided from A BACKMAN COULTER COMPANY. The ELISA used with UV detector 450 nm, mode 380.

Estimation of Serum Zinc: Serum zinc was estimated by spectrophotometer using zinc kit (LTA SrI-via Milano). Serum zinc measured by using zinc kit. The concentration of zinc in the serum measured by the assessment of the colour density that are generated by the reaction of zinc in the samples with chromagen present in the reagent forming a coloured compound which colour intensity is proportional to the zinc concentration present Its colour intensity is determined by using a spectrophotometer.[9]

Statistical Analysis: All results were analyzed by using(Mean (Average); Standard Error; Standard deviation SD;and Student-test to compare between the means of two groups), any p-value >0.05 was considered significant.

Finding: The result of this study shows that cutaneous leishmaniasis constitute 54.2% in age group <15 years, which was higher than that in > 15 years old which was 45.8%. This relation was statistically not significant (p >0.01) as shown in table (1).

Table (1): The case of infection and control distribution according to age.

Characteristics	Control		Cases		Total	
	NO	Percent	NO	Percent	NO	Percent
≤15 years	23	47.9	26	54.2	49	51
> 15 years	25	52.1	22	45.8	47	49
Total	**48**	**100**	**48**	**100**	**96**	**100**

The data in table (2) revealed that in CL patients ≤ 15 years, the mean Zn concentration was 9.6 µmol/l, and in those patients > 15 years old, it was 9.7 µmol/l.

The mean of Zn concentration in male patients was 10.0 µmol/l and in male control it was 11.6 µmol/l. Mean Zn concentration in females patients was 9.4 µmol/l, in contrast to female control it was 10.8 µmol/l, as shown in table (3). This relation was statistically significant, (p value <0.01).

Table (2): Mean zinc concentration among different age groups.

Age	Case Definition	N	Mean	Std. Deviation	P value (df)
≤15 years	Control	21	11.4µmol/l	2.0	<0.05(44)*
	Cases	25	9.6 µmol/l	1.8	
> 15 years	Control	23	10.9µmol/l	2.2	<0.05(43)*
	Cases	22	9.7µmpl/l	1.3	

Table (3): Mean zinc concentration among different sex groups.

Sex	Case Definition	N	Mean	Std. Deviation	P value (df)
Male	Control	18	11.6 µmol/l	1.9	<0.05(36)*
	Cases	20	10.0 µmol/l	1.5	
Female	Control	26	10.8 µmol/l	2.2	<0.05(51)*
	Cases	27	9.4 µmpl/l	1.5	

The serum level of IFN-γ in CL patients was higher than that in the control. In the age group <15 years old, it was 0.81 lU/ml and 0.53 lU/ml respectively. This relation was statistically significant (p value < 0.05) as shown in figure (1). However, the serum level of IFN-γ in CL patients was higher than in control in the age >15 years old, it was 0.97 IU/ml and 0.58 IU/ml respectively. This relation was also statistically significant (P value <0.01) .

Table (4) shows mean concentration of IFN-γ in CL patients aged <15 years, was 0.8 IU/ml, while in those patients > 15 years old, it was 1.0 IU/ml. Mean concentration of

IFN-γ in male patients was 1.1 IU/ml, while it was 0.6 IU/ml in male control. It was observed that mean IFN-γ concentration in female patients was 0.7 IU/ml and in female control it was 0.5 IU/ml, as shown in (Table 5). This result was statistically significant (p value <0.01).

Table (4): Mean IFN-γ concentration among different age groups.

Age	Case Definition	N	Mean	Std. Deviation	P value (df)
≤15 years	Control	23	0.5 IU/ml	0.3	<0.05(47)*
	Cases	26	0.8 Iu/ml	0.6	
> 15 years	Control	25	0.6 IU/ml	0.4	<0.05(45)*
	Cases	22	1.0 IU/ml	0.6	

Table (5): Mean IFN-γ concentration according to sex.

Sex	Case Definition	N	Mean	Std. Deviation	P value (df)
Male	Control	21	0.6 IU/ml	0.4	<0.05(40)*
	Cases	21	1.1 IU/ml	0.7	
Female	Control	27	0.5 IU/ml	0.3	<0.05(52)*
	Cases	27	0.7 IU/ml	0.5	

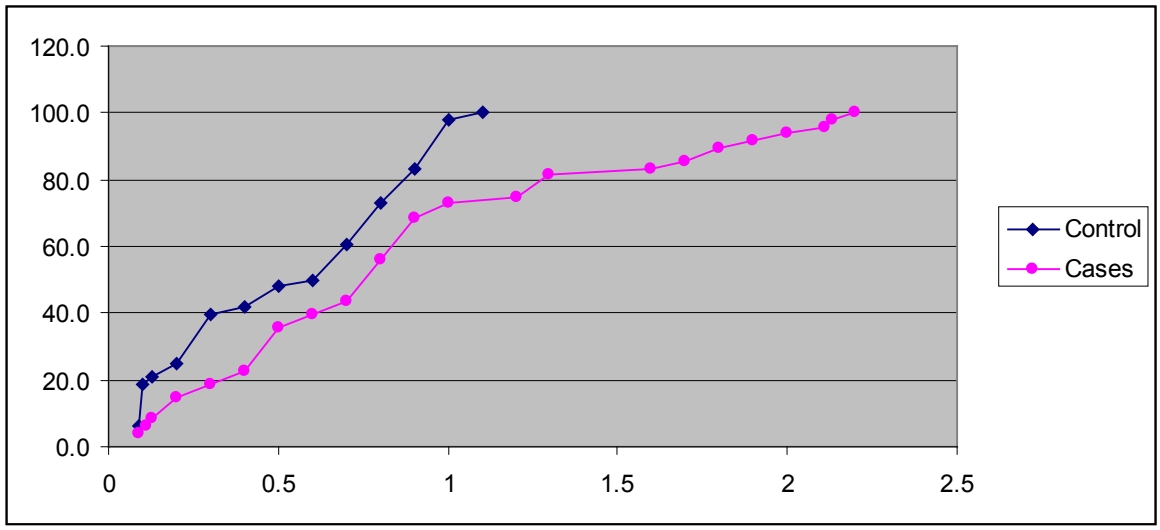

Fig (1): Distribution of IFN-γ concentration in CL patients and control groups.

Figure (1) shows distribution of IFN-γ concentration in CL patients and control groups. It revealed that in more than 20% of CL patients the IFN-γ concentration was 0.5 IU/ml, and in less than 80% of them the IFN-γ was 2 IU/ml. Also this figure shows that in more than 20% of control the IFN-γ level was 0.25 IU/ml, and in less than 80% of them the IFN-γ was 1 IU/ml.

Discussion

In this study results revealed that cutaneous leishmaniasis most commonly occurred in fifteen years and below. This result is in agreement with that found by Alrajhi AA.[10] in Turkey and Nimri et al.[11] in Jordan, because younger children have more outdoor activities like playing in the garden so they are more exposed to sandfly bites, also they discovered that older people may be more resistant to the bites of sandflies than younger children. This result is disagree with Azad thesis, [12] who found that incidence of cutaneous leishmaniasis is most commonly above 15 years, he explained that because most of them work in the farm.

Zinc is an essential trace element for all organisms. In human, body growth and development is strictly dependent on Zn. Zinc is a cofactor of more than 300 enzymes influenc sing various organ functions having a secondary effect on the immune system. Direct effects of Zn on the production, maturation and function of leucocytes. [13]

The data revealed that serum zinc concentration in all cutaneous leishmaniasis patients in different ages (< 15 years and > 15 years old) is significantly decreased ($p<0.01$). Cutaneous leishmaniasis is regarded as an infectious disease and zinc deficient peoples are more susceptible to infectious diseases. This result could be explained that CL patients might be already have Zn deficiency, therefore were infected by CL disease. Even that the decreased in Zn level in serum of CL patients might be due to defense mechanism or leishmania itself could participate in decreased of Zn level in serum through multiplication and synthesis of Zn metalloenzyme glycoproteinase (gp63), the whole surface of leishmania that consume the Zn ions from the host's cells and the cells try to substitute this consumption from the serum. [14] This is in agreement with that found by Murthy A, et al.[15] who found that Zn is required by human being pathogens for proliferation and decreasing in plasma Zn concentration during an acute phase of infection is a defense mechanism of human organisms. Regarding to Zn concentration in CL patients, the result in this study is in agreement with that found by Kocigit et al.[16,17] they found that there is decreased Zn concentrations and iron levels in serum of CL patients.

This result also agree with M. Faraydi.[18] who found that the mean concentration of zinc in serum was significantly low in CL patients, because low serum zinc play a role in exacerbation of skin infection. Also he found that low serum zinc level is correlates with the severity of the skin lesion. In addition to that patients with Zn deficiency are very susceptible to skin infections such as *Staphylococcus aures*, viral infection, parasitic infection, so that decrease serum zinc level might be

due to defence mechanism during an acute phase of infection. Most microorganisms require Zn in some amount for basic cellular processes, during the acute phase response Zn is redistributed from plasma to the liver and lymphocytes. It has been suggested that this is an adaptive response intended to deprive invading pathogens of zinc.

Serum zinc level was measured in the serum of CL patients and in the serum of control in both gender in this work. It reveals that mean serum zinc in males and females patients are slightly decrease than in control groups, so both genders are susceptible to CL. This agree with M. Faryadi, et al.[18] They explained these results due to abnormality as a result of a specific deficiency from dietary inadequacies and imbalances, and abnormality secondary to other infectious diseases. Thus, leukocyte–endogenous mediators (interleukins), released from activated phagocytic cells, induce low serum Zn by the redistribution of Zn from plasma to the liver. Decreasing serum Zn levels apparently results from the synthesis of methallothionein (MT) in liver and other tissues. Methallothionein binds 7g atoms of Zn/mol and serum to draw Zn away from free-circulating pools, this lead to low serum Zn. The thesis of Azad.[12] revealed that in males and females patients above 15 years old and < 15 years, the percent of CD_4^+ is significantly decreased than in control groups ($p<0.01$). The decrease in mean of CD_4^+ might be related to zinc deficiency and inability of CL patients to eliminate the infection.

Conclusions

Regarding to the results of this study, there were many conclusions:

1. Cutaneous leishmaniasis affects all age groups and both sexes in human.
2. All cutaneous leishmaniasis patients have low Zn level in their serum.

Ethical Clearance: No

Obesity as a Risk Factor for Disease Development: Part-I Cardiovascular Diseases and Renal Failure

Moheb Ahmed Salih[1], Amina Hamed Alobaidi[2], Abdulghani Mohamed Alsamarai[3]

[1]Department of Medicine, Tikrit University College of Medicine, Tikrit,
[2]Kirkuk University College of Veterinary Medicine, Kirkuk, [3]Tikrit University College of Medicine, Tikrit, Iraq

Abstract

Background: Obesity was a global healthcare problem with increase in incidence with time. Reported studies suggest an association between obesity and development of some diseases.

Aim: To clarify if there was an association between obesity and development of some diseases in an Iraqi population.

Materials and Method: A review of 3 studies which included 462 patients were performed and to compared to 342 subjects as control group. Body Mass Index [BMI], age and odd ratio mean values were determined in both groups. BMI calculated by dividing the weight in kilogram by height square in meter.

Results: Odd ratio indicated a significant association between obesity as determined by BMI and development of hypertension (P<0.0001), cardiovascular disease (P<0.001), and renal failure (P<0.001).

Conclusion: Obesity may be a risk factor for the development of cardiovascular diseases and renal failure.

Keywords: *Obesity, BMI, hypertension, cardiovascular disease, renal failure.*

Introduction

Obesity was a global healthcare problem with increase in incidence with time **(1).** A condition that was associated with metabolic, immunologic and inflammatory changes and responses that contribute to development of multiple organ diseases **(2).** Adipose tissue is not a storage site for energy, but it acts as endocrine and metabolic organ and secreted adipokines **(3,4)** The adipose tissue physiological complexity may interfere with functions and body processes through different mechanisms that included inflammatory, metabolic and immunologic changes **(5-7)** Obesity was an epidemic global health conditions with a rate of 1.9% in India to 33% in USA, which may lead to development of a chronic diseases (8). Previously reported reviews **(8-11)** suggest an association between obesity and disease development. To reveal the association between obesity and cardiovascular diseases and renal failure in Iraqi community this study was conducted.

Materials and Method

The data gathered by a review of 3 studies that included 362 patients (age range 16-86 years) and 342 control subjects (age range 14-68 years). Mean of age and BMI were calculated for each disease. The number of subjects in each group are shown in Table 1. BMI was calculated by dividing the patient weight in kg by the square of the height in meter. The study protocol was approved by Tikrit University College of Medicine Ethical Committee.

Statistical Analysis: The data were presented as mean ± standard deviation. The significance between two means were determined using student t test. The odd ratio and significance levels were determined using SPSS package [version 20].

Finding: The age mean was significantly higher in patients with cardiovascular disease (P<0001), hypertension (P< 0001) and renal failure (P<0.008)

as compared to controls. Additionally, BMI was significantly higher in patients with cardiovascular disease (P<0.0001), hypertension (P<0.0001) and renal failure (P<0.0001) as compared to controls, Table 1. As shown in Table 2, odd ratio indicated that there was a significant association between obesity and hypertension (OR=89.25; P<0.0001), renal failure (OR=4.56; P<0.001), and cardiovascular diseases (OR=3.16; P =0.001).

Table 1. BMI and age mean values in disease groups compared to controls

Disease	Group	Number	Mean [SD]	
			BMI	Age
Cardiovascular disease	Patient	172	27.70 [1.60]	52.30 [5.20]
	Control	102	24.56 [3.07]	37.02 [11.77]
	P value		<0.0001	<0.0001
Hypertension	Patient	120	36.41 [3.62]	18.60 [1.17]
	Control	140	27.32 [4.87]	17.72 [1.18]
	P value		<0.0001	<0.0001
Renal failure	Patient	170	28.77 [4.08]	49.33 [13.45]
	Control	100	23.83 [2.81]	45.04 [11.34]
	P value		<0.0001	0.008

Table 2. Odd ratio of BMI with disease development

Disease	Odd Ratio	OR 95% CI	Z value	P value
Cardiovascular	3.16	1.59-6.25	3.29	0.001
Hypertension	89.25	12.12-657.15	4.41	<0.0001
Rena failure	4.56	2.67-7.78	5.57	<0.001

Discussion

Obesity is a condition that with increased prevalence in developed and developing countries and contribute to many abnormalities that interfere with life style and disease development [9]. The present study shows a significant association between obesity and hypertension. Hall *et al.,* [10] in a review suggest the evidence that overweight was the major aetiology of hypertension and form the rate of 65% to 75% as a risk factor for essential hypertension. Kumar *et al.,* [11], in a rural community-based study, India, which included 500 subjects, found an association between obesity and hypertension. Jiang *et al.,* [12] in a review concluded that obesity is a major risk for hypertension. Sari *et al.,* [13] from Turkey reported that in intellectual disabilities adults and adolescent were with high rate of hypertension and obesity. Aronow et al., [14] reviewed 12 studies that included a large number study population suggest an association between hypertension and BMI. Price et al., [15], in a population based study in sub-saharan Africa which included 28 891 subjects found that hypertension, obesity and diabetes were common in rural and urban Malawi. Babu *et al*.,[16], in a meta-analysis systematic review that included 18 studies, reported a pooled odd ratio of 3.82 between hypertension and obesity. The induction of hypertension as a consequence of obesity may be attributed to different mechanisms that include, sodium retension, insulin resistance, kidney physical compression, rennin-angiotensin-aldosterone system activation, sympathetic nervous system increased activity, activation of mineralcorticoid receptor, brain melanocortin activation, atherosclerosis, inflammation, aletred vascular function and oxidant-antioxidant ratio disruption [10,12,17]. Epidemiological studies suggest an association between obesity and hypertension and diabetes in developing and developed countries [18]. The present study shows a significant association between obesity and cardiovascular diseases and this was in consistent with recent reviews suggestion [19-22] . Riaz *et al.,* [23] in a meta-analysis review of 4660 articles suggested that coronary artery disease and diabetes were associated with obesity, however, mendelian

randomization not prove causality, but supportive of a causal association.

Current study shows a significant positive association between obesity and renal failure. Evangelista *et al.,* [24] found an association between obesity and chronic kidney disease and loss of weight approach is effective intervention for the prevention of disease in moderate chronic kidney disease but not the severe. In literature many population-based studies reported a significant association between the progression and development of chronic kidney disease [25-37]. Although, previous studies documented the effect of obesity on chronic kidney disease, there was lower mortality in obese with end stage and advanced chronic kidney disease [29, 38-41]. Chang et al., [42], in Taiwan study which included 7357 subjects with CKD and age of 20 to 85 years, reported none significant association between chronic kidney disease progression and BMI. Some studies suggested that waist-to-height ratio was associated with progresioin of CKD and mortality rate increase in CKD rather than BMI [43-46]. Other study reported that waist circumference in women and waist-to- height ratio in men were more associated with chronic kidney disease than BMI [47]. Lu *et al.,* [37], in USA study that included 3 376 187 subjects found that BMI ≥30 was associated with rapid loss of renal function. Kim *et al.,* [48], in Korean study that included 19,331 subjects as national population reported an association between increased albumin to creatinine ratio as chronic kidney disease risk factor and obesity. Cao *et al.*, [49], in a study that included 6852 Chinese subjects found that obesity and overweight were a risk factors for a chronic kidney disease without co-existence of metabolic syndrome. Additionally, Chang *et al.,* [50], in a study that included 62 249 metabolically healthy subjects suggest that obesity and overweight are associated with increase in chronic kidney disease. Atanassova et al., [51], reported that the increase of BMI was associated with reduction in glomerular filtration rate in chronic kidney disease. Obesity lead to metabolic, structural and hemodynamic alterations in the kidney [52]. Additionally, obesity contributed to metabolic abnormalities that affect the kidney, however, the mechanisms by which chronic kidney disease induced and/or worsened is unclear [53]. Adipose tissue production of resistin, adiponection and leptin [54-56] may cause effects on kidney through increased insulin resistance, increased insulin production, rennin-angiotensin-aldosterone system activation, oxidative stress, lipid metabolism abnormality and inflammation[57-62]. Although, there was an obesity paradox in kidney disease as previous studies indicated, data consistency suggest a high biologic reasonability.[41]

Conclusion

1. The present study shows a significant association between obesity and hypertension.
2. Our results have indicated a significant association between obesity and cardiovascular diseases.
3. BMI as indicator of obesity shows a significant association with chronic renal failure.

Role of Interleukin-28B in Clearance of HCV in Hemodialysis Patients in Kirkuk City

Nuha M. Wahid[1], Israa H. Saadoon[2]

[1]Medical Laboratory, Kirkuk Health Directorate, [2]Department of Microbiology, College of Medicine, Tikrit University, Tikrit, Iraq

Abstract

Patients undergoing hemodialysis are at increased risk of infection with blood-borne viruses, especially viral hepatitis. The present study investigated these issues and the possibility of nosocomial transmission among patients undergoing hemodialysis. A cross sectional study was carried out on 200 patients with end stage renal disease (ESRD) undergoing hemodialysis (HD) and 50 blood donorsas control who admitted to blood bank in Kirkuk province from 1st of August 2018 to 1st of February 2019.

Results: The study showed that the highest rate of HCV Ab (14%) was recorded in HD patients whereas no one of control group was infected with HCV, the result was highly significant. The highest rate of HCV infection (18.75%) was found in patients with dialysis for more than 3 years.The highest mean level of IL-28 B was recorded in HD patients with HCV infection comparing with patients without HCV infection (0.097 *vs.* 0.092 pg/ml).There was highly significant relation between HCV infection and mean level of alanine aminotransferase (ALT) and aspartate aminotransferase (AST) in HD patients comparing with patients without HCV infection.

Keywords: *HCV, IL-28B, HD, HCC.*

Introduction

Patients on maintenance hemodialysis (HD) have a high risk of blood-borne viral infections. A small percentage of common viral infections are caused by hepatotrophic or other hepatitis associated viruses such as hepatitis B virus (HBV) and hepatitis C virus (HCV) [(1)].Hepatitis is acute when it lasts less than six months and chronic when it persists longer. Acute hepatitis can be self-limiting (healing on its own), rarely, can cause acute liver failure or can progress to chronic hepatitis [(2)]. The HD machine used might play a role in HCV dissemination because of accidental contamination of the membrane on the device and inadequate subsequent disinfection[(3)]. In study showed the high nucleotide similarity of HCV isolated from patients involved in the outbreak strongly indicates that the patient with previously known chronic HCV infection, who was on HD maintenance in the same room and during the same shifts[(4)].Hepatitis C virus infection is a major cause of viral hepatitis with a global seroprevalence estimated to be greater than 185 million[(5)].Extended periods of HCV infection "persistent HCV infection" may lead to cirrhosis and even hepatocellular carcinoma (HCC). Up to date, the treatment of chronic HCV infection included 6 months to 1.5-year, course of interferon-alpha in accompanied with ribavirin[(6)].

These treatments eradicate HCV infection in only 40%–50% of patients infected with genotypes 1 or 4 and 75%– 90% of those infected with genotypes 2 or 3[(7,8)]. However, adverse effects due to this treatment regimen frequently lead to poor tolerance. Among patients with chronicHCV infection, interferon (IFN)α can clear the HCV virion based on treatment in some patients. The gene for interleukin-28B (IL-28B) is found along with IL28-A and IL-29 in a cytokine cluster at 19q13.13 and codes for IFNλ3. This gene is associated with the spontaneous clearance of HCV infection and with the response to standard therapy with IFN-α and ribavirin treatment in individuals with chronic HCV infection[(9)]. Interleukin-28B locus on a human chromosomal region

mapped to 19q13 execute immune defense against viruses. During HCV infection the IL-28B has a promising role in deciding the consequence of infection for spontaneous clearance of viruses or causing chronic liver infection. Treatment of chronic hepatitis C includes use of direct acting antivirals,

Pegylated-Interferon (PEG-IFN) and Ribavirin (RBV) therapy. Numerous reports have revealed the association between certain IL-28B polymorphisms and response to the PEGIFN- RBV therapy in patients infected with HCV[10].However,recently the IL-28B genotypes were also related to hepatic fibrosisprogression in untreated patients, using the liver biopsy,that aimed to assess the role of different IL-28Bgenotypes in the liver stiffness progression in a cohort of untreated subjects affected by chronic hepatitis C[11].The present studyaimed to find the role of IL-28B in HCV infection with related clinical effect.

Method and Materials

The current study included 200 patients with end stage renal disease (ESRD) undergoing HD and 50 blood donors as a control group who were apparently healthy who admitted to blood bank in Kirkuk province in northern Iraq from 1st of August 2018 to 1st of February 2019. Blood samples were withdrawn with a vacutainer set to exclude air contamination. Serum samples were stored at -20°Cuntil processing.

Detection of HCV antibodies: Fortress diagnostics HCV kit (United Kingdom) is an enzyme-linked immunosorbent assay for qualitative detection of antibodies to hepatitis C virus in human serum or plasma. It is intended for screening blood donors and diagnosing patients related to infection with hepatitis C virus.

Detection of human IL-28B: According to manufacturer instruction, IL-28B ELISA-KOMABIOTECH, (Korea), Catalog No. K0332172, is an *in vitro* diagnostic kit for quantitative measurement of the protein from samples including serum, plasma, culture medium or other biological fluids. Human IL-28B ELISA Kit, is an enzyme immunoassay based on the sandwich principle.

Biochemical tests: Liver function tests including aspartate aminotransferase (AST), alanine aminotransferase (ALT) were performed on autoanalyzer Roche-Reflotron.

Statistical analysis: Computerized statistically analysis was performed using SPSS (Statistical Package for Science Services). Comparison carried out using; Chi-square (X^2) and probability (P value).

Finding: The present study showed that the highest rate of HCV infection(14%) was recorded in HD patients whereas no one of control group was infected with HCV. The result was highly significant..Table 1.

Table 1: Detection of HCV infection in patients with hemodialysis

Anti-HCV Ab (ELISA)	HD Patients		Control Group		P. value
	No.	%	No.	%	
Positive	28	14	0	0	0.0049
Negative	172	86	50	100	
Total	200	100	50	100	

Figure 1 In the present study, HCV infection was found in a higher rate in males (65%) than that in females (35%).

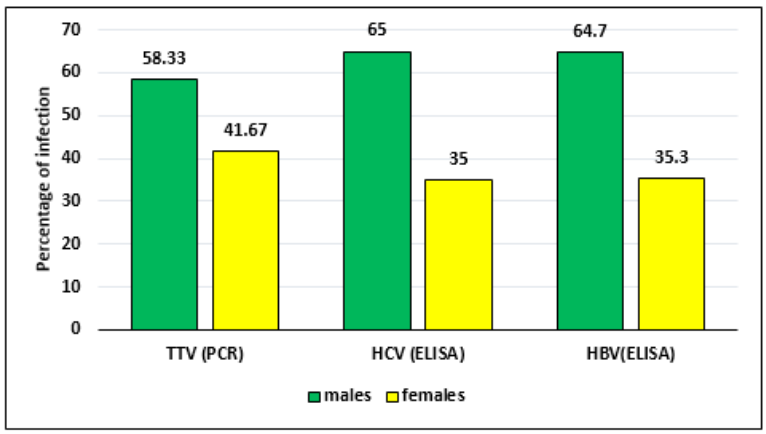

Figure 1: Distribution of HCV infection according to sex.

The present study revealed that the highest rate of HCV infection (22.22%) was found in HD patients within the age group 15-24 year followed by those within the age group 65-75 year(21.42%) and the mean age of HD patients with HCV was 49.89 year.. Table 2.

Table 2: Relation of HCV infection with age of patients under hemodialysis.

Age Groups (Years)	Total No. (200)	HCV Ab (ELISA) (n:28)	
		No.	%
15-24	18	4	22.22
25-34	20	3	15
35-44	28	5	17.86
45-54	48	4	8.33
55-64	44	3	6.81
65-75	42	9	21.42
P. value		0.26	
Mean age (years)		49.89	

The present study demonstrated that the highest mean level of IL-28 B was recorded in HD patients with HCV infection comparing with patients without HCV infection (0.097 *vs.* 0.092 pg/ml) and the lowest level was found in the control (0.055 pg/ml). The results were non-significant.. Table 3.

Table 3: Level of IL-28 B in HD patients with and without HCV infection and the control group

Level of IL-28 B (pg/ml)	HD patients		Control group	P. value (ANOVA)
	HCV +ve	HCV -ve		
No.	28	172	50	0.93
Mean±SD.	0.097±0.082	0.092±0.073	0.055±0.012	
P. value (HCV +vevs. HCV -ve): 0.94				

The study showed that the highest rate of HCV infection (18.75%) was found in patients with dialysis for more than 3 years and rate of HCV infection was increased with increasing of dialysis duration. The result was non-significant.. Table 4.

Table 4: Relation of HCV infection with duration of hemodialysis.

Duration of hemodialysis (Year)	Total No. (200)	HCV Ab ELISA				P. value
		Positive (n:28)		Negative (n:188)		
		No.	%	No.	%	
≤ 1	52	2	3.85	50	96.15	0.061
2-3	116	20	17.24	96	82.76	
>3	32	6	18.75	26	81.25	

The current study revealed that there was highly significant relation between HCV infection and Mean±SD level of ALT and AST in HD patients with HCV comparing with patients without HCV infection and the control group.. Table 5.

Table 5: Level of ALT and AST in HD patients with and without HCV infection and the control group

Parameters		HD patients		Control group (n:50)	P. value	
		HCV +ve (n:28)	HCV –ve (n:172)		(ANOVA)	HCV +vevs. HCV –ve
ALT* (IU/ml)	Mean±SD.	27.63±22.4	11.60±4.13	10.17±2.89	0.0001	0.0001
AST** (IU/ml)	Mean±SD.	27.31±15.7	11.7±7.51	10.41±2.42	0.0001	0.001

* ALT: Alanine aminotransferase.** AST: Aspartate aminotransferase. ***Normal Range ALT& AST (<20 IU/ml).

Discussions

Viral hepatitis is a clear threat in our country, especially viral hepatitis C that is considered low intensity in Iraq [12].Hepatitis C virus infection remains a burden and a risk of chronic hemodialysis population and significantly increases the risk of death. Diagnosisof HCV infections in acute phase are pivotal for providing prompt antiviral treatment to minimize the impact of the infection. Early detection of HCV infection is also pivotal for the prevention of further spread of infection in vulnerable hemodialysis patients who experience multiple invasive procedures [13]. The present study showed that the highest rate of HCV infection (14%) was recorded in HD patients whereas no one of control group was infected with HCV (P<0.01). Our findings were in agreement with Martins *et al*[14]who reported that the prevalence of HCV infection in hemodialysis patients was almost eight times greater than that observed in blood donors from the same region. On the other hand, Ibrahim *et al*[3] reported that the prevalence of HCV in HD patients was 59% compared with (14%) in control group.

The present study revealed that the highest rate of HCV infection (22.22%) was found in patients within the age group 15-24 year. An overall prevalence of 25.3% of HCV infection was reported among hemodialysis patients in the Middle-East region. This might be due to higher rate of renal diseases in older ages [15]. In the present study, HCV infection was found in a higher rate in males (65%) than that in females (35%), this result is in agreement with Ibrahim *et al* [12] who reported that men who were on maintenances dialysis units were more likely to have HCV infection (58% men) than women. The reasons for the predominance infection in men may be due to the fact that men are at greater social risk in our societies [16].

The present study showed that the highest rate of HCV infection (18.75%) was found in patients with dialysis for more than 3 years. Patel *et al* [17] found that HCV was present in patients with hemodialysis for more than 6 months and not detected in patients with hemodialysis every 20th day.Jadoul*et al* [18] reported that longer dialysis duration was correlated positively with hepatitis B and C infection.In individuals who present with spontaneous viral clearance, the immune response is mediated by pro-inflammatory components of type 1 immunity, the type III interferon class in particular, which includes IL-29, IL-28A, and IL-28B. These cytokines exhibit significant antiviral, antiproliferative, and anti-tumor activity and are expressed by mononuclear cells, monocyte derivatives, and dendritic cells when viral infection occurs [10]. The present study demonstrated that the highest mean level of IL-28 B was recorded in HD patients with HCV infection comparing with patients without HCV infection (0.097 *vs.* 0.092 pg/ml). The present study is in agreement with the results of Abe *et al*[19] who establish that the serum IL-28B levels were declined in HCV-infected patients. Other study reported that levels of IL-28B together with the combination therapy would enable clearance of the virus and the expression levels of IL-28B in liver are lesser in PEG-IFN-treated patients having rs8099917 TT genotype.

The current study revealed that the highest mean level of ALT and AST were recorded in HD patients with HCV infection, the result was highly significant. Previous study found that most of patients with HCV had ALT and AST with in normal range, indicating that liver enzyme incases of viral hepatitis on hemodialysis who had low or normal values were not good indicator or not sensitive markers for ongoing HCV and HBV replication[20,21,22].Duong *et al* [13] reported of all 201 patients undergoing hemodialysis, levels for AST and ALT were within normal range and were not different between patients with and without HCV.

Conclusion

The current study revealed an important role of IL-28B in HCV infection, which was supported by many independent studies. Interleukin-28B genotyping may be use as predictors of response for IFN-based therapy and personalized treatment of hepatitis C patients.

Abstract

The current study was carried out in Baghdad-Iraq from March to November 2018 and included 110 participant (50 patients with diabetic retinopathy, 35 without diabetic retinopathy and 25 healthy control). Diabetic patients who attended who attended specialized center for Endocrinology and diabetes in Baghdad city, all diabetic retinopathy were diagnosis by specialist ophthalmologist, control group was from blood donors who haven't any chronic disorders. Patient other ocular, patients with previous vitrectomy, other ocular surgery were excluded from the study. Blood sample were collected from each participant in the study for determination of HbA1c, Interleukin-12 and IFN- γ levels. The study demonstrated that 29 (58%) of patients with diabetes retinopathy were males compared with 21(42%) were females, 15(42.86%) of diabetes patients without retinopathy were males compared with 10(57.14%) were females, so mean age of diabetes retinopathy patients was 55.5±1.1 year while 42.8±2.1 year in diabetes without retinopathy (P<0.01). The study found that of 28 (56%) of patients with diabetes retinopathy were suffered from type I diabetes compared with 22(44%) were with type II diabetes, and found that 6 (24%) of diabetes patients without retinopathy were with type I diabetes compared with 19 (76%) were with type II diabetes (P<0.01). The Group 1 shower highest mean of duration of diabetes (15±4.2 year) compared with Group 2 (9.1±5.2 year) (P<0.01). The study also demonstrated that mean of HbA1c was significantly (p<0.00 elevated in Group 1 followed by Group 2 and the lowest mean was in the control group (Group 3). The study found that interleukin-12 level was significantly elevated (P<0.01) in patients with diabetes retinopathy (44.03±15.12 pg/ml) followed by diabetics without retinopathy (40.01±22.3 pg/ml) and the lowest mean was in the control group (23.05±2.1 pg/ml). The highest mean of IFN-γ was in diabetic retinopathy (39.21±2.3pg/ml) followed by diabetics without retinopathy (23.22±2.99 pg/ml) and the lowest mean was in the control group (8.92±1.8 pg/ml) (P<0.01).

Introduction

The term; diabetes mellitus (DM) is the most cause of mortality and first public problem of human disorders in the world [(1,2)]. Daily activities, obesity and elderly are the predominate risk factors of this disorder. Thus, the increase in DM numbers globally, may reach two thousands or more[(3)]. Additionally, diabetes mellitus have several consequences and complications like Diabetic retinopathy (DR), a visual defect accompanied with blindness which occur mainly active age in developed countries[(4)]. The rate of DR occurrence in the world is related to duration of diabetes in certain patients, i.e: the DR rate is low in first age of DM, but when DM extended to several decades may lead to retinopathy[(5)]. Individuals with new diagnosis with

type 2 diabetes (T2D) may affected directly with DR or may stay years to be with DR, eventually nearly 60% of T2D patients will suffered from DR in their elderly[1]. Thus, the pivotal efforts to diagnose and management of DR is one of public strategies toward these problems in the world. Moreover, DR is developed defect of microaneurysms accompanied with small hemorrhages which may lead to some complications like "retinal ischemia", "permeability", and "neovascularization"[7]. Ischemic progressions lead to damage of neurons which have the vital role in developing of ischemia in retinopathy because of its important role blockage of blood capillaries and impermeability of retina. Inflammation of the area of retina are occur after little time of ischemia, especially in the glial tissues of retina [8]. In opportunity, the inflammations provoke these tissue cells :glia cells" to produce abundant types factors characterized with cytotoxicity, and these immune factors mainly the first cause of destruction of blood-barrier and releasing of further glial cells and leucocyte [9]. These cellular compartments and immune factors are the principal cause of inflammatory features of DR due to induction of ischemia injury of retina [10,11].

Neovascularization is principal feature of DR pathogenesis which occur after inflammatory reaction. One of causes of vascular permeability is the vascular endothelial growth factor (VEGF) which is assumed as the regulator key of DR [12,13,14]. Recently, some facts accompanied with VEGF explain the progression of retinopathy. These factors which produced- as mentioned above- by cells (gangelial cells) which found inside the tissue retina of diabetic animal, examples of that factors (pro-inflammatory cytokines, interleukin (IL)-12 and interferon (IFN)- γ[15]. Hence, these cytokines are essential in consequence of DR occurrence and development and paly a central role in pathogenicity in several DM associated diseases[1]. In regarding the diabetic retinopathy (DR) and other related diabetic complications, the elevated levels of these inflammatory cytokines are some of important aims for clarification nowadays [1,10]. Some speculation is the significant role of reduction in of tyrosine phosphorylation lipoprotein as well the elevation of Interleukin-4, IL-10 and IL-12 in the development and advancement of retinopathy in diabetes mellitus patients, which are detected by several way including enzyme immune assays[12]. The identification of such factors may contribute to clarify the exact process of inflammation processes in development of DR in DM patients [16]. However, till now, extra efforts was paid to view full role of other inflammatory factors in DR [17]. So, the study intended to determine interleukin-12 and IFN- γ levels in patients with diabetic retinopathy.

Patients and Method

This cross-sectional study was conducted in Baghdad city-Iraq from March to November 2018 and included 110 participant distributes as in Table 1, 50 patients with diabetic retinopathy, 35 without diabetic retinopathy and 25 healthy control. Diabetic patients who attended specialized center for Endocrinology and diabetes in Baghdad city, all diabetic retinopathy were diagnosis by specialist ophthalmologist control group was from blood donors who haven't any chronic disorders. Patient other ocular, patients with previous vitrectomy, other ocular surgery were excluded from the study. Blood sample were collected from each participant in the study for determination of HbA1c (Immunofluorscence, iChroma, Korea) and Interleukin-12 and IFN- γ by ELISA (Koma-Bioteck USA).

Statistical Measurements: The program (SPSS, ver 23.1) was used in this study for determination of P. value ($p<0.01$ highly significant, ≤ 0.5: significant and >0.05: non-significant (NS)).

Finding: The current study included 110 participant, distributes as in Table 1, 50 patients with diabetic retinopathy, 35 without diabetic retinopathy and 25 healthy control.

Table 1: Distribution of patients of the studied group

Studied Groups		No.	%
G1	Diabetic retinopathy	50	45.45
G2	Diabetic without retinopathy	35	31.82
G3	Control group	25	22.73
Total		**110**	**100**

$P < 0.05$

The study demonstrated that 29 (58%) of patients with diabetes retinopathy were males compared with 21(42%) were females, 15(42.86%) of diabetes patients without retinopathy were males compared with 10(57.14%) were females,mean age of patients with diabetes retinopathy was 55.5±1.1 year while 42.8±2.1 year in diabetes without retinopathy ($P<0.01$) (Table-2).

Table 2: Distrbution of studied groups according to sex and mean age

Parameter		G1 (n:50)	G2 (n:35)	G3 (n:25)	P. value
Gender	Males n (%)	29 (58%)	15 (42.86%)	15 (60%)	NS
	Females n (%)	21(42%)	20 (57.14%)	10 (40%)	
Age (mean±SD) (yrs)		55.5±1.1	42.8±2.1	30.5±1.3	<0.01

The study found that of 28 (56%) of patients with diabetes retinopathy were suffered from type I diabetes compared with 22(44%) were with type II diabetes, and found that 6 (24%) of diabetes patients without retinopathy were with type I diabetes compared with 19 (76%) were with type II diabetes (P<0.01). The Group 1 shower highest mean of duration of diabetes (15±4.2 year) compared with Group 2 (9.1±5.2 year) (P<0.01). The study also demonstrated that mean of HbA1c was significantly (p<0.00 elevated in Group 1 followed by Group 2 and the lowest mean was in the control group (Group 3) Table 3.

Table 3: Relation of diabetes types, diabetes duration and HbA1c levels with diabetic retinopathy.

Studied Groups	Type of Diabetes		Duration of Diabetes (Yrs)	HbA1c (Mean±SD)
	Type I n(%)	Type II n(%)		
Group 1	28 (56%)	22 (44%)	15±4.2	8.1±1.2
Group 2	6 (24%)	19 (76%)	9.1±5.2	7.2±0.9
Group3	0	0	0	4.1±0.3
P. value	<0.01		<0.01	<0.01

The study found that interleukin-12 level was elevated in significant level (P<0.01) in patients with diabetes retinopathy (44.03±15.12 pg/ml) followed by diabetics without retinopathy (40.01±22.3 pg/ml) and the lowest mean was in the control group (23.05±2.1 pg/ml) (Table 4). Additionally, The maximum mean of IFN-γ was in diabetic retinopathy (39.21±2.3pg/ml) followed by diabetics without retinopathy (23.22±2.99 pg/ml) and the lowest mean was in the control group (8.92±1.8 pg/ml) (P<0.01).

Table 4: Level of Interleukin-12 and IFN-γ in sera of study groups

Studied Groups	Interleukin-12 (pg/ml) (Mean±SD)	IFN-γ (pg/ml) (Mean±SD)
Group 1	44.03±15.12	39.21±2.3
Group 2	40.01±22.3	23.22±2.99
Group3	23.05±2.1	8.92±1.8
P. value	<0.01	<0.01

Discussion

In comparison with our findings with other studies, it is found in a study Nis-France; Out of 600 patients with diabetes, 52.33 % were males and 47.67% were females, mean age 61.2 years [9]. In comparison, in study done in Turkey; the mean age of DM was 57.1 year and Two thirds of patients had type II diabetes [10]. In one study done previously on patients with diabetes, it showed that, 50 years was the mean age of DM onset and T2D formed 33% of these patients [11].

Expression of INF-γ was increased in significant level in DR patients with no change was occurred on IL-6 levels in patients with DR group and the elevation in INF-γ was found in patients with proliferative DR[13,14]. Likewise, in experimental models, an increase in INF-γ expression was observed actually when using of streptozotocin injections in retina of lab mice to induce diabetes[15,16]. During the development of DR, pro-inflammatory INF-γ is well known to increase the endothelial permeability after induction of vascular dysfunction and activation of caspase-3[15]. Interestingly, other studies done earlier, demonstrated that, the different links occurred between IL-12 and to the progression of T2D, like metabolic reparation, ß-cell dysregulation and insulin resistance and suggested a positive association with retinopathy [18,19]. In the past decades, the fact the DR

was formed due to inflammatory reactions, as the retina is one of sequestered a tissue of immune surveillance. However, the distinctive clinical inflammation features of DR, like formation of edema. But in reverse to past thoughts, increase production of iCAM protein by pathway of VEGF in DR patients is a signal immune cells contribution[20]. Moreover, one study reported that elevation of serum IL-12 was associated with DR pathogenesis and in patients with T1D while it hasn't studied in proliferative retinopathy of patients with diabetes yet [23]. The highly relation of DR with duration of DM, this findings was agreed Jenchitr *et al* [24] who found a significant relation of DR with the duration of DM, they found that, the retinopathy in DM patients varied from 13.1% to 22.91% in diabetic patients with up to ten years and 42.86% in those with diabetic for as much as 20 years. Additionally, Krishnaiah *et al* [25] also found the prevalence of DR was(2.42)% in persons with diabetes intended for less 10 yrs and up to 12.20% for those along with diabetes for up to be able to 20 years. McCarter *et al* [26] indicated that, the acute occurrence of DR was simply linked with a extended period of diabetes connected positively to higher glycosylated hemoglobin levels and indicated that diabetics with higher HbA1c had three times greater risk of retinopathy.

Conclusion

High elevated levels of both INF-γ and IL-12 were present in patients with retinopathy.

Prevalence of Celiac Disease among Cases of Irritable Bowel Syndrome in Baghdad, Iraq

Marwan Majeed Ibrahim

CABM Internal Medicine, Tikrit University College of Medicine, Physician at Al-Yarmouk Teaching Hospital

Abstract

Celiac disease is a common illness need not to be mistaken as IBS or GI motility disorders and careful evaluation of IBS patients especially those with diarrhea predominant type may need to be considered.

This study disclose that about more than 12% of patients who had been already diagnosed as IBS is discovered to have positive serology of gluten sensitivity and the diagnosis of Celiac disease had been confirmed by histopathology study.

Though and careful evaluation of presumed cases of IBS especially those with poor response to conventional therapy or those who with atypical presentations is essentialin order to reach to an alternative diagnoses.

Keywords: *Celiac disease, Gluten sensitivity, Irritable bowel syndrome, Anti tissue transglutaminase, Gluten free diet.*

Introduction

Celiac disease is a common cause of malabsorption of one or more nutrients. Recent observations have established that it is a common illness with protean manifestations, a worldwide distribution is approximately 1%.[1]

Its incidence has been raised over the past five decades. Celiac disease has several other names, as nontropical sprue, celiac sprue, and gluten-sensitive enteropathy,the etiology of celiac disease is not completely understood, but immunologic; environmental; and genetic factors imply the major role in pathogenesis.

Celiac disease is considered an "iceberg" disease. A few number of patients have classic symptoms and manifestations linked to micronutrient malabsorption along with a varied natural history; the onset of symptoms can occur at all points of life, though the disease has two peaks of ages: the first is early in life, at approximately 2 years of age (after gluten containing diets has been introduced), or later in the second to fourth decades of life. It may first manifest after an attack of prolong diarrhea following gastroenteritis or even after abdominal surgery.[2]

A larger number of patients have "atypical celiac disease," with presentations that are not obviously linked to small intestine malabsorption (e.g., anemia, infertility, osteopenia, and neurologic and psychological manifestations). Even larger figure of patients have "silent celiac disease"; they are essentially asymptomatic despite abnormal small-intestinal histopathology and positive gluten sensitivity serology.

Other symptoms of patients with celiac disease may range from significant malabsorption of multiple nutrients, with diarrhea;weight loss; steatorrhea;and the consequences of nutrient depletion (i.e., metabolic bone disease and anemia), to the total absence of gastrointestinal symptoms despite evidence of the depletion of a singlenutrient (e.g., iron or folate deficiency;edema;osteomalacia from protein loss).[3]

Both IBS and gluten sensitivity are common in the general population and both can coexist with each other independently without necessarily sharing a common pathophysiological basis.[4]

Not all patient with IBS or IBS predominant diarrhea is candidate for screening for gluten sensitivity but testing should be considered in the following situations :

1. Patients with GI symptoms including recurrent or chronic diarrhea;weight loss;malabsorption and abdominalbloating or distension and severe lactose intolerance.
2. Patients with noalternative explanations for extraintestinal manifestations of combined nutritional deficiencies and/or anemia, persistent transaminitis, delayed puberty, short stature, females with recurrent abortions, hypofertility, recurrent aphthous ulcers, dental enamel hypoplasia, idiopathic peripheral neuropathy or cerebellar ataxia, or recurrent atypical migraine.
3. Patients with type 1 diabetes mellitus if they present with clinical manifestations of presumed celiac disease.
4. Asymptomatic first-degree relatives of patients with an established celiac disease.

These recommendations are consistent with the American College of Gastroenterology guidelines.[5]

The Rome III criteria can establish the diagnosis of IBS without further extensive testing and seeking for alternative diagnoses may be considered in cases of nocturnal diarrhea, symptoms unrelated to food or defecation. Alarm features that raise the concern of other diagnosis in presumed IBS cases are weight loss, anemia, bloody stool, positive family history of inflammatory bowel diseases, colonic cancer or celiac disease.

It is very important to remember that patients with celiac disease is at high risk of several malignancies like esophageal and intestinal adenocarcinoma, B- cell MALT lymphoma, hence increased mortality, so strict gluten free diet is essential.[2]

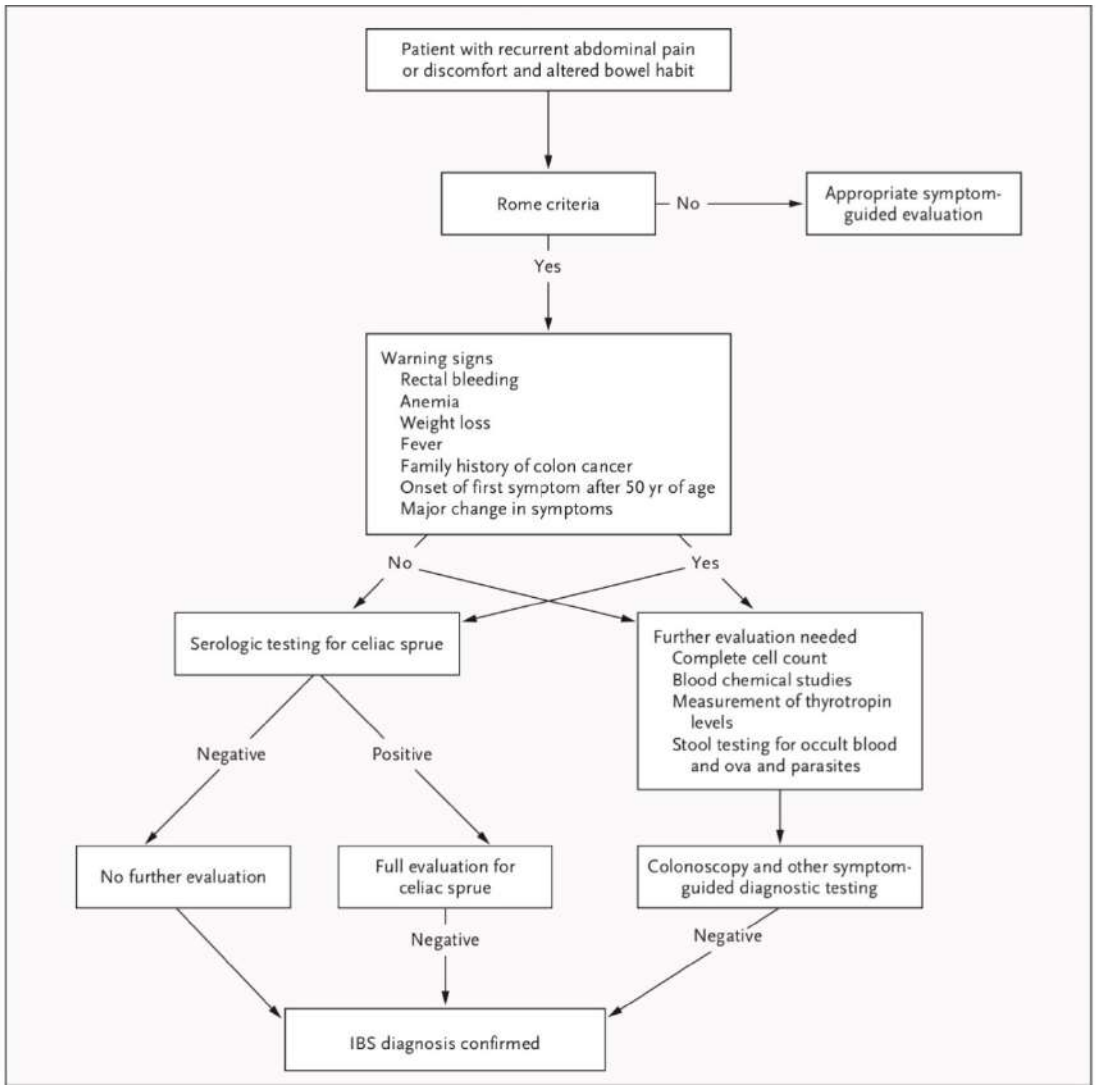

Figure 1 Testing for celiac disease in cases with diagnosed IBS depending on Rome criteria, especially in cases of diarrhea predominant IBD or there is possible alternative diagnosis other than IBS[6]

Diagnosis

Serum Antibody Assays:

1. IgA endomysial antibody (IgA EMA)
2. Immunoglobulins tissue transglutaminase antibody (IgA tTGA and IgG tTGA).
3. Immunoglobulins deamidated gliadin peptide (IgA DGP and IgG DGP)

All patients with Celiac disease express the HLA-DQ2 or HLA-DQ8 allele, although only a minority of people expressing DQ2/DQ8 have celiac disease. Absence of DQ2/DQ8 excludes the diagnosis of celiac disease.

Endoscopic small bowel mucosal biopsy is the gold standard. Endoscopic biopsy is mandatory in suspected cases even if mucosalooks normal. As the histological changes can be patchy, multiple biopsies – usually, more than four biopsies from the second part of the duodenum in addition to one from the duodenal bulb – should be obtained.[7]

Histopathological feature mainly seen are villous atrophy or completely absent with a reduced villous-to-crypt ratio and crypts looks hyperplastic. There is increase in cellularity of the lamina propria with a mainly plasma cells and lymphocytes. The number of intraepithelial lymphocytes per unit length of absorptive epithelium is usually increased.[8]

Modified Marsh Classification of histologic findings in celiac disease (Oberhuber)

Marsh Type	IEL / 100 enterocytes – jejunum	IEL / 100 enterocytes - duodenum	Crypt hyperplasia	Villi
0	<40	<30	Normal	Normal
1	>40	>30	Normal	Normal
2	>40	>30	Increased	Normal
3a	>40	>30	Increased	Mild atrophy
3b	>40	>30	Increased	Marked atrophy
3c	>40	>30	Increased	Complete atrophy

- IEL/100 enterocytes, intraepithelial lymphocytes per 100 enterocytes
- Type 0: Normal; celiac disease highly unlikely.
- Type 1: Seen in patients on gluten free diet (suggesting minimal amounts of gluten or gliadin are being ingested); patients with dermatitis herpetiformis; family members of celiac disease patients, not specific, may be seen in infections.
- Type 2: Very rare, seen occasionally in dermatitis herpetiformis.
- Type 3: Spectrum of changes seen in symptomatic celiac disease.

Patients and Method

A cross sectional study conducted at Alyarmouk teaching hospital internal medicine outpatient clinic from the period of march 2018 to march 2019 involving 140 patients who had been labeled as IBS or presented with recurrent symptoms highly suggestive of IBS.

Inclusion criteria are patients had been previously diagnosed by general practitioner, physician, or gastroenterologist as having irritable bowel syndrome based on symptoms such as recurrent abdominal discomfort, colicky abdominal pain, altered bowel habits, and bloatingat time of presentation.

Exclusion criteria are patients with recent infectious diarrhea, history of inflammatory bowel disease, peptic ulcer disease, gastrointestinal malignancies, previous gastrointestinal surgeries, alcoholism and patients with advanced chronic illnesses (chronic renal failure, long term diabetes mellitus, and congestive heart failure).

The patients had been re-evaluated regarding the diagnosis either due non convincing response to IBS therapy, insufficient initial work up, or new symptoms had been developed.

Screening for gluten sensitivity had been done by using anti tissue transglutaminase (tTGA)assay then the patient with positive results undergone upper endoscopy and histopathological analysis of multiple biopsy specimens from second part of duodenum to confirm the diagnosis.

All the patients who had been diagnosed as Celiac disease undergone complete evaluation for anemia and micronutrient deficiency with CBC, serum ferritin, B12, and vitamin D level.

The patient who had been confirmed to have celiac disease established on gluten free diet and set for follow up.

Statistical Analysis: Analysis of data was carried out by available statistical package (version 25). Statistical significance was considered at (P value ≤ 0.05).

Findings: This study which in cover 140 IBS cases, in which each case had been assessed for possible gluten sensitivity and the results were 17 patients of 140 (12.1%) have positive serology for gluten sensitivity,all the cases with positive serology undergone upper endoscopy which confirm the diagnosis of celiac disease.

Fourteen of 17 patient (82.4%) who were positive were females and 3 (17.6%) were males in which it carry no statistical significance. P =0.585.

Most of these cases were diarrhea predominant IBS 10 of 17 (58.8%) where as 7 (42.2%) were constipation predominant type. Table 1

Table 1: Classification of patients according to age;gender and type variant of IBS in relation with positivity of tTGA

		Anti Tissue Transglutaminase						P value
		Total		Positive		Negative		
		No	%	No	%	No	%	
Age (Years)	<20y	9	6.4	1	5.9	8	6.5	0.405

IBS-C irritable bowel syndrome – constipation, IBS-D irritable bowel syndrome - diarrhea

All the 17 cases with positive serology were undergone upper endoscopy and biopsy specimen had been obtained from second part of duodenum and sent for histopathological analysis.

The results of histopathological finding were positive for features of Celiac disease and were ranging from (2-3b) modified Marsh Classification of histologic finding in celiac disease (Oberhuber); 8 Patients type 2, 7 Patients type3a, and 2 patients type 3b. Figure 2

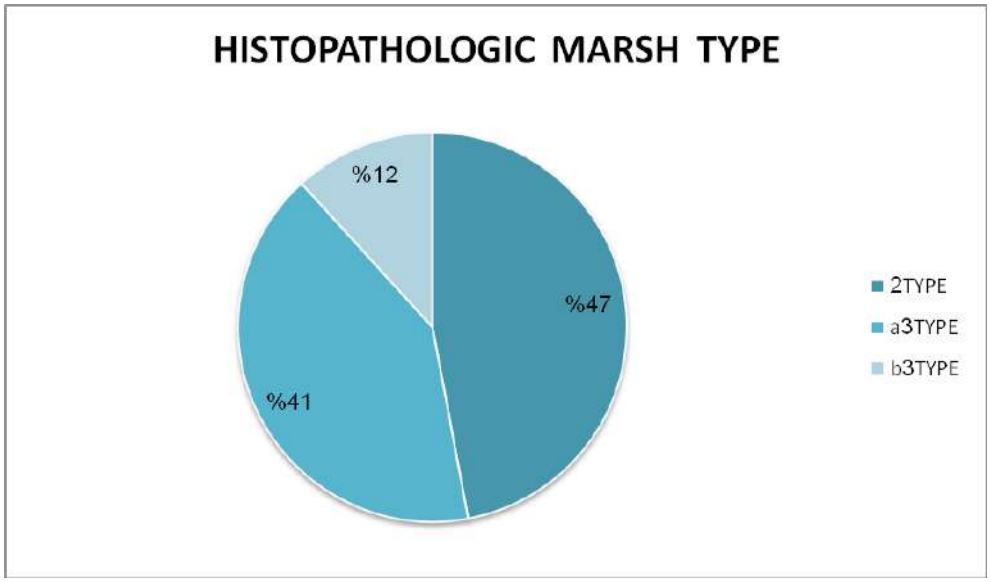

Figure 2: Histopathological finding in patient with positive anti tissue transglutaminase.

Among the total 17 patients, 10 has anemia (7 cases hypochromic microcytic anemia and the rest 3 has normochromic normocytic anemia and no cases of megaloblastic anemia seen despite that there were 3 cases discovered to have B 12 deficiency in which they were had normal hemoglobin and MCV level)Figure 3. All the 7 cases of hypochromic microcytic anemia is confirmed to be iron deficiency anemia as well as 2 cases of normochromic anemia and 3 non anemic patients were had below normal ferritin level; so the total number was 12 of 17 hashad iron deficiency state. Lastly all patients found to have vitamin D level below the reference range. Table 2.

All the cases who had been confirmed to be Celiac disease had been advised for gluten free diet and follow up.

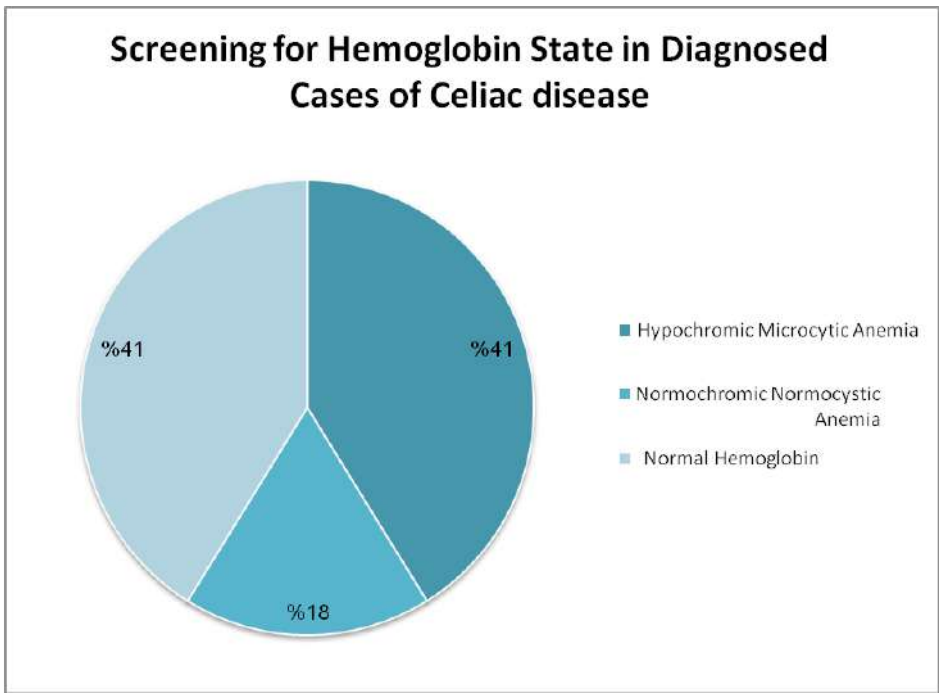

Figure 3: Hemoglobin state in cases of Celiac disease

Table 2: Micronutrient State in cases with Celiac disease

Screening for micronutrient deficiency in Diagnosed cases of Celiac Disease					
Vitamin D3		Vitamin B12		Iron State	
Normal	Deficient	Normal	Deficient	Normal	Deficient
0 (0%)	17 (100%)	14 (82%)	3 (17.6%)	5 (29.4%)	12 (70.5%)

Discussion

Celiac disease is one of the most readily missed illnesses in practice due to the complexity of gastrointestinal symptoms associated with this disease, such as flatulence,diarrhea or rarely constipation, abdominal cramps and fullness which may overlap with other various gastrointestinal illnesses, such as inflammatory bowel diseases, chronic infections and helminth infestation, other food allergies, lactose intolerance, motility disorders and irritable bowel syndrome.

The lack of history or features of micronutrients deficiency, mineral bone diseases and other cutaneous and neurological manifestations of celiac disease does not exclude the presence of this syndrome. So thorough evaluation for gluten sensitivity is essential in presumed cases of IBS which not respond to conventional dietary and medical approaches and carry the same importance of excluding inflammatory bowel disease or other pathologies that may simulate IBS.

Although it has to be pointed that some IBS cases with no evidence of gluten sensitivity may surprisingly get significant benefit in improvement of their symptoms after exclusion of gluten containing food from their diet.

According to this study there is significant number of those patients who had been diagnosed and managed as IBS are actually haveCeliac disease, especially those with diarrhea predominant subtype.

The usual work up of patients who present with symptoms suggestive of IBS does not involve regularly screening for gluten sensitivity or any form of food allergies unless the patient has features of malabsorption ofmicronutrients, diarrhea, steatorrhea, weight loss or coexistence of dermatitis herpetiformis.

Still early diagnosis of Celiac disease and establishment of gluten free diet is essential to prevent long term serious complications other than vitamin and minerals malabsorption such us ulcerative jejuno-ileitis, small intestinal lymphoma and small bowel adenocarcinoma.[9]

As compared with the study*The prevalence of celiac disease in patients with irritable bowel syndrome and its subtypes* byDanuta Domżał-Magrowskawho had been published in Przegląd Gastroenterologiczny 2016 in which concomitant positive result of genetic testing and any elevated serum antibodies specific to celiac disease was found in 12.5% of IBS patients.[10]

So this study carry a highly comparable results, Screening for anemia and micronutrient deficiency in the cases who had been confirmed to have Celiac disease reveals that anemia is present in 10 of 17 cases (58.8%) that was mainly of iron deficiency which is the most common type of nutritional anemia in Celiac disease, there is also significant number of cases with iron deficiency state to be added to cases of IDA to be a total of 12 of 17 (70.1%).

Mainly because of small size of sample there is no case with megaloblastic anemia detected but still there are 3 cases with low serum B12 level. It is also important to be referred that there is no data available about folate statues in our study because lack of availability of reliable test for red blood cell folate in our facility at time of the study and the level of serum folate does not reflect the actual folate level state.

Vitamin D deficiency is present in all cases who had been diagnosed as Celiac disease but it may reflect the high prevalence of vitamin D deficiency among Iraqi patients in general as well as the effect of Celiac disease on lipid soluble vitamins absorption.

Finally it is important to follow up all the patients who had been diagnosed as celiac disease regarding improvement in their GI symptoms following exclusion of gluten from their diet, if not, the coexistence of IBS or other GI pathologies still possible and careful clinical re-evaluation is warranted.

Conclusions

There is significant number of celiac disease patient had been diagnosed and managed as IBS cases (mainly diarrhea predominant type) and there may be coexistence of both illnesses in the same patient.

Incidence of Caesarian Section (C/S) in AL- Fallujah Teaching Hospital

Huda Hamid Al-Janabi[1], Omar Mahmood Shakir[2], Aya Falah Ahmed[3], Suha Hamdi Mahmood[4]

[1]College of Medicine, AL- Fallujah University, Obstetrician in AL-Fallujah Maternity & Children Teaching Hospital, [2]College of Medicine, AL-Fallujah University, Urosurgeon in AL-Fallujah Teaching Hospital, Iraq, [3]Resident Doctor in AL-Fallujah Maternity & Children Teaching Hospital, [4]Resident Doctor in AL-Ramadi Teaching Hospital

Abstract

Background: In Iraq as in most Arab countries and others in world, increased the rate of Cesarean section from year to year therefor the objective Study determine the incidence of caesarians action during 6 month in Fallujah teaching hospital.

Patients and Method: A prospective analysis of 540 cases of caesarian action done from September 2018 to February 2019, in Department of Gynecology and obstetric Al Fallujah teaching hospital. data collected from hospital record their personal data,type of c/s,indication of c/s.

Results: There were 540 cases c/s done 69 is emergency and 471 is elective. Most of them 466 at age between(26-35) years and about 349 indicated to c/s due to previous c/s.

Conclusion: c/s are commonly performed operation for women and its associated with increase in maternal and infant morbidity particularly after emergency c/s .the overall rate of c/s is high and most frequent reason for c/s is scarred uterus.

Keywords: *Incidence; Caesarian section (C/S); AL- Fallujah Teaching hospital.*

Introduction

Over several decades, has come to a dramatic increase in the number of Caesarean sections performed across the world, especially in developed countrie[(1)]. The Labour is the physiological process that results in birth of ababy, delivery of the placenta and the signal for lactation to begin[(2)].

An understanding of the physiological and anatomical principles involved in normal and abnormal labour is best summarized using the '3 Ps', which are the powers, the passages and the passenger. The 'powers' refers to forces, firstly the contractions of the uterine muscle that result in passage of the fetus through the birth canal, and secondly the maternal effort of pushing in the second stage of labour.

The 'passages' refers to the birth canal itself, which is made up of the bony pelvis, the muscles of the pelvic floor and the soft tissues of the perineum.'passenger' refers to the fetus in terms of its size (small, average, large) presentation (that part of the fetus entering the pelvis first, e.g. vertex of head,face, brow or breech) and position (orientation of the presenting part in relation to the maternal public symphysis, e.g. occipito-anterior, occipito-posterior). When the 3Ps are favourable, normal labour is likely to ensue, resulting in an unassisted or spontaneous vaginal birth[(3).]

When any of the 3Ps are unfavourable, labour is likely to be abnormal,resulting in the need for intervention and with that, an increased risk of morbidity or mortality. A caesarean section is a surgical procedure in which incisions are made through a woman's abdomen

(laparotomy) and uterus (hysterotomy) to deliver one or morebabies[4].

Increased range of Cesarean delivery (CD) delivery rate were reported across the world. CSdelivery rate (20%) in the United Kingdom and (22.5%) in Canada. Whilst more than 85% in both South America and Italy[5].

Rates have risen in the United States in a dramatic fashion from less than 5% in the 1960s to 32.7% by 2013, with stable rates around 32% to 33% in the past 5 years(2), Among the reasons for this increase are (1) a continued increase in primary CDs for dystocia, failed induction, and malpresentation; (2) an increase in the proportion of women with obesity, diabetes mellitus, and multiple gestation, which predispose to CD; (3) limited use of a trial of labor after cesarean (TOLAC) delivery[6].

The WHO has proposed an incidence of CD between 10% and 15% as a target to optimize maternal and perinatal health[7].Instead of setting goals or limits for overall CD rates, it is most important to monitor maternal and perinatal health outcomes(2).so in iraq overall rate of cesarean sections increased from 18.0% in 2008 to 24.4% in 2012 [8].

Caesarian section also causes psychosocial complications as a longer stay in hospital on that occasion the woman is separated from family and other children, separation from the newborn, then she has a sense of "being sick", which also affects the lack of desire for breastfeeding the baby[9]

Traditionally, caesarean sections have been classified as elective or emergency, Elective caesarean sections are usually booked days or weeks ahead of time and are conducted during daytime hours, All other caesarean sections can be classified as emergency, irrespective of whether the woman was in labour or not. so the classification system for emergency caesarean section as category 1: Immediate threat to life of woman or fetus; category 2: No immediate threat to life of woman or fetus; category 3: Requires early delivery and category 4: At a time to suit the woman and maternity services(1).Aim of study to determine the incidence of c/s during 6 month, type of c/s and indication of c/s in Gynecology and obstetric department of Al-Fallujah teaching hospital. This study will help to determine why the incidence increase and to research about the effect of c/s in subsequent pregnancy

Patients and Method

We prospectively analyzed by cohort study a total 540 women who underwent c/s between september2018 and february 2019 at AL-Fallujah teaching hospital, department of gynecology and obstetrics .the data was collected from patient and from hospital record.

The medical record sheets of all identified women were reviewed regarding age, parity, type of c/s, indication of c/s(failed labor, previous c/s, pregnancy induced hypertention, gestation DM, multiple gestation, cord prolapse, premature rupture of membrane, intrauterine pathology, oligohydramnios, placenta Previa, maternal request, malpresentation, fetal distress.

Finding: The most common indication in this study is previous c/s about 64.60% while the incidence of other indication show in the table 1 .

Table 1: Indication of caesarian section in our study

Parameters	N	%
Maternal request	23	4.20
Premature rupture of membrane	4	0.74
Cord prolapse	0	0.00
Intrauterine pathology	2	0.37
Multiple gestation	6	1.11
oligohydramnious	15	2.80
Placenta previa	2	0.37
malpresentation	47	8.70
Gestation DM	1	0.18
Pregnancy induced hypertension	48	8.90
Previous C/S	349	64.60
Fetal distress	43	8.00

The percentage according to type of C/S was emergency in 12.8% patient & 87.2 % was electively see table 2.

Table 2: Type of C/S.

Type	N	%
Emergency	69	12.8
Elective	471	87.2
Total	**540**	

The percentage according to age group were 37.8% patient below 25years old, 49,2 % from patient were from 26-35 years old and 13% patients more than 35 years see table 3.

Table 3: Age distribution of patients.

Age (Years)	No.	%
15-25	204	37.8
26-35	266	49.2
>35	70	13
Total	**540**	**100**

Discussion

Increase rates of c/s delivery in women has been a public health concern now a days .in the past the rate is lower and usually performed for fetal reasons but nowadays mainly for maternal reasons. In this study elective c/s 87.2% and most of them due to previous c/s in 67% of patients, while the emergency about 12.8%.

We notice that there is increase in percentage of caesarian section in our hospital which is mainly due to repeated scar. The incidence of caesarean section varies between(10- 25) % in most developed countries, caesarean section[10].

Our study also limited by a 6 month period and just in governmental hospital therefore future research needs to consider private hospitals. This high rate of c/s is higher than the recommendation of WHO health expert who considered the ideal rate for c/s to be between 10% and 15%[7].

Current study show that age between 15-25 years have high incidence, The results of the current study were consistent with Diana et al., study, which showed that(85, 91)% of the women were in the age18-30 years whilst (15, 9) % were in (31-40) years in the elective and emergency caesarean sections respectively[11].

The percentage of elective caesarean (87.2%)were more than emergency caesarean section (12.8%), these results of the current study fully consistent with the findings of Diana & Tipandjan where the results showed that significantly higher among those who had elective caesarean than those had emergency caesarean section in the present delivery because decision to have elective caesarean mainly depends on women who had one or more previous caesarean sections prior to the present delivery[11].

Conclusion

- In current study about The most common indication in this study is previous c/s about 64.60% .
- 87.2% of cases is elective and 12.8% is emergency. And about 49.2% of them at age between(26-35) years, so 37.8% at age(15-25) years and 13% at age >30 years .
- Caesarian section are commonly performed operation for women and its associated with increase in maternal and infant morbidity particularly after emergency c/s .
- The overall rate of c/s is high and most frequent reason for c/s is scarred uterus .

Recommendation

- Future research is needed to explore the non clinical causes of c/s like attitudes, behaviors, skill of obstetricians as well as the social, economic and legal environment in the country.
- To maintain an acceptable caesarian section rate a multidisciplinary quality assurance program should be established in all facilities in which delivery occurs.

Conflict of Interest: Non

Source of Findings: Self

Ethical Clearance: This research was carried out with the patient's verbal and hospital approval before the cases was taken.

Relation of Anti FSH Antibodies and Polycystic Ovarian Syndrome in Women

Najat jabbar Ahmed[1], Burhan Ahmed Salih[2], Bestoon Salah Othman[3]

[1]Clinical Immunology PhD, Medical, Laboratory Department, College of Technical Health, Erbil Polytechnic, University, Kurdistan Region, [2]Biochemistry Ph.D., Medical Laboratory, Department, College of Technical Health, Erbil Polytechnic University, Kurdistan, Region, [3]Erbil Polytechnic University, Kurdistan Region/Iraq)

Abstract

The aim of the study was to detect the level of anti-follicle stimulating hormone antibody in polycystic women and compared to normal control group. A cross-sectional study was carried out in Erbil city from January 15th of October 2018, to 15th of March 2019. The number of polycystic ovary syndrome (PCOS) women under study was 60 women whose ages were between 15 and 45 years old. These patients admitted to Gynecology and Obstetrics Teaching Hospital. The control group who were matched to the patients studied included 30 individuals. The study showed that there is the significant difference between PCOS women and the control group concerning Anti FSH Antibodies level and the highest mean of Anti FSH Ab level occurred in PCOS women (1.61± 0.14 vs. 0.92 ± 0.04). There was a non-significant relation between each one of LH, FSH, LH/FSH ratio with Anti FSH Ab, in this study. The highest rate of PCOS women had irregular menstrual cycle. The study showed that most PCOS women included in the study had hirsutism. The rate of acne recorded among PCOS women in the study was 48.4 while 51.6 without acne. Conclusion: It was concluded that there was a highly statistically significant relation of Anti FSH Ab with PCOS.

Keywords: *Anti FSH Antibodies; Polycystic Ovarian Syndrome (PCOS); LH;FSH; LH/FSH ratio.*

Introduction

Polycystic ovarian syndrome (PCOS) is a common endocrine disorder and abnormality in the ovaries at reproductive ages and caused by the imbalance of female sex hormones(1). Levels of the sex hormones progesterone and estrogen are out of balance in the condition of PCOS, this can cause problems with women's menstrual cycle(2). With a prevalence rate of approximately 5% - 10% among women of reproductive age(3). Pathophysiology of polycystic ovary syndrome appears to be multifactorial and polygenic, key features include menstrual cycle disturbance, hyperandrogenism, and obesityand increased risk for type 2 diabetes(4). A polycystic ovarian syndrome is diagnosed by the appearance of at least two of the following criteria: increased androgenic hormones, irregular or absent ovulation(5). With 12 follicles at least from 2 to 9mm per ovary and/or ovarian volume at least 10 ml(6).

The human ovary can be the target of an autoimmune attack in different circumstances, including many organ-specific or systemic autoimmune diseases, the presence of a specific antibody is a commonly accepted sign of autoimmune disease and works to distinguish between autoimmune and autoimmune conditions, for both clinical practice and other research studies, other diseases regarding ovaries, such as unexplained infertility, PCOS and endometriosis have been associated with anti-ovarian autoimmunity(7). Several types of research suggested the relationship between PCOS and autoimmunity with controversial results, which showed that serologic signs of autoimmunity elevated in patients with PCOS(8).

With the confirmation of the autoimmune of the ovary, the anti-FSH body may interfere with the internal or external function of FSH; anti- FSH antibody may interact with FSH and form immune complexes so provoke its clearance, maybe FSH antibodies can interfere with the FSH link to its receptors(9). FSH's specific beta-epitope antibodies were found to be more prevalent in endometriosis and polycystic ovary syndrome (PCOS)(10).

Methodology

A cross-sectional study was carried out in Erbil city from January 15th of October 2018 to 15th of March 2019. The number of PCOS women under study were 60 women whose ages were between 18 and 45 years. Diagnosis of PCOS was based on the presence of two of following Rotterdam criteria: oligo and/or anovulation, clinical and/or biochemical signs of hyperandrogenism, and polycystic ovaries on ultrasound, meaning presence of 12 or more follicles measuring 2–9 mm in diameter in each ovary and/or ovarian volume more than 10 cm3. Besides, the control group consisted of 30 healthy volunteer women aged between 18 and 45 years with regular menstrual cycles. A 5 ml volume of the blood sample was taken by vein puncture from each subject enrolled in this study. Blood samples were placed into sterile test tubes after blood clotting, centrifuged at 3000 rpm for 15 minutes then clot removed and remain re-centrifuged at 3000 for 10 minute and the resulting serum was inhaled using mechanical micropipette and transported into clean test tubes and stored in Deep freeze at-20 °c until time of analysis.

Statistical Analysis: Computerized statistically analysis was performed using GraphPab Prism6 statistic program version 6.01. Comparison was carried out using; T-Test probability (P-value)

Finding: The study showed that the highest rate of PCOS women had an irregular menstrual cycle 76.6% and 23.4% of them had a normal menstrual cycle, Moreover, the highest rate of hirsutisms among PCOS women recorded was 75% while only 25% were without hirsutisms, Including Acne was observed the highest rate of PCOS women has 48.4% while 51.6 were without any acne, Finally the alopecia in PCOS women had the highest rate was 20% while 80% of them without alopecia. Table 1

Table 1: Clinical data in PCOS women.

Parameters		No.	%
Age	<30 year	33	55
	>30 year	27	45
BMI (kg/m²)	<30	23	38.4
	>30	37	61.6

Discussion

PCOS is an endocrine disorder with multifactor etiology and different clinical manifestations. This is the most common cause of menstrual disturbance and ovulatory infertility in women[11].

Hirsutism is the most common clinical manifestation of hyperandrogenism or the presence of excess terminal hairs in a male-like pattern, excessive hair growth can often cause significant psychological and emotional distress[12]. Like that on the face, chest, written alba, lower back, buttocks and front thighs. Hirsutism is caused by androgen effects on the lipid unit and is usually associated with acne and oily skin. This is usually due to increased androgen production from the ovaries or adrenal glands[13]. High concentrations of testosterone, one of the factors contributing to the emergence of some symptoms of PCOS such as infertility, PCOS, hirsutism, and acne[14]. The results noticed were in agreement with *et al*[15].And *et al*[16].

Concluded the source of hyperandrogenism due to the genetic abnormalities in insulin receptor resulting in the thickening of the ovarian theca that increased the androgen production and inhibition of SHBG synthesis. The degree of hirsutism might be influenced by the relative activity of the 5α reductase that converts testosterone to the more active metabolic dihydrotestosterone[17-19]. But menstrual cycle irregularity is a relatively accurate surrogate of ovulation and is easily obtained from medical history[20]. Therefore, menstrual cycle pattern might serve as a marker of IR in patients with PCOS, as IR can induce oligo- or anovulation and thus menstrual cycle irregularity by exacerbating hyperandrogenemia and by disrupting follicular growth[21]. Nevertheless, very few small studies evaluated the association between menstruation abnormalities and the endocrine and metabolic characteristics in PCOS[22].

Gowri *et al*[23] showed that the acne was seen in highest percentage (67.5%), followed by hirsutism (62.5%) and fasting insulin levels was the most common hormonal abnormality seen in both acne and hirsutism. Sharma *et al*[24]Majumdar *et al*[25]also showed that acne was the most common cutaneous manifestation in PCOS group. The pathophysiology of PCOS appears to be multifactorial and polygenic. The main pathophysiology points to the ovary being the source of excess androgens, which appears to result from an abnormal regulation of steroidogenesis[26]. The excessive secretion of androgens in PCOS patients results in a series of skin changes including hirsutism, acne, seborrhea and androgenetic alopecia[27].

In agreement with our findings, Hussein *et al* [28] found that FSH Ab were elevated in PCOS women, there is increasing in the anti-FSH antibody level in PCOS women as compared to healthy women was agreed with the study done in Basrah[29]. Similarly,Haller-Kikkatalo *et al*[30].Found the anti-FSH Ab of is statistically higher in infertile PCOS than in control group and also detected anti-FSH antibodies in healthy non-pregnant women but at lower rates than for patients with endometriosis or PCOS.

An autoimmune mechanism has also been suggested in some cases of PCOS, where increased prevalence of antiovarian antibodies and common organ- and nonorgan specific autoantibodies has been detected[31, 32]. To explain the presence of such spontaneous antibodies, it was supposed that an alteration of the immune system might be necessary and that the antigen responsible for

their production could be either the circulating FSH from the female organism or the FSH in seminal fluid that may upregulate the anti-FSH immune response in females[30]. Thus, anti-FSH antibodies might have an inhibitory effect on FSH by preventing the binding of the hormone to its receptor or by trapping FSH in immune complexes[32, 33].

There are many hypotheses concerning the causes of PCOS development and the concurrent coexistence of many interdependent disorders is also possible. Most attention is paid to the hypersecretion of LH and insulin resistance as well as hyperinsulinemia.In agreement with our findings,Tracy WillIams*et al*[34] founded revealed the elevation of LH and reduction of FSH in PCOS women with elevation in of LH/FSH ratiowhen compared with healthy .Some studies assess the incidence of elevated LH/FSH ratio in PCOS women reached 94%[25]

This is maybe part of an autoimmune process that is not specified in this case, and the ovary is targeted by the body's immune system leading to a pathological condition known as "ovarian autoimmune" in most autoimmune diseases of endocrine glands, an abnormal level in hormone regulatory system is the primary diagnostic indicator for potential diseases, the diagnosis is confirmed by the measurement of specific antibodies. Regardless of the mechanisms involved in autoimmune diseases[7].To explain why some infertile patients develop anti-gonadotropin antibodies, some studies focused on the Major Histocompatibility Complex (MHC) Class II[10]. The role of the MHC Class II is to present exogenous proteins to immune cells, which leads to a humoral immune response. Finally, no more research has been found in this regard and this proves that this subject needs to be studied and more research to reach sufficient results.

Serum Ferritin Levels with Some Hematological Parameters in Women with Preterm Labour or PPROM

Lamia Ahmed Salih

MB.CH.B.DOG./Al-Alam General Hospital/Salah Al-Din Health Department/Salah Al-Din/Iraq

Abstract

Preterm labour is defined as the presence of uterine contractions of sufficient frequency and intensity to cause progressive effacement and dilation of the cervix prior to term gestation between (24- 37) weeks of gestation**.**Aim of current study aims at conducting and detecting the serum ferritin level could be use as predictor in women with preterm labour. So to decrease morbidity and mortality among the mother and her baby by predicting early labour .Patient and Method:The study was conducted at the Department of Obstetrics and Gynecology at Tikrit Teaching Hospital,included 100(study and control)laboring women attending to hospital, patients included in the study were subdivided into two groups:fifty of them were preterm labour cases(gestational age between 24-37) and 50 of them had intact membranes and the other 50 were with preterm premature rupture of membranes.the second group consist of 100 patients with gestational age more than 37 weeks.all patient were subjected to the Hematological investigations(HB%,PCV,and serum ferritin). Results:In this study the patients were of comparable age with a mean age of the preterm labour group of 23.45+4.18 ranging from16-35 years, so gestational age distribution of both group, the preterm group women had a mean gestational age (34 weeks) which is significantly lower than those of the term pregnant women (38 weeks).All groups were comparable in terms of hemoglobin and PCV level ($p>0.05$), while there was higher serum iron and higher serum ferritin level in the preterm group compared to the control group ($p<0.0001$).only serum ferritin was higher in those PPROM($P<0.0001$)while the other parameter were not significantly different in there level between the two groups.Preterm group **showed** significant higher of serum iron of preterm from control ($P<0.0001$)and preterm premature ruptured membranes PPROM from control ($P<0.0001$).The serum ferritin showed a significantly higher level in preterm labour from control ($P<0.0001$) and significantly higher level in preterm premature ruptured membranes PPROM than control group ($P<0.0001$).**Conclusion** Elevated serum ferritin level could be use as a predictor for prediction of spontaneous preterm delivery and PPROM at high risk of these complication, although it is worth mentioning that a larger study population .

Keywords: *Serum ferritin; hematological parameters; women with preterm labour;PPROM.*

Introduction

For reasons related to etiology, out come and recurrence risk, preterm labour should be divided into three gestational groups**:** mildly preterm at 32^{+0} to 36^{+6} weeks (incidence 5.5%), **moderately** preterm 28^{+0} to 32^{+6} weeks (incidence 0.7%) and **extremely** preterm birth at 24^{+0} to 27^{+6} weeks (incidence 0.4%) **[1,2,3].**

The incidence of preterm labour in developed world between 7 to 12%**[1].** There has been a small gradual rise in the incidence of preterm labour associated with assisted reproduction and an increased tendency to obstetric intervention. The rate of preterm labour prior to 32 weeks has remained relatively stable at 1-2%. About one quarter of preterm labour is elective deliveries, usually for pre-eclampsia, intrauterine growth restriction, or maternal disease. The remainder is due to preterm labour and delivery. The incidence is at

e-mail: drnihadkhalawe@gmail.com

its lowest in women in their 20s.The risk is increased in teenagers and in women in their 30s [1, 3].

There are relatively frequent causes of preterm labour approximately 5-10% of patients with preterm labour have infection outside the uterus; most common is urinary tract infection [4].Romero and Mazor has presented the evidence suggesting that extra uterine infection may cause preterm labour by mechanism involving productionof IL and TNF by maternal macrophage which in turn will trigger the production of PG by amnion [4].

Early differentiation between true & false labor is difficult before there is demonstrable cervical effacement & dilatation .Painful or painless uterine contractions, symptoms such as pelvic pressure, menstrual-like cramps, watery vaginal discharge & lower back pain have been empirically associated with impending PTL[5].

Women at high risk of preterm labour will initially be detected based on past obstetrical history[6]Ferritin is a large protein shell(Molecular weight 450,000) comprised of 24 subunits,covering an iron core containing up to 4000 atomsof iron [7] ferritin occurs in virtually all cell of body and also in tissue fluids,it mainly located in the spleen, liver, and bone marrow,it is also found in the mucosal cell of the small intestine, placenta,kidney,testes,skeletal muscles and circulating plasma[8,9]

Ferritin act as the soluble storage form of iron in tissue (hemosiderin is relatively insoluble).It may serve other functions as well although these are controversial. It is found in most cells of the body, especially macrophages, hepatocytes, erythrocytes. Synthesis occurs in the liver and the rate correlates directly with the cellular iron content. Control of ferritin synthesis occur post-transcriptionally (at the mRNA level).There are iron-and cytokine-responsiv elements in ferritin mRNA. Increased iron or cytokine (suchIL-1, IL-6) promotes ferritin translation resulting in increased iron storage. This is one of the causes of iron sequestration that occurs in animals with chronic or inflammatory disease and will reduce serum iron value. The function is not known,but the concentration correlate well with the amount of stored iron in normal(and most diseased) subjects. It has been proposed that extra cellular ferritin has an important role in host defense against bacteremia by stimulating oxidative metabolism[6,10], in women receiving routine prenatal care,low serum ferritin level is indicated of low iron store,but high serum, ferritin concentration appear to represent an acut-phase reaction and predict preterm delivery[11].In pregnancy, serum ferritin concentration is maximum at 12-16 weeks gestation, and then falls with advancing gestation to reach a nadir at the third trimester[6]

Because of previously reported very strong association between preterm birth and intrauterine infection, and because other inflammatory conditions have been associated with elevated ferritin level, it was hypothesized that sub clinical maternal infection was responsible for both elevated ferritin level and for the spontaneous preterm birth[12,13].Serum ferritin could be useful to identify preterm labour in pregnancy.to account for the association between elevated serum ferritin concentration and spontaneous preterm delivery we suggest that the production of ferritin or the release of ferritin from tissue may be of an acute phase reactant associated with an upper genital tract infection. Themechanism of such association may be secondary to the increased production of ferritin by macrophages that infiltrate in to the choriondecidual interface after bacterial colonization[12,14]

Aim of current study aims at conducting and detecting the serum ferritin level could be use as predictor in women with preterm labour. So to decrease morbidity and mortality among the mother and her baby by predicting early labour by The current study was done aiming to measure the serum ferritin level with some other hematological parameters in women with preterm labour or PPROM and compare them to that of control group composed of term pregnant women in order .

Patient and Method

The study was conducted at the Department of Obstetrics and Gynecology at Tikrit Teaching **Hospital,**included 100(study and control)laboring women attending to hospital and fulfilling the following criteria(Cervical dilatation >3cm; Fully effaced cervix; Uterin contraction 3/10m), While laboring women with the following criteria were excluded(Anemia (hemoglobin<10.5g/dl); diabetes mellitus; Pr e-eclampsia, eclampsia; Polyhydramnios; Iron overload stats;Liver disease; Renal disease;Chronic infectious diseases;Smoker;Fetal congenital anomalies; Blood transfusion; Drugs, iron, thyroid drug; Haematological disorder;Multiple pregnancy.

The patients included in the study were subdivided into two groups:

1. fifty of them were preterm labour cases(gestational age between 24-37) and 50 of them had intact membranes and the other 50 were with preterm premature rupture of membranes.Gestational age was calculated by combined information from last menstrual period and first trimester ultrasound.
2. The second group consist of 100 patients with gestational age more than 37 weeks.All patient were subjected to the following:
   a. Hematological investigations(HB%,PCV,and serum ferritin)

b. Abdominal ultrasound to check for gestational age,and also to exclude congenital anomalies.

c. Serum ferritin was assayed by UBI Mgiwelltm Ferritin quantitative test system.

Estimation of serum ferritin: The serum ferritin (SF)was assayed by UBI Magiwelltm Ferritin quantitative test system. This is a solid phase enzyme-linked immunosorbent assay (ELISA).Using the mean absorbance value for sample, determine the corresponding concentration of ferritin in ng/ml for the standard curve.

Expected value and sensitivity of ferritin for female 10-12ng/ml, Hb and packet cell volume were estimated by automated coulter.Serum iron was estimated by standard method recommended by the international committee for standardization Hematology. The concentration (X) of each reference was plotted against its absorbance(y) on a full logarithmic graph paper and a standard curve was drawn. Ferritin values of samples were obtained by reference to the standard curve following the obtaining of the **equation** between (x) and (y). Obtained from the standard curve. (Figure 1).

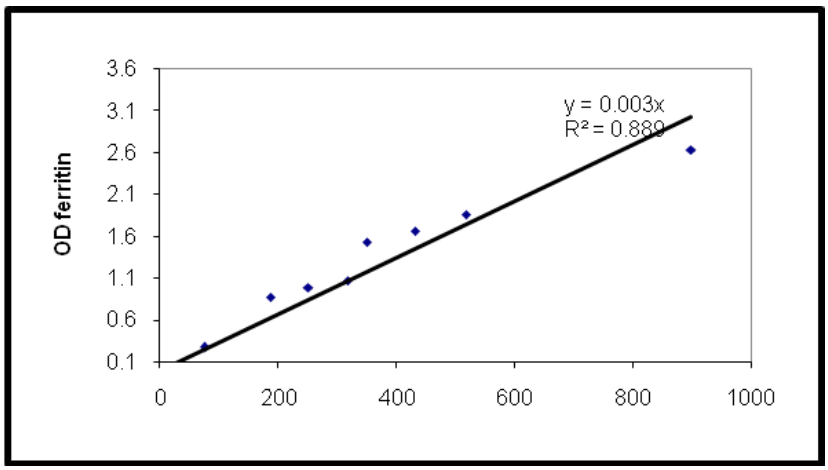

Figure 1: The standard curve for ferritin concentration.

Statistical Analysis: Statistical analysis was performed using (Statistical Packages for Social Sciences version 15) analysis software.

Finding: In this study the patients were of comparable age with a mean age of the preterm labour group of 23.45+4.18 ranging from 16-35 years, While the mean age of control group was 24.75+4.18 ranging from 15-35 years as show in Table 1.

Table 1:The Maternal Age (years) Distribution in the Studied Groups

Age (Years)	Preterm Labour No	Preterm Labour %	Control No	Control %
15-19	18	18.0	12	12.0
20-24	47	47.0	33	33.0
25-29	28	28.0	44	44.0
30-34	4	4.0	7	7.0
35	3	3.0	4	4.0
Mean+SD (min-max)	23.45±4.14 (16-35)		24.75±4.18 (15-35)	

P=0.086 (Not significant using Pearson chi-squared test at level of significance)

Table 2 showed the gestational age distribution of both group, the preterm group women had a mean gestational age (34 weeks) which is significantly lower than those of the term pregnant women (38 weeks).

Table 2: The Gestational Gge (weeks) Distribution in the Studied Groups.

Gestational age (weeks)	Preterm Labour No	Preterm Labour %	Control N0	Control %
24-29	9	9.0	-	-
30-31	6	6.0	-	-
32-33	4	4.0	-	-
34-35	64	64.0	-	-
37	17	17.0	34	34.0
38-39	-	-	42	42.0
40-42	-	-	24	24.0
Mean± SD	34.02±2.23 (28-36)	34.02±2.23 (28-36)	38.46±1.6 (37-42)	38.46±1.6 (37-42)

P=0.0001(Significant using Pearson chi-squared test at 0.05 level of significance)

All groups were comparable in terms of hemoglobin and PCV level (p>0.05) as it is shown in table 3, while there was higher serum iron and higher serum ferritin level in the preterm group compared to the control group (p<0.0001).

Table 3: The Hemoglobin, PCV, Serum Iron and Serum Ferritin Levels in the Studied Groups

	Pre-term labour men±SD	Control	Pvalue
Hb(g/dl)	11.80±0.76 (11.00-13.40)	11.88±0.74 (11.00-13.30)	0.445
PCV%	0.36±0.03 (0.30-0.40)	0.37±0.02 (0.33-0.40)	0.355
Iron(Mg/dl)	23.45±9.38 9.87-48.70	19.44±4.83 (12.40-30.20)	0.0001*
Ferritin(ng/ml)	25.81±7.69 (0.50-40.00)	9.24±5.50 (0-19.50)	0.0001*

Data were presented as Mean± SD(Range)

Regarding the comparison of the preterm labour with intact membrane groups with the (PPROM)group, as it is shown in table 4.only serum ferritin was higher in those PPROM(P<0.0001)while the other parameter were not significantly different in there level between the two groups.

Table 4:The hemoglobin, PCV, serum iron, and serum ferritin level in the studied groups.

	Preterm labour	Preterm PROM labour	P value
Hb(g/dl)	11.79±0.82 (11.0-13.40)	11.8±0.70 (11.0-13.00)	0.927
PCV%	0.36±0.03 (0.30-0.40)	0.36±0.02 (0.30-0.40)	-
Iron(Mg/dl)	21.79±5.75 (16.70-48.70)	25.12±11.80 (9.87-48.50)	0.076
Ferritin(ng/ml)	19.98±5.62 (0.5-26.00)	31.64±4.31 (25.50-40.00)	0.0001*

Data were presented as Mean± SD(Range), *highly Significant using t-test for two independent means at 0.05 level of significant.

Table (5): The hemoglobin, PCV, serum iron, and serum ferritin levels in the studied groups.

	Preterm Labour	PPROM	Control	P value for preterm x control	P value for PPROM xcontrol

Table 5 showed the comparison between preterm labour and preterm premature rupture of membranes PPROM with that of control term pregnant women regarding different hematological parameters .Preterm group showed significant higher of serum iron of preterm from control (P<0.0001)and preterm premature ruptured membranes PPROM from control (P<0.0001). The serum ferritin showed a significantly higher level in preterm labour from control (P<0.0001) and significantly higher level in preterm premature ruptured membranes PPROM than control group (P<0.0001).These findings were demonstrated graphically for serum ironand serum ferritin levels.

Discussion

The prediction of which pregnancies will end in preterm birth is a reasonable goal for several reasons. First, predicting which women might have a preterm delivery may allow us to initiate appropriate risk – specific treatment. Second, it may help us to define a population of women who are at risk so that we can study a particular treatment. Finally, being able to predict which women will have a subsequent preterm birth may allow us to gain important insights into the mechanisms or pathways that ultimately lead to a preterm birth.[10,15]

Elevated serum ferritin level during the thired trimester are predictive of early spontaneous preterm delivery, possibly because these reflect an acute-phase reaction to sub clinical infection that are closely associated with premature delivery.[8]

Serum ferritin was 19.98±5.6290.50-26.00) and in PPROM group was 31.64±4.31(25.50-40.00), in the control group serum iron was19.44±4.83(12.40-30.20), and serum ferritin was 9.24±5.50(0-19.50). These finding are consistent with the study carried out by Saha *etal*., who found serum ferritin in the preterm labour group was (23.24±12.13), and in PPROM group was (29.44±28.41),compared to control group which was (8.69±3.7), and that carried out by Robert L who found high, but not low,plasma ferritin level, especially at 26 weeks, were strongly associated with subsequent preterm delivery.[1,15]

The possible explanation for higher serum ferritin level in patients with preterm labour and PPROM in this context could be iron overload or latent chorioamnionitis, and as iron overload has been excluded in the study by considering various hematological parameters, thus the high serum ferritin obtained in the preterm and PPROM is most likely a part of acute phase reaction to a sub clinical infection while Gopal *etal.,* reported a negative relation between serum ferritin level and preterm labour.[2,8]

In this study serum iron was significantly higher in control group 19.44±4.83 than in preterm labour 21.79±5.75 and PPROM25.12±11.80 while Kaneshige studied several hematological parameters during pregnancy he observed an increase in serum iron level in the first trimester as compared to that of non-pregnant women, then in third trimester giving a weak inverse correlation between serum iron and period of gestation.

Conclusion

Elevated serum ferritin level could be use as a predictor for prediction of spontaneous preterm delivery and PPROM at high risk of these complication, although it is worth mentioning that a larger study population such conclusion.

Evaluation the Effect of a Different Beta Blockers Agents on Somebody Metabolic Parameters in Patients with Essential Hypertension

Labeeb H. Al-Alsadoon[1], Thamer S. Ali[2], Shihab A. Al-Bajari[3], Aida M. Shafiq[4]

[1]Mosul Technical Institute/Northern Technical University, Mosul, Iraq

Abstract

Background: Hypertension is a common disease characterized by elevation of blood pressure above normal levels .The causes of Hypertension in most individuals cannot actually be determined. It is termed essential hypertension. Initial treatment of Hypertension to decrease blood pressure includes modification of lifestyle and medication. Beta-blockers is the most important antihypertensive agent that is accepted as a first-line antihypertensive agent, but may exert side effects on lipid and glucose metabolism, glucose tolerance and weight.

Method: The study was carried out on 60 individuals;Divided into three groups (A,B and C),they consisted of 20 individuals for each group (10 males +10 females). Three Beta-blockers agents were attended in this study: Propranolol 40 mg for group A, Atenolol 50 mg for group B and nebivolol 5 mg for group C. Systolic, diastolic blood pressure, pulse,HbA1c, Lipid Profile and BMI measured at two interval first at starting treatment second 3 months later.

Results: Results of group A showed significant decrease of pulse, SBP,DBP, HDL-c, high significant increase in AI, significant increase in Hb A 1c, TG,VLDL-c, BMI . No significant of TC and LDL-c. While the results of group Bshow significant decrease of pulse, SBP, DBP, and HDL-c, significant increase inHb A 1c, TG,VLDL-C, AI and BMI. No significant of TC and LDL-c. whereas results of group C showed a significant decrease in SBP, DBP and pulse, all other metabolic profiles showed no significant changes.

Conclusion: The current study concluded that Propronalol 40 mg Atenolol 50 mg and Nebivolol 5 mg were effective antihypertensive that decrease SBP, DBP, Heart rate with Nebivolol have favorable action on metabolic profile, Propronaloland Atenololcauseun favorable action on metabolic profile, but still used as antihypertensive.

Keywords: *Blood Pressure, Lipid Profile, HbA1c, BMI.*

Introduction

Hypertension is a common age progression disease characterized by an elevation of blood pressure above normal levels. It includes systolic SBP or diastolic DBP or both [1]. American College of Cardiology–American Heart Association 2017 Hypertension Guideline defined Hypertension as blood pressure(systolic) 130 mm Hg or more and or a diastolic 80 mm Hg or more[2] The causes of Hypertension in majority of individuals cannot be determined. It is termed Essential hypertension which a arising from many environmental, behavioral and genetic, factors other factors, such, stress, diabetes, obesity, life style, high sodium salt intake, and uses of medications, may increase incidences of hypertension.[3]

Beta-blockers is the most important antihypertensive agent, the exact mechanism of action of beta blockers is incompletely understood, Basically, antagonize catecholamines action on the beta-adrenoreceptors(β1, β2, β 3.)These blocked contribute to the therapeutic cardiac action, side effect,toxicity.[4] Blockers agents differ in their clinical action, duration, selectivity to receptors, vasodilating properties, intrinsic sympathomimetic activity (ISA)[5] . Blockers have been classified as nonselective first-generation (e.g.,

Propranolol), cardioselective β_1-blockers second-generation (e.g., Atenolol),third-generation β-blockade vasodilatory(e.g.Nebivolol) [6]Beta blockers is widely accepted as the first-lineantihypertensive agent in last four decades [7], Using Beta-blockers may exert an side effects on, lipid metabolism,glucose metabolism and tolerance, insulin action,weight[8].

Dyslipidemia is characterized by elevated triglycerides, fatty acids, diclaine HDL with dysfunction, increased slightly or normal (LDL)low-density lipoprotein cholesterol level with increased small dense LDL. Drugs such asbeta-blockers were found to alter lipids profile [9].Beta-blockers have effects on glucose metabolism,not all agents have same effect[10]. Therefore,it is important to select the agent not adversely worsen the glycemic state [11].

Overweight and obesity was health problems that threatening lifeand can induced serious diseases including hypertension[12] .Many guidelines introduced to measure obesity the most recent one is body mass index BMI thatis based on weight,height[13].

Materials and Method

Study Groups: This study include 60 individuals with Primary hypertension, no history of diabetes, hyper lipedemia, and not obese,divided into three groups A(Propranolol 40),B(Atenolol 50 mg) and C (nebivolol 5 mg)consist of 20 individuals (10 males +10 females) in each group.

Measurement of Pulse, Systolic and Diastolic Blood Pressure: By multiple reading of pulse, SBP, DBP using electronic devices main of the reading was taken at two interval of the study.

Blood sample collection: Five ml of blood was collected for each individuals at two study interval, The serum is isolated by putting tubes in water bath at 37ºC for 10 min, and centrifuged at 13000xg by refrigerated centerfuge for 10 min. The supernatant was taken to conserve in freezing at -20°c to be thawed for analysis

Measurement of the BMI: BMI of each individuals at two interval of study was calculated according to equation

BMI = Body weight (kg) divided by squared height (meter) = kg/m^2[13].

Measurement of Lipid Profile: The lipid parameter Total cholesterol (TC), Triglycerides (TGs) and high density lipoprotein- cholesterol (HDL-c) were determined by using a standard enzymatic assay (Fortress/UK kit)

Very low density lipoprotein- cholesterol (VLDL-c) and Low density lipoprotein- cholesterol is based on the following formula :VLDL-c = TG/2.2, LDL-c= TC– HLL-c – VLDL-c . [14].

Measurement of HbA1c: Two milliliter was collected in a tube containing ethylene diamine tetra acetate as an anticoagulant for determination of HbA1c for assessment of glyceamic state. Concentration of HbA1cwas measured after hemolysis of the anti coagulated whole blood specimen; assay techniques for HbA1c include affinity chromatography by using Stanbio-laboratory Kit, USA [15].

Statistical analysis of the data: Statistical analysis of data was conducted using SPSS for windows software. Value used as (mian ± standard deviation) Students paired T-Test was applied among pre and post value of the parameters. Difference between data considered significant at $P \leq 0.05$ (*) and high significant at $P \leq 0.01$(**)

Finding: Descriptive data of the individuals included in the study groups are presented in Table 1.

Discussion

Results of Pulse, SBP, DBP in Table 2 showed significant decrease of Pulse, SBP DBP in all groups this result agreement with Rapole *et al.* 2017[161], disagree with Bharati *et al. 2*016[11] This result contributed to antagonistic action ofbeta blockers on beta-adrenoreceptors also Nebivolol with the vasodilatory properties have additional hypotensive effect due to decrease peripheral resistance. this vasdilatation

may produce a reflex to increase heart rate[17] which counteract the additional hypotensive effect .

Results of Hb A 1c in Table 3 show a significant increase of Hb A1c in groups A, Bbut no significant increase in group C. Result of group A is in agreement with most previous study, but the result of group B, and C was in agreement withFonseca VA 2010[18], Bharati *et al.* 2016 [11] showed no significant of atenolol at 12 weeks,but significant after 24 weeks while (Van Bortel *et al.* 2010)[191 showed that Nebivolol have significant improvement in glycaemic state. β-blockers were less opposed a1-activity.It may lead to cause vasoconstriction,.β-blockers may inhibit pancreatic β cells secretion of insulin and worsening glucose homeostasis[11]Nebivolol has favorable action due to its vasodilating properties [18]. Which have a protective for glycemic state Nebivolol a good choose for diabetic patients [20]

Results of Lipid profile in Table 4 show thatresult of group A show a not significant increase in TC, LDL-c, Significant increase in TG, VLDL-csignificant decrease in HDL–c,with high significant increase in AI .This result show worsening lipid control and agreement with Fonseca VA 2010 [18]. Result of groupB show a not significant increase in TC, LDL-c, significant decrease in HDL –c, and significant increase in TG, VLDL-c, AI, this result agreement with Bashi A,Y,D *et al.* 2010)[21]. While group C show a non-significant change of all lipid profile and agreement with Vakharia *et al.* 2018) [7].Beta-blockers agents (traditional) carry wide side effect on lipid homeostasis, not all member have the same effect. Catecholamines stimulatory effect on lipolysis mediated through beta receptors may have a regulatory action on lipid homeostasis which activate sensitive lipase of fatty cell to release free fatty acid and this regulatory action inhibited by beta blocked[7].Beta blockers agents inhibited lipoprotein lipase lead to elevated level of triglycerides, VLDL-cand decrease level of HDL-C, and may lead to exacerbation of preexisting hypertriglyceridemia[22] Nebivolol the vasodilating high selective beta 1 blockers with partial agonistic activity on beta 3 receptors, stimulate the endothelial nitric oxide release a signaling bioactive molecules that play an important function to regulate lipid, glycemic state, which show a favorable or neutral metabolic effect[9] several mechanism proposed that vasodilation reduce oxidative state and some reducing NO degradation, increase insulin sensitivity, control lipid and glycimic state [23]

Results of BMI in Table 6 show that a significant increase in groups A and B while group Cnot significant. (Wharton *et al.* 2018[24] showed that weight gain is associated with beta blockers for first few months as moderate manner and may be not significant later . The mechanism was not exactly know and may be explained by reduce expenditure resting energy, thermal food effect, tolerance of exercise in addition to inhibited process of lipolysis, also insulin resistance contributed weight gain[25] the antagonizes of adrenoceptorβ1, β2by traditional agents contributed this metabolic proses without or less antagonizes of β3 [26] Beta-blockade associated with 4% reduction in basal rate of metabolic and a 25% reduction of food thermic effect[27] Nebivolol has unique action as β -3 agonist with antioxidant properties and vasodilation mediated by release nitric oxide (No)which mediates a regulatory roles on glucose, lipid metabolism. With tolerate and exert less adverse metabolic effects than traditional beta blockers.[9]. Nebivolol, through β3AR, induce lipolysis and upholdthermogenic and mitochondrial genes. The stimulation of lipolysis and the thermogenicsequencer depend on β3 agonist activity and the consequent stimulation of thermogenicsequencer in human adipocytes. [28]

Conclusions

The current study concluded that Propronalol 40 mg Atenolol 50 mg, Nebivolol 5 mg were effective antihypertensive that decrease SBP, DBP,Heart rate, with unfavorable action of Propronalol and Atenololon metabolic profile including HbA1c, Lipid Profile and BMI while Nebivololhave favorable action of above metabolic profile which concluded that Nebivolol is the best beta blocked agent on metabolic profile but may be cause other side effect, Propronalol and Atenolol even cause unfavorable action on metabolic profile but these effect within the normal range of each parameters and still used as antihypertensive in which.That effect can be avoided by patient through change the dietary, physicalactivity and life style.

Call for Papers / Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialities. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper: A general invitation is extended to authors to submit papers papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article as attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your Affiliation (designations with college address)
- Abstract
- Key words
- Introduction or back ground
- Material and Methods
- Findings
- Conclusion
- Acknowledgements
- Interest of conflict
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file

All articles should be sent to: **editor.ijphrd@gmail.com**
