## EXECUTIVE EDITOR

**Prof. Vidya Surwade**

Deptt. of Community Medicine, Dr Baba Saheb Ambedkar, Medical College & Hospital, Rohini, Delhi

## INTERNATIONAL EDITORIAL ADVISORY BOARD

1. **Dr. Abdul Rashid Khan B. Md Jagar Din** (*Associate Professor*)  
Department of Public Health Medicine, Penang Medical College, Penang, Malaysia
2. **Dr. V Kumar** (*Consulting Physician*)  
Mount View Hospital, Las Vegas, USA
3. **Basheer A. Al-Sum**,  
Botany and Microbiology Deptt., College of Science, King Saud University,  
Riyadh, Saudi Arabia
4. **Dr. Ch Vijay Kumar** (*Associate Professor*)  
Public Health and Community Medicine, University of Buraimi, Oman
5. **Dr. VMC Ramaswamy** (*Senior Lecturer*)  
Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur
6. **Kartavya J. Vyas** (*Clinical Researcher*)  
Department of Deployment Health Research,  
Naval Health Research Center, San Diego, CA (USA)
7. **Prof. PK Pokharel** (*Community Medicine*)  
BP Koirala Institute of Health Sciences, Nepal

## NATIONAL SCIENTIFIC COMMITTEE

1. **Dr. Anju D Ade** (*Professor*)  
Community Medicine Department, SVIMS, Sri Padamavati Medical College, Tirupati,  
Andhra Pradesh.
2. **Dr. E. Venkata Rao** (*Associate Professor*) Community Medicine,  
Institute of Medical Sciences & SUM Hospital, Bhubaneswar, Orissa.
3. **Dr. Amit K. Singh** (*Associate Professor*) Community Medicine,  
VCSG Govt. Medical College, Srinagar – Garhwal, Uttarakhand
4. **Dr. R G Viveki** (*Associate Professor*) Community Medicine,  
Belgaum Institute of Medical Sciences, Belgaum, Karnataka
5. **Dr. Santosh Kumar Mulage** (*Assistant Professor*)  
Anatomy, Raichur Institute of Medical Sciences Raichur(RIMS), Karnataka
6. **Dr. Gouri Ku. Padhy** (*Associate Professor*) Community and Family  
Medicine, All India Institute of Medical Sciences, Raipur
7. **Dr. Ritu Goyal** (*Associate Professor*)  
Anaesthesia, Sarswathi Institute of Medical Sciences, Panchsheel Nagar
8. **Dr. Anand Kalaskar** (*Associate Professor*)  
Microbiology, Prathima Institute of Medical Sciences, AP
9. **Dr. Md. Amirul Hassan** (*Associate Professor*)  
Community Medicine, Government Medical College, Ambedkar Nagar, UP
10. **Dr. N. Girish** (*Associate Professor*) Microbiology, VIMS&RC, Bangalore
11. **Dr. BR Hungund** (*Associate Professor*) Pathology, JNMC, Belgaum.
12. **Dr Sartaj Ahmad**, PhD Medical Sociology, *Associate Professor*,  
Swami Vivekananda Subharti University Meerut UP India
13. **Dr Sumeeta Soni** (*Associate Professor*)  
Microbiology Department, B.J. Medical College, Ahmedabad, Gujarat, India

## NATIONAL EDITORIAL ADVISORY BOARD

1. **Prof. Sushanta Kumar Mishra** (*Community Medicine*)  
GSL Medical College – Rajahmundry, Karnataka
2. **Prof. D.K. Srivastava** (*Medical Biochemistry*)  
Jamia Hamdard Medical College, New Delhi
3. **Prof. M Sriharibabu** (*General Medicine*) GSL Medical College, Rajahmundry,  
Andhra Pradesh
4. **Prof. Pankaj Datta** (*Principal & Prosthodontist*)  
Indraprastha Dental College, Ghaziabad

## NATIONAL EDITORIAL ADVISORY BOARD

5. **Prof. Samarendra Mahapatro** (*Pediatrician*)  
Hi-Tech Medical College, Bhubaneswar, Orissa
6. **Dr. Abhiruchi Galhotra** (*Additional Professor*) Community and Family  
Medicine, All India Institute of Medical Sciences, Raipur
7. **Prof. Deepti Pruthvi** (*Pathologist*) SS Institute of Medical Sciences &  
Research Center, Davangere, Karnataka
8. **Prof. G S Meena** (*Director Professor*)  
Maulana Azad Medical College, New Delhi
9. **Prof. Pradeep Khanna** (*Community Medicine*)  
Post Graduate Institute of Medical Sciences, Rohtak, Haryana
10. **Dr. Sunil Mehra** (*Paediatrician & Executive Director*)  
MAMTA Health Institute of Mother & Child, New Delhi
11. **Dr Shailendra Handu**, *Associate Professor*, Phrma, DM (Pharma, PGI  
Chandigarh)
12. **Dr. A.C. Dhariwal**: *Directorate* of National Vector Borne Disease  
Control Programme, Dte. DGHS, Ministry of Health Services, Govt. of  
India, Delhi

**Print-ISSN:** 0976-0245-**Electronic-ISSN:** 0976-5506, **Frequency:** Quarterly  
(Four issues per volume)

**Indian Journal of Public Health Research & Development** is a double blind peer reviewed international journal. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned International Standards Serial Number (ISSN) and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMCare. The journal is now part of DST, CSIR, and UGC consortia.

## Contents

---

---

Volume 11, March 03

March 2020

1. Development and Validation of a Questionnaire on Eating Behaviour for School Children and its Correlation with Nutritional Status.....1  
*A. Ayesha Fathima, T.H. Hema, A.J. Hemamalini*
2. Occupational Varicella outbreak at a Tertiary Care Hospital: An Insight.....7  
*Abhisek Mishra, C.M. Singh, Binod Ku Pati, Barkha Rani Beck, Hari Krishnan Ashokan*
3. An Exploratory Study To Identify Factors Affecting Non Compliance To Dots Therapy Among Tb Patients At Selected Dots Centre Vadodara ..... 13  
*Akash S. Patel, Miss. Varsha Hun, Mr. Adithya S.*
4. Assessment of Cognitive Impairment among Elderly in the Selected Rural Community, Kancheepuram District, Tamil Nadu ..... 19  
*Akila K., Divya R., Preethianushya M., Aravindhan B., Rogina J.S. Savarimuthu*
5. Safety and Tolerability of Two Different Formulations of Mycophenolate (Mycophenolate Mofetil and Mycophenolate Sodium) among Patient with Connective Tissue Disease Associated Interstitial Lung Disease (CTD-ILD) in a Tertiary Care Hospital.....22  
*Amrut Kumar Mohapatra, Pratima Singh*
6. Assessment of Awareness of Parents on Importance of Dental Care in Pediatric Patients in Ethnic Tamil Population .....27  
*Anandhi D., R. Bharanidharan, Lekshmy Jayan, Ramya R., K. Rajkumar, R. Hemalatha*
7. Study of Total Time Taken for OPD Billing Process in a Multi-Specialty Hospital .....32  
*Anil Pandit, Savita Prashar*
8. Sleep Quality and Glycemic Control among Patients with Type II Diabetes Mellitus .....41  
*Anju Babu, Sabitha V Janardhanan, Sreevidhya R., Sruthy K.S.*
9. A Comprehensive Break Even Analysis of MRI and CT Unit of a Tertiary Care Hospital in Sikkim.....47  
*Ankit Singh, Priya Ravi, Soniya Joseph*
10. A Descriptive Survey on the Consumption of Sweetened Beverages and Contributing Factors among Adolescents in Selected PU Colleges at Mangaluru .....53  
*Anu Joseph, Anuja Susan Varughese, Archana P.S., Ashigha Anil Kumar E., Aswathi P., Athira Anto, Anju Ullas*

## II

11. Effect of Smoking and Tobacco Chewing on Superoxide Dismutase Activity.....57  
*Utkarsh Yadav, Junaid Ahmed, Nandita Shenoy, Nanditha Sujir, Ceena Denny*
12. A Study of Young Adults' Intention towards Genetically Modified Foods: Mediating Effect of Health Belief .....63  
*Avinash Rana, Vishal Soodan*
13. Assessment Of Stress Among Who Take Care Of Elderly Individuals At Home In Selected Rural Community At Kanchipuram Distrect, Tamil Nadu, India. ....69  
*B. Indra, K. Gowri Lakshmi, S. Saritha, G. Jayashree, M. Yagajeyanthi*
14. Life beyond the Diagnosis of Breast Cancer: A Qualitative Study on the Lived Experiences of Breast Cancer Survivors .....73  
*Binsha Pappachan C., Fatima D'Silva, Safeekh A.T.*
15. A Study of Prevalence of Type 2 Diabetes Mellitus among Adults in an Urban Population of Eluru: POT2DIE Study.....78  
*Chandrasekhar Vallepalli , Chandra Sekhar Kalevaru, Balaraju Ratna, U. Vijaya Kumar, Ch. Rama Mohan, P.G. Deotale*
16. A Comparative Study to Assess the Academic Performance and Factors Affecting it among Higher Secondary School Students in Both Rural and Urban Areas of Vadodara.....84  
*Chetana Patel, Rajesh Joseph, Nirmal Raj*
17. Applications of Chitosan in Dentistry .....89  
*Chitharanjan Shetty, Aditya Shetty, Shishir Shetty, Gurmeen Kaur, Mithra N. Hegde, Lakshmi Nidhi*
18. Health, Sanitation and Hygienic Problems among Women Travellers in Nepal .....96  
*Devika S., Sreenath Muraleedharan K.*
19. A Study to Assess the Level of Knowledge on Home Management of Diarrhea among Mothers .....100  
*Divya R., Nandhini T., Pradeep Raj, Subbulakshmi S.*
20. Autonomic Function Tests in Chronic Obstructive Pulmonary Disease (COPD) and their Correlation with Disease Severity .....104  
*Ganesan R., Gaur G.S., Karthik S., Vishnukanth*
21. A Cross Sectional Study on Smartphone Addiction among Students in Ayapakkam, Thiruvallur District, Tamil Nadu, 2018 .....110  
*Gideon J.I., Mosoniro Kriina, Athira Venugopal, Minu Maria Mathew, Boopathi K., Vasna Joshua*
22. A Study to Assess the Effectiveness of Health Teaching Programme on Knowledge Regarding Stem Cell Collection, Preservation & its Benefits among Student Nurses of Selected Nursing Colleges of Vadodara.....116  
*Ishita P. Shah, Vruti Patel, Robby Solanki*
23. A Study to Assess the Level of Nomophobia among Students at Sumandeep Nursing College, Vadodara with a View to Develop an Information Booklet.....121  
*Ismail P.A., Darshni Patel, Harika Patel, Feni Patel, Drashti Patel*

24. A Study on Drug Utilization in Hypertension in Medical Care Hospital..... 125  
*Jalpa Suthar, Priyal Shah, Krupali Patel, Pankti Pathak*
25. A Retrospective Study to Compute the Prevalence of Pneumonia and its Associated Risk Factors among Children in Selected Tertiary Care Hospital, Kelambakkam, Kancheepuram, Tamilnadu, India..... 131  
*Jegin P., Dinesh Kumar M. , Dayana J., Elakiya E., Subbulakshmi S.*
26. A Comparative Study to Evaluate Early Postoperative Complications and Short-Term Quality of Life Assessment Between Stripping and Endovenous Laser Therapy in the Treatment of Chronic Venous Insufficiency Patients: A Study From North India ..... 134  
*Jitendra Kumar Kushwaha, Ankit Gupta, Pranav Yadav, Abhinav Arun Sonkar*
27. Risk Assessment of Catheter Associated Urinary Tract Infection among Catheterised Patients at Selected Hospital at Mangaluru ..... 141  
*Jomol Johny, Joseymol Joy, Jositta Reji, Juby Kurian, Keerthana K.R., Indumathi*
28. Evaluation of Serum Level of RANTES among Vitiligo Patients before and After Treatment by Fractional Carbon Dioxide Laser ..... 145  
*Hisham A. Shokeir, Hanaa Emam, Yasmin Abdel Latif, Ola Omar Abou Zeid, Mai Shoeib, N.S. Hanafy, Mohamed Mohsen Soliman*
29. Effectiveness of Myotherapy on Stress among Patients Subjected to Major Orthopaedic Surgery at a Tertiary Care Hospital, South India..... 152  
*K. Sathiya, Vijayasamudeeswari, Mohan kumar*
30. Impact of Cranial Electrical Stimulation on Statistical Indices of Time Domain Parameters of Heart Rate Variability in Hypertensive Individuals ..... 157  
*Khyatee, Aparna Sarkar, Rajeev Aggarwal, Inder singh*
31. Role of Hip Complex Re-Training Exercises on Patients with Chronic Low Back Pain ..... 164  
*Krishna Kumar Singh, Swapnil Ramteke, Subrat Samal*
32. Assessment of the Prevalence of Febrile Seizure and Associated Factors among Children: A Retrospective Study..... 169  
*L. Jisha, P. Jayaprabha, S. Gnanawel, K. Gowtham Kumar, P. Kogila*
33. Effectiveness Practice-intervention Based Project on Knowledge, Attitude and Practice Compliance to Infection Control Measures and Factors Predicting Non-compliance among Nurses Working in Tertiary Care Hospital, Mangalore, India..... 172  
*Larissa Martha Sams, Shalini Lidwin Fernandes, Diana Lobo, Amitha P. Marla*
34. Awareness of Oral Complications of Diabetes Mellitus in Diabetes Patients: A Questionnaire Study..... 179  
*Lekshmy Jayan, A. Ramesh Kumar, R. Ramya, Monika Srivastav*
35. Effectiveness of Nursing Intervention on Knowledge of Family Caregivers of Patients with Paraplegia..... 184  
*Liny Joseph, C. Kanniammal*
36. Effect of Video Assisted Teaching on Usage of Plastics and its Impact on Environment among Adolescent in a Selected School, Kanchipuram District, Tamil Nadu..... 189  
*M. Saranbharathi, T. Sowmiya, D. Moses Rathnakumar, M. Pradheepa J., Shenbagaprabha N.*

#### IV

37.	Assessment of Risk of Fall among Elderly .....	192
	<i>M. Vijay, S. Mohanapriya, V. Vinodhini, R. Divya, Sathiyapriya V.</i>	
38.	Recharging Ground Water Using Age– Old Traditional Mechanisms.....	196
	<i>Manbeer Kaur, Mona Prashar</i>	
39.	A Study on Work Life Balance and Stress of Female Employees in IT Sector: A Study with Special Reference to Employees in Chennai.....	202
	<i>Mary Sudharshini Fernando, M. Kavitha</i>	
40.	Comparison of the Masticatory Efficiency and Biting Force between Conventional Complete Dentures and Implant Retained Over Dentures with Different Types of Attachments .....	207
	<i>Mohammed Abid, Nagesh Bhat, Seema Abdul Gani, Nagarajappa R.</i>	
41.	Concept Mapping as a Clinical Learning Strategy on the Competency Scores of Nursing Students .....	214
	<i>Jasmine Joseph, Hemalatha R.</i>	
42.	A Study on Nutritional Value and Sensory Evaluation of Wheat Gateaux by Addition of Jaggery.....	219
	<i>John Williams, H.M. Moyeenudin, Manivel K., Mark Keith Faraday</i>	
43.	Thyroid Disease Classification Using Decision Tree and SVM.....	224
	<i>K. Dharmarajan, K. Balasree, A.S. Arunachalam, K. Abirmai</i>	
44.	An Empirical Study on Impact of Traffic Pollution on Health of Roadside Vendors and its Effects on Their Business .....	230
	<i>Lavanya A., Kiruthikasri S., Aishwarya H.S., Surendarnath K., Shashank S., G. Devakumar</i>	
45.	A Study to Analyse the Reliability and Validity of the Smartphone Goniometer Application (G-PRO) by Measuring the Elbow Joint Range of Motion.....	235
	<i>Maheshkumar P.G., Harihara Subramanyan, Swapna N., J. Jannet Merlin</i>	
46.	Water Quality Assessment of Kanchipuram Temple Pond by Using Statistical Method and Water Quality Index .....	241
	<i>Meenakshi Perumal, Sriram Gopalsamy</i>	
47.	Awareness of Ceramic Implants among Dentists in Tamilnadu .....	248
	<i>Mohamed Thamemul Ansari K.A., Dhanraj M.</i>	
48.	Problems of Nosocomial Infection in Newly Upgraded and Newly Opened Government Health Institutions and their Management .....	253
	<i>Naresh Vashist, Raveen Chauhan, Kumari Kamlesh</i>	
49.	A Study on Brand Awareness and Customer Engagement .....	258
	<i>P. Vanitha, S. Subramanian</i>	
50.	Linezolid Resistantclinically Significant Isolates of Coagulase Negative Staphylococci: An Emerging Therapeutic Concern.....	263
	<i>Priyanka Chaturvedi, Anita Pandey</i>	

51.	Quality Characteristics and Antioxidant Properties of Bread Supplemented with Iron Rich Black Strap Molasses.....	269
	<i>R. Balakrishnaraja, P. Pavithra, C. Sivapriya, K. Saranya, T. Vishnu, J. Bindhu</i>	
52.	Personal Health Record Using Cloudcomputing Technology.....	275
	<i>R. Sumithra, V. Jayalakshmi, R. Priya</i>	
53.	Knowledge, Coverage and Usage Patterns of Health Insurance in Rural South India.....	282
	<i>Rahul Hegde, Karthamada Ganapathy Kiran, Nanjesh Kumar S.</i>	
54.	Role of Intrinsic Motivation in Eating Habits and Physical Activity in Adults with Primary Hypertension	287
	<i>Rajkumar Eslavath, Madhavaram T. Kishore, P. Madhira</i>	
55.	The Combination of Transcranial Direct Current Stimulation (tDCS) and TENS - Its Effectiveness on Pain and Functional Outcomes in Knee OA Patients: A Pilot Study .....	295
	<i>Rekha Chaturvedi, Sivachidambaram Kulandaivelan</i>	
56.	A Study on Epidemiology and Its Models.....	299
	<i>S. Balambigai, S. Siva Shankar, Gayatri Parasa, M. Mary Sujatha</i>	
57.	Ideal Self-Concept Factors influencing on Emotional Intelligence among School Teachers and Nurses.....	305
	<i>S. Antonysamy, J.M. Asgarali Patel, A. Velayudhan</i>	
58.	A Study to Assess Prevalence of Cysts and Tumours in the Oral Cavity: A Retrospective Study .....	311
	<i>S. Bhuvaneshwari, Silpiranjan Mishra</i>	
59.	Neural Network Based Implementation of Corner Detection for Biomedical Application in Computer Vision.....	314
	<i>Santosh M. Herur, S.S. Kerur, Kalmeshwar N. Hosur</i>	
60.	Effectiveness of Ultrasound Therapy on Oral Submucosal Fibrosis.....	320
	<i>Senthilkumar S., Chitra S., Vijayaraghavan R., V. Hemaashree, Subhavani P.</i>	
61.	Clinicomicrobiological Profile of Gram Negative Bacterial Infections in Adult ICU's of a Tertiary Care Centre .....	326
	<i>Shalini Shenoy Mulki, Sevitha Bhat, Pooja Rao</i>	
62.	Comparitive Evaluation of pH and Calcium Ion Release in Newer Calcium Silicate Based Root Canal Sealers.....	332
	<i>Sunpreet Kaur, Navneet Kukreja, Abhishek Bansal, Anamika Thakur, Ankita Sharma, Aayush Malhotra</i>	
63.	Tobacco Prevalence and Usage Pattern in the Urban Slum of Visakhapatnam .....	337
	<i>Surada Chandrika, Chepuru Rajyalakshmi</i>	
64.	Psychological Health in Respect of Self Esteem among Rural, Urban and Semi Urban College Students of Different Genders of East Midnapore District: A Cross Sectional Study .....	343
	<i>Susmi Biswas, Sourav Gangopadhyay, Jayeeta Majumder</i>	
65.	Utility of High Fidelity Simulation Training in Improving Adherence to Critical Actions During Cardiopulmonary Arrest.....	348
	<i>Parag Rishipathak, Monesh Bhandari, Anand Hinduja</i>	

## VI

66. Effectiveness of Video Assisted Teaching on Knowledge Regarding Home Care Management among Patients Diagnosed with Acute Coronary Syndrome .....352  
*Parvathy Chandran, Binutha V.P.*
67. Assess the Prevalence of Type 2 Diabetes Mellitus among Adults at Selected Areas in Kanchipuram District, Tamilnadu, India.....358  
*Pavithra M., Kavitha S., Chindiya J., Yogalakshmi R., Steffepressill A.A., Haripriya R., Shenbagaprabha N.*
68. Assessment of Self Esteem and Peer Pressure among Adolescents in Selected College of Kanchipuram District, Tamil Nadu .....360  
*Pema Drema Gyamo, P. Nivetha, P. Pavithra, S. Nandhini, Metha J.*
69. A Modified Technique for Establishing the Occlusal Plane in Complete Denture Prosthesis.....364  
*Pradeep S.*
70. Quality of Life among Survivors of a Disaster in Kodagu District, India.....367  
*Prakash B., Jose Jom Thomas, Praveen Kulkarni, Narayana Murthy M.R.*
71. Surgical Approaches to Infra Orbital RIM Fractures: A Review Literature .....373  
*Prakash Dhanavelu, Senthilnathan, Vijay Aravind R.*
72. Caffeine: Benefits, Risks and Effects-A Review .....377  
*Praveen Kumar Gupta, Himashankari B., Anwasha Sinha, Kandi Arvind Reddy, Priyadharsini V., Lingayya Hiremath, Ajeet Kumar Srivastava*
73. Internet Addiction among Medical Postgraduate Students: A Cross- Sectional Study.....383  
*Ishan Pathak, Preet P. Khona*
74. Sickness Absenteeism and Associated Factors among Foundry Workers in Belagavi, Karnataka: A Cross Sectional Study .....388  
*Preet P. Khona, Sulakshana Baliga*
75. The Burden Leprosy Diseases in India: A Study with Special Reference to Tamilnadu and their Districts .393  
*Dr. R. Hariharan*
76. Post Endodontic Treatment in Diabetic Patients and Correlation with their Glycemic Status: A Study .....399  
*R. Jagadish Rajkumaar, Gheena S.*
77. A Descriptive Study to Assess the Knowledge, Practice and Attitude on Iron Deficiency Anemia among Adolescent Girls at Selected Private School, Kanchipuram Dt, Tamilnadu, India .....404  
*R. Renuga, S. Sivaranjani, S. Jeevitha, S. Ashwin Kumar, Subbulakshmi S.*
78. Effectiveness of Structured Teaching Programme Regarding Weaning Practices among Primipara Mothers in a Selected Area at Kanchipuram District, Tamilnadu, India.....409  
*R. Vinothini, M. Deepan Babu, S. Vasuki, T. Nandhini, J. Nancy Victoria*
79. Anthropometric Profile of Mentally Challenged Children .....413  
*Syed Tariq Murtaza, Ashish Kumar Katiyar, Farkhunda Jabin*

80.	The Relationship of Low Birth Weight Babies with Stunting in Toddlers Aged 12-36 Months in Bogor Regency, 2019 .....	420
	<i>Ari Wijayanti, Ratna Djuwita</i>	
81.	Bio-monitoring of Atmospheric Heavy Metals Deposited on Selected Tree Leaves in Kanchipuram, Tamilnadu .....	426
	<i>Sumathi Ramesh, Sriram Gopalsamy</i>	
82.	Unmet Need of Objective Monitor to Evaluate Performance Status in Lung Cancer Patients .....	432
	<i>Reema Shyamsunder Shukla, Yogender Aggarwal, Shreeniwas S. Raut, Rakesh Kumar Sinha</i>	
83.	The Drug Compliance and Factors Influencing Therapeutic Regimen among Senior Citizen .....	437
	<i>Regina Antony, Shali Mol U.S, Revathy R. Nair, Rintu Thomas</i>	
84.	Competency on Breast Feeding among Mothers of High Risk Babies and Practice of Nurses in Assisting the Mothers with a View to Develop A Protocol .....	442
	<i>Sanaya Suresh, Anila. K.P., Rafia Islam</i>	
85.	Nutritional Status of Adolescent Girls Residing in the Urban Field Practice Area of S.N. Medical College, Bagalkot .....	448
	<i>Vasundara S. Gayakwad, Gowri Shankar</i>	
86.	A Comparitive Study on Road Traffic Accident in Kerala and Tamil Nadu: A Secondary Data Analysis ...	453
	<i>N. Venkata Abinaya, Saravanan Govindaraj</i>	
87.	Evaluation of Effective Dose and Associated Radiation Risks in Common Computed Tomography Procedures .....	460
	<i>Abdul Kayyum, Nitika C. Panakkal, Arathy Mary John</i>	
88.	A Correlative Study to Assess the Knowledge and Practice of Housewives Regarding Householdwaste Management in Selected Rural Community at Mangalore with a View to Provide an Information Pamphlet .....	466
	<i>Abin Baby, Shycil Mathew</i>	
89.	Role of the Internet in the Health-Seeking Behaviour of Parents of Children Under-Five During Fever .....	471
	<i>Abinaya Sivakumar, Padmasani Venkatramanan, Sarala Premkumar</i>	
90.	Poverty and Access to Medicine: A Medico Legal Study.....	474
	<i>Ajay Kant Chaturvedi, R.L. Koul</i>	
91.	To Assess Cases of Trigeminal Neuralgia.....	479
	<i>Alankrita Chaudhary, Kuldeep Dhanker, Sachin Chand, Pallavi Sharma, Priyanka Bhushan</i>	
92.	Early Postoperative Pain Intensity after Laparoscopic Cholecystectomy and Associated Risk Factors.....	483
	<i>Amrita Panda, Jagadish Chandra Mishra, Ansuman Panigrahi, Sowyma Kandregula, Riddhika Majumder</i>	
93.	Determination of Efficacy of Different Apex Locators.....	488
	<i>Anu Vashisht, Ekta Choudhary, Sagar Chaudhary, Ritu Sharma, Rukhsar Anjum, Aashima Kulshreshtha</i>	
94.	Correlation of Cancer Antigen 125 Levels with Adnexal Masses .....	491
	<i>Atmajit Singh Dhillon, Neha Vashishat, Bimal K. Agrawal</i>	

## VIII

95. Dependence of Demographic Indicators upon Government Expenditure on Health: A Study of the Indian States .....496  
*Bandita Deka*
96. Correlation of Total Serum Calcium and Ionic Calcium Levels with Severity of Birth Asphyxia.....503  
*Kusum Mahajan, Bharat Bhushan Singh, Charu Chandwani, Vikramjot Singh*
97. Usage of Complementary Alternative Medicine among the Patients Attending Tertiary Care Hospital.....509  
*Bodhi Sri Vidya Vennam, Srinivasa Reddy. Pulusu, N.G. Nagamani, R.V. Manasa*
98. Adoption of Health Management Information System (HMIS) among ESIC Healthcare Professionals in Southern Districts of Tamil Nadu: An Integrated Model.....514  
*C. Sriram, V. Mohanasuundaram*
99. Malpositioning of Central Venous Catheter from Right Internal Jugular Vein into Ipsilateral Vertebral Vein: A Rare Phenomenon .....519  
*Chashamjot Bawa, Laveena Dabla, Jyoti Raina, Himank Chadha*
100. Prevalence of Nomophobia and its Association with Loneliness, Self Happiness and Self Esteem among Undergraduate Medical Students of a Medical College in Coastal Karnataka.....523  
*Chethana K., Maria Nelliyanil, Manjula Anil*
101. Silver Diamine Fluoride in Arresting Dentinal Caries in School Children.....530  
*Shivani Daga, Vabitha Shetty, Amitha Hegde*
102. Study of Effects of Formalin Exposure in Dissection Hall on Pulmonary Function Tests of Medical Students .....536  
*Shrirang N. Patil, Milind Thorat*
103. Effectiveness of an Animation Video on Behavioral Response to Pain among Toddlers During Immunization in a Selected PHC at Mangalore India .....542  
*Bijimol N.J., Shycil Mathew*
104. Marsupialization for the Management of Unicystic Ameloblastoma-Retrospective Study .....548  
*Srikar M.V., Sangamesh N.C., Vidya K.C. Rao, Jugajyothi Pathi*
105. Sepsis Unfolding a Very Large Pheochromocytoma in an Elderly Patient: A Case Report .....553  
*Subhash Chandra Dash, Naba Kishore Sundaray, Debabrata Kumar Sabat, Urvashi Ghosh, Promod Kumar Tudu, Sohail*
106. Assessment of the Level of Awareness on Negative Impact on Playing Mobile Games among High School Students in Selected Higher Secondary School, Kanchipuram District, Tamilnadu.....558  
*Rebetha S., Vaishnavi R., Robin Jayaraj C., Divakar Rao G., T.R. Manjula*
107. The Cut that Scars: Exploring Female Genital Mutilation in Somalia with Reference to Select Texts.....562  
*Reshma Sarah Easo, Sreenath Muraleedharan*
108. Development of Rapid, Sensitive and in-expensive Point of Care Diagnostic Method for Brucellosis in Dairy Cattle at Resource-Limited Areas .....566  
*Revathi Poonati, Prudhvi Chand Mallepaddi, Rudrama Devi Punati, Soumendra Nath Maity, Krishna Satya Alapati, Kavi Kishor B. Polavarapu, Rathnagiri Polavarapu*

109. Effect of Recreational Therapy on Attention and Depression in School Children with Learning Difficulties .....573  
*Rutuja Amit Lalingkar, Trupti Saurabh Yadav, Sayali Shreenivas Gijare*
110. Human Papilloma Virus Infection Status and Oral Cancer Incidence in South India–Lack of Evidence and its Current Impacts .....579  
*S. Karthika Nagarajan, Usha Subbiah*
111. Assessment of Knowledge, Attitude and Practice on Immunization among Primi Mothers of Children .....583  
*S. Aswini, S. Tharaniya, R.J. Joey Persul, B. Avinash Lingam, P. Kogila*
112. Fluorosis: An Endemic Health Disease .....588  
*Sakshi Chaturvedi, Chakrapani Chaturvedi, Ashutosh Dadhich*
113. Incidence and Recurrence of Dental Caries after Repeated Application of Topical Fluoride Gel on Permanent Dentition of School Children of a School-based Dental Program in Nerul: A Retrospective Study .....591  
*Shatakshi Srivastava, Shrirang Sevekar, Sabita M. Ram, Mihir Jha, Laresh Mistry, Vaibhav P. Thakkar, Sujata Hirve*
114. Evaluation of Balance Control and Pattern of Muscle Activation from Functional Perspectives Across the Ages– An Observational Study Protocol .....595  
*Singh Sonia, Kaur Ravinder, Sharma Sorabh, Multani Kaur Narinder, Sonia Singh*
115. Dental Stem Cells Beyond Dentistry .....600  
*Sona Baburathinam, Vidyarani Shyamsundar, Aravindha Babu N., Masthan K.M.K.*
116. Relationship between Maxillary Molar Root Tips and Maxillary Sinus Floor Using CBCT .....605  
*Suhas Manoharan, Jayanth Kumar V.*
117. To Study the Effect of Rotator Cuff Exercises on Tennis Elbow .....610  
*Swapnil Ramteke, Subrat Samal*
118. Relationship between Occupational Stress and Resilience .....615  
*S. Vasantha, R. Santhi*

# Development and Validation of a Questionnaire on Eating Behaviour for School Children and its Correlation with Nutritional Status

A. Ayesha Fathima<sup>1</sup>, T.H. Hema<sup>2</sup>, A.J. Hemamalini<sup>3</sup>

<sup>1</sup>Postgraduate, <sup>2</sup>Lecturer, <sup>3</sup>Head of the Department, Department of Clinical Nutrition, Sri Ramachandra Institute of Higher Education and Research, Porur, Chennai, Tamil Nadu, India

## Abstract

**Background:** Eating behaviours in childhood are linked to malnutrition and have found to influence the eating behaviour into adolescence and adulthood.

**Aim:** (i) To develop and validate a questionnaire on the eating behaviour patterns of school children and correlate it with their nutritional status (ii) To test the utility of the questionnaire using the Intra-class coefficient, factor and construct validity.

**Objective:** (i) To develop a self-administered questionnaire on the prevailing eating behaviour patterns among school going children and validate the content using a multidisciplinary team ii) To compare the eating behaviour of school children and the nutritional status of children using anthropometric measures (iii) To test the developed Eating Behaviour Questionnaire for School Children for its factor and construct validity.

**Method:** A questionnaire was developed and validated based on eating behaviour patterns and habits that were prevalent supported by scientific evidence. The validated questionnaire was administered among 462 school going children of age 10 -12 years. Factor analysis, construct validity for the same was performed and correlated with the anthropometric measures.

**Results:** The correlation of BMI verses WHtR was 0.305 and the correlation value between the subsets was  $>0.2$  indicating weak uphill (positive) linear relationship.

**Conclusion:** The Eating Behaviour Questionnaire was found to have an acceptable reliability but the intraclass correlation coefficient was found to be unacceptable and the scores of the questionnaire were found to be independent of BMI and WHtR.

**Keywords:** *Eating behaviour, Body Mass Index, Waist to Height Ratio, Questionnaire, Obesity, Overweight.*

## Introduction

Healthy eating is essential during school going years due to their increasing nutritional needs and because these behaviours are carried forward in the later years of life<sup>[1]</sup>. Eating behavior is a term that encompasses physiologic, psychological, social, and genetic factors influencing a person's meal timing, quantity of food intake, food preference food choice and motives, feeding practices, dieting, and eating-related problems<sup>[2]</sup>.

**Purpose of the Study:** There is a need to find out the type of eating behaviour existing among school children. Though there are many questionnaires that have been widely used across the globe to study the eating behaviour patterns in school children, questionnaire that are formulated to specific geographic areas is limited

**Aim:** (i) To develop and validate a questionnaire on eating behaviour patterns of school children and correlate it with their nutritional status (ii) To test the utility of the

questionnaire using the Intra-class coefficient, factor and construct validity

**Objective:** (i) To develop a self-administered questionnaire on the prevailing eating behaviour patterns among school going children and validate the content using a multidisciplinary team ii) To compare the eating behaviour of school children and the nutritional status of children using anthropometric measures (iii) To test the developed Eating behaviour Questionnaire for School Children for its factor and construct validity.

## Method and Materials

The study employed descriptive research design. The sampling technique employed to carry out the study was multistage cluster sampling. The study was conducted during the period of June – July 2018. Inclusion criteria included students willing to participate, students present on the day of data collection, students of 10 to 12 years age group, students without present or past health issues, students without learning, writing or cognitive disabilities (as indicated by the teacher), students who completed the questionnaire, students who submitted participant and parent informed consent form.

**Development of the Questionnaire:** The initial questionnaire was formulated after a thorough review of publications and literature search and six categories were framed. The questions were close-ended and all the questions were given five options (*always, mostly, sometimes, rarely, never*) to choose from. After the initial setting up of the questionnaire, it was subjected to content validation by a Dietitian, Paediatrician, Academician and Psychologist.

**Pilot Study:** A pilot study was conducted with a sample of n=30. The questionnaire was administered twice within a duration of two weeks to the same participants, to find the reliability of the questionnaire. These samples were excluded from the major study.

**Major Study:** The major study was carried out using 462 samples and. The previously validated Eating Behaviour Questionnaire for School children was administered to N=462 students, it took approximately

15- 20 minutes for the study participants to fill the questionnaire. Height, weight, waist to height ratio of all the subjects were measured and tabulated.

**Informed Consent:** Informed consent was obtained from all the individual participants included in the study.

**Statistical Analysis:** SPSS 22.0 was utilized for examining primary data including descriptive statistics, correlation analysis, factor analysis, independent sample t-test with the end goal to touch base at a more decisive result of the information assembled through the survey.

## Results

The final questionnaire had a total of n=23 questions with each question having five options to choose from. The options given in the questionnaire were *always, mostly, sometimes, rare and never*. Environmental Factors had the minimum mean value (2.664) and Meal Preparation had the maximum mean value (3.488). The analysis showed negative skewness values for Food Responsiveness (-.084), Hygiene (-.125), Meal Preparation (-.271). Meal Timings (.144), Environmental Factors (.438), Eating Problems (.908) were found to be positively skewed. The subsets including Food Responsiveness (-.306), Meal Timings (-.234), Environmental Factors (-.373), Meal Preparation (-.464) had negative Kurtosis and Hygiene (.709), Eating Problems (6.675) had positive Kurtosis.

Extraction values for all the six categories are listed in the communalities and Eigen values for the components were also found along with the% of variance and cumulative% (Table I). Finally, one component was extracted using principal component analysis. The Eating Behaviour Questionnaire for School Children was entered into a 6 factor model and all factor loadings were found to be >0.4 by Principle Confirmatory Analysis method. The communalities of the six subsets ranged between 0.241 and 0.444. Only two factors (Food Responsiveness and Meal Timings) had Eigen values  $\geq 1$  with a total variance of 57.13% the other factors has Eigen values <1.

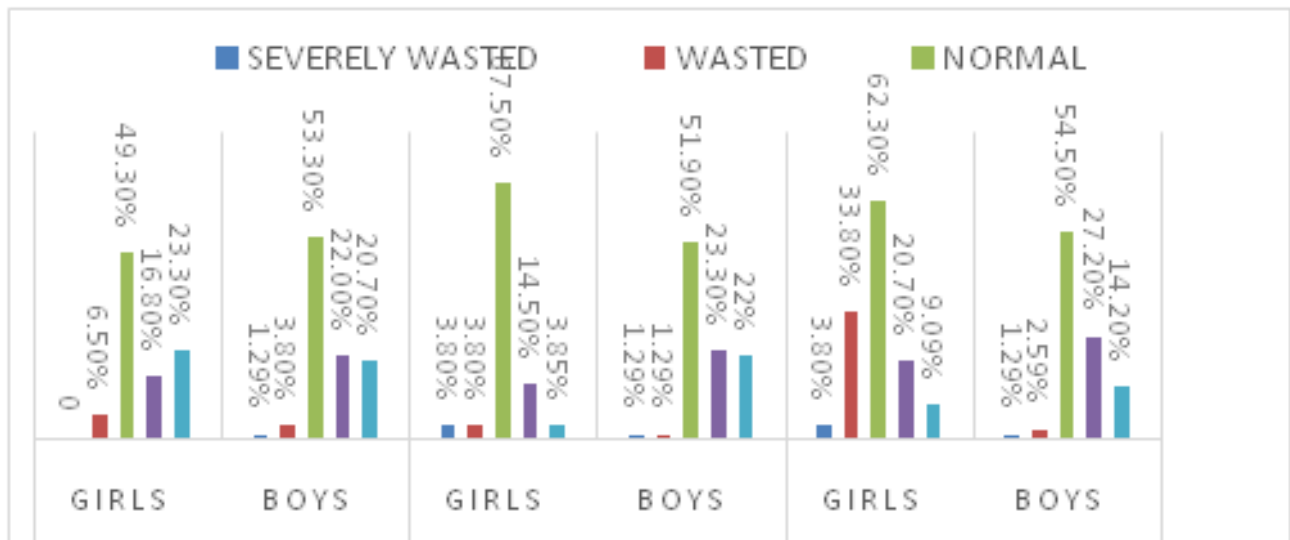

**Table I: Factor analysis - indicating the communalities, eigen values,% of variance and the components extracted (n=462)**

Subsets (N=23)	Communalities	Eigen values	% of Variance	Factor loadings** <sup>a</sup>
Food Responsiveness (n=4)	0.433	2.429	40.475	0.658
Meal Timings (n=4)	0.437	1	16.659	0.661
Environmental Factors (n=4)	0.344	0.737	12.278	0.586
Eating Problems (n=6)	0.53	0.679	11.324	0.728
Hygiene (n=1)	0.444	0.611	10.189	0.666
Meal Preparation (n=3)	0.241	0.545	9.075	0.491

**Note:** \* one component extracted, <sup>a</sup>Extracted using principle confirmatory analysis

**Construct Validity of the Eating Behaviour Questionnaire:** The Kaiser-Meyer-Olkin measure of sampling Adequacy was found to be 0.770 and the Bartlett’s test of sphericity was found to have a significance of 0.000.

The Figure I depicts the percentage of students under each category of BMI including severely wasted, wasted, normal, overweight and obese.

**Figure I Various categories of nutritional status classified according to BMI in relation to their age**

Boys under 12 years of age are seen to have the highest incidence of overweight (27.20%) when compared to all the three age groups. Finally, obesity is higher in girls of 10 years of age with a percentage of 23.30%. It was found that the mean for all age groups was 0.5 with merger differences in the standard deviation. When compared with the different age groups severe wasting was found to be higher among girls. Wasting was found to be higher among girls than boys

among all the three age groups. In obese category both boys and girls were equally distributed among 10 years old, but the incidence was higher among boys compared to girls in 11- and 12-years categories. Figure II depicts the various categories of nutritional status classified based on their BMI in relation to their age, Class I and II obesity according to WHtR is highest in 12 year-old boys and differs among gender based on age. Class III obesity is highest in 11 year-old boys.

Figure II. Various categories of nutritional status

**Classified according to BMI in relation to their age:** The percentage of participants in relationship to BMI and WHtR was analysed and it was noted that only n=52 of the total sample had a normal BMI and WHtR.

Out of n=80 participants who were identified to have a normal WHtR, it was found that according to BMI eight were overweight and six were obese despite normal abdominal fat distribution.

Table II: Cross tabulation of Waist Height Ratio in comparison with their corresponding body mass index (n=462)

Anthropometric Variables		BMI (kg/m <sup>2</sup> ) n (%)					Total
		Severely wasted (<5 <sup>th</sup> percentile) n(%)	Wasted (5 <sup>th</sup> -15 <sup>th</sup> percentile) n(%)	Normal (15 <sup>th</sup> -85 <sup>th</sup> percentile) n(%)	Overweight (85 <sup>th</sup> -97 <sup>th</sup> percentile) n(%)	Obese (>97 <sup>th</sup> percentile) n(%)	
WHtR	Less than 0.426 (normal) n(%)	6(1.29)	8(1.73)	52(12.385)	8(1.73)	6(1.30)	80
	0.426-0.466 (class I obese) n(%)	2(0.43)	2(0.43)	55(13.09)	17(3.68)	11(2.38)	87
	0.467-0.512(class II obese) n(%)	1(0.21)	3(0.65)	90(21.43)	40(8.66)	19(4.11)	153
	More than 0.512 (Class III obese) n(%)	1(0.21)	1(0.21)	63(13.64)	41(8.87)	36(7.79)	142
Total		10	14	260	106	72	462

Table III illustrates the correlation values of all of variables. The WHtR versus BMI was 0.305 and this reflects that the two variables have weak uphill (positive) linear relationship and p-value =.01 indicating that they were significantly related. The correlation value r = 0.314 between meal timing versus food responsiveness shows that there is a weak uphill (positive) linear relationship between them. The correlation value of 0.590 of environmental factors and meal timing indicates a moderate uphill (positive) relationship between these

variables, and the p-value=.01 indicates that they are positively significant. The relationship between eating problem versus food responsiveness, meal timing, and environmental factors are r=0.357, 0.310, 0.314 respectively. This again shows a weak uphill (positive) linear relationship with significant p values. While the relationship of hygiene versus food responsiveness, meal timings, environmental factors and eating problems are 0.273, 0.314, 0.289, and 0.395 respectively this again indicates a weak uphill (positive) linear relationship.

**Table III: Cross tabulation of waist height ratio in comparison with their corresponding body mass index (n=462)**

Anthropometric Variables		BMI (kg/m <sup>2</sup> ) n(%)					Total
		Severely wasted (<5 <sup>th</sup> percentile) n(%)	Wasted (5 <sup>th</sup> -15 <sup>th</sup> percentile) n(%)	Normal (15 <sup>th</sup> -85 <sup>th</sup> percentile) n(%)	Overweight (85 <sup>th</sup> -97 <sup>th</sup> percentile) n(%)	Obese (>97 <sup>th</sup> percentile) n(%)	
WHtR	Less than 0.426 (normal) n(%)	6(1.29)	8(1.73)	52(12.385)	8(1.73)	6(1.30)	80
	0.426-0.466 (class I obese) n(%)	2(0.43)	2(0.43)	55(13.09)	17(3.68)	11(2.38)	87
	0.467-0.512(class II obese) n(%)	1(0.21)	3(0.65)	90(21.43)	40(8.66)	19(4.11)	153
	More than 0.512 (Class III obese) n(%)	1(0.21)	1(0.21)	63(13.64)	41(8.87)	36(7.79)	142
Total		10	14	260	106	72	462

### Discussion

Overall reliability of the questionnaire was found to be acceptable but when each component subset was compared for the intra-class correlation it was concluded that the subsets were dependent on each other with a low reliability index. Similarly, the Cronbach's alpha value was also below 0.5 for all the six categories indicating an unacceptable internal consistency. A study named "Association between eating habits and body mass index (BMI) of adolescents" used Eating Behaviour Questionnaire (EBPQ) among Iranian female students like the present investigations, it was found to have Cronbach's  $\alpha$  and ICC which ranged between 0.55 to 0.78 and 0.67 to 0.89, respectively.<sup>[3]</sup> Similarly, a study conducted to validate child nutrition questionnaire was found to have ICCs ranging from 0.47–0.66 ( $p < 0.001$ ) while for two scores ICCs were  $< 0.4$  ( $p < 0.05$ ) and Cronbach's alpha was 0.50–0.80.<sup>[4]</sup>

The KMO value of other similar questionnaire was also found to be higher than 0.07 and Bartlett's specificity was also found to be significant ( $p < 0.01$ ).<sup>[5, 6]</sup>

Data from UK National Diet and Nutrition Survey that was used in a study on Waist-to-height ratio as an indicator of 'early health risk' outlined that the value for WHtR (0.5) identifies more people at 'early health risk' than does a more complex 'matrix' using traditional boundary values for BMI and WC.<sup>[7]</sup> Similar results were obtained in the present study. However, the proportion of participants by both the method are not same, this is mainly due to the fact that, BMI have been classified into Normal, Underweight, Overweight and Obese, whereas, WHtR is determined based on single cut-off value of 0.5.

In a study children between 6 to 12 years were assessed for their BMI and it was found that the largest numbers of overweight and obese children belong to age group 11 years and also females were more likely to be overweight and obese.<sup>[8]</sup> In another study it was found that overweight and obesity prevalence was more in girls when compared to boys.<sup>[9]</sup> These were similar to the results obtained in the study. A study on "The importance of waist circumference and body mass index in cross-sectional relationships with risk of cardiovascular disease in Vietnam" by<sup>[10]</sup> found that measurements of WC and BMI were correlated. In a study to find "The correlation between eating habits and body mass index (BMI) of adolescents in Karnataka" as per the BMI assessment, it was found that 34% belonged to normal and underweight, 21.44% were obese and 10.66% were overweight. It was also found also that there was no correlation between BMI and eating behaviour.<sup>[5]</sup> In a study to examine how body image, Body Mass Index (BMI), and eating attitudes were related among adolescents aged 13 to 17 years old in Malaysia, it was found that only snacking and convenience as well as emotional eating were shown to be associated with BMI status.<sup>[11]</sup> A study conducted in Spain using EAT 26 Eating Attitudes Test indicate that restrictive eating attitudes and habits can have different effects depending on the BMI and the gender of the subjects.<sup>[12]</sup>

Anthropometric parameters assessed between the age groups show that boys have a much higher prevalence of overweight and obesity when compared to girls. Only about 52 samples in the study had normal BMI and WHtR and there was also prevalence of underweight categories who were found to have a higher WHtR cut off. The BMI and WHtR ratio had a positive

correlation and showed significance between both the variables. When extraction values were computed for sections in the questionnaire all the values were positive and no negative extraction values were found. The BMO and the Bartlett's value for sphericity confirmed that structure of the questionnaire and that the factor analysis was useful for the data along with condition that the correlation matrix would be an identical one. Correlation analysis found that there was no significant relationship between various categories of the questionnaire and the anthropometric measures.

**Conclusion:** The questionnaire was validated using factor analysis and correlation between the variable was found using Pearson's correlation. There was a significant correlation between BMI and WHtR and between the categories of the questionnaire. However, the eating behaviour questionnaire did not significantly correlate with anthropometric measures indicating that they were independent of the anthropometric measures. The results suggested that the questionnaire is validated and thus can be used to assess eating behaviour of school children of age 10- 12 years in the given population.

# Occupational Varicella outbreak at a Tertiary Care Hospital: An Insight

Abhisek Mishra<sup>1</sup>, C.M. Singh<sup>2</sup>, Binod Ku Pati<sup>3</sup>, Barkha Rani Beck<sup>4</sup>, Hari Krishnan Ashokan<sup>4</sup>

<sup>1</sup>Assistant Professor, Dept. of Community and Family Medicine,, <sup>2</sup>Professor, Medical Superintendent and Professor, Dept. of Community and Family Medicine, <sup>3</sup>Associate Professor, Dept. of Microbiology, <sup>5</sup>Nursing Officer, Nursing Officer, AIIMS Patna

## Abstract

Varicella is a contagious viral disease which is caused by Varicella Zoster. Nosocomial Varicella is costly for healthcare settings increasing absenteeism and hampering quality patient care. Human are the only known susceptible host for this viral illness. The disease is usually acute and self-limiting but occasionally can lead to complications such as encephalitis, pneumonia, and secondary bacterial infections. Once believed to be the infection of pediatric age group now gripping mostly adults in a severe manner in health care setting. The previous vaccination and primary episode of infection are not found to be protective. In India, >30% of persons >15 years of age are susceptible for this infection. Reports have suggested the airborne transmission plays a key role in transmission of Varicella Zoster in health care settings

In health care setting the close contact between subclinical cases and susceptible individuals favors the rapid spread of the disease. Areas like Intensive Care Units (ICUs) are the most focal point of spread as immunity of admitted individuals are mostly compromised. The closed cubicles and chambers of the resident and working nursing officers in hospital setting act as a point of focus for the disease spread. Strict isolation words and quarantine procedures to be followed at institutional level for limiting viral dissemination. Knowledge building activities like Hand washing, Barrier nursing and mask use to be promoted among all health care staffs. Institutional policy to be made in order to control any viral outbreaks

## Introduction

Chickenpox or Varicella is an acute infection caused by Varicella zoster virus, belong to the family Herpesviridae. Human are the only known susceptible hosts of the virus. It is a highly contagious illness with rash that is transmitted from person to person by airborne route, however transmission via aerosol or by

direct contact is also reported<sup>1</sup>. The average incubation period is 14–16 days (Range, 10–21 days). Chickenpox is primarily a disease of the temperate regions where it occurs throughout the year, commonly in children between 1 and 14 years of age<sup>2,3</sup>. The prevalence of the disease is 13–16/1000 people per year. The fact that, chicken pox is more severe in adults than in children is well established<sup>4,5</sup>.

Based on conservative estimates, the global annual varicella disease burden would include 4.2 million severe complications leading to hospitalization and 4200 deaths [20]. The extent of disease and severity in adults in tropical climates is also greater than for temperate climates. In India, >30% of persons >15 years of age are susceptible for this infection. Persons with underlying

immune compromising medical conditions (e.g., cancer, HIV/AIDS) are especially likely to have more severe disease and a longer time to crusting of lesions; thus, they may shed virus from skin lesions for a prolonged

period<sup>6</sup>. The Secondary attack rates among susceptible household contacts occur in 65% to 86% of cases<sup>7-9</sup>.

In India as per IDSP January 2019 compiled report there are 7 outbreaks of chickenpox.

**Table No 01: State and Unon territories showing Chickenpox out break in January, 2019**

State/UT	District	Cases	Deaths
Dadra & Nagarhaveli	Dadra & Nagarhaveli	15	0
Bihar	Madhubani	19	01
Gujrat	Mahesana	28	0
Karnataka	Hassan	89	0
Karnataka	Tumkur	12	0
Kerala	Ernakulum	65	0
Madhya Pradesh	Alirajpur	11	0

Investigations of varicella outbreaks in hospital settings in the vaccine era will improve the knowledge on the epidemiology of varicella and patterns of virus transmission. In addition, monitoring the frequency and proportion of varicella outbreaks in previously infected/vaccinated individuals will help to assess impact of the vaccination. Here this study is describing the events, their chronology, use of spot map in identification of possible source and various containment measures at a tertiary care hospital, which will facilitate the development and refinement of appropriate measures to control and prevent future varicella outbreaks.

#### **Study objectives:**

##### **Primary objective:**

- To describe the Outbreak of the Varicella in terms of time, place and person in the Tertiary care hospital
- To assess various factors possibly modifying viral dynamics during this outbreak

#### **Material and Method**

It's a hospital based cross sectional study conducted at All India Institute of Medical Sciences, Patna between August to October 2018 (3 months). All the person developed the sign and symptom of Varicella are being taken as study subjects during this study period. Person who have not given their consent are excluded from the

study. The pretested questionnaire are being used as data collection instruments. Microsoft excel, Spss-16 are being used as statistical analysis tools. Microsoft word used for Flow chart and Spot map construction.

The study ethics and confidentiality of the data has been maintained.

#### **Results**

**Reporting about the incident:** A client named Shilam Devi, 36 year old female (The Index case), brought her baby to AIIMS for treatment and later on advised for surgical intervention. During her stay on 20/07/2018 Shilam Devi had noticed rashes in face, hand and which gradually developed all over body which was clinically diagnosed as Chickenpox infection. The Baby of the client was not kept in isolation ward in paediatric surgical Intensive Care Unit (ICU) .No screening had been done neither for the patient, nor for the family members and health workers at that point of time.

Two weeks later One of Junior resident posted in Paediatric Intensive Care Unit (PICU) and Paediatric surgical ward reported similar episodes of Rashes, fever and headache and were diagnosed clinically as chickenpox. Further in varying interval of days (with in next 2months) 5 nursing officers, whose place of posting was close to the Paediatric ward and PICU had reported

similar episodes of Varicella infections. These residents and the Nursing officers were directly involved in patient care in clinical area. Meanwhile two paediatric patient were diagnosed to be affected by varicella infection. Severity of the infection was assessed by the number of lesions present over the body.

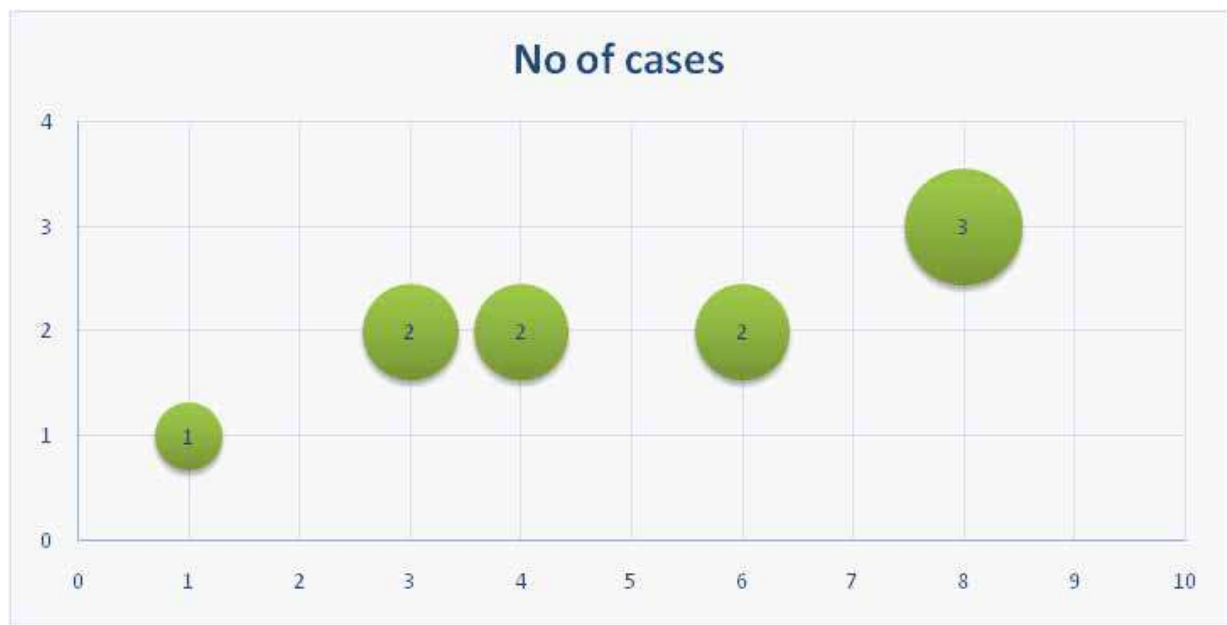

Junior resident and nursing officers immediately went on leave till all their rashes were subsided. Two paediatric patients were shifted to isolation corner of the paediatric ward. Patient cubical once occupied by those patients were prohibited from further admission.

**Table No 02: Details of the person involved in the Varicella outbreak at AIIMS Patna**

Sl. No	Name of the Person	Age in Yrs	Gender	Designation	Previous history of Chicken pox	Previous Vaccination for Chicken pox	Diagnosed on
01.	Ms Shilamdevi	32	F	Index patient	No	No	20-7-2018
02.	Dr Dharendra Kumar	25	M	JR	No	No	5-08-2018
03.	Mr Divyanshukumar	06	M	Patient	No	No	10-8-2018
04.	Mr Surendra	26	M	Nursing Officer	Yes	No	21-08-2018
05.	Mr Rajanish	28	M	Nursing officer	No	No	22-08-2018
06.	Mr Deepsingh Choudhary	24	M	Nursing Officer	Yes	No	7-09-2018
07.	Mr Shivamraj Mishra	07	M	Patient	No	No	9-09-2018
08.	Mr Mejin	30	M	Nursing Officer	Yes	No	21-09-2018
09.	Mr Satish	27	M	Nursing officer	yes	No	23-09-2018
10.	Ms Madhukumari	24	F	Nursing Officer	No	No	24-09-2018

The above table describe the details of the cases, their designation and place of working at AIIMS Patna during the study period. The date of their clinical diagnosis had been given in the right column of the table. It also describe their early vaccination status and previous episodes of infection. The operational definitions had been used for describing the Varicella outbreak episodes at AIIMS Patna were as per CDC (Center for Disease Control).

For the purpose of investigations, the outbreak recognition or definition was taken as three cases or more from any given long term care facility, within one incubation period and chicken pox cases were defined according to Center for Disease Control (CDC) case classification. Definition of exposure was considered as the presence in the same room of a known case, regardless of duration of time and a susceptible employee was defined as one who had never had varicella and who had never been vaccinated before being in contact with affected persons.

X-axis represents no of weeks since the first case, Y-axis represents no of cases of Varicella

**Figure No 01: Description of cases as per time distribution**

The above two figures are describing the place and time distribution of clinically confirmed Varicella cases at AIIMS Patna.

### Discussions

This report explains about an occupational outbreak of Varicella in a tertiary health care delivery hospital. The hospital setting may act as an excellent opportunity for the viral spread, as mobility is maximum and immunity status of most of the person is unknown<sup>10</sup>. The contact between suspected or confirmed cases with other susceptible person often resulted in outbreaks in hospital settings. Similar events have been reported consistently across India in which health personnel like Resident doctors, Nursing officers and ward attendants are being affected by several occupational outbreaks of Varicella. In an event from Jaipur, Rajasthan six health care workers (three were previously vaccinated) have developed Varicella following exposed to an admitted case of the disease. These cases had no direct contact with the index case, but they had either worked or resided (in the nurses hostel) with the primary case before their diagnoses had been made at some point of time. All the secondary cases were reported at varying intervals of time possibly indicating towards either a subclinical infection in some staffs or altered viral transmission dynamics depending on immunization. Another community outbreak of Varicella was reported

at Chandigarh where in total 162 cases reported<sup>11</sup>.

Among all the person developed Varicella infection at AIIMS, four (4) individuals are having previous episodes of Chicken pox infection. Many International opinion states that with time there is evidence of decreasing immunity (Due to primary infection) or may be vaccine failure to a single dose of vaccine<sup>12, 13</sup>. There is an ambiguity in the doses of Varicella vaccine in prevention of the infection as per existing literature. The American advisory committee on immunization practices has recommended a single dose of Varicella vaccine at 4-6 yrs of age since 2006<sup>14</sup>. However the expected effectiveness of the two doses vaccine is upto 98% as per a randomized prospective trial and another cohort study<sup>15, 16</sup>. In this outbreak the average age of occurrence of this outbreak episode is found to be 30 years, which is in adult age group. Across many literatures researchers have suggested that a longer time since vaccination act as a risk factor for developing varicella in adult patients. This aspect of this research is consistent with the findings from other studies<sup>3, 17-19</sup>. As per Ozakia et al in Japan, the vaccine failure is seen in around 5% of the recipient after single dose of the vaccine administration<sup>20</sup>. The other finding need

to highlight from this research is that Breakthrough varicella infection, which is common in hospital setting can be attributed to waning vaccine immunity. This breakthrough infection in previous infected/vaccinated individuals may point towards administration of another dose of the vaccine. The additional dose will be highly effective in reducing severity of Varicella infection and frequency of intermittent outbreaks.

Another study in North East India on Varicella outbreak among Troops, reveals that this infection mostly occur in winters due to huddling together of susceptible in one location. These kind of setting is perfect for spread of the disease<sup>21, 22</sup>. Garnet et al point towards the transmission of VZV might be adversely affected by temperature and moisture in tropical countries<sup>23, 24</sup>. However this present outbreak has occurred in the Month of August and September possibly indicating transmission of the Virus throughout the year among susceptible person as subclinical infection. This finding has been supported by studies which have concluded that there is inconsistent seasonal pattern in its occurrence.

**Conclusion:**

Chicken pox has been known to cause frequent outbreaks in Health care settings like Hospitals, Nursing homes and clinics. It may affect adults in more severe manner than that of children. The focal aggregation of subclinical cases and health care workers in wards and ICUs is a perfect point of contact and spread of this infection. Thou predominant season for the infection is winter, it is seen in Post Monsoon months indicating towards circulation of the virus throughout the year. The previous episodes of infection/vaccination is not protective, as found in this study. Hence more than one doses of the vaccine may be recommended in the appropriate age for full protection.

The general awareness activities regarding Hand hygiene and self-protection against droplet infections are the key measures that can successfully check the outbreak in Health care setting. Proper isolation, timely quarantine, Risk group (Antenatal staffs) duty relocation, Planning at Institutional level and commitment from all hierarchy is a must for successful control of any Outbreak of Varicella.

# An Exploratory Study To Identify Factors Affecting Non Compliance To Dots Therapy Among Tb Patients At Selected Dots Centre Vadodara

Akash S. Patel<sup>1</sup>, Miss. Varsha Hun<sup>2</sup>, Mr. Adithya S.<sup>3</sup>

<sup>1</sup>M.Sc. Nursing, <sup>2</sup>Assistant Professor, <sup>3</sup>Assistant Professor and HOD, Community Health Nursing, Sumandeep Nursing College, Sumandeep Vidyapeeth, Gujarat, India

## Abstract

**Background:** Tuberculosis kills 2 people in every 3 minutes. While India has been relying on DOTS treatment to fight the disease, & also faced the recent controversy of drug resistance after a team of doctors from Mumbai's Hinduja hospital recently found cases of totally-drug resistant TB resistant to all drugs used to treat the disease.

**Material and Method:** In this research study a quantitative research approach with non-experimental descriptive survey design was used, The sampling technique was non probability purposive sampling to collect the 100 TB patient and the data collection was done by using self-structured rating scale and checklist. Result: the study results shows that among samples the majority of the participants (68%) from 21-40 year age group. Majority of the participants (86%) were male and (16%) were female. Majority of the participants (73%) belongs to nuclear family and (27%) belongs to joint family. Majority of the participants (42%) working as private employ. Majority of the participants (58%) family income was around 10,001-15,000/- Rs. Majority of the participants (69%) were having the primary education. Majority of the participants (86%) were from rural area and (14%) were from urban area. Majority of the participants (62%) were having episode for second time.

It seen that out of 100 participants 31% were non compliance to DOTS therapy and 69% participants were compliance to DOTS therapy.

It shows that the factors related to non compliance to DOTS therapy among TB patient. Among total sample 76.16% were non compliance to DOTS therapy due to Transportation Factors, while 75% were due to Side effects of DOTS therapy, 68.80% were due to Factor related to Health care facility, 79.50% were non-compliance due to Factor related to Discrimination and stigma, 70.16% were due to Factor related to Lake of time and 75.50 were due to other Factors.

There is no significant association between the demographic variable except Family monthly income and Occupation in hence H<sub>1</sub> hypotheses is rejected. Conclusion: the purpose of the study was identify factors affecting non compliance to DOTS therapy among TB patients at selected DOTS centre Vadodara" The findings of the study concluded that majority 69% participant's were compliance to DOTS therapy and 31% were non compliance to DOTS therapy.

**Keywords:** Factor affecting, non compliance, DOTS therapy.

## Introduction

*"Anybody can get tuberculosis, but everybody can prevent it"*

Anybody can get tuberculosis; TB is communicable disease it can be transmit to anybody. It isa droplet infection. But it can be prevent by DOTS treatment, DOTS can cure the TB. Mycobacterium tuberculosis,

the bacteria that causes tuberculosis has been around for centuries. Recently fragments of the spinal cord from Egyptian mummies from 2400 B.C. were found to have definite sign of the ravage of this terrible disease. Tuberculosis was first described by Greek doctor Hippocrates around 460 B.C. He called it phthisis which is the Greek word for consumption; because it described the disease consumed its victims. Consumption was the most widespread disease of the time, and most people are died. The consumption was used to describe unit 1882, when the tuberculosis bacteria were identified as the cause of disease. Researcher can trace the history of tuberculosis back many of years. Throughout history, developing a cure for tuberculosis has proved to be a difficult task.<sup>1</sup>

In 1993, World Health Organisation (WHO) declared TB to a global emergency saying that: "Tuberculosis today is humanity's greatest killer, and it's out of control in many parts of the world." The disease is preventable and treatable, has been grossly neglected and no country is immune to it (Arati Kochi, Manager WHO Tuberculosis program).<sup>1</sup>

The problem of global TB results in the deaths each year of the nearly one and a half million people from a disease that many years has been treatable and curable. It is clear though whether this continuing high level of deaths is due to a failure of global TB control strategies, the impact of the joint TB and HIV epidemics, the increasing problem of drug resistance TB, a lack of TB funding or more likely combination of all four.<sup>2</sup>

**Need of the Study:** Tuberculosis continues to be a major health problem in the world particularly in the developing countries. 24<sup>th</sup> March is the World Tuberculosis Day. India is a highest TB burden country in the World HHHHHHHealth Origination statistics of 2011 giving an estimated incidence figure of 2.2 million caused of TB preventable figure for 2011 is given as 3.1 million. It is estimated that about 40% of the Indian population is infected with TB, the majority of who have latent rather than active TB.<sup>2</sup>

In India, according to the health ministry's TB control programme statistics. In 2016, there were an estimated 1.3 million TB deaths among HIV-negative people (down from 1.7 million in 2000) and an additional 3,74,000 deaths among HIV-positive people. An estimated 10.4 million people fell ill with TB in 2016: 90% were adults, 65% were male, 10% were people

living with HIV (74% in Africa) and 56% were in five countries: India,<sup>4</sup>

**Statement of the Problem:** "An exploratory study to identify factors affecting non compliance to DOTS therapy among TB patients at selected DOTS centre Vadodara"

#### **Objectives:**

1. To identify prevalence of non compliance to the DOTS therapy among TB Patients.
2. To identify the factor affecting non compliance to DOTS therapy among TB patients.
3. To find out the association between treatments non compliance to DOTS therapy among TB patient with selected demographic variables.

#### **Hypothesis:**

**H<sub>1</sub>**-There will be significant association between treatment non compliance to DOTS therapy with selected demographic variables.

### **Methodology**

**Research design:** The research design used for the study was non-experimental descriptive survey research design.

**Setting:** The main research project was conducted at DOTS centre of Dabhoitaluka, Vadodara

**Sample:** The 100 participants included in this study. The sample for the study was selected by non-probability purposive sampling technique according inclusion criteria as availability of sample.

#### **Inclusion Criteria:**

- TB patients who were taking DOTS treatment minimum from last 3 month.
- TB patients who were present at the time of study.

#### **Exclusion criteria for sampling:**

- A critically ill patient
- Patient who were not willing to participate in study.

#### **Tool for data collection:**

#### **This consist in three parts**

**Section A:** Description of the samples according their demographic characteristics

**Section B:** Rating scale was used to identify prevalence of non compliance DOTS therapy among TB patient.

**Scoring interpretation**

**If the scoring is:**

- 11-20 were including in non compliance to DOTS therapy.
- 21-30 were including in compliance to DOTS therapy.

**Section C:** Check list was used to identify factors affecting to non compliance to DOTS therapy with selected demographic variables.

**Data collection procedure:** The main study data collection was conducted from 10<sup>th</sup> December to 22<sup>nd</sup>December. The data collection done within a given period of 2 week. Investigator selected 100 TB patient from selected DOTS centre Dabhoi who meeting the inclusion criteria for data collection by using non-probability convenient sampling. We were selected the

subject and established the rapport by explaining purpose of the study. Formal administrative approval was obtained from the concerning authority and informed consent was obtained from the samples. The data collection done within a given a period of 2 week. We were selected 100 participants meeting the including criteria for data collection by using non probability purposive sampling. Investigator collects demographic data, and with the use of rating scale and checklist to identify the prevalence of compliance and factors affecting of non compliance DOTS therapy.

**Statistical Design:** Data were verified prior to computerized entry. The Statistical Package for Social Sciences (SPSS version 20.0) was used. Descriptive statistics were applied (e.g., mean, standard deviation, frequency and percentages). Test of significance (chi square) was applied to test the study hypothesis

**Findings:**

**Section A:** Description of the samples according their demographic characteristics

**Table: 1 Frequency and percentages distribution of samples, according to their demographic characteristic. n=10**

Sr No	Demographic variable	Categories	No of respondents in frequency	No of respondent in percentage
1	Age in Year	≤20	03	03%
		21-40	68	68%
		41-60	22	22%
		>60	07	07%
2	Gender	Male	84	84%
		Female	16	16%
3	Type of family	Nuclear	73	73%
		Joint	27	27%
4	Occupation	Govt Employ	03	03%
		Private Employ	48	48%
		Self Employ	15	15%
		Unemployed	34	34%
5	Family income	≤5000	04	04%
		5001-10,000	23	23%
		10,001-15,000	58	58%
		>15,000	15	15%
6	Education Status	No formal education	05	05%
		Primary	69	69%
		Higher secondary	25	25%
		Graduation and above	01	01%

Sr No	Demographic variable	Categories	No of respondents in frequency	No of respondent in percentage
7	Residential area	Rural	86	86%
		Urban	14	14%
8	Episode of TB	1 <sup>st</sup> Episode	28	28%
		2 <sup>nd</sup> Episode	62	62%
		3 <sup>rd</sup> Episode	10	10%
		More than 3 Episode	00	00%

Majority of the participant (68%) from 21-40 year age group and minimum participant (3%) were in the group of  $\leq 20$  year age group. Majority of the participant (86%) were male and (16%) were female. Majority of the participant (73%) belongs to nuclear family and (27%) belongs to joint family. Majority of the participant (42%) working as private employ. Majority of the participant (58%) family income was around 10,001-15,000/- Rs.

Majority of the participant (69%) were having the primary education. Majority of the participant (86%) were from rural area and (14%) were from urban area. Majority of the participant (62%) were having episode for second time.

**Section B:** Prevalence of compliance and non compliance to DOTS therapy among TB patient.

**Table: 2 Distribution categories, frequency and percentage of TB patient regarding use of DOTS therapy among TB patient. n=100**

Sr No	Statement	Categories	Frequency	Percentage
1	Non compliance to the DOTS	11-20	31	31%
2	Compliance to the DOTS	21-30	69	69%

In this it shows that out of 100 participant's 31% were non compliance to DOTS therapy and 69% participant's were compliance to DOTS therapy.

**Section C:** Distribution of mean, mean percentage and SD of factors related tonon compliance to DOTS therapy among TB patient

**Table: 3 Distribution of mean, mean percentage and SD of factors related tonon compliance to DOTS therapy among TB patients. N=100**

Sr No	Factors	Maximum	Mean Score	Mean percentage
1	Transportation factors	06	4.27	71.16%
2	Side effects of DOTS therapy	04	3.00	75%
3	Factor related to health care facility	10	6.88	68.8%
4	Factor related to Discrimination and stigma	06	4.77	79.5%
5	Factor related to lack of time	06	4.21	70.16%
6	Other Factors	08	6.04	75.5%
7	Overall score	40	29.17	72.92%

In this, it shows that the factors related to non complianceto DOTS therapy among TB patient. Among

total sample 76.16% were non compliance to DOTS therapy due to Transportation Factors, 75% were non

compliance to DOTS therapy due to Side effects of DOTS therapy, 68.80% were non compliance to DOTS therapy due to Factor related to Health care facility, 79.50% were non compliance to DOTS therapy due to Factor related to Discrimination and stigma, 70.16% were non compliance to DOTS therapy due to Factor related to Lack of time and 75.50 were non compliance to DOTS therapy due to other Factors.

SECTION D: Association between factor related to non compliance to DOTS therapy with selected demographic variables.

It reveals that association between factors and demographic variables. Significant demographic variable are occupation of the participant with  $\chi^2$  value 7.90 (3df=7.82) and Family income  $\chi^2$  value 8.10 (3df=7.82), so hypotheses  $H_1$  rejected.

### Discussion

the researcher presents with discussion part according to the results obtained from statistical analysis based on the data of the study, the reviewed literature, hypothesis which were selected for the study. The researcher also presents the conclusion about the meaning and implication of the findings, i.e., what the results mean, why things turned out the way they did, how the findings fit with other evidence, and how the results can be used in practice. The discussion includes the following elements:

The present study was conducted study to identify factors affecting Non compliance to DOTS therapy among TB patients at selected DOTS centre Vadodara. In order to achieve the objectives of the study, a descriptive survey design was adopted. Purposive sampling technique was used to select the sample. The data was collected from 100 respondents by using check list. The findings of the study have been discussed with reference to objectives, hypothesis, and with the findings of other studies.

### Conclusion

Nursing research is needed to update and expand knowledge and awareness regarding TB and DOTS therapy to cure it to upgrade the nursing profession. The study findings help in the base for other professional nurses and the student nurse researcher to conduct more studies.

Research study regarding factor affecting non compliance to the DOTS therapy can be conducted in a large scale which helps to understand the factors affecting to DOTS therapy and how to overcome from it.

# Assessment of Cognitive Impairment among Elderly in the Selected Rural Community, Kancheepuram District, Tamil Nadu

Akila K.<sup>1</sup>, Divya R.<sup>1</sup>, Preethianushya M.<sup>1</sup>, Aravindhana B.<sup>1</sup>, Rogina J.S. Savarimuthu<sup>2</sup>

<sup>1</sup>B.Sc. (Nursing) IV Year Students, <sup>2</sup>Associate Professor & HOD, Mental Health Nursing Department, Chettinad College of Nursing, Chettinad Academy of Research and Education

## Abstract

A study was conducted to assess the cognitive impairment among elderly. The objectives were 1. To assess cognitive impairment among elderly in the selected rural community and 2. To associate cognitive impairment with selected demographic variables. Majority of the clients who scored positive for cognitive impairment were between 60 - 70 year of age, were female, living in nuclear families, were supported by family members financially, watching television was their leisure time activity, remembered family occasions had altered vision and/or hearing and were using denture.

**Keywords:** Cognitive impairment, elderly.

## Introduction

Cognition is the process of thinking, learning and remembering. Cognitive impairment is not uncommon in later life and may be due to the normal aging process associated with physical or mental disorders. It is characterized by memory disturbance, which occurs frequently among the elderly.

### Objective:

- To assess cognitive impairment among elderly in the selected rural community.
- To associate cognitive impairment with selected demographic variables.

### Methodology:

**Research approach:** Descriptive approach.

**Research design:** Non experimental, descriptive research design.

**Research setting:** The study was conducted among individuals age group of 60 and above who were residing at a selected village, Kanchipuram district.

**Population:** Individuals aged 60 and above, who are residing at a selected village, Kanchipuram district.

**Sample Technique:** A convenient sampling technique was used to select 81 participants for the study.

**Sample size:** The sample size was calculated using the formula  $n = \frac{4pq}{d^2}$

**Subject Selection:** Individuals aged 60 and above, who are residing at a selected village, Kanchipuram district, during the time of data collection.

**Instrument:** Section- A consisted of self structured questionnaire consisting of 9 question to assess demographic variables and Section -B includes standardized Brief Cognitive Rating Scale (BCRS) to assess the cognitive level among elderly which consist of 5 axis.

---

### Corresponding Author:

**Akila K.**

B.Sc (Nursing) IV Year Students, Mental Health Nursing Department, Chettinad College of Nursing, Chettinad Academy of Research and Education  
e-mail: akilaammu02@gmail.com

## Scoring and Interpretation:

Each axis score is interpreted as follows:

Score	Interpretation
1.	Normal, no cognitive decline present. Average or better performance.
2.	Very mild. Subjective impairment in comparison with 5 or 10 years previous.
3.	Mild. Minimal impairment which is clinically verifiable with detailed questioning
4.	Moderate. Marked impairment which is readily evidenced clinically.
5.	Moderately Severe. Severe impairment on assesment.
6.	Sever. Very severe impairment; some residual capacity in some assesment areas.
7.	Very severe. Very severe impairment, little residual capacity elicited in assessments.

**Findings:** Majority of the participants were between 60-70 years of age (47%), females (64%), belonged to nuclear families (63%), supported financially by family members (60%), had watching television as their leisure time activity (53%), were able to remember family occasions (79%) and had altered vision, hearing and were using dentures (86%).

Remembering family occasions was significantly associated with Axis I: Concentration ( $p=0.037$ ). Age, source of income and ability to remember family occasions were significantly associated with Axis II: Recent memory ( $p=0.000$ ,  $0.014$ ,  $0.037$  respectively). Age and ability to remember family occasions were significantly associated with Axis III: Past memory ( $p=0.001$ ,  $0.007$  respectively). Age, leisure time activity and ability to remember family occasions were significantly associated with Axis IV: Orientation ( $p=0.000$ ,  $0.001$ ,  $0.000$  respectively). Age, leisure time activity and ability to remember family occasions were significantly associated with Axis V: Functioning and Self-care ( $p=0.000$ ,  $0.046$ ,  $0.000$ )

## Discussion

Cognitive impairments impair everyday functional abilities. It is reported that there exist significant impairment in cognitive domains of concentration, recent memory, remote memory, orientation, functioning and self-care along with disorientation, disturbance in attention and recent memory<sup>1</sup>. Moreover age related disorders accelerate cognitive impairment.

## Conclusion

Elderly should be assessed for cognitive impairment and intervened appropriately. Healthy lifestyle may decrease cognitive decline among the elderly<sup>2</sup>.

**Conflict of Interest:** Nil

**Source of Funding:** Self-funding and no external funding

**Ethical Clearance:** Department clearance was obtained from department of mental health nursing and Chettinad college of Nursing. UG Committee clearance and institutional ethical committee clearance was obtained from Chettinad university. Formal permission was be obtained from the Principal, Chettinad college of Nursing. Formal consent was obtained from the study samples before collecting the information.

# Safety and Tolerability of Two Different Formulations of Mycophenolate (Mycophenolate Mofetil and Mycophenolate Sodium) among Patient with Connective Tissue Disease Associated Interstitial Lung Disease (CTD-ILD) in a Tertiary Care Hospital

Amrut Kumar Mohapatra<sup>1</sup>, Pratima Singh<sup>2</sup>

<sup>1</sup>Assistant Professor, <sup>2</sup>Associate Professor, Department of Pulmonary Medicine, Kalinga Institute of Medical Sciences, KIIT University, Bhubaneswar, Odisha, India

## Abstract

**Background:** One of the leading cause of mortality in various connective tissue diseases(CTD) like systemic sclerosis(SSc)is Interstitial lung disease(ILD). The various CTD which may present as ILD include systemic sclerosis (SSc), rheumatoid arthritis(RA),dermatomyositis (DM), primary Sjogren's syndrome(pSS), mixed connective tissue disease(MCTD) and systemic lupus erythematosus (SLE).

**Objective:** To compare the safety and tolerability of two salts of mycophenolate,i.e. mycophenolate mofetil and mycophenolate sodium in our patients with CTD-ILD.

**Patients and Method:** Ourstudy was retrospective observational study; involving 70 patients diagnosed with CTD-ILD and was treated with two formulations of Mycophenolate (Mofetil and Sodium) minimum for six months with at least one follow-up during the period of May 2013 to April 2017 at tertiary care hospital from India. Fifty-six patients received MPS and fourteen patients received MMF. The details of patients obtained from case records were recorded in a proforma. Statistical analysis was performed using Graph pad for frequency, mean and percentages.

**Results:** In our study,most of the patients receivedMycophenolate sodium (n=56) with the BD dose regimen of 720 mg (n=36), 540 mg (n=18) and 180 mg (n=2). Patients treated with MMF 1000 mg (n=12) and 750 mg (n=2) as BD dose regimen.The adverse events reported in this study were GI (diarrhoea), herpes zoster infection, cytopenia, malignancies or any other infections. The incidence of diarrhea is most commonly observed in this study population. Out of 26 reported cases, 14 patients had an episode of diarrhea at least once and 12 patients had diarrhea attack twice the preceding year.

**Conclusions:** Both formulations of Mycophenolate were tolerated well, and have low-dose corticosteroid use with no discontinuation of therapy.

**Keywords:** *Mycophenolate, Connective tissue disease, Interstitial Lung disease.*

## Introduction

Interstitial lung disease (ILD) refers to a heterogeneous group of lung diseases with typical restrictive pattern of lung function in spirometry with typical radiological findings in chest radiograph or high resolution computed tomography (HRCT) scan of chest. It is associated with significant morbidity and mortality

due to progressive fibrosing nature of the disease. ILD can be either idiopathic, known as idiopathic pulmonary fibrosis (IPF) or it can be complication of connective tissue disease known as CTD-ILD. One of the leading cause of mortality in various connective tissue diseases (CTD) like systemic sclerosis (SSc) is Interstitial lung disease (ILD). The various CTD which may present as ILD include systemic sclerosis (SSc), rheumatoid arthritis (RA), dermatomyositis (DM), primary Sjogren's syndrome (pSS), mixed connective tissue disease (MCTD) and systemic lupus erythematosus (SLE). Early recognition of CTD-ILD improve outcome due to early institution of therapy. There is limited data on CTD-ILD from India where lung disease due to tuberculosis burden is very high.<sup>1</sup>

In the study by Sen et al and Kumar et al, ILD is under reported in India due to lack of awareness and inadequate availability of diagnostic facilities for the same.<sup>2,3</sup>

In patients with clinically significant CTD-ILD, immunosuppression therapy remains the mainstay of treatment along with supportive care, however there few prospective and systemic studies for the same in available literature.<sup>4</sup> Though in systemic sclerosis associated ILD, cyclophosphamide has been well studied, toxicity limits its use in various CTD-ILD.<sup>5</sup> Fisher et al studied the use of MMF in CTD-ILD with low discontinuation rate, with stable or improved lung function over median follow up of 2.5 years, hence MMF appears to be promising therapy in spectrum of CTD-ILD including scleroderma lung disease.<sup>6,7</sup>

In this study, we compared the side effect profile of mycophenolate mofetil and mycophenolate sodium in patients with CTD-ILD, as both are bioequivalent.<sup>8</sup>

### Patients and Method

70 patients diagnosed with CTD-ILD and were treated with two formulations of Mycophenolate minimum for six months with at least one follow up during the period of May 2013 to April 2017 were included in this study. The clinical and laboratory details of the patients were obtained from the case records retrospectively; they were recorded in a proforma. We analysed the details of medical history, physical findings, laboratory test results like hemogram, liver function, renal function, lung function tests like spirometry, mantoux test, sputum for acid fast bacilli, chest radiograph and high resolution computed tomography of thorax of the patients.

In case of incomplete data, patients were contacted for required data from our hospital study team. As this was a retrospective observational survey, there was no ethical consideration required. Patient's privacy and confidentiality in relation to the patients information was maintained throughout the duration of the study.

As per patients records, side effects of MMF and MPS in CTD-ILD parameters were considered; like gastrointestinal side effects, respiratory and other infections, herpes zoster infection and number of hospitalization (if any). Information on duration of MPS/MMF therapy & average dosage of glucocorticoid therapy of patients were also obtained.

### Results

Out of 70 patients, 58 were females and 12 were males, with mean age of 44.81 years, with mean disease duration of 4.2 years. The clinical presentation commonly noted was dry cough in 60 (85.7%) and exertional dyspnea in 50 (71.4%) patients. Other symptoms noted were fever in 35 (50%), skin involvement in 42 (60%) and dysphagia in 35 (50%) patients. Prior history of misdiagnosed tuberculosis with anti-tubercular treatment was observed in 7 (10%) patients. On radiological examination (chest X-ray), the signs of ILD were observed in 35 (50%) patients, whereas, on HRCT scan 60 (85.7%) patients have shown positive findings.

Patients were treated with Mycophenolate sodium (n=56) with the BD dose regimen of 720 mg (n=36), 540 mg (n=18) and 180 mg (n=2) and those treated with MMF 1000 mg (n=12) and 750 mg (n=2) as BD dose regimen. Table 1 shows the steroid usage in CTD-ILD patients. The duration of MMF usage in all patients was in between 6 months to 4 years. The use of steroid (Prednisolone or Deflazacort) has been observed during study period. The patients received Prednisolone dose as 5 mg once daily (n=33) or alternate day (n=25), whereas the dose of Deflazacort was 6 mg per day. Table 2 shows the comparison of adverse events in patients treated mycophenolate mofetil and mycophenolate sodium within last one year. The adverse events reported in this study were GI (diarrheal attacks), herpes zoster infection, cytopenia, malignancies or any other infections. The incidence of diarrhea is most commonly observed in this study population. Out of 26 reported cases, 14 patients had an episode of diarrhea at least once and 12 patients had diarrhea attack twice the preceding year.

**Table 1: Steroid Usage in CTD-ILD Patients**

Steroid usage in CTD-ILD:	Total Number of Patients	Mycophenolate Mofetil (MMF) (No. of Patients)	Mycophenolate Sodium (MPS) (No. of Patients)
	70	14	56
Oral Steroids	63	10	53
a. Prednisolone (Dose)	33	5mg/day	5mg/day
b. Deflazacort (Dose)	25	5mg/alternate day.	5mg/alternate day.
	12	6mg/day	6mg/day
Dosage and Duration (N) Strength:	----	a.1000mgBD (12) b.750mg BD (02) c.500mg BD- None	a.720mgBD (36) b.540mgBD (18) c.180mgBD (02)

**Table 2: Comparison of adverse events in mycophenolate mofetil and mycophenolate sodium treated CTD-ILD patients within last one year.**

5. Tuberculosis	02	0	02
6. Herpes Zoster Infections	01	0	01
7. Malignancies	0	0	0

## Discussion

In present study, we evaluated the two formulations of mycophenolate, i.e. mycophenolate mofetil (MMF) and mycophenolate sodium (MPS). Both formulations of Mycophenolate were well tolerated, have no discontinuation due to adverse drug reactions and were associated with low-dose corticosteroid use, and showed good clinical efficacy. The most preferred dose for MMF was 1000 mg BID (n=12) and for MPS was 720 mg BID (n=36).

The adverse reactions reported in the study were mainly GI related and more with MPS, i.e. nausea (n=10) and diarrhea (n=11) where in MMF it was comparatively much less, i.e. nausea (n=2) and diarrhea (n=3). Other adverse events reported in MPS group were cytopenia (n=2), tuberculosis (n=2) and herpes zoster infection (n=1). In the current study, infection rate

was lower compared to other clinical trials involving mycophenolate mofetil and mycophenolic acid.<sup>7,9</sup>

The hospitalization due to severity of ILD or any other co-morbidity condition was less, only five patients required hospitalization due to disease other than CTD-ILD. Amongst other events reported, two patients developed tuberculosis and one of them had miliary tuberculosis, one of the diabetic patient developed herpes zoster infections while two patients reported with cytopenia in the form of leucopenia within the preceding one year. Throughout the follow-up period, no malignancies were reported in any of the patient's record. Hospital admissions due to any cause during the course of mycophenolate therapy was also found to be quite low in the current study which is also evident in other reported studies done by Mendoza et al, Derk et al.<sup>10,11</sup>

The GI side effects were more in MPS group than in MMF group in our study which is in contrast to findings by Chan et al<sup>12</sup>, which may be related to concomitant co morbidities like reflux disease and short bowel syndrome, other medications use. Overall the tolerability of mycophenolate was found to be good in this study in contrast to that done by Stratton et al, where as many as 43% of patients had developed some adverse effects of mycophenolate.<sup>13</sup>

Immunosuppressive therapy including biologics such as Rituximab and anti-TNF drugs in CTD-ILD is difficult only with partial response to therapies. In comparison to cyclophosphamide, mycophenolate is a safer therapeutic option. Mycophenolate is a pro-drug for mycophenolic acid, which is a potent and selective uncompetitive and reversible inhibitor for the enzyme IMPDH (inosine monophosphate dehydrogenase). This results in inhibition of *de novo* pathway of guanosine nucleotide synthesis without incorporation into DNA. T and B lymphocytes, which are dependent upon the *de novo* purine synthesis; are selectively inhibited by MPA compared to other cells which can utilize salvage pathways.<sup>14</sup>

Our study highlights that, both the salts of Mycophenolate are well tolerated for CTD-ILD patients, the major drawback of the study being variability in dose of mycophenolate used, heterogeneity of the study population, concomitant use of steroids.

### Conclusion

Mycophenolate appears to be a safe inpatients with CTD-ILD, usually well tolerated although gastrointestinal adverse effects in the form of diarrheal attacks, infectious disease and cytopenia in very few cases remain a point of safety concern. A randomized safety clinical trial may be undertaken to confirm these findings.

**Conflicts of Interest:** Nil

# Assessment of Awareness of Parents on Importance of Dental Care in Pediatric Patients in Ethnic Tamil Population

Anandhi D.<sup>1</sup>, R. Bharanidharan<sup>2</sup>, Lekshmy Jayan<sup>3</sup>, Ramya R.<sup>4</sup>, K. Rajkumar<sup>5</sup>, R. Hemalatha<sup>6</sup>

<sup>1</sup>House Surgeon, <sup>2</sup>Senior Lecturer, <sup>4</sup>Reader, <sup>3</sup>Post Graduate Student, <sup>5</sup>Professor and Head of the Department, <sup>6</sup>Professor and Head of the Department, Department of Pedodontics, SRM Dental College, Chennai

## Abstract

The character of a child is built upon his observations from the immediate environment which is basically composed of his family. Parents play an important role in not only the upbringing of the child but basically in instilling the basic principles of hygiene.

**Materials and Method:** Questionnaire study were conducted and parents of children between 3-12 years were included in the study. The Questionnaire was prepared in accordance with National Oral Health Care Survey guidelines.

**Results:** 180 participants were included in the study around 67.8% of the patients had never had any dental treatment or check up performed before. Many of the parents were not aware of the various risk factors involved in the causation of dental caries.

**Conclusion:** Parents play an important role in prevention various dental related problems in children. Lack of awareness about the various oral hygiene measures and prophylactic treatments in parents will expose their child to an increased predisposition to dental caries.

**Keywords:** *Dental caries, Pediatric patients, Awareness, Oral hygiene, Questionnaire, Dental care.*

## Introduction

It is a well acknowledged fact that the character and nature of a child is greatly influenced by his/her environment and by the people present in their environment especially the parents. A child's behaviour is greatly influenced by the parents in particular by the mother. <sup>(1)</sup> During the early growth period of the child the shaping of his/her character is greatly done by the parents especially by mother. Parents are the primary influencing factor in their life till a particular

age directing their mental growth and development. It has been proven by studies that parents with higher education who possess proper knowledge about child's general as well as oral health have better control of their social as well as demographic relationship. <sup>(2)</sup>

Parental involvement has a crucial role in a child's oral hygiene maintenance. But a large percentage of parents do not adequately pay attention to their child's oral hygiene and consider the ability of the child to maintain his/her oral hygiene. <sup>(3)</sup> There are lots of misconceptions in parents regarding oral hygiene practices and regarding dental check-ups which are main reason for increased carious incidence in children. Most of the parents wait till the child is developing a symptom especially pain to seek dental care for their child. <sup>(4)</sup> Majority of the parents are unaware that their child has dental caries or has developed gingival swelling. Ignorance or lack of proper awareness in parents can affect the quality of life of the child. <sup>(5)</sup>

Oral hygiene or oral health not only signifies healthy dentition but also involves the role of them in the physical, social and emotional status as well as their speech, aesthetics, growth and development. Dental health professional plays an important role in the maintenance of oral health.<sup>(2)</sup> Oral health is important as lack of proper maintenance can lead to caries, periodontal disease etc, this leads to pain, swelling loss of tooth all of which eventually affects the emotional wellbeing of the person. Proper awareness about the importance of oral health in parents are thus essential in the well being of the child as that the future generation can be shaped with essential knowledge.<sup>(6)</sup> The aim of the study was to evaluate the awareness in parents of paediatric patients in ethnic Tamil population.

## Materials and Method

Ethical clearance was obtained from the Institutional Review Board of the college, SRM dental college. The study was conducted at the Pedodontics Department of SRM Dental College, Ramapuram, Chennai. The participants chosen were parents of children aged between 3-12 years of both sexes. A total of 180 participants were given the questionnaire after explaining the purpose of study and obtaining informed consent. The questionnaire was constructed following the guidelines by National Oral Health Survey and was in English language. The questionnaire comprised of 14 questions regarding the oral hygiene practices and about their preference on other aids of oral hygiene, frequency of visits to dental clinic etc. The answers were then tabulated and analysed to assess the attitude, knowledge and awareness level towards child's oral health.

**Table 1: Questionnaire for assessing awareness of parents on importance of dental care in pediatric patients in ethnic Tamil population**

Sl No	Question	Option1	Option 2	Option 3
1	What method do you use for brushing your child's teeth?	Toothbrushing	Use of finger	Not started brushing my child's teeth
2	Which among these do you use to brush your child's teeth	Toothpaste	Toothpowder	Don't use anything
3	Are you aware of brushing technique to be followed for your child?	Yes	No	-
4	In a day how many times does your child brush his/her teeth?	Once	Twice	After every meal
5	Does your child rinse his/her mouth after every meal?	Yes	No	Don't know
6	Do you use mouthwash for your child?	Yes	No	-
7	Does poor brushing cause dental problems?	Yes	No	Don't know
8	Does your child have any habits?	Yes	No	If yes specify
9	If your answer is yes, what is the action taken to stop the habit	Punishment	Sitting with the child and explaining the bad effects of the habit	No action taken
10	Do you take your child for frequent dental check ups	Yes	No	We don't have a dentist
11	Has your child complained of pain or discomfort in tooth recently?	Yes	No	Don't remember
12	Do you check your child's mouth for deposits or decay?	Yes	No	-
13	Does food substances that contain sugar cause tooth decay?	Yes	No	Maybe
14	Do you floss your child's teeth?	Yes	No	-

## Results

Around 243 individuals were given the questionnaire for the study, and among that only 180 participants were willing to participate in the study. The responses were recorded in Google forms by one of the investigators and the results were tabulated in pie charts and analysed.

The percentage of parents who use toothbrush and toothpaste for brushing their child's teeth were 96% and 97% respectively. Around 63% of the parents were not aware of a proper brushing technique to be followed for brushing their child's teeth. Around 67% of children brush their teeth only once a day with around 30% brushing twice daily and only 3% of the children brush after every meal. When asked the question of whether your child rinses her/his mouth after eating around 43% were unaware of it with 55.3% answering yes and remaining 2% answering no to the question. More than 50% of the parents reported that their child has a habit with tongue thrusting and nail biting being the most common one.

When asked whether any action was taken against it, 83% of the parents said no with 17% having used punishment as a resort for doing it. Around 67.8% of the parents reported to have never visited a dentist before for their child's oral care. 70% of the participants reported that their child had recent complaint of discomfort or pain in their tooth less than 20% of the parents have admitted to frequently inspect their child's oral cavity for caries and deposits.

## Discussion

The main aim of our study was to assess the awareness of parents in maintenances of oral health in their children and whether they play a role in the increased incidence of dental caries in children. Proper oral hygiene is one of the essential factors in prevention of dental caries and this care begins at home and should be implemented on the child at a young age.<sup>(7)</sup> It is the duty of the parent to ensure that the child maintains oral health effectively and they should take responsibility in keeping it that way.<sup>(8)</sup> From our study, it can be inferred that there are more negative responses than positive responses which shows that there is lack of proper awareness in parents for maintaining oral hygiene in children. This is one of the causes of increased caries incidence in developing as well as undeveloped countries. There is lack of a proper system which ensures that proper oral health care is provided to all with equal weightage regardless of their

caste, class, gender etc.<sup>(9)</sup>

In a study conducted by Khanal et al (2015), they assessed the knowledge of oral hygiene measures in parents of pediatric patients and found that parents had sufficient knowledge on oral hygiene measures were satisfactory which was contradicting the results obtained from the current study.<sup>(2)</sup>

Torabi et al (2016), conducted a study assessed SIC, DMFT and plaque indices in pediatric patients were assessed and parents role in maintaining oral health in children was assessed using questionnaire. They inferred that the oral hygiene knowledge of the parents directly influence the prevalence of dental caries in pediatric children.<sup>(10)</sup>

Elham et al (2013), after analysing over 222 children and their parents concluded that the health behaviours of parent especially brushing habit directly influences the same in children.<sup>(1)</sup>

Gurdeepsingh et al (2014), conducted a cross sectional study on 322 children between 6-12 years of age and dental caries was assessed by visual examination and DMFT scoring was evaluated in accordance with the WHO guidelines. They inferred that children born to illiterate mothers and children with poor oral hygiene had increased prevalence of dental caries.<sup>(11)</sup>

In our study more than 90% of parents preferred to use toothpaste and toothbrush for their child's oral care whereas, less than 10% of the parents also use mouthwash and less than 5% use flossing as an adjunct to brushing habits. Only a small percentage of the parents were aware of the proper brushing technique to be followed for brushing child's teeth. Less than 35% of the children brush their teeth twice or after every meal in a day. Almost of half of the participants were unaware of whether their child rinses his/her teeth after having food.

More than 50% of the parents reported that their child has a habit with tongue thrusting and nail biting being the most common one. This shows that majority of the children participated in the study have various habits like nail biting, tongue thrusting, lip biting, mouth breathing etc. but owing to lack of proper management of this habit by the parent it is being continued and on clinical examination most of the children has changes in the oral cavity as a result of the habit. More than 80% of the parents have reported to have not taken any actions against quitting this habit and though a

smaller percentage, few of the parents actually preferred punishment as an effective method in stopping the habit.

More than half of the participants have never visited a dentist before for their child's oral care. This shows high level of negligence towards the child's oral care and points at the lack of awareness of the importance of oral health in the child's quality of life and health.

Though more than 70% of the participants reported that their child had recent complaint of discomfort or pain in their tooth less than 20% of the parents have admitted to frequently inspect their child's oral cavity for caries and deposits. This actually tells us that parents of pediatric patients lack the general awareness regarding the basic steps required in maintaining the child's oral health as well as of the essential steps in preventing decay and other common dental and related problems in them. This can be overcome by conducting camps in schools and housing complexes which emphasise on the importance of oral health and the essential factors that will both help in prevention and to manage such conditions. They should also be made aware of how this negligence can affect the quality of life of their child. Further studies in a larger population with diverse ethnicity should be done to evaluate whether the ethnicity plays any role in affecting the oral health of the child.

**Conflicts of Interest:** Nil, the authors have no conflicts of interest

**Funding:** Self funded study

### Conclusion

Parents have an indispensable role in the development of a child. Their behaviour is highly influenced by the parent. Lack of awareness of complications of oral health and of proper method for management of oral health has led to increased incidence of dental caries in pediatric patients in the country. From our study it has been inferred that there is a lack of awareness in parents of pediatric patients regarding the maintenance of oral health and should be given guidance in providing oral care for their child.

# Study of Total Time Taken for OPD Billing Process in a Multi-Specialty Hospital

Anil Pandit<sup>1</sup>, Savita Prashar<sup>2</sup>

<sup>1</sup>Chief Medical Director (Former Prof & HoD, SIHS, Pune), Chellaram Hospital Diabetes Care & Multi Specialty, Bavdhan, Pune, <sup>2</sup>Student, MBA (HHM), SIHS, S.B. Road, Pune

## Abstract

Patients' waiting time for OPD billing has been defined as "the length of time from when the patient gets the token in the outpatient clinic to the time the patient actually reaches the OPD billing counter". Total billing time includes the waiting time and the time taken at the counter till the process is completed.

Waiting times act as barrier to efficient patient flows thus have been considered a serious problem in many health care systems.

OPD is considered as the window to hospital services and a patient's impression of the hospital begins at the OPD. Therefore, it is essential to ensure that OPD services provide an excellent experience for customers.

This was the undertaken for assessing the waiting time and total time taken for billing in the outpatient department and recommending suggestions to reduce the waiting time for billing process.

The Waiting time and total time taken for the billing process was calculated using direct observation study. It was found that there was a significant increase in the total time and waiting time for the billing in the outpatient department after 11 AM and till late afternoon; it varied from 8 minutes to 27 minutes and from 4 minutes to 23 minutes, on an average respectively.

Reducing the waiting time for OPD billing will help to retain the loyal patients.

**Keywords:** *Waiting time and total time taken for the billing process, Outpatient Department.*

## Introduction

Outpatient service is the most important service provided by all the hospitals as it is the point of contact between a hospital and the community. It is an ambulatory care centre which provides to all members of a community the whole scope of services that are needed

to keep them in good state of health directly or by referral to more qualified institutions. OPD in a hospital serves the facility for diagnosis and treatment of patients. Many patients gain their first impression of the hospital from the OPD. In other words, the first impression will have lasting effects. A well-managed, neat and clean hospital with necessary information boards and proper directions generally provide good image. Successful and efficient management of OPD can lighten the burden on the patient wards<sup>1</sup>.

The hospitals tend to judge themselves entirely on formal, non-psychological levels, the number of beds, specialist, procedures, modernity of buildings and equipment, the size of the budget and so forth. Yet the fact is that the patient almost never reacts to such

---

statistical aggregates. The key to solving this dilemma may be for health sector to focus on health service quality by considering specific concept and modality found in the services marketing literature<sup>2,3</sup>. Every day, healthcare providers make decisions that directly impact people's health and safety. A single error on their part could cause irreversible damage to a patient's life, and lead to expensive lawsuits, billions of dollars in damages, and a permanently tarnished reputation. Health care providers need new ways to manage risk that combine innovative solutions with a deep understanding of the industry's issues and requirements<sup>4,5</sup>. Efficiency and innovation are perhaps the most important goals of a health system and quality of care measurement is the biggest challenge in that effort<sup>6</sup>.

Satisfaction is achieved when patient/client's perception of quality of care & services that they receive in Health care settings has been positive, satisfactory & meets their expectation. Customer feedback is recognized method of available health services<sup>7</sup>. The high patient satisfaction is certainly indicative of good treatment. Return of customers is a fundamental marketing principle that is becoming increasingly important for health care providers in today's competitive environment. Second, by identifying the sources of patients' dissatisfaction, the organization can address system weaknesses, thus improving its risk management. Thirdly, satisfied patients are more likely to follow the specified medical regimens and treatment plans<sup>8</sup>.

Out Patient services are the most important service provided by the hospital as it provides services to a large number of patients at affordable cost. OPD is considered as the window to hospital services and a patient's impression of the hospital begins at the OPD. This impression often influences the patient's sensitivity to the hospital and therefore it is essential to ensure that OPD services provide an excellent experience for customers. The utilization of many of the other services provided by the hospital, often depend on how satisfied the patient is with the outpatient services provided. It is also well-established that 8-10 per cent of OPD patients need hospitalisation. When well organised and professionally run, not only can such OPDs help avoid confusion, frustration and overspending by fearful patients, but can also regulate the flow of inpatients to the hospitals. Patient waiting time has been defined as "The length of time from when the patient enters the outpatient department to the time the patient."<sup>9</sup>

Usually it is observed that patients at the hospital OPDs have to wait for a disproportionately long time before they can get medical treatment or advice by professional healthcare workers. Long waiting time in hospitals causes discontent among patients. In a competitively managed healthcare environment, long waiting time of patients in an OPD adversely affects the hospitals ability to attract new increased business. It is difficult to sell services if individuals are dissatisfied with the delayed process and increased waiting time<sup>10</sup>. Because of great volume of ambulant patients in most communities, an efficient outpatient department (OPD) in hospital is clearly of critical importance. This is more because of lower cost of outpatient services compared to inpatients<sup>11</sup>. Health care, it turns out, is simply a tough problem to "solve. "In many countries, Sweden, for example, the problem is long wait times for care.

There are many indicators of quality assurance in hospitals. In outpatient departments, one of the important indicators of quality assurance for patients is "waiting time". Hence it is detrimental for a hospital on the whole to have long OPD waiting time.

Nowadays OPD services of the majority of hospitals are having queuing and waiting time problem.

Common problems to be encountered in OPD system are as follows<sup>10</sup>:

- Patients waiting time occur long at the front desk of the hospital.
- Patients might be directed to wrong services
- Large number of patients waiting to be served at the OPD will result in uncomfortable conditions such as congestion, noise, and poor ventilation.

Thus, the main objectives of the Out-patient department of a hospital should include the reduction of patients' time in the system, improvement on the services given, and better resource utilization.

The advantages of study in hospital OPD are to improve the method/procedures of various jobs. Out Patient Department should improve both Clinical and non-clinical facilities such as overall OPD layout that can decrease the overcrowding and delay in consultation. In hospitals this can also include reducing the efforts patients need for treatment as well as for their routine hospital check-up.<sup>11</sup>

**Aim and Objectives:** Aim : To study the total time taken for billing in the outpatient department of a Multispecialty Hospital and suggesting recommendations to improve the workflow of the OPD.

#### **Objectives:**

- To determine the average waiting time for the billing process in the OPD.
- To determine the total time taken in the billing process in the OPD.
- To identify the factors responsible for prolonged waiting time for billing process in the OPD and suggest interventions.

#### **Scope:**

- The immediate and major cause for increased waiting time for billing in the OPD can be assessed and rectified.
- The idle time of OPDs can be ascertained and means to schedule OPDs accordingly with a view to reduce peak workload can be done.

**Limitation:** OPD billing for ECHS and CGHS patients and for patients coming in the late evening could not be included.

**Review of Literature:** Out Patient Department (OPD) is defined as a part of the hospital with allotted physical facilities and medical and other staff in sufficient number, with regular scheduled hours, to provide care for patients who are not registered as in patients. It witnesses maximum footfall daily when compared to any other department in the hospital. The waiting period is one of the most important indicators of quality of service. Long waiting periods are found to be one of the key challenges in the healthcare system. A prolonged waiting time directly reflects on the quality of service being provided. Keeping patients waiting unnecessarily can be a cause of stress for both patient and doctor. Waiting time is a tangible aspect of practice that patients will use to judge health personnel, even more than their knowledge and skill. Waiting time is the time required just after patient's arrival at the OPD to meet his health needs. Patient's waiting depends on many factors including efficiency, sincerity and punctuality of the health care providers as well as the existing facilities of the institution. The Institute of Medicine (IOM) recommends that, at least 90% of patients should be seen within 30 minutes of their scheduled appointment. Several studies have documented the negative association between increased

waiting time and patient satisfaction. This type of feedback triggers a real interest that can lead to a change in their culture and in their perception of patients.

Improving patient's satisfaction towards healthcare services by reducing their waiting time, attending the patient in time and sympathetic approach will create a positive image of hospital in the minds of people and will also help the hospital to build an image in the community. By decreasing waiting and treatment times, costs can be reduced, while increasing accessibility. Three goals that benefit from healthcare delay reduction are: waiting time reduction for needed service, timeliness for reaching the service, and elimination of inefficient activities. The operational cost is reduced. One of the reasons for long waiting times found was that there are too many patients who come in at the same period of time. Queue and delay analysis can produce dramatic improvements in medical performance, patient satisfaction and cost efficiency of healthcare. A proper appointment system is necessary to reduce the congestion of patients which can be done by examining the OPD system. An optimal policy must balance the risks of patient waiting, staff overtime and clinic under-utilization.

### **Methodology**

**Study Design:** The study was an exploratory and descriptive in nature. It was conducted in a 200 bedded Multi-specialty hospital in Noida. The study began with mapping the process of the OPD patient flow and collecting retrospective data from the HIS, (Hospital Information System) and then continued as a concurrent study, wherein simultaneous observation and data collection was carried out at the OPD sector. The token generation time of each patient was noted and manually entered into an Excel sheet, following the display of the patient ID number on the screen within the OPD premises. The waiting time for each patient was then calculated from the difference between the timings of the patient reporting at the counter and the token generation time. Then the time taken by the coordinator to complete the billing process was noted.

**Study Procedure:** The study is carried out in three phases.

#### **Phase 1: Included data collection**

- a. Retrospective data collection from the HIS to determine the token generation. Other figures asked by the supervisors to improve the resource

management like idle time of the coordinator, waiting time of the system, time taken to complete the process by different coordinators were also noted for the organisation's requirement.

- b. Concurrent data collection by observation of the required parameters within the OPD processes.

**Phase 2:** Involved compilation of the data collected, calculation and analysis of the findings to arrive at the results of the study.

**Phase 3:** Was the final phase that involved, discussion of the findings of the study, making recommendations.

A Patient Experience Feedback questionnaire was administered to the OPD patients

Process Mapping-  
For a complete understanding of the OPD system an in-depth knowledge of the Outpatient billing process flow is essential. This should include the activities occurring at each step and the waiting time and other information which can identify factors which are hindering the flow charting or process mapping..

A fishbone diagram can be helpful in identifying possible causes for a problem that might not otherwise be considered by directing the team to look at the categories and think of alternative causes.

**Measurable:**

- Total time taken for the billing process.
- Waiting time for the billing.

**Sample Size:** 200

**Study Population:** All patients who came for OPD visit.

**Inclusion Criteria:**

- All the patients visiting the OPD for either consultation by the doctor or for investigations.
- Willingness to participate

**Exclusion Criteria:** CGHS/ECHS patients

**Tools:**

- Process mapping
- Root cause analysis
- Questionnaire

**Data Analysis:** Analysis of the workflow of the OPD billing section, waiting time and reasons for

increased waiting time for the billing and total time taken for billing at different workload hours.

**Findings and Discussion**

As per the information and briefing given by the OPD head and staff, there was a rise in the complaints regarding the workflow of the OPD billing section. Hence, a study was conducted to identify the bottlenecks and peak workload hours. The increased waiting time for billing was identified as a major factor for patient dissatisfaction.

Process flow of an Outpatient billing begins with the Registration process in the case of a new patient and from Acknowledgement of the UHID number into the system in the case of an existing patient and ends with the patient getting the bill payment receipt, either for a prescription for medication/treatment or for laboratory/radiological investigations.

The series of events occurring in the Process flow of an Outpatient billing from the time a patient enters the hospital OPD billings section till he exits are as follows:

**Step 1:** Taking the token

The patient need to get a token from the token vending machine placed near the billing counters and waits for display on the LCD screen put in the premises.

**Step 2:** Acquiring hospital UHID number

In the case of a new patient, at the billing counter, the registration form is completed and submitted following which the registration staff enter the details of the patient into the system and prints the UHID card.

**Step 3:** Acknowledging the patient

In the case of a new patient, after the registration process is completed, the UHID number of the patient is acknowledged. On the other hand, a known patient who already holds a UHID number proceeds directly for UHID acknowledgement.

**Step 4:** Billing for Consultation

After acknowledgement, the patient is billed for consultation depending on whether it is a first visit or a follow-up. A follow up consultation within 7 days of the first consultation, with the same consultant is not billed and this is confirmed by checking the patient history in the HIS. Once the patient is billed, a printout of the bill is handed over to the patient

**Step 5: Billing for investigation**

In case the patient has come directly for the investigations, he follows the same process of billing as mentioned in the above steps. However, the process takes more time at the billing counter because of code search, code identification, informing the patient about the amount of each investigation/procedure, and billing as per different codes for various investigations.

If the doctor prescribes investigations/diagnostic procedure to the patient after consultation, the patient undergoes the same cycle from getting the token again, waiting for his/her turn for the billing, and payment of the investigation/diagnostic procedure.

**(Patient waiting time) in the Process flow**

Idle time was observed in the process flow of an Out Patient where Queuing occurs indicating waited time for patients are:

1. In the OPD waiting area for the announcement and display of their token number.
2. At the billing counter to obtain UHID number and acknowledgement of UHID number.
2. Billing for the consultation fee at the counter.
3. Getting the information on the charges of various investigations.
4. Billing of investigations, post consultation or general.

The token system did help in queuing the patients on first come first served basis. But it was observed that the billing for investigations take more time than the billing for consultation as showed in figure 1. This was because of the different codes for different investigations and procedures. Some were available on the HIS but for some the coordinator had to reach the lab department. Also, some of the new staff was not that well acquainted

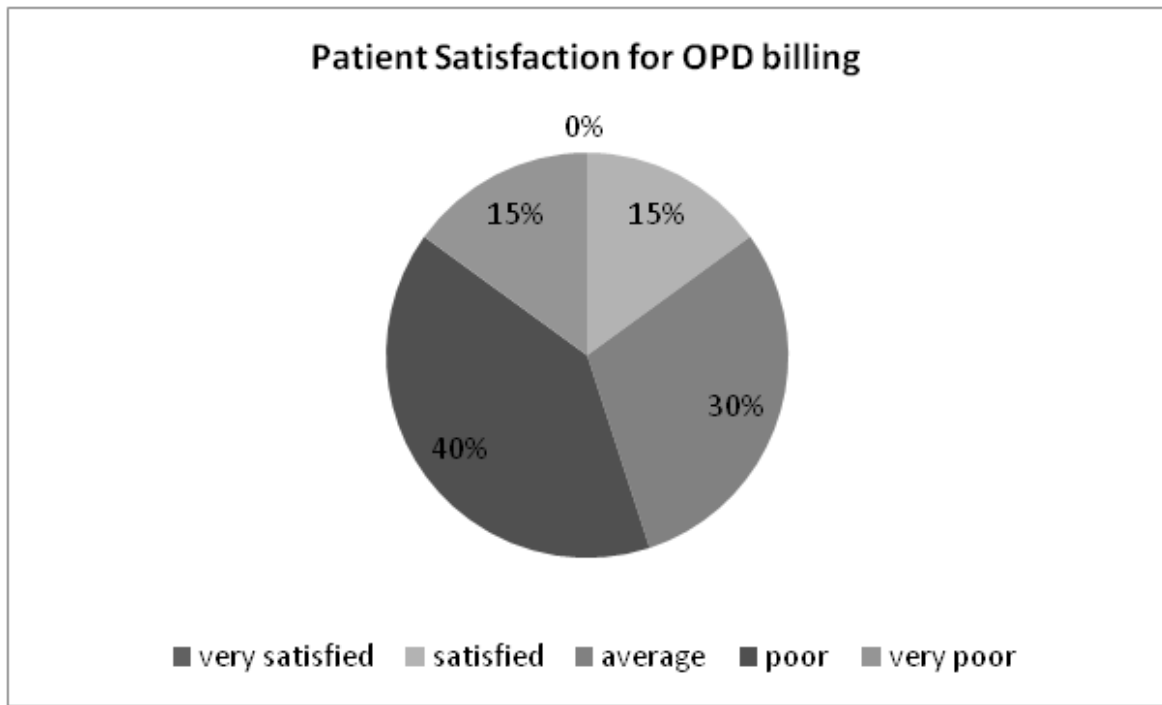

with the various codes. The time required for the billing for investigations used to increase with the number of tests the patient needs to get done.

Because the counters for the billing for investigations and consultations were common, the patients who need to consult a doctor had to wait that long. Also, registration before the billing of the new patient used to increase the total time of the process. Because of improper communication between the patients and the staff, problems like improper scheduling leading to overcrowding and increased waiting time, patients could not see the doctor for consultation. Because of longer durations of waiting, patients used to get late for their appointment with the doctor or for the investigative procedures which again used to lead to obstacles in the process flow of the OPD.

The registration process involves filling up of the registration form by the patient and submission of the same to the billing coordinator. The coordinator then fills the details of the patient in the HIS and registers the patient after which a unique identification code for the patient is generated. The number of staff when this study started was very less as compared to the need. This used to lead to a chaotic situation in the peak workload hours which were identified during the day in this study.

The waiting time and the total time taken for the whole billing process was noted and recorded. There was a significant increase in the total time taken and waiting time for billing in the out-patient department after 11 am till late afternoon. Table 1 and table 2 shows the data.

To solidify the need of this study, a simple questionnaire was designed for the patients to understand their need in a better way. This gave a qualitative idea of the patient satisfaction regarding the OPD billing process and staff service.

**Figure 1: Patient satisfaction was determined with the help of questionnaire**

It was found that about 40 percent of people were poorly satisfied with the OPD billing service whereas the percentage of patients who were highly satisfied was zero.

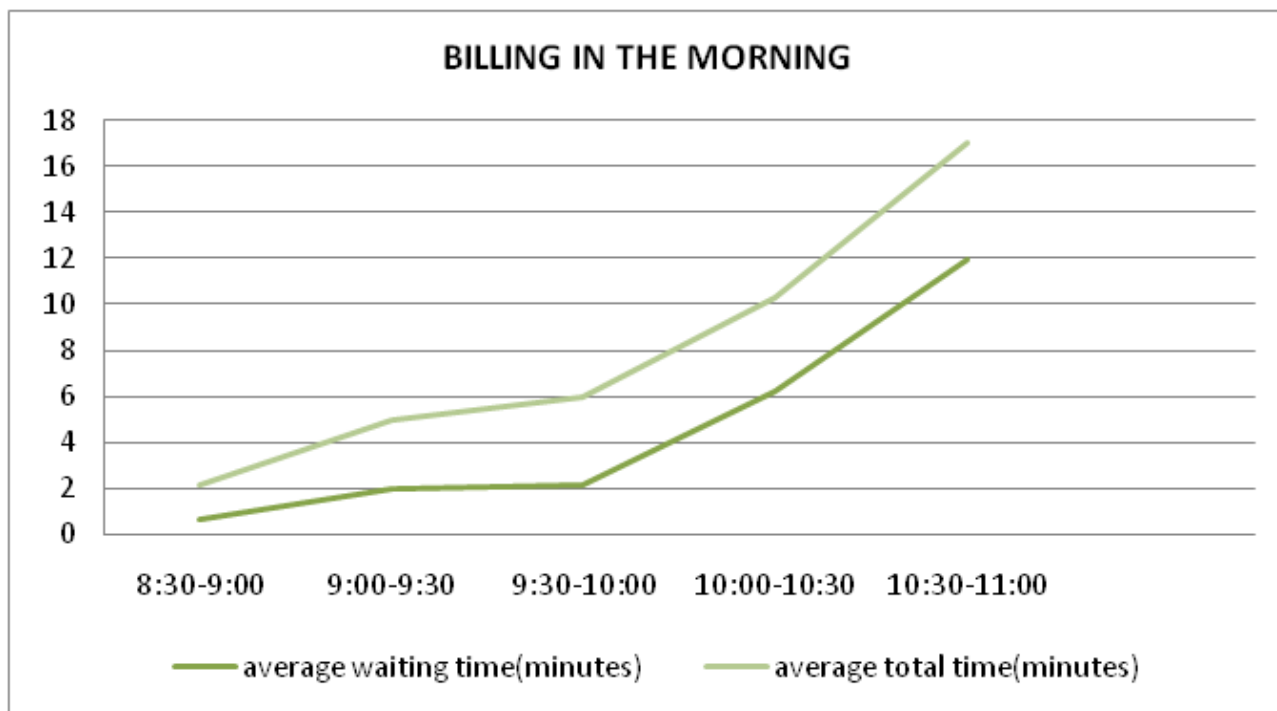

**Figure 2: The time taken for the billing process for ten investigations and ten consultations.**

The registration process (if the patient is new to the hospital) was excluded as that usually takes same amount of time on an average. It was observed that billing for investigations takes more time than billing for doctor’s consultation.

**Table 1: Billing in the early morning**

Time interval	Average waiting time(minutes)	Average total time (minutes)
8:30-9:00	0:7	2:15
9:00-9:30	2	5
9:30-10:00	2:17	6
10:00-10:30	6:30	10:30
10:30-11:00	12	17

This table shows the average waiting time and total time taken in the billing process of the hospital OPD in the time interval of 30 minutes from the time the OPD is open till the peak hours as showed in Graph below.

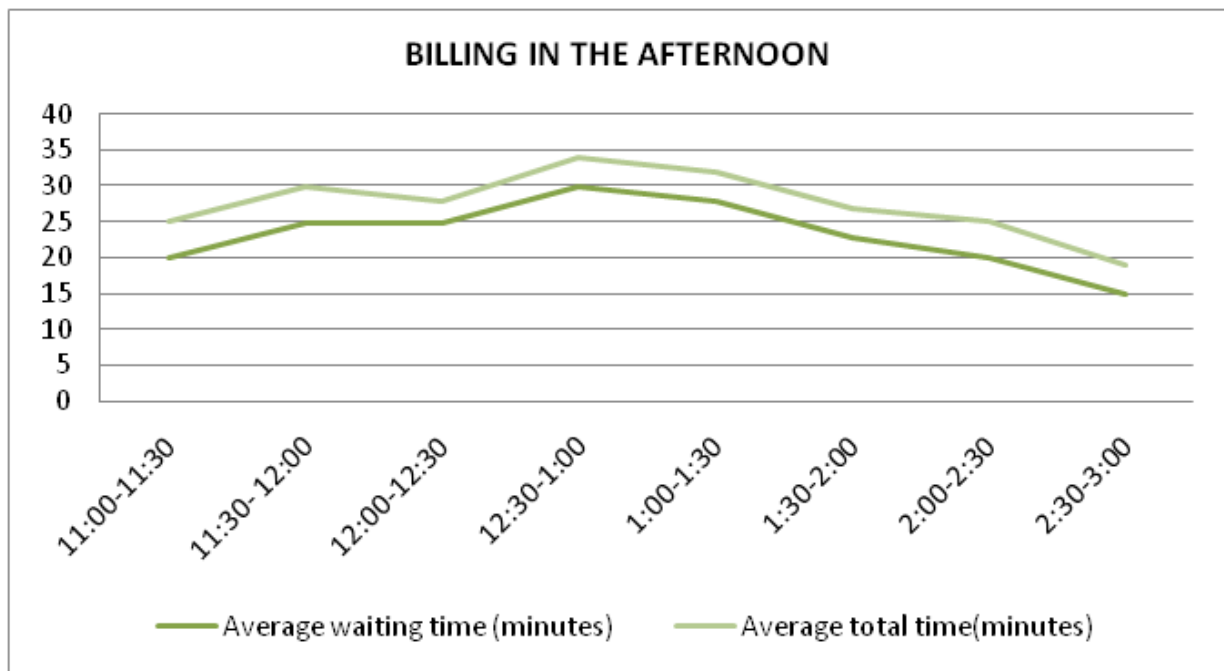

**Figure 3: The average waiting time for billing before 11 am .**

It was observed to be 4 minutes. The total time taken to complete the whole billing process at the hospital OPD was found to be 8 minutes on an average.

**Table 2: Billing after 11 am.**

Time interval	Average waiting time (minutes)	Average total time (minutes)
11:00-11:30	20	25
11:30- 12:00	25	30
12:00-12:30	25	28
12:30-1:00	30	34
1:00-1:30	28	32
1:30-2:00	23	27
2:00-2:30	20	25
2:30-3:00	15	19

This table depicts the average waiting time and total time taken in the whole billing process in the hospital OPD with a time interval of 30 minutes.

**Figure 4: After 11 am the average waiting time for billing in the hospital OPD.**

It was found to be 23 minutes with total time taken to complete the whole process of OPD billing was found to be 28 minutes. This shows the significant rise in the waiting time and total time taken for the whole billing process in the hospital OPD.

It depicts that during the day; the hours after 11:00 am were of peak workload and needed an increase in the staff at least for the peak hour

**Recommendations:** Bottlenecks in the present process flow were identified which were, mainly crowding of the patients at the Registration desk and OPD reception and unnecessary movement of the patients for billing, investigation and report collection. The primary changes recommended were to decentralize billing and make outpatient laboratory reports available at all counters to ease the patient flow and disperse the crowd at the front desk.

The billing for investigations and consultations both are done at the OPD front office. Investigations are billed by entering the UHID number of a patient and selecting the respective investigations to be billed. This on an average takes 5-6 minutes for each patient, varying according to the number of investigations that need to be billed.

The room for laboratory room testing and collection was located close to the billing counters. Thus, limiting the investigation billing and laboratory report collection to the front office, resulted in amassing of people.

Therefore, it was recommended that the hospital OPD should have well trained staff to enable decentralized billing for investigations at respective OPDs. Laboratory investigation report printouts should be made obtainable at respective OPDs as well, to further reduce patient movement. Billing counters for investigation billing could be separated from the counters for consultation billing along with modification in the token system.

The registration for new patient coming to the hospital was also done at the OPD billing counter. Starting from the time the Registration file is taken to fill in details, till the UHID number is generated, the average time to register a patient varies from 1-2 minutes. This adding to the billing done for the service increases the total time taken for and the waiting time for the billing process. At times, a few patients have difficulty in filling the registration form and complying with the Registration process.

There can be floor navigators, easing the process flow for those patients who have difficulty in complying with the outpatient process.

Introducing online registration was suggested for new patients so that they can fill the form online and bring it along to cut down on their waiting time for registration, thus total time taken for the billing.

This on other hand will avoid long queues at the registration desk. A suggestion to Introduce iPads/ Tablets with staff who can walk amongst the queues and register patients while they wait, quickly dispersing the crowd was also made.

The security staff in the OPD should guide the patients regarding the counters and guards must be trained for the same. Regular training sessions should be conducted for all the staff.

A suggestion to implement OPD reception and consultation room checklist to make sure all necessary resources are available at all times. The receptionist staff must be trained to attend phone calls efficiently. A system generated SMS can be sent to the patient confirming his/her OPD timing.

Proper display of the consultant's timings in the OPD, as well as online, will reduce the number of enquiries made by the patients. OPD coordinators should be trained for proper scheduling of the appointments to decrease the overcrowding. There should be a fixed schedule allocation by which the patients with appointments and Walk-in patients are called for consultation. This means that the Walk-in can be informed of an approximate waiting time period (arbitrarily 2 patients with appointments followed by one Walk-in patient for those consultants who have greater numbers of patients with appointments).

### Conclusion

Patients coming to the hospital if satisfied will help in developing the good image of the institute and waiting time is one of the important indicators of patient satisfaction. The study reveals the average time taken for the whole billing process both for investigations and consultations. It also mentions their view towards the OPD billing process.

The investigations took more time than the consultation for billing. This was due to the time taken for identification and application of different codes for different investigations. The staffs were not well

equipped with all the codes for different investigations and diagnostic procedures.

There is no Conflict of Interest.

**The study was not funded by any agency:** Since the study was done as a part of Project by MBA (HHM) students, there were no Ethical issues involved. There were no human or animal experiments or interventions.

# Sleep Quality and Glycemic Control among Patients with Type II Diabetes Mellitus

Anju Babu<sup>1</sup>, Sabitha V Janardhanan<sup>1</sup>, Sreevidhya R.<sup>2</sup>, Sruthy K.S.<sup>2</sup>

<sup>1</sup>Lecturer, <sup>2</sup>IV Year B.Sc. Nursing Students, Amrita College of Nursing, Amrita Vishwa Vidyapeetham, Kochi, Kerala, India

## Abstract

**Background:** Diabetes Mellitus is one of the most serious health problem that arise from poor sleep quality.

**Objective:** Objectives of the study were

1. Identify relationship between the sleep quality and glycemic control among patients with type II Diabetes Mellitus.
2. Determine association of sleep quality and glycemic control with selected socio demographic and clinical variables.

**Materials and Method:** A Non-Experimental descriptive study was conducted among 200 Type II diabetic patients attending Endocrinology OPD at a tertiary care hospital, Kochi. Subjects were selected using convenient and purposive sampling. Data were collected by using Tool 1: Structured Questionnaire and Tool 2: Pittsburgh Sleep Quality Index and Tool 3: Recent FBS and HbA1C Scoring

**Results:** The study found that there is a borderline significance (p value of 0.046) ( $\chi^2=6.1773$ ) with uncontrolled diabetes (HbA1C >6.5) and poor sleep quality (PSQI >5) but the correlation of FBS and PSQI was insignificant (p value of 0.319) ( $\chi^2=2.283$ ). Moreover females were the groups with poor sleep quality when compared to males (p value of 0.022) ( $\chi^2=5.227$ ) and the co morbidities (P=0.049) ( $\chi^2=3.885$ ) and duration of illness within 4-8 years (p value =0.027) ( $\chi^2=7.217$ ) presents positive correlation with the PSQI values.

**Conclusion:** Diabetes Mellitus being a metabolic disorder, it affects various physiologic process. The one among being sleep. So by better glycemic control, it will pay a way to have good sleep quality.

**Keywords:** Sleep Quality, Glycemic Control, Type II Diabetes Mellitus.

## Introduction

Diabetes Mellitus is a chronic multisystem disease related to abnormal insulin production, impaired insulin utilization, or both. Diabetes Mellitus is a serious health problem throughout the world, and its prevalence is rapidly increasing.<sup>1</sup> It is associated with damage, dysfunction, and failure of different organs, especially the eyes, kidneys, nerves, heart and blood vessels<sup>2</sup>. Management of type 2 diabetes requires considerable dexterity on the part of the patient to manage drugs, diet and exercise.<sup>3</sup>

In 2017, an estimated 8.8 percent or 451 million of the adult population worldwide had diabetes and is expected to raise to 9.9 percent, which will be 693 million by 2045. Moreover, in 2017

5 million deaths among 20-99 years of age was attributed by Diabetes Mellitus and health care expenditure was estimated to be 850 billion.<sup>4</sup> WHO projects that diabetes will be the 7<sup>th</sup> leading cause of death in 2030. American Diabetes Association reports 62 million Indians currently being affected with diabetes<sup>5</sup> and Kerala stands at the top list among Indian states

with a score of 19.4% with an age group of 45-69 years comparing with Chandigarh (13.6%), and Tamil Nadu (10%).<sup>6</sup>

According to WHO, Diabetes Mellitus is being classified into Type I, Type II, Pre-Diabetes, Gestational Diabetes and other specific types of diabetes.<sup>7</sup> Type II diabetes is a complex and demanding chronic condition resulting from the body's inability to adequately produce and or effectively utilize insulin.

India is the 'Diabetes Capital' of the world. The number of cases of diabetes is sharply increasing and so are the complications from diabetes.<sup>8</sup> The prevalence of type II diabetes in Ernakulum district in 2017 that was reported in the Journal of endocrinology and diabetes is about 7.4% among adults. The mean age of the population was 42.7 years (16.03) with males and females equally distributed at a ratio of 48.9: 51.<sup>9</sup> The main risk factors for the development of type II Diabetes Mellitus is family history, race/ethnicity, age, lifestyle changes: less physical activity, consuming more calories, being overweight. The most neglected risk factor according to the studies is sleep disruption.

Diabetes is one of the most serious health problem that arise from poor sleep quality. The evidences shows that there is a powerful connection between body's metabolism, hormones that regulate appetite and eating patterns and the body's use of blood sugar and insulin with sleep.<sup>10</sup>

A hospital based descriptive cross-sectional study at International Archives of Integrated Medicine, Hyderabad assessed the prevalence of poor sleep quality and factors influencing it in type II Diabetes Mellitus patients along with the impact of sleep quality on glycemic control among 100 patients with PSQI and HbA1c level. The study findings revealed that sleep pattern (PSQI global score > 5) was poor in 64% where they conclude on the high prevalence of poor sleep quality in diabetic patients and is strongly associated with diabetic neuropathy<sup>11</sup>.

Sleep is an active biologic function that is essential for life and is critical for physical, mental and emotional well-being<sup>12</sup>. Most adults require 7-8 hours of sleep within 24-hour period. Any defects in sleep quality and quantity may lead to several complications including metabolic errors. This includes impaired glucose tolerance, increased cortisol concentration, insulin resistance contributing to type II Diabetes Mellitus;

higher leptin levels resulting in weight gain-obesity<sup>13</sup>. Studies show that glucose intolerance in the body which may contribute to type II Diabetes Mellitus and vice versa. The average sleep hour for diabetic adults is about 6 hours or less. Research findings shows role for circadian rhythm in the development of diabetes.<sup>14</sup>

Study findings reveals that insulin operates on a daily cycle and the circadian clock of the body directs the production and release of insulin from pancreas where any disruption in this clock often leads to sleep problems and thereby reducing the effectiveness of insulin, which with time leads to insulin resistance.

Another contribution of poor sleep on diabetes is the stress created on pancreatic cells due to sleep disruption which impairs the blood glucose levels in turn leading to decreased insulin sensitivity and decreased glucose tolerance.

### Objectives

1. Identify relationship between the sleep quality and glycemic control among patients with type II Diabetes Mellitus.
2. Determine association of sleep quality and glycemic control with selected socio demographic and clinical variables.

### Materials and Method

**Study design, sample and setting:** The present study is a hospital based Non-Experimental descriptive study conducted among the Out patients visiting the Department of Endocrinology at a tertiary care hospital, Kochi. The sample consisted of 200 Type II Diabetes Mellitus patients attending the Outpatient department with their recent FBS and HbA1c values were randomly recruited to the study after considering the inclusion and exclusion criteria. The study was initiated after obtaining Ethics committee permission. Informed consent was taken from the participants those who meet the inclusion criteria.

#### Data collection instruments:

**Tool 1:** Structured Questionnaire: It had two sections. Section A: Socio demographic variables and Section B: Clinical variable

**Tool 2:** Pittsburgh Sleep Quality Index which is a subjective measurement of sleep. A PSQI global score of >5 is considered to be suggestive of significant sleep disturbance.

**Tool 3:Recent FBS and HbA1C Scoring.**

**Data Analysis:** The data were optically scrutinized and entered into SPSS and data were analyzed using descriptive and inferential statistics.

**Results**

**Section 1: Socio demographic data of the subjects:** Out of the 200 subjects, majority of the subjects 132(66%) belongs to the age of less than 55 years and both male and female found to be in equal frequency (50%). The highest percentages of samples were having education up to higher secondary level (50%). Majority were married (87.5%). 33.5% of samples were retired and 33% were unemployed. Most of the samples 127 (63.5%) belonged to urban area.

**Section 2: distribution of subjects based on clinical data:** By assessing clinical variables, it was found that out of 200 data's collected, 108 (54%) of them were of normal and underweight BMI category. And 195

(97.5%) of them having higher waist circumference and 180 (90%) of them with higher neck circumference. But neither of them showed any significance with poor sleep quality. Among the collected data's, 146 (73%) of them showed family history of type 2 DM. It was found that 25 (12.5%) of the patients who were being diagnosed with type 2 DM was in the range of 4-8 years and is having a significant correlation of 80.60% (p value 0.027) with poor sleep quality. 90 of the total patients were having their age of onset of illness <45 years. Among these diabetic patients, 93 (46.5%) of them are on Oral Hypoglycemic Agents (OHA) and 66 (33%) of them on both OHA and insulin and out of which 146 (73%) of them are on diabetic diet. Out of 200 diabetic patients, 14 (7%) are taking sleep medications. 86 (43%) out of 200 are doing daily walking exercise and 57 (28.5%) are doing yoga. 185 (92.5%) are having the habit of tea or coffee intake. Among these patients, 19 (9.5%) and 9 (4.5%) are having the habit of alcoholism and smoking respectively. Within the selected patients, 195 (97.5%) are on continuous medications.

**Section 3: Relationship between the sleep quality and glycemc control among patients with type II Diabetes Mellitus**

**HbA1C and PSQI:**

HbA1C	Total	PSQI		df	Chi square value	P value
		Poor Sleep Quality				
		Number	Percentage (%)			
Normal	9	6	66.70%	2	6.1773*	0.046
Prediabetic	28	16	57.10%			
Diabetic	163	128	78.50%			

The above table shows that out of 163 diabetic patients, 128 (78.5%) of them were presented with poor sleep quality. Where it gives p value of 0.046 ( $\chi^2=6.1773^*$ ) showing border line significance.

**FBS and PSQI:** The research analysis reveals that out of 117 diabetic patients, 92 (78.6%) of them were

having poor sleep quality. But on p value estimation it gives a value of 0.319 ( $\chi^2=2.283$ ) showing no significance.

**Section 4:** Association of sleep quality and glycemc control with selected socio demographic and clinical variables.

**Sex and PSQI:**

Sex	Total	PSQI		df	Chi square value	P value
		Poor Sleep Quality				
		Number	Percentage (%)			
Male	100	68	68.00%	1	5.227	0.022
Female	100	82	82.00%			

Above table shows that out of 100 females, 82 (82%) of them were presenting with poor sleep quality. P value of 0.022( $\chi^2=5.227$ ) depicts that poor sleep is more among females as compared to males.

**Comorbidities and PSQI:**

Comorbidity	Total	PSQI		Df	Chi square value	P value
		Poor Sleep Quality				
		Number	Percentage (%)			
Yes	156	122	78.20%	1	3.885*	0.049
No	44	28	63.60%			

The above table shows that out of 156 diabetic patients with comorbidities, 122 (78.2%) of them were having poor sleep quality. Where p value of 0.049( $\chi^2=3.885^*$ ) is suggestive of considerable significance.

**Duration of Type II DM and PSQI:**

Years	Total	PSQI		df	Chi square value	P Value
		Poor Sleep Quality				
		Number	Percentage (%)			
1-3	29	16	55.20%	2	7.217*	0.027
4-8	31	25	80.60%			
>8	140	109	77.90%			

The above table shows that for the patients diagnosed of being diabetic for 4-8 year duration was found to have poor sleep quality (80.60%). Where giving a p value of 0.027( $\chi^2=7.217^*$ ) indicates positive correlation between duration of illness and sleep quality.

**Discussion**

The present study was conducted among 200 diabetic patients visiting Endocrinology OPD at a tertiary care hospital Kochi. Ideally it would have a better result if there were a control group of non diabetic population. But it was not possible in the study situation. As the present study result shows that there is a borderline significance among diabetic patients HbA1C values and poor sleep quality ( $p=0.046$ ) ( $\chi^2=6.1773$ ), this shows a congruency with the study conducted by Abdulilah M, among 400 diabetic patients in Saudi where patients with uncontrolled diabetes (HbA1C >7%) had significant

prevalence of poor sleep quality (p value of <0.001%), however there were no correlation with sleep quality and age, smoking status<sup>15</sup> where the present study too shows no significant correlation.

A study conducted by Lou et al, showed a significant congruency with the present study which states that poor sleep quality can be observed among older females and among illiterate, the study result also finds that females have significant correlation with poor sleep quality. But without significance, it was identifies that poor sleep quality is more in low literate population but within <55 year groups.<sup>16</sup> The present study reveals that out of 100 females, 82 (82%) of them were presented with poor sleep quality. P value of 0.022( $\chi^2=5.227$ ) depicts that poor sleep is more among females as compared to males.

On a study conducted by Gozashti MH, among diabetic patients in Kerman, showed that there were a

significant correlation among patients with higher BMI (more among females)(p value of 0.03%) and poor sleep quality.<sup>17</sup> No such significant correlation were identified in the present study with the above mentioned variable.

The present study shows that out of 156 diabetic patients with co morbidities, 122 (78.2%) of them were having poor sleep quality. Where p value of 0.049( $\chi^2=3.885^*$ ) is suggestive of considerable significance. Another study conducted among Osaka diabetic patients revealed that there is a significant correlation between co morbidities specially with BP (p value of 0.010)<sup>18</sup> which makes high congruency with the present study.

### Conclusion

The study has showed that there is a considerable significance between the HbA1c values and the Sleep Quality Index (p value of 0.046)( $\chi^2=6.1773$ ) of the patients with type II Diabetes Mellitus, while the FBS values are far less to concern with the PSQI values (p value of 0.319)

( $\chi^2=2.283$ ). Mostly women being the troubled sleepers as revealed by the study (p value of 0.022) ( $\chi^2=5.227$ ), they lie within the age group experiencing menopausal to post-menopausal metabolic dynamics. It is also identified that in the present study, there is positive correlation between duration of illness and sleep quality (p value =0.027) ( $\chi^2=7.217$ )

**Ethical Consideration:** The research proposal was approved by the committee of ACON and Thesis Review Committee of a tertiary care hospital, Kochi on 2018. Formal administrative permission was obtained from the Head of Department of Endocrinology unit to conduct the study within selected setting. The voluntary nature of participation and confidentiality of the data was explained and consents were obtained from the participants.

**Source of Funding:** No sources of funding were available from the private or public organizations.

**Conflicts of Interest:** There is no conflict of interest among the authors

# A Comprehensive Break Even Analysis of MRI and CT Unit of a Tertiary Care Hospital in Sikkim

Ankit Singh<sup>1</sup>, Priya Ravi<sup>2</sup>, Soniya Joseph<sup>3</sup>

<sup>1</sup>Assistant Professor, Department of Hospital Administration, <sup>2</sup>Executive Operations, Central Referral Hospital, Sikkim Manipal University, <sup>3</sup>Student, Manipal Institute of Management, MAHE, Manipal

## Abstract

Break Even Analysis has wide application in most of the industries but its application so far is limited in hospital industry, this study attempts to perform break even analysis of both MRI and CT unit of a tertiary care hospital in North Eastern state of India, Sikkim. In this study the MRI machine was found to be underutilized with a utilization coefficient of 48%, whereas the CT machine utilization was acceptable with a utilization coefficient of 73%. In this study the MRI unit was incurring a loss of Rs 1837.39 per scan whereas the CT unit was making a profit of Rs 891 per scan. Moreover, the break-even point for MRI is found to be 203 scans per month, the current average scan per month was 138, similarly for CT the calculated break even point was 308 scans and the current average CT scans done were 550 scans per month. This study also uses the break-even selling price calculation to determine the price revision for MRI assuming that the number of MRI scans per month will remain 138 only and after doing the calculation it was found that the average selling price per MRI scan should be Rs 6231 i.e. an increase of Rs 1837 per scan from the existing average selling price of Rs 4394. However, revision of price should not be seen in isolation but together with the competitor's prices, and anticipated reduction in cases because of price elasticity.

**Keywords:** Break Even Analysis, MRI, CT, Utilization Coefficient, Variable Cost, Fixed Cost

## Introduction

In India the private sector fulfils almost seventy percent healthcare needs of Indian citizens<sup>(1)</sup>. Hospitals otherwise are labour and cost intensive organizations with a long gestation period for giving back profits or attaining Break Even Point. This is due to the fact that almost 60 percent of the expenditure in setting up a hospital goes to the equipment's section and only radiology department consumes around 10 percent of the budget in the teaching hospitals<sup>(2)</sup>. Hence it becomes imperative for the hospital administrators to exercise cost control especially in the radiology department. Break even analysis also called as cost volume relationship basically helps managers by serving three functions i.e. determining the number of units to be produced to reach no profit no loss situation, the price to be charged, and to determine the volume to achieve a target profit. It also helps in determining whether the current performance of a service in the long run will be profitable or not? The fundamental concept of break-even analysis is that profit

changes with changes in volume, costs and revenue<sup>(3)</sup>.

Radiology department comes under clinical supportive services in a hospital<sup>(4)</sup>. Regardless of whether the hospital is not-for-profit or for-profit, an optimally functioning radiology department would surely increase the profitability of the hospital.

This study was carried out in a 500 bed tertiary care teaching hospital which was having one CT machine 64 slice of and one MRI machine of 1.5 Tesla. The study was carried out for a period of two months i.e. from April 2019 to March 2019. The aim of the study was to do the Break-Even Analysis of MRI and CT scan units in radiology department of the tertiary care hospital of Sikkim. The objectives were:

1. To calculate the utilization coefficient of both MRI and CT units.
2. To calculate the unit cost of CT and MRI scan
3. To do the Break-Even analysis of CT and MRI units.

**Literature Review:** Nowadays radiology department in most of the hospital is also known as imaging department and this has happened with the wide acceptance and reliance on Computed Tomography (CT) and Magnetic Resonance Imaging (MRI). However, these facilities are mostly associated with only tertiary care hospitals or hospitals with adequate patient load otherwise installation of these imaging equipment's won't be profitable for the hospital<sup>(4)</sup>. CT is a specialised X ray which provides detailed anatomical information of the patient's body whereas MRI helps in differentiation of white and grey matter.

To calculate the utilization coefficient the formula<sup>(5)</sup> used was,

$$\frac{N}{M} \times 100$$

Where,

N = Average number of hours the equipment is used per day.

M = Maximum number of hours the equipment can be used per day

Similarly, to calculate break-even analysis contribution margin needs to be calculated first, with the help of the formula

To calculate the Break Even point the formula used was,

To calculate the Break Even selling price i.e. the price that should be charged to achieve break even is the formula used is,

Break Even Price = (Fixed cost X Number of Scans in one month) + ( Variable cost per scan X Number of Scans in one month)/Number of Scans in one month

## Methodology

The retrospective study was conducted using the data of four months, i.e. (January 2019-April 2019) for calculating Unit Cost and Break Even Point of MRI and CT units. First of all, the unit cost was calculated to find out the cost, the hospital puts in for one MRI and CT scan. The unit cost was then calculated by classifying the costs into Fixed and Variable cost.

### The fixed cost included:

- Manpower Cost
- Comprehensive Maintenance Contract (CMC)
- Area used for the procedure
- Depreciation

### The variable cost included:

- Electricity Cost
- Consumable Cost

Each cost was considered by taking the average of the cost during the study period (i.e. Jan 2019- Apr 2019). Cost summary per unit scan was calculated by dividing the monthly costs (fixed and variable) with the total number of scans in a month.

## Results

Scans per month for MRI and CT was calculated by taking the average of scans done for four months i.e. (Jan 2019 -Apr 2019). On an average there were around 138 MRI scans per month and 550 CT scans per month, similarly the average time per MRI procedure on an average was 50 minutes and for CT scan it was 20 minutes below

**Table 1: Average Monthly performance of MRI and CT uni**

Description	MRI	CT
Scans per month	138	550
Yearly scans	1656	6600
Average time per procedure(minutes)	50	20
Total machine hours per month	175 (7*25)	250 (10*25)
Total machine hours per year	2100	3000

**Table 2 Calculation of utilized Machine Hours per month for MRI and CT units**

MRI	CT
Average per day scan = 4 Average procedure time = 50 mins 4*50 = 200 min 200/60= 3.33 hrs per day 3.33*25 =83.3 utilized machine hours per month	Average per day scan = 22 Average procedure time = 20 mins 22*20 = 440 min 440/60 = 7.33 hrs per day 7.33*25 = 183.3 utilized machine hours per month
1000 machine hours utilized per year	2199 machine hours utilized per year

Hence the utilization coefficient calculated for MRI unit it was 48% whereas for CT unit it was 73%, see below

**Table 3 Utilization Coefficient**

MRI	CT
3.33/7 Hrs = 0.47 0.47*100 = 48%	7.33/10 Hrs = 0.73 0.73*100 = 73%

Moreover, the revenue per scan was calculated by dividing the revenue earned by each month of the study period with the number of scans done in each month and their average was taken.

Hence the average revenue per scan for MRI = 4394.1 and the average revenue per scan for CT = 2258.3

Revenue per month is then calculated by multiplying average revenue per scan with average scans per month.

Therefore, Average scans for MRI = 138

Revenue per month for MRI Unit = 4394.1\*138 =6,06,385.8

Average scans for CT = 550

Revenue per month from CT unit = 2258.3\*550= 12,42,065

The calculation of cost summary per unit scan for MRI and CT unit is given below

**Table 4: Calculation of Cost per Scan for MRI and CT**

Fixed Cost	MRI	Percentage of Total Cost	CT	Percentage of Total Cost
Manpower Cost	2,249.07	54.41%	505.83	36.69%
Depreciation	2208.12	34.82%	344.1	24.96%
CMC	1,268.11	30.68%	286.45	20.78%
Area used for the procedure	29.41	0.47%	3.07	0.22%
TOTAL	5754.71	92.35%	1139.45	83.34%

Variable Cost	MRI	Percentage of the Cost	CT	Percentage of the Cost
Electricity	200.87	3.17%	43.93	3.19%
Consumable Cost	275.91	4.35%	183.93	13.34%
TOTAL	476.78	7.52%	227.86	16.53%

Total Cost Per Scan	6231.49	100%	1,367.31	100%
---------------------	---------	------	----------	------

Manpower cost of MRI and CT includes the monthly salaries of the technicians, radiologists, HOD, clerk and the general duty workers. The cost per scan was calculated by dividing the salaries with number of scans in a month. The manpower of MRI contributes 54.41% of the total cost and CT contributes 36.69% of the total cost. Similarly, the depreciation of MRI and CT was calculated using the Write down Value (WDV) method as Income tax authorities recognize this method and 20% is used as the depreciation rate. The cost per scan was calculated by dividing the depreciation per month with number of scans in a month. Depreciation of MRI contributes 34.82% of the total cost and CT contributes 24.96% of the total cost. The cost per scan was calculated by dividing the monthly CMC with the number of scans in a month. CMC of MRI contributes 30.68% of the total cost and CT contributes 20.75% of the total cost. The area used for the procedure by MRI was 1075 sq. ft. and

area used for the procedure by CT was 520 sq. ft. The cost of 1 sq. ft. was Rs.631. The cost of area was then calculated after taking the depreciation at the rate of 10% for a period of 25 years. The area of procedure for MRI contributes 0.47% of the total cost and CT contributes 0.22% of the total cost. The electricity cost of MRI contributes 3.17% of the total cost and CT contributes 3.19% of the total cost. Consumables contributed 4.35% of the total cost and CT contributes 13.34% of the total cost. Total cost per scan was calculated by adding fixed cost and variable cost. Hence the unit cost of an MRI scan came as Rs 6231.41 and unit cost per CT scan was Rs 1367.31. Lastly to determine the profit and loss situation of both the units the total revenue per scan was subtracted from total revenue and it was found that the hospital was losing Rs 1837.39 per MRI scan and was generating a profit of Rs 890.99 per scan.

**Table 5 Calculation of Profit and Loss per scan for MRI and CT**

Description	MRI	CT
Total Cost Per Scan (Fixed Cost + Variable Cost)	6231.49	1367.31
Total Revenue Per Scan	4394.1	2258.3
Net Profit Per Scan (Total Revenue – Total Cost)	-1837.39	890.99
Net Profit%	- 41.81%	39.45%

**Break Even Analysis:** The break-even analysis of MRI revealed that that break-even point for MRI unit is 203 scans per month, see below. Whereas the break-even point for CT unit is 308 scans per month, see below.

**Table 6 Break Even Analysis for MRI and CT**

Variable	MRI	CT
Total Fixed Cost	(5754.71*1656) 95,29,799.76	(1139.45*6600) 75,20,370
Total Variable Cost	476.78	227.86
Sales Revenue	4394.1	2258.3
Contribution Margin (Sales revenue- Variable cost)	3917.32	2030.44
Breakeven Point (Fixed cost/Contribution Margin)	2432.73 scans per year 203 scans per month	3703.81 scans per year 308 scans per month

**Loss of MRI is calculated by using the formula,**

$$\begin{aligned} \text{Profit} &= \text{Sales Revenue} - \text{Total Cost} \\ &= (4394*138) - [(5754.7*138) + (477*138)] \\ &= 6,06,372 - [7,94,150 + 65,826] \\ &= 6,06,372 - 8,59,976 \\ &= \text{Rs. } 2,53,604 \text{ Loss per month.} \end{aligned}$$

**Profit of CT scan is calculated by using the formula,**

$$\begin{aligned} \text{Profit} &= \text{Sales Revenue} - \text{Total Cost} \\ &= (2258*550) - [(1139.5*550) + (228*550)] \\ &= 12,41,900 - [6,26,725 + 1,25,400] \\ &= 12,41,900 - 7,52,125 \\ &= \text{Rs. } 4,89,775 \text{ Profit per month.} \end{aligned}$$

From the above calculation it can be seen that the on an average the MRI unit is in the loss of Rs 2, 53,604 per month, on the other hand CT unit is generating a profit of Rs . 4, 89,775 per month.

**Discussion**

In this present study the calculated cost incurred per MRI came to Rs 6231.49 which is higher than other twostudies, in first study<sup>(6)</sup> it came to Rs 4447.30 whereas in the another one it was Rs 3500, the same is for CT also as in the present study it came as Rs 1367.31 whereas it was Rs 581.40 in the same study discussed earlier.This difference is there due to the difference in the manpower cost which is in the present study is 36.6% of the total cost whereas in the study done by Rehana et al <sup>(6)</sup> the manpower cost was only 13.8 percent of the total cost. Moreover the breakeven point for MRI and CT scans in this study came to 203 and 359 respectively whereas in another study it came to 135 scans per month for MRI with a cost of Rs 5339.67 per MRI scan <sup>(7)</sup>. However the direct labour cost in the study done by satyashanker et al <sup>(7)</sup> was only 4.54 percent. However, the satyashanker et al studywas done in 2008, nearly 11 years earlier and since then there is a great change in the salary packages of the radiology and imaging staff, In addition to that this hospital is situated in hilly terrain where the availability of qualified medical professional and technicians is a challenge hence the salary packages are also on the higher side. Lastly in the study done by Chakravarty and Naware <sup>(8)</sup> the break-even point for MRI scan per month came to 153 scans with Rs 4129 cost per scan for MRI scans with contrast. Again, this study was done in 2008 and is from a non-hilly terrain.

We suggest that the hospital administrators should not stop at the calculation of break-even point only, they should also calculate the required selling price to be charged to achieve the break-even point for example in this study it was found that the current MRI scans per month are 135, whereas to achieve break even the hospital needs to do 203 MRI scans per month, In case the increase in volume is not possible then the only way left is increase in the selling price, the hospital should calculate the Break Even selling price for MRI unit with the help of formula

$$\begin{aligned}
 &\text{Break Even Price} \\
 &= \frac{(\text{Fixed cost} \times \text{Number of Scans in one month}) + (\text{Variable cost per scan} \times \text{Number of Scans in one month})}{\text{Number of Scans in one month}} \\
 &= [(5754.7 \times 138) + (477 \times 138)] / 138
 \end{aligned}$$

$$\begin{aligned}
 &= [7, 94,150 + 65,826] / 138 \\
 &= 859976 / 138 \\
 &= \text{Rs.6231 per scan}
 \end{aligned}$$

Current average selling price of MRI in the hospital is Rs. 4394. Therefore, to achieve the break even with the existing number of scans the hospital administration need to ponderupon increasing the price by Rs.1837 to the existing selling price to recover the cost per scan. While taking the decision administration also needs to consider the competitive price in the nearby market and the likely impact of increased price on the volume after considering all this only they should take a final call on price increase.

**Conclusion**

The application of break-even analysis in hospitals is very limited and it is mostly used only for ascertaining the profit and loss situation of the unit, however there are additional utility of break-even analysis such as used in this study in determining the break-even selling prices and for calculation of target profit. The authors would like to again emphasize that break even analysis should not be seen in isolation and healthcare being a unique industry dealing with human life’s there is no room for unethical practises but still break even analysis gives a valuable insight to the hospital administrators especially working in private sector in evaluating their current performance and in determining the future course of action.Lastly, it should be remembered that break even analysis although being a very useful tool haslimitations as well such as difficulty in distinguishing fixed and variable cost, unrealistic assumptions such as the selling price should be constant, when the organization sells more than one product the difficulty in performing break even analysis.

The study is not funded by any agency.

There is no conflict of Interest.

The study was conducted as a part of Internship of healthcare management students and hence there was no Ethical Issues involved, as there was no direct/indirect intervention with any patient or animals.

Yenepoya Nursing College, Yenepoya (Deemed to be) University, Mangaluru, Karnataka, India

## Abstract

**Objectives:** The objectives of the study were to identify the consumption rate of sweetened beverages among adolescents, to identify the factors influencing the consumption of sweetened beverages and to find out the association between consumption rate and the selected demographic variables.

**Method:** A descriptive survey was conducted among 100 adolescents from Pre University Colleges at Mangaluru from August to January 2019. Probability simpler and om technique was used in the study to select the sample. The criteria checklist was used as the tool for finding the consumption rate and factors influencing consumption rate.

**Result:** The result showed that 69% percentages of head ole scents were extensively consuming sweetened beverages and the factors that have an effect on the se consumption rates are peer pressure, encouragement of the family, advertisements, availability, taste, color and climatic condition. The study also shows that there no association between the consumption rate and the selected demographic variables.

**Conclusion:** Increased consumption rate of sweetened beverages among adolescents was associated with taste, easy availability of sweetened beverages, peer pressure, climatic conditions etc.

**Keywords:** *Adolescents, sweetened beverages, consumption rate.*

## Introduction

A sweetened beverage is also known as liquid candy.<sup>1</sup> It consists of sugar, fat, and carbohydrates.<sup>2</sup> Some of the sweetened beverages are Pepsi, bear, cococola, slice, sprite, seven up, coke etc. The increase in consumption of sweetened beverages can be described as a worldwide health problem. Now a day, adolescents are mostly prompt to have sweetened beverages due to their life style pattern, financial background, peer group involvement and food habits. Taste preference, eating behavior and advertisement have a significant influence on the consumption of sweetened beverages. In most of the families both parents may be working so they may not be have enough time to look after their children and provide homely food. They may provide junk food and sweetened beverages to their children and it becomes

first preference to adolescents. According to the World Health Organization (WHO), over 340 million children and adolescents aged 5-19 were overweight or obese in 2016<sup>3</sup>. The result of the study conducted in India to identify the factors associated with soft drink consumption among adolescents in age group of 16-18 shows that majority of the adolescents 71.6% had habit of consuming soft drinks. About 22% agreed that soft drinks provide sort of fun.<sup>4</sup> Media plays an important role in contributing to eating behaviors and food choice in children through food advertisements.

Now a days the consumption of sweetened beverages has been increased. The rise consumption may be due to the taste, color, availability and accessibility of sweetened beverages today. The effort to decrease the consumption of sugar sweetened beverages is very critical because

adolescents are the highest population who is consuming sugar sweetened beverages.<sup>5</sup> According to the World Health Organization (WHO), over 340 million children and adolescents aged 5-19 were overweight or obese in 2016<sup>6</sup>. Limiting the amount of sweetened beverages intake and help individuals to maintain a healthy weight and have a healthy diet. Examples of sweetened beverages include, regular soda (not sugar free), fruit drinks, sweetened waters, energy drinks, coffee and tea beverages. The students who are eating fast food of tenly and who do not eat fruits regularly are most likely to be frequent consumers of sweetened beverages.

### Materials and Method

The study was conducted in a school at Mangaluru and the school were selected based on the feasibility of conducting the study and the availability of samples.. The probability simple random technique was used for the selection of samples. The study samples were consisting of 100 adolescent students. The checklist was used to assess the consumption rate and factors influencing the consumption of sweetened beverages. The data were analyzed using descriptive statistics.

### Findings:

#### Section I: Factors influencing the consumption of sweetened beverages

Figure 1: Bar diagram depicting the factors influencing consumption of sweetened beverages

The result shows that tastes of the sweetened beverages are the major influencing factor among adolescent students (i.e. 81%). Availability of those sweetened beverages (77%) peer pressure (67%), climatic condition (67%), color(64%) are the other

factors that influence the consumption of sweetened beverages.

#### Section II: Distribution of subjects according to their consumption rate

Table 1: Frequency and percentage distribution of subjects according to their consumption rate n = 100

Consumption Rate	Frequency (f)	Percentage (%)
Extensive consumption	69	69
Moderate consumption	31	31
Poor consumption	-	-

The data presented in Table 2 shown that, many of the subjects had extensive consumption rate (69%), followed 31% had moderate consumption rate.

**Section III: Association between consumption rate and demographic variables**

In order to find out association between consumption rate and selected demographic variable, the following null hypothesis was stated.

**H<sub>1</sub>:** There will be a significant association between consumption rate of sweetened beverages among adolescence with their selected demographic variables.

**Table 2: Association between consumption rate and selected demographic variables. n=100**

Sl. No	Demographic variables	Consumption rate			Df	Chi-square value	Association

7	Working status of the father						
	Private employee	69	27	-	1	.577	NS
	Government employee	2	2	-			
	Unemployed	0	0	-			

The Table 3 shows that there is no significant association between the consumption rate and demographic variables. For these the null hypothesis is rejected and research hypothesis is accepted.

**Conclusion**

The study result shows that the sweetened beverages is highly consumed by the adolescent students (16-19) and there are some factors that affect these consumption

rates that are taste, availability of SSB, peer pressure, climatic condition etc.

**Ethical Clearance:** Yenepoya Ethics Committee-1 approved our study protocol number 2018/064 titled "A descriptive survey on the consumption of sweetened beverages and contributing factors among adolescents in selected Pre University College at Mangluru" On 18/6/2018 under the chairmanship of Dr Vikram Shetty.

# Effect of Smoking and Tobacco Chewing on Superoxide Dismutase Activity

Utkarsh Yadav<sup>1</sup>, Junaid Ahmed<sup>2</sup>, Nandita Shenoy<sup>3</sup>, Nanditha Sujir<sup>4</sup>, Ceena Denny<sup>5</sup>

<sup>1</sup>Post Graduate, <sup>2</sup>Professor and Head, <sup>3</sup>Associate Professor, <sup>4</sup>Reader, Department of Oral Medicine and Radiology, <sup>5</sup>Associate Professor, Department of Oral Pathology, Manipal Academy of Higher Education, Manipal, Karnataka

## Abstract

**Background:** Tobacco either in smoke or smokeless form is a significant source for free radicals that induces neoplastic changes in the body. Saliva is the first fluid that is exposed to tobacco and its anti-oxidative system consists of many enzymes like superoxide dismutase which play an important role in cancer prevention. The present study has been conducted to investigate the effect of tobacco on the antioxidative system of saliva in individuals indulging in the habit of tobacco consumption either in the form of smoking or chewing and compare it with changes if any among healthy individuals.

**Materials and Method:** A cross sectional study comprising of 100 patients were enrolled for the study and was divided into two groups- Group A and Group B. Fifty healthy individuals who were age and gender matched, and with a negative history of smoking or chewing tobacco & without the presence of any periodontal disease were assigned to group A. The remaining fifty were allocated to group B who had a history of smoking cigarettes/chewing tobacco daily. Unstimulated saliva samples of these subjects were investigated for activity of salivary superoxide dismutase (SOD). Data was analyzed using SPSS (11.5) and running Kruskal-Wallis test. Statistical significance was set at  $p < 0.05$ .

**Results:** There were significant differences in the activity of superoxide dismutase and was consistently seen to be low in patients with no history of pan chewing/smoking and there was an increase in the mean SOD levels among pan chewers and a decrease in the mean SOD levels in patients with the habit history of smoking 5-10 cigarettes.

**Keywords:** Tobacco, saliva, superoxide dismutase, smoking, pan chewing, cigarettes.

## Introduction

Smoking and chewing of tobacco is an abusive habit practiced by millions of people all over the world. Tobacco is a major etiological factor for oral cancer accounting for 30-40% of deaths in India. Cigarette

smoke contains many toxic components such as carbon monoxide, cyanide hydrogen, benzopyrene and oxygen radicals.<sup>1,2</sup> These components can predispose to systemic disorders: cardiac diseases, cancer, and pulmonary disorders.<sup>3, 4-6</sup>

Smokeless tobacco can produce free radicals.<sup>7</sup> These include super oxideanion ( $O_2^-$ ), hydroxyl radical ( $HO\bullet$ ), peroxy radicals ( $ROO\bullet$ ), and hydrogen peroxide ( $H_2O_2$ ).<sup>8</sup>

Free radicals can change the structure of intracellular and extracellular components such as proteins, lipids, and DNA and interfere with cell function.<sup>9</sup>

Antioxidants are the body's defense system that neutralizes the destructive effects of reactive oxygen

---

species (ROS) and minimize damage to cells. As the first defensive line, saliva has a protective antioxidant system that fights against oxidant-induced damage.<sup>10</sup> One of the most important antioxidant enzymes which regulate oxidation-reduction process of cells in normal and tumorigenic conditions is superoxide dismutase (SOD).<sup>11</sup>

There are three types of superoxide dismutase including Fe-SOD, Mn-SOD and Cu-Zn SOD. SOD contains copper and zinc and is found in all body tissues as well as in some body fluids, especially in saliva.<sup>12</sup>

SOD converts O<sub>2</sub> to H<sub>2</sub>O<sub>2</sub> during its catalytic activity.<sup>13</sup> The present study was undertaken to evaluate the effect of tobacco use on the antioxidant system, predominantly superoxide dismutase activity

1. To study the levels of antioxidant enzymes superoxide dismutase in saliva of healthy individuals with the habit of tobacco usage either in the form of smoking or chewing.
2. To compare these levels with healthy controls without any tobacco habit.

### Materials and Method

The protocol of the present cross-sectional case-control study was approved by the Ethics Committee of our institute. Informed consent was obtained from all the participants. Out of 100 participants, 50 healthy individuals were assigned to group A. Participants in group A had no periodontal disease and never smoked. 50 participants were allocated to group B, these were cases with the habit of smoking, pan/gutkha or both. Cases were selected if they had a positive habit history

(smoking/chewing of tobacco) and without any systemic diseases, periodontitis or pre-malignant lesions.

All our participants were homogenous in terms of age and gender and their salivary samples were collected in the morning. All the participants rinsed their oral cavities with physiologic Salivary before the sampling procedure. Then, each subject's non-stimulatory saliva was collected in special containers for 5 minutes. The salivary samples were immediately centrifuged and transferred into freezer at -20°C. The plastic containers were coded and sent immediately to Biochemistry Lab. Then in the laboratory, they were centrifuged for 10 minutes at a speed of 2000 rpm.

**Estimation of Salivary Superoxide Dismutase:** Superoxide dismutase was assayed in all the study groups by the method devised by Marklund S, Marklund G modified by Nandi and Chatterjee.<sup>14, 15</sup>

**Principle:** Pyrogallol autooxidises rapidly in aqueous or alkaline medium solution and this has been employed for the estimation of superoxide dismutase. SOD inhibits the auto oxidation of pyrogallol. This principle was employed in a rapid and convenient method for the determination of the enzyme concentration.

Reagents used as seen in figure 1

1. **Tris Buffer:** 50 ml of Tris buffer (containing 50 mM of Tris buffer and 1 mM of EDTA) was prepared. To this, 50 ml HCL was added to adjust the pH at 8.5 and volume was made up to 100 ml.
2. **Pyrogallol (20 mM concentration):** 25 mg of pyrogallol was dissolved in 10 ml of distilled water.

Figure 1: Reagents used

**Procedure**

**For Control:** To 2.9 ml of Tris buffer, 0.1 ml of pyrogallol solution was added, mixed and reading was taken at 420 nm, exactly after 1 minute 30 seconds and 3 minutes 30 seconds. The absorbance per two minutes was recorded and the concentration of pyrogallol was adjusted (by diluting the pyrogallol solution) so that the rate of change of absorbance per minute was approximately 0.020 – 0.023 nm.

**For Sample:** To 2.8 ml of Tris buffer, 0.1 ml of Salivary sample was added, mixed and started the reaction by adding 0.1 ml of adjusted pyrogallol solution (as per control). It was read at 420 nm exactly after 1 minute 30 seconds and 3 minutes 30 seconds and absorbance per 2 minutes was recorded. The absorbance of each sample was measured with a spectrophotometer (Spectrophotometer -106) at 420 nm wavelength as shown in figure 2.

**Figure 2. Spectrophotometer -106**

**Calculations**

Absorbance reading of control - A  
 Absorbance reading of sample - B  
 Units of SOD/3 ml of assay mixture = [(A-B)/(A×50)] ×100  
 Unit×10 = Units/ml of sample solution.

**Definition of Unit:** One unit of superoxide dismutase is described as the amount of enzyme required to cause 50% inhibition of pyrogallol auto oxidation per 3 ml assay mixture

**Statistical analysis:** The data obtained from tobacco consumer and non-consumer groups were analyzed by One Way ANOVA Power Analysis.

**Results**

Out of 50 cases and 50 controls, 61 were males and 39 were females.

**Bar diagram 1-** Showing mean SOD levels varying with different age groups

**Inference:** Correlating the mean SOD levels with the age group, it is noted that the mean SOD levels are increasing from <20 years of age group to 31-40 years of age group and its decreasing in the age group 41-50 years.

**Bar diagram 2:** Showing mean SOD levels in males and females.

**Inference:** Correlating the mean SOD levels with gender, it is noted that the mean SOD levels are higher in females when compared to males.

**Bar diagram 3:** Mean SOD levels with increasing frequency of pan chewing

**Inference:** Correlating the mean SOD levels with increasing frequency of pan chewing, it is noted that the mean SOD levels are low in patients with no history of pan chewing and there is increase in the mean SOD levels in patients who are chewing 1-5 pans per day. There is a decrease mean SOD levels in patients who are chewing 5-10 pans per day.

**Bar diagram 4:** Mean SOD levels with increasing frequency of smoking

**Inference:** Correlating the mean SOD levels with increasing frequency of smoking, it is noted that the mean SOD levels are low in patients with no history of smoking and there is decrease in the mean SOD levels in patients who are smoking 1-5 cigarettes per day. There is an increase in mean SOD levels in patients who are smoking 5-10 cigarettes per day.

**Bar diagram 5:** Mean SOD levels with increasing frequency of guthka chewing

**Inference:** Correlating the mean SOD levels with increasing frequency of guthka chewing, it was noted that the mean SOD levels are high in patients with no history of guthka chewing and there is decrease in the mean SOD levels in patients who are chewing 1-5 guthkas per day.

**Bar diagram 6:** Mean SOD levels in a decreasing order seen in patients with no habits, patients having both smoking and tobacco chewing habit, patients with tobacco chewing habit and patients with smoking habit

**Inference:** The mean SOD levels in decreasing order were seen in individuals with no habit history, individuals having mixed habit history followed by individuals chewing pan or gutkha and least seen in smokers

## Discussion

Smoking and chewing of tobacco is a vice that has been practiced by millions of people all over the world. It is estimated that among 400 million individuals aged 15 years and above in India of the 250 million kilograms of tobacco used for domestic consumption in India, 86% is used for smoking and 14% is used in the smokeless form.<sup>16</sup>

The heat (generated during smoking) as well as pH (change during chewing) of body fluids due to tobacco consumption affects the formation and stabilization of free radicals. The alkaline conditions observed in betel nut chewing are reported to favor the formation of free radicals.<sup>17</sup>

Reactive oxygen metabolites (ROMs) such as superoxide anion ( $O_2^\bullet$ ), hydrogen peroxide ( $H_2O_2$ ) and hydroxyl radical ( $OH^\bullet$ ), malondialdehyde (MDA) and nitric oxide (NO) are directly involved in multi stage process of carcinogenesis by bringing out a continuous endogenous damage to cellular DNA.<sup>18</sup>

Inactivation and removal of these reactive oxygen species depend on reactions involving the antioxidative defense system. Antioxidants have a shielding role by scavenging the free radicals.

The free radicals released by tobacco are known to bring about alterations in antioxidant levels in humans, and these free radical-associated damages are reflected through antioxidant enzyme activities in blood. Thus, it would be fundamentally important to study the biological parameters like antioxidant enzyme system, in evaluating the role of tobacco on antioxidant status in tobacco users. The salivary antioxidant system has been drawing increased attention in recent years.<sup>19</sup>

Rupali Agnihotri et.al (2009)<sup>20</sup> showed a decrease in mean SOD levels with increase in frequency of smoking. The present study showed that the mean SOD levels were seen to be reduced in patients who smoke 1-5 cigarettes per day as compared to patients who have no habit history and there is an increase in mean SOD levels in patients who smoke 5-10 cigarettes per

day. This reduction in the levels of SOD may be related to an increased concentration of cadmium in cigarette smoke. Cadmium replaces the bivalent metals in SOD, such as zinc, copper, and manganese, resulting in its inactivation. An increased accumulation of cadmium in blood and a decrease in the levels of SOD enhance the destructive process, which was reported earlier.<sup>21</sup>

The Biochemical hypothesis on this states that as the frequency of smoking increases there is an increased accumulation of undetoxified  $H_2O_2$ , which belongs to the Reactive Oxygen Species and it acts as a constant source of oxidative stress and further decreases the level of SOD.<sup>22</sup>

Chundru Venkata Naga Sirisha et.al (2013)<sup>23</sup> showed mean SOD levels were seen to be decreasing with increase in frequency of gutkha chewing which was similar to the findings of our study which showed that the mean SOD levels were decreasing with increase in frequency of gutkha chewing.

Leila Farhadmollashahi et.al (2014)<sup>24</sup> showed that the mean SOD levels were seen to be increasing with increase in frequency of pan chewing. The study stressed on the point that there is an increase of this enzyme, as a component of the antioxidant defense system in saliva, is to reduce the damaging effects of free radicals produced by the consumption of pan. The present study showed a contrary report as it showed that the mean SOD levels appeared to decrease in patients who chew 1-5 pan per day as compared to patients who have no habit history and there was a further decrease in mean SOD levels in patients who chew 5-10 pan per day.

Leila Farhadmollashahi et.al (2014)<sup>24</sup> showed no significant difference in mean SOD levels with respect to gender and age. The present study showed that the mean SOD levels are increased in case of females although no significant difference was noticed with respect to age. Studies have reported that ROS production was higher in the vascular cells from males than in the cells from females<sup>25</sup>. In addition, clinical and experimental data suggested a greater antioxidant potential in females over males<sup>26</sup>. These studies indicate that there is an apparent association between gender and oxidative stress, where women seem to be less susceptible to oxidative stress.

## Conclusion

The present study gave us an insight about the relationship between antioxidant enzyme activity &

tobacco in the form of both smoked & smokeless. This study was an attempt to establish a relationship among oxidative stress and habit among our subjects. The role of oxidative stress in the pathogenesis of Potentially Malignant Disorders (PMD) is well established and this study emphasized that the imbalance of oxidant/antioxidant system as a risk factor in the development of oral malignancies. It is important to have a regular assessment of salivary antioxidant system in patients with a positive habit history of tobacco consumption so as to promote early management of these damaging effects in oral cavity. Detecting changes in the levels of SOD can help in earlier prediction of PMD which may be used to halt further progression of the disease or follow up of its treatment and thus favoring a better prognosis and management of such conditions.

# A Study of Young Adults' Intention towards Genetically Modified Foods: Mediating Effect of Health Belief

Avinash Rana<sup>1</sup>, Vishal Soodan<sup>1</sup>

<sup>1</sup>Assistant Professor, Mittal School of Business, Lovely Professional University, Phagwara, Punjab, India

## Abstract

The study is an attempt to gauge intentions of Indian young adults towards purchase of GM food in three states of north India with 528 respondents as sample. The study employed questionnaire method of data collection using Likert scale. Structural Equation Modeling through AMOS is used for data analysis. Results reveal that information about GM foods, their effects, safety issues and health beliefs of young adults are significant determinants of GM food purchase intention. There is an insignificant relationship between emotional involvement and purchase intentions. Health belief mediates between the variables. Results can augment the current understanding of governments, organizations and other bodies towards the behavior of young adults towards GM foods.

**Keywords:** Adoption, Consumers, Emotional-Involvement, Health Belief, Intention.

## Introduction

After the expansion of knowledge and diffusion of information, we can view every individual in the society as a potential consumer. It is crucial to obtain insights and improve awareness towards consumers' buying behavior<sup>[1,2]</sup>. Study of user behavior requires learning specific attributes of consumers while buying known as consumption styles. Every origination has a substantial risk attached to it, and takes a significant amount of brainstorming from experts to decide about products' safety and security after considering their pros and cons<sup>[3]</sup>. These concerns are fruitful, as regulations by governments on production and sale of genetically modified (GM) foods has improved public sentience about their content, usage and benefits. However, there is an extensive research highlighting the benefits of GM foods<sup>[4,5,6]</sup> which has led to worldwide acceptance of

these modified form of food. Previous findings suggest that GM Foods shall fulfill the expectations of fulfilling the food shortage and crisis prevailing in some countries<sup>[7]</sup>. Apart from having a positive image and a hope to increase the food production capacity, there are scholarly studies that debate harmful impacts of GM foods.

Apparently, advances in Genetically Modified Foods (GMF) and technologies across the planet stirred a controversial debate on fitness of these crops for human consumption. Being on the receiving end of the cycle there is need to study the intention of users toward GM food. The present study selected young adults as respondents representing a cohort of consumers accounting for nearly half of the Indian working population. This group possesses substantial spending power and carry the potential for consumption of products and services<sup>[8]</sup>. Owing to indirect involvement of consumers in the decision-making process, the study attempts to measure intention of young adults towards Genetically Modified Foods which is amongst the world's most controversial products category.

**Attitude towards GM Foods: A literature Review:** Researchers have shown great interest in studying consumers' attitudes towards GM Foods across different cultures and regions<sup>[9,10]</sup>. Comparative studies have indicated both positive and negative

attitudes<sup>[11,12,13]</sup>. Researchers highlighted four aspects of consumer attitudes towards GM Foods in the current study. Based on the literature and association of attitude with the aspects of adoption, the study has hypothesized:

**H1:** There is a positive relationship between Young adults’ attitude towards GM foods and their intention to use.

**Information:** There is a common notion in people’s mind that GM crops can resist pest infestations, common crop diseases and poor weather common in developing nations. We can state that GM foods can prove helpful in reducing the demand and supply gap of food in developing world. Having proper information about product under investigation proves to be a significant determinant of purchase intention. The study proposes the following:

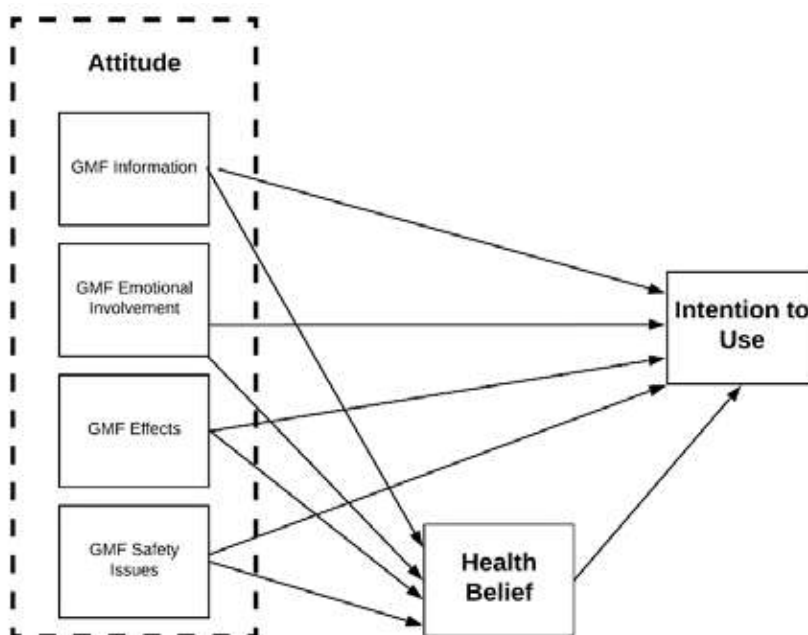

**H1a:** Information about GM foods has a significant relationship with young adults’ intention to use.

**Emotional Involvement:** Alteration in genetic composition adds new desirable traits to the plants that

help them resist from common plant problems. This association with the product gives rise to emotional attachment. Emotional involvement designates the involvement of the individual behavior with their interest in some action<sup>[14]</sup>. In case of food studies, emotional involvement is designated as a significant factor for consumers having intentions to purchase biotech products<sup>[17,18,19]</sup>. The study proposes the following assumption:

**H1b:** Emotional Involvement of young adults is positively related to their intention to use GM foods.

**Perceived Effects:** GM foods are known for their detrimental effects on human body. Some researches indicate that consumption of genetically modified foods leads to development of incurable diseases. Being new, these foods are not recognized for their long-lasting effects on human beings. It has been reported in the previous studies that consumers consider GM foods as unsafe to health and assess the effects on their health<sup>[20]</sup>. The study therefore assumes the following:

**Figure 1: Conceptual Framework**

**H1c:** Perceived effects of GM foods positively influences young adults’ intention to use.

**Perceived Safety:** Food-borne disorders have increased over the years and negatively affected the

health and economic well-being of many developing nations<sup>[19]</sup>. Many forums advocate that there is no evidence for labeling a crop as unsafe to eat just because it is genetically modified<sup>[20]</sup>. Previous studies have confirmed the role of safety issues in purchase

of GM foods suggesting consumers who perceive GM foods as safe for consumption will purchase them and *vice versa*<sup>[5,18]</sup>. Based on above discussion, the study therefore proposes the following:

**H1d:** Perceived safety issues has positive relationship with young adults’ intention to use GM foods.

**Mediating role of Health Beliefs:** Health belief remains a vital facet of an individual’s health considerations. Evidently, health belief of an individual will influence his/her health behavior<sup>[21]</sup>. The health belief model (HBM) posits that a person’s decision to engage or not to take a health-related action depends on his/her discernment about the perceived threat of avoiding the action and the benefits of taking the action. The study proposes the mediating role of health belief between attitude constructs and intention to use GM Foods. The mediating role of health beliefs can be hypothesized as:

**H5:** Young adult’s attitude and their usage intention towards GM safety issues is mediated by health belief.

**H2:** Young adult’s attitude towards GM Food Information on their usage intention is mediated by health belief

**H3:** Young adult’s attitude towards Emotional Involvement towards GM Foods and intention to use is mediated by health belief.

**H4:** Young adult’s attitude towards GM effects on their usage intention is mediated by health belief among young adults.

**Methodology**

The research was set up in Punjab (a leading GM crop producer state) and its two border states *viz.* Delhi

and Haryana. These states were singled out because of high density of young adults and presence of potential GM foods users. The data was gathered using the survey method. Investigators addressed potential respondents at various venues *viz.* Supermarkets, Retail Stores, and shopping malls located in cities of Delhi, Chandigarh, Ludhiana, Jalandhar and Panipat. Respondents were requested to give approval for cooperation in the survey. To qualify for the study, the probable respondents were asked whether they are aware about GM foods? Those who fit into this criterion were further asked whether they have purchased GM foods recently or not? All affirmative respondents were asked to fill a validated and self-administered questionnaire. In total 622 respondents were approached out of which, 528 respondents from three states Punjab, n= 198 (37.5%), Haryana, n= 172 (32.6%), Delhi, n=158 (29.9%) filled the responses correctly (85% response rate).

**Instrument validation:** To reduce dimensionality of twenty-five items used in the questionnaire factor analysis was conducted. The Kaiser-Meyer-Olkin (KMO) test of sample adequacy and the Bartlett test of sphericity were performed and it was found that the KMO measure was 0.778 and the Bartlett test of sphericity was significant at  $p < .05$ . The analysis gave factors with eigen value greater than one with a cumulative percentage variance of 74.03% satisfying the variance criterion<sup>[22]</sup>.

**Reliability and Validity Measurement:** The perfect level of standardized loadings for reflective indicators is 0.60<sup>[23]</sup>. Further, the calculated AVE was found to be within the accepted range<sup>[24]</sup>. The convergent validity was confirmed as values of Average Variances Extracted (AVEs) above the minimum accepted range and less than the Composite Reliabilities, thus approving CR<sup>[25]</sup>. The discriminant validity in the model is appropriate <sup>[26]</sup>.

**Table 1: Inter-Construct Validity and Discriminant Analysis**

	INF	EI	EF	SI	HB	IN
INF	0.777					
EI	0.145	0.823				
EF	0.063	0.246	0.837			
SI	0.057	0.082	0.294	0.776		
HB	0.045	0.221	0.055	0.318	0.834	
IN	0.172	0.184	0.286	0.264	0.093	0.796

**Measurement and Structural Model:** As per model fit statistics,<sup>[27]</sup>the values ( $\chi^2/df = 1.214$ ; GFI = 0.825; TLI = 0.912; CFI = 0.817; RMSEA = 0.026) were found to be in accordance to the threshold limit. As per suggestions,<sup>[27]</sup> the significance level of the model was

satisfactory. The proposed model showed appropriate acceptance of goodness-of-fit indices, where  $\chi^2/df = 1.532$ ; GFI = 0.988; TLI = 0.849; CFI = 0.89; RMSEA = 0.051. The analysis show that model is fit for analysis in SEM.

**Table 2: Hypotheses (Direct effects) testing results**

Hyp	Path	Estimate	S.E	t-value	Result
H1a	GMF Information→ Intention	.247	.044	3.163***	Supported
H1b	GMF Effects→ Intention	-.074	.215	-.513	Not Supported
H1c	GMF Emotional Involvement→ Intention	.253	.036	3.524**	Supported
H1d	GMFsafety issues→ Intention	.136	.019	3.120***	Supported

The hypotheses shown (Table 2) are concerned with the direct effects of young adults’ attitude and intention to use GM foods. The variables, Information about GM Foods ( $\beta = .247, t = 3.163$ ), emotional involvement ( $\beta = 0.253, t = 3.524$ ) and safety issues ( $\beta = .136, t = 3.120$ ), were significantly related to the intention and supported the hypothesis H1a, H1c and H1d . Whereas, GMG effects ( $\beta = -.074, t = -.513$ ) is found insignificant (H1b). Therefore, based on hypothesis testing result three sub-hypotheses are supported with indicates that the primary hypothesis (H1) is accepted.

individual can influence intention to adopt GM foods. Various studies related to intention of health-related products and services have pointed out the indirect effect of health belief on adoption intentions. Mediation effects were tested as suggested by previous works<sup>[28]</sup>. As a precondition to mediation analysis the independent variables should have significant effect on dependent variables. As per the direct effect analysis (Table 3) all independent variables except emotional involvement could be subjected to mediation analysis. Table 3 gives the test results and explains the type of mediation observed:

**Testing of mediation effects:** Health belief of an

**Table 3: Mediation result and hypotheses test results**

Hyp	Path Description	Direct effects	Direct effects with mediator	Indirect effects	Result
H2	GMF Information---> Health belief---> Intention	.156***(.063)	.247*** (.044)	.0171***	Partial mediation (Supported)
H4	GMF Emotional Involvement---> Health belief---> Intention	.274*** (.047)	.253***(.036)	.0457**	Partial mediation (Supported)
H5	GMF Safety issues--->Health Belief---> Intention	.594*** (.13)	.136**(.019)	0.188***	Partial mediation (Supported)

\*\* indicate Level of significance (P Value less than 0.01), \*\*\* indicate Level of significance (P Value less than 0.001)

**Note:** Bootstrapping of 5000 samples at 95% C.I.

Entries are standardized estimates (standard errors). \*\*\*= p<.001.

The results of mediation indicate three cases where partial mediation caused by health belief of young adults. The effect of Information about GM Foods, emotional involvement and safety issues related to GM foods on intention of use GF foods are mediated through health belief. The presence of health belief did not inhibit

the direct relationship between predictor variables and usage intention.

**Discussion**

Previous empirical research recommend a broader and contextual approach to substantiate the factors

affecting usage intention towards GM foods. The study aims at bridging conceptual gaps in existing models. This study obtained a measure of the intention to use GM food as measured by different researchers in varied contexts including adoption intentions<sup>[29]</sup>.

The study result extends the findings in context of young adults. With an explosion of information and availability of various mediums, young individuals seek, keep and recall necessary information about their surroundings. The agencies involved in research, production and marketing should spread useful, valuable and relevant information to intended audience. Results reveal insignificance of emotional involvement in purchase. The study is an exception to the results of the previous study<sup>[17]</sup>. The psychological association formed by young adults such as empathy, affection and fascination is likely to contribute to their usage intentions, but current study found no significant impact of emotions on purchase intentions. On one hand, young adults perceived biological and environmental effects associated with GM foods, interestingly these effects do not directly influence their intentions. This could be because young adults may have a higher regard for benefits of GM foods than harmful effects. The results suggest safety issues concerned with GM foods are important determinants of usage intention. This is in line with previous empirical investigations<sup>[5,18]</sup>. The effects associated with GM food conveyed by product manufacturers and research agencies are likely to affect the usage intentions of young adults. Notably, younger adults are better equipped to process and interpret information related to effects of GM foods at individual, societal and environmental levels.

While analyzing the mediation effect of health belief between attitude and intention, the study found that information, emotional involvement and safety issues are partially mediated by health belief. This indicates that health belief of young adults play an important role in forming GM foods usage intentions. In support of previous research<sup>[5,10]</sup> the study suggests that individuals who consider GM foods as healthier show willingness to take healthy actions shaping positive attitude.

### Conclusion

The organizations producing or are planning to produce, and market GM foods should parse uniform and quality information to intended markets. Also, governments should focus on strengthening the beliefs

of individuals by explaining the benefits and various issues associated with GM Foods. Clearly, young adults consider safety as their prime concern, and therefore authorities should focus on reprisal of safety issues of the consumers label GM foods as safe for consumption. Further, health belief of individuals is a determinant of GM food adoption is an important aspect in GM food adoption. As it is evident that younger adults hold a major potential to use and buy products, the agencies should integrate information highlighting the health-related information. Similarly, as younger adults give importance to safety issues concerned with GM food, the agencies should convey the users about mitigating efforts being undertaken by them coupled with precautionary steps to be taken while using or consuming GM foods.

# Assessment Of Stress Among Who Take Care Of Elderly Individuals At Home In Selected Rural Community At Kanchipuram Distrect, Tamil Nadu, India.

**B. Indra<sup>1</sup>, K. Gowri Lakshmi<sup>1</sup>, S. Saritha<sup>1</sup>, G. Jayashree<sup>1</sup>, M. Yagajeyanthi<sup>2</sup>**

<sup>1</sup>*IVth Year B.Sc. (Nursing), Chettinad College of Nursing, <sup>2</sup>M.Sc. (Nursing), HOD (Community Health Nursing) Chettinad College Of Nursing, Chettinad Academy of Research & Education, Kelambakkam District, Tamil Nadu, India*

## Abstract

“Care givers is any one who provides any type of physical and/or emotional care for an ill or disabled loved one at home. Stress is your body’s way of responding to any kind of demand” study topic was Assessment of stress among who take care of elderly in a selected rural community at Kanchipuram district, tamilnadu, India. the study objectives are to assess the stress level of family care givers and to associate the level of stress among caregiver with selected demographic Variables such as age, sex, education, work, reliever for care giver, presence of chronic illness. the research approach used was quantitative-research approach. the research design used was descriptive research design. The research setting was Vadakadambadi. The total sample was 90 old age care givers at home. the sampling technique was non probability purposive sampling technique. a self administered questionnaire was used for data collection. The result shows was mild stress 82 (91%), moderate stress 07 (7.77), severe stress 0 (0%). the study reveals that there is no significant association between stress of family care givers with age, sex, educational status, working status, reliever of old age care givers.

**Keywords:** *Stress, old aged people, family care givers, rural area.*

## Introduction

**Kalyani K, Mehta (2014)** In our India, there is a lack of formal long-term care facilities, responsibility of taking care of old aged in family (cultural norms). stress process modal, assessed the care givers burden among impairments of old aged .family is main source of older parents caring and also central place to security, safe area for old aged in India .family care givers are important role care chronically elderly patient in hospital also neighbours and friends help in 80%in home, when older adults are impaired with mildly or moderately means spouse or children are providing care<sup>1</sup>

**Anne Branscum (2016)** (UNFPA) united nations population fund declared that say population growth of old aged of 60 above increase from (8% to 19%)in 2015. In India expecting to growth population 56% in 60 plus age group, while the 60plus, increase in 32% and 70% in 80 plus age group<sup>7</sup>.

## Need for the Study:

**Lawton, M., Rajagopal, D., Brody, E. & Kleban, M. (2015).** In 2011 National Study on Care giving offer a window into how caregivers experience their roles some times caregivers are risk for debilitating the stress. 2011, (NHATS) National Health and Aging Trends Study), says that the entire network of care givers are taking care of older adults between 65-85 making it comprehensive than previous large studies. The studies says that 9 out of 10 informal caregivers are family members, mainly spouses or adult children. <sup>4</sup>

**Sayoko Uemura<sup>1</sup>, Keiko Sekido (2014)** care provided by family members depend on economic resources, family structure, quality of relationships, and other demands in the family members’ . Family care giving ranges from minimal assistance to elaborate full-time care. family care giving takes about 24 hours per week, 20% of the time more than 40 hours per week.

Caregivers of the elderly said that 63% of their care recipients have long-term physical conditions and 29% have cognitive impairment.<sup>5</sup>

**Background of the Study:**

**Freedman VA, (2014)** Caregivers who take care of older adults in world, care is delivered including interacting with numerous providers, back- and-forth transitions from hospital to home or rehabilitation facility, going to a senior homes,visiting their living homes, caring nursing home, end-of-life care. There is role changes in health and functional status of old people, it affect the social, physical, and emotional health of the caregivers<sup>(20)</sup>The caregivers, individual experiences the effects ranging from wide and highly, also risk for side effects on their well-being.<sup>10</sup>

**Schulz and Tompkins (2010)** caregivers have to remember about taking of elderly people. when providing in-home elderly care for long-term care facility be honest,quite straight forward,obvious health care and personal care, they are the simple things we neglect on a daily basis. They are every human’s basic inner needs; they are just needed more by older peopleElderly people can easily lose trust in a caregiver if they arrive late do not anger, many older people do not have the patience to keep trusting other promise .Most of the elderly people have lived independent lives for years. There are cases where an older person would take the chance to care for herself when the caregiver doesn’t arrive on time.<sup>11</sup>

**Statement of the Problem:** Assessment of stress among family members who take care of elderly individuals at home in selected rural community at kanchipuram district, Tamilnadu.

**Study Objectives:**

- To assess the stress level of family care givers

- To associate the level of stress among caregiver with selected demographic Variables such as age, sex, education, reliever for care giver, presence of chronic illness for old age.

**Research Methodology:**

- Research approach: Quantitative-Qualitative approach
- Research Design: Non-Experimental- Descriptive research design
- Population: The Accessible Population of the present study is who take care elderly individuals at home in a selected rural community at Kanchipuram District.
- The Sample size of 90 family care givers will be selected
- Research setting: The study will be collected in the Selected rural community at Kanchipuram District, Tamilnadu.
- Sampling Technique: Non Probability - Purposive random sampling

**Results**

**Section A:** Frequency and percentage of stress among family care givers of old aged.

**Table: 1**

Grade	Stress Level	Percentage
Mild Stress	82	91%
Moderate Stress	08	8.88%
Severe Stress	00	0%

**Section B:** Frequency and percentage of distribution of association of stress with demographic variables.

**Table: 2**

# Life beyond the Diagnosis of Breast Cancer: A Qualitative Study on the Lived Experiences of Breast Cancer Survivors

Binsha Pappachan C.1, Fatima D'Silva<sup>2</sup>, Safeekh A.T.<sup>3</sup>

<sup>1</sup>Ph.D. Scholar, Nitte University, Mangalore, <sup>2</sup>Principal, Nitte institute of Nursing Sciences, Mangalore, <sup>3</sup>HOD, Dept. of Psychiatry, Father Muller Medical College, Mangalore

## Abstract

**Background:** The advances in biomedical technology that lead to an increase in early diagnosis and treatment have helped to increase the number of health breast cancer survivors in Indian as well as worldwide. Researches carried out on survivorship have focused mainly on the psychological impact and health outcome of the disease. The goal of this study was to focus on exploring the lived experiences of breast cancer survivors from diagnosis of the disease till the survivor life.

**Objective:** To explore the lived experiences of women who are breast cancer survivors.

**Design, Setting and Participants:** A purposive sampling strategy was used to recruit participants from a medical college hospital. A total of 18 women breast cancer survivors were interviewed.

**Findings:** The study concluded with four major themes that described lived experiences of women. These were factors from the diagnosis and treatment of breast cancer impacting survivorship, support system and relationships, and issues in survivor life. All the participants noted that it was so stressful journey that they went through after diagnosis till the completion of various treatment modalities. Each one found their own way to cope with the stress. Support from family was shared as the key which gave them strength and courage through the different stages of treatment. However, they found it difficult to explain what survivorship meant.

**Conclusion:** This study using in-depth interview techniques, shed light on the lived experiences of breast cancer survivors who have completed the treatment. All of them had fear and frustration during their diagnosis and treatment. They felt depressed due to body changes still the support they received from their partners and family helped them to come out of that feelings. However, they noted that they still live with the fear of recurrence of cancer.

**Keywords:** *Lived experiences, breast cancer, survivor, qualitative.*

## Introduction

Breast cancer is now the most common cancer in most cities in India, and 2nd most common in the rural areas.

---

### Corresponding Author:

**Dr Fatima D'Silva**

Principal, Nitte institute of Nursing Sciences,  
Mangalore

e-mail: ftds\_1970@rediffmail.com

Mob.: 9980645781

In India, we are witnessing more and more numbers of patients being diagnosed with breast cancer to be in the younger age groups<sup>1</sup>. Breast cancer has ranked number one cancer among Indian females with age adjusted rate as high as 25.8 per 100,000 women and mortality 12.7 per 100,000 women. The age adjusted incidence rate of carcinoma of the breast was found as high as 41 per 100,000 women for Delhi, followed by Chennai (37.9), Bangalore (34.4) and Thiruvananthapuram District (33.7).<sup>2</sup>

At the same time, the number of breast cancer

survivors is increasing due primarily to advances in biomedical technology leading to an increase in early diagnosis and treatment. Mortality rates also have been decreasing since 1990, and there are over 2.9 million women in the United States who have survived breast cancer.<sup>3</sup> The cancer registry data at the urban city level show that India will face a rapidly increasing number of breast cancer survivors in future. However, this survivor population has until now received very little attention.<sup>4</sup> Health professionals have low awareness of recognizing the long-term and late effects of cancer and its treatment and supportive care services specifically for cancer survivors are lacking in the country.<sup>5</sup> Under such circumstances, breast cancer survivors are often marginalized in the health-care system and have many unmet medical and psychosocial needs, requiring special attention.

There is not much research done on the various experiences Indian women are undergoing after the diagnosis and treatment of Breast Cancer. The term survivor is defined as life without cancer after treatment.<sup>6</sup> Thus, the purpose of this phenomenological study was to understand the lived experiences of breast cancer 'survivors'. The central research question was 'What is the experience to be a breast cancer survivor?'

#### **Sub questions were as follows:**

1. How did they cope with the diagnosis of cancer?
2. How did the cancer diagnosis affected their personal life?
3. How do breast cancer survivors perceive life after diagnosis and treatment?

### **Method**

**Ethics Approval:** The central ethics committee of KSHEMA has approved the study. Each participant was informed about rights to withdraw from the study anytime they want and principles of protection of human subjects, and each approved their participation with a written informed consent.

**Selection and recruitment of participants:** All the women were recruited from K.S. Hegde Medical Academy. Women those who have come for follow up after two year were considered for sampling. A purposive sampling strategy was used by researcher to recruit the participants (N = 18). The desire was to have a sample that represented a variety of perspectives but shared some common experiences. The aim of the purposive

strategy was to recruit participants that represented a range of perspectives within the follow up cases.

A diversity of experiences was based on age at diagnosis, stage at diagnosis and financial background. The goal was to get a broad cross section of perspectives within this framework. At eighteen participants, we had reached a level of saturation with the population of breast cancer survivors from our potential sample frame. There was no further new information that contributed to our analysis of the breast cancer survivor experience. The inclusion criteria were women: (i) 18-70 years of age (ii) English-speaking; (iii) a diagnosis of breast cancer; and (iv) completion of treatment, surgery, chemotherapy and/or radiation.

**Data Collection:** The data collection method was by a one-to-one semi-structured, in-depth interview with all participants in the counseling room of the Oncology OPD. Topic guides were developed based on the cancer literature and the researchers' experiences working with cancer patients. During the interview the participant's statements provoked further questions and clarifications.

**Analysis:** The research was focused to develop a set of logical and consistent understandings based on the perspectives of women with breast cancer. Data were analyzed following phenomenological coding guidelines. Analysis of data began after all tapes were reviewed by the researchers several times to get familiar with data and expressions of participants in regard to their breast cancer experience. Initially a line-by-line analysis of the data was conducted and the identified statements were highlighted. Next the overlapping statements were eliminated. From the final list of statements, the researchers created meanings without disrupting the original meaning of the participants. Codes were assigned to all meaningful units, which were then organized into categories of similar codes. Finally the themes were developed by considering all categories of codes to include the commonalities that cover several categories which gave a clear understanding of the experiences of breast cancer survivors.

**Reliability and validity of the study:** The following measures were taken by the researchers to ensure the reliability and validity of the instrument and study: (i) the first author who interviewed all participants transcribed tapes verbatim and completed the first phase of analysis (ii) the second and third authors reviewed the codes and themes to ensure the validity of the themes

and subthemes with the reality (iii) finally all the authors met to explore differences and final refinement of codes.

**Rigor:** To ensure rigor we initially established methodological coherence by ensuring the validity across the study that each part matches the research objective and also is consistent with its methodological assumptions. Secondly, we adopted the rule of purposive sampling by ensuring that 18 participants selected were able to provide a rich and in-depth understanding of survivorship experience. To enhance the reliability of the study, we used a single researcher and the same interview schedule to increase the consistency of data collection.

**Findings:** Eighteen breast cancer survivors participated in interviews that lasted from 60 to 90 min. The age of participants ranged from 32 to 69 years. Of the eighteen women, five were diagnosed at stage I, eight at stage II and five women had stage III cancer. Nine women had been cancer free between 6 and 12 months, while eight reported between 1 and 2 years cancer free. Analysis of the interviews identified three major themes that were important to the lived experiences of the women. These were (i) diagnosis and treatment of breast cancer impact on survivorship (ii) support system impact on survivorship (iii) and issues in survivor life.

**Factors from the diagnosis and treatment management impacting survivorship:** According to some of them though very little, the awareness they had about breast cancer helped them to identify early and they feel happy about it. However most of them agreed that they didn't have much knowledge about breast cancer and hence they ignored the appearance of lump as a common symptom of any infection and expected to disappear in due course. Only when it grown to severe extend where it was very much palpable they seek for medical checkup, by then it crossed first stage.

Survivor 3 explained that one day accidentally she felt 'a small lump on the left lateral side of her breast, which was of the size of a small peanut' and she could sense the danger that something is wrong with her breast. She was happy that she had enough awareness about breast cancer from the media and society and she rushed for the treatment. Although she was happy that she could diagnose her cancer in the initial stage she worries about the larger portion of society who is ignorant about the same and landing up in the late stages for the diagnosis and treatment.

Stage at diagnosis was another factor that impacted the survivorship. Survivors explained about the reaction at the point of diagnosis as 'shocked' or as 'end of life' feeling. Survivor 2 who was diagnosed stage 2 expressed as 'I thought it is going to be end of my life as the recurrence may be at any time and any form'. Though she was a health worker, she ignored the initial symptoms and postponed her screening test at the earlier stage which she is regretting very badly. Those survivors who had an early stage diagnosis were happy that their recurrence chances are less. Whereas those who had late diagnosis were more upset and fearful as they were having a fast recurrence.

The changes in their physical appearances were the major problem they had faced. None of them seemed to be bothered about the disfigurement by mastectomy; however all of them had a difficult time to cope with their emaciated body and the evident hair loss during chemotherapy. The financial burden was expressed by two of them who didn't have any insurance coverage. During treatment they had to literally sell of many things to fetch money for the treatment. Who had health insurance were thankful for that so that they could maintain a good quality of life during treatment which was difficult if they didn't have an insurance coverage.

According to them the journey after cancer diagnosis and treatment was a 'terrific one with full of anxieties and uncertainties' which was even complicated by other associated problems of family, work and financial issues.

**Support system impact on survivorship:** All of them had expressed that the support they had received during and after the treatment of cancer was the key factor for their successful completion of cancer journey. Survivor 12 said 'I was so surprised to see the overwhelming care and concern that was showered up on me by my relatives and was feeling so blessed to know my importance for all of them'.

Participants also expressed that even the friends and colleagues have turned up to be so caring and protecting in all the phases of the treatment. Emotionally, physically and financially all of them had offered themselves to these participants. Survivor 7 expressed her concern for her parents by saying 'I was feeling that I had gone back to my childhood, seeing the way my parents caring for me as if I was in my preschool period, and it was hurting me that instead of caring for them in their retirement life, they had to care for me'. All of them agreed that

the support they had received from their closed ones have gave them strength and motivation to complete the journey successfully.

### 3. Issues in survivorship

Each participant had their own way of explaining their survivor life. They agree that it was a tough journey, though were not sure what lies in future. Most of them still had a fear of recurrence at any time but said that they are ready to face anything that comes in their life. Most of them were happy that they could come back to their normal life.

Survivor 9 said ‘Now I feel I am more confident on myself and I know what I have to do in my future. I have a plan for each day and a list of things to complete before it (cancer) hits me back again..The days in my hand I feel are counted and will be grateful to God for every blessing he showered up on me’

## Discussion

This study envisaged to explore the lived experiences of a cancer survivor and various factors that are affecting the survival life of breast cancer survivors. In the analysis various factors emerged to be having an influence on the survival life and the issues that they experience during their survivorship.

Individuals who had undergone their breast cancer treatment and living a cancer free life are often called as cancer survivors. However most of the survivors are not happy to be called as cancer survivor as it brings all the painful memories to their mind. Some of them expressed that they are still not sure that they are really cancer free. Though the active medical treatment is stopped and they need not go for regular check- ups to hospital, they feel they still have some ailments for which much attention is not given.

Some of them said that the care they were receiving from family and friends have suddenly dropped caring and they found it difficult to adjust as their recovery is not complete. From this study the major problem breast cancer survivors faces is the fear of recurrence. They live their day and night thinking when it will come back. One of them even expressed her wish to surrender to death if recurrence occurs. Along with the fear of recurrence they also had concerns about body disfigurement, resuming their family and work responsibilities, sexual life post mastectomy which was supported by other studies.<sup>7</sup>

Social support was one of the key factors which helped them to cope with the stress effectively.<sup>8</sup> Support from family members, friends and co-workers motivated them and gave them encouragement to fight with cancer. Similar studies also showed the effectiveness of social support in breast cancer women.<sup>4</sup> Most of the participants also had the same experiences. Other important factors which came out in the present study were the influencing factors such as stage at diagnosis, age of women during diagnosis etc which had a greater impact on the survivorship. Young women were more depressed and worried about their future and commitments and those who diagnosed cancer at the later stages were having more fear of recurrence and death. This also was supported by similar studies. Consistent with other study findings the hair loss decreased their self esteem and self confidence to a larger extent<sup>9</sup>; in fact the mastectomy did not affect much. Financial burden came from the treatment cost had affected the quality of life of women who were not insured, however others thankful for the services they had received from the insurance.

## Conclusion

This study tried to shed some light in to the undiscovered experiences of women went through the traumatic life experiences after breast cancer diagnosis and treatment. It also tried to explore the experiences of survivorship and what it actually meant for them to live in a society with all fears of recurrence. These experiences what they have shared should be a guiding light for health care professionals to plan policies and protocols to support women to undergo the journey of breast cancer survivorship effectively. The three areas identified during the in-depth interviews can be explored further by researchers so that those areas can be focused in the management of women with breast cancer.

**Acknowledgement:** The authors are grateful to the participants who were very cooperative in willingly sharing their experiences.

**Conflicts of Interest:** None declared.

**Ethics Approval:** The central ethics committee of KSHEMA has approved the study.

**Source of Funding:** Self-funded

## Abstract

**Background:** Globally as of 2013, an estimated 382 million people or 8.3% of adults, are estimated to have diabetes, out of which about 46% were undiagnosed. The disease affects more than 50 million Indians-7.1% of the nation adults and kills about 1 million Indians a Year. The prevalence in south India has been reported to vary between 0.7% in Pondicherry to 19.5% in Kochi in urban areas.

**Objectives:** 1. To find out the prevalence of type 2 diabetes mellitus among adults in urban population of Eluru. 2. To study the socio-demographic variables in relation to type 2 diabetes mellitus in the study population.

**Methodology:** This was a community based cross sectional study carried out in the urban area of Eluru for a period of one year among 454 adults 30 years and above age group. WHO diagnostic criteria was used. The data was collected using a pretested semi structured questionnaire. All data collected was entered and analysis was done by using the Microsoft Office Excel 2007 and necessary statistical tests like proportions and chi square tests were applied.

**Results:** In the present study 48.9 percent of the study population were males and 51.1 percent were females. The prevalence of the type 2 diabetes mellitus was 21.1 percent in the present study. The present study showed significant association between the educational status and diabetes mellitus ( $p < 0.0001$ ). Statistical significant association ( $p < 0.05$ ) was found between different socio economic class of people and Diabetes mellitus.

**Conclusion:** Prevalence of type 2 diabetes mellitus in the urban population was showing increasing trend. Diabetics and high-risk groups should be included in the health education, IEC activities and counseling programmes.

**Keywords:** Diabetes Mellitus, POT2DIE, Urban, Eluru, Prevalence.

## Introduction

The prevalence of type 2 diabetes is rapidly rising all over the world. Diabetes is undoubtedly one of the most challenging health problems of the 21st century. Globally as of 2013, an estimated 382 million people or 8.3% of adults, are estimated to have diabetes, out of which about 46% were undiagnosed. About 80% live

in low and middle income countries. This will raise the global burden of diabetes mellitus to above 592 million by 2035. This equates to approximately three new cases every 10 seconds or almost 10 million per year.<sup>1,2</sup>

Diabetes is leading cause of death, disability and economic loss throughout the world and it is predicted to become the seventh leading cause of death in the world by the year 2030. Diabetes and its complications are major causes of early death in most countries. Cardiovascular disease is one of the leading causes of death among people with diabetes. It can account for 50% or more of deaths due to diabetes in some populations. Approximately 5.1 million people aged between 20 and 79 years died from diabetes in 2013, accounting for 8.4% of global all cause mortality among people in this age group. Close to half (48%) of deaths due to diabetes are in people under the age of 60. The highest number of deaths due to diabetes occurred in countries with the largest numbers of people with the disease: China, India, USA, and the Russian Federation.<sup>1,3</sup>

The disease affects more than 50 million Indians-7.1% of the nation adults and kills about 1 million Indians a Year. The International Diabetes Federation (IDF) estimates the total number of people in India with diabetes to be around 65.1 million in 2013, rising to 109 million by 2035. The average age on onset is 42.5 years.<sup>4-6</sup> The high incidence is attributed to a combination of genetic susceptibility plus adoption of a high calorie, low activity lifestyle by India's growing middle class. In many regions, up to 50% of people with diabetes remain undiagnosed. Population survey is the best means to detect large numbers of hitherto undiagnosed diabetes, as well as to create awareness regarding the disease among the masses.<sup>7-8</sup>

The prevalence in south India has been reported to vary between 0.7% in Pondicherry to 19.5% in Kochi in urban areas. It is clear that in the last two decades, there has been a marked increase in the prevalence of diabetes among urban south Indians. The fact that there is a shift in age of onset to younger age groups is alarming as this could have adverse effects on the nation's economy.

### Objectives:

1. To estimate the prevalence of type 2 diabetes mellitus among adults in urban population of Eluru.
2. To study the socio-demographic variables in relation to type 2 diabetes mellitus.

### Materials and Method:

The present study was a community based cross sectional study carried out in the urban health centre area Ashoknagar, Eluru for a period of one year from May 2013 to April 2014 among adults 30 years and above age group. The urban health centre Ashoknagar, functions under Alluri Sitarama Raju Academy of Medical sciences (ASRAM), Eluru. So this field practice area was selected for this study. This urban health centre area has 2487 households with 11,065 population and got divided into 6 areas which are Ashoknagar, Ameenapeta, Yetigattu, Mothevari thota, Harijana peta and Pathebad.

**Sample frame:** There were 4536 individuals 30 years and above age group in the urban health centre area.

**Sample size:** 454 individuals 30 years and above age group in the urban health centre area.

**Sampling method:** Systematic random sampling method was used for the collection of sample in this study. Sampling interval was calculated by dividing the sample frame population with required sample size, so every 10<sup>th</sup> individual was taken in to the study.

The data was collected using a pretested semi structured questionnaire. A pilot study was conducted and tested for appropriateness of study questionnaire and the actual study was started after making necessary corrections and advises in it. Importance of the study was explained and an informed consent was taken from all the study participants before data collection and the study was approved by institutional ethical committee. The data was collected by interview method.

Pregnant women, actually ill subjects and who are not willing to give consent were excluded from the study.

**Calculation of sample size:** considering Amrita Diabetes and Endocrine Population Survey (ADEPS)<sup>9</sup> revealed a prevalence of Diabetes Mellitus as 19.5 per cent. This prevalence is considered to find out the sample size with Allowable error (L) equal to 20%

412 was the sample size estimated using above formula  $N = 4PQ/L^2$  which is added with another 10% sample to make the sample more representative. So the sample size required for the study was found to be 454.

**Study tools:** Questionnaire Proforma, Portable Stadiometer, Portable Weighing machine, Measuring Tape, Glucometer, Blood-Pressure monitor.

**Data and statistical analysis:** All data collected was entered and analysis was done by using the Microsoft Office Excel 2007 and necessary statistical tests like proportions and chi square tests were applied.

**Diagnostic criteria:<sup>10</sup>**

Diabetes diagnosis was based on the World Health Organization (WHO) definition using Fasting blood glucose of 126 mg/dl or more. Impaired fasting glucose (IFG) as a blood sugar of 110 – 125 mg/dl.

**Results**

**Table 1: Prevalence of Type 2 Diabetes Mellitus in the study Population**

Study Population	Number	Percentage
Old diabetics	74	16.3%
Newly detected diabetics	22	4.8%
IFG individuals	65	14.3%
Non diabetics	293	64.6%
Total	454	100%
IFG-Impaired Fasting Glucose		

Table-1 depicts 21.1% is the prevalence of type 2 diabetes mellitus in the study population

**Table 2: Age of the study population in relation to Diabetes Mellitus**

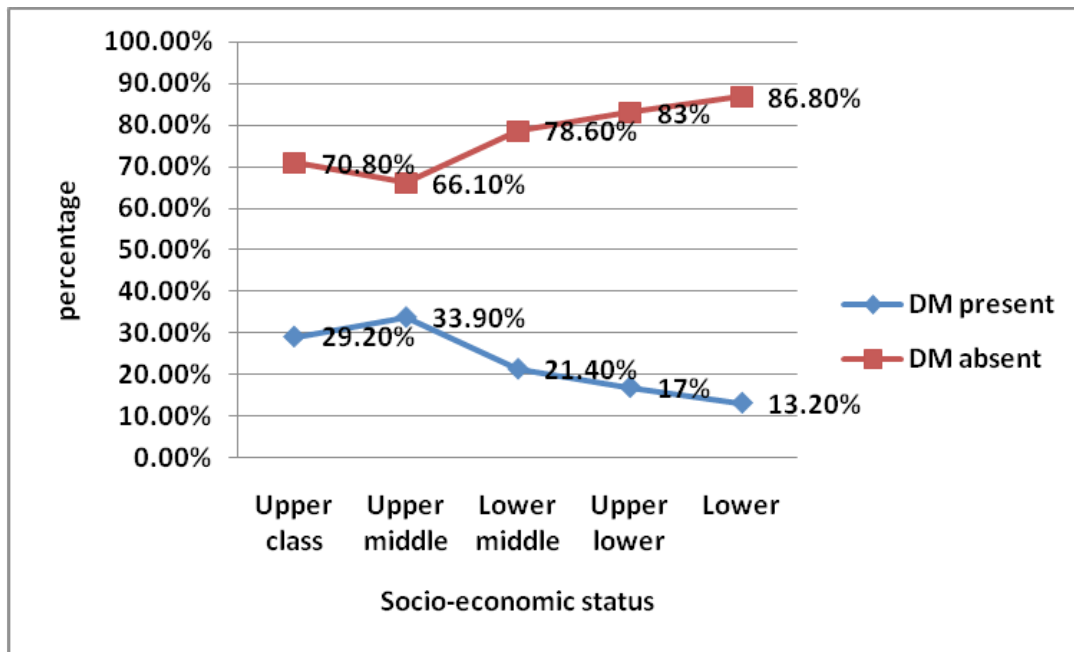

Age (in Years)	DM Present n (%)	DM Absent n (%)	Total N (100%)	p-value
30 to 40	8 (6.1)	123 (93.9)	131	< 0.0001 s
41 to 50	24 (15.7)	128 (84.3)	152	
51 to 60	35 (36.1)	62 (63.9)	97	
> 60	29 (39.1)	45 (60.9)	74	
DM-Diabetes Mellitus, p-probability, n-number, s- significant				

Table 2 shows that Majority of the study subjects belongs to 41 to 50 years age group that is 33.5 percent and there is a high statistically significant association between increasing age of the study population and diabetes mellitus (p<0.0001)

**Table 3: Education level of the study population in relation to Diabetes Mellitus**

Education Level	DM Present n (%)	DM Absent n (%)	Total N (100%)	p-value
Illiterate	23 (22.5)	79 (77.5)	102	0.004 s
Primary school	25 (39.1)	39 (60.9)	64	
Middle school	5 (21.7)	18 (87.3)	23	
High school	12 (13)	80 (87)	92	
Intermediate	11 (18.3)	49 (81.7)	60	
Graduate and above	20 (17.7)	93 (82.3)	113	
DM-Diabetes Mellitus, p-probability, n-number, s- significant				

Table 3 elicits that majority of the study population were of graduation and above and there is an significant association between education level and diabetes mellitus (p<0.05)

**Figure 1: Distribution of study population by Socio-Economic status**

In figure 1, line diagram depicts that prevalence of diabetes mellitus was high among the upper class and upper middle class which were 29.2%, and 33.9% respectively.

**Discussion:**

In the present study 48.9 percent of the study population were males and 51.1 percent were females. Majority that is 33.5 percent of the study subjects belongs to 41 to 50 years age group. The prevalence of the type 2 diabetes mellitus was 21.1 percent in the present study and similar findings were observed in the study done by Menon VU et al<sup>9</sup> who observed the prevalence of 19.5% in urban areas of Ernakulam district in Kerala. A Ramachandran et al<sup>11</sup> (18.6%), Mustafa N, Kushwaha S et al.<sup>12</sup> (18%). Gupta R et al<sup>13</sup> (2007) found the prevalence in their study in Jaipur as 18%. Bai PV et al<sup>14</sup> (17.4%), Kutty VR et al<sup>15</sup> (16.3%). The Eluru survey which was done by Rao PV et al<sup>16</sup> (1989) found the prevalence of diabetes was 1.5%. Prevalence was increased 14 times in the same area in this study after 25 years that is 21.1%. The differences of prevalence observed in the above studies were conducted in different parts of world and considerable variations may be due to socio cultural, ethnic, genetic, life style and environmental changes.

Impaired fasting glucose in the present study was

found to be 14.3% and 4.8% were newly detected diabetic individuals, this was in concordance with the study done by Ramachandran A, Snehalatha C et al<sup>8</sup> (2001) which found the prevalence of IGT as 14%. Similarly Bai PV et al<sup>14</sup> (23.4%). Menon VU et al.<sup>9</sup> (2006) has revealed a prevalence of known and undiagnosed diabetes were 9.0 and 10.5 per cent respectively. The ADEPS done in Kerala showed that 11.2 per cent of the subjects had either IFG or IGT. In the present study prevalence of diabetes mellitus is found to be high was in the age group more than 60 years that is 39.1% and is least in the age group 30 to 40 years that is 6.1%. It is observed that the prevalence of diabetes mellitus increases as the age advances. Similar results were observed in a study done by Vijaykumar G et al<sup>17</sup> (2009) and Rao PV et al.<sup>16</sup> Ramachandran A, Snehalatha C et al<sup>18</sup> (1994) in a study of the elderly population, age > 60 years, highlighted the high prevalence of diabetes and IGT, with increasing age. Prevalence of diabetes in the urban and rural elderly population were 24% and 9.9% respectively.

The prevalence of type 2 diabetes mellitus in this study was higher among females that is 21.5% and in males was 20.8%. However, this difference was not statistically significant (P > 0.05). Ramachandran A, Snehalatha C et al<sup>8</sup> (2001) concluded that prevalence of diabetes mellitus does not have any gender difference. National Urban Diabetes Survey (NUDS)<sup>8</sup> and

Prevalence Of Diabetes in India Study (PODIS) <sup>19</sup> studies reported similar prevalence of diabetes in males and females. The present study showed significant association between the educational status and diabetes mellitus ( $p < 0.0001$ ). Similar results were seen in the study done by Ma S, Cutter J et al.<sup>20</sup> In the present study prevalence of diabetes mellitus was high among the upper class and upper middle class which were 29.2%, and 33.9% respectively. Statistical significant association ( $p < 0.05$ ) was found between different socio economic class of people and Diabetes mellitus. Ramachandran A, Snehalatha C et al <sup>21</sup> (2002) stated that diabetes mellitus is increased among high socio economic group. Mohan V et al.<sup>22</sup> also found a lower prevalence of diabetes in the lower income group compared with middle income group in southern India.

### Conclusion:

In the present study which involved 454 urban population of Eluru who have been studied for one year period showed the prevalence of diabetes as 21.1%, 14.3% were found to be impaired fasting glucose one and 64.6% people were having normal glycaemic status. Based on the study results, prevalence of type 2 diabetes mellitus in the urban population was showing increasing trend and also alarming situation in urban areas. Simple life style modifications like increase in physical activity, decreased fat intake and avoidance of junk foods will reduce or delay the onset of type 2 diabetes mellitus.

Diabetics and high-risk groups should be included in the health education, IEC activities and counseling programmes. This would help in the care of the patient and would also act as primordial prevention for other family members. Large scale implementation of National Diabetes control programme and periodical diabetic screening programme to be implemented to detect the disease at early stage and prevent complications in the adults especially among the individuals of 40 to 60 years and positive family history.

**Ethical Clearance:** taken from Institutional ethical Committee.

**Source of Funding:** None

**Conflicts of Interest:** None

# A Comparative Study to Assess the Academic Performance and Factors Affecting it among Higher Secondary School Students in Both Rural and Urban Areas of Vadodara

Chetana Patel<sup>1</sup>, Rajesh Joseph<sup>2</sup>, Nirmal Raj<sup>3</sup>

<sup>1</sup>M.Sc. Nursing, Child Health Nursing, <sup>2</sup>Associate Professor, <sup>3</sup>HOD of Child Health Nursing, Sumandeep Nursing College, Sumandeep Vidyapeeth Campus Vadodara

## Abstract

**Background of the Study:** The student's academic performance is plays a important role in producing the good quantity alumnae who will become manpower and leader of a particular country, and it is consequently responsible for country's economic and social development. Economical, personal, psychological, and environmental factors affect the Student's performance.

**Aims and Objectives:** The aim of the study was to compare the academic performance and factors affecting it among higher secondary school students in both rural and urban areas of Vadodara.

**Material and Method:** Comparative research design, and a non-probability convenience sampling technique was adopted to achieve the goal of the study. The tool consists of two parts. First part consists demographic data of the sample and second part consists of self-modified academic appraisal scale. The sample was 200 students those were taken from selected higher secondary schools of urban and rural areas of Vadodara.

**Results:** The collected data was tabulated and analyzed using comparative and inferential statistics. In urban higher secondary school student's mean percentage was 73.78 and urban student's mean percentage was 66.47, and difference between it was 7.38%.

**Conclusion:** According to the calculation of mean score of academic performance indicates that there was higher academic performance among higher secondary school students of urban area compare with rural area.

**Keywords:** Comparison, Academic performance, Rural and Urban areas, higher secondary school.

## Introduction

Performance or Academic achievement is the degree to which a teacher, student or institution has attained their long or short-term educational goals.<sup>1</sup>

In the current century of globalization, students are the vital element of any nation. The students' performance plays a very important role in the development of quality of Students. This improves the financial growth of a country. Academic achievement is bear in mind as a first step for hiring novel graduates. Therefore, it is connected with students to raise their output and quality of life.<sup>2</sup>

Amounting of academic performance of students is confronting since student performance is result of, psychological, socio-economic and environmental factors. There are two groups of students as generally observed i.e. those who improve and those who don't improve. Education is growing as a gainful industry with prime objective of enlarging profit by delivering high quality education that produces skilled, well-educated, mannered students according to requirements and needs of the lively growing market. So that it is said that possibility of research is always there to find out what are the factors that affect the performance of the students.<sup>3</sup>

## Review of Literature:

**Section A:** Review of literature regarding assessment of academic performance

**Section B:** Review of literature regarding factors affecting academic performance

**Section A:** Review of literature regarding assessment of academic performance

**O. Samdal (2010)** conducted an interventional research study to assess relationship between Student's Perceptions of School Environment, their Satisfaction with School and perceived academic the researcher used 11, 13, and 15 year old students from Finland, Latvia, Norway and Slovakia as a sample. It is based on self-reported data from the "Health Behavior in School-aged Children Survey". The result of the research study suggest that the most valuable psychosocial school setting predictors of students' insight of their academic achievement are that they feel satisfied with school, that they feel the teachers do not expect too much of them, and that they have a good relationship with their fellow students & also entail that interventions which improve the students' satisfaction with school are likely to improve their achievement as well.<sup>4</sup>

**John T. E. Richardson (2008)** carried out a research study to assess the intellectual ability and academic performance of mature students, the research literature based on the academic performance of mature students includes no good evidence that mature students perform any less well than younger students on duration of study in higher education. The result of the study suggest that oldest mature students can obtain good results when assessed by means of both coursework and examinations, normal ageing alters the capacity for learning in higher education is most questionable.<sup>5</sup>

Albert Bandura, et. al (1992) conducted a research study on student's role of self-efficacy beliefs and academic goals in self-motivated academic achievement were studied using path analysis procedures. 56 students were used as a sample. Students' self-efficacy, Parental goal setting and personal goals at the beginning of the semester served as predictors of students' final course grades in social studies. Moreover, their grades in a prior course in social studies were included in the analyses. Student's prior grades were predictive of their parents' grade goals for them, which in turn were linked to the grade goals students set for themselves the result of

the study suggest that self-regulated learning affected their observed self-efficacy for academic achievement, which in turn influenced the academic goals they set for themselves and their personal goal final academic achievement and self efficiency improve the results of the students.<sup>6</sup>

**Norman G. Lederman (1992)** conducted a quantitative research study to assess teacher's and Student's conceptions of the nature of science. The development of adequate student conceptions of the nature of science has been a perennial objective of science instruction regardless of the currently advocated curricular or pedagogical emphases. Resulted that, it has been an area of productive research characterized by several parallel, but distinct, lines of investigation. Although research related to students' and teachers' conceptions of the kind of science has been conducted for approximately 40 years, a complete review of the real life literature (both quantitative and qualitative) has yet to be presented. The purpose of this review is to help clarify what has been learned and to elucidate the basic assumptions and logic which have guided earlier research efforts. finally, advice related to both methodology and the focus of future research are offered.<sup>7</sup>

**Carruyo-Vizcaíno, et. al (1995)** carried out a correlation research study in Venezuela of nutrient concentration and Hemoglobin in middle-class adolescents. The researcher use 213 adolescents in which 112 male and 101 female belongs to) belonging to a medium income group from private secondary educational institution as a sample. In this study the researcher correlate biochemical data and hematologic with academic performance. The result shows that there is positive correlation between hemoglobin and A.A.I., total iron binding capacity in males. It reveals that due to inadequate dietary intake combined with an increase of nutritional requirements and probably parasitic infestation there is high incidence of folate and iron deficiency in adolescent, especially in the adolescent female group.<sup>8</sup>

**Section B:** Review of literature regarding factors affecting academic performance

**Dr. Ehtesham Anwar, et. al (2005)** conducted a research study to examine the effects of gender and socio-economic status on academic achievement of higher secondary school students of Lucknow city. The researcher used 102 males and 98 females in age range of

15 to 19 from five higher secondary schools of Lucknow city Uttar Pradesh as a sample. The researchers collect the data randomly over a period of time. The result of this study was that the difference between low and high socio-economic status groups and also found that the academic achievement was influenced by the socio-economic status and the students who belonged to high socio-economic status showed better performance.<sup>9</sup>

**Karen Scouler (2001)** conducted a research study on the influence of two assessment method on students learning method. 206 students are used as a sample in research study. Assignment essay and multiple choice questions (MCQ) used as a assessment method. Results suggest that. Poorer performance in the MCQ examination was associated with the employment learning strategies. Students were more likely to employ deep learning approaches when preparing their assignment essays which they gain as assessing higher levels of cognitive processing.<sup>10</sup>

**Dr. Amit Kumar Singh (2017)** carried out A cross sectional study to identify and analyze factors that affect the students' academic performance in Community Medicine. As a sample 182 students were used. The structured questionnaire was used to collect the data. The Results of this study suggest that 1% of the students reported using computer, smart phones and access to the internet and three fourth of the students, reported that consuming meals before the examination. Demographic factors like gender and age were significantly associated with students' overall academic achievement in multiple linear regression analysis ( $p < 0.05$ ).<sup>11</sup>

**Preeti Singh, et. al (2015)** carried out the survey research study to investigate the impact of socioeconomic status on the academic achievement of secondary school students in Delhi. In which they used government as well as private schools located in Delhi and 15 schools were finalized. Normative survey method used upon 450 samples from class XI. A survey research study used to collect the data. The result of this study that the academic achievement was influenced by the socioeconomic status and those who belonged to middle and high socioeconomic status have shown better performance, also found that the difference between low and high socioeconomic status groups and further

reveals that gender influences the academic achievement at secondary school (Standard XI) level.<sup>12</sup>

**Usman Sabahat (2012)** conducted a research study to examine the perception of the teachers' on the factors influencing student's academic performance at higher secondary level in Rawalpindi District. In which they used ninety (90) teachers randomly drawn from seven colleges in Rawalpindi city. The result of the study showed that proper methodology, high socio economical status, good study environment, high motivations,, curricular activities regularity in the class, teachers' good behavior, overcrowded classes, teachers' professional educations, distance from home to school and lack of the school resources and large school size enhance students' achievement, traditional thinking of the parents Lack of communication skills and selective study habits decrease student's performance.<sup>13</sup>

## Materials and Method

**Statement of the Problem:** A comparative study to assess the academic performance and factors affecting it among higher secondary school students in both rural and urban areas of Vadodara.

### Aims & Objectives of the Study:

1. To assess the academic performance of higher secondary school students in both rural and urban areas.
2. To compare academic performance of higher secondary school students among urban and rural areas.
3. To find out the factors affecting academic performance of higher secondary school students in rural and urban area.
4. To find out the association between academic performance of higher secondary school students and selected demographic variables.

### Hyothesis:

$H_1$ : There will be a significant association between the academic performance of higher secondary school students with the selected demographic variables.

Research Approach	Quantitative Approach
Research Design	Non- Experimental research design
Setting	Urban and Rural Higher secondary schools of Vadodara district
Population	Higher secondary students
Sample	100 students from Urban & 100 students from Rural Higher secondary school
Sampling Technique	Purposive Sampling Technique
Tool-Development	Socio Demographic data Self Modified academic appraisal scale
Content Validity	Suggestion from various experts i.e Master in the field of Child Health Nursing the Asst. Prof. -5, Statistician -1, Language: Gujarati & English -2
Reliability	Using the cronbachs alpha and the reliability of tool was 0.8%
Pilot Study	Conducted on 14 higher secondary students, 7 from urban high school and 7 from rural high school
Data Collection Procedure	1 <sup>st</sup> week-Data was collected from urban Higher secondary school students 2 <sup>nd</sup> week- Data was collected from urban Higher secondary school students.
Analysis of Data	Descriptive and Inferential statistics

**Findings:** The findings of the study are presented in detail in reference to the objectives and hypothesis of the study.

- 1. Analysis of socio demographic characteristics of the respondent:** The distribution of higher secondary students according to their gender shows that among 200 participants 88 (44%) belonged to the male group, 112(66%) belonged to the female group. According to their class shows that among 200 participants 104(52%) belongs to 11<sup>th</sup> class students, and 96(49%) belongs to 12<sup>th</sup> class students. According to areas of residence that among 200 participants 100(50%) belongs to urban area, and 100(50%) belongs to rural area. According to religion shows that among 100 participants 162(81%) belongs to Hindu religion, 23(11.5%) belongs to Muslim religion, 15(7.5%) belongs to Christian religion, and none of students belong to other cast. According to their ordinal position in family. Shows that among 200 participants 80(35%) belongs to first ordinal position, 82(16.66%) belongs to second ordinal position, 38(23.34%) belongs to above to second ordinal position. According to their type of school shows that among 200 participants 160(80%) belongs to private school, and 40(20%) belongs to government school.
- 2. Assessment of academic performance of higher secondary school students:** In urban area mean of

academic performance is 442.71(73.78%) of high school students. In rural area mean of academic performance is 398.42(66.40%) of high school students.

The overall assessment shows that there is high academic performance in higher secondary students of urban area than rural high school students.

- 3. Comparison of academic performance of higher secondary school students among urban area and rural area:** In urban area mean of academic performance is 442.71(73.78%) of high school students. In rural area mean of academic performance is 398.42(66.40%) of high school students. There is difference between mean of academic performance of urban and rural area is 44.29 and means percentage difference is 7.38%.

The overall assessment shows that there is mean difference is 44.29 and mean percentage difference is 7.38%, it suggest that there is high score of academic performance of higher secondary school students of urban areas compare with rural area.

- 4. Factors affecting academic performance of higher secondary school students in rural and urban area:** There is major factors like internal and external classroom factors, family stress, distance from school which affect the academic performance of high school students of rural area compare with

urban area, so that there is academic of students than urban areas student's academic performance

- 5. Association between academic performance of higher secondary school students and selected demographic variables:** There is demographic variables such as gender, class, area of residence, ordinal position in family and types of school associate with academic performance of students. But only religion is not associated with academic performance So that  $H_1$ : There will be a significant association between the academic performance of higher secondary school students with the selected demographic variables is rejected.

### Conclusion

The study undertaken to compare the academic performance and factors affecting on it, among higher secondary school students with Purposive sampling technique was used to draw the sample. overall conclusion of the study was that major factors affect the academic performance of the rural high school, so there was low academic performance compare with the urban higher secondary school students

### Conflict of Interest:

- All authors have participated in (a) conception and design, or analysis and interpretation of the data; (b) drafting the article or revising it critically for important intellectual content; and (c) approval of the final version.
- This manuscript has not been submitted to, nor is under review at, another journal or other publishing venue.
- The authors have no affiliation with any organization with a direct or indirect financial interest in the subject matter discussed in the manuscript

**Source of Funding:** Self funding

# Applications of Chitosan in Dentistry

Chitharanjan Shetty<sup>1</sup>, Aditya Shetty<sup>2</sup>, Shishir Shetty<sup>2</sup>, Gurmeen Kaur<sup>3</sup>, Mithra N. Hegde<sup>4</sup>, Lakshmi Nidhi<sup>5</sup>

<sup>1</sup>Reader, <sup>2</sup>Professor, <sup>3</sup>Post-Graduate Student, <sup>4</sup>Professor, Head of Department, <sup>5</sup>Lecturer, Dept. of Conservative Dentistry and Endodontics, A.B. Shetty Memorial Institute of Dental Sciences, NITTE University, Mangalore

## Abstract

Chitosan has gained popularity in dentistry, its various applications including endodontic treatment, periodontal therapy, wound healing, implant surface modifiers, etc. Recently it has been used in root canal sealers due to antibacterial properties, chelating effect and enamel and dentin regeneration. Furthermore, chitosan nanoparticles penetrate deeper into dentinal tubules and enhance its actions. When used in combination with traditional dental materials, chitosan improves efficacy of restorative materials, adhesives, root canal sealers, disinfectants, etc. Antimicrobial effect against *E. Faecalis* and *Candida albicans*, its bioactive and biomimetic properties make chitosan an ideal ingredient in root canal medicaments.

**Keywords:** Chitosan, nanoparticles, endodontics, antimicrobial, biomimetic, root canal sealer, intracanal medicament.

## Introduction

Chitosan is biocompatible polysaccharide derived from chitin, the second most abundantly occurring polymerized carbon in nature.<sup>1</sup> It is used in various biomedical areas due to its biocompatibility, biodegradability, antimicrobial, emulsifying and chelating properties.<sup>2</sup>

In the field of medicine and dentistry, chitosan is used as an antioxidant, anti-bacterial, antacid, plaque inhibitor, osteogenesis promoter, haemostatic agent, fat absorbent, healing of ulcers and wounds, etc.<sup>3</sup>

Chitosan nanoparticles have characteristics of chitosan and properties of nanoparticles. One of its most imperative properties is elevated bioactivity, which has led to development of new biomaterials for application in dentistry.

French Professor Henri Braconnot, first isolated Chitin in 1811 while studying mushrooms. In 1859, Prof. CRouget found that boiling chitin with hot potassium hydroxide solution caused deacetylation of chitin, yielding an acid soluble substance, later called as Chitosan by Hoppe Seiler.<sup>4</sup>Hydrolyzing chitosan, the glucosamine component was confirmed by Gilson in 1894.<sup>5</sup>

### Preparation and structure

Chitin naturally occurs as microfibrils in shells of arthropods, cell walls of fungi and yeasts. It is intimately attached to protein onto which calcium carbonate deposits, part of protein being involved in a complex with polysaccharide. Deproteinization and demineralization are necessary, along with removal of pigments and lipids.<sup>6</sup>

Thermal maneuvering of chitin under strong aqueous alkali gives partially deacetylated chitin reckoned as chitosan. Heterogenous deacetylation is preferred method for obtaining chitosan by treating chitin with hot solution of NaOH and selective reaction in amorphous regions of polymer occurs, leaving the obstinate crystalline intrinsic regions unaltered.<sup>7</sup>

Whereas, in homogenous deacetylation, lower concentration (13%w/v) alkali acts on pre-swollen chitin

---

### Corresponding Author:

**Dr. Aditya Shetty**

Professor, Dept. of Conservative Dentistry and Endodontics, A.B. Shetty Memorial Institute of Dental Sciences, NITTE University, Mangalore  
e-mail: dradityashetty@nitte.edu.in

to develop interactivity with the alkali and left at 25-40°C for 12-24 hours, followed by dissolution in crushed ice.<sup>8</sup>

Chitosan is composed of copolymers of  $\beta$ -(1,4)-linked glucosamine units (2-amino-2-deoxy- $\beta$ -D-glucopyranose) and N-acetyl glucosamine units (2-acetamino-2-deoxy- $\beta$ -D-glucopyranose) with two free hydroxyl groups and one primary amino group for each C6 structure unit. These free amino groups offer chitosan a positive charge which allows its interaction with negatively charged surfaces<sup>9</sup>

When in contact with anions, chitosan forms beads of 1-2mm diameter, large enough to limit drug delivery.<sup>10</sup> Hence, in 1994, Ohya and co-workers developed chitosan nanoparticles by emulsifying and crosslinking, for intravenous delivery of 5-fluorouracil, an anticancer drug<sup>11</sup> Chitosan nanoparticles are synthesized most commonly by ionotropic gelation and polyelectrolyte complex or by microemulsion, emulsification solvent diffusion, and reverse micellar method<sup>12</sup>

#### **Chemical and physical properties of Chitosan:**

2-acetamide-2-dexosi-D-glucopyranose and 2-amino-2-deoxy-D-glucopyranose units determine the average degree of acetylation of chitosan or degree of deacetylation of chitin, and concentration of amino groups. Solubility of chitosan along with physical, chemical and biological properties is directly influenced by the relative percentage of these units.<sup>5</sup>

Solubility relies on degree of deacetylation, molar weight, concentration of acid and biopolymer and ionic strength.<sup>13</sup> Though insoluble alkali and organic solvents, it is soluble in solutions of organic acids with  $\text{pH} < 6$ . Chitosan with 50% deacetylation from homogeneous processing is water soluble<sup>14</sup>.

Along with flexible polymer chain, chitosan is composed of reactive functional groups: amino ( $-\text{NH}_2$ ) groups at C-2 position, primary and secondary hydroxyl groups at the C-3 and C-6 positions, respectively, which are hydrophilic and make chitosan bioadhesive that promptly attaches with negatively charged surfaces (mucosal membranes)<sup>15</sup>

Chitosan is good coagulating agent and flocculant due to high density of amino groups. The adsorption ability depends on free amino group content, degree of crystallization, deacetylation and affinity for water ions.<sup>14</sup>

**Biomedical applications of chitosan:** Chitosan is hemostatic, but sulfated chitosan acts as anticoagulant. Chitosan bandages and sponges were prepared for surgical treatment and wound protection<sup>16</sup>. Tokura et al. immobilized partially sulfated chitosan oligomers on the surface of molded chitosan materials, such as artificial blood vessels and fibers, for producing antithrombogenic medical products.<sup>17</sup> Chitosan is effective against cholesterol and various hypolipemic formulations containing chitosan were prepared for oral administration<sup>18</sup>. Chitosan membranes and gels have potential for use in immobilized cell culture systems<sup>3</sup>. Sirca and Woodman showed that chitosan selectively aggregates leukemia tumor cells in vitro, forming a dense aggregate and inhibiting cell growth<sup>19</sup>. Hadwiger et al. confirmed its interaction with DNA and built a model to explain the resistance response of host cells to the pathogen.<sup>20</sup> Chitosan is used for delivering lower concentrations of drugs and reducing side effects by controlled release.

#### **Applications of chitosan in dentistry:**

**Antimicrobial Activity:**  $\text{NH}_3^+$  groups of glucosamine interact with negatively charged surface components of bacteria, resulting in extensive cell surface attraction, leakage of intracellular substances, and causing damage to vital bacterial activities<sup>21</sup>. Antimicrobial action is influenced by Microbial factors (species, age of cell); Intrinsic factors of chitosan (deacetylation, crystallinity, positive charge density, molecular weight, hydrophobic and hydrophilic characteristics, chelation capacity); Physical factors (solubility, state of matter) and Environmental factors (pH, ionic forces, temperature, time).

Allan et al. demonstrated bacteriostatic action of chitosan against organisms derived from common skin bacterium. *S. epidermis* was completely inhibited by 0.1% solution of chitosan, whereas *S. aureus* and *P. aeruginosa* required 1% concentration.<sup>22</sup> Kong et al. reported stronger inhibitory effect at low pH and antibacterial activity reduced with increase in the pH<sup>23</sup>.

Higher molecular mass increases bactericidal power of chitosan, whereas Lower molar weight chitosan can

easily penetrate cell wall of fungi, which affects faster the vital components of cells and physiological activities<sup>24</sup>

bacterial cell wall, chitosan presents better bactericidal and bacteriostatic action for Gram-negative bacteria than Gram-positive bacteria.<sup>25</sup>

Due to phospholipids and carboxylic acids in

**Gram Positive Cell Surface**

**Reduction in plaque formation and caries development:** Chitosan toothpastes (Chitodent®), Mouthwash solutions and chewing gums have shown antibacterial activity against Streptococci and are effective in reducing bacterial plaque formation and

stimulating salivation. Studies on association of chitosan with dental materials, such as tetrafluorileno and hydroxyapatite suggest that chitosan enhances biocompatibility of materials, favors cell migration and hinders absorption of oral bacteria (*S. sanguis*, *S.*

mutans, *S. mitis*, *S. salivarius*) to the tooth.<sup>26</sup> Chitosan functions as preventive and therapeutic agent for dental caries<sup>27</sup> Thiolated chitosan based formulations are used in mucoadhesive patches to prevent dental caries.<sup>28</sup>

**Smear Layer Removal:** Chelating property of chitosan removes inorganic portion of smear layer by forming complexes with metal ions due to adsorption, ionic exchange, and chelation and eliminates dentin calcium ions.<sup>29</sup> Chitosan has less chemical and physical changes in radicular dentine and less invasive alternative to 17% EDTA.<sup>30</sup>

**Enamel Regeneration:** Organic amelogenin delivery at site of enamel defects with chitosan-restorative formulations resulted in human enamel regeneration. Ruan et al. aimed to rejuvenate the aligned crystal structure using chitosan based hydrogel as a carrier for amelogenin<sup>31</sup>

**Dentin Remineralization:** In biomineralization of dentine, non-collagen proteins with high affinity for calcium ions and collagen fibrils are responsible for regulating nucleation and growth of minerals, such as dentine matrix protein (DMP1) and dentine phosphophoryn (DPP, DMP2) with highly phosphorylated serine and threonine residues.<sup>32</sup> Phosphorylated chitosan functions as template-analogues and induces homogenous nucleation. Zhen Chen et al, reported that stable nanocomplexes of carboxymethyl chitosan/amorphous calcium phosphate (CMC/ACP) infiltrated into collagen fibrils due to chelation of calcium ions, causing intrafibrillar mineralization of collagen, thus facilitating remineralization of dentine.<sup>33</sup>

### **Modification of Dental Materials:**

**Restorative Materials:** Chitosan was added to conventional glass ionomer cements (GIC) to evaluate its effect on protein and growth factor release vital pulp therapy. Petri et al. reported improved flexural strength and increased rate of fluoride release in GIC incorporated with chitosan. Chitosan-modified GICs could be used for bioactive dental restorations and regenerative endodontics.<sup>34</sup>

Composites containing chitosan powder showed antibacterial characteristics with low OD<sub>660</sub>, smaller Colony Forming Units without altering flexural modulus and Vickers hardness<sup>35</sup>

**Intracanal medication and sealers:** Antimicrobial efficacy of chlorhexidine increases when combined with chitosan. Ballalet al., reported that combination of 2% chlorhexidine (CHX) gel and chitosan showed highest antimicrobial effect against *C. albicans* and *E. faecalis* when compared with CHX gel or 2% chitosan alone<sup>36</sup>. Whereas, Jaiswal N stated that combination of 1% Chitosan+1% Chlorhexidine shows better antimicrobial efficacy.<sup>37</sup>

Chitosan nanoparticles incorporated into zinc-oxide eugenol (ZOE) sealer enhanced antibacterial effects in membrane-restricted assays<sup>38</sup>, suggesting that Chitosan nanoparticles disperse from sealer, piercing into dentinal tubules and anatomical complexities.

Upon contact with saliva, phosphorylated chitosan (PHCS) at dentin interface facilitates biomineralization of collagen matrices<sup>39</sup>, which forms a protective blockade against bacterial recolonization that can hamper bacterial adherence to tooth surfaces<sup>40</sup>.

Shaymaa et al. observed that Ca (OH)<sub>2</sub> combined with chitosan solutions were more efficacious in inhibiting the growth of *E. faecalis* compared with Ca (OH)<sub>2</sub> mixed with saline<sup>41</sup>

Shrestha A, et al. reported lessening of biofilm bacteria and disrupting *E. Faecalis* biofilm structure.<sup>42</sup> Nair N reported that amalgamation of chitosan nanoparticles into calcium hydroxide based sealers considerably improves antibiofilm efficiency against *E. faecalis* strain ATCC-29212<sup>43</sup>

2% chitosan gel containing 0.1% chlorhexidine shows antifungal action against *Candida albicans*.<sup>44</sup> Shaik J, et al. demonstrated antimicrobial effect of combination of chitosan with Triple Antibiotic Paste and calcium hydroxide against *C. albicans* and *E. faecalis*<sup>45</sup>

Chitosan and rose bengal-conjugated nanoparticles (CSRBnps) have shown to exhibit significant antibiofilm effectiveness, stabilize dentin collagen after photo-cross-linking, and hinder collagenolytic activity.<sup>46</sup>

**Chitosan based adhesives:** Bioadhesive polymers and chitosan-based dentine replacement materials have been developed. Antioxidant chitosan hydrogels with propolis, β carotene and nystatin demonstrated dynamic dentine bonding systems with increased shear bond strength values of up to 38MPa after 24h and >20MPa

after 6 months, significantly higher than conventional dentine bonding systems irrespective of phosphoric acid etching.<sup>47</sup>

**Periodontal Therapy:** Chitosan is favourable substrate for periodontal tissue regeneration due to its bioactive, biointegrative, conducive, chemical, physical properties and optimal particle size that elicit favourable host tissue response.

**Wound Healing:** Chevrier and co-workers, reported that chitosan increases vascularization of blood vessels and stimulates budding tissue. Chitosan is used as a substitute for bone graft. Park, Klokkevold and Lee and co-workers reported that spongy chitosan stimulates osteoblasts and enhances osteogenesis.<sup>48-50</sup>

**Chemotherapy:** Folic acid conjugated carboxymethyl chitosan coordinated to manganese-doped zinc sulfide (ZnS: Mn) quantum dot (FACMCS-ZnS: Mn) nanoparticles were used in targeting, sustained drug release and imaging of cancer cells.<sup>51</sup>

### Conclusion

Advantageous characteristics of chitosan such as antimicrobial properties, coagulation with red cells, and complex with DNA have made chitosan not just a waste by-product from seafood processing industry, but a bioactive material with innumerable applications in medicine and dentistry. Chitosan and its nanoparticles are now used as sealer in root canal therapy with sustained antimicrobial activity and due to its ability to cause remineralization of dentine collagen matrix.

# Health, Sanitation and Hygienic Problems among Women Travellers in Nepal

Devika S.<sup>1</sup>, Sreenath Muraleedharan K.<sup>2</sup>

<sup>1</sup>Research Scholar, <sup>2</sup>HOD, Department of English and Languages, Amrita Vishwa Vidyapeetham, Kochi Campus, India

## Abstract

The travels made by women are distinctive as it possesses the beauty of journey and the threat of poor sanitation facilities provided by many South Asian Countries. As the increase in travel sparked an unparalleled interest in travel writing all over the world, there must be an initiation to create awareness among public on the need to facilitate better hygienic conditions to tourists, especially women, to make their travel less troublesome and more safe. Health, Hygiene and Sanitation are essential considerations not only for the traveller but also for the host country. People who travelled between different countries have an impact on economic, technological and cultural factors. But their influence of the epidemiology of disease, particularly infections should also be taken into account. The present study focuses on the hazards faced by women travellers in Nepal, where development is still in slow wain. The present study also looks at the ways and tactics adopted by the female travellers in a foreign country.

**Keywords:** Travel, Women travellers, Hygiene, Health, Sanitation.

## Introduction

Mobility is one of the greatest social phenomena of recent history. Travel begins with forced massive human migration in response to economic hardship, war, famine and social injustice. But human international wanderings are not limited to hardship or economic necessity. As Robert Louis Stevenson wrote in *Travels witha Donkey* (1878), 'For my part, I travel not to go anywhere, but to go. I travel for travel's sake. The great affair to move'. This is in part where tourism exists.

The systematic effort to promote sanitation in Nepal dates back to 1980s when UN declared International Decade of Drinking Water Supply and Sanitation. But travels to Nepal by women travellers started in early 1960s after the unification of Nepal in the year 1951. The first travel narrative on Nepal *The Waiting Land: A Spell in Nepal* by Dervla Murphy appeared in the year 1967 describing the experiences of an Irish women traveller in bicycle. The British traveller Barbara J Scott showed anxiety in the future of Nepal in her work *The Violet Shyness of their Eyes: Notes from Nepal* published in the year 1993. This is said to be the first work from a feminist

point of view with the author's note on social issues and the position of woman in Nepal. The Caribbean writer Jamaica Kincaid tried out a new treatment in her writing as a traveller in her narrative. Written as part memoir and part travel journal, Jamaica in her work *Among Flowers: A Walk in the Himalayas* takes a walk in search of the flora and fauna of Nepal. Analysing this narrative is an effort to bring in the experience of a black woman and her quest for identity in Nepal. The concept of empowered woman is introduced to the Western readers by the American traveller in the year 2014 in her work *The Living Goddess*. Elizabeth Enslin's *While the Gods Were Sleeping: A Journey through Love and Rebellion in Nepal* (2014), yet another American travel narrative, is set in rural Nepal which provides an insight into the life of marginalised, native woman of Nepal. More than being an American, Enslin's encounter with Nepali life helps to accommodate herself in second home. Thus the writing as a travel narrative is her quest to find the 'self'.

## Methodology

Patricia Lorcin in her work *Women's Travel Writings* studies travel writing as a rich source of history. She

marked the presence of women's narratives from 15th century and studied the 'other' and 'gaze' in women's travel narratives. The 'other' is the antithesis of the self and therefore serves an accentual purpose in the conceptualization the self. The 'gaze', on the other hand, is the way a particular group, conditioned by its gender, national allegiance, social standing or professional class, views the world. One can therefore talk of the female gaze, the colonial gaze, the Western gaze, etc.

Inderpal Grewal, in her seminal work *Home and Harem: Nation, Gender, Empire and Cultures of Travel*, reworks the colonial discourse and studies both sides of the colonial divide that discusses Indian women travelling West and English Women in travelling the East. The work is a transnational cultural study of the interaction of ideas between two cultures.

Mary Louise Pratt in her pioneering book *Imperial Eyes: Travel Writing and Transculturation* (1992) formulates the concept of 'contact zones'. Contact zones, according to her, are "social spaces where disparate cultures meet, clash and grapple with each other, often in highly asymmetrical relations of domination and subordination..."<sup>(p 16)</sup> She also analyses the significance of travel writing as one of the ideological apparatuses of the empire through which hegemonies of power could be effectively disseminated.

A more intensive work on women's travel narratives by Babitha Justin *Making of an Anecdotal India: A Study in the Writings of British Women Travellers in Independent India* throws light on the functioning of traveller's identity in the works of select women's travel narratives. For the study, she viewed the perspective of British women travellers of 20th century who had come to India as a part of the colonial legacy during the colonial as well as postcolonial period. The work retraces the history of travel made by women in India. She examined how the alien "Other" is comprehended through one's understanding of spaces, time, and relationships with the members of that community. By experiencing the 'other' spaces, time and personal relationships, the women travellers systematically try to

internalize and understand the phenomenon of a cultural strangeness they encounter. In their writings on travel, they try to imagine and conjure up an image of the 'alien' space they have travelled through these first-hand experiences. In fact, the India that the women travel, experience and write about, more or less, mirrors their understanding from their own subject positions and their psychic conditions.

## Results and Discussions

Dervla Murphy quotes the experience of a traveller who made his travel in the year 1877 as follows:

"From a sanitary point of view Kathmandu may be said to be built on a dunghill in the middle of latrines"<sup>(26, The Waiting Land)</sup>.

The situation was nothing different than what she has quoted when she made her travel in 1967. Murphy writes:

"In some quarters reeking water lies stagnant in square stone public baths, and I doubted the evidence of my eyes when I first saw people drinking this brew. After the scum has been pushed aside and the liquid-one can hardly describe it as water- has been collected in earthenware or brass pitchers it looks like strong tea"<sup>(28)</sup>

Among the five women travellers, Dervla Murphy is the only one traveller who has travelled to Nepal before the initiation of Government policies. The Government of Nepal developed plans to eradicate the problem son water supply and to ensure public hygiene and the target was expected to be accomplished in the year 2017.

The problems faced during the exploration of Nepal has been note down by most of the women travellers. While taking into account the experiences of five women travellers from different countries, the issues they have come across stood as a real barrier to achieve the needs of making a journey. Based on their personal accounts written as travel narratives in different time periods, the issues can be listed out as follows:

**Table 1. Common issues faced by the women travellers**

ISSUES FACED BY THE TRAVELLER	DERVLA MURPHY	BARBARA J SCOTT	JAMAICA KINCAID	ISABELLA TREE	ELIZABETH ENSLIN
DRINKING WATER	YES	NO	YES	NO	NO
PUBLIC HYGIENE	YES	YES	YES	YES	YES
SHELTER	NO	YES	YES	NO	NO

**Socio Cultural Contexts:** The socio cultural context of Nepal and the typical geography of Nepal holds back the country to attain sustainable development in many sectors including public health and hygiene. The census made in the year 2001 has come up with varied findings on the social conditions of Nepal.

**Low land holding:** The census survey also shows that about 29% of the total population are landless. These landless people do not have any physical space to build toilets. They are mostly living as squatters in public places and slums where construction of toilets is not legally recognized.

**Settlement pattern:** The settlement pattern too poses a problem for building toilets in some parts of the hills and ethnic Madhesi settlements in the Terai. The settlements are tightly clustered and there is lack of space for building toilets. The only possible solution is public and community toilets in such areas but these seem difficult in terms of the operation and management perspective.

**Poverty:** A recent UNDP survey reveals that the number of people under the poverty level is 65% of the total population (rural and urban). The National Planning Commission, however, claims it is only 25.4%. Besides, there is a big gap of sanitation coverage between poor

(12%) and rich (80%) . Hence poverty remains a major factor in the promotion of toilets in the country. Given the widespread poverty in the country, their affordability would pose a special problem for the community-wide promotion of toilets.

**Lack of awareness:** The illiteracy rate is 37% of the total population above six years old. Due to widespread illiteracy and lack of education, there is inadequate awareness of the connection between unsanitary conditions and practices and vulnerability to disease and ill-health, particularly the fact that human excreta is the main source of transmission and spread of a wide range of communicable diseases.

**Rampant open defecation:** Open defecation continues to be rampant in the country, more so in the Terai. Due to the high ground water table, construction of a toilet is a costly option and open defecation is a most common practice in the Terai.

**Socio-cultural taboos:** In some ethnic culture, traditional beliefs such as a father-in-law and daughter-in-law cannot use the same toilet, has also compelled many people to go for open defecation. In other culture specially in the mid and far western region, menstruating women cannot use the toilet with a belief that they are untouchable during those menstruating days.

### Measures Taken by the Travellers:

**Table 2. Safety Measures taken by the travellers**

MEASURES	DERVLA MURPHY	BARBARA J SCOTT	JAMAICA KINCAID	ISABELLA TREE	ELIZABETH ENSLIN
USING PUBLIC TOILETS	NO	NO	NO	YES	YES
CARRYING FIRST AID	YES	YES	YES	YES	YES
DEPENDS ON NATURAL RESOURCES	YES	YES	YES	NO	NO

## Conclusion

With all the geographical, economic and financial barrier Nepal faces all these years, Nepal rises gradually in overcoming the barriers on health issues. The Master Plan implemented by the Government of Nepal helps the nation to build around a safe and friendly atmosphere for the tourists to visit the country.

Through all South Asian Conferences on Sanitation, Nepal has made firm commitments to develop the Sanitation and Hygiene Master Plan. This commitment was also reinforced through the Nepal Country Plan for the International Year of Sanitation-2008. Considering the existing challenges and barriers to overcome and the commitment needed to meet National and MDG targets, having the Master Plan in place is essential to mainstream the efforts of concerned stakeholders at various levels. Hence, the Steering Committee for National Sanitation Action has formulated this Master Plan to expedite the pace of sanitation promotion and demonstrate Nepal's commitment in its sanitation endeavours.

# A Study to Assess the Level of Knowledge on Home Management of Diarrhea among Mothers

Divya R.<sup>1</sup>, Nandhini T.<sup>2</sup>, Pradeep Raj<sup>3</sup>, Subbulakshmi S.<sup>2</sup>

*1B.Sc. (Nursing) Student Researcher, <sup>2</sup>Associate Professor, Chettinad College of Nursing, Chettinad Academy of Research and Education, Tamilnadu, India.*

## Abstract

Diarrhea is one of the most common manifestations of illness in infants and children. Diarrhea is a symptom of variety of conditions, and it constitutes one of the main causes of morbidity and mortality among infants and throughout the world<sup>1</sup>. The present study was **to assess the level of knowledge on home management of diarrhea among the mothers** and the objectives were to assess the existing level of knowledge on home management of diarrhea among mothers and to associate the level of knowledge on home management of diarrhea with their selected demographic variables. Non experimental –descriptive research study was conducted. The study sample consisted of total 100 mothers of under five children. The study finding shows that majority of the mothers were having inadequate knowledge and most of the mothers were having moderate knowledge and no mother were having adequate knowledge. The mean value of knowledge score was 9 and the standard deviation was 3. The study findings also shows that there is no significant association between the demographic variables such as (age, education, income, type of family, residence, source of information) and the level of knowledge of mothers regarding home management of diarrhea at  $p < 0.05$  level.

**Keywords:** *Level of knowledge, home management of diarrhoea, mothers.*

## Introduction

Diarrheal disease is a common cause of childhood death in developing countries. World health organization [WHO] estimated that diarrhea kills 2,195 children every day more than AIDS, malaria and measles combine diarrheal disease account for in a child death worldwide<sup>4</sup>. Diarrhea is the second leading cause of death among children under the age five years. About 88% of diarrhea associated deaths are attributed by unsafe water, inadequate sanitation and insufficient hygiene.

India has highest incidence of diarrheal death among children below the age of five year about one third of total hospitalized children are the diarrheal disease. Health of the children has been considered as the vital important to all societies because the children are the basic resources for the future of human kind<sup>2</sup>. Child health depends up on prevention and the majority of child health problems are preventable. Modern approach of child health care emphasis on “preventive care rather than curative care most of the childhood diseases are prevented by mother’s role<sup>3</sup>.”

**Statement of the Problem:** A study to assess the level of knowledge on home management of diarrhea among the mothers at pediatric department, Chettinad Hospital and Research Institute, Kelambakkam, Kanchipuram district, Tamil Nadu, India.

## Objectives of Study:

1. To assess the existing level of knowledge on home management of diarrhea among mothers.

---

## Corresponding Author:

**Ms. Divya R.**

Student Researcher, Chettinad College of Nursing,  
Chettinad health City, Kelambakkam, Kancheepuram  
Dt, Tamilnadu, India, Pin-601103  
e-mail: divyaraja968@gmail.com

2. To find out the association between the level of knowledge on home management of diarrhea and the selected demographic characteristics of mothers.

**Hypothesis:**

**H1-** There is a significant association between the level of knowledge on home management of diarrhoea among mothers with their selected demographic variables.

**Operational Definition:**

**Assess:** It refers to the level of knowledge on home management of diarrhea among the mothers that will be evaluated through the structured interview schedule in selected aspects of diarrhea.

**Knowledge:** Knowledge refers to the level of understanding will be measured by the correct responses from the mothers to the tool regarding the home management of diarrhoea.

**Diarrhoea:** Diarrhea is defined as the passage of three or more loose or liquid stools per day (or) more frequent passage than is normal for the individual.

**Home Management:** A specific measures practiced at home to reduce the occurrence and frequency of diarrhoea.

**Mothers:** The mother who are having children in the age of 0-5 years who are obtaining care in pediatric department, Selected Tertiary Care Hospital, Kanchipuram DT, Tamil Nadu during the period of data collection.

**Materials and Method**

**Research Approach:** Quantitative–evaluative research approach was used

**Research Design:** Non experimental, descriptive research design was used.

**Research Setting:** The study was conducted at pediatric department, Chettinad Hospital and Research Institute, Kelambakkam, Kanchipuram District, Tamil nadu, India.

**Sample:** Mothers who were having children either male or female between the age of 0-5 years available at pediatric department, Chettinad Hospital and Research

Institute, Kelambakkam, Kanchipuram District, Tamil nadu, India.

**Sampling Technique and sample size:** Non probability – Purposive sampling technique was used to select the mothers of children and the sample size was 100 based on population proportion and the open-epi sample size determination.

**Sampling Criteria:**

**Inclusion Criteria:**

**The study includes the mothers who were:**

- having children 0-5 years of age.
- able to understand Tamil or English.
- available at the time of data collection.
- willing to participate in the study.

**Exclusion Criteria:**

The study excludes the mothers who were

- having critically ill children.

**Data Collection Procedure:** Structured interview schedule was used to assess the data of demographic variables and the level of knowledge on home management of diarrhea. Data was collected over a period of one week. Prior permission and consent were obtained from the mothers before conducting the study.

**Tool Description:** It consist of two parts like part-I and part-II

**Part-I:** Selected demographic variables of mothers such as age, religion, educational status, occupational status, family income, type of family and previous knowledge on home management of diarrhea.

**Part-II:** The level of knowledge was evaluated by the structured interview schedule consists of 20 questions regarding home management of diarrhea. Each questions consists of four options out of which one was the correct option, the mother instructed to select the correct option and to mark in box given for each questions.

**Scoring Interpretation:**

Score	Percentage (%)	Inference
0-9	<50%	Inadequate knowledge
10-15	50-75%	Moderately adequate Knowledge
16-20	76-100%	Adequate knowledge

**Analysis And Interpretation:****Table 1: Frequency and percentage distribution of level of knowledge of mothers on home management of diarrhea. N=100**

S.No.	Level of Knowledge	No of Mothers	Percentage
1.	Adequate	0	0%
2.	Moderate	47	47
3.	Inadequate	53	53

**Table 2 mean and standard deviation of level of knowledge of a mothers regarding home management of diarrhea. N=100**

S.No.	Level of knowledge	Total mothers	Score range	Mean value	Standard deviation
1.	Inadequate knowledge	100	53	9	3
2.	Moderate Knowledge		47		
3.	Adequate knowledge		0		

**Association between selected demographic variables of mothers and their level of knowledge:** It shows that there is no significant association between the selected demographic variables such as age, education, occupation, income, type of family, residence, sources of information and their level of knowledge of mothers regarding home management of diarrhea at  $p < 0.05$  level. Hence the research hypothesis H1 is strongly rejected.

**Discussion**

Demographic data of mothers showed that majority of the mothers (67%) were in the age group of 20-31 years, which showed that the women were married at an appropriate age. The findings were consistent with the study on children with young age mother conducted by V.Suganyabibitha baby (2017) in that study the age group of mother was 20-30 years. Majority of the mothers belong to Hindu religion, the fact that Tamil Nadu being a Hindu predominant state would have been the reason for majority of the participants to be Hindus. Most of the mothers were educated up to primary education school level. The fact might be their low socio economic status and few families were not showing interest in female literacy.

Majority of the mothers (87%) were housewives, with the family income of Rs.5000/- per month which showed that most of the participants were doing Cooley work due to their educational level, familial practice and the economics status.

While assessing the existing level of knowledge it was

noted that 53% of mothers had inadequate knowledge, 47% of mothers had moderately adequate knowledge and no one had adequate knowledge on home management of diarrhea. A study was conducted by Parker in 2018 on knowledge on management of infectious diarrhea among mothers showed that in the pretest the majority of mothers had inadequate knowledge. In posttest the majority of mothers had adequate knowledge it stated that structured teaching method was very effective among the mothers for incorporating new knowledge.

The mean value was 9 and the standard deviation was 3. The reason for the low level of mean value might be due to the poor educational status and most of the mothers were primi mothers so they were not oriented to home management of diarrhea among young children.

The study results shows that there is no significant association between the selected demographic variables such as age, education, occupation, income, type of family, residence, sources of information and their level of knowledge of mothers regarding home management of diarrhea at  $p < 0.05$  level.

**Recommendations:**

- The same study can be replicated on a larger sample and also at different settings.
- A study on mother's attitude and practice aspects of home management of diarrhea for under five children need to be conducted.
- A structured teaching programme can be prepared

and given to village health nurses and balwadi workers so that they can generate knowledge to all mothers regarding home management of diarrhea and their practice.

- A qualitative observational study of the housing conditions to clarify specific dangers in view of home management of diarrhea need to be conducted.

### **Conclusion**

The study results showed that most of the mothers were not having adequate knowledge on home management of diarrhoea. The knowledge should be strengthened by the health care workers and the mass media and even the school educational syllabus should focus on diarrhoea to reduce the burden of diarrhoea related morbidity and the mortality.

**Conflicts of Interest:** Nil

**Source of Funding:** Self funding and no external funding.

**Ethical Clearance:** Obtained clearance from institutional human ethical committee on 11.04.2018.

# Autonomic Function Tests in Chronic Obstructive Pulmonary Disease (COPD) and their Correlation with Disease Severity

Ganesan R.<sup>1</sup>, Gaur G.S.<sup>2</sup>, Karthik S.<sup>3</sup>, Vishnukanth<sup>4</sup>

<sup>1</sup>Assistant Professor, Department of Physiology, Melmaruvathur Adhiparasakthi Institute of Medical Sciences and Research, Melmaruvathur, Tamil nadu, India, <sup>2</sup>Professor, <sup>3</sup>Associate Professor, Department of Physiology, JIPMER, Pondicherry, India, <sup>4</sup>Associate Professor, Department of Pulmonology, JIPMER, Pondicherry, India

## Abstract

**Background:** Chronic hypoxemia in COPD patients, predispose them to cardiovascular autonomic neuropathy and cause sudden cardiorespiratory arrest. COPD patients without hypoxemia can also develop cardiovascular autonomic neuropathy. Similarly, cardiovascular autonomic neuropathy, though observed more often in patients with moderate and severe COPD, can also occur in patients with mild COPD. There is paucity of literature, revealing the relationship of autonomic function tests with disease severity in COPD patients.

**Objective:** In our study we intended to assess, autonomic function tests among different stages of COPD and also to identify the association of these autonomic function tests with disease severity.

**Method:** It is a Cross-sectional study done on (n=130) male COPD patients (who could maintain oxygen saturation above 88%). Anthropometric parameters, autonomic function tests and Pulmonary function test were assessed. Later, based on the GOLD stage criteria they were divided into 4 sub-groups. Data were analysed by SPSS 19.0 version software. One-way ANOVA was used to find Statistical difference between the groups. Correlations between the variables were done using Pearson correlation test.

**Results:** 30/15 ratio and E/I ratio levels were significantly decreased in very severe, severe and moderate COPD patients when compared to mild COPD patients. The  $\Delta\text{DBP}_{\text{IHG}}$  levels were significantly increased during isometric handgrip in very severe, severe and moderate COPD patients when compared to mild COPD patients. E/I ratio ( $r=-0.463$ ), 30/15 ratio ( $r=-0.496$ ) negatively correlated with disease severity and  $\Delta\text{DBP}_{\text{IHG}}$  levels ( $r=0.687$ ) positively correlated with disease severity

**Conclusion:** In our study group of COPD patients, we found increase in the sympathetic vascular BP response which gets increased as the disease severity is increased. 30/15 ratio and E/I ratio levels negatively correlated with disease severity and  $\Delta\text{DBP}_{\text{IHG}}$  levels positively correlated with disease severity.

**Keywords:** Autonomic function tests, COPD, Cardiovascular risk, FEV1, GOLD criteria.

## Introduction

Chronic obstructive pulmonary disease (COPD) is a lung disease characterised by chronic obstruction of lung airways which is irreversible.<sup>1</sup> COPD was predicted to be the third most common cause of death by 2020.<sup>2</sup> In India, burden of COPD -14.84 million.<sup>3</sup> COPD causes deaths in 90% of patients in low-and-middle-income countries.<sup>2, 5</sup> In India, the mortality rate of COPD is

---

64.7% which is highest in the world.<sup>6</sup> COPD is now recognised as the systemic inflammatory disease, known to cause cardiovascular diseases (CVD)<sup>7</sup> which accounts for 50% of COPD deaths.<sup>2, 8,9</sup> Lung Health Study showed that higher diastolic blood pressure and reduced pulmonary function were the most potent cardiovascular risk factors in COPD.<sup>10</sup>

Studies have showed that COPD is an independent risk factor for development of cardiovascular disease.<sup>11-13</sup> Lower the FEV1, the higher the risk of CVD in COPD patients<sup>14</sup>. This is because the levels of FEV1 were known to be reduced in low grade systemic inflammatory conditions such as in COPD.<sup>15</sup> Since low-grade systemic inflammation is associated with atherosclerosis, reduced FEV1 might be a significant risk factor for cardiovascular morbidity and mortality, independent of cigarette smoking, hypertension and serum cholesterol.<sup>16,17</sup>

Chronic hypoxaemia causes autonomic neuropathy in COPD patients and COPD patients without hypoxemia can also develop cardiovascular autonomic neuropathy<sup>18,19</sup>. COPD also known to increase sympathetic drive and causes autonomic dysfunction.<sup>20,21</sup> This is again a possible risk factor for CVD in COPD.<sup>22</sup> Conventional autonomic function tests (CAFT) are noninvasive and useful tool to assess cardiac autonomic activity and sympathovagal balance.<sup>23,24</sup> Pulmonary function tests are reliable tool to assess the disease severity in COPD<sup>25</sup>. In the present study, cardiac autonomic functions and pulmonary function tests will be assessed, and the association of cardiac autonomic function with disease severity will be studied.

## Materials & Method

**Study Design:** This was a cross sectional study conducted in 130 male COPD patients. Sample size was estimated conveniently based on logistics, time and budget. It was designed to assess the pulmonary function tests, Cardiovascular autonomic function tests [CAFTs] in male COPD patients and also to correlate CAFTs with disease severity. Before the start of the study, approval from JIPMER scientific advisory committee and Institute ethics committee for human studies were obtained.

**Selection of Subjects:** Male COPD patients (GOLD – Stage I-IV) aged between 35-60 years attending JIPMER pulmonology OPD were included in the study. COPD patients who cannot maintain oxygen saturation above 88%, COPD patients with systemic complications like coronary heart disease, arrhythmia, Stroke and

Alcoholics, Diabetic, hypertensive patients, Tobacco chewers were excluded from the study.

**Experimental Design:** The study was carried out in pulmonary function testing laboratory, and autonomic function testing laboratory in Department of Physiology, JIPMER between 9 am to 1 pm. The subjects were explained clearly about study protocol in their native language and written informed consent was obtained from them. The participants were asked to have light Breakfast around 7 am and come for tests around 9 am as the subjects will have difficulty in performing PFT and CAFTs with the full stomach.

The PFT parameters were measured from a spirometer called SpirolabIII hardware manufactured from Medical international research (MIR), Italy and Winspiro PRO software which assess the total lung function. Pulmonary function parameters studied were, forced vital capacity (FVC) in litres, forced expiratory volume in the first second (FEV1) in litres, the ratio between FEV1 and FVC (FEV1/FVC) in percentage.

Autonomic reactivity tests (CAFT) studied were HR response to standing (30:15 ratio which depicts parasympathetic activity) HR response to deep breathing (E: I ratio which depicts parasympathetic activity) and BP response to sustained isometric handgrip ( $\Delta$ DBP<sub>IHG</sub> which depicts sympathetic activity)

**Statistical analysis of data:** SPSS version 19 was used for statistical analysis. The continuous data such as age, duration of illness, anthropometric parameters (Ht, Wt, BMI, WHR), heart rate and blood pressure were expressed as mean with standard deviation and the intergroup differences in mean were compared using Oneway ANOVA test. CAFTs such as heart rate response to standing (30:15 ratio), heart rate response to deep breathing (E:I ratio), blood pressure response to isometric handgrip ( $\Delta$ DBP) was expressed in mean with standard deviation and the intergroup differences in mean were compared using Oneway ANOVA test. The correlation between CAFTs and FEV1 was done using Pearson correlation test. The difference was considered statistically significant if probability of chance was less than 0.05.

## Results

All the anthropometric, PFT & CAFTs parameters were assessed in 130 COPD patients after obtaining informed consent from them and the data were analysed.

**Comparison of parameters among different stages of COPD:**

**Demographic Characteristics:** The mean age, duration of illness, anthropometric indices of the study group were given in Table 1.

**Heart rate and Blood pressure parameters:** The mean Heart rate, SBP, DBP, PP, MAP of the study group were given in Table 2.

No significant difference was noted among the four subgroups of COPD.

**Conventional autonomic function tests (CAFT) parameters:** Comparison of CAFT parameters among patients in different COPD severity groups was done using One-way ANOVA and the Tukey post-hoc test was performed to find the significant difference among the groups

Among the CAFT parameters, 30/15 ratio and E/I ratio levels were significantly decreased (Table 3) in

very severe, severe and moderate COPD patients when compared to mild COPD patients. The  $\Delta\text{DBP}_{\text{IHG}}$  levels were significantly increased during isometric handgrip in very severe, severe and moderate COPD patients when compared to mild COPD patients. (Table 3). 30/15 ratio and E/I ratio levels negatively correlated with disease severity and  $\Delta\text{DBP}_{\text{IHG}}$  levels positively correlated with disease severity (Table-4)

Values are expressed as mean (SD); Comparison of variables between groups done using ANOVA

\*p<0.05 is statistically significant among the four groups of COPD

30:15 ratio: ratio of RR interval at 30<sup>th</sup> and 15<sup>th</sup> beat after standing; E:I ratio: ratio of RR interval during expiration and inspiration;  $\Delta\text{DBP}_{\text{IHG}}$ : difference in diastolic blood pressure with isometric hand grip (mmHg)

**Table: 4 Correlation of FEV1 with CAFTin COPD patients (n=130)**

Parameters	Disease Severity	
	r Value	P value
<b>AFT Parameters</b>		
30/15 ratio	-0.496*	0.002
E/I ratio	-0.463*	0.004
$\Delta$ DBP <sub>IHG</sub>	0.687*	0.005

Correlation between variables is done using Pearson’s correlation test. \*p<0.05 is statistically significant 30:15 ratio- ratio of RR interval at 30<sup>th</sup> and 15<sup>th</sup> beat after standing; E:I ratio- ratio of RR interval during expiration and inspiration;  $\Delta$ DBP<sub>IHG</sub> - difference in diastolic blood pressure with isometric hand grip (mmHg)

### Discussion

In our study population of 130 male COPD patients, anthropometric parameters such as height, weight, BMI and waist-hip ratio were assessed. Later the mean height, weight, BMI (20.1, 20.8, 21 and 22) and waist-hip ratio (0.81, 0.82, 0.83, and 0.85) were compared among the four subgroups of COPD patients. We found that none of the anthropometric parameters showed statistical significance among the four subgroups of COPD patients.

In our study, we assessed the autonomic reactivity tests such as E/I ratio, 30/15 ratio and DBP response to isometric handgrip in COPD patients. The E/I ratio and the 30/15 ratio are mainly assessing the parasympathetic reactivity. The mean E/I ratio (1.11) and 30/15 ratio (1.13) were within the normal range for the age group.<sup>26</sup> These findings suggested that the parasympathetic reactivity is unaltered in all four groups of COPD patients included in the study. We found an increased DBP in response to isometric handgrip ( $\Delta$ DBP<sub>IHG</sub>) in COPD patients indicating enhanced sympathetic reactivity. Conversely, study done by S.K. Chhabra et al., showed that 30/15 ratio, E/I ratio levels were decreased in COPD patients and reflected decreased parasympathetic reactivity in COPD patients.<sup>18</sup> In this study, exclusion criteria was not mentioned clearly, as patients included in the study might have had associated systemic comorbid condition which might alter these autonomic function tests.

Though 30/15 ratio and E/I ratio were in normal limits we found significant difference (p<0.05) in the levels of E/I ratio, 30/15 ratio and  $\Delta$ DBP<sub>IHG</sub> in very severe, severe and moderate COPD patients when compared to mild COPD patients. The levels of 30/15 ratio and E/I ratio decreased, and  $\Delta$ DBP<sub>IHG</sub> levels increased from mild to

very severe group of COPD patients.

Our study also assessed the correlation of these autonomic reactivity tests with disease severity and showed that E/I ratio (r=-0.463), 30/15 ratio (r=-0.496) negatively associated with the disease severity.  $\Delta$ DBP<sub>IHG</sub> (r=0.687) was positively associated with the disease severity in COPD patients. Our study is in accordance with the study done by S.K. Chhabra et al.,<sup>18</sup> Conversely in the study done by Doha Rasheedy et al., showed that 30/15 ratio, E/I ratio levels had no significant difference among mild, moderate and severe COPD patients and also showed these autonomic reactivity tests were not correlated with disease severity.<sup>19</sup> However, in this study COPD patients with chronic comorbid condition were recruited which may alter these autonomic function tests. In the study done by Sherman MF et al., showed that blood pressure change to isometric handgrip had no significant difference in mild, moderate and severe COPD patients and there was no correlation between blood pressure change in isometric handgrip and disease severity.<sup>27</sup> The sample size of the study was only 11 COPD patients which might not be enough to get statistical difference between the COPD groups and to correlate with the disease severity. So in our study group of COPD patients, we found increase in the sympathetic vascular BP response which gets increased as the disease severity is increased.

### Conclusion

From the present study, we conclude that, in COPD patients, as the disease severity increases the levels of diastolic BP difference during isometric handgrip were increased. Increased levels of diastolic difference during isometric handgrip suggested cardiac autonomic dysfunction in the form of increased sympathetic

activity. Cardiac autonomic dysfunction increases the cardiovascular risk in COPD patients and the risk increases with increase in disease severity. CAFTs such as 30/15 ratio and E/I ratio levels negatively correlated with disease severity and  $\Delta\text{DBP}_{\text{IHG}}$  levels positively correlated with disease severity.

# A Cross Sectional Study on Smartphone Addiction among Students in Ayapakkam, Thiruvallur District, Tamil Nadu, 2018

Gideon J.I.<sup>1</sup>, Mosoniro Kriina<sup>1</sup>, Athira Venugopal<sup>1</sup>, Minu Maria Mathew<sup>1</sup>, Boopathi K.<sup>2</sup>, Vasna Joshua<sup>3</sup>

<sup>1</sup>M.Sc. Biostatistics Students, <sup>2</sup>Faculty and Senior Technical Officer-3, <sup>3</sup>Course Coordinator and Scientist C., Department of Biostatistics, ICMR-National Institute of Epidemiology, Second Main Road, Tamil Nadu Housing Board, Ayapakkam, Near Ambattur, Chennai

## Abstract

**Background:** India stands second for Smartphone usage in the world according to “global market” report. Smartphone addiction affects the younger generations to a greater extent. The objectives of the study was to estimate the proportion of students of age 18–24 years who were addictive to their Smartphone, to estimate the average time spent by them, to find the main reasons for usage and also to find the association between Smartphone usages and sleep quality of the students.

**Method:** A cross sectional community based study was done in Ayapakkam, Thiruvallur district, Tamil Nadu. Two stage cluster sampling methodology was employed for selecting a random sample of 139 students. In the first stage 4 clusters were selected based on the more populous clusters and in the second stage a minimum of 35 students were interviewed from each of the selected cluster. Smartphone Addiction Scale (SAS) and Pittsburgh Sleep Quality Index(PSQI) were the tools used for assessing the association of Smartphone addiction and sleep quality of the students. Data was collected using tablet and Epicollect 5 web application.

Descriptive statistics, Chi-Square for association and t-test to determine whether there exists significant difference between the means of two groups was assessed.

**Results:** The proportion of students who were addict to their Smartphone was 52.7% and among them it was more in males (66.2%). On an average 6.42 hours/day was spent on their Smartphone. The major reason behind using their Smartphone was for communication (5.03 hours/day). The association between SAS and PSQI were found to be highly significant ( $\chi^2 = 11.035$ , p-value < 0.01).

**Conclusions:** It is an alarming sign that students are prone to addiction to Smartphone. The younger generation must be brought awareness about their Smartphone addiction and health impact they are prone in due course of time.

**Keywords:** Smartphone addiction, Sleep quality, Students.

## Introduction

Addiction to electronic devices has turned out to be an emerging behavioral addiction among youth<sup>(1)</sup>. According to the global market it was reported that India stood second for Smartphone usage in the world and it has brought about psychological dependency towards Smartphone leading to addiction in them<sup>(2)</sup>. Smartphone

addiction is considered to be a disorder involving compulsive overuse of the mobile devices usually quantified as the number of times users access their devices and/or the total amount of time they are online over a specified period. A previous study says that one of the fastest growing regional electronics is located in India. The increased usage of Smartphones has changed the modern world irreversibly. Smartphone contribute to 24/7 aspect of life whereby one can purchase, bank, chat, study and play games online at different time zones<sup>(3)</sup>. It has been expected that the number of Smartphone users to grow from 2.1 billion in 2016 to around 2.5 billion in 2019 worldwide<sup>(3)</sup>. A study conducted in the Middle Eastern population age 18 plus years, showed that 17% were addicts and 64% were somewhat addicts<sup>(4)</sup>. The main objective of the study was to estimate the proportion of students (18-24 years) who were addictive to their Smartphone and also to estimate the average time spent on their Smartphone and to find the main reasons behind the use of their Smartphone and to find the association between Smartphone usages and sleep pattern.

## Method

**Study population and study design:** A cross sectional community based study was conducted among the students of Ayapakkam, Thiruvallur District, Tamil Nadu, which is the field unit of the institute.

**Inclusion/exclusion criteria:** He/she should be a full time student.

He/she should be within the age 18 to 24.

He/she should be a resident of Ayapakkam, Thiruvallur District, Tamil Nadu.

He/she should own a personal Smartphone.

**Sample size:** Ayapakkam consisted of 13,000 households as per door to door survey in 2014-2015 and, there were 2235 students in the age group 18-24. The required sample size for the present study was 139 students with 95% of confidence level, 10% relative precision, assuming  $p=80%$ , design effect=1.5 and 10% allowance for non response.

**Sampling Procedure:** The entire line listing of students in the Ayapakkam Cohort was readily available and the students were selected using the two stage cluster sampling. The study area consisted of 7 clusters and among them 4 clusters which were higher populated was selected. A minimum of thirty five students were

interviewed from each of the clusters to satisfy the required sample size of 139.

**Data collection procedure:** Data was collected by one-to-one interview method using Epicollect5<sup>(5)</sup>. The interviews were conducted in the local language (Tamil) as well as in English by the post graduate students at the institute. For each cluster, one random start was generated and the required numbers of students were interviewed. In case of two or more students age 18-24 in a household, the available/willing respondent was interviewed. The study was proposed to the Institutional Ethics Committee, ICMR-National Institute of Epidemiology and was approved by the committee and also written informed consent was obtained from all the study participants.

**Training and pilot testing:** The students were trained by the Institute's experienced field and technical staffs on the usage of Epicollect 5, design the form/questionnaire, data collection and data entry. A pilot study was done to validate the questionnaire and to check the respondent's understanding of the *questions* and question flow.

There were three major divisions in the questionnaire. They were a structured questionnaire for socio demographic characteristics and questions on time spent by the students on their Smartphone on daily basis. The second one was about Smartphone addiction scale (SAS-SV)<sup>(6)</sup> in which the questionnaire included 10 questions describing daily life disturbance, positive anticipation, withdrawal, cyberspace-oriented relationship, overuse and tolerance. For each item, participants expressed their opinion on a 6-point scale ranging from 1 (strongly disagree) to 6 (strongly agree). The SAS score ranged from 6 to 60. Male were considered addicted to their Smartphone, if their scores was greater than or equal to 31, and for females it was greater or equal to 33. Higher scores has been indicated as more addiction.

The third division was the Pittsburgh sleeping quality index questionnaire (PSQI)<sup>(7)</sup>. The PSQI questionnaire included 9 questions with 7 components. The sum of component scores ranged from 0 to 21. Subjects who got PSQI global score of 5 or less were classified as 'good sleepers', and those who got more than 5 as 'poor sleepers'. Higher scores has been indicated less sleep quality.

**Data Analysis:** The cluster weights were assigned and data analysis was done. Descriptive statistics and

Chi-Square test for the association between Smartphone addiction and sleep quality and also between different characteristics like gender, age, education, branch of study and Sleep quality. The students' t-test was done for comparison of means between addicted and not-addicted groups, good sleep quality and poor sleep quality. SPSS 25 was used for all the data analysis.

## Results

Among the 147 students surveyed 54% were females and 67% of the students were below 21 yrs of age. The average age of the students was  $19.78 \pm 0.13$ SD and 86.5% of the students were undergraduates and 31.3% were currently pursuing their degree in Engineering. Overall 11.5% students were also earning through part time jobs in IT Company, teaching etc. and also 66.7% of the students bought Smartphone based on their own choice. Smartphone addicts and poor sleeper's median months of owning the Smartphone was 36 months. The Pearson's Chi-Square of association indicated the proportions of addicts among males were significantly higher than among females (Chi-Square=8.65, P-Value<0.01). Also the proportion of students who bought Smartphone of their own choice were significantly more addicted than students who bought without their own choice (Chi-Square=11.09, P-Value<0.01).

**Smartphone addiction:** The overall average SAS-SV score was found to be  $32.80 \pm 9.28$ SD, Whereas the average score of female and male were  $31.45 \pm 10.07$ SD and  $33.98 \pm 8.35$ SD respectively and the mean score was not significant between male and female ( $t=1.645$ ,  $p\text{-value}=0.102$ ). In the study 52.4% of the students participated were addicted to their Smartphone, among which 58.4% were males and 41.6% were females. It was also found that among addicted 79.5% were students who bought Smartphone based on their own choice.

**Time spent on their Smartphone and main usage of Smartphone:** The average hours of time spent on their Smartphone by the students was found  $6.42 \text{hrs} \pm 3.7$  SD per day. The average time spent by students during day were more than the night time and also it was little higher during weekends (table 1). Major time spent on Smartphone (43.7%) was for communication (which includes all modes of online and offline communication) followed by entertainment and education with 31.5% and 21% respectively (table 2).

It was also found (table 3) that students who were addicted to Smartphone (SAS score) spent on an

average 7.7 hours/day whereas it was 5hrs/day by non addicts. According to PQSI the average time spent on Smartphone by the poor sleepers was 7.35hrs/day whereas it was 5.51 hrs/day for good sleepers. Both of the factors were statistically highly significant.

**Smartphone usage among addicts and non addicts:** Smartphone usage for communication purposes ( $t=3.9$ ,  $p\text{-value}<0.01$ ), for entertainments ( $t=3.7$ ,  $p\text{-value}<0.01$ ), for other purposes like navigation, flash lights, news etc. ( $t=2.02$ ,  $p\text{-value}<0.05$ ) were significantly different between addicts and non-addicts.

The mean time spent on their Smartphone for studies ( $t=1.01$ ,  $p\text{-value}=0.31$ ) does not differ significantly among addicts and non-addicts whereas the mean time spent on services such as SMS ( $t=2.12$ ,  $p\text{-value}<0.05$ ), phone calls ( $t=3.19$ ,  $p\text{-value}<0.01$ ), games ( $t=3.23$ ,  $p\text{-value}<0.01$ ), internet Surfing ( $t=2.38$ ,  $p\text{-value}<0.05$ ), WhatsApp ( $t=2.84$ ,  $p\text{-value}<0.01$ ), Facebook ( $t=2.33$ ,  $p\text{-value}<0.05$ ), twitter ( $t=2.26$ ,  $p\text{-value}=0.03$ ), music and videos ( $t=3.08$ ,  $p\text{-value}<0.01$ ), Instagram ( $t=3.22$ ,  $p\text{-value}<0.01$ ), Selfie ( $t\text{-value}=2.15$ ,  $p\text{-value}<0.05$ ) were significantly higher between addicts and non-addicts.

**Smartphone usage among poor sleepers and good sleepers:** Smartphone usage for communication purposes ( $t=2.29$ ,  $p\text{-value}<0.05$ ) were significantly different between poor sleepers and good sleepers.

The mean time spent on their Smartphone for studies ( $t=1.77$ ,  $p\text{-value}=0.08$ ), entertainments ( $t=1.4$ ,  $p\text{-value}=0.17$ ) and for other purposes like navigation, flashlights, news etc. ( $t=0.62$ ,  $p\text{-value}=0.54$ ) does not differ significantly among poor and good sleepers.

The mean time spent on services WhatsApp ( $t=3.13$ ,  $p\text{-value}<0.01$ ), Instagram ( $t=2.5$ ,  $p\text{-value}=0.01$ ), games ( $t=2.05$ ,  $p\text{-value}=0.04$ ) and Selfie ( $t=2.01$ ,  $p\text{-value}=0.05$ ) were found to be significantly higher among poor and good sleepers.

The mean time spent on services music and videos ( $t=1.81$ ,  $p\text{-value}=0.07$ ), SMS ( $t=1.28$ ,  $p\text{-value}=0.2$ ), Phone calls ( $t=1.82$ ,  $p\text{-value}=0.07$ ), Internet Surf ( $t=1.27$ ,  $P\text{-value}=0.21$ ), Facebook ( $t=1.54$ ,  $p\text{-value}=0.13$ ), Twitter ( $t=0.91$ ,  $p\text{-value}=0.37$ ) and other purposes like navigation, flash lights, news etc. ( $1.84$ ,  $p\text{-value}=0.07$ ) does not differ significantly among poor and good sleepers.

The Pearson's Chi-Square for Smartphone addiction

and Sleep quality were highly associated ( $\chi^2=12.662$ , p-value < 0.01). There existed a positive linear relationship between Smartphone addiction and sleep quality and also people who are addicted have higher odds of getting sleep disorders(OR=3.57, CI:1.81, 7.06),

and also exist an higher odd of getting addicted between male and female (OR=2.87, CI: 1.47, 5.64) and also between person who bought Smartphone by their choice and who bought not by their choice (OR=3.6, CI: 1.72, 7.33).

### Discussion

According to a study conducted in Deakin, 34% tend to lose sleep and 40% felt disoriented without Smartphone. A study conducted in Tamil Nadu among

medical college students showed that 79.2% had poor sleep when they use more than 2 hours/day as compared to 65.7% who had poor sleep when they use 1 to 2 hours/day<sup>(1)</sup>. Another study in Chennai Urban area has shown

that 41.4% among the age group 15-35 were at risk of addiction to Smartphone.

The present study conveys that more than half of the student's community was addicted to their Smartphone and also from the mean SAS-SV score it was also observed that almost all the students were in the verge of Smartphone addiction. Thus the entire surveyed students/younger generation is in jeopardy to be Nomo Phobic which may cause serious imbalance in the physical and mental health of the younger generation.

It was also found that mean SAS-SV score doesn't differ significantly between male and female, Though some studies reported that the mean scores were significantly different between genders and the mean SAS-SV were high in males than that of females<sup>(8)</sup> and also in some studies the mean SAS-SV score in females were more than that of males<sup>(9,10)</sup>.

There existed a linear relationship between the time spent on Smartphone and Smartphone addiction and also between the Smartphone addition and sleep quality. Thus in due course the increase in usage of Smartphone time might lead to more Smartphone addiction and which in turn may lead to serious health conditions such as poor sleep quality.

It was also observed that students who bought Smartphone based on their choice were more addicted than that of students who didn't buy Smartphone based on their choice. It is an alarming sign among the students who are prone to addiction to Smartphone. The students unknowingly sacrifices their mental and physical health at the cost of health by detaching from family members spending more time over phone, sacrificing their sleep which may lead to serious health issues. The young generation must be brought awareness about their Smartphone addiction and health impact which they are prone in due course of time.

**Limitation:** The exact usage timings by the students for each category may be little biased for the following reasons. Students who stay at home during vacation may tend to use their Smartphone more, rather than while in classrooms. Also the Smartphone usage timings cannot be exactly attributed to any specific reason because few students simultaneously used for multipurpose like downloading/tracking and phone calls/chatting etc..

Since it's a community level student's based study, the non-availability rate and non-response rate was little

high (10%). Though the line listing of the entire study area was available due to more non availability (engaged in coaching classes, travelling a long distance, involved in part time jobs) and non response by the selected students, the simple random sampling methodology could not be adopted.

**Financial Support and Sponsorship:** ICMR-NIE.

**Conflicts of Interest:** None

**Ethical Clearance:** Taken from Institutes Ethics committee.

**Acknowledgement:** The authors thank the students Aleena Joy, Sai Teja G and the field staffs of NIE for their support in the field work.

# A Study to Assess the Effectiveness of Health Teaching Programme on Knowledge Regarding Stem Cell Collection, Preservation & its Benefits among Student Nurses of Selected Nursing Colleges of Vadodara

Ishita P. Shah<sup>1</sup>, Vruti Patel<sup>2</sup>, Robby Solanki<sup>3</sup>

<sup>1</sup>M.Sc. Nursing, <sup>2</sup>Assistant Professor, <sup>3</sup>HOD, Obstetrics and Gynecology Nursing, Sumandeep Nursing College, Sumandeep Vidyapeeth, Gujarat, India. Gujarat, India

## Abstract

**Background of the Study:** Stem cell transplantation is a life saving procedure for a number of malignant and non- malignant life threatening diseases. They are characterized by the ability to renew themselves through mitotic cell division and differentiate into a diverse range of specialized cell types. It is beneficial for later stage in life. In this study an evaluative research approach with pre-experimental research design was used, data was collected from 100 student nurses belongs to selected colleges of Vadodara city.

**Objectives of the Study:** 1. Assess the existing knowledge regarding stem cell collection, preservation & its benefits among student. 2. Determine effectiveness of health teaching on stem collection, preservation & its benefits. 3. Find out the association between pre-test knowledge scores and selected demographic variables.

**Material and Method:** In this research study an evaluative research approach with pre-experimental one group pre-test-post-test design is used. The sampling techniques was non probability convenience sampling is used to collect the 100 samples of student nurses and data collection done by administering the structured questionnaire. Data was analyzed by using descriptive and inferential statistics.

**Result:** With regards to the pre test assessment, the score of (41%) student nurses having moderate level of knowledge and (59%) student nurses having inadequate knowledge while in post test (18%) of student nurses having moderate level of knowledge and (82%) having adequate level of knowledge nobody was found at the inadequate level. The obtained “t” test value 43.10 is greater than table value, at the DF=99 which is significant at 0.05 level. It indicates that there is increased in the level of knowledge regarding stem cell collection, preservation & its benefits after providing HTP. Hence, Hypothesis H<sub>1</sub> accepted. The association of pretest knowledge score was only associate with the age, education level, gender and source of information others are not associate. Hence, H<sub>2</sub> is rejected and conclude that the pretest knowledge score is not associated with the demographic variable of the samples in this study.

**Discussion and Conclusion:** The findings of the study concluded that majority of student nurses were having inadequate level of knowledge & the health teaching programme was effective among student nurses regarding stem cell collection, preservation & its benefits.

**Keywords:** Effectiveness, Health Teaching Programme, Knowledge, student nurses, stem cell collection, preservation & its benefits.

## Introduction

*The only gift is a portion of self.” “Be a blood and organ donor. All it costs is a little love,”* –Emerson

*“Donate Cord Blood – You Can Save a Life”*

Health is the important aspects of life which needs to be maintained at any time in person’s life at any cost. Stem cells are young, primitive and undifferentiated

cells with remarkable potential to renew differentiate and develop in the body. Stem cells have ability to regenerate & stored in the different tissues. Umbilical cord is direct connection between mother & fetus, which is always show that emotional bonding between mother & fetus.<sup>1</sup>

Mother gives birth to the baby that times the blood store in the umbilical cord it is called as cord blood. This blood contains more number of haemopoetic stem cells & these cells have ability to self degenerate.<sup>1</sup> there are mainly two types of stem cells: Embryonic stem cells originate from the inner cell mass of the blastocyte & adult cells originate from adult tissue.<sup>1</sup>

Cord blood contains blood producing hematopoietic stem cells as well as mesenchymal cells. Hematopoietic stem cells are ability to develop brain cells, cardiac muscles, and liver cells. The mesenchymal cells have an ability to develop cartilage, bone, joints, ligament, and fat. Cord blood cells may be useful for the siblings, parents, cousins if there is an adequate Human leukocyte Antigen (HLA).<sup>2</sup> same as a cord blood connective tissue from an umbilical cord also can be preserved for the future medical need & further research. More than cord blood, whartshon jelly, connective tissue is specific source of stem cells & it is called as mesenchymal cells.<sup>2</sup>

Constantly growing attempts are being made to spread awareness of the phenomenon of umbilical cord blood banking that has created a sensation in the scientific community. Research on stem cell therapy has shown that advanced stem cell therapy could be used to treat more than 75 life threatening diseases. Currently research in the use of stem cells to treat more than 85 diseases such as diabetes, heart attack, stroke, spinal cord injuries etc, is being undertaken. There has been a completely new wave of research trials involving umbilical stem research that has swept through the nation.<sup>3</sup>

Although a relatively new concept, cord blood storage is fast gaining momentum as a less traumatic alternative to waiting lists, as a way to treat neurological illness, and as an insurance for the family against a host diseases. So, it increases the need of the participation of health care providers in cord blood storage and the first step in this process is awareness about the cord blood banking. Hence educational programme are in great demand especially for health care providers who in turn aware the public about cord blood storage.<sup>3</sup> The Nurses

most important role in the cord blood transfusion is that preparation, labeling & packaging.<sup>4</sup>

**Need for the Study:** Different research studies have shown that cord blood has various benefits over bone marrow transplantation, mostly in children, and can be life-saving in rare cases where a same bone marrow donor cannot be found. Approximately 50% of patients requiring a bone marrow transplant will not find a suitable donor within a critical period. In certain cases, there may be some medical issues around using one's own cord blood cells as well as availability of cells which will requires treatments done using cells from another donor, with the vast majority being unrelated donors. However, studies have proved that cord blood cells can also be used for siblings and other members of your family who have a matching tissue type. Siblings have up to a 75% chance of match and the cord blood may even be a match for parents & grandparents.<sup>5</sup>

According to WHO more than 70 malignant & nonmalignant disease are cured with stem cell transplantation, so this intervention have more useful for other disease specially in leukemia & lymphoma patients. At present there are at least 3 public and 7 private cord blood banks in India.<sup>6</sup> The Hindu (September, 2010) Newspaper reported that 1500 stem cells are received every month in India.

**Statement of Problem:** "A study to assess the effectiveness of health teaching programme on knowledge regarding stem cell collection, preservation & its benefits among student nurses of Selected Nursing colleges of Vadodara."

#### Objectives:

- Assess the existing knowledge regarding stem cell collection, preservation & its benefits among student.
- Determine effectiveness of health teaching on stem collection, preservation & its benefits.
- Find out the association between pre-test knowledge scores and selected demographic variables.

#### Hypothesis:

H<sub>1</sub>: There will be significant difference between pre-test & post test knowledge score regarding stem cell collection, preservation & its benefits

H<sub>2</sub>: There will be significance association between

knowledge of student nurses regarding stem cell collection, preservation & its benefits and selected demographic variable.

## Methodology

**Research Design:** The research design used for the study was Pre-experimental research design

**Setting:** The main research project was conducted at selected nursing colleges of vadodara city.

**Sample:** The 100 participants included in this study. The sample for the study was selected by non-probability sampling technique according inclusion criteria as availability of sample. Inclusion criteria:

- Students who are able to speak & write in Gujarati & English.
- Students who are willing to participate in the study.
- Students Nurses from G.N.M,B.Sc. or PB B.Sc

### Exclusion criteria for sampling:

- A.N.M students are excluded

### Tool for data collection

#### This consists of two parts:

Section 1: Demographic variables such as age, educational status, gender, previous exposure regarding stem cell collection, preservation & its benefits.

Section 2: Structured knowledge questionnaire will be used to assess knowledge Regarding stem cell collection, preservation & its benefits.

### Scoring interpretation of knowledge:

- Adequate knowledge - >67%
- Moderately adequate knowledge - 34-66%
- Inadequate knowledge - < 33%

**Data Collection Procedure:** The formal permission was obtained for the approval of the study from different colleges of Vadoara city. The data collection done within a given period of 1 week. The investigator selected the subject and established the rapport by explaining purpose of the study, the co-operation required and the anonymity assured before obtaining verbal consent. Initially the demographic tool, self structured questionnaire, administered to the sample to know existing level of knowledge regarding stem

cell collection, preservation, its benefits then the health teaching plan was given to the samples of the study. After 7 days post test was administered to assess the effectiveness of the health teaching programme among student nurses.

**Ethical Clearance:** The ethical approval was taken from ethical committee of university of Sumandeepvidhyapeeth. Ethical clearance was obtained from the SVIEC.

**Statistical Design:** Data were verified prior to computerized entry. The Statistical Package for Social Sciences (SPSS version 20.0) was used. Descriptive statistics were applied (e.g., mean, standard deviation, frequency and percentages). Test of significance (chi square and paired t test) was applied to test the study hypothesis

### Analysis:

**Section:** A description of the samples according their

#### Demographic Characteristics:

**Section 1:** Frequency and percentages distribution of samples, according to their demographic characteristic

Majority of student nurses (71%) from 21-23 age group & minimum student nurses (29%) were in the group of 18-20 year.

Majority of student nurses (94%) were Female and (6%) were male.

The highest percentage (50%) of student nurses (50%) was from B.sc nursing, (32%) from G.N.M & only (18%) from P.P.B.Sc.

Majority of student (92%) were not having previous exposure regarding stem cell collection procedure & only (8%) students having exposure to stem cell collection procedure.

Majority of student nurses (57%) were used news paper for source of information, (21%) were used internet, (14%) were used television and only 5% were having previous clinical exposure regarding stem cell collection..

Section 2: Analysis of pre-test & post test knowledgescore of student nurses regarding stem cell collection, preservation & its benefits.

**Table 1: Distributions of pre test knowledge score of student nurses regarding Stem cell collection, preservation & its benefits. N=100**

Sr. No.	Knowledge Level	Frequency	Percentage
1	Inadequate	59	59%
2	Moderate	41	41%
3	Adequate	00	00
	Total	100	100%

**Table 2: Distributions of post test knowledge score of student nurses regarding Stem cell collection, preservation & its benefits. N=100**

Sr. No	Knowledge Level	Frequency	Percentage
1	Inadequate	00	0%
2	Moderate	18	18%
3	Adequate	82	82%
	Total	100	100

Section 3: Effectiveness of health teaching programme

**Table 3: Comparison of pre test and post test knowledge score of student nurses N=100**

Variable		Mean	Mean Difference	Std. Deviation	t- Value
Knowledge regarding stem cell collection,preservation & its benefits	Pre-test	9.98	15.15	6.88	43.10
	Post-Test	25.13		5.22	

\*Significant at 0.05 level \*t (0.05, 99df) =2

**Section D: Association between pre test knowledge score with socio-demographic variables.**

Association between pre test knowledge score and socio-demographic variables

This section shows the association between knowledge of student nurses and demographic variable. Significant demographic variable are age of student nurses with  $\chi^2$  value 8.94 (1df=3.94), gender of student nurses with  $\chi^2$  value 4.43 (1df=3.84) and educational status  $\chi^2$  value 6.76 (2df=5.99), for source of information of student nurses  $\chi^2$  value 9.46 (3df=7.82) so, for this variable hypothesis is accepted. The non significant demographic variable is previously any exposure regarding programme. Hence, research hypothesis  $H_2$  is failed to accept.

**Discussion**

Stem cells have tremendous promise to help us understand and treat a range of diseases, injuries and other health-related conditions. Their potential is evident in the use of blood stem cells to treat diseases of the blood, a therapy that has saved the lives of thousands of children with leukaemia and can be seen in the use of stem cells for tissue grafts to treat diseases or injury to the bone, skin and surface of the eye. When exploring the knowledge of the nurses about the stem

cells, an important element highlighted in this study is the lack nurse’s knowledge in basic clinical information regarding stem cells.

The purpose of the study is to evaluate the effectiveness of the health teaching programme among 100 students nurses. The findings of the study concluded that majority of student were having inadequate level of knowledge. The health teaching programme was effective among student nurses in improving knowledge (t (99) =43.10) significant at 0.05 level regarding cell collection, preservation & its benefits. Finding reveals the health teaching programme is effective to increase the knowledge of respondent and another finding reveals there is association between pre test knowledge score with demographic variable of age, education, gender & source of information.

Different research studies have shown that cord blood has various benefits over bone marrow transplantation, mostly in children, and can be life-saving in rare cases where a same bone marrow donor cannot be found. Approximately 50% of patients requiring a bone marrow transplant will not find a suitable donor within a critical period. In certain cases, there may be some medical issues around using one’s own cord blood cells as well as availability of cells which will requires treatments done using cells from another donor, with the

vast majority being unrelated donors. However, studies have proved that cord blood cells can also be used for siblings and other members of your family who have a matching tissue type. Siblings have up to a 75% chance of match and the cord blood may even be a match for parents & grandparents.

Although a relatively new concept, cord blood storage is fast gaining momentum as a less traumatic alternative to waiting lists, as a way to treat neurological illness, and as an insurance for the family against a host diseases. So, it increases the need of the participation of health care providers in cord blood storage and the first step in this process is awareness about the cord blood banking. Hence educational programme are in great demand especially for health care providers who in turn aware the public about cord blood storage. The Nurses most important role in the cord blood transfusion is that preparation, labeling & packaging.

### Conclusion

In the light of the study findings, it can be concluded that there was a statistically significant improvement in nurses' knowledge mean scores after intervention. The implementation of an educational intervention was effective and significantly improved nurses' knowledge cord blood collection procedure. Furthermore, the above mentioned findings proved and supported the research hypothesis. The purpose of the study is to evaluate the effectiveness of the health teaching programme among 100 students nurses. The findings of the study concluded that majority of student were having inadequate level of knowledge. The health teaching programme was effective among student nurses in improving knowledge ( $t(99) = 43.10$ ) significant at 0.05 level regarding cell collection, preservation & its benefits. Finding reveals the health teaching programme is effective to increase the knowledge of respondent and another finding reveals there is association between pre test knowledge score with demographic variable of age, education, gender & source of information.

### Recommendations:

Based on the findings of the present study recommendation offered for the future study:

- The similar study can be conducted in different settings.

- The similar study can be conducted on staff nurses.
- The similar study can be conducted on mothers to assess the knowledge & attitude regarding cord blood banking.
- The similar study can be conducted in large sample.
- The similar study can be conducted in different cord blood bank.

## Abstract

**Background:** This study was designed to assess the level of nomophobia among students studying in Sumandeep Nursing College, Vadodara. Emphasis was put on trying to establish the relation between age, gender, course of study, family income, occupation of parents, and duration of mobile usage. The research instruments were established and data was collected from 100 nursing students from Sumandeep Nursing College. To analyze the data descriptive and inferential statistics was used with the aim of finding association between the levels of nomophobia with selected demographic variable.

**Aims and Objectives:** The aim of this study is to find out the level of nomophobia among students at Sumandeep Nursing College, Vadodara and develop the awareness of nomophobia through an information booklet in nursing students. **Material and Method:** In this research study a quantitative survey approach with descriptive research design is used. The sampling technique was non probability convenient sampling used to collect the 100 samples of student. Data collection was done by administering the NMP-Q. Data was analyzed by using descriptive and inferential statistics such as chi-square test. **Results:** In this study, 18% were having mild nomophobia, 68% were having moderate nomophobia, and 14% were having severe nomophobia. Also the findings show that there is an association between the levels of nomophobia with certain demographic variables.

**Conclusion:** This study has dealt with the analysis and interpretation of the data collected from 100 nursing students. Both descriptive and inferential statistics were used to analyze the data. The analysis has been recognized and presented under various sections like description of demographic variable, association between the nomophobia levels with selected demographic variables. It was found that students have 18% mild nomophobia, 68% moderate nomophobia and 14% severe nomophobia. After that we gave awareness to the students through an information booklet.

**Keywords:** *Assess, level of nomophobia, students, information booklet, develop.*

## Introduction

*“Technology is a useful servant but a dangerous master”<sup>1</sup>*

Nomophobia is the irrational fear of being without your mobile phone or being unable to use your phone some reason, such as the absence of a signal or running out of minutes or battery power. Nomophobia is the irrational fear of being without your mobile phone or being unable to use your phone some reason, such as the absence of a signal or running out of minutes or battery power. The term “no-mobile-phone phobia”, was coined in 2008 study by the UK Post Office who commissioned YouGov evaluating anxieties suffered by mobile phone users. The study found that nearly 53% of mobile phone users in Britain tend to be anxious when they “lose their

mobile phone, run out of battery or credit, or have no network coverage". The study, sampled 2,163 people, found that about 58% of men and 47% of women suffer from the phobia, and an additional 9% feel stressed when their mobile phones are off. 55% of those surveyed cited keeping in touch with friends or family as the main reason that they get anxious when they could not use their mobile phones. The study compared stress levels induced by the average case of nomophobia to be on-par with those of "wedding day jitters" and trips to the dentist. More than one in two nomophobes never switch off their mobile phones. The study and subsequent coverage of the phobia resulted in two editorial columns authored by individuals who minimized their mobile phone use or chose not to own one at all these authors appeared to treat the condition with light undertones of mockery, or outright disbelief and amusement.<sup>2</sup>

**Need for the Study:** Since the first mobile phone was introduced to the consumer market in 1983, these devices have become significantly main stream in the majority of societies. Mobile phone is playing an important role in this modern world. It is very hard to see a person without a mobile phone. Kids are also spending lot of time on cell phone while playing a game is a very much interest in them. Due to excessive use of cell phone nowadays people have no real friends. And their stress level is very high and they always feel anxiety while they have no cell phone in their hands. Students are so addicted nowadays to their phones. They feel that their phones are their lifeline and a moment without means literal death. They use their phone so extensively, that they click photos of their exams time tables and record the slides of PowerPoint presentation on them. They also recorded entire lectures on them. A recent study by the Hankamer School Business at Baylor University found that college students spend an average of 9 hours a day using their cell phone. While female college students spend 10 hours using the device, male college students use their cell phone for almost 8 hours a day.<sup>3</sup>

**Literature Review: Farooqui IA et.al (2017)** conducted a study Nomophobia: an emerging issue in medical institutions. Assess the prevalence of Nomophobia in the students in 1st year MBBS. Study area: A medical college in Pune city. December 2015 to February 2016. A cross-sectional study was carried out on all the students of 1st year MBBS. A predesigned and pretested questionnaire was used to collect data. Data were analyzed statistically by simple proportions using SPSS v20. A total of 145 students were monitored

according to inclusion and exclusion criteria. Amongst all the participants, 45.5% were males (66/145) and 54.5% were females (79/145). Mild Nomophobia was found in 17.9% students whereas 60% had moderate and 22.1% had severe Nomophobia. Amongst the males, 56.06% and 24.24% had moderate and severe Nomophobia, respectively while in females, moderate and severe Nomophobia was found to be 63.25% and 20.25%, respectively. Nomophobia is found to be prevalent in students of 1st year MBBS.<sup>4</sup>

**Prasad M, et.al (2017)** Nomophobia: A Cross-sectional Study to Assess Mobile Phone Usage among Dental Students. To assess the pattern of usage of mobile phones and its effects on the academic performance of students. A descriptive cross-sectional study was conducted amongst 554 students of D. J. College of Dental Sciences and Research through a self-administered questionnaire to collect the data regarding the usage and associated anxiety with mobile phone. About 39.5% students agreed that they score low marks in professional exams if they spend more time on phone. The number of students who frequently checked their cell phone during their classes or while doing clinical work were 24.7%. A total of 24.12% of the students were found to be nomophobic and at risk of being nomophobes were 40.97%. A statistically significant difference was found among preclinical, clinical, interns and postgraduates regarding the usage and effect of mobile phone on them. The pattern of usage of mobile phone among dental students showed alarming indication that students have been addicted to mobile phone which in turn affect their academic performance in a negative way. It would be useful to advise the students about the controlled as well as proper usage of mobile phone.<sup>5</sup>

## Materials and Method

**Research Design:** The research design used in this study is Non- Experimental descriptive survey design.

**Research Setting:** The study will be conducted in Sumandeep Nursing College, Piparia, Vadodara

**Samples:** 100 Students

**Criteria for Selection of Sample:**

**Inclusion Criteria:**

- Students who are studying in Sumandeep nursing college.
- Students who are willing to participate in the study.

- Students available during data collection.
- Students who are using smartphone

**Exclusion Criteria:**

- Students who are absent at the time of data collection.

**Description of Tools:**

This consists of two parts

**Section 1:** Consists of demographic variables such as Age, Gender, Year of study, Family Income, Occupation of parents, Duration of mobile usage

**Section 2:** NMP-Q consist of 20 statements.

Score	Nomophobia Level
NMP-Q Score = 20	Absent
21 ≤ NMP-Q Score ≤ 60	Mild
60 ≤ NMP-Q Score ≤ 100	Moderate
100 ≤ NMP-Q Score ≤ 140	Severe

**Data Collection Procedur:** Prior permission will be obtained from principal of sumandeeep nursing college and concerned will was taken from each respondent who will participate in this study. On the day one, the purpose of study was explained to the sample and informed consent was taken before starting the study. A test was conducted by administering standard NMP-Q to selected 100 nursing students.

**Analysis and Interpretation:** The process of organizing and synthesizing data to answer research questions and test hypothesis is known as analysis.

Data collected will be analysed by using descriptive and inferential statistics.

**Descriptive Statistics:** Frequency and percentage distribution is used to describe the demographic variables.

**Inferential Statistics:** Chi – square test will be used to associate the level of nomophobia with selected demographic variables.

**Findings:**

Section-1: Frequency and percentage distribution of socio demographic variables.

- According to age 6% nursing students were between 17-18 years, 26% nursing students were between 18-19 years, 37% nursing students were between 19-20

years and 31% nursing students were >20 years.

- According to gender 71% among them were female, and 29% were male
- According to course of study 50% had under graduate education, and 50% had diploma education
- According to family income 11% were having below 10,000Rs monthly income, 25%were having between 10,000-20,000 Rs, 32% were having between 20,000-30,000 and 32% were having >30,000 Rs.
- According to occupation of parents 33% had government job, 37% had private job, 23% had self employment and 7% had unemployed.
- According to how long they using smartphone 33% were using smartphone < 1 year, 14%were using smartphone 1 year or < 2 year, 15% were using smartphone 2 year or <3 year, 15% were using smartphone 3 year or < 4 year, 13% were using smartphone 4 year or < 5 year, and 10% were using smartphone 5 year or more.
- According to mobile data plan in their mobile phone 87% were having internet in their smartphone.
- According to 33% students were spend their time on smartphone per day for 1-2 hours, 24% students were spend their time on smartphone per day for 2-3 hours, 30% students were spend their time on smartphone per day for 3-4 hours, and 13% students were spend their time on smartphone per day for> 4 hours.
- According to 19% were check their smartphone every 5 minutes, 20% were check their smartphone every10 minutes, 20% were check their smartphone every 20 minutes, 10% were check their smartphone every 30 minutes, 17% were check their smartphone every hour, 8% were check their smartphone every 2 hours and 6% were check their smartphone every 3 hourly

Section 2: Association of nomophobia level with selected demographic variables

**Hypothesis:**

H<sub>1</sub>: There will be significant association between the levels of nomophobia with their selected demographic variables.

Data presented in research reveal that the calculated

the statistical findings shown to be statistically significant  $X^2_5$  value for occupation of parents is 15.207 at  $p < 0.05$  level and  $X^2_9$  value for how often do you think you usually check your smartphone is 33.794 at  $p < 0.05$  level. These findings show that there is significant association between the mean pre test NMP-Q score and its demographic variables.

The statistical findings shown to be stastically not significant  $X^2_1$  value for age is 9.075;  $X^2_2$  value for gender is 0.520;  $X^2_3$  value for course of study is 9.523;  $X^2_4$  value for family income is 9.636;  $X^2_6$  value for how long have you been using your smartphone is 13.245;  $X^2_7$  value for Do you have a mobile data plan allows you to access the internet through your Smartphone is 3.282;  $X^2_8$  value for Approximately how much time per day do you think you spend using smartphone is 6.014; at  $p < 0.05$  level. These findings show that there is no significant association between the mean pre test NMP-Q score and its demographic variables.

### Conclusion

The present study “Assessed the level of nomophobia among students at Sumandeep Nursing College, Vadodara with a view to develop an information booklet.” And found that the majority of students have moderate nomophobia.

According to level of nomophobia assessment 14% students suffers with severe nomophobia, 68% students suffers with moderate nomophobia, and only 18% students have mild nomophobia level.

### Recommendations:

- Similar study can be repeated on a large sample to generalize the findings.

- Comparative study can be done on students studying in school.

**Conflict of Interest:** There is no conflict of interest

**Sources of Funding:** Researchers used their own fund for their research

**Ethical Clearance:** Ethical clearance for this UG research project was obtained from the ethical commiittee SVIEC of Sumandeep Vidyapeeth deemed to be University.

# A Study on Drug Utilization in Hypertension in Medical Care Hospital

Jalpa Suthar<sup>1</sup>, Priyal Shah<sup>2</sup>, Krupali Patel<sup>2</sup>, Pankti Pathak<sup>2</sup>

<sup>1</sup>Assistant Professor, Department of Pharmacology, <sup>2</sup>B.Pharm Student, Ramanbhai Patel College of Pharmacy (RPCP), Charotar University of Science and Technology, Anand, Gujarat, India

## Abstract

Blood Pressure is the product of the cardiac output (CO) and Total Peripheral Resistance (TPR). Hypertension means elevation of arterial blood pressure. Anti-Hypertensive drugs are the agents which either decreases or normalize the elevated blood pressure.

**Objective:** To study the prescription pattern of anti- hypertensive agents in the General Medicine department of Private Medical Hospital, Ahmedabad, Gujarat.

**Methodology:** A cross sectional observational study was carried for one month duration.

**Results:** During study, 100 hypertensive cases were collected. Among which 55% were males and 45% were females who were prescribed with anti-hypertensive agents. From various anti- hypertensive drugs, six major classes were commonly prescribed to the patients. It includes Diuretics (Ds), Calcium Channel Blockers (CCBs), Angiotensin Receptor Blockers (ARBs), Beta Adrenergic Blockers (BABs), Alpha Adrenergic Blockers (AABs) and Angiotensin Converting Enzyme Inhibitors (ACEIs). ARBs were prescribed in 31 prescriptions whereas; AABs were given in 4 patients only.

**Conclusion:** Among beta blockers, Metoprolol was the most frequently utilized anti-hypertensive drug (31.48%) and Ramipril was the least utilized drug (1.36%). The telmisartan+amlodipine FDC was the common prescribed in patients with indication of CVS complications.

**Keywords:** Hypertension, anti- hypertensive drugs, Angiotensin Receptor Blockers, Telmisartan.

## Introduction

Hypertension represents the elevation of arterial blood pressure for longer duration of time. The World Health Organization (WHO) has projected that 1.5 billion people globally are likely to suffer from hypertension by 2025.<sup>1</sup> The overall prevalence of hypertension in India is estimated at 29%.<sup>2</sup> Cardiovascular diseases are responsible for 1.5 million mortality in India. Hypertension is linked to 57% of all stroke deaths and 24% of all coronary event deaths.<sup>3</sup> Hypertension is the single most important risk factor for cardiovascular, cerebrovascular, and renal disease that can be modified by timely detection as well as decisive therapeutic intervention.

Pharmacist with help of physician and other health

care teams take required steps to improve the drug therapy.<sup>4</sup> Due to the growing epidemic of hypertension regular evaluation of the antihypertensive prescribing patterns is required. Increase in number of new antihypertensive drugs and the increase in number of drug combinations that are introduced into the market with alteration in guidelines make the study of pattern of anti-hypertension prescription more important.<sup>5</sup> The standard treatment guidelines are updated from time to time, based on evidence deriving from basic and clinical research, and guide physicians to select the most appropriate antihypertensive agent in a patient.

Pharmacoepidemiological studies like drug utilization and prescription pattern studies are an important research tool by which the impacts of

guidelines have on the selection of therapeutic agents can be assessed and analyzed. It has been observed that evidence-based clinical research is not adequately incorporated into clinical practice,<sup>6</sup> which can in turn result in suboptimal patient health-care practices. The objective of this study is to observe the pattern of utilization of antihypertensive in a tertiary care teaching hospital.

### Method and Data Collection Procedure

This cross-sectional observational study was conducted in the Private Medical Hospital, Ahmedabad, Gujarat. Before initiation of the study, the approval of the Institutional Ethics Committee was obtained. A predesigned pretested Case Record Form (CRF) was employed to collect the data. The CRF contained information about basic demographic data, Comorbid conditions, and detail recording of the antihypertensive

drugs prescribed. Patients coming to the medicine outpatient department were screened over a 1-month period. All the prescriptions were screened and that had antihypertensive medications were noted along with the hospital number. Data were represented according to gender, age of the patients, type of anti-hypertensive prescribed.

### Results

A total 100 cases of patients with antihypertensive drugs were recorded and studied. Figure 1 represented demographic characteristics of patients to whom antihypertensive drugs were administered based on age and gender. Maximum number of antihypertensive was administered in the age group of 50-60 and 60-70 years (27% in each) and among 100 cases, males were 55% and females 45%.

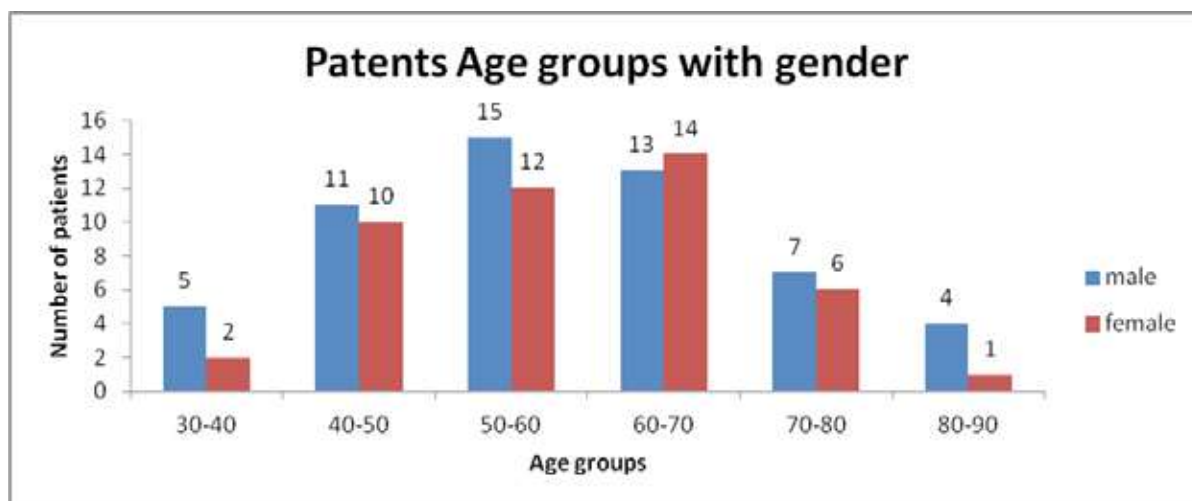

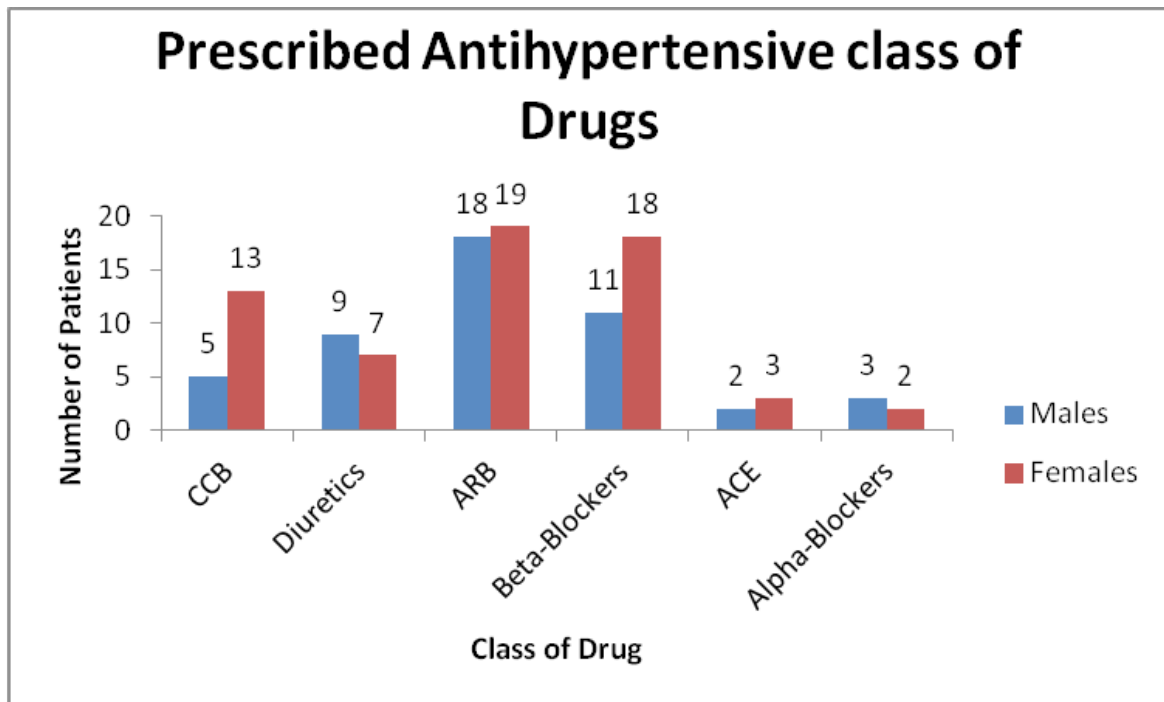

Figure 1: Distribution of Patient's gender according to Age

A classification of prescribed antihypertensive drugs among the gender is depicted in Table 1 Figure 2. Total 37 (68.8%) prescriptions were having Telmisartan as drug of choice and out of them 18 (37.5%) males and 19 (30.64%) females, followed by beta blockers (BBs) in 11 (22.91%) males and 18 (29.03%) females. The least prescribed drug was found to be a alpha blocker (9.47%).

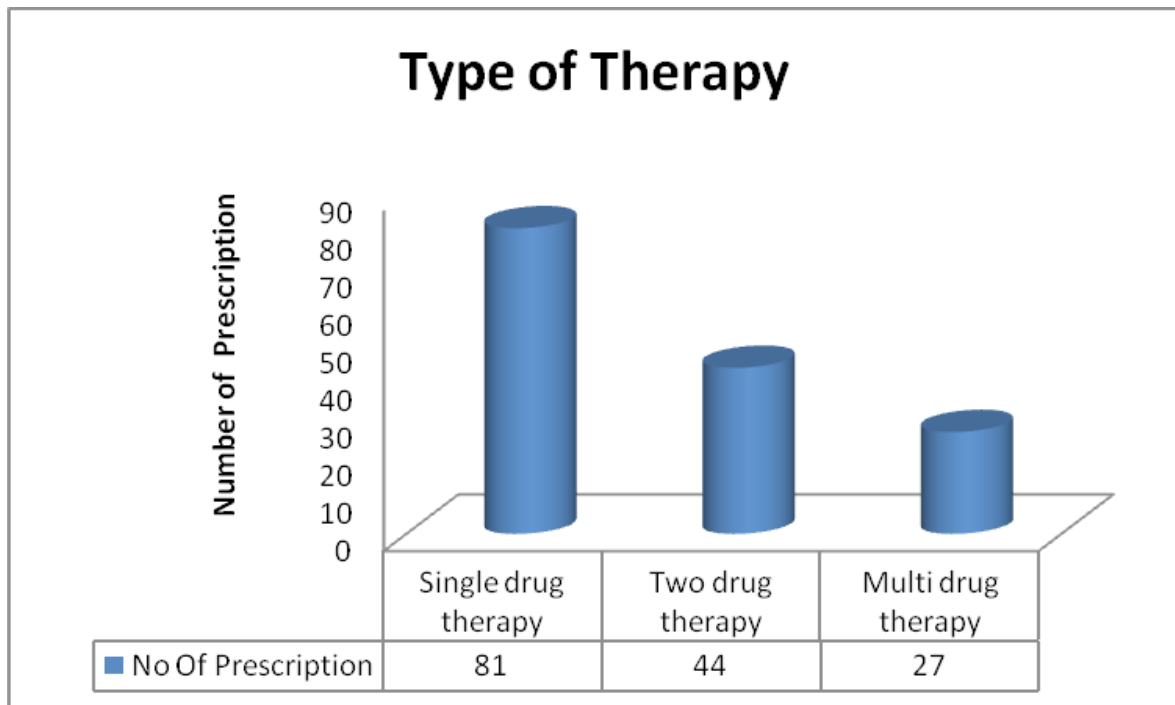

Table 1: Classification of Antihypertensive Drugs Prescribed

Classification	Males	Females	% Males	% Females
CCBs	5	13	10.41	20.96
Diuretics	9	7	18.75	11.29
ARBs	18	19	37.5	30.64
Beta-Blockers (BBs)	11	18	22.91	29.03
ACEs	2	3	4.16	4.83
Alpha-Blockers (ABs)	3	2	6.25	3.22

**Figure. 2: Classification of Antihypertensive Drugs Prescribed**

Figure 3 depicts the pattern of antihypertensive drug use on the basis of type of therapy. Combination therapy (46.7%) and monotherapy (53.28%) of antihypertensive were recorded in different group of patients.

**Figure 3: Type of Therapy**

The most frequently prescribed Fixed Dose Combinations (FDCs) was Telmisartan + Amlodipine (31.81%) followed by Telmisartan +Metoprolol (25%). The table 2 represents the pattern of FDCs antihypertensive therapies received by patients.

**Table 2: Pattern of Fixed Dose Combination among Hypertensive Patients**

Fixed Dose Combination drug	No. of Prescription	% Prescription
Two drug combination	44	
ARB+CCB	14	31.81
ARB+D	2	4.54
CCB+D	3	6.81
ACEI+CCB	3	6.81
ACE+BB	2	4.54
ARB+BB	11	25
ACEI+D	2	4.54
CCB+BB	7	15.91

The frequency of antihypertensive drug used in the medical care hospital is shown in Table 3 The most common prescribed antihypertensive drug was metoprolol and Telmesartan and the least prescribed was atenolol.

**Table 3: Frequency of Anti-hypertensive drugs prescribed**

Antihypertensive Drug	Male	Female	% Male	% Female
Furosemide	3	3	5.35	5.55
Amlodipine	9	10	16.07	18.52
Telmisartan	20	16	35.71	29.63
Metoprolol	20	17	35.71	31.48
Prazosin	1	4	1.78	7.41
Atenolol	0	1	0	1.85
Losartan	1	1	1.78	1.85
Ramipril	2	2	3.57	3.70

## Discussion

Drug utilization studies are an important Pharmacoepidemiological tools and which help in providing an in-depth insight into the disease profile of patients and prescribing behavior of clinicians. In this study, the frequency of hypertension was more in males (63.6%) than in females (36.3%). A relative male preponderance was also observed in other studies.<sup>7,8</sup> However, some studies have reported a relatively higher incidence of hypertension in females than in males.<sup>9,10</sup> The mean age of hypertensive patients was  $60 \pm 15.8$  years. A study done in Bengaluru,<sup>9</sup> in contrast to the findings of this study, observed that the mean age of the male patients was slightly less than that of female patients. In age analysis, the highest percentage of hypertensive patients was found between the age group of 50-70 years (54%). The least percentage of the patient was found between the age group of 30-40 (7%).

Monotherapy and combination therapies were prescribed to the patients as per their clinical need in

present study. ARBs have been found as most frequently prescribed class of antihypertensive as monotherapy and combination as well. The second highest prescribed antihypertensive drug group was BBs, which was a choice of drug in monotherapy and combination too. Recent research clearly demonstrated that treatment with ARBs is protective, reduces cardiovascular risk, and provides cerebral and renal protection beyond that achieved by blood pressure-lowering alone. Beta-blockers are very effective for the symptomatic treatment of patients with effort angina or arrhythmias.<sup>11</sup> Most evidence for the reduction of cardiovascular events by beta-blockers concerns acute coronary syndrome patients; especially in the presence of LV dysfunction.<sup>12</sup> The utilization of diuretics particularly that of the thiazides, was low (11.29%) as compared to all the other antihypertensive drug groups. Such underutilization of thiazides has been observed across many studies<sup>9,10</sup> despite being recommended as the first choice antihypertensive consequent to their ability to prevent major cardiovascular events<sup>13,14</sup> and low cost. The

relatively less frequent use of thiazides could be a result of concerns regarding adverse effects and poor market availability.<sup>15</sup>

Monotherapy was given in large number of patients (53.28%) as compared to combination therapies (46.28%). The least use of combination therapy could be due small patient populations observed during study. Moreover, Patients were diagnosed in early stage of Hypertension and without associated co-morbidities. Additionally, The study findings are not consistent with the JNC7 Report which states that most hypertensive patients with diabetes or renal disease will require two or more antihypertensive drugs to achieve the target blood pressure<sup>16,17</sup> of <130/85 mm Hg. In contrast to it, higher use of combination antihypertensive drug therapy in relation to monotherapy study done in Chandigarh<sup>10</sup> where approximately 46% patients received monotherapy and 54% patients received combination therapy. The findings are similar in studies done in India<sup>9,18</sup> and Ethiopia<sup>19</sup> where the use of monotherapy exceeded that of combination therapy. Variation in the frequency of patients having co morbidities observed in some of the other studies could be a reason for the predominant use of a single antihypertensive agent.

The average number of antihypertensive medicines prescribed is 1.9. the finding are similar with one study reported earlier.<sup>20</sup> The most frequently prescribed Fixed Dose Combinations (FDCs) was Telmisartan + Amlodipine (31.81%) followed by Telmisartan +Metoprolol (25%). Whereas, Metoprolol and Telmisartan were the most common prescribed antihypertensive drugs and the least prescribed was atenolol. This study represented high use of Angiotensin-II receptor blocking agents with few added benefits like better efficacy and blood pressure control in the patients. In addition, when FDCs were selected patient compliance will be enhanced and showed better blood pressure control. The British Hypertension Society Guidelines<sup>21</sup> recommends the use of ACE-I/ARBs or beta blockers in younger hypertensive (higher rennin levels) and CCBs or diuretics for elderly (lower renin levels). The findings are consistent with present study.

### Conclusion:

As it is a primitive study, although the use of antihypertensive in this hospital is relatively aligned with the recommended treatment guidelines. ARBs were the most common class of drugs recommended now a day

in clinical setting. ARBs are best in controlling blood pressure in compelling indications.

**Ethical Clearance:** Taken from Institutional Ethics committee for Human Research (IEC-HR) RPCP

**Source of Funding:** Nil

**Conflicts of Interest:** There are no any conflicts of interest.

# A Retrospective Study to Compute the Prevalence of Pneumonia and its Associated Risk Factors among Children in Selected Tertiary Care Hospital, Kelambakkam, Kancheepuram, Tamilnadu, India

Jegin P.<sup>1</sup>, Dinesh Kumar M. <sup>2</sup>, Dayana J.<sup>2</sup>, Elakiya E.<sup>2</sup>, Subbulakshmi S.<sup>3</sup>

<sup>1</sup>Student Researcher, <sup>2</sup>B.Sc. Nursing Students, <sup>3</sup>Professor, Chettinad College of Nursing, Chettinad Academy of Research & Education, Rajiv Gandhi Salai, Kelambakkam, Kancheepuram District, Tamilnadu, India

## Abstract

A Retrospective study to compute the prevalence and associated risk factors of pneumonia among children at selected tertiary care hospital, Kelambakkam, Kanchipuram district, Tamil Nadu. The objectives are to determine the prevalence of pneumonia among children, to find out the association between selected risk factors and the occurrence of pneumonia among children. The convenience sampling was used. Data collected from the medical records from January 2017 to December 2018. Totally 312 pediatric cases were admitted for respiratory infection among which 49 cases diagnosed with pneumonia. The data was collected by using structured selected risk factors tool. The study results shows that the prevalence of pneumonia was high in the age group of 7 – 12 years and it was highly noted among females. The occurrence of pneumonia was high in rural area. The study results revealed that the prevalence of pneumonia is high mainly in monsoon season and also shows that the prevalence is more among children not vaccinated with flu and PCV vaccine. The study also revealed that the prevalence of pneumonia among children (0 – 18 years) from January 2017 to December 2018 at selected tertiary care hospital, Kelambakkam, Kanchipuram, Tamilnadu, India was 16% and it also shows that there was a significant association between the selected risk factors such as age, gender, area of residence, season, immunization status and the occurrence of pneumonia at  $P < 0.05$  level.

**Keywords:** *Pneumonia, respiratory infection, prevalence, retrospective study, risk factors.*

## Introduction

Pneumonia is an infection that inflames the air sacs in one or each lungs. The air sacs may fill with fluid or pus (purulent material) inflicting cough with phlegm or pus, fever, chills, and issues respiration. A variety of organisms, together with bacterium, viruses and fungi, can cause pneumonia<sup>1</sup>.

Pneumonia will place seriousness from gentle to life threatening. It is most serious for infants and young children, people older than age, and people with health problems or weakened the immune systems.<sup>5</sup>

Pneumonia is associate in nursing inflammation or infection of the lungs. Some have considered any lower (sublaryngeal) respiratory tract infection to be pneumonia, including viral croup, bronchitis, and

bronchiolitis of viral etiology. This review, however, focuses on infections of the gas exchange units (terminal and metastasis bronchioles, alveoli, and interstitium) usually seen in medicine apply. Note that croup, bronchitis, and pneumonia can occur simultaneously.<sup>2</sup>

**Statement of the Problem:** “A retrospective study to compute the prevalence and the associated risk factors of pneumonia among children at selected tertiary care hospital, Kelambakkam, Kanchipuram district, Tamilnadu, India.”

## Objectives of the Study:

1. To determine the prevalence of pneumonia among children with respiratory infections.
2. To find out the association between selected risk

factors and the occurrence of pneumonia among children.

### Operational Definitions

**Compute:** To calculate the number of children diagnosed with Pneumonia in the age of 0 to 18 years during the period of January 2017 to December 2018.

**Prevalence:** Prevalence is associate in nursing applied mathematics idea concerning the amount of cases of a unwellness that was gift in an exceedingly specific population at a amount of January 2017 to December 2018.<sup>4</sup>

**Pneumonia:** Pneumonia is a form of acute respiratory infection that affects the lungs and it is the single largest infectious cause of death in children worldwide.<sup>3</sup>

**Selected Risk Factors:** In this present study the researcher included the selected available related risk factors in the medical records of children diagnosed with pneumonia such as age, gender, area of residence, immunization status, season.

**Children:** In this present study the researcher focused on children in the age of 0-18 years diagnosed with respiratory infection during the period of January 2017 to December 2018.

### Material and Method

**Research Approach:** Quantitative evaluatory approach was adopted in this study.

**Research Design:** Quantitative non-interventional descriptive retrospective design was used to conduct the study

**Research Setting:** Present study was conducted at Medical Record Department, in Chettinad Hospital and Research Institute, Kelambakkam, Kanchipuram district, Tamilnadu, India. Permission to pursue the Medical Record Department document for specified data was obtained from the Dean, CHRI.

**Sample and sample size:** Data on pneumonia and associated risk factors among children was collected for the period of 2 years (January 2017 to December 2018).

### Sampling Criteria:

**Inclusion Criteria:** The study includes data on pneumonia

1. From January 2017 to December 2018
2. Among children in the age group of 0-18 years

**Exclusion Criteria:** The study excludes data other than the children with respiratory tract infections.

**Data Collection Procedure:** Data collection is the gathering of information needed to address or face a research problem. The data collection was done for a period of 1week from 01.04.2019 to 07.04.2019 at 8.30 am to 4.00 pm in Medical Record Department. In Medical Record Department they provide all the case files which was diagnosis as Pneumonia from the month of January 2017 to December 2018 for all age group. And we have separate the case files from the age of 0-18 years which is needed for our study. The needed data was collected on all the days. Data confidentiality was maintained.

**Research Tool:** Part 1: Structured tool on selected risk factors of pneumonia.

**Analysis and Interpretation:** The study results shows that the prevalence of pneumonia was high in the age group of 7 – 12 years and it was highly noted among females. The occurrence of pneumonia was high in rural area. The study results revealed that the prevalence of pneumonia is high mainly in monsoon season and also shows that the prevalence is more among children not vaccinated with flu and PCV vaccine. The study also revealed that the prevalence of pneumonia among children (0 – 18 years) from January 2017 to December 2018 at selected tertiary care hospital, Kelambakkam, Kanchipuram, Tamilnadu, India was 16% and it also shows that there was a significant association between the selected risk factors such as age, gender, area of residence, season, immunization status and the occurrence of pneumonia at  $P < 0.05$  level.

### Conclusion

**Frequency and percentage Distribution of selected risk factors among children with respiratory infection:** The Study findings revealed that the frequency and percentage distribution of selected risk factors among children with respiratory infection that most of the children in the age groups of 0 – 6 years and majority of them were males. Majority of the children belongs to urban area and most of the children hospitalized in the month of winter season. Most of the children hospitalized were not vaccinated with flu and PCV vaccines.

**Frequency and percentage distribution of selected risk factors among children with Pneumonia:** The study findings shows that the prevalence of pneumonia was high among the children belongs to rural areas and not vaccinated with flu and PCV vaccine. The percentage of pneumonia was high in the age groups of 7 – 12 years among children. The percentage of pneumonia was high among female gender and the prevalence of pneumonia was high in the monsoon season.

**Estimation of prevalence of pneumonia among children with respiratory infections:** The study results shows that the total number of admitted pediatrics with respiratory infection from January 2017 to December 2018 were 312 and 49 cases were diagnosed with pneumonia. The prevalence of pneumonia in our study was 16%.

**Association between selected risk factors and the occurrence of pneumonia among children:** The study results revealed that there was significant association between the selected risk factors such as age groups, gender, area of residence, season and immunization status and the occurrence of pneumonia at  $P < 0.05$  level.

**Conflicts of Interest:** Nil

**Source of Funding:** Self funding and no external funding.

**Ethical Clearance:** Obtained clearance from institutional human ethical committee on 04.02.2019.

# A Comparative Study to Evaluate Early Postoperative Complications and Short-Term Quality of Life Assessment Between Stripping and Endovenous Laser Therapy in the Treatment of Chronic Venous Insufficiency Patients: A Study From North India

Jitendra Kumar Kushwaha<sup>1</sup>, Ankit Gupta<sup>2</sup>, Pranav Yadav<sup>2</sup>, Abhinav Arun Sonkar<sup>3</sup>

<sup>1</sup>Associate Professor, <sup>2</sup>Senior Resident, <sup>3</sup>Professor and Head, Department of General Surgery, King George's Medical University, Lucknow, India

## Abstract

**Introduction:** Most common cause of chronic venous insufficiency (CVI) is Great saphenous vein (GSV) followed by short saphenous vein (SSV) insufficiency. Various modalities for the treatment of CVI are Endovenous thermal (by laser or radiofrequency) ablation, Foam sclerotherapy and Ligation and stripping of GSV.

Endovenous thermal therapy is costly for the patients residing in the developing country. Herewith we have compared quality of life and early complications between ligation and stripping (L & S) of GSV and Endovenous laser therapy (EVLT).

**Method:** Patients of CVI were diagnosed clinically and radiologically by duplex doppler USG. Fifteen patients in group 1(L & S) and 22 patients in Group 2 (EVLT) were followed at the 6 weeks, 3 months and 6 months.

Early post procedural outcomes were documented at one week. Generic health was assessed by SF 36 tools and Specific health was assessed by Aberdeen varicose vein questionnaires (AVVQ) at baseline (preprocedural), at 6 weeks,3 months and at 6 months.

**Results:** Postoperative pain in group 1 and group 2 patients were in 20.0% and 04.5% patients respectively( $p>0.05$ ). Paresthesia was in 26.7% and 9.1% respectively ( $p >0.05$ ). Skin hyperpigmentation was 00.00% and 4.5% respectively ( $p 0.403$ ). In both groups, infection was found in 20.0% and 04.5% respectively ( $p 0.137$ ). Tract haematoma along GSV was in 13.3% and 0.00% respectively in both groups.

Physical function, role limitation due to physical problems and emotional problems, emotional well-being, social function, pain, general health at end of 6 weeks and at end of 6 months were slightly better in EVLT patients but was insignificant ( $p >0.05$ ). DVT and recurrence were absent in both groups.

**Conclusion:** Regarding treatment of CVI, Early post-operative complications, Short term General and disease specific QoL is slightly better in patients having EVLT than L & S, but is statistically insignificant.

**Keywords:** *Chronic venous insufficiency, ligation and stripping (L & S) of GSV, Endovenous laser therapy (EVLT), Quality of Life Assessment.*

### Introduction

Varicose vein refers to dilated, elongated and tortuous superficial vein of leg having reflux. Prevalence

varies from 01% to 73% in females and 2% to 56% in male. Most commonly it is caused by Great saphenous vein (GSV) insufficiency (60- & 70%) followed by short saphenous vein (SSV) insufficiency (10-15%) and it may be due to both (10-15%)<sup>1,2</sup>. Treatment modalities of chronic venous insufficiency (CVI) are Endovenous thermal (laser or radiofrequency) ablation, Foam sclerotherapy, saphenofemoral junction (SFJ) ligation and stripping (L & S) of GSV up to knee joint<sup>3-7</sup>.

Endovenous thermal therapy can be performed by Laser or radiofrequency. Various studies have shown that both are equally effective while few studies show that RFA causes less pain. Stripping of GSV causes slightly more paresthesia, pain, bruising, and tract hematoma. 1470 nm laser fiber is water specific and it shows better results as compared to 810 nm, which is hemoglobin specific<sup>8,9</sup>.

Herewith authors have evaluated early postoperative complications and short-term quality of life (QoL) between Ligation and stripping (L & S) and EVLT of GSV in patients having CVI.

## Material and Method

Patients admitted at King George's Medical University, Lucknow, for the treatment of CVI were enrolled and evaluated by duplex doppler USG in standing position.

This study was open Level, Parallel groups having two arms. Group 1 for L & S and Group 2 for EVLT. Duration of study was from October 2017 to July 2018 and patients were followed for 6 months.

Primary end points were to evaluate early post interventional complications at one week. Secondary end points were to evaluate Generic QoL by SF 36 items and disease specific QoL by Aberdeen varicose vein questionnaires in both groups.

Patients having primary Varicose vein, having age more than 15 years in any grade from C3 to C6 (CEAP classification) were included for this study. Patients having DVT or any other secondary varicose vein (Pregnancy, Pelvic mass) deranged coagulation profile, AV fistula, BMI  $\geq$ 40, or any patients not giving consent for the study were excluded.

If reflux time on duplex doppler in standing position at saphenofemoral junction (SFJ) and saphenopopliteal junction (SPJ) on Valsalva or calf muscle squeeze

was more than 500 msec and in perforating vein more than 350 msec, then these valves were considered incompetent.

Patients having SFJ incompetency were treated by L & S in group 1 and patients in Group 2 were treated by EVLT.

Patients having concurrent SPJ incompetency was treated by SPJ ligation and division of SSV and passing Foam sclerosant in SSV (1.5% Polidocanol). In both groups, varicosities of tributaries were treated by USG guided Foam sclerotherapy (1% polidocanol). Foam prepared by mixing 1% polidocanol with 4 times room air (Tessari technique) in Luer lock syringes, connected to triway stopcock.

Duplex doppler USG were performed in these patients at baseline, 6 weeks, 3 months and at 6 months. Pain, hyperpigmentation, hematoma, DVT, paresthesia and recurrence were documented on one week for primary end points.

Anatomical closure in group 1 was defined as total absence of GSV in the stripped part while in group 2 it was defined as total occlusion of ablated GSV.

Before treatment(baseline)parameters for QoL by SF 36 tool and AVVQ were noted. After treatment, patients were followed up at end of 6 weeks, 3 months and at end of 6 months and these parameters were documented (in the OPD or on the cell phones).

Generic health was assessed by 36 item Short Form Survey (SF 36) scoring instructions version 1.0.<sup>10</sup>. These were scored by RAND 36 Score calculator available online<sup>11</sup>.

Aberdeen varicose Vein questionnaires (AVVQ) contain 13 questions. AVVQ scores range from 0 to 100, with the manikin diagram contributing up to 22 points, depending on the extent of the varicose veins<sup>12,13</sup>. The total score for 13 questions ranges from 0 to 100, patients with 0 points indicates best quality of life<sup>14</sup>.

**Ligation and Stripping (Group 1):** This procedure was performed under spinal anesthesia. Under USG guidance SFJ site was marked and incision planned. All three tributaries along with GSV were ligated and divided at SFJ. Stripper was passed through this cut end of GSV and was taken out at knee level through a small incision. Lower end of stripper at knee was ligated along with GSV and stripper was pulled through groin incision.

GSV was stripped from groin to knee. Immediately elastic crepe bandage was applied.

**Endovenous Laser Therapy (Group 2):** EVLT was performed under spinal anesthesia. This was performed ultrasound guided with a 1470 nm diode laser on pulse mode by Biolitec machine. In brief, USG guided venous access was obtained by puncturing the vein at knee level by a 16 FrSeldinger needle. After entrance to varicose vein, J tip guide wire was passed fascial dilator with introducer sheath was introduced inside the GSV. Laser fiber was passed into GSV through introducer sheath up to 2 cm below to SFJ. Tumescant fluid (normal saline) was infiltrated in perivenous space deep to saphenous fascia (5 ml/cm). energy setting of 8W power and energy 60 j/cm on pulse mode. Fiber was pulled out 1 cm at every 10 seconds interval.

**Statistical Analysis:** Categorical variables were presented in numbers and continuous variables was presented as mean  $\pm$  SD. Quantitative variables was

compared using Unpaired t-test between two groups and paired t test was used to compare pre and post-operative values. Mann Whitney U test was applied to compare preop and post op variables in different time intervals. A p value of  $<0.05$  was considered statistically significant. The data was entered in MS EXCEL spreadsheet and analysis was done using Statistical Package for Social Sciences (SPSS) version 16.

## Results

Total 44 patients were enrolled in the study and were divided in two groups of 22 each. Out of these, 15 patients in group 1 and 22 patients in group 2 were completely followed up for 6 months.

In the study, we found Anatomical closure rate 100% in group 1(total absence of GSV in treated part) and 90.90% (20 patients) in group 2 at 6 months. No recurrence was found till 6 months in both groups.

**Table 1. Demography of Patients**

Attributes		Group 1(n=15)	Group 2(n=22)
Age (Mean)		37	38.00

6 Months	Group1	04.07	06.00	0.293
	Group2	02.24	04.43	

**Aberdeen Varicose vein scoring:** At 6 weeks, 3 months and 6 months Quality of life was better in Group 2 but was statistically insignificant

### Discussion

The wavelengths applied in EVLT treatment ranged from 810 to 1320 nm, and these were associated with recanalization in 5% of the patients in the first year<sup>15,16</sup>.

In a RCT by Dermody M, they found that there was a significantly higher rate of wound infection for L & Svs EVLT. The paresthesia rate was significantly lower with EVLT (3.8%) as compared with L & S (7.4%)<sup>17</sup>. In our study we found SSI in 20% in group 1 and 4.5% in group 2 while paresthesia was 26.7% in group1 and 9.1% in group 2.

In RCT by Jan et al, the difference in treatment failure at 2 years between EVLT (7 of 98) and HL/S (0 of 99) was insignificant<sup>18</sup>. In our study we found Anatomical closure rate 100% in group 1 (total absence of GSV in treated part) and 90.90% (20 patients) in group 2 at 6 months<sup>18</sup>.

In a study by Pan Y, Procedural failures were more common following EVLA than in conventional surgery at one- and two-year follow-up. However, fewer complications were observed in EVLA compared with HLS, including bleeding and hematoma (1.28% versus 4.83%), wound infection (0.33% versus 1.91%) and paresthesia (6.73% versus 11.27%)<sup>19</sup>.

In a meta-analysis, performed at 12 months postintervention, surgical ligation and vein stripping versus the other interventional procedures were equally effective approaches to treat GSV incompetence in terms of quality of life<sup>20</sup>.

Cryostripping is less traumatic, with lower rates of complications and recurrence, than conventional stripping<sup>21,22</sup>. Cryostripping is more cost effective than EVLT<sup>23</sup>. No difference in outcomes and postoperative complications in cryo stripping and EVLT groups<sup>24</sup>.

In a RCT by Rasmussen LH studied laser, radiofrequency, foam and stripping groups. Disease-specific quality-of-life and Short Form 36 (SF-36®) scores was improved in all groups by 1-year follow-up. In the SF-36 domains, bodily pain and physical functioning, the radiofrequency and foam groups were performed better in the short term than the others<sup>25</sup>.

### Conclusion

Early postoperative outcomes is slightly more in ligation and stripping of GSV for the treatment of CVI but is statistically insignificant. Short term generally (by SF 36) is slightly better in Patients of having EVLT but is statistically insignificant. Physical function is better in patients having laser therapy at 6 weeks. Disease specific QoL (by AVVQ) is better for laser therapy but is statistically insignificant. So, we concluded that both therapies are almost equally effective.

# Risk Assessment of Catheter Associated Urinary Tract Infection among Catheterised Patients at Selected Hospital at Mangaluru

Jomol Johny<sup>1</sup>, Joseymol Joy<sup>1</sup>, Jositta Reji<sup>1</sup>, Juby Kurian<sup>1</sup>, Keerthana K.R.<sup>1</sup>, Indumathi<sup>2</sup>

<sup>1</sup>IV<sup>th</sup> Year B.Sc. Nursing Students, <sup>2</sup>Lecturer, Department of Medical Surgical Nursing, Yenepoya Nursing College, Yenapoya, Deemed to be University, Mangaluru, Karnataka, India

## Abstract

**Objectives:** The objectives of the study is to assess the relation between the risk scores and the demographic variables and to assess the risk of occurrence of catheter associated urinary tract infection among catheterized patients.

**Method:** A descriptive study was conducted among 100 catheterized patients from selected hospitals at Mangaluru from October 2018 to January 2019. Probably simple random techniques was used in the study to select the sample. A standardized risk assessment tool was used to find out the risk rate of the patient.

**Result:** The result showed that 74%% of the patients is at medium risk for getting CAUTI. The study shows that there is an association between the risk score and demographic variable such as size of the catheter used and there is no significant association between the other demographic variables and the risk scores.

**Conclusion:** There is a medium risk for the catheterized patients for getting catheter associated urinary tract infection.

**Keywords:** *Catheterization, catheter associated urinary.*

## Introduction

Urinary Catheterization, a sterile procedure including the introduction of a tube into the urinary bladder through urethra to drain the bladder<sup>1</sup>. Urinary tract infections are the most common nosocomial infection accounting for up to 40% of infections reported by acute care hospitals<sup>2</sup>. Up to 70%-80% urinary tract infection are associated with the presence of an indwelling catheter. Recent studies shown that a urinary catheter is the most common indwelling device, about 17.5% of patients in 66 European hospitals and 23, 6% in US hospitals<sup>3</sup>. About 5 million urinary catheters are put annually in US. Between 12% to 25% of the patients will receive urinary catheters on their hospital stay, in this half are placed without indication<sup>4</sup>. About 40% of the physicians are unaware that their patients are having urinary catheter<sup>5</sup>. Urinary tract infections account for approximately 40% of all hospital. Acquired infections

annually and also accounting for about 23% of hospital acquired infection among adults ICU patients in US in the general care ward it usually tend to increase ranging from 4.7 infections per 1000 catheter days in adults step downs units to 16.8 infections in rehabilitation units<sup>4</sup>

Urinary tract infections are most common health care associated infections. The main cause is indwelling catheters, catheter care, host susceptibility, drainage system connected are main contributing factors for occurrence of urinary tract infections . This could be a major issue to be taken care by all health care professionals to prevent and control the infections up to the extent while caring the patients with indwelling catheters. If the urinary bladder empties completely while voiding there will be no chance for bacterial growth in the urinary tract<sup>6</sup>. Areas of catheterization also play a major role in contributing to urinary tract infections. This means catheterization done other than operation theatre

shows a high incidence rate of CAUTI. Daily catheter care is an important factor that can minimize the risk of infection in the patient with indwelling catheters. Aseptic technique can follow while caring with patients and after catheterization position of the catheter (thoroughly fixed to patient’s thighs), drainage bag (below the bladder level) is properly monitored. Personal hygiene is very necessary and important, especially regular personal hygiene is mandatory when the patient is on indwelling catheter. Patients should be taught and aware of the importance of personal hygiene<sup>7</sup>.

**Materials and Method**

The study was conducted at a selected hospital of Mangaluru and the hospital were selected based on the feasibility of conducting the study and the availability of the samples. The probability simple random technique was used for selection of the sample. The study samples were consisting of 100 catheterized patients. The a standardized risk assessment tool was used to assess the risk of CAUTI.

**Finding:**

**Section 1:** Assess the risk of occurrence of catheter associated urinary tract infection.

**Table: Frequency and percentage distribution of subject according to risk rate.**

Level of Risk	Frequency	Percentage
High	18	18%
Medium	74	74%
Low	8	8%

Table table 1: shows that maximum(74%) have medium risk, 18% have high risk and 8% have low risk.

**Section 2: association of the risk scores and the selected demographic variables.**

In order to find out association between risk scores and selected demographical variable, the following null hypothesis was stated

**H<sub>1</sub>:** There will be a significant association between risk scores of catheterized patients with their selected demographic variables

**Table 2: Association between risk scores and selected demographic variables. n=100**

Sl. No.	Variables	Rating			df	Chisquare	Inference

# Evaluation of Serum Level of RANTES among Vitiligo Patients before and After Treatment by Fractional Carbon Dioxide Laser

Hisham A. Shokeir<sup>1</sup>, Hanaa Emam<sup>2</sup>, Yasmin Abdel Latif<sup>3</sup>,  
Ola Omar Abou Zeid<sup>4</sup>, Mai Shoeib<sup>4</sup>, N.S. Hanafy<sup>4</sup>, Mohamed Mohsen Soliman<sup>1</sup>

<sup>1</sup>Professor, Dermatology Department, National Institute of Laser Enhanced Science, Cairo, Egypt, <sup>2</sup>Professor, Public Health and Preventive Medicine Department, National Research Centre, Cairo, Egypt, <sup>3</sup>Lecturer, Medical Biochemistry Department, National Research Centre, Cairo, Egypt, <sup>4</sup>Lecturer, Dermatology, Venereology and Andrology Department, National Research Centre, Cairo, Egypt

## Abstract

**Aim:** RANTES (Regulated upon Activation, Normal T cells Expressed and Secreted) is a CC chemokine that plays a critical role in activating and attracting a variety of cells. The present study aimed to evaluate the expression of RANTES among stable non segmental vitiligo patients before and after treatment by fractional CO<sub>2</sub> laser.

**Method:** The present study was a non-randomized, comparative, trial that included 30 adults' patients with stable non-segmental vitiligo and 15 age and gender-matched healthy volunteers as a control group. All eligible participants were exposed to sunlight twice daily for three months. In addition, patients with vitiligo received three sessions of fractional CO<sub>2</sub> (10600nm) laser therapy with one month apart between each session. Assessment of serum RANTES in all subjects was done using enzyme-linked immunosorbent assay (ELISA) technique

**Results:** The mean RANTES significantly decreased to reach  $980.483 \pm 1957.1$  ng/L in vitiligo patients three months after treatment ( $p < 0.001$ ). Similarly, the mean VAS score significantly decreased to reach  $12.7 \pm 8.2$ . There were statistically significant differences between patients group and control group in terms of RANTES ( $p < 0.001$ ); patients had significantly higher RANTES values than the control group before and after treatment.

**Conclusion:** In conclusion, the current study suggests a possible involvement of RANTES in the development of vitiligo lesions and it could be considered as a possible marker for screening of early disease.

**Keywords:** Vitiligo; Chemokines; Inflammatory markers; RANTES.

## Introduction

Vitiligo is a multifactorial, idiopathic, depigmentation disorder of the skin that is characterized by destructive loss of melanocytes. Recent epidemiological studies reported that the prevalence of vitiligo ranged from 0.1%–0.2% of the global population, with higher prevalence in Africa and female predominance<sup>1,2</sup>. The pathophysiology of vitiligo is still largely unknown. However, recent reports demonstrated that autoimmunity

represents the basic pathophysiological process of vitiligo which develops in response to different environmental and inflammatory triggers in genetically-susceptible individuals<sup>3,4</sup>. Such triggers can induce oxidative stress in melanocytes with subsequent cellular disruptions and upregulation of a number of cytokines and chemokines<sup>5,6</sup>. Consequently, this upregulation attracts inflammatory cells infiltration into the epidermal and follicular tissues which lead to the development of histopathological pattern of vitiligo<sup>7</sup>.

While the role of some cytokines as Interferon- $\gamma$  (IF- $\gamma$ ) in the pathogenesis of vitiligo is well-established<sup>8</sup>, the involvement of some other chemokines is still controversial. RANTES (Regulated upon Activation, Normal T cells Expressed and Secreted) is a CC chemokine that plays a critical role in activating and attracting a variety of cells including T $\square$ helper (Th1) 1 cell and Th2 $\square$ mediated responses<sup>9</sup>. Previous studies have shown a significant upregulation of RANTES in many inflammatory diseases including rheumatoid arthritis, asthma, atopy, and diabetic nephropathy<sup>10,11</sup>. Nevertheless, there is a scarcity in the published literature which assessed the role of RANTES in vitiligo pathogenesis.

Effective treatment is critical in order to optimize the physical and psychological outcomes of vitiligo patients. Narrowband ultraviolet B (NB-UVB) therapy is one of the established treatment of vitiligo which induce immunosuppression and melanocyte proliferation<sup>12</sup>. However, owing to adverse reaction of NB-UVB, sun exposure represents a convenient alternative, especially in sunny countries<sup>13</sup>. In addition, the CO<sub>2</sub> fractional laser has emerged as treatment option in vitiligo with fair re-pigmentation rates and patients' stratification when combined with NB-UVB<sup>14</sup>. It was reported that the CO<sub>2</sub> fractional laser acts in vitiligo by alternating the release of cytokines and inducing growth factors for melanocytes proliferation<sup>15</sup>. Thus, it is postulated that the combination of CO<sub>2</sub> fractional laser and sun exposure can be associated with significant downregulation of vitiligo-related chemokines such as RANTES.

The present study aimed to evaluate the expression of RANTES among stable non segmental vitiligo patients before and after treatment by fractional CO<sub>2</sub> laser in order to detect if it could be a possible indicator for the prognosis of treatment through an easy laboratory test.

## Materials and Method

**Study Design and Sampling:** The present study was a non-randomized, comparative, study that was conducted at dermatology outpatient clinic of National Research Centre and National Institute of Laser Enhanced Science of Cairo University from August 2017 till March 2019. Adults' patients were included if they had stable non-segmental vitiligo. All patients should have stable refractory lesions with no improvement to conventional treatments. We excluded pregnant or breastfeeding women, active infection, or other autoimmune diseases. In addition, age and gender-matched healthy volunteers were included as a control group.

A non-probability, consecutive, sampling technique was utilized to recruit eligible patients. The sample size calculation was done using Stats Direct statistical software version 2.7.2 for MS (Windows, StatsDirect Ltd., Cheshire, UK) and the effect size was obtained from Yang et al<sup>16</sup>. The study included 45 subjects who were divided into two groups: Laser group which included 30 patients with stable non segmental vitiligo and control group which included 15 healthy volunteers.

**Interventions:** Eligible participants were exposed to sunlight daily for three months. In addition, patients with vitiligo received three sessions of fractional CO<sub>2</sub> (10600nm) laser therapy with one month apart between each session. The sun exposure was applied to the affected area at the 5<sup>th</sup> day after each session and the non-affected area was protected by sunscreen.

**Data Collection:** The following data were collected from every participants: demographic characteristics, clinical types and/or patterns of vitiligo, Vitiligo Area Severity Index (VASI)<sup>17</sup>, and serum RANTES level.

**Detection of RANTES:** Before the application of study intervention, venous serum samples 3-5 cc were withdrawn from the anti-cubital fossa of each subject and were left to clot for 30 minutes at room temperature, then the samples were subjected to centrifugation for 10 minutes at 5000 rotation per minute (rpm). The supernatant serum was separated in ependorph tubes and stored at -80 $\square$ c till the time of analysis. Repeated freeze and thaw cycles were avoided. Assessment of serum RANTES in all subjects was done using enzyme-linked immunosorbent assay (ELISA) technique through a kit supplied by Glory Science Co., Ltd, Del Rio, TX 78840, USA. This step was done in the Medical Biochemistry

department in the National Research Center. By the end of third month, the serum RANTES level was measured again.

**Statistical Analysis:** Data analysis was carried out using SPSS (Statistical Package for the Social Science; SPSS Inc., Chicago, IL, USA) version 22 for Microsoft Windows. Quantitative data were described in terms of mean±standard deviation (±SD), while qualitative data were expressed as frequencies (number of cases) and relative frequencies (percentages). Comparison of numerical variables between the study groups was done using Mann Whitney U test for independent samples. Correlation between various variables was done using Spearman rank correlation equation. A probability value (p-value) less than 0.05 was considered statistically significant.

### Results

In the present study, 30 patients with vitiligo and 15 age and sex-matched controls were included. The mean age of the patients was 33.3 ±14.3 years and the majority of patients were females (60%). Almost 33% of the patients had positive family history. There were

no statistically significant differences between patients group and control group in terms of age (p =0.75) and gender (p =0.81). In contrary, there was statistically significant difference between patients group and control group in terms of family history (p <0.001). Patients with vitiligo were more likely to have positive family history. The face was the most common site of initial lesion. At study’s enrollment, the mean VASI score of the patients was 23.03 ±12.7 and the mean RANTES score was 1223.4 ±588.6 ng/L.

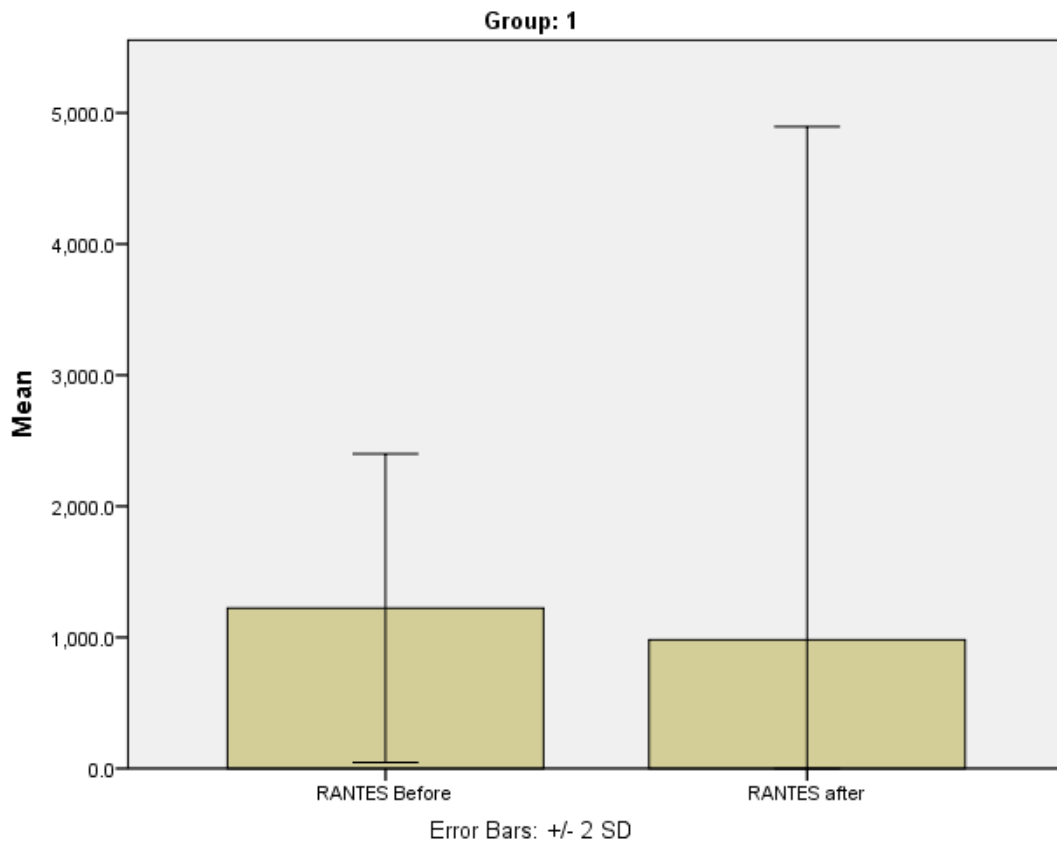

With regard to the change in study’s outcomes after treatment, the mean RANTES significantly decreased to reach 980.483 ± 1957.1 ng/L in vitiligo patients three months after treatment (p <0.001) (**Figure 1**). Similarly, the mean VASI score significantly decreased to reach 12.7 ±8.2 (p <0.001) (**Figure 2**). Notably, there was no significant change in RANTES level in control group after exposure to sunlight. There were statistically significant differences between patients group and control group in terms of RANTES (p <0.001); patients had significantly higher RANTES values than the control group before and after treatment (**Table 1**).

**Table 1: The changes in RANTES values**

Variables	Patients (N = 30)	Control (N =15)	P-value
<b>RANTES values before in ng/L</b>			
- Mean ±SD	1223.4 ±588.6	197.1 ±111.6	<0.001
- Median (Range)	1224.8 (893–1466.43)	173.8 (80.6 – 214.6)	
<b>RANTES values after in ng/L</b>			
- Mean ±SD	980.483 ±1957.1 585.9 (498.9 – 782.4)	191.6 ±76.8 190.1 (98.1 – 294)	<0.001
- Median (Range)			

\*Data are presented as mean ±SD, median (Range), or number (%).

**Figure 1: The change in RANTES levels after treatment in Vitiligo Patients**

**Figure 2: The change in VASI after treatment in Vitiligo Patients**

## Discussion

The present comparative study demonstrated that patients with non-segmental, stable, vitiligo had statistically significant higher level of serum RANTES than healthy controls. In addition, the fractional CO<sub>2</sub> laser, in combination with sun exposure, was effective in reducing the serum RANTES level 3 months after treatment; while sun exposure alone was not associated with significant reduction in serum RANTES level in control group. On the other hand, there were no significant correlations between serum level of RANTES and age of patients, duration of the disease, gender, family history, or disease severity.

Though the exact pathogenesis of vitiligo is still unclear, the oxidative stress and the infiltration of inflammatory mediators have been well-established as major contributors for the progressive, autoimmune-mediated, destruction of melanocytes seen in vitiligo<sup>18</sup>. Recently, upregulation of RANTES, a potent chemotactic agent of Th1 cell, has been proposed as a significant consequence to the oxidative stress which lead to the characteristic infiltration of inflammatory cells seen in vitiligo. In the present study, the serum level of RANTES was significantly higher in patients with vitiligo compared to normal population. In concordance with our findings, Rezk and colleagues<sup>19</sup> reported significant elevation of RANTES level in cultured vitiligo melanocytes and skin samples of early vitiligo. Another case-control study reported that the serum RANTES level was significantly elevated in active vitiligo patients compared to stable patients and healthy controls<sup>20</sup>. Another interesting report by Rashighi and colleagues<sup>21</sup> reported that both human vitiligo patients and a mouse model of vitiligo expressed high levels of RANTES that were correlated with disease activity. Such findings highlight the important role of chemokines signals in stimulating the migration of melanocyte-specific CD8<sup>+</sup> T cells to the skin, with subsequent infiltration and destruction of melanocytes<sup>22,23</sup>.

In the setting of wound healing, it was found that fractional CO<sub>2</sub> laser enhanced fibroblast functions and suppress pro-inflammatory cytokines such as IL-1<sup>24-26</sup>. In the present study, we found that the fractional CO<sub>2</sub> laser, in combination with sun exposure, was effective in reducing the serum RANTES level 3 months after treatment.

Notably, our results showed that RANTES level was not significantly associated with duration of disease

activity or severity. Similar to our findings, a previous prospective study on 85 patients reported that serum RANTES level did not correlate with the extent of the lesions, though it correlated significantly with disease activity<sup>27</sup>.

## Conclusion

In conclusion, the current study suggests a possible involvement of RANTES in the development of vitiligo lesions and it could be considered as a possible marker for screening of early disease. On the other hand, the fractional CO<sub>2</sub> laser, in combination with sun exposure, is an effective treatment strategy in reducing the inflammatory process in vitiligo, as demonstrated by the significant decrease in the serum RANTES level 3 months after treatment. RANTES is considered as a possible early indicator for assessment of the successfulness of the treatment. Nevertheless, larger studies are still needed to confirm our findings and to investigate the role of RANTES in disease severity.

# Effectiveness of Myotherapy on Stress among Patients Subjected to Major Orthopaedic Surgery at a Tertiary Care Hospital, South India

K. Sathiya<sup>1</sup>, Vijayasamudeeswari<sup>1</sup>, Mohan kumar<sup>2</sup>

<sup>1</sup>Lecturer, Faculty of Nursing, <sup>2</sup>Professor and Senior Consultant in Orthopaedics, Sri Ramachandra Institute of Higher Education and Research (DU), Chennai, India

## Abstract

**Introduction:** The stress response to surgery, critical illness, trauma, and burns encompasses derangements of metabolic and physiological processes which induce perturbations in the inflammatory, acute phase, hormonal, and genomic responses. The surgery-induced stress response is largely similar to that triggered by traumatic injuries, the duration of the stress response, however, varies according to the severity of injury.

**Objectives:** The objectives of the study were to determine the effectiveness of myotherapy on stress and associate the selected background variables with stress.

**Method:** The research design adopted for the study was randomized controlled trial. The study was conducted among 250 samples, 125 in the study and 125 in control group to evaluate the effectiveness of myotherapy on stress among patients subjected to major orthopedic surgeries. The mean age of the study participants were male and female equally distributed. Data were collected and analyzed using descriptive and inferential statistics.

**Findings:** Independent t 't' test revealed that mean difference score was observed in stress at p=0.001 level. Post stress in the study group was significantly associated within previous history of hospitalization at the level of p<001.

**Conclusion:** The study result reveals that the orthopaedic surgical patients suffering with severe stress, economically burdened and functional disability for long time. Myotherapy is one of the complementary medicine which has a great impact on the human body and this study suggested that the practice of myotherapy can decrease the stress

**Keywords:** Stress, Myotherapy, post operative, surgery.

## Introduction

The incidence of stress among individuals submitted to major surgery is relevant<sup>1</sup>. The surgical patients have

a high probability of presenting one of the four phases of stress. Recognizing the stress phase that affects the patient permits the medical team to act in a more appropriate manner and to propose interventions that will prevent worsening of the disease and an unsuccessful outcome of surgery<sup>13</sup>. The physical and psychic components involved in the stress, evoke physical and psychological responses in humans and make them to restore their homeostasis after a physical or psychical threads. The physiological component involves various symptoms, mouth dryness, arterial hypertension, and cardiovascular and digestive disturbances. In addition to these symptoms, stress involves increased insomnia,

diarrhea, tachycardia, changes in appetite, muscle tension and tooth grinding, among other manifestations. The psychological component involves emotional states such as anxiety and fear (Straub 2005). And also added states of irritability, impatience, depression, anguish, anger, and apathy<sup>2</sup>. Other authors consider laughing, smoking and expressing oneself in a pessimistic manner as manifestations of behavioural stress<sup>3</sup>. An observational cross sectional study was carried out to identify stress and factors associated with stress during hospitalization by an in depth interview using pretested structured proforma on patients admitted the medicine, OBG, Surgery and Orthopaedic wards and rated on 11 point scale. Total of 700 patients participated, out of which, 510 (72.9%) were under stress due to hospitalization. Females (76.5%) and patients from urban (77.6%) area were in more stress. Fear of losing body part or function, stress of undergoing operation and not knowing the outcome of treatment were found to be major factors for stress<sup>14</sup>. Nurses caring for patients during the post-operative period find it challenging to their stress. Therefore, there is a need for nurses to have scientifically tested, simple and effective interventions to manage stress. A steady, emerging body of evidence suggests that myotherapy is vital to the healing process of patients undergoing general surgery. However, very little is known about their effectiveness in orthopaedic

surgery patients. So, the researcher has chosen the study to propagate this intervention on a wide spread in all health care settings. This intervention is feasible and also can be done easily at any setting. All these above mentioned issues prompted the investigator to undertake The objective of this study was to evaluate the effectiveness of myotherapy on stress among patients subjected to major orthopaedic surgery.

**Materials and Method**

**Ethical Issues:** Ethical clearance was obtained from the Institute Ethics Committee (Human studies). Permission was obtained from the orthopedics department to carry out the study. Written consent was obtained from the patients.

**Study Design and Setting:** The experimental research design adopted was Randomized controlled trial. The 250 samples were selected based on the selection criteria. The investigator used randomization to have a control over the individual and extraneous variables and to secure good comparable groups. Block randomization was adopted using 5 blocks with 50 patients in each block. The patients were randomly assigned to the study and control groups based on the lottery method. The procedure was explained to them and written consent was obtained from them.

**Table 1. Schematic representation of the Research design**

Group	Pretest	Intervention	Post test	
	1 <sup>st</sup> Post- operative day	1 <sup>st</sup> to 5 <sup>th</sup> Post-operative day	12 <sup>th</sup> post- operative day	30 <sup>th</sup> post- operative day
Study	*O <sub>1</sub> ♣	*X @	* ¨	* ♣
Control	*O <sub>1</sub>	*	*	* ♣ ¨

**Key:** R - Block Randomization of patients with major orthopedic surgeries to the study and the control group., O1 - Pretest assessment of back ground variables, \* - Routine care including medications, X - Intervention - A series of steps performed by investigator over the predefined pressure points on the patient’s foot and hands by applying direct pressure using the palm daily for five days. This is to stimulate the spinal points in order to reduce pain, stress and to improve the ADL., @ - Demonstration of myotherapy to the patients caregiver, Δ - Return demonstration by the patients’ caregiver, ¨ - Issuing of myotherapy manual to the study group on 5<sup>th</sup> POD with performance checklist diaries attached at the end of the booklet and control group on 30<sup>th</sup> POD

**Setting:** The study was conducted at orthopedic ward of Sri Ramachandra Hospital ‘G’ Block (SRH). SRH ‘G’ block is a 1175 bedded multispecialty hospital. An average of 100- 150 patients was admitted with various orthopedic problems. on average 5-15 patients were posted every day. The sample consisted of major orthopedic surgical patients who fulfilled the sampling criteria during the study period.

**Sample Size Calculation:** Sample size was calculated based on power analysis and effect size ( $\alpha = 5\%$  and  $1-\beta = 80\%$ ). The sample size estimated was 110 patients for each group with a total of 220, to achieve 80% power at a 5% level of significance. Considering the chance of attrition, an increase of 15% was done and the obtained value was rounded to 250. A total of 125 for the study group and 125 for the control group.

**Sampling Criteria:** Block Randomization technique was adopted using five blocks with 50 samples in each block. Each block had 25 samples in the study group and 25 samples in the control group. The investigator identified the samples from the operation theatre secretary desk of department of orthopedic and assessed the samples for the eligibility criterions. The investigator randomized the samples that 125 samples were allotted to the study group and 125 samples to the control group. The following patients were included in the study Male and female in the age group of 21- 60 years, patients who received either general/spinal/epidural anesthesia, who underwent surgery like open reduction internal fixation (femur, tibia, fibula), total knee replacement and total hip replacement, who completed 24 hours after surgery with irrespective of receiving analgesics and antibiotics during post-operative period and patients' caregivers who is willing to perform myotherapy for patients' and available during data collection period. The Demographic variables of the patients were age, gender, educational status, occupation, monthly income, marital status, type of family and residency, The Clinical variables of the patients were co morbid illnesses, edema, previous history of hospitalization, previous history of surgery and caregivers support and Surgical variables of the patients were type of surgery type of anesthesia. The Perceived Stress Scale (PSS) was used to measure stress. The questions in this scale ask about your feelings and thoughts during the last month. First, reversed the scores for questions 4, 5, 7, & 8. On these 4 questions, changed the scores like this: 0 = 4, 1 = 3, 2 = 2, 3 = 1, 4 = 0. Individual scores on the PSS can range from 0 to 40 with higher scores indicating higher perceived stress. The Scoring and interpretation as follows: 0-13 - low stress, 14-26 - Moderate stress and 27-40 - High stress.

**Intervention and data collection procedure:** Independent variable myotherapy was used as an intervention for the patients in the study group who were subjected to major orthopedic surgeries. Myotherapy is series of steps of procedures performed by the investigator such as head spin, ankle slide, rotation massage, foot

side twist, planter pressure, sole massage, dorsal press, groove press, top of foot crease side and closing over the predefined pressure points on the patient's foot(12 steps) and Finger massage, Finger stretch, Finger squeeze, Wrist massage both side and Wrist shake on hands (5 steps in each hand) by applying direct pressure in the palm during hospital stay, there after by the care giver who observed the demonstration This is to stimulate the spinal points in order to reduce stress. The intervention intended to reduce the stress..

**Findings:** All 250 sample each in intervention and control group were almost equally distributed in age, gender, education, income, type of family, marital status, residency, co morbid condition, edema, type of surgery, type of anesthesia, caregiver's support, previous history of surgery and previous history of hospitalization categories . During pretest 97 (77.6%) in the study group and 100(80.0%) in the control group had high stress and 28 (22.4%) in the study group and 25(20.0%) in the control group had moderate stress. None of them had low stress. It was not statistically significant [table 2]. During post test 99 (79.2%) in the study group and 19 (15.2%) in the control group had low stress, 23 (18.4%) in the study group and 94(75.2%) in the control group had moderate stress and 3(2.4%) in the study group and 12(9.6%) in the control group had high stress. It was statistically significant at  $p < 0.001$  level There was a statistically significant mean difference found between the pretest and posttest in the study group at  $p < .001$  level [table 3]. During pre and posttest the mean score of stress in the study group was 34.82 and 4.08 with SD of 9.68 and 7.29. The MD score was 30.73 .It was significant at  $p < .001$  level [table 4]. The mean difference score of stress was 30.73 in the study group and the mean difference score was 19.01 in the control group. It shows that there was a statistically significant difference at  $p < .001$  level [table 5]. There was an association between age groups, type of surgery and marital status and level of stress among patients with major orthopedic surgery in the study group.

**Table 2: Comparison of level of stress among patients in the study group and the control group during pre test (N=250)**

Level of stress	Study group (n=125)		Control group (n=125)	
	No	%	No	%
Low stress	-	-	-	-
Moderate stress	28	22.4	25	20.0
High stress	97	77.6	100	80.0
X <sup>2</sup> & p value	0.215 & .642			

**Table 3: Comparison of level of stress among patients in the study and control group during post assessment (N=242)**

Level of stress	Study group (123)		Control group (120)	
	No	%	No	%
Low stress	97	78.8	19	15.8
Moderate stress	23	18.6	89	74.1
High stress	3	2.4	12	10
X <sup>2</sup> & p value	96.719 .000***			

\*\*\* p<.001

**Table 4: Comparison of pre and post mean score of stress among patients in the study group (n=125)**

Duration of study	Mean	SD	Mean difference	Paired t Value & p Value
Pretest	34.82	9.68	30.73	28.77
Posttest	4.08	7.29		.000***

\*\*\* p<.001

**Table 5: Comparison of mean difference score of stress among patients between the study group and the control groups (N=242)**

Level of stress	Study group	Control group	Independent 't' value and p value
	MD	MD	
Pre and post test	30.73	19.01	9.20 .000***

\*\*\* p<.001

The mean difference score of stress was 30.73 in the study group and the mean difference score was 19.01 in the control group. It shows that there was a statistically significant difference at p<.001 level.

These study findings were closely consistent with the study conducted by Albert Moraska, Robin A. Pollini, Karen Boulanger, Marissa Z. Brooks, and Lesley Teitlebaum collected a comprehensive review on massage therapy for stress reduction.. On-line databases were searched for articles relevant to both massage therapy and stress. A total of 25 studies met all inclusion criteria. A majority of studies employed a 20–30 min massage administered twice-weekly over 5 weeks with evaluations conducted pre-post an individual session (single treatment) or following a series of sessions (multiple treatments). Single treatment reductions in salivary cortisol and heart rate were consistently noted<sup>11</sup>. The stress is occurs in different stages among surgical patients. In the first, the alarm phase, the central nervous system is stimulated and there is catecholamine release from the hypothalamus, which may cause arterial

hypertension and tachycardia. In the second stage, the body is mobilized to prepare itself for the fight-or-flight response.<sup>4</sup> Coping is the process by which an individual administers the internal and external demands perceived as stressful and the emotions they generate<sup>6</sup>. The greater difficulty is to compare theoretical studies. The articles point out that there are internal and external sources of stress with physical, emotional, behavioral and hormonal components that contribute to the occurrence of stress during the perioperative period<sup>7</sup>.

.Many literature reports regarding psychosomatic medicine, especially studies of psycho neuro immunology indicate that strong fear and stress before an operation are associated with difficulties in recovery. A long period of hospitalization, enhances perioperative complications, high rates of re-hospitalization, and mortality, especially due to infections<sup>5</sup>. There are physical and psychic components of stress which act for the defense of the organism, while at the same time causing a deterioration of its condition<sup>1</sup>. The effectiveness of a relaxation massage therapy programme in reducing stress, anxiety

and aggression on a young adult psychiatric inpatient unit. The result showed that there was a significant reduction in self-reported anxiety ( $p < 0.001$ ), resting heart rate ( $p < 0.05$ ) and cortisol levels ( $p < 0.05$ ) immediately following the initial and final massage therapy sessions. Significant improvements in hostility ( $p = 0.007$ ) and depression scores ( $p < 0.001$ ) on the SCL-90-R were observed in both treatment groups<sup>9</sup>.

### Conclusion

The study result reveals that the orthopedic surgical patients suffering with severe pain, stress, economically burdened and functional disability for long time. Myotherapy is one of the complementary medicine which has a great impact on the human body and this study suggested that the practice of myotherapy can decrease the stress and can improve the quality of life. The myotherapy is to be considered a noninvasive, cost effective intervention, positively influencing therapy and contributing to the reduction of stress and improvement of quality of life in patients following orthopedic surgery.

## Abstract

**Background:** Hypertension is primary care in medical world which is a lifestyle disorder linked with an increased risk of cardio vascular diseases, it is crosslinked to anxiety, depression, state of confusion and stress. They act as cofactor for sympathetic dominance. We conducted a study to analyse Heart rate variability in Hypertensive subjects and assessed impact of Cranial Electrical Stimulation on them. Heart Rate variability (HRV) is a powerful tool which is a clinical biomarker and non -invasive helps to detect the neuro cardiac function.

**Objectives:** To assess the statistical indices of time domain parameters of heart rate variability in hypertensive individuals.

**Design:** Pre-post experimental design.

**Methodology:** Forty subjects of pre hypertension and grade 1 hypertensive subjects with SBP(120-159mm of Hg) and DBP(80-99mm of Hg) with age group of 40-60 years were recruited by convenient sampling, they were randomly allocated in two groups Group A (control) and Group B (Experimental). We used Alpha Stim Aid from EPII (Miner wells, Texas U.S.A), stimulation to the experimental group for 20 minutes for 7 weeks (5 days per week). Heart rate variability of both the groups was measured using sophisticated tool based on MATLAB software (KUBIOS 2.1), pre and post intervention analysis done.

**Results:** Statistically significant differences were found in Group B comparison with Group A, like Mean RR, STD RR, MeanHR, RMSSD, NN50, pNN50, SBP, DBP with p value ( $p < 0.001$ ), ( $p < 0.001$ ), ( $p < 0.001$ ), ( $p < 0.075$ ), ( $p < 0.002$ ), ( $p < 0.0012$ ), ( $p < 0.001$ ), ( $p < 0.001$ ) respectively. Heart Rate variability was significantly higher in Hypertensive subjects of Group B comparison with Group A after receiving Cranial Electrical stimulation.

**Conclusion:** It was concluded from this study that experimental group treated with cranial electrical stimulation had significant increase in their heart rate variability, which defines the dominance of parasympathetic control and sympatho-vagal balance.

**Keyword:** Cranial Electrical Stimulation, Autonomic Nervous system, Heart rate variability, Hypertension.

## Introduction

Cranial electrical stimulation (CES) is the application of low-level, pulsed electrical currents (usually not

exceeding one mill ampere), and applied to the head for medical and/or psychological purposes. It is primarily used to treat state (situational) and trait (chronic) anxiety,

depression, insomnia, stress related and drug addiction disorders. Cranial electrical stimulation is a simple treatment that can easily be administered at any time<sup>(1-3)</sup>. Cranial electrical stimulation is an alternate current stimulation applied through ear clip electrodes creates rhythmic oscillations in cortex of the brain by producing cortical noise in the ongoing brain wave oscillations<sup>(4)</sup>.

In our study purpose is to investigate the cross-sectional association between cranial electrical stimulation, and pre hypertensive and grade-1 hypertension subjects measuring beat to beat variation of heart through heart rate variability. Cranial electrical stimulation (CES) is a non-invasive therapeutic device that applies pulsed, alternating micro current (<1000  $\mu$ A) transcutaneous to the head via electrodes placed on the earlobes, mastoid processes, zygomatic arches, or the maxilla-occipital junction<sup>(1)</sup>. Cranial electrical stimulation helps in enhancing alpha activity (increasing relaxation), and reduction of beta and delta activities (decreasing fatigue and ruminative thoughts) by cortical deactivation of brain which are similar changes those produced by anti-anxiolytics, proved in a study through functional magnetic resonance imaging<sup>(5-6)</sup>. In our study CES has decreased blood pressure in case of pre hypertensive individuals (systolic BP 130-139 and diastolic BP 80-89) and grade 1 hypertensive individuals (Systolic BP 140-159 and Diastolic BP 90-99) according to WHO guidelines. As stress, anxiety, depression, and insomnia are primary co factors for blood pressure. Hypertension is a result of dysregulation in the autonomic nervous system

Traditionally, heart rate (HR) has been considered a product of emotional response or stress, but it is becoming apparent that the interval between beats is a marker of the capacity to regulate internal and external demands. The intervals are not constant, but differ from beat to beat: essentially a higher HRV indicates better general health<sup>(7)</sup>. All the parameters of HRV decrease with the age increases, especially of parasympathetic cardiac activity due to aging<sup>(8)</sup>. Conversely, there is developing confirmation that unfavourable psychosocial factors might also be connected with a fall in HRV and different measures of irregularity in sympatho vagal<sup>(9)</sup>.

There are two approaches to measuring HRV: Time domain and frequency domain measures. In time domain, the standard deviation of NN intervals (SDNN) represents the general measurements of the nervous system<sup>(10)</sup> and the root mean square of successive

differences (RMSSD) reflects the parasympathetic activity of the nervous system. Geometric time-domain method are obtained through the conversion of the NN intervals data into geometric forms like histograms or the HRV triangular index (RRTri) and Triangular interpolation of RR intervals (TINN) that is a valuable estimate of overall HRV<sup>(11-12)</sup>.

## Methodology

**Materials and Method:** Forty subjects were recruited in the study including Males and Females between age group 40 years to 60 years suffering hypertension SBP (120-159mm/Hg) and DBP (80-99mm/Hg) were divided into two groups, Group A (Control N=20) and Group B (Experimental N=20).

Cranial Electrical Stimulation [ALPHA STIM AID from Electro Medical Products 4 international Inc.] was given to Group B for 21 days (5 days per Week) with duration of 20 minutes per day and Heart Rate variability [PHYSIO PACK, KUBIOS, MATLAB SOFTWARE], short term heart rate variability was measured by recording 5 minutes ECG of each subject.

HRV was assessed as per protocol. After HAP screening a set of instruction (i.e. to remain nil orally 2 hours prior to test) was conveyed to the selected subjects. HRV was assessed with certain requisites such as removing any metal objects (including jewelry), being silent and relaxed with close eyes lying Supine with palms facing upwards, without any physical movements.

### HRV examination

#### Overall Process:

- A written consent was taken from all participants in the study.
- All the Parameters of the group were collected between 9:00am to 5:00 pm at room temperature (20-22°C).
- Subjects were told to report 15 minutes before screening.
- They were asked to have light breakfast at least two hour before and allowed to have relaxed for half an hour before the HRV test.
- The study was conducted at Amity University, Noida.
- Subjects were recruited from the faculties and students from the campus

**Inclusion Criteria:** 40-60 years pre hypertensive and grade -1 hypertensive subjects including both male and females were recruited for the study. Subjects having normal BMI and not on anti -hypertensive medications were recruited for the study (18-24kg/m<sup>2</sup>).

**Exclusion Criteria:** Individuals unwilling to participate and presenting any feature of systemic disorder were excluded from the study. Subject on any medication were excluded from the study. Pregnant females were excluded from the study. Subjects with any kind of cardiovascular, respiratory, neurological or musculoskeletal disorder were excluded from the study

**Study Design:** Pre and post experimental study.

**Experimental Design:** Out of 60 screened volunteers, 40 were found free from any systemic and sleep disorders. On the basis of HAP (Health assessment proforma) the subjects with Pre-hypertensive group (SBP- 120-139 mm/Hg) and (DBP- 80-89 mm/Hg) and Grade 1 Hypertensive group (SBP- 140-159 mm/Hg) and (DBP- 90-99 mm/Hg) not taking any anti-hypertensive medication were included and categorised into two groups i.e. Group A (Control group) hypertensive group treated with placebo effect of cranial electrical stimulation, and Group B (Experimental group) Hypertensive group treated with cranial electrical stimulation.

Cranial Electrical stimulation (ALPHA STIM AID) was given to Group B for 21 days (5 days per week) and duration 20 mins per day. Heart rate variability was measured by Physio Pack (Kubios 2.1)

**HRV Procedure:** HRV was assessed as per the HRV protocol. After HAP screening a set of instruction (i.e. to remain nil orally 2 hours prior to test) was conveyed to the selected subjects.

**Analysis of HRV Data:** The first 5 min. resting (supine) phase ECG data was analyzed. The analysis of the data is done by using a sophisticated tool, Kubios HRV software package. The variability of heart beat intervals can be easily measured by using Kubios HRV.

**Statistical Analysis:** Categorical variables were presented in number and percentage (%) and continuous variables were presented as mean  $\pm$  SD and median. Normality of data was tested by Kolmogorov-Smirnov test. If the normality was rejected then non parametric test was used.

**Statistical tests were applied as follows:** Quantitative variables were compared using Independent t test/Mann-Whitney Test (when the data sets were not normally distributed) between the two groups. Paired t test/Wilcoxon signed rank test was used to compare pre and post.

A p value of <0.05 was considered statistically significant.

The data was entered in MS EXCEL spreadsheet and analysis was done using Statistical Package for Social Sciences (SPSS) version 21.0.

## Results

A total of 60 individuals were screened, but 40 healthy subjects were screened according to the Health assessment proforma (HAP). Participants were categorized randomly according to their blood pressure (pre hypertension and grade 1 hypertension) into two groups out of which autonomic activity of 40 subjects was assessed with baseline Heart Rate Variability as (pre intervention) and after 7 weeks heart rate variability (Post intervention) was for further analysis.

**Table 1. Comparison of Time Domain Parameters and Blood pressure between Group A [control] and Group B [Experimental] before treatment with Cranial electrical stimulation [Pre intervention comparison]**

Factors	Group A (Control)	Group B (Experimental)	p Value
Mean RR (ms)	769.88 ± 93.58	762.14 ± 78.14	NS
STD RR (ms)	63.05 ± 40.72	63.92 ± 32.25	NS

### Discussion and Conclusion

Dysregulation of the autonomic nervous system has been implicated in the development of hypertension. We found altered Heart rate variability in both groups before intervention. But in experimental group after applying Cranial electrical stimulation for 7 weeks (5 days per week) time domain parameters increased significantly. Cranial electrical stimulation through ear clip method stimulate subcortical areas of brain like reticular activating system, thalamus, and hypothalamus, Medulla, hence it helped in reducing blood pressure in experimental group with a significant difference. Cranial electrical stimulation produces cortical noise in ongoing brain wave oscillations producing rhythmic oscillations in the cortex of the brain as it is alternating current stimulation. Hence it was concluded from this study that experimental group treated with cranial electrical stimulation, the hypertensive individuals had significant effect on heart rate variability. In time domain parameters there were significant increase in which defines the dominance of parasympathetic control with increase of overall HRV, there was improved sympatho vagal balance.

Time domain indices like Mean RR, STDHR, SDNN, RMSSD, pNN50 showed significant increase in experimental group in comparison to control group. In Blood Pressure there were significant reductions of both systolic and diastolic blood pressure of experimental group in comparison to control group. The mean

RR interval is an indicator of the ratio of the cardiac sympathetic to parasympathetic tones (sympatho-vagal balance). The higher mean RR interval denotes a lower overall resting heart rate. This suggests a tilt of the overall cardiac sympatho-vagal balance of the experimental group towards the parasympathetic side as compared to control group<sup>(13)</sup>. The STDHR, an indicator of overall HRV, was significantly increased in the individuals treated with cranial electrical stimulation in experimental group.

Changes in the pNN50 and RMSSD are both reported in the literature to reflect parasympathetic modulation<sup>(14)</sup>. This result suggests that the parasympathetic activity also increased significantly in the experimental group.

**Conflicts of Interest:** Nil.

**Source of Funding:** Self.

**Ethical Clearance:** Taken from IEC of Amity University, Noida.

## Abstract

**Background:** Although the strengthening of hip posterolateral complex (HPC) strengthening is largely used in physiotherapy practice for treating patients with hip and knee injuries, there is still a lack of proof regarding patients with chronic low back pain (CLBP). The efficacy of the HPC strengthening as an additional intervention to conventional treatment in a well-designed trial with statistic power needs to be tested.

**Method:** An experimental trial with a sample size of 30 CLBP subjects, divided into two groups, 15 in each group was used. Group A- received HC musculature strengthening along with Conventional Physiotherapy Program and Group-B received Conventional Physiotherapy Program only. All the participants underwent a pre- treatment assessment at the start (0 week) and post-treatment assessment at the end of 2 weeks and 4 weeks using the NPRS and HC muscle strength measurement.

**Results:** The present study showed that both the treatment group attained statistically meaningful improvement in Pain (NPRS), and Strength.

**Conclusion:** HC musculature strengthening exercises can be used as an adjunct in reducing pain, minimizing disability and improving the strength of HPC muscles in subjects with CLBP.

**Keywords:** *Chronic low back pain, conventional back exercises, Hip posterolateral complex musculature strengthening exercises, Oswestry disability index, Hand-held dynamometer.*

## Introduction

Chronic low back is categorized as pain arising from lower margin of the rib cage to the lower glutei fold, with or sans referral into the lower extremity.<sup>1</sup> It may be criterion to a specific etiology where directing the underlying pathology can adequately cope with the pain. Non-specific LBP, where there is no known

dismemberment, is much more common representing as much as 85% of the population of people with low back pain.<sup>3</sup> Most of acute episodes of non-specific low back pain resolve instinctively without any significant intervention.<sup>4</sup> When episodes of non-specific LBP do not resolve they often progress to chronic non-specific low back pain. Very often, the pain is “non specific”, meaning related to a mechanical origin. The main factors inducing the pain to become chronic are individual factors, psychological factors or socio-professional factors.<sup>2</sup> The clinical entity of chronic non-specific low back pain is a tremendous burden, accounting for most of the expenses related to low back pain care. Low back pain is the fifth most common reason to visit a physician and the second most common reason for lost productivity in the workplace.<sup>8</sup> A biomechanical approach that has been described is that a weakness

of the hip abductors, extensors, and lateral rotators musculature (hip posterolateral complex HPC) would lead to undue contralateral pelvic drop during weight-bearing activities such as walking, running, climbing up or downstairs, generating an overloading the lumbar area. Although the strengthening of the HPC is largely used in physiotherapy practice for treating patients with hip and knee injuries, there is still a lack of proof regarding patients with LBP. Therefore, the question remains to be tested i.e. the efficacy of the HPC strengthening as an additional intervention to conventional treatment in a well-designed trial with adequate statistical power<sup>12</sup>. Most clinical practice guidelines prescribe exercise for the management of CLBP<sup>15</sup>. One of the major challenges for researchers in the field of LBP is to provide proof regarding the treatment, which provides the most benefit for subgroups of patients with low back pain<sup>16</sup>. Biomechanically, the hip extensors and abductors play a major role in all ambulatory activities, stabilizing the trunk and hip and helping to transfer force from the lower extremities to the pelvis<sup>17,18</sup>. The gluteus maximus plays a key role in stabilizing the pelvis during trunk rotation or when the center of gravity is grossly shifted, while the hamstrings play a more significant role during activities such as running or jumping<sup>17,18</sup>. The gluteus medius/minimus are the major stabilizers of the pelvis during single limb stance<sup>19</sup>. Activation of these hip abductors prevents the Trendelenburg sign whereby the pelvis contralateral to the weight-bearing extremity tilts downward during the stance phase of gait. The hip musculature thus plays a major role in transferring forces from the lower extremity up towards the spine during upright activities. Poor endurance and the delayed firing of the gluteus maximus and gluteus medius muscles have earlier been noted in persons with CLBP<sup>20,21,22,23</sup>.

So, this study was designed to determine the efficacy of re-training exercises on hip complex in on reducing pain, improving the strength of HC musculature and reducing disability thus improving functionality in patients with CLBP.

## Materials and Method

### Inclusion Criteria:

1. Both males and females of age group within 30-50 years;
2. Numerical pain rating scores from 3 to 6;
3. Consistent daily LBP for a minimum of 12 weeks
4. Location of pain is below the costal margin and

above the gluteal folds with or without leg pain

### Exclusion Criteria:

1. History of major trauma, persistent night pain, bladder or bowel dysfunction, and/or lower extremity neurological deficit
2. Previous surgery to the lumbar spine, abdomen, pelvis, or hip
3. Use of any radiological interventions or injections in the past 3 months
4. Any contra indication for exercise therapy (e.g. uncontrolled hypertension, previous myocardial infarction, cardiovascular disease, peripheral vascular disease, respiratory disorders)
5. Patients unable to perform isometric contraction and hold it for 30 seconds while testing
6. Any pain originated because of SI pathology
7. Menstruation during testing days and
8. Individuals incapable of understanding and answering the questionnaire

Ethical approval from Central Ethics Committee on Human Research (C.E.C.H.R) C.E.C.H.R/D.M.I.M.S/12/2010 was obtained.

### Procedure:

**Ethical Approval:** Ethical approval for this study, with protocol number Clearance from Central Ethics Committee on Human Research (C.E.C.H.R) C.E.C.H.R/D.M.I.M.S/12/2010 was obtained was obtained from the Health Research and Ethics Committee of University of Iowa Spine Center Physical Therapy Clinic. The nature and purpose of the study was explained to each subjects and informed consent was obtained

Experimental group performed active resistance exercises for the hip joint using elastic bands (Theraband, USA). The band colors were selected based on subjects' ability. For hip joint flexion, extension, abduction, and adduction, the subjects were instructed to fix the band on the ankle in the standing position, the starting position and to perform active exercises throughout the entire range of motion for each task. For internal rotation and external rotation, the subjects were instructed to fix the band on the ankle in an upright sitting position on a fixed chair, the start position, and to perform active exercises throughout the entire range of motion for each task. Verbal encouragement via the physiotherapist saying

the word push repeatedly in a loud voice was provided during the muscle contraction. Patients performed 2 maximal contractions for each tested motion.

The subjects maintained 10 seconds of contraction in of each exercise, before returning to the initial position and resting for three seconds. They repeated each exercise four times per set for four sets, with 30 second rest periods between each set. As subjects' ability to perform the exercises improved, load was increased accordingly. In control group received hot fomentation over glutei region for 15 mins under supervision along with hip extension, static glutei, back extension exercise. All these exercise were administered to the patient with verbal cues. The subjects maintained 10 seconds of contraction in of each exercise, before returning to the initial position and resting for three seconds. They repeated each exercise four times per set for four sets, with 30 second rest periods between each set. As subjects' ability to perform the exercises improved, load was increased accordingly.

**Statistical Analyses:** Initial evaluation was done

and patients was assessed at two weeks, six weeks and twelve weeks by the same investigator. In each visit measurement of pain intensity and disability level was performed by Visual Analogue scale (VAS). Post intervention result was compared with baseline result. Data were processed manually and analyzed with the help of SPSS (Statistical package for social sciences) Version 19.0. Quantitative data were expressed as mean and standard deviation and comparison were done by student "t" test.

## Results

Results In group-A, the maximum patients were in 30-50 years (52.3%) of age group, 35% of the patients of age 41-55 years, 10% of the patients of age 51-62 years, and 6.57% of the patients of 61-70 years were all allocated to group A. On the other hand, in Group-B, the 16 patients were in 30-40 years of age group (46.67%), 08 were of patients of age between 41-50 years, 05 were patients of age between 51-60 years and 3 patients were of age between 61-70 years were allocated to Group-B (Table 1).

**Table 1: Age group distribution of the study group**

Age Group	Group-A n(%)	Group-B n(%)	Total
30-50 yrs	16(53.3)	14(46.67)	30
41-55 yrs	09(30.0)	08(26.67)	17
51-62yrs	03(10.0)	05(16.67)	08
61-70 yrs	02(6.67)	03(10.0)	05
Total	30(100)	30(100)	60

**Table 2: Mean Visual Analogue Scale Score pretreatment and 2 weeks, 6 weeks and 12 weeks follow up**

Visual Analogue Scale	Group A	Group B	P Value
Base line score	8.10(±1.62)	7.30(±1.78)	1.00ns
Score at 2 weeks	6.29(±1.29)	6.58(±1.13)	0.42ns
Score at 6 weeks	3.50(±1.13)	3.00(±1.43)	0.19ns
Score at 12 weeks	0.20(±0.40)	1.10(±0.71)	<0.001 S

Regarding improvement after treatment, it was found that in pre treatment mean Visual Analogue Scale Score was 8.10 (±1.62) were in group A and 7.30 (±1.78) were in group B ( $p > 0.05$ ), after 2 weeks follow up 6.29 (±1.29) were in group A and 6.58 (±1.13) were in group B, ( $P > 0.05$ ) which was not significant and after 6 weeks

follow up 3.50 (±1.13) were in group A and 3.00 (±1.43) were in group B ( $p > 0.05$ ) that was not statistically significant. But after 12 weeks follow up the score was 0.20 (±0.40) in group A and 1.10 (±0.71) was in Group B ( $p < 0.05$ ) that was statistically significant (Table 2)

## Discussion

The improvement in the patients in the present study may be explained by the effect of therapeutic exercise. Exercise is one of the most important rehabilitation modalities<sup>9,10</sup>. In this study, patients who continued with exercises had better improvement in disability and pain scores<sup>9</sup>. Exercise may have a significant role in clinical improvement<sup>9</sup>. McKenzie suggested extension exercises and Hansen et al.<sup>10</sup> applied a method based on principles used in body building which involve intensive dynamic hyper-extension back exercises. These exercises were reported to be beneficial in the treatment of patients with chronic low back pain. The improvement of this study in both groups may also be explained by physical therapy consisting of local superficial heat and thermal ultrasound effects, a proposed mechanism of alleviating pain. But most of the previous studies indicated temporary efficacy of these modalities.<sup>11,12</sup> The mean pain score was not statistically lower at follow-up, while the disability scores reduced, indicating improvement on disability but no statistically Significant improvement seen. In this study, patients reported feeling better as a result of therapeutic exercise, but they still experienced recurrence of pain. The HC musculature strengthening exercise group showed more improvement in HC strength compared to the conventional physiotherapy group. But when considering pain reduction the study results showed that both treatment groups attained a significant reduction in pain not only statistically but also with the clinically significant important difference of NPRS.<sup>13</sup> The hip musculature thus plays a significant role in transferring forces from the lower extremity up towards the spine during upright activities. Poor endurance and delayed the firing of the hip extensor (gluteus maximus) and abductor (gluteus medius) muscles have previously been noted in individuals with CLBP.<sup>13,14</sup> Jeong et al.<sup>14</sup> showed that lumbar segmental stabilization exercise plus exercise to strengthen the muscles of the gluteus lead to a greater reduction in LBP disability index and increase in lumbar muscle strength and increased balance ability.

The present study has few limitations. Such as non-blinded clinicians, lack of long term outcomes data, relatively small sample size and data collection not by an independent observer. A power analysis was calculated based on a pilot data of eight participants. A large sample size with more diverse population would allow greater generalization of results to clinical practice.

**Ethical Clearance:** IT has been obtained by datta meghe ethical committee, dmims, sawangi meghe wardha.

# Assessment of the Prevalence of Febrile Seizure and Associated Factors among Children: A Retrospective Study

L. Jisha<sup>1</sup>, P. Jayaprabha<sup>1</sup>, S. Gnanawel<sup>1</sup>, K. Gowtham Kumar<sup>1</sup>, P. Kogila<sup>2</sup>

<sup>1</sup>B.Sc. (Nursing) IIIrd Year Students, <sup>2</sup>M.Sc. (Nursing), Associate Professor, Child Health Nursing, Department, Chettinad College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kancheepuram District, Tamilnadu

## Abstract

A study to assess the prevalence of febrile seizure and associated factors among children admitted in tertiary care hospital. Seizure is the most common neurological finding in children as 10% of kids experience such clinical condition sometime during their life. Febrile seizure is the most common seizure disorder in children. It occurs in 2-4 percent of children at least once before five years of age. The signs and symptoms dependent on the areas involved and ranging from varying degrees of motor, sensory, and sensorimotor changes and altered consciousness. Prevalence of febrile seizure in children is approximately 3%-4% and usually develops in children of 9 months to 5 years old following an increase in body temperature higher than 39°C without evidence of acute electrolyte imbalances and Central Nervous System infection or history of febrile seizure. The objectives are to assess the prevalence and types of febrile seizure among children, to find out the relationship between febrile seizure and selected associative factors. Data related to febrile seizure and associated factors among children was obtained from the Medical Records at Medical Record Department on Febrile seizure from January 2018 to December 2018. An extensive review of literature and guidance by experts formed the foundation to the development of the study. The data collection tool was validated and reliability was established. The data collection for the study was done. Collected data was tabulated and analyzed. Data on Febrile seizure and associated factors among children was collected for the period of 1 year (January 2018 to December 2018). A sample of 33 febrile seizure who fulfilled the inclusion criteria were selected for the study and age of 0-2 years - 17 (52%), 2-4 years - 07 (21%), 4-6 years- 09 (27%).

**Keywords:** Febrile seizure, Prevalence, Associated factors, Children (0-6 years).

## Introduction

Seizure is the most common neurological finding in children as 10% of kids experience such clinical condition sometime during their life. Febrile seizure is the most common disorder in children. It occurs in 2-4 percent of children at least once before five years

of age<sup>1</sup>. The signs and symptoms dependent on the areas involved and ranging from varying degrees of motor, sensory, and sensorimotor changes and altered consciousness. Prevalence of febrile seizure in children was approximately 3%-4% and usually develops in children of 9 months to 5 years old. . It is characterized by loss of consciousness, involuntary movements of limbs on both sides of the body. In most cases it occurs during the first day of fever. The febrile seizure observed as simple and complex febrile seizure<sup>2</sup>.

Febrile convulsions are the most common seizure disorders in childhood and generally have excellent prognosis. The febrile seizures is defined as a seizure during fever, between 6months to 6 years of age in absence of intracranial infection or previous unprovoked

e-mail: jittujisha98@gmail.com

seizure<sup>10</sup>. Another definition from the International League Against Epilepsy (ILAE) is a seizure occurring in childhood after one month of age upto 6 years, associated with a febrile illness not caused by an infection of the Central Nervous System(CNS), without previous neonatal seizures or a previous unprovoked seizures, and about 5% have symptomatic seizures<sup>3</sup>. In United States between 2% and 5% of children have febrile seizure by their 5<sup>th</sup> birthday. A similar rate of febrile seizure is found in western Europe<sup>4</sup>. The incidence else where in the world varies between 5% and 10% for India, 8.8% for Japan, 14% for Guam, .35% for Hongkong, and 0.5-1.5% for China. Variation in prevalence relates to differences in case definitions, ascertainment method, geographical variation and cultural factors. Males have a slightly higher incidence of febrile seizures<sup>5</sup>.

According to AAP(American Academy of Pediatrics) the definition of febrile seizure includes a child who has febrile illness or certainly fever, is neurologically healthy between 6 months and 5 years of age; whose seizure is brief (<15 minutes), generalized and occurs only once (Simple febrile seizure) or more times(Complex febrile seizure) within 24 hours during fever<sup>6</sup>.

**Statement of the Problem:** A study to assess the prevalence of febrile seizure and associated factors among children admitted in tertiary care hospital, Kelambakkam, Kancheepuram district, Tamilnadu, India.

### Objectives of the Study:

1. To assess the prevalence and types of febrile seizure among children.
2. To find out the relationship between febrile seizure and selected associative factors.

### Operational Definitions:

**Febrile Seizure:** A febrile seizure also known as a fever fit or febrile convulsion is defined as a convulsion associated with a significant rise in body temperature<sup>7</sup>.

**Children:** Febrile seizures are occurring in children less than 6 years associated with fever without other underlying causes such as Central Nervous System (CNS) infection or electrolyte imbalance<sup>8</sup>.

**Associated Factors:** Associated factors is an expression used for describing a perfect compatibility. Electrolytes and hemoglobin are the associated factors

which are involved in the febrile seizure. Fever can worsen the effects of iron deficiency anemia on the brain and therefore cause convulsion. Acute or severe electrolyte imbalances can manifest with rapidly progressive neurological symptoms of seizure<sup>9</sup>.

## Materials and Method

**Research Approach:** Quantitative evaluatory approach was adopted in this study.

**Research Design:** Quantitative non-interventional descriptive retrospective design was used to conduct the study.

**Research Setting:** Present study was conducted at Medical Record Department, in Chettinad Hospital and Research Institute, Kelambakkam, Kanchipuram district, Tamilnadu, India. Permission to pursue the Medical Record Department document for specified data was obtained from the Dean, CHRI.

**Population:** Data related to febrile seizure and associated factors among children was obtained from the Medical Records at Medical Record Department on Febrile seizure from January 2018 to December 2018.

**Sampling Size:** Data on Febrile seizure and associated factors among children was collected for the period of 1 year (January 2018 to December 2018).

**Sampling Technique:** Purposive sampling technique was adopted for this study.

### Sampling Criteria:

#### A. Inclusion Criteria:

The study includes medical records data on

- Febrile seizure and associated factors from January 2018 to December 2018
- Children with 0-6 years
- Both male and female

#### B. Exclusion Criteria:

The study excludes data on other than the

- Non febrile Seizure

Selection and Development of the Study Instrument

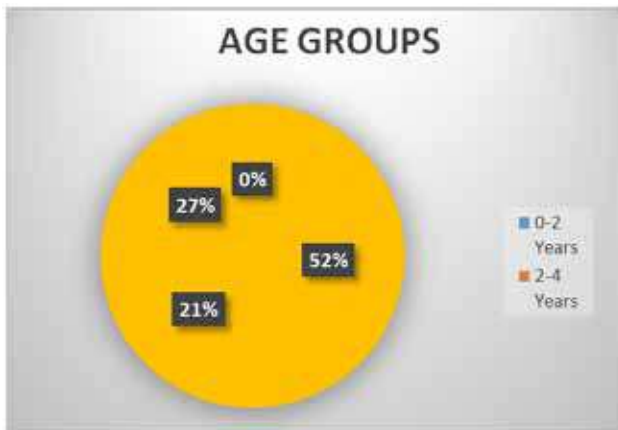

### Tool Description:

**Part 1:** Determine the Age, Gender, Season, Past history of febrile seizure, Area of residence.

**Part 2:** Determine the types of febrile seizure, causes of fever, prevalence and associated factors of electrolytes and hemoglobin in febrile seizure among children.

**Data Collection Procedure:** Data collection is the gathering of information needed to address or face a research problem. The data collection was done for a period of 1week from 01.04.2019 to 07.04.2019 at 8.30 am to 4.00 pm in Medical Record Department. In Medical Record Department they provide all the case files which was diagnosis as febrile seizure from the month of January 2018 to December 2018 for all age group. And we have separate the case files from the age of 0-6 years which is needed for our study. The needed data was collected on all the days. Data confidentiality was maintained.

**Findings:** The demographic variables shows that the febrile seizure is mainly occurring in children with the age group of 0-2 years(52%) in male children (64%) during summer season (36%) with no past history of febrile seizure (73%) and it is mainly occurring in children staying in urban area (88%). In types of seizure and types of febrile seizure the prevalence is more in partial seizure (45%) and simple febrile seizure (94%) among children. This shows that their is association between the febrile seizure and the selected variables were the level of haemoglobin is associated with gender and the past history of febrile seizure and the level of RBC is associated with gender. The percentage of associated factors also shows the same result as demographic variables.

**Figure 1: Frequency distribution of age groups who affected with febrile seizure.**

## Conclusion

We have conducted a research topic on A study to assess the prevalence of febrile seizure and associated factors among children admitted in tertiary care hospital, Kelambakkam, Kancheepuram district, Tamilnadu, India. The quantitative non- interventional descriptive retrospective design was used to conduct the study on data obtained on febrile seizure from January 2018 to December 2018. 33 samples were collected.

**Conflict of Interest:** Nil

**Source of Funding:** Self

**Ethical Clearance:** Chettinad Academy of Research and Education, Institutional Human Ethics Committee on 04.02.2019.

# Effectiveness Practice-intervention Based Project on Knowledge, Attitude and Practice Compliance to Infection Control Measures and Factors Predicting Non-compliance among Nurses Working in Tertiary Care Hospital, Mangalore, India

Larissa Martha Sams<sup>1</sup>, Shalini Lidwin Fernandes<sup>2</sup>, Diana Lobo<sup>3</sup>, Amitha P. Marla<sup>4</sup>

<sup>1</sup>Principal & Professor, <sup>2</sup>Asst. Professor, <sup>3</sup>Professor, Laxmi Memorial College of Nursing, <sup>4</sup>MD, HA. Director, Medical Administration, A.J.Hospital and Research Center, Kuntikana, Mangalore, India

## Abstract

**Introduction:** Safety practice adherence by the nurses is the important aspect in patient care health facilities. Their knowledge, attitude for and compliance with infection control practice is the primary target in any healthcare system. The present study planned to survey the knowledge, attitude and compliance (KAP) in infection control practice among the nursing staff and to evaluate the effect of practice -intervention based project where besides direct training programme, one to one by infection control trained staff to other nurse could be speculated.

**Method:** This was an experimental study with pre-test post-test design that included 2 groups of nurses (30 – group I(core); 50 –group II(trainee)) working in a tertiary care hospital. Structured knowledge questionnaires were designed to assess various aspects of knowledge; Likert scale to measure attitude and infection control compliance in pre and post training tests. **Results:** Compared to pre-test, there was comparable and sustained significant improvement of knowledge attitude and practice compliance in the subsequent post test results among both groups of nurses. Higher age group (odds ratio (OR) 6.037, 95% CI 0.706-51.621), low knowledge (OR 4.985, 95% CI 1.562-15.910), poor attitude (OR 1.114, 95% CI 0.474-2.622), unavailable infection control measures (OR 1.066, 95% CI 0.369-3.077), less time since training (OR 13.145, 95% CI 1.929-89.564), and working in surgical department (OR 8.043, 95% CI 1.97-32.838) showed higher odds of non-compliance to infection control practices.

**Conclusion:** This study illustrated the need of target based educational training interventions in any form of either direct or trained group training the other nurses, to improve the KAP in infection control practices.

**Keywords:** Practice-intervention based project, Knowledge, Attitude, Compliance, Infection Control Practices, Nurses.

## Introduction

Healthcare/hospital acquired infections (HAIs)

otherwise called nosocomial infection is associated with increased morbidity and mortality and predisposes healthcare workers (HCWs) to an increased risk of infections. HAI has grown into a major problematic area of patient safety, with estimation of more than 1.4 million patients worldwide in developed and developing countries affected at any time.<sup>1</sup> An estimated 10%-25% of hospitalized patients in developed and developing countries develop HAIs, and subsequently results in adverse healthcare outcomes as increased hospital stay,

---

### Corresponding Author:

**Dr. Larissa Martha Sams**

Principal & Professor, Laxmi Memorial College of Nursing, Mangalore, Karnataka, India  
e-mail: vasini71@rediffmail.com

economic burden, significant morbidity, and mortality.<sup>2</sup> Challenges of lack of standardized infection prevention program in healthcare settings, deficient infrastructures, limited resources and poor quality of care contribute towards burden of HAIs.<sup>3-5</sup>

HAIs are infections that were not present or incubating at the time of admission but contracted by the patient during the process of care in health care facility like, Hepatitis B, C virus, HIV, mostly can be transmitted by failure to practice infection prevention measures.<sup>6</sup>

Patient safety is the central concern of current healthcare delivery systems,<sup>7</sup> and it is an important indicator of health care quality. Nurses, who are responsible for the constant care of in-patients, can be the most reliable persons to incorporate their knowledge, attitude and practice compliance on several health related aspects, healthy habits and care among the patients.<sup>8</sup> An assessment of the knowledge, attitude and practice (KAP) of standard precautions by healthcare workers is a prerequisite for initiating and implementing a successful infection prevention and control (IPAC) strategy in any health facility. There are numerous evidences,<sup>9, 10</sup> that have shown that HCW display capricious KAP of standard safety measures in keeping with their professional group and duration of professional experience, among other factors. More professional experience, awareness and training in standard precautions, and high risk perception have all been associated with improved compliance with standard precautions among health workers.<sup>11</sup>

Limitation in current knowledge and practice, lack of attitude, type of work shift, professional experience and training can predict noncompliance to infection control. Hence this study was designed to find the factors that can predict the noncompliance and adopt a reliable and sustainable practice based training programme by nurses as trainer themselves to fellow colleagues to improve infection control practice.

## Materials and Method

**Subjects and Study Setting:** This is an experimental study with pre-test post-test design where 2 groups of nurses (30 and 50 in number respectively) working in a tertiary care hospital with 960 beds were included in the study after obtaining institutional ethical clearance and informed consent. The study population consisted of registered nurses with valid state council number. No specific inclusion and exclusion criteria were applied in this study to include the nurses. Seventy other health

professionals included in the first phase only were-physicians, medical interns and post graduates. Only those who were willing were included in the study.

**Research Tools and Data Collection:** Structured knowledge questionnaire, Likert scale to measure attitude and practice compliance were designed by researchers. Questionnaires and scales were validated by subject experts and Cronbach's alpha was used to calculate the consistency of questionnaire, ( $r=0.9$ ). A pre-test survey was done based on these questionnaires. 70 other health professionals including doctors, post graduates and interns were included only during pre-test survey. Practice-intervention based project was implemented to the group 1 nurses (core group) by researchers for 2 hrs/day, for a week. It was imparted by pedagogue, demonstration using multimedia devices and practicing under direct observation. Posters on infection control and hand hygiene were displayed in prominent places. The bundles included; nursing bundles-Blood Streamline Infections (BSI) Form-adapted from CDC center, Surgical Site Infections (SSI) checklist, Urinary Tract Infections (UTI) check list.

Three Post-test surveys were done at interval of one month for 3 months to check the sustainability of training. Similarly these trained nurses of group 1 (core group) trained 3-4 nurses (trainee group) each in their respective units. Infection control pamphlets were also displayed in prominent places of hospitals. The time take for the administration of tools and collection of data lasted for 15-20min for a subject.

Chi square test was used to analyse the difference between two groups of nurses, and differences in pre and post-test performances. Ordinal regression with plum analysis was used to find the factors predicting non-compliance.

**Ethical Considerations:** The study protocol was approved by the Institutional Ethics Committee (IEC/ Rev/22/2015-16). All subjects were informed about the purpose of the study and obtained written informed consent. The questionnaires were anonymous, and the confidentiality of study data was emphasised.

## Results and Discussion

Out of 30, group-1 nurses, 50 group-2 nurses, 27 and 42 belonged to 20-30 years age group respectively. Twenty six group 1, 29 group 2 nurses worked in surgical and the rest in orthopaedics department. Twenty group

1 and 42 group 2 nurses had professional experience between 1-3 years and the rest had < 1 year experience. Twenty group 1 nurses and 44 group 2 nurses had alternate shift work pattern. All had participated in 1

day training programme in infection control prior to the study. Twenty seven group 1 and 44 group 2 nurses had participated in infection control workshop less than 6 months back; the rest more than 6 months back.

Legend to Table No.4, ICM-Infection control measures, P<0.05-sig;<0.01-highly significant;<0.001-very highly significant;

According to the present study results, nurses' knowledge of infection control was low at the pre-intervention phase of study.<sup>12</sup> The study demonstrated significant improvement in knowledge regarding all the areas of infection control, attitude towards infection control and practice compliance in both group 1 and group 2 nurses after training. A similar improvement in infection control measures of nurses was testified in similar studies.<sup>13,14</sup> This improvement was sustained during the next 3 consecutive post-tests that were conducted at one month intervals (Table No. 1 and 2).

Other health professionals (physicians, interns and postgraduates) had better knowledge and attitude though not significant, when compared with both group of nurses in some areas (Table No. 3).<sup>15</sup> Other health professionals positively associated with a better knowledge & attitude for compliance practices compared to nurses, this could be explained by the heterogeneity of both the subject groups, their higher educational qualification (level) and training programmes they had undergone.<sup>16</sup> This result is in contrast to study done at Amhara region, and this difference might be due to the sampling size, study participants.<sup>17</sup>

Age group higher than 30 years has more odds of being non-compliant when compared younger one. Interesting to notice nurses working in surgical departments had significantly higher odds of being non-compliant when compared with others. Nurses with professional experience of less than 1 year had

significantly higher odds of non-compliance compared with more experienced nurses which is in line with the study in Bahirdar city.<sup>18</sup> Maybe with increasing work experience in clinical setting was their motivation for further self-learning.

Nurses with alternate shifts in working had higher odds of non-compliance, because of the irregular pattern with the disturbed working pattern showed to impact on the patient care and the safety practices due to mental fatigue, which was in hand with similar study assessed impact of working of nurses on patient safety.<sup>19</sup>

Moreover, this study showed that when infection control measures guidelines were not available, nurses had higher odds of non-compliance (Table no. 5) which was in line with the study conducted in Nigeria<sup>20</sup> and Australia.<sup>21</sup> Findings in this study also depicts, nurses with incorrect knowledge and poor attitude had poor compliance suggesting that all these factors are interlinked to some extent and invariably impact the patient safety.

It is interesting to note that young nurses showed a better knowledge, attitude and compliance to practice compared to other elder nurses who are recently trained. This can be addressed by routinely conducting training programmes to these groups of nurses comprising of seminars, Continue Nursing Education sessions. They should be encouraged to interact with other less skilled nurses in the unit thereby exert a positive influence on their knowledge, attitude towards practice compliance.

Conclusion: as the practice based intervention was indeed effective to enhance the knowledge, compliance of nurses' in infection control, identified some predictors for the poor compliance among nurses. This study illustrated the need of educational training interventions to improve the KAP practice compliance among the nurses and one to one training method effectively be implemented.

Declarations: The author(s) declare no potential conflicts of interest with respect to the research, authorship, and publication of this article. Ethics clearance was granted for the study by the institutional ethics committee. Project is funded by Rajiv Gandhi University of Health Sciences, Bengaluru.

# Awareness of Oral Complications of Diabetes Mellitus in Diabetes Patients: A Questionnaire Study

Lekshmy Jayan<sup>1</sup>, A. Ramesh Kumar<sup>2</sup>, R. Ramya<sup>3</sup>, Monika Srivastav<sup>1</sup>

<sup>1</sup>Post Graduate Student, <sup>2</sup>Professor, <sup>3</sup>Reader, Department of Oral and Maxillofacial Pathology and Microbiology, SRM Dental College, Chennai

## Abstract

**Background:** Diabetes mellitus is one of the many metabolic disorders that show a drastic increase in its prevalence with every year. Though there are many literatures available explaining the importance of oral hygiene in preventing complications in diabetes there is a tendency in the patients to ignore their oral hygiene. The role of dentist in resolving or preventing the oral complications is important at the same time, the patient themselves should take an initiative to acquire more knowledge about their condition.

**Method:** A two-page questionnaire was created in accordance with the OHSU guidelines for evaluating the awareness of oral complications in diabetic patients.

**Results:** Majority of the patients, irrespective of being graduates or literate lacked sufficient knowledge on oral complications of Diabetic patients in spite of being aware about the general complications.

**Conclusion:** Awareness is needed for the patients with diabetes in both systemic and dental complications as it can affect their quality of life. Diabetic individuals should be encouraged to get regular dental check-ups done and more frequently than non-diabetic individuals to seek active care for their problems for better prognosis and improved quality of life.

## Introduction

Diabetes mellitus or diabetes is a group of metabolic disorder which is characterised by high blood glucose levels for a prolonged period of time. Diabetes is an endocrinal disorder of the pancreas where the gland is not able to produce insulin the hormone which regulates blood glucose levels in the body. Even with advance in treatment strategies still the prevalence and incidence of the disease is becoming alarmingly higher every year.

In the year 2016, 422 million people all over the world were estimated to be suffering from diabetes mellitus, which is an average of 8.3% of the total population of the world. WHO has reported an average of 1.5 million deaths due to diabetes every year all over the world and about 2.2 million death due to diabetes associated complications affecting the renal, cardiac system etc.<sup>(1)</sup>

The need for special care to those affected with this disease was established as early as in 1900s with the first recognised step being the St Vincent Declaration in 1989, which aimed in improving the care of those affected with diabetes. Following this several countries have adopted various programs and measures to help these individuals to live a better life and to improve their life expectancy and living standards.<sup>(2)</sup>

Not only is the disease dangerous, but the complications produced by it as a result of it is more

devastating. The aftermath of the disease affects many other systems in the body, mainly renal system, cardiac system, eyes. But though the knowledge about the behavioural pattern and characteristic of the disease is blooming every day, proper awareness is yet lacking in many. The individuals affected by diabetes lack the basic understanding of the course of the disease in their body and how it will behave, which leads to negligence and delayed diagnosis of many complications of it which if noticed earlier could have been at least controlled. Proper awareness of the disease as well as the complications of the disease should be provided to the patients as well as their family to prevent this. <sup>(3)</sup>

The oral manifestations of diabetes vary in its severity in relation with the blood sugar level it can be as simple as normal gingivitis or xerostomia to as severe devastating opportunistic infections like mucormycosis or candidiasis. Proper awareness of oral complications is also relevant as maintenance of oral health also plays hand in hand with maintenance of blood sugar level. <sup>(4)</sup> If the patient has poor oral hygiene because of the compromised immune status owing to defective neutrophil chemotaxis seen in this condition predisposes the individual to many infections in the oral cavity, like dental caries, gingivitis, periodontitis, candidiasis etc. It is the duty of the dentist to impart to the patient importance of maintaining oral hygiene and the need for frequent dental visits especially in diabetic individuals for assessment of their oral health. Proper brushing techniques should also be demonstrated. The various oral complications that follow this disease should also be informed and ways in preventing as well as managing these complications also should be informed. <sup>(5)</sup>

In this study we have conducted a questionnaire to assess the awareness of complications of diabetes in diabetic patients to evaluate the need for awareness campaign for the same.

**Aim:** To evaluate awareness of complications of diabetes mellitus in diabetic individuals.

**Objectives:**

1. Evaluate awareness of complications of diabetes mellitus in diabetic individuals.
2. Assess the need for awareness campaigns on complications of diabetes mellitus.

## **Materials and Method**

The study was approved by the Institutional Review Board of SRM dental college. A two-page questionnaire was prepared following the guidelines by OSHU<sup>(6)</sup> for questionnaire for evaluation of systemic evaluation of diabetic individuals and after referring the literature. The questionnaire was made in English language. The questionnaire included questions regarding:

- a. Duration of the diabetes.
- b. Patients awareness about the harmful complications of diabetes.
- c. Patients awareness about the importance of oral hygiene.
- d. Patients awareness about the oral complications of diabetes.
- e. Patients attitude about dental hygiene and awareness about the role of dentists in managing this disease.

No changes were made to the questionnaire during the course of the study.

Patients attending the department of Oral Medicine in SRM dental college, Ramapuram were included for the study. Out patients with known diabetes who were willing to participate in the study were included in the study after obtaining informed consent. Patients were asked to fill the forms either by themselves and those who did not understand English were allowed to take help from by-standers for filling the forms. A total of 106 responses obtained over a duration of 3 months. The results were compiled into graph and then analysed.

## **Results**

A total of 500 diabetic individuals were given the questionnaire study, 302 responses were obtained. 64.8% of the respondents were graduates showing that diabetes is a life style disease which commonly affects the educated individuals. 40% of the respondents reported a history of diabetes for more than 10 years with 37.1% of individuals being affected for a duration of 2-5 years. 53.3% of the individuals reported no history of other systemic illness whereas 46.7% of the individuals reported other related health problems. 72.4% of the diabetic individuals check their blood sugar levels regularly. 39% of the individuals reported that they take insulin injection to manage their blood sugar levels.

Out of the 302 responses obtained, 48.1% of the individuals consult their physician only when need arises. Again, 80% of the patients go to dental check-up only when they have any symptomatic problem (Fig1). 35.8% of the patients noticed loosening of teeth or mobility of teeth, i.e., periodontal problem (Fig2).

70.5% of the individuals were aware that uncontrolled diabetes can cause delayed wound healing and 61.9% reported that they are aware of the increased risk of developing cardiac diseases. 52.4% of the diabetic patients were unaware of the risk of dryness of mouth associated with diabetes (Fig 3). 61.9% of the individuals had no idea that dryness of mouth is associated with increased risk of infections and caries development (Fig 4). 24.8% of the respondents have suffered from burning sensation of mouth. 35.2% of the patients suffer from frequent ulcer formation in their mouth.

64.8% of the respondents reported to have not been demonstrated proper tooth brushing technique (Fig 5). 62.9% of the respondents were informed about the importance of maintenance of oral health by their dentist. While enquired as to whether they discuss about their diabetic status to their dentist 41.9% reported that they donot see a dentist (Fig 6).

### Discussion

Incidence of Diabetes mellitus has increased exponentially in the past two decades with 1.6 million

cases being diagnosed every year in India. It shows high prevalence among elderly and individuals affected with diabetes mellitus how a two to four fold increased risk of developing cardiovascular disease, peripheral vascular disease and stroke. The complications of diabetes account for about 65% of the mortality caused by it, making it the seventh most common cause of death in the country.<sup>(1)</sup>

The surge in the number of new cases reported every year can be attributed to lack of proper platform for spread of awareness about the disease. Many of the patients as well as their caretakers are unaware of the devastating effects of this disease.<sup>(7)</sup> The complications of this disease are product of the effect of either the reduction in the level of hormone or due to effect of the drugs administered to maintain blood sugar level. The number of individuals affected by diabetes mellitus is estimated to be around 552 million.<sup>(1)</sup>

Diabetes mellitus is a disease whose causation is primarily attributed to lifestyle factors and genetics.<sup>(8)</sup> Diabetes is considered to be a product of insulin sensitivity as a result of insulin resistance where there is a fall in the amount of insulin produced by the pancreatic beta cells of Islets of Langerhans.<sup>(9)</sup> There is a dysregulation of level of blood glucose level. The amount of hepatic glucose and glucagon that are increased during fasting are not reduced with meal because of lack of insulin.<sup>(10)</sup>

In 2019, the American Diabetic Association gave 5 important guidelines for the Standard of Medical Care in Diabetes, which is directed in providing clinical practice recommendations and treatment goals and guidelines and tools to evaluate quality of care. In these guidelines the ADA has emphasised on the importance of diabetes self-management education and support as well as participation of the diabetic patients in achieving knowledge on the skills, ability necessary in diabetic self-care.<sup>(2)</sup>

In our study, we have performed a questionnaire study for assessing the awareness of the possible complications of diabetes mellitus in diabetic patients. Our results showed though 50-60% of the participants were aware about the different aspects of the disease still there is a part of the population who still don't understand fully the complications associated with this disease which will hamper the management of the disease.

In another study by Allen et al 2008, they assessed

the knowledge of diabetic patients regarding the increased risk of development of periodontal diseases showed that around 7% of the patients that participated were unaware of the type of diabetes they had. Also, the authors concluded that there is a need for awareness in diabetic patients regarding the potential association between diabetes, oral health and general health.<sup>(11)</sup>

In a cross-sectional study conducted by Ahmed et al 2011, they compared the perceived health status in both hypertensive and diabetic patients who visited the primary health centres in Oman, they found that even though the mental scores in both the diseases were similar, the physical scores in patients with diabetes mellitus was lower than that in hypertensive patients.<sup>(10)</sup>

In 2012, Bharateesh et al, conducted a case-control study on diabetes patients to assess the prevalence of common dental infections like dental caries and periodontal disease and found that the prevalence was significantly higher in patients with diabetes than in non-diabetic individuals.<sup>(4)</sup>

In 2011, Bowyer et al, conducted a questionnaire study to assess the knowledge of diabetic patients visiting general dental practitioners in UK about the importance of oral health as well as on the complications in diabetes mellitus, they found that there was a poor knowledge and stressed on the need for awareness in patients as well healthcare professionals. They also wanted to recheck the role of dental care professionals in diagnosis of diabetes.<sup>(5)</sup>

Adults with diabetes mellitus were found to have poor awareness of the complications of diabetes and also lacked proper knowledge on the importance of oral hygiene in preventing many of these complications<sup>(12)</sup>. Majority of the patients who participated in our study admitted to visit dentist only when the need arises and many of the patients deter from visiting dentist. This is due to lack of knowledge about the importance of oral health care.

Despite the study's limitations, our study suggests that patients are receiving inadequate oral health care advice from dental and non-dental health professionals it is important to provide knowledge as well as preventive measures to prevent oral complications of diabetes as some of these may be debilitating. We would like to suggest the need for oral hygiene camps as well as awareness campaigns with emphasis on the oral health care and its role in diabetes.

## Conclusion

Diabetes mellitus is a lifestyle-based disease with dangerously increasing incidence rates in the past few decades. Health professionals should be provided with knowledge about the oral manifestations as well as the proper complications of the disease. Diabetic individuals should be encouraged to get regular dental check-ups done and more frequently than non-diabetic individuals to seek active care for their problems for better prognosis and improved quality of life.

**Ethical Clearance:** Ethical clearance was obtained from the Institutional Review Board of SRM DENTAL COLLEGE, Ramapuram.

# Effectiveness of Nursing Intervention on Knowledge of Family Caregivers of Patients with Paraplegia

Liny Joseph<sup>1</sup>, C. Kanniammal<sup>2</sup>

<sup>1</sup>Assistant professor, Govt. College of Nursing, Kottayam-8, Kerala, <sup>2</sup>Dean, SRM College of Nursing, SRM University, Kancheepuram, Tamil Nadu

## Abstract

Paraplegia creates debilitating effect on patient and family. The patient with spinal injury requires creative nursing management in all phases of care. The treatment and rehabilitation period is long, expensive and exhausting in paraplegia. Whether complete or incomplete, spinal injury rehabilitation is a long process that requires patience and motivation of the patient and relatives. The present study focussed on the effectiveness of nursing intervention on knowledge of family caregivers of patients with paraplegia. The research design adopted in the study was quasi experimental pretestpost test control group design and was conducted in physical medicine and rehabilitation wards. The sample consisted of 80 family caregivers who satisfy the inclusion criteria. Nursing intervention consisted of the structured, individual patient and caregiver education of 3 sessions of 45 minutes duration using power point slides on exercises, nutrition, skin care, sexual functioning, psychological aspects, bladder training, bowel training, demonstration and return demonstration of exercises and provision of an information booklet describing the interventions to be followed by the patients and family caregivers. Post test was conducted on 25<sup>th</sup> day and 90<sup>th</sup> day. The effect of intervention was found to be significant which indicates that there exists a significant difference in knowledge scores of family caregivers of patients with paraplegia.

**Keywords:** *Nursing intervention, knowledge, paraplegia.*

## Introduction

The international symbol of disability is the wheel chair and the stereotype of a person with disability is a young man with paraplegia. Paraplegia is the impairment of the motor or sensory functions of the lower extremities and comes from the Greek word which means “half-striking”. It is truly a devastating injury with profound consequences to the individual, his family and society. Someone in the prime of their life becomes disabled in an instant. The consequences of paraplegia are either premature mortality or at best social exclusion.<sup>1</sup>

Spinal injury creates debilitating effect on patient and family. The patient with spinal injury requires creative nursing management in all phases of care. The treatment and rehabilitation period is long, expensive and exhausting in paraplegia. Whether complete or incomplete, spinal injury rehabilitation is a long process that requires patience and motivation of the patients

and relatives.<sup>2</sup> Education during rehabilitation may help with the attainment of effective problem-solving abilities, or at least provide the patient with the factual knowledge. Providing education about bladder and bowel management and skin customarily falls within the nursing domain while patients with SCI are in the acute rehabilitation setting, and there is evidence that the education that rehabilitation nurses provide focus on these topics. The planning, implementation and evaluation of educational intervention for family caregivers regarding appropriate ways to perform care and adaptation to the environment falls under the nurse’s responsibility.<sup>3,4</sup> The patients with spinal trauma and their caregivers are quiet unaware of basic information and routine activities regarding condition and its management. It was also noticed that there is a higher incidence of complications among patients with paraplegia. The lack of knowledge regarding care of spinal trauma was a major factor that nullified the effect of treatment programme.

**Objectives of the Study:**

1. To evaluate the effectiveness of nursing intervention on knowledge of family caregivers of patients with paraplegia
2. To determine the association between knowledge of family caregivers and selected socio- demographic variables

**Materials and Method**

A quantitative research approach was adopted in the present study. The research design adopted in the study was quasi experimental pretest post test control group design and was conducted in physical medicine and rehabilitation wards of Government Medical Colleges, Kottayam and Thiruvananthapuram. The subjects were selected through non probability purposive sampling technique. The sample consisted of 80 family caregivers who satisfy the inclusion criteria. Among the 80 family caregivers, 40 family caregivers were in the control group and 40 family caregivers were in the experimental group. Only one primary family caregiver was included in the study.

The tools used for data collection include sociodemographic data sheet of family caregivers and structured knowledge questionnaire. Pretest done and the routine care was provided to the control group. The nursing intervention was administered to the experimental group individually on day 2, day 3 and day 4 at their bedside in wards. Nursing intervention consisted of the

structured, individual patient and caregiver education of 3 sessions of 45 minutes duration using power point slides on exercises, nutrition, skin care, sexual functioning, psychological aspects, bladder training, bowel training, demonstration and return demonstration of exercises and provision of an information booklet describing the interventions to be followed by the patients and family caregivers. Post test was conducted with the same tools on 25<sup>th</sup> day and 90<sup>th</sup> day.

**Results**

Most of the family caregivers of patients with paraplegia (52.5% and 67.5%) both in control and experimental groups were spouses. Interestingly 30% of family caregivers in control group and 45% in experimental group were between the age group of 35 – 45 years. It is noticeable that the most of the family caregivers were females (75% and 82.5%) in both groups. Most of the participants were Hindus (60% and 65%) in control and experimental group. Nearly half of the family caregivers in control and experimental groups (42.5% and 50% respectively) were with high school education. Most of the family caregivers in both groups (65% and 92.5%) reported that they were unemployed. Nearly half of the family caregivers in control and experimental group (50% and 47.5%) reported that their family monthly income was between Rs 5001 – 10,000.  $\chi^2$  values were calculated and were not significant at 0.05. Hence it is inferred that the groups were not homogenous in terms of socio-demographic variables.

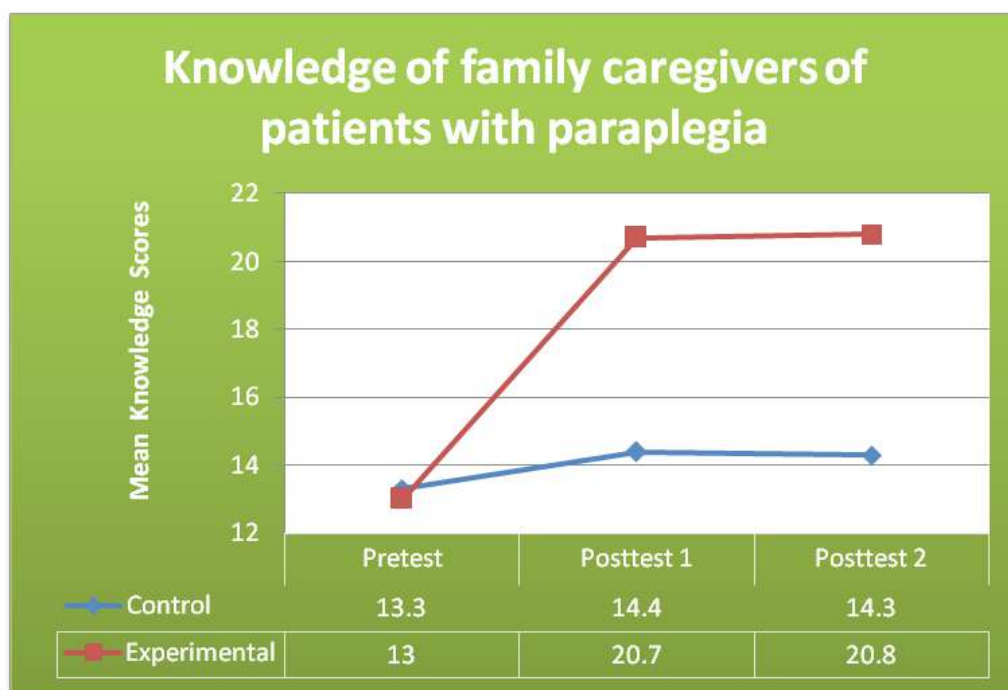

**Table 1: Comparison of knowledge of family caregivers of patients with paraplegia**

Knowledge		Mean	SD	t	p
Pretest	Control	13.3	2.5	0.5	0.616
	Experimental	13	2.4		
Post test 1	Control	14.4	2.4	12.74**	<0.01
	Experimental	20.72	2		

\*\* p< 0.01

Table 1 shows that mean pretest knowledge score in control and experimental group was 13.3 and 13 respectively. The independent t test was done and the t value obtained was not significant in pretest (t = 0.5, p > 0.05). It denotes that there were no statistically significant difference in pretest knowledge scores between control

and experimental group and hence both the groups were comparable. The mean post test 1 knowledge score in control and experimental group was 14.4 and 20.72 respectively. The t value obtained was t =12.74, which was significant at 0.01 level.

**Figure 1: Comparison of mean knowledge scores of family caregivers of patients with paraplegia indifferent time intervals among control and experimental group**

**Table 2: Repeated measures of ANOVA of knowledge of family caregivers of patients with paraplegia in experimental group n = 40**

Group	Mean	SD	F	p
Pretest	13	2.4		
Post test 1	20.7	2	670.29**	p < 0.01
Post test 2	20.8	1.9		

\*\* p < 0.01

The results show that knowledge scores of patients with paraplegia in experimental group were 13+ 2.4 in pretest, 20.7 + 2 in post test and 20.8 + 1.9 in post test 2. The main effect between the period of measurement (F = 670.29, p < 0.01) was found to be significant which indicates that there exists a significant difference in knowledge scores of family caregivers of patients with paraplegia in experimental group between different measurement period.

Table 3 shows significant difference in pretest – post test1 value (mean difference = 7.68, p < 0.05), pretest – post test 2 value (mean difference = 7.83, p < 0.05) and post test1 – post test 2 (mean difference = 0.15, p < 0.05). The finding was interpreted that there was a statistically significant difference in knowledge scores

of family caregivers of patients with paraplegia who received nursing intervention and effect was sustained in post test 1 and 2.

**Table 3: Pair wise comparison of knowledge scores in experimental group n = 40**

Sl. No.	Pairs	Mean Difference	p
1	Pretest	7.68*	p < 0.05
	Post test 1		
2	Pretest	7.83*	p < 0.05
	Post test 1		
3	Post test 1	0.15*	p < 0.05
	Post test 2		

\* p < 0.05

**Table 4: Association between knowledge of family caregivers of patients with paraplegia and selected socio-demographic variables n = 80**

Variables	df	χ <sup>2</sup>	p
Relationship	2	2.01	0.366
Age	3	2.07	0.558
Gender	1	0.01	0.926
Education	2	2.22	0.329

The above table shows that the calculated Chi square value is not significant for the selected socio-demographic variables. There will be no significant association between knowledge of family caregivers of patients with paraplegia and selected socio-demographic variables.

### Discussion

In the present study the majority of the family caregivers of patients with paraplegia had moderately adequate knowledge in control and experimental group (85% and 82.5% respectively). None of them expressed adequate knowledge. The nursing intervention was effective for making a statistically significant difference in knowledge scores of family caregivers of patients with paraplegia. The main effect between the period of measurement ( $F= 670.29$ ,  $p<0.01$ ) was found to be significant which indicates that there exists a significant difference in knowledge scores of family caregivers of patients with paraplegia in experimental group between different measurement period.

A descriptive analysis conducted in 214 paraplegic patients reported that at the time of discharge from rehabilitation, 22% of patients were found to have poor knowledge, 30% average knowledge and only 47% had good knowledge about their illness. This study showed improved knowledge scores compared to the present study findings.<sup>5</sup>

The findings of the present study were backed by an evaluative study of patient education in spinal cord injury rehabilitation. Knowledge was evaluated with a Multiple Choice Questionnaire. Problem-solving ability based on participants' responses to Life Situation Scenarios relevant to each topic area was rated on a standardized four-point criterion reference scale. There was significant improvement in knowledge scores from admission to discharge ( $p = 0.04$ ) and admission to follow-up ( $p = 0.02$ ). For problem-solving ability, there was a trend toward improvement in all content topics with significant improvement from admission to follow-up for the topic of bowel care ( $p = 0.004$ ).<sup>6</sup>

A prospective study was carried out to determine whether an integrated and an intensive outpatient programme would result in functional improvement of SCI patients. A significant increase in median total knowledge and functional independence measure scores in post treatment scores ( $p<0.001$ ) compared to pre treatment score was found. Multidisciplinary

rehabilitation programmes are recommended as safe and effective post injury rehabilitation for SCI patients in achieving long term independence.<sup>7</sup>

The finding was in accordance with an educational model for increasing and retaining the knowledge of pressure ulcer prevention and management of SCI. Results indicated that participants in the intervention group gained more knowledge during hospitalisation than those in the control group. The participants retained most of their discharge knowledge upto 24 months post discharge. The authors concluded that enhanced individualised education about pressure ulcer prevention and management was effective in improving pressure ulcer knowledge during hospitalisation.<sup>8</sup> In another study of patient and caregiver knowledge on autonomic dysreflexia, found that patient and caregiver education about SCI and related secondary medical complications, is an essential component to a successful transition to home and community. Additionally, proper education and knowledge about SCI and associated complications will help patients and caregivers direct their care throughout their lifespan.<sup>9</sup>

### Conclusion

The study explored an area which is underexplored in terms of knowledge of family caregivers of patients with paraplegia in Indian scenario. The present study sheds light on the fact that the QOL of patients with paraplegia was low. The general principles of care for paraplegia and specific nursing strategies to minimise secondary problems like pressure sore, contracture, spasticity and urinary tract infection were effective in improving the lifespan of paraplegics. The identification and acceptance of effects of paraplegia, among the patients and family caregivers and effective way of communication with them were also achieved through this research study.

# Effect of Video Assisted Teaching on Usage of Plastics and its Impact on Environment among Adolescent in a Selected School, Kanchipuram District, Tamil Nadu

M. Saranbharathi<sup>1</sup>, T. Sowmiya<sup>1</sup>, D. Moses Rathnakumar<sup>1</sup>, M. Pradhepra J.<sup>1</sup>, Shenbagaprabha N.<sup>2</sup>

<sup>1</sup>B.Sc. Nursing IV Year, <sup>2</sup>Assistant Professor, Chettiand College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram District, Tamilnadu, India

## Abstract

Almost certainly you will see plastic. Our homes, offices, schools, hospitals, factories indeed, our entire surroundings are dominated by products made from this material. As a consequence, the production of plastics has increased substantially over the last 60 years from around 0.5 million tonnes in 1950 to over 260 million tonnes today. The study topic was “to assess effects on video assisted teaching on usage of plastics and its impact on environment among Adolescent in selected school, Kanchipuram district, Tamil Nadu. The objective of the study were to assess the pre-test knowledge on usage of plastics and its impact on environment, to assess the effect of video assisted teaching on usage of plastic and its impact on environment among Adolescent, to associate between pre-test, post-test knowledge regarding the usage of plastics and its impact on environment with selected demographic variables. Quasi-experimental research design was used for this study. The sample consist of 84 adolescents. Self-structured questionnaire was used to assess the effects on video assisted teaching on usage of plastics and its impact on environment among Adolescent. The data collection period was one week. The data was collected in 84 adolescents in the age group between 13 to 16 years in a selected school, Kanchipuram district, the sample was selected by using simple random sampling technique. The data was analysis and tabulated. The study results shows that majority 65.4% (55) having inadequate knowledge, 33.3% (28) having moderate knowledge, only 1% (1) of them having adequate knowledge regarding usage of plastics and its impact on environment after the video assisted teaching the study results shows that majority 94% (79) having adequate knowledge, 6% (5) having moderately adequate knowledge and none of them were having inadequate knowledge regarding usage of plastics and its impact on environment.

**Keywords:** Effect, Plastic, Adolescents, Environmnet, Video Assisted Teaching.

## Introduction

Almost certainly you will see plastic. Our homes, offices, schools, hospitals, factories-indeed, our entire

surroundings are dominated by products made from this material<sup>3</sup>. We live in the age of plastics; bright, attractive, colourful, long-lasting, relatively inexpensive substances whose invention has revolutionized the manufacturing industry. Plastic certainly have advantages. Unfortunately, they also bring problems to our world, not the least among these being the generation of vast quantities of waste material<sup>1</sup>.

e-mail: shenbagamae83@gmail.com

Plastic bag uses are at risk of number of health hazards. These are many types of bag available today to cater the shopping needs of people. Many factor are been steadily established and harmful chemical and materials are being used in the production grow, from the time of

their origin have become an indispensable part of our life and modern society<sup>2</sup>.

## Material and Method

**Research Approach:** Quasi experimental research

**Research Design:** Quasi experimental design

**Research Setting:** The study conducted in a selected school.

**Population:** Adolescent (boys and girls) who were in a selected school

**Sample:** The age group between 13 to 16 years in a selected school,

**Sample Size:**  $n = [DEFF * Np(1-p)] / [(d^2 / Z^2_{1-\alpha/2} * (N-1) + p * (1-p))]$  .84 samples .

**Sample Technique:** Simple Random sampling technique

### Findings:

**Section A:** Frequency and percentage distribution of demographic variables to effect of Video Assisted Teaching on Usage of Plastics and its Impact on Environment among Adolescent in a Selected School

**Gender:** The maximum (51%) of the sample belongs to the gender of male, (49%) were in the gender of female,

**Age:** The maximum (88%) of the sample belongs to the age group between 13-14 years, (12%) were in the age group between 15-16 years

**Income:** The maximum (38%) of the sample belongs to the income of Rs,5001-10000, (37%) were in the income up to 5000, (24%) of the samples belong to the income of Rs.10001-15001, (1%) were in the income of above 15001.

**Family Members:** The maximum (53.5%) of the sample 3-4 members, (46.5%) were 5-6 members, maximum (43%) of the sample

**Source of Information:** The maximum family and friends, (40%) were from books, (11%) of the sample from the health personals, (6%) were from media.

**Section B:** Distribution and percentage of pre- test knowledge on the usage of plastics and its impact on environment.

It shows that majority 65% (55) having inadequate knowledge, 33% (28) having moderate knowledge, only 1% (1) of them having adequate knowledge regarding usage of plastics and its impact on environment.

**Section C:** Distribution and percentage of and post-test knowledge on usage of plastics and its impact on environment.

It Shows that majority 94% (79) having adequate knowledge, 6% (5) having moderately adequate knowledge and none of them were having inadequate knowledge regarding usage of plastics and its impact on environment.

**Section D:** Comparison of Pre-test and Post-test Knowledge on usage of plastics and its impact on environment.

It depicts that Pre-test level of knowledge regarding the usage of plastics and its impact on environment mean score was 4.33 and the Post-test mean score was 8.47 which projects 't' value of -15.70 which was statistically significant at  $p < 0.05$  level. The 't' value is greater than the table value hence the research hypothesis is accepted. The post-test knowledge score is greater than the pre-test knowledge score. There is a significant difference between pre and post test score. This indicates the Video assisted teaching on the usage of plastics and its impact on environment is effective in increasing the knowledge level among adolescents.

**Section E:** Association between post-test knowledge regarding the usage of plastics and its impact on environment.

It reveals that there is significant association between the levels of knowledge regarding the usage of plastics and its impact on environment with gender, monthly income, members of the family and source of the information  $p < 0.05$ . Thus the researcher rejects the null hypothesis and accepts the research hypothesis. Other demographic variable such as age has no association with the of knowledge regarding the usage of plastics and its impact on environment

## Discussion

It deals with the discussions in accordance with the objective of the study and hypothesis. The study was conducted to the assess effects on video assisted teaching on usage of plastics and its impact on environment among Adolescent in selected school, Kanchipuram

district, Tamil Nadu. A total of 84 samples were selected by using Simple Random sampling technique the knowledge level of samples was assessed using a self-structure questionnaire. The collected data were

analysed by using the descriptive statistic and inferential statistics. This chapter discusses the findings of the study derived from statistical analysis and its pertinence to the objectives set for the study

**Summary:** This chapter deals with the analysis and interpretation of the collected data from the effect of Video Assisted Teaching on Usage of Plastics and its Impact on Environment among Adolescent in selected school. The data collected was tabulated and analyzed using descriptive and inferential statistics, frequency and percentage were compared to summarize the sample characteristics. Mean, mean percentage and chi square were used to compare the effect of Video Assisted Teaching on Usage of Plastics and its Impact on Environment.

# Assessment of Risk of Fall among Elderly

M. Vijay<sup>1</sup>, S. Mohanapriya<sup>1</sup>, V. Vinodhini<sup>1</sup>, R. Divya<sup>1</sup>, Sathiyapriya V.<sup>2</sup>

<sup>1</sup>B.Sc. (Nursing) IV<sup>th</sup> year Students, <sup>2</sup>M.Sc. (N), Assistant Professor, Department of Medical Surgical Nursing, Chettinad College of Nursing, Chettinad Academy of Research and Education, Rajiv Gandhi Salai, Kelambakkam, Kanchipuram Dis, Tamilnadu, India

## Abstract

Assessment of risk of fall among elderly in selected community area, Kanchipuram district, Tamilnadu, India. The objectives are to assess the risk of fall among elderly in selected community area, To associate the risk of fall with demographic variables in selected community area. The research approach used for the study was Quantitative Approach Purposive sampling technique was used to select 60 samples. The data were collected by using Fall Risk Assessment scale. The collected data were tabulated and analyzed. The level of significance selected was  $p < 0.05$  level. Descriptive and inferential statistics were used. The result showed that 62% of elderly had low level of risk where as 38% of elderly had moderate level of risk of fall. the showed that the demographic characteristics like Age ( $\chi^2 - 7.588$ ), Blood Pressure ( $\chi^2 - 2.00$ ), Diabetes ( $\chi^2 - 2.347$ ), Vision ( $\chi^2 - 3.45$ ) have significant association where as demographic characteristics like Gender ( $\chi^2 - (0.020)$ ), Arthritis ( $\chi^2 - 0.006$ ) have no significant association .

**Keywords:** Assessment, Risk of fall, elderly people, level of risk.

## Introduction

Falls are one of the foremost serious health concerns facing older persons. Falls are a crucial reason for morbidity and mortality within the older and are a marker of poor physical and psychological functioning. Falls within the older could also be because of either intrinsic (age-related changes) or external (environmental) risk factors<sup>1</sup>.

Falls occur additionally typically with advancing age. Each year, some half-hour to four-hundredth of individuals aged sixty five years and older who sleep in the community fall. Roughly half all falls lead to hospitalization. In nursing injury, of that 100 percent are serious, and injury rates increase with age. The direct medical costs for falls total nearly \$30 billion annually<sup>1</sup>.

Falls within the patient setting are typically outlined as “coming to rest accidentally on the bottom or lower level, undue to an acute overwhelming event” (eg, stroke, seizure, loss of consciousness) or external event to that any individual would be vulnerable<sup>1</sup>.

Falls are a serious threat to older adults' quality of life, typically inflicting a decline in self-care ability and participation in physical and social activities. The concern of falling, that develops in two hundredth to thirty ninth of individuals who fall, will result in more limiting activity, dependence on others<sup>1</sup>.

Older adults oftentimes suppose that falls are inevitable with aging however underestimate their personal risk of falling. Environmental and activity factors (eg, rushing, being distracted) are most frequently seen as inflicting falls; intrinsic (personal/health) factors are seldom recognized. Thus, medical care providers (PCPs) have a vital role in serving to patients perceive the importance of intrinsic factors in inflicting falls<sup>2</sup>.

Age is one of the key risk factors for falls. Older individuals have the highest risk of death or serious injury arising from a fall and also the risk will increase with age. For instance, within the U.S. of America, 20–30% of older those who fall suffer moderate to severe injuries like bruises, hip fractures, or head trauma. This risk level may be partly because of physical, sensory,

and psychological feature changes related to ageing, together with environments that don't seem to be tailored for Associate in Nursing aging population<sup>3</sup>.

Few older adults use well-tried fall interference method like balance exercises. When asked what they're doing to forestall future falls, individuals ordinarily report being additional careful. However, there's no proof that being additional careful alone prevents falls<sup>3</sup>.

Less than half older adults WHO fall speak with their health care suppliers concerning it. Therefore, tips specify that suppliers ought to raise all their patients aged sixty five years and older concerning falls a minimum of annually. By evaluating patients for fall risk and inspiring them to adopt evidence-based interference method, PCPs will facilitate patients cut back their possibilities of falling and experiencing practical decline, injury, or death<sup>4</sup>.

Gerontological nurse has an important role to scale back fall and its connected injuries through providing safety measures, environmental modification, eliminating risk factors and up the balance through exercise educational program. Education should be directed toward serving to older persons to spot potential hazards and ever-changing their health follow and habits consequently. Adequate physical, social and psychological rehabilitation of older with a history of falls and injury has been according to forestall more falls<sup>4</sup>.

**Statement of the Problem:** Assessment of risk of fall among elderly in selected community area, kanchipuram district, Tamilnadu, India.

#### **Objectives:**

- To assess the risk of fall among elderly in selected community area.
- To associate the risk of fall with demographic variables in selected community area.

#### **Operational Definition:**

**Assess:** Evaluate or estimate the risk of fall among elderly<sup>7</sup>.

**Risk of fall:** Risk of Fall is something that increases an older person's chance of fall<sup>6</sup>.

**Elderly:** Individuals over 60 year sold<sup>5</sup>.

**Assumptions:** Elderly are having high risk of fall.

## **Material and Method**

**Research Approach:** Qualitative approach will be used.

**Research Design:** Non experimental descriptive research design will be used for the study.

**Research Setting:** The study will be conducted in selected community area, Kanchipuram district.

**Sample and sample size:** Elderly people those who are fulfilling the inclusion criteria available at selected community area, Kanchipuram District, Tamil nadu, India.

Purposive sampling technique will be used to select the elderly and the sample size was 60 based on population proportion and the open-epi sample size determination.

#### **Criteria for Sample Collection:**

##### **Inclusion Criteria:**

- Elderly aged 60 years above, living in selected community area.
- Elderly who can able to participate in the study.

##### **Exclusion Criteria:**

- Elderly who are critically ill.

**Method of Data Collection:** The data collection procedure will be carried out for a period of 1 week. The study will be initiated after obtaining prior permission from the concerned authorities. The data will be collected from elderly living in selected village by using Fall Risk Assessment Tool.

#### **Tool for Data Collection:**

**Description of the Tool:** Tool consists of two parts

**Section A:** Demographic variables includes age, gender, education, arthritis, diabetes, hypertension, vision.

**Section B:** Fall Risk Assessment Tool is used to collect the data from elderly living in the community area.

**Analysis and Interpretation:** The study shows that the majority 48% were belongs to the age between 60-69 years and 47% of them between 70-75 years and

only 5% of them above 80 years, the gender showed that majority 53% were belongs to Male and 47% of them Female, the arthritis showed that majority 92% were having arthritis, 8% were not having arthritis, showed that majority 55% were having blood pressure, 45% were not having blood pressure. showed that majority 52% were having diabetes and 48% were not diabetes and showed that equally having that 50%. Normal and 50% Impaired Vision.

- To assess the risk of fall among elderly in selected community area.
- To associate the risk of fall with demographic variables in selected community area.

The first objective of study to assess the risk of fall among elderly

The result showed that majority 62% having Low Risk of fall, were as 38% having moderate Risk of fall .

The second objective of study was to find the associate between the risk of fall with selected demographic variables among elderly

It showed that the demographic characteristics like Age ( $\chi^2$ -7.588), Blood Pressure ( $\chi^2$ - 2.00), Diabetes ( $\chi^2$  - 2.347), Vision ( $\chi^2$ - 3.45) have significant association where as demographic characteristics like Gender  $\chi^2$  - (0.020), Arthritis ( $\chi^2$  - 0.006) have no significant association.

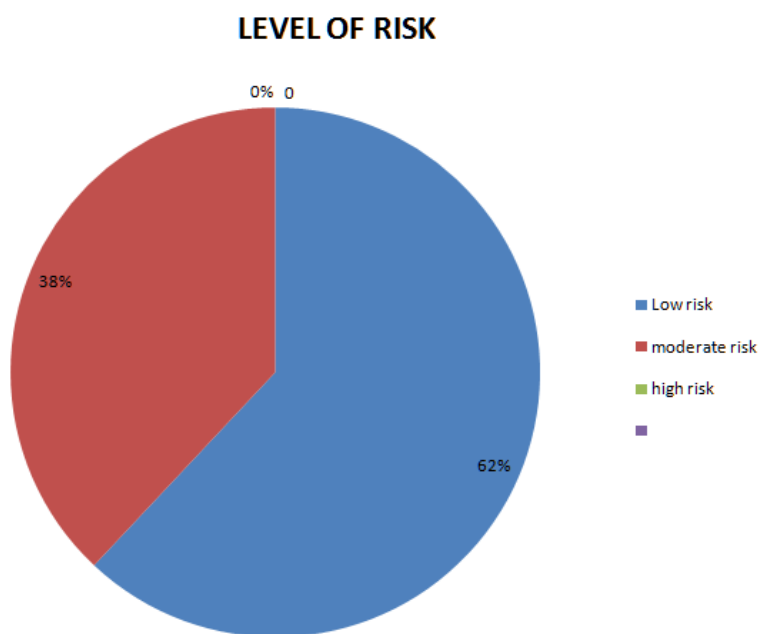

Fig 1:Percentage distribution of level of Risk of fall. N=60

Table 1: Association of risk of fall among elderly with demographic variables. N=60

Category	Inadequate Knowledge	Moderate Knowledge	Adequate Knowledge	Result
<b>Age</b>				
a) 60-69	23	6	0	$\chi^2$ -7.588 p value – 0.0225 S

b) Impaired	22	8	0	<i>p</i> value – 0.0631S

\*Significant level  $p=0.05$

### Conclusion

This study concluded that majority 62% having Low Risk of fall, were as 38% having moderate Risk of fall. It showed that the demographic characteristics like Age ( $\chi^2 - 7.588$ ), Blood Pressure ( $\chi^2 - 2.00$ ), Diabetes ( $\chi^2 - 2.347$ ), Vision ( $\chi^2 - 3.45$ ) have significant association where as demographic characteristics like Gender ( $\chi^2 - 0.020$ ), Arthritis ( $\chi^2 - 0.006$ ) have no significant association .The study results which really gives us the alarm to focus on Elderly health to Reduce the risk of fall.

**Conflict of Interest:** Nil

**Source of Funding:** Self funding and no external funding.

# Recharging Ground Water Using Age– Old Traditional Mechanisms

Manbeer Kaur<sup>1</sup>, Mona Prashar<sup>2</sup>

<sup>1</sup>Assistant Professor, B.A.M. Khalsa College, Garhshankar, District Hoshiarpur, Punjab, <sup>2</sup>Research Scholar, University School of Business, Chandigarh University, Gharuan, Mohali District, Punjab, India

## Abstract

*“Give back unto the Earth if water is desired in the coming generations”*

“Pawan Guru, Pani Pita, Mata Dharat Mahat” the Gurbani or word of the Gurus as embodied in the holy Guru Granth Sahib has in these words immortalized the relationship of men with Nature by saying that the “Wind is the teacher; Water is Father while the entire Earth is the mother”. When this strong bonding of men and Nature had been recognized several centuries ago it stupefied the human senses to think that man had ended up destroying the natural habitat unmitigatedly.

Since earliest times almost all natural resources have been reserved and utilized judiciously by civilizations. The Chinese, Indus valley, Mesopotamian, Roman, Aztec and most other great settlements used water conservatively. Even back then there was concern for wastage of water.

This paper is focused on looking at the systems of conserving, purifying water and utilizing it to the optimum without wasting any part of it. The objective of the paper is to determine the functioning and use of these techniques for present day communities.

**Keywords:** *Earth, Ma, Nature, habitat, water, purification, conservation, techniques, civilizations, traditional, optimum, communities.*

## Introduction

India’s population is over 1.3 billion. This population inhabits several thousands of villages in each of its states and union territories besides cities and towns. Over this and the past century, water availability to the world’s population has been declining rapidly due to increased urbanization and urban populations. In India a large percentage of surface water is contained and unusable. It is a disturbing fact that India as of today uses more ground water than China and the United States put together. Needless to say the ground water levels are rapidly declining all over the country but in some regions they are doing so at an astronomical pace.

The drinking water situation in the country is fast becoming a Pandora’s Box. On the one hand populations have been known to face death due to not having sustainable access to clean drinking water and on the other hand there is rampant waste of this precious

commodity. The villages at one time had had wells and ponds that hummed with life<sup>1</sup>. These days’ wells are obsolete while ponds have become stench holes. Most villages have their waste (solid and liquid) flowing gravitationally into their pond and they do not pay heed to the ominous degradation of this once healthy resource.

“If the villagers do not consider their ponds to be worthy of being saved they will in their lifetimes see the folly of their ways” said an octogenarian in one of the villages of the Doaba region in Punjab. Taking his concerns further it can be deduced that villagers will gradually loose:

- i. A healthy environment to live in
- ii. Be forced to live in a vector infested habitat
- iii. Be prone to diseases all the year round when neither children nor the elderly will be spared.

- iv. Loose the vital lungs of the village
- v. Become bereft of a vital water recharging source that could have replenished their water reservoirs.
- vi. Very few villagers choose to inhabit areas around the villages pond.
- vii. Gain a little bit of extra land for settlers and loose a major village asset like the pond.

In most villages it can be observed that people living near the pond are doing so only under duress. They have no choice, no alternative but to tolerate the harmful, stench saturated and unhealthy environment.

**Rejuvenation through Ponds:** Once the ponds have optimum content of oxygen in the water special blends of bacteria and enzymes can be introduced into them. These biological blends are successful at breaking down organic matter. They are efficient in consuming water borne pathogens that are causative of pollution and other bad effects of stagnation in the pond.

Access to clean water can affect the performance of milch animals markedly and is therefore very necessary for healthy livestock. With availability of clean water ponds these milk giving animals drink and eat more, and ultimately gain weight quicker. This directly affects their milk yield.

Downing<sup>2</sup> in his paper titled ‘Emerging Global Role of Small Lakes and Ponds: Little Things Mean a Lot’, presents the concept that little water bodies do a lot for the entire ecological systems. He carefully studied small ecosystems and proposed that ecosystems having small areal extent played a major role in global ecological processes of existence. He continued that the areal extent of continental waters is dominated by ponds and small lakes. They show a large functional intensity of many ecological processes and these can be seen through various seasonal cycles.

Ponds provide sustainable solutions to most of the major issues of water management being faced from the village to the global level. Thus, ponds, therefore, have been recognized as an important functional freshwater habitat<sup>4</sup>. They play a critical role in maintaining the environmental biodiversity. With sensitive planning at the village level these very ponds can bring about major benefits to the resident population in terms of:

- i. Rich, healthy Biodiversity

- ii. Promoting a Healthy Environment
- iii. Pollution alleviation and promotion of a clean environment
- iv. Conducive habitat for domestic animals
- v. Provide flood relief during heavy rains
- vi. Guards the environment against rapid climate change
- vii. Adds to an aesthetically appealing living environment for most villagers

The pond’s ecosystem is directly connected with the resident community the people, the decision-makers and the implementers. The ponds also helped maintain, to a large extent, the communities’ inherent cultural and economic resources. Ponds with good water quality are economically desirable all over the world.

The National Water Policy of India lays emphasis on the significance of ponds in India. These desirables have been underlined by several world bodies. The United Nation’s Sustainable Development Goals (SDGs) have mandated that it is essential to safeguard the planet’s water resources. By 2030 AD the world’s water requirement is expected to increase by 30%. It is important to realize that ecological and ecosystem security is a prerequisite for human and water security.

No doubt the demand for water has accelerated over the decades because of the escalating population size and unsustainable consumption and production patterns that have begun showing their debilitating impact in the current century. Competition for water has severely impacted upon the Earth’s ecosystems and biodiversity. Its worst effects are visible on populations in parts of the developing world where natural water resources have been depleted and artificial water recharging mechanisms have proven to be cost prohibitive.

**Significance of Ponds in the Village Habitat:** There is no universally accepted definition of the term pond. Ponds can be described as a body of still surface water which is either natural or man-made and is quite smaller than a lake. These small water resources are significant contributors to development of local communities, and marginalized lower income households especially in the urban areas. The village ponds are essential receptors and reservoirs for natural rainwater harvesting. They are providential for maintaining groundwater levels, naturally.

According to Dubey<sup>3</sup> who closely examined the biological diversity presented in village ponds and their crucial role in sustainable development established irrefutably that there is an undeniable equation between man and his environment.

Dubey<sup>3</sup> details that the village ponds “conserve and preserve the history, mystery and science of rural realities of developing, underdeveloped and partially developed nations.” We continue that ponds are “intricately wedded to biological identities carrying cultural concepts and social strains associated with religious tenets.”

**Biological Diversity of Indian Village Ponds:** The flora and fauna of the ponds protect and preserve a wide variety of organisms and micro-organisms. These include the amphibians, aquatic invertebrates, aquatic plants and some mammals. The smallest pond is normally infested by a huge variety of invertebrates like the dragonfly and damselfly. Species like pygmy damselfly (*Nehalennia speciosa*) and island darter (*Sympetrum nigrifemur*) are salient ones inhabiting and surviving in the pond ecosystem. These ponds are home to the medicinal leech (*Hirudomedicinalis*) and the water beetle (*Graphoderus bilineatus*) along with a number of other creatures that are determined by the lay of the land, the temperatures and the population pressures. Being a complete ecosystem the pond is home to several commonly sighted birds like the egrets, the pond herons, the red wattle lapwings, the cormorants, the kingfishers, the ducks, the geese, the swans and the cranes along with a variety of others. In some areas these ponds are breeding grounds for a large number of migratory birds.

The plants growing in the pond provide food, oxygen and shelter to animals. Ponds in the open are healthier than ponds in the shade because they have access to sunlight to make their food. The smallest plants in a pond are the microscopic phytoplankton which provide most of the food in a pond. The phytoplankton and larger algae form the first part of the pond's food chains. Pond vegetation grows in 'zones'. Plants like the great willow herb and meadow sweet grow in the bankside zone. They like damp places but are not true water plants. The yellow iris and mud-sedge grow nearest the pond edge or the marsh zone. The ponds are potent shelters for several categories of microbes. They comprise bacteria, protozoa, algae and rotifers.

#### **Dynamism of Pond Life and Biodiversity Value:**

Ponds have a distinctive life in which are featured different kinds of organisms which live in a number of networks that are interdependent and inter reactive. They share the available food to live and reproduce. Different types of foods are found in ponds because each animal eats different things. A pond, thus, may have combinations of three variant food webs. The first one is based on larger plants, the second one is based on decayed plants and the third is based upon algae. Ponds therefore provide significant sources of biological diversity in any geographic landscapes not only for plants and animals but it can be observed that ponds are central to the life and wholesomeness of the entire ecosystem in rural India. Since earliest civilizations villages have been known to originate around ponds. Rain water gets harvested naturally by the pond. It gets stored up, recharging the ground water and indicating the level of the water table in the village. Each pond has its own unique biodiversity, with all participants discharging their specific ecosystem functions.

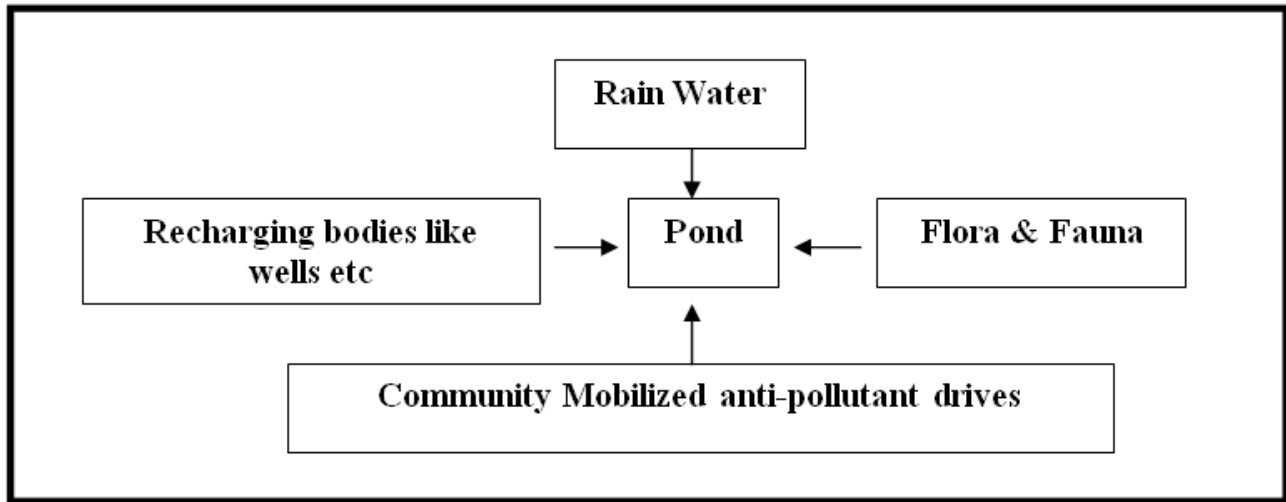

There is another important aspect that brings forth the socio-cultural significance of ponds. It is an established fact that village ponds have had and continue to have a deeply entrenched cultural and historical significance. Since centuries ponds have played a crucial role in maintaining and encouraging the vital link between people and wildlife. There are numerous socio-psychological links that have been established between ponds and their resident settlements. Several rituals are associated with ponds. There are several periodic, lesser or major monthly and annual fairs that are held on the banks of ponds. These are a significant salient reality even in the present times. The Biodiversity Value of ponds is reinforced on the basis of three fundamental truths:

- i. Their status as a critical habitat for uncommon and rare species
- ii. Their role as stepping stone habitats for upward or downward mobility of flora and fauna
- iii. Their value as thriving biodiversity hot spots

**Threats to Ponds Biodiversity:** Severe pollution of ponds is being done by the dumping of wastes, chemical pollutants like the powdery chemical fertilisers having nitrates that are washed off by rain into the nearby ponds. This rich supply of nitrogen causes water plants, like algae to grow rapidly. These plants use up much oxygen during the night and during their decaying processes that

virtually none is left for the remaining pond-life forms. This unmitigated growth also prevents sunlight from reaching the organisms below. The past century has seen about forty percent of the old village ponds being

choked and filled up for residential or pasture and even cropping purposes. Currently there are several villages in Punjab that are totally devoid of any water body.

**Figure 1: Interactive Relationships of Village Ponds**

The above figure gives the almost symbiotic relationship network that develops between ponds and their human, flora and fauna partners. These may be positive or negative depending upon the needs and exploitative overtures of the users of the pond environment.

**Government and Community Approach to Pond Restoration:** Most village ponds require a pragmatic approach for their eco-restoration. The channelization of free flowing rain water from the village catchments is essential for sustainable eco-restoration of ponds. Another significant task is the stocking of various niches of the pond with native vegetation and animals.

This essential task of systematic eco-restoration and sustained management of ponds requires several collective steps to be taken in tandem by individuals, groups and organisations acting in unison.

The Chief Minister of Punjab, had vide his D.O. letter dated 22<sup>nd</sup> March, 2012, detailed the problems related to the disposal of waste water and need of rehabilitation of village ponds in Punjab. He appraised the Minister for Rural Development, Drinking Water and Sanitation that

some pilot projects using the technology of UNICEF and Government of India had been in Ludhiana and Muktsar districts and should be replicated all over the State.

Subsequently, a team was constituted of various experts to study the situation of ponds and how they could be resurrected. The team looked into the status and survival of ponds in the following villages:

1. Village Mohlan, Mandal Malout, District Muktsar
2. Village Birk, Block Sidhwan Bet, District Ludhiana
3. Village Guru, Block Jagraon, District Ludhiana
4. Village Dewatwal, Block Ludhiana, District Ludhiana

The Waste Stabilization Ponds (WSP) do not require any electrical energy. They are extremely efficient. They efficiently remove excreted pathogens. The success and progress attained by WSPs is largely because the systematic stage-wise implementation of various steps of the process are measureable and standardized on the basis of internationally experimented and implemented procedures.

- i. The first stage of waste water treatment is the removal of large floating particles and heavy mineral particles like sand and grit. This is done by simple screening and grit removal a good duration before the raw waste water enters the other parts of the WSP.
- ii. Secondly, the measurement of the incoming waste water is important. This measurement is essential for determining diurnal flow variations and for constantly evaluating the performance of the treatment system.
- iii. The system comprises three treatment units:
  1. Anaerobic pond
  2. Facultative pond
  3. Maturation pond

The anaerobic and facultative ponds are designed for BOD removal and the maturation ponds are designed for faecal bacteria removal.

- a. **Anaerobic Ponds:** These are 2 to 5 metres deep tanks that receive high organic loading, more than 100 gms BOD/cum. Day. It is equivalent to 3000Kg./ha day, containing no dissolved oxygen and no algae. The primary function of these units is BOD removal.
- b. **Facultative Ponds:** These units are designed for BOD removal on the basis of low surface BOD loading. It is usually in the range of 100-400kg/ha day to permit development of healthy algal growth, because the Oxygen for BOD removal by pond bacteria is mostly produced by algal photosynthesis. Liquid depth usually in the range of 1 – 1.8 mts, 1.5 mts.
- c. **Maturation Ponds:** The main maturation pond reduces the number of excreted pathogens, mainly faecal bacteria and viruses present in effluents from the facultative ponds. These ponds are typically aerobic. The depth of these maturation ponds is about one metre. Shallow ponds are more efficient due to greater light penetration.

The principal mechanism for faecal bacteria removal in these and facultative ponds are:

- i. Temperature
- ii. High pH values

- iii. High light intensity

## Conclusions and Policy Implications

It has been derived from the foregoing narrative that rejuvenation and resurrection of village ponds is essential for the sustained promotion of human habitation conducive environments. Water is a rare source of life with increased ability to make informed choices. The following are some suggestions that may have policy implications at the state and national level.

- i. Waste Stabilisation Pond<sup>5</sup> technology is the simplest, suitable technology to treat waste water in rural areas.
- ii. Places having high water table may be in danger of ground water pollution.
- iii. A protocol for ground water quality monitoring should be developed to regularly monitor ground water quality near such WSPs.
- iv. Boulders can be used for inner embankment of ponds, up to the waste water level to check soil erosion.

Convergence with various government departments is envisaged, especially the Departments of Rural Development, Health as well as Forests and Environment besides Water and Sanitation. All these departments need to pool their efforts in giving a new lease of life to the stagnating pond wealth of Punjab. Needless to say this would not be practicable without the total participation of the community.

# **A Study on Work Life Balance and Stress of Female Employees in IT Sector: A Study with Special Reference to Employees in Chennai**

**Mary Sudharshini Fernando<sup>1</sup>, M. Kavitha<sup>2</sup>**

*<sup>1</sup>Ph.D. Research Scholar, <sup>2</sup>PG Professor & Research Supervisor, Department of Commerce,  
VISTAS, Pallavaram, Chennai.*

## **Abstract**

The main aim of this study is to find the work life balance and it causing stress among the female employees working in IT sector. The primary data is collected by using primary method such as questionnaires. For this study questionnaires are used to collect primary data from the respondents. Factor analysis is used to find the result by the researcher. The results shown that Work-life-balance is an important issue in IT profession. In today's competitive era, with changing demands, regulations and so much pressure the work needs have increased a lot. This leads to increase in stress level of the female IT employees. Majority of the respondents expressed that there is no separate policy for work life balance in their organisation and many people were doing work overtime.

**Keywords:** *Work life balance, Stress, Job Performance.*

## **Introduction**

Every individual is an integral part of the family in particular and the society in general. In today's business world, employee performance is key determinant in the achievement of organizational goals. As a result, organizations look for different ways of motivating their employees, in order for them to give their best to the organization. Employee performance is a focal point in any establishment. Every policy should be geared towards increasing the employee performance. For organizations to remain on top they should be able to improve their employee performance and monitor it. In a situation where this does not occur, they are liable to face several challenges which stands as a set back to the organization in the sector where they belong.

Work life balance is a very important phenomenon that is of great concern to various employees in both private and public sector. It goes beyond prioritizing the work role and one's personal life. It also affects the social, psychological, economical and mental well being of the individual. All these is been reflected in the output of the individual, which affects his or her performance in the work place on the long run. Work life balance

has implication on employee attitudes, behaviours, wellbeing as well as organizational effectiveness (Eby, Casper, Lockwood, Bordeanx and Brindley, 2005). The competition for market leadership in the banking sector, may lead to bank managers giving their employees excessive work load in order to meet up with their target. Employees try their best to be retained in the organization by putting in more time at work which may be at detriment of their personal life. All these may affect the upbringing of children, lead to broken and unhappy homes and poor social life.

The conventional wisdom indicates that a happy worker is a better worker. But it seems that the employers find it difficult to understand this fact. We all experience pressure on a daily basis. We need it to motivate us and enable us to perform at our best. However, when the pressure becomes excessive, it leads to stress. Many of the stressful life events are related to the workplace, e.g. lack of job security, changes in working hours, changes in working conditions, layoffs, downsizing, organizational readjustments, etc. IT industry in India has long been exempted from labour regulations in order to facilitate its rapid growth and competency in the global market.

Although this is a sound argument in the wake of our developing economy struggling to sustain and expand economic growth, yet it needs to be checked whether the burden is not being borne by the industry's labour force.

The recent past is a witness to changes in work schedules. A larger part of the IT sector is hence moving from a standard eight-hour a day regime to operating twenty four hours a day for seven days of the week. Many employees need to work on Saturdays and Sundays too. Moreover, there is a changing pattern in the working hours which is quite different from the standard one, which normally operates from 9 am to 5 pm. While some employees work in the standard time some others need to be available for work that normally starts early in the evening and continues well through the night. Sometimes they need to even work beyond the normal eight hours. Increasing workloads have pressurised employees to demonstrate their commitment to work in more obvious ways. Consequently, a larger part of them have tended to be present at their work place for longer periods of time, thereby reducing the time for which they are available at home.

Employees who start to feel the pressure to perform are likely to get caught in a downward spiral of increasing effort in order to meet rising expectations but no increase in job satisfaction. The internet and mobile phones have made it possible for the organizations to keep in constant touch with the employees both during the day and at night. To a large extent in the IT sector, the employee is expected to be engaged on the job almost at all times. Consequently, there are growing reports of stress and work imbalance. The constant requirement to work at optimum performance takes its toll in job dissatisfaction, employee turnover, reduced efficiency, illness and even death in some cases. Absenteeism, alcoholism, bad or snap decisions, indifference and apathy, lack of motivation or creativity are all by-products of an over stressed workplace. So the distinctions between work-life and family-life have vanished.

**Review of Literature:** Chassin et al. (1985) found three types of conflicts in their research on a sample of 83 working parents who have pre-school kids. These differences were related to (a) the demands of multiple roles, (2) between role expectations of self and spouse, and (3) lack of congruence between expectation and reality of roles<sup>4</sup>.

Frone et al. (1992a) in their randomly drawn sample

of 631 comprising 278 male and 353 female respondents also found that work to family conflict is more prevalent than family to work conflict. Their study suggested that family boundaries be more permeable to work demands than are work boundaries to family needs<sup>8</sup>.

Bachmann (2000) found that work arrangements such as flexi-time, telework ethic are depicted as an important component of an individual's work preference towards work time. There is a suggestion that such work arrangements will help the employee achieve a better blend between their work and non-work activities. This will assist the organizations recruit, retain and motivate their workforce<sup>1</sup>.

Hochschild (1997) has observed that to enhance commitment to an organization, the promotion of work life balance policies is of a compulsory interest to the governing body<sup>10</sup>.

**Burke (2002)** noted that an organization that supports work life balance is preferred by both women and men. The benefit for Men appeared to be more than women. Satisfaction was more for Men when their achievement in job was more even at the cost of ignoring the family. On the other hand, women emphasized the need to strike a balance between work and family sources for their gratification. Women feel unhappy, disappointed and frustrated when work prevents them from taking care of their family. Women do not like the crisscrossing of the boundaries between work and home<sup>3</sup>.

**De Bruin and Dupuis, (2004) and Greenblatt (2002)**, emphasized the integration of the work and non-work roles of employees. Then the levels of multiple-role conflict, and the associated stress and job-dissatisfaction, can be minimized or avoided<sup>5</sup>.

**Doherty (2004)** in the study on working life balance initiatives for women in the hospitality industry explored the main barriers to advancement into managerial roles. It was found that managerial roles called for long working hours<sup>7</sup>.

**Grady and McCarthy (2008)** in their study defined that work-life integration is an outcome of the complex relationship between the dynamics of employment and personal factors. They found the balance between work and life is achievable through the funding and coordination of multiple activities which included the organization's interest. Children were given first priority by the respondents exhibiting a deep sense of motherhood.

Factors like work stimulation, challenges, achievement and enrichment were given high importance and sought more self-care time to balance work and family<sup>9</sup>.

**Baral (2010)** studied 485 employees working in varied organizations in India found that working men and women in India experience more work family enrichment than the work family conflict. It was also found that there were no gender differences in the employee perception of work family enrichment<sup>2</sup>.

**Desai et al (2011)** found that home-based working women had less stress, able to adjust better and were more satisfied with their careers<sup>6</sup>.

**Objectives of the Study:**

- To find out problems faced by women employees in IT sector
- To determine the factors affecting work-life balance and causing stress
- To examine the effect of work life balance on Job performance

**Hypothesis of the Study:**

1. There is no significant difference among the factors influencing work-life balance.
2. There is no significant impact of Work life balance on the Job performance of the female employees.

**Research Methodology:** Research methodology is a method to solve the research problem research systematically. It involves gathering data, use of statistical techniques, interpretations and drawing conclusions about research data. Keeping in view the objectives of the study, data is collected from the following sources. Source of data are:

- Primary data
- Secondary data

**Primary Data:** The primary data is collected by using primary method such as questionnaires. For this study questionnaires are used to collect primary data from the respondents.

**Secondary Data:** Secondary data collected from various journals, websites and other research reports.

**Sample Size:** Under this research 50 respondents in Chennai opinion are being to obtained on the basis of convenient sampling method.

**Analysis and Interpretation:**

**Factors affecting work-life balance:** The factor analysis results in five important work-life-balance factors of the respondents and the names were considered based on the list of items under each component and the respective loadings of the item. The Eigen value and the percent of variance explained by factors are presented in the below table

**Table 1: Factors Constituting Work-Life-Balance**

Sl. No.	Factors	Number of variables	Eigen value	Percent of variation explained	Cumulative percent of valuation
1.	Job Nature	9	13.001	12.841	12.841
2.	Work Load	7	2.081	11.336	24.177
3.	Work environment	10	1.838	13.303	37.480
4.	Organizational support	6	1.428	10.864	48.343
5.	Family Domain	3	1.316	7.838	56.182

**Source:** Computed Data

It is clear from Table 4 that five dominant work-life-balance factors, which consist of thirty five work life-balance components, accounted for 56.182 percent of total variance.

**Inference:** ‘Job Nature’ is the dominant factor that influences the work-life-balance since its Eigen value

and percent of variation explained are 13.001 and 12.841 respectively. Work load is the next significant factor with Eigen value of 2.081 and percent of variation explained is 11.336. ‘Work environment’ is the third important factor followed by ‘Organisation Support’ and ‘Family Domain’ in terms of their Eigen value of 1.838, 1.428

and 1.316 and percent of variation explained with value of 13.303, 10.864 and 7.838 respectively. It is concluded that ‘Job Nature’, ‘Workload’, ‘Work Environment’, ‘Organizational Support’ and ‘Family Domain’ are the predominant factors of work life balance.

**Relationship and Impact of Work Life Balance on Employee’s professional life:** Correlation analysis was carried out to study the relationship between work

life balance and professional life of working female employees. The results were shown in the below table.

**Table 2: Professional Life**

Work life balance	Pearson Correlation	.594
	Sig. (1 – tailed)	.000

Source – computed data

**Table 3: Showing Coefficients**

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	6.053	1.30	.594	5.231	.000
Worklife balance	.612	.085		6.943	.000

Dependent Variable: Professional Life

Source: Computed data

Value of t for human resource system comes out to be 6.943, p value is .000 and beta value is .594 which is significant at 5 percent level of significance. Thus null Hypothesis 2 was not accepted in this regard.

**Inference:** The result depicted significant positive relationship between work life balance and employees’ professional life. Coefficient of correlation 0.594 is significant at 5 percent level of significance. The result depicted that there exists a significant positive relationship between work life balance and female employees’ professional life.

Thus there is significant impact of work life balance on employees’ professional lives. Hence there must be focus on improving the work life balance which will further improve their professional life leading to more productive and efficient staff.

**Findings and Conclusion**

Work-life-balance is an important issue in IT profession. In today’s competitive era, with changing demands, regulations and so much pressure the work needs have increased a lot. This leads to increase in stress level of the female IT employees .Majority of the respondents expressed that there is no separate policy for work life balance in their organisation and many people

were doing work overtime. Also management has not done much in terms of designing and implementing effective work life balance policies and practices. If the personal and professional lives of female employees are balanced, they can devote more time to their children and can focus on their upbringing. It was found that the number of hours worked per week, the amount and frequency of overtime, and inflexible work schedule increase the likelihood of employees to experience conflict between their work and family roles as it kills their time to perform family related activities.

Also there is significant positive relationship and impact of work life balance on employee’s professional life. Study also revealed some of employees feel so stressed that they are not able to handle family responsibilities even after coming from workplace as they feel so tired and exhausted because of long working hours. Breaks are also very short so they were not able to take proper rest. However, their company provides no policy as such to help their employees meet their family commitment. Thus focus must be there in making policies that can help the female employees to have balance between the two.

The study was also able to measure women IT employees’ work-life-balance and found that ‘frequently extended work schedule’, ‘frequent

changing requirement of clients', 'role overload', 'lack of flexible options' and 'unrealistic deadlines' are some important determinants which influenced women employees' work-life-balance. The analysis also reveals that five factors namely, Job Nature, Work Load, Job Environment, Organizational Support, and Family Domain constitute work-life-balance of women professionals. The result of correlation analysis also confirms the positive correlation among the above five factors. The companies in IT industry may consider the above five factors and modify their HR policies suitably and create conducive work environment to maintain work –life-balance among women professionals so as to improve their performance.

## Abstract

**Background:** The prosthodontic management of the edentulous patient has always been a major challenge to prosthodontists. Patients wearing conventional complete dentures often complain about the instability and dissatisfaction especially with lower dentures. Implant retained over dentures help to solve this instability problem. Masticatory efficiency and biting force is a major indicator of functional state of masticatory system and its measurement is an important parameter during treatment planning.

**Materials and Method:** This study involves the use of miniature load cell to determine the maximum biting force and color changing chewing gum to evaluate masticatory efficiency in 20 edentulous patients wearing conventional complete dentures and comparing it with implant over dentures retained ball and bar retained over dentures. Paired t-test and Anova test were applied to statistically evaluate the data.

**Results:** Indicated that patients with bar retained implant over dentures demonstrated significant levels of masticatory biting force and masticatory efficiency as compared with ball retained over dentures and ball retained over dentures showed better results upon conventional complete dentures.

**Keywords:** Conventional complete dentures, Implant Retained Overdentures, Maximum Biting force, Masticatory efficiency.

## Introduction

The prosthodontic management of the edentulous patient has been a major challenge to prosthodontists. Most prosthodontists consider treating such patients with complete maxillary and mandibular dentures as a traditional standard of care. Mandibular residual ridge provides less than 1/4<sup>th</sup> of the support offered by the periodontium to natural teeth, yet patients expects that

their prosthesis to replace natural teeth. Most elderly patients face problems adapting to their lower denture due to lack of bone support resulting in less retention and stability resulting in difficulty to chew and eat.<sup>1</sup> This instability leads to a feeling of insecurity, inefficient function, and overall dissatisfaction with the prosthesis. Patient's expectations urge and desire for better masticatory functions is prime factor for treating with implant-supported or retained dentures.

Prosthodontists focus on the restoration of osseointegrated dental implants has evolved dramatically in the two decades.<sup>2</sup> An axiom of treating patients with implants is to provide the most desirable and predictable yet cost-effective modality of treatment that satisfies the patient's anatomical needs and personal expectations.<sup>3</sup> Many studies conducted to evaluate the masticatory performance and oral function showed a significant

e-mail: md\_abidhussain@yahoo.co.in

improvement in cases treated with implants in the mandibular arch.<sup>4-7</sup> Researchers recommend fabricating over dentures by placing two mandibular implants rather than treating with traditional conventional complete denture prosthesis as the first treatment option.<sup>8,9</sup>

Implant overdentures can be retained using a variety of attachment types and designs. Most companies are fabricating and marketing newer and better attachment systems. Amongst the varieties available, a few systems are quite popular and frequently used are ball and socket, bar and clip, magnets and newer mechanical attachments. Prosthodontists select a system based on his experience, ease of use, availability and patient's economic status. Either splinting implants with a bar or individual un-splinted implants connected to the overdenture using O-ring attachments have been preferred. The precise selection and placement of attachments may, however, affect the clinical success of implant-retained overdentures.<sup>10</sup>

The rehabilitation of edentulous patients, primarily to restore the masticatory functional status may be of critical value. The rationale that patient's masticatory efficiency and bite force improves is a bit point of concern before fabricating a conventional complete denture and comparing with implant-supported or retained dentures.<sup>11-15</sup> The aim of this study was to evaluate and compare the masticatory efficiency and masticatory bite in conventional complete dentures and implant retained over dentures with different types of attachments.

## Materials and Method

Twenty edentulous patients participated in this study, aged between 40-65 years (Mean 54±1.2 years). Patients selected were free from any systemic/local, acute or chronic diseases that might contraindicate the placement of the implant. All subjects had good oral hygiene, class-I type of ridges with enough height and width covered by normal thickness of muco-periosteum. The informed consent was obtained from all the subjects prior to the start of treatment. This study was approved by the Ethics Committee, Pacific Dental College, Udaipur, Rajasthan, India. Detailed Intra and extra-oral along with radiological examinations (OPG and CBCT) and routine blood investigations were carried out for each patient.

Fabrication of Conventional complete dentures (CCD): It was fabricated in heat cure Polymethyl-methacrylate resin with all standard procedures for

each patient and inserted and left for one month to get accustomed to the denture (Figure 1).

**1. Dentures after insertion**

**2. Surgical drilling for implant**

Fabrication of surgical template: By duplicating each patient's lower dentures, template was fabricated. 2mm diameter metal balls were placed at inter canine region. The stent was checked in patient's mouth for correct positioning.

**Patient preparation for implant surgery:** According to standardized two-stage protocol, two implants with 3.3 or 4.1mm diameter and length of 10 or 13 mm. were placed per patient at the right and left mandibular canine and first premolar regions (B and D positions) under local anesthesia and single dose of prophylactic antibiotic coverage (Figure 2). The implants were left submerged for 3 months to osseointegrate. The patient was instructed to discontinue denture for 15 days following implant surgery and was recalled after two weeks for relining with softliner.

**3. Ball abutments fixed on implant**

**4. Bar fabricated and tried on cast in lab**

After three months, second-stage surgery was performed to place healing caps. 1-week later healing caps were removed; ball and socket attachments were replaced over the fixture (Figure 3). The intaglio surface of the denture was modified that to accommodate O-Ring attachments and the denture was reinserted and left for 2-3 weeks. The patient was recalled, and evaluation of the masticatory efficiency and bite force was done, the ball and socket attachments were replaced by bar and clip attachment with standard prosthodontic technique (Figure 4). Masticatory efficiency and masticatory biting force were evaluated with predetermined methodology and the data collected was statistically evaluated.

**Bite force measuring appliance:** It is measured by several devices as reported in literature most commonly used is the sieving method.<sup>24</sup> Nowadays, sensitive electronic devices which are more precise (80%) and accurate (10 N) to record the bite force (50-800 N) are available. These devices use load cells (transducers) to

convert force to electrical energy which is amplified directly and then transferred to threshold-detection circuit in which the output signals are recorded on computer screen.

**Measuring the biting force:** One month after dentures insertion, the subjects were recalled and bite force recording procedure demonstrated. The Ultra-Miniature Load Cell transducer was covered with putty rubber base and fitted onto the occlusal surface between second premolar and first molar. Similarly, a metal piece with same dimensions of the load cell was also covered in putty and placed in the same region but on contralateral side to counterbalance the force. Patient was instructed to occlude in desired position until the material sets to form a bite (Figure- 5). Later again the patient was directed to bite on both sides for three seconds and repeat thrice with a one-minute rest between trials. Thus, biting force on both sides for conventional complete dentures and average values were recorded. After replacing the healing caps with ball and socket attachments, the patient was recalled after 3 weeks; the bite force test was recorded on both sides as mentioned above for conventional dentures and was similarly repeated after replacing the ball and socket attachment with bar clip attachment. All the data recorded was collected was statistically evaluated.

**5. Load cell and metal piece in silicone putty**

**6. Xylitol color changing gum.**

**Masticatory efficiency:** It was evaluated with a color changeable chewing gum XYLITOL as a test item. The color of this chewing gum changes as the patient bites and the chewing strokes proceeds, masticatory efficiency can be evaluated by visual assessment. Subjects were given one-third quantity (1g) of chewing gum(Figure 6) and instructed to chew with 15, 30, and 45 strokes, respectively. All patients chewed the gum at a constant pace of one stroke per second until the assigned strokes this was repeated thrice. Every bolus of the chewing gum was picked immediately after 15, 30, 45 strokes and placed between two polyethylene films and compressed between two glasses plates to a thickness of 1.5mm to evaluate its color with scale provided by the manufacturer.

## Results

The data collected was statistically evaluated using SPSS software. The masticatory bite force was evaluated statistically by *t*-test. The mean bite force in patients using implant retained overdentures was more than double compared with conventional dentures. The mean bite force range for *n* = 20 patients. The paired sample *t*-test showed that no significant differences for the mean and standard deviation values for right and left sides within the same groups of conventional complete dentures, Ball IOD and Bar IOD (Table 1). However, it was observed that there were high significant differences in patient’s ability for maximum biting force when comparing for the right and left sides between CCD and both of Ball IOD & Bar IOD. In contrary, there were significant differences of maximum biting force in the right and left sides between Ball IOD and Bar IOD (Table 2).

**Table 1. The mean values and standard deviations of maximum biting force in Conventional complete denture (CCD), Ball retained implant overdenture (Ball IOD) and Bar retained implant overdenture (Bar IOD).**

		Mean ± S. D	Std. Error Mean	t	P
CCD	Right	4.823± 0.419	0.081	1.421	0.170
	Left	4.615± 0.402	0.077		
Ball IOD	Right	9.778± 0.666	0.147	1.801	0.083
	Left	9.367± 0.666	0.148		
Bar IOD	Right	9.862± 0.684	0.151	1.432	0.161
	Left	9.859± 0.691	0.152		

**Table 2. The mean difference values and standard deviation difference values of maximum biting force between CCD & Ball IOD, CCD & Bar IOD, and Ball IOD & Bar IOD.**

Side	Pair	Paired Differences		t	p
		Mean ± SD	Std. Error Mean		
Right	CCD – Ball IOD	-6.912 ± 0.6117	0.1000	-57.634	0.000**
	CCD – Bar IOD	-7.058 ± 0.5418	0.104	-58.366	0.000**
	Ball IOD – Bar IOD	-0.089 ± 0.1396	0.027	-3.309	0.003*
Left	CCD – Ball IOD	-6.971 ± 0.6073	0.099	-57.776	0.000**
	CCD – Bar IOD	-7.054 ± 0.5488	0.105	-57.985	0.000**
	Ball IOD – Bar IOD	-0.097 ± 0.1322	0.026	-3.626	0.001*

**Masticatory efficiency:** No significant differences in color scores was noted using paired sample t test between the right side and left side with conventional

dentures during the 15, 30 and 45 strokes (*p*>0.05) and during the 15 and 30 strokes with Ball IOD and Bar IOD. However, with 45 strokes, significant difference

was reported between the right side and left side in all the three groups (Table 3). When comparison was done using paired t test, the results indicated that a very high significant difference in color scores with 15 chewing cycles as compared between the CCD versus Ball IOD and CCD versus Bar IOD ( $p<0.001$ ). However, significant difference was noted between the Ball IOD versus Bar IOD ( $p<0.05$ ). For 30 chewing cycles, high significant differences in color was noted between the CCD versus Ball IOD, the CCD versus Bar IOD and the Ball IOD versus Bar IOD ( $p<0.001$ ). High

significant differences in color scores was recorded with 45 chewing cycles between the CCD versus Ball IOD, the CCD versus Bar IOD and the Ball IOD versus Bar IOD ( $p<0.001$ ). In case of Bar IOD, a high significant difference in color scores between 15 versus 30 chewing cycles and 30 versus 45 chewing cycles ( $p<0.001$ ) was noted. The one-way ANOVA (F) test showed that with 15, 30 and 45 chewing cycles there were high significant differences in color scores between the CCD, Ball IOD and Bar IOD ( $p<0.001$ )(Table 4).

**Table 3. The mean values of color scores during chewing color changeable gum with CCD, Ball IOD and Bar IOD.**

## Discussion

The teeth loss in elderly patients not only disables their stomatognathic system but also their psychological status, social status, self-esteem and quality of life.<sup>16-19</sup> The rehabilitation of these patients using conventional dentures, regardless of the quality, fails to completely solve either functional or psychological problem.<sup>20,16</sup> Mandibular implant-supported removable overdentures have shown to provide significantly superior function and patient satisfaction in chewing ability and comfort.<sup>21-24</sup> Bite force evaluation in edentulous patients has been investigated by many researchers with an objective to understand the mastication mechanism and its therapeutic effects on prosthodontic appliances.<sup>25</sup>

In this study, masticatory bite force was measured by using miniature load cell. When comparing the effect of conventional complete denture and over denture attachments on the maximum biting force. The result of the present study found that the maximum biting force when using over denture supported by bar attachment was significantly highly increased, than with the conventional denture and over denture supported by ball and socket attachment. This was similar to the results obtained by similar studies.<sup>26-29</sup> Also the maximum bite force generated by subjects with Ball IOD was significantly lower than that generated with a bar-clip or bar IOD. This was similar to results obtained by Haas R et al.<sup>30</sup> The result of the present study found highly significant differences in masticatory efficiency between the conventional denture with overdenture supported by bar attachment (Bar IOD) and the conventional denture with overdenture supported by ball and socket attachment (Ball IOD). This was in accordance with the results of Chen et al.<sup>31</sup>

While, when comparing the effect of over denture supported by bar attachment and over denture supported by ball and socket attachment on the masticatory efficiency at different masticatory cycles (15, 30 and 45). The result of the present study found significant increase in the masticatory efficiency when using overdenture supported by bar attachment. The results also demonstrate that the patients restored with implant supported overdenture showed higher masticatory efficiency than those restored with conventional dentures. However, between bar and ball the differentials were significantly different. This was in agreement with the results obtained in other studies.<sup>27,30</sup>

## Conclusion

This study concluded that the mandibular implant Over Dentures (both Ball and Bar) were found to be clinically more retentive and stable than the Convention complete dentures. This insufficiency of conventional denture treatment makes mandibular implant overdenture a preferred option, furthermore it is simple, minimally invasive, highly predictable, efficient, affordable and attractive treatment option. Bite force is very important parameter for implant selection and prosthodontic case planning especially in edentulous patients who can deliver very high occlusal loads. Patients rehabilitated with overdenture retained by ball or bar clip attachments had significant improvement in masticatory performance (bite force) and masticatory efficiency when compared with conventional dentures. However, the masticatory performance and efficiency still was found to be significantly lower in ball IOD as compared to Bar IOD subjects. The result of the present study concluded that the maximum bite force increased significantly (more than the double) after implant treatment. Also, highly significant increase in maximum bite force occurred with the bar clip attachment in comparison with conventional denture and over denture supported by ball and socket attachment.

# Concept Mapping as a Clinical Learning Strategy on the Competency Scores of Nursing Students

Jasmine Joseph<sup>1</sup>, Hemalatha R.<sup>2</sup>

<sup>1</sup>PhD Scholar, Shri JJT University & Principal, Krupanidhi College of Nursing, 12/1, Chikka Bellandur, Carmelaram P.O., Varthur Hobli, Bangalore, <sup>2</sup>Principal, Universal College of Nursing, Nirmalaram Campus, Arekere, IIM B P.O., Bannerghatta Road, Bangalore

## Abstract

**Background:** Nursing students are valuable human resources. Therefore, its crucial to detect potential clinical difficulties experienced by the nursing students and identify appropriate ways to enhance their learning as well as academic and clinical outcome.

### Objective:

1. To determine the effect of concept mapping on the clinical competency scores of nursing students.
2. To compare the clinical competency scores of the subjects during the first few weeks of training in concept mapping

**Method:** Quasi experimental research study with Posttest only design was used to accomplish the purpose of the study. The study setting comprised of two private nursing colleges offering diploma, degree and PG program in nursing. Data was collected from the II and III B.Sc. Nursing students in both the college. Convenient sampling was used in the study. The study sample consisted of 136 student nurses. The data collection tool comprised of assessment of 1) Baseline Performa of the students and 2) Concept map clinical grading rubric to evaluate the concept maps

**Result:** Based on the findings of the study there was a significant improvement in the competency of concept map preparation. This was evidenced by the increase in competency scores from week one to week two and three.

**Conclusion:** The technique was beneficial for the students as well as educators who had noticed change in the performance of the students who practiced the concept mapping technique. It also enhanced the students to prioritize the need and the care to be provided to the patient.

**Keywords:** *Concept mapping, clinical learning strategy, competency, nursing students.*

## Introduction

Nursing students are valuable human resources. Therefore, its crucial to detect potential clinical difficulties experienced by the nursing students and identify appropriate ways to enhance their learning as well as academic and clinical outcome. Identifying factors affecting productivity among nursing students can help nursing educators to find ways to increase the learning as well as academic outcome<sup>1,2</sup>

Certainly, stress in the college setting cannot be eliminated, but preparing the student nurses to manage it properly can do a better task<sup>3</sup>. The researchers has observed that traditional nursing education is not optimal in promoting learning and is laden with problems<sup>4</sup>. Traditional education also known as basic, conventional education refers to long established customary education that society has traditionally used in schools. It is concerned with the teacher being the controller of the learning environment<sup>5</sup>. Recent advances in technology have unlocked entirely new directions for educational research. Many institutions are moving towards innovative method of teaching as a solution to produce graduates who are creative, think critically, be analytical and able to solve problem independently<sup>6</sup>.

Today technology has made teaching and learning interesting and interactive. There are many different method like concept mapping, blended learning, e-learning, virtual and hybrid labs which are widely used today for teaching students. Concept mapping is the visual presentation of the key concepts in relation to a specific subject matter. They are useful tools that are utilized in order to represent the structure of knowledge in a form that is mentally compatible with the way human beings construct meaning. Students who use meaningful learning method tend to retain knowledge over time. They also find ways to connect new information with prior learned materials<sup>7</sup>. Concept mapping can influence student's perceptions of the learning environment and subsequently their study experiences, learning outcomes, and ultimately the clinical judgment and patient care<sup>8</sup>.

Concept mapping learning strategies in nursing education is expected to promote nursing students to be actively involved in self-regulated learning, to transform traditional one-way delivery of knowledge to cultivate patient-centered teaching and learning model<sup>4</sup>. There were not many studies done in India, especially in the clinical setting to assess the development of clinical competency in the application of theoretical knowledge to the clinical setting, the researcher felt the need to identify the effectiveness of concept mapping on the clinical competency scores of nursing students.

Objective: To determine the effectiveness of concept mapping as a clinical learning strategy on the competency scores of nursing students

## Materials and Method

Quasi experimental research study with Posttest

only design was used to accomplish the purpose of the study. The study setting comprised of two private nursing colleges who are offering nursing education for more than 25 years and were offering diploma, degree and PG program in nursing. Data was collected from the II and III B.Sc. Nursing students in both the college.

Convenient sampling was used in the study. Statistical power analysis was calculated to determine the required sample size and was estimated as 100. The actual sample consisted of 136 B.Sc. Nursing II and III-year students. The subjects were in the age group of 18 to 25 years and 9% of subjects were males. Total enumeration sampling technique was used for the study in order to help eliminate potential bias occurring through sampling technique.

Thirteen clinical teachers assisted the students in the clinical area for the study. The clinical teachers comprised of both nursing educators with more years of teaching experience and those who have just obtained their graduation in nursing.

Non - probability convenient sampling technique was used for the study and based on the inclusion and exclusion criteria the subjects were selected for the study.

### Instruments Used for the Study

**Baseline Performa of subjects:** This was designed to collect the baseline information of the subjects such as age, gender, year of study, religion, clinical and academic details

Evaluation tool for concept map: Concept map clinical grading rubric was used to evaluate the concept maps that were prepared by the subjects. This consisted of a rating scale with 10 items according to the components of the care plan such as history, lab investigations, medications, nursing problems & interventions.

The Likert type scale consisted of 10 items and the score ranged from 10 to 40. A score of 1-10 was considered as Unsatisfactory, while 11-30 was satisfactory score whereas a score of 31-40 was considered as exceeds expectation.

**Method of Data Collection:** Ethical approval was obtained from the college authority and consent from the participants was voluntarily taken after they had been instructed about the research. Data was collected before the training session on Baseline characteristics of the

sample. The students were trained on the preparation of concept map and its technique. The preceptors were provided with the skill orientation program. The subjects were asked to prepare a concept map for the given case vignette. The prepared concept map was evaluated using concept map clinical grading rubric and scoring was done. During the clinical posting students were made to prepare 1 to 2 concept map per week for 3 weeks duration based on their patient assignment. The students worked individually to collect relevant information from their assigned patient to design concept mapping. One map each per week was considered for the evaluation.

Initially this was a group activity and after 2-3 maps they developed the requisite skill in preparing the concept map. Then they proceeded to individual activity. Student's benefited from the peer discussions during the individual and group activity. Students also had to familiarize themselves on referring the textbook and preparing the relevant content. Once they were familiar with the process of concept map preparation, they were trained to use the tool in the clinical setting.

**Findings:**

**Table 1: Comparison of competency scores for assessing concept map during the first few weeks of training n = 13**

Competency of concept map over the weeks	Mean	Std Deviation	95% CI	
			Lower Bound	Upper Bound
CM Week1	15.59	4.81	14.78	16.40
CM Week2	24.39	5.66	23.44	25.34
CM Week3	29.94	4.93	29.12	30.77

Table 1 shows the level of student's competency in preparation of concept maps during three different observations. The first test was done during the 1<sup>st</sup> week immediately after the training on concept mapping. This was designated as CM<sub>1</sub>. At a gap of 1 week the 2<sup>nd</sup> and 3<sup>rd</sup> test was done. The table indicates that the competency mean score has increased from CM1

(15.59± 4.81) with 95% Confidence interval (14.78, 16.40) to CM2 (24.39±5.66) with 95% Confidence interval (23.44, 25.34) to CM3 29.94 ± 4.93 with 95% Confidence interval (29.12, 30.77). The data shows that there was significant improvement in the student's clinical competency scores during week 1, week 2 and week 3 from the application of concept mapping.

**Table 2: Test for Homoscedasticity in repeated measures ANOVA**

Within Subjects Effect	Mauchly's W	Approx. Chi-Square	df	Sig.	Epsilon		
					Greenhouse-Geisser	Huynh-Feldt	Lower-bound
Time	.94	8.42	2	.015	.944	.956	.500

Table 2 represents the extend of violation of sphericity. Using repeated measures of Analysis of Variance Mauchly's Test of Sphericity shows that Chi Square value = 8.42 with 2 degree of freedom and

P=0.015, indicating the variance in the data are unequal and therefore further analysis is carried out using Greenhouse- Geisser test for ANOVA

**Table 3: Distribution of mean difference in Concept mapping Competency scores over the weeks**

Mean Difference in CM scores from week 1, 2 & 3	df	Sum of Squares	Mean Sum of square	F	P
Weeks	1.887	14560.523	7714.194	396.885	<0.001
Error	260.475	5062.811	19.437		

Table 3 showed that, over a period of time from week one score (CM1) to week three score (CM3) there is a significant improvement in competency score among the group. The repeated measures ANOVA for concept mapping is found to be statistically highly significant (F = 396.885, P < 0.001). Hence a post-hoc test was carried out to test the significance difference of means from

Week1 to week2 and Week2 to week3. The post hoc test revealed that the mean scores differed significantly during each week. Hence it is inferred that there was statistically significant improvement in the competency scores of subjects after 3 weeks from the application of concept mapping in the clinical care setting.

**Table 4 Comparison of concept mapping scores from week 1 to week 3**

Comparison of CM score over the weeks	Week	df	Sum of Squares	Mean Sum of square	F	P
Weeks	1 to 2	1	10760.640	10760.640	241.052	<0.001
	2 to 3	1	4287.655	4287.655		
Error	1 to 2	138	6160.360	44.640	118.196	<0.001
	2 to 3	138	5006.345	36.278		

The first test was done during the 1<sup>st</sup> week immediately after the training on concept mapping. This was designated as CM<sub>1</sub>. At a gap of 1 week the 2<sup>nd</sup> and 3<sup>rd</sup> test was done. The post-hoc test shows that there is a highly significant improvement in the competency score from CM1 to CM2 (F= 241.052, P= <0.001). Similarly, a significant improvement was also observed from CM2 to CM3 (F = 118.196, P= <0.001)

It is evident from the above table that training program on concept mapping has an effect on the competency scores of subjects which improved from week 1 to week 2 and week 3.

**Discussions**

The usefulness of concept mapping as a learning strategy was determined by monitoring the competency scores of subjects. This was compared over the first three weeks of the training program. Findings of this study was consistent with the previous studies on concept mapping and the mean concept map scores increased significantly<sup>9,10</sup>.

In the beginning, the nursing students expressed some difficulty & concerns and it was necessary to make them comfortable with the process of preparation. Hence initially the preparation of concept map was done as a group activity and when the subjects attained requisite skill in preparation of the map it was converted to individual activity. Several other studies have reported that some students felt “lost” while others expressed difficulty in choosing the right words or phrases<sup>11,5</sup>. This was considered to be difficult in the beginning.

The first concept maps were poorly written and structured making them not very useful, but with practice it improved. One of the students stated that “This is a new method and we are finding it interesting and fun”. With time and effort, the competency scores improved indicating improvement in the nursing student’s knowledge and skill. Some of them expressed “we wish we could have used this method from the beginning of the academic year”.

The competency score of the nursing students increased significantly from week 1 to week3. The average and slow learners were found to benefit more

by the use of concept mapping techniques. During the orientation as well as post clinical discussion subjects had to be reinforced regarding data gathering from the textbook as well as from the patient and records.

Thought most of the nursing teachers involved in the present study were not aware of the concept mapping technique, with skill orientation program and follow up mentoring they were able to equip themselves with the requisite skill. There is a lacuna related to the nursing teacher awareness and use of concept mapping. The continual use of concept mapping from the beginning of the academic year will help improve their competency<sup>12,13</sup> post test control group design was used. The IV year B.Sc nursing students were included as experimental group (n=40).

**Conclusion:** The technique was hence beneficial for the students as well as faculties who had noticed change in the performance of the students who practiced the concept mapping technique.

The study provides substantial information regarding the need for a strategy to make learning more meaningful and interesting for the nursing students. Certain barriers that can come across are also mentioned so that it can effectively be overcome in order to make teaching and learning process a memorable and less stressful one.

# A Study on Nutritional Value and Sensory Evaluation of Wheat Gateaux by Addition of Jaggery

John Williams<sup>1</sup>, H.M. Moyeenudin<sup>2</sup>, Manivel K.<sup>3</sup>, Mark Keith Faraday<sup>4</sup>

<sup>1</sup>Asst. Professor, School of Hotel and Catering Management, Vels Institute of Science, Technology & Advanced Studies, (VISTAS), Chennai, India

## Abstract

The most delightful sweets are prepared with sugar and artificial sweeteners in order to give sweet taste and flavor in the prepared dish or refreshment, these sweeteners used in various forms like granulated, powdered or as a syrup according to the type of food preparation. The refined sugar is rich in carbohydrates especially the sugar obtained from sugarcane and acts as best sweetener for making deserts like gateaux. There are many varieties of gateaux prepared and it is commonly available dessert from generations, an enticing slice of gateaux makes a choice to opt for it. In recent days health has become a primary concern especially with over nutrition which leads to obesity. Although the sugar is considered as a daily commodity in foods, gateaux contains large amount of sugar content, consuming in regular basis may lead to health implications. This study is focused towards the Nutritional Value of jaggery and the usage as a substitute for sugar by incorporating it in the preparation of Gateaux, Lastly to distinguish the sensory evaluation of gateaux made out of jaggery.

**Keywords:** Jaggery, Gateaux, Cake, Healthy Diet, Nutritional Value.

## Introduction

The Jaggery is obtained from sugarcane by reducing the sugarcane juice in an open container or pan. India is the major producer of jaggery in world<sup>[1]</sup>, even it is considered as an unrefined sugar, the characteristic of Jaggery (Gur) is sweet and has medicinal values due to its nutritional content it is also loaded with natural minerals, nutrients with a value of sucrose as 50% and rich in iron content, that assist in curing anemia and helps in carrying oxygen to blood, Vitamin B6 present in jaggery reduce depression, heart disease and supports in treating disease like Alzheimer, Vitamin D2 of jaggery aid in curing the individuals suffering from hypoparathyroidism<sup>[2]</sup>, this

vitamin is also helps in curing the people who have the symptoms of rickets, most importantly the vitamin e found in jaggery improves the immune system, as it has lot of medicinal properties it is considered as a good substitute for sugar in making desserts<sup>[3]</sup>, Jaggery is already used as a normal sweetening agent in traditional food preparation of south India, so as to use jaggery instead of sugar, gateaux are prepared by swapping sugar with jaggery<sup>[4]</sup>. The added ingredients for making gateaux are eggs, Wheat flour, shortening along with jaggery. The gateaux prepared with jaggery has similar attributes with an adequate quality identified by a sensory evaluation through experts. The jaggery has its unique flavor and characteristics while cooking as an additional amount of jaggery used in comparison with sugar and a higher amount of sticking temperature is observed<sup>[5]</sup>.

## Materials and Method

The raw materials are taken for making wheat gateaux are wheat flour, Jaggery, Butter, eggs, Baking powder, and vanilla essence which was purchased from a marketer of provisional products in Chennai,

Tamilnadu, India. The healthy wheat gateaux recipe is formulated with ratios of ingredients and its value. A commercial oven is used to bake the Wheat Gateaux with a cake mould. The Nutritive value of the ingredients are identified by calculating the protein, carbohydrates, vitamin and fat available in the ingredients and a sensory evaluation of wheat gateaux is done by 15 panel judges from school of Hotel and Catering Management of VISTAS using 9 points Hedonic Scale from Like extremely to dislike extremely. There were two sorts of strategy pursued to discover the outcomes in the most precise way. The strategies are nutritional value and sensory assessment technique, the examination is carried on in a food production unit.

## Results and Discussion

**Nutritional Value of Gateaux prepared with Jaggery:** A total number of 1144 calories will be available in a gateaux prepared for 5 to 6 servings with the nutrients and minerals available as mentioned below. Due to the addition of Jaggery with this preparation this dish showing significant nutritional value comparing with sugar. There are many ingredients that contributes the Nutritive value like wheat flour, butter as a shortening, eggs for softness and jaggery as a sweetener, the main reason for swapping refined sugar to jaggery is to have lesser carbohydrates<sup>[6]</sup>. The monosaccharide's  $C_nH_{2n}O_n$  present in jaggery as single sugar compound whereas the polysaccharides present in refined sugar is a condensed form of sugar<sup>[7]</sup>.

The purpose of swapping sugar to jaggery and all-purpose flour to wheat flour in gateaux is to have a better nutritional value and healthier comparatively, because jaggery has lot of minerals and nutrients in comparison with sugar<sup>[8]</sup>, especially the sugar has more carbohydrates in relation with Jaggery which will lead to over nutrition in regular diet, since Jaggery has fructose, sucrose along with minerals and vitamins, it will be a right alternative for refined sugar in the preparation of a gateaux further more to make this dish as more healthier

wheat flour is used instead of all-purpose flour. As the natural sugar sucrose and fructose available in Jaggery 130- 170 grams of sucrose and 20 – 30 grams of fructose will helps in converting in to energy whereas the carbohydrates present in sugar will increase the sugar level in blood. The ingredient like wheat has higher amount of fibre considered as good substitute for all-purpose flour in making deserts<sup>[9]</sup>, in the preparation of gateaux around 100 grams of wheat flour is used which has 10 - 11 grams of fibre along with that 100 grams of butter is used instead of commercial margarine, butter has saturated fat which contains conjugated linoleic acid (CLA) with antioxidants that have anti-cancer as well as anti-tumor properties. There is an ample amount vitamins available in butter like Vitamin A, E and K. Hence making a gateaux with Jaggery, Butter and Wheat is a best option as it has very good nutritive value.

**Table 1. Show the Nutritional Value present in Wheat Gateaux in addition of Jaggery**

S. No.	Nutrients and Minerals	Quantity
1.	Sucrose	130 – 170 grams.
2.	Fructose and glucose	20–30 grams.
3.	Iron	22 mg, or 70% of the RDI.
4.	Magnesium	140-180 mg, or 30% of the RDI.
5.	Potassium	1050 mg, or 25% of the RDI.
6.	Manganese	0.4– 1 mg, or 12–24% of the RDI.
7.	Phosphorus	40-180 mg
8.	Protein	4.2 grams.
9.	Fat	0.2 grams
10.	Vitamin A	1183IU
11.	Vitamin B6	0.02 mg
12.	Vitamin D2	14 mg
13.	Vitamin E	222.60 mg
14.	Saturated Fat	62 Grams
15.	Cholesterol	180mg
16.	Fibre	10.7 grams

## Preparation Method of Wheat Gateaux

**Table 2. Method of Baking Wheat Gateaux**

S.No.	Ingredients	Quantity	Procedure	Calories
1.	Jaggery	100gms	Melt and make a syrup out of jaggery	383
2.	Wheat Flour	100gms	Sieve the flour with the baking powder	364
3.	Eggs	2nos	Add the eggs to the butter	156

S.No.	Ingredients	Quantity	Procedure	Calories
4.	Butter	100gms	Cream the butter with the eggs and jaggery syrup	717
5.	Milk	100ml	Add the milk to the egg, jaggery and butter mixture	44
6.	Baking powder	1/2 tea spoon	Add the baking powder and flour mixture to the batter and mix. Pour in into a baking tray and bake	
7	Vanilla Essence	Few Drops	Mix well	
	Total			1664

This wheat gateaux need be prepared with equal amount of wheat flour, butter and jaggery along with eggs, 100 grams of wheat flour is added with baking powder, this flour mixed well and kept separate. A bowl is taken two whole eggs are added whisked well with a whisker 100 grams of butter is added gradually with the mixture and few drops of vanilla essence is added then the little by little jiggery syrup is added later wheat is mixed with mixture gradually in order to avoid lumps, pour the whole mixture in a baking tray and keep it in a preheated oven with a 190° C for 30 minutes, take it out allow it become cool and demould it. This gateaux will have 5 to 6 serving.

**Sensory Evaluation:** A Sensory evaluation is carried out to evaluate the composition of food by its look, Aroma, smoothness, hotness and palatability<sup>[10]</sup>. This study is to identify the quality of product as the new ingredients are added like the incorporation of jaggery and wheat. This product is examined for its sweetness and texture especially to appraise and acquire the response. Around fifteen judges are finalized to evaluate the sensory features of wheat gateaux with satisfactory level of the panel judges, using 9 point hedonic scale extending to know the likes and dislikes on look, smell, consistency, palatability and for an overall acceptance. This evaluation is done in a bright and ventilated area in order to evaluate exactly<sup>[11]</sup>.

**Table 3. Overall Scores through Sensory Evaluation**

S.No.	Sensory Attributes	Overall Scores of Judges about Wheat Gateaux	Overall Scores of Judges about Gateaux with Refined Sugar
1	Aroma	7.7	8.1
2	Texture	7.2	9.2
3	Taste	8.5	8.8
4	Look	8.8	9.1
5	Overall Acceptance	8.1	9.1

In table 3. There are various sensory attributes indicates the characteristics of food along with overall hedonic scores of gateaux with jaggery and another one with refined sugar. This analysis was done dependent on the ignored natural sweetener Jaggery to know the importance of using by its nutritive value with a compact method for fusing jaggery into wheat gateaux for a health dish that contains good nutritional source in order to give an happy and healthy life style especially for the individuals who face issues like Putting on weight, hormonal lopsidedness, diabetes and so forth. The aroma got the score 7.7 in jaggery gateaux might be lesser than 8.2 of the gateaux made out of refined sugar was not

showing a phenomenal change and in the part of tastes it was varied with 8.5 – 8.8 having a minute variation of .3.

The fundamental point of the investigation is to substitute the refined sugar which is considerably contains synthetic substances that become a reason for numerous different complexities over the long haul. This investigation on Wheat Gateaux dishes were set up so as to give out examples of it and get the reaction of 15 panel judges in a board who tried this dish and gave their perspectives on it. Physical assessment was the subsequent technique utilized in this investigation where the prepared Wheat gateaux were passed out to

the specialists and were given a sheet which is a tactile score card which had the characteristics which were taste, smell, appearance, aroma and so on.

The outcome got was sure and good towards the examination and the mean scores were brought down in table 3, therefore the scores were got the most noteworthy which was 8.8 for the appearance and 8.5 for taste this is considered as a good remark on the study carried for adding jaggery for making gateaux instead of using refined sugar, along with that wheat flour is substituted for all-purpose flour for a fibre rich food, this results shows 7.2 for its texture and 7.7 to its aroma with an overall acceptance 8.1 out of 10. The wheat gateaux having quality attributes nearer to gateaux prepared with refined sugar and all-purpose flour, the measure of egg and jaggery required was 92% for 100 g of wheat flour. Adding wheat flour and Jaggery in making wheat gateaux will a nutritional food as it is required for a balanced diet.

The general quality score of Wheat Gateaux with jaggery was lower than the Gateaux prepared with refined flour and refined sugar. As this study shows 9.1 as an overall acceptance comparatively higher than the gateaux prepared with Jaggery proves a normal gateaux having better texture and acceptance as a gateaux with jiggery has 7.2 overall score for texture whereas the gateaux made with refined sugar shows the score 9.2. The jaggery syrup had higher sogginess, crumbly stuff and lower absolute sugar when contrasted with refined sugar was the main reason in texture difference. The gelatinization temperature and highpoint consistency of wheat flour were seen to raise with inclusion of jaggery gives rigidness in gateaux.

### Conclusion

The Wheat Gateaux made out of jaggery confirmed the little amount of softness, more degree of reddish brown pigmentation and yellowish than in comparison with refined sugar and all-purpose flour gateaux<sup>[12]</sup>. The Wheat Gateaux made out of jaggery also had higher sogginess, browning, lower protein, fat and little amount of sugar substance when contrasted with the gateaux with refined sugar and flour. Despite the fact that there was contrast in vapor pressure of the food and acidic values shows variation in terms of storage with the texture attributes, this can be managed by reducing storage time. Nevertheless the quality score for the Wheat Gateaux with jaggery while distinguished with

normal Gateaux with refined sugar, there is a minimum amount of variance is observed. Thus it is proved very well that Jaggery can be utilized as substitution for refined sugar on equivalent weight. In any case, it could be utilized in the advancement of making any deserts<sup>[1]</sup>. The dampness substance of wheat gateaux goes far in recommending the time span of usability of the item for shorter duration. But consuming wheat gateaux instead of gateaux prepared with refined sugar will have higher nutritional value with vitamins and nutrients. This will help in safeguarding from diabetes cause by excess of carbohydrates.

# Thyroid Disease Classification Using Decision Tree and SVM

K. Dharmarajan<sup>1</sup>, K. Balasree<sup>2</sup>, A.S. Arunachalam<sup>3</sup>, K. Abirmai<sup>4</sup>

<sup>1</sup>Associate Professor, Department of Information Technology, <sup>2</sup>Research Scholar, Department of Computer Science, <sup>3</sup>Associate Professor, Department of Computer Science, VISTAS, <sup>4</sup>Assistant Professor, Department of BCA, Guru Nanak College, Chennai, India

## Abstract

Thyroid is one of the disease that can be increasing day by day due to their lifestyle. Thyroid disease is a very common disease among humans. A Thyroid disorders are the conditions that affects the thyroid gland and also the butterfly-shaped gland at the front of the neck. The thyroid gland is located on the below of Adam's apple that wrapped around the trachea. The Hydroxide is also known as T4 and it is the primary hormone produced by the gland. Thyroid hormone that regulates the body numerous metabolic mechanisms throughout the body. When compare to male, female is more affected than male due to the thyroid disease. In thyroid, there are two types of diseases, They are Hyperthyroidism and Hypothyroidism. Hypothyroidism that produces a lots of thyroid hormone in the blood and in Hypothyroidism that produces less thyroid hormone in the blood. This is controlled by the pituitary gland and hypothalamus. The disorders of these tissues can also be affecting a thyroid function and it causes the thyroid problems. There are the Specific types of thyroid glands are includes: Hypothyroidism, Hyperthyroidism, Goiter, Thyroid nodules and Thyroid cancer. This paper describes about the diagnosis of thyroid disorders using decision tree attribute splitting rules. The proposed method, classifies the thyroid nodules accurately and efficiently. In this study, the comparative thyroid disease diagnosis were performed by using the Machine learning techniques that can be a method which is Support Vector Machine (SVM), Naïve Bayes and Decision Trees. The accuracy of this classification is to be 99.89%. This result is very efficient when compared to our previous work that used the Decision tree.

**Keywords:** *k Nearest Neighbours, Support vector machine, Decision tree and Naïve bayes.*

## Introduction

Classification techniques that plays a vital role and there is a major role for analyzing diseases and providing facilities to reduce the cost for the patients. Nowadays, the peoples are more suffering from the diseases they are diabetes, heart disease, typhoid, tuberculosis and kidney disease, etc., Thyroid disease can be affected by the people in worldwide, after affecting the peoples becomes a serious health problem<sup>[1]</sup>. In India, it is expected that about 42 million people suffer from thyroid disorders. Symptoms that includes, Weight gain, tiredness, weakness as well as feeling cold etc<sup>[2]</sup>. The hormones made in the thyroid gland affected almost every organ in the body including the heart. There are Hypothyroidism, hyperthyroidism and goiter deficiency disorders. Hypothyroidism can cause the heart beat more and

slowly and the hyperthyroidism causes fast heartbeat<sup>[3]</sup><sup>[4]</sup>. The evaluated levels of thyroid hormones can also lead to increase the blood pressure level. The Symptoms that includes weight loss/weight gain, swollen neck, changes in heart rate, Hair loss and other symptoms like problems in vision, Diarrhea, Irregularities for women's in the menstrual cycle then Trembling hands and Muscle weakness<sup>[7][8]</sup>. Goiter and Iodine Deficiencies, Goiter is one of the abnormal enlargements of your thyroid gland. Iodine is the element that can be needed for the production of thyroid hormone. The recent population that shown in the studies nearly about 12% of adults have been affected by the palpable goiter<sup>[9]</sup>.

The main aim of this paper was to build an integrated model using competitive Machine learning algorithm to predict thyroid disease. Specifically, this research uses

recognized variables (input and output) for diagnosing the thyroid disease (through the published research) and to develop an integrated framework model and validated with Decision-tree model. A variety of these algorithms including Decision trees, Random forest, Support vector machine, Artificial Neural Network and Logistic regression have been widely used in development of predictive models of thyroid disease.

Thyroid function testing is the most used diagnostic evaluation in endocrine practice and is used as a screening tool, to verify the clinical diagnosis of hyperand hypothyroidism, to assess adequacy of medical treatment, and in the followup of differentiated thyroid cancer<sup>[10][11]</sup>.

It may predict the patients and doctors in handling thyroid disease with care and there'll fully be suggestions for a social development by applying an integrated model. Classifying possible variables (both input and output) affecting the diagnosis of thyroid disease and investigating the relationships among such variables<sup>[6]</sup>.

**Pre Processing:** Types of pre-processing: Data cleansing, Data editing, Data reduction, Data wrangling. The pre-processing is to resolve the several types of problems that includes the noisy data, redundant data and missing datas and values, etc.,<sup>[2][8]</sup>. The high quality of data that will be lead to the high quality results and also by the costs that reduced for the data mining. The Missing data can be pre-processed and it is also to allow the whole data set to be processed. It undergoes the pre-processing<sup>[13]</sup>. The numbers are not a missing number that constraints are checked using masking method. If the missing values or not a Number values that can be presented and it is replaced by the mean value of the column. Pre-processing, it refers to the program that processes the input data values and also to produce output used as input to a compiler<sup>[11]</sup>.

**Dataset Explanation:**

1. The datas are collected from the thyroid patients. (500 patients).
2. It is a blood samples.
3. There are three categories of patients.

**Thyroid Classification:** Classification is a machine learning task that predicts the classes according to some constraints. Supervised learning is a classification algorithm in data mining<sup>[2][7]</sup>. The main desire of the classification issue is to diagnose the class for new data.

Various classification algorithms are used to diagnose the classes. In this thyroid dataset using classification algorithm it.

**Specific kinds of thyroid disorders:**

- Hypothyroidism
- Hyperthyroidism
- Goiter
- Thyroid nodules
- Thyroid cancer

**Method and Methodology**

**K-Nearest Neighbor (K-NN):** A k-nearest-neighbor is often abbreviated as k-NN algorithm. It is the data classification that estimates likely as a data point into the member of one group or into the other depending on grouping the data points that may be nearest. The k-nearest-neighbor is also called as a “lazy learner” algorithm that not be built on a model that is using in a training set until the query of the data set is performed<sup>[9]</sup>. It is the classification algorithm, to determine the attempts of the data groups that points by looking the data points that looking the data at one points in group A or it is in group B. It is to look at the states of the points that may nearest<sup>[2]</sup>. The range of arbitrarily is the point to take a sample of the patients data and analyze it. If there is a many points in the group A, then it is likely that the data point will be A rather than B and a vice versa.

**Algorithm:** The algorithm is in the case, is classified by the majority of vote to its neighbors, with the case being assigned to the class, the most common among its K nearest neighbors. Measured by a distance function. If the value K = 1, then the Case value is simply assigned to the class of its nearest Neighbor. The three distance measures are noted as a valid continuous Variables.

In the instance of the Hamming distance must be used. When the values are 0 and 1 it is used to brings the issue of the standardization of numerical values as well as a mixture of numerical and categorical Variables in the dataset.

$$(x + Sa)^n = \sqrt{\sum_{i=1}^k (xi - yi)^2} \dots (1)$$

**Naive Bayes (NB):** It is the simple classification algorithm for predicting modeling with clear semantics,

representing and the probabilistic learning method based on Bayesian theorem. Naive classifier assumes the value of the one attribute is not dependent on the value of another attribute and it assumes that the presence or absence of particular attribute of the prediction process does not affect. Suppose there are m classes say K1, K2...Kn having a unidentified data sample X, Naive Bayesian classifier will predict an unknown sample X to the class Ki on the basis of the classes having highest probability<sup>[3][9]</sup>.

$$P(K_i | X) > P(K_j | X) \text{ for } 1 \leq j \leq m, j \neq i \dots (2)$$

**Applications:** Real time prediction of the Naive Bayes is an eager learning classifier and it is the fastest one. It is used for making predictions in real time. Multi class Prediction algorithm is also called as a multi class prediction feature. Text classification or Spam Filtering or Sentiment Analysis, Naive Bayes classifiers are

mostly used in text classification that have the higher success rate when compared to the other algorithms. In result, it is widely used in Spam filtering and Sentiment Analysis.

Recommendation System, Naive Bayes classifier and Collaborative Filtering that makes together to build a recommendation system, uses machine learning and data mining techniques to filter unseen information and also to predict the user is liking a given resource<sup>[13]</sup>.

**Support Vector Machine (SVM):** Support Vector Machine is one of the managed machine learning algorithm used for both the classification and regression issues and it is usually used for a bit of arrangement problems. The estimation of selected organize is of the each half being the estimation. Then the tendency to perform characterization by finding the hype-plane, is completely have categories<sup>[11],[12]</sup>.

**Table 1: Percentage of peoples affected by thyroid**

Percentage of peoples affected by Thyroid	2014	2015	2016	2017
Male	20%	10%	12%	15%
Female	50%	60%	45%	56%

**Fig 1. Peoples affected in thyroid gender wise year by year**

Mentally disturbed. All the newborns are given by screening the blood test in hospital to evaluate the thyroid function.

**Accuracy Metrics:** Note, the accuracy of this model is very high at 97.3%

- The disease that spread very quickly, who is in sick condition.
- The positive that represent here as a fraud case

- The positive value represents terrorist and also as the model says it's a non-terrorist.
- Idea about the costs that having a mis-classified actual positive value is very high there.

**Precision and Recall**

**There are two new metrics are:**

- Precision is True Positive/True Positive + False Positive.

- Recall is True Positive/true positive + false positive.

**Precision:** The Precision that explains about that how precise or the accurate model is out of those predicted positive and then the actual positive value predicts how many how many positive values occurred<sup>[11]</sup>. The Precision that is good to measure and determine about the costs, if the False Positive is high, mail spam detection. In email spam detection there is a false positive means they have an email that in non-spam has been identified as a spam message that is unwanted. This email user might lose important emails if there is a precision is not high for the spam detection model.

**Precision = True Positive/True Positive + False Positive**

**Recall:** The same logic to recall the application. Recall is also calculated.

True positive/True positive + False Negative is an Actual Positive

**Recall= True positive/Total actual value.**

Recall calculates that how many positives values in our model captures labeling as Positive. Applying the same as we recall that shall be the model metric and to select the use of our best model, high cost that associated with the False Negative values.

In fraud detection or the sickness of patient detection. If a fraudulent transaction is predicted as a non-fraudulent, then the consequence can be very bad and in sick patient detection, If a sick patient goes through the test and it can be predicted as not sick then the cost can be associated as a False Negative then it will be extremely high, the sickness is contagious.

**Recall= True Positive/Total Actual Positive.**

**Score:** There is a lots on Precision and Recall; cannot avoid the other measure of F1, which is a function of Precision and Recall.

**Score = 2\*Precision\*Recall/precision+ Recall.**

Score is needed to seek a balance between the Precision and Recall. So, the difference between F1 Score and if the accuracy is previously seen then that accuracy can be largely contributed by a large number of True Negative values which is the most business circumstances and do not focus, because the False Negative and False Positive is usually having the

business costs then the Score is more better to measure the use of the need to seek a balance between a Precision and Recall<sup>[15]</sup>.

### Percentage of people affected by Thyroid in Genderwise

**Fig 2: Overall percentage of peoples affected in thyroid.**

#### Result Analysis:

**Table 2: Percentage of Algorithm comparison result**

	Classification Model			
	Naive Bayes	Decision Tree	SVM	KNN
Accuracy	91.62%	97.35%	95.3%	94.2%

The impact of certain attributes is that the classification of model accuracy. The following attributes were ignored and query on thyroxin, hypothyroid, hyperthyroid. The classification model is based on the decision tree obtained as a best accuracy (97.35%), while Naïve Bayes obtained the weakest classification.

Accuracy of classification model after removing the three of the model attributes.

**Future Enhancement:** The major difference between the thyroid hormones and tendons disease are clinically relevant. The accurate diagnosis of diseases and providing efficient treatment are the important part of valuable medical services given for the patients in the health-care system. The unique characteristics of these databases are that the challenges for data mining are privacy-sensitive, heterogeneous and voluminous data. These types of data’s may have valuable information awaits extraction. The knowledge that has to be found as various encapsulated regularities and patterns that is not in the raw data or pre-processed data. The Feature selection method that may use to identify the

most relevant for classification and it is broadly used to categorize the subset selection method and ranking method.

### Conclusion

The medical dataset in the various data mining and the machine learning techniques are available and then the important aspect of medical data mining is to increase the accuracy and efficiency of disease diagnosis. The main objective of this research is to show the variance of thyroid after 90 days 60 days from the available raw medical dataset then the various splitting rule for decision tree attribute selection and had been analysed and compared. This helps to diagnosis the thyroid diseases through the extracted rules. It is clear and normalized based splitting rules have high accuracy and sensitivity or true positive rate. The data mining technique is applied on the hypothyroid and hypothyroid dataset and it is also to determine the positive and the negative values from the entire dataset. The experimental result provides, when compared to male and female dataset, females are more affected than male. The improved accuracy, precision and recall by comparing the Decision tree, Support vector Machine. Further enhancement has been made by using the various optimization algorithms or rule extraction algorithms. The future work is applied on validating the multiple disease dataset simultaneously like heart disease, diabetics, etc.

<sup>2</sup>Head, Innovation and Entrepreneurship Development Centre and Head–MBA in Marketing Management, Faculty of Management and Commerce Ramaiah University of Applied Sciences, Bengaluru

## Abstract

Clean atmospheric air plays a significant role in Humans Health. Now a days due to increase in vehicle movement there is a huge impact to the roadside vendor's health and their business. This study has been conducted with the aim to Analyse various factors impacting health of roadside vendors and its effects on their business in Bengaluru and understand various challenges faced by roadside vendor so that a kind of awareness program can be suggested with a view to improve the health of roadside vendors. In this research simple random sampling has been carried out by conducting face to face interview. A sample size of 145 Roadside Vendors have been met and data's have been collected. Quantitative Analysis were carried by using SPSS and Smart PLS software. Based on the factors identified from the literature gap a framework was developed. Dependent variable is business sustainability and Independent Variable were Intensity of Traffic Pollution, Diseases caused and remedies. The result obtained from analysis shows that Intensity of Traffic pollution has a moderate impact on business sustainability, Diseases caused has got positive impact on business sustainability and Remedies has also got a positive impact on their business sustainability. Based on the output of research analysis recommendation has been made to plant more trees in busy roads and Normal vehicles can be replaced by Compressed Natural Gas and electronic vehicles.

**Keywords:** *Traffic pollution, roadside vendors, health effects and business sustainability.*

## Introduction

In urban areas traffic pollution is considered to be substantially increasing every year and it's a known factor, in all areas of Bangalore people have been using different types of vehicles in a vast numbers to travel to their destination throughout the day, and these vehicles cause various air pollutants which majorly affects the health of roadside vendors who typically runs their business on the roadsides are been highly affected by the pollution compared to others.<sup>1</sup> From many years,

the vehicles emissions have become the major source of air pollutions. People are still trying to come up with new ideas in order to eradicate pollutions affecting the roadside vendors.

Uncontrolled urban pollution, increased number of vehicles, industries and urban population have made the problem of traffic pollution even worse. Urbanization, industrialization and population overgrowth adverse health effects ad om in ant occupation in urban areas of developing countries exposes the vendors to several environmental pollutant.<sup>2</sup> The amount of this pollutant has great impact on the local areas and other industrialized areas of Bangalore, as the vehicle movement is high and the health of the roadside vendors in this region is been affected. The level of traffic pollution is said to be high in peak hours i.e. in morning and evening as the vehicle movement is high at that point of time even the pollutant is high by forming various

---

air pollutant producing significant amounts of nitrogen oxides, carbon monoxide, and other pollution into the air.<sup>3</sup> Traffic pollution is Caused by vehicles in order to reduce traffic pollution and its impact on roadside vendors health and there should be proper awareness regarding planting more trees and barriers which blocks the smoke and other dust particles on the roadside. This will reduce traffic pollution caused by vehicle emission. There is less space for emission or pollutions created by traffic to escape because urban and metropolitan city is fully surrounded by buildings. The research objective of the study is to analyze the factors influencing various diseases, intensity of traffic, framework on remedial action, and finally suggesting suitable recommendation for the business sustainability caused by traffic and its pollution.<sup>4</sup> The vehicles which aren't in good conditions and still used produce bad emissions which affects the overall health of the roadside vendors. Every year about 200,000 people in Bangalore die due to air pollution which is caused mainly by traffic pollution and there is clear evidence that the mortality rate is higher among people living in areas with more polluted air.<sup>5</sup>

Urbanization, industrialization and population over-growth adverse health effects a dominant occupation in urban areas of developing countries expose the vendors to several environmental pollutant. Over recent years there are several factors faced by roadside vendors such as Chronic Respiratory problems, Skin Allergy etc.<sup>6</sup> The number of vehicles being driven has increased every year and has also led to several traffic congestion and affects the business sustainability of the street vendors, there are many researches from past years focusing on various ways to reduce traffic pollution and also steps to prevent risk of health affecting roadside vendors.<sup>7</sup> Proper awareness has to be created in order to ensure proper use of face mask which will at least prevent them from the diseases caused due to traffic pollution.

### Methodology

After the above problem is identified, the problem is described in a process through proper selection of methodology to collect related data and the analysis of the data is been taken for interpretation of solved data. The study was done to know exactly what were the issues and problem caused by the traffic pollution and its effect on roadside vendors health as well as their business, and to provide a proper conceptual framework and other remedial aspects. The collection of data was collected through survey on a face to face conversation with the

roadside vendors. Survey was been collected with the sample size of 145 was achieved. The questionnaire was mainly developed with an objective to obtain the information that the respondents possess about traffic pollution affecting roadside vendor's health. The survey was conducted after doing relevant literature reviews along with the expert panel opinions. The first section of the questionnaire deals with the demographic details of the respondent. The demographic detail contained a total of 4 sub variables. The second section included questions regarding Disease caused due to traffic pollution and its 69.0% and female with 31.0% and the percentage of the cumulative frequency within each interval is been calculated.<sup>8</sup> The third section mainly deals with the opinion of respondents regarding Intensity of traffic pollution. The aim is to understand the knowledge of Roadside Vendors. The third section included questions regarding Remedies and intention of respondent for using the sharing platform. The collected data was analyzed and implementation of tools and other statistical measures and process is been analyzed by developing the data by solving various data analysis of demographic profile of the respondents, statistical analysis i.e. Cronbach's alpha, KMO and Bartlett's test analysis which was done with the help of the SPSS software and Partial Least Square (PLS) analysis through Smartpls software. The Findings of the research shows that many people are suffering from various diseases caused through traffic pollution which in turn affects their business

### Results and Discussion

To verify the validation of hypothesis formed and explain the findings of the research, the data samples are statistically calculated with SPSS and PLs software, the following is the overview of the results obtained: The data obtained is checked for internal consistency i.e., how reliable is the data collected for this Cronbach's Alpha test is utilized for which the value obtained should be greater than 0.7, for our data sample the Cronbach's Alpha value obtained is 0.815 as shown in Table 1 below, which is greater than 0.7. This proves that the data collected through our survey posses' high internal consistency i.e., the data obtained is highly reliable.

Following the Cronbach's Alpha test is the KMO and Bartlett's test which is conducted to verify if the factor analysis that will be carried out on the data collected for the research will be useful or not for the study and the Bartlett's test of Sphericity checks whether the

hypothesis that our correlation is an identity matrix, if it is identity matrix then the variables will be unrelated. The significant variable must be less than 0.05 for Bartlett’s test. The Fig 1 below shows the conceptual frame work considered for the research, where the independent variables are intensity of traffic, diseases caused by the traffic pollution and remedies against traffic pollution and business sustainability is the dependant variable, Fig 2 shows the output for the conceptual framework, where it shows the factors and sub factors affecting the business sustainability of roadside vendors.

The main results are the validation of the alternate hypothesis formed from the objective of the research is analysed using Regression analysis, Regression (Symbol  $R^2$ ) is carried out to analyse the variance between the dependant and independent variable i.e., how well the independent variable can explain the dependent variable. Table 2 shows the result  $R^2$  value obtained for the alternate hypothesis  $H^1$ : Intensity of Traffic is directly affecting business sustainability of roadside vendors, for which the value obtained is 0.230, which shows that the intensity of traffic doesn’t have a greater impact on business sustainability of road side vendors.

Next alternate hypothesis  $H^2$ : Diseases caused due to traffic pollution has positive impact on business sustainability of roadside vendors, for which the regression result obtained is shown in Table 3 below, the  $R^2$  Value obtained is 0.453 which shows that diseases caused has much greater impact on the business sustainability of roadside vendors i.e., independent variable diseases caused can explain the dependent

variable Business sustainability. For the last alternate hypothesis  $H^3$ : Remedies against the impact of traffic pollution has positive effect on business sustainability of roadside vendors, has a considerable impact on business sustainability of roadside vendors as the  $R^2$  value obtained from regression analysis is 0.324 as shown in Table 4 below.

Overall the results obtained from the statistical analysis carried out for the data obtained, variables show that the considered variable and data collected from the survey has a great internal stability and reliable, the alternate hypothesis formed relating dependent and independent variables were proved of having a significant impact on dependent variable

- i. From the analysis the results that are obtained are, as the traffic pollution causes severe chronic respiratory problems in roadside vendors, they have difficulty in running their business as there will many off days of business due to illness caused, which will hinder them from achieving their full potential.
- ii. By following the provided remedies against the traffic pollution, its effects can be reduced which can help in bringing up the business sustainability of the roadside vendors and also reduce the effects on their health.<sup>12</sup>

## Conclusion

To conclude, Traffic pollution has an impact on the health of roadside vendors and their business. There are many new technologies like CNG vehicles (Compressed Natural Gas) is significantly less expensive than gasoline.<sup>9</sup> Out of 145 respondents 115 said that traffic pollution affected their health and their business. Most of the respondent was unaware of remedies to safeguard them self from traffic pollution.<sup>10</sup> Choose low polluting model of vehicles and replace existing vehicles with electronic vehicle because main cause of traffic pollution was vehicle emission. Plant more trees along busy road will help to eradicate traffic pollution.<sup>11</sup> Therefore, Proper Awareness has to be created in order to improve health of roadside vendors.

# A Study to Analyse the Reliability and Validity of the Smartphone Goniometer Application (G-PRO) by Measuring the Elbow Joint Range of Motion

Maheshkumar P.G.<sup>1</sup>, Harihara Subramanyan<sup>1</sup>, Swapna N.<sup>2</sup>, J. Jannet Merlin<sup>2</sup>

<sup>1</sup>Assistant Professor, <sup>2</sup>Student, Faculty of Physiotherapy,  
Meenakshi Academy of Higher Education and Research, Chennai

## Abstract

Universal goniometer (UG) is commonly utilized as a standard evaluation tool to assess range of motion (ROM) as portion of joint movements. It has certain imperatives, such as including both hands of the therapist, which leads to precariousness of hands and blunder. In the modern era the smart phones usage has been increasing due to its accessibility. Hence, a trial version of goiniometer application in smart phone is used for this study. The reason of the research was to analyze the unwavering quality and legitimacy of the smart phone goniometer app. and Universal Goniometer in evaluation of range of motion of elbow. The maximum Range Of Movement of elbow in position of flexion was examined for 100 healthy subjects with Universal goniometer and smart phone. Data was analyzed and synthesized by statistical analysis using kappa score and specificity and sensitivity were calculated to find the specificity and validity of the goniometer application

The findings of this research showed equal Universal goniometer reliability and validity of the smartphone. The strength agreement of Kappa score is considered to be "GOOD" Smart phones can be excellent options for Universal Goniometer owing to easy access and use for the therapist and the patient

**Keywords:** Smartphone, Goniometry application (G-PRO), Elbow Joint, Range of Motion.

## Introduction

The goniometer was used for measuring joint range of motions (ROM) due to more cost, portability and reliability and was considered a normal methodology for range of motions determination. One of the limitations of this method is that the practitioners should use their two hands for the examinations and in this situation maintaining the limbs stable is just too hard and may result in some mistakes reading the angles. Digital tools are lightweight and portable for measuring joint motion (electrical inclinometer) and are similar to goniometer use<sup>1</sup>.

The only downside of this device is its price greater than the goniometer. The digital inclinometer (inclinometer application on a smartphone) was another application. In this situation, the phone is positioned at the angle along the horizontal line indicated by its implementation to evaluate the angle<sup>2</sup>. Smartphone's use as a digital inclinometer has an important advantages, such as accessibility, considerable price of inclinometer applications; and straight forward measure because of the business band that fixes the device in respective locations. Therefore throughout the examinations, examiners don't need both hands, and also it permits the patients to evaluate their method of healing and also the effectiveness of therapy on its own<sup>3,4</sup>.

**About the Goniometer application:** Smartphone applications like G-PRO and Dr G (in android and ios phones) developed by 5fuf5 co, U. S., released on May 2013) was employed in this study to measure the correct joint range of motion<sup>5,6</sup>. Goniometer pro

has been designed together with health care providers (HCP) in an attempt to develop a simple to use and reliable ROM measure tool, a stronger goniometer app. The advanced Smartphone application is a digital tool that has been proven to be accurate equivalent to the universal goniometer by numerous studies and analysis. It's very helpful for Physical Therapists in serving to assess treatment effectiveness. it's conjointly utilized by radiologist in x-ray interpretations (e.g. to determine the degree of scoliosis)<sup>7</sup>.

**Advantages of the goniometer application:** Focal points of the smartphone goniometer application Using smartphone as a advanced inclinometer has critical points of interest such as – accessibility, calculable cost of inclinometer application, and simple estimation owing to the commercial band that fixes the gadget in considered areas<sup>8</sup>. Thus, physical therapist do not require both hands amid the examinations, and it too permits patients to evaluate their recuperating prepare and the adequacy of treatment at domestic on their own

## Methodology

Experimental study, 100 subjects participated in this study, Agerange of 19 - 22 years. Duration 3 months.

**Inclusion criteria :** Healthy subjects were identified for this research without chronic orthopedic disorders, such as old fractures, articular pain or discomfort, Cubitus valgus or varus deformities for this study were healthy subjects without having chronic orthopedic disorders, such as old fractures, articular pain or discomfort, Cubitus valgus or varus deformities. This study was designed to use of digital tools and UG (standard and common technique) in the measuring of elbow joint maximum ROM.

**Instruments:** For evaluation, two techniques including UG and smartphone were used. The UG had a 360° conveyor with two 12-cm arms - one stable arm and one movable arm and a smartphone (VIVO model) with Android operating system and equipped with G-pro version app (version-2.9, offered by 5fuf5 co, United States, released on May 2013) was used in the present study (Figure 1 and Figure 2).

**Measurements:** This study was double blinded and study details were not known to assessors and statistical analyzers. To determine the range of movement as a large extremity joint, the dominant hand elbow was selected and therefore the range of active movements

was measured. The students evaluated the computer memory of elbow by the two devices as well as Universal Goniometer and Smartphone and active Movements of elbow joint and the measurements were matched between them. The Universal Goniometer was considered as a clinical standard technique. the information sheets were used to collect the data. The subjects were examined in two separate rooms with same facilities once a quick interview concerning the method of the study. During the research, the participants were blinded. At first, the arm and forearm longitudinal axes were determined. in the sitting position, the subject arm placed in a relaxed position for measurement of elbow joint range of motion Then the elbows and forearms were located in the neutral position and Universal Goniometer was placed on the lateral epicondyle and stable arm was placed toward the accordion process. Also, the Smart phone was set on the zero point of horizontal line along the elbow. the subject was asked to flex his/her elbow and therefore the angle was evaluated by the moving arm of Universal Goniometer and placing phone on the subject arm, the wrist strap was used. There was one hour rest for subjects after initial evaluation by goniometer and the second one by Smart phone.

Figures 1: Goniometer

Figures 2: ROM Measurement Technique

**Figure 3: Range of motion measurement method using Smartphone**

**Statistical Analysis:** The data was collected and synthesized to analyse the specificity and sensitivity and also the kappa score was calculated to find out the reliability of the goniometer application.

**Sensitivity:** Probability that a test result will be positive (true positive)

**Specificity:** Probability that a test result will be negative (true negative)

**Figure 4: Sensitivity and Specificity**

**Kappa score**

**Kappa:** A measure of agreement between two individuals when two binary variables are attempted to measure the same thing. The strength of the agreement is considered to be “GOOD”.

**Discussion**

A few ponders have been conducted to work out

the range of motion of the elbow joint<sup>9</sup>. There are a few Reports on the comparison of Smartphone and Universal goniometer within the range of motion movement of the overwhelming hand elbow joint as a huge joint within the upper appendage. Universal goniometer and advanced strategies are comparative in terms of education, versatility and light weight. However, both hands ought to be utilized in deciding the range of motion of the elbow joint by goniometric

technique. In this manner not exclusively it's harder be that as it may conjointly a few mistakes might happen amid totally distinctive measurements. The initial state of the rotation center conjointly the long pivot of the appendage were visually calculable as an occasion this may result within the action blunders<sup>10,11,12</sup>. The findings showed that both Smartphone and Universal goniometer techniques had greater agreements on all evaluations of motion. Smartphone's measurements were like a universal goniometer. Similar studies to verify the Universal goniometer and inclinometer method to assess shoulder joint motions were conducted in 2012. The findings showed that Smartphone conducted the reliability and validity of the readings as goniometer readings in an exceedingly similar study conducted by (Kolber et al. 2012)

Measured shoulder joint elevation at bone level (Scaption). The results showed a maximum difference of 11 ° in the smartphone and goniometer measurement of this angle<sup>13</sup>. But, there was less variations during this research.

Mitchell et al. Evaluated the esteem of dynamic shoulder joint movement measurement by two iPhone Smartphone and goniometer strategies on 94 female cases. Like our comes about, Smartphone has been exceedingly reliable in deciding the extend of shoulder development<sup>14</sup>. The comparative studies weren't confined to shoulder and elbow joints. These tests were performed with the computerized inclinometer (Saunders demonstrate) to measure the anterior curve of the spine<sup>15</sup>.

Moreover, Prushansky et al. 2010 appeared that in healthy themes there was no vital qualification in cervical movement measurements collected from advanced instrument and ultrasound techniques. For the events around the sagittal and frontal axis, these measurements were taken. The discoveries appeared that there was a more noteworthy assortment of rotational developments, measured by advanced devices. Yaikwawongs et al. 2009 contrasted the exactness of knee joint development extend in two strategies as well as the goniometer and roentgenographic picture of the digital compass. ICC was calculated zero<sup>16</sup>.

Ockendon et al. (2012) repeated this inquire about in partitioned considers, as well as assessing the legitimacy of smartphone versus knee goniometer for five sound volunteers. The relationship between intra-observers

was zero for the smart phone

In fortytwo healthy subjects, Cleffken et al. 2007 contrasted two method of digital goniometry and digital electronic inclinometer. They showed that there were reduced excursions to active peak flexion than passive peak flexion. Furthermore, passive peak flexion showed greater reproducibility rates<sup>17</sup>. Jenny et al. (2013) contrasted smartphone measurement reliability with conventional routine knee flexion range measurements in ten TKA patients<sup>18</sup>. For each technique, the readings were carried out six folds (i.e. completely twelve times). They showed that when TKA was one of the most accurate ways to measure the smartphone consumption. Another knee goniometry is mainly based on photographic goniometry. The pictures of the knee transmitted from the camera to the computer were drawn here, and the computer program deciphered them.

Now, there is some unique software in the smartphone, called Dr Goniometer (DrG), which conducts all the process automatically. Ferriero et al. 2013 contrasted the smartphone DrG software in thirty-five topics with standard photographic-based goniometry. The intra-rater and inter-rater correlations were always calculated at zero.958 in accordance with the outcomes during this research. The findings showed that Dr. G software has been a reliable way of living the variety of knee movement and is much easier than the traditional technique<sup>19,20</sup>.

Measuring the variety of hip joint movement has an significant role to play in assessing lower limb injuries. According to past research, in both healthy topics and patients with femoro acetabular deficiency, goniometer has high accuracy in evaluating the variety of movement of the hip joint. Although this tool is less reliable than the electromagnetic monitoring scheme, Universal Goniometer<sup>22</sup>.

In keeping with the current consider, Charlton et al. 2014 surveyed the unwavering quality of Savvy phone to assess the flexion, rotation, abduction and adduction development of the hip joint. This investigate was conducted on twenty solid youthful men. The extreme comes about appeared that the Shrewd phone had keen to exceptionally great unwavering quality for numerous of the joint developments in any case it had constrained unwavering quality on snatching, adduction and outside turn. Amid this consider, all-time moo ICC was for elbow flexion, when utilizing the goniometer (0.77). In

spite of the fact that Widespread Goniometer the ICC values of smart phone for all the developments are > zero.9, the littlest sum esteem was had a place to the elbow flexion<sup>23</sup>.

However, Blonna et al. 2012 evaluated icc of visual estimation compared to clinical goniometry in fifty elbows. icc for visually-based goniometry was zero.97 for each extension and flexion estimations of elbow. Another study was conducted to evaluate the fifth meta carpo phalangeal joints which the results showed high value of icc (> zero.95).In this study, the results Universal Goniometer has high reliability and validity of Smart phone to evaluate the active movement of the elbow of dominant hand.

One amongst the necessary works physical therapy is to determine the degree of impairment. However, the results have to be compelled to be replicated in future studies by additional samples. Some benefits of this technique appear to be the simple handling of the smart phone by patients and physicians and the acceptable reliability of this device when measuring the variety of movement.

### Result and Conclusion

The findings of this research show that the smart phone inclinometer application is highly reliable and valid in evaluating the active motions of the dominant hand elbow joint. The comparison of two method shows the accuracy of the smartphone application which can be used progressive training and rehabilitation protocols. The study shows the latest development of the physical therapy instrumentations. The study shows the cost-effective method in measuring the range of motion of joints.

**Limitations:** In this study, healthy volunteer subjects without intense and incessant defects in upper limb joints were evaluated. But it ought to be taken note that in the event that there's any variation from the norm within the upper extremity, the research must be repeated. For example, on the off chance that there is a disruption in the shoulder joint, too a few measurements within the elbow joint will be affected. In this study, we had to inform subjects approximately process of procedures. So, the blindness of study can be affected. Aging as a perplexing calculate can influence the comes about. In this consider, the greatest age was 22 a long time. In any case, the subjects were suggested for preparing some time recently the estimations. Too, in

this consider sex impacts, as a perplexing figure, on the unwavering quality of estimations was not considered.

**Ethical Clearance:** IHEC approval was obtained before subject enrolment from MAHER.

**Source of Funding:** Self

**Conflict of Interest:** Nil

# Water Quality Assessment of Kanchipuram Temple Pond by Using Statistical Method and Water Quality Index

Meenakshi Perumal<sup>1</sup>, Sriram Gopalsamy<sup>2</sup>

<sup>1</sup>Assistant Professor, Department of Civil & Structural Engineering, <sup>2</sup>Professor, Department of Mechanical Engineering, Sri Chandrasekharendra Saraswathi Viswa Mahavidyalaya, Enathur, Kanchipuram, Tamilnadu, India

## Abstract

The environmental change having an impact on the pond water in Kanchipuram. The holiest temple pond level is decreasing every year. The aim of the study is to assess the quality of temple pond water by analyzing the factors pH, Dissolved oxygen, Total Dissolved Solids, Chlorides, Sulphates, Iron and Total Coliforms. The results are compared to tolerance limits of inland water from ISI-IS: 2296-1982 standards (Class C). The position of temple pond water was determined by using the water quality index. The statistical (correlation & regression) analysis is done to determine the relationship between water quality parameters. The calculated WQI value for temple ponds differs from 47.50 to 96.02 (good to very poor). There is a significant positive correlation between TDS & Cl (0.932), TDS & SO<sub>4</sub> (0.941), Cl & SO<sub>4</sub> (0.960). The results found that all measured parameters within the limit expect dissolved oxygen. Hence pond water is not directly suitable for drinking; it can be suitable for fish culture.

**Keywords:** Temple pond water, Water Quality Index, Correlation, Regression, Dissolved Oxygen.

## Introduction

Water is the elementary requirement for the social culture. Surface water is the vulnerability pollution, mainly due to easy access for disposal of pollutants and wastewater. This is most important tools of the environment and an integral part of the biological cycle. Ponds and tanks are recognized to be environmental indicators of the strength of a city. The quality of surface water is governed by the natural processes and difficult anthropogenic activities. Surface water bodies have an effect on the groundwater board and subsurface water values of the close aquifers due to the presence of direct contact between the surface and groundwater<sup>1</sup>. The pond water is the main important role in the environmental bio-monitoring due to the reasons such as groundwater recharge, bases of water surface and discharge for irrigation, nourishment, overflow control and preservation, regeneration, environment change for bio biological cycles, persistence of fishes and animals, precipitation harvesting. The ecological condition of any lake or pond structure mainly depends upon the nature of that lake or pond and its occurrence to the various

ecological factors. Hence, the surface water value be determined by not only on systematic procedures but also on anthropogenic special effects<sup>2</sup>. The quality of Water also shows the relation of physical, chemical and biological properties of the surface water. The water quality design contains the study of physico- chemical and biological factors that reproduce the biotic and abiotic grade of the environment<sup>3</sup>. The Water quality index is an important tool deals with a nominal number that is denoted by definite place and time, also based on some of the water quality factors<sup>4</sup>. The current learning deals with the assessment of temple pond water and position of temple pond water on the basis of calculation of water quality index<sup>5,6</sup>. This work also deals with the Correlation and regression analysis for defining the major linear relationship among different pairs of water quality parameters<sup>7</sup>.

## Method

- i. **Study Area:** The study area is temple ponds in the Kanchipuram town. The samples were collected from seventeen locations in January 2018. Kanchipuram

is one of the distinguished cities of temples in South India. It is positioned 72 kms from Tamil Nadu state and the capital is Chennai. Kanchipuram is a town in the north portion of Tamil Nadu state. It is a famous visitor spot, with the more than 170,000 people. The topographical position of the study area lies between 12°46'30'' - 12°52'00'' North Latitude and 79°39'00'' - 79°46'20'' East longitude.

**ii. Sample Collection:** The pond water samples have been collected at seventeen different temples using well cleaned polythene container. After collecting the sample containers were tightly closed and categorized. The collected pond water samples were examined for pH, Dissolved oxygen, Total Dissolved Solids, Chlorides, Sulphate, Iron and Total Coliforms. The Class C surface water quality parameter values prescribed by ISI-IS: 2296-1982 presented in Table 1.

**iii. Water Quality Index:** Water Quality Index specifies the quality of water in terms of key number and offers a useful performance of the overall wealth of water<sup>8,9</sup>.

Water quality index value has been calculated to determine the suitability of water quality of temple pond water using the weighted arithmetic index technique<sup>10,11</sup>.

WQI value is determined by the following equation.

$$WQI = \sum (w_n \times q_n) / \sum w_n \quad \dots(1)$$

There is an amount of elements in the water sample result;

$q_n$  signifies the quality of  $n^{\text{th}}$  parameter in the water sample with reference to standard allowable value. Quality rating  $[q_n] = [100 (\text{observed value} - \text{ideal value}) / (\text{Standard value} - \text{ideal value})]$

Ideal value = 0 But for pH, dissolved oxygen ideal value is dissimilar, it can be determined by

$q_n$  for pH =  $100 (\text{observed value} - 7) / (8.5 - 7)$  and  $q_n$  for DO =  $100 (\text{observed value} - 14.60) / (15.00 - 14.60)$ . Unit weight  $[W_n] = \text{proportionality constant } (k) / \text{standard acceptable value given for } n^{\text{th}} \text{ parameter } (S_n)$  ( $W_n = K/S_n$ )

Water quality Index and Category of water quality is as follows:

Excellent Category (0–25), Good Category (26-50), Poor Category (51-75)

Very Poor Category (76–100), Unfit for drinking Category (Greater than 100)

1. Statistical analysis was carried out using statistical package for social sciences [11] (SPSS Version 17).

2. The physico-chemical parameters for all the study sites were analyzed by calculating Pearson's correlation Coefficient (r) value.

**iv. Correlation and Regression Analysis:** Correlation is essential in finding out the power of the relationship between the two interdependent variables. A regression has a statistical method for understanding the relationship between independent variables<sup>12,13</sup>.

## Results

**i. Physico-Chemical Properties:** The level of water and analytical values of physico, chemical and biological parameters for seventeen temple pond water is shown in Table 1.

**ii. Water Quality Index:** In WQI calculation quality rating of each parameter calculated by the formula

$$[q_n] = [100 (\text{observed value} - \text{ideal value}) / (\text{Standard value} - \text{ideal value})]$$

Next step, the unit weight for each measured parameters are calculated. Table 2 shows the Class C standards and unit weight for each parameter.

**iii. Correlation and Regression Analysis:** Statistical analysis was carried out by using SPSS Version 17<sup>14</sup>. Correlation coefficient (r) between pH, Dissolved Oxygen, Chloride, Sulphate, Iron, Total coliform count and regression coefficient k shown in Table 4 and Table 5.

## Discussion

**i. Physico-Chemical Properties**

**a. pH:** pH value for P12 (8.86), P3 (9.31) station were greater than the prescribed limit, remaining station ranged from 6.86 to 8.26 which is in limit, therefore, pH of fifteen station got the criteria of the quality standard of Class C.

**b. Dissolved Oxygen (DO):** DO is important for the survival of living organisms. The measured DO values varied between 6.2 mg/l to 7.8 mg/l, as per ISI-IS: 2296-1982 Class C standards DO should be less than 4 mg/l,

Hence the DO of seventeen stations was out of the standard permissible limit. The higher DO value is due to the enlarged solubility of oxygen at minor temperature.

- c. **Total Dissolved Solids:** Total Dissolved Solids denotes the presence of total dissolved elements present in water. The amount of TDS in the sample points varies from 114 mg/l to 1204 mg/L. Hence the TDS of seventeen station was within the standard permissible limit.
- d. **Chloride:** Chloride content in pond water gives the idea about the impurity of the water by solvable chloride salts, sewage discharge, etc. The amount of chloride in the seventeen stations varies from 28mg/l to 349mg/l. The standard limit prescribed is 600mg/l. The chloride concentration in all seventeen stations was below the permissible limit. Hence the pond water samples has not affected by chloride pollution.
- e. **Sulphate:** The amount of sulphate in the seventeen stations varies from 13mg/l to 184mg/l. The standard limit prescribed is 400mg/l. The sulphate concentration in all seventeen stations was below the permissible limit. Hence the pond water samples have not produce scale build up in pipes and avoid the bitter taste of water.
- f. **Iron:** Iron has not directly poisonous to living organisms. The ferric hydroxide from iron causes obstruction in breath of fish. The measured value of the iron ranges from 0.02mg/l to 0.09mg/l. The standard limit prescribed is 50mg/l. The iron concentration in all seventeen stations was below the permissible limit. Hence the pond water samples has not affected by iron.
- g. **Total Coliform Count:** The amount of the Total coliform count in the seventeen stations varies from 700 MPN to 2300MPN. The standard limit prescribed is 5000MPN. Presence of coliforms produces pathogenic diseases of fishes, the measured values of all seventeen stations was below the permissible limit. Hence the pond water samples are in safe condition.

ii. **Water Quality Index:** In this analysis, Table 4 shows the water quality index and category of temple pond water. The value of WQI ranged 47.50 to 96.02 in all the sample stations. From the results P1, P8, P17 temple pond water in a good category, these pond water fit for drinking purpose after the conventional treatment followed by disinfection (Class C). P2, P5, P6, P7, P9, P10, P11, P13, P14, P15, P16 are in poor category and P3,P4,P12 are in very poor category, these pond water fit for fish culture, irrigation (CPCB & BIS standards) comparing the results of Table 3.

### iii. Correlation and Regression Analysis:

Correlation Co-efficient matrix of different parameters as presented in Table 4. pH showed weak positive correlation with TDS ( $r = 0.090$ ), Cl ( $r = 0.154$ ),  $SO_4$  ( $r = 0.175$ ), TCC ( $r = 0.318$ ) and weak negative correlation with DO ( $r = -0.383$ ), Fe ( $r = -0.266$ ). DO showed weak positive correlation with TDS ( $r = 0.398$ ), Cl ( $r = 0.405$ ),  $SO_4$  ( $r = 0.328$ ), Fe ( $r = 0.222$ ), weak negative correlation with TCC ( $r = -0.207$ ). TDS showed strong positive correlation with Cl ( $r = 0.932$ ),  $SO_4$  ( $r = 0.941$ ). TDS showed weak positive correlation with Fe ( $r = 0.063$ ), TCC ( $r = 0.343$ ). Cl showed strong positive correlation with  $SO_4$  ( $r = 0.960$ ), weak positive correlation with TCC ( $r = 0.413$ ), weak negative correlation with Fe ( $r = -0.085$ ).  $SO_4$  showed weak positive correlation with TCC ( $r = 0.475$ ), weak negative correlation with Fe ( $r = -0.080$ ). Fe has weak correlation with TCC ( $r = -0.020$ ).

Regression analysis is a method of analytical modeling method which examines the relationship between a dependent and independent variable. Regression analysis data in Table 5 showed that TDS good regression with  $SO_4$  ( $k = 0.885$ ), TDS good regression with Cl, ( $k = 0.845$ ). Cl good regression with  $SO_4$  ( $k = 0.941$ ). The regression equation of TDS with  $SO_4$  & Cl; Cl with  $SO_4$  as presented in Table 5. Scatter diagrams for regression analysis shown in (Fig.1,2 and 3).Regression analysis shows a positive linear regression model between TDS with  $SO_4$ , Cl and Cl with  $SO_4$ .

**Table 1: Analytical values of physico, chemical and biological parameters for seventeen temple pond water**

Sl. No..	Pond No.	Name of The Temple	Level of Pond Water	pH	DO (mg/l)	TDS (mg/l)	CL (mg/l)	SO <sub>4</sub> (mg/l)	Fe (mg/l)	TCC MPN
1	P1	Lakshmi Narayana Temple	High	7.03	6.8	159	56	22	0.07	800

**Fig. 3: Regression between Cl with SO<sub>4</sub>.**

### Conclusion

The outcomes of present study conclude that Lakshmi Narayana temple, Kachabeshwarar temple, Thamarai Kulam pond water was in good category according to class C standards (drinking water source with conventional treatment followed by disinfection). The rise in DO value and presence of TCC indicates the water directly not used for drinking purpose. All other temple pond water has WQI value poor to very poor. This increase value of WQI across the location points is due to anthropogenic activity, runoff, etc. The correlation and regression analysis conclude that total dissolved solids have significant positive correlation with chloride and sulphate. Some of the parameters do not have significant correlation between them indicating the different cause of pollution. The high value of WQI is mainly greater value of DO, it predict that all the temple pond water suitable for fish culture without any treatment, with proper treatment it can be used for drinking purpose.

# Awareness of Ceramic Implants among Dentists in Tamilnadu

Mohamed Thamemul Ansari K.A.<sup>1</sup>, Dhanraj M.<sup>2</sup>

<sup>1</sup>Graduate Student, <sup>2</sup>Professor, Department of Prosthodontics, Saveetha Dental College, Saveetha Institute of Medical and Technical Science, Saveetha University, Chennai

## Abstract

**Introduction:** Dental ceramics made of silicate glasses, porcelains, glass- ceramics, or extremely crystalline solids. They differ from the materials like metals, acrylic resins, and resin-based composites by exhibiting different physical, chemical and mechanical properties.

The present study aims at gaining knowledge on the awareness of dentists about ceramic implants.

**Materials and Method:** This questionnaire based survey study was conducted employing self-administered questionnaire at the Saveetha Dental College and Hospital. A total of About 70 participants (dentists) to be included for this survey. The survey to be conducted using a questionnaire containing closed ended and open ended questions and responses are to be analysed using appropriate statistical method.

**Results:** From the study, almost 83% of dentists possess adequate knowledge about ceramic implants.

**Conclusion:** Although the dentists possess basic awareness about ceramic implants, in order to keep up with the current trends more knowledge is required on their part.

**Keywords:** Dental ceramics, Implants, dentists, Titanium, Aesthetics.

## Introduction

Dental ceramics made of silicate glasses, porcelains, glass- ceramics, or extremely crystalline solids. They differ from the materials like metals, acrylic resins, and resin-based composites by exhibiting different physical, chemical and mechanical properties.<sup>[1]</sup> Silicate glasses differ from non-silicate glasses therein semiconducting material is that the central power ion that's guaranteed to four comparatively massive chemical element anions that link during a random order to other tetrahedra to form polymeric-type (SiO<sub>2</sub>)<sub>n</sub> chains. The properties

of ceramics are customised for dental applications by precisely controlling the types and amounts of the components used in their production.<sup>[2]</sup> The impact of the introduction of ceramics into dentistry developed a various findings in the field of Implantology.<sup>[3]</sup>

According to the history of implants, people were using various kinds of animal bones and some metals to place in the tooth socket as an implant. With evolution, Many metals like Titanium were used. Titanium is one of the good materials for implant due to its good aesthetic property and biocompatibility.<sup>[4]</sup> The rehabilitation of fully and partially edentulous patients with dental implants may be a scientifically accepted and well documented treatment modality. Presently, Titanium and Ti alloys are the materials most frequently used as an implants and became normal for tooth replacement in dental implantology.<sup>[5]</sup> These materials have earned thought use due to their glorious biocompatibility, favourable mechanical properties, and well documented useful results. once exposed to air, Ti like a shot develops a stable chemical compound layer, that forms the premise

e-mail: drganapathyss@gmail.com

of its biocompatibility.<sup>[6]</sup> The principal disadvantage of Ti is its dark grey colour, which frequently is visible through the peri-implant membrane, thus impairing aesthetic outcomes within the presence of a skinny tissue layer genotype. Unfavourable soft tissue conditions or recession of the gingiva may lead to compromised aesthetics. This is of nice concern once the jaw incisors are concerned. Furthermore, reports suggest that metals are able to induce a nonspecific immunomodulation and autoimmunity. Galvanic side effects after contact with spittle and halide are delineate. Though aversions to Ti are terribly rare, cellular sensitisation has been incontestable. Due to these disadvantages, novel implant technologies that turn out ceramic Implants.<sup>[7]</sup>

Ceramic Implant provides a particular aesthetic resolution for patients with specific needs like a thin gingival genotype and for those patients who explicitly express their need for metal-free alternative. There are certain people who are either allergic or sensitive to alternative metals in their body or specific issues on having any metals within their body.<sup>[8]</sup> Ceramic implants sometimes cannot be left to heal below the gums. Usually the osseointegration procedure takes nearly six months to finish. Once surgically inserting the dental implants, they must have primary stability or a certain force worth. Implants that do not possess smart primary stability should be left for healing beneath the gums for 3 to 6 months once placement. Majority of zirconium dioxide dental implants might not heal below the gums due to their “one-piece” style, implying that they do not possess a removable abutment but one which is fixed to the implant. For dispelling such issues and having an implant option for such individuals, several companies have undertaken analysis and Development on “metal-free” implants. This has resulted in creating use of zirconia.<sup>[9,10]</sup> Use of zirconia became widespread initial in its type of crystalline (cubic form) zirconium dioxide because it resembled a perfect diamond. Several years ago single crystal sapphire implants were used; but, these days they’re not a lot of detected of. In the type of zirconia, it’s used for dental applications. Actually, it’s not a type of pure zirconia—there square measure traces of another part metallic element (Hf) and its chemical compound is combined with metal (yet another metal) to boost its properties. This yields a white opaque product and during this type, it’s tagged as ceramic, tho’ there square measure gold-bearing atoms within the material.<sup>[11,12]</sup>

Since, The ceramic implant technology is developing

in a wide range field, Dental practitioners must be aware about the ceramic implants and its wide range of uses. Our Aim of the study is to know the knowledge and awareness about ceramic implants among dentists in Tamilnadu.

## Materials and Method

**Participants and study design:** It is a questionnaire based survey study (quantitative and observational) was conducted employing self-administered questionnaire at the Saveetha Dental College and Hospital .The participants were dentists in Saveetha Dental college and Hospital .The participants were informed in advance about the objective of the study. The participation of the subjects was entirely voluntary and their identities were kept anonymous.

**Data collection method:** About 15 questions were prepared with open ended and close ended questions for the survey. With the help of 75 dental practitioners across the Tamilnadu an online survey was conducted through survey planet.com. The questionnaire contains questions which is helpful to assess the knowledge and awareness about ceramic implants among dentists in Tamilnadu. The results were collected and analysed.

**The structured questionnaire consists of three sections:**

1. Knowledge of dentists about ceramic implants
2. Awareness about Ceramic implants
3. Management and treatment plans for ceramic implants.

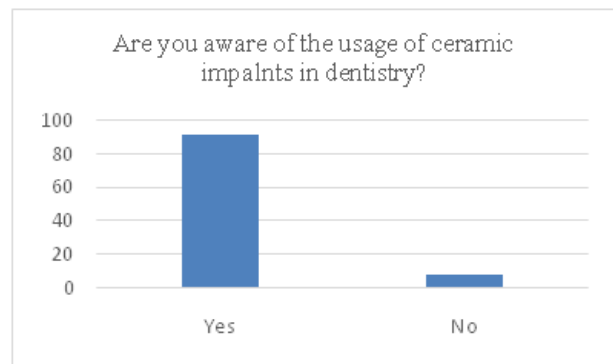

## Results

In this survey, totally 70 dental practitioners were participated in which 43 were males and 27 were females. Out of the total about 52 people were dental practitioners, 28 people were an implant doctor. The outcome of the survey varies from other studies according to the sample size and results.

## Discussion

About 92% of the dental practitioners aware about ceramic implants where only 8% of them doesn’t know about it. (figure1). About 40% of the dentists told that ceramic implants has got better osseointegration. Whereas 60% of the dental practitioners told Titanium implants is better than ceramic implants in osseointegration. But moreover ceramic implants got somewhat better

osseointegration property. About 62% of the dentists told Titanium implants has got highest crestal bone loss. So, Usage of ceramic implant may lowers the crestal bone loss. About 57% of dentists using cement retained prosthesis for ceramic implants while 43% are using screw retained prosthesis<sup>[13]</sup>. About 78% of dentists told that ceramic implants is easier to clean and maintain (figure 2). Where basically ceramics are easier to clean due to its glassy property. Because of its glassy property ceramic implants are more prone to get fracture. About 75% of dentists told ceramic implants will get fractured if we apply more pressure. The success rate of ceramic implant is almost 80% for most of the patients, who were given ceramic implants (figure3). Almost 43% of dentists told it gives 75% of success rate only 15% of dentists told the success rate is below 50% (figure 4). So almost most of them are accepting that ceramic implants are coming in good success rate.<sup>[14]</sup> Due to mechanical fractures, physical and chemical cause, almost both the titanium and ceramic implants have an equal rate of failures. So, the selection of implants will be according to the patients. Due to the physical property of porcelain and its natural appearance, ceramic implants will give better aesthetics than titanium implants. Almost 85% of the dentists accepted that ceramic implants gives better aesthetics (figure 5). About 75% of the dentists prefers ceramic implants when a patient comes with the highest bone loss. Almost, 44% of the dentists told ceramic implants do not cause more side effects (figure 6). But almost equally the results are came. So, side effects will be basically depends on the oral hygiene of the patient. Titanium implants bears more stress than ceramic implants. Because those implants are made of strong metal titanium. So, comparatively titanium implants bears more stress than ceramic implants. 60% of dentists accepted the statement. . Ceramic implants are more bio inert than titanium implants because of its chemical property. It won't react with the biological tissue when it is in placed in the mouth<sup>[15]</sup>. 84% of the dentists accepted that ceramic implants are more bio inert. About 67% of the dentists told titanium implants heals faster than ceramic implants. Like we discussed before, Titanium implants has got better osseointegration than ceramic implants. So, it heals faster than ceramic implants. 70% of the dentists told the same. About 48% of the dentists told that The ceraRoot implant system is the best to follow for the implant procedure. From this question its clear that almost 70% of the dentists using ceramic implants in their routine basis in patients. More of the patients opt ceramic implants due to its better aesthetic property.

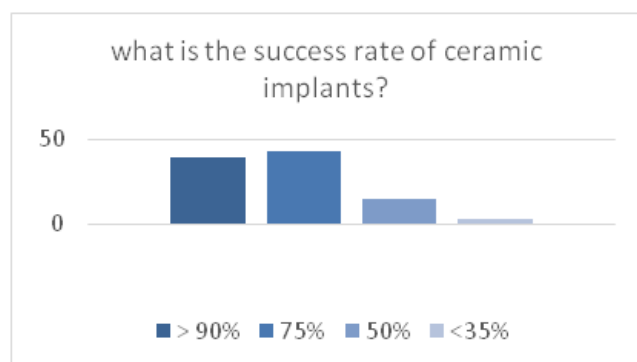

**Fig.1 Awareness about ceramic implants**

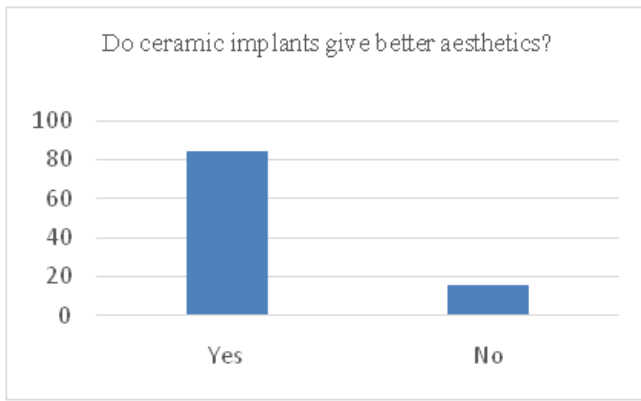

**Fig.2 Maintenance of implants**

**Fig.3 Fracture capability of implant.**

**Fig.4 Success rate of ceramic implant**

**Fig.5 Aesthetics of ceramic implants**

**Fig.6 Side effects of implants**

**Conclusion**

Based on the survey, it can be well documented that almost two-third of the dentist use ceramic implants mainly because of it aesthetics. Additionally, the knowledge on the properties of the dental ceramics among dentists is appreciable. Dentists can still take measures to stay updated with the newer technologies available in the field of dentistry.

# Problems of Nosocomial Infection in Newly Upgraded and Newly Opened Government Health Institutions and their Management

Naresh Vashist<sup>1</sup>, Raveen Chauhan<sup>2</sup>, Kumari Kamlesh<sup>3</sup>

<sup>1</sup>Pharmacy Officer, Health & Family Welfare Department, Himachal Pradesh, India & Pharmacy Practice,

<sup>2</sup>Assistant Professor, <sup>3</sup>Pharmacy Practice, Department of Pharmaceutical Sciences, Shoolini University, Bajhol, Distt. Solan, H.P, India.

## Abstract

**Background:** Problems of nosocomial infections are arisen in health institutions due to insufficient facilities, infrastructures, finance, manpower etc as health institutions are upgraded and opened in same existing buildings or in hired buildings or in local governing bodies' buildings, in Himachal Pradesh. These infections are acquired by patients, attendants or visitors in these health institutions during their stay or visit in health institutions by susceptible patient or person, hospital care staff, in addition to infected or contaminated bed linen, equipment or air droplets, staff who are infected and from infected patients, also originates from patients' own skin micro biota, becoming opportunistic after surgery.

**Method:** The data collected by survey of about 224 newly opened and upgraded health institutions and correlated with previous research articles and researches published in different journals, by citations and observed present conditions of different health institution by survey and suspected nosocomial infections and problems which are arising in management of these nosocomial infections.

**Results:** The total newly opened and upgraded health institutions w.e.f. 01-04-2016 to 31-03-2019 are 224 which are opened in pre-existing buildings or opened in hired or local governing body's buildings There is the scarcity of resources which may lead to the problems of nosocomial infections, caused by different gram-positive and gram-negative bacteria, and different species of viruses and fungus. These are the problem of inadequate and infected water supply, availability of contaminated sinks, non-availability of water sinks, contaminated toilets, ineffective cleaning policies, in disposing off the human wastes, in laundry services, in implementing strict hand washing policies, in isolation for the patients of specific infections, in the control of the infection after the death of the patient. The major cause is the scarcity of many resources to fulfill the needs of health institutions.

**Conclusion:** In newly opened and newly upgraded health institutions, the nosocomial infections are caused by bacteria, virus and fungus because the norms and protocols of health institutions are not followed due to deficiencies of all requirements and facilities but generation of bio medical waste is started from first day of opening or upgradation of health institution which may increase risk of nosocomial infections in these institutions by direct or indirect contacts.

**Keywords:** *Nosocomial Infections; gram-positive and gram-negative bacteria; susceptible patient; micro biota.*

## Introduction

**Background:** Many health institutions are opened and upgraded in Himachal Pradesh in recent years.

These health institutions are running in pre-existing buildings or in hired private buildings or in buildings of local governing bodies with lacking of many facilities for running these health institutions. This leads to

management problems of nosocomial infections in these institutions. Different microorganisms which are responsible for nosocomial infections in these health institutions are bacteria, viruses and fungal parasites. The most common microorganism responsible for nosocomial infections are bacteria in these health institutions. Acinetobacter causes nosocomial infections in Intensive Care Units of these institutions whereas Bacteroides fragilis is a commensal bacteria causes nosocomial infection in intestinal tract and colon<sup>1</sup> which is present in these health institution abundantly. Due to lack of facilities in these health institutions the microorganisms like Methicillin-resistant S.aureus (MRSA) causes pneumonia, sepsis and surgical site infection which is transmitted through direct contact, open wounds and contaminated hands and is highly resistant towards beta-lactams antibiotic.<sup>2</sup> In these newly opened and newly upgraded health institutions, viruses contribute about 5% in nosocomial infections<sup>3</sup>

and fungal parasites like Aspergillus spp, Candida albicans, Cryptococcus neoformans etc cause nosocomial infections in immune-compromised individuals during hospital stay<sup>4</sup> in these health institutions. In upgraded health institutions, during renovation or construction, Aspergillus infections are caused by inhalation of fungal spores from contaminated air whereas Candida infections arise from patient's endogenous microflora<sup>5</sup> during the stay of patients in these health institutions.

## Material and Method

The data collected by survey of about 224 newly opened and upgraded health institutions and correlated with previous research articles and researches published in different journals, by citations, and observed present conditions of different health institution by survey and suspected nosocomial infections and problems which are arising in management of these nosocomial infections.

**Table 1 The newly opened and upgraded health institutions in Himachal Pradesh w.e.f 01-04-2016 to 31-03-2019**

S.No.	Type of Facility/Health Institution	Number of Institutions
1.	Health Sub-Centres Newly Opened	58
2.	Primary Health Centre Newly Opened	76
3.	Primary Health Centre upgraded from Health Sub-Centres.	34
3.	Community Health Centres upgraded from Primary Health Centres	36
4.	Civil Hospitals upgraded from Community Health Centres	20
	Total Health Institutions	224

## Results

The total newly opened and upgraded health institutions w.e.f. 01-04-2016 to 31-03-2019 are 224 which are opened in pre-existing buildings or opened in hired or local governing body buildings. There is the scarcity of resources which may lead to the problem in management of the nosocomial infections, caused by different gram-positive and gram-negative bacteria, and different species of viruses and fungus. These are the problem of inadequate and infected water supply, availability of contaminated sinks, non-easy accessibility of sinks in all areas and non-availability of sinks, contaminated toilets, in management of the effective cleaning policies, in disposing off the human wastes, in management of laundry services, in implementing strict hand washing policies, isolation for the patients of specific infection, in the management for the control of

the infection after the death of the patient. The major cause is the scarcity of many resources to fulfill the needs of health institutions.

## Discussion

### 1. Problem of inadequate and infected water supply:

**Causing Agents:** Pseudomonas, Stenotrophomonas, Serratia, Acinetobacter, Aeromonas, Chryseobacterium, Mycobacterium species, Enterobacter, Flavobacterium, Campylobacter, Klebsiella and sub spp Abscessus. Fungi like Fusarium, Exophiala, Aspergillus.<sup>6</sup>

**Management:** Water supply should be disinfected properly and there should be sufficient water supply with enough water filters and ROs for drinking water.

**2. Problems of availability of contaminated sinks, and non-availability of sinks:**

**Causing Agents:** Multidrug-resistant gram-negative bacilli<sup>7,8</sup> Candida like Achromobacter spp., Acinetobacter spp., Aeromonas spp., Enterobacter spp., Flavobacterium spp., Moraxella spp., Pseudomonas spp.<sup>9</sup>

**Management:** Hand washing facilities should be available with decontaminated sinks in every areas as per the needs of the employee and patients.

**3. Problem of contaminated toilets:**

**Causing Agents:** C.difficile contaminate bathroom surfaces via droplet within 90 minutes.<sup>10</sup> Staphylococcus spp. Streptococcus spp., Enterococcus spp., Enterobacteriaceae and non-Enterobacteriaceae Gram- negative bacteria methicillin-resistant Staphylococcus spp.and CTX-M-9 group extended-spectrum  $\beta$ -lactamase-producing Escherichia coli<sup>11</sup>.

**Management:** The toilets should be decontaminated twice or thrice a day. Sufficient number of toilets for males and female should be available.

**4. Problem of ineffective cleaning policies:**

**Causing Agents:** Methicillin-resistant Streptococcus aureus (MRSA), glycopeptide-resistant enterococci (GRE), Clostridium difficile, Acinetobacter species, fungi, and noroviruses, vancomycin-resistant Enterococci and methicillin resistant Staphylococcus aureus (MRSA), C. difficile, noroviruses, and Gram-negative bacilli. Acinetobacter, Klebsiella spp., Enterobacter spp., Pseudomonas spp., Serratia, and Flavobacterium.<sup>12</sup>

**Management:** The floors should be cleaned twice or thrice with disinfectant, fumigation of the disinfectant should be done daily. Other items and apparatus should be sterilized properly

**5. Problems in disposing off the human wastes:**

**Causing Agents:** Salmonella spp., Clostridium spp, Shigatoxin-producing E. coli (STEC), Vibrio spp., Listeria monocytogenes, Campylobacter spp., norovirus, Shigella spp., Yersinia spp., Hepatitis A virus, Giardia, and Cryptosporidium.<sup>13</sup> extended-spectrum-beta lactamases (ESBL)- producing Enterobacteriaceae.<sup>14</sup>

**Management:** Human wastes should be buried or

throw into the drainage after disinfection by 1% sodium hypochlorite solution.

**6. Problems of laundry services:**

**Causing Agents:** Moulds Coagulase-negative staphylococci, saprophytic Gram negative bacilli, Staphylococcus spp., MRSA, Coagulase negative Staphylococci, saprophytic Gram negative bacilli, Vancomycin resistant enterococci spp. The microorganisms like Sarcopitescabiei, microsporumcanis, salmonella spp., hepatitis A virus.<sup>15</sup>

**Management:** Laundries services should be available in the health institutions or may be hired on contract basis.

**7. Problems in implementing strict hand washing policies:**

**Causing Agents:** Staphylococcus aureus in surgical siteinfection, pneumonia, sepsis Pseudomonas spp. in lower respiratory tract infection, escherichia coli in urinary tract infection, rotavirus in viral gastroenteritis, clostridium difficile in antibiotic-associated diarrhea.<sup>16</sup>

**Management:** Hand washing policies should be implemented efficiently and strictly in every health institutions.

**8. Problem of isolation for the patients of specific infection:**

**Causing Agents:** Direct contact disease like influenza virus, mumps, parvovirus, rubella, Viral hemorrhagic fevers due to Lassa, Ebola, Marburg, Crimean-Congo fever viruses, Pneumonia: Adenovirus, H. influenzae type b (infants and children), pertussis etc are spread by droplets and disease like Influenza A, Measles, Mycobacterium tuberculosis: laryngeal and pulmonary disease, extra-pulmonary draining lesion, disseminated disease.<sup>17</sup>

**Management:** The sufficient space should be provided to the patients with specific diseases, for isolation.

**9. Problem of the control of the infection after the death of the patient:**

**Causing Agents:** Patients who died with Anthrax, Plague, Rabies, Viral hemorrhagic fevers, Human Immunodeficiency Virus infection (HIV) Hepatitis

C, Avian influenza and all other communicable disease.<sup>18</sup>

**Management:** Isolation of the dead bodies should be according to Categories specified like Category 3, red coloured, in for patients who died with diseases like Anthrax, Plague, Rabies, Viral hemorrhagic fevers. In category 2, the patients of Human Immunodeficiency Virus infection (HIV) Hepatitis C, Avian influenza, in yellow coloured. Category 1, all other than Category 2 and 3.<sup>18</sup>

### Conclusion

Nosocomial infections are hospital acquired infections which are acquired by patients, attendants and visitors during their visit in health institutions, rehabilitation centres, clinics etc. from infected patients or from healthcare providers, through the direct or indirect contacts. In newly opened health institutions and newly upgraded health institutions, norms and protocols of health institutions are not followed due to scarcity of all requirements and facilities but generation of bio medical waste is started from first day of opening or upgradation of health institution which may increase risk of nosocomial infections in these institutions. Prior to upgradation or opening of new health institutions, all norms and protocols should be considered and adhered strictly because health institutions are for improvement of health of patients instead of giving them additional diseases. Prior to upgradation of health institutions or opening of new health institutions there should be proper consideration and observation of all norms and essential conditions for upgradations or opening. The financial needs should be fulfilled timely, sufficiently and properly. Man power should be considered and provided according to need and demand of work in newly opened and upgraded health institutions. All protocols and norms regarding cleaning policies, disinfection, biomedical wastes management should be followed and assets and needs should be fulfilled time to time for this management. The infrastructure, furniture, medical instruments, medical equipment etc should be available according to need and in sufficient quantity. Health institution should not be run in local governing bodies' buildings or in private buildings as these buildings are not according to norm of health institution or if opened in these buildings, the norms and protocols should be followed. As biomedical wastes are generated from first day of opening of health institution which may increase risk of nosocomial infections much more.

**Conflict of Interest:** No conflict of interest.

**Source of Funding:** Self.

**Ethical Clearance:** No experiment has been done on any animal or human beings. This manuscript is ethically clear.

# A Study on Brand Awareness and Customer Engagement

P. Vanitha<sup>1</sup>, S. Subramanian<sup>2</sup>

<sup>1</sup>Research Scholar, <sup>2</sup>HOD & Research Supervisor, Department of Commerce (Ca), Vistas, Pallavaram, Chennai

## Abstract

People are choosing the brand based on the awareness and consciousness. Brand awareness created by the marketers through various factors. The main aim of this article to find the factors of brand awareness and the relationship with customer engagement. The researcher used linear regression analysis to find the result. Finally concludes that there is a positive relationship between brand awareness and customer engagement.

**Keywords:** Brand awareness, Customer engagement, Word of mouth.

## Introduction

The brand awareness has turned into an important variable that impacts customer's perceptions of a brand. Achievement in brand management arises from understanding and overseeing brand image and loyalty correctly to create strong characteristics that will impact consumers when making on their decisions. This world is a technical world and in light of the prominence of intuitive media and most recent technologies, routine marketing has changed as organizations and clients have both changed; there is a revolution in marketing and trade through giving various service, for example, interchanges, data get to and promote brand awareness, saving money, protection, advertising, training, purchasing and offering, which additionally opens up potential outcomes in the zones of marketing, costumers behavior and criticism, lower exchanges and requesting expenses, and consumers maintenance.

As there is positive impact of brand loyalty on sustainability of brand, people who are loyal with the products they are ready to pay more for the products because they believe that these products are more useful for them. The Internet has created channels for both

business manager and consumers to attain their own particular objectives as it empowers organizations to achieve their clients worldwide, and consumers of all age gatherings utilize this channel to research, select, and purchase products and service from organizations as far and wide as possible. Business and consumers must exploit this data. Managing the brands in the fast growing consumer's products industry, the brand personality is a central variable and the company makes greater efforts to communicate them to their target consumers.

The wider range of the brands extended the higher the awareness the company needs regarding how their consumer perceives the extended brand. In order to make it possible for measure such a non figurative and intangible indicator such as "brand personality". A company can measure brand awareness by different ways including brand recall, brand recognition, top of the mind brand and dominant brand. Brand awareness is important in decision making because it can be depicted into brand recall when any cue is given. It also help to choose the brand even in case of little attachment and change decisions by associating brand image.

Brand commitment is a variation in customer behavior due to his personnel predilections or emotions. It is about choosing a single brand among many brands in same category again and again at any price. It can also be referred as brand slavery. When someone is buying a product and he has the name of the brand in his mind it means that, the consumer is highly aware about that particular brand. And if the products satisfy its consumers they not only remain loyal to their brand

but they also help the brand to grow by advertising their brand through their word of mouth. The product that has higher brand awareness will definitely grow better in the market and help the company in earning profits.

Customer engagement is a business communication connection between an external stakeholder (consumer) and an organization (company or brand) through various channels of correspondence. This connection can be a reaction, interaction, effect or overall customer experience, which takes place online and offline. In this research the researcher finds the brand awareness and its influence on customer engagement.

**Review of Literature:** Muhammad Ehsan Malik et al (2013). Importance of Brand Awareness and Brand Loyalty in assessing Purchase Intentions of Consumer. International Journal of Business and Social Science Vol. 4 No. 5; May 2013. The aim of this endeavor is to identify the effect of brand awareness and brand loyalty on purchase intention. Questionnaires were distributed to collect the responses from the employees in services sectors and conveniently available general public while descriptive statistics and regression analysis were used to analyze the data and draw the conclusions. Brand Awareness and brand loyalty have strong positive association with purchase intention. Managers all over the world should strive to promote the brand awareness along with brand loyalty as both of them contribute towards positive purchase intentions<sup>6</sup>.

Aqeel Ahmad et al (2014) The Study Of Brand Credibility And Brand Awareness As Positive Predictors For Brand Loyalty. Arabian Journal of Business and Management Review (Nigerian Chapter) Vol. 2, No. 12, 2014. This research study investigates method of brand loyalty through brand credibility and brand awareness. Simple random sampling method and Structure questionnaire were used for data collection. Data was analyzed through SPSS. The findings of this research study showed that brand loyalty has been observed to have positive association with brand credibility and also with brand awareness<sup>3</sup>.

Muhammad Asif et al (2015) Impact of Brand Awareness and Loyalty on Brand Equity. Journal of Marketing and Consumer Research www.iiste.org ISSN 2422-8451 An International Peer-reviewed Journal Vol.12, 2015. The objective of our research is to know the factors that impact on brand equity. The study considered the brand awareness and loyalty of brand,

to search out that how these influence the brand equity. The study was based on the primary which gathered from 200 respondents by means of a questionnaire. The application of random sampling technique are used and statistical tool like SPSS software was used for checking the reliability of questionnaire and for revealing the result of this research the correlation analysis are used. The research result indicates that the brand awareness and loyalty influence the brand equity. Main focus of every business is the customer attraction, the findings and recommendation of this research will help the managers to develop insight of research factors about the brand equity<sup>5</sup>.

Asaad Ali Karam (2015) An Analysis Study of Improving Brand Awareness and Its Impact on Consumer Behavior Via Media in North Cyprus (A Case Study of Fast Food Restaurants) International Journal of Business and Social Science Vol. 6, No. 1; January 2015. This is focused around the assumption that all these dimensions of customer based-brand image and loyalty will have impact on consumer's perceptions of brand. Brand awareness was treated with independently from different dimensions because of the difference in scale, and moreover media and sorts of media affecting on consumer behavior. The research studied four dimensions of consumer's based-brand equity specifically brand awareness, brand image, perceived quality and brand loyalty. Among the three dimensions, brand loyalty seems to have the minimum brand equity rating by consumers than alternate dimensions. Although, the dimension seem to have impact on consumer perceptions of brand. This paper likewise provides a solution to brand awareness via media store sellers which may help the sellers to promote their products in light of consumer behavior<sup>1</sup>.

Margarita Isoraita (2016) Raising Brand Awareness Through The Internet Marketing Tools. The opinions of different authors on raising brand awareness. The article are analyzes the opinions of different authors on raising brand awareness. The concept of internet marketing and its implementation it also describes and analyzes the concept of internet marketing and its implementation. The analysis investigation of the most urgent and the most effective online marketing tools in developing brand awareness are provided in the article. The article analyses website, internet advertising, social networks and the search engine optimization<sup>4</sup>.

Afaq Ahmed Khan (2016) Impact of Advertising

on Brand Awareness and Commitment in Female Apparel Industry. International Journal of Academic Research in Business and Social Sciences March 2016, Vol. 6, No. 3 ISSN: 2222-6990. The aim of this study is to explore the effectiveness of advertisement on brand commitment with the moderating role of quality between brand awareness and commitment. The empirical result indicates that how consumer’s present and future commitment is affected by brand awareness. The research is carried out with minimum resources and not many respondents which were not enough to observe the inclination of the whole population towards brands<sup>2</sup>

Zarlish Shahid, Tehmeena Hussain,Dr. Fareeh aZafar (2017) The Impact of Brand Awareness on The consumers’ Purchase Intention. Journal of Marketing and Consumer Research www.iiste.org ISSN 2422-8451 An International Peer-reviewed Journal Vol.33, 2017. This paper presents a review about the impact of brand equity and brand awareness on the purchasing intentions of the consumers. The purpose of the paper is to elaborate the relation between the awareness of a brand and the intention of consumer of buying that brand. This has been done by going through different literature and articles by different authors. It will help the readers to come across the work done by various well

known authors at one place and hence will help to know how knowing a brand well will affect the consumer in making decision about buying a product<sup>7</sup>.

**Objectives of the Study:**

1. To examine the factors influencing brand awareness
2. To examine the influence of brand awareness on customer engagement

**Hypotheses of the Study:**

1. There is no significant among factors influencing brand awareness.
2. There is no significant influence of brand awareness on customer engagement

**Analysis and Discussion**

Branding is the important criteria used by the marketer to get the customer engagement for their products. There are many factors used by the marketers to create customer awareness. The main factors are advertisement, target market, integrated market, positioning and social media marketing. The following tables show the influence of brand awareness factors to customer engagement.

**Table 1: Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.996 <sup>a</sup>	.993	.993	1.08005

a. Predictors: (Constant), AW1, AW2, AW3, AW4, AW5, AW6

Source: Computed data

The above table shows that R = .996 R square = .993 and adjusted R square .993. This implies the brand awareness variable create 99% variance over the customer engagement. The cumulative influence of six

variables of brand awareness over customer engagement is ascertained through the following one way analysis of variance.

**Table 2: ANOVA<sup>a</sup>**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	77894.243	6	12982.374	11129.302	.000 <sup>b</sup>
	Residual	566.921	486	1.167		
	Total	78461.164	492			

a. Dependent Variable: Customer engagement, b. Predictors: (Constant), AW1, AW2, AW3, AW4, AW5, AW6

Source: Computed data

Table 2 presents that  $f = 11129.302$   $p=.000$  are statistically significant at 5% level. This indicates all the six variables cumulatively responsible for customer

engagement. The individual influence of all this six variables is clearly presented in the following coefficient table.

**Table 3: Coefficients<sup>a</sup>**

Model B		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		Std. Error	Beta			
1	(Constant)	.789	.130		6.083	.000
	Integrated Marketing	.819	.173	.095	4.723	.000
	Word of Mouth	1.644	.182	.186	9.035	.000
	Positioning	1.001	.188	.112	5.327	.000
	Advertisements	1.928	.102	.218	18.939	.000
	Social media marketing	1.288	.158	.138	8.175	.000
	Target marketing	2.255	.163	.272	13.852	.000

a. Dependent Variable: Customer engagement

Source: Computed data

From the above table it shows that Integrated marketing (Beta=.095,  $t=4.723$ ,  $p=.000$ ), Word of mouth (Beta=.186,  $t=9.035$ ,  $p=.000$ ), Positioning (Beta=.112,  $t=5.327$ ,  $p=.000$ ), Advertisements (Beta=.218,  $t=18.939$ ,  $p=.000$ ), Social media marketing (Beta=.138,  $t=8.175$ ,  $p=.000$ ) and Target marketing (Beta=.272,  $t=13.852$ ,  $p=.000$ ) are statistically significant at 5% level. This indicates that the all the six variables of brand awareness influenced to customer engagement. Moreover, advertisement is the important factor to create brand awareness and get customer engagement to the branded products.

**Findings and Conclusions**

Brand is the one of the important tool that occupy the target market by the marketer. Branding influence and attracts many customers for various reasons. They feel branded products getting some features such as quality, long life and good service. There are positive relationship between brand awareness and customer engagement. The people are getting brand awareness they are automatically engaged with the same brand till they get bad experience.

Brand awareness are created by the following factors. There are Target marketing, Positioning, Integrated marketing, Advertisement, Word of mouth and social media marketing. Among the all factors advertisement create more brand awareness than other factors. People

are getting brand awareness and they are marketer gets customer engagement from the same. Finally it concludes that brand awareness creates customer engagement to the concern products and it develops good equity level to the marketer.

# Linezolid Resistant clinically Significant Isolates of Coagulase Negative Staphylococci: An Emerging Therapeutic Concern

Priyanka Chaturvedi<sup>1</sup>, Anita Pandey<sup>2</sup>

<sup>1</sup>Resident, Post Graduate, <sup>2</sup>Professor & Head, Post Graduate, Department of Microbiology, Subharti Medical College and Associated Chhatrapati Shivaji Subharti Hospital, Meerut, (U.P.), India

## Abstract

Multidrug resistant Coagulase Negative Staphylococci (MDRCoNS) have emerged as a major cause of morbidity and mortality in hospital settings. A total of 706 clinically significant isolates of CoNS, were identified up to species level. Antimicrobial susceptibility testing was carried out with especial reference to linezolid and methicillin. *Staphylococcus epidermidis* (44.33%) was the predominant species isolated followed by *Staphylococcus haemolyticus* (39.37%) and *Staphylococcus lugdenensis* (5.24%). Isolates were predominantly recovered from blood 82.86%. Linezolid resistance (LzR) was seen in 2.54%. *S. haemolyticus* was the most resistant phenotype. The LzR isolates were also methicillin resistant. MDRCoNS poses a significant therapeutic challenge demanding judicious use of antibiotics.

**Keywords:** CoNS, *S. epidermidis*, *S. haemolyticus*, linezolid, methicillin resistance.

## Introduction

Coagulase Negative Staphylococci (CoNS) have been recognized as important agents of human disease.<sup>1</sup> There are more than 40 recognized species of CoNS, making them the most prominent microbes inhabiting the normal skin and mucous membranes.<sup>2</sup> Commonly implicated species include *S. epidermidis*, *S. haemolyticus*, *S. lugdunensis*, *S. schleiferi*, *S. warneri*, *S. hominis*, *S. simulans*, *S. capitis*, *S. cohnii*, *S. xylosus*, and *S. saccharolyticus*.<sup>3</sup> CoNS are important opportunistic pathogens and have been reported as causes of human infections, such as bloodstream infections, wounds infections, urinary tract infections etc.<sup>2</sup> Multidrug resistant (MDR) CoNS is a matter of therapeutic concern due to limited options left for treatment. This is the first study carried out from this geographical area which

phenotypically characterizes the clinically significant CoNS upto species level and determines their antibiotic susceptibility pattern with especial reference to linezolid.

## Method

A total of 706 non-repeat clinically significant isolates of CoNS obtained from different clinical samples over a period of one year from various inpatient units and outpatient departments was processed. The isolation and identification of CoNS was carried out as per standard bacteriological technique.<sup>2</sup> Only the Gram positive cocci, catalase positive, fermentative, slide and tube coagulase test negative were included in the study. Other bacterial pathogens were excluded from this study.

**Identification and Confirmation:** The CoNS were identified phenotypically upto species level by pigment production, clumping factor, novobiocin susceptibility, mannitol fermentation and ornithine decarboxylation<sup>2</sup> and confirmed by Vitek-2 system, using GPID card number P628 (Biomérieux, France).

**Antimicrobial susceptibility testing (AST):** AST was carried out as per CLSI recommendations 2017<sup>4</sup> using commercially available antibiotic discs (Hi Media). Methicillin resistance was tested using

---

cefoxitin (30µg) disc. Susceptibility to linezolid was tested using linezolid (30µg) disc and interpreted as per CLSI 2017.<sup>4</sup> A zone diameter of  $\leq 20$  mm for linezolid was taken as screen positive and further these isolates were subjected for Minimum Inhibitory Concentration (MIC) and value of  $\geq 8$  µg/ml was taken as resistant to linezolid. Vancomycin susceptibility was tested by MIC. Staphylococcus aureus ATCC 25923 was used for quality control.

## Results

Out of the total 706 clinical isolates of CoNS processed during the study period, majority of the isolates 680 (96.31%) were from indoor samples, predominantly from wards 434 (63.82%). The isolation rate was maximum from blood 585 (82.86%) followed by pus 78 (10.89%) and urine samples 24 (3.40%). CoNS species were commonly isolated from patients in extreme of ages 36.54% (< 10 years) & 15.72% (>61 years). There was male predominance (78%) and the male: female: ratio was 1.45:1.

Among the various species of CoNS isolated, S. epidermidis 313 (44.33 %) was the most frequent followed by S. haemolyticus 278 (39.37 %) and S. lugdenensis 37 (5.24 %). S. saprophyticus, S. hominis, S. intermedium and S. warneri were other CoNS species less frequently isolated from our Hospital (Table 1).

The clinical isolates of CoNS were MDR including very high level of resistance to penicillin (Table 2). Similarly, Methicillin resistance (MRCoNS) was also high among all the species ranging from 88% to 100%. None of our isolates of CoNS were resistant to Vancomycin. However, there was emergence of linezolid resistance (LzR) among various CoNS species. Overall LzR was seen in 18/706 (2.54 %) of isolates. All the LzRCoNS, were isolated from ICUs 11 (61.11%) predominantly from blood 10 (55.55%) and pus 5 (27.8%) samples. S. haemolyticus 9 (50%) was the most resistant phenotype followed by S. epidermidis 5 (27.8%), S. lugdenensis 3 (16.7%) and S. hominis 1 (5.55%) (Table 3). All the LzRCoNS were also MRCoNS (Table 4).

**Discussion**

CoNS, resistance to many important antimicrobial agents including linezolid has been reported from clinical samples obtained from hospitalized patients.<sup>5,6,7</sup> Our study shows a high isolation rate of CoNS from blood (82.86%) followed by pus (10.89%) and urine samples (3.40%). Similar finding has been reported,<sup>8</sup> whereas another study reported higher rate from pus followed by urine and blood.<sup>9</sup>

Majority of our CoNS were isolated from indoor samples (96.31%), predominantly from wards (63.82%). However, Singh et al isolated majority of CoNS from ICUs.<sup>10</sup> Lesser isolation rate from ICU in our study may be because our ICU (a high risk area) is under constant surveillance and monitoring by the Infection Control team (ICT). Strict monitoring by ICT may have been overlooked in wards (comparatively less critical areas) thus emphasizing the need for equal monitoring also in the wards by the ICT team.

The isolation of CoNS was maximum in extreme of ages and there was male predominance. This may be because of vulnerability of subjects to infections in this age group due to lower immune status and sex dependent genetic factors. Similarly, a recent study has shown rising trend of CoNS in neonates with male predominance.<sup>11,12,13</sup>

S. epidermidis (44.33%) was the most frequent species isolated, predominantly from blood and pus followed by S. haemolyticus. (39.37 %) Other studies

have also reported similar findings.<sup>14,15,8</sup> However, Karigoudaret al. reported maximum isolates from pus samples followed by urine.<sup>16</sup> Other recent studies have also reported S. epidermidis as the most frequent isolate followed by S. haemolyticus.<sup>17, 9</sup> S. lugdenensis was the third commonest species isolated in our study (5.24 %), majority (89.18 %) from blood. S. saprophyticus, S. hominis, S. intermedium and S. warneri were other CoNS species less frequently isolated from our Hospital. S. saprophyticus was predominantly isolated from urine samples of female patients which is similar to a study by Sheikh et al.<sup>18</sup> Various studies from India<sup>10, 19</sup> and abroad<sup>20, 21</sup> have reported species wise distribution in different geographical areas. This may be due to the difference in colonization characteristic of patients and the varying adaptability of different species to selective pressures such as biocides and antimicrobials in the environment.<sup>10</sup>

The isolates of CoNS showed resistance to multiple antimicrobial agents including very high level of resistance to penicillin-G and ceftioxin. Similar findings have been reported.<sup>21,22</sup> High isolation rates of MRCoNS from our hospital is a matter of concern as they are resistant to multiple antibiotics leaving very few treatment options. Such strains are becoming the common causes of morbidity and mortality mainly in hospital settings. Few recent studies have reported MRCoNS ranging from 38% to as high as 62%.<sup>10,23</sup>

Antibiotics like linezolid and vancomycin are the alternative therapeutic agents for these MDR pathogens and if resistance develops to these drugs we

are left with no therapeutic options. Overall, emergence of linezolid resistance (LzR) in CoNS ranging from 0% to as high as 16% has been reported from India<sup>24</sup> and abroad.<sup>25</sup> We report LzR in 2.54% of our clinical isolates of CoNS which is comparable with data from the global surveillance studies report of 2%. *S. haemolyticus* (50%) was the most resistant phenotype followed by *S. epidermidis* (27.8%), *S. lugdenensis* (16.7%) and *S. hominis* 1 (5.55%). Species wise susceptibility to linezolid has been reported by various workers; Kalawat et al reported LzR in *S. lugdenensis* and *S. hominis*,<sup>6</sup> Peer et al in *S. cohnii* and *S. kloosii*,<sup>5</sup> Gupta et al in *S. haemolyticus*<sup>26</sup> and recently Matlaniet al in 2016<sup>27</sup> reported mucoid strain of *S. haemolyticus* showing LzR. Such high level of resistance to linezolid is an alarm for the judicious use of this drug.

Linezolid is one of the few therapeutic options shown to be effective against MDR Staphylococcal infections and is available both as oral and parenteral formulations. Studies have reported that LzR in Staphylococci has emerged due to prolonged exposure to the drug,<sup>28</sup> thus emphasizing judicious use of reserve drug like linezolid, vancomycin and tigecycline in routine clinical practice.<sup>23</sup> Due to the ease of oral administration; linezolid has been misused in clinical practice which has gradually led to emergence of resistance against this drug. Linezolid does not display cross resistance with other classes of antimicrobial agents. However, all our clinical isolates of CoNS were sensitive to vancomycin, the last resort drug we are left with, in this era of desperation.

All these LzR CoNS were isolated from ICUs (61.11%), predominantly from blood sample. Case reports of LzR CoNS in blood and pus samples have been published from India recently.<sup>21,26</sup> These LzR CoNS were also MR CoNS. The emergence of LzR in Staphylococcus poses significant challenges to the clinical treatment of infections caused by these organisms. Similar findings have been reported.<sup>5,28</sup> Studies have shown that *cfr* gene confers resistance to linezolid in *S. aureus* as well as species of CoNS.<sup>29</sup> Mechanism of resistance to linezolid is by mutations in 23S rRNA or presence of *cfr* gene,<sup>10</sup> therefore the isolates should also be tested for *cfr* genes responsible for LzR. Unfortunately the molecular typing method to detect *cfr* gene could not be performed in our isolates due to limited resources, which is one of the limitation of our study. In future genotypic method of resistance will be looked for in these isolates.

## Conclusion

Multidrug resistant CoNS is an emerging therapeutic concern and poses a significant challenge to the treatment of infections caused by these organisms. Accurate identification of resistant phenotype followed by strict infection control measures are required to prevent nosocomial spread. It is important to keep a close monitoring to track resistance to linezolid particularly when frequent and extended linezolid therapy is prescribed. Paucity of newer antimicrobials demands judicious use of linezolid.

# Quality Characteristics and Antioxidant Properties of Bread Supplemented with Iron Rich Black Strap Molasses

R. Balakrishnaraja<sup>1</sup>, P. Pavithra<sup>2</sup>, C. Sivapriya<sup>3</sup>, K. Saranya<sup>4</sup>, T. Vishnu<sup>5</sup>, J. Bindhu<sup>5</sup>

<sup>1</sup>Head of the Department, <sup>2</sup>Assistant Professor, <sup>3</sup>Faculty of the Department, <sup>4</sup>M.Tech Final Year Student, <sup>5</sup>Research Associate Come Assistant Professor, Department of BioTechnology, Bannari Amman Institute of Technology, Tamilnadu, India

## Abstract

**Aim:** Sugar cane molasses is a rich source of various natural nutrients. The light molasses is concentrated to dark molasses which is rich in antioxidants and iron. To analyze the compounds present it nuclear magnetic resonance imaging is performed.

**Methodology and Result:** Preparation of blackstrap molasses was done, from that the antioxidants was extracted through sonication, filtered and purified by column chromatography. Antioxidant assay and iron determination for the molasses and the compounds present in molasses was identified by NMR spectroscopy. Following the conversion of molasses, the wheat bread is made using different percentage of molasses.

**Conclusion:** Significance and impact of study: End product is performed and the result showed that the end product is rich in iron. Molasses act as alternative sweetener, it has antioxidants which are used to destroy the free radicals and also have high iron content. To provide the iron rich product to reduce the effect of iron deficiency diseases.

**Keywords:** Sugar cane molasses, antioxidant, Iron, Bread.

## Introduction

Sugarcane (*Saccharum officinarum*) is a type of grass which belongs to the family of poaceae. It is an annual crop which requires huge amount of water and nutrients for cultivation. The extracted juice is boiled to crystallize the sugar. The sugar crystals are filtered from the fluid. The left over thick, brownie liquid is called molasses<sup>1</sup>. Molasses is a viscous liquid which is sweet in taste and has no more commercially extractive sugar. It is an alternative sweetener to honey. Hence it can be regarded as low price and highly nutritious commodity<sup>2</sup>.

Black strap molasses's the syrup obtained during third stage of boiling. It is the thickest liquid and very dark in color and also tends to have a bitter taste. Consumption of molasses is approved by FDA. Also, people believe that beyond sweetening molasses possess variety of nutrient supplements<sup>3</sup>. Recently, the sugarcane molasses is found to have the therapeutic applications. Some of the effects of molasses include resistance towards bacteria and viruses, stimulation of immunity and promotion of growth in animals. But there is no detailed evidence for its antioxidant activities<sup>4</sup>. The sugar cane molasses can be used as a hypertonic solution in osmotic degradation of fruits and vegetables<sup>5</sup>.

Sugar cane juice has numerous volumes of phytochemicals which has biological activity such as anti-cancerous, antidiabetic, antibacterial, antifungal, antioxidant, anti-mutagenic, hypercholesterolemia, etc.. Molasses has a significant amount of antioxidant<sup>6</sup>. Antioxidants destroy the free radicals which cause

oxidative stress and leads to common diseases such as atherosclerosis, diabetes mellitus and chronic renal failure<sup>7</sup>. The antioxidants are intracellular product. There are various techniques such as Soxhlet extraction, reflux method for extraction. But all these methods will deactivate the bio compounds and hence new method such as micro wave assisted, supercritical fluid assisted and ultra-sonication which provides maximum concentration of bio compounds is preferred. The extracted antioxidant is quantified by DPPH<sup>8</sup>. DPPH reacts with antioxidants and produce stable radical which results in color change from violet to pale yellow<sup>9</sup>. The results showed that DPPH method can be used as a standard method for antioxidant assay<sup>10</sup>.

Over 1.6 billion people were affected by IDA (Iron Deficiency anemia). In developing countries, IDA is common among adolescent girls due to malaria, poverty, worm infection and poor diet. It leads to birth of low weight babies and fetal mortality<sup>11</sup>. Also in comparison with last decade the percentage of birth of low weight babies had not count down<sup>12</sup>. Molasses provides 85% of total bioavailability of iron compared to beef liver, oat meal, eggs and lettuce<sup>13</sup>.

Bakery products can be produced with additional nutrients with biological supplements such as molasses<sup>14</sup>. It has been evident from the recent studies that elements such as calcium, sodium, magnesium, iron and copper are essential for the development of human cells<sup>15</sup>. Addition of molasses in bread increase potassium content by 67%, calcium by 35% and sodium by 4% and iron by 4%<sup>16</sup>.

## Materials and Method

**Collection of Sample:** Sugar cane Molasses, the byproduct of sugarcane was collected from Sakthi Sugar Industry Pvt Ltd. The collected sample is stored at 4°C to control the growth of yeast.

**Preparation of Blackstrap Molasses:** The light molasses is heated at 80°C for 10-15 mins. During this process the impurities were removed in the form of foam. Once the thick brown colored viscous liquid is formed, it is cooled down and secured for further process.

**Extraction of Antioxidants: Ultra Sonication:** The antioxidant which is to be extracted is an intracellular product and hence the cell wall should be lysed to release the product. The Sugar cane molasses was extracted by ultra-sonication method. Sugar cane molasses (5ml) was

extracted by adding 30 ml of 70% ethanol using an ultrasonicator (Vibracell, 130W, 20 KHz). The extraction was done at room temperature of about 37°C for 1 hour. The extract was concentrated under fume hood to obtain the total extraction fraction. Finally, the total extracted fraction was suspended in 70% ethanol<sup>17</sup>.

**Filter Sterilization:** The ultra-sonicated Sugar Cane Molasses extract was filtered using the syringe filter. The filtered extract of 10 ml was collected in the centrifuge tube and stored at 4°C. The stored extract was purified by column chromatography and antioxidant assay was performed.

**Chromatography:** Column chromatography is the most common technique used for purification of a mixture. Since molasses is polar, silica column is used. The silica powder (1%) and the solvent ethanol (70%) were mixed initially and poured into the column. The column was packed carefully without air bubbles.

Once silica gets settled, 50ml of solvent (ethanol) is allowed to run. Then, 1ml of the extract was loaded and the flow was maintained. The separated processed molasses was collected and stored under optimum conditions.

**DPPH ASSAY:** 1mM DPPH solution was prepared by dissolving 0.04g DPPH in 100ml of 100% ethanol. 700µl of different concentrated extracts (10<sup>-1</sup>, 10<sup>-2</sup>, 10<sup>-3</sup>, 10<sup>-4</sup>, 10<sup>-5</sup>, and 10<sup>-6</sup>) were mixed with 700µl of DPPH solution. The mixture was shaken vigorously and incubated in dark at 37°C for 30min. Then the absorbance was measured at 517 nm. The assay was performed for light molasses, bread samples containing different concentration of raw molasses and processed molasses<sup>18</sup>.

**Determination of Iron:** The molasses is converted into ash as mentioned in<sup>19</sup>. 1.7g of ferric chloride is dissolved in 100ml of distilled water and labeled as 1% iron. The serial dilution for iron solution is performed to get different concentration such as 0.1%, 0.01%, 0.001%, 0.0001%, 0.00001% and 0.000001%. Take 5ml of solution from each concentration and add 0.1M KSCN solution. The sample is heated at 200°C in muffle furnace for 1 hour. The obtained ash is dissolved in 5ml of distilled water. Filter the solution and add 5ml of 0.1M KSCN solution. The absorbance at 450nm is taken for sample and standard. Then the assay was performed for bread samples containing raw molasses and processed molasses.

**NMR Spectroscopy:** The blackstrap molasses was diluted to 50% using distilled water. C<sup>13</sup> NMR (400MHz Bruker) of diluted sample was performed using deuterium oxide (D<sub>2</sub>O) and recorded.

**Preparation of iron Supplemented Bread:** Commercially available wheatflour was used for making the bread. The ingredients such as wheat flour (100g), instant yeast (3g), sugar (2g), salt (1g), fat (10g), milk (25 ml), raw molasses were mixed together to get a loose dough and it was allowed to ferment for 1.5 hours and baked in preheated oven at 220°C<sup>20</sup>. Similarly, the same ingredients were mixed with the processed black strap molasses

**Results and Discussion**

**DPPH ASSAY:** Among the five different serial diluted samples, the sample with minimum dilution showed high concentration of antioxidant. The antioxidant scavenging activity of different bread samples were analyzed by DPPH assay and their response was shown in the table 2. In general, Molasses is a rich source of antioxidants. These antioxidants have a great potential to scavenge free radicals which causes mutation in living cells. Also the ultra-sonicated samples contain low percentage of free radicals.

**Table 1. Antioxidant concentration in serial diluted light molasses**

Dilution (%)	Concentration (mg/ml)
10-1	475
10-2	401.4
10-3	227.14
10-4	152.85
10-5	70.71

S4	4	657	820
S5	5	752	876

B<sub>a</sub> - Bread prepared using raw blackstrap molasses, B<sub>b</sub> - Bread prepared using raw blackstrap molasses

**Determination of Iron for Molasses:** The standard graph was plotted using percentage of dilution and absorbance of the ferric chloride and the concentration of iron of the sample was extrapolated and the concentration of iron was founded out. The results of the present study

showed that the molasses is rich in iron which amounted to 2.36mg/ml. The iron content in blackstrap molasses was 60% of the natural honey (4mg/ml). This makes molasses as the most economical and preferable iron supplement.

Table 3. Determination of iron for light molasses

Dilution (%)	Absorbance
10 <sup>-1</sup>	3.502
10 <sup>-2</sup>	2.504
10 <sup>-3</sup>	0.195
10 <sup>-4</sup>	0.025
10 <sup>-5</sup>	0.024
10 <sup>-6</sup>	0.021
Sample	1.856

B<sub>a</sub> - Bread prepared using raw blackstrap molasses, B<sub>b</sub> - Bread prepared using raw blackstrap molasses

**Interpretation of NMR:** The compounds present in the molasses have been identified by C13 NMR. And it was found that in addition to sucrose, molasses is rich in ferric oxide, magnesium oxide, potassium oxide and 18 amino acids. The compounds present in the molasses were listed in the Table 5.

**Sensory Evaluation of Bread:** Molasses possess bitter taste and hence it is mandatory to perform the sensory analysis. The color of the crust and crumb, dough and taste were evaluated. Sensory evaluation was done for the acceptability of the product by the customers. The parameters such as taste, odor and appearance of the crust and crumb were analyzed for the bread samples. These evaluations were done by the 15 panel members<sup>20</sup>.

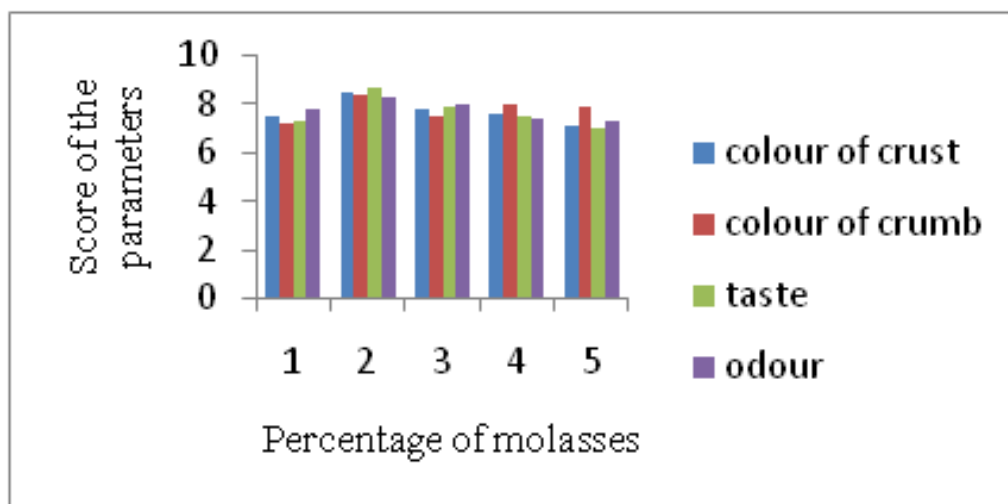

Figure 3. Sensory evaluation of bread (five different concentrations of molasses)

## Conclusions

Molasses is an organic waste product from sugar cane industry which is a source of many economically beneficial products. The current work involves the extraction of such compounds from the molasses. In general, molasses is used as a raw material for production of ethanol. DPPH assay evidently shows that molasses contain antioxidants and hence it showed antioxidant scavenging property. The presence of polyamines in molasses makes it difficult for handling. This can be rectified by performing ultra-sonication. This reduces the formation of super radicals, enhancement of bioavailability and increase in surface volume ratio. From the results of NMR, it has been identified that molasses is a very good source of iron. Molasses has 60% of iron contained in natural honey. In addition to iron, molasses also contain magnesium, potassium, calcium, phosphorous and 18 amino acids. Since molasses is bitter in taste, milk bread is prepared using different concentrations of molasses for the ease of consumption.

From the sensory analysis, 2% molasses containing bread is preferred.

**Declaration:** The author's report no conflict of interest.

## Abstract

Personal Health Record (PHR) empowers the patient to deal with their own therapeutic records in a digitalized and centralized path, which extraordinarily facilitates the storage, access, and sharing of PHR with the development of cloud computing. PERSONAL HEALTH RECORD contains sensitive knowledge that ought to be protected against unauthorized users. In this paper, a novel technique is proposed for access control of PHRs, and leverage RSA (Rivest, Shamir, Adleman) algorithm is used to encrypt each patient's PHR file. Other than the previous works related to secure data outsourcing, focus is made on the multiple data owner scenarios and dividing the users in the PHR system into multiple security domains that significantly reduce the critical management complexity for owners and users. A high degree of patient privacy is guaranteed simultaneously by exploiting multi-authority ABE. This method enables dynamic modification of access policies or file attributes, supports efficient on-demand user/attribute revocation and break-glass access under emergency scenarios.

**Keywords:** Personal health record, cloud computing, access control, RSA algorithm.

## Introduction

In recent years, a personal health record (PHR) has emerged as a patient-centric model of health information exchange. A PHR service allows a patient to create, manage, and control her personal health data in one place through the web, which has made the storage, retrieval, and sharing of the medical information more efficient<sup>[1]</sup>. Notably, each patient is promised full control of her medical records and can share her health data with a wide range of users, including healthcare providers, family members or friends. Due to the high cost of building and maintaining specialized data centers, many PHR services are outsourced to or provided by third-party service providers, for example, Microsoft HealthVault. Recently, architectures of storing PHRs in cloud computing have been proposed in <sup>[2]</sup> <sup>[3]</sup>.

Due to the high value of sensitive personal health information (PHI), third-party storage servers are often the targets of various malicious behaviors which may lead to exposure of the PHI <sup>[4]</sup>.

To ensure patient-centric privacy control over their own PHRs, it is essential to have fine-grained data access control mechanisms that work with semi-trusted

servers. A feasible and promising approach would be to encrypt the data before outsourcing. Basically, the PHR owner herself should decide how to encrypt her files and to allow which set of users to obtain access to each file. A PHR file should only be available to the users who are given the corresponding decryption key, while remaining confidential to the rest of users<sup>[5]</sup>.

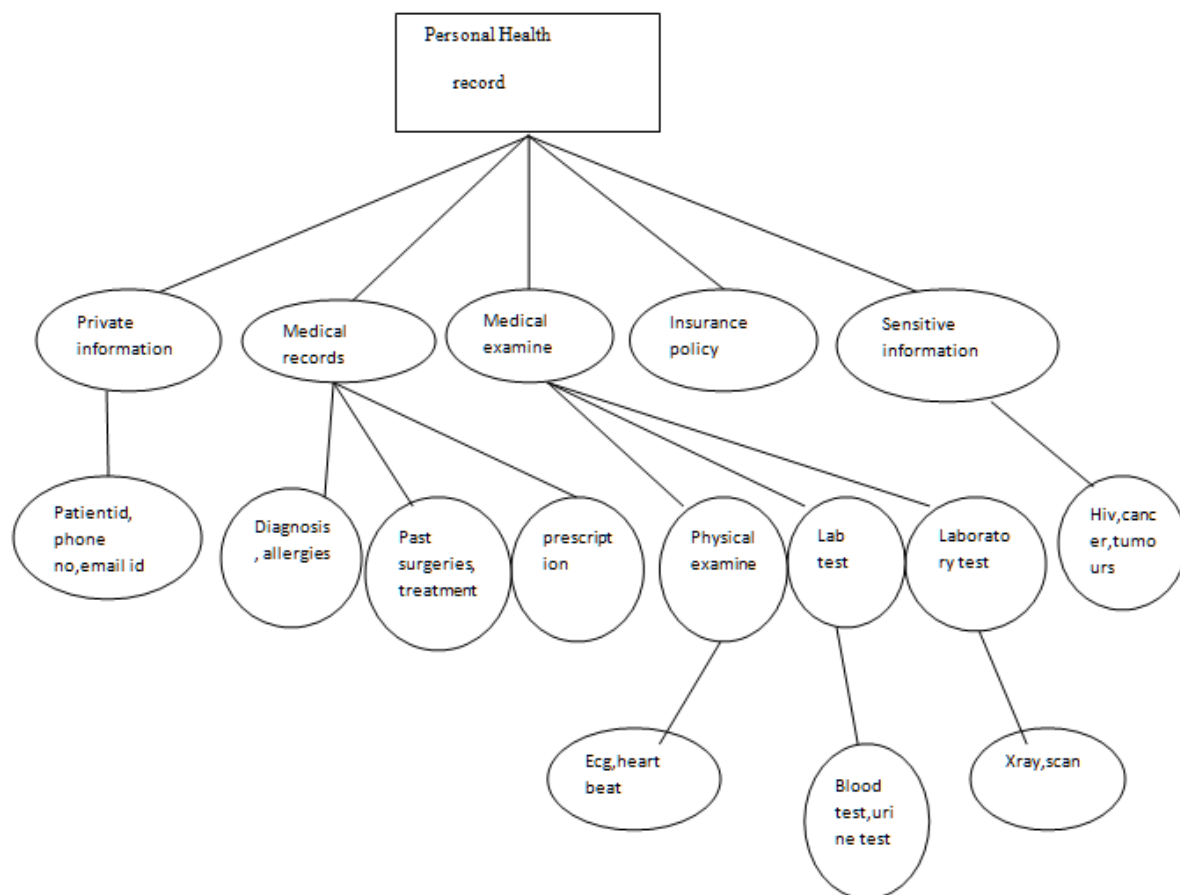

**Personal Health Record:** The term personal health record (PHR) has been connected to both paper-based and processed system; current utilization typically suggests an electronic application used to gather and store health information. An electronic health record associated data on personal health that follows to across the country recognized inhuman operability needs which will be drawn from multiple assets at the identical time as being controlled, shared and managed with the help of the individual. whereas associate degree electronic health record (EHR) could be a computer-based mostly record that originates with and is managed by doctors, a personal health record (PHR) will be generated by a general practitioner, patients, pharmacies and totally different assets however is controlled by the affected person<sup>[6]</sup>.

In figure 1.1 the personal health record model

is based on the role-based access control technique. These techniques introduced many roles like patient information, medical records, medical examine, pharmacy, insurance policy, and sensitive information. This technique will include another method which is called role-based authentication. This method is used for default website will be created the role fields such

as patient information contains name, age, sex,height, weight, patient id,etc.All the personal information are presented here and the medical history contains health conditions, medicated prescriptions, allergies and medical examine contains physical examination ,lab test, laboratory test and insurance policies and sensitive information like HIV, PCOD cancer, tumor etc<sup>[7]</sup>.

**Fig 1: Personal Health Record Model**

In this paper, study on the patient-centric is endeavored, secure sharing of PHRs stored in semi-trusted servers and focus is done on addressing the complicated and crucial challenging management issues. In order to protect the personal health data stored on a semi-trusted server, the RSA (Rivest, Shamir, Adleman) algorithm is adopted as the first encryption primitive. The complexities per encryption, key generation, and decryption are only linear with the number of attributes involved.

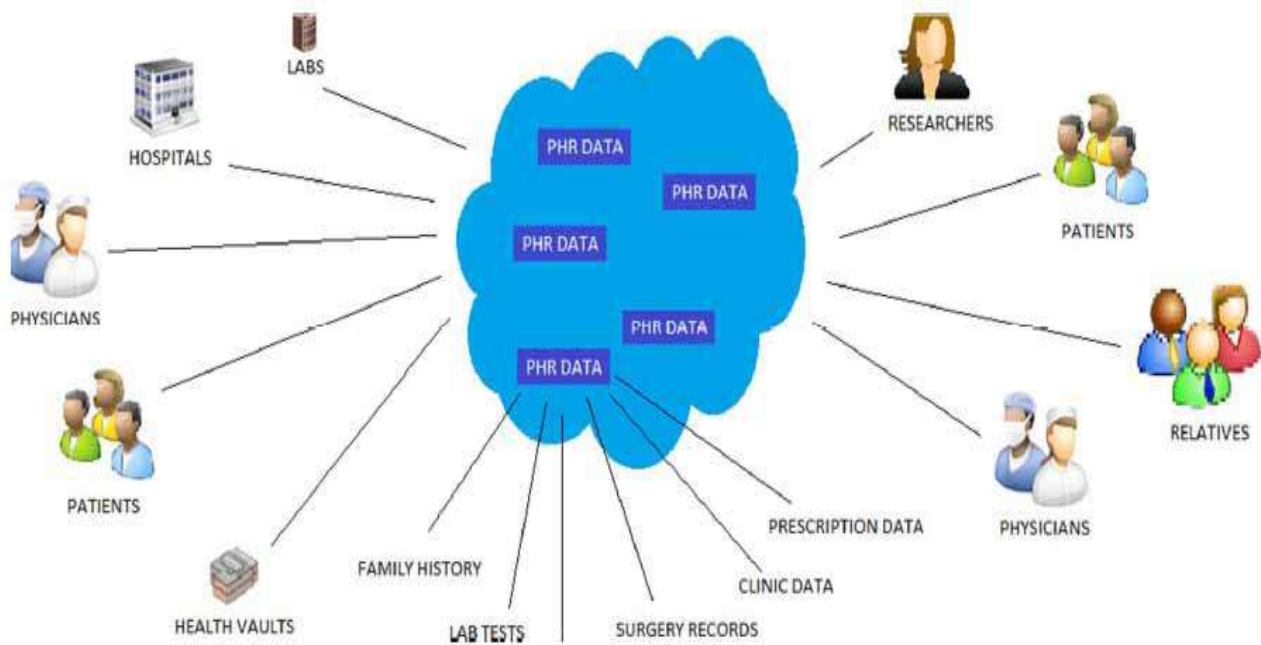

**Personal Health Record (PHR) in Cloud:** Personal Health Record (PHR) is a flourishing online service

model for sharing health information. It helps patients to create, control, and share their health information with other users as well as healthcare providers. The owners, i.e., patients, are ultimately responsible for making decisions about their health. The structure of the PHR is shown in Figure 2. A PHR should be designed to provide complete health information to patients. Also, it should be accessible anywhere, anytime and accurate. Medical records contain compiled health information such as diet plans or data from home monitoring systems, as well as patient contact information, diagnosis lists, medication lists, allergy lists, immunization histories, etc., maintained by healthcare providers<sup>[2][16]</sup>.

The difference occurs in the way a PHR is used to improve the quality of healthcare services. PHR owners play an active role in monitoring their health information in healthcare systems by creating their own PHR. Generally, PHR allows a user to create and track his/her personal data pervasively through the web. It has made the storage, retrieval, and sharing of medical information more efficient. Each PHR user possesses control over their own health data, and they can effectively share their records with a broad range of users, including doctors, family, friends, researchers and insurance agents in a cloud environment.

**The personal health record is logically partitioned into the following five portions. There are:**

- (i) Private Information.
- (ii) Medical Records.
- (iii) Medical Examine.
- (iv) Insurance Policy.
- (v) Sensitive Information.

**Fig 2: Structure of PHR in Cloud**

**Literature Review:** According to previous studies, cryptography algorithms are used in personal health record for security purpose. The authors as in [8] used general framework mechanism for secure sharing of personal health records in cloud. The authors L. Ibraimi, M. Asim, and M. Petkovic [9] are used cipher text policy-attribute based encryption (CP-ABE) scheme. This scheme is used to transfer the encrypted information and solely authorized users who satisfy the access policy will decrypt done the information. The curiosity of our development is that properties can be from two security areas: social space (for example family, companions, or individual patients) and expert area (for example

specialists or medical caretakers). F. Xhafa proposed a multi authority cipher text-policy ABE scheme which has been used for access policy can be hidden and user access privacy has been protected. This scheme can be very secure and efficient<sup>[10]</sup>. C.Leng et al. [11] proposed a methodology is fine grained access control and proposed the technique which is proxy reencryption to enforces sticky policies and furnished clients with compose benefits for PHRs. Whenever clients complete the process of composing information to their PHRs, they sign the altered PHRs. Notwithstanding, clients sign the PHRs utilizing the signature key of the PHR owner and it is along these lines hard to accurately

check who signed the PHR. Prajakta Solapurkar, Girish Potdar are proposed the scheme is patient-centric access control. The purpose of this scheme is confidentiality, integrity, authenticity of personal health data in cloud storage. key aggregate cryptosystem has been used for revocation of access control<sup>[12]</sup>. The authors <sup>[13]</sup> proposed the methodology is sesphr which can be used for securely hold on transmission of the private health records to the approved entities within the cloud storage. PHR owner storing the encrypted data on cloud storage and only authorized person can be access the valid re encryption keys provided by a semi trusted proxy can be decryption of PHR. Personal health records (PHRs) modify customers to electronically store, create, and share their own health data, isolated from electronic or paper medical records maintained by their health care suppliers<sup>[14]</sup>. The authors are proposed the elgamal encryption and proxy encryption scheme can be used for privacy purpose<sup>[15]</sup>.

**RSA Algorithm with Bilinear Group:** In the personal health record system, there are many risks involved in patient security. But the patients are in the dilemma of whether they can share and store their personal records which are stored on a third-party server. The fine-grained access control technique increases the level of security and privacy for the data owners and data entities that can access the data. The technique is very flexible, and it allows access control policies. The fine-grained access control technique is straightforward and efficient to use. So Patients may be comfortable to share their records when their disease is fully cured. Hence all patients wish that their health record is fully secured in order to secure this that is a system called PHR cloud computing system.

**Algorithm:** RSA algorithm is stands for (Rivest, Shamir, Adleman) in 1978 which is used for encrypt and decrypt the data and it is an asymmetric cryptographic algorithm. In this algorithm there are two keys. One is public; another one is private. Every user in the network having both the keys the private key should not sharable between all. It must be kept secret. so only users can use the private key if one key is used in the encryption side and we have to use the other key of the same way in the decryption process the public key is used at encryption, and we have to use a private key of the same user in the decryption process.

The RSA algorithms classified into four processes there are set up, key generation, encryption algorithm,

decryption algorithm.

**Algorithm:**

$$CK = g^x \text{ mod } n \quad \dots(1)$$

$$CK = g^y \text{ mod } n \quad \dots(2)$$

**Setup:** The bilinear mapping group of prime order  $N=PQ$  and  $e: B*B \rightarrow B_1$  is a non-degenerate bilinear map, that is (i) Bilinear: for all  $b_1, b_2 \in B$  and  $y, x, y < L$ ,  $e(b_1^x, b_2^y) = e(b_1, b_2)^{xy}$ . (ii) Non degenerate: for generator  $b$  of  $B$ ,  $e(b, b)$  generator  $B_1$ .

Let  $B_p$  and  $B_q$  denote the subgroups of  $B$  of order  $p$  and  $q$  respectively.

Then  $B = B_p * B_q$ . If  $b$  is a generator of  $B$  then  $bp$  and  $bq$  denote the generators of  $B_p$  and  $B_q$  for all random elements  $L_p \in B_p$  and  $L_q \in B_q$ . So we have  $e(L_p, L_q) = 1$  because  $e(L_p, L_q) = e(bp^x, bq^y) = e(b, b)^{p^x q^y} = 1$  for some generator  $b$  in  $B$ .

**Key Generation:** Generate bilinear group  $B$  of order  $N = PQ$ . public key and private key are generated by the bilinear mapping group, which is  $pk$  and  $sk$ .

$pk = (B, N, b, bp)$  and  $sk = (p)$  here  $pk$  is the public key and  $sk$  is the secret key.

**Encryption:** Enc  $(pk, x)$  here  $pk$  and  $x$  is a public key .

$V < L * n$  and  $F < b^x (bp)^v \in B$ . Here  $V$  is a random variable, and it belongs to  $L * n$  .

Here the random variables  $v_1, v_2, v_3, v_4, v_5 \in L * n$  are generated and variable  $v_i$  is used for encrypting  $i$ th partition of PHR.

$$F_p = L^{v_1} \dots PHR_p \quad (3)$$

Where  $F_{p_i}$  is the semi encrypted file that contains the private information partition as encrypted text.

$PHR_{p_i}$  is private information on personal health records.

$$F_m = L^{v_2} \dots PHR_m \quad (4)$$

$F_{m_r}$  is the semi encrypted file that contains the medical record partition as encrypted text in addition to the  $F_{p_i}$  that was encrypted in the previous step.  $PHR_{m_r}$  is medical record of personal health record.

$$F_{m_i} = L^{v_3} \dots PHR_{m_i} \quad (5)$$

Fme is the semi encrypted file that contains the medical examine partition as encrypted text in addition to the Fpi, Fmr that was encrypted in the previous step. PHRme is medical examine of personal health record.

$$F_p = L^{V_5} \cdot PHR_p \tag{6}$$

Fip

is the semi encrypted file that contains the Insurance Policy partition as encrypted text in addition to the Fpi, Fmr, Fme that was encrypted in the previous step. PHRip is insurance policy of personal health record.

$$F = L^{V_5} \cdot PHR_s \tag{7}$$

F is the completed encrypted file that contains all the partitions in the encrypted form. PHRsi is sensitive information on personal health records.

The above-stated encryptions the client also calculates the following parameters.

$$V_{pi\_p} = b^{V_1 X_p} \tag{8}$$

$$V_{me\_p} = b^{V_2 X_p} \tag{9}$$

$$V_{mr\_p} = b^{V_3 X_p} \tag{10}$$

$$V_{ip\_p} = b^{V_4 X_p} \tag{11}$$

$$V_{si\_p} = b^{V_5 X_p} \tag{12}$$

Here Xp is the private key of the patient and Vis the parameter which is used to produce the re-encryption key for the partition indicates in the subscript of each V and P is the user. The parameters Vpi\_p, Vme\_p, Vmr\_p, Vip\_p, Vsi\_p are transmitted to the re-encryption key along with the file identification for which their parameters are generated.

**Decryption:** Calculates the re-encryption keys (Vk) and V and transmits it to the user I.

$$F_p = [b^x]^p \cdot [b^y]^p = [bq]^x$$

The re-encryption keys and V are calculated below.

$$Vk_{p \rightarrow I} = b^{\frac{x_I}{x_p}} \tag{13}$$

Here xI and xp are the private keys of I and P.

V is the parameter corresponding to the user I are calculated according to the following equations.

$$\begin{aligned} V_{pi\_I} &= e(Vk_{p \rightarrow I}, V_{pi\_p}) \\ &= e(b^{\frac{x_I}{x_p}}, b^{V_1 X_p}) \\ &= e(b, b)^{V_1 X_i} \\ \text{Therefore } L &= e(b, b) \\ V_{pi\_I} &= L^{V_1 X_i} \end{aligned} \tag{14}$$

Where Vpi\_I is the parameter used to decrypt the partition Private Information and it is applicable for the user I. Similarly V parameters for other partitions corresponding to the user I are calculated.

$$\begin{aligned} V_{me\_I} &= e(Vk_{p \rightarrow I}, V_{me\_p}) \\ &= e(b^{\frac{x_I}{x_p}}, b^{V_2 X_p}) \\ &= e(b, b)^{V_2 X_i} \\ \text{Therefore } L &= e(b, b) \\ V_{me\_I} &= L^{V_2 X_i} \end{aligned}$$

$$\begin{aligned} V_{mr\_I} &= e(Vk_{p \rightarrow I}, V_{mr\_p}) \\ &= e(b^{\frac{x_I}{x_p}}, b^{V_3 X_p}) \\ &= e(b, b)^{V_3 X_i} \\ \text{Therefore } L &= e(b, b) \end{aligned}$$

$$V_{mr\_I} = L^{V_3 X_i}$$

$$\begin{aligned} V_{ip\_I} &= e(Vk_{p \rightarrow I}, V_{ip\_p}) \\ &= e(b^{\frac{x_I}{x_p}}, b^{V_4 X_p}) \\ &= e(b, b)^{V_4 X_i} \end{aligned}$$

$$\text{Therefore } L = e(b, b)$$

$$V_{ip\_I} = L^{V_4 X_i}$$

$$\begin{aligned} V_{si\_I} &= e(Vk_{p \rightarrow I}, V_{si\_p}) \\ &= e(b^{\frac{x_I}{x_p}}, b^{V_5 X_p}) \\ &= e(b, b)^{V_5 X_i} \end{aligned}$$

$$\text{Therefore } L = e(b, b)$$

$$V_{si\_I} = L^{V_5 X_i}$$

The above given parameters are provided to the user I that decrypts each of the partitions based on the following equations.

$$V_{pi\_I} = L^{v_1 x_i}$$

$$L^{v_1} = V_{pi\_I}^{\frac{1}{x}}$$

$$F_{pi} = L^{v_1} \cdot PHR_{pi}$$

$$PHR_{pi} = \frac{F_{pi}}{V_{pi\_I}^{\frac{1}{x}}}$$

$$V_{me\_I} = L^{v_2 x_i}$$

$$L^{v_2} = V_{me\_I}^{\frac{1}{x}}$$

$$F_{me} = L^{v_2} \cdot PHR_{me}$$

$$PHR_{me} = \frac{F_{me}}{V_{me\_I}^{\frac{1}{x}}}$$

$$V_{mr\_I} = L^{v_3 x_i}$$

$$L^{v_3} = V_{mr\_I}^{\frac{1}{x}}$$

$$F_{mr} = L^{v_3} \cdot PHR_{mr}$$

$$PHR_{mr} = \frac{F_{mr}}{V_{mr\_I}^{\frac{1}{x}}}$$

$$V_{ip\_I} = L^{v_4 x_i}$$

$$L^{v_4} = V_{ip\_I}^{\frac{1}{x}}$$

$$F_{ip} = L^{v_4} \cdot PHR_{ip}$$

$$PHR_{ip} = \frac{F_{ip}}{V_{ip\_I}^{\frac{1}{x}}}$$

$$V_{si\_I} = L^{v_5 x_i}$$

$$L^{v_5} = V_{si\_I}^{\frac{1}{x}}$$

$$F_{si} = L^{v_5} \cdot PHR_{si}$$

$$PHR_{si} = \frac{F_{si}}{V_{si\_I}^{\frac{1}{x}}}$$

### Conclusion

In this paper, proposed a novel framework is proposed for secure sharing of personal health records in cloud computing. Partially trustworthy cloud servers are considered and discussed to fully realize the patient-centric concept, and patients shall have complete control of their own privacy through encrypting their PHR files to allow fine-grained access. The framework addresses the unique challenges brought by multiple PHR owners and users, which significantly reduces the complexity of key management while enhancing the privacy guarantees compared with previous works. RSA is utilized to encrypt the PHR data so that patients can allow access not only by personal users but also by various users from public domains with different professional roles, qualifications, and affiliations.

## Abstract

**Introduction:** Out-of-pocket payments by individual households are the main source of health care financing in India. Contrary to most other consumption expenses, medical expenditure is largely unpredictable both in timing and quantity. Households, especially in low income countries, cope either by divesting their savings, borrowing, mortgaging or selling assets or by forgoing treatment.

**Aim:** To study the knowledge, coverage and usage patterns of health insurance in a rural area of south India.

**Method:** A community based cross sectional study was done in a village in south India. Data was collected by questionnaire method among the heads of the selected households and analysed.

**Results:** This study found that 30.4% households were enrolled in a health insurance scheme. Among the eligible households only 14.5% were aware about government funded health insurance schemes. Highest enrolment was in Sampoorna Suraksha Scheme 33 (47.1%), followed by ESI 21 (30%). Among the enrolled households 118 (51.4%) had utilised it in the past one year.

**Conclusion:** Presently people are getting aware of health insurance, through acquaintances, health insurance agents, mass media etc., but this awareness has not yet resulted in satisfactory levels of enrolment/utilisation. As the results have shown, only 30.4% of households are being covered by some form of health insurance scheme, a large chunk of the population is still financing health care expenditure without health insurance coverage. Moreover it was observed that a large proportion of the eligible households were unaware about Government funded Health insurance schemes.

**Keywords:** Health Insurance, Out of pocket expenditure, Enrolment, Utilisation.

## Introduction

Improvement in health status is vital for the enhancement of human capabilities. Of all the risks

facing poor households, health risks pose the greatest threat to their lives and livelihoods. A health shock adds health expenditures to the burden of the poor. Even a minor health shock can cause a major impact on poor person's ability to work and curtail their earning capacity. Moreover, given the strong link between health and income at low income levels a health shock usually affects the poor the most<sup>1</sup>.

Non-availability of necessary finances is a major obstacle in the health care attainments of people in many developing countries, including India. There is a growing awareness that access to healthcare cannot be free-of-

charge, due to the low level of government spending on health, nor funded mainly out-of-pocket by care-seekers, due to the regressive effect of this financing mode<sup>2</sup>.

Health Insurance (HI) has emerged as part of the reform drive in many countries, both as a way of augmenting financial resources available for care, and as a means of better linking health demand to the provision of services<sup>3</sup>.

Health insurance in a narrow sense would be ‘an individual or group purchasing health care coverage in advance by paying a fee called premium.’ In its broader sense, it would be any arrangement that helps to defer, delay, reduce or altogether avoid payment for health care incurred by individuals and households<sup>4</sup>.

In this backdrop, the present study is an attempt to understand the

1. Awareness of Health insurance schemes available, particularly government funded among the people.
2. To know the enrolment pattern among the households.

3. To find the utilisation rates & patterns of utilisation.
4. To find the out-of pocket spending on healthcare among the households.

### Material and Method

A cross-sectional study was conducted in Munnur village of Karnataka state in South India. A sample size of 226 was estimated using a prevalence of 17%<sup>5</sup>. A total of 230 households were selected for the study using the probability proportional to size sampling technique. After obtaining an informed consent, the head of the households were interviewed using a pre-tested, structured questionnaire for the collection of data. The first part of the questionnaire contained questions on socio-demographic data like age, sex, religion, occupation, education status, ration card, monthly household income and household size and the second part about awareness, enrolment & utilisation of health insurance schemes and out-of pocket expenditure on healthcare for the entire household. The data collected was analysed using SPSS version 20 software.

### Findings:

**Table 1: Socio-demographic distribution of study population (n=230)**

Socio-Demographicvariables	Variables	Frequency	Percentage (%)
Gender	Male	181	78.7
	Female	49	21.3
Age group (Years)	25-40	62	27.0
	41 – 64	139	60.4
	65 and above	29	12.6
Religion	Hindu	122	53.0
	Muslim	73	31.7
	Christian	35	15.2
Education	Illiterate	35	15.2
	Primary	116	50.4
	Secondary	69	30.0
	Graduate	9	3.9
	Professional	1	0.4
Socio-economic status	APL	78	33.9
	BPL	152	66.1

Table 1 shows that majority of the study subjects were males (79 %), 60% belonged to the age group of 41-64 years, 53% were Hindus, 85% were literate and 66% belonged to BPL families.

Table 2 shows that a majority of the study participants (80%) were aware about health insurance schemes, only (15.7%) were aware about government funded health insurance schemes for the poor, and only (30.4%) had

enrolled in a health insurance scheme, also a majority (73.9%) of them said that health insurance coverage will reduce out of pocket expenditure, and (48.3%) had an OOPE on healthcare of more than Rs. 5000 during the last one year

Table 3 shows that (47.1%) had enrolled in Sampoorna Suraksha scheme, (31.4%) had utilised HI in the past one year, and (42.4%) had used it for surgical causes.

**Table 2: Awareness, enrolment status, opinion & OOPE about health insurance among study population (n=230)**

	Responses	Number	Percentage (%)
Awareness status	Aware	184	80.0
	Not aware	46	20.0
Awareness of Government funded Health Insurance schemes	Aware	36	15.7
	Not aware	194	84.3
Enrolment status in a health insurance scheme	Enrolled	70	30.4
	Not enrolled	160	69.6
Opinion about reduction in OOPE by using health insurance	Helpful	170	73.9
	Not helpful	11	4.8
	Don't Know	49	21.3
Out of pocket expenditure on healthcare in the past one year	Less than 1,000	36	15.7
	1,001 – 5,000	83	36.1
	5,001 – 10,000	59	25.7
	10,001 – 25,000	37	16.1
	25,001 – 50,000	15	6.5

**Table 3: Health insurance enrolment pattern, utilisation rates and type of service availed by the households in the past one year (n=70)**

	Responses	Number	Percentage (%)
Enrolment pattern in health insurance schemes	Sampoorna Suraksha	33	47.1
	ESI	21	30.0
	RSBY	6	8.6
	Voluntary or Private for profit	9	12.9
	National Insurance Company	1	1.4
Utilisation rate of health insurance during the past one year	Once	22	31.4
	Twice	12	17.1
	Thrice	2	2.9
	Not used	34	48.6
Type of service health insurance was used for	Surgical	22	42.4
	Obstetric	5	9.6
	Medical	25	48.0

## Discussion

This community based observational study assessed the knowledge, coverage and usage patterns of health insurance among the rural population in Karnataka, India. In this study majority of the participants were males (79%), 60% belonged to the age group of 41-64

years, 53% were Hindus, 85% were literate and 66% belonged to BPL families.

In this study 80% of the subjects were aware about health insurance schemes. These results are almost similar to a study conducted by Bawa S K et al.<sup>6</sup> (2011), in which 91.3% of respondents were aware about HI.

In this study the first source of information about HI was friends/family among 111 (60.3%) respondents, followed by insurance agent 28 (15.2%), print media 25 (13.6%), electronic media 16 (8.7%) and others 4 (2.2%). These results differ to a study by Bawa S K et al.<sup>6</sup> (2011), in which TV (26.5%), newspaper (21.2%), insurance agent (17.8%), friends (10.5%) and family (6.9%), were the major sources of information. This shows that there are various sources of creating awareness about HI.

During the study it was found that majority of the respondents 194 (84.3%) were unaware of Government funded Health insurance schemes for the poor, while 36 (15.7%) were aware about it.

In this study, majority of the eligible households 130 (85.5%) were unaware of Government funded HI schemes. These results differ to a study by Rajasekhar D et al.<sup>7</sup> (2012), in which the awareness levels for RSBY was 86.5%, Yeshasvini 100% and Vajpayee Arogyashree Scheme 13.9% in the sample households in Karnataka. When asked, majority of the respondents mentioned that Gram Panchayat officials had not communicated about Govt. funded HI schemes to them. The reason for such a low level of awareness in this study may be due to lack of awareness campaigns undertaken by Insurance company and village level government officials in the study area.

In this study, majority of the respondents 170 (73.9%) said that HI helps in reducing OOPE on healthcare. This shows that a large portion of the people knew about the intended benefit of HI schemes.

The study found that 70 (30.4%) households had enrolled in a Health insurance scheme. These results differ with a study by Prinja S<sup>8</sup> (2012), who reported that the proportion of India's population under insurance cover was about 15%.

Thus the enrolment rate in this study is more than most of the studies reviewed; the reason for this could be better penetration of micro health insurance scheme like Sampoorna Suraksha Scheme (SSP) in the study area.

In this study, enrolment was highest in Sampoorna Suraksha Scheme 33 (47.1%), followed by ESIS 21 (30%), voluntary or private for profit 9 (12.9%), RSBY 6 (8.6%) and National Insurance Company 1 (1.4%). SSP was responsible for almost half of the enrolment rate, this may be because a large portion of the women in the study area were members of SKDRDP promoted

self-help groups, which has been active in this area since many years, due to which they had enrolled their families in this scheme<sup>9</sup>.

During the study, it was found that among the 70 enrolled households, Health insurance was utilised by 36 (51.4%) in the past one year. Among them 22 (31.4%) used it once, 12 (17.1%) used it twice and 2 (2.9%) used it thrice. These results differ with the study by Rajasekhar et al.<sup>7</sup> (2012), in which 0.4% of enrolled households had utilised their HI scheme. The reason for this may be because the study by Rajasekhar et al. was done 6 months after commencement of the scheme. Devadasan N et al.<sup>10</sup> (2010) reported that 10% insured individuals, had utilised HI scheme in a period of 12 months. The higher utilisation rate in this study may be due to the proximity of the study area to two Medical college hospitals.

It was also found that the services for which the HI were utilised in the past year by the households enrolled were medical services 25 (48%), followed by surgical 22 (42.4%) and obstetric services 5 (9.6%). Interestingly there was no usage of HI for trauma care.

This study revealed that the OOPE on healthcare among all the households in the past one year was – 83 (36.1%) spent in the range of Rs.1,001 – 5,000, followed by 59 (25.7%) in Rs.5,001 – 10,000, 37 (16.1%) in Rs.10,001 – 25,000, 36 (15.7%) less than Rs.1,000 and 15 (6.5%) Rs.25,001 – 50,000.

Majority of the enrolled households 68 (97.1%) were satisfied with their HI scheme. These results are almost similar to the survey carried out by Research Institute<sup>11</sup> in Kerala, in which more than 90 % of beneficiaries of RSBY were satisfied with the scheme. Grover and Palacios<sup>12</sup> (2011) found that among the beneficiaries of RSBY in Delhi 85% were satisfied with the scheme. A survey by Nabard Consultancy Services<sup>11</sup> among beneficiaries of Yeshasvini scheme found that 90% were satisfied with the scheme. This shows that almost all the people who had HI coverage were happy with its benefits.

## Conclusion

Health Insurance is not a new concept. Presently people are mainly getting aware of it, through friends and family, Health insurance agents, print media, electronic media etc., but this awareness has not yet resulted in satisfactory levels of enrolment/utilisation of HI. As

the results have shown, only 30.4% of households are being covered by some form of health insurance scheme, a large chunk of the population is still financing health care expenditure without health insurance coverage. Moreover it was observed that a large proportion of the eligible households were unaware about Government funded Health insurance schemes. It was found that almost all the households covered by Health insurance schemes were satisfied with the services provided and were willing to continue with the scheme they have opted for. More intensified efforts should be made to educate the public about government funded health insurance schemes among the beneficiaries which will help in reducing the OOPE on healthcare in India.

## Abstract

Eating habits and physical activities are identified as the major, modifiable risk factors of hypertension. However, management of these risk factors is reportedly mediated by the motivation levels of the individual. This study aims to examine the role of intrinsic motivation in eating habits and physical activity in adults with primary hypertension. The study includes 140 adults with primary hypertension recruited from community based private hospitals through purposive sampling method. They were divided into two equal groups based on the level of intrinsic motivation (high intrinsic motivation = 70 and low intrinsic motivation = 70). Patients were asked to fill questionnaire that included questions related to their motivation eating habits, food choice and physical activity. Results of study indicated that there is a significant difference between high intrinsic and low intrinsic motivation groups in their food choice and eating habits. And there was no significant difference found between high intrinsic motivation group and low intrinsic motivation group with regard to physical activity. This study suggests that motivation alone is not a valid indicator of physical activity. Hence the interventions need to focus beyond motivational analysis when targeting physical activities among those with primary hypertension.

**Keywords:** *Intrinsic motivation, Eating habits, Physical activity, Primary hypertension, Adults.*

## Introduction

Hypertension is the leading non communicable disease and is estimated to be the cause of mortality in nearly 10 per cent of all deaths in India [1].

Prevention, early diagnosis, and control of hypertension can be done with the help of targeting the modifiable risk factor [2].

The risk factors for hypertension are varied. Risk factors are distinguishable into modifiable, and unmodifiable. Unmodifiable risk factors are inbuilt and cannot be altered such as age, ethnicity and family history etc, and modifiable risk factors include changes in various lifestyle habits, such as, physical activity, alcohol consumption, smoking and high salt intake. Psychosocial stresses such as work stress seem to affect hypertension [3].

Dietary habits (e.g. salt intake, fruit and vegetable intake) are the most important modifiable risk factors for hypertension. The Scientific Advisory Committee on Nutrition [4] suggests an association between high salt intake and elevated blood pressure. Similarly unhealthy diets along with physical inactivity are two of the main risk factors of many chronic diseases. An unhealthy diet is an independent risk factor of chronic disease in itself. Up to 2.7 million lives could be saved annually with sufficient fruit and vegetable consumption. Low fruit and vegetable intake is among the top 10 selected risk factors for global mortality. Worldwide, low intake of fruits and vegetables is estimated to cause about 19% of gastrointestinal cancer, about 31% of ischaemic heart disease and 11% of stroke are occurring due to less consumption of fruits and vegetables [5]

Physical activity is one of the ways to prevent the blood pressure. It is the bodily movement produced

by skeletal muscle that requires energy expenditure. Physical inactivity has an indirect association with the development of hypertension through its association with risk factors such as obesity, insulin resistance, and hyper insulinemia [6]. Physical activity may be as or even more important than pharmacotherapy for reducing the risk of mortality in adults with hypertension [7].

There are several models which explains about why people do or do not engage in various health enhancing activities. Some theories focus on the cognitive antecedents of motivation such as knowledge, attitudes and beliefs. For example, the health belief model suggests that people are motivated to change their health behaviours by specific beliefs about their susceptibility to a particular disease and about its likely severity. The Theory of Reasoned Action suggests that beliefs about the outcomes of the behaviour and the value they attach to these outcomes and at subjective norms are important motivating factors [8].

Motivation may be internally or externally driven. Many psychological theories identify motivation as an important behavioural determinant. "Motivation is an inner drive to behave or act in a certain manner, the inner conditions such as wishes, desires, goals, activate the person to move in a particular direction"<sup>[9]</sup>. Intrinsic motivation is entailed whenever people behave for the satisfaction inherent in the behavior itself, even when there are no attractive external agents such as rewards<sup>[10]</sup>. The association between intrinsic motivation and physical activity was investigated by different researchers. Perceptions of personal responsibility were associated with more intrinsic motivation toward physical education and a higher stage of physical activity<sup>[11]</sup>.

Diet and nutrition are major determinants of population health. At the individual level the determining eating behaviors are taste preferences, nutrition knowledge, attitudes and intentions [12]. Unsatisfactory hypertensive control was related to food intake and eating habits which includes high salt diet, coffee consumption and inadequate milk intake [13]. Still there is a little literature regarding why people don't engage in health promoting behaviors and do not have control over their risk behaviour and literature also suggests that intrinsic motivation as an important behavioural determinant but there is little literature in this regard in the Indian setting, so present study aimed at assessing the role of intrinsic motivation in eating habits and physical activity

## Method

**Plan and Design:** The design of the study is descriptive design with the independent variable being intrinsic motivation and dependent variables eating habits and physical activity.

**Participants:** The sample was drawn from the adults with primary hypertension population aged between 30 to 70 years (M=49.2, SD=9.28), from various hospitals of Hyderabad, Andhra Pradesh. The sample consisted of 140 (high intrinsic motivation group = 70 and low intrinsic motivation group =70). Purposive sampling technique with snowball method was used to select the participants. The inclusion criteria for the sample were that the age group is between 30-70 years, with a medical diagnosis of primary hyper tension and/or on antihypertensive medication and able to give informed consent. The exclusion criteria for the sample were age below 30 years and above 70 years, patients diagnosed with secondary hypertension, and patients with psychiatric disorder.

**Tools:** Global Motivation Scale, Food Choice questionnaire, Leisure Time Physical Activity Questionnaire.

**Procedure:** In order to select the sample, the hospitals in Hyderabad were approached and a detailed explanation about the study was given to the hospital authority. An informed consent was received from the hospital authority and patients were selected by asking the patients about their diagnosis and from case sheets. After that informed consent was taken from the patient and given detailed information about the study, objectives, its scope, ensured them the confidentiality regarding the information which they are going to share. After the instructions were given, the participants were handed over the questionnaires and were asked to fill in the response. First, the Intrinsic Motivation Subscale of Global Motivation Scale was used to identify the level of motivation. Then the other two tools were administered.

**Statistical Analysis:** The obtained data from the sample was analyzed with the help of Statistical Package for Social Sciences for Windows Version 20.0 (SPSS 20.0). Descriptive statistics, t-test, Mann– Whitney U test were applied as per their basic assumptions. t-test was performed to study the group differences where there were two independent groups

## Results

Table 1 shows the distribution of demographic details of the two study groups, where there were 70 participants in each group. In the groups of high motivation and low motivation, percentage of both the males and females were found to be equal (male 64.28% and female 35.71%). In the group with high intrinsic motivation there is more number of participants with primary education and secondary education (42.5% and 37.71%) as compare to the group with low intrinsic motivation. In the group with high intrinsic motivation there were more participants who were self-employed (40%) as compare to the group with low intrinsic motivation.

Table 2 shows, distribution eating and dietary habits of two study groups. Though it was found that majority of the both groups did not report taking regular meals outside home, a higher percentage (27.14%) of people from low motivation group took meals outside as compare high motivation group. Further, the low motivation group had higher percentage (32.85%) of people who reported weight gain in the last one year as compare to high intrinsic motivation group. And both groups tried various dietary restrictions such as low salt diet, low fat diet and low spicy diet.

Table 3 shows the results of t test done to find out the group differences on food choice and eating habits. Significant differences were noted on health dimension between high motivation and low motivation groups ( $t_{138}=4.92$ ,  $p < .01$ ). The high motivation group ( $M=16.43$ ;  $SD=2.52$ ) was found to have the higher mean score compared to low motivation group ( $M=14.26$ ;  $SD=2.69$ ). In the dimension of convenience significant differences were found between high motivation and low motivation groups ( $t_{138}=2.33$ ,  $p<.05$ ). The high motivation group ( $M=14.40$ ;  $SD=2.68$ ) was found to have the higher mean score as compared to the low motivation group ( $M=13.33$ ;  $SD=2.73$ ). In the dimension of natural significant differences were found between high motivation and low motivation groups ( $t_{138}=2.20$ ,  $p<.05$ ). The high motivation group ( $M=7.14$ ;  $SD=2.04$ ) was found to have the higher mean score as compared

to the low motivation group ( $M=6.41$ ;  $SD=1.85$ ). In the dimension of price significant differences were found between high motivation and low motivation groups ( $t_{138}=2.24$ ,  $p<.05$ ). The high motivation group ( $M=8.87$ ;  $SD=2.32$ ) was found to have the higher mean score as compared to the low motivation group ( $M=7.90$ ;  $SD=2.78$ ). In the dimension of weight control significant differences were found between high motivation and low motivation groups ( $t_{138}=2.47$ ,  $p<.05$ ). The high motivation group ( $M=7.83$ ;  $SD=3.06$ ) was found to have the higher mean score as compared to the low motivation group ( $M=6.77$ ;  $SD=1.84$ ) and no significant difference was found between the groups on mood, sensory appeal familiarity and ethical concern dimensions. It indicates that the high motivation group had consistently higher scores in the domains of health, convenience, natural content, and price and weight control.

Table 4, to test the group differences Mann-Whitney U Test was conducted because the variance between the groups was larger as indicated by the Mean and SD values of the physical activities of the two groups (high motivation group  $M=6.28$  and  $SD=19.64$  and low motivation group  $M=2.14$   $SD=8.86$ ). Table 5 shows the mean ranks of the two groups for the number of days involved in physical activity in three months. The group difference was not significant ( $Z=-1.20$ ). It implies that both the groups did not differ significantly on physical activity.

Table 5 shows reasons for not following regular physical activity. Both the groups reported work related constraints, family responsibilities and lack of time as reasons in that order for not indulging in physical activity. In high motivation group, 11.42% reported no time as a reason or not indulging in physical activity as compare to 2.85% of low motivation group. Sixty percent of high motivation group and 52.85% of low motivation group cited work related constraints as a reason for not indulging in physical activity. Further, 28.57% of the high motivation group and 44.28% of the low motivation group reported family responsibilities as a reason for not following regular regimen of physical activity.

**Table 1: Demographic details of the two study groups.**

Socio-demographic variables		High-motivation Group n (%)	Low-motivation Group n (%)
Gender	Male	45 (64.28)	45 (64.28%)
	Female	25 (35.71)	25 (35.71%)
Education	No education	9 (12.8%)	19 (27.1%)
	Primary education	30 (42.85%)	28 (40%)
	Secondary education	25 (35.71%)	20 (28.57%)
	Intermediate and above	6 (8.57%)	3 (4.28%)
Occupation	Government	4 (5.71%)	2 (2.85%)
	Private	9 (12.8%)	19 (27%)
	Self employed	28 (40%)	25 (35.71%)
	Causal labor	13 (18.57%)	9 (12.85)
	House wife	15 (21.42%)	4 (5.71%)
	Others	1 (1.42%)	1 (1.42%)

**Table 2: Group differences on eating and dietary habits**

Eating Habits		High motivation group n (%)	Low motivation group n (%)
Do you take meals out side	Yes	10 (14.2%)	26 (27.14)
	No	60 (85.71)	44 (62.85)
Has weight changed in the last year	No	42 (60%)	33 (47.14%)
	Yes, I gained in kgs	12 (17.15%)	23 (32.85%)
	Yes, I lost in kgs	16 (22.85%)	14 (20.00%)
Kinds of diets tried to manage hypertension	Low salt diet	40 (57%)	39 (55.71%)
	Low fat diet	29 (41.4%)	28 (40%)
	Low spicy diet	1 (1.42%)	3 (4.28%)

Reasons	High-motivation Group n (%)	Low-motivation Group n (%)
No time	8 (11.42%)	2 (2.85%)
Work related constraints	42 (60%)	37 (52.85%)
Family responsibilities	20 (28.57%)	31 (44.28%)

**Discussion**

Hypertension is the most prevalent risk factor for cardiovascular disease in elderly people. But the age of onset is gradually decreasing across the globe. However, improved dietary habits and other lifestyle factors, such as physical activity, can reduce its prevalence. Physical activity and intrinsic motivation are complimentary to each other in managing hypertension; together they mediate one’s personal responsibility in expecting good health. Strong beliefs that physical activity can manage hypertension; and one’s own confidence to continue physical activities without relapse could further enhance motivation to control hypertension. Motivation to change unhealthy eating habits, taste preferences, nutrition knowledge, attitudes and intentions has an impact on hypertension status. Therefore this study is aimed at understanding how food and eating habits and physical activity vary with intrinsic motivation in regard to hypertension.

**Role of intrinsic motivation in eating habits:**

This study establishes the significant difference between high intrinsic and low intrinsic motivation groups in their food choice and eating habits. Nine dimensions were covered to see the difference in eating habits and food choice between high intrinsic and low intrinsic motivation groups. They are health, mood, convenience, sensory appeal, natural content, price, weight control, familiarity, ethical concern. The significant differences were found in five of the following dimensions: health, natural content, price, weight control and convenience.

In the dimension of health, there is a significant difference between high intrinsic and low intrinsic motivation groups. This indicates that people with high intrinsic motivation are concerned more about their health. This finding is supported by a few studies which suggest that health-related expectations could mediate the food intake and eating habits [14]. This finding strengthens the earlier findings that people with high intrinsic motivation choose the food which contains

vitamins, minerals, proteins, nutrients which keeps them healthy in order to control the disease avoidance and maintain a better physical well-being [15].

Significant difference was found in this dimension between high motivation and low motivation groups in the domain of natural content, which reflects concerns with the use of additives and the selection of natural ingredients. People with high motivation choose the food which contains natural ingredients and no additives as compare to low motivation people. Combing this trend with the above, we may infer that people with high intrinsic motivation seek out food that is healthy and has optimum natural content and has minimal or no additives. This finding corroborates with the earlier studies that people who are knowledgeable about their health and are motivated to maintain health usually search for specific food components and positive health message included in label claims [16].

Price is an obvious influence on food choice. The cost of food is an important element in selection among people with low income compared with those that are better. In this dimension there is a significant difference between high motivation group and low motivation. People with high motivation group prefer food which is not expensive and they manage the budget and purchase the food which helps them maintain better health. Perceived worth of food i.e., getting the most out of their money or the value for money is an important factor for those who are health conscious[15].

In the dimension of weight control there was a significant difference between high intrinsic and low intrinsic motivation groups this could be because people with high intrinsic motivation practicing caloric restriction favor natural foods such as raw vegetables over prepared dishes and low fat diet which helps them to control weight and keeps them healthy as compared to low motivation groups. Significant difference between high intrinsically motivated people and low intrinsic motivated people could be explained by the consumption

of low fat foods for weight control by former group [17]. Controlling weight might be considered not only as “physical image model of healthiness” by avoiding overweight, but a consequence of greater knowledge of the impact of weight control in reducing the incidence of certain illnesses [18].

The mood dimension covers the constructs like general alertness and mood, as well as to relaxation and stress control. In this dimension, no significant difference was found between high motivation group and low motivation group. This may imply that both groups are similar when choosing the food which alleviates their mood and make them to feel good. Or, mood may not be an important variable in determining the eating behaviours and food choices.

The convenience dimension includes concepts like, purchasing and preparing food. Significant difference was found in this dimension between high motivation and low motivation groups. It means that high motivation group prefers food that is easy to prepare and cook. Convenience takes precedence over health, then education and information about healthy food that is also readily available and easy to prepare might be of greater value than messages emphasizing health alone. Time as a commodity to be spent or saved, weighing the value of convenience in terms of time in negotiation with other values such as ease of access or preparation [16]. Therefore, there is a need to make healthy foods conveniently accessible.

In the sensory appeal dimension, which refers smell, taste and appearance of food, no significant difference was found between high motivation and low motivation groups. This finding is supported by an earlier study which indicates found that health motives were negatively correlated with convenience; while health and sensory appeal (i.e. pleasure) were unrelated [19]. It means that sensory appeal of food does not vary with the motivation of the groups when food choices are made.

In the dimension of familiarity and there is no significant difference is seen between high motivation and low motivation groups. It reflects how important it is for the person to eat their accustomed food and diet, rather than being adventurous in food choices. From the results it can be inferred that both the groups were not concerned about the familiarity of the food.

The above findings indicate that people with high intrinsic motivation seek foods that are healthy, high on

natural content; that gives value for money, and regulates health and weight. Therefore, efforts may be focused on educating about the foods that facilitate health, bodily wellbeing and minimize specific risks. At a larger level there is a need for clear labeling of food informing the buyer about the natural content, additives, price tags, possible risks so that they make informed choices in selecting food items and modifying food habits.

Health and weight control dimension falls more internal to the individual level or within the purview of the individual. So individual efficiency could be enhanced by evaluating the variables knowledge of diseases, health related motivation, health related self-efficacy and disputing health related myths and health related negative beliefs in the context of food choices and eating behaviors and hypertension.

#### **Role of intrinsic motivation in physical activity:**

There was no significant difference between high intrinsic motivation group and low motivation group with regard to physical activity which may indicate that sedentary behavior, lack of self-efficacy for physical activity, and lack of perceived health in adults with hypertension is still a common phenomenon [20]. Reasons given by study groups for not doing physical activity were work related constraints, family responsibility and lack of time, in that order. These findings are supported by several other studies that lack of enjoyment associated with physical activity, lack of self-determination to engage in physical activity and lack of perceived effectiveness in physical activity might explain the physical inactivity in the both the groups [21]. Physical inactivity by the both groups could be related to intentional level, lack of perceived competence in them, lack of intention and perceived success by engaging in physical activity [22]. Some studies also explain that lack of stronger beliefs towards physical activity; and perceiving physical activity as functionally inconsequential in managing disease may result in poor physical activity levels [23]. Lack of perceived personal responsibility in managing diseases could also explain the physical inactivity in both the groups [24]. Lack of significant association between intrinsic motivation and engaging in physical may imply several reasons: one, motivation alone is not sufficient; two, physical activity is not a need as compared to food and hence not many shall perceive it as something important that needs to be modified. Realizing the importance and benefits of physical activity, it is important to understand the factors other than motivation. Though it is not within the scope

of this study, it is apt to note that studies indicate gender, income, previous experience, self-efficacy are some of the important factors that influence physical activity.

### Conclusion

On a concluding note, the present study examined the role of intrinsic motivation in eating habits and physical activity among adults with primary hypertension. findings revealed that, In the context of hypertension, those with high intrinsic motivation shape their eating habits and food choices based predominantly on health parameters, convenience, and natural content, value for money and weight control. Factors such as mood, familiarity, sensory appeal and ethical concern may not be mediated by intrinsic motivation in the context of hypertension. Even studies reported that motivation as an important behavioural determinant in the present study findings revealed Motivation, particularly, intrinsic motivation, may not help us understand the physical activities of hypertensive. Therefore, we need to understand that motivation based psychological strategies may help guiding the eating habits and food choices but not the physical activities. These findings may be considered while preparing comprehensive psychological interventions for the hypertensive.

**Limitations and future directions:** This study has its own limitations. The primary one is the sampling technique- purposive sampling, which will limit generalizations. Illness related factors such as onset, duration, knowledge of illness were not considered. Future studies may consider these limitations. Nevertheless, the present findings may be utilized in designing intervention strategies to improve healthy eating habits and physical activity.

**Declaration of Conflicting Interests:** The author declared no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

**Funding:** This study was not supported by any funding agency; it was a self funded study

**Ethical Clearance:** Researcher obtained permission from Centre for Health Psychology, University of Hyderabad.

# The Combination of Transcranial Direct Current Stimulation (tDCS) and TENS - Its Effectiveness on Pain and Functional Outcomes in Knee OA Patients: A Pilot Study

Rekha Chaturvedi<sup>1</sup>, Sivachidambaram Kulandaivelan<sup>1</sup>

<sup>1</sup>Assistant Professor, Guru Jambheshwar University of Science and Technology, Hisar, Haryana

## Abstract

The goal of the study is to investigate the effectiveness of combination of Transcranial direct current stimulation (tDCS) and TENS on pain and functional outcomes in patients with knee osteoarthritis. Study Design: 4-arm parallel group, participant blinded; sham (placebo) controlled randomized trial. Sampling: Simple random Sampling. Sample: 40 patients based on the inclusion and exclusion criteria were recruited and randomized into following four groups: Active tDCS/active TENS (group 1), Sham tDCS/active TENS (group 2), Active tDCS/sham TENS (group 3), Sham tDCS/sham TENS (group 4). Procedure: tDCS 2 mA on M1-SO montage and High frequency TENS at 100 Hz for 20 min for 5 consecutive days followed by supervised exercise sessions for next 5 weeks. Outcome variables: Pain, Six minute walk test and self-reported questionnaire KOOS. Result: Significant pain reduction and functional improvement in Active tDCS/Sham TENS group. Conclusion: tDCS effective in reduction of pain and improving the functions and quality of life. However use of tDCS in isolation or in combination with TENS should be further investigated.

Trial Registration: CTRI/2018/02/012027.

**Keywords:** *Transcranial direct current stimulation, TENS, Osteoarthritis, Knee.*

## Introduction

Osteoarthritis (OA) of knee joint is a standout amongst the various reasons for musculoskeletal pain and disability. As persistent pain is common in OA, this causes maladaptive neuroplastic changes in the brain and at the spinal cord<sup>1,2</sup>. A recent study displaying the MRI findings has shown that there is bilateral decrease in volume in the somatosensory, insular, and motor cortices along with many structural and functional changes in the primary motor cortex (M1) area in patients with knee OA. Therefore, interventions that have potential to reorganize the cortex may result in reduction of pain and improvement in function<sup>3</sup>.

Transcranial direct current stimulation (tDCS) a non-invasive neuro-modulatory technique is researched extensively to treat pain in various chronic pain conditions<sup>4</sup>. Various studies have already proved the effectiveness of TENS in reducing pain in the cases of knee OA<sup>5,6</sup>. Therefore tDCS along with the TENS can

be used in treating the OA knee and the effects of the combination can be explored further.

Priming the brain to reach an optimal state of excitability is already experimented in a study using tDCS in combination with the TENS in chronic low back pain patients<sup>7</sup>. Application of low amplitude currents induces changes in the neuronal membrane potential<sup>8,9</sup> and releases endogenous opioids in the mid anterior cingulate cortex and periaqueductal grey matter<sup>10</sup>, and the high-frequency TENS manages the pain by segmental inhibition in the pain gate<sup>11</sup> and descending pain suppression via  $\mu$ -opioid mechanisms<sup>12,13</sup>. Thus, the cortical effects produced by tDCS and spinal and peripheral effects are obtained by TENS may produce superior decrease in pain. Therefore, this study aims at i) whether the combination of tDCS and TENS will reduce pain to greater extent, improve function and overall quality of life (QoL) in patients of knee OA ii) to provide data for sample size estimation for a fully powered trial.

## Method

**Design, Participants and method:** The present study is 4-arm parallel group, participant blinded; sham (placebo) controlled randomized trial.

The trial registration, study design and the procedure are published in the protocol study for the trial<sup>14</sup>.

**Data Analysis:** Data distribution was tested for normality (Shapiro Wilk test). The analysis was performed according to principle of intention-to-treat. Missing data were not replaced. ANOVA was done to find the between group differences from baseline to post intervention scores of each outcome. Post hoc comparisons were done. Repeated measure ANOVA was used to compare within group differences from baseline to post intervention scores of each outcome.

## Result

**Pain (VAS):** Group 2 (Active tDCS/Sham TENS) has 1.20 less pain than group 3 (Sham tDCS/Active TENS) at the baseline MD= -1.20 95% CI (-2.14, .252). At week 1 group 1 has 1.40, Group 2 has 1.23 and group 3 has 1.08 less pain than group 4 with aMD= -1.40 95% CI (-2.47, -.328), MD -1.23 (-2.30, -.158), -1.08 (-2.152, -.008) respectively. At week 2 group 1 has 1.51 group 2 has 1.57 and group 3 has 1.52 less pain as compared to group 4 with a MD= -1.51 (-2.50, -.515), -1.57 (-2.56, -.575), -1.52 (-2.51, -.525) respectively. At week 6 group 1 has 1.42, group 2 had 1.52 and group 3 had 1.45 less pain as compared to group 4 with a MD= -1.42 (-2.44, -.399), -1.52 (-2.54, -.499), -1.45 (-2.47, -.429) respectively.

**Functional Improvement:** The functional improvement measured through six minute walk test showed no significant improvement in any of the four groups at any time points.

**Quality of life:** KOOS subgroup variables of symptom showed group 2 has 12.7 higher score than group 4 at week 1 MD= 12.70 95% CI (3.03, 22.37). At week 2 group 1 has 10.2 more scores than group 4 with a MD= 10.20 95% CI (.69, 19.71) and 13.4 higher score than group 4 at week 6 with a MD= 13.40 (1.03, 25.77). At week 2 group 2 has 14.70 more scores than group 4 with a MD= 14.70 (5.19, 24.21) and 17 more scores than group 4 at week 6 with a MD= 17.00 95% CI (4.63, 29.37). In the KOOS pain variable only Group 2 has significant improvement and has 12.5 more scores than group 4 at week 1 MD=12.50 95% CI (.47, 24.53),

13.6 higher scores at week 2 and 6 with a MD=13.60 (1.46,25.74) and MD= 13.60 95% CI (1.44, 25.76) respectively. KOOS function scores showed significant improvement in group 2 and has 10.7, 10.5 and 11.4 higher scores as compared to group 4 at week 1,2 and 6 with a MD= 10.70 95% CI (1.02, 20.38), MD= 10.50 95% CI (1.76, 19.24) and MD= 11.40 (.31, 22.49) respectively. Group 1 also showed significantly higher scores by 11.7 as compared to group 4 at week 6 with a MD= .61, 22.79). KOOS sports function variable showed significant improvement only in group 4 as compared to group 1 at the baseline values with a MD= 17.90 95% CI (40.12, 31.68) and no improvement thereafter at any time points in any of the groups. There was no significant improvement in KOOS quality of life variable in any of the groups.

## Discussion

The result showed that the participants in the Group 1 (Active tDCS/Active TENS) had maximum reduction in pain at the week 1 as compared to group 2 and 3. However, the reduction in VAS score was slightly higher as compared to the group 1 (Active tDCS/Active TENS) and group 3 (Sham tDCS/Active TENS) at week 2 and 6 showing the consistent effect (short and long term) of the interventions. The functional improvement was not significant in any of the groups. The reduction in pain can be attributed to the use of M1-SO montage that might have induced the analgesic effects by modulating M1 thalamic inhibitory connections involved in pain processing pathways in these patients. Previous studies have also reported the reduction of pain by application of M1-SO montage by modulating the activities in areas involved in pain processing and by facilitating descending pain inhibitory mechanisms<sup>15,16</sup>. The effectiveness of M1-SO montage stimulation paradigm in reduction of pain has been described in various studies. Fregni et al 2006 showed significant reduction in pain with anodal stimulation over C3 position in female patients with fibromyalgia<sup>17</sup>. Mori et al 2010 reported significant improvement in pain with the same montage in adults with multiple sclerosis<sup>18</sup>. It was conceptualised previously that the OA is a regional pain condition in which the symptoms are produced because of the pathology in the periphery, but the studies have shown that the intensity of pain does not co-relate with the severity of structural damage or the presence of inflammation<sup>19,20</sup> suggesting the involvement of central pain processing in OA patients. Various studies have also demonstrated alteration in the central pain processing

in patients of OA<sup>21</sup>. A study reports that the reliable cortical and subcortical neurophysiological response to tDCS with this montage<sup>22,23</sup> and demonstrates increase in regional cerebral blood flow response to mechanical pain stimulation in multiple areas of brain like cingulate, insula, thalamus, amygdala and putamen<sup>24,25</sup> supporting the finding of altered pain processing system in patients of OA. In the KOOS subscales of symptom both the group 1 and 2 both showed improvement, but the improvement was greater in group 2. In the KOOS subscale of pain and function only the group 2 (Active tDCS/Sham TENS) have shown significant improvement. The use of tDCS in combination with TENS or in isolation must be explored further in order to elaborate the effectiveness of the tDCS to be used as an independent tool to modulate the pain or to be used as a priming intervention that accentuates the effect of subsequent interventions for managing the symptoms of knee osteoarthritis.

### Conclusion

The use of tDCS in combination with TENS or in isolation must be explored further in order to elaborate the effectiveness of the tDCS to be used as an independent tool to modulate the pain or to be used as a priming intervention that accentuates the effect of subsequent interventions for managing the symptoms of knee osteoarthritis.

## Abstract

Epidemiology, the study of disease transmission is the review and analysis of the patterns, causes, and impacts of health and disease conditions in characterized population. In this paper we have presented a deep study about Epidemiology and its models since it is the foundation of human health. From this study it is clearly observed that in the literature there is no sufficient papers or works available related to epidemiology and very few papers have been published comparing to other research areas and out of that no paper presents an accurate model for calculating the disease transmission specifically about basic reproduction rate, and final size of the epidemic. Hence it is good to promote more number of researches in the future related to Epidemiology.

**Keywords:** *Epidemiology, disease transmission, susceptible, Infectious, Recovered.*

## Introduction

Epidemiology, the study of disease transmission is the review and analysis of the patterns, causes, and impacts of health and disease conditions in characterized populaces. It is the foundation of public health, and shapes approach choices and confirmation based practice by distinguishing hazard elements for disease and focuses for preventive healthcare. Disease transmission specialists help with study design, collection, and statistical analysis of information, correct elucidation and scattering of results (counting peer audit and infrequent methodical survey). The study of disease transmission has created procedure utilized as a part of clinical research, public health examinations, and to a lesser degree, fundamental research in the natural sciences<sup>1</sup>. Significant zones of epidemiological review incorporate disease etiology, transmission, flare-up examination, disease observation, measurable the study of disease transmission and screening, biomonitoring, and correlations of treatment impacts, for example, in clinical trials.

Disease transmission specialists depend on other logical orders like science to better comprehend disease forms, measurements to make productive utilization

of the information and make suitable determinations, sociologies to better comprehend proximate and distal causes, and designing for presentation evaluation. The foundation and spread of irresistible diseases is a mind boggling marvel with many cooperating components, e.g., the earth in which the pathogen and hosts are arranged, the population (s) it is presented to, and the intra-and between elements of the populace it is presented to. The part of the scientific study of disease transmission is to show the foundation and spread of pathogens. A transcendent technique for doing as such, is to utilize the thought of abstracting the populace into compartments under specific suspicions, which speak to their health status as for the pathogen in the framework.

**The SIR Model:** The SIR model marks these three compartments S = number susceptible, I = number infectious, and R = number recovered (resistant). This is a decent and straightforward model for some infectious ailments including measles, mumps and rubella. The letters likewise speak to the number of individuals in every compartment at a specific time. To demonstrate that the numbers may differ after some time (regardless of the possibility that the aggregate populace estimate stays steady), we make the exact numbers a component

of t (time): S (t), I (t) and R (t). For a particular ailment in a particular populace, these capacities might be worked out keeping in mind the end goal to foresee conceivable episodes and bring them under control. The SIR model is dynamic in three senses. As suggested by the variable function of t, the model is alterable in that the numbers in every compartment may change after some time. The significance of this dynamic perspective is most clear in an endemic illness with a short infectious period, for example, measles in the UK preceding the presentation of a vaccine in 1968. Such maladies have a tendency to happen in cycles of episodes because of the variety in number of susceptibles (S (t)) after some time. Amid a pandemic, the quantity of susceptible people falls quickly as a greater amount of them are tainted and in this manner enter the infectious and evacuated compartments. The illness can't break out again until the quantity of susceptibles has developed back thus of posterity being naturally introduced to the susceptible compartment.

Every individual from the populace normally advances from susceptible to infectious to evacuate. This can appear as a stream chart in which the crates speak to the distinctive compartments and the bolts the move between compartments.

**Transmission Rates:** For the full details of the model, the bolts ought to be marked with the move rates between compartments. Amongst S and I, the move rate is  $\beta I$ , where  $\beta$  is the contact rate, which considers the likelihood of getting the malady in a contact between a susceptible and an infectious subject.

Amongst I and R, the move rate is  $\nu$  (just the rate of recuperation or demise). On the off chance that the span of the contamination is signified D, then  $\nu = 1/D$ , since an individual encounters one recuperation in D units of time. It is expected that the changelessness of each single subject in the pandemic states is an irregular variable with exponential circulation. More mind boggling and reasonable dispersions, (for example, Erlang appropriation) can be similarly utilized with couple of changes. Quality Check

All submitted paper should be cutting edge, result oriented, original paper and under the scope of the journal that should belong to the engineering and technology area. In the paper title, there should not be word 'Overview/brief/Introduction, Review, Case study/Study, Survey, Approach, Comparative, Analysis,

Comparative Investigation, Investigation'.

**Bio-Mathematical Deterministic Treatment of the SIR Model:**

**The SIR Model without Vital Dynamics:** The elements of an epidemic, for instance this season's cold virus, are frequently much quicker than the progression of birth and death, consequently, birth and death are regularly discarded in straightforward compartmental models. The SIR framework without purported indispensable flow (birth and death, now and then called demography) depicted above can be communicated by the accompanying arrangement of normal differential equations<sup>2</sup>.

$$\frac{dS}{dt} = \frac{\beta IS}{N} \quad (1)$$

$$\frac{dI}{dt} = \frac{\beta IS}{N} - \nu I \quad (2)$$

$$\frac{dR}{dt} = \nu I \quad (3)$$

This model was surprisingly proposed by O. Kermack and Anderson Gray McKendrick as an extraordinary instance of what we now call Kermack-McKendrick hypothesis, and took after work McKendrick had finished with Ronald Ross. This framework is non-direct, and does not concede a non specific explanatory arrangement. All things considered, noteworthy outcomes can be determined analytically. Firstly take note of that from the equation the below mentioned equation has been derived.

$$\frac{dS}{dt} + \frac{dI}{dt} + \frac{dR}{dt} = 0 \quad (4)$$

$$S(t) + I(t) + R(t) = N = Constant \quad (5)$$

It is noted that the above equation is communicating in numerical terms the consistency of populace. Take note of that the above relationship suggests that one need just review the condition for two of the three factors. Secondly, we note that the dynamics of the infectious class depends on the following ratio:

$$R_0 = \frac{\beta}{\nu} \quad (6)$$

The purported basic reproduction number (additionally called basic reproduction proportion).

This proportion is inferred as the normal number of new diseases (these new contaminations are here and there called optional diseases) from a solitary disease in a populace where all subjects are susceptible. This thought can most likely be all the more promptly checked whether we say that the run of the mill time between contacts is, and the average time until recovery is From here it takes after that, by and large, the number of contacts by an infected individual with others before the infected has recovered is: . From here it takes after that, all things considered, the number of contacts by an infected individual with others before the infected has recovered is  $T_i/T_c$ .

By partitioning the principal differential condition by the third, isolating the factors and incorporating we get

$$S(t) = S(0)e^{-Ro(R(t)-R(0))/N} \quad (7)$$

where  $S(0)$  and  $R(0)$  are the initial numbers of respectively, susceptible and removed subjects. Thus, in the limit  $t \rightarrow +\infty$ , the amount of recovered persons follows the transcendental equation

$$R_\infty = N - S(0)e^{-Ro(R_\infty - R(0))/N} \quad (8)$$

The above condition demonstrates that toward the end of an epidemic, unless  $S(0)=0$ , not all people of the populace have recovered, so some must stay susceptible. This implies the finish of an epidemic is brought about by the decrease in the number of infected people instead of a flat out absence of susceptible subjects. The part of the basic reproduction number is critical. Truth be told, after reworking the condition for irresistible people as takes after:

$$\frac{dI}{dt} = (RoS/N - 1)\gamma I \quad (9)$$

It derives that if, then that is, there will be a legitimate epidemic episode with an expansion of the number of the irresistible which can achieve an impressive part of the populace. On the opposite, if, then that is, autonomously from the underlying size of the susceptible populace the sickness can never bring about an appropriate epidemic flare-up. As an outcome, plainly the basic reproduction number is critical.

**The Force of Infection:** Note that in the above model the function models the move rate from the compartment of susceptible people to the compartment

of irresistible people, so it is known as the compel of disease. In any case, for huge classes of transmittable sicknesses it is more practical to consider compel of contamination that does not rely on upon unquestionably the number of irresistible subjects, however on their part regarding the aggregate steady populace  $N$ .

$$F = \beta \frac{I}{N} \quad (10)$$

**The Sir Model with Vital Dynamics and Constant Population:** Considering a populace described by a death rate  $\mu$  and birth rate  $\tilde{\Lambda}$ , where a transmittable disease is spreading the model with mass-activity transmission is:

$$\frac{dS}{dt} = \tilde{\Lambda} - \mu S - \beta IS \quad (11)$$

$$\frac{dI}{dt} = \beta IS - (\gamma + \mu)I \quad (12)$$

$$\frac{dR}{dt} = \gamma I - \mu R \quad (13)$$

**Recent Advances In Computational Epidemiology:** General wellbeing epidemiology plans to comprehend the spatio-temporal spread of diseases and to create strategies to control such spread. The danger of pandemic flare-ups over various landmasses and the related monetary and social expenses is a key societal concern, and keeps on requesting critical assets for modeling, detection, and control efforts. Computational epidemiology has ended up progressively multidisciplinary (getting procedures from epidemiology, atomic science, connected arithmetic, hypothetical software engineering, machine learning, and elite figuring) and has prompted to novel computational techniques for understanding and controlling spatio-temporal malady spread. Here, we highlight some current advances, concentrating particularly on modeling, information mining, and inferential and arranging questions. We concentrate on irresistible diseases, basically including people.

**Modeling Epidemics:** An Interaction Based Approach

Customarily mathematical epidemiology has concentrated on rate-based differential equation models. In this approach, one parcels the populace into subgroups in light of different criteria (e.g., demographic qualities and disease states), and uses differential equation models to depict the disease elements over these gatherings.

Models, portray disease progression by a parameter,  $R_0$ , the essential multiplication number.  $R_0$  is characterized as the quantity of optional infections created by a solitary infective individual into an entirely defenseless populace. It figures out if an epidemic can happen by any means; if  $R_0 < 1$ , the epidemic will cease to exist, while if  $R_0 > 1$ , then we will have an epidemic. This approach has been tremendously effective in illuminating general wellbeing strategy. All things considered, a potential shortcoming is its powerlessness to catch the many-sided quality of human cooperations and practices. Compelling arranging and reaction in case of epidemics is not about just forecast, but rather reckoning and adjustment.

The normal work process of a general wellbeing expert includes the measure-extend break down mediate cycle. Differing information is gathered by means of overviews, online networking, sensors and approach archives, which are then broken down to yield relevant situational representations. Dynamic models as PC recreations are then used to interject and in addition extrapolate from the information. Reenactments are additionally used to assess different imagine a scenario in which situations (counterfactual trials. This information is utilized by an approach expert to settle on particular strategy choices, possibly prompting to changes in epidemic flow. The measure-extend break down mediate cycle propels an 'association based approach' for creating informatics stages. Here we plan to precisely display the social communications that shape the premise of disease transmission. The approach utilizes endogenous representations of people together with express collaborations between these operators to produce and catch the disease spread over the social cooperation organize.

**Synthetic Information Environments:** A Synthetic Information Environment (SIE) comprises of four parts: 1) a factual model of the population of intrigue, which we allude to as a synthetic population, 2) a movement based model of the social contact organize, 3) models of disease progression, and 4) models for representing and evaluating interventions, open strategies and individual behavioral adaptations. Initial, a synthetic population is produced by coordinating evaluation information with other demographic and geographic information to make a population of individual specialists. Synthetic populations are statistically indistinguishable to the information sources that are utilized to develop them yet protect individual security and look after secrecy. Second, we create a definite minute-by-minute calendar

for every individual in the synthetic population, utilizing time-utilize overviews consolidated with machine learning strategies (e.g. Truck). A period fluctuating, spatially unequivocal individual area system can now be built utilizing the synthetic information. The combination of such systems is a continuous research subject in computational social science and is infrequently alluded to as generative social science<sup>7</sup>. As of late, specialists have investigated different techniques to integrate littler social contact systems utilizing smart phones, RFID labels and other computerized gadgets consolidated with social media; illustrations incorporate blend of social contact systems for among secondary school understudies when going to schools and undergrads.

**Fig. 1: An example graph**

**Big Data driving Real-time Epidemiology:** Real-time epidemiology, a quickly creating zone inside general wellbeing epidemiology looks to bolster arrangement producers in close ongoing as the epidemic is unfurling<sup>4</sup>. A characteristic utilization of ongoing epidemiology is in disease observation, i.e., the issue of checking the space-time progression of disease. Customary instruments for observation incorporate sentinel facilities and serological testing<sup>5</sup>.

As of late, social media information<sup>6</sup> has been utilized to acquire disease episodes and progression, a phenomenal case of how computational advances are changing general wellbeing epidemiology. Maybe the most commended case of social media reconnaissance

is Google FluTrends (<http://www.google.org/flutrends/>) that utilizes internet searcher questions as a pointer of wellbeing looking for conduct, and in this manner a marker of disease (flu) action among a population. Not long after Google FluTrends was presented, procedures for nowcasting flu rates utilizing Twitter got to be distinctly conspicuous<sup>7</sup>.

Analysts have given careful consideration to substance modeling of tweets. For example, Lamb et al<sup>6</sup> have created strategies to separate tweets that report genuine flu infections from others that display simple mindfulness/worry about the flu.

**Fig. 2: Dominator Tree**

We have formalized the possibility of social network sensors utilizing the idea of graph dominators<sup>8</sup>. In a given graph, a hub  $x$  is said to overwhelm a hub  $y$  if all ways from an assigned begin hub to  $y$  must experience  $x$ . For our situation, the begin hub shows the wellspring of the contamination or disease. In Fig. 1, which depicts a social contact network with hubs as individuals, all ways from hub  $A$  (the assigned begin hub) to  $H$  must go through  $B$ ; in this way  $B$  rules  $H$ . Take note of that a man can be ruled by numerous other individuals.

To disentangle such transitive circumstances, we say that hub  $x$  is the novel quick dominator of  $y$  if  $x$  commands  $y$  and there does not exist a hub  $z$  to such an

extent that  $x$  rules  $z$  and  $z$  overwhelms  $y$ . This empowers us to reveal a basic tree of dominator connections, as appeared in Fig. 2, with a much littler number of edges than the first graph.

**Conclusion**

In this paper we did a detailed study about Epidemiology, the study of disease transmission is the review and analysis of the patterns, causes, and impacts of health and disease conditions in characterized population. Also, this paper elaborated the Epidemiology models. From this study it is clearly explained that in the literature there is no sufficient works carried out in the past and there is no accurate model for calculating the disease transmission specifically about basic reproduction rate, and final size of the epidemic. Hence it is important to stress that more research has to be carried out in the future related to Epidemiology.

# Ideal Self-Concept Factors influencing on Emotional Intelligence among School Teachers and Nurses

S. Antonysamy<sup>1</sup>, J.M. Asgarali Patel<sup>2</sup>, A. Velayudhan<sup>3</sup>

<sup>1</sup>Research scholar, Department of Psychology, Annamalai Nagar, Annamalai University, <sup>2</sup>Head and Professor, Department of Psychology, Annamalai University, <sup>3</sup>Professor and Head, Department of Psychology, Bharathiar University, Coimbatore

## Abstract

The present research is an empirical effort made to study how the ideal self-concept influences on the Emotional Intelligence. The sample-size is 350 (comprised of 200 Teachers and 150 Nurses). The stratified random sampling method is adopted. The age ranges from 22 to 56 (Mean Age= 31.87). The research is executed with non-clinical samples. The tools adopted are: (1) Emotional Intelligence scale<sup>4</sup> and (2) Self-concept ration scale<sup>13</sup>. The participants are contacted individually by the researcher and data is obtained with the help of the above mentioned tools. The descriptive statistics and correlation are used for the statistical analyses. Results indicated that all dimensions of the emotional intelligence are positively and significantly correlated with the dimensions of the ideal self-concept at 0.01 percent level of significance. The physical self-concept is significantly correlated at 0.05 percent level of significance with the value orientation. This finding supports the understanding and the development of effective strategies for strengthening the self-concept of client in psychotherapy.

**Keywords:** *Ideal Self-Concept, Emotional Intelligence, non-clinical samples.*

## Introduction

Self-concept is defined as the overall image or awareness of one's own self, including the beliefs and values. It is considered as contextualized dynamic cognitive structure<sup>3</sup> that adapts and regulates the behavior. The self-concept is viewed as a multifaceted phenomenon of images, schemas, conceptions and prototypes<sup>15</sup>. The core characteristic of self-concept is that it perpetuates and remains stable over time<sup>17</sup> and seen as a product of interpersonal interactions<sup>18</sup> where the overall self-concept is in a state of flux being more readily influenced by the current experience, social roles taken and the people with whom one associates. It is a process in which there are three stages: Self-identity, self-evaluation and self-ideal<sup>1</sup> that are based on the positive or negative attitudes. It is explicitly articulated in the words we frequently engage in talking about ourselves or while performing silent monologues. The person with negative self-concept considers themselves as failures, and they have pessimistic approaches, complain and not generally open to criticism. On the other hand the

person with positive self-concept are confident, believe in themselves, handle different situations, overcome challenges, respect themselves and others, and have realistic assessment about themselves.

Emotional intelligence refers to the ability or competency to deal effectively with emotions. It is a set of abilities to identify, understand, use and regulate the emotions for promoting greater emotional and personal growth<sup>11</sup>. It embodies the inter-personal and intra-personal intelligence<sup>8</sup> as proposed by Gardner (1993). The inter-personal intelligence denotes the ability to understand other people, their moods, desires and motivations<sup>2</sup> which enable a person to work effectively with others with empathy and understanding. On the other hand, intra-personal intelligence denotes the ability to understand one's own emotions, moods, goals, etc. which is important for personal success and happiness. Thence the emotional intelligence means handling of one's own emotions and managing it in such a way that it is channeled towards one's own personal growth by impacting other people in the social environment.

**Emotional intelligence and self-concept:** Research done outside of India portrays that the emotional intelligence is essential for building the self-concept<sup>6</sup> and for the mental health<sup>7</sup>. The low self-concept (inferiority complex) would lead to low emotional intelligence which in turn brings forth the anxiety and depression<sup>5</sup>. It implies that the emotional intelligence significantly and positively influence the self-concept<sup>10 15 17</sup>. In other words, the high self-concept facilitates a greater ability for regulating one's own emotions as well as those of others. The acceptance and regulation of one's self and emotion bring novelty in relations<sup>10</sup>. By analyzing the earlier studies, we conclude that the self-concept and the emotional intelligence influence each other reciprocally. If the emotional intelligence is low then the self-concept would be also low, and if the self-concept is high then the emotional intelligence would be also high.

The figure-1 shows the relationship between the emotional intelligence and self-concept

**Significant of the Research:** Review of literature reveals that there has no study on ideal self-concept of adult population in an Indian context in particular to the service sector respondents like teachers and nurses. This fills the research gap. This research would help the readers to understand the interpersonal issues better. Consequently this study will assist in counseling and psychotherapy towards strengthening the 'self'.

#### Objectives:

1. To identify the levels of Ideal self-concept among the respondents.
2. To identify the levels of Emotional Intelligence of the respondents.
3. To find out the relationship between the responses of the respondents towards the Ideal self-concept and Emotional Intelligence.

Hypothesis: The research hypothesis is a tentative solution to a research problem<sup>9</sup>. Based on the above

stated descriptions about the self-concept and the emotional intelligence, the following hypothesis is being framed:

Ho: There is no significant relationship between the factors of ideal self-concept and the emotional intelligence.

Ha: There is significant relationship between the factors of ideal self-concept and the emotional intelligence.

#### Method

Descriptive survey method was adopted. 350 samples were selected following the stratified random sampling from Cuddalore district- Tamil Nadu, consisting of 153 males and 197 females in which 200 teachers were working in private, aided and government institutions, and 150 nurses were working in private and government healthcare centers. The age was ranging from 22 to 56 (Mean Age= 31.87). The participants were contacted individually by the researcher and data was obtained with the help of the selected tools. Before the data collection was made, oral permission was obtained from the correspondent and principles of the concerning schools and healthcare centers.

#### Instruments Used:

**Emotional Intelligence Scale (EIS):** The Emotional Intelligence scale is developed and standardized by Hyde, A., Pethe, S., & Dhar, U. (2002) for Indian Milieu. It contains 34 items with five-point rating scales as 5-strongly agree, 4- Agree, 3-uncertain, 2-disagree, and 1-strongly disagree. The scale measures the ten dimensions of Emotional Intelligence namely, self-awareness, empathy, self-motivation, emotional stability, managing relations, integrity, self-development, value orientation, commitment and altruistic behavior. It has split-half reliability value of 0.88 and validity with 0.93. This scale is used only for individual assessment, research and survey purposes. It does not require the services of highly trained test administrator. Based on this stated reasons, the EIS-scale was selected and used for this research purpose.

**Self-Concept Rating Scale:** The self-concept rating scale is developed and standardized by Saraswat, R.K. (2011) in an Indian context. It contains 57 personality traits based on dimensions like physical, power, ability, social and psychological characteristics. The responses

are to be received on a three points rating scale (low, average and high) for each trait and under each self-concept (real, ideal and social). It is to be administered for adult population. Test-retest reliability was found to be 0.83. Based on these stated reasons, the scale was selected and used for this research purpose.

**Analysis Strategy:** The statistical program IBM SPSS 21 was used for the data analysis. The descriptive statistics were adopted. For determining the relationships between the research variables of this study, Karl Pearson’s moment correlation (‘r’) was used towards determining the significance, direction and strength of the relationship between the variables.

**Results and Discussion**

The research goal was to find out the relationship between the Ideal self-concept and the emotional intelligence of the teachers and the nurses. The collected data was coded with IBM SPSS 21 version. The tables were obtained through descriptive analysis and correlations.

The table-1 shows the frequency and its corresponding percentages of the responses under low, average and high levels towards the five dimensions of the Ideal self-concept

Dimensions of ideal self-concept	Low		Average		High	
	Frequency	%	Frequency	%	Frequency	%
Power self-concept	2	0.57	189	54	159	45.42
Social self-concept	1	0.28	152	43.42	197	56.28
Ability self- concept	3	0.85	175	50	172	49.14
Physical self-concept	-	-	144	41.14	186	53.14
Psychological self-concept	1	0.28	195	55.71	153	43.71

Source: Primary data

Table-1 shows the frequency and its corresponding percentages of the responses under low, average and high levels towards the five dimensions of the Ideal self-concept. It identifies the levels of Ideal self-concept among the respondents. It is found that 171 (48.85) individuals have scored average and 174 (49.53) individuals of high on the dimensions of the ideal self-

concept. Highest frequency of 197 (56.28) goes with the Social self-concept among all the five dimensions.

The table-2 shows the frequency and its corresponding percentages of the responses under low, average and high levels towards the 10 dimensions of the Emotional Intelligence

Dimensions of Emotional Intelligence	Low		Average		High	
	Frequency	%	Frequency	%	Frequency	%
Self-awareness	25	7.14	171	48.85	154	44
Empathy	22	6.28	212	60.57	116	33.14
Self-motivation	16	4.57	182	52	152	43.42
Emotional stability	30	8.57	207	59.14	113	38
Managing relations	21	6	201	57.42	128	36.57
Integrity	29	8.28	199	56.85	122	34.85
Value orientation	53	15.14	188	53.71	109	31.14
Commitment	40	11.42	171	48.85	139	39.71
Altruistic behavior	31	8.85	200	57.14	119	34
Self-development	31	8.85	189	54	130	37.14

Source: Primary data

It is vivid from the table-2 that the dimensions of Emotional Intelligence are measured with low, average and high with their percentage. It identifies the levels of Emotional Intelligence of the respondents. It is found that overall 30 (8.51) individuals have scored low, 192 (54.85) individuals have scored average and 128

(36.62) individuals have scored high on the dimensions of emotional intelligence.

The table-3 shows the correlation between the dimensions of emotional intelligence and ideal self-concept

Dimensions of emotional intelligence	Dimensions of ideal self-concept				
	Power self-concept	Social self-concept	Ability self-concept	Physical self-concept	Psychological self-concept
Self-awareness	.266**	.231**	.278**	.267**	.269**
Empathy	.252**	.204**	.243**	.273**	.231**
Self-motivation	.255**	.248**	.283**	.280**	.285**
Emotional stability	.235**	.192**	.241**	.230**	.234**
Managing relations	.280**	.170**	.250**	.218**	.202**
Integrity	.272**	.230**	.277**	.293**	.295**
Value orientation	.142**	.165**	.173**	.127*	.174**
Commitment	.188**	.180**	.210**	.192**	.223**
Altruistic behavior	.228**	.262**	.262**	.228**	.262**
Self-development	.184**	.181**	.174**	.165**	.146**

Source: Primary data \*\*. Correlation is significant at the 0.01 level (2-tailed), \*. Correlation is significant at the 0.05 level (2-tailed).

Table 3 shows the results of Karl Pearson’s moment correlation (‘r’) which is used to elicit the relationship between the dimensions of the emotional intelligence and the ideal self-concept. It is found that the dimensions of the emotional intelligence are positively and significantly correlated with the dimensions of the ideal self-concept at the 0.01 level. But the physical self-concept alone is significant and correlated at the 0.05 level with the value orientation. Even though the responses are more in the average and high levels in both the responses through the two scales, the correlation results show the relationship as positive and significant. But the Correlational values ranges from 0.127 – 0.295. This indicates the low correlation. Even then the correlation seems to be significant and positive.

### Discussion

The primary intension of the research is to find out the relationship between the dimensions of the ideal self-concept and the emotional intelligence. The ideal self-concept is the persons’ perceptions of aspirations and beliefs that one ought to be. These aspirations and beliefs may be within the reach of the person, or it may be so unrealistic that it can never be reached in real life<sup>14</sup>. According to Carl Rogers (1951) -founder of

the humanistic approach- states that everyone strives to reach an “Ideal self”. It implies that the person is striving to become by fulfilling the expectation of others which do not match their experiences. When the person is forced to fulfill the conditions and expectations of others, the person leaves behind one’s organismic beliefs and values, and forms the conditional positive self-regard. As the result, the person develops the ideal-self: being afraid to accept one’s own experiences as valid, looking for winning approval from other<sup>12</sup> and being moved or controlled by the external factors or forces. From table-1 it is clear that the 174 (49.53) individuals have the high ideal self-concept. This indicates that the individual’s aspirations are unrealistic which would never be reached in real life where the person would look for winning the approval from others.

This higher score on the ideal self-concept reflects the higher score on the dimensions of the emotional intelligence. From the table-1 and table- 2, it is vivid that 174 (49.53) individuals have the high ideal self-concept, correspondingly 128 (36.62) individuals have score high on the dimensions of emotional intelligence. This indicates that there is a positive relationship between the ideal self-concept and the dimensions of emotional

intelligence where increasing in one dimensions would induce to increase in another dimensions. This also confirms the theoretical aspects of cognitive therapy as envisaged by Aaron Temkin Beck (1994) where the thinking influences the emotions of the persons.

Further analyzing the relationship between the dimensions of the emotional intelligence with the dimensions of ideal self-concept with the help of Karl Pearson's moment correlation ('r'), it is clear from the table-3 that all dimensions of the emotional intelligence are positively and significantly correlated with the dimensions of the ideal self-concept at the 0.01 level, while the physical self-concept from the ideal self-concept dimensions alone is significantly correlated at the 0.05 level with the value orientation of emotional intelligence. Thus the present research confirms with the earlier findings<sup>15 10 17</sup> and accepts the research hypothesis that there is significant relationship between the factors of ideal self-concept and the emotional intelligence.

**Implication and Limitation:** There research is done in an Indian context. This would help us to understand the relationship between the dimensions of Ideal self-concept and Emotional Intelligence, and how the thinking (self-concept) would influence the emotions of the persons. The finding would be helpful for developing strategies effectively in psychotherapy where the person's self-concept would be strengthened in order to encounter the emotions that come in intra and inter-personal relationships. On the other hand the limitations as such, the sampling area covered in the present research is from non-clinical populations. Though the data were collected following the stratified random sampling, covering teachers and healthcare professionals working in private, and government institutions and centers, but the data was collected at the convenience of the researcher as well. Regarding the target population, young and middle adults were only included. The data analyzed for this study were originally meant for research purpose rather than clinical analysis or making diagnosis.

**Conflict of Interest:** The conflict of interest is nil.

**Source of Funding:** The source of funding is self-funded.

**Ethical Clearance:** Ethical Clearance is taken from Center for Academic Research (CARE) Annamalai University, Psychology wing.

## Conclusion

From above the empirical study we conclude that the dimensions of the ideal self-concept and emotional intelligence are positively related. Based on the cognitive therapy, we also affirm if the self-concept (cognition) about oneself and other is positive, then the emotions related to oneself and other would also be positive, moving in the positive direction. On the other hand, if the self-concept (cognition) about oneself and other is negative, then the emotions related to oneself and the other would also be negative. Strengthening the self (intra-personal) facilitates the inter-personal relationship, through enhancing the emotional intelligence.

# A Study to Assess Prevalence of Cysts and Tumours in the Oral Cavity: A Retrospective Study

S. Bhuvaneshwari<sup>1</sup>, Silpiranjan Mishra<sup>2</sup>

<sup>1</sup>Professor and HOD, Department of oral medicine diagnosis and Radiology, Kalinga institute of dental sciences, KIIT University, Bhubaneshwar, Orissa, <sup>2</sup>Senior Lecturer, Department of Oral Medicine Diagnosis and Radiology, Kalinga Institute of Dental Sciences, KIIT University, Bhubaneshwar, Orissa

## Abstract

**Background:** Geographic differences are seen in prevalence and pattern of orofacial cysts and tumors. The purpose of this study was to determine the prevalence of cysts and tumors in the oral cavity.

**Material and Method:** The present study was conducted to assess the prevalence of Odontogenic cysts and tumors diagnosed histopathologically in 260 patients over the period of 6 months. Data regarding age, gender, location, size, histopathological evaluation and treatment done were gathered from the clinical records. Data was analyzed using the SPSS - 20 (Chicago, IL-USA). The level of significance was set at  $P < 0.05$ .

**Results:** In the present study 53.46% were male and 46.53% were females. The gender distribution showed a slight male predilection in Odontogenic Cysts, while the Odontogenic Tumors showed female predilection. Dentigerous cysts were most commonly occurring cysts than the other odontogenic cysts and shows male predilection. Ameloblastoma was most commonly occurring tumor than the other odontogenic tumors and shows female predilection.

**Conclusion:** Our study concluded that odontogenic cysts were more prevalent than odontogenic tumors and the gender distribution in odontogenic cysts showed a slight male predilection, while the Odontogenic Tumors showed female predilection.

**Keywords:** Dentigerous cysts, odontogenic cysts, Ameloblastoma, odontogenic tumors.

## Introduction

The oral cavity is a unique, peculiar environment and one of the most dynamic regions in the body.<sup>1</sup> A cyst is defined as a pathologic cavity containing fluid, semifluid or gaseous contents that are not created by the accumulation of pus; frequently but not always, is lined by epithelium. Odontogenic cyst (OC) is categorized into two groups on the basis of their origin:

developmental and inflammatory. OCs are unique as they only affect the oral and maxillofacial region which are characterized by resorption of bone and they develop from the components of the odontogenic epithelium or its residuals which remain trapped within the gingival tissue or bone.<sup>2</sup> The knowledge of prevalence of odontogenic cysts and tumors is limited, which may be due to inadequate documentation in our hospitals and health care centres. A very limited prevalence studies of odontogenic cysts and tumors have been carried out in India and information is limited.<sup>3,4</sup> The purpose of this study was to determine the prevalence of cysts and tumors in the oral cavity.

**Material and Method:** The present study was conducted to assess the prevalence of Odontogenic cysts and tumors which were diagnosed histopathologically

in 260 patients over the period of 6 months. Before the commencement of the study ethical approval was taken from the Ethical committee of the institution. Data regarding age, gender, location, size, histopathological assessment and treatment done were collected from the clinical records. Classification of the diagnosis was based on the International Statistical Classification of Diseases and Related Health Problems (ICD-10) published by World Health Organization. Data was analyzed using the SPSS - 22 (Chicago, IL-USA).

The level of significance was set at  $P < 0.05$ . Results: In the present study 53.46% were male and 46.53% were females. The gender distribution showed a slight male predilection in Odontogenic Cysts, while the Odontogenic Tumors showed female predilection. Dentigerous cysts were most commonly occurring cysts than the other odontogenic cysts and shows male predilection. Ameloblastoma was most commonly occurring tumor than the other odontogenic tumors and shows female predilection.

**Table 1: Distribution of Odontogenic Cysts according to gender**

Type of Odontogenic cysts	Male (%)	Female (%)	Total (%)
Dentigerous cysts	36 (23.07%)	33 (21.153)	69 (44.23%)
Radicular cysts	26 (16.66%)	21 (13.46%)	47 (30.12%)
Odontogenic kerotocysts	24 (15.38%)	11 (7.05%)	35 (22.43%)
Glandular cysts	5 (3.20%)	0 (0%)	5 (3.20%)
Total	91 (58.33%)	65 (41.66%)	156 (100%)

**Table 2: Distribution of Odontogenictumors according to gender**

Type of odontogenic tumors	Male (%)	Female (%)	Total (%)
Ameloblastoma	29 (27.88%)	41 (39.42%)	70 (67.30%)
Odontoma	5 (4.80%)	3 (2.88%)	8 (7.609)
Adenomatoid odontogenic tumor	4 (3.84%)	3 (2.88%)	7 (6.73%)
Ameloblastic fibroma	3 (2.88%)	2 (1.92%)	5 (4.80%)
Calcifying epithelial odontogenic tumor	2 (1.92%)	3 (2.88%)	5 (4.80%)
Odontogenic myxoma	0 (0%)	4 (3.84%)	4 (3.84%)
Peripheral odontogenic fibroma	5 (4.80%)	0 (0%)	5 (4.80%)
Total	48 (46.15%)	56 (53.84%)	104 (%)

## Discussion

Odontogenic tumors are lesions which are formed from epithelial and/or mesenchymal rudiments that are part of the tooth-producing tissues or its remnants. The lesions shows range from hamartomatous tissue proliferation to malignant neoplasms, with metastatic potential.<sup>5,6</sup> In humans, odontogenic tumors are reasonably rare, consists of about 1% of all tumors in the jaw.<sup>7</sup>

Santos et al., however, showed a peak occurrence in the second decade of life, this difference in age incidence may be due to being related to the major prevalence of odontomas in such an age range, in their study.<sup>8</sup>

Meningaud et al. found that cysts may be asymptomatic for a long period of time, which in turn, may lead to severe bone destruction. The most common site for radicular cysts in their study was the mandible.<sup>9</sup>

Prockt AP conducted a study and confirmed that Odontogenic Cysts occurred more commonly in males.<sup>10</sup>

Odontogenic Tumors occurred most commonly in females which was confirmed by the studies done by Fernandes,<sup>11</sup> Ochsenius et al.<sup>12</sup>.

## Conclusion

Our study concluded that odontogenic cysts were more prevalent than odontogenic tumors and the gender

distribution in odontogenic cysts showed a slight male predilection, while the Odontogenic Tumors showed female predilection.

# Neural Network Based Implementation of Corner Detection for Biomedical Application in Computer Vision

Santosh M. Herur<sup>1</sup>, S.S. Kerur<sup>2</sup>, Kalmeshwar N. Hosur<sup>2</sup>

<sup>1</sup>Faculty, Department of E & CE, GMIT, Davanagere and, Research Scholar, Department of E & CE, SDMCET, Dharwad, <sup>2</sup>Faculty, Department of E & CE, SDMCET, Dharwad, Visvesvaraya Technological University, Belagavi, Karnataka, India

## Abstract

The identification of the corner is one of the important features of the visual processing system. When the image is extracted and used to modify the image, image may be enhanced according to the application, such as corner detection, edge detection, sharpness, etc. Different devices, such as real-time video surveillance, medical imaging, facial recognition, include object detection, including detection in a corner. We are proposing a Corner Detection Method with Neural Network in order to provide improvement over existing corner detector method. The theoretical rigor benefits are there in conventional differential filter-based algorithms but excessive post-processing is required. The proposed new network technique is used in the realization of corner detection tasks, it takes advantage of the extraction of momentum, can process an input picture of any size without preparation.

**Keywords:** *Neural Network, Corner Detection, Convolution, Biomedical imaging.*

## Introduction

Corners contain high information points which are one of the important features in the pictures<sup>[1]</sup>. The two dimensions are closely positioned. Much work has been conducted on this subject until now, but each methodology is different and findings are slightly different. These method results have difficulties in detecting the correct detection in the corner.

Typical corner detection method are of two kinds: (i) Second grade variation (ii) Convolution based estimation.

The pixel value on the image is measured in the middle method between two above mentioned method. The presence of corner is deduced if the value of the pixel exceeds the value of the user Threshold. This value is not specified by a fixed model. The image is captured and processed in different environments. Typical technology is not invariant where coins are detected, where noise, particularly for the second derivative method, is also important. Here we compute labels of Bayesian subsequent probabilities, which is one of a

corner detection problem in recognition of statistical patterns. Training based methodology is important and here we use a neural feed network trained by traditional error propagation. This approach is useful because it is easy to apply to hardware like Raspberry Pi in real time. Due to inadequate preparation, disappointing results have been shown in the past in real time. There have been many attempts in this regard. We have trained our models with large data with gray corner detection models to achieve good results. This makes for a good broad. It was hard to learn mapping here. Pre-treatment steps have removed known corner problems and thus reduced the difficulty of the classification problem. Instead of training a single network, we have used training sets and trained modules.

The output of each individual module is used to create a second training package that is used for training a further network. This approach contrasts the findings with traditional method. The results are good in the analysis.

**ANN Corner Detection Algorithm:** The design of the model Neural Networks by David Hubel and Torsten

Wiesel was scientifically inspired by the architecture and function of the vision system of mammals<sup>[8]</sup>. The introduction of data should be used for the artificial expansion of the data set by means of label-preserving transformations<sup>[7]</sup>. The artificial profound thinking can be recognized as part of a correlation with human intelligence on the basis of its model. Algorithms and marked training data are necessary in order to simulate the broad neuronal spectra of the neocortex in an artificial “neural network” computing infrastructure. Several types of brain functions are known, in particular the primary visual cortex (PVC). Good fellow et al.<sup>[2],[9]</sup> outlined three PVC characteristics in order to model a network: i) It is organized as a spatial map since the structure of PVC is in 2D. Networks capture this property by having features defined with regard to 2D maps. ii) PVC contains several simple cells that are characterized in a broad, spatially distributed receptive field by a linear image feature. The network detector units are designed to copy such properties from simple cells. iii) These cells respond to characteristics and include various complex cells. Complex cells cannot change the position of their characteristics or remain unchanged, regardless of changes in measuring conditions other than simple cells. The pooling of networks is motivated.

**Operation:** The term Convolution is used when a new feature is generated from two variables. The new function demonstrates how much the original features relate to the accuracy of the graphs. According to the convolution principle, the Fourier transformation is a point-specific consequence of the Fourier transformation. The unification of two functions of one domain (for instance, the time domain) is regarded as a point-specific distribution within another domain (for example the frequency domain).

$$g(x) = f(x) \otimes h(x) = \int_{-\infty}^{\infty} f(s)h(x-s)ds \quad (1)$$

When two functions are f(x) and g(x), s is a buzzing parameter for integration (takes values 0 or 1). The convolution between two functions is shown as follows in two dimensions:

$$g(x,y) = f(x,y) \otimes h(x,y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(s,t)h(x-s,y-t)dsdt \quad (2)$$

An asterisk\* is used for the operation of convolution. The convolution operation (1) is, for example, based on a signal time domain, X(t) and frequency region, w(a) for one-Dimensional use.

$$s(t) = (x * w)(t) \quad (3)$$

When x is an input, w is a kernel; s(t) is an output called a map or kernel feature. In computer applications, time series data are binary and the time index t can only take integer values. As the discrete convolution, this can be defined:

$$s(t) = (x * w)(t) = \sum_{-\infty}^{\infty} x(a)w(t-a) \quad (4)$$

Typically, the input is a multidimensional information set, which is a multidimensional array of items suited to the training algorithm. These multifaceted displays are referred to as tensors. If two-dimensional space, like image I as a source, exists, kernel K must be used twice. The integration is two-dimensional.

$$S(i,j) = (I * K)(i,j) = \sum_m \sum_n I(m,n)K(i-m,j-n) \quad (5)$$

If we assume, on the assumption that the convolution is commutative, that scope for valid values m is less variable than n, we can write (5) exactly as following:

$$S(i,j) = (K * I)(i,j) = \sum_m \sum_n I(i-m,j-n)K(m,n) \quad (6)$$

In m, the input index is raised, but the index is reduced to the kernel, so we have moved the kernel to the input. If the kernel is not inverted, we use the feature called the cross-correlation.

$$S(i,j) = (K * I)(i,j) = \sum_m \sum_n I(i+m,j+n)K(m,n) \quad (7)$$

The algorithm is used to learn the appropriate kernel value in an appropriate location in machine learning<sup>[2]</sup>. In the machine learning the combination of other functions is not used on its own but at the same time. This works on the basis of the concepts of the neural network.

**Neural Networks:** In the Neural network, there is an AB matrix generated by a two-matrix n x m, with n being one of the matrix parameters and m interacting with each input device and the output device<sup>[2]</sup>. The neural network uses a parameter of AB. The topology here is focused on the receptive domain, weight shared and spatial or temporal sampling<sup>[10]</sup>. Each layer is of small kernels that extracts high-level characteristics and different layer types. The final layer is supplied for fully connected layers. The neural nets have less connections and easier to train if they are constrained in number to learn<sup>[5]</sup>. This neural network uses data-driven filtering to draw input descriptive features<sup>[3]</sup>. The template design comprises an input layer, alternating layer, pool or sub-sampling layer

as well as a non-linear layer. The layers of spatial and configurable invariance are combined with sub-sampling layers to reduce computational time. The input layer is a set of information that is multidimensional in which data are sent into the network<sup>[3]</sup>. Picture pixels or conversion of image data, patterns, time series, or video signal can include input data. The principal building blocks of the network are groundbreaking layers. The primary purpose of this layer is to draw from the input different characteristics such as corners, rims, contrast, sharpness, etc. Krig<sup>[12]</sup> defines a variety of learnable kernels that are used to measure the kernel map with local characteristics and each kernel.

Important elements like boundaries, angles, textures and lines are removed in the first layer. The next convolution layer develops higher levels but the higher levels are derived from the last convolution layer<sup>[13]</sup>. The kernel size means that the filter is around the map, while the filter slides are the stage. It determines how the filter fits the feature map. That is why the filter rotates every cycle around the various layers of the map of the system by sliding one unit<sup>[2]</sup>. For the neural network too, it is important to introduce padding which enables information to be extended to include elements V, i, j and k, in instance. For example, the zero input padding is used when managing the Output size and kernel width W separately. The detector step is used to detect each linear activation through a non-linear activation feature. In other words, linear activation leads to neural networks being non-linear and allows for the learning of complex models<sup>[11]</sup>. There are many non-linear capabilities. The standard model of the f neuron output is with the function of its inputx of  $f(x) = \tanh(x)$ ,  $\text{sigmoid}(x)$  or  $\text{rectified linear unit}$ <sup>[11]</sup>. It is quicker than rehearsingfor most days. Many authors use the sigmoid (·) function in its simplicity<sup>[6]</sup>. Network encoding and computational complexity decrease previous map resolution<sup>[14]</sup>. The pooling layer is immune to the previously observed small change in usability. Pooling maintains the focus of the network on important trends.

The sampled version of the input map comes from a bundle that reduces the dimensionality of the next layers of function maps<sup>[3],[4]</sup>. The pooling splits the inputs into areas of R x R to create one output from each zone. If an input with a length W x W is inserted in the pooling layer, the output value P is achieved<sup>[15]</sup>:

$$P = \left\lfloor \frac{W}{R} \right\rfloor \tag{8}$$

Maximum pooling, median rectangle and testing pooling are included in the pooling. The full pooling operation is planned for the rectangular quarter's maximum output. Max outputs for each kernel the maximum number and reduces the function's map width. The average sum of the four factors is selected for the highest amounts. Max pooling accounts for invariance. For the average pooling, the average of four values is chosen. The median values are rounded off by a fraction to the next integer. A combination of several input maps may be combined in each output graph. Ordinarily<sup>[16]</sup> we can compose:

$$x_j^L = f\left(\sum_{i \in M_j} x_j^{L-1} * k_j^L + b_j^L\right) \tag{9}$$

- where L: the convolution layer;
- L-1: The surface of the down sample;
- $x^{L-1}$ : Convolution layer input characteristics;
- $k_{ij}^L$ : Convolution layer kernel maps.;
- $b^L$ : Convolution additive bias;
- $M_j$ : Represents a selection of input maps;
- i: Input;
- j: Output.

Neural network extraction usually consists of a number of comparable phases and three cascading layers: convergence level, activation layer, and pooling.

N x N x D dimensions are converted into p kernel numbers with the kernel scale k x k x D. The 3D convolution approach used in neural networks is shown in Figure 1. A kernel with the input map generates a chart of the output variable, which p immediately produces p maps. Both kernels switch from the top-right corner of the feature diagram to the top-right part of the section. Then the kernel transfers an element to the left and turns on the right side. This process happens when the kernel is down to the ground. For operations, a component of an output function k x k x D is required. The above criteria suggest that the filter is normally slit over the induction and calculated by a non-linear activation function, accompanied by a filter which incorporates non-linearity into the template<sup>[11]</sup>. Generally, the new function map is created. A convergence surface is, for example, the input character graph, kernel and the convolution performance. In each feature map, each unit has the same weights (filters).

Figure 1. The convolution process

The benefits of share weights are a small number of parameters and the capacity to identify this function irrespective of its location in the inputs<sup>[15]</sup>. The result for the next step shall be converted using max pooling or average pooling. The layers are fully connected. This is the last phase of a standard multi-layered topology network. The last few layers will be fully connected with any activation in the previous layer<sup>[4]</sup>. Features to train a different classifier from these layers can be extracted. Diverse loss functions can be used to demonstrate how network learning penalizes the difference between expected labels and true ones, e.g. softmax, sigmoid cross-entropy or euclidean loss.

### Results and Discussions

The latest array of imaging techniques, such as MR, computed tomography (CT), POT (PET), OCT (Optical Consistency Tomography), and ultrasound provide a better understanding of the human body's various anatomical and functional systems. Although such imaging technology has improved significantly over the years with the goal of achieving improved signal-to-noise (SNR) resolution and decrease in the rate of purchase, due to operational, financial and

physical constraints there remain numerous fundamental compromises between these three aspects. The data collected can thus belargely unusable due to factors like noise, technological elements, poor resolution and contrast. Further, the complexity of data from biomedical imaging makes interpreting and analyzing the acquired data meaningfully and efficiently often difficult for researchers and clinicians. Researchers in the VIP group are developing exciting and new ways to better visualize, diagnose and understand various conditions affecting the human body in the field of biomedicine imagery to support clinicians, radiologists, pathologists and clinical investigators.

#### a. Skin Cancer Detection:

**Figure 2: Skin Cancer Detection (i) Input image (ii) Harris Corner Detection (iii) Good Features Corner Detection (iv) ANN Corner Detection**

**Figure 4: Capsule Endoscopy (i) Input image (ii) Harris Corner Detection (iii) Good Features Corner Detection (iv) ANN Corner Detection**

**b. Diabetic Retinopathy:**

**Figure 3. Diabetic Retinopathy (i) Input image (ii) Harris Corner Detection (iii) Good Features Corner Detection (iv) ANN Corner Detection**

**c. Capsule Endoscopy:**

**d. Hip Replacement:**

**Figure 5. Hip Replacement (i) Input image (ii) Harris Corner Detection (iii) Good Features Corner Detection (iv) ANN Corner Detection**

In Figure 2, 3, 4 and 5, for the input image (i), the respective corner detections such as Harris Corner Detection, Good Features Corner Detection and ANN Corner Detection are depicted as (ii), (iii) and (iv) respectively. We can observe the improvement in total number of corners detected through machine learning based ANN Corner Detection.

**Conclusion**

We have implemented the neural network to mark corner functions in this paper. This network trains information from the grey-level corner design. For partitioning components, the bootstrapped technique is

used. Network tests are higher than those of other corner detectors. The purpose of this research was to explain the basic theoretical principles and neural networks for applicability. The reduction in parameter numbers contributes to less noise during the exercise. It is because the number of parameters depends on the width of the kernel. The number of parameters in the model is directly proportional to the kernel width. Eventually, it can be considered that for the extraction of features like corner detection by neural networks the proposed algorithm should be adapted.

# Effectiveness of Ultrasound Therapy on Oral Submucosal Fibrosis

Senthilkumar S.<sup>1</sup>, Chitra S.<sup>2</sup>, Vijayaraghavan R.<sup>3</sup>, V. Hemaashree<sup>4</sup>, Subhavani P.<sup>4</sup>

<sup>1</sup>Assistant Professor, Saveetha College of Physiotherapy, Saveetha Institute of Medical and Technical Science, Chennai, <sup>2</sup>Professor and HOD Dept of Pathology, Saveetha Medical College and Hospital, <sup>3</sup>Research Director, Dept of Research and Development, Saveetha Medical College And Hospital, <sup>4</sup>UG Students, Saveetha College of Physiotherapy, Saveetha Institute of Medical and Technical Science, Chennai

## Abstract

**Aim:** The aim is to find the effectiveness of ultrasound therapy on oral submucosal fibrosis.

**Objective:** To evaluate the efficacy of ultrasound therapy to increase level of mouth opening in oral submucosal fibrosis.

**Procedure:** The study procedure was explained to all the participants with an information sheet and a written informed consent was obtained. Assessment was done and 40 individuals with osmf were selected based on the inclusion and exclusion criteria following which participants were randomly allocated into groups, Group A and Group B. Group A individuals were treated jaw opening exercises. Group B individuals were treated with ultrasound and jaw opening exercises. Both the group participants were assessed for level of mouth opening using scale and divider. After two weeks of intervention, post period assessment same as of pretest was performed to ensure any differences.

**Outcome Measures:** Level of mouth opening.

**Result:** Statistical Analysis made with quantitative data revealed statistical significance between pre and post test values.

**Conclusion:** From the result it has been concluded that ultrasound therapy is effective in increasing the level of mouth opening in osmf individuals

**Keywords:** Oral submucosal fibrosis, mouth opening, ultrasound therapy, Physiotherapy.

## Introduction

Oral Submucous fibrosis is a chronic disease of insidious onset featuring the deposition of fibrous tissue in the juxta epithelial layer of mucous membrane

involving the pharynx, palate, fauces, cheek and lips, pharynx and oesophagus<sup>(1)</sup>. Although occasionally preceded and/or associated with vesicle formation, is always associated with juxtaepithelial inflammatory reaction followed by fibro elastic changes in lamina propria with epithelial atrophy leading to stiffness of oral cavity leading to trismus and inability to eat<sup>(2)</sup>. Oral sub mucous fibrosis has now become an Indian epidemic with an estimated 2.5 million people being affected with this disease. The rate varies from 0.2-2.3% in males and 1.2-4.57% in females in Indian communities. Oral sub mucous fibrosis also has a significant mortality rate because it can transform into Oral cancer, particularly squamous cell carcinoma, at a rate of 7.6%<sup>1</sup>. It is a

pre-malignant condition with 15 % of all cases converted to malignancy<sup>(3)</sup>. Oral Submucous Fibrosis (OSF) is a lesion found among people who chew betel nut (Areca catechu) with or without tobacco and other ingredients. Gutka is the predominant form of areca nut (with or without tobacco) consumption in most parts of India, Gutka (also called gutkha,) is a powdery or granular preparation of areca nut, betel nut, tobacco, lime and savory flavorings. It is a popular product in India and available under several dozen names<sup>(4)</sup>. Presently, the etiology of OSMF is mainly attributed to the use of areca nut and quid chewing habit. Areca nuts contain alkaloids, of which arecoline seems to be a primary etiology factor<sup>(5)</sup>. Areca nut is available in processed and unprocessed forms. The processed areca nut products are available in a variety of commercial forms with and without tobacco such as plain arecanut (without tobacco) and Gutkha (with tobacco). Areca nut is taken as it is or wrapped in a betel leaf along with slaked lime and several condiments according to taste referred to as betel quid. Most important risk factor is chewing betel quid and this has been supported by epidemiological, case control, animal tissue culture studies as well. Also, it has been a part of religious, social, and cultural rituals. There is no definitive treatment for OSMF<sup>(6)</sup>. A common presenting symptom is a burning when eating hot and spicy food and a progressive decrease in the mouth opening, associated with difficulty in eating, changed gustatory sensation, dryness of mouth and nasal voice.

Oral submucous fibrosis is divided into four stages clinically graded OSMF into: Stage I: Faucial bands only., Stage II: Faucial bands and buccal bands., Stage III: Facial, buccal and labial bands and functionally graded OSF into, stage A : Mouth opening  $\geq 20$  mm, Stage B : Mouth opening 10-19 mm, Stage C : Mouth opening  $\leq 10$ mm The oral mucosa loses its resiliency and becomes blanched and stiffing its advanced stage. Other features of the disease include pigmentation and recurrent ulceration of oral mucosa, restricted movement of the soft palate, dryness of the mouth, burning sensation, decreased mouth opening, and tongue protrusion<sup>(7)</sup>.

The management of OSMF is mainly followed by two major strategies—medical and surgical; however, the question of improving the elasticity of oral mucosa and thus increasing the mouth opening is prevailing. Considering the above facts, apart from medical and surgical management, physiotherapy is offering the third dimension to the management of OSMF. Basic physiotherapy techniques, viz., active jaw movements

and stretching have been tried postsurgically as a supportive therapy. Apart from this, ultrasound (US) is conventionally being used for fibrous and scar tissues, however, it has not been extensively used for oral mucosa. Ultrasound is defined as a form of acoustic vibration with frequencies so high that it can't be perceived by human ear. Thus frequencies less than 17000 Hz are usually sound and those above are defined as ultrasound. Ultrasound used for therapeutic purpose has a frequency of about 0.8-1 MHz and an intensity of 0.5-3 w/cm<sup>2</sup><sup>(8)</sup>.

Ultrasonic treatment: ultrasonic waves produce tissue heating at a deeper level than moist heat; this increase in local tissue temperature leads to increase in blood flow and removal of metabolic byproducts responsible for pain and may help decrease adhesions. The physiotherapy is third dimension of treatment in oral sub mucous fibrosis, which include disrupting collagen cross-linkage.

Stretching exercises: Physical therapy using muscle-stretching exercises for the mouth may be helpful in preventing further limitation of mouth movements. This is often combined with medical and surgical therapy. Muscle stretching exercises for the mouth may be helpful to prevent further limitation of mouth movements. This includes forceful mouth opening with the help of sticks, ballooning of mouth, hot water gargling. This is thought to put pressure on fibrous bands. Forceful mouth opening have been tried with mouth gag & acrylic surgical screw. Hence, this study is designed to evaluate the adjuvant effects of therapeutic ultrasound and physiotherapy in OSMF patients<sup>(9)</sup>.

## Methodology

Study design: experimental study. Study setting: saveetha medical college and hospital, saveetha institute of medical and technical sciences, thandalam, chennai. Sampling method: convenient sampling technique sample size: 40 individuals. Inclusion criteria: gender: both males and females, age group: 20 -50 years, eligibility: less than 30-35 mm and subjects: mouth opening level less than 30 mm using pan or other substance for more than 6 months. Exclusion criteria: mouth opening level more than 30-35mm, using pan or other substance for less than 6 months, any fracture in the oral cavity, surgeries done in oral cavity and established cancer cases

**Procedure:** Following the Institutional Scientific Review Board approval the study was initiated with participants chosen from Saveetha Medical College and

Hospital, Saveetha Institute of Medical and Technical Sciences, Thandalam.

The study was approved by institutional human ethical committee and ethical clearance was obtained from Saveetha Medical College and Hospital, Saveetha Institute of Medical and Technical Sciences, Thandalam. The study procedure was explained to all the participants with an information sheet and a informed consent was obtained. Assessment was done and 40 individuals with oral submucous fibrosis were selected based on the inclusion and exclusion criteria following which participants were randomly allocated into groups, Group A and Group B. Group A individuals were treated with ultrasound and jaw opening exercises. Group B individuals were treated with jaw opening exercises. Both the group participants were assessed for the level of mouth opening using scale and divider. After Preliminary Evaluation, the participants in Group A and group B were made to proceed into a 2-week treatment program. After two weeks of intervention, post period assessment same as of pretest was performed to ensure any differences.

#### Group A:

Group A individuals were treated with jaw opening exercises.

The participants were asked to perform the following exercises

- Wide mouth opening and maintaining it for five seconds- 10 repetitions
- Lateral deviation of mandible to right and left side -10 repetitions
- Protrusion of mandible-10 repetitions
- Gradual mouth stretching by placing the left thumb over the lower incisor and right index finger over the lower incisor and maintain it for 5 seconds-10 repetition

These exercises are done two times a day for five days per week for two week

#### Group B:

Group B individuals were treated with ultrasound and jaw opening exercises

The participants were made to lie down in supine position comfortably.

Ultrasound is applied to the affected side cheek .The parameters of ultrasound therapy are

It is followed by jaw opening exercises

- Wide mouth opening and maintaining it for five seconds- 10 repetitions
- Lateral deviation of mandible to right and left side -10 repetitions
- Protrusion of mandible-10 repetitions
- Gradual mouth stretching by placing the left thumb over the lower incisor and right index finger over the lower incisor and maintain it for 5 seconds-10 repetition

These exercises are done two times a day for five days per week for two weeks

#### Outcome Measures:

Figure 1: Level of mouth opening measurement

Figure 2: Level of mouth opening

**Statistical Analysis:** The collected data was tabulated and analyzed using descriptive and inferential statistics. To all parameters mean and standard deviation (SD) was calculated. Paired t-test was used to analyze significant changes between pre-test

and post-test measurements. Unpaired t-test was used to determine significant difference between the groups. A p-value less than 0.0001 were considered as statistically significant.

**Table: 1 Comparison of pre test and post test values of Group A**

Outcome Measure	Pre Test		Post Test		t-Value	p-Value
	Mean	S.D	Mean	S.D		
Level of Mouth Opening	24.70	1.92	25.55	1.73	6.4743	<0.0001

**Table:2 Comparison of pre test and post test values of Group B**

Outcome Measure	Pre Test		Post Test		t-Value	p-Value
	Mean	S.D	Mean	S.D		
Level of Mouth Opening	24.50	1.85	30.20	1.64	17.9777	<0.0001

**Table:3 Comparison of post test values between group A and group B**

Outcome Measure	Group A		Group B		t-Value	p-Value
	Mean	S.D	Mean	S.D		
Level of mouth opening	25.55	1.73	30.20	1.64	8.7163	<0.0001

**Results**

From statistical analysis made with quantitative data revealed statistically significant between pre and post test value the post test mean value of group a (jaw opening exercises) is 25.55 and group b (ultrasound and jaw opening exercise) is 30.20. Pre test and post test values of group a (jaw opening exercises). The paired t value shows that there is extremely statistically significant change at  $p < 0.0001$  and t value 6.4743 (Table 1). Pre test and post test values of group b (ultrasound and jaw opening exercises). The paired t value shows that there is extremely statistically significant change at  $p < 0.0001$  and t value 17.9777 (Table 2). Post test values of group a and b. the paired t value shows that there is extremely statistically significant change at  $p < 0.0001$  and t value 8.7163 (Table 3).

**Discussion**

OSMF is a commonly occurring and widely spread premalignant condition increasingly affecting the youth. The occurrence of OSMF in gutkha chewers is far more faster and more severe as compared in other forms of

areca nut products chewers. The easy availability and promotions of these areca nut products specially gutkha and pan masala outside the schools colleges and social places has impacted younger population in India which has led to the increased occurrence of OSMF. Causation of OSMF is multifactorial but in present study pan masala was the commonest product used

According to this study our dual therapy of local ultrasound and jaw opening exercise has led to significant improvement in mouth opening when compared to the group treated with only jaw opening exercises.

The purpose of this study was to determine the effectiveness of ultrasound in osmf patients. This improvement could be explained on the basis of effect of pulsed ultrasound due to mechanical effect which causes loosening of adherent fibrous tissue probably due to the separation of collagen fibres from each other and softening leading to pliability jaw opening exercises include opening of the mouth, gradual stretch to the mouth .

The two treatment modalities definitely show a

significant improvement in the patient's condition with no reported side effects, hence should be included in the treatment protocol for patients with OSMF before a more invasive surgical intervention is sought<sup>(10,11)</sup>. Reduction in pain and improvement in maximal mouth opening was appreciably significant in both the groups. The results indicated that ultrasound when given along with exercise resulted in significantly better subjective and objective outcome. Therapeutic ultrasound when used as an adjuvant shows a significant improvement in the patient's condition with no reported side effects, hence, should be incorporated in the treatment protocol for patients with OSMF<sup>(12)</sup>. There was significant improvement in mouth opening in both the groups, that is, exercise alone and the ultrasound along with exercise in patients with OSMF. However ultrasound in combination with exercise gives more improvement in mouth opening compared to exercise alone<sup>(13,14)</sup>.

### Conclusion

Ultrasound therapy followed by jaw opening exercises can be alternate mode of treatment for OSMF to improve mouth opening level. The subjects treated with ultrasound followed by jaw opening exercises were more satisfied with the outcome than the subjects treated with jaw opening exercises only. Patients with OSMF suffer a lot because of pain and limited mouth opening level several techniques such as cortisone injections are used. Study is required in physiotherapy method since it is a non invasive method which will be fruitful to the patients.

**Ethical Clearance:** IHEC approval was obtained before subject enrolment from SIMATS, Chennai.

# Clinicomicrobiological Profile of Gram Negative Bacterial Infections in Adult ICU's of a Tertiary Care Centre

Shalini Shenoy Mulki<sup>1</sup>, Sevitha Bhat<sup>2</sup>, Pooja Rao<sup>2</sup>

<sup>1</sup>Professor, <sup>2</sup>Associate Professor, Department of Microbiology, Kasturba Medical College, Manipal Academy of Higher Education, Mangalore

## Abstract

**Objectives:** To identify the common Gram negative bacteria associated with health care associated infections, To study the antibiogram and to identify the presence of genes responsible for Carbapenem resistance in Gram negative bacterial pathogens

**Method:** Prospective study was carried out for 2 years. The pathogens from cases of clinically suspected infection in ICU were identified by the standard biochemical reactions. Antibiotic sensitivity testing was done by the Modified Kirby-Bauer disk diffusion method. Multiplex PCR was done to detect the carbapenem resistant genes in Gram negative bacilli :bla<sub>NDM-1</sub>, bla<sub>VIM</sub>, bla<sub>IMP</sub>, bla<sub>OXA-48</sub> and bla<sub>KPC</sub> genes

**Results:** Study included 175 clinically significant Gram negative bacterial isolates. 42% of the isolates were from ET aspirate, followed by sputum, pus and blood. Klebsiella spp. and Acinetobacter spp. were the common pathogens. 18% of the pathogens showed Carbapenem resistance. The statistically significant risk factors were Invasive procedure, ventilation, catheterization, prior antibiotic use, chronic liver, lung diseases and diabetes. NDM 1 was the common gene identified.

**Conclusion:** Antibiotic resistance is on rise in our setup mandating continuous monitoring of the trend.

**Keywords:** Antibiotic resistance, Gram negative bacilli, Infections, NDM-1.

## Introduction

Gram-negative bacteria cause infections including pneumonia, bloodstream infections, wound or surgical site infections, and meningitis in healthcare settings. Gram-negative infections include those caused by Klebsiella spp., Acinetobacter spp., Pseudomonas aeruginosa, and E. coli.<sup>1</sup>

The prevalence of infections in ICU is reported as 51.4%. The proportion of Drug resistant bacilli

is increasing including carbapenemase-producing Klebsiella pneumoniae (KPC), Acinetobacter spp. and Pseudomonas aeruginosa.<sup>2,3</sup> Compared with infections caused by susceptible strains of the same organism, infections caused by several antibiotic-resistant bacteria have been associated with worse outcomes, including longer hospitalization, higher mortality rates, and greater healthcare expenditure.<sup>4</sup>

The reported risk factors for Gram negative bacterial infections include diabetes mellitus, chronic respiratory conditions, and nosocomial factors such as empiric use of fluoroquinolones, immunosuppression and the use of invasive devices.<sup>5</sup>

The previous studies have reported 2-3 % in ICU. Pneumonia was the most frequently detected infection (62.07%), followed by urinary tract infections and central venous catheter associated bloodstream infections.

e-mail: sevitha.bhat@manipal.edu

Gram-negative Enterobacteriaceae were most frequently isolated pathogens, while *P. aeruginosa* was the single most frequent causative organism in ICU infections.<sup>6</sup>

For empirical treatment, the in vitro susceptibility pattern for a CRE in the hospital will be worthwhile.<sup>9, 10</sup> There recent reports coming from India and the neighboring countries (including Pakistan and Bangladesh) show that the distribution of NDM β lactamases among clinical and environmental isolates of Gram-negative bacteria is widespread in these areas.<sup>11-16</sup>

**Aim and Objectives:**

1. To identify the common Gram negative bacteria associated with health care associated infections
2. To study the antibiogram of Gram negative bacilli associated with health care associated infections
3. To identify the presence of genes responsible for Carbapenem resistance in Gram negative bacterial pathogens
4. To identify the risk factors, treatment and outcome in these cases

**Material and Method**

**Study Design:** Prospective study.

**Study Subjects:** Patients of the age 18 years and above developing infections with Gram negative bacilli after 48 hrs of admission into hospital.

**Exclusion Criteria:** Patients presenting with infections at the time of admission and patients below 18 years of age.

**Study Duration:** 2 years

**Sample Size:** With 95% confidence level and 80% power, with reference to [14], the sample size came to be 175 based on the following calculations:

The collected data was entered into MS Excel and analysis was done using SPSS Version 15. For categorical variables, statistical test chi square was done, and only those with p value less than or equal to 0.05 was considered statistically significant.

Samples from cases of clinically suspected infection

in ICU are plated on chocolate agar and blood agar and MacConkey agar and incubated at 37°C overnight and bacterial growth was identified by the standard biochemical reactions. Antibiotic sensitivity testing was done by Modified Kirby-Bauer disk diffusion method. The results were analysed and interpreted in accordance with Clinical Laboratory Standards Institute (CLSI) recommendations.

The genes for Carbapenem resistance were detected by PCR. Multiplex PCR was done to detect the carbapenem resistant genes in Gram negative bacilli: bla<sub>NDM-1</sub>, bla<sub>VIM</sub>, bla<sub>IMP</sub>, bla<sub>OXA-48</sub> and bla<sub>KPC</sub> genes using the protocol previously published.<sup>21</sup> The empirical antibiotic given, any changes/de-escalation done after receiving the report, duration of antibiotic treatment was noted from the case sheets .

**Results**

The study included 175 clinically significant Gram negative bacterial isolates .The distribution of clinical samples and Gram negative pathogens are given in Tables 1 and 2 respectively. The Antibiotic resistance pattern of Gram negative bacterial pathogens is shown in Table 3 .ESBL producers 72/175 (41.14%). Cefaperasone sulbactam and Piperacillin Tazobactam: the resistance rates were 29% .The statistically significant risk factors were Invasive procedures, mechanical ventilation, catheterization, prior antibiotic use, chronic liver, kidney and lung diseases and diabetes. (p value : Chi square test <0.001 very highly significant as shown in Table 4 The characterization of Carbapenem resistant genes in Gram negative bacteria shown in Table 5. Agarose gel picture of the PCR for the detection of carbapenemase genes is shown in Figure 1 .

**Table 1: Distribution of Gram negative pathogens in clinical specimen**

In our study, 89 of the 175 patients (50.85%) with Gram negative bacterial infections in ICU expired . The

immediate cause of death in these patients were Sepsis with MODS, malignancy, cellulitis, renal failure. The empiric antibiotic treatment given was Cefotaxime, Ceftriaxone, Meropenem, Amikacin, Cefepime sulbactam and Piperacillin tazobactam .

In 35% of the cases in ICU, the empiric antibiotic Piperacillin tazobactam and Meropenem was deescalated to Cefotaxime .In 32% of the cases, the antibiotics Cefotaxime, Piperacillin tazobactam and Amikacin were escalated to Meropenem based on the antibiotic sensitivity report .In 18% of the cases, the empiric treatment was Piperacillin tazobactam or Meropenem,it was escalated to Colistin or Colistin with Tigecycline .

## Discussion

The Gram negative bacterial infections (51%) reported include pneumonia, UTI, surgical site infections. We studied 175 cases in the ICU with Gram negative bacterial infections . The

commonest bacterial pathogens reported in our ICU were Klebsiella spp. .Acinetobacter spp., Pseudomonas spp., Escherichia coli.<sup>18</sup> The major infections found in ICU were due to Acinetobacter baumannii, Escherichia coli, Klebsiella pneumoniae, Pseudomonas aeruginosa, Staphylococcus aureus and Streptococcus pyogenes.

The infection rate was maximum in the urinary tract (44.4%) followed by wound infections (29.4%), pneumonia (10.7%) and bronchitis (7.4%)...The maximum isolation of Klebsiella spp., Acinetobacter spp, were from respiratory samples, Pseudomonas spp. from pus and Escherichia coli were isolated majorly from urine .The prevalence of nosocomial infections in ICU has been 11-60%. On the contrary some studies have reported UTI accounting for the 30% of nosocomial infections.<sup>19,20</sup>

The antibiotic resistance rates detected in our set up were aminoglycosides (39%), fluoroquinolones (40%), third generation cephalosporins (44%), Piperacillin tazobactam (29%) Carbapenems (18%). ampicillin and co-trimoxazole 75% and 59%, respectively. E. coli resistance to third-generation cephalosporins increased from 70% to 83%, and fluoroquinolone resistance increased from 78% to 85%. The rate of Carbapenem resistance in E coli is 13%. Klebsiella pneumoniae had a resistance of 80% to third-generation cephalosporins, 73% to fluoroquinolone, 52% to Carbapenem in tertiary-care hospital in New Delhi .<sup>21</sup>

In Acinetobacter isolates from ICU the resistance rates reported were 31% to Ciprofloxacin, 60% to Ceftazidime, 62% to Ceftriaxone, 64% to Amikacin, 75% to Piperacillin.<sup>22</sup> The previous studies on the ICU isolates of Pseudomonas aeruginosa have reported the following resistance rates: Ceftazidime : 58%, Gentamicin: 73%, Amikacin: 68%, Ciprofloxacin : 71%, Piperacillin tazobactam : 45%, Cefaperasone sulbactam: 64%, Imipenem : 67%.<sup>23</sup>

The common carbapenem resistant genes detected in our setup were bla<sub>NDM-1</sub> (26%), bla<sub>VIM</sub> (19%) and bla<sub>OXA-48</sub> (17%) We did not detect bla<sub>KPC</sub> and bla<sub>IMP</sub> was detected in 1 isolate of Pseudomonas aeruginosa.. The carbapenem resistant genes were detected in 54% of the isolates . The remaining mechanisms could be contributed by porin loss and/or chromosomal ampC hyper production bla<sub>NDM</sub> was the the most common MBL identified, agreeing to the previous reports. The occurrence of bla<sub>NDM</sub> ranged from 5% to 24% in various studies from India. <sup>24</sup> The ICU mortality rate was 50% in our setup. Some studies have reported mortality rates as high as 67% in ICU . Elderly male patients with sepsis accounted for 80% of the expired cases <sup>25</sup>. In the previous published studies de-escalation was done in 52% of the cases. The empiric antibiotic Piperacillin tazobactam was deescalated to Ceftriaxone. In our study antibiotic de-escalation was done in 36% of the cases.<sup>26</sup>

### Conclusion

In our study the maximum isolation of Gram negative bacilli as pathogens were from respiratory samples (ET aspirate, sputum) followed by urine and pus .Pneumonia was the commonest infection reported followed by Urinary tract infection and catheter related blood stream infections.

Antibiotic resistance is on rise in our setup mandating continuous monitoring of the trend . The antibiotic resistance rates detected in our set up were aminoglycosides (39%), fluoroquinolones (40%), third generation cephalosporins (44%), Piperacillin tazobactam (29%) Carbapenems (18%).

The common carbapenem resistant genes detected in our setup were bla<sub>NDM-1</sub> (26%),bla<sub>VIM</sub> (19%) and bla<sub>OXA-48</sub> (17%) .

<sup>5</sup>Reader, Department of Oral and Maxillofacial Surgery, M.M. College of Dental Sciences and Research, MM  
(Deemed to be University, Ambala)

## Abstract

**Introduction:** The aim of root canal treatment is to provide three-dimensional obturation of the root canal system to prevent the entry of bacteria and fluid. Recent Calcium Silicate Sealers (CSS) have been claimed to be excellent sealers with alkaline pH, low solubility and providing good sealing owing to their setting expansion. To date, there are not enough publications that prove their physiochemical behavior.

**Aim:** The aim of this study is to evaluate and compare both pH and calcium ion release in newer calcium silicate-based root canal sealers.

**Material and Method:** We compared 3 commonly used calcium silicate sealers which were categorised as Group 1 (n = 5) control group, Group 2 (n = 10) sealapex, Group 3 (n = 10) mineral trioxide aggregate (MTA) fillapex, and Group 4 (n = 10) White MTA. The polyethylene tubes were prepared and materials were filled according to the groups made. The tubes were packed and flask was closed and stored at a constant temperature of 37°C during all the evaluation period at different intervals of 24 h, 7 days and 1 month. pH and calcium ion released was measured using pH meter and atomic absorption spectrophotometer, respectively.

**Results:** At 24 h, White MTA showed the highest pH and highest calcium (Ca<sup>++</sup>) release. MTA fillapex maintained an alkaline ph even after 1 month of the study. MTA Fillapex showed the highest Ca<sup>++</sup> release even after 30 days that gradually increased aswell.

**Conclusion:** MTA Fillapex proves to show better alkalinizing ability and Ca<sup>++</sup> release of as compared to White MTA and (Sealapex) with increase in time intervals can be explained by greater solubility of MTA Fillapex with time as compared to the other two materials.

**Keywords:** Calcium silicate, filapex, MTA, sealapex.

## Introduction

The aim of root canal treatment is to provide three-dimensional obturation of the root canal system to

prevent the entry of bacteria and fluid.<sup>1,2</sup> To provide hermetic sealing, core materials such as gutta-percha (GP) and root canal sealers are essential.<sup>3,4</sup> The introduction of sealers with therapeutic properties applied in endodontics conceivably created prospective of a higher success rate of root canal treatment.

Properties like pH changes and released elements of root canal sealers have an impact on their clinical, biological and antibacterial behaviors. The alkaline pH is closely related to the increased hydroxyl and calcium ion (Ca<sup>2+</sup>) release after root canal obturation, which

inhibits growth of residual microbes, and this enhances healing of periapical pathosis.<sup>5,6</sup>

The use of calcium hydroxide clinically in the root canal was first reported by Rohner in 1940. Hence, the focus of research in sealers shifted toward calcium ( $\text{Ca}^{++}$ ) based sealers due to their antimicrobial activity owing to their  $\text{Ca}^{++}$  releasing potential. These sealers have been popularly used because of their potential for providing a high alkaline environment.

In 1993, at Loma Linda University, Dr. Torabinejad invented MTA. MTA is a complex blend of hydrophilic tricalcium silicate, tricalcium oxide, and tricalcium aluminate with added oxides (bismuth oxide).<sup>8</sup> Various studies have shown MTA to be biocompatible with the ability to stimulate mineralization and have the property of deposition of apatite-like crystals in dentin due to which its use was encouraged as a sealer. However, it has revealed specific drawbacks of extended setting time and challenging handling properties.<sup>10</sup> So as to recover some MTA drawbacks, numerous new calcium silicate-based materials have been invented.<sup>11</sup>

Latest among these sealers is MTA Fillapex. Which is basically MTA incorporated with salicylate resin, natural resin, bismuth, and silica. Their good handling property makes them easier to be used in the canal as a sealer. However, there is limited research regarding the physiochemical and biological properties of MTA Fillapex.<sup>12</sup>

Recent Calcium Silicate Sealers (CSS) have been claimed to be excellent sealers with alkaline pH, low solubility and providing good sealing owing to their setting expansion. To date, there are not enough publications that prove their physiochemical behavior. Hence, it is necessary to evaluate pH and  $\text{Ca}^{++}$  release of these materials to analyze their alkalization ability and induction of mineralization.

Therefore, this study was designed to evaluate pH and calcium ion release of a new calcium silicate-based sealer-MTA Fillapex and compare it with White MTA and the conventional calcium hydroxide-based sealer-sealapex.

## Material and Method

The root canal sealers tested in this study were Sealapex, MTA Fillapex and White MTA. N° polyethylene tubes were cut into 35 tubes of equal sizes; with each tube measuring 10 mm length  $\times$  1.0 mm diameter using bard parker blade and digital Vernier caliper. The tubes were pre-weighed and were prewashed with 5% nitric acid to prevent interference with phosphate ions and alkaline metals. The polyethylene mounted tubes were divided as: Group 1 ( $n = 5$ )-control group-empty tubes, Group 2 ( $n = 10$ )-tubes filled with Sealapex, Group 3 ( $n = 10$ )-tubes filled with MTA Fillapex and Group 4 ( $n = 10$ )-tubes filled with White MTA.

Fresh mixed sealers were prepared according to manufacturer instructions. The mixed MTA was carried into the polyethylene tube with the help of lentulo spiral. After complete filling of the tubes, the materials were condensed with the hand pluggers to avoid any voids in the inserted sealer. Subsequently, the samples were radiographed and those containing voids were discarded.

Subsequently, the samples were placed in polypropylene flasks, containing 10 ml of deionized water. The deionized water was verified for the total absence of calcium ions and the presence of neutral pH (6.8). The flask was closed with the lid, and the samples were stored in an incubator at a constant temperature of 37°C during all the evaluation period. At 24 h, 7 days and 1 month, the deionized water was measured for pH by a pH meter and released calcium ions were measured by atomic absorption spectrophotometer. Following each evaluation, the water was discarded, and the samples were immersed in fresh deionized water of similar amounts (10 ml).

**Statistical analysis:** According to the normality test, the data was statistically analyzed by the One-Way ANOVA and Post-Hoc Tukey HSD tests using SPSS software (Version 21.0; SPSS, Inc, Chicago, IL) at significance level of 5%, to compare the tested materials.

## Results

In the present study all the materials were evaluated for both pH and calcium release at three time intervals namely: after 24 hrs, after 7 days/ 1 week and lastly at 30 days or 1 month.

**Table 1: Comparitive pH Values of Study Materials at 24 Hours,7 Days and 30 Days.**

Study Groups	Mean pH Values 24 hrs	Mean pH Values 7 Days	Mean pH Values 30 Days
Group 1 (N=5)	6.87±0.14	6.90±0.02	6.88±0.05
Group 2 (N=10)	8.32±0.10	8.45±0.14	8.34±0.12
Group 3 (N=10)	8.29±0.05	8.68±0.08	8.74±0.10
Group 4 (N=10)	8.42±0.12	8.52±0.20	8.58±0.08

The results of mean pH values of all the study groups are compared in table 1. Our results showed that highest mean pH values observed at 24 h was shown by White MTA (group 4) with 8.42±0.12, Sealapex (group 2) with 8.32±0.10 and MTA fillapex (group 3) with 8.29±0.05. The highest mean pH values observed at 7 days and at 30 days was of MTA fillapex with 8.68±0.08 and 8.74±0.10 respectively. There was no statistically significant difference between pH of White MTA and sealapex. The difference in values of MTA Fillapex was significantly higher than other two groups ( $P < 00001$ ).

Further table 2 demonstrated mean values of calcium release by all study materials. It was observed

that The highest calcium ion release at 24 h was shown by White MTA (group 4) with 15.20±0.42 followed by group 2 i.e Sealapex with 9.04±0.08 and lastly least values were obtained from MTA Fillapex (group 3) with 6.21±0.10. Control group showed negligible Ca<sup>++</sup> release at all time periods (0.03). All the experimental materials showed Ca<sup>++</sup> release at all time periods. At 7 days, MTA Fillapex showed the highest Ca<sup>++</sup> release with 9.24±0.20, whereas, Sealapex showed significantly lowest calcium ion release with 8.02±0.12. At 30 days, the calcium ion release by MTA Fillapex was again the highest with 18.56±2.40. The difference the values of MTA Fillapex when compared with other groups was found to statistically highly significant ( $P < 00001$ ).

**Table 2: Comparitive Mean Calcium Values of Study Materials at 24 Hours, 7 Days and 30 Days.**

Study Groups	Mean Values 24 hrs	Mean Values 7 Days	Mean Values 30 Days
Group 1 (N=5)	0.04±0.02	0.04±0.02	0.04±0.02
Group 2 (N=10)	9.04±0.08	8.02±0.12	6.89±0.28
Group 3 (N=10)	6.21±0.10	9.24±0.20	18.56±2.40
Group 4 (N=10)	15.20±0.42	8.32±0.42	9.86±2.10

**Graph 1: Comparitive Mean Calcium Values of MTA Fillapex at 24 Hours, 7 Days and 30 Days.**

When pH and calcium ion release at different time intervals was compared, it was found that Sealapex showed an almost constant pH and gradual decrease in calcium ion release with increasing time intervals. MTA Fillapex in our study showed an increase in the pH and a significantly higher calcium ion release with an increase in the period.

## Discussion

The present study compared the change in pH and calcium release in three commonly used materials as Sealapex, MTA Fillapex and White MTA at three different time intervals.

With regard to the pH our study reported MTA fillapex to maintain an alkaline pH even after 1 month of the study. But there are controversies among studies when literature was reviewed. Some studies supported our finding as strongly alkalinity (pH range 10-12) that continued for four weeks after setting<sup>13-15</sup>.

In yet another study, the initial pH of MTA-Fillapex was low in alkaline (pH = 9.3) that gradually declined over time to be 7.76 after 7 days.<sup>16</sup> It was believed that a strong alkaline pH may encourage a prolonged setting time which enhances a long-lasting antibacterial effect and eliminates the residual microbes that survive on the dentinal wall.<sup>17</sup> On contrary the pH value in the current study was found to be less than reported by Torabinejad *et al.* and Cutajar *et al.*<sup>18</sup>

Different pH values are observed with different formulations of MTA which can be explained on basis that calcium hydroxide present in MTA and MTA based sealers dissociates into  $\text{Ca}^{++}$  and  $\text{OH}^-$  ions, thus increasing the pH of the solution and because of this variation in the concentration of calcium hydroxide there is variation in pH as well. Furthermore, although both White MTA and MTA Fillapex are MTA based sealers, but the size of the polymer chain formed after setting may vary which may explain the difference in the result.

Further in our study, MTA Fillapex showed higher  $\text{Ca}^{++}$  release which can be explained by the higher solubility of MTA Fillapex as was seen in the study by Borges *et al.* where the solubility of MTA Fillapex (14.85%) was more than Sealapex (5.65%).<sup>19</sup> In a study by Nassari MRG *et al.*, Fillapex presented a solubility of 16.6% at 2 days and 15.03% at 7 days, whereas Sealapex exhibited solubility of 13.42% at 2 days and 9.97% at 7 days.<sup>20</sup> A decrease in solubility should manifest as a decrease in  $\text{Ca}^{++}$  release and a decrease in pH.

The calcium ion release and, in consequence, the increase in pH values is closely related to setting time and solubility<sup>21</sup>. According to Parirock and Torabinejad<sup>22</sup>, the presence of calcium may favor an alkaline pH, which leads to a biochemical effect that accelerates the healing process.

In 2013, Silva *et al.* suggested that due to high alkalinity of MTA Fillapex,<sup>16</sup> it had a strong capacity to release hydroxyl ions, thereby causing a high  $\text{Ca}^{2+}$  ion release. The alkaline media could activate the alkaline phosphatase, neutralize the acid, inactivate the osteoclasts, prevent the further bone destruction and allow tissue repair with concomitant apatite formation. The extreme alkalinity, however, can induce severe tissue cytotoxicity overtime. The significant difference in  $\text{Ca}^{2+}$  released from the four brands of CSS confirmed its different alkaline pH values.<sup>16</sup>

## Conclusion

MTA Fillapex proves to show better alkalinizing ability and  $\text{Ca}^{++}$  release of as compared to White MTA and (Sealapex) with increase in time intervals can be explained by greater solubility of MTA Fillapex with time as compared to the other two materials. However, further studies are needed to establish better and confirmed findings with a methodology which would probably better simulate the clinical situations.

# Tobacco Prevalence and Usage Pattern in the Urban Slum of Visakhapatnam

Surada Chandrika<sup>1</sup>, Chepuru Rajyalakshmi<sup>1</sup>

<sup>1</sup>Assistant Professor, Department of Community Medicine, GITAM Institute of Medical Sciences, Visakhapatnam

## Abstract

Tobacco use is one of the biggest public health threats the world has ever faced and leads not only to human loss, but also heavy social and economic costs. Hence study was initiated with objectives to determine prevalence of tobacco usage and patterns among urban slum population and to study socio-demographic characteristics among study population. It was an observational, descriptive cross-sectional study conducted in the urban field practice area of GITAM Institute of Medical Sciences & Research, Visakhapatnam for a period of 3 months. The study population included were adults aged above 18 years who were residing in that area since 1 year and willing to participate in the study. The sample size was 350. A simple random sampling procedure was followed. Present questionnaire adopted from GATS survey Questionnaire. Data entered in MS excel sheet. Analysis done by using SPSS soft ware. Out of 350 study population 216 (61.7%) were males and 134 (38.3%) were females. In this study prevalence of current users of smoking daily was 34.9% and less than daily users was 7.1%. The most common type of smoking product used was cigarettes (30.9%). There was 15.1% of former smoking of users was observed. The prevalence of current daily users of smokeless form of tobacco was found to be 13.7% and product used for smokeless form was chewing tobacco (8.8%). There was 12.5% of study population exposed to second hand smoke. Most common reason for initiation of tobacco use was fun (16%). Prevention of tobacco use in people appears to be the single opportunity for preventing non-communicable disease in the world today. India needs to adopt a more holistic and coercive approach to fight the problem of tobacco by adopting media awareness, behavior change communication interventional activities and establishing tobacco de-addiction and counselling centres for slum dwellers.

**Keywords:** Smoking, Tobacco usage, Tobacco patterns, Urban slum, Visakhapatnam.

## Introduction

Tobacco use is one of the biggest public health threats the world has ever faced and leads not only to human loss, but also heavy social and economic costs. It is claiming the lives of nearly 5.4 million people a

year worldwide.<sup>[1]</sup> Burden in South East Asia region is one of the highest among WHO regions.<sup>[1]</sup> Tobacco is one of the major causes of death and disease in India, accounting for nearly 0.9 million deaths and 12 million people fall ill due to tobacco every year.<sup>[2]</sup> Nearly 275 million adults (15 years and above) in India (35% of all adults) are users of tobacco, according to the Global Adult Tobacco Survey India, 2009-10.<sup>[3]</sup> Tobacco use is a major risk factor for many chronic diseases including lung diseases, cardiovascular diseases and stroke. Among other diseases, tobacco use increases risk for lung and oral cavity cancers.<sup>[4]</sup> Tobacco use accounts for one in six deaths due to non-communicable diseases (NCDs). In India tobacco consumption pushes approximately 150 million people in poverty.<sup>[4]</sup>

e-mail: rajyalakshmi.chepuru26@gmail.com

**Objectives:**

- To determine prevalence of tobacco usage and patterns among urban slum population.
- To study socio-demographic characteristics among study population.

**Methodology**

**Study Design:** An observational, descriptive cross-sectional study.

**Study Setting:** Urban field practice area of GITAM Institute of Medical Sciences & Research, Visakhapatnam.

**Study Population:** Adults aged above 18 years who were residing in that area since 1 year.

**Inclusion Criteria:**

1. Age >18 years
2. Both gender (male and female).
3. Those who were willing to participate in the study.

**Exclusion Criteria:**

- a. Age <18 years
- b. Those Who were not willing to participate in the study.

**Study Period:** 3 months (Feb 2019 to April 2019)

**Sample Size:** Considering the prevalence of tobacco use as 35% among adults in a previous study [5] with a relative precision of 5% the minimum required sample size for assessing the prevalence of tobacco use

among adults was calculated to be 350 by using formula  $(1.96)^2pq/L^2$ .

**Sampling Technique:** A simple random sampling procedure was adopted to select 350 families from the house list of the area. Then from every house one person was randomly selected who matched the inclusion and exclusion criteria of the study. After obtaining consent data was collected by interviewing the randomly selected participants by house to house survey.

**Study Tools:** Present questionnaire adopted from GATS survey Questionnaire. Modified questionnaire includes information on their socio-demographic status, tobacco usage and patterns, reasons for their initiation and/or addiction to tobacco and on their knowledge about ill effects of tobacco use.

**Ethical Considerations:** Ethical clearance was obtained from Institutional Ethical committee, GITAM Institute of Medical sciences & Research, Visakhapatnam before starting of the study. Informed consent was taken from all the study participants.

**Statistical Analysis:** Data entered in MS excel sheet. Analysis done by using SPSS software. Qualitative data was represented as percentages and proportions. Chi square test applied for finding out statistical significance. P value <0.05 is considered as statistically significant.

**Results**

A total of 350 study participants were studied, out of which 216 (61.7%) were males and 134 (38.3%) were females.

**Table 1 : Distribution of study population according to socio demographic characteristics**

Variable	Grouping	Male n (%)	Female n (%)	P value
Marital status	Married	151 (69.9%)	94 (70.15%)	0.002
	Unmarried	65 (30.1%)	40 (2.85%)	
	Total	216 (100%)	134 (100%)	
Religion	Hindu	183 (85)	116 (86.56)	0.25
	Christian	21 (10)	11 (8.20)	
	Muslim	12 (5)	7 (5.22)	
	Total	216 (100%)	134 (100%)	

Variable	Grouping	Male n (%)	Female n (%)	P value
Education	Illiterate	97 (45)	54 (40)	0.08
	Primary	43 (20)	26 (20)	
	Secondary	32 (15)	34 (25)	
	High school & above	44 (20)	20 (15)	
	Total	216 (100%)	134 (100%)	
Type of family	Nuclear	183 (85)	116 (86.56)	0.25
	Joint	21 (10)	11 (8.20)	
	Three generation family	12 (5)	7 (5.22)	
	Total	216 (100%)	134 (100%)	
Socioeconomic status	Upper class	0	0	6.64
	Upper middle	44 (20)	20 (15)	
	Lower middle	43 (20)	26 (20)	
	Upper lower	32 (15)	34 (25)	
	Lower class	97 (45)	54 (40)	
	Total	216 (100%)	134 (100%)	

In this study most of the study participants were married (male-69.9% & female-70.15%), and majority belong to Hindu by religion (male-85% & female-86.5%). Most of them were illiterates by education. Majority were from nuclear family and most of them belonged to lower socioeconomic class.

Fig. 1: Distribution of study participants based on age group

In the present study more than half of the study population in both gender group belonged to 20-30 years age group.

**Table 2: Prevalence of Tobacco among study population**

Variable	Frequency	Percentage
<b>Current smoking</b>		
Daily users	122	34.9
Less than daily users	25	7.1
Not at all	203	58
Former users for smoking	53	15.1
<b>Type of smoking product used</b>		
Cigarette	108	30.9
Hand rolled cigarette	26	7.4
Chutta	4	1.1
Others	9	2.5
<b>Current Smokeless tobacco users</b>		
Daily	48	13.7
Less than daily	28	8.0
<b>Type of smokeless form</b>		
Tobacco chewing	31	8.8
Gutka	20	5.7
Khaini	17	4.9
Others	4	1.1
Former smokeless	19	5.4
Second hand smoke	44	12.5

In this study prevalence current users of smoking daily was 34.9% and less than daily users was 7.1%. the most common type of smoking product used was cigarettes (30.9%). There was 15.1% of former smoking of users was observed. The prevalence of current daily users of smokeless form of tobacco was found to be 13.7% and product used for smokeless form was chewing tobacco (8.8%). There was 12.5% of study population exposed to second hand smoke.

**Table 3: Reasons for initiation of smoking among study participants**

Reasons for initiation	Frequency	Percentage
Fun	56	16
To pass time	37	10.6
Curiosity	8	2.3
To remove burden	12	3.4
Peer pressure	27	7.7
Stress	9	2.6
Movies/ads	10	2.9
Parenteral habits	8	2.3
Occasions	28	8
Multiple responses	37	10.6

Most common reason for initiation of tobacco use was fun (16%) followed by for time pass (10.6%) and also multiple responses.

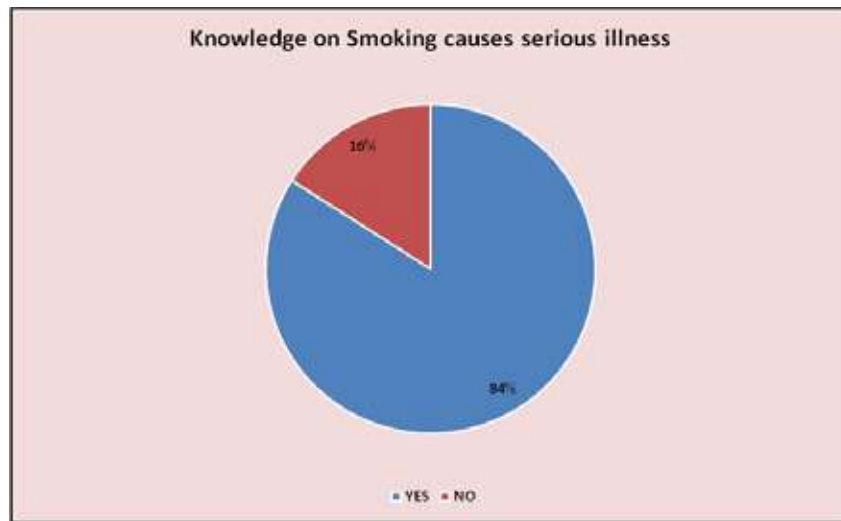

Fig 2: Knowledge on smoking causes serious illness

Majority (84%) of the study population had knowledge that smoking causes serious illness.

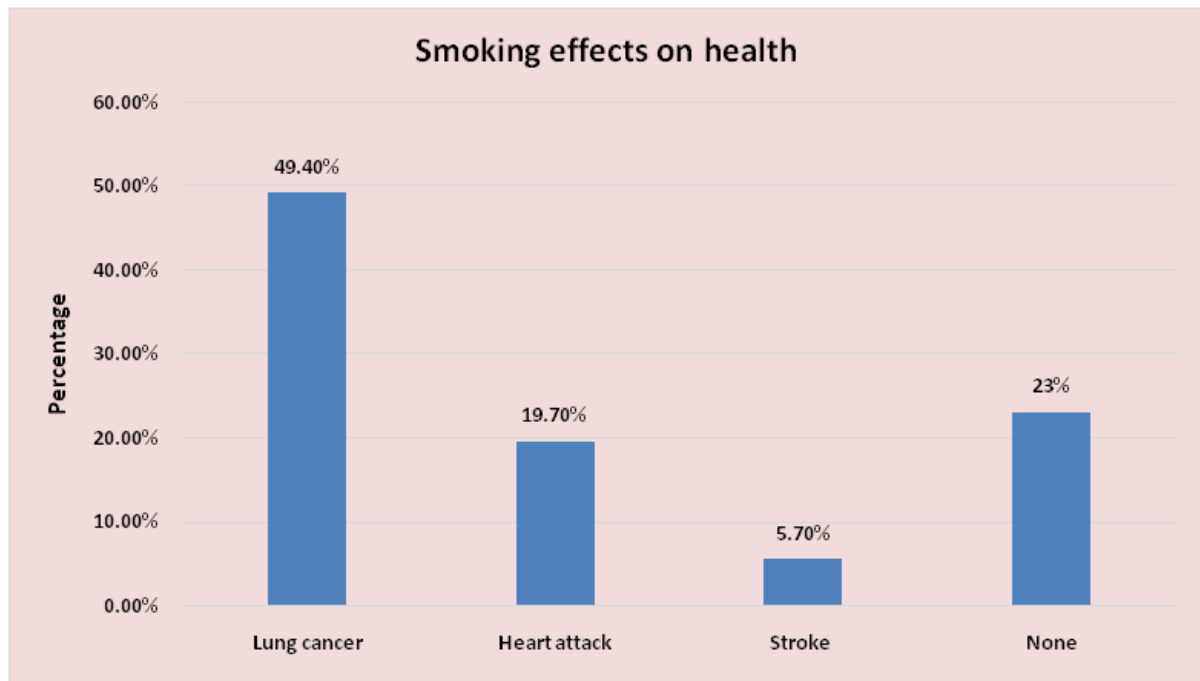

Fig 3: knowledge regarding effects of smoking on health

Knowledge regarding smoking effects on health, 49% had knowledge that smoking causes lung cancer followed by heart attack (19.7%) and stroke (5.7%).

### Discussion:

In this study prevalence of current users of smoking daily was found to be 34.9% and less than daily users was 7.1%. Similar results were observed by study conducted by GATS<sup>[3]</sup> in 2009-10 showed that the prevalence of

tobacco use among Indians was 34.6%. Higher level of prevalence was observed in a study done by Hussain CA et al., <sup>[5]</sup> found that 88.4% participants have ever used tobacco products where as 28.9% were daily users, 4.1% were less than daily users and 51.6% were occasional users. In study conducted by Das R et al,<sup>[6]</sup> showed that

the prevalence of tobacco use among urban residents was 61.76%.

In the present study most common reason for initiation of tobacco use was fun (16%). These findings were compared with other studies. Study done by Hussain CA et al.,<sup>[5]</sup> found that 31.19% of study participants had smoking offered in occasions. In study conducted by Das R et al,<sup>[6]</sup> showed that most common reason for initiation of tobacco use was “group habit” and the reason for maintenance of its use was “sense of wellbeing”.

### Conclusions & Recommendations

A total of 350 study participants were studied, out of which 216 (61.7%) were males and 134 (38.3%) were females. In the present study more than half of the study population in both gender belong to 20-30 years age group. In this study prevalence current users of smoking daily was 34.9% and less than daily users was 7.1%. The most common type of smoking product used was cigarettes (30.9%). There was 15.1% of former smoking of users was observed. The prevalence of current daily users of smokeless form of tobacco was found to be 13.7% and product used for smokeless form was chewing tobacco (8.8%). There was 12.5% of study population exposed to second hand smoke. Most common reason for initiation of tobacco use was fun (16%) followed by for time pass (10.6%) and also multiple responses. Majority (84%) of the study population had knowledge that smoking causes serious illness. Knowledge regarding smoking effects on health, 49% had knowledge that smoking causes lung cancer followed by heart attack (19.7%) and stroke (5.7%).

Prevention of tobacco use in people appears to be the single opportunity for preventing non-communicable disease in the world today. India needs to adopt a more holistic and coercive approach to fight the problem of tobacco by adopting media awareness, behavior change

communication interventional activities and establishing tobacco de-addiction and counselling centres for slum dwellers. Not only the government, but all responsible citizens will need to support the fight against this global epidemic. Non governmental organ is at ions should also help governmet for creating awareness among people on ill effects of smoking on health.

# Psychological Health in Respect of Self Esteem among Rural, Urban and Semi Urban College Students of Different Genders of East Midnapore District: A Cross Sectional Study

Susmi Biswas<sup>1</sup>, Sourav Gangopadhyay<sup>1</sup>, Jayeeta Majumder<sup>1</sup>

<sup>1</sup>Assistant Professor, Management Department, Haldia Institute of Management, Haldia, West Bengal, India

## Abstract

Self esteem is the expression of the existence of psychological health. Self esteem is needed as it is one of the most important human rights. Self esteem is greatly affects the quality of life as well as the productivity of the people that is why the self esteem is greatly impacted on the student's performance as they are the future of our country. This study has conducted to assess the existing level of self esteem among east Midnapore college students of technical and allied stream; also it is concentrated on whether self esteem is significantly related with gender of the students and area the students are residing. Total 159 students are included in the study after doing convenient sampling method. A questionnaire has formed which follows Rosenberg Self Esteem scale system. T test and ANOVA has conducted by SPSS 21 software and it shows neither gender nor area are significantly related with the level of self esteem among students of technical and allied stream because in every cases the p value is greater than .05.

**Keyword:** *Psychological health, Selfesteem, rural, semi urban, urban, mental health, human right, technical and allied.*

## Introduction

Self esteem has a positive relation with the psychological health. It is shown by many researchers, that self esteem is negatively related with the depression (Orth, 2008)<sup>15</sup> anxiety (Dumont, 1999)<sup>7</sup>, it has positive relation with the self efficacy (Bandura, 1977)<sup>3</sup> Self esteem is self learned, experience and it stays throughout life (Sari et al., 2018)<sup>17</sup>. It is the self evaluation of the individual either positively or negatively (Baumeister, 1998)<sup>4</sup>. The self esteem is one of the most popular topics among many psychologists around the world (Baumeister, 1993)<sup>5</sup>. The self esteem is affected when someone's social expectations are not matched with their

actual performance also social and cultural factors affect the self esteem (Tashakkori, 1993)<sup>20</sup>. Many researchers found high self esteem is helpful to improve academic excellence, accept failure, know their capabilities, ready to take challenges and many more (Baumeister, 1998)<sup>4</sup>. The level of self esteem is also associated with the higher education (Arshad et al., 2015)<sup>2</sup>. Adolescent is important because adolescent aged boys and girls are going through series of diversified environments, challenges and in that way their carrier are developed, in this regard level of self esteem is deciding factor. So analyzing the existing level of self esteem among the boys of girls of adolescent age is important (Sirin, 2004)<sup>19</sup>. Many researchers have found that the girls are having higher level of self esteem than boys (Tella, 2007)<sup>22</sup> and they have higher level of acceptance of failure and show greater responsibility also girls use social support more often than boys, and have fewer inadequate reactions (Al-Bahrani, 2013)<sup>1</sup>. On the other hand some researchers have found that the boys can cope more than a girl as the boys are more independent than the girls (M. Minev, 2018)<sup>13</sup>, also girls have lower self esteem than that of boys which

Mobile No.: 9874030955

causes depression and even develop suicidal tendencies (Kearney, 1999)<sup>11</sup> Some researchers have found different level of self esteem among rural and urban students but on the other hand some researchers have found there are no significant differences existing among the rural and urban populations (Joshi & Srivastava, 2009)<sup>10</sup>. Some researchers have found that the urban people are more exposed of stress full life than that of rural people but urban people are taking life more positively than the rural people. On the other hand some researchers have found opposite results (Harter, 1985)<sup>8</sup>. According to those researchers the rural people are having more self worth, more competent and that is how the level of self esteem is increasing day by day among them (Pipher, 1995)<sup>16</sup>.

### Aims and Objectives:

1. To assess the level of self esteem among college students of technical and allied subject of East Midnapore district of West Bengal.
2. Whether the level of self esteem is significantly related with areas the students are living i.e. rural, urban and semi urban areas.
3. Whether the level of self esteem is significantly related with gender of students.

### Materials and Method

A cross sectional study has conducted among the students of technical and allied subject of East Midnapore district who are studying in different private colleges located at East Midnapore district. Convenient sampling method has followed and total 200 students are included in the study and among them 159 were selected and 41 of them are rejected as 32 of them gave ambiguous answer and 9 of them left the questionnaire incomplete as they lost interests in the research. Respondents are college goers and are comfortable in English. Informed consent was obtained and signed from each respondent. A questionnaire having two parts was formed. First part is containing name, age, gender, religion, name of the college, stream, year, semester and residential information of the respondents and the second part of the questionnaire is following Rosenberg Self Esteem which a ten itemed Likert scale is having four options strongly agreed, agreed, disagreed and strongly disagreed. The items of the questionnaire have two types – 10, 9, 8, 5, 3 items are revers scored i.e. 1 for “Strongly Disagree”, 2 points for “Disagree”, 3 points for “Agree”, and 4 points for “Strongly Agreed”. Rests of the items i.e. 1, 2, 4, 6, 7,

are scored directly. Higher score indicates the higher self esteem. The interview of process was conducted during the month of November 2019. The data are analyzed by Microsoft excel and SPSS 21 version.

### Result

This study shows that among 159 respondents 87 are female and 72 are Male; 151 are Hindu and 8 are Muslims, 49 are from rural areas 74 are from semi urban areas and 36 are from Urban areas.

**Table 1: Self esteem score**

		Total Number of Respondents	Self esteem Score
Gender	Male	72	2.9569
	Female	87	2.9345
Area	Rural	49	3.0122
	Semi Urban	74	2.8824
	Urban	36	2.9806

**Table 2: Score of each items**

Items	Average Score of each items
I feel that I am valuable, at least like others.	3.31
I feel that I have some good qualities.	3.32
I feel that I am a failure.	3.10
I am able to do things as well as most other people.	3.14
I do not have much to be proud of.	2.27
I always try to take a positive attitude toward myself.	3.50
I am satisfied with myself.	3.53
I wish I could have more respect for myself.	1.91
Frequently I feel useless at times.	2.77
Sometimes I think I am no good at all.	2.56

- According to the study Male populations are having numerically higher score in self esteem than that of female population.
- The rural students have numerically higher score in self esteem and semi urban students have numerically lowest score in self esteem.
- The overall self esteem score of students of technical and allied subject is 2.94 out of 4 which about 73.5%.
- The lowest score is observed in case of item number

8 which says ‘I wish I could have more respect for myself’. The mean score of this item is 1.91. • The highest score is observed in case of 7<sup>th</sup> item which says ‘I am Satisfied with myself’. The score is 3.53.

**Table 3: The group statistics and Independent sample t test**

Descriptive Statistics associated with Self Esteem						
		N	Mean	Std. Deviation	Skewness	Kurtosis
Self Esteem Score	Male	72	2.9569	.27925	.327	.025
	Female	87	2.9345	.37287	.112	-.307
Independent samples Statistics						
		Levene’s Test for Equality of Variances		t-test for Equality of Means		
		F	Sig	T	Df	Sig- (2 tailed)
Self Esteem Score	Equal variances assumed	5.146	.025	-.422	157	.673
	Equal variances not assumed			-.434	155.537	.665

The Male group (N=72) was associated with a self esteem score M=2.9669 (SD= .27925). By comparison Female group (N=87) was associated with a numerically lower self esteem score M=2.9345 (SD=.37287). To see whether male and female population were associated with statistically significantly different mean score of self esteem an independent t test was performed.

The independent sample t test (Table 4) is showing that the self esteem score is not significantly related with gender of the students as the P value is .665 which is greater than .05 as the Levene’s test shows that equal variances is not assumed. It can be seen in table 3 the Male and the female distribution were sufficiently for the purpose of conducting a t test (i.e. skew <2 and Kurtosis i.e. <9; Schmider, Ziegler, Danay, Beyer, & Buhner, 2010)<sup>18</sup>. Thus the gender of the population is not statistically significantly different from each other.

**Table 4: The Descriptive analysis**

Self Esteem Score		
	N	Mean
Urban Areas	36	2.9806
Semi Urban Areas	74	2.8824
Rural Areas	49	3.0122
Total	159	2.9447

From the above chart it can be concluded that the mean of self esteem score in student of rural areas (3.0122) followed by Semi Urban areas (2.8824) and lastly the urban areas (2.9806). The existing self esteem score is numerically different in urban, rural and semi urban areas are collected and plotted in the SPSS and one way ANOVA was performed and it gives the output below

**Table 5: ANOVA Table**

Self Esteem					
	Sum of Squares	df	Mean Square	F	Significance
Between Groups	.557	2	.278	2.561	.080
Within Groups	16.956	156	.109		
Total	17.513	158			

From the above ANOVA table, it can be concluded that there is no significant differences existing among students from rural, urban and semi urban areas on existing level of self esteem.  $F(2, 156) = 2.561$ , and the P value is .080 which is greater than .05.

**Table 6: Multiple comparisons for knowledge level of risk of Obesity**

Areas 1	Area 2	Significance
Urban	Semi Urban	.253
	Rural	.894
Semi Urban	Urban	.253
	Rural	.110
Rural	Urban	.894
	Semi Urban	.110

The Games Howell method reveals that no significant differences among Rural - Semi Urban, Rural-Urban and Semi Urban – rural are existing in respect to level of self esteem. In case of rural - semi urban, rural-urban the p value is .110 and .894 respectively and in case of semi urban – urban, p value is .253. So multiple comparisons shows that there is no significant differences existing among rural, semi urban and urban students in respect of their self esteem score.

### Discussion

- Our study indicates that the level of self esteem among the students of technical and allied courses of east Midnapore district is 73.5%, which is satisfactory. The rural students have numerically higher self esteem score than that of urban students. The finding is opposing the research finding which says the urban self esteem is greater than the rural self esteem (Tauro, 2018)<sup>21</sup> but the finding of the study is similar to some other finding of researchers who are showing similar results (Harter, 1982)<sup>8</sup>. Some researchers hypothesises that the rural students have inferiority complex and they lost their confidence (Bronfenbrenner, 1958)<sup>6</sup> in a way to lose self esteem but it is not true in that case, in fact it shows the rural students have certain level of self worth and competencies but though the differences is not significant. The study also revealed that there are no significant differences existing between these two groups but many researchers have found significant differences existed among the rural urban population in terms of self esteem (McCaul, 1984)<sup>12</sup>.
- The study shows that the level of self esteem is

numerically higher in case of male population than that of the female population. This finding is supporting numerous findings by different researchers (M. Minev, 2018)<sup>13</sup>. The study also shows the difference between the mean score of male and female are not significantly different which is opposing many researchers who have found significant differences existed among two groups (Nasir, 2012)<sup>14</sup>. So it proves that the self esteem is not depending upon the locality of the respondents but other social, psychological factors are responsible for that.

### Conclusion

Psychological health in the college goers is important for any nation. As self esteem is a major component of psychological health so the self esteem becomes an important factor of the college goers. There should not be any kind of disparities of level of self esteem among students of different genders and areas where the students came from. Many researchers have found significant differences existing but in this case there is no significant differences existed among students of both boys and girls from rural, urban and semi urban areas of east Midnapore district. The study shows the boys haven scored numerically higher than girls which support many research finding by many researchers but the rural college goers of East Midnapore district have numerically higher self esteem score than that of urban and semi urban college goers. This is a really a unique findings because most of the researchers have found rural students are having lowest self esteem score than that of urban or semi urban population.

**Ethical Clearance:** Vice Chairman of different private colleges of East Midnapore district gave ethical. Before that we have explained the purpose of our research and on the other hand each respondent was assured by the researchers to maintain complete confidentiality.

# Utility of High Fidelity Simulation Training in Improving Adherence to Critical Actions During Cardiopulmonary Arrest

Parag Rishipathak<sup>1</sup>, Monesh Bhandari<sup>2</sup>, Anand Hinduja<sup>3</sup>

<sup>1</sup>Director, Symbiosis Centre for Health Skills, <sup>2</sup>Medical Officer, Academics, Symbiosis Institute of Health Sciences,

<sup>3</sup>Adjunct Faculty Symbiosis Centre for Health Skills, Symbiosis International (Deemed University), Pune, India

## Abstract

**Introduction:** Cardiopulmonary resuscitation (CPR) is emerging as a viable rescue strategy for refractory out-of-hospital cardiac arrest. Effective CPR implementation requires intensive and repetitive training for Emergency Medical Service (EMS) providers. Adherence to ACLS protocols throughout an event is associated with increased revival rate of cardiac arrest patients. Using high fidelity simulation for BLS ACLS training improves the quality and confidence of EMS providers, students to abide by the AHA guidelines.

**Objective:** To utilize high fidelity simulation training in improving adherence to critical actions during cardiopulmonary arrest.

**Methodology:** A high fidelity manikin was utilized to create four unique clinical simulation scenarios based on cardiac arrest. 80 students of the Post Graduate Diploma in Emergency Medical Services (PGDEMS) program participated.

Each simulation session lasted for approximately 10 minutes followed by structured debriefing lasting for 20 minutes. The video recorded sessions were analyzed by two independent facilitators to avoid bias.

At the end of 8 week period, the students underwent post intervention simulation session structured in the same format as the pre-intervention session.

**Result:** The study focused on critical performance steps to be followed as per AHA 2015 guidelines.

**Discussion:** As per AHA 2015 guidelines, there are some critical performance steps to be followed while giving Basic Life Support (BLS) to a cardiac arrest patient. These steps if followed correctly, not only provide help to the patient immediately but also increase the chance of survival of the patient.

The drastic increase in the total score obtained from pre-intervention to post-intervention underscores the importance of regular simulation sessions, to inculcate better assessment practices in a safe and non-threatening environment.

**Conclusion:** Though participants performed the critical actions and managed the scenarios as per AHA 2015 guidelines, few actions, which superficially seemed to be insignificant were not performed.

**Keywords:** Cardiac arrest, critical actions, performance measures, CPR.

## Introduction

Cardiopulmonary resuscitation (CPR) is emerging as a viable rescue strategy for refractory out-of-hospital cardiac arrest. Effective CPR implementation requires intensive and repetitive training for Emergency Medical

Service (EMS) providers. A study in the U.S. has shown that limited training of emergency medicine providers is a barrier to widespread implementation.<sup>1</sup>

EMS providers and resident doctors do not always apply proper resuscitation guidelines in hospitals.

Hence, there is a need for continuing training in basic and advanced resuscitation for all according to the guidelines.<sup>2</sup>

The American Heart Association (AHA) Advanced Cardiac Life Support (ACLS) algorithms are the standard of care for patients suffering from cardiac arrest. Adherence to ACLS protocols throughout an event is associated with increased revival rate of cardiac arrest patients.<sup>3</sup>

Correctly following ACLS protocol has improved post – code mortality but institutions should train EMS providers in implementing ACLS protocols to improve revival of patient.<sup>4</sup>

Along with proper implementation of ACLS protocols and guidelines, non-technical skills including leadership, communication skills, adaptability, handling stress etc. are responsible for successful and effective resuscitation.<sup>5</sup>

For improving and developing updated guidelines regularly, it is necessary to conduct research on resuscitation, based on cases who were treated as per the existing AHA guidelines.<sup>6</sup>

As a result, the lack of organized simulation practice results in deficient knowledge and skills because of deliberate practice. Using high fidelity simulation for BLS ACLS training, improves the quality and confidence of EMS providers and students to abide by the AHA guidelines. Numerous studies have shown that high fidelity simulation should be utilized for deliberate practice of students.<sup>7</sup>

**Objective:** To utilize high fidelity simulation training in improving adherence to critical actions during cardiopulmonary arrest.

**Methodology:** A high fidelity manikin was utilized to create four unique clinical simulation scenarios based on cardiac arrest i.e. Ventricular Fibrillation (VF), pulseless Ventricular Tachycardia (pVT), Asystole and Pulseless Electrical Activity (PEA). The scenarios underwent dry run by facilitators before the student sessions. 80 students of the Post Graduate Diploma in Emergency Medical Services (PGDEMS) program participated in the study. The students were initially taught the assessment and management of cardiac arrest through didactic lecture method and case

study discussions. For the pre-intervention simulation session, the students were divided into eight groups and prebriefed on the features of high fidelity simulation manikin and the background of their respective cases. Informed consent was taken from students to record the sessions.

Each simulation session lasted for approximately 10 minutes followed by structured debriefing lasting for 20 minutes. The video recorded sessions were analyzed by two independent facilitators to avoid bias. The student groups were rated on 15 assessment parameters as per AHA 2015 guidelines. The maximum score that could be obtained by a group was 15. The shortcomings of these students were discussed during debrief.

Over the next 8 weeks, students were trained on various cardiac arrest scenarios using High fidelity simulation. Each simulation training session lasted for four hours and the students were provided real time feedback on their performance on various critical actions to be taken in a cardiac arrest scenario. At the end of 8 week period, the students underwent post intervention simulation session structured in the same format as the pre-intervention session. Critical actions performed were again recorded for the 4 case scenarios during the test. The pre-intervention vs post-intervention data was tabulated and analyzed for difference in means.

**Result**

The study focused on critical performance steps to be followed as per AHA 2015 guidelines.

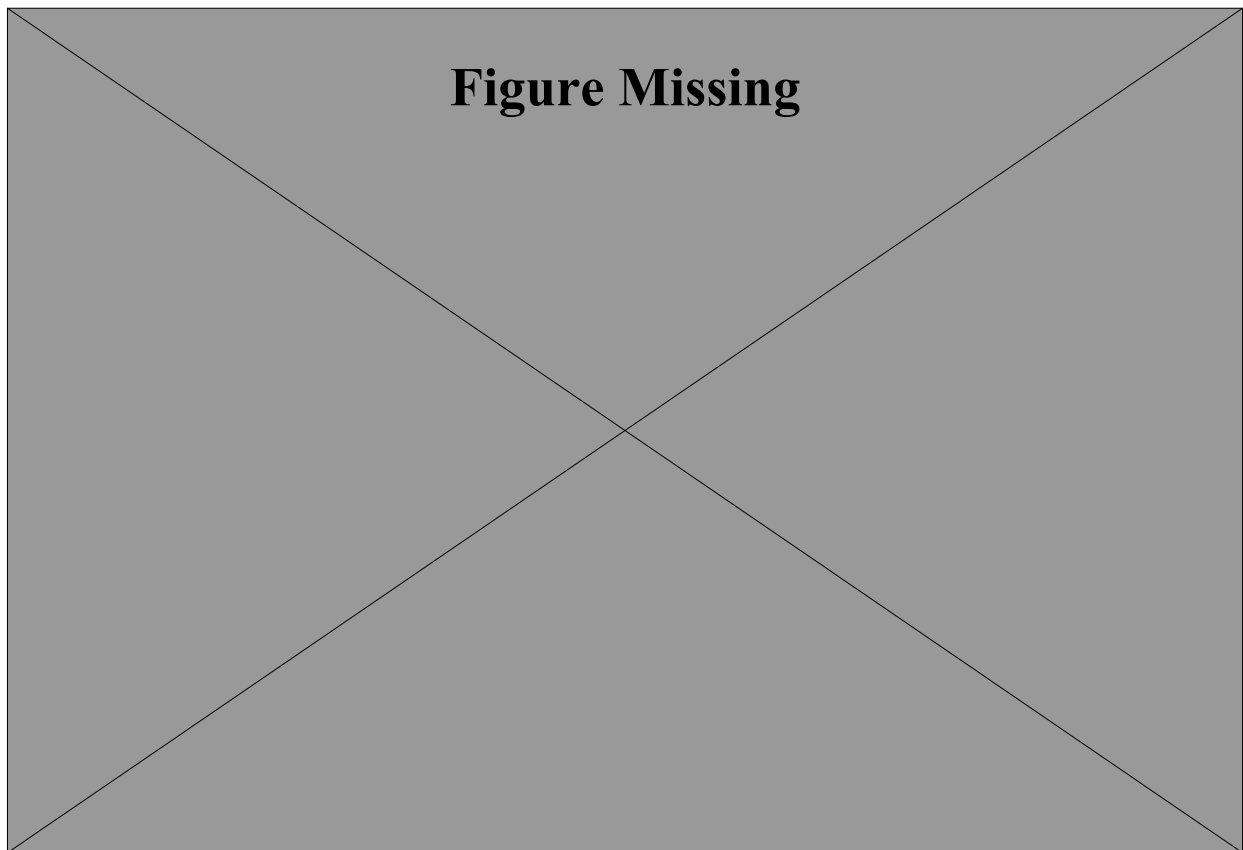

The pre and post intervention values have been tabulated below:

**Table 1: Critical actions performed (Pre-intervention vs Post-intervention)**

Cardiac Rhythm	Mean of Number of Critical actions performed (Pre-intervention)	Mean of Number of Critical actions performed (Post-intervention)
Ventricular fibrillation	8.5	13
Pulseless Ventricular tachycardia	8.5	14
Pulseless Electrical Activity	6.5	11
Asystole	7.5	11.5

**Table 2: Mean Score**

	Mean Score Obtained
Pre intervention	5.2
Post intervention	12.3

**Figure 1: Performance on individual critical action**

**Discussion**

As per AHA 2015 guidelines, there are some critical performance steps to be followed while giving Basic Life Support (BLS) to a cardiac arrest patient. These steps if followed correctly, not only provide help to the patient immediately but also increase the chance of survival of the patient.

The critical steps have been categorized under Assessment, Team Leader and Management.

During pre-intervention session, during assessment of clinical simulation scenario majority of the groups failed to perform “shout for help” step when cardiac arrest was recognized. But for post intervention four groups out of eight performed the step. It is important to perform this step to initiate chain of survival and for additional help to arrive.

For a Team Leader, steps like ensuring high quality CPR at all times, assigning team member roles and ensuring that team members perform well are critical. During pre-intervention session, only two out of eight groups ensured high quality CPR at all times, but improvement was observed in the post intervention sessions. The team leader from all groups assigned team member roles in pre –intervention as well as post–intervention test. During pre-intervention session, 5 out of 8 groups did not monitor the team members’ performance but significant improvement was seen in post intervention session.

During the pre-intervention session the students performed poorly in areas of intervention including maintaining appropriate cycles of drug-rhythm check/ shock CPR, administrating appropriate drugs and doses, verbalizing potential reversible causes (H’s and T’s).

This was found to be corrected in the post intervention session. The drastic increase in the total score obtained from pre-intervention to post-intervention underscores the importance of regular simulation sessions, to inculcate better assessment practices in a safe and non-threatening environment. High Fidelity Simulation sessions offer a chance to provide real time feedback on the critical actions that are required to be preferred during cardiac arrest. Simulation also allows to create a variety of clinical scenarios on cardiac arrest to acclimatize students to possible real clinical simulation.

### Conclusion

Though participants performed the critical actions and managed the scenarios as per AHA 2015 guidelines, few actions which superficially seemed to be insignificant were not performed.

EMS students should have proper understanding and knowledge regarding each critical action to be performed in a cardiac arrest. There is a need for more research to study the Human Factor in case of cardiac arrest using High fidelity simulation.

# Effectiveness of Video Assisted Teaching on Knowledge Regarding Home Care Management among Patients Diagnosed with Acute Coronary Syndrome

Parvathy Chandran<sup>1</sup>, Binutha V.P.<sup>2</sup>

<sup>1</sup>Lecturer, (Department of Medical Surgical Nursing), Amrita College of Nursing, Amrita Vishwa Vidyapeetham, Kochi-41, <sup>2</sup>Associate Professor, (Department of Medical Surgical Nursing), Bishop Benziger College of Nursing, Kollam, Kerala, India

## Abstract

**Background:** Recently Coronary Artery Disease among Indians is a major challenge for many research centers worldwide.

**Objectives:** Effectiveness of VAT on knowledge regarding home care management among patients diagnosed with ACS and find the association between pretest knowledge scores with socio demographic variables.

**Methodology:** To evaluate the effectiveness of VAT on knowledge regarding home care management among patients diagnosed with ACS, Quasi experimental pretest posttest research was selected with Quantitative research approach. Purposive Sampling was used. 60 Sample Size was taken, 30 in both experimental and control group. Pretest was conducted for both groups on first day, followed by VAT program and on the seventh day posttest were conducted. The VAT program was provided only for experimental group, with 40 minutes duration, routine care was given for control group.

**Results:** The findings shows a statistically difference in post test knowledge score of experimental group regarding home care management among patients diagnosed with ACS after VAT.

**Conclusion:** Present study suggests the need for VAT program is to improve the knowledge level regarding home care management of patients diagnosed with ACS.

**Keywords:** *Effectiveness; Knowledge; Acute Coronary Syndrome; Video assisted teaching.*

## Introduction

A heart healthy lifestyle which includes eating right diet, regular exercises, maintaining a healthy weight, no smoking, and moderate amount of drinking, no recreational drugs, controlling hypertension and managing stress.<sup>1</sup> The ACS death rate is one in three.<sup>2</sup>

Medication, exercise and smoking cessation is an important component of the treatment strategy for ACS.<sup>3</sup> Depression was reported to adversely affect quality of recovery, after treatment of ACS.<sup>4</sup> In addition, self-efficacy increased self-care compliance among ACS patients.<sup>5</sup> Intervention to prevent the symptoms had a modest effect on the quality of life of patients who experience AML.<sup>6</sup> Home care management includes exercises, diet, complementary therapies, and lifestyle modifications.<sup>7</sup>

An epidemiological study was done to evaluate the incidence of ACS in Mediterranean country with a population of 2172. The results revealed that there were 22.6 events per 10000 of population.<sup>8</sup> To modify

the risk factors or prevent their development with the aim of delaying or preventing newonset is the primary prevention of ACS.<sup>9</sup>

An article on “How to prevent and control coronary heart disease risk factors” published in the United States of America (USA) advises that children should avoid or quit smoking.<sup>10</sup>

To increase the effectiveness of interventions on lifestyle changes need to focus on the motivation of individuals with the goal of modifying their behavioral barriers<sup>11</sup> and individualizing their treatment plan under consideration of similar risk factors and efficacy<sup>12</sup>. Using these interventions, nurse-led educational meetings and telephone follow up was to assist elderly patients with ACS to achieve lifestyle changes, including healthy eating practices, regular physical activity, and smoking cessation.<sup>13</sup> For Korean patients with ACS, integrated symptom management<sup>14</sup> and motivational enhancement therapy<sup>15</sup> were identified as effective strategies for lifestyle modification. Participation rates remain less than optimal because of many barriers such as limited availability and accessibility, program length, distance and transportation, time conflicts, or financial issues<sup>16</sup>, and lack of support from family.<sup>17</sup>

## Materials and Method

**Research Approach and Design:** Quantitative research approach with Quasi experimental non randomized control group design was used for the study.

**Research Settings:** The study was conducted in Bishop Benziger hospital and Upasana hospital, Kollam.

**Population:** ACS patients in Bishop Benziger hospital and Upasanahospitals, Kollam during the data collection.

**Sample and Sampling techniques:** 60 ACS patients from Bishop Benziger hospital and Upasana hospitals, Kollam, 30 in experimental group and 30 in control group. The sampling technique used for the study was purposive sampling technique.

**Data collection Instruments:** After an extensive review of relevant literature, a semi structured questionnaire was developed. Tool consists of two

sections. Section 1: the first section included the demographic information. It contains 7 items like Age in years, Gender, Education, Occupation, Monthly income, Diet and habit. Section II was prepared which include the questions on ACS and its home care management. 20 questions are included in this section. Immediately after the pretest VAT programme of 40 minutes was given to the samples in experimental group. For control group VAT programme was not given. On the 7<sup>th</sup> day, posttest was done in both experimental and control group. Content validity of the semi structured questionnaire was determined through a panel of experts. Reliability of the tool was computed by test retest method.

**Procedure for data collection:** The ethical clearance was obtained from Thesis Review Committee and Head of the institution for conducting the study. Purpose of the study was explained and an informed consent was obtained from the samples. A pilot study was conducted to ensure the reliability of the tool, applicability of items and identify the obstacles and problems that may be encountered in data collection, this number were excluded from the studied sample. The data was analyzed using descriptive and inferential statistics.

## Results and Discussion

Sample characteristics based on socio demographic variables:

**Frequency and percentage distribution of demographic variables according to baseline characteristics:** It was found that the highest percentages (55%) of subjects were within the age group of 61-70 yrs and least (15%) percentage of subjects were within 51-60 yrs. About 31.6% of samples were female. 48.3% of samples belonged to the category of School level. 50% belong to Private employee and 21.6% belong to Self employed category. Majority (48.3%) of the samples have monthly income Rs 5001-10,000 and 20% of samples have monthly income in between Rs 10,001-15,000. Majority (60%) of Samples belong to the category of Non Vegetarian. About (45%) of the sample belong to the category of no such habits and 36.6% of the sample belong to the category of Smoking and 13.4% samples belong to the category of Alcoholism.

**Table 1: Frequency and percentage distribution of knowledge score in experimental group (n=30)**

Level of Knowledge	Pretest		Posttest	
	Frequency	Percentage	Frequency	Percentage
Poor	1	3.33%	0	0
Average	13	43.33%	5	16.67%
Good	15	50%	22	73.33%
Excellent	1	3.34%	3	10%

Data in table 1 shows that in pretest, A good percentage (50%) belongs to Good level of knowledge and the remaining (43.33%) belongs to Average level of

knowledge category. In posttest Remarkable percentage (73.33%) samples were having good level of knowledge.

**Table 2: Frequency and percentage distribution of knowledge score in control group (n=30)**

Level of Knowledge	Pretest		Posttest	
	Frequency	Percentage	Frequency	Percentage
Poor	1	3.34%	1	3.34%
Average	14	46.66%	13	43.33%
Good	14	46.66%	15	50%
Excellent	1	3.33%	1	3.33%

Data in table 2 shows that in pretest, A good percentage (46.66%) belongs to both average and good level of knowledge and the remaining (3.34%) belongs to Poor level of knowledge category. In posttest good percentage (50%) of the samples were having good level of knowledge and (43.33%) were having average level of knowledge.

**Section B:** Evaluation of effectiveness of VAT regarding home care management among patients diagnosed with ACS.

**Part I:** Comparison of pretest and posttest knowledge scores among patients with ACS in experimental group.

**Table 3: Mean, Standard Deviation and t value of pretest and posttest knowledge score in experimental group. (n=30)**

	Mean	Standard Deviation	t value
Pretest	10.57	2.68	12.184*
Posttest	12.97	2.26	

Tabulated  $t_{(29)} = 2.04, p < 0.05$  \*Significant

The Tabulated value is lesser than the calculated

paired t value at 0.05 level of significance; hence research hypothesis  $H_1$  was accepted. So there is statistically significant difference between the mean pretest and posttest knowledge scores in the experimental group.

**Section B:**

**Part 2:** Comparison of posttest knowledge scores among patients with ACS among experimental and control group.

**Table 4: Mean, Standard Deviation and t value of mean pretest knowledge score in experimental and control group. N=60**

Pretest	Mean	Standard Deviation	t value
Experimental group	10.57	2.68	0.95NS
Control group	9.9	2.77	

Tabulated  $t^{(59)} = 2.00, p < 0.05$  NS-Not Significant

The calculated unpaired t value is less than tabulated value at 0.05 level of significance. Hence there is statistically no significant difference in the mean pretest knowledge scores in experimental and control group, the homogeneity of the sample was ensured.

**Table 5: Mean, Standard Deviation and t value of mean posttest knowledge score in experimental and control group. N=60**

Posttest	Mean	Standard Deviation	t value
Experimental group	12.97	2.26	4.17*
Control group	10.26	2.73	

Tabulated  $t_{(58)} = 2.00$ ,  $p < 0.05$  \*Significant

The Tabulated value is less than the calculated value at 0.05 level of significance. Hence there is statistically significant difference in the mean posttest knowledge scores in experimental and control group.

**Section C:** Association between knowledge scores among patients with ACS with demographic variables.

Chi square value showing association between knowledge scores with demographic variables.

The data shows that there is significant association between the pretest levels of knowledge with selected demographic variables like Education, since the calculated chi square value is more than the table value at 0.05 level of significance. Hence the research hypothesis  $H_3$  is accepted.

The data shows that there is no significant association between the pretest levels of knowledge with selected demographic variables like Age in years, Gender, Occupation, Monthly income, Diet and habit, since the calculated chi square value is lesser than the table value at 0.05 level of significance. Hence the research hypothesis  $H_3$  was not accepted.

**Discussion**

In order to achieve the objectives of the study, quasi experimental non randomized control group design was adopted. The subjects were selected by purposive sampling method. The findings of the study have been discussed in relation to the objectives and other similar studies.

**Effectiveness of VAT on knowledge regarding home care management among patients diagnosed with ACS.**

The present study was supported by a similar quantitative study conducted to evaluate the effectiveness of VAT programme on knowledge regarding cardiac rehabilitation among post myocardial infarction patients admitted in cardiac inpatient department at

a selected cardiac hospital in Erode. The findings of reference study revealed that the level of knowledge in experimental group was significantly higher than the control group, which was similar to the present study. After implementation of VAT programme on cardiac rehabilitation the mean posttest knowledge score of most of the patients was found to be adequate and moderately adequate. Study concluded that video assisted teaching programme was effective among cardiac patients.

The Present study and the supporting studies show that the VAT program is effective in improving the knowledge regarding home care management among patients diagnosed with ACS.

**Association between pretest knowledge scores with selected demographic variables.**

The findings of the present quasi experimental study was supported by a descriptive study conducted to find the knowledge about risk factors, symptoms, complications and knowledge about prevention of coronary disease among patient admitted to SSMS Hospital and Mitford Hospital. The result of reference study revealed that there is a lack of awareness among a sampled Bangladeshi population regarding CAD and its modifiable risk factors. The findings of the reference study and present study revealed that there was significant association between knowledge score with selected demographic variables.

The study results along with the supportive studies show that there was a positive relationship between knowledge scores with selected demographic variables.

**Conclusion**

ACS is one of the most dangerous types of Coronary Heart Disease (CHD) and contributes to significant mortality and morbidity worldwide.<sup>18</sup> ACS is a set of symptoms due to rupture of a plaque.<sup>19</sup> In recent years, an important objective of cardiovascular research has been to find new markers that would improve the risk stratification and diagnosis of patients presenting with symptoms of ACS.<sup>20</sup> The result of the study showed that the mean posttest knowledge score of experimental group ( $12.97 \pm 2.26$ ) was higher than the mean pretest score ( $10.57 \pm 2.68$ ). Hence the research hypothesis was accepted. This shows that VAT was effective in improving knowledge regarding home care management among patients diagnosed with ACS.

## Abstract

“Assess the prevalence of type 2 diabetes mellitus among adults” at selected areas in Kanchipuram District, Tamilnadu. The objectives were to assess the prevalence of diabetes mellitus among adults at selected area. Found out the level of diabetes mellitus among adults. To find out the association between diabetes mellitus among adults among with selected demographic variables and selected Personal information sheet of among diabetes mellitus. A non – experimental, descriptive study was conducted. The sampling technique was non-probability, purposive sampling technique with the sample of 50 and Standard Structured questionnaires (SSQ) in the form of interview schedule was used type 2 diabetes mellitus among adults. The variables were assessed the type 2 diabetes mellitus among adults. Hypotheses were formulated. The level of significance selected was  $p < 0.05$ . The investigator used personal information sheet and Standard Structured questionnaires (SSQ) was used to collect data. The data collection for the main study was done. The collected data was tabulated and analyzed. Descriptive and inferential statistical were used. The mean 9.94 value was and the standard deviation was 14.600328. The study shows that the type 2 diabetes mellitus among adults inadequate (13%) were moderate (33%) and adequate was (6%). The study concludes that there is moderate 33% the type 2 diabetes mellitus among adults.

**Keywords:** Assess, prevalence, Type 2 Diabetes Mellitus, Adult.

## Introduction

Diabetes Mellitus is a group of metabolic disorder arising either due to relative or absolute deficiency of a digestive hormone called insulin or inability or resistance of body cells to use the available insulin<sup>1</sup>. Diabetes Mellitus is a silent disease and is now recognized as one of the fastest growing threats to public health in almost all countries of the world. Every 5<sup>th</sup> person who suffer

from diabetes in the world today is an Indian<sup>2</sup>.

The main underlying causes of the disease are genetic and environmental, such as urbanization and industrialization, as well as increased longevity and changes in lifestyle from a traditional healthy and active life to a modern, sedentary, stressful life and over-consumption of energy-dense foods<sup>3</sup>. The prevalence of diabetes mellitus varies among populations due to differences in genetic susceptibility and social risk factors such as change in diet, obesity, physical inactivity and possibly, factors relating to intrauterine development. Migrants are especially affected.<sup>4</sup>

## Research Methodology

**Research Approach:** Descriptive research approach

**Research Design:** Non experimental descriptive design

**Research Setting:** The study was conducted in the selected community area

**Population:** Adult's age of 40-55 years in a selected area

**Sample Size:** 60 Samples

**Sampling Technique:** Non probability purposive sampling

## Results

**Section-A:** Distribution of demographic variables of the prevalence of Type 2 Diabetes Mellitus among adults in selected community area.

Age in years, in which majority 44% were belongs to the age between > 55 years, 22% were belongs to the age between 40-45 years.

Sex, in which majority 60% of the samples were Male 40% of samples were Female

Area of residence in which majority 40% were belongs to urban, 26% were belongs to semi urban

Education Status, in which majority 40% were primary/secondary education, 12% were illiterate

The occupational status, in which majority were government employee 38%, 10% were self-employee

Marital status, in which majority 42% of the samples were widowed and 22% samples were divorced.

The family income per month in rupees, in which majority 40% of the samples were Rs.10,000 to 15,000, 28% samples were Rs.5,000 to 10,000.

Type of family, in which majority were joint family 40% and 28% nuclear family

The eating habits in which majority 82% were non-vegetarian and 28% were vegetarian.

The family history of diabetes mellitus in which majority were mother 32% and 12% were grandmother

**Section-B:** Distribution of knowledge on prevalence of Type 2 Diabetes Mellitus among adults in selected community area.

The study finding revealed that the frequency distribution in the study shows that majority 52% of them having Inadequate knowledge, 18% of them having moderate knowledge and 30% of them having Adequate knowledge on Type 2 Diabetes Mellitus among adults.

### Fig. 1: Distribution of knowledge on prevalence of Type 2 Diabetes Mellitus among adults in selected community area.

**Summary:** This chapter has dealt with the analysis and interpretation of the collected data from the adults on the knowledge regarding Diabetes Mellitus. The collected data was tabulated and analyzed using descriptive and inferential statistics. Statistics diagrams like, conical graph, pie chart were used to represent the important data of the study.

## Conclusion

The finding of the study revealed that there is no significant association between types 2 Diabetes Mellitus with the selected demographic variables like age, sex, marital status, education, occupation, eating habits, family history of Diabetic Mellitus. There is significant association between type 2 Diabetic Mellitus with the selected demographic variables like family income per month, area of residence.

# Assessment of Self Esteem and Peer Pressure among Adolescents in Selected College of Kanchipuram District, Tamil Nadu

Pema Drema Gyamo<sup>1</sup>, P. Nivetha<sup>1</sup>, P. Pavithra<sup>1</sup>, S. Nandhini<sup>1</sup>, Metha J.<sup>2</sup>

<sup>1</sup>B.Sc. (Nursing) III<sup>rd</sup> Year Students, <sup>2</sup>M.Sc. (Nursing), Assistant Professor, Mental Health Nursing Department, Chettinad College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kancheepuram District, Tamilnadu

## Abstract

A descriptive study to assess of self esteem and peer pressure among adolescents in a selected college Kanchipuram district Tamil Nadu. The objectives are to assess self esteem and peer pressure among adolescents. To find out the association between levels of self esteem and peer pressure among adolescents and selected demographic variables of adolescents. The sampling technique was non probability purposive sampling. Sample size was 132 samples of adolescents. Rosenberg self esteem scale was used to assess self esteem and peer pressure inventory by brown to assess peer pressure. The demographic variables performa, structured interview schedule to collect data. The data collection was done. The collected data was tabulated and analyzed, using descriptive and inferential statistics. The self esteem mean value is 21.9 and peer pressure mean value is 8.1.

**Keyword:** *Self esteem, peer pressure, Adolescents.*

## Introduction

An Adolescents is a transitional period and it is the bridge between childhood and adulthood. It is the time of rapid development of growing to sexual maturity and social direction. Age of adolescents is age identity formation where occupation, education and personal context develop. During this period social expectation of the individual are drastically under modification.<sup>[1]</sup>

**Peer Pressure:** According to Lashbrook (2000) emphasizes processes related to peer pressure, namely

conformity. According to him, peer pressure is a specific instance of social influence, which typically produces conformity to a particular way of acting or thinking. However, one major limitation of the aforementioned conceptualization is that it neglects examples of peer pressure that do not produce conformity.<sup>[4]</sup>

Peer pressure can also be a good thing. Teens learn social norms from their peers. Similarly self confident teens can act as positive and set good examples for others. A positive peer group that your teens fits into well help boost her self esteem; it might prevent her from engaging in harmful or risky behaviors (burack 1999). Although some authors ascribe peer groups some very valuable positive functions related to negative effect is dominant (Beaty and Alexey, 2008).

**Self Esteem:** Self-esteem can be broadly defined as the overall evaluation of oneself in either a positive or negative way (Hughes, J. N etal, 2005). It is one of the basic needs of human being. The degree of our self-esteem impacts every major aspect of our lives. Deficits

in self-esteem contribute to virtually all psychological problems.<sup>[2]</sup>

According to Brandon (1992), self esteem is an evaluation made by the individual and maintained, it expresses an agreement or disagreement, and it's indicated the extent to which an individual believes that he is capable, important, successful and worthy .In short, self esteem is a self assessment of the worthiness expressed in the individual's attitude towards him. <sup>[3]</sup>

**Statement of the Problem:** Assessment the self esteem and peer pressure among adolescents in selected college Kanchipuram district, Tamilnadu, India.

### Objectives of the Study:

1. To assess the self esteem and peer pressure among adolescents in selected college in Kanchipuram district Tamil Nadu.
2. To associate the self esteem and peer pressure among adolescents in the selected college in Kanchipuram district, Tamil Nadu with selected demographic variables.

### Operational Definitions:

**Self Esteem:** Self esteem is a well known psychological term that is used interchangeably with words such as self confidence, self respect, self efficacy, and self concept.

**Peer Pressure:** It refers to the feeling that one must do the same things as other people of one's age and social group in order to be liked and respected by their peers. Its effect on the individual is by changing their attitudes values or behaviors to conform to those of influencing group or individual.

**Assess:** It refers to the process of gathering information using Rosenberg self esteem scale to measure the; level of self esteem and peer pressure inventory by brown to assess the peer pressure among the adolescents.

**Adolescents:** It refers to the period of adolescents between age of 17 to 19 years.

## Materials and Method

**Research Approach:** Quantitative descriptive approach was used.

**Research Design:** Descriptive design was used for the study.

**Research Setting:** Research was conducted among adolescents in Madras Institute of Hotel Management and catering Technology, Tamil Nadu.

**Population:** Research was conducted among adolescents age between 17 to 19 year.

**Sampling Size:** Sample formula  $n = \frac{DEFF * Np(1-p)}{[(d^2/Z^2(1-\alpha/2*(N-1) + p*(1-p))]$ .

Sample size  $n = 132$

**Sampling Techniques:** The participants of the present study were selected by purposive sampling technique.

### Sampling Criteria:

#### A. Inclusion Criteria:

1. The adolescents available at the time of data collection.
2. Both male and female college students.
3. Adolescents who are able to read and speak English.

#### B. Exclusion Criteria:

1. Adolescents who are not willing to participate.
2. Adolescents who are having mental illness.

### Selection and Development of the Study Instrument:

#### Tool Description:

**Part 1:** This structured demographic variable consist of age(17 to 19 years), gender (male, female and others), type of family (nuclear, joint family, others), social background (income of the family), academic achievements (high, average, low),area of residence (urban, rural).

**Part 2:** Rosenberg self esteem scale, a widely used report instrument for evaluating individual self esteem, was investigated using item response theory. The scale is believed to uni-dimensional. All items are answered using a 4 point Likert scale ranging from strongly agrees to strongly disagree. It is a model that consists of 10 questions that was framed to assess the self esteem among adolescents [age 17-19 years] under peer pressure and its effects in their mental heal

**Data Collection Procedure:** In this study the researcher planned to assess the self esteem and peer pressure among the adolescents in selected college, Tamil Nadu, in demographic characteristics of adolescents was assessed with the help of demographic variable Performa and level of knowledge was assessed with the help of structured interview schedule on legal and ethical responsibilities.

**Findings:** The demographic variables shows significant percentage of adolescents was age between in age between 17-19 (41.6%). Significant percentage of adolescents family monthly income was (40.2%). Half of adolescents family were from nuclear family (53.8%). Half of the adolescents achievement in academic performance was moderate (48%). Most of the adolescents gender is male (72.7%). Most of the adolescents were from urban area (57.6%). It also showed that the mean score 21.19, mean % 52.9% and standard deviation 5.82 aspect of adolescents in self esteem and the mean score 81, mean % 50.94 and standard deviation 1.36 aspect of adolescents in peer pressure. Overall mean is self esteem and peer pressure among adolescents aspects found to be 100% the maximum score for self esteem and peer pressure were mild 41(31.06%), moderate 55 (41.66%), high 36(27.27%).

It also indicates that there is significant association between the demographic variable and the self esteem among adolescents in their age as self esteem is relatively high in childhood and that it drops during adolescent period (example: age and gender difference in self esteem- a cross cultural window by Weibke Blidorn, Ruben C. Arslan, Jasp J. A. Denissen), family monthly income because the higher the family income is the higher the self esteem among adolescents and lower the family monthly income is lower the self esteem among adolescents (example: income disparity as predictor of happiness and self esteem by Azmat Jahan, Namita Tyagi, Sushma Suri.), area because the adolescents today living in urban area has more self esteem than those who live in rural area as adolescents those who live in rural area feel that the way speak, dress, present themselves, behavior is different than those who live in urban area (example; the cost and cause of low self worth by Nicholas Emler). And there is no significant association between demographic variables and self esteem among adolescents in gender, type of family, academic performance.

And that there is significant association between the demographic variable and the peer pressure among adolescent in age as during our adolescents period we tend to want acceptance more from our peers than anyone else (example: a study done by Laurence Steinberg age differences in resistance to peer influence), area since the adolescents living in urban area are more sensitive and exposed with situations, substances (example : a study by Nicole Marie Howard on peer pressure in relation to academic performance and socialisation among adolescents). There is significant association between demographic variables and peer pressure among adolescent in gender, type of family, family monthly income and academic performance.

### Conclusion

We have conducted a research topic on assessment of self esteem and peer pressure among adolescents in selected college Kancheepuram district, Tamilnadu, India. The quantitative descriptive design was used to conduct the study on data obtained on self esteem and peer pressure among adolescents. 132 samples were collected.

# A Modified Technique for Establishing the Occlusal Plane in Complete Denture Prosthesis

**Pradeep S.**

*Additional Professor, Dept. of Prosthodontics, Manipal College of Dental Sciences*

## **Abstract**

Occlusal plane position is considered to be the primary link between function and esthetics. Canted occlusal planes result from the canted interpupillary line if the latter is used as reference plane. Establishing this occlusal plane correctly by orienting it is of prime importance. Bubble gauge mounted to the fox plane provides more accurate orientation of occlusal plane irrespective of reference planes. This modification can be used to achieve optimum result in facial asymmetries and canted interpupillary lines, since interpupillary line cannot be used as a guide in such cases.

**Clinical Implications:** If a clinician uses bubble gauge-fox plane approach for establishing occlusal plane, then the aesthetic outcome will be enhanced. This method is also of value since it reduces subjective variations.

**Keywords:** *Occlusal cants, reference planes, complete denture esthetics, interpupillary line.*

## **Introduction**

Occlusal plane is the average plane established by the incisal and occlusal surfaces of the teeth. Generally, it is not a plane but represents the planar mean of the curvature of these surfaces<sup>1</sup>. The orientation of the occlusal plane is lost in patients rendered edentulous and should be relocated if complete dentures are to be esthetic and to function satisfactorily. It is the most important plane to be determined in complete denture work, as it is a vital and important basis for tooth arrangement<sup>2</sup>. Complete dentures are constructed to function in the mouth as an integral part of the masticatory system; therefore, they should be designed to conform to the patient's physiologic jaw relations. The plane of occlusion forms one essential physiologic concept of jaw relation and occlusion. A well contoured occlusal rim with occlusal plane parallel to ridge posteriorly and

parallel to interpupillary line anteriorly stabilises the denture<sup>3</sup>.

During the maxillomandibular relations after forming the rim with the correct vertical heights, the plane of occlusion is modified until it is parallel with a line projected from ala of nose to the superior edge of the tragus of ear (Camper's line). The incisal-canine esthetic line should be made parallel to the interpupillary line when the patient is looking straight ahead<sup>2,4,5,6</sup>.

An occlusal plane indicator such as a Fox plane guide is used to achieve this goal<sup>7</sup>. In practice, a metallic scale is used along with Fox plane<sup>8,9,10</sup>. The Fox plane is placed inside the mouth touching the occlusal rim and is held by the operator, while the metal scale is held at the level of Camper's line or interpupillary line. Conventional methods have the following disadvantages:

It is difficult to hold the scale steady. The scale position changes every time the operator checks the parallelism. Moreover, when checking with naked eye, the operator has to be at eye-level to check the parallelism as any change in angulation of eye leads to incorrect results. This not only increases the chances of error but also makes the procedure tedious and time-consuming. Trying to imagine the interpupillary line and

---

e-mail: paddusb@gmail.com

comparing it with the Fox plane guide is quite difficult. It is difficult for the practitioner to compare between the fox plane guide and an instrument that represents the interpupillary line with a distance of several centimetres apart. It is difficult to fix or stabilize the pupils because the patient doesn't understand the importance of stabilizing the pupils, nor does he/she know in which correct position to stabilize the pupils. In elderly subjects who receive the majority of the complete dentures the muscle coordination is poor<sup>3</sup>.

A range of facial asymmetries can influence the choice of occlusal plane during prosthodontic treatment. Thus, an occlusal plane parallel to the ala tragus and interpupillary lines, as often supported by prosthodontists, may result in less than ideal esthetics in the final restoration<sup>11,12</sup>.

In the event that one eye is higher than the other (which often occurs), the incisal-canine line would be made slanted in relation to true horizontal when the patient's head is erect. The interpupillary is not the best esthetic reference line and has advocated making the incisal-canine line parallel to horizontal when the patient's head is perfectly erect regardless of the eyes or any other facial feature<sup>13</sup>.

To overcome the above disadvantages a modification to the Fox plane in which, bubble gauge is mounted to the Fox plane (Fig 1). The bubble gauge consists of coloured liquid in a tube consisting of bubble and markings in the centre. The presence of the bubble in between the markings indicates that the surface is parallel to ground level or the truehorizontal<sup>14</sup>. Bubble gauge is used in automobile industry, water level monitoring etc.

Applying the same principle to complete denture prosthodontics, it can be used inmaxillomandibular relations procedure where the planes are of utmost significance.

**Procedure for use of bubble gauge:** The patient is made to sit erect looking straight ahead at horizon. The labial form of occlusal rim should provide adequate lip support and labial fullness. The vertical length of the maxillary occlusion rim is established. The occlusal plane is adjusted using the centralisation of bubble in between the markings as a guide (Fig 2). The procedure is carried out independent of the interpupillary line.

## Discussion:

Several method for the determination of occlusal plane have been proposed<sup>15,16,17,18</sup>. Conventional method have their inherent demerits. This modification is simple and inexpensive. It is very easy to use for the beginners. Need to be at eye level is eliminated and hence the chances of change in the angle of operator eye level leading to incorrect plane of occlusion are nil. This method is of advantage in cases with facial asymmetries and canted interpupillary lines. The practitioner would not need to imagine or try to present the interpupillary line with any instrument. Posture of the patient can bring about changes in the position of bubble. So the patient is made to sit erect looking straight ahead at horizon. When mounting the bubble gauge to the Fox plane, it should be done on a flat base as any inclination in surface can lead to incorrect mountings.

Fig – 1 Mounted bubble gauge on fox plane

Fig – 2 Centred bubble gauge

## Conclusion

Arranging the teeth in the correct plane of occlusion is important for the success of complete denture

prosthesis. This modification is thus reliable alternative method for the orientation of the occlusal plane and can be used with less subjective bias than that of the conventional method utilizing the interpupillary line

# Quality of Life among Survivors of a Disaster in Kodagu District, India

Prakash B.<sup>1</sup>, Jose Jom Thomas<sup>2</sup>, Praveen Kulkarni<sup>3</sup>, Narayana Murthy M.R.<sup>4</sup>

<sup>1</sup>Professor, <sup>2</sup>Postgraduate, <sup>3</sup>Associate Professor, <sup>4</sup>Professor and Head, Department of Community Medicine, JSS Medical College, JSS Academy of Higher Education and Research, Mysuru, Karnataka, India

## Abstract

**Introduction:** Global climate is changing every day. An increased incidence of natural disasters can be attributed to this change in the climate. Natural disasters are known causes of psychosocial problems and a reduction in health-related quality of life. This study attempts to assess the quality of life of victims of a natural disaster in the Kodagu district of India.

**Method:** A community based cross-sectional survey was conducted in the disaster-affected areas, 4-6 months after the impact. Two areas were randomly selected and a total of 171 samples were assessed using the WHOQOL BREF questionnaire. The scoring was done to a scale of 0 to 100 and data was analyzed using SPSS 23. Relevant statistical tests were performed to identify the associations between different factors affecting and quality of life.

**Results:** The median score out of 100 in physical health dimension of quality of life among the study participants was 56 (interquartile range: 38-69). The psychological domain score was 69 (interquartile range: 56-81) while social relationships showed a good quality of median score 100 (interquartile range: 75-100). The median score for quality of life in the environmental domain was 63 (interquartile range: 44-81).

**Conclusion:** The quality of life among the survivors of 2018 floods and landslides was observed to be reduced. The main factors associated with the quality of life were gender, occupational status, level of education and experience of a direct disaster impact.

**Keywords:** *Quality of Life, Disaster, Flood.*

## Introduction

The incidence of natural disasters related to climate change is on the rise since the 1960s. 332 natural disasters claiming over 30000 deaths were recorded in 2011 alone.<sup>1</sup> Many people have suffered

injuries, diseases and long-term health effects as well as emotional disturbances from the traumatic events of different natural disasters.<sup>2</sup> As the climate is still changing, extreme weather events and will become more frequent and severe in the future.<sup>3</sup> Nearly 60% of the Indian landmass is susceptible to earthquakes while 40 million hectares of land is flood-prone. About 8% of the subcontinent is prone to cyclones while more than two third of the areas are susceptible to drought.<sup>4</sup>

Kodagu (Coorg), is a district surrounded by the Western Ghats of India and agriculture is the major source of Income in the area including paddy fields and coffee and pepper agro-forestry.<sup>5</sup> Kodagu district recently witnessed its worst monsoon rainfall in the last century. Over 200 villages were affected and consequent

landslides wiped out homes, plantations, roads and bridges. 16 people have lost their lives and 39 are listed as missing. More than 1200 houses have collapsed.<sup>6</sup> The valley areas faced severe flooding while the hilly regions suffered mainly from landslides. The tourism field faced significant damage due to the floods. The disaster is expected to have long term effects especially in the agriculture and plantations.<sup>7,8</sup>

Natural disasters have a definite impact on the health-related quality of life. Different grades of disaster impact showed definite changes in the quality of life from studies from different countries.<sup>9</sup> Even though many epidemiological studies have been conducted on the psychological impacts of natural disasters in India, not much data is available on the effect on the quality of life by disasters in the country. So the study was conducted with the objectives to assess the quality of life among the survivors of the disaster in Kodagu and the factors influencing the quality of life of the survivors.

### Methodology

The main features of the 2018 Kodagu disaster were landslides and floods. This community based cross sectional study was conducted between 4<sup>th</sup> and 6<sup>th</sup> month after the impact of the disaster from December 2018 to February 2019. The Madikeri taluk of Kodagu district was selected randomly by lottery method to conduct the study. From the list of primary health centres which were affected by landslide and flood in Madikeritalukas, one rural primary health center viz. Bhagamandala and one urban primary health centre viz. Madikeri Urban, were selected randomly again using lottery method. The study area of Bhagamandala was principally affected by floods while landslides caused major devastation in Madikeri town and adjacent areas. A total sample size of 171 was decided by convenience and 86 samples were selected from Bhagamandala and 85 from Madikeri. In each area, the disaster-affected localities were identified and from the centre of the locality, one direction was selected randomly and all the houses in the selected lane were selected for the study. All eligible members in the house were studied until the sample size was met.

Residents who were residing in affected areas in Kodagu district during the floods and continue to reside at the same settlement and aged between 18 to 65 years were included in the study. Persons not willing to participate were excluded from the study.

Informed consent was obtained from the study

participants and socio-demographic information like age, gender, education, occupation, income, marital status, and type of family was collected. Mode of Impact of the disaster was assessed using the preformed questionnaire and WHOQOL-BREF questionnaire was used to assess the quality of life.<sup>10</sup>

**Statistical Analysis:** The data were entered into Microsoft Excel and analysed using SPSS 23. The descriptive data were represented using percentages and inferential statistical tests like Mann Whitney U Test and Kruskal Wallis Test were used for testing associations between the variables.

**Findings:** Among the 171 participants, 69% were females and 31 % were males. Majority of the participants (46.2%) were belonging to the age group of 46 to 65 years. 39.7% of them were in the age group 26 to 45 years and the rest of them (14%) were under 25 years.

Out of the 171 individuals participated in the study, 83% were married and 10.5% were not married. 5.8% were widowed and one person was separated from the spouse. Most of the study participants lived in nuclear families (77.2%) while 18.7% were living in three-generation families and 4.1% in joint families. The educational status of the participants was varying. 38.6% of samples were educated till high school while 16.1% had diplomas or finished their pre-university college education. 11.1% had upper primary and 10.5% had lower primary education. 9.4% of persons participated in the study were graduates or postgraduates and 14% had formal education. 26.9% of participants were belonging to the occupational category of clerical/ shop owners and farmers. While 1.8% were semi-professionals, and 18% were skilled workers, 5.3% were semi-skilled workers and 5.8% were unskilled workers. 58.5% of the participants in the study were unemployed.

Among the 171 study participants, 40.4% had to move to temporary shelters during the disaster. 45% faced partial or complete damage to their house. Only one person was identified with a direct physical injury. 12.9% had damage to their source of income that is agriculture fields or plantations. 32.2% of participants, all of whom were farmers and/or plantation owners were expecting a long term reduction in their income due to the damages happened in the plantations. (Table 1.0)

The median score out of 100 in physical health dimension of quality of life among the study participants

was 56 (interquartile range: 38-69). The psychological domain score was 69 (interquartile range: 56-81) while social relationships showed a good quality of median score 100 (interquartile range: 75-100). The median score for quality of life in the environmental domain was 63 (interquartile range: 44-81). (Figure 1.0)

The quality of life in all domains was compared among different demographic factors for association. On analysis, a statistically significant association (Mann Whitney Test p value <0.05) was observed between the gender and quality of life in physical and environmental quality of life. An association, which is statistically significant, was observed between different occupational categories and quality of life in all four domains. (Kruskal Wallis Test p value <0.05). The Kruskal Wallis test showed a significant association between the level of education and quality of life in all the domains. The presence of at least one disaster experience (Direct disaster impact) was proven to be a factor significantly associated with the physical and environmental quality of life (Mann Whitney Test p value <0.05). (Table 2,3,4,5).

**Discussion**

The physical and environmental domains of quality of life where the scores were higher among males. All domains of quality of life showed variation in different occupational groups and educational. People with a history of a direct impact/experience of disaster were having a lower quality of life in physical and environmental domains.

Comparing the quality of life scores obtained by this study to existing studies where defining norms for quality of life scores in general population was attempted, a

decrease in the quality in domains of physical health, psychological health, and environmental health was observed.<sup>11</sup> A paradoxical increase in the quality of social relationships of disaster survivors was noted in the study. This was comparable with similar studies from different parts of the world. An overall decrease of quality of life with a paradoxical increase in social relationships was also observed by Marco Valenti et al following an earthquake in L’Aquila, Italy, and A Ardalan et al, following an earthquake in Iran.<sup>12,13</sup> However no such observation was made in another post-disaster study from Sichuan, China, by Liang Y, where a uniform decrease in quality of life was observed in all domains of life of elderly people residing in the area.<sup>14</sup>

As the study was conducted 4-6 months after the disaster, most of the victims who faced complete damage to their house or had a severe impact from the disaster had moved from the localities and hence many such individuals could not be identified in this study. Since only limited number of similar studies were available from the area regarding the health-related quality of life designed by world health organization among flood-affected individuals, the study could not benefit from adequate comparisons.

**Conclusion**

The quality of life among the survivors of 2018 floods and landslides was observed to be reduced. The main factors associated with the quality of life were gender, occupational status, level of education and experience of a direct disaster impact. Hence we recommend a comprehensive primary care level approach from the authorities to improve the quality of life of disaster victims.

# Surgical Approaches to Infra Orbital RIM Fractures: A Review Literature

Prakash Dhanavelu<sup>1</sup>, Senthilnathan<sup>1</sup>, Vijay Aravind R.<sup>2</sup>

<sup>1</sup>Professor, <sup>2</sup>Post Graduate, Department of Oral and Maxillofacial Surgery,  
Sree Balaji Dental College and Hospital, Pallikaranai, Chennai

## Abstract

In most people, the relationship between the ocular globes and the cheek tissues is such that on lateral view, the cheek projects beyond the eye. This relationship is primarily due to the development of the facial bones beneath the cheek tissues, fractures of the infra orbital rims causes severe deformity to the face with ocular imbalance, so infra orbital rim is essential to maintain the anatomy of the eye and shape of the eye.

**Keywords:** *Infra orbital rim, diplopia, retro bulbar haemorrhage, sub conjunctival incision.*

## Introduction

The zygoma articulates with the frontal, sphenoid, temporal, and maxillary bones and contributes significantly to the strength and stability of the midface. The forward projection of the zygoma causes it to be injured frequently<sup>(1)</sup>. The zygoma may be separated from its four articulations. This is called a zygomatic complex fracture. The terms trimalar or tripod fracture are therefore inaccurate. These terms reflect an inability to easily identify the orbital (zygomaticosphenoid) portion of the injury before the advent of computed tomography (CT). The zygomatic arch may be fractured independently or as part of a zygomatic complex fracture. All zygomatic complex fractures involve the orbital floor, and therefore an understanding of orbital anatomic features is essential for those treating these injuries. The orbit is a quadrilateral pyramid that is based anteriorly. The orbital floor slopes inferiorly and is the shortest of the orbital walls, averaging 47 mm<sup>(2)</sup>. It is composed of the orbital plate of the maxilla, the orbital

surface of the zygomatic bone, and the orbital process of the palatine bone. The medial and lateral walls converge posteriorly at the orbital apex. The medial wall consists of the frontal process of the maxilla, the lacrimal bone, the orbital plate of the ethmoid, and a small portion of the sphenoid body. The lateral orbital wall is the thickest and is formed by the zygoma and the greater wing of the sphenoid. The orbital roof is composed of the frontal bone and lesser wing of the sphenoid.

The sensory nerve associated with the zygoma is the second division of the trigeminal nerve. The zygomatic, facial, and temporal branches exit the foramina in the body of the zygoma and supply sensation to the cheek and anterior temporal region. The infraorbital nerve passes through the orbital floor and exits at the infraorbital foramen. It provides sensation to the anterior cheek, lateral nose, upper lip, and maxillary anterior teeth. Muscles of facial expression originating from the zygoma include the zygomaticus major and labius superioris.

The position of the globe in relation to the horizontal axis is maintained by Lockwood's suspensory ligament. This attaches medially to the posterior aspect of the lacrimal bone and laterally to the orbital (Whitnall's) tubercle (which is 1 cm below the zygomaticofrontal suture. Accompanied by an anti mongoloid downward cant of the lateral canthal region caused by displacement of the zygoma on the medial aspect of the frontal process of the zygoma). The shape and location of the medial

and lateral canthion of the eyelid are maintained by the canthal tendons. The lateral canthal tendon is attached to Whitnall's tubercle. The medial canthal tendon is attached to the anterior and posterior lacrimal crests. Zygomatic complex fractures are often accompanied by an antimongoloid (downward) cant of the lateral canthal region caused by displacement of the zygoma.

**Causes and Etiology:** Zygomatic fractures are common facial injuries, representing either the most common facial fracture or the second in frequency of facial fractures. The incidence, etiology, age, and sex predilection of zygomatic injuries vary, depending largely on the social, economic, political, and educational status of the population studied. The common etiological factors for these type of fractures are R.T.A, Altercations, Falls, Sports related injuries.

**Pathology of Infra Orbital RIM Fracture:** In total medial displacement, the orbital rim is completely severed at the frontozygomatic suture. The Zygoma is depressed in the orbital region as well, leading to reduction in size of the orbit. This can lead to exophthalmos, which may be aggravated by further haematoma. On the other hand with a defect of the floor of the orbit, orbital tissue may prolapse into the maxillary sinus so that enophthalmos would result due to medial displacement. The telescoping intrusion of the Zygoma into the orbit and maxillary sinus can lead to incarceration and injury of orbital fatty tissue and musculature causing diplopia as a result of disturbances of mobility. As the medial fracture line is always in the region of the infra orbital nerve, the nerve is pinched or torn in medial displacement fractures.

Inferior displacement arises when force impinges on the body of the Zygoma obliquely from above. Temporal fascia prevents inferior displacement of the zygoma by its broad attachment. The frontal process of the Zygomatic bone may be tilted dorsally or forward, In this type of displacement, the orbital cavity is enlarged. This leads to exophthalmos with the eye lowered and double vision. Sagging of the lateral wall of the orbit leads to displacement of the palpebral fissure in the lateral region in a caudal direction (antimongoloid). The total medial fracture dislocation can lead to restriction of mouth opening as a result of impingement of the coronoid process on the zygoma.

**Various Approaches for the Management of Infra Orbital RIM:** Several approaches to the orbit through the skin surface of the lower eyelid have been

described. They differ in the level at which the skin incision is made and level of dissection to the infraorbital rim. The subtarsal approach is one of the more frequently used approaches for access to the infraorbital rim and orbital floor. The subciliary approach, also called the infraciliary approach, or blepharoplasty, has been favored by a number of U.S. surgeons over the past 20 years. The skin incision is made approximately 2 mm inferior to the grayline of the lower eyelid, along the entire length of the lid. The transconjunctival approach, also called the inferior fornix approach, was originally described by Bourguet in 1928. Two basic transconjunctival incisions have since been described, the preseptal and retroseptal approaches, which vary in the relationship of the orbital septum to the path of dissection

Dr. P Tessier (1973): He described the transconjunctival approach, both preseptal and retroseptal for the repair of fractures involving the orbital floor and rim. The main advantage to this technique is the lack of visible scar Bromely S. Freeman (1962)<sup>(3)</sup>: stresses the need for direct exposure to investigate the anatomic position of bony continuity in fractures of the anatomic position of bony continuity in fractures of the midfacial area with the exploration of the orbital floors. He advises the use of a graft material in the reconstruction of orbital floor as against blind elevation of the floor with packs or balloons which do not always maintain the position of the floor, frequently caused reactions are relatively clumsy, often offensive and at best, approximately accurate.

## Discussion

Paul N. Manson et al (1987)<sup>(4)</sup>: state their experience with a single lower eye lid incision with mobilization of the lateral canthus is described for exposure of the zygoma, lower and lateral orbit, zygomaticofrontal suture and the incision may be either subciliary with a skin muscle flap or transconjunctival. Both require mobilization of the canthus. They are of the opinion that reattachment of the canthus is not required in acute zygomatic fracture treatment but is preferred for secondary orbital reconstruction or in patients in whom a simultaneous coronal incision is employed. They also state that the approaches described reduce cutaneous scarring and provide generous exposure of the lower and lateral orbit. Kuniolkemura et al (1988)<sup>(5)</sup>: did a study in fractures of zygomatic complex and found that there is no displacement of zygoma after fixation at frontozygomatic region using a miniplate and additional

wiring at the infra orbital rim. They suggest that there is no need for three point or four point fixation of zygoma except for complex or comminuted fractures as a bone plate gives stability in three planes.

Vriens JP, Moos KF (1995): They said that open reduction and fixation of an orbitozygomatic complex fracture offer a better prognosis for complete recovery of the infraorbital nerve function than elevation only with or without Kirschner wire fixation. Jan P M Vriens et al 1998<sup>(6)</sup> presented a study on infra orbital nerve function following the treatment of orbitozygomatic complex fractures. The patients were treated with various available method. Sensory nerve function was assessed using several method for a period of 6.3 months on an average. The study revealed that sensory disturbances were more pronounced in patients who underwent closed reduction without mini plate fixation.

Yonehara et al (2005)<sup>(7)</sup> studied patients for whom treatment of zygomatic fractures without inferior orbital rim fixation was done. They stated that inferior orbital rim fixation with mini or microplates is recommended for reduction of comminuted fractures and orbital floor fractures with herniation of internal orbit components. They found out in their study that patients who did not undergo inferior orbital rim fixation were free of inferior orbital rim deformity, diplopia, and postreduction rotation.

**The main advantages of the subtarsal approach are the following:**

1. It is relatively easy;
2. The incision is placed in a natural skin crease so that the scar is imperceptible; and
3. It is associated with minimal complications. It has few disadvantages

The subciliary approach, also called the infraciliary approach, or blepharoplasty, has been favored by a number of U.S. surgeons over the past 20 years. The skin incision is made approximately 2 mm inferior to the grayline of the lower eyelid, along the entire length of the lid. The incision may be extended laterally approximately 1 to 1.5 cm in a natural crease inferior to the lateral canthal ligament. The main advantage to this incision is the imperceptible scar that it creates. The disadvantages are the following: (1) the procedure is technically difficult for the novice; and (2) a higher risk of postoperative ectropion exists.<sup>(8-12)</sup>

The transconjunctival approach, also called the inferior fornix approach, was originally described by Bourguet in 1928<sup>(13)</sup>. Converse et al<sup>(14)</sup> have added a lateral canthotomy to the transconjunctival retroseptal incision for improved lateral exposure. The advantage of the transconjunctival approaches is that they produce superior cosmetic results when compared with any other commonly used incision because the scar is hidden behind the lower lid. Other advantages are the following: (1) these techniques are rapid; and (2) no skin or muscle dissection is necessary. In a study by Wray et al<sup>(15)</sup> in which the transconjunctival approach was used for orbital floor and rim fractures.

### Conclusion

Incisions and approaches are always on the hands of the surgeons. If the fracture can be treated with existing laceration, it gives positive result with proper closure, age, sex and severity of the injury also plays a vital role in reduction and fixation. Always subconjunctival and subciliary incisions are better when compared to the infra orbital incisions. Since it is placed in Rstl lines of the face which gives minimal scar with less post operative complications.

## Abstract

Caffeine, the world's most widely consumed psychoactive drug is a central nervous system(CNS) stimulant of the methylxanthine class. It is a white crystalline purine, a methylxanthine alkaloid which is bitter in taste. Caffeine is structurally related to the adenine and guanine bases of DNA and RNA. It is found in the nuts, seeds or leaves of a number of plants native to East Asia, Africa, and South America, and its natural function is to prevent germination of nearby seeds and to protect them against predator insects. Caffeine can have both positive and negative impact on human health. It can be used to treat and prevent the premature infant breathing disorders such as bronchopulmonary dysplasia of prematurity and apnea of prematurity. Caffeine citrate is on the WHO Model List of Essential Medicines which confers a modest protective effect against some diseases, including Parkinson's disease. Caffeine is classified by the US FDA as generally recognized as safe(GRAS). Toxic doses are over 10 gm/day for an adult, which are much higher than the typical dose of under 500 mg/day. However, pure powdered caffeine, available as a dietary supplement, can be lethal in tablespoon-sized amounts. In this review article, we discuss about the health benefits and adverse effects of caffeine along with its future prospects.

**Keywords:** *Caffeine, coffee, dependence, safety doses, toxicity.*

## Introduction

The world was and still continues to be a big fan of coffee, the beverage that is globally accepted with open arms. Coffee is a major source of caffeine for most populations<sup>[1]</sup>. Coffee is often produced from the roasted beans of great variety of coffee crops<sup>[2]</sup>. The two most economically important species-Coffea canephora and Coffea arabica<sup>[3,4]</sup>. The world coffee trade is increasing each year showing the importance of coffee to the global

economy. The composition of the two main coffee species (Arabica and Robusta) varies consistently with the origin, storage and terroir conditions. During the roasting process a number of reactions give rise to the organoleptic properties of coffee<sup>[5]</sup>. Coffee contains mineral ingredients such as Ca, K, Fe, P, Ni, Mg, and Cr<sup>[6,7,8]</sup> among others. The bioactive compounds of coffee include the following: methylxanthines (caffeine, theobromine and theophylline), diterpenes (kahweol and cafestol), phenolic compounds (chlorogenic acid and its derivatives), nicotinic acid<sup>[9]</sup>. These compounds have been associated with many potential health benefits. For example, diterpene alcohols and chlorogenic acids(CGA) have chemo-preventive and antioxidant activity, whereas caffeine reduces risk of developing neurodegenerative disease<sup>[10]</sup>.

Caffeine, the common name for 1,3,7-trimethylxanthine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>), was derived from the German word kaffee and the French word café.

Fig 1: Structure of caffeine<sup>[11]</sup>

Caffeine is the most widely consumed psychoactive substance in the world<sup>[11]</sup>. The psychostimulant properties of caffeine are due to its interaction with neurotransmission in different regions of the brain, to promote behavioral changes, such as attention, mood, vigilance, and arousal<sup>[12]</sup>. By suppressing the actions of adenosine, caffeine increases neural activity in the brain, which leads to a temporary increase in mental alertness and thought processing, while reducing drowsiness and fatigue. At low to moderate doses of caffeine, the most prominent behavioral effects are amplified alertness and attention. Higher doses of caffeine encourage negative effects such as anxiety, insomnia, restlessness and tachycardia<sup>[13]</sup>. The WHO identifies caffeine dependence as a clinical disorder<sup>[14]</sup>. Caffeine is found in common beverages, in products containing cocoa or chocolate, and in medications (Table 1).

Table 1: The average amounts of Caffeine in various food products.(Food Regulation Standing Committee, Caffeine Working Group. (2013))

Product	Average caffeine content (mg/100 ml)
Red Bull®	32.0
Mountain Dew®	15.0
Coca Cola®	9.7
Diet Coke®	9.7
Coke Zero®	9.6
Brewed black-tea	22.5
Brewed green-tea	12.1
Coffee (cappuccino)	101.9
Coffee (flat white)	86.9
Coffee (long black)	74.7
Coffee (from ground coffee beans)	194.0
Chocolate (milk-added milk solids)	20.0
Chocolate (dark-high cocoa solids)	59.0

**Synthesis:** The biosynthesis of caffeine is considered as an example of convergent evolution among different species. Primary substrates for Caffeine synthesis are malonic acid and dimethylurea. For commercial use, caffeine is produced as a byproduct of decaffeination.

Fig 2: Synthesis of Caffeine

**Decaffeination:** Caffeine and decaffeinated coffee, are produced by using solvents such as benzene, trichloroethylene, chloroform, and dichloromethane have all been used over the years but for safety reasons,

environmental impact, cost, and flavor, they have been superseded by the subsequent main method:

- Supercritical carbon dioxide extraction:

Supercritical CO<sub>2</sub> is an excellent nonpolar solvent usually safer than other organic solvents used regularly. It has gas like properties that enable it to penetrate deep into the beans and also has liquid-like properties that dissolve 97–99% of the caffeine. During the extraction process CO<sub>2</sub> is forced to enter the green coffee beans at pressures above 73atm and temperatures above 31.1°C (“supercritical” conditions for CO<sub>2</sub>). The caffeine-laden CO<sub>2</sub> is then sprayed with high-pressure water to remove the caffeine. The caffeine is then isolated by charcoal adsorption, distillation, recrystallization or reverse-osmosis.

- Water extraction: Coffee beans are soaked in water. This water is then passed through activated charcoal for removing caffeine. The water is then added back to the beans and evaporated dry, leaving decaffeinated coffee with its original flavor. The recovered caffeine is sold for use in soft drinks and/or over-the-counter caffeine tablets.
- Extraction by organic solvents: organic solvents such as ethyl acetate and use of triglyceride oils obtained from spent coffee grounds is also preferred. these compounds are less hazardous to health and environment compared to aromatic compounds.

Commercial decaffeinated coffee does contain caffeine in some cases. Studies have shown that decaffeinated coffee contained 10mg caffeine per cup, compared to approximately 85mg caffeine per cup for regular coffee.

**Pharmacokinetics of Caffeine:** The liver is the primary caffeine metabolism site. Rate of metabolism varies across the population; the half-life is diminished in smokers, but augmented during pregnancy and in women taking oral contraceptives<sup>[15]</sup>. Caffeine is quickly and entirely absorbed from the gastrointestinal tract, with 99% being absorbed within 45 min of ingestion<sup>[16]</sup>.

Peak plasma concentrations take place between 15–120 minutes after oral ingestion. This wide variation in time might be because of variation in gastric emptying time and the presence of other dietary constituents, for example, fiber<sup>[17]</sup>. Caffeine has a physiological half-life of 3.5 to 6 hours<sup>[18,19]</sup>. Its physiological impacts are seen in less than 1h. Infants do not metabolize caffeine and therefore have a half-life of around 4 days<sup>[20]</sup>. CYP450 oxidase enzyme system is predominantly involved in caffeine metabolism. This metabolic process

involves conversion of caffeine by the CYP1A2 isozyme into three dimethylxanthines,<sup>[21]</sup> paraxanthine (72%), theobromine (20%) and theophylline (8%)<sup>[22]</sup>, each of which effect the body in various ways.

- Paraxanthine: Increases lipolysis, causing rise in glycerol and free fatty acid levels<sup>[22]</sup>.
- Theobromine: Along with being the key alkaloid in cocoa bean, it dilates blood vessels and increases urine volume<sup>[22]</sup>.
- Theophylline: Relaxes smooth muscles of the bronchi and are utilized to treat asthma<sup>[22]</sup>.

Further metabolism takes place in each of these metabolites, followed by renal excretion. Caffeine can accrue in people with severe liver disease as expressed before, expanding its half-life<sup>[23]</sup>.

During pregnancy estrogens and gestates inhibit CYP1A2 activity, this increases the half-life time up to 16 hours(3-4 times longer than in non-pregnant women). Since caffeine can't be metabolized by neither fetus nor placenta, caffeine readily crosses the placenta into the fetus. Given the prolonged half-life of caffeine during pregnancy, fetus of caffeine consuming women are exposed to caffeine and its metabolites for a significantly prolonged time. Several genetic and non-genetic factors have been reported that significantly affect caffeine metabolism by CYP1A2 for various population groups. Considering the reduced maternal clearance and prolonged half-life during pregnancy and the fetus' exposure to maternal caffeine plasma levels, the unborn child is the most vulnerable to adverse effects of caffeine among the general population.

**Pharmacodynamics Effects:** In the absence of caffeine little adenosine is present in neurons. Over time adenosine accumulates in the neuronal synapse, and binds to the adenosine receptors found on certain CNS neurons; this binding of adenosine to its receptors produces a cellular response that increases drowsiness. When caffeine is consumed, it antagonizes adenosine receptors; in other words, caffeine prevents adenosine from activating the receptor by blocking the location on the receptor where adenosine binds to it. As a result, caffeine temporarily prevents or relieves drowsiness, and thus maintains or restores alertness. It also temporarily increases the production of dopamine, a chemical substance in the brain that is associated with increased concentration.

Four adenosine receptors (A1, A2A, A2B and A3) are present in humans, the distribution of these receptors ultimately affects caffeine activity at various organs and tissues. For example: psychomotor stimulant effect of caffeine is generated by affecting a particular group of projection neurons located in the striatum (high levels of adenosine A2A receptors).

**Health Benefits:** The positive effects of caffeine consumption have been reported through clinical studies. At a dose of 6 mg/Kg body mass, it exhibited an ergogenic effect, in sedentary men<sup>[24]</sup>.

Its stimulatory activity was tested on Parkinson's disease patients, it seemed to be helpful in managing both motor and non-motor symptoms<sup>[25]</sup>. In a mouse model,  $\beta$ -amyloid peptides (characteristic feature of Parkinson's disease patients) accumulation reduced with crude caffeine intake<sup>[26]</sup>. Another study showed that 4.1% of people in the US are suffering from clinical depression. In a Harvard study published in 2011, women who drank 4 or more cups of coffee per day had a 20% lower risk of becoming depressed<sup>[27]</sup>.

Studies show that coffee drinkers have up to a 40% lower risk of liver cancer<sup>[28,29]</sup>. Similarly, one study in 489,706 people found that those who drank 4–5 cups of coffee per day had a 15% lower risk of colorectal cancer<sup>[30]</sup>.

Investigations have revealed that crude caffeine did possess hydrophilic antioxidant activity (145  $\mu$ mol Trolox equivalent (TE)/g) and lipophilic antioxidant activity (66  $\mu$ mol TE/g), and its administration led to the inhibition of cyclooxygenase-2 enzyme better than aspirin<sup>[31]</sup>.

#### Adverse Effects

Some of the adverse effects of high doses of caffeine include overstimulation of CNS, decrease tonus of lower esophageal sphincter muscle, and intrauterine growth retardation<sup>[32]</sup>. High doses of coffee intake during pregnancy increase the risk of miscarriage, independent of pregnancy related symptoms<sup>[33]</sup>.

Caffeine-induced anxiety-disorder is one of four caffeine-related syndromes. Extremely high intake of 1,000mg/day or more have been reported to cause nervousness, jitteriness and similar symptoms in most people, whereas even a moderate intake may lead to similar effects in caffeine-sensitive individuals<sup>[34,35]</sup>.

Increased urination is a common side effect of high caffeine intake due to its stimulatory effects on the bladder. Most of the research on the compound's effects on urinary frequency has focused on older people and those with overactive bladders<sup>[36,37,38]</sup>. In one study, 12 middle-aged people with overactive bladders who consumed 2 mg caffeine per pound (4.5mg/kg) of body weight daily experienced significant increases in urinary frequency and urgency<sup>[37]</sup>.

Caffeine's ability to keep people awake is one of its most prized qualities. However, too much caffeine can disrupt the sleep cycle. Studies have found that higher caffeine intake increases the time taken to fall asleep. It may also decrease total sleeping time, especially in the elderly<sup>[38,39]</sup>.

**Regulations:** The FDA in the US currently allows only beverages containing less than 0.02% caffeine, but caffeine powder, which is sold as a dietary supplement, is unregulated<sup>[40]</sup>. It is a regulatory requirement for packaged food to show presence of additives such as caffeine in the label. However, there is no regulatory provision for mandatory quantitative labeling of caffeine, (e.g., milligrams caffeine per stated serving size). There are a number of food ingredients that naturally contain caffeine. These ingredients must appear in food ingredient lists.

#### Future Prospects and Conclusion

Refined western tastes for specialty blends and developing economies have led to an increase in coffee demand worldwide with the International Coffee Organization expecting the market to grow almost 25% by 2020. With the rising demand, supply is unable to keep up. Coffee supply chain networks are structured to reward roasters and distributors, leaving growers with not much in return for their labor. Poor economic futures combined with the mounting threat to crop yields due to global warming have created a problem that will take time to resolve. As temperatures rise, so will farms. Only 2% of the land currently appropriate for the farming of coffee is actually used to produce the crop. However, a warming climate will cut suitable land in half. Available geographical terrain for coffee production will shift in latitude and increase in elevation. A recent study done by Conservation International reported that tropical forests cover 60% of future farmable land with one-third of that marked as a pristine and protected area. Parts of Central America, the Andes and Southeast Asia are

under the greatest threat of deforestation which would impact and destroy crucial ecosystems that presently assist in carbon storage and provide both freshwater and biodiversity for communities. “Coffee Rust” is the most detrimental disease to coffee plants and has accompanied rising global temperatures.

# Internet Addiction among Medical Postgraduate Students: A Cross- Sectional Study

Ishan Pathak<sup>1</sup>, Preet P. Khona<sup>2</sup>

*1Assistant Professor, Department of Community Medicine, DM Wayanad Institute of Medical Sciences, Wayanad,  
2Tutor, Department of Community Medicine, Gadag Institute of Medical Sciences, Gadag*

## Abstract

**Introduction:** Internet addiction was not officially recognized as a disorder by the psychiatric community till recently. However, with internet access becoming widespread, problematic internet use is increasingly being reported. It has been suggested that excessive internet use could represent addictive behavior with mental health implications. Therefore, the present study was conducted with the objective to assess the prevalence of internet addiction and pattern of internet usage among post graduate students in a medical college.

**Materials and Method:** A cross sectional study was conducted among post graduates of Jawaharlal Nehru Medical College, Belagavi. The study was conducted from January 2018 to June 2018 with a universal sample size. The data was collected by using Kimberly Young IAT questionnaire. The data was further tabulated and analysed.

**Results:** The study revealed that 138 (92%) reported internet addiction and 12 (8%) reported normal internet usage. The students residing in hostel were more prone for internet addiction. Almost two thirds of participants used internet for communication, social networking and entertainment.

**Conclusion:** Although being trapped in the busy schedules, medical postgraduates were also prone to internet addiction, leading to various mental disorders like depression. To overcome that various internet rehabilitation centres, regulation of use of internet in working hours can be done.

**Keywords:** *Internet, Post Graduate, Addiction.*

## Introduction

Internet has been a revolution in the world of technology since its inception and changed the world in terms of communication. However, this “new” technology has also introduced, especially among

young people, problematic use such as addiction to online gaming, gambling, chatting and pornographic videos watching<sup>1</sup>. Internet addiction was not officially recognized as a disorder by the psychiatric community till recently<sup>2</sup>. In addition, there were various tools and cutoff points to measure the addiction levels and thus, there was a wide range of reports on the prevalence rate of internet addiction among youth<sup>3,4</sup>.

Ph No.: 9886115014

Internet users’ population worldwide had increased from 360 million in December 2000 to 4383 million in March 2019; this shows that worldwide internet penetration rate in June 2017 was 56.8%. In Asia, it had grown from 114 million internet users in December 2000 to 2197 million in March 2019, this shows that internet penetration rate in Asia was 51.8%, which represents

50.1% of internet users are only in Asia, whereas rest of the world represent 49.9% of users in March 2019. In India, there were about 560 million internet users as on March 2019, as compared to 5 million in 2000, so the internet penetration in India is 40.9% of population, which represents 25.5% of internet users of Asia<sup>5</sup>.

There have been growing concerns worldwide for what has been labeled as “internet addiction”. The term “internet addiction” was proposed by Dr. Ivan Goldberg in 1995 for pathological compulsive internet use.<sup>6</sup> “Addiction” has generally been associated with substance use. However, with internet access becoming widespread, problematic internet use is increasingly being reported. It has been suggested that excessive internet use could represent addictive behavior with mental health implications.<sup>7-9</sup> Psychological and environmental factors in the lives of college students may leave them disproportionately vulnerable to Internet addiction.<sup>10,11</sup>

As internet addiction is increasing at an alarming trend among the current younger generation laying a significant impact on their comprehensive development, it appears to be a major public health concern. Internet usage, both by broadband and mobile users, has increased in India and abroad. The university campuses are being made wireless with free and unlimited access to the internet. Many online courses are now available for the medical students interested in pursuing such courses, to add to their credentials.<sup>12</sup> However, when it comes to students of professional courses especially medical field, the scenario may be different in consideration of lack of time to access internet with these students.

A number of studies across the world have studied internet addiction especially among adolescents. Research specifically on internet addiction among young adults in health care system, is relatively new and limited.<sup>12</sup> Therefore, the present study was conducted with the objective to assess the prevalence of Internet addiction and pattern of internet usage among post graduate students in a medical college.

## Materials and Method

A cross sectional study was conducted among post graduates of Jawaharlal Nehru Medical College, Belagavi. The study was conducted from January 2018 to June 2018 with a universal sample size of 176. The data was collected by using Kimberly Young questionnaire.

The rationale behind applying the Internet Addiction Test (IAT) by Kimberly Young in this study was that it is a validated instrument to assess internet addiction among adolescent and adult populations.<sup>13</sup> The IAT is a 20 item, 6 point Likert scale with scores ranging from 0 to 5 for each item, which measures the severity of self-reported compulsive use of the internet. After all the questions have been answered, numbers for each response were added to obtain a final score. Total internet addiction scores were calculated, with possible scores for the sum of 20 items ranging from 0 to 100. Higher the score, greater the level of internet addiction and the problems internet usage causes. A score of 0-19 was considered as no addiction/normal internet usage, 20-49 points as mild addiction, 50-79 as moderate addiction and 80-100 as severe addiction.<sup>14-16</sup> The data was analysed using the software SPSS version 24.0.

## Results

A total of 150 out of 176 questionnaires were analyzed, 26 forms were rejected because of being incompletely filled. Out of the 150 study subjects, 84 (56%) were males and 66 (44%) students were females, 82 (55%) resided in hostel whereas 68 (45%) were non hostelites (Table 1).

**Table 1: Socio demographic profile of study**

Gender	Frequency	Percentage
Male	84	56
Female	66	44
Total	150	100
Residence	Frequency	Percentage
Hostel	82	55
Non Hostel	68	45
Total	150	100

The study revealed that 138 (92%) reported internet addiction and 12 (8%) reported normal internet usage. The internet addiction test scores revealed 12 (8%) in the score range of 0-19 i.e. no addiction, hence normal users, 111 (74%) in the score range of 20-49 i.e. mild internet addiction and 21 (14%) in the score range of 50-79 i.e. moderate internet addiction and 6 (4%) of the study subjects reported severe addiction i.e. with a score range of 80-100 (Table 2). Among the study population, 123 (82%) had a low risk (score  $\leq$ 49 points) while 27 (18%) had a higher risk (score  $\geq$ 50 points) for internet addiction.

**Table 2: Internet addiction test inferences**

Score	Description	Number	Percentage
<20	No internet addiction	12	08
20-49	You are an average on-line user. You may surf the Web a bit too long at times, but you have control over your usage	111	74
50-79	You are experiencing occasional or frequent problems because of the Internet. You should consider their full impact on your life.	21	14
>80	Your Internet usage is causing significant problems in your life. You should elevate the impact of the Internet on your life and address the problems directly caused by you Internet usage.	06	04

Chi square test was applied as a test of proportions and it was found to be statistically insignificant, with males and females being equally addicted to the internet ( $\chi^2=4.686, P = 0.19$ ) (Table 3), where as when it was

applied with residence of participants, hosteliars were more prone for internet addiction and its effects. ( $\chi^2=4.686, P = 0.19$ )

**Table 3 - Association between gender and internet addiction**

Severity of addiction	Male	Female	Total
Normal	06	06	12
Mild	58	53	111
Moderate	15	06	21
Severe	05	01	06
Total	84	66	150
Chi square – 4.686, p – value – 0.19			

**Table 4 - Association between residence and internet addiction**

Severity of addiction	Hostel	Non Hostel	Total
Normal	01	11	12
Mild	65	46	111
Moderate	12	09	21
Severe	04	02	06
Total	84	66	150
Chi square – 11.474, p – value – 0.0094			

The pattern of usage of internet among participants was analysed. 51 (34%) agreed to the fact that their monthly budget was hampered due to excessive internet usage, 27 (18%) felt it hampered their health and well being. Among the study participants, 16% used internet for more than 5 hours a day, 42% were using internet for more than 10 years.

The purpose of use of internet was also assessed, which revealed that 51 (34%) participants used internet for communication or social networking and entertainment, followed by 21 (14%) for news, 18 (12%) for studies and 9 (6%) for other purpose. (Graph 1)

**Graph 1: Purpose of internet usage**

## Discussion

The prevalence of internet addiction among the study subjects in the present study was 74% mild, 14% moderate and 4% severe, while 8% students reported normal internet usage. In a study conducted in Kurnool, prevalence of internet addiction was 52.63% mild, 24.21% moderate.<sup>12</sup> In another similar study in China, a prevalence among participants was 16.2%.<sup>17</sup> Chathoth Vidya Mavila et al, reported prevalence of internet addiction (representing moderate and severe addiction) as 18.88% in undergraduate Medical students in Mangalore, which was similar to our study.<sup>18</sup>

In the present study, it was observed that there was no statistical difference in the gender which was contradictory compared to the study conducted by Arvind Sharma et al, where the male students were more addicted to internet than the female students ( $\chi^2=22.673$ ,  $P=0.0001$ ).<sup>19</sup> This may be due to the time availability among post graduates, as both males and females are equally posted in the duties, their addiction is also similar.

In this study we found statistical significance between internet addiction and their place of residence. ( $\chi^2=4.686$ ,  $P=0.19$ ) Participants staying in hostels are more prone to being alone and often stuck to the screen,

where as if they lived outside, students tend to be pre occupied by outdoor activities.

In this study, we found that 84% participants spent <5 hours per day on internet. Grover et al, in their study found that more than half (56.73%) of the sample was using Internet at least for 2 h/day.<sup>20</sup> The time spent using internet per day also majorly depends on the speed of the internet connection.

## Conclusion

Majority of the study participants fell into the category of “Average On-line user” with no apparent signs of internet addiction. Medical postgraduate students were also addicted to internet, which can be a boon or bane. Residence plays a major role in internet addiction. Almost half of the participants used internet for Communication or Social Networking and entertainment, which enhances the current need of socialization. Only 18% participants opined that the effects of internet usage on health are adverse.

**Recommendations:** Internet addiction disorder is not included in DSM-V and should be inducted in the next cycle. Awareness of ill-effects of internet addiction should be increased and people should be advised about various other constraints occurring due

to internet addiction. Use of Internet during work hours should be monitored and regulated. This study can be replicated in other colleges to get a broader perspective of the situations like depression and other major mental disorders occurring due to internet addiction.

**Conflict of Interest:** Nil

**Source of Funding:** Nil

**Ethical Clearance:** No intervention was done in the study and only the data was collected by questionnaire and analysed.

# Sickness Absenteeism and Associated Factors among Foundry Workers in Belagavi, Karnataka: A Cross Sectional Study

Preet P. Khona<sup>1</sup>, Sulakshana Baliga<sup>2</sup>

<sup>1</sup>Tutor, Department of Community Medicine, Gadag Institute of Medical Sciences, Gadag,

<sup>2</sup>Associate Professor, Department of Community Medicine, Jawaharlal Nehru Medical College, Belagavi

## Abstract

**Introduction:** Absenteeism is an important factor determining the productivity of a given industry, and it depends upon worker's health, and also on other factors including personal and socioeconomic conditions of workers. Recorded sickness absences accurately reflect the health of working populations, when health is understood in terms of physical and social functioning.

**Materials and Method:** A cross sectional study was conducted among individuals working in Foundry in Belagavi district. The study was conducted from January 2018 to June 2018 with a universal sample size of 250. Data was collected from the patients regarding the socio-demographic details, employment status, details regarding their leaves. Further the absence details were cross checked with the records of the attendance in the foundry.

**Results:** The prevalence of sickness absenteeism among foundry workers was 61.6%, the mean days lost per worker per year was 21.09 days. Common causes for sickness absenteeism included social factors followed by medical factors. Among medical factors, diseases related to musculoskeletal system were more common. 90% of sickness absenteeism was seen among blue collar workers, which shows the amount of stress they bear.

**Conclusion:** Foundry workers are more prone for sickness absenteeism and injuries due to various factors related to the work pattern. To overcome that various recreational activities, medical checkups, cross trainings can be conducted.

**Keywords:** *Sickness Absenteeism, Foundry Workers, Occupational Health.*

## Introduction

Sickness absenteeism is the major occupational health problem in developing countries where the majority of working population are engaged in hazardous sectors,

such as foundry; causing loss of work-hours, reduced productivity and workplace injuries. Absenteeism is a complex phenomenon whose predictors vary according to the frequency – related to workers' tasks, aspects of leadership and work shift, to the company's organization and to lack of measures to control absences – and the duration of the periods of absences<sup>1,2,3,4</sup> (influenced by age, working conditions, benefits and access to medical care).<sup>1</sup> A few days of absence are mainly associated with organizational culture, which allows absences i.e., more related to labour structure and process than to health problems. Long-term absenteeism is considered a reflex of health conditions and family problems.<sup>1</sup> Sick leaves might be better explained by the influence of complex interrelation mechanisms between individual-related

factors and factors related to the physical and social environment.<sup>5</sup>

Sickness absenteeism is dependent on various individual factors like age, sex, education status, marital status, duration of employment, distance of workplace from home, socioeconomic conditions, health conditions, habits and occupational factors like type of work, shifts, physical environment, workplace injuries, workplace relations, psychosocial environment etc.

The study of illnesses causing absence of workers from work in industries is a practical method to obtain health status of industrial workers and to identify occupational health hazards.<sup>6</sup> Absenteeism is an important factor determining the productivity of a given industry, and it depends upon worker’s health, and also on other factors including personal and socioeconomic conditions of workers.<sup>7</sup> Recorded sickness absences accurately reflect the health of working populations, when health is understood in terms of physical and social functioning.<sup>8</sup>

Study of health conditions of workers is important to identify health problems and studying the health of workers in relation with their social and family related factors provides understanding of the burden of health problem, in relation to social context, which can help to bring necessary changes in labour welfare policies and to create healthy working conditions of workers. Since sickness absenteeism has not been stressed upon among foundry workers in India, the present paper was aimed to analyse the prevalence and risk factors of sickness absenteeism among foundry workers in Belagavi.

**Materials and Method**

A cross sectional study was conducted among individuals working in foundry in Belagavi district, after obtaining a written permission from the management of the foundry. The study was conducted from January 2018 to June 2018 with a universal sample size of 250. All the workers working in the day shifts were included in the study. Written informed consent was obtained from the participants. Data was collected from the participants regarding the socio-demographic details, employment status, details regarding their leaves on one on one interview. Further the absence details were cross checked with the records in the foundry. Ethical clearance was obtained from ethics committee of Jawaharlal Nehru Medical College (JNMC), Belagavi. The data was analysed using the software SPSS version 24.0.

**Results**

A total of 250 foundry workers participated in the study. Out of these, 34.4% were between the age group of 26-35 years, with mean age being 36.8 ± 10.1 years. 84.4% participants were males, 71.2% were literates and 49.2% belonged to socio economic status Class 3. A complete demographic profile of participants is given in Table 1.

An overview of participants’ work pattern and work related variables is given in Table 2. 90.8% participants have blue collar jobs, 80.7% are temporary workers and almost half of participants have work experience of 5 years.

**Table 1: Sociodemographic Variables**

Age Group	Number (%)	Education	Number (%)	Type of Family	Number (%)
<25	32 (12.8)	Illiterate	47 (18.8)	Nuclear	185 (74)
26 – 35	86 (34.4)	Primary	42 (16.8)	Joint	60 (24)
36 – 45	77 (30.8)	Secondary	85 (34)	Broken	05 (02)
46 – 55	49 (19.6)	PUC	36 (14.4)	Socio Economic Status	Number (%)
>55	06 (2.4)	Degree	40 (16)	Class 2	30 (12)
				Class 3	123 (49.2)
				Class 4	93 (37.2)
				Class 5	04 (1.6)
Religion	Number (%)	Marital Status	Number (%)	Sex	Number (%)
Hindu	247 (98.8)	Married	218 (87.2)	Male	212 (84.8)
Muslim	03 (1.2)	Unmarried	32 (12.8)	Female	38 (15.2)

**Table 2: Work Related Variables**

Type of Work	Number (%)	Work Experience	Number (%)
White collar	23 (9.2)	<5 years	142 (56.8)
Blue collar	227 (90.8)	≥5 years	108 (43.2)
Employment Type	Number (%)	Hrs of Work in a Day	Number (%)
Temporary	202 (80.7)	08 hrs	182 (72.8)
Permanent	48 (19.3)	12 hrs	68 (27.2)

The prevalence of sickness absenteeism among the workers was 61.6%. Among the participants, 61.6% of workers missed atleast a working day due to the reasons of sickness or injury in the past 12 months. The missed working days was further confirmed with the records.(Table 3).

**Table 3: Prevalence of Sickness Absenteeism**

Sickness Absenteeism	Number	Percentage (%)
Yes	154	61.6
No	96	38.4
Total	250	100

Among the reasons for sickness absenteeism, most common reason was due to any social commitment (61.03%), followed by medical (46.10%), non occupational (37.01%) and economic (31.81%). (Table 4).

**Table 4: Reasons for Sickness Absenteeism**

Reasons	Number(*)	Percentage
Economic	49	31.81
Social	94	61.03
Medical	71	46.10
Non occupational	57	37.01
*- Multiple answers		

Among blue collar workers health problems related to musculoskeletal system (36) and gastrointestinal system (11) were found to be high whereas among white collar workers musculoskeletal system (5) was the only health problem seen. The comparison of health problems is shown in Table 5.

**Table 5: Health Problems among Blue and White Collar Workers**

	Gastrointestinal	Respiratory	Musculoskeletal	Others	Total
White collar	00	00	05	00	05
Blue collar	11	04	36	15	66
Total	11	04	41	15	71

Overall 21.09 days were lost per worker per year due to sickness absence (see Table 6). A blue collar worker lost 21.9 days compared to 13.2 days by a white collar worker ( $p = 0.02$ ).

**Table 6: Number of Workdays Lost Per Worker Per Year**

Variables	Mean Work Days Lost Per Worker/12 Months
Type of work	
White collar	13.2
Blue collar	21.9
p value - 0.024	

## Discussion

Our study estimated 61.6% of sickness absenteeism among workers, with a loss of 21.09 days per worker per year due to sickness absenteeism, which was higher in men as compared to women. When compared with previous studies on sickness absenteeism in India, our study had higher values.<sup>9,10</sup> The higher prevalence could be due to the work pattern of the study participants who were involved, as the iron and steel industry is believed to be a more strenuous place of work, resulting in higher sickness absenteeism, than other industries.<sup>11,12</sup>

The reasons for sickness absenteeism were most common due to social reasons. This can be explained by the fact that majority of the workers never got leave for their social commitments, so they had get it under sickness absenteeism.

Blue collar workers experienced more health problems than white collar workers, among which problems related to musculoskeletal system (57.7%) and gastrointestinal system (15.5%) were found to be high. Similar finding were seen in a study conducted by Manjunatha R et al in 2011.<sup>13</sup>

The proportion of hospitalization among blue collar workers was also found to be high (11.2%) and blue collar workers had higher sickness absenteeism than white collar workers; they lost more number of working days (21.9 days) due to sickness absenteeism when compared to white collar workers (13.2 days). As workers in Blue collar work are exposed to harmful physical and chemical work environments,<sup>14</sup> it increases the risk of having health problems, mainly involving musculoskeletal system and respiratory system,<sup>15</sup> resulting in higher sickness absences.<sup>14</sup>

## Conclusion

Sickness absenteeism is high among foundry workers when compared with other workers due to the stress and work pattern they have. Blue collar workers loose significant number of days due to sickness absence, and they face more problems related to musculoskeletal system and gastrointestinal system in comparison to other workers. It was not possible to visit each unit so current picture was not assessed completely. Personal biases of the respondents might have affected the responses. Only small sample was considered which doesn't reflect the exact picture. Further studies with larger sample size need to be conducted for the same.

**Recommendations:** We can offer employees medical, dental checkups and rehabilitation of chronic absentees as healthy employees are happy employees. A set schedule and recreational facilities can be provided, so that employees get a chance to rest. Cross training should be done to avoid burnout. Employer should have positive mindset and should have healthy relationship with employees.

**Conflict of Interest:** Nil

**Source of Funding:** Nil

**Ethical Clearance:** No intervention was done in the study and only the data was collected and analysed retrospectively.

# The Burden Leprosy Diseases in India: A Study with Special Reference to Tamilnadu and their Districts

**Dr. R. Hariharan**

*Assistant Professor, PG & Research Department of Economics, Alagappa Government Arts College,  
Karaikudi, Tamilnadu*

## Abstract

**Background:** Leprosy is one of the oldest diseases known to mankind. Despite the advancements made by science and technology, this curable disease remains misunderstood and dreaded. India is home to the largest number of new leprosy cases globally. Tamilnadu is one among state of high level of leprosy cases in India. The country was still seen to have largest number of leprosy patients in 2018 especially female and children. Keeping this view, “*The Burden Leprosy Diseases in India: A study with special reference to Tamilnadu and their Districts*” was undertaken.

**Data and Method:** The paper uses the secondary data from Report of the National Leprosy Eradication Programme, Ministry of Health and Family Welfare and other research studies and carries out the bi-variate analysis to realise its objectives.

**Findings and Suggestion:** The Tamilnadu contribution of growth of leprosy diseases was continuously decreased because our government will take more steps to reduce the number of leprosy cases. Then only it is possible to reach less than one like Kerala and Punjab. Chennai (9.07%), Erode (9.93%) and Villupuram (9.48%) are the large number new leprosy cases deducted district in Tamilnadu. The budget allocation of Tamilnadu share was very low than the other states in India for the purpose of treatment of leprosy diseases. Government will educate the female and children to prevent from the communicable diseases like leprosy.

**Keywords:** *Leprosy, Communicable Diseases, Prevalence Rate, Tamilnadu.*

## Introduction

Leprosy is one of the oldest diseases known to man. East Africa is the more likely place of origin of leprosy. Leprosy also known as Hansen’s disease (HD), is a chronic infection caused by the bacteria *Mycobacterium leprae* and *Mycobacterium lepromatosis*. Leprosy is not highly infectious. It is transmitted via droplets, from the nose and mouth, during close and frequent contacts with

untreated cases. Untreated, leprosy can cause progressive and permanent damage to the skin, nerves, limbs and eyes. In 1982 multi drug therapy (MDT) consisting of Rifampicin, Clofazimine and Dapsone were identified as cure for leprosy on recommendation of WHO came into use<sup>1</sup>.

**Signs and Symptoms:** The mode of transmission of leprosy is still unknown. It is widely believed that the most common mode of entry of leprosy bacilli into the body of the contact person is the inhalation of bacilli laden droplets of nasal secretions of the affected patient<sup>2</sup>. The peak age of onset is between 10 - 20 years. The entry of leprosy in human body ranges from 3 months to 20 years and more, the average being 2-3 years<sup>1</sup>. A person affected by leprosy, management of disability can be assisted or aggravated by that person’s own attitude and surrounding environment. It is essential for the patient

---

### Coressponding Author:

**Dr. R. Hariharan**

Assistant Professor, PG & Research Department of Economics, Alagappa Government Arts College,  
Karaikudi-03, Tamilnadu  
e-mail: ramuhariharan@ymail.com

to be part of the process of management of disability<sup>3&4</sup>. Leprosy usually starts with a non-itching and non-painful patch or patches in the skin. These patches may appear on the visible or non-visible parts of the body. Untreated leprosy can lead to Claw hands, Ulcers and wounds in feet and hands due to anaesthetic condition. Absorption of fingers and toes, Eyelids do not close and eyeballs are damaged resulting in blindness and wrist and ankle drop due to nerve damage.

**Setting the Problem:** India shares about one fourth of the global estimated leprosy case load and over 60 per cent of the registered cases<sup>5</sup>. There has been a steady increase in the number of cases through successive decades starting with 1.5 million in 1941 and reaching 79,426 cases in 2018. About 50 per cent of the patients are female and children<sup>2</sup>. Tamilnadu is one among state of high level of leprosy cases in India. Keeping this view, **“The Burden Leprosy Diseases in India: A study with special reference to Tamilnadu and their Districts”** was undertaken with the following aims.

**Objectives:** The following are the objectives of this paper: (1) To understand the Incidence and percentage share leprosy diseases in states and union territories of India; (2) To study the percentage share and prevalence rate of leprosy cases in Tamilnadu; (3) To assess the burden of new detected leprosy cases of female and children in Tamilnadu and (4) to suggest some control and prevention method to overcome the leprosy diseases in Tamilnadu.

**Data and Method:** The paper uses the secondary data from report of the National Leprosy Eradication Programme, Central Leprosy Division Directorate General of Health Services<sup>6</sup>, Ministry of Health and Family Welfare, Government of India<sup>7</sup> and other research studies and carries out the bi-variate analysis to realise its objectives.

## Results and Discussion

The percentage share of leprosy diseases in Tamilnadu during the period of 2011 to 2108 is presented in the *table-1*. The Tamilnadu contribution of growth of leprosy diseases was continuously decreased over the years except in the period of 2016 (3.7) and 2017 (3.6) in India. The Tamilnadu government will take more steps to reduce the number of leprosy cases because the percentage share of Tamilnadu was slightly increased. So Health education programmes should be better implemented to prevent the physical disabilities,

to reduce the traditional cultural beliefs and values associated with leprosy<sup>8</sup>. Then only it is possible to reach less than one per cent of leprosy cases deducted like Kerala and Punjab. But in the number of leprosy cases wise concern, India's position was continuously increased and Tamilnadu position (vice versa) is continuously decreased. In overall the table results reflects the India will have to take some more effort to reduce the leprosy problem especially to concentrate major populous states, then only possible to decline trend of leprosy cases in India.

The prevalence rate of leprosy cases in Tamilnadu is explained in the *Table-2*. The prevalence rate is calculated from the number of leprosy cases affected by their total population multiplied by one lakh. It is nothing but how much leprosy cases deducted per one lakh population in Tamilnadu. On an average four persons was affected by leprosy diseases per one lakh population in every year in Tamilnadu. The prevalence rate was less than 4.0 in 2013, 2015 and 2018. The prevalence rate was more than 4.0 in 2011, 2012, 2016 and 2017. The prevalence rate of leprosy disease in present situation is very low than the previous mentioned years in Tamilnadu. It clearly reflects the National Leprosy Eradication Programme was taken massive steps for the main reason was reduce the leprosy in Tamilnadu.

Percentage share of female and children affected by the leprosy diseases in Tamilnadu are presented in the *Table-3*. In recent years, female and Children are the most vulnerable group of population affected by the leprosy diseases in Tamilnadu. The table clearly explain the percentage share of female was continuously increasing for affected by the leprosy diseases in Tamilnadu after 2011. The current status of female leprosy cases in Tamilnadu was 2113 (65.9%). By their children wise concern, nearly and more than one fourth of the percentage of children affected by the leprosy diseases from the following years 2011 (22.7%), 2016 (24.8%) and 2017 (27.2%) by the total affected cases in Tamilnadu. In overall the table clearly reveals the percentage share of majority leprosy cases were female and children only in Tamilnadu. So our government will concentrate more on children and female and divert the more amount of public health expenditure to the female and children leprosy cases. This is the way to reduce the number and percentage share female and children leprosy cases in Tamilnadu.

*Table-4* explains the District wise percentage share

of leprosy cases in Tamilnadu during the period from 2015 to 2017. Chennai (9.07%), Erode (9.93%) and Villupuram (9.48%) are the large number new leprosy cases deducted district in Tamilnadu for following period of 2015, 2016 and 2017. Perambalur (0.86%) and Nilgiris districts (0.14%) had less than one per cent share of leprosy cases deducted in Tamilnadu in the year of 2015 in and Ariyalur (0.95%) and Nilgirs Districts (0.18%) had less than one per cent share of leprosy cases deducted in 2017. But in the year of 2016, four districts had less than one per cent share of leprosy cases deducted, they are Ariyalur (0.91%), Karur (0.75%), Perambalur (0.91%) and Nilgirs (0.37%). In overall, Villupuram district is the only district the percentage share of leprosy cases are high in all the mentioned years.

The percentage share of allocation released and expenditure during the financial year 2014-15 to 2016-17 in Tamilnadu is presented in the **table-5**. The table found that the budget allocation of Tamilnadu share was very low than the other states in India in all mentioned years but at the same time the share is slightly in increasing trend from 2015 to 2017 likewise leprosy cases deducted. By their released amount wise concern, less amount was released in the financial year of 2016-17. The Tamilnadu Government was more amount of rupees utilised for removing or reducing leprosy diseases than the allocation amount of budget.so that the new leprosy deducted from Tamilnadu in controlled manner.

**Table-1: Percentage Share of Leprosy Diseases in Tamilnadu**

Year	India	Tamilnadu	Percentage Share
2011	83041	3195	3.8

### Findings and Conclusion

The Tamilnadu contribution of growth of leprosy diseases was continuously decreased over the years except in the period of 2016 (3.7) and 2017 (3.6). The percentage share of Tamilnadu was slightly increased. So the Tamilnadu government will take more steps to reduce the number of leprosy cases. Then only it is possible to reach less than one like Kerala and Punjab. But in the number of leprosy cases wise concern, India’s position was continuously increased and Tamilnadu position (vice versa) is continuously decreased. In overall the result reflects the India will have to take some more effort to reduce the leprosy problem especially to concentrate major populous states, then only possible to decline trend.

On an average 4 persons only affected by the leprosy diseases per one lakh population in Tamilnadu every year. The prevalence rate of leprosy disease in present situation is very low than the previous mentioned years in Tamilnadu. The result clearly reflects the National Leprosy Eradication Programme was taken massive steps for the main reason was reduce the leprosy in Tamilnadu. In recent years, female and children are the most vulnerable group of population affected by the leprosy diseases in Tamilnadu. The percentage share of female was continuously increasing from 2011 onwards. So our government will concentrate more on children and female and divert the more amount of public health expenditure to the female and children leprosy cases.

This is the way to reduce the number and percentage share female and children leprosy cases in Tamilnadu. Chennai (9.07%), Erode (9.93%) and Villupuram (9.48%) are the large number new leprosy cases deducted district in Tamilnadu. The budget allocation of Tamilnadu share was very low than the other states in India for the purpose of treatment of leprosy diseases. By their released amount wise concern, less amount was released in the financial year of 2016-17. The Tamilnadu Government was more of amount of rupees utilised for removing or reducing leprosy diseases than the allocation amount of budget. That’s why the new leprosy cases deducted from Tamilnadu in controlled manner.

India achieved the goal of elimination of leprosy as a public health problem. Mahatma Gandhi did lot of work for upliftment of people affected with leprosy. There are lots of myths, socio-cultural beliefs, and the stigma attached to leprosy, so Government will conduct more awareness programme about misbelief and misconception of leprosy diseases to the public people. Most of the people they don’t have awareness about its curability. So NGOs’ will take responsibility to create awareness through the already cured people. Government will educate the children and female to prevent from the communicable diseases like leprosy. In that way only, Tamilnadu will reduce the number of leprosy affected cases in future.

# Post Endodontic Treatment in Diabetic Patients and Correlation with their Glycemic Status: A Study

R. Jagadish Rajkumaar<sup>1</sup>, Gheena S.<sup>2</sup>

<sup>1</sup>Undergraduate Student, <sup>2</sup>Reader, Department of Oral Pathology, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, SIMATS, Chennai

## Abstract

**Aim:** The aim of this study was to investigate the prevalence of flare up post endodontic treatment in diabetes mellitus (DM) patients and compare between the controlled and uncontrolled diabetic patients and to examine the effect of glycemic control on the prevalence of flare ups.

**Materials and Method:** A study was conducted of convenience sampling among 20 diabetic patients from a private dental clinic who had undergone Root canal treatment in the past one year and their post RCT radiographs and glycemic status were collected in order to correlate the success and failure of endodontic treatment.

**Result:** The prevalence of periapical pain was higher in uncontrolled diabetic group than in the controlled diabetic group (13.5 vs 11.9% respectively) this difference was statistically significant ( $p = 0.000$ ). The poorly controlled DM group had a higher prevalence of the restored tooth being extracted post complications compared with the well-controlled DM group (18.29 vs 9.21 respectively). This difference was statistically significant ( $p = 0.000$ ).

**Conclusion:** This survey therefore demonstrates a higher prevalence of flare ups in uncontrolled diabetic patients compared with controlled diabetic group, with an increased prevalence of persistent chronic apical periodontitis. Compared with a well-controlled diabetic group, a poor glycemic control may be associated with a higher prevalence of Apical Periodontal disease and increased rate of endodontic failures.

**Keywords:** Endodontic treatment, Diabetes mellitus, Periapical pain.

## Introduction

Diabetes mellitus (DM) is a group of complex multisystem metabolic disorders due to a deficiency in insulin secretion caused by pancreatic  $\beta$ -cell dysfunction and/or insulin resistance in liver and muscles. Patients with diabetes present impaired capacity of polymorphonuclear leukocytes (leukocyte adhesion, chemotaxis, and phagocytosis), hindered bactericidal activity, altered reaction to the antigens, and altered capacity of T lymphocytes. Numerous studies have shown a clear connection between chronic irritation and the advancement of Type 2 Diabetes Mellitus (DM2). The mechanisms of the effect of chronic periapical infections on diabetic patients is the Chronic inflammation through the action of inflammatory

mediators and is mainly associated with the development of insulin resistance, which is influenced by genetically modified environmental factors, including decreased physical activity, poor nutrition, obesity and infection.

Apical periodontal disease (AP) is an acute or chronic inflammatory lesion around the apex of a tooth caused by microorganism infection of the pulp canal system. Periradicular lesions consecutive to AP result from a periapical inflammatory response triggered by polymicrobial irritants from root canals. AP may be a current drawback in the treatment of endodontic treatment in patients who suffer from uncontrolled diabetes<sup>(1)</sup>. Once the disease has progressed treatment is aimed toward restoring the periradicular tissues to health: this may be usually applied by treatment

with surgical extraction<sup>(2)</sup>.The periradicular infection produces a spread of native tissue responses with the likely purpose to confine and limit the spreading of the infectious components, AP may not entirely be a localised development. In its non-balanced acute stage, spreading of the infection and additionally the inflammatory technique to close tissue compartments is possible and can increase in its severity, but it is rare to produce fatal inflammatory conditions.

Since diabetes is the third most prevalent condition in medically compromised patients seeking dental treatment, dentists should be aware of the possible relationship between endodontic infections and diabetes and take it into account in the dental treatment of diabetic patients. The prognosis of the diabetic patients undergoing root canal treatment is to be examined because of the factors that follow diabetes may promote conditions like delayed healing and less salivary flow that lead to the failure of the endodontic treatment.

### Materials and Method

A study was conducted among 20 diabetic patients from a private dental clinic who had underwent root canal treatment in the past one year and their post RCT radiographs and glycemc status were collected in order to correlate the success and failure of endodontic treatment.

### Results

The prevalence of periapical pain was higher in uncontrolled diabetic group than in the controlled diabetic group (13.5 vs 11.9% respectively) this difference was statistically significant (p = 0.000) as shown in (Table-2). The poorly controlled DM group had a higher prevalence of the restored tooth being extracted after complications compared with the well-controlled DM group (18.29 vs 9.21 respectively). This difference was statistically significant (p = 0.000) as shown in (Table-1).

**Table 1: Tooth extraction \*Group**

**Discussion**

DM affects many functions of the immune system and is associated with delayed healing and compromised immune responses<sup>(6)</sup>. DM-induced changes in immune cell function produce an inflammatory immune cell phenotype (up-regulation of pro-inflammatory cytokines from monocytes / polymorphonuclear leukocytes and down regulation of growth factors from macrophages). This predisposes to chronic inflammation, progressive tissue breakdown, and diminished tissue repair capacity<sup>(7)</sup>.

In our study the results were found to be significant for patients who had uncontrolled diabetes to contract with periapical pain followed by extraction of the tooth which is in correlation with the other scientific literature that shows a higher prevalence of periapical lesions in patients with poorly controlled diabetes<sup>(9,13)</sup>. A recent clinical study showed that patients with DM2 presented a significant association with an increased incidence of periapical lesions and endodontic treatments<sup>(14)</sup>. Regarding the success rate of endodontic treatment, another article published in 2011<sup>(15)</sup> states that patients with DM had a lower success rate in primary root canal treatment in comparison with non-diabetic patients,

while both groups presented the same success rate in secondary root canal treatment.

Bender et al.<sup>(8)</sup> reported that, in cases of poorly controlled DM, peri-apical radiolucencies tend to develop during treatment but, if DM is under therapeutic control, periapical lesions heal as readily as in non-diabetics, this is in correlation with our study.

Bender & Bender<sup>(9)</sup> found a high rate of asymptomatic tooth infections in diabetics exhibiting poor glycaemia levels of an unclear cause. Falk et al.<sup>(10)</sup> conducted a clinical and radiographic investigation showing a greater prevalence of periapical lesions in type 1 diabetics this is in contrary to the present study where all the patients examined had type 2 diabetes mellitus.

Fouad & Burlison<sup>(11)</sup> investigated endodontic diagnostic and treatment outcome data in patients with and without diabetes. A multivariate analysis showed that patients with diabetes have increased periodontal disease in root-filled teeth and have a reduced likelihood of success of root canal treatment in cases with preoperative periradicular lesions. Britto et al.<sup>(12)</sup> investigate the prevalence of radiographic periradicular radiolucencies

in root-filled teeth and untreated teeth in patients with and without diabetes. Results showed that men with type 2 diabetes who had root canal treatments were more likely to have residual lesions, this is in correlation with the present results from this study which also showed post treatment radiolucencies.

The incidence of peri-apical pain in patients with controlled and un-controlled diabetes provide evidence that the treatment objectives and definition of success should be different for these patients. A recent review concluded that current knowledge about the microbiology of endodontic infections and inflammatory reactions is limited, and that such knowledge could help implement new forms of treatment for these patients. Further research is required to better understand the issue and so as to increase the success rates of endodontic treatment among these patients<sup>(16)</sup>.

### Conclusion

This study demonstrates a higher prevalence of flare ups in uncontrolled diabetic patients compared with controlled diabetic group, with an increased prevalence of persistent Chronic Apical Periodontitis. Compared with a well-controlled diabetic group, a poor glycemic control may be associated with a higher prevalence of AP and increased rate of endodontic failures. It's been shown that diabetes exists in a bidirectional relationship with disease and should result in different oral pathologies. For this reason, doctors and dentists should be open-eyed with reference to the varied oral manifestations of diabetes so as to form an early diagnosis. Full understanding and awareness of the pathophysiology, manifestations, and management of different types of diabetes-related orofacial infection by the endocrinologist and also the dental practitioner are essential to optimizing the care of diabetic patients.

# A Descriptive Study to Assess the Knowledge, Practice and Attitude on Iron Deficiency Anemia among Adolescent Girls at Selected Private School, Kanchipuram Dt, Tamilnadu, India

R. Renuga<sup>1</sup>, S. Sivaranjani<sup>1</sup>, S. Jeevitha<sup>1</sup>, S. Ashwin Kumar<sup>1</sup>, Subbulakshmi S.<sup>2</sup>

<sup>1</sup>B.Sc. Nursing Students, Chettinad College of Nursing, Chettinad Academy of Research & Education, Rajiv Gandhi Salai, Kelambakkam, Kancheepuram District, Tamilnadu, India, <sup>2</sup>Professor, Chettinad College of Nursing, Chettinad Academy of Research & Education, Rajiv Gandhi Salai, Kelambakkam, Kancheepuram District, Tamilnadu, India

## Abstract

Prevalence of iron deficiency anemia is more common among adolescent girls. A descriptive study to assess the knowledge, practice and attitude on iron deficiency anemia among adolescent girls was conducted. The study objectives were to assess the level of knowledge, practice and attitude on iron deficiency anemia among adolescent girls, and to find out the association between the level of knowledge, practice and attitude on iron deficiency anemia among adolescent girls and with their selected demographic variables, and to find out the correlation between the knowledge & practice, knowledge & attitude and practice & attitude. 100 Adolescent girls in the age group of 13-18 years were selected as a sample for this study, based on inclusion criteria. The purposive sampling technique was used. Structured questionnaire, check list and likert scale was used as a tool to collect the data on knowledge, practice and attitude on iron deficiency anemia.

Chi-square and Karl Pearson Coefficient of correlation were used for data analysis. The study result shows that, Majority (75%) of adolescent girls were having moderate knowledge, 24% were having inadequate knowledge, and only 1% were having adequate knowledge on iron deficiency anemia. Majority (75%) of adolescent girls were having desirable practice, few 25% were having undesirable practice on iron deficiency anemia. In this study, for the knowledge, practice and attitude, mean, mean percentage and standard deviation was estimated. For the knowledge, practice and attitude, the association with the demographic variable were partially accepted. The correlation between knowledge & practice, knowledge & attitude and practice & attitude were rejected. The study concluded that, Adolescents girls were not having sufficient awareness regarding iron deficiency anemia. The study recommended that, health teaching regarding iron deficiency anemia to adolescent girls is must to overcome the high prevalence rate.

**Keywords:** Anemia, Iron deficiency anemia, knowledge-practice-attitude on anemia, Adolescent girls.

## Introduction:

Globally anemia is one of the most common and

intractable nutritional problem. Iron deficiency anemia occurs at all stages of life, but it is more prevalent in pregnant women and young children<sup>[1]</sup>. Adolescents especially girls are particularly more vulnerable to iron deficiency. The highest prevalence is between the age of 12-15 years, when requirements are at peak<sup>[2]</sup>.

In all members states of the south east Asia region, except Thailand, more than 25% of adolescent girls are reported to be anemic; in some countries the prevalence is as high as 50%<sup>[3]</sup>. Adolescence is a time of increased iron needs because of the expansion of blood volume

e-mail: jeevijaanu98@gmail.com

and increase in muscle mass [4]. Young women are at particular risk for the development of iron deficiency due to menstrual blood loss [5]. In addition, adolescent athletes and adolescents who limit their intake of meat products are at risk. Iron deficiency affects both physical endurance and cognitive performance in adolescents [6].

**Title of the Study:** A descriptive study to assess the knowledge, practice and attitude on iron deficiency anemia among adolescent girls at selected private school, Kancheepuram Dt.

**Objectives of the Study:**

- To assess the level of knowledge, practice and attitude on Iron deficiency anemia among adolescent girls.
- To find out the association between the level of knowledge, practice and attitude on iron deficiency anemia among adolescent girls and with their selected demographic variables.
- To find out the correlation between the knowledge & practice, knowledge & attitude and practice & attitude.

**Operational Definition:**

**Assess:** It is the organized, systematic and continuous process of collecting data from adolescent girls regarding iron deficiency anemia.

**Knowledge:** It refers to the facts, information and skills acquired by the sample regarding iron deficiency anemia, which was evaluated through structured questionnaire.

**Practice:** It refers to the use or application of a gained knowledge and acquiring skills in their daily life by the sample regarding iron deficiency anemia, which was evaluated through check list.

**Attitude:** It refers to the sample point of view or perception regarding iron deficiency anemia, which was evaluated through likert scale.

**Iron Deficiency Anemia:** Anemia is defined as haemoglobin (Hb) level less than 12.0 g/dl in women and less than 13.0 g/dl in men. The decreased number of haemoglobin level due to poor intake of iron rich foods[1].

**Adolescent Girls:** It refers to the girls who attained puberty between the 13 to 18 years of age, studying 9<sup>th</sup>

Standard.

**Material and Method**

**Research Approach:** Quantitative, Evaluative approach was seems to be the most appropriate approach for this study.

**Research Design:** Non Experimental, Descriptive design was to be the most appropriate design for this study.

**Research Setting:** This study was conducted at Buvana Krishnan Matriculation Higher Secondary School, Kelambakkam, Kanchipuram Dt, Tamilnadu, India.

**A. Population:**

**Participants:**

- Adolescent girls who attained puberty between the age of 13-18 years at Buvana Krishnan Matriculation Higher Secondary School, Kelambakkam, Kanchipuram Dt, Tamilnadu, India.

**B. Sampling Technique:**

- Non probability purposive-Sampling technique was used for this study.

**C. Sample Size:**

- Sample size  

$$n = [DEFF * Np(1-p)] / [(d^2 / Z^2_{1-\alpha/2} * (N-1) + p*(1-p)]$$
- Confidence Level : 95%
- Confidence Interval : 5%
- Population : 300
- Sample size : 100

At the confidence level of 95%, the sample size (n) is 100

**G. Sampling Criteria:**

**(A) Inclusion Criteria:**

- The study includes the adolescent girls who were
- attained puberty between the age of 13-18 years.
  - can able to understand Tamil and English.
  - willing to participate in this study.

**(B) Exclusion Criteria:**

The study excludes the adolescent girls who were,

- less than 13 years and more than 18 years of age.
- absent on the day of data collection.
- not willing to participate in this study.

**Datacollection Tool:** The data was collected by using Structured Tool.

**It contains two parts:**

**Section-A:** Selected demographic variables of adolescent girls.

**Section-B:** It includes the three parts

Part-1: It includes Multiple choice questions to assess the level of knowledge on iron deficiency anemia.

Part-2: It includes Dichotomous questions (Yes/No) to assess the practice regarding iron deficiency anemia.

Part-3: It includes Likert scale to assess the attitude of sample regarding iron deficiency anemia.

**Plan for Data Collection:**

- The researcher planned to collect the data for the period of one week.
- The written consent was obtained from the participants before gathering the information.
- In this present study the researcher, collected the demographic data and Responses for the tool to assess the knowledge, practice and attitude on iron deficiency anemia among adolescent girls.

**Plan for Data Analysis:** The data was organized, tabulated and analyzed by using descriptive and inferential statistics.

**(A) Descriptive Statistics:**

- It includes mean, frequency, percentage, range, and standard deviation.

**(B) Inferential Statistics:**

- Chi-square test was used.
- Karl Pearson Coefficient of correlation was used.

**Analysis and Interpretation:**

**Research Design:**

- Descriptive study was used to conduct this study. The data obtained from the adolescent girls from June 11.06.2019 to June 15.06.2019 in Buvana Krishna Matriculation Higher Secondary School,

Kelambakkam.

- Sample of 100 adolescent girls were selected, who met the inclusion criteria were selected for the study by using purposive sampling method. Structured questionnaire, check list and likert scale was used as a tool to collect the data on knowledge, practice and attitude on iron deficiency anemia.
- Prior permission and consent were obtained from the respective authorized person. Chi- Square test was used to find out the association related to knowledge, practice and attitude on iron deficiency anemia. Correlation Coefficient was used to find out the correlation between the knowledge & practice, knowledge & attitude and practice & attitude.

**Assessment of Demographic Variable of Adolescent Girls:**

The study findings revealed that

Majority of (79%) of adolescent girls were in the age group of 12-14 years. Most (56%) of the adolescent girls father's educational status were belongs to the High school education. Most (49%) of the adolescent girls Mother's educational status were belongs to the High school education. Most (48%) of the adolescent girls father's occupational status were belongs to the private sector. Most (57%) of the adolescent girls mother's occupational status were belongs to the category of home maker. Most (69%) of the adolescent girls family type was belongs to the Nuclear family. Most (56%) of the adolescent girls were belongs to the category of having only 1 sibling. Majority (54%) of their family income of adolescent girls was above RS.10,000. Majority (85%) of the adolescent girls dietary pattern were belongs to the category of mixed diet. Most (48%) of the adolescent girls attained menarche in the age of 13-14 years. Majority (56%) of the adolescent girls having 3-5 days of menstrual flow. Majority (61%) of the adolescent girls having the menstrual cycle of 20-25 days once. Majority (70%) of adolescent girls received information on Iron Deficiency anemia through their teacher. Majority (92%) of adolescent girls not having the family history of Iron deficiency anemia.

**Assessment of Level of Knowledge of Adolescent Girls on Iron Deficiency Anemia:**

The study findings revealed that

Majority (75%) of adolescent girls were having moderate knowledge, 24% were having inadequate

knowledge, and only 1% were having adequate knowledge on iron deficiency anemia.

#### **Assessment of Level of Practice of Adolescent Girls on Iron Deficiency Anemia:**

The study findings revealed that

Majority (75%) of adolescent girls were having desirable practice, few 25% were having undesirable practice on iron deficiency anemia.

#### **Assessment of Level of Attitude of Adolescent Girls on Iron Deficiency Anemia:**

The study findings revealed that,

Majority (75%) of adolescent girls were having moderate knowledge, 24% were having inadequate knowledge, and only 1% were having adequate knowledge on iron deficiency anemia.

**Mean, Mean Percentage and Standard Deviation of Knowledge, Practice and Attitude on Iron Deficiency Anemia:** In this study, for the knowledge, practice and attitude, mean, mean percentage and standard deviation was estimated. For the knowledge, mean value is 12, mean percentage is 53% and standard deviation is 4. For the practice, mean value is 6, mean percentage is 57% and standard deviation is 2. For the attitude, mean value is 68, mean percentage is 68% and standard deviation is 7.

#### **Association between the Demographic Variable and Knowledge of Adolescent Girls on Iron Deficiency Anemia:**

The study findings revealed that,

Demographic characteristic of age of the adolescent girls had a significant association [(P = 0.01) ( $X^2 = 16.3$ ) at  $P < 0.01$  level] with the level of knowledge of adolescent girls on iron deficiency anemia. The adolescent girls who were in the age group of 12-14 years had more level of knowledge on iron deficiency anemia than the 15-18 years. Other demographic characteristics such as father's educational status, mother's educational status, father's occupational status, mother's occupational status, type of family, number of siblings, family income, dietary pattern, age of menarche, duration of bleeding, length of menstrual cycle, source of information and family history of iron deficiency anemia, not had a significant association with the level of knowledge of adolescent

girls on iron deficiency anemia at the level of  $p = 0.05$ . Hence, the null hypothesis  $H_01$  is partially accepted.

#### **Association between the Demographic Variable and Practice of Adolescent Girls on Iron Deficiency Anemia:**

The study findings revealed that,

Demographic characteristic of age of the adolescent girls had a significant association [(P = 0.01) ( $X^2 = 19.53$ ) at  $P < 0.01$  level] with the level of practice of adolescent girls on iron deficiency anemia. The adolescent girls who were having a family monthly income of RS.10,000 and above, had more level of desirable practice on iron deficiency anemia than the family income of RS.5000 and RS.5001-10,000.

Other demographic characteristics such as father's educational status, mother's educational status, father's occupational status, mother's occupational status, type of family, number of siblings, dietary pattern, age of menarche, duration of bleeding, length of menstrual cycle, source of information and family history of iron deficiency anemia, not had a significant association with the level of practice of adolescent girls on iron deficiency anemia at the level of  $p = 0.05$ . Hence, the null hypothesis  $H_02$  is partially accepted.

#### **Association between the Demographic Variable and Attitude of Adolescent Girls on Iron Deficiency Anemia:**

The study findings revealed that,

Demographic characteristics such as age, father's educational status, father's occupational status, mother's occupational status, family income, type of family, number of siblings, dietary pattern, age of menarche, duration of bleeding, length of menstrual cycle, source of information and family history of iron deficiency anemia, not had a significant association with the level of attitude of adolescent girls on iron deficiency anemia at the level of  $p = 0.05$ .

Demographic characteristics of mother's educational status, not had a significant association with the level of attitude of adolescent girls on iron deficiency anemia at the level of  $p = 0.01$ . Hence, the null hypothesis  $H_03$  is partially accepted.

#### **Correlation of Knowledge and Practice of Adolescent Girls on Iron Deficiency Anemia.**

In this study, while comparing the knowledge score along with practice, it shows that, there is a moderately positive correlation between knowledge and practice. It indicates that, when knowledge increases practice also increases ( $r = 0.5$ ). Hence, the null hypothesis  $H_04$  is rejected.

#### **Correlation of Knowledge and Attitude of Adolescent Girls on Iron Deficiency Anemia.**

In this study, while comparing the knowledge score along with attitude, it shows that, there is a moderately positive correlation between knowledge and attitude. It indicates that, when knowledge increases attitude also increases ( $r = 0.5$ ). Hence, the null hypothesis  $H_05$  is rejected.

#### **Correlation of Practice and Attitude of Adolescent Girls on Iron Deficiency Anemia.**

In this study, while comparing the practice score along with attitude, it shows that, there is a moderately positive correlation between practice and attitude. It indicates that, when practice increases attitude also increases ( $r = 0.6$ ). Hence, the null hypothesis  $H_06$  is reject.

#### **Recommendation:**

- The same study can be replicated on a larger sample and at a different settings.
- The research can be conducted on nutritional assessment, and hemoglobin estimation for assessing iron deficiency anemia.
- A structured teaching programme can be prepared and given to the Village Health Nurse and Schools to incorporate their knowledge on iron deficiency anemia among adolescent girls.
- A true experimental study can be conducted to assess the effectiveness of Instructional Teaching Programme on iron deficiency anemia.

## **Conclusion**

Adolescence is an opportunity time for interventions to address anemia. Interventions to prevent and correct the iron deficiency anemia therefore must include measures to increase iron intake through food based approaches, namely dietary diversification and food fortification with iron; iron supplementation and by improved health services and sanitation.

**Conflict of Interest:** Nil

**Source of Funding:** Self funding and no external funding.

**Ethical Clearance:** Obtained clearance from institutional human ethical committee on 04.02.2019.

## Abstract

To evaluate the effectiveness of structured teaching programme regarding weaning practices among Primipara mothers. To determine the association on weaning practices with the selected demographic variables. The convenience sampling technique with the sample of 53 primipara mothers and self structured questionnaire to assess the pre-test and post-test knowledge of mothers on weaning practices. The structured teaching programme to assessing the level of knowledge of primipara mothers on weaning practices. The level of significance selected was  $p < 0.05$ . The data collection tools was validated and reliability was established. The data were collected by self structured questionnaire. The collected data was tabulated and analyzed. Descriptive and inferential statistics were used. The pre test mean value is 8 and post test mean value is 97 and the pretest standard deviation is 2.227 and post test standard deviation is 336.4. The study showed that pretest on 1.88 % of primipara mothers had adequate knowledge, 58.4% of primipara mothers had moderate knowledge, 39.6% of the primipara mothers had inadequate knowledge and post test on 92.4% of primipara mothers had adequate knowledge, 7.54 % of primipara mothers had moderate knowledge, 0% of the primipara mothers had inadequate knowledge on weaning practices and there was a significant association of the knowledge with demographic variables.

**Keywords:** Knowledge, Weaning practices, Primipara mothers.

## Introduction

*“Children are the wealth of tomorrow; take care of them if you wish to have a strong India ever ready to meet various challenges”* —[Jawaharlal Nehru]

The term ‘to wean’ means to ‘accustom’ and it is defined as the process by which the infant gradually becomes accustomed to the full adult diet. The physiological process of weaning is complex and includes biochemical, microbiological, immunological,

nutritional and psychological adjustments. Weaning food is important both socially and nutritionally. Additional protein becomes necessary towards the end of the first year of life and the infant also wants bulk of roughage about this time (K. Park, 2005).<sup>[14]</sup>

Weaning is the term which will be familiar for every mother. Proper knowledge and training is required to perform effective weaning. Many studies conducted on Weaning practices in India and abroad reveal that most of the mothers, especially primipara mothers have inadequate knowledge regarding effective weaning practices as they are following traditional feeding practices. Effective weaning in the child requires proper knowledge and good technique skills in the mothers. The investigator found the Structured Teaching Programme to improve the level of knowledge on primipara mothers regarding Weaning.<sup>[12]</sup>

Weaning is one of the many milestones in baby’s process of development. It is very important for baby’s health and development. Weaning is process were baby moves or shifts from having breast feed to consuming solid or semi solid or Its gradual adaptation of the baby from breast feed to other foods(Piyush Gupta 2014).<sup>[12]</sup>

Weaning can be initiated by child, mother or it may be shared decision of both in age between 4 month to 4 years. It is unknown for an infant younger than 12 months to self wean. The duration of weaning varies from child to child.<sup>[11]</sup>

Weaning can be a very emotional time for the woman and child. It is not just a transition to another feeding method, but conclusion of special relationship between mother and child. During this process child may need more attention and cuddle time to take the place the nursing (Ghai OP, Paul VK, Bagga.A 2015).<sup>[11]</sup>

**Research Methodology:** A Quantitative approach with descriptive design was used in the study. The study was conducted among Primipara mothers above(6 months-1 year) in a Selected area, Kanchipuram District, Tamil Nadu, India. Non-probability purposive sampling technique was used to select 58 samples with the following inclusion criteria.Primipara mothers who are:After 6 months of postpartum period,Accessible during the study,Willing to participate in the study,Who can read and understand Tamil and English.The data was analysed by using descriptive and inferential statistics.

**Research Tool:** It consists of self structured questionnaire to assess the pre-test and post-test knowledge of mothers on weaning practices.A structured teaching programme will be prepared for weaning practices as a tool for data collection. It will consist of the following section.

**Part-1:** Questions related to socio demographic profile of mother which includes.Age of mother (in years) at time of delivery, Type of family, Mothers education, Mothers working status, Monthly income in rupees, Nationality, Types of delivery, Gestational age, History of baby admitted in NICU, Information regarding weaning practice.

**Part-2:** Self-structured Questionnaires related to weaning practices.

**Scoring Interpretation:**

Scoring	Level of Knowldege
Below 75%	Adequate knowledge
51-75%	Moderated knowledge
Above 50%	Inadequate knowledge

**Summary, Finidings, Implications, Limitations, Conclusion And Recommendations:** The essence of any research project lies in reporting the findings this chapter gives brief of the present study including conclusion drawn from the finding recommendation,Ilimitations, suggestion for future studies and running implication.

**Summary:** The objectives of the study were

1. Evaluate the effectiveness of structured teaching programme regardingweaning practices among Primipara mothers.
2. Determine the association on weaning practices with the selecteddemographic variables.

**The study attempted to examine the following research hypothesis that**

H<sub>0</sub>. There is no significant association on weaning practices with selected demographic variables among primipara mothers in a selected area at Kanchipuram District, Tamil Nadu, India.

The review of literature enabled the investigator to develop methodology of the study literature review was done and organized as studies to knowledge on weaning practices among primipara mothers .

1. The research approach used was quasi experimental one group pretest post test research design to evaluate the weaning practice among primipara mothers.
2. 53 samples were selected by sampling the main study was done in a selected area at Kancheepuram District, Tamil Nadu, India.
3. A self structured questionnaire was used to collect the data regarding the knowledge on weaning practices being among primipara mothers.
4. The data gathered were analyzed by using descriptive and inferential statistical method .The finding were presented on the basis of objectives of the study.

**Findings:** Findings of the study were presented under the following headings based on the study objectives.

**Objective 1:** To evaluate the knowledge on structured teaching programme regarding weaning practices among Primipara mothers.

**The Findings of the Present Study Reveals that Pretest:**

S.No.	Level of Knowledge	Frequency	Percentage
1	Adequate knowledge (below 75%)	01	1.88%
2	Moderate knowledge (51-75%)	31	58.4%
3	Inadequate knowledge (above 50%)	21	39.6%
		<b>Total</b>	<b>100%</b>

**The Findings of the Present Study Reveals that Post Test:**

S.No.	Level of Knowledge	Frequency	Percentage
1	Adequate Knowledge (below 75%)	49	92.4%
2	Moderate Knowledge (51-75%)	04	7.54%
3	Inadequate Knowledge (above 50%)	0	0%
		<b>Total</b>	<b>100%</b>

**Objective 2:** To determine the association on weaning practices with the selected demographic variables among primipara mothers.

To find out the association between pretest level of knowledge regarding weaning practices with selected sociodemographic variables. But since there is inadequate pre test level of knowledge between selected socio demographic variables, the investigator cannot proceed to analyze the association between pre test level of knowledge with selected socio demographic variables.

The findings of the study shows that there is a statistically significant difference between pre test and post test level of knowledge and there was no statistical significant in pre test level of knowledge with regard to age of mother (in years at time of delivery), types of family, mothers education, mothers working status, types of delivery, gestational age, baby admitted to the NICU, received information on weaning practices.

**Nursing Implication:**

**Nursing Practice:** The community health nurses working in the health services should be equipped with the knowledge to evaluate the knowledge on weaning practices among primipara mothers.

Health teaching programmes to evaluate knowledge regarding weaning practices are to be scheduled on fixed days and time. The nurse to evaluate the knowledge on primipara mothers by using appropriate audio visual aids like flash cards and through mass media.

**Nursing Education:** During training period, emphasis needs to be given in preparing health education regarding importance of monitoring the health status.

A structured teaching programme regarding weaning practices on conduct the pretest and post test should be given special focus in nursing education. The students are given opportunity to do flash card to the primipara mothers regarding weaning practices. In area setting people are utilized to teach the mothers to gain knowledge on post test regarding weaning practices.

**Nursing Administration:** The community health nursing administrator holds more responsibilities in understanding weaning practices of primipara mothers.

The administrator should initiate health education programmes in a community utilizing the trained staff and encouraging them in such activities.

Extend the role in strengthening and designing the primary health centre services as per the felt of the community to bring healthy future citizens.

Regular follows-up services are to be planned in an effective way to strengthen and widen the peripheral approach.

The administration should facilitate to implementation of various health education programmes and such activities need to be documented for better implementation.

**Nursing Research:** Nurse researchers should be motivated to conduct more studies on weaning practices.

Nurse researchers should concentrate on weaning practices children.

Nurse researchers should come forward to develop validate new strategies standardized tool to improve knowledge on primipara mothers.

**Limitations:** Primipara mothers in early postpartum period (Before 6 months) are only included in the study.

Mothers who are not willing.

**Recommendations:** The study can be conducted in the rural area.

The study can be conducted at the hospital setting, PHC, child clinic.

The study can be taken for the cross sectional, pre experimental study.

Health education like flash cards, booklet, modules regarding weaning practices can be taught to the postnatal mothers.

### Conclusion

The finding of the present study reveals that pretest on 1.88% had Adequate knowledge, 58.4% had Moderate knowledge, 139.6% had Inadequate knowledge, that post test on 92.4% had Adequate knowledge, 17.54% had Moderate knowledge, 0% had Inadequate knowledge, The findings of the study shows that there is a statistically significant difference between pre test and post test level of knowledge and there was no statistical significant in pre test level of knowledge with regard to age of mother (in years at time of delivery, types of family, mothers education, mothers working status, types of delivery, gestational age, baby admitted to the NICU,

received information on weaning practices with selected demographic variables.

# Anthropometric Profile of Mentally Challenged Children

Syed Tariq Murtaza<sup>1</sup>, Ashish Kumar Katiyar<sup>2</sup>, Farkhunda Jabin<sup>3</sup>

<sup>1</sup>Principal Investigator & Associate Professor, <sup>2</sup>Project Fellow & Level-2 Anthropometrist (ISAK), Department of Physical Education, A.M.U., Aligarh (U.P.) India, <sup>3</sup>Physician & Assistant Professor, Department of Ilaj Bit Tadbeer (Regimenal Therapies), Jamia Hamdard University, New Delhi, India.

## Abstract

A concise report on mentally challenged children was focused on to their health and wellbeing by assessing their somatotype characteristics. For this study 25 (male) participants, age ranging in between 14 - 18 years, trainable and educable mentally challenged without any multiple disabilities were selected from Special School for Mentally Challenged People under Department of Teacher Training & Non-formal Education, Jamia Millia Islamia, New Delhi. Purposive sampling method and Ex-post facto design were applied. By using Heath- Carter Anthropometric Method each subject was somatotyped. Analysis of Data done through SOMATOTYPE (Computer Programs for Somatotype Analysis) to calculate somatotypes, descriptive and comparative statistics and plotting somatocharts with mean, standard deviation. The result clearly indicated that mentally challenged participants have low level of body fat and observed more percentage in mesomorphic and ectomorphic category and it has been observed that they all were having improper skeleto-muscular development, unbalanced lifestyle. So, it is necessary for mentally challenged participants to involve in special physical education program to develop their fitness level.

**Keyword:** Somatotype, Heath- Carter, somatometry, somatochart, somatoplot.

## Introduction

In anthropology Somatometry is a fundamental research method used for the assessing the somatic symmetries of human beings in order to understand growth, exercise, performance, and nutrition. Before starting the measurement, it is imperative to ask certain questions as like; 1) Why am I measuring; 2) kind of data to be generated; 3) how to determine the points of measurement on the body; 4) by which instruments, measurement should be taken (Toth, T., et.al 2014)<sup>1</sup>?

Any somatotype will be evaluated by denoting three numerical; the first number being the endomorphic;

second numerical denotes the mesomorphic status; and the third numerical denotes ectomorphic status. Any component below 2.5 is considered low in rating, from 3.0 to 5.0 represents medium and 5.5 to 7.0 as high status. Higher than 7.5 values are always considered as extreme. The calculated triple-numbers are applied to a sphere-shaped triangle (asomatograph) on the each side of peak are like marginal types; in the centre, balanced types; and inside medium types (Carter, 1996)<sup>2</sup>.

Sheldon's typology was the principle, who gave the concept of somatotypology by classifying people into three types *viz.* endomorphic, mesomorphic, and ectomorphic based on thousands of photographs and measurements that he yielded during data collection from Ivy League schools (Carter and Heath, 1990)<sup>3</sup>. The estimations of each segment and their common proportion express the particular individual variations in the shape and composition of a human body and its parts.

Persons with disabilities (PwDs) stay among the most minimized in every society. While the International

Human Rights framework is the agency responsible to deal with the issues of human rights and it has changed lives of all, especially persons with disabilities (PwDs). It's a starking fact that PwDs are the last in long que to get the basic human rights. Most of the PwDs have to look at the others' face to help them in mundane activities of life.

As the case with every regular human needs, the expert guidelines for systemic physical activity for the PwDs is very scarce. From the last thirty years, we have been seeing the importance of regular physical activity in the open sunlight as it was also highlighted by (Rimmer, Braddock, and Pitetti, 1996)<sup>4</sup>.

*"The benefits of physical activity and physical fitness have become one of the more popular topics in media circles, with findings from new studies being reported on the evening news, radio talk shows, and in newspapers and magazines around the country. But despite all this publicity, the message seems to be reaching only a small percentage of Americans. Much of the rest of the country remains sedentary, and despite knowing very little about the physical activity habits of persons with disabilities, it is generally accepted that they are at the forefront of this sedentary existence"*.

As, we all know the impact of regular systemic physical activities on one's well-being to preserve and maintain health, hence more efforts are needed to scrutinize exercise guidelines for PwDs.

The outsized collection of somatotype studies has specified up much constructive information in relation to normal children's body type. Nevertheless presently any studies have been hardly conducted on mentally challenged children, especially in India. Keeping this in mind an effort has been made to study anthropometric somatotype profile of mentally challenged children's of India.

## Material and Method

Participants of the Study: 25 (male) participants, age ranging in between 14 - 18 years, trainable and educable mentally challenged without any multiple disabilities were selected from Special School for Mentally Challenged People under Department of Teacher Training & Non-formal Education, Jamia Millia Islamia, New Delhi.

**Research Design:** Ex-post facto design was used.

**Study Population and Sampling:** The targeted population included male adolescents with mental disabilities. A purposive sampling of adolescents was used to collect sample and retrieved information. Purposive sampling is suitable for the difficult-to-reach special target population stated by (Neuman, 2006)<sup>5</sup>.

**Equipment for Somatotype:** Anthropometric equipment include a stadiometer and headboard, weighing scale, small sliding caliper, flexible steel tape measure, and a skin fold caliper. The small sliding caliper is a modification of a standard anthropometric caliper or engineer's vernier type caliper. For accurate measuring of biepicondylar breadths the caliper branches must extend to 10 cm and the tips should be 1.5 cm in diameter (Carter, 1980)<sup>6</sup>. Skinfold caliper should have upscale interjaw pressures of 10 gm/mm<sup>2</sup> over the full range of openings.

**Measurement Techniques:** The following procedure was adopted from (Carter and Heath, 1990)<sup>7</sup> for analyzing anthropometric somatotype for that we are needed to calculate ten (10) anthropometric bodily measurements i.e. height, body mass, four skinfolds (triceps, subscapular, supraspinale, medial calf), two bone breadths (biepicondylar Humerus and femur), and two limb girths (arm flexed and tensed, calf).

**Procedures to Prepare Somatochart:** A computer program SOMATOTYPE developed by Carter and Goulding, was used for Somatotype Analysis to calculate somatotypes, descriptive and comparative statistics and for plotting somatocharts too (Carter & Goulding, 2007)<sup>8</sup>.

## Results and Discussion

The descriptive statistics Table 1, shows the mean, median, standard deviation and range from all the selected variables of the participants' in which all the major components of somatotype (Endomorphy, Mesomorphy, Ectomorphy); *somatotype attitudinal distance (SAD)* which is the three-dimensional distance from a profile to the mean of all profiles; *Height-Weight Ratio (HWR)* calculated as height (cm) divided by mass (kg) raised to the power 1/3, i.e.  $HWR = \text{Height}/(\text{Mass})^{1/3}$ ; *Age*; and *Anthropometric Variables* (Height and Mass; Triceps, Subscapular, Supraspinale and Calf Skinfolds; Flexed Arm and Calf Girth; Biepicondylar Humerus and Femur Breadth) were given below.

The following table presents descriptive statistics of 10 anthropometric variables, which were also

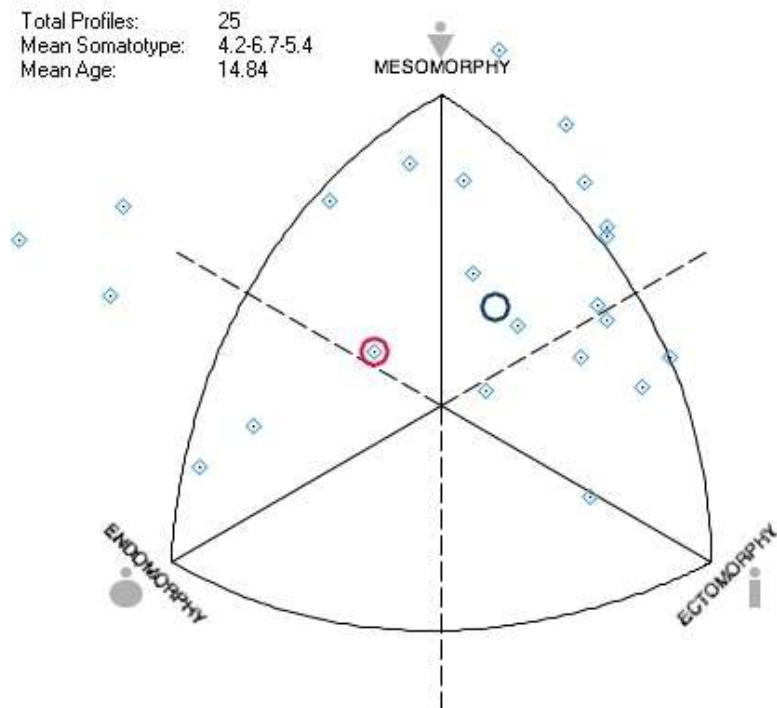

recorded for the assessment of anthropometric profile of the participants. The mean value of height and weight was 154.2 cm (SD 16.98 cm),38.86 kg (SD

10.96 kg) respectively. Descriptive statistics for other anthropometric variables e.g. skin folds; breadths and girths measurements are also given in the Table 1.

**Table 1: Descriptive Statistics of Anthropometric Measurements of Mentally Challenged Participants.**

Variable	Mean	Median	SD	Range

O	0.9	0.1	28.1	77.39	27.2	-28.8	balanced ectomorph
P	2.7	6.2	6.4	47.84	3.7	3.3	mesomorph-ectomorph
Q	10.4	8.9	1	40.31	-9.4	6.4	mesomorphic endomorph
R	4.1	7	4.8	45.57	0.7	5.1	ectomorphic mesomorph
S	1.6	4.2	6.1	47.33	4.5	0.7	mesomorphic ectomorph
T	2	7.3	5.7	46.78	3.7	6.9	ectomorphic mesomorph
U	8.2	4.3	2.8	42.87	-5.4	-2.4	mesomorphic endomorph
V	2.8	7.4	3.3	43.54	0.5	8.7	balanced mesomorph
W	1.7	9.2	3	43.16	1.3	13.7	ectomorphic mesomorph
X	2.7	6.4	6.2	47.47	3.5	3.9	mesomorph-ectomorph
Y	1.9	8.7	4.7	45.52	2.8	10.8	ectomorphic mesomorph

From the Table 2, total percentage of profiles which falls under each of the significant somatotype categories has been shown in table no. 3.

**Table 3: Percentage of profiles which fall under each of the significant somatotype categories.**

S.No.	Major Somatotype Categories	Number of People	Percentages
1	Endomorph-Ectomorph	0	0
2	Ectomorphic endomorph	0	0
3	Balanced endomorph	0	0
4	Mesomorphic endomorph	4	16%
5	Mesomorph-endomorph	2	8%
6	Endomorphic Mesomorph	3	12%
7	Balanced Mesomorph	1	4%
8	Ectomorphic Mesomorph	7	28%
9	Mesomorph-Ectomorph	3	12%
10	Mesomorphic Ectomorph	3	12%
11	Balanced Ectomorph	2	8%
12	Endomorphic Ectomorph	0	0%
13	Central	0	0%
	<b>Total</b>	<b>25</b>	<b>100%</b>

From the category chart, the result reveals that mentally challenged participants were found more mesomorphic and less endomorphic in comparison to ectomorphic from the overall participant's profiles Somatotype data.

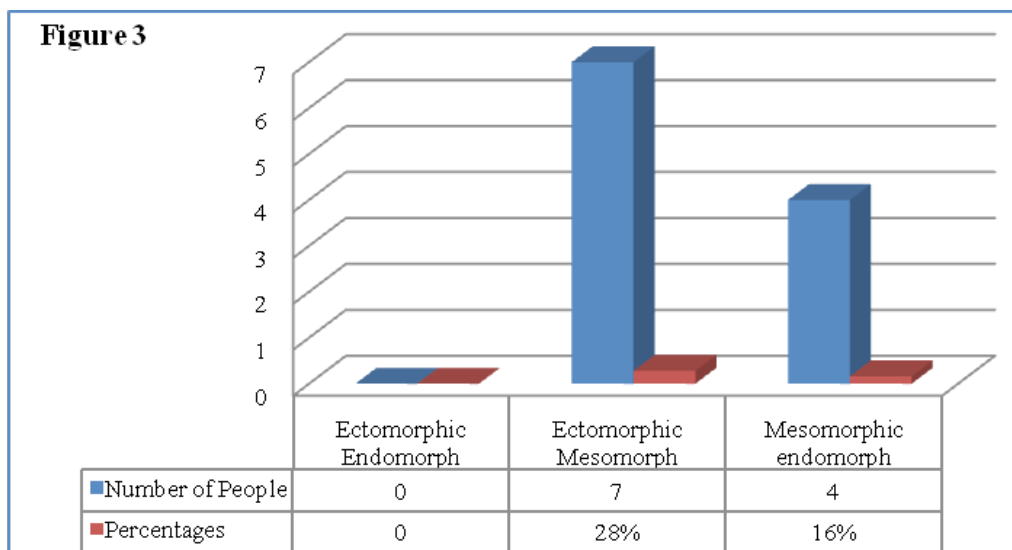

And from Table 3, graphical representations of all the major somatotype categories as per the somatotype

category chart are presented and given below in the Figure 2, 3, & 4.

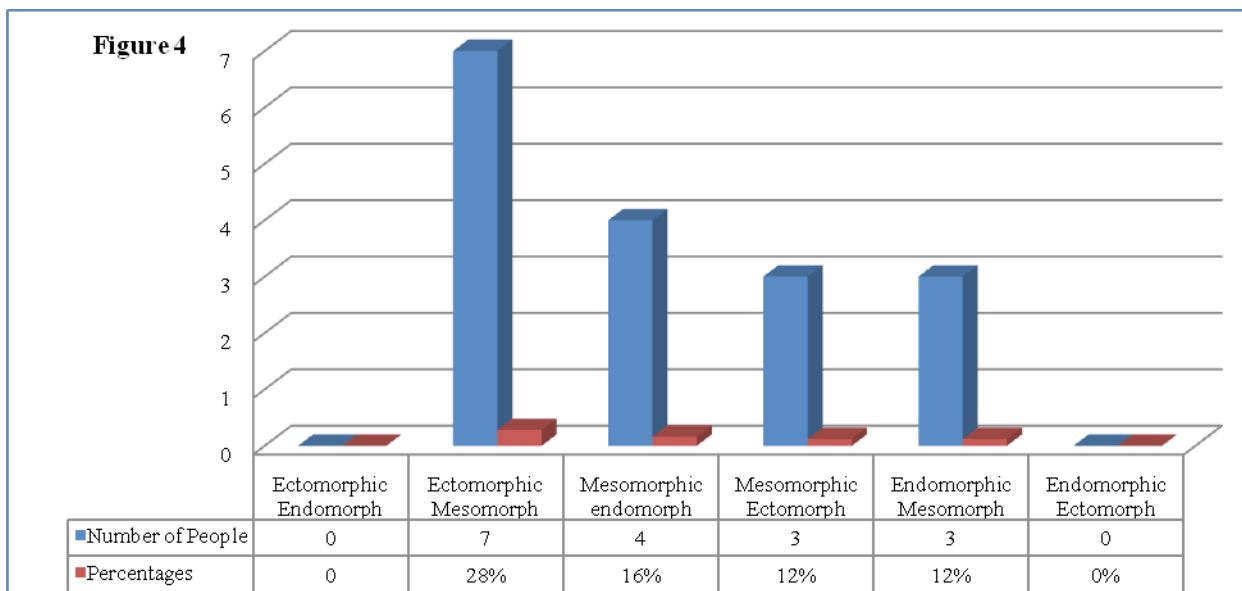

The Figure 2, shows the total number of people and total number in percentage which fall under the category of Balanced Mesomorph (4%), Balanced Ectomorph (8%) from overall Somatotype profiles data.

The Figure 3, shows the total number of people and total number in percentage which fall under the category of Mesomorph-Endomorph (8%), Mesomorph-Ectomorph (12%) from overall Somatotype profiles data.

The Figure 4, shows the total number of people and total number in percentage which fall under the category of Ectomorphic Mesomorph (28%), Mesomorphic-Ectomorph & Endomorphic Mesomorph are (12%), Mesomorphic endomorph (16%) from overall Somatotype profiles data.

### Conclusion

The data show that endomorphic component is lower in comparison to ectomorphic and mesomorphic, the maximum number of participants falls under ectomorphic mesomorph category. This shows that participants found greater in number in mesomorphic and ectomorphic in comparison to endomorphic characteristics. In balanced category of Mesomorph, mentally challenged participants are found lowered in comparison to Ectomorph from overall Somatotype profiles data. Result clearly indicates that mentally challenged participants have low level of body fat and observed more percentage in mesomorphic and ectomorphic category. It is very important for mentally challenged participants to get involved in physical activity because they have improper skeleto-muscular development system and having unbalanced lifestyle. It is necessary for mentally challenged participants to involve in special physical education program to develop their fitness level.

# The Relationship of Low Birth Weight Babies with Stunting in Toddlers Aged 12-36 Months in Bogor Regency, 2019

Ari Wijayanti<sup>1</sup>, Ratna Djuwita<sup>1</sup>

<sup>1</sup>Department of Epidemiology, Faculty of Public Health, Universitas Indonesia

## Abstract

**Background:** The incidence of short toddlers to as stunting is one of the nutritional problems experienced in the world and in Indonesia. Stunting is caused by many factors, one of the most basic factors is Low Birth Weight Babies (LBW). To assess the association of LBW to stunting in toddlers aged 12-36 months in Bogor Regency, Indonesia is the purpose of this study.

**Method:** This study used a cross-sectional study design with a total sample of 500 toddlers aged 12-36 months taken in Bogor Regency, West Java Province, Indonesia. Stunting status is assessed based on the height/age indicator  $<-2$  z-score, while the LBW categorization is baby born weight  $<2500$  grams. Analysis of the association between LBW and stunting in this study uses multivariate cox regression analysis and the magnitude of the effect is expressed in the prevalence ratio (PR) with a confidence interval (CI) of 95%.

**Result:** The results of this study indicate the prevalence of stunting in toddlers aged 12-36 months in Bogor regency is 39.2%. Cox regression test results of LBW relationship with stunting showed PR 1.51 (95% CI: 1.01-2.24) which means that toddlers born with LBW ( $<2500$  grams) had a stunting prevalence of 1.51 times higher than toddlers with normal birth weight ( $>2500$  grams) after being controlled by the variable "mother's education".

**Conclusion:** Stunting can be prevented by reducing LBW rates by increasing maternal nutrition during pregnancy and improving mother's education so it will increase mother's knowledge related to nutrition intake consumed during pregnancy and toddlers with LBW will be reduced.

**Keywords:** *Stunting, 12–36 months, Child, Low Birth Weight, Bogor Regency.*

## Introduction

The incidence of short toddlers or commonly referred to as stunting is one of the nutritional problems experienced by toddlers in the world today. In 2017, 22.2% or around 150.8 million toddlers in the world experienced stunting. More than half the stunting toddlers in the world came from Asia (55%), while 39%

lived in Africa. Indonesia is included in the third country with the highest prevalence in the South-East Asia Regional (SEAR), stunting prevalence data collected by the World Health Organization (WHO). The average prevalence of stunting toddlers in Indonesia in 2005 - 2017 is 36.4%<sup>(1)</sup>.

According to Decree of the Minister of Health Number 1995/MENKES/SK/XII/2010 concerning Anthropometric Standards for Assessment of Child Nutrition Status, the short and very short definition is nutritional status based on Body Length Index by Height by age which is the equivalent of the terms stunted (short) and severely stunted (very short). Short toddlers (stunting) can be known if a toddler has measured his length or height, then compared to the standard,

and the results are below normal. Short toddlers are toddlers with nutritional status based on length or height according to age when compared to the standard WHO-MGRS (Multicenter Growth Reference Study) in 2005, the Z-score is less than -2 SD and is categorized very short if the Z-score is less than -3 SD<sup>(2)</sup>.

Basic Health Research 2018 reported the prevalence of stunting in toddlers in Indonesia has reach 30.8%<sup>(3)</sup>. West Java is a province in Indonesia that still has high prevalence in stunting, which has significant increase in cases from 25.1% in 2016 to 29.2% in 2017. While regencies in West Java with Stunting cases that are still high, one of them is Bogor Regency 28.5%<sup>(4)</sup>.

Stunting not only caused by one factor, but it is caused by many factors, which are interconnected with one another. There are three main factors that cause stunting: unbalanced food intake (related to nutrient content in food, namely carbohydrate, protein, fat, minerals, vitamins and water), history of low birth weight (LBW), and history of diseases. One of the risk factors that influence the incidence of stunting in toddlers is a history of low birth weight (LBW). As a result of low birth weight babies will be disrupted, if this condition continues with inadequate feeding, frequent infections, and poor health care can cause stunting<sup>(5)</sup>.

LBW, which is baby birth weight less than 2500 grams will carry the risk of death, impaired growth and development of children, including the risk of being short if not handled properly. The percentage of children aged 0-59 months with low birth weight less than 2500 grams (LBW) in Indonesia was 11.1% in 2010 and there was a slight decrease in 2013 to 10.2%<sup>(2)</sup>.

According to the Puskesmas (Community Health Center) report from Bogor Regency in 2017, there were 1557 male and female LBW babies or 1.28% of the total number of babies born to 131,446 babies<sup>(6)</sup>. Because of that, the purpose of this study is to assess the relationship of LBW to stunting in toddlers aged 12-36 months in Bogor Regency, Indonesia.

## **Method**

This research used a cross sectional design which taken in Tamasari District, Bogor Regency, Indonesia<sup>(7)</sup>

<sup>(8)</sup>. Tamansari District was chosen because has the highest stunting prevalence in Bogor Regency. Tamansari district has 3 Puskesmas with 111 Posyandu (Integrated Service Post). Among 46 of 111 posyandu were selected as sampling locations because they carrying out activities compared to other. The study population was 10,447 toddlers aged 12-36 months<sup>(6)</sup>. The research sample was 500 toddlers aged 12-36 months that were randomly selected with probability proportional to size (PPS).

Toddlers live with parents and have lived at the research site for at least one year are eligible to include in this study. Meanwhile, toddlers with abnormalities (disabilities) thus hampering the process of anthropometric measurement and mothers who refuse to participate are excluded from this research.

Data collection was carried out on July 2019 using a questionnaire by enumerators of Nutritionist and Epidemiology Masters Students who were trained in advance.

The dependent variable is stunting status while the independent variable is LBW with mother's education, family's income, maternal body mass index (BMI), toddler's calorie intake and protein intake covariate. Anthropometric data for toddler height were measured using a Length Measuring Board (LMB) for ages 12-24 months and microtoise for ages 25-36 months. Data on the age of toddlers is obtained by reading birth certificates or maternal and child health books (MCH). Calorie intake data used a 24 hour recall questionnaire. Data on birth weight of babies are obtained from the MCH book.

Data analysis was performed using the statistical data analysis software. To determine stunting status based on weight/age z-score value using WHO Anthro software, caloric intake status using Nutri Survey software and for categorizing LBW variable data are made into 2 categories, babies born normally if birth weight  $\geq 2500$  grams and babies born low if birth weight  $< 2500$  grams. Analysis of the association between independent and dependent variables using multivariate cox regression analysis, and for the interpretation of the effect is expressed by the PR and Confidence interval of 95%<sup>(9)(10)</sup>.

## Result

**Table 1. Individual Characteristics in Tamansari District, Bogor Regency, West Java, Indonesia in 2019**

Variable	Frequency	Proporsi
	n=500	%
<b>Stunting</b>		
Stunting	196	39.2
Normal	304	60.8
<b>Birth Weight</b>		
LBW	49	9.8
Normal	451	90.2
<b>Mother's Education</b>		
Low (< 12 years)	376	75.2
High (≥ 12 years)	124	24.8
<b>Family's Income</b>		
< 2 million	177	35.4
≥ 2 million	323	64.6
<b>Maternal Body Mass Index</b>		
Underweight	54	10.8
Normal	295	59
Overweight	151	30.2
<b>Toddler's Calorie Intake</b>		
Poor	287	57.4
Satisfactory	213	42.6
<b>Toddler's Protein Intake</b>		
Poor	293	58.6
Satisfactory	207	41.4

Based on the results of univariate analysis in Table 1. The proportion of toddlers aged 12-36 months with stunting was 39.20%. The proportion of toddlers in the LBW category was 9.80%. The proportion of mothers with low education is much greater 75.2% compared to mothers with high education 24.8%. The proportion family income ≥ 2 million rupiah 64.60%. Based on the

body mass index (BMI) of mothers, the proportion of mothers whose BMI is quite greater is 59.0% compared to the proportion of BMI of women less than 10.8% and more than 30.2%. The proportion of poor calorie intake was 57.40%. The toddlers with less protein intake was 58.60%.

**Table 2. Low birth weight and stunting in toddlers aged 12-36 months in Taman Sari District, Bogor Regency, West Java**

Variable	Stunting	%	Normal	%	Total	PR	95% CI	P value
	N=500		N=500					
<b>LBW</b>								
LBW	29	59.2	20	40.8	49	1.60	1.23 – 2.08	0.0026
Normal	167	37.0	284	62.9	451			

In table 2 the analysis of the relationship between LBW and stunting shows that there were 29 (59.2%) children born with LBW and stunted, while among children born normal, 167 (37.0%) had stunting. Chi Square test results obtained p value = 0.0026, it can be concluded that there is a significant association between LBW and stunting events. From the analysis also obtained PR value = 1.60, meaning that children with low birth weight have a prevalence of 1.60 times higher to experience stunting compared to children who were born normal.

**Table 3. Risk Factors for Stunting in toddlers aged 12-36 months**

Stunting Risk Factors	PR	95% CI	P-Value
LBW	1.54	1.03–2.29	0.034
Mother’s Education	1.61	1.09–2.37	0.016
Family’s Income	1.23	0.92–1.64	0.172
Maternal Body Mass Index	1.14	0.90–1.44	0.278
Toddler’s Calorie Intake	1.00	0.67–1.50	0.999
Toddler’s Protein Intake	0.87	0.58–1.31	0.511

In Table 3. a full model of the results of the bivariate analysis is included in the multivariate cox regression analysis. To control the effect of confounding variables from the results of the full model, the selection is done by looking at the difference in PR for the main variable by removing the confounding candidate variables individually.

**Table 4. Final Model Risk Factors for Stunting in toddlers aged 12-36 months**

Variable	PR	95% CI	P-Value
LBW	1.51	1.01–2.24	0.042
Mother’s Education	1.63	1.12–2.39	0.011

Table 4 above shows the final multivariate models that have been carried out. In the multivariate confounding assessment, there are no potential variables as confounders because the difference between PR crude and PR adjust is still <10%. However, in substance there is a potential variable as a confounder, namely mother’s education so that both variables are included in the final model. PR are 1.51 (95% CI 1.01 - 2.24) which means that children born with LBW (<2500 grams) have a stunting prevalence of 1.51 times higher than normal born children (≤2500 grams) after being controlled by the “mother’s education” variable.

## Discussion

From this study, it was found that LBW controlled by mother’s education was significantly PR 1.51 (95% CI 1.01 - 2.24) which is risk of stunting in the Bogor District, West Java, Indonesia. LBW is an indicator of public health because it is closely related to mortality, morbidity, incidence of malnutrition in the future, one of which is the status of short nutrition/stunting<sup>(11)</sup>. LBW about 20% of the occurrence of stunting<sup>(1)</sup>. This study is consistent with the results of the study of Paudel et al. (2012) in Nepal which shows that low birth weight is a factor in the incidence of stunting. Toddlers with low birth weight have a stunting prevalence of 4.47 times higher than toddlers with normal birth weight<sup>(12)</sup>.

Fetus with dismaturity, since in the womb has experienced intrauterine growth retardation and will continue after they birth and will experiencing growth and development slower than babies born normally, and often failed to follow the growth rate that should be achieved at age after birth<sup>(13)</sup>. Growth barriers that occur are related to brain maturity, which growth barriers occurred before 20 weeks’ of gestation related to brain maturity, such as somatic changes<sup>(14)</sup>.

This information shows the importance of giving birth to a normal baby, because if the baby is born short, its growth will be hampered, and even has an impact on other consequences, such as stunted development and the risk of suffering from infectious diseases later in adulthood. As a result, this toddlers will be short and in the future if someday they will be mothers, they porbably will give birth to a short generation, and so on so that it occurs short across generations<sup>(15)</sup>.

Besides LBW, mother’s education level is also a factor causing stunting in toddlers. Based on Table 4, the mother’s education shows that the percentage is higher in the group of low educated mothers (75.2%). This result is in line with the research of Ramli et al in Maluku (2009) finding that mother’s education is significantly related to the incidence of stunting in toddlers<sup>(15)</sup>. Research in Nepal, from Tiwari et al (2014) showed the same thing that mother’s education is related to the incidence of stunting of toddlers<sup>(16)</sup>.

Mothers with higher education can make decisions that will improve the nutrition and health of their children. The level of education of the mother also determines the ease of the mother in absorbing and understanding the nutritional knowledge gained. This can be used as a

basis for distinguishing appropriate counseling method. From the importance of family nutrition, education is needed so that a person, especially the mother, will be more responsive to nutritional problems in the family and can take immediate action<sup>(17)</sup>.

Knowledge about nutrition in parents is influenced by several factors including age. The process of mental development will become good, in line with age and intelligence or the ability to learn and think abstractly in order to adjust to new situations, also the environment in which a person can learn good things is also bad depending on the nature of the group. Culture also plays an important role in knowledge, education is fundamental to developing knowledge, and experience is the best teacher in honing knowledge<sup>(18)</sup>.

### Conclusion

From this study, it was shown that LBW after being controlled by mother's education variables significantly increased the risk of stunting in Bogor Regency, West Java, Indonesia. Children with a history of LBW have a risk of 1.51 times greater for stunting than children with a history of normal birth. A good way to prevent stunting is to prevent children born with LBW in pregnant women by increasing mother's knowledge so that related knowledge about nutritional intake consumed during pregnancy will increase. Health workers are expected to monitor the nutritional status of pregnant women to prevent LBW. This can be done by holding home visits to pregnant women who do not routinely to health services, as well as providing motivation and counseling to mothers to undergo a healthy pregnancy so that they will give birth to babies with normal birth weight. In addition, it can also provide information and socialization to the public through IEC media in order to improve the nutritional status of children under five, especially stunting. In addition, we also recommend for future research on stunting in a wider population and not only in regency.

**Ethical Considerations:** This study was approved by The Research and Community Engagement Ethical Committee Faculty of Public Health Indonesia University (Ket-560/UN2.F10/PPM.00.02/2019).

**Competing Interests:** The authors declared that no competing interests exist.

# Bio-monitoring of Atmospheric Heavy Metals Deposited on Selected Tree Leaves in Kanchipuram, Tamilnadu

Sumathi Ramesh<sup>1</sup>, Sriram Gopalsamy<sup>2</sup>

<sup>1</sup>Assistant Professor, Department of Civil & Structural Engineering, <sup>2</sup>Professor, Department of Mechanical Engineering, Sri Chandrasekharendra Saraswathi Viswa Mahavidyalaya, Enathur, Kanchipuram, Tamilnadu, India

## Abstract

Kanchipuram, one of the holiest cities is highly polluted with heavy metals due to industrialization and urbanization. It is most important to know the role of plants in the cleansing process of heavy metals in this temple city. In this study, the heavy metals ( $\text{Fe}^{2+}$ ,  $\text{Pb}^{2+}$ ,  $\text{Cu}^{2+}$ ,  $\text{Zn}^{2+}$ ,  $\text{Al}^{2+}$ ,  $\text{Cd}^{2+}$ ,  $\text{As}^{2+}$ ,  $\text{Cr}^{3+}$ ,  $\text{Mn}^{2+}$ ) from the dust deposited on the leaves of the trees were analyzed. The tree species were collected from different zones of the Kanchipuram town such as residential area, traffic area, Institutional area, hospital area and industrial area. Heavy metals concentrations were analyzed by inductively coupled plasma mass spectrometry. Most of the heavy metals were found below their detectable limits ( $\text{Pb}^{2+}$ ,  $\text{Cd}^{2+}$ ,  $\text{Cu}^{2+}$ ,  $\text{Cr}^{3+}$ , and  $\text{As}^{2+}$ ). Some of the heavy metals were in highly increased values ( $\text{Fe}^{2+}$ ,  $\text{Al}^{2+}$ ) almost in selected species. In few locations the content of  $\text{As}^{2+}$  and  $\text{Mn}^{2+}$  in lower levels were deposited on some species. The results obtained from the analysis were compared statistically and correlated by using Pearson's co-efficient. The results obtained from the analysis shown that the heavy metals were emitted from various combustion processes and other anthropogenic activities. The tree species selected can be used in bio monitoring as bio indicators of increased  $\text{Fe}^{2+}$ ,  $\text{Al}^{2+}$  in the ambient air.

**Keywords:** Heavy metals, Bio Monitoring, Bio Indicators, Species, Deposition, Correlation.

## Introduction

Pollution due to air is one of the major issues in heavily populated towns and cities, which mainly begins from fast and unsystematic development of industrialization and urbanization<sup>1,2</sup>. As human undergone industrialization the quantity of waste thrown away in the ambience starts to increase enormously. This increased population and industries force the environment as highly polluted<sup>3,4</sup>. Out of various pollutants heavy metals are one of the major pollutants in the cities due to various anthropogenic activities such as emission from combustion processes, automobile exhaust and disposal from industries<sup>5,6</sup>. Heavy metals distributed in the local and regional areas are not clearly defined but they worsen the quality of air<sup>7</sup>. The study and analysis of heavy metal pollution in the environment is very important and interest due to their severe and harmful health disorders. The characteristics of air, water and soil, microbial activities and growth of vegetation are greatly disturbed by heavy metals<sup>8,9</sup>. Heavy metals

are also named as silent killer when they are exceeding their values of  $5\text{gm}/\text{m}^3$  but they are generally specified as toxic metals. Hence the testing of heavy metals is an important mechanism to improve and regulate the environmental impact assessment in developed and developing cities and towns<sup>10</sup>.

Bio monitoring is one of the simplest and cheapest method for detecting heavy metal concentration in the ambient air<sup>11,12</sup>. Plant bio monitoring is the better choice for determining the air quality compared to other conventional method because of its cheapness and easy to carry out the work. Monitoring by equipment poses the problem in setting the proper stations and also suitable for confined areas but plant species are readily available and existing at all places and easy to monitor<sup>13</sup>. The plant called as a good bio monitor, when it should be widespread in the topography and to find and collect at the time of sampling<sup>14</sup>. Bio indicators give the feasible way of estimating the pollutant level in the environment and it has been used for several years to examine the

accumulation and deposition of heavy metals on the leaves. Plants absorbed the various air borne pollutants thereby reducing the pollutant level. The degree of absorption and adsorption capacity differs from plant to plant without showing any toxic effects and they are acting as a sink for gases, particulate matters and toxic heavy metals<sup>15</sup>. Lower plants like mosses and lichens are acting as ideal bio indicators but it is difficult to plant in the urban areas and in industrial areas, higher plants can serve this purpose. Different types of higher species are used as bio indicators to monitor and detect the heavy metal pollution<sup>16,17,18</sup>. The dust deposited on the tree leaves predict the level of heavy metal contamination in the environment<sup>19</sup>. Most of the countries are successfully using the different types of species as bio indicators for analyzing the various levels of pollutant in the atmospheric air<sup>20</sup>.

The purpose of this study is to determine the present levels of atmospheric trace element pollution in the Kanchipuram town. Therefore, two different plant species such as *Saraca Asoca* and *Terminalia Cattappa* were selected as potential biomonitors of trace elements including iron, lead, copper, zinc, Aluminum, chromium, cadmium, arsenic and manganese (mg/Kg, dry weight). The samples were collected from two different heights of each tree species as high point and low point. Inductively coupled Mass spectrometry was used to determine the concentrations of trace elements.

### Method

i. Species: *Saraca asoca* is an important tree grown mostly in various parts of India. It is an evergreen tree grown up to a height of 9.14m. This tree is effectively used for controlling noise pollution hence it is commonly planted in all places Fig.1. *Terminalia Cattappa* is a large tree grown in tropical areas. It grows up to a height of 35m with horizontal

branches and grown equally and properly at its top. The leaves are 0.1-0.14m broad, large and 0.15-0.25m long.

ii. Study Area: Kanchipuram is one of the districts in the northeast of the state of Tamil Nadu in India and 72 km (45 mi) from Chennai. It lies between 77° 28' to 78° 50' longitudes and 11° 00' to 12° 00' latitudes. Total geographical area of the district has 4,432 km<sup>2</sup> (1,711 sq mi) and coastline of 57 km (35 mi). It is very famous for temples and silk sarees hence it is named as temple city and silk city. Kanchipuram is one of the important industrial cities, which is very nearer to Chennai, capital of Tamil Nadu. The population of the town is suddenly increased which leads to heavy traffic and urbanization.

iii Sample sites: In this study the sites were selected from industrial areas Vella Gate near rice mills(site1), institutional areas near National highway(site2), sensitive areas as hospital located on the highways(site3), heavy traffic zone(site4), residential area Pallavar Medu (site5) and commercial area such as collector office(site6).

iv. Sampling: Samples from *Saraca Asoca* and *Terminalia Cattappa* were collected the

height of above 1.8m. The leaves were collected in air tight zip lock polythene bags and taken to the laboratory for analysis. The heavy metals were analyzed by using closed-system mineralization by microwave digestion and measurement with inductively coupled plasma mass spectrometry.

**Statistical Analysis:** The results obtained from the study were correlated using Pearson's correlation coefficient and statistical analysis was carried out for the results. Statistical analysis was done with SPSS software package. The results were given in Table 1.

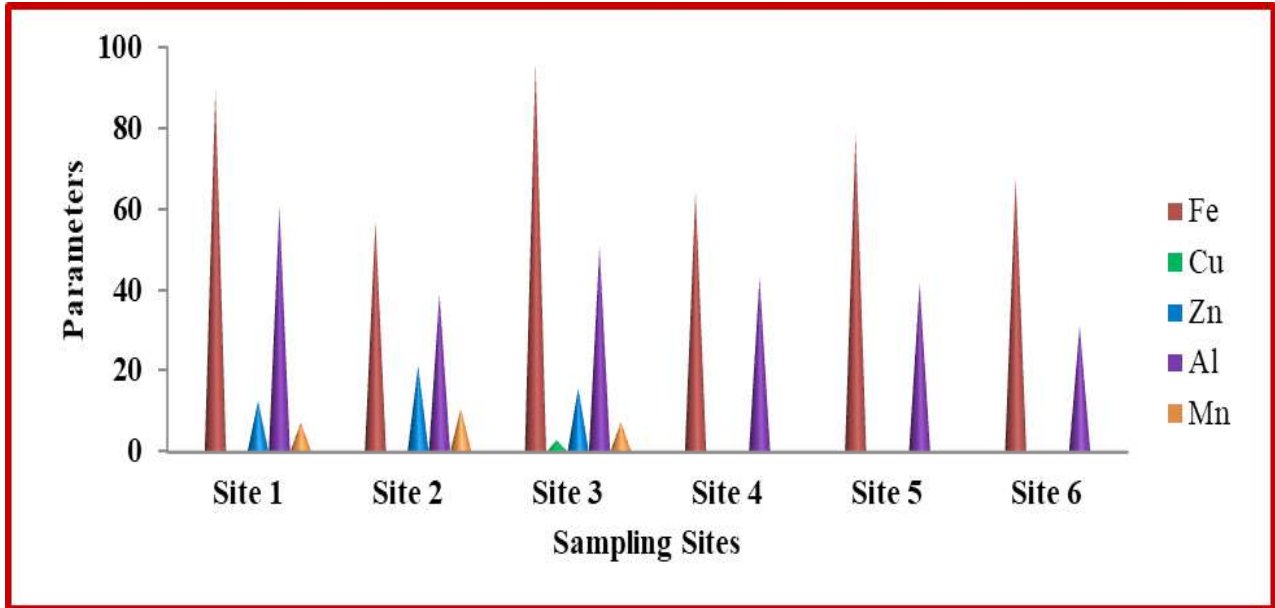

**Table 1. Heavy metals deposited on species from six sites**

Parameters	Saraca Asoca					Terminalia Catappa				
	Mean	Median	Max	Mini	SD	Mean	Median	Max	Mini	SD
Fe	75.5	73.15	96	57	15.18	36.25	21.9	131	0	47.35

Fig. 4: Regression equation for Fe Vs Cu, Zn, Al and Mn in Terminalla Cattappa

### Results and Discussion

Heavy metals widespread in the ambient air were clearly proved in the present study. Metals deposited on the leaves varied from species to species and with sampling sites. The samples collected from the selected sites showed the different levels of pollution in the air. Few heavy metals were found with high concentration in the sensitive areas such as hospital and also near rice mill located along the highway. Most of the heavy metals were with lowest concentration and below their detectable limit. The results obtained from the study was not shown a significant difference in the concentration of heavy metals taken from various places but clearly indicated that it depends upon the type of species selected<sup>21</sup>.

Among the nine metals analyzed, Fe was found in all the selected six sites with highest concentration. This higher level of Fe was due to abrasion, wear and tear of any machines or obsolete equipments and vehicles. The test results clearly indicated that the absorbing capacity of heavy metals by *Saraca Asoca* was higher than *Terminalla Cattappa* in all the selected sites except near rice mill along the highway as shown in Fig.1. Concentration of Fe ranged between 57 and 96 and the highest value was identified near CSI hospital and lower value near the cancer institute. This results clearly indicated that the proper disposal method and widespread of trees near the institute were reduced the Fe level in the environment. From the correlation study Fe was positive correlation with Cu and Al and weak

relation with Zn and Mn in *Saraca Asoca*. In *Terminalla Cattappa* significant correlation with Al and positive relation with Zn and Mn. Fe was negatively correlated with Cu as shown in Table 2.

Alike Fe, Al was found in the selected species. Al enters the environment from a large industrial plant and through containers such as drum or bottle. The absorption capacity of Al by *Saraca Asoca* was comparatively higher than *Terminalla Cattappa* as shown in Fig.2. In *Saraca Asoca* the value ranged from 31.1 to 60.4 and in *Terminalla Cattappa* the concentration varied from 2.8 to 82.0.

The concentration of Al was found in higher figure near the rice mills located on the road side compared than other five sites. The results obtained from the analysis showed that the more usage of Al leads to increase their content in the atmosphere. From the correlation study Al was positively correlated with Mn in *Saraca Asoca* and in *Terminalla Cattappa*.

Zinc is also an important metal released from the use of pesticides, insecticides and due to the combustion of fossil fuel and the use of brake shoes used in all types of vehicles. Zn concentration was absorbed by both *Saraca Asoca* and *Terminalla Cattappa* was below their detectable limit in three sites. Lower results were found in sensitive areas and near rice mill both in *Saraca Asoca* and *Terminalla Cattappa*. Zn values ranged between below detectable limit and 21.3 in *Saraca Asoca* and 10.5 in *Terminalla Cattappa*. The correlation study showed that Zn was highly related with Mn and weakly correlated with Al in *Saraca Asoca*. In *Terminalla Cattappa* Zn had significantly correlated with Mn and positive relation with Al as shown in Fig. 3 and Fig.4.

Mn was identified only near the hospital sites and rice mill site with lower concentration due to the usage of more pesticides, insecticides. The response to the absorption of Mn by *Saraca Asoca* and *Terminalla Cattappa* were nearly same. The concentration of Mn was below their detectable limit in other three sites where the usage of pesticides was negligible.

Pb was not found in any samples collected from all the sites. This is due to the continuous improvement in automotive technologies, usage of unleaded fuel and stringent rules and regulations made on the emission of Pb. The level of Pb in the air was decreased 89 percentage by the regulatory efforts taken by Environmental Protection Agency<sup>22</sup>.

Cr, Cd and As also not detected in any collected samples. The concentration of Cu was below their detectable limits in all the selected sites except near CSI hospital. Cu absorbed by both the species were in lower concentrations.

In the present study concentration of Fe and Al were on the higher side and the values were exceeded their threshold limits. Zn, Mn were with lowest concentrations and the other metals such as Cu, Cd, Pb, As and Cr were below their detectable limits.

Vehicular emission is not only the source for pollution, usage of pesticides and combustion process also plays a vital role the distribution of heavy metals in the atmosphere. The present study was used to prove the species selected such as *Saraca Asoca* and *Terminalla Cattappa* are the best indicator of heavy metal pollution. The results obtained from the study clearly indicated that the concentration of Fe and Al were higher level in air compared to other metals as Pb, Cu, Zn, Cd, As, Cr and Mn. The species responded to the absorption of heavy metals were varied with different locations. From this study, *Saraca Asoca* can be effectively used than *Terminalla Cattappa* for the bio monitoring of heavy metal pollution.

<sup>3</sup>Medical Oncologist, Curie Abdur Razzaque Ansari Cancer Institute, Ranchi, Jharkhand, <sup>4</sup>Professor, Bio-Engineering Department, Birla Institute of Technology, Mesra, Ranchi, Jharkhand, India

## Abstract

Quality of life (QOL) of lung cancer patients can be improved by using modern technical tools. There is a necessity to develop a system, which incorporates all the functions to evaluate severity of the disease and critical condition of the patients. There exists a need of an objective monitor for monitoring performance of lung cancer patients with parameters of heart rate variability (HRV), saturation of peripheral oxygen (SpO<sub>2</sub>) and peak expiratory flow rate (PEFR). A questionnaire-based survey was carried out in cancer physicians, surgeons and radiotherapists. Total 100 clinicians participated in this questionnaire, 31 medical oncologists, 32 oncosurgeons and 37 radiation oncologists. The analysis of this survey showed that presently ECOG (Eastern Cooperative Oncology Group) scale was preferred to KPS (Karnofsky Performance Status) scale (70% versus 30%) because of simplicity to remember. The popular tests to assess patient status were Computed Tomography scan (68%), Positron Emission Tomography scan (32%) and bone scan (68%). Other tests preferred among clinicians were SpO<sub>2</sub> (45%), 2D Echocardiography (30%) and chest X-ray (42%). But for evaluation of autonomic nervous system (ANS), e.g. HRV test, all the clinicians (100%) showed interest but rejected the availability of test facilities. SpO<sub>2</sub> and pulmonary function test (PFT/PEFR) were also rated as mobile tools for assessing the performance. It is suggested that HRV, SpO<sub>2</sub> and PFT/PEFR could be an added value to improve the QOL in cancer patients.

**Keywords:** KPS, ECOG, Monitor, Questionnaire, PEFR, SpO<sub>2</sub>.

## Introduction

Karnofsky performance status (KPS) scale scoring was initiated by Dr. David A. Karnofsky and Dr. Joseph H. Burchenal in 1949. The KPS rating varies from 0 with dead to 100 with perfect health.<sup>1</sup> It was designed to evaluate the degree of cancer patient activity and medical care necessities. Eastern Cooperative Oncology Group (ECOG) score or Zubrod score was initiated by

C. Gordon Zubrod, rated as 0 with perfect health to 5 with death. It is simpler and preferred over KPS. The ECOG is used to decide the treatment and prognosis for the patient and assess the progress of the disease.<sup>2</sup> The degree of patient activity and medical care requisites can be measured by the KPS.<sup>3</sup> KPS and ECOG scaling factor has been explained in detail in our previous work.<sup>4,5</sup>

Langley recognized the different components of the autonomic nervous system (ANS), with the term “sympathetic” limited to the thoracic outflow of the autonomic system; he suggested the term “parasympathetic” to assign its cranial and sacral outflows.<sup>6</sup> Brain haemodynamics can be studied in response to sensory stimulations by measuring haemoglobin oxygen saturation (SpO<sub>2</sub>). It can be used to evaluate the effects of chemotherapy and radiotherapy on tumors.<sup>7</sup> Heart rate variability (HRV) along with

---

pulmonary function test (PFT) can be an aid for prognosis of cardiac disease.<sup>8</sup>

It is hypothesized that health quality of cancer patients can be improved by determining the performance status (PS) through various parameters. HRV would help us understand the severity of the disease and the ANS dysfunction. SpO<sub>2</sub>, heart rate (HR) and PFT would add an aid to the quality evaluation process. Therefore, a single multiparameter monitor exhibiting HR, HRV, SpO<sub>2</sub> and PFT would make the clinician’s task simple to evaluate the PS using ECOG Scale in lung cancer patients.

Method: The questionnaire used for clinicians are as mentioned in Table 1 in order to assess the patients’ performance. The questionnaire includes a survey on the selectivity of PS of ECOG or KPS by different clinicians, correlation of symptoms of cancer patients with the scale, tests for evaluation of patients’ PS, correlation of PS with autonomic nervous system or any expected tests to be conducted. Total 100 clinicians had participated in this questionnaire (31 medical oncologists, 32 oncosurgeons and 37 radiation oncologists).

**Table 1. Questionnaire for clinicians**

Q 1.	Which scores do you use to assess performance status of cancer patients, KPS, ECOG or any other score?
Q 2.	Why do you prefer it?
Q 3.	Do you feel if there is any variation in labelling the score taken by different clinicians?
Q 4.	How would you rate the variation in labelling the scores by different clinician; minute, minimal, considerable or gross?
Q 5.	Do you feel there is any scope in improvising the labelling of performance status of patient (Y/N)?
Q 6.	Do you think improvement in the labelling of scores would alter the management of the patient (Y/N)?
Q 7.	How would improvement in the labelling of scores would alter the management of the patient?
Q 8.	What are the symptoms associated with the cancer patients when he complains about the deterioration of his performance (dyspnea, palpitation, fatigue or any other symptom)?
Q 9.	Which system do you give priority for evaluation when the cancer patient complains there is deterioration of his performance (cardiovascular, pulmonary, neurological, Gastrointestinal or any other system)?
Q 10.	Do you think there is any need of objective monitor for monitoring the cancer patients (Y/N)?
Q 11.	What tests do you routinely prescribe in your practice to periodically assess the patients status?
Q 12.	Which other supportive parameters/tests are routinely available or can be made accessible to assess the performance status of cancer patients excluding the tests in point 11?
Q 13.	Can graphical representation of vital parameters versus time help in understanding the improvement or deterioration of performance status of cancer patients (Y/N)?
Q 14.	Would you like to test the ANS to assess the performance of cancer patients (Y/N)?
Q 15.	What test would you prefer for easy assessment of ANS dysfunction?

**Duration:** The questionnaire-based survey was conducted by clinicians for advanced cancer patients from 01/03/2015 to 01/02/2016.

**Results**

All the clinicians were familiar with both KPS and ECOG scores. However, in practice there was a high preference to ECOG score than KPS score (70% versus 30%). The only reason for this was simplicity and ability to remember the score.

Eighty four percent doctors agreed that there is interclinician variation in labeling the patient PS. This

difference was rated as “considerable” by 35% doctors and as “gross” by 65% doctors. All the doctors agreed that there is a scope of improvement in the evaluation of PS. Sixty two percent doctors agreed that there will be alteration in management of the patient with respect to change in performance and it may prevent unnecessary hospitalizations and investigations.

Fatigue (56%) was the most common symptom with deterioration of performance of cancer patients followed by dyspnea (32%) and vague complaints (23%). Regarding the preferences of different systems for clinical evaluation of deteriorating performance,

37% doctors gave foremost importance to cardiac, 33% doctor to pulmonary system, while 21% doctors gave importance to metabolic parameters, *i.e.*, blood investigations. Neurological and gastrointestinal systems were evaluated only when there were localizing symptoms rather than in general deterioration of performance.

In general, there was consensus (73%) that objective tool for monitoring performance is necessary. The tests preferred for assessing patient status were Computed Tomography Scan 68%, Positron Emission Tomography 32%, Bone Scan 68%. Other supportive tests were SPO<sub>2</sub>: 45%, 2D Echocardiography: 30%, Chest X-Ray: 42%, PFT/PEFR: 13%. However, for HRV test, all the clinicians (100%) rejected the availability of test facilities. Conversely, 74% of clinicians underlined its need as one of the tests to evaluate ANS dysfunction and probable deterioration in cancer associated performance. The PFT parameters such as SpO<sub>2</sub> and peak expiratory flow rate (PEFR) were also rated as mobile tools for assessing performance, *i.e.*, home based monitoring. Correlation of various parameters plotted against time in days/months was a need for 58% clinicians. Moreover, 66% clinicians also wanted some parameter to evaluate the recent short term performance (For example. Hemoglobin A 1C predicts blood glucose control in recent past few months).

Thus, detection of subclinical deterioration of performance was a felt need by most (77%) of the clinicians. Sixty five percent doctors pointed to the ANS evaluation for this subclinical progression.

## Discussion

Patient PS is extremely vital in the area of cancer care in directing prognosis thereby planning of the best treatment for cancer patients.<sup>9</sup> PS in cancer patients determines the severity of the disease. Further, using ECOG scale of performance status, clinical stage and surgical treatment provided to the lung cancer patients can determine their survival rate.<sup>10</sup> KPS was less capable than ECOG PS to distinguish patients with varied prognosis. ECOG can predict the functional status better and therefore is preferred to KPS.<sup>11</sup>

It is essential to examine the cancer patient's tolerance levels, health and their PS before subjecting them with chemotherapy, surgery or radiation therapy. It is essential to analyze the weightage of benefits over risks since chemotherapy could diminish rather enhance

life expectancy.<sup>12</sup> PS score helps clinicians to understand patients' response and their progress to treatment. It also helps clinicians to plan appropriate referrals in order to enhance their quality of life.<sup>13</sup>

It is very important for clinicians to know if patients are with poor or good PS. Lung cancer patients with poor PS cannot tolerate chemotherapy but need targeted therapy.<sup>14</sup> The clinicians plan for the mono or combination chemotherapy treatment of cancer patients as per their performance status.<sup>15-16</sup>

Palliative chemotherapy can be harmful for patients even with good PS. It is not necessary that chemotherapy would improve their quality of life (QOL). It may worsen the PS of end stage cancer patients.<sup>20</sup> PS evaluation has a strong correlation with survival rate in cancer patients. The poor PS score indicates the declination in quality of life in stage IV lung cancer patients.<sup>21</sup> Patient rated PS (Pt-PS) was compared with physician rated PS (MD-PS), where it was found that Pt-PS was poor in comparison with clinicians' score.<sup>22</sup>

Pulse oximeter is a noninvasive method of measuring SpO<sub>2</sub>, which is a routine test after lung resection in lung cancer patients. Patients with <90% SpO<sub>2</sub> indicates increased possibility of death.<sup>23</sup> It was found that SpO<sub>2</sub> > 90% and PS score in lung cancer were independent predictors of survival. LCSS fatigue, appetite score, and pulse oximetry are prognostic factors in lung cancer patients.<sup>24</sup>

PFT is another vital test to be performed after thoracotomy in lung cancer patients with information of lung volume and capacity is essential.<sup>25</sup> Forced expiratory volume (FEV) is a vital parameter to study. If it is >60% in a second, then lung resection cannot be performed since there exists an advanced risk of death after operation.<sup>26</sup> Since there is a correlation between PFT parameters (PEFR and FEV<sub>1</sub>) and HRV parameters, low frequency (LF) and high frequency (HF), this can help us in predicting cardiac morbidity in chronic smokers. So HRV should be included as a routine test along with PFT in chronic smokers for early diagnosis of cardiac involvement. Smoking affects all the parameters of PFT and HRV.<sup>27</sup>

Lowered value of HRV indicates autonomic dysfunction. ECOG4 has decreased HRV values in comparison with ECOG1. In lung cancer, time domain, frequency domain and nonlinear domain measures were evaluated. It was found that HRV measures

decreased in cancer patients as compared to healthy controls. Amongst all the tests, HRV is a noninvasive method, which can be conducted at room temperature by acquiring Electrocardiogram for 5 minutes. It was found that the HRV measures in lung cancer were lower than controls and highly decreased values were found in ECOG4 scale. Hence, HRV is preferable test to study ANS and easy to acquire and interpret.<sup>17-19</sup>

Thus, HRV, SpO<sub>2</sub> and PEFR can be combined in a single monitor, which would help the clinicians to understand the PS of lung cancer patients and plan their treatment appropriately. PS monitor for lung cancer does not exist in the market, however, it can be devised as a monitor in future for the lung cancer assessment.

### Conclusion

The present subjective performance scales in lung cancer patients are vague and subjected to interpersonal difference of opinions. Clinicians need a better objective monitor of performance score. Further, noninvasive monitors are preferred over invasive monitors. Cardiac and pulmonary systems are more focused for evaluation whenever deterioration of performance is complained by patient and their relatives. Moreover, ECOG scale is preferred over KPS scale to determine the performance status. HRV analysis may be helpful for studying autonomic system dysfunction. The SpO<sub>2</sub> and PEFR parameters can further add to scope of improving the QOL of patients.

# The Drug Compliance and Factors Influencing Therapeutic Regimen among Senior Citizen

Regina Antony<sup>1</sup>, Shali Mol U.S.<sup>2</sup>, Revathy R. Nair<sup>3</sup>, Rintu Thomas<sup>3</sup>

<sup>1</sup>Associate Professor, HOD, Department of Foundations of Nursing, <sup>2</sup>Assistant Professor, Department of Foundations of Nursing, <sup>3</sup>Fourth Year B.Sc. Nursing Students, Amrita College of Nursing, Amrita Vishwa Vidyapeetham, Kochi, Kerala, India

## Abstract

**Background of the Study:** One of the serious consequences in older patients is drug noncompliance. Nearly 40% to a high of 75% is estimated as the extend of noncompliance in the elderly .The aim of present study is to determine the compliance level and to identify the factors influencing the therapeutic regimen among senior citizen.

**Materials and Method:** Quantitative approach with non-experimental descriptive design was used. A modified Morisky Medication Adherence Scale (MMAS) and modified WHO's Adherence Model tool was used to assess the level of compliance and to identify the factors influencing the therapeutic regimen among the 409 subjects in Amrita Institute of Medical Sciences, Kochi (AIMS).

**Result:** The study results showed that among 409 subjects,all were on medications and were between the age group from 60 – 76 yrs and above, 210 (51.3%) subjects were male and 199(48.7%) subjects were female,majority of the subjects 338(82.8%) were married the educational status of the subjects were 113(27.6%) had primary education and 160(39.1%) subjects had secondary education, nearly 228(55.7%) subjects were unemployed and 119(29.1%) subjects were retired 65(15.9%) subjects had good compliance however, 295(72.1%) subjects had moderate compliance and 49 subjects (12%) were identified with poor compliance to therapeutic regimen. There was significantly high association between education(0.002), income (0.043) and level of compliance ( $p<0.05$ ), but there was no significant association between level of compliance and other demographic variables.

**Conclusion:** The level of compliance among the elderly were good among highly educated elderly and of high economic status.

**Keywords:** Drug compliance, Therapeutic regimen, Senior citizen.

## Introduction

Aging is inevitable and universal. According to Indian Maintenance and Welfare of Parents and Senior

Citizen Act, “a senior citizen” is defined as any person being a citizen of India who has attained the age of 60 ages or above <sup>[1]</sup>. According to Population Census 2011 there are nearly 104 million elderly persons in India.53 million females and 51 million males. A report released by the United Nations Population Fund and Help Age India suggests that the number of elderly persons is expected to grow to 173 million by 2026. Both the share and size of elderly population is increasing over time. From 5.6% in 1961 the proportion has increased to 8.6% in 2011. For males it was marginally lower at 8.2% while for females it was 9.0%. As regard to rural

Phone: 9446190836

and urban areas, 71% of elderly population resides in rural areas while 29% in urban areas<sup>[2]</sup>. Health problems are supposed to be major concern of this section of the society and it is estimated that one out of two elderly in India suffers from at least one chronic disease which requires lifelong medication<sup>[3]</sup>.

Patient compliance with medical regimen is a behavioral problem of interest because it affects the patient's health. Noncompliance in some instances could result in serious complication requiring the individual to be hospitalized. Thus not only adds considerable physical strain and mental agony to the individual and the family but results in economic burden as well <sup>[4]</sup>.

R Shruthi, R Joythi H P Pundarikaksh, GN Nagesh and T G Tushar conducted a descriptive study regarding medication compliance in geriatric patients with chronic illness at tertiary care hospitals (2016) among 251 geriatric patients at Kempegowda Institute of Medical Science Hospital and Research Centre, Bangalore. The study findings revealed that the average number of medications  $2.96 \pm 1.42$  per subject and most of the subject were receiving Fixed Drug Combination's (FDC's). The compliance level was assessed by way of interview using a 20 item structured pretest questionnaire as per modified MMAS (Morisky Medication Adherence Scale)<sup>[5]</sup>. The factors identified from the studies and reviews are into several categories, namely, patient centered factors (such as age and gender), therapy related factors (e g: the complexity of regimen), health care system factors (such as the number of contacts with a health care provider), social and economical factors, and disease factors. Elderly patients may also have problems in vision, hearing, and memory. In addition they may have more difficulties in following therapy instruction tablets, distinguishing color or identifying marking on drugs, side effects or reactions from the drugs <sup>[6]</sup>. The growth of the aging population poses various health-related issues. Among them, non-compliance with drug prescription is identified as a potentially life-threatening problem (Stewart & Cluff, 1972). In addition, physiological, pharmacological, and pharmacokinetic changes in old age (Gainsborough & Powell-Jackson, 1990; Williams & Lowenthal, 1992; Offerhaus, 1997) contribute to an increase in the incidence of adverse reactions (Gryfe & Gryfe, 1984; Frattura et al., 1989; Lee, 1996) associated with the absence of both a health education process (OMS, 1994) and a pharmacotherapeutic follow-up, with potentially

serious consequences for the patient. This is a complex and multidimensional problem that merits participation by all segments of society involved with drugs<sup>[7]</sup>.

Drug compliance and its determinants is complex and are often poorly understood. There is not much published Indian/Kerala studies that have estimated the prevalence of antihypertensive drug compliance in the community setting<sup>[8]</sup>.

## Materials and Method

A quantitative approach and a non-experimental descriptive design was used for the study conducted in Geriatric OPD and General Medicine ward of Amrita Institute of Medical Sciences and Research Centre, a tertiary care centre hospital, Kochi among 409 subjects using convenient sampling technique. The patient selected according to the inclusion criteria for study were senior citizen on medication, who were able to read and write English or Malayalam. All the patients' were informed about the aim of the study and an informed consent was obtained from each subject. Data was collected by using Tool I - Semi-structured Questionnaire consists of two sections. Section I :- Socio-demographic data and Section II :- modified Morisky Medication Adherence Scale, to assess the subject's compliance and Tool II - WHO's Adherence Model, to assess the factors affecting compliance. The MMAS has 8 item with 2 response format yes-1, no-0 Scoring was categorized into 3, good compliance = 0-2, moderate compliance = 3-5, low compliance = 6-8 Adherence Model consist of 41 yes/no type questions organized under 7 domains. Data analysis was done by using descriptive and inferential statistics.

## Result

**Section I: Description of sociodemographic variables of the subjects:** The demographic characteristics showed that among the 409 subjects, 129 (31.5%) subjects belonged to the age group of 60-65 years, 210 (51.3%) subjects were male and 199 (48.7%) subjects were female, majority of the subjects 338 (82.8%) were married, the educational status of the subjects were 113 (27.6%) had primary education and 160 (39.1%) subjects had secondary education, nearly 228 (55.7%) subjects were unemployed and 119 (29.1%) subjects were retired, 150 (36.7%) subjects had income between Rs 5001-15000/month and 121 (29.6%) subjects had income between Rs 15001-25000/-, nearly 98.5% subjects used to take their medicine regularly.

**Figure 1: Bar diagram showing frequency distribution of subject based on gender**

The data illustrated in Figure 1 shows that among 409 subjects, majority of the elderly 210 were males and 199 were females

**Section II: Level of compliance among Geriatric subjects:** The data findings shows that 161 (39.4%) subjects forget to take medicine, 65 (15.9%) subjects used to skip their medications in the last 2 weeks, 59 (14.4%) subjects stopped their medications without the physician's consultation, 112 (27.4%) subjects on travel or when not at home used to skip their medications, 21 (5.1%) subjects forgot to take medicine the previous day, more than half of the subjects i.e 237 (57.9%) believed that health well-being depends on medications, however 55 (13.4%) subjects reported that they stopped taking medications when their symptoms were under control, whereas 88 (21.5%) mentioned hassled in sticking to the treatment plan.

**Section III: Factors influencing with drug compliance:** The data findings enumerate, regarding the patient related factor influencing the drug compliance among the elderly subjects, majority of the subjects had

knowledge of their disease and their management i.e 86.6% & 85.3%, however 313 (76.7%) subjects reported visual impairment and 145 (35.5%) subjects mentioned of hearing impairment. In relation with therapy related factor influencing the drug compliance among the elderly subjects 119 (29.1%) subjects complained that they found their therapy complex, nearly 25.7% subjects mentioned difficulty in polypharmacy. With respect to sociocultural factor, 351 (85.8%) subjects reported that they are having family support. Regarding the economical factors 136 (33.3%) subjects are not able to afford the cost of the therapy, and 322 (78.8%) subjects reported they do not have insurance coverage. Disease related factors 27 (6.6%) subjects find difficulty to follow the treatment due to the exacerbations of symptoms. The psychological factors affecting the drug compliance among elderly are 99 (24.2%) subjects are feeling depressed of their condition, hospitalized factors causing stress were reported by 146 (35.7%) subjects, whereas 302 (73.2%) subjects are not able to cope with illness.

## Section IV: Association of Level of Compliance and Selected Variables

Table 1: Association between Level of Compliance and selected demographic variables N=4

Demographic Variables	High Adherence		Moderate Adherence		Low Adherence		$\chi^2$	df	p value
	f	%	f	%	f	%			
<b>Gender</b>									
Male	28	43.1	155	52.5	27	55.1	2.225	2	0.329ns
Female	37	56.9	140	47.5	22	44.9			
<b>Education</b>									
Illiterate	1	1.5	1	0.3	3	6.1	31.37	12	0.002**
Primary	14	21.5	80	27.1	19	38.8			
Secondary	18	27.7	122	41.4	20	40.8			
Higher Secondary	9	13.8	17	5.8	2	4.1			
Diploma	10	15.4	36	12.2	1	2			
Graduate	10	15.4	33	11.2	3	6.1			
Post graduate	3	4.6	6	2	1	2			
<b>Income per month (Rs)</b>									
< 5000	12	18.5	71	24.1	22	44.9	15.95	8	0.043*
5001 to 15000	23	35.4	112	38	15	30.6			
15001 to 25000	26	4	87	19	8	3			
25001 to 50000	4	6.2	19	6.4	3	6.1			
> 50001	0	0	6	2	1	2			

\* Significant (P<0.05), ns =No significant

The association computed using chi-square between the level of compliance and selected demographic variables is presented in table 3 and the data presented depicts that, there was significantly high association between education(0.002), income (0.043) and level of compliance (p<0.05), but there was no significant association between level of compliance and other demographic variable.

### Discussion

In the present study, level of compliance to therapeutic regimen among geriatric age group on medication was assessed by using modified MMAS .Total level of compliance was categorized as high, moderate and low compliance.The result of the study showed that most of the subjects 295 (72.1%) have moderate compliance, 65(15.9%) subject exhibited high compliance and 49 (12%) identified with low compliance to therapeutic regimen.

In the light of literature it is found that few study were showing consistent finding with the present study findings. R.Shruthi,R.Joythi,H.P.Pundarikaksh, G .N. Nagesh and T.G Tushar conducted a descriptive

study regarding medication compliance in geriatric patients with chronic illness at tertiary care hospitals (2016) among 251 geriatric patients at Kempegowda Institute of Medical Science Hospital and Research Centre, Bangalore . The study findings revealed that the average number of medications 2.96 +\_ 1.42 per subject and most of the subject were receiving Fixed Drug Combination's (FDC's). The compliance level was assessed by way of interview using a 20 item structured pretest questionnaire as per modified MMAS (Morisky Medication Adherence Scale). The level of compliance was good in 45.4%, moderate in 35.45% and poor in 19.12% of study subject [6].

To summaries the discussion based on first objective is markedly clear that level of compliance of the participants were moderately to high.

There are seven set of factors such as patient related factors, therapy related factors, health care system related factor, sociocultural factor, economic factor, disease condition related factor and psychological factor. Among the seven factors therapy related factor is the highest factor influencing compliance (79.5%), followed by health care system related factors (75.4%), patient related

factors (72.5%), sociocultural factors (72.5%), disease condition related factors (71.8%), psychological factors (62.7%), and economical factors (49.3%). In the present study it is identified that economic factors play the pivotal role in hindering compliance with treatment. Hyekyung Jin, Yeomen Kim and Sandy Jeonghie the study findings revealed that the mean score of total FHL (Functional Health Literacy) test was 7.72+<sub>-</sub>3.51 (range 0-15). The percentage of total number of correct answers for the reading comprehension subtest and numeracy subtest medications. The study finding shows the factors affecting medication adherence included the patient degree of satisfaction with service sufficient explanation of medication counselling, educational level, health related problem and dosing frequency<sup>[8]</sup>. The supporting studies also mentions the impact of multifactorial influence in the adherence of medication in elderly. There is a significant association between the level of compliance and factors influencing compliance to therapeutic regimen. The study revealed that there is a high significant association between education(0.002), income (0.043) and level of compliance (p<0.05). In R. Shruthi, R. Joythi, H. P. Pundarikaksh, G. N. Nagesh and T. G. Tushar study findings revealed that the level of compliance positively correlated with the educational status of the study subjects and their awareness about the diseases and prescribed medications. The overall level of compliance was higher in subjects living with spouse or families, subjects without any functional impairment, subjects who were regular for the follow-up visits and also in subjects who did not experience any adverse events<sup>[6]</sup>.

The supportive studies and the present study findings are similar.

### Conclusion

Common trends in health care that affect medication in elderly are increased consumer awareness, fragmentation of care, polypharmacy and related problems, high cost of medicine & noncompliance.

**Conflicts of Interest:** Nil

**Source of Funding:** Self

**Ethical Clearance:** Research proposal was presented before the research committee of Amrita College of nursing and obtained approval. Later ethical clearance obtained from the ethical committee of AIMS, Kochi.

# Competency on Breast Feeding among Mothers of High Risk Babies and Practice of Nurses in Assisting the Mothers with a View to Develop A Protocol

Sanaya Suresh<sup>1</sup>, Anila. K.P.<sup>2</sup>, Rafia Islam<sup>3</sup>

<sup>1</sup>M.Sc. Nursing, <sup>2</sup>Professor, <sup>3</sup>Lecturer, Department of Child Health Nursing, Amrita College of Nursing, Amrita Institute of Medical Sciences, AMRITA Vishwa Vidyapeetham, Kochi, Kerala, India

## Abstract

**Introduction:** The mother of a high risk neonate is confronted with numerous parenting challenges, not the least of which is the decision about how to nourish her vulnerable newborn. Successful breastfeeding depends on overcoming obstacles posed by neonate's condition, maternal health, and intensive care unit environment.

**Objective:** to assess the competency on breastfeeding among mothers of high risk babies and practice of nurses in assisting the mothers in selected Intensive Care Unit, AIMS, Kochi, with a view to develop a nursing care protocol.

**Methodology:** The descriptive research design was adopted and non-probability convenience sampling technique was used to collect data from 40 mothers by using structured questionnaire and observational checklists to assess the practice of mothers and staff nurses in NICU.

**Results:** The study reveals that 22 (55%) mothers were having average knowledge and most of the mothers 23 (57.5%) had poor practice regarding the breastfeeding of the high risk neonate in NICU. Most of the staff nurses (50%) had average level of practice while assisting the mothers during breastfeeding in NICU. There is significant association between knowledge and demographic variables like education of the mother, order of pregnancy and source of knowledge.

**Conclusion:** The nursing protocol was implemented and established a comprehensive improvement in the knowledge, care, support and management. Thus, the health care professional ultimately work towards providing a positive impact on the lives of high risk neonate.

**Keywords:** Breastfeeding, High risk neonates, Mother.

## Introduction

Breastfeeding is the art of motherhood and it is the

ideal form of feeding to a neonate. Artificial feeding exposes the neonates to infection and results over millions of death annually worldwide due to ill effects. Infant Mortality Rate (IMR) is regarded as an important sensitive indicator of health status of a community. It reflects the effectiveness of intervention for improving maternal and child health in a country. Mothers' milk is the best milk for neonates to improve the health and prevention of infection. In India, 25 million babies born every year, Sample registration System (SRS)-2018 reports that current neonatal mortality in India of 25.4 per 1000 live birth.<sup>1</sup>

Every family look forward to the birth of a healthy newborn. It is an exciting time with so much enjoy. In some cases though, unexpected deliveries and challenges occur along the way. Some newborns are considered as high risk. This means that a newborn has a greater chance of complications because of condition that occur during fetal development, pregnancy condition of mother or problem that occur during or after birth.<sup>2</sup>

Giving birth to a premature or other high risk neonates (or babies) does not mean cannot breastfeed. Actually there is even more reason to provide mothers' milk, and eventually breastfeed, to sick newborns. Providing breastfeeding to baby lets mothers to participate in baby's healthcare in a very crucial way. The breastfeeding to a high risk neonate is entirely different from the breastfeeding of a full term neonate, needs some more practice, patience and persistence.

The mother of a high risk neonate is confronted with numerous parenting challenges, not the least of which is the decision about how to nourish her vulnerable newborn. Successful breastfeeding depends on overcoming obstacles posed by neonate's condition, maternal health, and intensive care unit environment. These obstacles include maternal separation from nursing infant during hospitalization, delayed initiation of expression of breastmilk due to maternal illness and or surgery, the inability to suckle or feed on demand and the lack of sufficient maternal follow up after discharge.<sup>3</sup>

## Materials and Method

A descriptive research study was conducted among 40 mothers of highrisk babies admitted and the registered staff nurses working in NICU at AIMS, Kochi. Before starting data collection, Ethical Clearance certificate was obtained from the Ethics Committee and Scientific committee of Amrita Institute of Medical Sciences and Research Centre (AIMS), Kochi. The sample was selected by non-probability convenience sampling technique based on inclusion criteria. Total 60 sample were selected among 40 mothers whose babies are admitted and 20 staff nurses working in NICU. Data had been collected by structured questionnaire for collection of demographic data and to assess the knowledge of mothers on breastfeeding of a highrisk neonates. An observational checklist for assessment of the practice of mothers and staff nurses in assisting mothers during breast feeding of a highrisk neonates in NICU. After

building rapport with the mothers, the investigator explained the importance of the study and significance. Written informed consent was obtained from each sample. The socio-demographic data and knowledge were assessed using a structured questionnaire. After the knowledge assessment, the mothers were assessed the practice while they were feeding their neonates in the nursery, at the same time the practice of staff nurses were also assessed without their awareness while they were assisting the mothers to feed their neonates. Observation without concealment technique was used during the assessment of practice of both mothers and staff nurses. The collected data were analyzed using descriptive statistics and inferential statistics. Frequency and percentage distribution was used to distribute sample according to socio-demographic variables. Chi-square test was used to find the association of knowledge and practice on breastfeeding among mothers of high risk babies with demographic variables. Pearson Correlation method was used to find the correlation between knowledge and practice of mothers of the high risk babies regarding breastfeeding.

## Results

In the data, age wise distribution showed that 15(37.5%) mothers belongs to 25 -30 years of age group. Majority of the mothers were non-health professionals, 28(70%) and 26(65%) belongs to nuclear family.

Figure 1 depicts that knowledge level of the mothers regarding the breastfeeding of a high risk neonate in Neonatal Intensive Care Unit. The figure shows that most of the mother had an average 22(55%), 10(25%) had good knowledge and only 8(20%) had poor knowledge regarding the breast feeding and its importance among high risk neonates.

Based on the level of practice of the mothers, regarding the breastfeeding of high risk neonate, this figure shows that mothers of high risk neonate had 23(57.5%) poor practice, 9(22.5%) had average practice and only 8(20%) had good practice during breastfeeding of high risk neonates in NICU. Only 6% mothers were continually observing for regurgitation and monitoring for any complications during breastfeeding their neonates. Very few mothers (5%) were practicing the infection control measures like using of hand rub before breastfeeding their neonates.

**Figure 1: Knowledge level of the mothers on breastfeeding of high risk neonates.**

**Figure 2: Level of practice of the mothers regarding the breastfeeding of high risk neonate.**

**Figure 3: Practice level of staff nurses in assisting mothers of high risk neonate during breastfeeding.**

Based on the level of Practice of staff nurses in assisting mothers of high risk neonate during breastfeeding, the diagram shows that 10(50%) staff nurses had average level of practice, 7(35%) of staff nurses had good practice, and only 3(15%) of staff nurses had poor practice while assisting the mothers during breastfeeding of high risk neonate in NICU.

There is significant association between the order of pregnancy, source of knowledge of the mothers and level of knowledge of mothers regarding breastfeeding.

**Table 1: Correlation of Knowledge and practice of mothers of high risk neonate n=40**

Knowledge	r- value	p-value
Practice	-0.244	0.05

Correlation is not significant at the 0.05 level (p=0.05)

The Correlation had found using Pearson correlation coefficient method. It was found that there is negative correlation between knowledge and practice score of mothers of high risk neonate. But statistically it is not significant.

**Table 2: Practice scores of mothers after implementation of protocol n=5**

Practice of Mothers	Frequency (f)	Percentage (%)
Average	2	40
Good	3	60

The data shows that 60% of mothers had good practice during breastfeeding of high risk neonate in

NICU after the implementation of the protocol. There is a marked level of increase in the practice of mothers after the implementation of the nursing care protocol.

**Table 3: Practice scores of staff nurses after implementation of protocol n=5**

Practice of Staff Nurses	Frequency (f)	Percentage (%)
Average	1	20
Good	4	80

The data shows that 80% of staff nurses have good level of assistance of mothers during breast feeding of a high risk neonate in NICU. There is a marked level of increase in the practice of the staff nurses after the implementation of nursing care protocol.

### Discussion

Mothers of neonates admitted into NICU not able to function in traditional role of mother. They are separated from their neonate and the role of a caregiver shifts to the health care professionals.

The present study result shows that most of the mothers 22(55%) had an average knowledge, 10(25%) had good knowledge and only 8(20%) showed poor knowledge regarding the breastfeeding and its importance among high risk neonates. Nathaine Subhash conducted a descriptive study which revealed that 65% mothers had inadequate knowledge and practice regarding breast feeding and concluded that supportive groups are necessary for improving the knowledge of the mothers regarding breast feeding<sup>4</sup>

The present study result showed that majority of the mothers 23(57.5%) had poor practice during the breastfeeding of high risk neonate and 9(22.5%) had average practice and 8(20%) had good practice during breastfeeding of high risk neonate in NICU. The result showed that the majority of the mothers had poor practice during breastfeeding of high risk neonate in NICU.

Another study, quoted the mothers of high risk infant is confronted with numerous parenting challenges, not the least of which is the decision about how to nourish the vulnerable newborn.<sup>3</sup>

Another community based study was conducted by M. Sai Sunil Kishore, Praveen Kumar and Arun K Agarwal, 2008 on breastfeeding knowledge and practices amongst mother in a rural population of north India and revealed that 30% and 10% exclusively breastfed

their infants till 4 months and six months of age. They concluded that practice and breastfeeding knowledge and suboptimal among the rural north Indians mothers and breastfeeding counseling can improve the breastfeeding practices.<sup>5</sup>

The result of the present study and the literature reviewed the fact that near half of the mothers had inadequate practice on breastfeeding of the high risk neonates in NICU. The mothers of the vulnerable neonates had several barriers to breastfeed in NICU. Most of the mothers had average level of knowledge regarding the breastfeeding but they cannot properly practice feeding due to the psychological or emotional conflicts occur during the visit. Most of the mothers were lacking knowledge in areas like proper positioning of the baby, cleaning of the breast, proper skin to skin contact, holding and support the baby, attachment to the breast, proper stimulation of the high risk neonates, proper eye contact, monitoring for regurgitation in high risk neonates and keeping in proper position. Only 6% of mothers were continually observing for regurgitation and monitoring for any complication during breastfeeding their neonates. Very few mothers (5%) were practicing the infection control measures like using of hand rub before breastfeeding their neonates. So, health care professionals' support is very essential in predictive of success with breastfeeding in NICU.

Anderson and Geden conducted a survey programme and result showed that nurses received insufficient education and training to effectively support the breastfeeding of a vulnerable neonates.<sup>6</sup>

Based on the assessment of knowledge and practice of mothers and staff nurses during breastfeeding of high risk neonate, a nursing care protocol was prepared, addressing the need of breastfeeding, nurse's role, assessment, implementation of care, problem solving and discharge planning. A study conducted by Siddell on effectiveness of an education plan in NICU to foster the breastfeeding, showed that increased knowledge acquisition by health care professionals following an education plan and training can affect the attitudes and knowledge about breastfeeding.<sup>7</sup>

Studies have found that education and training to mothers, influences the attitude and increase the knowledge about breastfeeding (Bernaix, Marinelli, Froman and Burke).<sup>8</sup>

Newborn care practices in deliveries conducted at

home are far from ideal, it is of paramount importance that practical strategies involving behavioral change communication should be adopted in order to realistically reduce neonatal mortality in India.<sup>9</sup>

## Conclusion

The study findings strongly suggest that the mothers of high risk neonates had average knowledge regarding the breastfeeding and importance. It was found that the staff nurses' assistance were average in the NICU during breastfeeding. The protocol was implemented in the setting to improve the practice of staff nurses in assisting the mothers during breastfeeding to improve the breastfeeding practice of the mothers. The practice level of the mothers and staff nurses was improved after the implementation of the nursing care protocol.

# Nutritional Status of Adolescent Girls Residing in the Urban Field Practice Area of S.N. Medical College, Bagalkot

Vasundara S. Gayakwad<sup>1</sup>, Gowri Shankar<sup>2</sup>

<sup>1</sup>Assistant Professor, <sup>2</sup>Professor, Department of Community Medicine, Shri. B.M. Patil Medical College, Vijayapura, Department of Community Medicine, S. Nijalingappa Medical College, Bagalkot Karnataka

## Abstract

**Background:** Adolescence is a very crucial period in life characterized by rapid growth and development, physiologically, psychologically and socially Objective: to study the nutritional status of adolescent girls residing in the urban field practice area of S.N. Medical College, Bagalkot.

**Study Design:** A Community based cross sectional study. Setting: field practice areas of the urban health training centers, Department of Community Medicine, S. Nijalingappa Medical College in Bagalkot. Participants: 400 unmarried adolescent girls. Sampling: Systematic random sampling.

**Statistical Analysis:** Data was tabulated in Microsoft Excel 2010 and analyzed by using Open Epi software. P-value was calculated using chi-square test and difference was accepted significant at more than 95% (p-value <0.05).

**Results:** In the present study, the prevalence of thinness and stunting was found to be 25.8% and 29.3% respectively. Anemia was the predominant micronutrient disorder observed in this study (55.5%) followed by baldness of tongue (3.5%), goiter (2%), koilonychia (1.5%), angular stomatitis (0.3%) and none had Bitot spots.

**Conclusion:** The present study revealed high prevalence of thinness, stunting and anemia reflecting poor nutritional status among adolescent girls.

**Keywords:** Adolescent Girls, Anemia, Urban Area, Thinness, Stunting, Obese, Sahli's Method.

## Introduction

Adolescence is an opportunity period for interventions to address malnutrition. Nutrition is required not only for growth and preparation for pregnancy, but also needed for physical and academic excellence.<sup>1</sup> Today's healthy adolescent girls are tomorrow's healthy women, future of every society and a great resource of the nation.<sup>2</sup>

Globally, adolescent health and nutrition has gained importance in the last decade only.<sup>3</sup> Although, in India adolescent health has gained grounds since 1997 as a component of RCH programme, it did not receive the attention it deserved.<sup>4</sup> However, in the recently launched RMNCH plus A strategy (2013) emphasis is given on nutritional status of adolescent girls to improve maternal health and child survival.<sup>5</sup>

Continued assessment of nutritional status in adolescent girls is the need of the hour.<sup>6</sup> World Health Organization (WHO) recommends various anthropometric indices to evaluate nutritional status in children. BMI is the most appropriate tool for epidemiological studies on assessment of nutritional status among adolescents especially at the community level. New growth charts are recommended since 2006.<sup>7</sup>

More than half of the global population is urban and histories largest-ever urbanization wave will continue for many years to come. Urbanization brings enormous changes to landscapes and lifestyles. It offers many opportunities including increased access to jobs, education and essential services, but it can also see inequalities concentrated in slums and informal settlements.<sup>8</sup> The urban slum adolescent girl is subjected

to more physical and mental challenges on a day to day basis due to pressure of modernization and she needs to work hard to cope with future demands of life.<sup>9</sup>

So far most of the studies have been done in schools and rural areas. The findings of studies on school children cannot be extrapolated to adolescent girls, as their school enrollment is less. It is likely that girls not attending schools belong to disadvantaged segment of society and contribute significantly in domestic and peridomestic activities, there by jeopardizing their health.<sup>10</sup>

Bagalkot is a city affected by backwaters of irrigation dam, has seen large scale changes in bio-ecosystem in this decade. The Urban field practice area where the present study was conducted is designated as a resettlement area.<sup>11</sup>

So the present study was carried out to study the nutritional status of adolescent girls residing in the urban field practice area of S. N. Medical College, Bagalkot

**Materials and Method:** The present community based cross sectional study was conducted in the field practice areas of the urban health training centers, Department of Community Medicine, S. Nijalingappa Medical College in Bagalkot. The study period was from Jan 1<sup>st</sup> 2015 to Jun 31<sup>st</sup> 2016. The population of urban health training centre was 17,922 and there were 1784 adolescent girls as per data obtained from UHTC survey registers as on May 2014. Study protocol was approved by the Institutional Ethical committee.

Local cultural values and ideas were respected. Confidentiality was assured. Informed written consent was taken from individual adolescent girl and their parents before interview. The nature and purpose of the survey were explained in detail to them in their own language.

**Inclusion Criteria:** Unmarried Adolescent girls residing in the urban field practice area for more than a year and willing to participate in the study.

**Exclusion Criteria:** Those who could not be contacted even after 3 consecutive visits.

**Sample Size:** According to the study of Prashant K and Shaw C on “Nutrition Status of Adolescent Girls from an Urban Slum Area in South India”; the prevalence of malnutrition was 20.6%.<sup>9</sup>

Desired sample size (N) was obtained by formula-

$N = 4PQ/l^2$  where P is prevalence of positive factor (20.6%), Q =100-P, l is allowable error (20% of P) =  $4 \times 20.6 \times 79.4 / (4.12)^2 = 385.53 = 386$  approximately.

So, a total of 400 study subjects were taken.

**Sampling Procedure:** Systematic random sampling technique was used to enroll the study subjects. **Study Tools:** The preparatory phase was completed and necessary approval was obtained from the college authorities. Survey records of UHTC area were verified and a total number of adolescent girls were estimated and list was prepared. Predesigned, pre-tested, semi-structured questionnaire regarding socio-demographic variables, Dietary intake assessment by 24 hour recall method, Anthropometric Measurements. Hemoglobin estimation was done by using Sahli’s Hemoglobinometer and anemia grading was done based on WHO criteria

**Data Analysis:** Data was entered in Microsoft Excel 2007 spread sheet, and subsequently it was analyzed using SPSS (trial version 20) and Open Epi software. The various factors and their association with nutritional status were studied using Chi square test. P value of <0.05 was considered statistically significant and <0.001 as highly significant.

## Results

In this study, out of total 400 Study Subjects, most of them i.e. 203(50.7%) were in early adolescence (10-13 years) followed by 128 (32%) in middle adolescence (14-16years) and 69(17.3%) were in late adolescence phase (17-19years). Majority of study subjects belonged to Hindu religion (245, 61.2%) followed by 38.8% Muslims (154) and Christians (1). Majority of study participants belonged to Other Backward Classes (253, 59.8%) followed by General Category (105, 28%) and least were in SC/ST category (42, 12.2%). Majority of the girls belonged to nuclear families (235, 58.8%) followed by 72(18%) in joint families, 47(11.8%) in three-generation families and 46(11.4%) in broken families. Majority of the girls i.e. 280(70%) had 5 to 10 members in the family followed by 90(22.5%) girls who had <5 members and 30(7.5%) girls had >10 members. According to Modified B. G. Prasad Classification of Socio-economic status, 210(52.5%) belonged to Class IV followed by 120 (30%) to Class V, 42(10.5%) to Class III, 26(6.5%) to Class II and 2(0.5%) to Class I.

Out of 400 Study Subjects, 78 were found to be having thinness and 25 were having severe thinness. The

prevalence of thinness and severe thinness in the present study was found to be 19.5% and 6.3% respectively with overall prevalence of 25.8%. 17(4.3%) girls were overweight and 5(1.2%) girls were obese with overall prevalence of Overweight to be 5.5%. Rests of the 275 (68.7%) girls were found to be having normal BMI. Table 1.

**Table 1: Distribution of Study Subjects by BMI-for-age**

Body Mass Index (BMI)	No.	%
Normal	275	68.7
Thinness (> -3SD to < -2SD)	78	19.5
Severe thinness(< -3SD)	25	6.3
Overweight (> +1 SD)	17	4.3
Obese (> +2 SD)	5	1.2
Total	400	100

According to height for age, 99 girls were found to be having stunting and 18 were having severe stunting. The prevalence of stunting and severe stunting in the present study was found to be 24.8% and 4.5% respectively with overall prevalence of 29.3%. Rest of the 283(70.7%) girls had normal height for age. Table 2

**Table 2: Distribution of Study Subjects by Height for age**

Height for Age	No.	%
Normal	283	70.7
Stunting (< -2 SD)	99	24.8
Severe stunting (< -3SD)s	18	4.5
Total	400	100

Majority of the girls had pallor (222, 55.5%) followed by baldness of tongue in 3.5% girls, goiter in 2% girls, koilonychia in 1.5% girls, angular stomatitis in 0.3% girls. None of them had Bitot spots. Table 3

**Table 3: Distribution of Study Subjects by Clinical Signs of Nutritional Disorders**

Clinical Signs	Present		Absent		Total	
	No.	%	No.	%	No.	%
Pallor	222	55.5	178	44.5	400	100
Koilonychia	6	1.5	394	98.5	400	100
Baldness of tongue	14	3.5	386	96.5	400	100
Angular Stomatitis	1	0.3	399	99.7	400	100
Goiter	8	2	392	98	400	100
Bitot spots	0	0	400	100	400	100

Discussion: In this study, early adolescent girls (10-13 years) were almost equal in proportion to middle and late adolescents (14-19years) [50.7%, 49.3%]. Mean age was 13.71 + 2.525. In studies done in Hyderabad<sup>12</sup> and Muzaffarnagar, Uttar Pradesh<sup>13</sup>, majority were in late adolescence where as in studies done in Nalgonda, Andhra Pradesh<sup>9</sup> and Dibrugarh, Assam<sup>14</sup> majority were in early adolescent age group.

Majority of study participants belonged to Hindu religion (61.2%) and other backward classes (59.8%). Similar findings were observed in studies done in Varanasi<sup>15</sup>, Hyderabad<sup>12</sup>, rural areas of Kancheepuram, Tamil Nadu<sup>16</sup> and Dakshina kannada<sup>17</sup>.

Most of the girls belonged to nuclear family (58.8%) which was similar to studies done in rural areas of Kancheepuram, Tamil Nadu<sup>16</sup> and Raipur city, Chattisgarh<sup>18</sup>. But in a study done in Hyderabad<sup>12</sup> joint families were more.

Majority of the girls were living in families with > 5 members (77.5%) with mean family size of 6.37+3. Similar findings were observed in studies done in Nalgonda, Andhra Pradesh<sup>9</sup>, Dibrugarh, Assam<sup>14</sup> and rural areas of Kancheepuram, Tamil Nadu.<sup>16</sup>

According to Modified B. G. Prasad Classification of Socio-economic status, majority of the girls belonged to Class IV (52.5%) and Class V (30%) which was similar to studies done in Nalgonda, Andhra Pradesh<sup>9</sup>, Bhopal<sup>19</sup> and rural areas of Kancheepuram, Tamil Nadu.<sup>16</sup> But, in a study done in Dibrugarh, Assam<sup>14</sup> none of them were in Class V and majority were in class IV and III.

In the present study, the prevalence of thinness and stunting was found to be 25.8% and 29.3% respectively.

**Following studies found almost similar findings:** In a study done in 2007 among adolescent Girls of Urban Slum Area in Nalgonda, Andhra Pradesh, it was found that overall prevalence of stunting was 47% and 28.3% as per NCHS and Indian standards respectively. Prevalence of thinness was 20.6% as per Indian standards.<sup>9</sup>

In a study done in 2008 among adolescent Girls in Urban Slums of Dibrugarh, Assam found that prevalence of thinness and stunting was 25.7% and 31.33% respectively.<sup>14</sup>

Similarly in a study done in 2013 among urban adolescent girls of Khalapar, Muzaffarnagar, it was

observed that Prevalence of under-nutrition was 21% and over-nutrition was 7%.<sup>13</sup>

In a study done in 2005 among adolescent girls in an urban community of Gulbarga district, Karnataka revealed that 94% had anemia and 27.6% had chronic energy deficiency.<sup>20</sup>

In a study done in rural area of Dakshina Kannada, Karnataka during 2014 among 100 adolescents (12-18 years) of both the sexes revealed that among girls, 30% had chronic energy deficiency (CED) and 15% were underweight.<sup>17</sup>

However, following studies finding were in contrast to the present study:

In a study done in urban slum of Hyderabad during 2014 revealed a high proportion of underweight (48.5%) and overweight (21.5%) in adolescent girls.<sup>12</sup>

In a study done in 2009-10 among rural adolescent girls of Belgaum; Karnataka found that prevalence of thinness and stunting was 57% and 59.8% respectively.<sup>21</sup>

In a Study done in 2009 among 230 rural adolescent girls of Kolar district found that prevalence of stunting was 32.17% respectively as per Waterlows classification and prevalence of thinness was found to be 73.5% as per Indian standards.<sup>10</sup>

In a study done in 2011 among 237 adolescent girls aged 12-19 years residing in urban slum of Karad, Maharashtra found that prevalence of undernutrition was 40.86%.<sup>22</sup>

These similarities and differences could be due to the study setting, sample size, age group distribution of study population and Growth standards used for nutritional assessment.

The prevalence of thinness, stunting and anemia in the present study could be attributed to low socioeconomic status and poor environmental sanitation in the study population.

Anemia was the predominant micronutrient disorder observed in this study (55.5%) followed by baldness of tongue (3.5%), goiter (2%), koilonychia (1.5%), angular stomatitis (0.3%) and none had Bitot spots. These findings were in contrast to a study done in Dibrugarh, Assam where prevalence of various other micronutrient deficiencies was found to be more i.e. pallor (93.30%);

angular stomatitis (35.56%); glossitis (34.15%); Goitre (4.22%) and bitots spots (0.35%).<sup>14</sup> This could be due to regional differences in the food habits.

## Conclusion

The present study revealed high prevalence of thinness, stunting and anemia reflecting poor nutritional status among adolescent girls. The prevalence of anemia in adolescent girls was significantly high in those with low BMI. Anemia was also found more in late adolescent age group

**Acknowledgment:** I would like to express my profound gratitude to all the participants for their co-operation and for their immense faith they reposed in me.

**Source of Funding:** Self

**Conflict of Interest:** None

# A Comparative Study on Road Traffic Accident in Kerala and Tamil Nadu: A Secondary Data Analysis

N. Venkata Abinaya<sup>1</sup>, Saravanan Govindaraj<sup>2</sup>

<sup>1</sup>Junior Research Fellow, <sup>2</sup>Research Officer, School of Public Health, SRM IST, Kancheepuram

## Abstract

**Background:** Injuries are neglected significant public health problem worldwide which; requires organized efforts for prevention. The vehicle population of India constitutes only 1 percent of the world but accounts for nearly 10% of the total accidents in the world. Globalization has led to increased vehicular movements leading to unsafe roads.

**Materials and Method:** This study aims at providing, comparison between Tamil Nadu and Kerala on the basis of Injury rates, on type of vehicle involved, type of roads and causative factor leading to road traffic crashes. In order to understand the severity of accidents and trends over time, we have collected data from various state and national reports published on various forums regarding the accidents in India, Tamil Nadu and Kerala and analyzed the data to see the trends and number of injuries over the past 3years.

**Results:** Between the two states, Tamil Nadu has shown high injury rates comparatively to Kerala over the period of 3 years. Though there are measures in place, somewhere there is a lack in proactive measure to stop this modern epidemic of motor vehicle trauma which shows an increase in accidents in Tamil Nadu than in Kerala.

**Keywords:** Road Traffic Injuries, Kerala and Tamil Nadu, Injury rates, RTA Comparison.

## Introduction

Road traffic injuries manifest greater part of morbidity and mortality rates in India. There are not many studies done in Indian background about the realistic magnitude, risk factors and impact of road traffic injuries, and ways to prevent and reduce the impact of road crashes. Kerala and Tamil Nadu is one of the best states in the country which has taken the initiative to have a full-fledged road safety policy to protect the lives of its citizens<sup>(1)</sup>. This review aims at providing an

overview comparison in road traffic accidents between Tamil Nadu and Kerala based on type of roads, type of vehicle involved and cause wise comparison, also describes on the injury rates between two states. This review is written in the view of presenting the road traffic accident scenario which can help various stakeholders to frame policies. RTA involves high human suffering and socioeconomic prices in terms of premature deaths, injuries, loss of productivity<sup>(2)</sup>. Globally the foremost productive cohort of the community young adults aged between 15 and 44 years constitutes more than half of the people killed in traffic crashes.

**RTA-India Scenario:** In India, statistics over the years have shown, greater than 130,000 people have died on Indian roads, giving India a honor in topping the world's list of fatalities due to road traffic injuries. Poor enforcement and non-existent of injury prevention laws and programs have led to this exaggerated situation in Indian scenario. Majority of data portrays, drunk and

Ph.No.: 9789978484

driving is the major cause of death, which is responsible for almost 70 percent of death in cities like Delhi and Mumbai<sup>(3)</sup>. Total number of road accidents for the calendar year 2016 was reported to be 4,80,652 causing injuries to 4,94,624 and claiming 1,50,785 lives in India. Comparing 2015-16, the numbers of road accidents and injured victims have been declined in 2016 by 4.1 percent and 1.1 percent respectively. That is on an average 55 accidents and 17 deaths every hour have occurred on Indian roads<sup>(4)</sup>. The number of road accidents relative to population, registered vehicles and road length are on a general declining trend from 2010, but the number of persons killed per lakh population has not undergone similar decline in recent years, but hiked to 11.9 in 2016, after an initial decline from 11.8 in 2011 to 11.2 in 2013<sup>(5)</sup>. It is projected that road traffic related injuries will surge to the third position by the year 2020 among the leading cause of world's disease burden. In order to cope up with this growing issue, there have been actions taken by countries internationally to implement road safety rules by The Decade of Action for Road Safety (2011–2020). The Sustainable Developmental Goals targets, to reduce the road traffic crashes and its related injuries to half by the year 2020<sup>(6)(7)</sup>.

**RTA- Tamilnadu Scenario:** In Tamil Nadu, the number of road traffic accidents and its related death and injuries has been in a constant rise. According to road statistics data from the Tamil Nadu State Transport Department have shown that, road traffic accidents in State have been doubled in 2016 comparatively to the year 2000. The total number of accidents in 2000 was 48923 and in 2016 it raised up to 71431<sup>(8)</sup>.

**RTA - Kerala Scenario:** In Kerala, the number of road traffic related death and injuries have been in a constant rise. Out of 4, 34,814 road accidents in India for the year 2015, 39,014 road accidents have occurred in the state of Kerala (which was contributing 7.8 percent out of total share of 86.7 percent of road traffic accidents among the top 13 states in India)<sup>(4)(9)</sup>. Out of total persons injured in road traffic crash (44108), 43253 road traffic injuries have occurred due, to the fault of the driver while driving the vehicle. Among the vehicles, two-wheelers have been reported to be the major cause of road traffic accidents among all other vehicles. As many as 1474 fatal cases were reported in the year 2016 due to two-wheeler.<sup>(9)(10)</sup>

**Comparison between Kerala and Tamil Nadu- Overview:** Among, top thirteen states in India, Tamil

Nadu ranks first, with 71431 accidents (which was 14.9 percent out of 86.5 percent of total number of road accidents reported) and Kerala ranks fifth in the list with 39420 accidents (which was 8.2 percent out of 86.5 percent of total number of road accidents reported)<sup>(8)(9)</sup>. A comparison of states unfolds that, top 13 states accounted for 83.7 percent of share in road traffic fatalities in India during the year 2016, of which Kerala did not happen to appear in the top 13 list for road traffic fatalities accounting for 4287 out of 1,26,159 total fatal cases in India. But, Tamil Nadu ranked 2<sup>nd</sup> with 19320 fatal accidents among the total fatal accidents reported in India<sup>(8)(9)</sup>. According to the severity of accidents between the cities of Kerala and Tamil Nadu, Madurai is a district in Tamil Nadu, that has a high severity index of 23.5, followed by Thiruchrapalli with 21.9, Coimbatore with 21.3 and Chennai has severity index of 15.8. In Kerala the severity of accidents in almost all the districts were minimal compared to Tamil Nadu [with the maximum severity of accident being reported in Kollam, Kerala (12.3)]<sup>(8)(9)(4)</sup>

**Chart I Injury Rates (Per 10,00,000 Population) in Tamil Nadu and Kerala between 2014-2015 And 2015-2016:** If we look into the road accidents statistics data from state transport department, which consisted of data on total number of injured persons and number of vehicle population, we were able to derive at the injury rate for both Tamil Nadu and Kerala. With the data on injury rate for a period of two years, Tamil Nadu has almost a constant injury rate within a period of two years, whereas Kerala has a sudden hike in injury rate to 33.8 (2015 -16) although the number of registered vehicle for the state was less comparatively to the previous year (2014 – 2015).

**Type of Vehicle Involved in Road Traffic Accidents between two States - Comparison:** By comparing the two states on the basis of vehicular category, total no of accidents inclusive of all categories of vehicles, Tamil Nadu ranked first among the two states with a total number of 71,431 and Kerala with 44,108 and among which **two wheelers topping** the list in both the states<sup>(8)(9)</sup>. In Tamil Nadu the total no of accidents recorded by **two – wheelers** according to the calendar year 2016 was 27,815 which was nearly two times higher comparatively to the accidents caused by two-wheelers in Kerala, which was reported to be 14,849. Followed by two wheelers, car/jeeps/taxi led to road traffic crashes, with Tamil Nadu having 19,797 car/jeep/taxi crashes which was almost 9 times more

compared to Kerala, were in the number of accidents by car/jeep/taxi was recorded to be 10,975<sup>(8)(9)</sup>.

**Chart II Percentage Comparison on No of persons killed by two-wheeler (PER 100 Vehicles) during the year 2016:** From figure 2, the total number of persons killed in the accident per 100 two wheelers in India is 27.3 percent (40779), of which Tamil Nadu records 12 percent of person killed in accidents per 100 two wheelers (4961) and in Kerala per 100 two wheelers 3 percent were killed (1280). Compared to Kerala, persons killed per 100 two wheelers is 4 times more in Tamil Nadu.

**Type of Road Involved In Road Traffic Accidents between Two States - Comparison:** Over the years only marginal changes have happened in terms of percentage share in number of road accidents and number of persons killed within various categories of roads. The share of **National Highways** was always been high in all the three parameters (total no. of accidents, number of persons killed and in no of persons injured)<sup>(4)</sup>. The total number of accidents occurred in National Highway in India is reported to be 29.6 percent out of which Tamil Nadu accounted for 15.8 percent (i.e. 22,573) of total accidents in National highway which was almost 9 percent more when compared to Kerala which was reported to be 6.4 percent (i.e., 9,209)<sup>(8)(9)</sup>. The number of accidents reported in State highway in India was 25.3 percent, out of which Tamil Nadu accounted for 19.2 percent of accidents in State Highway, which was almost 4 times more when compared to accidents reported in Kerala (5.8 percent), 2016<sup>(8)(9)</sup>.

**Chart III Percentage Comparison on No of persons killed based on the road type during the year 2016:** From figure 3, Tamil Nadu has a surge in total persons killed in fatal accidents among all the three types of roads compared to Kerala for the year 2016. (These percentages are obtained by taking total number of persons killed in respective Indian roads in the denominator)

**Cause Wise Comparison between the States:** Road accidents are multi-causal<sup>(4)</sup>. Based on the data

reporting system, the factors responsible for accident are reported on the basis of subjective judgment. The fatal accidents have been reported to be 84 percent (4,03,598) due to the fault of the driver driving the motor vehicle in India for the calendar year 2016. The major cause of accidents in Tamil Nadu and Kerala was due to the fault of the driver and in Tamil Nadu the second most cause of accident was due to fault of the passenger other than driver whereas in Kerala the second most cause was due to other conditions that has led to accidents<sup>(4)</sup>. Total number of accidents due to drivers fault in Tamil Nadu was reported to be 67,683 of which 15,031 were fatal accidents. Among fatal accident, 16,101 persons were killed. In Kerala, 38,189 total accidents were due to drivers fault, of which 3,457 was fatal accidents and 3,659 people were killed in fatal accident for the year 2016<sup>(4)(8)(9)</sup>. On comparison basis, 80.3 percent of people were reported to be killed in fatal accident due to drivers fault in 2016, in which Tamil Nadu had 13.2 percent of person killed, which was almost 4 percent more than Kerala for the year 2016<sup>(4)</sup>.

**Chart IV Percentage Comparison on total no of persons killed in Tamil Nadu and Kerala based on non-adherence of traffic rules:** From figure 4, Tamil Nadu has maximum number of total persons killed in accidents, exceeding lawful speed and in driving in wrong side compared to Kerala for the year 2016. (These percentages are obtained by taking total number of persons killed due to non-adherence of rules in India, has denominator).

**Chart V Percentage Comparison on No. of persons killed due to Non – Use of Safety Device between two states in 2016:** From figure 5, Tamil Nadu has maximum persons killed in accidents among non-use of safety device compared to Kerala for the year 2016. Number of persons killed in Tamil Nadu due to non – wearing of helmet is 11 percent more than in Kerala and the number of persons killed in Tamil Nadu due to non – wearing of seatbelt is 5 percent more than in Kerala (These percentages are obtained by taking total number of persons killed due to non-use of safety device in India, has denominator).

**Chart I: Injury Rates (Per 10,00,000 Population) in Tamil Nadu and Kerala between 2014-2015 and 2015-2016**

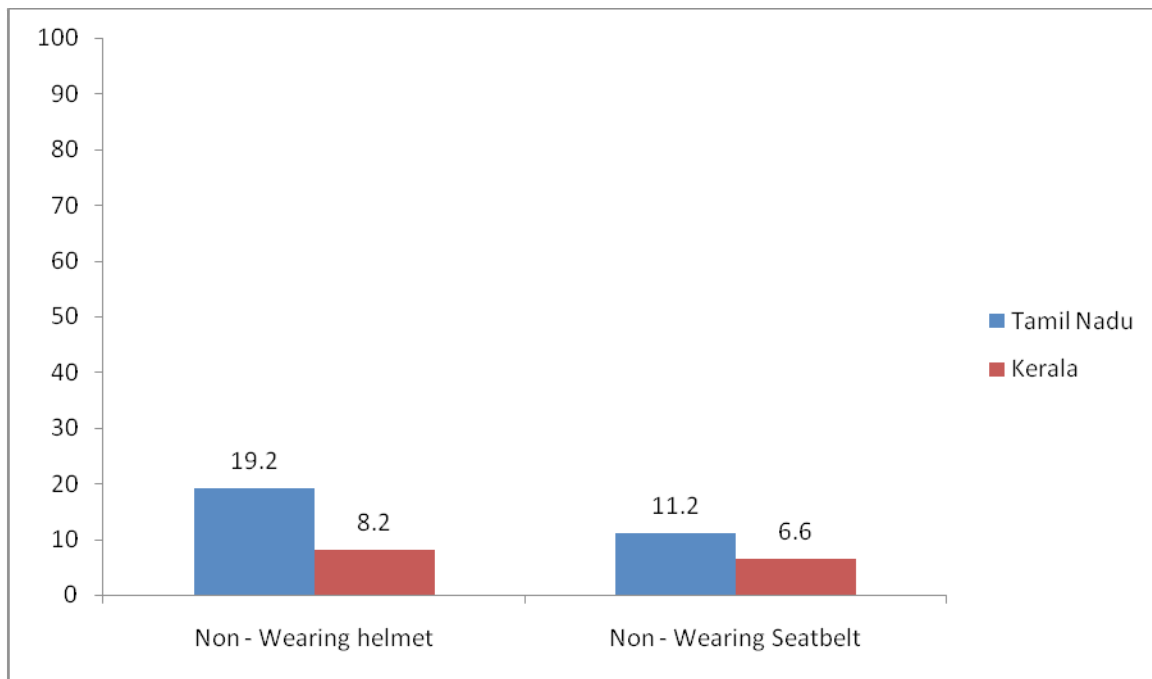

**Chart II: Percentage Comparison on No of persons killed by two-wheeler (Per 100 Vehicles) during the year 2016**

**Chart III: Percentage Comparison on No of persons killed based on the road type during the year 2016**

**Chart IV: Percentage Comparison on total no of persons killed in Tamil Nadu and Kerala based on non-adherence of traffic rules**

**Chart V: Percentage Comparison on No. of persons killed due to Non – Use of Safety Device between two states in 2016**

### Discussion

The mounting toll of road accidents, with increase in fatalities compared to previous years in India, especially in Tamil Nadu is in surge, which puts forth to continue the studies and research on road accidents and its preventive measures, which is an urgent matter. The global transport and road system will continue to develop and will undergo changes in the next 20 to 30 years, due to globalization, urbanization and declining natural resources<sup>(11)</sup>. Preventive measures are indeed a requirement to mitigate the growing incidence of accidents and also to condense the growing epidemic of mortalities and morbidities due to road traffic accidents.<sup>(12)</sup> The statistics projected in this study shows only the fatalities occurred at the scene of the accident and not the delayed mortality, since the data regarding the same is not available. In order to cut down these figures, care must be concentrated on the accident victim from the accident spot to the emergency ward and the ambulance must be provided with modern equipment for a better chance of survival. Regional services should also be made available. A study led by Dr.S.Krishnan et al, have portrayed that road users behavior has been found to be the primary reason for the accidents in 70 to 90 per cent of cases.<sup>(13)</sup> Another study conducted by Alagappan Meyyappan et al, in Chennai city, out of 1835 trauma

victims, 1806(98.4%) were due to road traffic accidents, of which two-wheelers accounted for 66.4 per cent and four-wheelers accounted for 21.6 per cent<sup>(14)</sup>. Education of public, regarding the road traffic rules and regulations has to be strictly enforced. Causative factor, that could be eliminated is poor road system and also the lack of yearly inspection of the vehicle, is another aspect that has to be given attention, as the old and the disused vehicles are more likely to cause injuries on their passengers. There cannot be enough emphasis placed immediately on the need for these measures to control and mitigate the mortality, morbidity and disability related to morbidity and damage to the property and the person(his/her family) who are indirectly getting affected due to the Road Traffic Accidents. Need for these actions becomes more apparent, when we realize the victims mostly affected are young age group, a fact that has to be stressed and given attention.

### Conclusion

Though India constitutes around 1 percent of the vehicle population in the world, the percentage of road traffic fatalities from India is nearly 10 percent. There have been many initiatives taken by the Government of India to save the precious life of citizens by creating “safer roads for everyone”, Tamil Nadu Government

with a vision to prevent and reverse the increasing trend in the number of accidents, number of deaths, number of injuries through adoption of comprehensive measures and by providing Road Safety policy covering Engineering, Education, Emergency care and execution of social control. On the other hand stern measures, intelligent enforcement and sustained efforts of law have quite helped the state of Kerala to reduce the road traffic accident related injuries and death comparatively to Tamil Nadu to an extent. From this it is indicated that, although there is Road traffic safety measures and funds, Emergency Accident Relief Centers and Compensations to Road Accident Victims, there is a lack of proactive measures to stop this modern epidemic of motor vehicle trauma amidst Globalization and thereby increased vehicular movements.

# Evaluation of Effective Dose and Associated Radiation Risks in Common Computed Tomography Procedures

Abdul Kayyum<sup>1</sup>, Nitika C. Panakkal<sup>2</sup>, Arathy Mary John<sup>2</sup>

<sup>1</sup>Intern, <sup>2</sup>Assistant Professor, Department of Medical Imaging Technology, Manipal College of Health Professions, Manipal Academy of higher education, Mangalore, Karnataka, India

## Abstract

**Background:** The radiation exposure associated with CT is known to be significantly higher compared to the conventional x-rays. The objective of this study was to estimate the radiation dose and related risks for five common CT procedures in clinical setting.

**Materials and Method:** The study included 150 patients referred for CT brain, cerebral angiography, neck, thorax, abdomen & pelvis. The scan was performed using a 64 slice Philips Brilliance. “Dose length product” was used to estimate “effective dose” using specific “conversion factors”. The lifetime attributable risk of cancer was determined using a formula adapted from the phase 2 BEIR VII report.

**Results:** The results depicted that the mean effective dose varied substantially for various CT procedures. The “effective dose” ranged from 2.19 mSv for CT brain to 11mSv for CT abdomen and pelvis. An estimated incidence of cancer due to each procedure was found to be 1 in 5618 for CT Brain, 1 in 4315 for CT Neck, 1 in 2.084 in CT Cerebral angiogram, 1 in 1773 patients for CT Chest and 1 in 1086 patients for CT Abdomen

**Conclusion:** Radiation doses for certain CT procedures were found to be higher than generally quoted thereby increasing the risk. Therefore there is a need for optimization of CT protocols.

**Keywords:** *Computed tomography, effective dose, Dose length product, Radiation risk.*

## Introduction

One of the most important advances in medicine is the invention of Computed tomography as it plays a significant role in diagnostic radiology. An estimate of more than 62 million CT scans takes place in a year in the United States<sup>(1)</sup>. However, the diagnostic power of computed tomography is always at the price of radiation dose to the patient. X-rays are low LET ionising

radiation and are considered a carcinogen according to the World Health Organization<sup>(2)</sup>. Depending on the length of time from the moment of irradiation to the first appearance of symptoms they are classified as early and late effects of radiation. Early effects of radiation are called non-stochastic or deterministic effect as their severity increases with increasing absorbed dose<sup>(3)</sup>. Stochastic effects of radiation are late effects of radiation that can cause somatic stochastic and genetic damage. Genetic effects are the biological damages to the future generations<sup>(4)</sup>. Although the individual radiation risk for adults are generally low for low LET radiation, the concern over CT risk is due to the greater usage of CT. These smaller individual risks if put in to an increasingly larger population can be a cause a potential public health issue in the near future<sup>(5)</sup>. The “national academy of sciences” have detailedly assessed the biological and epidemiological data to health risks from ionising radiation and published the “Biological effects of ionising

radiation report VII (BEIR VII) for risk estimates for cancer and other health effects from exposure to low-level ionising radiation<sup>(6)</sup>. The BEIR VII focuses on health effects from low LET radiations including x-rays and gamma rays. The main objective of “BEIR VII” was to create various risk models for estimating the risk that an exposed individual will develop cancer. The “BEIR VII” risk model predicts that approximately one individual in 100 persons would develop cancer from a dose of 100mSv however; lower doses would produce proportionally lower risks. Although individual radiation risks are small, the increasingly large number of people exposed to high exposure per examination can lead to many cases of radiation induced cancer<sup>(7)</sup>. Therefore the study aims to estimate the effective dose among patients referred for common CT procedures and use this specifics to estimate the “lifetime attributable risk of cancer” related with these procedures.

### Method

On approval from the institutional ethics committee, the prospective study included 150 patients referred for CT brain, cerebral angiography, neck, thorax, abdomen & pelvis. Only patients within the normal BMI category of 18.5-24.9 were included for CT chest and abdomen. Patients with a history of trauma or any indications for testicular pathologies were excluded. CT scans were performed using a 64-slice, Philips Brilliance multi-detector computer tomography.

The scan was performed using the routine CT protocol as shown in Table 1. The “dose-length product” for each series was collected from the dose information displayed on CT monitor and the product of “DLP” and specific “conversion factors” was used to estimate the effective dose as given in Table 2.<sup>(8-9)</sup>

The “lifetime attributable risk of cancer” incidence was estimated from an equivalent dose of 0.1 Gy using a report on the health risks from exposure to ionising radiation adapted from the phase 2 Table 12D-1 of BEIR report VII<sup>(6, 10)</sup>. The formula for calculating the LAR is given in equation 1<sup>[10]</sup> as follows:

$$\text{“LAR” at an age} = \frac{\text{ED (mSv)} \times \text{LAR (cancer incidence) at the age} \times 100 \%}{D \times 100000} \quad (1)$$

Where D is equivalent 0.1 Gy.

The radiation risk estimates are based on a single radiation exposure and the age of the patient at the time of exposure. The cancer related risks for each procedure

was estimated and compared for males and females.

By using descriptive statistical analysis, the mean effective dose for each procedure was calculated for both males and females. All continuous variables were summarized using mean and standard deviation and is represented as Mean ± SD. “One –way annova” was used to compare effective doses for each procedure.

### Results

The results showed that there was a clinically significant difference in “mean effective dose” for various CT studies, however there was no statistical significant difference (p=0.3602). The “mean effective dose” ranged from 2.1 mSv for CT brain to 11mSv for CT abdomen and pelvis as shown in table 3. Although we included a single sequence for each procedure, studies like CT abdomen and chest showed a high effective dose within each anatomic area. For abdomen scans, the “effective dose” differed from 7.37 “mSv” to 15.75” mSv”, whereas for the scans of the chest the “effective dose” ranged from 5.48 “mSv” to 10.15 “mSv”. However, CT brain (2mSv -2.3mSv) did not show a wide variation in effective dose.

Among the various CT procedures, CT abdomen has the highest mean effective dose of 11.3±2.3 mSv, followed by CT Chest with a “mean effective dose” of 7.04±1.13 mSv. CT Cerebral angiogram and CT Neck reported “mean effective dose” of 5.21±0.72 mSv & 2.96±0.67 mSv. The least “mean effective dose” of 2.19±0.13 mSv was recorded in CT Brain [Figure 1].

The mean radiation risk indicates the probability of incidence of cancer due to one exposure to each procedure. The results showed that the highest contributor to the radiation induced risk was for CT Abdomen followed by CT chest where the possibility of developing cancer would be 1 in 1442 and 1 in 2675 respectively. CT Cerebral angiogram also showed a significant share in radiation induced cancer with an estimated risk of 1 in 4355. CT brain and CT neck showed the least probability for the incidence of cancer with an estimated risk of 1 in 9079 and 1 in 6451 respectively.

The study also showed a variation in associated risk among males and females for the same procedure. In the present study, CT Abdomen showed the highest probability of incidence of cancer with 6 in 10000 for males and 8.3 in 10000 for females whereas CT Brain showed the least probability of incidence of cancer with

1 in 10000 males and 1.3 in 10000 for females. The variation in associated risk was not only seen among gender but was found to be decreasing with age. Figure

2 depicts the radiation induced cancer risk for male and female for five common CT procedures.

### Discussion

The frequency of number of CTs has increased drastically over last two decades which points out towards the high radiation dose delivered and its associated risk<sup>(11)</sup>. It is therefore essential to know how such risks change with age, sex, physical characteristics, and “radiation exposure”.

The results of the present study were found to be similar to a study conducted by Rebecca Smith et al<sup>(11)</sup> as depicted in Table 4. However, the “effective dose” for CT cerebral angiography and Abdomen was found to be lower in the present study. Rachel et al. conducted a similar study for 34 CT protocols and reported a higher mean DLP for CT brain and thorax compared to the present study<sup>(12)</sup>. However, the current study also reported a higher dose for CT abdomen and cerebral angiogram. The variations observed in the DLPs of the procedure could be due to several factors such as differences in the pre-set technical factors and the area coverage for the scan. The body compositions of subjects in studies also determine the DLP and effective dose. The “effective dose” for diagnostic CT procedures are typically estimated to be in a range of 1-10 mSv according to U.S food and drug administration where CT brain and chest has an “effective dose” of 2 and 7

mSv respectively. These were found to be similar to the present study<sup>(13-14)</sup>. Similarly the ICRP also shows typical doses of 1.7 mSv, 3 mSv and 7 mSv for CT Brain, neck and thorax respectively<sup>(15)</sup> as shown in table 5. The present study agrees with the most of the study reported in the literature where CT brain showed the least effective dose and CT abdomen showed the highest effective dose

One similar study conducted by Amy Berrington et al.<sup>(7)</sup> also showed that CT abdomen had the highest risk with a 10 in 10000 probability for incidence of cancer for both males and females. On the other hand CT Brain showed the least risk where the likelihood of incidence of cancer was found to be 3 in 10000 for males and 2 in 10000 for females. Another study conducted by Rebecca et al<sup>(11)</sup> showed the least probability of radiation induced cancer for CT brain with 1 in 7350 for males and 1 in 8100 for females whereas CT Abdomen showed the highest probability of radiation induced cancer with 1 in 660 for males and 1 in 930 for females.

It was also observed that females had a higher risk of incidence of cancer compared to males. The difference was observed in Abdomen (0.04%), Chest (0.018%) and cerebral angiogram (0.015%).

For CT Chest and CT Cerebral angiogram additional risk of breast cancer can be the main reason for increased incidence of cancer in females. The higher lung cancer risk coefficients for females also contributes to this variation<sup>(7)</sup>. The radiation induced risk was also seen increasing as the age decreased. This could be due to the increased sensitivity of growing and developing tissues and organs. Second, the carcinogenic effect of radiation may have a long latent period according to the type of the malignancy. So as the lifetime increases the period for incidence of cancer also increases<sup>(16)</sup>. Therefore, there is a need for optimizing the protocols. Using age/weight and indication specific protocols can also help in reducing the radiation dose<sup>(17)</sup>.

The risk estimated in the present study was adapted from BEIR VII phase 2 report. However, this data focuses on estimating the radiation risk from low LET radiations assuming that the model for calculating risk is a linear no threshold model. Also, the statistics of risk estimated in the present study are merely averages as they do not take into consideration the previous history of radiation exposure and various predisposing factors. Therefore further epidemiological studies can be done to study the radiation effects from exposure to CT scans.

### Conclusion

The study concluded that the radiation doses for certain CT procedures like CT thorax and CT abdomen were found to be higher than generally quoted thereby increasing the risk. It was observed that among the various CT procedures, CT Abdomen showed the highest effective dose. Therefore there is a need for optimisation of CT protocols

# A Correlative Study to Assess the Knowledge and Practice of Housewives Regarding Householdwaste Management in Selected Rural Community at Mangalore with a View to Provide an Information Pamphlet

Abin Baby<sup>1</sup>, Shycil Mathew<sup>2</sup>

<sup>1</sup>Nursing, Lecturer Dept. of Community Health Nursing, City College of Nursing, <sup>2</sup>Lecturer Department of Community Health Nursing, Yenepoya Nursing College, Yenepoya (Deemed to be University), Deralakatte, Mangaluru, Karnataka, India

## Abstract

**Background:** Improper waste management deteriorates public health, degrades quality of life, and pollutes local air, water and land resources. It also causes global warming and climate change and impacts the entire planet. Environmental problem faced by communities living near garbage dumps and marshy lands include air pollution, fires, smoke, flooding etc. Long term health problems like asthma, bronchitis, hepatitis, jaundice, malaria, elephantiasis and typhoid too have been faced by communities. So waste which are considered to be hazardous need to be disposed off safely and adequately.

**Materials and Method:** A descriptive correlative research design was used for this study. The sample comprised of 60 housewives between 18-55 years of age. The sample was drawn through purposive sampling technique. The study was carried out in rural community at Mangalore. A structured knowledge questionnaire was used to determine the knowledge of the subjects and practice rating scale was administered to assess the practice scores of housewives regarding household waste management.

**Results:** Majority of the subjects (65%) were having only average knowledge with knowledge score ranging between 0-20 with median 18 and SD 3.01 and majority of the subjects were have moderate practice score on waste management with median 20 and SD 3.52. There was a significant relationship between knowledge score and practice score of the subjects on waste management ( $r=0.346$ ,  $df=59.000$ ,  $p<0.05$ ). **Conclusion:** The findings of this study suggest that there is a need for educating the mothers regarding the proper household waste management. Women take a key role in housekeeping and disposing domestic waste. So the Government and frontline health workers need to take special initiatives to curb this public issue.

**Keywords:** Knowledge; practice; waste management; housewives; information pamphlet.

## Introduction

Waste is a material that no longer serves a purpose and so is thrown away<sup>(1)</sup>. In somecases what one person discards may be re-used by someone else<sup>(2)</sup>. All wastes are particularly hazardous<sup>(3)</sup>. Improper disposal of wastes causes negative impact on the environment, whether it is unsightly litter in urban streets or contaminated air, soil or water<sup>(4)</sup>. This improper waste disposal can affect the life negatively by creating an

environment that is potent for developing diseases in man as well as other living things. Toxic waste can seep into the ground and contaminate our water supplies, and sometimes cause widespread diseases. Due to uncollected waste and improper disposal techniques drains also get clogged which lead to mosquitoes by which various diseases like malaria, chikungunya, viral fever, dengue etc. arise and affect the health of people adversely<sup>(4,5)</sup>. The output of daily waste depends upon the dietary habits, lifestyles, living standards, and the degree of urbanization and industrialization<sup>(6)</sup>. In India we produce 300 to 400 Gms of solid waste per person per day in town of Normal size but exceptionally about 500 to 800gms of solid waste is generated per capita per day in metro cities like Delhi and Bombay<sup>(7)</sup>. The total population of Karnataka as per 2011 census is 5.273 core (52.73), Urban 33.98% and rural 66.01%. In Karnataka the waste quantities are estimated to increase from 46 million tons in 2001 to 65 million tons in 2015<sup>(7,6)</sup>. In a day-to-day life many people are unaware of the proper domestic waste disposal and its harmful effects on the health and environment<sup>(8)</sup>. Community based education, especially in women, on household waste management and hygiene is essential in order to improve the health of the community<sup>(9)</sup>.

**Aim:** The aim of this study is to assess the knowledge and practice of housewives regarding household waste management in a selected rural community at Mangalore with the view to provide an information pamphlet.

#### Objectives of the Study:

1. To determine the level of knowledge regarding household waste management among housewives as measured by a structured knowledge questionnaire.
2. To identify the practice of housewives on household waste management as measured by a practice rating scale.
3. To find the relationship of knowledge and practice scores of housewives on household waste management.
4. To find the association of knowledge scores of housewife on household waste management with the selected demographic variables.
5. To find the association of practice scores of housewife on household waste management with the selected demographic variables.

## Materials and Method

**Study setting and sample size:** A descriptive correlative research design was used for this study. The sample comprised of 60 housewives between 18-55 years of age. The samples were selected by purposive sampling technique. The study was carried out in rural community at Mangalore, India. A structured knowledge questionnaire was used to determine the knowledge of the subjects with 34 knowledge items with the maximum score of 34 to assess the knowledge of housewives regarding household waste management. and practice rating scale was administered to assess the practice scores of housewives regarding household waste management with 17 statements with three point scale i.e. always, sometimes and never. The statements were scored 2, 1, 0 respectively. The maximum possible score is 34. In order to educate the housewives on this regard the investigator has developed and distributed an information pamphlet to all subjects after collecting the data.

**Data Analysis:** The data was collected after obtaining prior permission from the concerned authority to conduct the study. The participants were assured about the confidentiality of their responses. The data was analyzed in terms of objectives of the study using both descriptive and inferential statistics. The data obtained was plotted in the master sheet.

#### Findings:

### Results

#### Section I. Description of baseline Proforma

- Maximum number of subjects (38.3%) were in the age group of 30-39 yrs.
- Maximum number of subjects (48.3%) were Muslims
- Most of the subjects (40%) have primary education
- Most of the subjects (45%) belong to nuclear family
- Majority of the subjects (40%) had monthly income of 4001-6000
- Most of the subjects (41.7%) received information from Magazines/Newspapers.

**Section II: Knowledge score obtained by the subjects regarding household waste management.**

- Majority of the subjects (65%) have average knowledge, 33.3% of subjects have good knowledge and only 1.7% of them have excellent knowledge regarding house hold waste management. This shows that majority of the subjects (65%) have only average knowledge regarding house hold waste management. (figure-1)

**Section III: Practice score of subjects regarding household waste management**

- Out of 60 housewives, 80% housewives had average disposal practices, 20% had good practices on disposal of house hold waste management. (Table-1).

**Section IV: Correlation relationship between knowledge and practice scores of subjects regarding household waste management**

- There is a moderate positive correlation between the knowledge and practice score ( $r = -0.346$ ,  $df=58$ , table value=0.236). (Table-2)

**Section V: Association between knowledge score and selected demographic variables.**

- There is no significant association between knowledge score with demographic variables except in religion and educational qualification.

**Section VI: Association between practice score and selected demographic variables**

- There is no association between practice score of subjects with demographic variables

**Discussion**

- The present study revealed that, majority of the subjects (65%) have average knowledge, 33.3% of subjects have good knowledge and only 1.7% of them have excellent knowledge regarding house hold waste management.
- Results obtained from this study consistent to the results reported in another study conducted by Arora L et al it was found that 162(54%) of the respondents could be classified as possessing low knowledge, whilst 138(46%) respondents were having medium level of knowledge regarding waste management <sup>(2)</sup>.
- In present study results revealed that out of 60 housewives, 80% housewives had average disposal practices, 20% had good practices on proper disposal of house hold waste management .

The findings of the study was similar the study conducted by John Jince V el al(2014) 75.1% had average practice, 24.9% had ppor practice and none of them had good practice regarding domestic waste management <sup>(13)</sup>.

There is moderate positive correlation between the knowledge and practice score ( $r = -0.346$ ,  $df=58$ , table value=0.236).

The findings of the study was similar the study conducted by John Jince V el al(2014) The study shows a positive correlation between knowledge and practice of housewives on management of domestic plastic waste ( $r=0.071$ )<sup>(13)</sup>

**Section II: Knowledge score obtained by the subjects regarding household waste management.**

**Figure 1: Cone diagram showing the distribution of subjects according to the grades of knowledge score.**

**Section III: Practice score of subjects regarding household waste management.**

**Table 1: Distribution of practice score of subjects on household waste management in terms of frequency and percentage N-60**

Practice Score	Grade	Frequency	Percentage
23-34	Good	12	20
12 -20	Average	48	80
0-11	Poor	0	0

**Section IV: Table 2: Correlation between knowledge and practice of subjects on household waste management. N-60**

Variables	Max Score	Min Score	SD	r value	df	Inference
Knowledge	31	16	3.01	0.346	58	Significant
Practice	30	15	3.52			

r' = 0.346 at df = 58

**Figure 2: Scatter diagram showing the correlation between knowledge and practice scores of housewives regarding household waste management**

**Conclusion**

The findings of this study revealed that, majority of the subjects had only average knowledge regarding household waste management and the study suggest that there is a need for educating the mothers regarding the

proper waste disposal, since the women take a key role in housekeeping and disposing domestic waste. So the Government and frontline health workers need to take special initiatives to curb this public issue.

**Acknowledgement:** The investigator sincerely

acknowledges the support given by Mrs. Shycil Mathew, Shanti Lobo and Janat Miranda for their timely support and smart guidance to complete the project. Sincere gratitude towards the study participants for their cooperation.

**Financial support and sponsorship:** Nil

**Conflicts of Interest:** There are no conflicts of interest

**Ethical Clearance:** Written informed consent was obtained from the housewives. Ethical clearance was obtained from institutional ethics committee of CHCT, Mangalore.

# Role of the Internet in the Health-Seeking Behaviour of Parents of Children Under-Five During Fever

Abinaya Sivakumar<sup>1</sup>, Padmasani Venkatramanan<sup>2</sup>, Sarala Premkumar<sup>3</sup>

<sup>1</sup>MBBS, CRRI, <sup>2</sup>Professor of Pediatrics, <sup>3</sup>Associate Professor of Pediatrics, SRIHER

## Abstract

**Introduction:** Internet has revolutionized the way the world accesses information and it is common for parents of young children to use the Internet to seek medical advice when their child is ill. There is very little data on how this influences the subsequent management of the illness. The aim of this study was to study the role of the Internet in the health-seeking behaviour of parents of under-five children during fever.

**Methodology:** 250 parents of children under five, with fever who presented to the Paediatric OPD were interviewed with a semi-structured questionnaire on their health-seeking behaviour and internet utilisation for health information. A semistructured questionnaire was used to interview the parents. Statistical analysis was done using SPSS version 16.0.

**Results:** 54.4% parents used the Internet for health information. 78.68% go through the first few sites shown by the search engine without knowing the name of the site or the credibility of the source. Internet-users were more likely to use a thermometer to record body temperature and know the temperature that denoted fever. There was no difference in the health seeking behaviour or initial action taken at home in the two groups. The positive health-care seeking behaviour of the mother was found to be related only to her education.

**Conclusion:** A large group of parents use the Internet for health information but do not know how to assess the credibility of the sources. Most parents used the information only to supplement the doctors' advice and not as a replacement.

**Keywords:** Health-seeking behaviour; Fever; Internet; Under-five.

## Introduction

Since its discovery in the early 1960s, the Internet has revolutionised the way the world accesses information<sup>[1]</sup>. 35% of India's population are Internet-users<sup>[2]</sup>. It is common for parents of young children to use the Internet to seek medical advice, before seeing a physician<sup>[3]</sup>. The Internet also helps parents collect additional information after a consultation, draw support from online forums and increase their awareness on alternative therapies<sup>[4]</sup>.

However, the Internet may act as both a facilitator and a barrier<sup>[3]</sup>. Health information found online may be misleading<sup>[3]</sup>, with little control over the timeliness of updates<sup>[5]</sup>. The aim of this study is to understand the role of the Internet in the health-seeking behaviour of caregivers of children under five years with fever.

## Method

Parents of children under five years who attended the Paediatrics Out-Patient Department of a tertiary care university teaching hospital with the chief complaint of fever were the subjects. After their written consent, they were interviewed with a semi-structured questionnaire using the 'funnel approach'<sup>[6]</sup>, by beginning discussions with open-ended, less-structured questions and moving to more focused questions and probes.

### The questionnaire contained four sections:

- Basic demographic details of the family
- Previous medical history of the child
- Questions pertaining to the current illness
- Details of Internet usage.

**Statistical analysis:** The data was analysed using SPSS software version 16.0 using frequencies for demographic details and percentages for categorical variables. Chi square test was done to determine the association between the various parameters and the association was considered significant if p value was  $\leq 0.05$ .

## Results

250 parents (239 mothers and 11 fathers) participated in this study. A younger age, higher educational level, being professionals and belonging to Socioeconomic class 3 or above were significantly associated with greater Internet utilization.

54.4% parents were Internet-users. 94.12% used mobiles and 5.8% of them used computers to access the Internet. It was observed that most parents used websites shown by the search engines (76.47%) over hospital (7.35%) and parenting websites (16.18%) and did not check the credentials of the author of the information (78.68%). None of the users knew which websites to access and how to judge the reliability of the sources. 27.21% parents asked their doctors about the accuracy of the information they read online but 13.97% parents believed whatever they read online. 8.82% parents used the Internet after consultation to check their doctor suggestions for reassurance.

Table 1 compares the knowledge and health-seeking patterns of Internet users and non-Internet users. In both the groups, 82.8% parents sought medical care for their child's fever within 24 hours and 89.2% parents gave their child paracetamol syrup/tablets, did tepid sponging or both before consulting a doctor. Although 62.4% parents used a thermometer to check the temperature of the fever, 40.4% did not know what the normal body temperature should be and what is considered fever. There was no association found between the education of the mother and the usage of a thermometer for measuring the fever of their child ( $p=0.141$ ).

Internet-users were more likely to use a thermometer for recording the body temperature ( $p<0.001$ ) of the child when he/she had fever, had more knowledge on the normal ranges ( $p=0.002$ ) and the temperature that denoted fever ( $p=0.001$ ). 50.74% parents had tried out home remedies suggested online before seeking medical help. There was however no difference in the promptness with which medical attention was sought ( $p=0.640$ ), the initial action taken at home ( $p=0.458$ ). Also, there was no relationship between gender of the child and health seeking behavior ( $p=0.306$ ) or the concerns ( $p=0.695$ ) the parents had amongst the Internet and non-Internet users.

**Table 1: Knowledge and Health seeking behaviour of internet users and non users**

Health Seeking Behaviour		Internet Users n(%) N=136	Non-Internet Users n(%) N=114	Total n(%) N=250	P value
Promptness of seeking care	$\leq 24$ h	114 (83.8%)	93 (81.6%)	207 (82.8%)	p=0.640
	$>24$ h - $\leq 48$ h	10 (7.4%)	17 (14.9%)	27 (10.8%)	
	$>48$ h - $\leq 72$ h	12 (8.8%)	4 (3.5%)	16 (6.4%)	
Use of thermometer	Yes	101 (74.3%)	55 (48.2%)	156 (62.4%)	p<0.001
	No	35 (25.7%)	59 (51.8%)	94 (37.6%)	
Knowledge of normal body temperature)	Don't know	42 (30.9%)	59 (51.8%)	101 (40.4%)	p=0.002
	Correct	76 (55.9%)	42 (36.8%)	118 (47.2%)	
	Incorrect	18 (13.2%)	13 (11.4%)	31 (12.4%)	
Definition of fever (according to parent)	Tactile perception	44 (32.4%)	59 (51.8%)	103 (41.2%)	p=0.001
	97-99 °F	25 (18.4%)	7 (6.1%)	32 (12.8%)	
	100 °F	63 (46.3%)	46 (40.4%)	109 (43.6%)	
	101-104 °F	4 (2.9%)	2 (1.8%)	6 (2.4%)	
Initial action by parent	Wait for medical consultation	13 (9.6%)	14 (12.3%)	27 (10.8%)	p=0.458
	Paracetamol	64 (47.1%)	47 (41.2%)	111 (44.4%)	
	Tepid sponging	8 (5.9%)	6 (5.3%)	14 (5.6%)	
	Both paracetamol & sponging	51 (37.5%)	47 (41.2%)	98 (39.2%)	

## Discussion

Of the 250 parents, 136 parents (54.4%) were Internet-users with the majority accessing the net through their mobile. This finding is similar to that of other studies in India and other countries<sup>[7,8]</sup>. It was observed that most parents used websites shown by the search engines (76.47%) over hospital (7.35%) and parenting websites (16.18%) and did not check the credentials of the author of the information (78.68%). None of the users knew which websites to access and how to judge the reliability of the sources. Other studies have also shown that people usually omit to check the origin of information found on the Internet<sup>[9]</sup>.

In our study, most parents used the Internet to get health-related information only to complement the doctors' advice and not as a replacement. Only 11.76% parents felt influenced by the Internet. Earlier studies have also reported that most parents considered their Paediatrician as their primary resource for information about fever<sup>[10]</sup>. This study showed that most parents sought medical help within 24 hours of the onset of fever in their child. The health-care seeking behavior of the parents found to be related to the mother's education ( $p=0.005$ ).

One limitation of this study is that it was done in the outpatient department of a university teaching hospital. A study in a community setting may throw more light on this important issue.

## Conclusion

A large group of parents use the Internet for health information but do not know how to assess the credibility of the sources. Most parents used the information only in addition to the doctors' advice and not as a substitute.

# Poverty and Access to Medicine: A Medico Legal Study

Ajay Kant Chaturvedi<sup>1</sup>, R.L. Koul<sup>2</sup>

<sup>1</sup>Ph.D. Research Scholar Under the Supervision of Professor, <sup>2</sup>Professor. (Dr). R.L. Koul, Professor,  
Amity Law School, Amity University, Uttar Pradesh

## Abstract

The right to health as a basic human right- and access to medicine as a part of it- have been a matter of attention for several decades. Also the responsibilities of different parties- particularly pharmaceutical companies- in realization of this right have been emphasized by World Health Organization. This is while many companies find no incentive for research and development of medicines related to rare diseases. Also some legal structures such as “patent agreements” clearly cause huge difficulties for access to medicine in many countries. High prices of brand medicine and no legal production of generics can increase the catastrophic costs- as well as morbidity-mortality of medication in lower income countries. Here we evidently review the current challenges in access to medicine and critically assess its legal roots. How societies/governors can make the pharmaceutical companies responsible is also discussed to have a look on possible future and actions that policy makers- in local or global level- can take.

**Keywords:** *Access to medicine, Pharmaceuticals, Pharmaceutical companies, Human rights.*

## Introduction

*“Poverty is the parent of revolution and crime” –*  
Aristotle

The above quoted couplet aptly summarises the concept of Poverty. Poverty is not having enough means, resources, material possessions or income for fulfilling a person’s needs. Poverty may be social poverty, economic poverty or political poverty. Absolute poverty is the complete lack of means necessary to meet basic needs which are strictly personal such as food, clothing and shelter. The threshold of absolute poverty always remains the same independent of the person’s permanent location or other corresponding factors. On the other hand relative poverty is when a person cannot meet a minimum level of living standards, compared to others in the same time and place. Accordingly the threshold or the benchmark of relative poverty varies from one country to another or from one society to another or from one system to another and so on.

Governments and non governmental organisations try to reduce poverty. The government’s ability to deliver services and provide basic needs to people who

are unable to earn a sufficient income can be held to ransom by the major bottlenecks and speed breakers in the form of corruption, tax avoidance, debt and loan conditions and by the brain drain of health care and educational professionals . Therefore, welfare solutions, economic freedoms and providing financial services must be included in various strategies of increasing income and providing succour to poor people. In contrast to *laissezfaire* era where the functions of the government primarily involved those of protecting the community against external attacks, maintaining internal law and order and guaranteeing contracts, the welfare state concept demands a much wider and more pervasive range of government activity. Not only should the government provide social services such as social security, medical treatment, education, welfare facilities and subsidised housing but these should go beyond the provision of a bare minimum towards ensuring that all have equal opportunity, so far as the country’s resources allow. There is difference of opinion as to how this can be most effectively done and what degree of public provision it should involve, relative to private, but the principle that this is a proper public concern is generally accepted . It is also generally accepted that

the government has an obligation to steer the working of the market economy in the directions considered to be socially desirable. Fiscal policy and monetary policy should be used to combat unemployment and inflation and promote steady growth. Encouragement must be given to types of investments thought to be desirable, by means of investment allowances and grants. Help should be given in developing new industries in those areas of the country which are lagging in growth and income. The concept of welfare states thus involves much more than social services. But social services are nevertheless its most characteristic element, since they are concerned with the positive provision of service to individuals of a type and on a scale that they would not obtain through the free market. In other words, the types of services most characteristic of the welfare states are those which meet what Musgrave<sup>1</sup> calls 'Merit Wants'. They are not concerned with pure public wants of a kind which cannot be satisfied through the market because the benefit from them is almost entirely social and there is little or no private benefit. Defence, law and order, general administration etc. are services of this kind. On the other hand, education, medical treatment and social security are not of this type as they provide distinct benefits to individuals and are provided through the market and for a price. But an element of social benefit, from an educated and healthy community or for ensuring that all members of the community are guaranteed a minimum income in the event of inability to earn is held to arise over and above the private benefits to the individuals. As per the report of World Day Lab, the effect of various govt. initiatives will result in a level of extreme poverty in India of 50 million people today which will come down to 40 million (a poverty rate of below 3%) by end 2019.<sup>2</sup> In July 2018, World Poverty Clock, Vienna based think tank reported that a minimal of 5.3% or 70.6 million Indians are living in extreme poverty compared to 44% or 87 million Nigerians. Till 2019, Nigeria and Congo surpassed India in terms of total population earning below dollar 1.9 a day.<sup>3</sup> Although India is expected to meet United Nations sustainable development goals on extreme poverty in due time, a very large share of its population lives on less than 3.2 dollar a day, putting country safely into category of lower middle income economies.

One third of deaths around- some 18 million people, a year or 50,000 per day are due to poverty related causes. People living in developing nations, among them women and children are over represented

among the global poor. Those living in poverty suffer disproportionately from hunger or even starvation and disease as well as lower life expectancy. According to World Health Organisation, hunger and malnutrition are the single gravest threats to the world's public health and malnutrition is by far the biggest contributor to child mortality, present in half of all cases.

Almost 90% of maternal deaths during childbirth occur in Asia and Sub-Saharan Africa, compared to less than 1% in the developed world. Those who live in poverty have also been shown to have a far greater likelihood of having or incurring a disability within their life. Infections, diseases such as malaria and tuberculosis can perpetuate poverty by diverting health and economic resources from investment and productivity; malaria decreases GDP growth by upto 1.3% in some developing nations and AIDS decreases African growth by 0.3-1.5% annually.<sup>4</sup> Poverty has been shown to impede cognitive function. One way in which this may happen is that financial worries put a severe burden on one's natural resources so that they are no longer fully available for solving complicated problems. The reduced capability for problem solving can lead to sub optimal decisions and further perpetuate poverty. Many other pathway from poverty to compromised cognitive capacities have been noted, from poor nutrition and environmental toxins to the effects of stress or parenting behaviour. All of which lead to sub optimal psychological development.<sup>5</sup> Neuroscientists have documented the impact of poverty on brain structure and function throughout the lifespan. Infections diseases continue to blight the lives of the poor across the world. An estimated 40 million people are living with HIV/AIDS, with 3 million deaths. Every year these are 350-500 million cases of malaria, with 1 million fatalities.

India doesn't have enough hospitals doctors, nurses and health workers and since health is a state subject, disparities and inequities in the quality of care and access to health varies widely not just between states but also between urban and rural areas. As per a W.H.O. Report 2018 on India's healthcare workforce, only one in five doctors in rural India are qualified to practice medicine. This leads to widespread problem of quackery. The WHO report said that 31.4% of those calling themselves allopathic doctors were educated only up to the class 12 and 57.3% doctors did not have a medical qualification. Doctors without formal training provide up to 75% of primary care visits. The new principal of BRD medical college, Dr. P.K. Singh lamented that the

hospital gets very sick babies because most parents seek local remedies and treatment from quacks before they bring their children to hospital. He also emphasized that the hospital can't turn anyone away and therefore two to three babies on one bed or two babies in one incubator was quite common. The author of the report 'Unqualified Medical Practitioners' opined that there are no large scale surveys on quackery by national statistical agencies such as the Census of India or National Sample Survey office which could form the basis for policy making in this area<sup>6</sup>. She further observed that the lack of Medical qualifications was particularly high in rural areas and whereas 58% of doctors in the urban areas had a medical degree, only 19% of these in rural areas had such a qualification.

The Indian scenario represents a bleak picture as India's spending on healthcare is even less than Nepal and Sri Lanka. Further 70 percent of overall household expenditure on health in the country is on medicines. Further an estimated 469 million people in India do not have regular access to essential medicines. Moreover 63% of primary health centres did not have an operation theatre and 29% lacked a labour room. The community health centres were short of 81.5% specialists. Various studies have shown the rising out of pocket expenditures on healthcare is pushing 32.39 millions below the poverty line annually<sup>7</sup>. Under national health mission the government has launched several schemes some of which are enumerated below:

- (a) **Reproductive, Maternal Newborn, Child and Adolescent health**—essentially to address the major cause of mortality among women and children as well as the delays in accessing and utilising health care and services.
- (b) **Rashtriya Balswasthyakavyakaran (RBSK)**—an important initiative aimed at early identification and early intervention for children from birth till 18 years to cover 4D's viz. Defects of birth, Deficiencies, Diseases, Development delays including Disability.
- (c) **Rashtriya Keshava Swasthya Kanyakumari**—an initiative to enable all adolescents in India to realise their full potential by making informed and responsible decisions related to their health.
- (d) **Shishu Suraksha Kanyakumari**—to encourage institutional deliveries and to pre-empt communicable and non-communicable diseases.
- (e) **National AIDS control organisation**—to ensure that

every person living with HIV has access to quality care and is treated with dignity.

- (f) **Revised National TB Control Programme is a State-run tuberculosis control initiative** of the govt. providing quality tuberculosis diagnosis and treatment through the Govt. Health system to ensure a TB free India.
- (g) **National leprosy Eradication Programme**—to ensure early detection and to provide appropriate medical rehabilitation and leprosy ulcer care services.
- (h) **Mission Indra Dhanush**—to improve coverage of immunization in the country

Apart from that Ayushman Bharat Yojana or Pradhan Mantri Jan Arogya Yojana or national health protection scheme is another major initiative of the central govt. This was launched on 23<sup>rd</sup> September 2018 by Hon'ble Prime minister in Jharkhand's capital Ranchi. It is also known as PM Jan Arogya Yojna. The scheme is targeted at poor and deprived rural families and identified occupational category of urban worker's families. The scheme aims to cover around 50 crore people whereby 8.03 crore families in rural and 2.33 crore in urban areas will be covered. It will have a defined benefit cover of Rs. 5 lakh per family (on a family float basis) per year for secondary and tertiary case hospitalization and will subsume the existing Rashtriya Swasthya Bima Yojana (RSBY) launched in 2008 by the UPA government. The scheme will be cashless and paperless at public hospitals and empanelled private hospitals. Each empanelled hospital will have an Ayushman Mitra to assist patients and will co-ordinate with beneficiaries and the hospital. The benefits of the scheme are portable across the country. PM Modi has predicted it to be a game changer.

#### **Mobile healthcare facility:**

“He who has health has hope and he who has hope has everything”.

#### **-Arabic Proverb**

Access to health care in rural India and for the poor in urban slum dwellers continues to be deplorable and has got less than 4% of Govt. Primary healthcare facilities. There are two primary reasons for the adverse health conditions of the urban slum dwellers; firstly the lack of education and awareness and secondly the unwillingness and impracticability to lose a day's wage in order to reach the nearest medical facility. Thus the healthcare

which is a desperate need remains unaddressed. A two pronged approach is therefore called for. The first one is to bring quality healthcare facilities and services to the door steps of the needy and second to promote healthcare awareness and contemporary healthcare seeking behaviour amongst the underprivileged. Some of the NGOs have taken a good initiative in this direction viz. Smile Foundation, Help Age India.

Another important aspect is the mobile based Primary healthcare management system CDAC. Electronics City Bangalore has initiated the development of 'mobile based Primary healthcare' management system for development in the PHCs for betterment of management of primary healthcare specifically in rural and urban slums of India. The system will capture complete information related to an individual patient treated by a PHC.

Another initiative SehatSaathi is being developed at Media Lab Asia research hub at IIT Kanpur. It involves front-end contact through a suitably trained non medical professional; back end support from doctors, pathologists and other health professionals for diagnosis and treatment; use of digital technology to achieve objects and dissemination of information on health and disease through digital means.

### Conclusions and Suggestions

The healthcare scenario in India and the access to medicine and other facilities are facing a bleak future and a catastrophe is bound to happen unless drastic measures are taken urgently. The abyss of despair through with this section is passing through requires a herculean task to bring it back on track of stability and growth with positive development. The reforms and changes required have a dual character. The initiatives are required in the medical field as well as legal field. On the legal front, it would be desirable that 'health care' is put on the concurrent list rather than on the state list. Entry 6 of the state list in schedule 7 of the Constitution provided 'Public health and sanitation; hospitals and dispensaries. This being a state subject, state govt. imposes fetters and bottlenecks on any major initiative by centre in this sector. The Ayushman Arogya Yojana initiated by PM Modi has met many such speed breakers by the hostile state govt. particularly in the national capital territory of Delhi and West Bengal albeit entirely on political factors. This has obviated a coordinated effort throughout the territory of India which could have yielded better results.

Putting it in the concurrent list will accelerate the implementation of such schemes and in cases of any contradiction in the central scheme and state scheme, the central scheme shall override. Besides it will not prevent the state government from bringing out any other beneficial health care initiative. Further the mobile health clinic facilities being undertaken at present through various NGOs and Social organisations may be developed and implemented on a large scale with prominent Public Health Care Hospitals in the Govt. Sector participating in it. This will lend credibility to the entire exercise and the faith of the public at large will be imbibed into this. The prominent hospitals in the Govt. sector in the vicinity of the area can fix a schedule and a day and time can be prefixed when the mobile health clinic shall visit the particular area. It would also be desirable that an Annual Health Appraisal of all the employees be conducted, be it in the private sector or in the public sector/Central Govt. Employees/State govt. Employees on the same lines as Annual Work and Performance appraisal. The employees be graded on both these appraisals and increments/promotions be linked to grades in these appraisals. A social audit of the same should be done annually and the report of the social audit should be part of the annual report of the organisation/company as is the corporate governance report. This is an essential requirement because it had been found that the medical facility at the workplace functions in a perfunctory manner.

These are some of the suggestions which I hope would go a long way in ensuring a better healthcare system in India and an easy access to medicine.

<sup>4</sup>Associate Professor, Department of Public Health Dentistry, Santosh Dental College

## Abstract

**Background:** Trigeminal neuralgia (TN) is a chronic, debilitating condition resulting in brief and intense episodes of facial pain. The present study was conducted to assess cases of trigeminal neuralgia.

**Materials and Method:** The present study was conducted on 74 patients of both gender diagnosed with trigeminal neuralgia. Age of onset, gender, site of involvement, and clinical presentations were recorded.

**Results:** Out of 74 patients, males were 40 and females were 34. Ophthalmic branch was involved in 5, maxillary in 32, mandibular in 27 and both maxillary+ mandibular in 10 cases. The difference was significant ( $P < 0.05$ ). Left side was involved in 25, right in 40 and both side in 9 cases. The difference was significant ( $P < 0.05$ ).

**Conclusion:** Authors found that trigeminal neuralgia was mostly noticed in males and maxillary branch and right side cases were prevalent.

**Keywords:** Trigeminal Neuralgia, Maxillary, Mandibular.

## Introduction

Trigeminal neuralgia (TN) is a chronic, debilitating condition resulting in brief and intense episodes of facial pain in the distribution of one or more branches of the fifth cranial nerve. The episodes of facial pain are sporadic, sudden, and often like “electric shocks” lasting from a few seconds to several minutes. Etiology may be either idiopathic or secondary to intracranial lesions such as tumor, infarction, and multiple sclerosis. Among neuropathic pains, TN has a peculiar profile.<sup>1</sup>

Trigeminal neuralgia is rare and statistical data regarding it is limited. The estimated annual incidence of

trigeminal neuralgia is 12.6 per 100,000 persons per year and its incidence increases with age.<sup>2</sup> Although peak onset occurs between age 50 and 70 years, the disorder can also occur in children. Early literature suggested a strong preponderance in women; however, current data indicate that only approximately 60% of patients with trigeminal neuralgia are female. The annual incidence for women is approximately 5.9 cases per 100,000 women; for men, it is approximately 3.4 cases per 100,000 men.<sup>3</sup>

Spontaneous remissions are not unusual. With the exception of a few identified organic causes, its etiology for long remained uncertain, so it was called “idiopathic” neuralgia. Even now with the sound hypothesis of neurovascular conflict, the pathophysiology of this disease still has obscure corners. The International Headache Society differentiates between classical TN and atypical facial pain.<sup>4</sup> The present study was conducted to assess cases of trigeminal neuralgia.

### Materials and Method

The present study comprised of 74 patients of both gender diagnosed with trigeminal neuralgia. Ethical clearance for the study was taken from institutional ethical committee. All patients were informed regarding the study and written consent was obtained.

Data related to patients such as name, age, gender etc. was recorded. Age of onset, gender, site of involvement, and clinical presentations were recorded. Results thus obtained were subjected to statistical analysis. P value < 0.05 was considered significant.

### Results

**Table I: Distribution of patients**

Total- 74		
Gender	Males	Females
Number	40	34

Table I shows that out of 74 patients, males were 40 and females were 34.

**Table II: Type of branch involved**

Branch	Number	P value
Ophthalmic	5	0.01
Maxillary	32	
Mandibular	27	
Maxillary + Mandibular	10	

Table II shows that ophthalmic branch was involved in 5, maxillary in 32, mandibular in 27 and both maxillary+ mandibular in 10 cases. The difference was significant (P< 0.05).

**Table III: Side involvement**

Side	Number	P value
Left	25	0.01
Right	40	
Both	9	

Table III, graph I shows that left side was involved in 25, right in 40 and both side in 9 cases. The difference was significant (P< 0.05).

**Graph I: Side involvement**

### Discussion

Classical TN is often caused by microvascular compression at the trigeminal root entry zone of the brain stem and symptomatic TN is caused by a structural

lesion other than vascular compression.<sup>5</sup> Persistent idiopathic facial pain previously termed atypical facial pain is a persistent, dull, poorly localizable, facial pain without sensory or other neurological deficits which

cannot be attributed to a different disorder. Therefore, investigations such as X-ray of the face and jaws, cranial computed tomography or magnetic resonance imaging are necessary to exclude any relevant abnormality.<sup>6</sup> The present study was conducted to assess cases of trigeminal neuralgia.

In present study, out of 74 patients, males were 40 and females were 34. Katusic et al<sup>7</sup> conducted a study on 1215 study participants with typical idiopathic TN. The mean age was  $50.62 \pm 15.872$  years. The mandibular nerve is involved in most of the cases (56.9%), followed by maxillary nerve (42%). The right side of the face (57.1%) is more involved than the left side (38.8%). TN was more prevalent (52.4%) in rural population than urban population (47.6%).

We found that ophthalmic branch was involved in 5, maxillary in 32, mandibular in 27 and both maxillary+mandibular in 10 cases. Left side was involved in 25, right in 40 and both side in 9 cases. Jankittivong et al<sup>8</sup> in retrospective study found that the mean age was 54.9 years; female to male ratio was 2.13:1; rural to urban ratio 1.76:1 with 62.5% suffered trigeminal neuralgic pain on the right side. Carbamazepine was found to be highly effective in 60.8% of the cases on long-term basis with maintenance doses. Other treatment modalities were employed in more refractory cases including add-on of gabapentin, which relieved the symptoms for an additional duration of  $13 \pm 3$  months. The neurolytic alcohol bloc was given in 30% of patients who stopped responding to combination of carbamazepine and gabapentin and relieved pain for a mean duration of  $17.25 \pm 2.95$  months. Twenty three percent of the patients (23%) required peripheral neurectomy. Carbamazepine was found to be highly effective in trigeminal neuralgia. Other treatment modality includes add-on of gabapentin, neurolytic alcohol blocs and peripheral surgical intervention in more refractory cases. Only limited cases needed further neurological consideration.

Urban et al<sup>9</sup> investigated the frequency of subclinical trigeminal and facial nerve involvement in 40 patients with diabetes mellitus (DM) and without clinical signs of cranial nerve lesions. Sixty percent of the patients had distal symmetric sensory polyneuropathy that was confirmed by nerve conduction studies. An electrophysiological study indicated that DM could often affect trigeminal nerve function.

Some authors suggest that the cause of the TN can be related to the compression syndrome, and the most popular is neurovascular compression hypothesis. Neurovascular compression at the root entry zone can be evoked by an arteriovenous malformation. A wide range of other compressive lesions can also cause TN. These include vestibular schwannomas, meningiomas, epidermoid cysts, tuberculomas and various other cysts and tumours. TN can be evoked also by presence of aneurysm, vessels aggregation and occlusion due to arachnoiditis. Compression of the trigeminal nerve root may be mediated by the tumour itself, by an interposed blood vessel or by distortion of the contents of the posterior fossa with displacement of the nerve root against a blood vessel or the skull base.<sup>10</sup>

## Conclusion

Authors found that trigeminal neuralgia was mostly noticed in males and maxillary branch and right side cases were prevalent.

**Conflicts of Interest:** The authors declare that there is no conflict of interest regarding the publication of this paper.

<sup>4</sup>Postgraduate Student, Surgery, Kalinga Institute of Medical Sciences, KIIT University, Bhubaneswar, India

## Abstract

**Background:** The present study was undertaken to evaluate the incidence of pain with severity  $\geq 50$  VAS points within 24 hours of LC and explore various factors that influence the early postoperative pain intensity after LC.

**Method:** 148 eligible adult patients ( $\geq 18$  years) of ASA physical status I and II undergoing elective uncomplicated LC for symptomatic cholelithiasis during the year 2018 were recruited for the study.

**Results:** Postoperatively, pain was the most frequent postoperative symptom and 49 (33.1%) of patients experienced severe postoperative pain during first 24 hours after surgery and opioids were consumed by 20.3% of patients to relieve pain. Multivariate regression analysis revealed that preoperative anxiety (aOR: 2.47, 95% CI: 1.53-3.97) and sensitivity to cold pressor induced pain (aOR: 1.52, 95% CI: 1.12-2.08) were the significant predictors for the intense early postoperative pain.

**Conclusion:** Intense pain is experienced by one third of patients in the early postoperative period after LC which can be effectively managed by properly addressing the preoperative risk factors as revealed in our study.

**Keywords:** Laparoscopy, Cholecystectomy, Pain intensity, Preoperative anxiety, Cold pressor.

## Introduction

Worldwide, Laparoscopic Cholecystectomy (LC) has replaced open cholecystectomy as the gold standard surgical procedure for symptomatic cholelithiasis. LC is safe, more effective, causes less pain and rapid recovery.<sup>1,2</sup> However, LC frequently results in significant early postoperative pain which warrants the need for rescue analgesia in PostAnaesthesiaCare

Unit (PACU).<sup>3,4</sup> Early pain is the dominant complaint after LC, most intense on the day of surgery and the main reason for prolonged hospital stay and prolonged convalescence after surgery thereby increasing treatment cost and decreasing quality of life of patients.<sup>5</sup>

Research regarding pain intensity and associated risk factors among patients undergoing LC is scarce in India. With this background, the present study was undertaken to address the following objectives: (1) to evaluate the incidence of pain with severity  $\geq 50$  VAS points within 24 hours of LC; and (2) to explore various factors that influence the early postoperative pain intensity.

## Method

A pilot study involving 18 patients undergoing LC and fulfilling the eligible criteria needed for the study

---

was conducted to test the feasibility of the study and calculation of the sample size. Assuming prevalence of high intensity ( $\geq 50$  VAS points) early postoperative pain was assumed as 28% (result of pilot study), sample size was determined as 138 at absolute precision 7.5% and 95% level of confidence.

We conducted an observational prospective study during the period January – December, 2018 involving 148 eligible adult inpatients aged  $\geq 18$  years of ASA physical status I and II undergoing elective uncomplicated laparoscopic cholecystectomy for symptomatic cholelithiasis. Exclusion criteria included patients with diabetes mellitus; cardiovascular or respiratory or hepatic or renal insufficiency; psychiatric diseases or disturbance of central nervous system; substance abuse, chronic use of analgesics or steroids. In total, 158 eligible patients were approached for the study and 151 agreed to participate (95.6%). Two patients who underwent relaparotomy were excluded, and one patient with difficult surgical dissection underwent open cholecystectomy and thus excluded from the study leaving 148 patients for further analysis.

Previous studies have shown that pain after surgery is influenced by various factors such as age, gender, preoperative pain, type of surgery, duration of surgery<sup>6-8</sup> and preoperative anxiety seems to be an important predictor for acute postoperative pain intensity.<sup>7,9,10</sup> Also, preoperative sensitivity to cold pressor induced pain was identified as an independent risk factor for early postoperative pain.<sup>5</sup> After obtaining the written informed consent, relevant data regarding demographic characteristics, preoperative anxiety level, preoperative sensitivity to cold pressor induced pain, pre and post operative pain intensity, duration of surgery etc. were collected.

The day before the operation, a cold pressor test<sup>5</sup> was conducted among the patients to assess the subjective sensation of discomfort by immersing hand into the ice water. Two containers were filled with mixture of one third crushed ice and two thirds tap water. The resulting ice water mix stirred to maintain a constant temperature of  $1.0 \pm 0.3^\circ\text{C}$  throughout the study. The patients were told that the test would be terminated after 4 minutes. They were instructed to immerse one bare arm into each container with the palms resting on the bottom of the containers. All the patients were instructed that they could remove their hands at any time prior to 4 minutes if pain intensity was unbearable. Subjective assessment

of cold pressor test was recorded by Visual Analogue Scale (VAS) after the procedure. Each patient rated the subjective pain experience on a 100 mm VAS (0 mm = no discomfort and 100 mm = worst possible discomfort).

To assess the anxiety level of patients before anaesthesia and surgery, a Visual Analogue Scale (VAS) consisting of 10 items<sup>11</sup> was used. The VAS was based on a 100 mm scale: ranging from 0 indicating no preoperative anxiety to 10 indicating the maximal preoperative anxiety.

All patients received similar general anaesthesia, surgical and prophylactic analgesic regimens. Routine premedication with glycopyrrolate (0.01 mg/kg) and midazolam (0.2 mg/kg) was done. Standard protocol for general anaesthesia consisted of administration of propofol (1-2 mg/kg) for induction, butorphanol (0.02 mg/kg) for intraoperative analgesia and vecuronium (0.08 mg/kg) intravenous to facilitate tracheal intubation and obtain intraoperative muscle relaxation. Maintenance of anaesthesia was done with oxygen and nitrous oxide in the ratio of 1:2 along with isoflurane (0.6 - 0.8%) and intermittent dose of vecuronium for muscle relaxation. At the end of surgery, neuromuscular blockade was reversed with neostigmine (0.05 mg/kg) and glycopyrrolate (0.01 mg/kg). Prior to closure, ondansetron (0.08 mg/kg) and paracetamol (1 g) was administered. All the operations were conducted and supervised by the experienced laparoscopic surgeons using the standard 4-trocar technique of laparoscopic cholecystectomy. During laparoscopy, intra abdominal pressure was kept at 12 mm Hg and at the end of procedure CO<sub>2</sub> was evacuated by gentle abdominal pressure with open trocars. When VAS score was  $\geq 4$ , rescue analgesia was done with administration of tramadol (50 mg) or diclofenac (75 mg) as required by the patient. In surgery ward, pain was managed with combination of analgesics such as diclofenac (75 mg) + paracetamol (1 g) or tramadol (50 mg) + paracetamol (1 g) as needed by the patient. The pain assessment was done on the day before operation and the postoperative assessment was done at 6 hours, 12 hours, and 24 hours after the operation. Presence of high intensity pain, defined as VAS  $\geq 50$ , occurring at least once within the first 24 hours after arrival at the PACU was considered as the dependent variable of the study.

Data were analyzed by using SPSS version 21.0 software. Univariate analyses were done by the t test for continuous variables and the chi square test

for dichotomous variables. Variables significantly associated ( $p < 0.05$ ) with the dependent variable were tested with spearman rank correlation test. The variables found to have  $p < 0.2$  in univariate analyses were entered into the multivariate logistic regression model to identify the predictors for the early postoperative pain intensity. Values were expressed as mean  $\pm$  SD, absolute numbers, percentages with significance defined as  $p < 0.05$ .

**Results**

The mean age of the study population was  $43.2 \pm 14.3$  years and majority (63.5%) were females. Pre operatively, the mean intensity of pain was  $4.66 \pm 1.06$  VAS points and abdominal pain was the most frequent (139, 93.9%) symptom experienced by the patients. Pain was localized exclusively to the right upper abdomen in 93 (62.8%) patients and almost two third of patients (55.7%) reported that pain was radiating to back. Postoperatively, pain was the most frequent postoperative symptom and the mean intensity of post operative pain was  $4.34 \pm 1.33$  VAS points. Out of 148 patients, 73 (49.3%) localized pain to the incisional sites, 47 (31.7%) to the right upper abdomen, and 28 (18.9%) reported diffuse abdominal pain. Also, 23 (15.5%) patients reported that pain was radiating to the back and 34 (22.9%) experienced pain radiating to the shoulder area. However, when asked regarding the site of more intense pain, 55 (37.1%) indicated to the incisional sites, 34 (23%) to the right upper abdomen, 9 (6.1%) to the shoulder area, and 5 (3.4%) to the back.

The intensity of postoperative pain during first 24 hours after surgery was high ( $\geq 5$  VAS points) as experienced in one third of patients. In most of the

patients (79.7%), mild analgesics such as paracetamol or diclofenac or combination of both were used to relieve the pain whereas opioids were consumed by 30 (20.3%) patients (Table 1). Table 2 revealed the univariate analyses showing association between various factors and the outcome variable i.e. maximal VAS pain score during the first postoperative day. Multivariate regression analysis showed that preoperative anxiety and sensitivity to cold pressor induced pain were the significant predictors for severe postoperative pain during first 24 hours after LC (Table 3).

**Table 1: Postoperative symptoms, pain intensity, and analgesics used during first 24 hours after laparoscopic cholecystectomy (n = 148)**

Characteristics	Number	Percentage
<b>Symptoms</b>		
Pain	148	100
Feeling abdominal pressure	78	52.7

	aOR	95% CI	
Preoperative pain	0.81	0.57 – 1.16	0.259
Preoperative anxiety	2.47	1.53 – 3.97	0.000
Cold pressor discomfort	1.52	1.12 – 2.08	0.007

\*  $< 5$  VAS points is taken as reference

**Note:** aOR: adjusted Odds Ratio, CI: Confidence interval,  $p < 0.05$  statistically significant; Model  $\chi^2 = 27.406$ ,  $p < 0.001$  and Hosmer & Lemeshow  $p = 0.968$  indicates that the model fits the data. The classification table reports that overall expected model performance is 71.6%; that is 71.6% of the cases can be expected to be classified correctly by the model.

## Discussion

Our study demonstrated that pain was the most frequent complaint in patients during first 24 hours of LC and the mean intensity of postoperative pain was 43 VAS points. One third of patients reported severe pain ( $\geq 50$  mm VAS points) and nearly 20% of the patients needed opioids. This indicates the importance of addressing pain in the early postoperative period and thus designing effective strategies for better pain management. In accordance with our study, other studies have shown the pain scores in the range of 40 mm within 24 hours after surgery<sup>5,12</sup> and exceed 50 mm in up to one third of patients during early postoperative period.<sup>13</sup> Few studies have reported higher proportion (46–65%) of patients undergoing laparoscopic cholecystectomy experienced severe pain.<sup>4,6</sup> This might be due to methodological variation and difference in patient characteristics. In agreement with the findings of earlier studies,<sup>5,13</sup>

Our results showed that preoperative anxiety and preoperative sensitivity to cold pressor induced pain were found to be the significant independent predictors of early postoperative pain. However, the correlations were weak ( $r_s = 0.14 - 0.33$ ) indicating ( $r_s^2 = 0.02 - 0.11$ ) 2% and 11% of the variability of postoperative pain after LC could be predicted by sensitivity to cold pressor induced pain and preoperative anxiety respectively. It was observed that the odds of having high intensity early postoperative pain increases 2.5 times with one unit increase in preoperative anxiety score in the patients undergoing LC. Fear of postoperative pain or fear of poor outcome of operation/anaesthesia may act as a stressor

that stimulates increased anxiety response which in turn amplifies postoperative pain and thereby contributing to the continuity of cycle of pain and anxiety. Our result is in consistency with the findings of previous literatures which showed that fear of surgical procedure might increase in postoperative LC pain intensity.<sup>6,10</sup> Ali et al also reported that patients with high preoperative anxiety had higher postoperative VAS score.<sup>14</sup> In addition, Bakr et al revealed that the patients receiving preoperative anxiety intervention before surgery showed lower pain scores as compared to the patients who did not receive preoperative anxiety intervention.<sup>15</sup> This emphasizes the need of prior psychological preparation of patients undergoing LC which might be useful in reducing preoperative anxiety level thereby alleviating the intensity of postoperative pain.

In our study, the risk of experiencing high intensity postoperative pain among patients undergoing LC increases almost 1.5 times with one unit increase in sensitivity to cold pressor test. Although the relation between preoperative sensitivity to cold pressor induced pain and early postoperative pain intensity after LC reached statistical significance, the correlation was found to be weak. This suggests minor clinical importance of the cold pressor test in predicting the early postoperative pain intensity. In an earlier study, Bisgaard et al also observed similar result.<sup>5</sup> Further prospective research is needed to find the predictive power of the 4 minute cold pressor test.

The present study has few limitations that may affect the generalizability of the results. This study was a single center study and used cross-sectional design without a follow up. There might be introduction of bias as the data on pain and anxiety were based on the subjective perception of the patients. The strength of the study lies in the fact that all the patients were similarly prepared as per the institutional protocol and the type of surgery and anaesthesia was standardized which could eliminate the misleading effects.

## Conclusion

It was revealed in the study that pain was the most frequent complaint by the patients within 24 hours of LC and one third of patients experienced severe early postoperative pain. Our findings suggest that along with peri-operative multimodal analgesia approach, effective strategies can be planned to address the preoperative risk factors which could be beneficial in reducing the pain intensity in the early postoperative period.

## Abstract

**Background:** A correct working length is a critical factor for the endodontic success. The present study assessed efficacy of Root ZX, Apex ID apex locator and Sybron Endo's Mini Apex locator.

**Materials and Method:** The present study was conducted on 45 mandibular molar teeth. In all teeth working length was assessed with 10 K file. Samples were divided into three groups. In Group I Root ZX, in group II Apex ID apex locator and in group III Sybron Endo's Mini Apex Locator was used. Based on the position of the file tip to the radiographic apex on the IOPA radiograph, the samples were categorized using the following scoring criteria. Acceptable = 0–1 short, short = >1 mm short and Long/Beyond = Beyond the apex.

**Results:** Reading with root ZX was acceptable in 13, short in 1 and beyond in 1 case, ID apex locator was acceptable in 12, short in 3 and beyond in 0, Endo's Mini Apex Locator was acceptable in 11, short in 2 and beyond in 2 cases. The difference was significant ( $P < 0.05$ ).

**Conclusion:** Authors found that Root ZX was more effective than ID apex locator and Sybron Endo's Mini Apex Locator in accessing working length.

**Keywords:** Apexlocator, electronic working length, Root ZX.

## Introduction

Working length is defined as the distance from a coronal reference point to the point at which canal preparation and filling should terminate. A correct working length is a critical factor for the endodontic success.<sup>1</sup> Failure to determine the proper root canal working length during root canal treatment may compromise the treatment result. The establishment of

appropriate working length is one of the most critical steps in endodontic therapy. Cleansing, shaping, and obturation of the root canal system cannot be accomplished perfectly unless the working length is determined precisely.<sup>2</sup>

To determine the working length, a number of techniques, including tactile sensation, radiographs, and electronic apex locators are routinely used in clinics. Electronic apex locators have been used clinically for over 30 years as an aid in deciding where canal preparation and obturation should terminate.<sup>3</sup> Accurate working length determination helps to decide the extent to which the instruments are placed and worked in the root canal system and this will determine how effectively the unwanted items are removed from it. This will also limit the depth to which the canal filling may be placed. Correct working length determination will also affect the

e-mail: respublication2000@gmail.com

degree of pain and discomfort that the patient would feel following the appointment. Thus it plays an important role in determining the success of the treatment. Accepted techniques for the determination of the working length include tactile, radiographic and electronic method.<sup>4</sup> The present study assessed efficacy of Root ZX, Apex ID apex locator and Sybron Endo’s Mini Apex locator.

**Materials and Method**

The present study was conducted in the department of Endodontics. It comprised of 45 mandibular molar teeth. The study protocol was approved from institutional ethical committee.

In all teeth working length was assessed with 10 K file. Samples were divided into three groups. In Group I Root ZX, in group II Apex ID apex locator and in group III Sybron Endo’s Mini Apex Locator was used. The file clip of apex locator was attached to the file and the file inserted until the “Apex” reading was reached in Root tip. This was the electronic working length (EWL). Differences between EWL and actual working length (AWL) were calculated.

Working length radiograph was taken using bisecting angle technique. Based on the position of the file tip to the radiographic apex on the IOPA radiograph, the samples were categorized using the following scoring criteria. Acceptable = 0–1 short, short = >1 mm short and Long/Beyond = Beyond the apex. Results were tabulated and subjected to statistical analysis. P value less than 0.05 was considered significant.

**Results**

**Table I: Distribution of teeth**

Groups	Group I	Group II	Group III
Apex locator	Root ZX	ID apex locator	Sybron Endo’s Mini Apex Locator
Number	15	15	15

Table I shows that in group I, Root ZX, in group II ID apex locator and in group III Sybron Endo’s Mini Apex Locator was used. Each group had 15 teeth.

**Table II: Accuracy of different apex locators**

Groups	Acceptable	Short	Beyond
Group I	13	1	1
Group II	12	3	0
Group III	11	2	2
P value	0.91	0.05	0.01

Table II shows that reading with root ZX was acceptable in 13, short in 1 and beyond in 1 case, ID apex locator was acceptable in 12, short in 3 and beyond in 0, Endo’s Mini Apex Locator was acceptable in 11, short in 2 and beyond in 2 cases. The difference was significant (P< 0.05).

**Discussion**

Apex locators have advantages over radiographic method; EWL determination with apex locators is easier, faster and can be indefinitely repeated without exposure to radiation.<sup>5</sup> Moreover, modern apex locators can locate not only the apical foramen but also, in contrast to radiographic method, the apical constriction, which is an optimal endpoint for root canal preparation and filling. The accuracy of apex locators is higher when compared with that of the radiographic method.<sup>6</sup>

Failure to accurately determine and maintain working length (WL) may result in length being too long leading to apical perforation, overfilling or overextension and increased post-operative pain with prolonged healing period and a lower success rate. A WL too short of the apical constriction can lead to incomplete cleaning and under filling causing persistent discomfort, and continued periradicular infection.<sup>7</sup> The apical constriction (AC) is suggested as the end-point of root canal treatment. This anatomical landmark is a point where pulpal and periodontal tissues reach together and is identified as minor apical foramen. It is generally accepted to be located at 0.5-1 mm coronal to the radiographic apex. AC might be located on one side of root at a distance up to 3 mm from the anatomical apex. Moreover, the position and topography of minor foramen varies between teeth, making it difficult to determine clinically.<sup>8</sup> The present study assessed efficacy of Root ZX, Apex ID apex locator and Sybron Endo’s Mini Apex Locator.

In present study, in group I, Root ZX, in group II ID apex locator and in group III Sybron Endo’s Mini Apex Locator was used. Each group had 15 teeth. Jenkinset al<sup>9</sup> conducted a study in which a total of 90 multirrooted teeth (maxillary and mandibular molars) with irreversible, infected or necrotic pulp tissue and completely formed roots were included in this study and were divided randomly into six groups (Root ZX II, Raypex 6, I-Root, Romiapex A-15, Sybron Endo Mini and Root ZX mini). The working length was determined using six different apex locators, and the accuracy of the

apex locators was compared with IOPA radiographs, to be categorized as accurate, short, and long or beyond. A total of 270 canals were evaluated, of which 233 (86.3%) canals exhibited acceptable working length, 28 (10.4%) canals exhibited short working length, and only 9 (3.3%) canals exhibited working length beyond the apex. There were statistically significant results in all the groups ( $P < 0.05$ ) and the comparison between the groups was statistically insignificant.

We found that reading with root ZX was acceptable in 13, short in 1 and beyond in 1 case, ID apex locator was acceptable in 12, short in 3 and beyond in 0, Endo's Mini Apex Locator was acceptable in 11, short in 2 and beyond in 2 cases. D'Assuncao et al<sup>10</sup> conducted a study in which seventy extracted human permanent molars with mature apices were selected. Equal number of maxillary and mandibular permanent molars (35 each) was sectioned at the cemento-enamel junction. Access opening was done and only the mesiobuccal root canal was studied for the purpose of standardization. Electronic working length measurements were taken before and after preparation of the mesio-buccal canal with Root ZX and ProPex II using various irrigants. P-values for actual and final canal lengths for Root ZX employing NaOCl(0.001), CHX(0.006), LA(0.020) and for ProPex II was (0.001) respectively. When the data were compared, results were statistically significant ( $P < 0.05$ ).

### Conclusion

Authors found that Root ZX was more effective than ID apex locator and Sybron Endo's Mini Apex Locator in accessing working length.

# Correlation of Cancer Antigen 125 Levels with Adnexal Masses

Atmajit Singh Dhillon<sup>1</sup>, Neha Vashishat<sup>2</sup>, Bimal K. Agrawal<sup>3</sup>

<sup>1</sup>Professor of Obstetric & Gynecology, <sup>2</sup>Resident, Department of Obstetric & Gynecology, <sup>3</sup>Professor of Medicine, M.M. Institute of Medical Sciences & Research, Maharishi Markandeshwar Deemed to be University, Mullana

## Abstract

**Background:** Adnexal masses can be of varied etiology. It may be benign like luteal cyst, infective like abscess or malignant like ovarian cancer. These masses are detected on pelvic or abdominal examination and sometimes incidentally found on ultrasonographic evaluation. Adnexal masses manifest with a wide spectrum of clinical, morphological and histological features. Cancer Antigen 125 is a marker in the blood that is known to be elevated in women with ovarian cancer, but also in people with other medical conditions and in some healthy people. This biomarker can be useful when an ovarian mass is felt on examination or seen on ultrasound and the physician is unsure whether it is ovarian cancer. The Aims and Objectives was to study the diagnostic value of Cancer Antigen 125 in adnexal masses, the correlation of this tumour marker with type of adnexal masses.

**Material and Method:** Fifty patients from reproductive to postmenopausal age group meeting the inclusion and exclusion criteria with adnexal mass were taken. Thorough history taking, clinical examination, laboratory investigation including CA 125 and histopathological evaluation was done.

**Results:** The mean age was found to be  $42.3 \pm 11.1$  years. Of fifty cases 80% were benign and 20% were malignant in histopathology. Maximum number of cases (54%) were with parity between 1-3. Clinical presentation had no clear predictive value in malignant or benign nature of the mass. In our study CA125 has a sensitivity of 90% and specificity of 35%. Positive predictive value was 25.71% and negative predictive value of 93.3%.

**Conclusion:** The detection of pelvic mass with an associated elevated CA 125 is highly suspicious of ovarian cancer, but there are various benign conditions which mimic the above findings, especially in premenopausal women.

**Keywords:** CA125, Adnexal mass, malignancy.

## Introduction

Adnexa is composed of ovaries, fallopian tubes, broad ligament and structures those evolved from

embryonic nests residing in it. The mass/masses arising from any of these structures are known as adnexal mass. Adnexal masses can have gynaecologic or nongynaecological aetiologies, ranging from normal luteal cysts to ovarian cancer to bowel abscesses. Diagnosis, nature and type of adnexal mass is a clinical challenge. Ovarian mass is by far the most common of all adnexal masses. Various parameters which are used in clinical practice include the gynaecologist's clinical findings, related biochemical tests including tumour markers, radiological findings, and intra-operative findings during laparotomies. Generally the final diagnosis is established from histopathological findings. Bimanual examination in detection of adnexal mass has

e-mail: drnehavashishat90@gmail.com

positive predictive value of 37% only and the negative predictive value has been found to be 99% .<sup>[1]</sup> Most adnexal masses in prepubertal girls have been found to be benign, and 5-15% have been found to be malignant<sup>[2]</sup>. Raised CA125 marker may help to distinguish benign from malignant adnexal masses <sup>[3]</sup>. To identify whether the mass is benign or malignant is an important step in determining the prognosis of the patient<sup>[4]</sup> .Therefore bridging the gap between the least invasive aid i.e. pelvic examination and the invasive laparotomy is the biomarker CA125. The various tumours markers related to ovarian pathology are CA125, OVX1, LDH, AFP and many more, some of these are still under research<sup>[5]</sup> . For early detection of ovarian cancer CA125 has been preferred <sup>[6]</sup>. This biomarker is present on the cell surface of mesothelial origin. This biomarker is also elevated in a large number gynaecological and non-gynaecological pathologies <sup>[7]</sup>. Thus, this biomarker cannot be used as a reliable screening test and interpretation is not possible without additional inputs from various modalities of evaluation. Pelvic ultrasonologic findings in conjunction with CA 125 represents the most frequently utilised investigations for patients with adnexal masses <sup>[8]</sup>. The CA 125 not only the most widely used tumor marker for the diagnosis of epithelial ovarian cancers but also it is used in monitoring the success of treatment <sup>[9, 10]</sup>. The aim of the study was to evaluate the role of serum CA125 levels in diagnosis of various adnexal pathology especially malignant ovarian tumour.

### Method and Material

The patients presenting with adnexal mass clinically and/or ultrasonographic ally were taken up for further evaluation. Finally fifty patients who had adnexal mass removed operatively were considered in the study. The decision to operate was purely at the treating gynaecologist's discretion.

Study Design-A prospective, observational Study

Study Duration-December 2017 to November 2018

#### Inclusion Criteria:

1. Woman of reproductive age group to postmenopausal presenting with adnexal mass with symptoms like pain abdomen, pelvic pain, abnormal bleeding per vagina or discharge per vagina and gastrointestinal pressure symptoms.
2. Asymptomatic patients in whom pelvic mass is detected at the time of routine pelvic examination.

#### Exclusion Criteria:

1. Age <15 years.
2. Pregnancy with adnexal mass.
3. Mass of nongynecological origin.
4. Patient who do not get operated.

All the patients who gave consent for the study and in whom surgery was indicated as per consultant were taken up for the study. Thorough history taking, clinical examination, routine laboratory investigation was done. All the patients were subjected to appropriate investigations which included all routine investigation and any special investigation if required. The biomarker CA 125 was estimated in all the patients meeting. All the cases were also subjected to transabdominal and transvaginal sonography by using 3.5MHZ probe and 6.5MHZ probe respectively using EPIQ 7G, Philips Ultrasound system. The statistical analysis was done using SPSS (Statistical Package for Social Sciences) version 22. The values were represented in number (%) and mean  $\pm$  SD.

### Results

The mean age was found to be  $42.3 \pm 11$  years. Maximum number of the patients, twenty eight (56%) were seen between the age group of 31 to 45 years. There were sixteen (32%) patients in the age group >45yrs and six (12%) patients in the age group 16-30yrs.

**Table 1: Clinical parameters of the patients**

	Benign N%	Malignant N%
Frequency	40(80%)	10(20%)
Mean Age	39years	51years
Nulliparous	6(15%)	1(10%)
Postmenopausal	12(30%)	4(40%)
Multilocular Mass (USG finding)	5(12%)	10(100%)
Thick Septations (USG finding)	5(12%)	9(90%)
Papillary Projection (USG finding)	0	3(30%)
CA125>35U/mL	26(65%)	9(90%)

Out of 50 cases, CA 125 values >35U/ml were found more in multilocular adnexal masses i.e. 14/15 cases(93.3%) as compared to unilocular masses 18/32(56.25%). Mean CA125 was 243.6U/ml in multilocular cyst and 67.8U/ml in unilocular cyst. Most of the malignant masses had thick septations on USG evaluation, which were 9/10 (90%). Patients In

premenopausal age group were 34 in number, out of which 28/40(70%) presented with benign condition and 6/10(60%) with malignant conditions. Patients in menopausal age group were 16 in number, out of which

12/40(30%) were benign and 4/10(40%) were malignant (Table 1). In post-menopausal age group CA125 values were raised in 11 cases and out of which 4 cases were malignant.

**Table 2: Histopathological findings**

Finding	Frequency	CA125 >35	CA125 <35
Serous cystadenoma	13(26%)	4(8%)	9(18%)
Dermoid Cyst	9(18%)	6(12%)	3(6%)
Mucinous cystadenoma	6(12%)	5(10%)	1(2%)
Endometriotic cyst ovary	7(14%)	6(12%)	1(1%)
Xanthogranulomatoussalpingoophritis	3(6%)	3(6%)	-
Clear cell carcinoma	2(4%)	2(4%)	-
Papillary adenocarcinoma	3(6%)	3(6%)	-

Serous Cystadenocarcinoma	2(4%)	2(4%)	-
Mucinous Cystadenocarcinoma	1(2%)	1(2%)	-
Product of conception	1(2%)	1(2%)	-

**Discussion**

Adnexal mass is one of the commonest presentation to a gynecologist and can be benign or malignant. It has generated much interest in the evaluation of all aspects of adnexal tumors. Adnexal masses manifests with wide spectrum of clinical, morphological and histological features. This tumour marker in the blood that is known to be elevated in women with ovarian cancer, but also in people with other medical conditions and in some healthy people. The significance of this tumour marker increases when it is correlated with clinical and imaging finding.

We conducted an observational study on 50 women presented with adnexal mass and subsequently operated and pathologically evaluated. The mean age was found to be 42.3 ± 11.2 years in our study. The study shows that among those less than 45 years of age group, most of the neoplasms were benign and as age increases the risk of malignancy increases. A study done by Dolitic et al [11]also reported that patients with malignant masses are significantly older and are most often menopausal than patients with benign adnexal masses.

Parity is a strong protective factor, particularly against the epithelial ovarian cancer (EOC), and the

effect is further intensified by increasing the number of births. Patalich et al [12] showed a 60% lower risk of EOC in women with parity ≥3 as compared with women with parity <1. The risk of ovarian cancer is reduced by 80% in women with parity >5, and increasing parity also protects women against the development of borderline tumours. In the present study, 54% of the patients were having parity between 1-3 and out of this 85% had benign lesions and 15% malignant. Because of the small sample size no significant observation was made in the present study as far as parity is concerned

The value of CA 125 varies between different laboratories depending on type of assay used, but levels <35U/L are considered to be normal. In view of wide distribution of CA 125 expression, serum CA 125 levels can be raised in various benign and inflammatory conditions such as menstruation, pregnancy, endometriosis, pelvic inflammatory disease, and non-gynaecological conditions. In our study CA125 was raised in 35(70%) number of the cases (Table 2) and out of which malignant lesions were 9(25%) and benign pathologies were 26(75%). The combination of pelvic mass and elevated level CA 125 arouses the suspicion of ovarian neoplasm, but other benign conditions should always be considered in the differential diagnosis. Raised

CA125 should not be considered in isolation especially in pre-menopausal female in the Indian scenario. This is so because genital tuberculosis and pelvic inflammatory disease is not uncommon and CA125 may be elevated in these conditions. A study conducted by Moss et al<sup>[13]</sup> in patients with adnexal mass showed that only 20% of the patients had malignancy. Another study by Aziz et al<sup>[14]</sup> in patients with adnexal mass had similar results. In our study sensitivity to diagnose malignancy on the basis of raised CA125 was 90% and specificity 35%, positive predictive value came out to be 25.71% and negative predictive value was 93.3%.

Sonographic evaluation of the structure of an ovarian mass in predicting the risk of malignancy have been reported. Various parameters taken were septal wall thickness, papillary projections, type of cyst. Univariate analysis of variables assessed by ultrasound of adnexal masses in our study showed presence of thick septae in 14, of which 9(64%) were malignant. All 3 cases showing papillary projection were malignant. Out of 14 cases showing multiloculation 11(79%) were found to be positive for malignancy.

In the present study histopathological analysis revealed that surface epithelial tumors were the most common tumors found (46%). serous cystadenoma (28%), 14% were mucinous cystadenoma, and 1% each were serous cystadenocarcinoma and papillary serous cystadenocarcinoma. According to study by Das et al surface epithelial tumor constituted 68% of the all ovarian tumor and serous cystadenoma was the most common benign tumor. Dermoid cyst (18%) the second largest occurring tumor in our study. Other tumors found were endometrioma in 14% of cases, genital tuberculosis in 6% of the cases, papillary adenocarcinoma, clear cell CA and adult granulosa cell tumor in 4% each, fibroid and product of conception in 2% each (Table 2).

Thus CA 125 can be useful when an ovarian mass is felt on exam or seen on ultrasound and the physician is unsure whether it is ovarian cancer. It is recommended that all women with an ovarian mass get a CA 125 level test. The postmenopausal women should be further evaluated if the biomarker level is over 35 U/ml. However, the chances of malignancy is less if CA125 level is normal. Before menopause women should not unnecessarily be evaluated unless the level is very high, since they are more likely to have a noncancer cause of an elevated CA 125.

**Ethical Clearance:** Ethical approval was taken from the Institutional Ethics Committee before initiating the study.

# Dependence of Demographic Indicators upon Government Expenditure on Health: A Study of the Indian States

**Bandita Deka**

*Ph.D. Scholar, Department of Social Sciences (Economics), Dibrugarh University*

## Abstract

Investment in health care is becoming more and more significant day by day because of an economic environment where resources are extremely scarce. As a result, there is a growing interest among economists in applying the economic skills to the health issue. As government health services are primarily meant for catering to the needs of the under served population, it will continue to play a significant role as a service provider. Hence, there is an urgent need to understand how demographic indicators vary in response to the changes in government health care expenditure or alternatively what effect does public health care expenditure have upon the demographic indicators (measured in terms of health outcomes).

**Keywords:** *Demographic Indicators, Health Outcomes, Government Expenditure, Health Care.*

## Introduction

The United Nations adopted its Universal Declaration of Human Rights in 1948, which states that ‘everyone has the right to a standard of living for the health and well-being for himself and his family, including food, clothing, housing, medical care and necessary services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control’. This necessitates the need for government intervention in the

health sector of a country. There is increasing interest on the part of the policymakers in the composition of public spending and it stems in part from the recognition that expenditure allocation in favour of education and health can boost economic growth while promoting equity and reducing poverty<sup>1</sup>. Investment on health in turn plays its part in increasing income also. The following figure explains the three stages framework of health-wealth nexus.

### Stage 1: The Traditional Understanding

### Stage 2: The Current State

### Stage 3: The Desired State

Source: Report of the National Commission on Macroeconomics and health, GoI<sup>2</sup>

**Figure 1: Evolution of understanding of health-wealth nexus**

In the three stages framework of health-wealth nexus, a rapid transition is needed in which efficient health systems improve quality of life, well-being of the people and reduce burden of the disease which in turn will increase the productivity and growth of the economy (stage 3). A huge public investment is needed to push the economy from one stage to the other.

One concern brought about the allocation of the public health care expenditure (PHCE) is the share of PHCE that is to be linked to the Gross Domestic Product (GDP). A study of the relationship between GDP and PHCE in developed countries showed that almost 92% of changes in PHCE can be explained by changes in economic growth, and that GDP per capita growth is the best indicator of the amount of resources a country can afford to allocate to the health sector<sup>3</sup>. Real GDP is the factor that has been identified most influential while determining the health care expenditure<sup>4</sup>. Even in under developed countries, for example a cross-sectional study in 30 African countries reveal that per capita GDP was the most influential factor while explaining per capita health care expenditure<sup>5</sup>. In India, huge gap in different states in economic terms and also in terms of development of health sector can be seen. In a study among the slum dwellers in Hyderabad, India, out-of-pocket health expenditure represents about 10% of total household expenditure<sup>6</sup>. In Rajasthan, India, only 3% of patients at public health facilities have at least one diagnostic test performed on them, but 38% nevertheless get prescribed an injection or a drip<sup>7</sup>. Such low-quality medical care is common throughout the developing world which in turn increases the curative health expenditure among the households. While analysing the performance of individual states, the gap between the states is an issue of serious concern<sup>8</sup>. Health, being a state subject in India, state policies has an important bearing on the public health expenditures in India. After liberalization, degree of control exercised by centre has been reduced in many areas leaving much greater scope for States to improve their performance level and initiatives. Keeping in view the theoretical considerations, the need is to find out whether the public health care expenditure does have a major impact on health outcomes in India. The World Bank Report, 1993 revealed the fact that the burden of disease in developing countries could be reduced greatly if governments provide a minimum package of essential, cost-effective clinical services<sup>9</sup>. From methodological point of view, since a country's growth rate depends on the growth rate of its different states, hence, states will

be a more appropriate units of study and thus, it provides the opportunity for analysing the effect of public health care expenditure on outcomes achieved in India, considering the states as units at a more disaggregated level. Moreover, practically, there is a need to define health in terms of different health indicators such as life expectancy, infant mortality, crude death rate etc.<sup>10</sup>.

**Research Question:** The research question that arises having the above discussed backdrop is whether there is any dependence of demographic indicators on government health expenditure or alternatively whether government health expenditure has a significant influence on health outcomes.

## Methodology

**Area of Coverage:** The study Covers 21 states of India: Andhra Pradesh, Arunachal Pradesh, Assam, Bihar, Goa, Gujarat, Haryana, Himachal Pradesh, Jammu and Kashmir, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Manipur, Meghalaya, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh, and West Bengal.

**Period of study:** The period of study is 22 years, i.e., from 1991 to 2012 as adequate data is available for this period.

**Variables and data sources:** The study is based on secondary data. The demographic indicators considered are Crude Birth Rate (CBR), Crude Death Rate (CDR), Infant Mortality Rate (IMR), and Sex Ratio. Government expenditure on health care includes revenue and capital expenditure on medical, public health and family welfare. Main sources of the database are Ministry of Statistics and Programme Implementation (MoSPI) and Ministry of health and family welfare (MoHFW).

**Method Used:** For examining the dependence of demographic indicators upon public health care expenditure in India, statistical tool of linear regression model has been used. This study is a panel data analysis and STATA 11.0 version has been used to perform this procedure.

## Results and Discussion

We use the growth rate of public health care expenditure (PHCE) as the explanatory variable and demographic indicators (CBR, CDR, IMR, and Sex Ratio) as the dependent variables.

First, we consider the demographic indicator Crude Birth Rate (CBR) and the growth rate of public health care expenditure (PHCE).

$$Y_{1t} = \alpha_1 + \beta_1 X_{1t} + U_t \quad \dots(i)$$

(t represents time period)

Where  $Y_{1t}$  represents the CBR,  $X_{1t}$  represents the growth rate of public expenditure on healthcare and  $U_t$  is the error term. The estimated value of equation (i) is given by,

$$\bar{Y}_{1t} = 23.7583 + -0.0391X_{1t} \\ (1.1135) (0.0092)$$

From the above equation, it has been found that CBR is negatively associated with PHCE growth rate. The above equation shows that a 1% increase in PHCE decreases CBR by 0.0391% and CBR is predicted to be 23.7583 when PHCE is zero. The following table shows the effect of PHCE on CBR in different states of India.

**Table 1: Effect of PHCE growth rate on CBR in different states of India: 1991-2012**

Dependent Variable (CBR) ( $Y_1$ )	Coefficients	Standard Error	t value	p>   t
PHCE (%) (Andhra Pradesh)	Reference Category	--	--	--
PHCE (%) (Arunachal Pradesh)	1.8005	.8115	2.22	0.027
PHCE(%) (Assam)	5.5443	.8115	6.83	0.000
PHCE (%) (Bihar)	9.5309	.8115	11.74	0.000
PHCE (%) (Goa)	-6.7025	.8115	-8.26	0.000
PHCE(%) (Gujarat)	3.7334	.8115	4.60	0.000
PHCE(%) (Haryana)	5.5589	.8115	6.85	0.000
PHCE (%) (Himachal Pradesh)	.4289	.8115	0.53	0.597
PHCE (%) (Jammu & Kashmir)	.0119	.8115	0.01	0.988
PHCE (%) (Karnataka)	1.0142	.8115	1.25	0.212
PHCE (%) (Kerala)	-4.4463	.8115	-5.48	0.000
PHCE (%) (Madhya Pradesh)	9.6220	.8116	11.86	0.000
PHCE (%) (Maharashtra)	-.1486	.8116	-0.18	0.855
PHCE (%) (Manipur)	-3.6692	.8115	-4.52	0.000
PHCE (%) (Meghalaya)	6.1706	.8115	7.60	0.000
PHCE (%) (Orissa)	2.0785	.8435	2.46	0.014
PHCE (%) (Punjab)	-.0005	.8115	-0.00	1.000
PHCE (%) (Rajasthan)	9.4177	.8115	11.61	0.000
PHCE (%) (Tamil Nadu)	-2.8999	.8115	-3.57	0.000
PHCE (%) (Uttar Pradesh)	10.9174	.8115	13.45	0.000
PHCE (%) (West Bengal)	-.0898	.8132	-0.11	0.912
Constant	21.4780	.5871	36.59	0.000
Number of observations = 462				
Prob = 0.0000				
R- squared = 0.7752, Adjusted R- squared = 0.7644				

Andhra Pradesh is obtained to be the base or the reference category (decision is arbitrary). The p-value for most of the coefficients in the above table is less than 0.05 indicating that growth rate of PHCE has a significant influence upon CBR (except for the states Himachal Pradesh, Jammu and Kashmir, Maharashtra, Punjab and West Bengal).

We now consider the demographic indicator Crude Death Rate (CDR) and the growth rate of public health care expenditure (PHCE).

$$Y_{2t} = \alpha_2 + \beta_2 X_{2t} + U_t \quad \dots(ii)$$

(t represents time period)

Where  $Y_{2t}$  represents the CDR,  $X_{2t}$  represents the growth rate of public expenditure on healthcare and  $U_t$  is the error term. The estimated value of equation (ii) is given by

$$\bar{Y}_{2t} = 7.8569 + -.0106X_{2t} \\ (.0606) (.0033)$$

It is found from the above equation that CDR is also negatively associated with PHCE growth rate. The above equation shows that a 1% increase in PHCE decreases CDR by .0106% and CDR is predicted to be 7.8569 when PHCE is zero. The following table shows the effect of PHCE on CDR in different states of India.

**Table 2: Effect of PHCE growth rate on CDR in different states of India: 1991-2012**

Dependent Variable (CDR) ( $Y_2$ )	Coefficients	Standard Error	t value	p>   t
PHCE (%) (Andhra Pradesh)	Reference category	--	--	--
PHCE (%) (Arunachal Pradesh)	-1.6507	.2931	-5.63	0.000
PHCE(%) (Assam)	1.1931	.2931	4.07	0.000
PHCE (%) (Bihar)	.5489	.2931	1.87	0.062
PHCE (%) (Goa)	-.8329	.2931	-2.84	0.005
PHCE(%) (Gujarat)	-.4913	.2931	-1.68	0.094
PHCE(%) (Haryana)	-.6918	.2931	-2.36	0.019
PHCE (%) (Himachal Pradesh)	-.5074	.2931	-1.73	0.084
PHCE (%) (Jammu & Kashmir)	-2.0315	.2931	-6.93	0.000
PHCE (%) (Karnataka)	-.4817	.2930	-1.64	0.101
PHCE (%) (Kerala)	-1.6179	.2931	-5.52	0.000
PHCE (%) (Madhya Pradesh)	2.0585	.2931	7.12	0.000
PHCE (%) (Maharashtra)	-.9520	.2931	-3.25	0.001
PHCE (%) (Manipur)	-2.9920	.2931	-10.21	0.000
PHCE (%) (Meghalaya)	.0812	.2930	0.28	0.782
PHCE (%) (Orissa)	1.8518	.3047	6.08	0.000
PHCE (%) (Punjab)	-.8253	.2931	-2.82	0.005
PHCE (%) (Rajasthan)	-.0588	.2931	-0.20	0.841
PHCE (%) (Tamil Nadu)	-.2487	.2931	-0.85	0.397
PHCE (%) (Uttar Pradesh)	1.6419	.2931	5.60	0.000
PHCE (%) (West Bengal)	-.9925	.2937	-3.38	0.001
Constant	8.1889	.2120	38.62	0.00
Number of observations = 462				
Prob = 0.0000				
R- squared = 0.6476, Adjusted R- squared = 0.6308				

Andhra Pradesh is obtained to be the base or the reference category (decision is arbitrary). The p-value for most of the coefficients in the above table is less than 0.05 indicating that growth rate of PHCE has a significant influence upon CDR (except for the states Bihar, Gujarat, Himachal Pradesh, Karnataka, Meghalaya, Rajasthan and Tamil Nadu).

Let us, now, find out the effect of the growth rate of public health care expenditure (PHCE) upon the Infant

Mortality Rate (IMR) in India.

$$Y_{3t} = \alpha_3 + \beta_3 X_{3t} + U_t \quad \dots(iii) \\ (t \text{ represents time period})$$

Where  $Y_{3t}$  represents the IMR,  $X_{3t}$  represents the growth rate of public health care expenditure and  $U_t$  is the error term. The estimated value of equation (iii) is given by,

$$\hat{Y}_{3t} = 55.2816 + -.1503X_{3t}$$

(.6568) (.0359)

It is found from the above equation that IMR is also negatively associated with PHCE growth rate.

The above equation shows that a 1% increase in PHCE decreases IMR by .1503% and IMR is predicted to be 55.2816 when PHCE is zero. The following table shows the effect of PHCE on IMR in different states of India:

**Table 3: Effect of PHCE growth rate on IMR in different states of India: 1991-2012**

Dependent Variable (IMR) (Y <sub>3</sub> )	Coefficients	Standard Error	t value	p>  t
PHCE (%) (Andhra Pradesh)	Reference category	--	--	--
PHCE (%) (Arunachal Pradesh)	-16.5471	3.1758	-5.21	0.000
PHCE (%) (Assam)	10.3835	3.1758	3.27	0.001
PHCE (%) (Bihar)	1.8110	3.1758	0.57	0.569
PHCE (%) (Goa)	-36.9891	3.1757	-11.65	0.000
PHCE (%) (Gujarat)	-2.9866	3.1757	-0.94	0.347
PHCE (%) (Haryana)	1.8247	3.1757	0.57	0.566
PHCE (%) (Himachal Pradesh)	-6.1688	3.1759	-1.94	0.053
PHCE (%) (Jammu & Kashmir)	-9.4122	3.1758	-2.96	0.003
PHCE (%) (Karnataka)	-6.0889	3.1756	-1.92	0.056
PHCE (%) (Kerala)	-46.2621	3.1758	-14.97	0.000
PHCE (%) (Madhya Pradesh)	24.6894	3.1763	7.77	0.000
PHCE (%) (Maharashtra)	-17.2676	3.1761	-5.44	0.000
PHCE (%) (Manipur)	-40.1788	3.1757	-12.65	0.000
PHCE (%) (Meghalaya)	-2.9173	3.1756	-0.92	0.359
PHCE (%) (Orissa)	22.9969	3.3012	6.97	0.000
PHCE (%) (Punjab)	-12.6733	3.1757	-3.99	0.000
PHCE (%) (Rajasthan)	13.6484	3.1758	4.30	0.000
PHCE (%) (Tamil Nadu)	-16.1295	3.1759	-5.08	0.000
PHCE (%) (Uttar Pradesh)	18.2416	3.1756	5.74	0.000
PHCE (%) (West Bengal)	-11.2568	3.1826	-3.54	0.000
Constant	61.5331	2.2974	26.78	0.000
Number of observations = 462				
Prob = 0.0000				
R- squared = 0.7766, Adjusted R- squared = 0.7659				

Andhra Pradesh is obtained to be the base or the reference category (decision is arbitrary). The p-value for most of the coefficients in the above table is less than 0.05 indicating that growth rate of PHCE has a significant influence upon IMR (except for the states Bihar, Gujarat, Haryana, Himachal Pradesh, Karnataka, and Meghalaya).

Let us, now, find out the effect of the growth rate of public health care expenditure (PHCE) upon the Sex ratio in India.

$$Y_{4t} = \alpha_4 + \beta_4 X_{4t} + U_t \quad \dots(iv)$$

(t represents time period)

Where Y<sub>4t</sub> represents the Sex ratio, X<sub>4t</sub> represents the growth rate of public expenditure on healthcare and U<sub>t</sub> is the error term. The estimated value of equation (iv) is given by,

$$\hat{Y}_{4t} = 939.7628 + .0868X_{4t}$$

(9.8710) (.0278)

From the above equation, it is found that the PHCE growth rate has a positive impact upon the sex ratio in India. The above equation shows that a 1% increase in PHCE increases sex ratio by .0868% and sex ratio

is predicted to be almost 940 when PHCE is zero. The following table will show the effect of PHCE on Sex Ratio in different states of India.

**Table 4: Effect of PHCE growth rate on sex ratio in different states of India: 1991-2012**

Dependent Variable (sex ratio) (Y <sub>4</sub> )	Coefficients	Standard Error	t value	p>  t
PHCE (%) (Andhra Pradesh)	Reference category	--	--	--
PHCE (%) (Arunachal Pradesh)	-84.5562	2.4645	-34.31	0.000
PHCE(%) (Assam)	-44.3151	2.4645	-17.98	0.000
PHCE (%) (Bihar)	-64.6440	2.4645	-26.23	0.000
PHCE (%) (Goa)	-16.4990	2.4644	-6.69	0.000
PHCE(%) (Gujarat)	-57.3522	2.4644	-23.27	0.000
PHCE(%) (Haryana)	-113.6665	2.4644	-46.12	0.000
PHCE (%) (Himachal Pradesh)	-10.1293	2.4645	-4.11	0.000
PHCE (%) (Jammu & Kashmir)	-86.7591	2.4645	-35.20	0.000
PHCE (%) (Karnataka)	-16.4557	2.4643	-6.68	0.000
PHCE (%) (Kerala)	79.3002	2.4645	32.18	0.000
PHCE (%) (Madhya Pradesh)	-59.5280	2.4648	-24.15	0.000
PHCE (%) (Maharashtra)	-54.4166	2.4647	-22.08	0.000
PHCE (%) (Manipur)	-5.0281	2.4644	-2.04	0.042
PHCE (%) (Meghalaya)	-7.4043	2.4643	-3.00	0.003
PHCE (%) (Orissa)	-5.1281	2.5618	-2.00	0.046
PHCE (%) (Punjab)	-99.0240	2.4644	-40.18	0.000
PHCE (%) (Rajasthan)	-60.3824	2.4644	-24.50	0.000
PHCE (%) (Tamil Nadu)	5.1014	2.4646	2.07	0.039
PHCE (%) (Uttar Pradesh)	-85.1901	2.4643	-34.57	0.000
PHCE (%) (West Bengal)	-47.6010	2.4697	-19.27	0.000
Constant	979.4571	1.7828	549.37	0.000
Number of observations = 462				
Prob = 0.0000				
R- squared = 0.9679, Adjusted R- squared = 0.9664				

Andhra Pradesh is obtained to be the base or the reference category (decision is arbitrary). The p-value for all the coefficients in the above table is less than 0.05 indicating that growth rate of PHCE has a significant influence upon sex ratio.

**Conclusion**

An efficient and equitable expenditure on health care in a country by the government contributes a lot in terms of improvement of human capital formation which in other way will improve the productivity of the country. There is an urgent need on the part of the government to

contribute a larger section of a country’s Gross Domestic Product on health care and education. Taking into account the equity considerations, the increased public expenditure would help the poor and socio-economically backward people to access the services as they cannot afford a private provider. Hence the study of the effect of public health care expenditure on health outcome is of utmost necessity to assess a country’s contribution to the formation of human capital.

<sup>1</sup>Professor, <sup>2</sup>Junior Resident, <sup>3</sup>Assistant Professor, Department of Pediatrics, Maharishi Markandeshwar Institute of Medical Sciences and Research, Maharishi Markandeshwar (Deemed to be) University, Mullana, Ambala, Haryana

## Abstract

**Background:** Birth asphyxia is a leading cause of morbidity and mortality among neonates in India. Common complications of birth asphyxia are cerebral palsy, persistent pulmonary hypertension of newborn, cardiogenic shock, irreversible renal cortical necrosis, hypotension, and heart failure. The risk of hypoxic-ischemic encephalopathy (HIE) increases with increasing severity of birth asphyxia. Hypocalcemia occurs with increased frequency in neonates with birth asphyxia. In our present study, we measured both ionized and total serum calcium levels in neonates with birth asphyxia and compared these levels with normal healthy neonates. Among cases, serum and ionic calcium levels were compared among neonates with different stages of HIE to find co-relation of calcium levels with the severity of birth asphyxia.

**Method:** Total serum calcium and ionic calcium levels obtained at birth were compared among neonates with and without birth asphyxia. Among asphyxiated neonates, total and ionic calcium levels were compared among neonates with different staging of HIE.

**Results:** Total serum calcium and ionic calcium levels at birth were significantly lower in cases ( $8.04 \pm 0.89$  mg/dl,  $3.62 \pm 0.46$  mg/dl) as compared to controls ( $9.32 \pm 0.72$  mg/dl,  $4.79 \pm 0.49$  mg/dl). In the case group level of Total serum calcium and ionic calcium levels showed a decreasing trend with increasing stage of HIE. Level of total serum calcium and ionic calcium were  $8.88 \pm 0.290$ ,  $4.03 \pm 0.178$  mg/dl among babies who had no HIE,  $8.07 \pm 0.675$ ,  $3.61 \pm 0.354$  mg/dl among babies who had HIE-1,  $7.78 \pm 0.572$ ,  $3.54 \pm 0.572$  mg/dl among babies who had HIE-2 and  $7.03 \pm 0.596$ ,  $3.12 \pm 0.342$  mg/dl among babies who had HIE-3.

**Conclusion:** Total serum calcium and ionic calcium levels are decreased in birth asphyxia. Total serum and ionic calcium levels are also decreased with increasing severity of HIE.

**Keywords:** Birth Asphyxia, Total serum Calcium, Ionic Calcium, Hypoxic Ischemic encephalopathy.

## Introduction

Birth asphyxia is an insult to the fetus or the newborn due to lack of oxygen (hypoxia) and lack of

perfusion (ischemia) to various organs of sufficient magnitude and duration to produce various functional and biochemical changes. It is the leading cause of morbidity and mortality among neonates in India. Along with prematurity and systemic infections birth asphyxia is one of the three most common causes of neonatal deaths<sup>1,2</sup>. Out of a total of 2.7 million stillbirths occurring globally 1.2 million occur during the intrapartum period largely due to asphyxia<sup>3</sup>. Common complications of birth asphyxia are cerebral palsy, persistent pulmonary hypertension of newborn, cardiogenic shock, irreversible renal cortical necrosis, hypotension, and heart failure<sup>4</sup>. Hypoxic-ischemic encephalopathy (HIE) is a disturbed

neurological and behavioral state consisting of altered level of consciousness and other signs of brain stem and motor dysfunction. HIE can be classified into three stages as per Sarnat and Sarnat scoring system. The risk of HIE increases with increasing severity of birth asphyxia. HIE staging and timely management is important to prevent serious long term neuromotor abnormalities among survivors<sup>5</sup>.

Various metabolic derangements have been seen in asphyxiated newborns. Hypoglycemia, hyperkalemia, hyponatremia, hyperuricemia, hypocalcemia, and raised creatinine levels are the biochemical abnormalities associated with poor outcomes in birth asphyxia<sup>6</sup>.

Hypocalcemia occurs with increased frequency in neonates with birth asphyxia<sup>7</sup>. Hypocalcemia in asphyxiated infants may trigger seizures or may compromise cardiovascular function with deleterious consequences<sup>8</sup>. Calcium occurs in two forms in serum Total serum calcium and ionic calcium. Correlation between ionized and total serum calcium level is poor when serum albumin concentration is low. In our present study, we measured both ionized and total serum calcium levels in neonates with birth asphyxia and compared these levels with normal healthy neonates. Among cases, total serum and ionic calcium levels were compared among neonates with different stages of hypoxic-ischemic encephalopathy to find a correlation of calcium levels with the severity of birth asphyxia.

### **Material and Method**

A total of 100 neonates admitted in the Neonatal Intensive Care Unit in the Department of Pediatrics, MMIMSR, Mullana (Ambala) were enrolled for study. Approval from the institutional ethical committee and informed consent from parents was taken before starting the study. Fifty term neonates, appropriate for gestational age with birth asphyxia (APGAR score < 7 at five minutes of life) were included in the case group. The control group included 50 term neonates appropriate for gestational age without birth asphyxia. Preterm and post-term neonates, neonates having gross congenital malformation, neonates of mother having diabetes, chronic renal or hepatic disease were excluded

from the study. Among the case group, Sarnat and Sarnat scoring was done and neonates were classified having no HIE, stage 1, stage 2 or stage 3 of HIE. Two ml of cord blood samples collected at the time of birth were used for the assessment of ionized and total serum calcium values at birth. Total serum calcium levels were obtained by analysis on a fully automatic biochemical analyzer, SIEMENS Dimensions Rxl Max Integrated Chemistry System. Ionized calcium levels were obtained by a fully automatic electrolyte analyzer, HDC Lyte Automated HD Consortium India Limited Descriptive and inferential statistical analysis of the data was done. SPSS (Statistical package for social sciences) version 21 was used for data analysis and interpretation. Total serum calcium and ionic calcium levels at birth were compared among asphyxiated and non asphyxiated neonates. Among the case group, total and serum calcium levels at birth were compared among neonates with different stages of hypoxic-ischemic encephalopathy and mode of resuscitation used.

### **Results**

There were 29 males and 21 females among cases and 31 males and 19 females among controls. Mean birth weight was  $2.72 \pm 0.44$  kgs among cases and was  $2.80 \pm 0.40$  kgs among controls. 27 neonates were delivered by vaginal delivery and 23 were delivered by caesarian section both among cases and controls. Out of 50 cases of birth asphyxia, 33 babies were resuscitated by the bag and mask ventilation and 17 cases were resuscitated by bag and tube ventilation. Among cases 18 did not develop HIE, 10 newborn developed HIE-1, 9 developed HIE 2 and 13 developed HIE 3.

Total serum calcium and ionic calcium at birth were found to be significantly lower among cases ( $8.04 \pm 0.89$ ,  $3.62 \pm 0.46$  mg/dl) as compared to controls ( $9.32 \pm 0.72$ ,  $4.79 \pm 0.49$  mg/dl) with p value < 0.001.

In case group significantly lower value of Total serum calcium and ionic calcium at birth were found among babies resuscitated by bag and tube ( $7.20 \pm 0.64$ ,  $3.22 \pm 0.39$  mg/dl) as compared to babies resuscitated by bag and mask ( $8.47 \pm 0.67$ ,  $3.83 \pm 0.34$  mg/dl) with p-value < 0.001.

**Table 1: Comparison of Total serum calcium and ionic calcium levels at birth among case group on the basis of mode of resuscitation used**

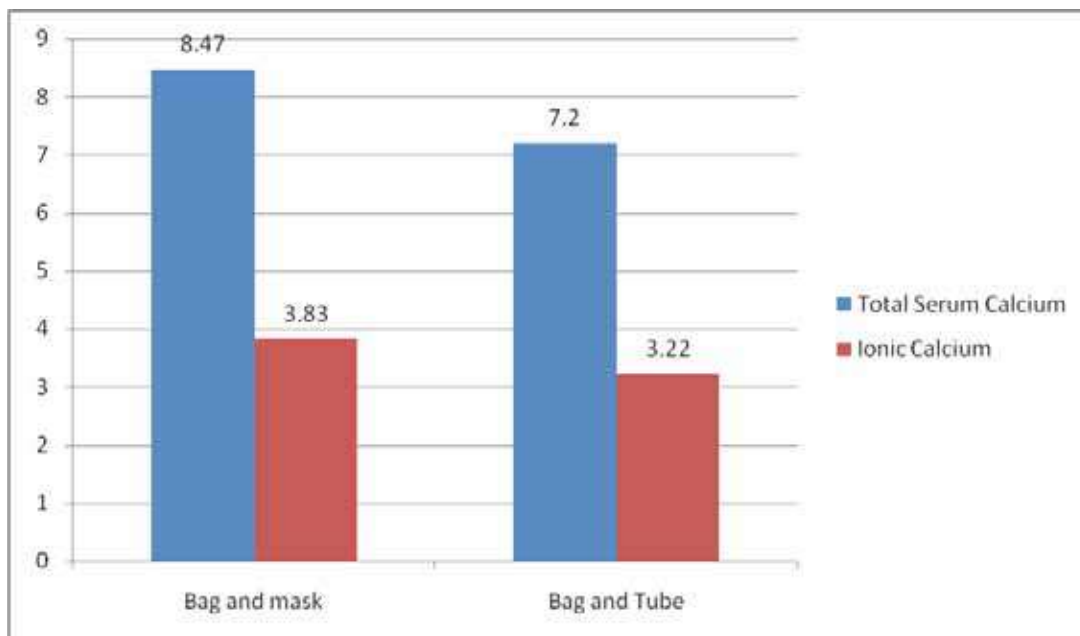

Group-Cases	Mode of Resuscitation Used	Number	Mean	SD	p-value
Total Serum Calcium (mg/dl)	Bag and mask	33	8.47	0.67	<0.001
	Bag and tube	17	7.20	0.64	
Ionized Calcium (mg/dl)	Bag and mask	33	3.83	0.34	<0.001
	Bag and tube	17	3.22	0.39	

In case group level of Total serum calcium at birth was  $8.88 \pm 0.290$  mg/dl among babies who had no HIE,  $8.07 \pm 0.675$  mg/dl among babies who had HIE-1,  $7.78 \pm 0.572$  mg/dl among babies who had HIE-2 and  $7.03 \pm 0.596$  mg/dl among babies who had HIE-3. Level of ionic calcium at birth was  $4.03 \pm 0.178$  mg/dl among

babies who had no HIE,  $3.61 \pm 0.354$  mg/dl among babies who had HIE-1,  $3.54 \pm 0.572$  mg/dl among babies who had HIE-2 and  $3.12 \pm 0.342$  mg/dl among babies who had HIE-3. Pearson correlation coefficient was  $-0.818$  for Total serum calcium and  $-0.769$  for ionic calcium.

**Table 2: Comparison of Total serum calcium and ionic calcium levels at birth among case group on basis of HIE staging**

Group-Cases	HIE Stage	Number	Mean	SD	p-value	Pearson Correlation
Total Serum Calcium (mg/dl)	0	18	8.88	0.290	<0.001	-0.818
	1	10	8.07	0.675		
	2	9	7.78	0.572		
	3	13	7.03	0.596		
Ionic Calcium (mg/dl)	0	18	4.03	0.178	<0.001	-0.769
	1	10	3.61	0.354		
	2	9	3.54	0.332		
	3	13	3.12	0.342		

**Figure 1: Comparison of Total serum calcium and ionic calcium levels at birth among case group on the basis of mode of resuscitation used**

**Figure 2: Comparison of Total serum calcium and ionic calcium levels at birth among case group among different HIE staging**

## Discussion

Birth asphyxia is one of the leading causes of perinatal death and recognizable cause of brain damage in newborn.<sup>9</sup> Common complications of birth asphyxia are cerebral palsy, irreversible renal cortical necrosis, persistent pulmonary hypertension of newborn, hypotension, cardiogenic shock or heart failure.<sup>10,11</sup> A number of metabolic disturbances like thermal instability, lactic acidosis, hypoglycemia, low sodium, and low calcium levels may occur along with birth asphyxia.<sup>12</sup> Only a third of deliveries in India are institutional and many asphyxiated babies are brought late to hospitals.<sup>3</sup> The signs of asphyxial injury are nonspecific and overlap with other illnesses. In the absence of perinatal records, it is difficult to retrospectively diagnose perinatal asphyxia. Several studies have been conducted to evaluate markers that help distinguish an asphyxiated from non-asphyxiated neonates and to assess the severity of asphyxia. Cerebral function of the newborn may be assessed by various noninvasive methods such as EEG, MRI, Cranial ultrasound and by various blood samples such as level of CK-BB, LDH, etc. But in India, these tests are usually available at tertiary care hospitals only. We conducted our study to check levels of total serum calcium and ionic calcium in birth asphyxia

and its relation with the severity of hypoxic-ischemic encephalopathy. Calcium level is a routine test available at most of the primary health facilities. Co-relation of calcium levels with severity of birth asphyxia will help in advance prediction of severity of birth asphyxia and its timely management.

Our study showed a significant decrease (with  $p$ -value < 0.001) of total serum calcium and ionic calcium levels both at birth among asphyxiated newborns as compared to non asphyxiated newborns. A study conducted by P Basu et al<sup>13</sup> had also concluded that total serum calcium level is lower in asphyxiated newborns as compared to non asphyxiated newborns. Studies conducted by Yoneda S et al<sup>14</sup> who had also reported lower ionized calcium levels at birth in asphyxiated newborns as compared to non asphyxiated newborns.

In our present study Total serum, calcium and ionic calcium levels showed a decreasing trend with increasing severity of HIE with Pearson correlation coefficient -0.818 for Total serum calcium and -0.769 for ionic calcium. In Study done by Yoneda S et al<sup>14</sup> neonates with birth asphyxia were divided into two groups of HIE, neonates with HIE who made full recovery and neonates with HIE having poor outcome and it was concluded that

serum ionic calcium levels were significantly lower in neonates with HIE who had poor outcome as compared to neonates with HIE who had favorable outcome. Results similar to our study showing lower levels of serum calcium levels with increasing severity of HIE were also reported by study by Seema Shah et al<sup>4</sup>. In

Study done by Yoneda S et al<sup>14</sup> neonates with birth, asphyxia were divided into two groups of HIE, neonates with HIE who made full recovery and neonates with HIE having poor outcome had also concluded that serum ionic calcium levels shortly after birth were significantly lower in neonates with HIE who had poor outcome

**Table 3: Comparison of total serum calcium levels in different HIE stages between Seema Shah et al<sup>4</sup> study and our study**

Study Type	Hie Stage	Number	Total Serum Calcium Levels
Seema shah et al study <sup>4</sup>	Non-HIE	25	9.12±0.64
	HIE-1	8	8.32±1.12
	HIE-2	16	7.76±0.48
	HIE-3	9	7.12±0.56
Our study	Non-HIE	18	8.88±0.29
	HIE-1	10	8.07±0.68
	HIE-2	9	7.78±0.58
	HIE-3	13	7.03±0.60

**Conclusion**

From our present study, it can be concluded that birth asphyxia leads to a decrease in both total serum calcium and ionic calcium levels at birth. Also, both total serum and ionic calcium levels are decreased in proportion to the severity of hypoxic-ischemic encephalopathy.

# Usage of Complementary Alternative Medicine among the Patients Attending Tertiary Care Hospital

Bodhi Sri Vidya Vennam<sup>1</sup>, Srinivasa Reddy. Pulusu<sup>2</sup>, N.G. Nagamani<sup>3</sup>, R.V. Manasa<sup>4</sup>

<sup>1</sup>Associate Professor, <sup>2</sup>Assistant Professor, <sup>3</sup>Professor, <sup>4</sup>Lecturer in Statistics, Dept. of Community Medicine, GITAM Institute of Medical Sciences And Research, Gandhinagar, Rushikonda, Visakhapatnam, Andhra Pradesh

## Abstract

**Background:** Complementary and alternative medicine (CAM) includes Ayurveda, Homeopathy, Unani, yoga and Naturopathy, and other traditional medicine.

**Aim and Objectives:** The study was conducted to determine the prevalence of usage of CAM among the patients attending tertiary care hospital.

**Methodology:** It was observational study. 528 patients were included in to the study randomly from out-patient department. Study instrument was a pre-designed, pre-tested, semi-structured schedule.

**Results:** The prevalence of Complementary alternative Medicine usage was 22.3%. Homeopathy was used most commonly (59.3%) by the users. 10.2% of users were continuing the usage of CAM. Most common indications for usage of CAM were musculo-skeletal problems (29.7%), allergies (23.7%).

**Conclusion:** Around one-fourth of patients attending tertiary care hospital were using CAM. Patients opted for CAM because of lesser side effects and more effective. Only few percent revealed to the doctors about the usage of CAM

**Keywords:** *Complementary Alternative medicine, alternative medicine, Ayurveda, Homeopathy, Unani.*

## Introduction

Health care usage in India is influenced by many social, cultural factors which are usually diversified in nature. With escalating costs of allopathic medicine, and continuing demand for health care services there is need to explore how the people are tackling their health care needs. World Health Organization in its document it is

stated that “traditional and complementary medicine can make a significant contribution to the goal of Universal Health coverage by being included in the provision of essential health services”<sup>1</sup>.

Traditional medicine is based on the knowledge, skills, beliefs of indigenous cultures, Complementary medicine or alternative medicine refer to broad set of health care practices that are not part of that country’s own tradition or conventional medicine and are not fully integrated into the dominant health-care system<sup>2</sup>.

The example of complementary alternative medicine includes Ayurveda, Homeopathy, Unani, Naturopathy etc. and these include Chinese, Asian, Pacific Islander, American Indian and Tibetan practices<sup>3</sup>.

A study done in India about AYUSH services expressed that understanding patterns of usage in various socio-demographic groups is important<sup>4</sup>.

This study was planned to know the magnitude and type of complementary alternative medicine usage among the patients attending the tertiary care hospital.

**Objectives:**

1. To determine the prevalence and most common type of Complementary Alternative medicine usage.
2. To determine the indications associated with the usage of CAM.

**Material and Method**

**Type of Study:** Descriptive cross-sectional study.

**Study Population:** Patients attending out-patient department of tertiary care hospital.

Study was conducted in October 2019 between 9.30 to 11.30 am at out-patient department. Total of 528 patients after returning from check-up in out-patient departments were taken into study randomly.

**Study Instrument:** A semi-structured, pre-designed, pre-tested schedule was applied after taking informed consent from the study participants. It contains questions related to socio-demographic details, usage of Complementary alternative medicine, indications for usage, reasons and type of CAM.

**Exclusion Criteria:** Patients aged below 15 years, who are severely ill.

Study analysis was done by using micro soft excel and SPSS software 22 version.

**Results**

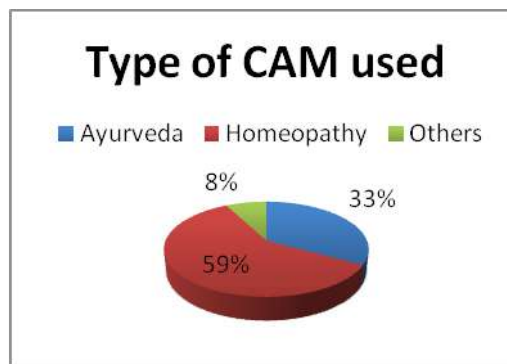

Among the total study subjects (528), more than two fifth of study subjects (22.3%)(118 out of 528) had used complementary alternative medicine (CAM). (Figure-1)

**Figure 1: The prevalence of CAM usage:**

Among them who revealed the usage of

Complementary alternative medicine, the most common type used by them was Homeopathy (59.3%), and Ayurveda (33%) (Figure-2)

**Figure 2: Types of CAM usage:**

Among them who had used Complementary alternative medicine, More than 85% of them belonged to low socio-economic status (based on Government Ration card). Majority (86.4%) were belong to Hindu religion. Most of the study subjects were males (61%) and were educated up to high school (55.9%)(Table-1).

**Table 1: Socio-demographic details of study subjects who had used Complementary alternative medicine (n=118)**

	N (%)
<b>Age in Years:</b>	
≤20	6 (5.1)
21-30	14 (11.9)
31-40	32 (27.1)
41-50	18 (15.3)
>50	<b>48 (40.7)</b>
<b>Gender:</b>	
Females	46 (39.0)
Males	<b>72 (61.0)</b>
<b>Ration Card:</b>	
Yes	<b>104 (88.1)</b>
No	14 (11.9)
<b>Education:</b>	
Illiterates	14 (11.9)
Primary and high school	<b>66 (55.9)</b>
Intermediate and above	38 (32.3)
<b>Religion:</b>	
Hindu	<b>102 (86.4)</b>
Christian	6 (5.1)
Muslim	8 (6.8)
Others	2 (1.7)

Around one third (33.1%) of the users were revealed that they were continuing the usage of Complementary

Alternative medicine while others (66.9%) were told that they used it in past one year.

Regarding indications of CAM usage: more than one fifth (29.7%) of them were using it for musculoskeletal problems and another chunk of one fifth (23.7%) of them were using it for Allergies (allergic rhinitis, dermatitis, food allergies). Other indications were Asthma (19%), Diabetes (19%), and for other indications (14.4%) (Table-2)

**Table 2: Indications for usage of complementary Alternative Medicine (n=118)**

Indication for usage of CAM	N (%)
Allergies	28 (23.7)
Bronchial asthma	19 (16.1)
Diabetes	19 (16.1)
Musculoskeletal problem	35 (29.7)
Others	17 (14.4)
Total	118

More than two fifth (45.8%) of users said that they considered usage of CAM because of lesser side effects. Other reasons for the usage said by them were more effective (16.9%), less cost (15.3%), no improvement with allopathy (13.6%), belief on practitioner (5.1%) (Table-3).

**Table 3 Reasons for usage of CAM:**

Reason for using CAM	N (%)
No improvement with allopathy	16 (13.6)
Less cost	18 (15.3)
Safer/less side effects	54 (45.8)
Belief on practitioner	6 (5.1)
Easy availability	4 (3.4)
More effective	20 (16.9)
Total	118

Very few of them (6.8%) told to their doctor about their usage of CAM, where as others didn't reveal because their doctor didn't ask them (47.5%), fear to tell (27.1%), forgot to reveal (11.9%) and because they felt there was no need to reveal because they were using natural medicine (6.8%).

Among the study subjects who were using Ayurveda, more than half of them (51.3%) were using it for musculoskeletal problems, and more than one third (37.1%) of homeopathy users were said that they were using it for Allergies. It was found to be statistically significant (figure-3).

**Figure 3: Type of CAM usage in relation with indications**

## Discussion

This study was done among the patients attending out-patient department in a tertiary care hospital.

The prevalence of usage of Complementary Alternative Medicine was found to be 22.3% among the study subjects (n=528). (figure-1). This result is in similar lines with study done at a tertiary care hospital by Roy V et al<sup>5</sup> and study done by Arjun aRao et al<sup>6</sup>. The present study result is lesser than the prevalence found out in a study done in North India<sup>7</sup> and study done by Jayanthi Roy et al<sup>8</sup>. This difference may be because difference in the study population.

The most common type of CAM usage was homeopathy (59.3%) and next comes Ayurveda (33.1%). (figure-2). This is different in lines with the studies done by M.S. Bhalerao et al<sup>9</sup>, Arjuna Rao et al<sup>6</sup>, M J Ranath et al<sup>10</sup>. where most common CAM was Ayurveda.

Most of the CAM users (88.1%) were belonged to low socio-economic class.(table-1) This findings in similar lines with study done by Rudra S et al<sup>4</sup> based on NSS 2014 survey.

The common indications for usage of CAM were musculoskeletal problems (29.7%), Allergies (23.7%) (table-2) which is similar to finding revealed in study done by Jayanthi Roy<sup>8</sup>.

It was found that Ayurveda, Homeopathy used mainly for musculoskeletal problems and allergies respectively. (figure-3)

The reasons for usage of CAM were found to be safer (less side effects), more effective, less cost Table-3).

## Conclusion and Recommendation

Around one-fourth of study subjects were CAM users and Homeopathy was common type used by them. They were using CAM for musculoskeletal problems, allergies, bronchial asthma, Diabetes. Only few persons revealed to the doctor that they were using CAM. Sensitization should be done to patients that they should reveal about the usage of CAM to the treating doctors.

**Conflict of Interest:** None

**Source of Funding:** None

**Ethical Clearance:** Taken from Institutional ethics committee.

# Adoption of Health Management Information System (HMIS) among ESIC Healthcare Professionals in Southern Districts of Tamil Nadu: An Integrated Model

C. Sriram<sup>1</sup>, V. Mohanasuundaram<sup>2</sup>

## Abstract

It has been emphasised that a Health Management Information System (HMIS) will improve the ability to collect, store and analyse accurate health data, service delivery efficiency and effectiveness of intervention. The objective of the system is to record information on health events and check the quality of services at different levels of healthcare. The successful implementation of Information and Communications Technology (ICT) and health programmes requires complex balancing of the competing views and concerns of the different stakeholders. Some clinicians will view new technology with suspicion, fearing its challenge to their professional autonomy and status. Patients will often seize on the potential benefits but will also hold legitimate concerns about the security and confidentiality of any electronically held patient data. IT specialists may seek to use cutting edge technology in the respective environments where existing tried and tested technology would be more than adequate to deliver real improvements in patient care. The adoption of the health management information system among Employees' State Insurance Corporation (ESIC) healthcare professionals and important issues related to system usage, including the implementation and current use of the HMIS at ESIC main hospital and dispensaries in Tirunelveli sub-region were examined by using a Technology Acceptance Model (TAM). Information and data were collected from 171 ESIC healthcare professionals in three southern districts (Tirunelveli, Tuticorin and Kanyakumari) in Tamil Nadu. An analysis provided enough evidence for the proposition that integration of ICT with the health care professional – patient relationship adequately addressed the service efficiency.

**Keywords:** *ICT, Health Management Information System, Stakeholders, Information systems and Service Efficiency*

## Introduction

In the context of increasing incidences of both communicable and non-communicable diseases, especially among the rural poor, a strong and vibrant hospital management information system (HMIS) is warranted. The HMIS is defined as a subsystem of a hospital, which comprises all information processing actions as well as the associated human or technical actors in their respective information processing role. To maximize communication in a hospital, the managing

organization should consider two parts: a human part and a machine or technical part. Successful implementation is dependent on how these two parts of a hospital work together to handle changes as well as challenges<sup>[7]</sup>. Here technology is the enabler and not the driver and further, more emphasis should be put on the people working in these newer forms of information system. To provide optimal care, health care institutions need timely patient information from different sources at the point-of-care<sup>[9]</sup>. One way to achieve this is through the use of ICT in health care. This encompasses the full range of electronic digital and analogue ICT, from radio and television to telephones (fixed and mobile), computers, electronic-based media such as digital text and audio-video recording, and the internet.

**Review of Literature:** A stratified random sample of medical group practices was used in a study by

Gans, Kralewski, Hammons, & Dowd, (2005) to know the progress of adoption of electronic health records (EHRs). Group practices were defined as three or more physicians practicing together with a common billing and medical record system. The main aim of the study was to assess the information technology usage of the medical practitioners. A five point scale was used to rate the benefits of electronic health records. It was found that electronic health records improved the access to medical record information. Further, they improved the workflow in medical practice and also brought about improved patient care<sup>[1]</sup>.

Some studies used the telemedicine referrals as a second opinion advice tool. Technology helped a lot in assisting the patients and updating medical knowledge. The staff was told about the available technology. Further, proper training and equipments were also given to them. But the main problem was that the staff was unable to put the technology into real practice (Shiferaw & Zolfo, 2012). Telemedicine referrals brought about a lot of awareness at the community level and also at the level of officials<sup>[2]</sup>.

Information Technology (IT) in health sector could be used for better diagnosis, better training and sharing of knowledge and improving communication about health (Kalpa, 2012). The scope of public health informatics is immense and it requires the application of knowledge from numerous disciplines, particularly information science, computer science, management, organizational theory, psychology, communications, political science, and law<sup>[3]</sup>. Standards or guidelines have to be formulated to maintain quality in health information system. Public private partnership should be encouraged to expand the utilization of health information technology.

Information management processes greatly helped in knowledge creation, sharing and use. They also helped to meet the future challenges of effectiveness, increasing needs and demands of patients and decreasing availability of staff resources (Kivinen & Lammintakanen, 2013). There were four sub-categories in the “usage of management information system”: system quality, information quality, use and user satisfaction and development. Most of the generated information was used for the human resource management<sup>[4]</sup>.

A few studies reported that effective e-health investment did not result in better quality and improved productivity but it freed up capacity and enabled

greater access (Kaye, Kokia, Shalev, Idar, & Chinitz, 2010). From the perspective of the doctors, health IT (particularly EHR) was found to be time-consuming. The doctors were too busy to deal with it and they feared that it would depersonalize healthcare and would interfere with their rapport with their patient<sup>[5]</sup>.

Medical Audit was found to be vital for the measurement of the quality of care given to the practice population (Elhadi, et al., 2007). Medical audit required standard setting, data collection, comparison with standards, review of data and standards<sup>[6]</sup>.

**Research Issue:** In the context of development and application of technologies, in the field of communication, challenges are numerous and require micro level studies to understand the issues as well as practical solutions<sup>[10]</sup>. As it involves both human and material (technology) factors in the application of a new system in the Indian reality a comprehensive approach is need of the hour. Health care services are mostly addressing the emotional side than the physical side<sup>[8]</sup>. Hence, a suitable framework has to be developed by incorporating the relevant variables and parameters.

### Objectives:

1. To apply the Technology Acceptance Model (TAM) in order to predict and explain the extent to which the Health Management Information System (HMIS) is perceived as useful and easy to adopt by physicians and healthcare professionals in ESIC hospitals and dispensaries.
2. To examine and explain the perception, behavioural intentions, behaviour relationship within TAM.

**Hypothesis:** 1.  $H_0$  There is no significant relationship between the constructs: System Quality, Computer Self-Efficacy, Facilitating Conditions, Perceived Usefulness, Perceived Ease of Use, Perceived Behavioural Control, Attitude, Subjective Norm and Behavioural Intention.

### Methodology

Technology Acceptance Model (TAM) was applied and tested in this study. Data were collected from the ESIC hospital and dispensaries in Tirunelveli sub-region (Tirunelveli, Tuticorin and Kanyakumari districts) covering 171 healthcare professionals working in different departments. The TAM based model shows the relationship between the dependent and the independent variables. The TAM based model was divided into

two parts: i) Products of interactions between System, Organization and Physicians and ii) Physician and staff outcomes. Limit on professional autonomy, training, computer self-efficacy and facilitating conditions form an integral part of the system, organization and physician environment. These independent variables have their own role to play in the working environment and directly or indirectly impact the Perceived Usefulness (PU), Perceived Ease of Use (PEOU) and Perceived

Behavioral Control (PBC) constructs. The users of the system would have their own opinion and attitude towards system usage. Subjective norm refers to the social influence and peer pressure. Both attitude and subjective norm influence Behavioral Intention (BI) and form a gate way for the second part of the model (i.e.) Physician and staff outcomes. System adoption would be the final part of the model. Any intention to use the system automatically enhances adoption and experience.

**Table 1: Results of Correlation Analysis**

### Adoption of Health Information System in ESIC

**Hospital:** The results of correlation analysis revealed a significant and positive relationship between the factors of adoption of health information system in ESIC hospital among the health care professionals. This indicates that all the major factors analysed in the present study are significant for the adoption of the HMIS in ESIC hospital and dispensaries.

The hypothesis that System Quality may positively impact the perceived usefulness of HMIS ( $r=.731$ ) was accepted. Likewise, the impact of System Quality on the perceived ease of use of HMIS ( $r=.561$ ) and on the perceived behavioural control of HMIS users ( $r=.709$ ) were found as positive. Computer self-efficacy positively impacted the perceived usefulness of HMIS ( $r=.652$ ), the perceived ease of use of HMIS ( $r=.587$ ) and the perceived behavioural control of HMIS users ( $r=.714$ ).

Facilitating conditions impacted the perceived behavioural control of HMIS users ( $r=.806$ ) and the computer self-efficacy of HMIS users ( $r=.739$ ) positively.

Users' perceived behavioural control positively impacted the intention of HMIS adoption ( $r=.645$ ).

HMIS perceived ease of use positively impacted the perceived usefulness of HMIS ( $r=.603$ ) and the attitude towards HMIS adoption ( $r=.512$ ).

HMIS perceived usefulness and attitudes toward HMIS adoption ( $r=.673$ ) and the intention to adopt HMIS ( $r=.672$ ) were found as positive and significant.

Attitude towards adopting HMIS positively impacted the intention of adopting HMIS ( $r=.678$ ) and the hypothesis that HMIS subjective norms may positively impact the intention of adopting HMIS ( $r=.699$ ) was accepted.

It has been a well established fact that the use of cumbersome, paper-based processes for checking and reporting patient health issues will undermine the efficiency and transparency in the healthcare environment. Further, the use of software metrics technologies to assess patient health information is a key issue in the management of health information system. The results in this study suggested that the adoption of health management information system in ESIC healthcare settings has been significantly improved by better system quality and facilitating conditions available

in the ESIC hospital. Significant improvement in patient data quality and handling is seen from the adoption of health management information system. However, if healthcare professionals are expected to trust the health management information system for routine usage, there will be likely need for more uniform and standardized settings in the existing software interface. Computer self-efficacy had a significant effect on perceived usefulness, perceived ease of use and behavioural intention. The healthcare professionals working in the ESIC hospital and dispensaries have prior experience with computers and subsequently, the training given to them by IT staff further enhanced their personal innovativeness in IT and computer self-efficacy. The findings show that "training" has a significant positive effect on HMIS self-efficacy and behavioural control. This means that if healthcare professionals are willing to adopt HMIS and have received enough training on HMIS, then their operation of HMIS will improve. The ESIC hospital management can provide education opportunity or training course to enhance the computer skill of healthcare professionals. More learning chances will help to improve the perceived behavioural control of healthcare professionals and finally, in this way, one can strengthen healthcare quality and eliminate the resistance from healthcare professionals. Further, the hospital management can encourage or set an order to healthcare professionals to pursue online health information management classes and courses. The health management information system used in the ESIC hospital and dispensaries comes with handy multitasking features but priority should be accorded to business continuity of computer systems and server backup facility. If these glitches are rectified, one could expect proper adoption of HMIS among ESIC healthcare professionals in Tirunelveli sub-region. Perceived ease of use indicates more importance than computer self-efficacy in determining perceived usefulness of HMIS for healthcare. The ESIC hospital management should choose a health management information system which is easy to use; this could help healthcare professionals feel the available health information system as useful and thereby produce more behavior intention. Hospital management and internal policy makers can set a technology standard for software manufacturers to ensure the basic level of ease of use. Practically, the results suggest that there exists compatibility between the health management information system and the work demands and between the reliability of the health management information system impact perceptions of

usefulness and ease of use as well. These two attitudinal variables ultimately influence one's attitude toward computer usage, one's behavioural intention to use the available health management information system, and actual use. Attitude also positively affects the intention to use health management information system among the ESIC healthcare professionals. Hence, attitude is an important factor and it plays a prime role in integrating software technology in modern healthcare settings. The results also state that prior computer experience is another factor that encourages the HMIS adoption process among ESIC healthcare professionals. Further, it can be concluded that perceived usefulness and perceived ease of use of the software are considered as important factors in the acceptance of health management information system in healthcare practice.

### Conclusion

The TAM based model will help the ESIC healthcare professionals to effectively adopt the HMIS software in the ESIC hospital and dispensaries in the Tirunelveli sub-region and thus will create a plan for addressing gaps in the HMIS adoption process among them. At the same time, this study has addressed the perspectives and opinions of stakeholders in the ESIC hospital and dispensaries only. Hence, in future, there is a need to elicit the perspectives of stakeholders at government hospitals in the state. Comparative studies could also be carried out between ESIC and state government, private hospitals to determine their differing perspectives regarding HMIS adoption, benefits and barriers.

# Malpositioning of Central Venous Catheter from Right Internal Jugular Vein into Ipsilateral Vertebral Vein: A Rare Phenomenon

Chashamjot Bawa<sup>1</sup>, Laveena Dabla<sup>2</sup>, Jyoti Raina<sup>3</sup>, Himank Chadha<sup>2</sup>

<sup>1</sup>Assistant Professor, <sup>2</sup>Junior Resident, <sup>3</sup>Senior Resident, Department of Anaesthesiology, Maharishi Markandeshwar (Deemed to be University), Mullana, Ambala, Haryana, India

## Abstract

**Introduction:** Central venous catheter insertions are being increasingly practiced by anaesthesiologists in major surgeries involving haemodynamic changes and massive fluid shifts. A common complication is misplacement of central line in intravenous territory which requires prompt identification and correction.

**Case Report:** The present case report describes a landmark guided CVC insertion done prior to surgery in a 70 year old patient with multiple stones in right renal pelvis and bilateral ureters with consequent right sided hydronephrosis and obstructive renopathy. Despite venous backflow from all 3 ports, chest X-ray showed central line folding upon itself directed upwards at the level of transverse process of 7<sup>th</sup> cervical vertebra which was confirmed on colour doppler to be in right vertebral vein.

**Conclusion:** Malpositions of central venous catheters are common and call for USG guidance to be made mandatory in every institute where USG is available.

**Keywords:** *Misplaced central venous catheter, Internal jugular vein cannulation, Land mark guided CVC insertion.*

## Introduction

Present day indications of central venous cannulation can be reiterated as lack of peripheral veins, to administer ionotropes, total parenteral nutrition, volume resuscitation, frequent sampling for VBG, haemodialysis and central venous monitoring for fluid administration. American Society of Anaesthesiologists Task Force recommends the use of ultrasound during IJV catheterisation because it is rapid and safe.<sup>1</sup> Our institution has been performing CVC insertions under

USG guidance since quite sometime now, but the landmark technique is still being practiced whenever USG is not available. We describe a patient in whom a CVC of diameter 7 french and length 20 cm became folded below the clavicle and accidentally entered the ipsilateral vertebral vein.

**Case Report:** A 70 year old patient (weight 67 kg, height 165cm) was admitted to our tertiary care centre with respiratory distress and decreased urine output. His hemodynamic parameters were pulse rate 102/min, non invasive blood pressure 160/100mmHg, oxygen saturation 92% on room air. His body temperature was recorded as normal. He was put on oxygen via face mask with flow rate 6L/min on which he maintained oxygen saturation >94%. He was catheterised and uro-flowmeter was attached for monitoring hourly urine output.

His USG abdomen and pelvis revealed multiple renal stones on right side and bilateral ureteric stones with right sided HDUN. It was decided to stabilise the patient

Mobile Number: 9812346455

and take him up for Percutaneous Nephrolithotomy coming morning. His initial blood investigations were as follows: Hb-6.6 gm/dl, haematocrit-22%, TLC-7800/mm<sup>3</sup>, DLC-76(N), 16(L), 4(M),4(E), platelet count-1.6 lac/cu mm, INR-1.2, Na<sup>+</sup>-134mEq/l, K<sup>+</sup>-5.8mEq/l, urea-78mg/dl and creatinine -5.18mg/dl. Electrocardiogram showed normal sinus rhythm with a rate of 89/min and Chest X-ray was within normal limits. Pre-anaesthetic assessment was done and patient was kept nil per oral night before surgery for PCNL procedure under general anaesthesia.

For the purpose of CVP guided fluid administration and blood transfusion, it was decided to put central venous catheter in the patient one day prior to surgery. We went forward with the procedure without ultrasonographic assistance due to the unavailability of USG at that time. Informed consent was taken and patient was shifted in pre-operative room and vitals were attached to the monitor which were within normal limits. The patient was positioned in a 15 degree head down position with head rotated to left side for right IJV cannulation. After cleaning the procedure site with 2% hypochlorite solution and sterile draping, 2% lignocaine injection 2ml was infiltrated in the skin and subcutaneous tissue. Sternal and clavicular heads of SCM muscle and carotid artery were marked with a marker. After adequate preparation and assembling of instruments, guiding prick was taken and aspirated for non-pulsatile venous backflow. On attempting to insert the guide wire through the needle, a lot of resistance was encountered after initial 10cm. It was thought that the guide wire was getting obstructed at the level of clavicle and hence the guidewire was pulled back, angulation of needle with the skin was reduced, reaspirated for venous backflow and attempted for reinsertion. After 2-3 failed attempts, needle was still getting free backflow of venous blood. So it was evident that the needle was in the internal jugular vein and hence, the guidewire was inserted though with some resistance still. No ECG changes were encountered during guidewire insertion. After dilating over guide wire, central line was inserted till 12 cm. Blood flow was aspirated from only the proximal port while forward flow was elicited in all 3 ports. Upon pulling back the catheter to 10cm, backflow was elicited from all three ports. Sutures and sterile dressing were applied

A chest radiograph was advised to confirm the position of tip of CVC and to rule out any complications otherwise not evident during the procedure. In chest radiograph, CVC was found lying behind the IJV

directed upwards at the level of transverse process of 7<sup>th</sup> cervical vertebra(Fig-1). Because the central venous catheter was functioning well with no extravasation of fluid, it was decided to get a colour doppler done which revealed it to be in right side vertebral vein.

**Figure 1: Misplaced CVC**

Malpositioning of CVC is known to increase the risk of catheter wedging, trapping and blockade, venous thrombosis and embolism, cranial retrograde injection, thrombophlebitis, endothelial damage, fluid leakage, localised lymphedema and swelling.<sup>2</sup> So the central line was pulled out till 6cm, guide wire was reinserted taking care this time that the J-curve is pointing medially and caudally and central line was reinserted over it till 12cm and fixed. Venous backflow was aspirated from all three ports and repeat CXR showed the tip to be in the distal 1/3<sup>rd</sup> of SCV(Fig-2).

**Figure 2 : Correctly placed CVC**

## Discussion

Central venous cannulations are commonly performed procedures in operating room as well as intensive care units. Although USG due to its real-time imaging has emerged as a blessing in these invasive procedures, landmark technique is still in vogue. The complications associated with landmark technique include immediate ones like haemothorax, pneumothorax, arrhythmias, misplaced catheter, and failed cannulation or delayed like infection, venous thrombosis, central venous stenosis, etc. Out of these, the misplacements of catheters have been reported in 5-12% cases, more so during the subclavian vein cannulation.<sup>3</sup>

The misplacement of catheter tip can occur either within the venous system or in dangerous cases, out of the venous system in reportedly every possible anatomical position like arterial system by inadvertent puncture or venous anomaly, mediastinum, pleura, pericardium, trachea, esophagus, subarachnoid space, paravertebral space and other aberrant sites. Although right internal jugular vein due to its straighter route to the right heart has infrequent misplacements, the intravenous malpositions can occur in ipsilateral subclavian vein,<sup>4</sup> mammary vein,<sup>5</sup> accessory hemiazygous vein,<sup>6</sup> vertebral vein<sup>7</sup> or contralateral pericardiophrenic vein<sup>8</sup>, internal jugular vein<sup>9</sup>, subclavian vein<sup>10</sup> etc.

Various factors have been attributed to increase the risk of central line misplacement like anatomical variations, venous stenosis, build of the patient, placement technique, direction of bevelled end of needle, resistance encountered while guide wire insertion, diameter of catheter etc. In our case, the resistance encountered during placement and absence of typical P wave changes on ECG during guide wire insertion raised suspicion of misplacement. It follows that any resistance while inserting guide wire makes it kink towards the path of least resistance by entering into other vein or if pushed with excessive force perforating the vein to enter extra vascular structures like pleura, pericardium or even lungs.

There are several ways for confirmation of correct placement of central venous catheter, out of which chest radiographs are the most commonly used. For correct CVC placement, tip of the catheter should lie within superior vena cava, above its junction with the right atrium typically at the level of carina. It must be parallel to the vessel wall or in other words, not making an acute angulation into the vessel to avoid kinking. It has been

postulated that tip seen above the pericardial reflection leads to vessel wall erosion while very low situated lines (in the right atrium) can cause arrhythmias, cardiac perforation, placement in the coronary sinus, damage to the tricuspid valve or even tamponade.<sup>11</sup>

Several other ways have been postulated for confirmation of displacement like SVC wave form confirmation after catheter placement, measurement of CVP by manometer, use of bedside USG during placement and confirmation by saline flush test, C-arm with image intensifier for clarity in identifying path of catheter, TEE or TTE for confirmation of tip of the catheter in the SVC. Although the facility of USG is available in our institution, but the number of machines are limited which was the main reason why only landmark guidance was used. Decision to take out the central line and reinsert it was taken promptly after seeing the digital X-ray, and the replacement was confirmed to be correct.

Although the displacement of central line from right internal jugular vein into vertebral vein is relatively rare, it can be identified on ultrasonography as the coiling of CVC from 6<sup>th</sup> or 7<sup>th</sup> cervical transverse process and going upwards or on chest radiograph as was seen in our case.<sup>12</sup> Main possible contributing factors are excessively rotating the patient's head and deep insertion of puncture needle. The later was thought to be the cause of displacement in our patient. Care should be taken to choose an appropriate length of catheter and keeping the bevel of needle medial while placement.<sup>13,14</sup> Due to possible complications like trapping of catheter, thrombosis, leakage of infusion fluid and endothelial damage, it is advised to reposition the catheter in such cases.

## Conclusion

Misplacement of CVC is showing a declining trend due to the introduction of ultrasonography. Use of the knowledge of landmarks and ultrasonography correctly during placement along with immediate waveform analysis, chest X-ray/TEE should be practiced by all anaesthesiologists in the modern era.

### Abbreviations:

CVC- Central Venous Cannulation

USG- Ultrasonography

TTE- Trans Thoracic Echocardiography

TEE- Trans Esophageal Echocardiography

SVC- Superior Vena Cava

IVC- Inferior Vena Cava

# Prevalence of Nomophobia and its Association with Loneliness, Self Happiness and Self Esteem among Undergraduate Medical Students of a Medical College in Coastal Karnataka

Chethana K.<sup>1</sup>, Maria Nelliyanil<sup>2</sup>, Manjula Anil<sup>3</sup>

<sup>1</sup>Assistant Professor, <sup>2</sup>Associate Professor, <sup>3</sup>Assistant Professor & Biostatistician, Department of Community Medicine, A.J. Institute of Medical Sciences and Research Centre, Kuntikana, Mangalore, Karnataka

## Abstract

**Background:** Revolution in technology with introduction of variety of smart phones has lead to increase in mobile dependence. Increased use of smart phone seemingly has created issues and challenges for students. The burden of this problem is now on a raise globally

**Objective:** To assess the prevalence and severity of nomophobia related to the use of smart phones among undergraduate medical students and the association of nomophobia with loneliness, self happiness and self-esteem among in them.

**Method:** A cross sectional study was conducted among 228 undergraduate students. 57 participants were selected by simple random sampling technique from first, second, final year MBBS students and Interns who were using smart phones. A pretested validated self administered, structured questionnaire was used to collect general information, patterns of mobile phone use. Nomophobia, Loneliness, Self Happiness, Self esteem were assessed by using Nomophobia Scale (NMP-Q), University of California, Los Angeles (UCLA) Loneliness Scale, Subjective Happiness Scale, Rosenberg's Self-Esteem Scale, respectively. Statistical analysis was conducted using Chi-squared test, Mann Whitney U test for various associations. Karl Pearson correlation coefficient was used to correlate the scores of the scales used.

**Results:** Median age of the participants was 21 years. 36.8% of the participants were males and 63.2% were females. It was observed that, 100% of the participants had nomophobia. Moderate nomophobia was found to be 53.5%, while 11.4% had severe and 35.1% had mild nomophobia. Duration of smart phone use in a day and frequency of checking the smart phone showed statistically significant association with severity of nomophobia. Nomophobia was found to be positively correlated with loneliness and negatively correlated with self happiness and self esteem, however only correlation of nomophobia and self esteem was statistically significant.

**Conclusion:** This study highlights the high prevalence of nomophobia amongst medical students and reflects the relation of nomophobia and psychological well being.

**Keywords:** *Nomophobia, Medical Students, Loneliness, Self-esteem, Self-happiness.*

## Introduction

Technological revolution with introduction of variety of smart phones and further decreasing cost of smart phones has lead to increase in mobile dependence worldwide.<sup>1</sup> Nowadays, cell phones have become a part and parcel of our life for means of communication and a basic requirement with innumerable benefits like

facilitating social networking, gaining knowledge and updating it, as a means of entertainment and utility purposes as personal diary, calculator and calendaretc.<sup>2</sup> Indian market, just next to China has emerged as the second largest consumer market for mobile phone handsets.<sup>3</sup> In today's fast moving world, cell phone technology has introduced a new sense of speed and connectivity to social life.<sup>4</sup> The smart phones are popular connectivity devices among the youth, including medical students.

Excessive use of smart phone seemingly has created issues and challenges for students and the most pressing ones include physical or health related, psychological and social issues. It has also become a major parental concern.<sup>5</sup> According to Shambare et al. (2012), cell phones are "possibly the biggest non-drug addiction of the 21st century". Studies reveal that, college students have been using phones for more than 9 hours a day, which could lead to phone addiction. Smart phones have emerged as an example of "a paradox of technology", with both the property of freeing and enslaving. Freeing from the real world and enslaving to the virtual world.<sup>6</sup>

Nomophobia is one of the psychological problems and it is demonstrated by addictive use of phones by users including students.<sup>7</sup> Nomophobia is a term used to describe "the fear of being out of mobile phone contact" and the "anxieties mobile phone users suffer". Over use of mobiles have led to involvement of various psychological factors e.g., low self-esteem, extrovert personality etc. In addition other mental disorders like, social phobia or social anxiety, and panic disorder may also precipitate nomophobic symptoms. The burden of this problem is now on a raise globally.<sup>8,9</sup>

The young adults are more likely to be addicted from nomophobia (Secur Envoy study). A survey described that most of the teens (77%) reported anxiety when they were without their mobile phones. Scientists proposed certain psychological predictors for suspecting nomophobia in a person such as, self-negative views, younger age, low esteem, self-efficacy; high extroversion/introversion, impulsiveness and sense of urgency and seeking.<sup>8</sup> Since younger generation are the major users of the mobile phones we decided to conduct the study among undergraduates of a medical college. Research conducted on determining the causes and associated variables of nomophobic behavior is limited. Hence, this study was conducted to assess the prevalence and severity of nomophobia related to the use

of smart phones among undergraduate medical students and the association of nomophobia with loneliness, self happiness and self-esteem among in them.

## Method

This cross sectional study was conducted among undergraduate students of a medical college during the study period of three months from January 2019 to March 2019. Ethical clearance for this study was obtained from the Institutional Ethics Committee and informed written consent was obtained from the study participants.

Sample size was calculated based on the findings of a study by SethiaS et al<sup>10</sup>, they reported a 67% prevalence of nomophobia. Hence considering 95% confidence interval and an allowable error of 10% and a non-response rate of 10%, a sample size of 228 was obtained. 57 participants were selected from first, second, final year MBBS students and Interns. Medical students including interns who were using smart phones were selected by simple random sampling technique to reach the desired number of participants from each group.

A pretested validated self administered, structured questionnaire was used. The questionnaire was divided into three parts, Part A (general information, patterns of mobile phone use etc), Part B [Nomophobia Scale (NMP-Q)]<sup>7</sup> and Part C (University of California, Los Angeles (UCLA) Loneliness Scale<sup>11</sup>, Subjective Happiness Scale<sup>12</sup> and Rosenberg's Self-Esteem Scale<sup>13</sup>).

In the current study the tools used had good reliability (Cronbach's Alpha coefficient NMP-Q:0.86, UCLA loneliness: 0.84, Subjective self happiness:0.76, Rosenberg Self esteem:0.86)

**Statistical Analysis:** Data was analyzed using Statistical Package for the Social Sciences (SPSS 16) trial version. Results were expressed as frequencies and proportions for categorical variables and median and inter quartile range for continuous variables. The prevalence of nomophobia was calculated as percentage of participants who scored more than 20 in NMP-Q. Chi-squared test was applied to capture the statistically significant differences in severity grading of nomophobia and pattern of smart phone use. Fischer's Exact probability test was considered if more than 20% of the cells had an expected count of less than 5. Mann Whitney U test was used to test the significant difference in nomophobia scores across the purpose of

smart phone usage. Karl Pearson correlation coefficient (r), was used to find the correlation of nomophobia scores with scores of loneliness, self happiness and self esteem among undergraduate medical students. The statistical significance level was fixed at p<0.05

**Results**

A total of 228 students participated in the study. The response rate was 100%. Median age of the participants was 21 (Interquartile range 19.0; 23.0) years. Among the participants, 36.8% of the participants were males and 63.2% were females. It was observed that, 100% of the participants had nomophobia. Moderate nomophobia was found to be 53.5%, while 11.4% had severe and 35.1% had mild nomophobia. Prevalence of moderate to severe nomophobia was 67.9% among males and 63.2% among females. There was no statistically significant association between gender and severity of nomophobia (p= 0.47). The age of the participants did not have a statistically significant association with severity of nomophobia (p= 0.34).

First year students had the highest prevalence of moderate to severe nomophobia with 77.2%, followed by interns with 68.4% and second year and third year students with 57.9% and 56.1%, respectively. It was observed that there is minimal difference in the median nomophobia scores among different batches of students.

However, it was found to be higher among 1<sup>st</sup> year students in comparison to other batches (p= 0.09). (Figure 1).

The severity of nomophobia was found to increase with increase in duration of smart phone use but however it was not statistically significant (p= 0.28). Duration of smart phone use in a day and frequency of checking the smart phone showed statistically significant association with severity of nomophobia (p= 0.02). (Table 1).

Most of the participants used their smart phone for browsing (90%), listening to music (92%), talking to family and friends (90%) followed by using social media (86%), texting (82%), for killing time (63%), gaming (40%) and watching movies (12%). It was found that gaming, texting, listening to music and use as time killer was significantly associated with nomophobia (p<0.05). (Table 2).

Most of the participants used their smart phone when they felt bored (96.1%) and when they were alone (86.4%) followed by when they were waiting for someone (87.3%) or travelling (71.1%). A small proportion of the participants reported using the smart phone while in the class (23.2%) and driving (6.6%). The participants reported that the average number of messages, calls and e-mails per day were eighty, ten and five respectively.

**Table 1: Distribution of participants according to the severity of nomophobia and pattern of smart phone use. (n=228)**

Pattern of Smart Phone Use		Nomophobia		P value †
		Moderate to Severe (%)	Mild (%)	
Duration of smart phone use (years)	Less than 2	22(56.4)	17(43.6)	0.28
	2-5	64(63.4)	37(36.6)	
	More than 5	62(70.5)	26(29.5)	
Having mobile data plan	Yes	146(65.5)	77(34.5)	0.34*
	No	2(40)	3(60)	
Duration of Smart phone use in a day (hours)	Less than 2	15(46.9)	17(53.1)	0.02
	2-5	100(65.4)	53(34.6)	
	More than 5	33(76.7)	10(23.3)	
Smart phone check frequency	Once every half an hour	81(74.3)	28(25.7)	0.001
	Once in every half an hour to an hour	63(60)	42(40)	
	Once beyond an hour	4(28.6)	10(71.4)	
Number of applications in the phone	Less than 20	48(58.5)	34(41.5)	0.09
	20-50	84(66.1)	43(33.9)	
	More than 50	16(84.2)	3(15.8)	

Test of Significance used: †Chi square Test and \*Fischers exact test

**Table 2: Distribution of nomophobia scores on the basis of reason of smart phone use (n=228).**

Purpose of smart phone use † (%)		Median Scores	Interquartile Range	p value *
Social Networking	Yes (86)	73.0	53.25; 88.75	0.24
	No (14)	70.0	49.0; 83.25	
Gaming	Yes (40)	77.0	58.0; 93.5	0.01
	No (60)	69.0	51.0; 83.0

	No (88)	74.0	53.5; 88.5	

†Purpose of internet use had multiple responses; \*Mann Whitney U Test

**Figure 1: Box plot representing the nomophobia scores among the study participants. (n=228)**

Nomophobia was found to be positively correlated with loneliness ( $r = 0.12$ ) but showed no statistical significance ( $p = 0.06$ ). Nomophobia was found to be negatively correlated with self happiness ( $r = -0.06$ )

and self esteem ( $r = -0.13$ ). Correlation of nomophobia with self happiness was not statistically significant ( $p = 0.3$ ). Nomophobia and self esteem showed a statistically significant correlation ( $p = 0.05$ ). (Figure 2).

**Figure 2: Scatter diagram representing the correlation between nomophobia and self esteem scores among participants. (n=228)**

### Discussion

In the current study, all the participants reported to have nomophobia, however 53.5% had moderate nomophobia, while 11.4% had severe and 35.1% had mild nomophobia. In a similar study done in a medical college in Kerala, the prevalence of nomophobia was reported to be 97%.<sup>14</sup> Sethia S et al also reported that only one participant did not report to have nomophobia.<sup>10</sup> In the current study 11.4% had severe nomophobia. Sethia S et al in their study in Bhopal reported that 6.1% of the participants suffered from severe nomophobia.<sup>10</sup> It is alarming that nomophobia is rising among medical

students and those suffering from severe nomophobia is on the rise.

Most of the participants used their smart phone for browsing, listening to music, talking to family and friends. Similarly, the study by Madhusudan M et al reported that students were using smart phones for calling family members, friends and also for listening to music.<sup>14</sup>

In the present study nomophobia was found to be positively correlated with perceived loneliness and negatively correlated with happiness and self esteem,

also the correlation between nomophobia and self esteem showed statistical significance, this finding was similar to that reported by Ozdemir B et al.<sup>15</sup> The study conducted by Çakir and Oguz in 2015 on Turkish students in Ankara demonstrated a significant and positive correlation between smartphone addiction and loneliness.<sup>16</sup> Study done among Japanese medical students also reported that loneliness and mobile phone dependence were positively related to degree of addiction.<sup>17</sup> Suresh VC et al also reported a general trend of lower levels of subjective happiness in association with higher levels of internet addiction.<sup>18</sup> These results give an alarming indication that the youth are getting more and more dependent on smart phones, which may lead to serious psychiatric and psychological problems among the users.<sup>19</sup>

**Conclusion:** This study highlights the high prevalence of nomophobia amongst undergraduate medical students hence there is a need to increase awareness about increasing incidence of nomophobia amongst the medical students. The correlation of nomophobia with loneliness, self esteem and happiness reflects the relation of nomophobia and psychological well being. The observations in this study are from a small group of students, which may not reflect the scenario worldwide. However, millions of smart phone users are added every day indicating that full blown nomophobia has all the potential to reach to an epidemic scale. What we are seeing may be the just the tip of an ice berg which warrants further research.

**Limitations:** The generalisability of results is low as the study was carried out only among students from one medical college. Social desirability bias for the purpose and pattern of smart use cannot be ruled out.

# Silver Diamine Fluoride in Arresting Dentinal Caries in School Children

Shivani Daga<sup>1</sup>, Vabitha Shetty<sup>2</sup>, Amitha Hegde<sup>3</sup>

<sup>1</sup>Post Graduate Student, <sup>2</sup>Professor, <sup>3</sup>Head of Department,  
AB Shetty Memorial Institute of Dental Sciences, Deralakatte, Mangalore

## Abstract

**Background:** In recent years, remineralisation of caries lesions has gained acceptance in the practice of minimally invasive dentistry and caries arrest treatment is being promoted as a part of basic oral health care. Silver diamine fluoride(SDF) has shown to be effective in arresting active caries in primary teeth. Whether a higher caries arrest rate can be achieved through more frequent application is unknown, hence in our study we had sought to explore this aspect. Aim: To evaluate the effectiveness of three different frequencies of application of SDF in arresting active dentinal caries primary teeth.

**Methodology:** 48 children aged 5-8 years were divided into three groups, group 1 who received monthly applications of SDF for three months, group 2 who received three monthly applications of SDF for 6 months and group 3 received 6 monthly applications. Active caries surfaces were recorded at baseline examination and SDF was applied. No attempt was made to excavate caries. Active and arrested caries were recorded at 6 months and one year for all the groups. Results: All three application protocols were effective in arresting caries at the end of 6 months and one-year. Inter-group comparison of active caries surfaces showed no statistically significant differences at the end of 6 months. At one year follow up there were statistically significant differences between the three groups, with caries arrest rate highest in group I, followed by group II and then group III.

**Conclusion:** Significant caries arrest was seen in all three application protocols of SDF at the end of six months as well as one year follow up. The one monthly application of SDF was most effective in arresting dentin caries in primary molars of children followed by the three monthly application and the 6 monthly application. Increasing the frequency of application of SDF solution can increase the caries arrest rate.

**Keywords:** *Silver diamine fluoride, active caries, caries arrest.*

## Introduction

Like many developing countries, in India due to the under-developed oral health care system, most of the decayed teeth in children remain untreated,

especially among those living in rural areas.<sup>1</sup> Treatment of dental caries requires surgical restorative approach. Sophisticated dental equipment, operators who are well trained and the procedure is relatively expensive. Caries if left untreated in children not just poses monetary problems to the parent but has potential risk and discomfort of the child with the disease. The ability to perform their routine activities, attending school, dietary patterns and sleep is greatly affected.<sup>2</sup>

Caries is a dynamic process that can progress or regress depending on demineralization and remineralization. In recent years remineralisation of lesions and caries arrest treatment has gained acceptance

in the practice of minimally invasive dentistry. It is also promoted as a part of basic oral health care.<sup>3,4</sup> It has been reported that arresting dentinal caries in primary teeth is possible without restorative intervention.<sup>5</sup>

Silver diamine fluoride (SDF) is an inexpensive topical fluoride used in many countries to treat dentinal caries across the age spectrum. It is very effective in arresting active caries in primary teeth.<sup>6,7</sup> It is a very cost effective topical fluoride which consists of silver and fluoride component, where fluoride aids in remineralisation by forming Fluor apatite crystal which is more resistant to acid attack and also forms a reservoir for the release of fluoride thereby increasing the substantivity. Silver ions perform the antimicrobial action.<sup>8</sup>

Studies have shown that the application frequency of SDF for caries arrest is effective once a year or every 6 months.<sup>9,7</sup> Whether caries arrest rate can be increased by using more frequent application is unknown<sup>6</sup>, hence in our study we have sought to explore this aspect.

### Methodology

The present study was conducted in a school situated in a rural area just outside Mangalore city, at Kulur primary school. A total of 120 children aged 5-8 years were examined of which 48 children who fulfilled the inclusion criteria were included in the study.

#### Inclusion Criteria:

- Children who had active caries<sup>7,10</sup> affecting the primary molars.
  - Children for whom oral health care was inaccessible and were not willing for an invasive/restorative dental treatment.

#### Exclusion Criteria:

- Teeth that were grossly decayed.
- Teeth with more than one third of the crown missing.
- Teeth symptomatic of pulpal involvement, non-vital teeth, any presence of a sinus or an abscess, and premature hypermobility.

#### Procedure:

- A written informed consent was obtained from parents of all the children. Assent was obtained from the participating children.

- At the beginning of the study an oral health talk was delivered to all the participants and regular reinforcement was done by their teachers.
- Ethical clearance for our study was obtained from the ethical committee of our institution.
- Children were seated in a well illuminated area, and examined with the help of mouth mirror and CPI probe. Active caries was recorded when the probe, applied with light force could penetrate dentin<sup>7</sup>. To avoid any damage to the tooth during probing great care was taken. No attempt was made to remove soft caries with an excavator. However gross debris was removed before examination. All five surfaces of each primary molar were examined After baseline examination, children were randomly allocated into three subgroups:
  - Group 1 children received 4 applications of silver diamine fluoride at one monthly intervals for 3 months. (baseline, end of 1<sup>st</sup>, 2<sup>nd</sup> and 3<sup>rd</sup> month)
  - Group 2 children received 3 applications of silver diamine fluoride at 3 monthly intervals for 6 months. (baseline, end of 3<sup>rd</sup>, and 6<sup>th</sup> month)
  - Group 3 children received 2 applications of silver diamine fluoride (one at the baseline and one at the end of 6 months)

38% SDF (Fagamin, Tedequim SRL Argentina) was dispensed in a plastic dappen dish. (Fig 3) The teeth selected were isolated from saliva using cotton rolls. Silver diamine fluoride was painted with a micro applicator tip brush for 2 minutes. Vaseline was applied to prevent any mucosal discomfort. Children were instructed to avoid eating or drinking for a minimum of 30 minutes post the application of SDF. SDF was applied to tooth surfaces as per the study protocol at regular intervals. All the children were re-examined at 6 months and at the end of one year. Caries was recorded as arrested when the dentin could not be penetrated.<sup>6</sup>

**Statistics:** Descriptive statistics of the quantitative variable were documented using Mean and standard deviation. ANOVA was used to compare between mean of quantitative variable between three groups. P<0.05 was considered statistically significant.

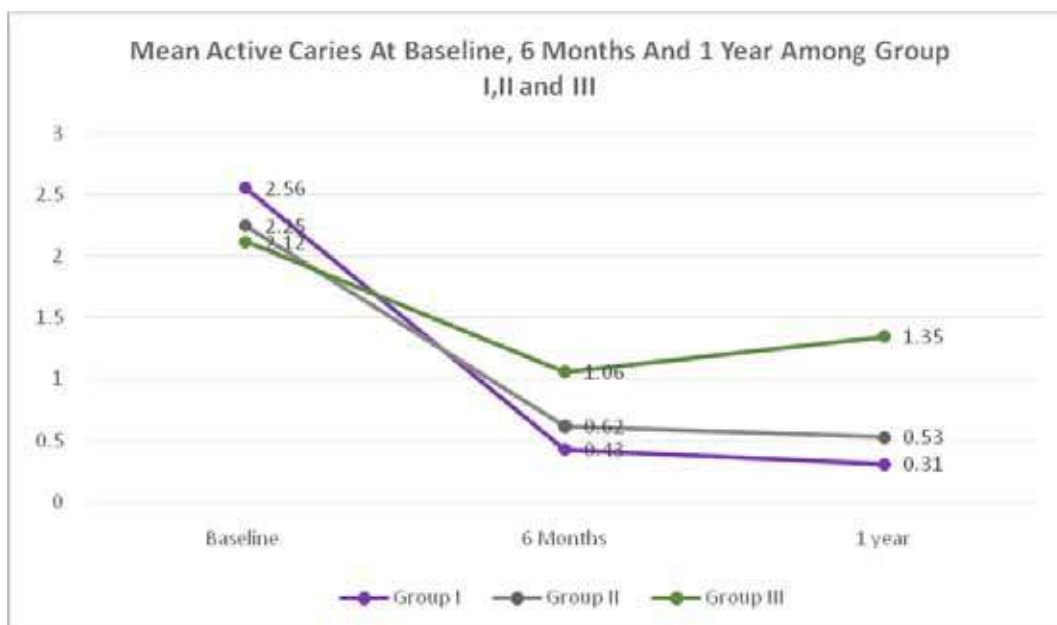

Statistical software SPSS (Statistical Package for Social Sciences) Version 24.0 (IBM Corporation, Chicago, USA) was used to analyse the collected data.

### Results

The mean active caries at baseline in all three groups were significantly reduced at 6 months and further at the end of 1 year (Graph 1). We observed no statistically significant differences when the mean active caries surfaces among the three groups were compared at 6 months (Table 1). However, we found statistically significant differences in mean active caries surfaces at 1 year among the three groups (Table 2).

The post hoc pair wise comparison showed, a mean difference of -0.22 between group 1 and group 2 which was not statistically significant. When group I was compared with group III, a mean difference of -1.04 was found which was statistically significant. When group II was compared to group III, a mean difference of -0.82 showed no statistical significance. (Table 3).

## Discussion

SDF has gained much attention in the past decade due to its simplicity and affordability. Numerous clinical trials have shown the effectiveness of SDF in arresting coronal carious lesions in primary teeth<sup>6</sup> and root caries in permanent teeth.<sup>11,12</sup>

The school included in our study comprised of children from low socio-economic strata who had very limited access to professional dental health care.

A systematic review<sup>13</sup> by Gao et al suggested that 38% SDF when used was very effective in case of primary teeth. Therefore, in our study we used a high concentration of 38% SDF due to its higher caries arrest.

This review also found that the guidelines on the prevalence of SDF application used to arrest caries have very little evidence, suggesting that more number of clinical trials should be performed to determine the optimal frequency strategy.

The commonly adopted regimen for the frequency of application of SDF is either once a year or every 6 months for arresting caries in primary teeth.<sup>6</sup> By reducing the time intervals between the SDF applications, caries arrest process could be enhanced.<sup>6</sup>

In our study, we found no significant differences in the active caries surfaces at baseline amongst the three groups. With this we can infer that the number of active caries surfaces in all three groups were comparable at the beginning of the study. However, at the end of 6 months and one year we observed a significant reduction in the mean number of active caries surfaces in all the three groups. From this we infer that all three treatment protocols of SDF were effective in caries arrest.

Inter group comparisons of active caries surfaces at the end of 6 months showed no significant differences amongst the three groups. This could probably be attributed to the short follow up time. However, at the end of one year we observed significant differences in active caries surfaces between the groups. The group 1 had the least mean active caries surfaces followed by group 2 and group 3.

A more detailed post hoc analysis of the results showed that Group 1 was significantly more effective in caries arrest than group 3 which could be attributed to the higher frequency of application of SDF in group 1. These results were in agreement with the study done

by MHT Fung et al<sup>14</sup>, and Zhi et al<sup>6</sup> who found that increasing the frequency of applications could increase the caries arrest rate and cause decrease in active carious lesions. However, there were no significant differences in the mean active caries surfaces between group 1 and group 2. From this we infer that caries arrest rates were comparable in these two groups. This could be attributed to the fact that both the groups had an intensive regimen of applications of SDF.

In our study we have used two application regimens of SDF which have not been reported in any other study, that is group 1 which had monthly applications for 3 months (a total of 4 applications) and group 2 which had three monthly applications for 6 months (a total of 3 applications). We also used a semi-annual application of SDF in group 3 which is frequently reported in literature.<sup>15,16,6</sup>

We observed a remarkable caries arrest rate when SDF was applied at monthly or 3 monthly intervals as compared to 6 monthly intervals (bi annual) at the end of 1 year, which indicated that increasing the frequency of applications showed an increase in caries arrest rate.

The positive outcomes of this study at the end of one year could also be attributed to the fact that the regular reinforcement of oral hygiene practices and the sustained release of silver and fluoride explained by “zombie effect”.<sup>17</sup>

One interesting observation of our study was that caries arrest rate was seen to be more in occlusal caries surfaces as compared to proximal caries surfaces. This could be because SDF could be retained for a longer time in occlusal caries surfaces. Proximal caries surfaces favor more food lodgment which probably could have caused a reduction in the action of SDF.

In our study, we found blackish discoloration in all the SDF treated teeth of the children which is a known side effect of SDF. We did not observe any other side effects, which is in agreement with Duangthip et al<sup>18</sup> who also did not report any other side effects other than the black staining over a follow up period of 18 months.

It is estimated that 9.5mg fluoride is contained in one drop of 38% SDF solution (sufficient to treat five teeth) which is much lower than the average lethal dose of 520mg/kg.<sup>8</sup> Hence the treatment protocol for application of SDF appears to be safe in our study group which comprised of school children.

There are certain limitations in this study that should be mentioned. The follow up period could have been longer to evaluate the effect of SDF over a longer period of time.

We recommend that either a one monthly or three monthly applications of SDF could be adopted when a non-restorative treatment approach is selected for managing dentinal caries in primary teeth. We suggest the caries risk of the child as well as compliance to be taken into consideration while selecting the above two protocols. The general recommendation is that more frequent applications of topical fluoride is advised in high risk children.<sup>19,20</sup> Our study comprised of school children for whom access to professional dental treatments was unavailable. SDF application provided a simple treatment in the halt of carious lesions in these children.

### Conclusion

Significant caries arrest was seen in all three application protocols of SDF at the end of six months as well as one year follow up. Application of SDF at one monthly interval (89.06%) was most effective in caries arrest followed by 3 monthly applications (68.66%) and 6 monthly applications (48.92%). Increasing the frequency of application of SDF solution can increase the caries arrest rate.

**Source of Funding:** Ours is a self-funded study.

# Study of Effects of Formalin Exposure in Dissection Hall on Pulmonary Function Tests of Medical Students

Shrirang N. Patil<sup>1</sup>, Milind Thorat<sup>2</sup>

<sup>1</sup>Professor, Department of Physiology, <sup>2</sup>Assistant Professor, Department of Anatomy, Krishna Institute of Medical Sciences Karad, Near Dhebewadi Phata Malkapur Karad Satara Maharashtra, India

## Abstract

**Introduction:** Formalin is being used for preservation of biological specimens including cadavers in laboratories and dissection halls of medical colleges worldwide. It is used as disinfectant and preservative solution in Anatomy mortuaries, Pathological laboratories, Hospitals and plastic industries. Exposure occurs mainly by inhalation. This study was planned to assess effects of exposure to formalin on lung function of medical students.

**Method:** Spirometry was done before exposure, after acute exposure and at end of academic year. Results were analysed.

**Results:** There was significant decrease in values of FVC, FEV<sub>1</sub>, FEF<sub>25-75</sub>, FEF<sub>2-1.2</sub> and MVV ( $p < 0.05$ ) after acute exposure to formalin. There was no any noticeable change in FEV<sub>1</sub>/FVC ratio ( $p > 0.05$ ). Though the PEF<sub>R</sub> was decreased after acute exposure it was not up to a statistically significant level ( $p > 0.05$ ). The values of FVC, FEV<sub>1</sub>, FEF<sub>25-75</sub>, FEF<sub>2-1.2</sub> and MVV which were reduced significantly after acute exposure came to normal after chronic exposure. The FEV<sub>1</sub>/FVC ratio was almost same ( $p > 0.05$ ). PEF<sub>R</sub> was significantly increased ( $p < 0.05$ ) compared to that after acute exposure.

**Conclusion:** In Anatomy dissection hall local exhaust ventilation system should be installed and personal protective equipments such as safety eyeglasses and gloves should be made available and used to reduce exposure to FA and prevent adverse effects on health of students.

**Keywords:** Formalin exposure Dissection hall Medical students Lung function.

## Introduction

Since ages Formalin is being used for preservation of biological specimens including cadavers in laboratories and dissection halls of medical colleges worldwide. Formalin is aqueous form of formaldehyde (CH<sub>2</sub>O). British Chemist August Wilhelm Von Hofmann

discovered formaldehyde in 1856<sup>1</sup>. Formalin contains 37% by weight or 40% by volume of formaldehyde gas in water. It is colourless & irritant, giving pungent formaldehyde (FA) vapours at room temperature<sup>2</sup>. It is used as disinfectant and preservative solution in Anatomy mortuaries, Pathological laboratories, Hospitals and plastic industries. For preservation of cadaver it is infused with chemical substances into the body tissues, that include formalin, alcohol, glycerine, carbolic acid and dye<sup>3</sup>. This embalming procedure helps cadaver to maintain a life like state to maximal extent and to retain the normal anatomical relations as required for dissection purposes<sup>4</sup>. Formaldehyde can be toxic, allergenic and probably carcinogenic as well. Exposure occurs primarily by inhalation. Sometimes it may be absorbed via skin by exposure of formaldehyde

containing fluids. The symptoms of exposure include irritation of airway, obstructive disorders like bronchial asthma, ocular irritations, corneal clouding, leukaemia, nasopharyngeal cancers, spontaneous abortions, congenital malformations, and menstrual irregularities. It may also cause dermatitis<sup>5</sup>. Medical students during dissection of cadavers are regularly exposed to formalin. The factors affecting level of exposure are time spent in anatomical dissection hall, working conditions at place and type of embalming procedure followed. Exposure to formalin is considered a significant health hazard because of its widespread use and subsequent toxicity<sup>6</sup>. However few studies have been carried out for studying effects of formalin exposure on lung function tests of medical students in this part of country. Hence the present research was planned for studying acute and chronic effects of formalin exposure on the pulmonary function tests of medical students.

### Materials and Method

The present study was carried out on 150 medical students (Males & females together) of a Medical College located in Western Maharashtra, admitted for academic year 2017-18. Out of 150 students some were dropped due to being absent on the day of test or some other reason. Finally 132 students were observed till end of academic year. Approval from Institutional Ethical Committee (IEC) was taken for the study. Students of both gender who were medically fit after general medical examination were included for this study. Students having history of any chronic respiratory illness like bronchial asthma; hypertension, diabetes mellitus, congenital anomalies of spine & thoracic cage, smoking habit were excluded. Informed written consent was obtained from all students included in study. Pulmonary function test (PFT), a baseline record prior to formalin exposure was carried out by using a computerized "MEDSPIROR" (RMS Chandigarh, India) instrument. Spirometry was carried out as per guidelines of American Thoracic Society<sup>7</sup>. Before recording PFT, subjects were shown a demonstration of the test. Consequently a minimum three readings of each test were taken for every subject and the best of the three was selected for having reproducibility and validity of the recorded parameters. The pulmonary function parameters studied included FVC (Forced Vital Capacity), FEV1 (Forced Expiratory Volume in First second of FVC), FEV1% (FEV1 as% of FVC), PEFR (Peak Expiratory Flow Rate in litres/sec), FEF25-75% (Forced Expiratory Flow Rate during 25 to 75% of expiration, FEF 0.2-1.2 (Forced Expiratory

Flow between 0.2 -1.2 litres of expiration) and MVV (Maximum Voluntary Ventilation). Students are exposed to formalin treated cadavers in anatomy dissection hall for three days in a week and duration of daily exposure is 3 hours. After one month of exposure spirometric PFTs were repeated which was considered as acute effect of formalin exposure. Students were handed over a self administered predesigned questionnaire for collection of information about symptoms arising from inhalation of formaldehyde fumes from formalin-treated cadavers (Questionnaire I). All the symptoms were graded on a scale of 0-3; grade 0: not at all, not recognizable, grade 1: barely recognizable, grade 2: strong, prominent and irritating, grade 3: intolerable. Then at the end of first academic year of exposure again spirometric PFTs were repeated which were considered as chronic effects of formalin exposure. Statistical analysis was carried out after summarizing the data by computing mean and standard deviation (SD) of each PFT parameter studied. The significance of difference of each variable was found by comparing basal levels with that after acute and after chronic exposure by applying ANOVA (Analysis of variance). Student t test was applied to compare the findings of PFTs before exposure with that after acute exposure and after chronic exposure.

### Results

The observed results were tabulated. Anthropometric parameters of both male & female students are shown in Table 1.

In table 2 the symptoms due to acute exposure to formalin and the severity of them is depicted.

The findings of PFT parameters before exposure to formalin & after acute exposure (after 1 month) are shown in Table 3. It was observed that there was significant decrease in values of FVC, FEV1, FEF25-75, FEF.2-1.2 and MVV ( $p < 0.05$ ) after acute exposure to formalin. There was no any noticeable change in FEV1/FVC ratio ( $p > 0.05$ ). Though the PEFR was decreased after acute exposure it was not up to a statistically significant level ( $p > 0.05$ ). Table 4 is depicting the changes in PFT parameters after acute and after chronic exposure. From Table 4 it was observed that values of FVC, FEV1, FEF25-75, FEF.2-1.2 and MVV which were reduced significantly after acute exposure came to normal after chronic exposure. The FEV1/FVC ratio was almost same ( $p > 0.05$ ). PEFR was significantly increased ( $p < 0.05$ ) compared to that after acute exposure. Table 5

shows the values of PFT before exposure to formalin and after completion of exposure (chronic exposure). From Table 5 it was observed that after chronic exposure the values of PFT parameters which were reduced after acute exposure (Table 2) have come to normal and some

above normal after chronic exposure. From table 6 it is observed that the values of most of PFT parameters which were reduced ( $p < 0.05$ ) after acute exposure except no change in FEV1/FVC% ( $p > 0.05$ ), came to almost normal after chronic exposure.

**Table 1: Anthropometric measurements**

	Age in Years Mean $\pm$ SD	Height in cms Mean $\pm$ SD	Weight in kg Mean $\pm$ SD

### Discussion

Formalin has been used for preservation of cadavers in dissection halls and also preserving other

tissues in laboratories. It is a aqueous solution of formaldehyde(37-50%)<sup>2</sup>. In dissection hall medical students are exposed to it. Recently its exposure has

been considered as one of the multiple causes of chemical sensitivity<sup>8</sup>. In this study we evaluated effects of acute and chronic exposure in Anatomy dissection hall on lung function of 132 medical students. We also studied the symptoms arising from acute exposure. The most common symptom noticed by majority of students (127, 96.21%) was unpleasant smell. This is consistent with the earlier study<sup>4,9</sup>. Other symptoms depending on chronology and severity were excessive lacrimation (115, 87.12%); redness of eyes (93, 70.45%), running nose (54, 40.9%). Some less common symptoms noticed by students were itching of eyes, nausea, congested nose, dryness or soreness in throat, itching or sore skin on hands, cough, respiration difficulties, blurring of vision (Table 2). One study also recorded increase in number of symptoms like burning of eyes, lacrimation, irritation of airways and dermatitis<sup>10</sup>. After acute exposure to formalin (1 month) there was significant reduction in values of FVC, FEV<sub>1</sub>, FEF<sub>25-75</sub>, FEF<sub>2-1.2</sub> and MVV. But there was no any significant change in FEV<sub>1</sub>/FVC ratio and PEF<sub>R</sub>. On acute exposure there was immediate reduction in FVC while other parameters of lung function remain unchanged in earlier study. This indicates that there is bronchoconstriction resulting from hypersensitivity reaction<sup>11</sup>. The same study also reported decrease in values of FEV<sub>1</sub> immediately after exposure but it was not statistically significant. There is creation of haptens after binding of formaldehyde (FA) to endogenous proteins and these haptens can elicit an immune response. Some studies have concluded that exposure to FA has been associated with immunological hypersensitivity leading to various acute and chronic effects. A study on histology technicians also shown decrease in pulmonary function, as measured by FVC, FEV<sub>1</sub> and FEF<sub>25-75</sub> compared to controls<sup>12</sup>. After completion of academic year we measured PFT parameters again and reported as chronic exposure effects. From Table 4 it is obvious that the values of PFT parameters which were decreased after acute exposure have again come to normal at the end of exposure period. Similar findings were reported in a study done earlier<sup>13</sup>. In Table 5 values of PFT parameters before exposure and after completion of exposure are given. It is observed that there is no difference between values except that of MVV, which was increased. This shows that the values were restored to basal levels after chronic exposure (Table 6). This may be due to adaptation of respiratory system to continuous exposure in low concentrations. The limitation of this study is that we could not determine the exact concentration of FA to which our subjects

were exposed in dissection hall. But we studied the lung function at fixed time of day i.e. between 3.00 pm to 4.0 pm and single observer was doing the PFT so influence of some factors was abolished. From observations of our and other studies done so far FA may not be considered an ideal chemical for embalming of cadaver. Efforts should be taken to reduce the concentration of FA by using other chemicals like glutaraldehyde, which may be a good substitute for FA<sup>14</sup>. In anatomy dissection hall local exhaust ventilation system should be installed and personal protective equipments such as safety eyeglasses and gloves should be made available and used to reduce exposure to FA and prevent adverse effects on health of students.

**Conflict of Interest:** Authors declare that there is no conflict of interest.

**Acknowledgement:** We are grateful to the medical students who actively participated in the study. We are also thankful to the staff members and working staff in the Physiology department for their cooperation during our research work.

# Effectiveness of an Animation Video on Behavioral Response to Pain among Toddlers During Immunization in a Selected PHC at Mangalore India

Bijimol N.J.<sup>1</sup>, Shycil Mathew<sup>2</sup>

<sup>1</sup>M.Sc. Nursing, Lecturer Dept. of Community Health Nursing, St. Johns's college of Nursing Koramangala, Bangalore, <sup>2</sup>Lecturer Department of Community Health Nursing, Yenepoya Nursing College, Yenepoya (Deemed to be University), Deralakatte, Mangaluru, Karnataka, India

## Abstract

**Background:** Immunization is regarded as one of the most significant medical achievements of all times. Recently, increasing attention has been paid to the pain resulting from routine childhood immunizations. In addition, lack of adequate pain management during immunization exposes children to unnecessary suffering and the potential for long-term consequences, such as fear of needles. Hence this study is intended to assess the Effectiveness of an Animation Video On behavioral Response to Pain among Toddlers during Immunization.

**Materials and Method:** A quasi-experimental research (non-equivalent post-test-only control group) design was used for this study. The sample was drawn through purposive sampling technique and comprised of 60 toddlers undergoing for immunization (30 in experimental and 30 in control group) in a selected PHC at Mangalore, India. Data was collected using Behavioral response assessment scale to pain. (Modified FLACC behavioral assessment scale).

**Results:** Majority of the toddlers in Group I (83.33%) were having moderate behavioural response to pain, only 16.7% were having severe behavioural response to pain whereas in Group II (100%) all the toddlers experienced severe behavioural response to pain during immunisation. The mean score of behavioural response to pain of Group II ( $10.97 \pm 1.69$ ) was greater than that of Group I ( $7.17 \pm 1.206$ ).

**Conclusion:** An animation video during immunization can be an effective, simple, non-invasive, and cost effective diversional technique had a positive effect on children's distress behaviour and pain and having no side effects on the toddlers.

**Keywords:** Animation video, immunization, behavioral response, pain, toddlers.

## Introduction

Prevention of disease is one of the most important

---

### Correspondence Author:

**Ms. Shycil Mathew**

goals in child care. During infancy and childhood, preventive measures against certain infectious diseases are available. Immunization is an important and cost effective public health tool for disease control<sup>(1)</sup> Routine immunization injections are the most common painful procedures in childhood. Most of the immunizations are administered early in a child's life. Most toddlers and many school-age children experience high distress during immunization injections<sup>(2)</sup>.

Untreated immunization pain might also lead to distorted negative memories of that experience.

Ultimately, early pain is linked to poorer healthcare attitudes and elevated fear and avoidance of medical procedures in adulthood<sup>(3)</sup>. The child's distress is upsetting not only for the child but also for the adults involved—both parents and professionals—and it often makes it more difficult to complete the needed procedure<sup>(4)</sup>.

Non-pharmacological method of pain control are widely accepted and can be used with or without analgesics<sup>(5)</sup>. A cardinal responsibility of a community health nurse taking part in giving immunisation is to alleviate pain, promote growth, and development of child<sup>(6)</sup>.

**Aim:** To assess the Effectiveness of an Animation Video On behavioral Response to Pain among Toddlers during Immunization.

### Objectives of the Study:

1. To determine the behaviour response to pain among toddlers receiving immunisation with animation video (Group I) as measured by structured behavioural response assessment scale to pain (modified FLACC behavioural assessment scale).
2. To identify the behaviour response to pain among toddlers receiving immunisation without animation video (Group II) as measured by structured behavioural response assessment scale to pain.
3. To compare the effectiveness of animation video on behavioural response to pain among toddlers in Group I and in Group II during immunisation.
4. To find the association between behavioural response to pain among toddlers receiving immunisation in Group I and in Group II with their selected demographic variables.

### Materials and Method

**Study setting and sample size:** A quasi-experimental research (non-equivalent post-test-only control group) design was used for this study. The sample was drawn through purposive sampling technique and comprised of 60 toddlers undergoing for immunization (30 in experimental and 30 in control group) in a selected PHC at Mangalore India. The parents were interviewed on the basis of baseline proforma. The child along with the caregiver was taken to the treatment room. In experimental group (Group I) the investigator made the parent sit on the chair comfortably with the child on the

lap and showed the animation video. In control group (Group II) the children were placed in position and restrained by the nurse or parent as routine practice of the clinic.

The behaviours of the subjects were observed by the investigator in three phases during the procedure, i.e., placing the child in position, pre immunisation, and actual procedure until the child is out of the immunisation room. The investigator observed and scored the child's behavioural response to pain during immunisation injection using the behavioural response assessment scale to pain. Data was collected using behavioral response assessment scale to pain. (Modified FLACC behavioural assessment scale).

**Data Analysis:** The data was collected after obtaining prior permission from the concerned authority to conduct the study. The participants were assured about the confidentiality of their responses. The data was analyzed in terms of objectives of the study using both descriptive and inferential statistics. The data obtained was plotted in the master sheet.

### Findings:

### Results

#### Section I: Description of baseline proforma

- Majority (83.3%) of the samples were between 12-18 months of age.
- Majority (63.3%) of the samples were male.
- All (100%) of the children were undergoing DPT immunisation.
- Highest percentage (46.7%) of the children showed minimal resistance to previous immunisation.
- Majority (56.7%) of children had more than 10 kg of weight at the time of immunisation.

**Section II: Description of level of behavioural response to pain among toddlers during immunisation procedure in Group I:** The area-wise mean percentage shows that the behavioural response to pain was more in the areas arms (mean percentage=66.67%) legs (mean percentage=65.00%), and restlessness (mean percentage=65.00%). There was less behavioural response to pain in the areas like muscle tone (mean percentage=63.33) cry and vocalisation (mean percentage=58.33%) and facial expression (mean percentage=41.67), in the Group I. [Table-1].

**Section III. Description of level of behavioural response to pain among toddlers during immunisation procedure in Group II.**

The area wise behavioural response to pain in Group II was more in the areas of arms, muscle tone, and restlessness (mean percentage=96.67%) cry and vocalisation (mean percentage=95%) leg (mean percentage=88.33%), and facial expression (mean percent=71.67%). [Table-II]

**Section IV. Comparison between level of behavioural response to pain scores in Group I and Group II**

The majority of the toddlers in Group I (83.33%) are having moderate behavioural response to pain, only 16.7% are having severe Behavioural response to pain whereas in Group II all toddlers (100%) experienced severe behavioural response to pain during immunisation. [Figure-1].

**Section V: Significant difference between level of behavioural response to pain among toddlers during immunisation injection in Group and Group II**

Significant difference between level of behavioural response of pain in Group I and Group II showed that Group II has severe behavioural response than Group I (10.97±.928 V/S 7.17±1.206). The calculated value (t=13.680, p<0.001) indicates the significant difference between the behavioural response scores between the two groups. [Table-III].

**Section VI: Association of level of behavioural response to pain among toddlers in Group I and Group II with their selected demographic variables**

The behavioral response to pain among toddlers in Group I and Group II with their selected demographic variables shows no significant association at 0.05 level of significance. [Table-IV].

**Table-I: Description of level of behavioural response to pain among toddlers during immunisation procedure in Group I. N<sub>1</sub> = 30**

Item	Max. Possible Score	Range	Group I		
			Mean	SD	Mean %
Facial Expression	2	0-2	.83	.379	41.67

\*Fisher's Exact test

## Discussion

The present study revealed that the behavioral response to pain among toddlers during immunization procedure in Group I and Group II showed that, the Group I had moderate behavioral response to pain (83.3%) and 16.7% had severe behavioral response to pain while undergoing immunization, whereas Group II had severe pain (100%) during the immunization.

The above findings are consistent with a quasi experimental study conducted at pediatric surgery ward (6th floor, C block) of Advanced Pediatric Centre (APC), PGIMER, Chandigarh by James *Jet et al* (2012) The mean pain score was significantly less i.e. almost half with animated cartoon ( $2.26 \pm 2.18$ ) as compared to routine care ( $4.76 \pm 2.08$ ) at pre venipuncture. Similarly the mean pain score during venipuncture was significantly less with animated cartoon ( $6.24 \pm 2.09$ ) as compared to routine care ( $8.06 \pm 1.70$ )<sup>(19)</sup>

The present study findings showed that there is no association between level of pain among toddlers in Group I and Group II and selected demographic variables (Fisher exact test,  $p > 0.05$ ).

The above findings are consistent with a quasi-experimental study was conducted on children of 3 to 6 years of age who were undergoing venipuncture in selected hospitals of Mangalore by MM Lobo and Umarani *j* (2012). The findings also revealed that there was no significant association between the level of pain and demographic variables<sup>(20)</sup>.

## Conclusion

Present study findings showed that, Distraction techniques like showing the animation video during immunizations are effective means for reduction of behavioural response to pain. It can also be used as a routine with immunisation so that children's behavioural distress can be managed in an effective way. The study concluded that animation video is effective on behavioural response to pain in children receiving immunisation. It is important for the nurses, who administer immunisation, to alter the painful responses as much as possible. Nurses must meet the challenges in relieving response by distracting the children.

**Acknowledgement:** The investigator sincerely acknowledges the support given by Mrs. Shycil Mathew and Shanti Lobo for their timely support and smart

guidance to complete the project. Sincere gratitude towards the study participants for their cooperation.

**Financial support and sponsorship:** Nil.

**Conflicts of Interest:** There are no conflicts of interest.

**Ethical Clearance:** Written informed consent was obtained from the parents of the children who brought their children for immunization at PHC. Ethical clearance was obtained from institutional ethics committee of CHCT, Mangalore.

<sup>1</sup>Prof. and Head Dept. of Omfs Kalinga Institute of Dental Sciences KiiT University Bhubaneshwar, <sup>2</sup>Prof. Dept. of Oral Medicine and Radiology, <sup>3</sup>Assoc. Prof., Dept. of Omfs, Kalinga Institute of Dental Sciences KiiT University, <sup>4</sup>Asst. Director Admin, Kalinga Institute of Dental Sciences KiiT University Bhubaneshwar

## Abstract

**Background:** An ameloblastoma is a benign odontogenic epithelial origin tumor that occurs from the cell rests of enamel organ, the epithelial linings of any odontogenic cyst or the basalar cells of oral mucosa. Marsupialization along with second-stage curettage was found as a successful plan in treating unicystic ameloblastoma and a reduced recurrence rates. The present study was conducted with the aim to retrospectively analyses marsupialization for the management of unicystic ameloblastoma.

**Materials and Method:** The present retrospective study was conducted in the Department of maxillofacial surgery for a period of 4 years. The speed of shrinkage was taken as the reduction rate divided by the duration of marsupialization (days). The effectiveness was calculated as per the reduction rate as follows: extremely effective, reduction rate of more than 80%, with a complete disappearance of cysts during marsupialization; moderately effective, reduction rate more than 50% but less than 80%; poorly effective, reduction rate more than 20% but less than 50%; and ineffective, reduction rate less than 20%. All the data thus obtained was arranged in a tabulated form and analyzed statistically using SPSS 21 software. Probability value of less than 0.05 was regarded as significant.

**Results:** The present study enrolled 50 subjects with unicystic ameloblastoma, out of which only 44 patients came for regular follow ups and hence were enrolled in the study. The mean age of the patients was 38.54+/-6.32 years. In cases where the size of tumor was less than 3 areas, the speed of shrinkage was 0.073 and in others where the size was more than 3 areas, the speed of shrinkage was 0.187. There was no significant difference between the two as the p value was more than 0.05. In cases where the tumor was at body and symphysis, 6 were effective and 3 were poorly effective and in others where there was ramal involvement, 27 were extremely effective and 8 were poorly effective. There was no significant difference between the two as the p value was more than 0.05.

**Conclusion:** The recurrence rate was also less. Marsupialization along with curettage is highly recommended amongst patients with unicysticameloblastomas of mandible.

**Keywords:** ameloblastomas, marsupialization, odontogenic, epithelial.

## Introduction

An ameloblastoma is a benign odontogenic epithelial

origin tumor that occurs from the cell rests of enamel organ, the epithelial linings of any odontogenic cyst or the basalar cells of oral mucosa.<sup>1</sup> Ameloblastomas accounts for 11% of the odontogenic tumors in the jaw bone and 1% of all oral swellings.<sup>2</sup> As, it is a slow-growing, locally aggressive tumor that has a high rates of recurrence, the treatment protocol for ameloblastoma is controversial.<sup>1,3,4</sup> As recurrence rates are high as 75%-90% after conservative management<sup>3,4</sup> a wider

e-mail: respublication2000@gmail.com

resection of the jawbone is advised for the treatment of ameloblastoma. Though, this is the management but it also consequences in variety of other problems, like dentition and bone alterations, numbness of lower lip, and masticatory disorders.<sup>5,6</sup> Now, marsupialization along with second-stage curettage was found as a successful plan in treating unicystic ameloblastoma,<sup>7-9</sup> a variant of ameloblastoma with lesser invasiveness and a reduced recurrence rates.<sup>10-13</sup> Marsupialization has been used as the primary procedure for the management for odontogenic cysts, mainly large cystic lesions in the mandible.<sup>14,15</sup> The advantages of marsupialization are neoplastic bone generation in the cystic cavity, protection of oral tissues, conservation of pulp vitality, prevention of dental extractions, avoidance of surgical damage to crucial anatomic structures, and reduced risk of recurrence.<sup>8,14-16</sup> The present study was conducted with the aim to retrospectively analyses marsupialization for the management of unicystic ameloblastoma.

#### Materials and Method

The present retrospective study was conducted in the Department of maxillofacial surgery. Kalinga institute of Dental sciences for a period of 4 years. The medical records of patients who underwent marsupialization for ameloblastoma were enrolled in the study. The study was approved by the institutional ethical board. Only patients with confirmed diagnosis of mandibular unicystic or multicystic ameloblastoma, Subjects with initial treatment of marsupialization and complete radiological record of treatment were enrolled in the study. Most of the patients were managed under local anaesthesia except with extensive lesions and having limitation in mouth opening. Care was taken not to injure tooth roots, inferior alveolar nerve and permanent tooth buds. The corners were trimmed and served as opening sites. This was followed by histological examination of the biopsy specimen extracted from the opening sites. For longer duration marsupialization, a post operative obturator was given to prevent infection and wound closure. Clinical and radiographic examinations were done for 3 months and wide resection was performed if needed to remove tumor completely. Curettage was performed. After curettage, subjects were trained to have clinical and radiographic checking every 3 months in the first 2 years, thereafter every 6 months for at least 5 years. The tumor sizes were obtained, and their rate of reduction and speed of shrinkage were calculated. The radiographs before and after marsupialization were examined using Image J. The mean value of two readings was used

for analysis. The speed of shrinkage was taken as the reduction rate divided by the duration of marsupialization (days). Additionally, the effectiveness was calculated as per the reduction rate as follows: extremely effective, reduction rate of more than 80%, with a complete disappearance of cysts during marsupialization; moderately effective, reduction rate more than 50% but less than 80%; poorly effective, reduction rate more than 20% but less than 50%; and ineffective, reduction rate less than 20%. All the data thus obtained was arranged in a tabulated form and analyzed statistically using SPSS 21 software. Probability value of less than 0.05 was regarded as significant.

#### Results

The present study enrolled 50 subjects with unicystic ameloblastoma, out of which only 44 patients came for regular follow ups and hence were enrolled in the study. The mean age of the patients was 38.54±6.32 years.

Table 1 shows the Speed of Shrinkage of ameloblastoma. In cases where the size of tumor was less than 3 areas, the speed of shrinkage was 0.073 and in others where the size was more than 3 areas, the speed of shrinkage was 0.187. There was no significant difference between the two as the p value was more than 0.05. In cases where the tumor was at body and symphysis, the speed of shrinkage was 0.135 and in others where there was ramal involvement, the speed of shrinkage was 0.180. There was no significant difference between the two as the p value was more than 0.05. In cases unicystic ameloblastoma, the speed of shrinkage was 0.205 and in multicystic ameloblastoma, the speed of shrinkage was 0.081. There was no significant difference between the two as the p value was more than 0.05.

Table 2 shows the efficacy of marsupialization of ameloblastoma. In cases where the size of tumor was less than 3 areas, 4 were extremely effective and 3 were poorly effective and in others where the size was more than 3 areas, 29 were extremely effective and 8 were poorly effective. There was no significant difference between the two as the p value was more than 0.05. In cases where the tumor was at body and symphysis, 6 were effective and 3 were poorly effective and in others where there was ramal involvement, 27 were extremely effective and 8 were poorly effective. There was no significant difference between the two as the p value was more than 0.05. In cases unicystic ameloblastoma, 24 were extremely effective and 8 were poorly effective

and in multicystic ameloblastoma, 9 were extremely effective and 3 were poorly effective. There was no significant difference between the two as the p value was more than 0.05.

**Table 1: Speed of Shrinkage of ameloblastoma (%/days)**

Variable	Speed	P value
Size of Tumor		>0.05
<3 Areas	0.073	
>3 Areas	0.187	
Location of Tumor		>0.05
Mandibular Body and Symphysis	0.135	
Ramal Involvement	0.180	
Type of Tumor		>0.05
Unicystic Ameloblastoma	0.205	
Multicystic Ameloblastoma	0.081	

**Table 2: Efficacy of marsupialization of ameloblastoma**

Variable	Extremely/ Moderately Effective	Poorly Effective/ ineffective	P value
Size of tumor			>0.05
<3 areas	4	3	
>3 areas	29	8	
Location of tumor			>0.05
Mandibular body and symphysis	6	3	
Ramal involvement	27	8	
Type of tumor			>0.05
Unicystic ameloblastoma	24	8	
Multicystic ameloblastoma	9	3	

## Discussion

On the basis of the evidence, few physicians have also stressed to use marsupialization to multicystic ameloblastomas, 8, 17 that belongs to the subgroup of solid/multicystic ameloblastoma.<sup>11</sup> Though, the recurrence rate exceeds 50%<sup>8,17</sup> that may be due to its aggressive behavior.<sup>18</sup> The outcome supported the negative results on the efficacy of marsupialization for multicystic lesions. Due to the frequency of cases was fairly less in past studies,<sup>7-9,17</sup> more studies should be performed to determine the efficiency of marsupialization in cystic ameloblastoma. Additionally, although few researches regarding the reduction rates

and speed of shrinkage of oral cystic lesions after marsupialization<sup>7,19-21</sup> the rate of reduction and speed of shrinkage of unicystic ameloblastoma have barely been invested. One of the difficulties of marsupialization is that it is a time-consuming procedure<sup>22</sup> this shortage of data is a problem for assessment of the cost-effectiveness of marsupialization in case of cystic ameloblastoma. Marsupialization is regarded as a more conservative form of management for odontogenic lesions to reduce their size and to restrict the level of surgery.<sup>14,15</sup> Thus, this procedure was used for cystic ameloblastomas.<sup>7-9</sup> Maxillary ameloblastomas are more aggressive compared to their mandibular counterparts, that may be because of the cancellous type of maxilla.<sup>23</sup> Additionally, maxillary ameloblastoma have the predisposition to invade the central regions.

In the present study, cases where the size of tumor was less than 3 areas, the speed of shrinkage was 0.073 and in others where the size was more than 3 areas, the speed of shrinkage was 0.187. There was no significant difference between the two as the p value was more than 0.05. In cases where the tumor was at body and symphysis, the speed of shrinkage was 0.135 and in others where there was ramal involvement, the speed of shrinkage was 0.180. There was no significant difference between the two as the p value was more than 0.05. In cases unicystic ameloblastoma, the speed of shrinkage was 0.205 and in multicystic ameloblastoma, the speed of shrinkage was 0.081. There was no significant difference between the two as the p value was more than 0.05. In cases where the size of tumor was less than 3 areas, 4 were extremely effective and 3 were poorly effective and in others where the size was more than 3 areas, 29 were extremely effective and 8 were poorly effective. There was no significant difference between the two as the p value was more than 0.05. In cases where the tumor was at body and symphysis, 6 were effective and 3 were poorly effective and in others where there was ramal involvement, 27 were extremely effective and 8 were poorly effective. There was no significant difference between the two as the p value was more than 0.05. In cases unicystic ameloblastoma, 24 were extremely effective and 8 were poorly effective and in multicystic ameloblastoma, 9 were extremely effective and 3 were poorly effective. There was no significant difference between the two as the p value was more than 0.05.

Various clinical studies have found that the dredging technique for mandibular ameloblastoma has shown a lower recurrence rate and limited complications.<sup>24,25,26</sup>

As per the study by Last, Li et al<sup>13</sup> showed that most unicystic ameloblastoma have a recurrence after more than 4 years.

In the present study, the follow-up duration was lesser than 4 years for 23 patients, who may have tendency to develop recurrences in the future. On the contrary, as per Lau and Samman<sup>12</sup>, marsupialization before initiating curettage can decrease the rate of recurrence. A research hat reviewed 23 conservatively managed subjects with ameloblastoma of mandible and showed a low recurrence rate of 11%.<sup>27</sup> Though few experts challenged that CT is an appropriate tool for assessment of morphological alterations,<sup>9,28</sup> Panoramic x-rays are more prevalent in diagnosis and examination of jaw cystic conditions due to convenience, cost-efficiency, and lower radiation. As per past studies, there existed a linear association between the space of cystic cavities in mandible and radiolucent region on panoramic x-rays.<sup>19,29</sup> The average speed of shrinkage of the cystic ameloblastomas was found to be 0.166%/day, proving that the time interval needed for the radiolucent region to shrink by half after the marsupialization procedure was 10 months. This result was comparable with the past studies that found 8 to 12 months for odontogenic tumors.<sup>19,20,30</sup>

### Conclusion

Marsupialization greatly decreases the volume of cystic lesions. There was amazing improvement in all the cases in our study. The recurrence rate was also less. Marsupialization along with curettage is highly recommended amongst patients with unicystic ameloblastomas of mandible.

Hospital, Siksha 'O' Anusandhan University, Bhubaneswar

## Abstract

Pheochromocytoma in elderly, often escapes the diagnosis or diagnosed incidentally. Even large pheochromocytoma can be non-secreting until triggered by an external factor. We report here, a case of very large tumor in an elderly patient which was silent till she was hospitalized with sepsis. A 72-years-old female admitted with fever for 15 days. Physical examination and investigations led to the diagnosis of lower respiratory infection with sepsis. Ultrasonography followed by CT scan showed left cystic suprarenal mass of 16.4x13.9x11.7 cm and 24-hour fractionated metanephrines were elevated by >3 fold the upper normal limit by high performance liquid chromatography (HPLC) method. Histopathology confirmed pheochromocytoma and biologically aggressive tumor (Pheochromocytoma of the adrenal gland scaled score of 4). Based on literature search, our case represents one of the largest, biologically aggressive, cystic pheochromocytoma in elderly.

**Keywords:** Giant pheochromocytoma, asymptomatic, elderly, triggering factor, aggressive tumor.

## Introduction

Pheochromocytoma are catecholamine secreting tumors of adrenomedullary chromaffin cells. It is frequently diagnosed at 40-50 years of age and considered uncommon in elderly. The typical manifestations of pheochromocytoma are paroxysmal hypertension, headache, palpitations, and diaphoresis and surgical removal is the curative treatment. Elderly patients can remain asymptomatic for years and often diagnosed incidentally.<sup>1</sup>

**Case Presentation:** A 72-years-old female presented with intermittent fever with occasional chills since 15 days and anorexia and weight loss of 5kg in 6 months. She denied any other associated symptoms relevant to her present illness. She had undergone left hip replacement for fracture neck of femur 7-years back and it was uneventful. She denied history of diabetes or hypertension or family history of any significant illness. On physical examination, patient had BMI of 17.31 (weight of 40kg), pallor, temperature of 100.9°F, pulse rate of 96/min, blood pressure (BP) of 122/60 mm Hg, respiration rate of 28 breaths/min, pulse oximetry (SpO<sub>2</sub>) of 92% on room air and no lymph node enlargement. She had decreased breath sound on left infrascapular area and a mass was palpable in the left lower abdomen on deep palpation. Laboratory investigation revealed neutrophilic leucocytosis with total leucocytes count of 19,720/ $\mu$ L and neutrophil of 86.3%. Hemoglobin was of 6.8gm% and ESR was 135 on 1<sup>st</sup> hour. Peripheral smear showed normocytic normochromic anemia, neutrophilic

University, Bhubaneswar  
e-mail: drsubhashdash73@gmail.com

leukocytosis with toxic changes. Random blood sugar was 111 mg/dL and other laboratory parameters were normal. Chest radiograph showed left sided pleural effusion and ECG was suggestive of sinus rhythm. Her echocardiography was unremarkable with normal ejection fraction. Ultrasonography of abdomen and pelvis revealed non-visualization of left kidney and a large complex cyst located posterior to pancreatic tail, possibly of left renal origin. Pleural fluid analysis was suggestive of exudation (sugar-170mg/dl, protein-3.03g/dl) and showed polymorphic leucocytosis (TLC-360/mm<sup>3</sup>, polymorph-70%) and no dysplastic or malignant cells on cytology examination. Blood cultures on two occasions were sterile. Contrast enhanced CT scan showed a large complex cystic left suprarenal mass of 16.4x13.9x11.7 cm (figure-1). Treatment was started in the line of sepsis with antibiotics, hydration with saline infusion and other symptomatic treatments like packed red blood cell transfusions and antipyretics. On 6<sup>th</sup> day of admission, patient had sudden onset of uneasiness, sweating, and pain in the left lumbar region. Her pulse rate was 116/min, BP was elevated to 210/130 mm Hg and SpO<sub>2</sub> was 80%. After immediate therapy, patient was shifted to intensive care unit (ICU). Further evaluation indicated development of acute renal failure, respiratory failure and tracheal aspiration fluid culture showed growth of pseudomonas organism. After laboratory and clinical parameters stabilized, she was shifted back to the ward after 12 days. Estimation of fractionated metanephrines in 24-hour urine by HPLC method showed metanephrine of 2095.92µg/24h (reference range: 74-297µg) and normetanephrine was 2753.25µg/24h (73-808µg). A final diagnosis of lower respiratory tract infection, sepsis and possibly pheochromocytoma was made. Her blood pressure medication has been changed to selective alpha-1 blocker prazosin, adequate fluid and liberal salt intake has been encouraged for volume expansion. Four weeks later, open left adrenalectomy was done and encapsulated mass was removed. Histopathology confirmed pheochromocytoma (figure-2). There was wide fluctuation of BP (systolic 60-170 and diastolic 40-90 mmHg) intra-operatively as well as postoperatively. Patient was shifted to ICU and started with saline infusion, blood transfusion, and inotropic support. But she had extensive anterior myocardial infarction and asystole on second post-operative day and despite of resuscitation measures; couldn't be revived. Microscopic examination showed neoplastic cells in diffuse sheets and nests and presence of capsular invasion, extensive areas of hemorrhage & necrosis, cellular monotony and

increase mitosis (scoring 1 point each), thus having 'Pheochromocytoma of the adrenal gland scaled score' (PASS) of four.<sup>2</sup>

## Discussion

This report presented a case of very large pheochromocytoma at the age of 72 years which remained asymptomatic until she was admitted with sepsis. Pheochromocytoma in elderly are frequently diagnosed incidentally or in autopsy. A study of 50-year autopsy series from Mayo Clinic found 22% of patients having pheochromocytoma were above 68 years and 75% of these patients diagnosed after death.<sup>3</sup> Ross NS, Aron DC et al, reported 7% of incidentaloma at the age of 70 years in autopsy.<sup>4</sup> Further, a study from Sweden, observed the average age at diagnosis of pheochromocytoma was 48.5 years for ante mortem diagnosis and 65.8 years for those diagnosed after death.<sup>1</sup>

The broad spectrum of clinical manifestations results from excess release of catecholamines by the tumor. Paroxysmal hypertension is the most noted sign that leads to clinical suspicion. The triggering factors for paroxysms are medications (e.g. antidepressants, beta blockers, opiates, metoclopramide, chlorpromazine), anesthesia and surgery, postural changes, tyramine containing foods and physical stress. It can be inferred from many previous studies that a significant percentage of elderly patients remain clinically silent or have minor symptoms before the diagnosis.<sup>1,3,4</sup> The paucity of symptoms may be attributed to multiple factors like age related decreased tissue response to catecholamines, decreased baroreceptor function and also misdiagnosis by presence of other co-morbid illnesses of the elderly.

Catecholamine metabolism by catechol-O-methyltransferase becomes predominant within pheochromocytoma. Concentration of the enzyme increases proportionally to the size of the tumor leading to decrease in catecholamine levels and increase in inactive metabolites like metanephrine and normetanephrine.<sup>5</sup> This explains why even the larger tumors may not have prominent symptoms.

However, the diagnosis of incidental pheochromocytoma is increasing lately due to wide availability and frequent use of CT scan imaging and improved laboratory facility.<sup>6</sup> CT scan has a sensitivity of 98-100% and specificity of around 70%, similar to MRI for localization of the tumor but MRI has an advantage of detecting extra-adrenal tumor.<sup>2</sup> For biochemical diagnosis, plasma free or urinary fractionated metanephrines is superior to other tests of catecholamine excess. Plasma free metanephrine and 24 hour urinary fractionated metanephrines have the

a.

b.

c.

**Figure 2: Histology of the tumor showing a. Zellballen arrangement of cells b. capsular invasion and c. areas of hemorrhage and necrosis**

sensitivity of 89.5-100% and 85.7-97.1% and specificity of 79.4-97.6% and 68.6-95.1%, respectively.<sup>7</sup>

Pheochromocytoma are prone to hemorrhage and necrosis due to vasoconstriction, adrenal vein thrombosis and high venous pressure as consequences of excess catecholamine; eventually resulting in cystic pheochromocytoma. Severe physical stress like sepsis among other factors (like surgery, pregnancy, anticoagulants, bleeding diathesis or coagulopathy, and idiopathic) can predispose to hemorrhage and the most consistent feature is lumbar or flank pain.<sup>8,9,10</sup>

Malignant pheochromocytoma is defined by the documented evidence of metastasis and not by the presence of capsular or vascular invasion or mitosis or tumor size.<sup>11</sup> Functional imaging and immunohistochemical staining couldn't be done in our case because of lack of facilities. However, PASS classify pheochromocytoma histologically into those with biologically aggressive tumors having PASS score of  $\geq 4$  and those with low risk of malignancy having score of  $< 4$ .<sup>2</sup> Our patient had a biologically aggressive tumor with high risk of malignancy. Based on literature review, this case is comparable to the previously reported giant malignant pheochromocytoma measuring 13.5x10.6x9.8 cm by Chenqquan et al.<sup>12</sup> Giant cystic benign pheochromocytoma were previously reported by Gupta A et al measuring 25x17x15 cm and another of 19x18x12 cm by Ambati D et al, in elderly patients.<sup>13,14</sup> Our case represents one of the largest tumors in respect to biologically aggressive, cystic pheochromocytoma in geriatric patients.

### Conclusion

Even larger pheochromocytoma can be asymptomatic in elderly. It can be non-secreting until triggered by an external factor and also being symptomatic; it is confounded by many co-morbid illnesses of the elderly. Hence, it poses a greater diagnostic challenge which needs a more precise clinical guideline and treatment plan in elderly patients.

## Abstract

The research project was to assess the level of awareness of negative impact of playing mobile games among high school students in a selected higher secondary school, Kanchipuram district, Tamil Nadu India. The objectives of the study were to assess the level of awareness on negative impact of playing mobile games among the high school students and to find out the association between the level of awareness on negative impact of playing mobile games with selected demographic variables of high school students. There were two stage of sampling technique such as stage I (purposive sampling technique) and stage II (simple random technique -lottery method) with samples of 175 high school students. An extensive review of literature on negative impact of playing mobile games were gathered. Demographic variable porforma and self structured tool were used to collect the data on level of awareness on negative impact of playing mobile game among high school students. The collected data were tabulated and analyzed. The mean value is 37.71 and standard deviation value is 1.75 and 33% were low level of awareness, 44% were moderate level of awareness, 23% were of high level of awareness on negative impact of playing mobile game among high school students. There were significant association between the level of awareness on negative impact of playing mobile games among high school students of age, gender, standard,number of mobile used at home, wearing spectacles, family income and BMI . According to the level of awareness health education given on negative impact on playing mobile games to the high school students.

## Introduction

Towards the end of the 20th century, mobile phone

ownership became ubiquitous in the industrialised world - due to the establishment of industry standards, and the rapid fall in cost of handset ownership, and use driven by economies of scale.<sup>(6)</sup>

A mobile game is a game played on a feature phone, smart phone/tablet, smart watch, PDA, portable media player or graphing calculator. Today smart phones are used for a variety of things. Like traditional mobile phones, smart phones are used to call and text, but also for example to navigate, use social networks and play games Smart phone games are popular, which is shown by games having the highest revenue among all smart phone app categories. Games generated 90% of Google Play and 75% of the Apple App Store revenue in 2015.<sup>(7)</sup>

Addiction is considered by **WHO** (WHO Expert Committee - 1964) as dependence, as the continuous use of something for the sake of relief, comfort or stimulation, which often causes cravings when it is absent. A new kind of health disorder in this category among adolescents, “smart phone’s addiction/abuse/misuse” is now challenging health policy makers globally to think on this rapidly emerging issue. Indian adolescents are also affected by this high smart phone engagement, and the current paper will use meta-analysis to discuss their addictive behaviors. <sup>(8)</sup>

Adolescents are defined as young people between the ages of 10 and 19 years as per WHO (2014) criteria. Today, 20% of people persons in the world are adolescents, constituting 1.2 billion people worldwide. Nearly, 243 million adolescents live in India as per the UNICEF Report (2011).<sup>(9)</sup>

Smart phones are popular and have numerous benefits. Nevertheless, their many features and high availability has caused a certain dependence. This dependence has caused social problems, including obsessive use and addiction, which have created a mental health concern.<sup>(10)</sup>

**Statement of the Problem:** A study to assess the level of awareness on negative impact of playing mobile games among high school students in selected higher secondary school, Kanchipuram district, Tamil nadu, India

**Objectives:**

- To assess the level of awareness on negative impact of playing mobile games among the high school students .
- To find out the association between the level of awareness on negative impact of smart phone games with their selected demographic variables.

**Methodology**

**Research Approach:** Quantitative descriptive research approach was used for the study.

**Research Design:** Non experimental descriptive research design was adapted.

**Research Setting:** The research was conducted in Atomic Energy Central School No-1, Kalpakkam, Kanchipuram district, Tamil Nadu.

**Sample and Sample Size:** Students those who were studying in standard 6<sup>th</sup>, 7<sup>th</sup>, 8<sup>th</sup> and 9<sup>th</sup> in selected higher secondary school. 175 High secondary school students were chosen for the study.

**Stage I:** Purposive sampling technique was used to select the students who were playing mobile games

**Stage II:** Simple Random Technique [Lottery method] has been used to select equal number of participant from each class.

**Sampling Criteria:**

**Inclusion Criteria:**

- High school students who were available during the data collection.
- Those who can understand English and Tamil

**Exclusion Criteria:**

- High school students who were not having mobile phone at their home.
- The students who were absent on the data collection.

**Data Collection Procedure:** The researcher conducted a personal interview to collect personal information and their level of awareness of negative impact of playing mobile games among high school students. Each participant has been interviewed for 15 min. Data collection for the period of 1 week.

**Description of the Research Tool:**

**Section-A:** Personal information sheet about the information of the participants which includes age, gender, standard, no of mobiles used, type of mobile used, no of hours spend, are they wearing spectacles, previous knowledge about negative impact, family income, symptoms they experience without mobile games and their BMI

**Section-B:** Self – structured questionnaire in the form of likert scale was used to assess the level of awareness of negative impact of playing mobile games among high school students. It consists of 13 items such as salience, tolerance, learning capabilities, mood changes, aggressive behavior, unpleasant feeling, conflicts, physical problems, lack of sleep, vision problem, human contact, time wastage and hate speech.

**Scoring Procedure and Interpretation:** The total attainable score was 65, which was interpreted follows:

Score	Percentage	Level of Awareness on Negative Impact of Mobile Games
13-32	20-50%	Low Level of Awareness
33-49	51-75%	Moderate Level of Awareness
50-65	76-100%	High Level of Awareness

**Statistical Analysis:** Descriptive statistics like frequency distribution, percentage, mean, standard deviation and inferential statistics like chi-square test was used to analyses the data.

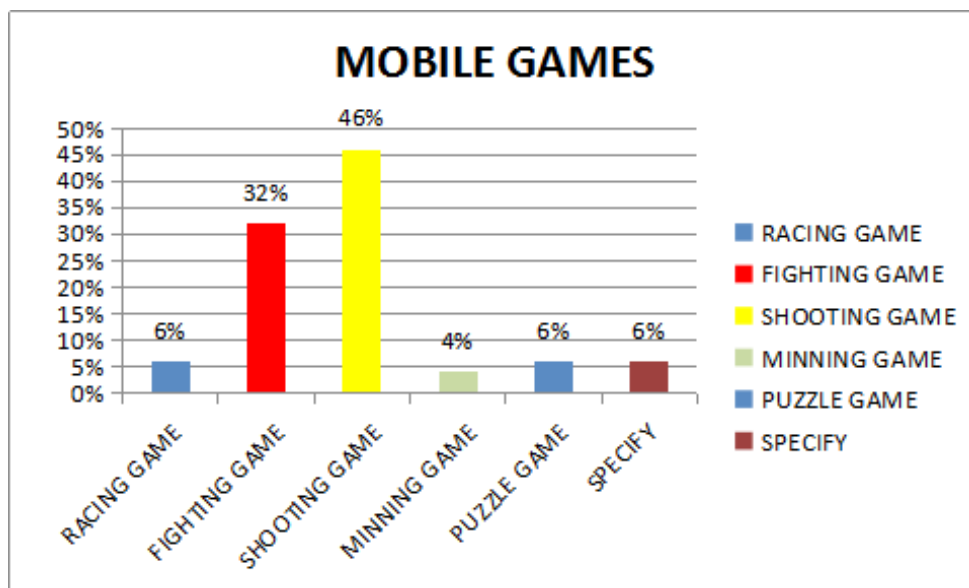

### Result and Discussion

**Table 1: Level of Awareness on Negative Impact of Playing Mobile Games**

Level of Awareness On Negative Impact of Playing Mobile Game	No of High School Students	Total No of Question	Score Range	No of students under each range	Total score	Mean	SD	Level of Awareness	
								Individuals	Total
Low awareness	175	13	13-32	58	6600	37.71	1.75	33%	100%
Moderate awareness			33-49	77				44%	
High awareness			50-65	40				23%	

The result showed mean (37.71) and standard deviation (1.75) aspects of high school students. The score for the level of awareness reveals that 58 (33%) have low level of awareness, 77(44%) have moderate level of awareness and 40 (23%) have high level of awareness.

**Distribution of the high school students based on the level of awareness on negative impact of playing mobile game (N = 175)**

**Graph 1: Percentage Distribution of the high school students according to their type of mobile used for**

**playing games**

The study further revealed that there is significant association between the level of awareness on the negative impact of playing mobile games among high school students of Age ( $\chi^2 = 27.835$ ) gender ( $\chi^2 = 15.93$ ), standard ( $\chi^2 = 22.26$ ), usage of mobile at home ( $\chi^2=26.62$ ), type of mobile games ( $\chi^2 = 20.15$ ), type of mobile ( $\chi^2 = 13.75$ ), wearing spectacles ( $\chi^2 = 15.42$ ), family income ( $\chi^2 = 46.995$ ), BMI ( $\chi^2 = 77.176$ ). Hence the researcher rejects a research hypothesis.

There is no significant association between the level of awareness on the negative impact of playing mobile games among high school students have previous knowledge on negative impact ( $\chi^2=3.621$ ), source of information on the negative impact of playing mobile games ( $\chi^2=12.15$ ), symptoms experienced ( $\chi^2=8.89$ ).

**Conclusion**

The study results shows that only 23% of students having good level of awareness on negative impact on playing mobile games which really gives us the alarm to focus on student's health to prevent negative impact due to playing mobile games.

# The Cut that Scars: Exploring Female Genital Mutilation in Somalia with Reference to Select Texts

Reshma Sarah Easo<sup>1</sup>, Sreenath Muraleedharan<sup>2</sup>

<sup>1</sup>Ph.D. Scholar, <sup>2</sup>HOD, Department of English Language and Literature,  
Amrita School of Arts and Sciences, Kochi, Kerala

## Abstract

Female Genital Mutilation (FGM) is termed as a horrendous practice that causes harm to the female genital organs. Tracing its roots before the arrival of Abrahamic religions, the ritual that was originally a part of Africa has crossed boundaries and is practiced around the globe. With more than 3 million girls cut every year, United Nations has declared FGM as a ritual that needs to be curbed. Somalia is one country where the incidence of genital mutilation and its aftermath is very high. Most women in Somalia undergo the ritual of cut to purify themselves. This paper looks into “type three cutting” (infibulation) in Somalia with the help of three works written by Somali authors-Hibo Wardere, Ayaan Hirsi Ali and Waris Dirie.

**Keywords:** Female Genital Mutilation, Tradition, Somali Writers, Violence.

## Introduction

Among the many gender violations, Female Genital Mutilation is a bodily violence that has existed from the pharaonic times to date. According to the United Nations, (UN) Female Genital Mutilation (FGM) also known as Female Circumcision (FC) involves all the practices that cause external injuries to the female genital organs in the name of religion, culture and tradition. It is an ancient ceremony that violates essential aspects of women’s and children rights. As Alice Walker wrote in *Warrior Marks*, “Clearly, female genital mutilation is a painful, complex, and difficult issue, which involves questions of cultural and national identities, sexuality, human rights, and the rights of women and girls to live safe and healthy lives.”<sup>1</sup>

In most cases, FGM is done from around three years to fourteen years. For better understanding the World Health Organisation has classified FGM into four divisions; type 1, type 2, type 3 and type 4.

Type 1, known as ‘cliterodectomy’ is the mildest form of the four and involves partial or total removal of the clitoral hood or the clitoris.

Type 2 called as ‘excision’ is the partial or total

removal of the labia minora, with or without removal of the clitoris and labia majora.

Type 3 also called as ‘infibulation’ is the most painful and horrific type of FGM. It involves the removal of the external genitalia as well as the sealing of the wound. Infibulation is also the most complicated type of cutting as only a miniscule opening is left to allow the flow of urine and menstrual blood. Scars are formed due to infibulations and for a scar to form; the legs of the victims are tied together for around two to six weeks.

Type 4 involves all harmful procedures to the female genitals for non- medical practices. These include; perforating, piercing, slitting, scraping and cauterization.

With a long evolved history, genital mutilation has emerged as a social norm that is quite challenging to be stopped suddenly. Even today, many countries especially the African Nations continue to practice this horrendous tradition. Though efforts to eliminate the practice have been happening for decades, the number of women and children subjected to this remain at large.

The attempt of this paper is to look into type three of genital mutilation also called as infibulation that occurs in Somalia with the help of works written by Somali

female writers Hibo Wardere, Waris Dirie and Ayaan Hirsi Ali.

## Methodology

Even after multiple attempts to ban Female genital mutilation in Somalia, the country still has one of the highest incidences of women having been cut. According to Thomson Reuters Foundation's research article; *Somalia: The Law and FGM*, there is still no law that punishes the practices of FGM. "The Constitution of Somalia (2012) state at Article 15 that: Circumcision of girls is a cruel and degrading customary practice, and is tantamount to torture. The circumcision of girls is prohibited. Article 29(2) further provides, 'Every child has the right to be protected from mistreatment, neglect, abuse or degradation'. Lack of education and tradition oriented thinking remains the main reason for the practice continuing among the Somalis.

Egyptian writer and women's activist Nawal El Saasawi in her work *The Hidden Face of Eve* wrote, 'The importance given to virginity and an intact hymen in these societies is the reason why female circumcision still remains a very widespread practice...Behind circumcision lies the belief, by removing parts of girl's external genital organs, sexual desire is minimized'.

Somali writer, Hibo Wardere in her work *Cut: One woman's fight against FGM in Britain today*, describes the torture she has been through. The cutting transforms Wardere into a new person and her relationship with her mother deteriorates. Like most in her tribe, she was cut in the presence of her mother and two other women. She quotes the ordeal as follows: "Then, with those long pincer nails, she dug between my legs and grasped my clitoris, my kintir...she lifted up that dirty razor, the one that still had the dried brown residue of other's blood clinging to it, like filthy reminders of her previous work, and she cut straight through my flesh". With no proper laws to curb the ritual, the story of Wardere remains the same for almost all Somali girls.

Waris Dirie is a Somali model and activist who endured the 'becoming a woman ceremony' at the age of five. As she belonged to a family of shepherds, unlike Wardere, she was cut by a gypsy woman under the shade of a tree on a flat rock with an old broken razor and was tied from hip to toes for the wounds to heal. In *Desert Flower: The Extraordinary Journey of a Desert Nomad*, Dirie write,

When the ties that bound me were removed from my legs, I was able to look at myself for the first time. I discovered a patch of skin completely smooth except for a scar down the middle like a zipper. And that zipper was definitely closed. My genitals were sealed up like a brick wall that no man would be able to penetrate until my wedding night, when my husband would either cut me open with a knife or force his way in .

Marriage was seen as the main reason for most girls being subjected to circumcision. A virgin woman always fetched higher price in the marriage market. Dirie's father agreed her marriage to a man in his 60's for five camels. To a family that herded sheep's, five camels were indeed a hefty prize.

Another Somali activist Ayaan Hirsi Ali also has the same story line like Wardere and Dirie. In her work *Infidel: My Life*, we see a similar pattern. She was cut in the vicinity of her home along with her brother and sister with a pair of scissors. Ayaan describes how the torture was more severe to her younger sister Haweya who was four at the time of her cutting. As a result of her cries and struggle, Haweya had to be stitched twice and the author mentions that her little sister was not the same anymore. "Haweya was never the same afterward. She became ill with a fever for several weeks and lost a lot of weight. She had horrible nightmares, and during the day began stomping off to be alone. My once cheerful, playful little sister changed".

## Results and Discussion

Traced to pharaonic rituals, FGM is often imbibed without knowing the real reason behind the procedure. As a result over the years this became a normative tradition and continues to do so. The concept of FGM in many cultures resonated with purity. As how her mother tells Wardere, "We are a family whose girls are known for our virginity. We are clean, and that means we can marry well, and you will stay pure until you get married to your husband". This was the notion of most mothers who had their daughters cut. The article *Somalia: The Law and FGM*, mentions that with the law of Somalia still in favour of FGM, countries sharing their borders with Somalia take their child to be cut in the country. "It is also suggested that many Somali women and girls from the Western diaspora (for example, in the USA, Australia, the UK and other European countries) are taken to Somalia for FGM because there is no risk of prosecution".

The issue takes a wider stage when it is understood that the cutting is not just limited to African countries. <sup>4</sup>According to Wardere (189), in 2001 around 66,000 women between the age of fifteen to forty nine living in England and Wales were cut. Taking cues from African nations, genital mutilation started to spread even to educated communities. Mothers often took their daughters to cut in order to preserve virginity and stop masturbation.

In table 1 below, the type 3 cutting that had to be endured by all three writers have been analyzed. With unfavorable settings and unsterilized tools, it is often a miracle that they survived. Waris Dirie and Hibo Wardere

had recuperated surgery done on them to minimize the damage that was done on their bodies. Even though it had little to do with sexual pleasure, the surgery helped them to urinate better.

14 questions are looked upon in table 1.

✓ Denotes YES

✗ Denotes NO

Some questions have answers in words while for some questions the data was not available and hence, NO MENTION is given.

**Table 1: Examining Type 3 cutting that was performed on Hibo Wardere, Waris Dirie and Ayaan Hirsi Ali**

	<b>Analysis of Infibulation</b>	<b>HIBO WARDERE</b>	<b>WARIS DIRIE</b>	<b>AYYAN HIRSI ALI</b>
1	Age when cut	6	5	5
2	Were women present during the procedure?	✓	✓	✓
3	Was the circumciser a woman?	✓	✓	✗
4	Were men present during the procedure?	✗	✗	✗
5	Was a sterilized tool used?	✗	✗	✓
6	Did the cut take place in a homely surrounding?	✓	✗	✓
7	Did the victim run a fever?	✗	✓	✗

14	Recuperate surgery	✓	✓	✓

**Socio Cultural Contexts:** Located on the eastern part of the African continent, Somalia has a population of 15.64 million of which 73 percent of Somalis live in poverty. Without a proper central government and occurrence of civil wars, the education system of the country has one of the lowest enrollment rates. So, it is often difficult for NGO’s or other organisations to communicate about the practice of FGM with the people. Women seldom talk about the practice and men choose to keep silent. As Dirie says, “The health problems I’ve coped with since my circumcision also plague millions of girls and women throughout the world. Because of a ritual of ignorance, most of the women on the continent of Africa live their lives in pain. Who is going to help

the woman in the desert- like my mother- with no money and no power?”<sup>5</sup>

Tradition is an important factor to most Somali tribes. They seldom part with the beliefs that they hold on to. According to the Egyptian customs, clitoris was a part that grew with age and so to curb its growth it needed to be cut. A cut woman was seen as pure and chaste while an uncut girl was seen as a slut in the society. <sup>6</sup>Ayaan’s grandmother asks her daughter, “Imagine your daughters ten years from now- who would marry them with long kintirs dangling halfway down their legs?” This was the notion of most mothers and grandmothers; a notion that has been handed down from generations to generations.

## Conclusion

With a hole as small as a match stick head left for urine and menstrual blood to pass out, infibulation leaves the victim with lifelong infections, hemorrhage and pains. Childbirth is the most torturous procedure that a woman with type 3 cutting has to go through. Even after several measures taken, FGM continues to be on a high incidence in Somalia. Primary level education should be a very important step towards tacking FGM. Even though it gets difficult to convince elderly women rooted in their tradition about the practice, medical camps organized by people from their same tribe can do wonders that an outside intervention. It's high time that men are informed and they take a stand too. As Saadwai mentions, <sup>3</sup>parents see circumcision as a safeguard against the deviations a girl might take.

All through history, the feminine sex had to undergo harsh customs and cruel traditional practices that deprive them of their choices. Female genital mutilation is one such barbaric practice where a female is inhibited and subdued. Not just protests, but a strong mind that can break stereotyped barriers is utmost necessary to put an end to a practice like genital mutilation. Preventing a cut after all, can make a big difference.

## Abstract

It is an emerging zoonotic disease spread all over the world, but its diagnosis is rather complex. Though a number of serological tests are currently available for diagnosis, none of them are useful at POC diagnosis. Further, they are not user-friendly and reproducible. Precisely for this reason, present study was aimed to develop a simple, inexpensive, field applicable POC diagnostics using protein G-based milk dipstick and indirect enzyme-linked immunosorbent (iELISA) assays. These are useful for rapid detection of brucellosis using a handheld ELISA reader at resource-limited POC areas near pen side. Overall, 4998 raw milk and whole blood samples were collected from organized dairy farms, where animals are reared (Goshalas), and villages in different districts of Andhra Pradesh and Telangana states, India. Collected samples used to evaluate diagnostic performances of these assays in comparison with milk ring test (MRT) and Rose Bengal Plate Test (RBPT) serological assays. The developed milk dipstick and iELISA showed 87.37%, 99.67% and 98.23%, 100% sensitivity and specificity respectively. Results proved that the developed assays can be used as potential diagnostics for rapid field diagnosis of *Brucellosis* from infected animals using raw milk and whole blood samples at resource-limited settings.

**Keywords:** MRT (Milk Ring Test), RBPT (Rose Bengal Plate Agglutination test), Point of Care (POC), Polymerase Chain Reaction (PCR), Milk dipstick, iELISA (indirect Enzyme-Linked Immunosorbent Assay).

## Introduction

*Brucella* is a facultative, intracellular, Gram negative pathogenic bacteria causes brucellosis. It is a neglected, highly infectious under reported zoonotic disease<sup>20</sup>. *Brucella* infects dairy animals, small ruminants, canine, swine, humans<sup>24</sup>, and is a highly contagious disease

of livestock causing severe morbidity, playing an enormous impact on economic losses<sup>17,31</sup>. Prevalence of brucellosis is not clear and is changing continuously because of improper usage of sanitary method, intensification of farming, socio-economic status of farmers and international movement of animals<sup>11,36</sup>. Recent studies pointed out an increased prevalence of brucellosis in dairy livestock of India, becoming geographical hotspot causing an economic loss of US \$3.4 billion per annum<sup>9,26,32</sup>. Lactating animals excrete bacterium into milk throughout their lives means that bacteria are localized in lymph nodes and mammary glands in infected animals<sup>13,14,19</sup>. Though, India is one among largest milk producers in world, there is still a

Genomix Molecular Diagnostics Pvt. Ltd, 5-36/207,  
Prashanthnagar, Kukatpally, Hyderabad-500072, India

huge demand for milk and dairy products. Since growth of dairy industry depends on productive and reproductive health of dairy animals, it is crucial not only to upkeep but also to prevent bovine diseases.

MRT is inexpensive technique for screening and monitoring of brucellosis<sup>2,24,30</sup>. It may give false positive reactions with milk samples such as colostrums or milk at the end of lactation period, milk from cows suffering from a hormonal disorder<sup>19</sup>. Serological diagnostics for brucellosis infection are RBPT, Slow Agglutination Test (SAT), Complement Fixation Test (CFT) for primary screening of brucellosis. However, agglutination techniques may have limitations in sensitivity<sup>2</sup>. Lateral flow immunochromatography showed better sensitivity and specificity compared to RBPT<sup>29</sup>. Existing diagnostics are not well established for field diagnosis and are time consuming; require expensive laboratory with expertise. Thus, there is a need to develop highly specific, sensitive, inexpensive, POC diagnostics for rapid detection of brucellosis. So, present study is aimed to develop and evaluate milk dipstick and iELISA with a portable hand held ELISA reader for the detection of brucellosis at resource-limited areas.

## Materials and Method

**Study site and animals:** A total of 4,998 individual milk and whole blood samples were collected from third and fourth lactating cows from organized dairy farms, Goshalas and villages in Kadapa, Kurnool, Ananthapuram, Chittoor, Prakasam, Krishna, Guntur, West Godavari, and Nellore districts in Andhra Pradesh; Khammam, Kareemnagar, Nalgonda, Sangareddy and Rangareddy districts in Telangana, India. The study samples include Holstein Friesians cows (1057), Jersey (909), Shahiwal (701), Ongole (813), Gir (512), Punganur (311) and Murrah buffaloes (695) as a source for sample collection.

**Sample collection and processing:** A total of 20 ml volumes of midstream milk was collected directly from all teats into a sterile 50ml falcon tube without preservative from selected individual cows. Approximately, 5ml volume of whole blood was collected from jugular vein of animal in Lithium-Heparin coated BD Vacutainer tubes (REF 367820) for serological studies with consent of farm owners and farmers under supervision of a veterinarian.

**Milk Ring Test:** MRT is standard, most common method for identifying infected animals for surveillance

of brucellosis free herds.<sup>21</sup>

**Culture:** Collected fresh milk samples were centrifuged at 3000xg for 10mins. Pellet was placed onto tryptose soy agar (Ref # M290, Himedia) media supplemented with antibiotics<sup>15,25</sup>.

**Antigen Preparation:** *Brucella abortus* strain 99 was obtained from Indian Veterinary Research Institute, Izatnagar, India was grown on soybean casein digest agar medium and harvested as per OIE recommended protocol<sup>23</sup>.

**Development of Dipstick Assay:** Dipstick strips are easy to perform for quick sero-diagnosis of brucellosis due to its robustness, simplicity and are highly suitable for application under field conditions<sup>10</sup>. Capillary action of dipstick resulted in formation of colored bands as shown in Figure 2.

**Development of indirect ELISA:** Protein G-based iELISA using sLPS was carried out with a modified protocol to increase the accuracy<sup>6</sup>.

**Hand-held ELISA Reader:** Battery-operated, portable, hand-held ELISA reader is easy to carry from one place to another with external facilities.

**Cut Off Value:** iELISA assay cut off value between positive and negative samples was derived by calculating mean OD values obtained from 450 negative samples plus three times of standard deviation<sup>28</sup>.

Cut off =  $X + 3 SD$  (X- mean, SD- standard deviation).

**Statistical Analysis:** Collected samples used for validation of milk dipstick and iELISA in comparison with MRT, RBPT, and culture. Calculation of specificity, sensitivity, PPV, NPV and efficiency were carried out using statistical analysis software NCSS 12 and McNemars Chi square test used to calculate significance level and  $p$ -value < 0.05 was used as significant.

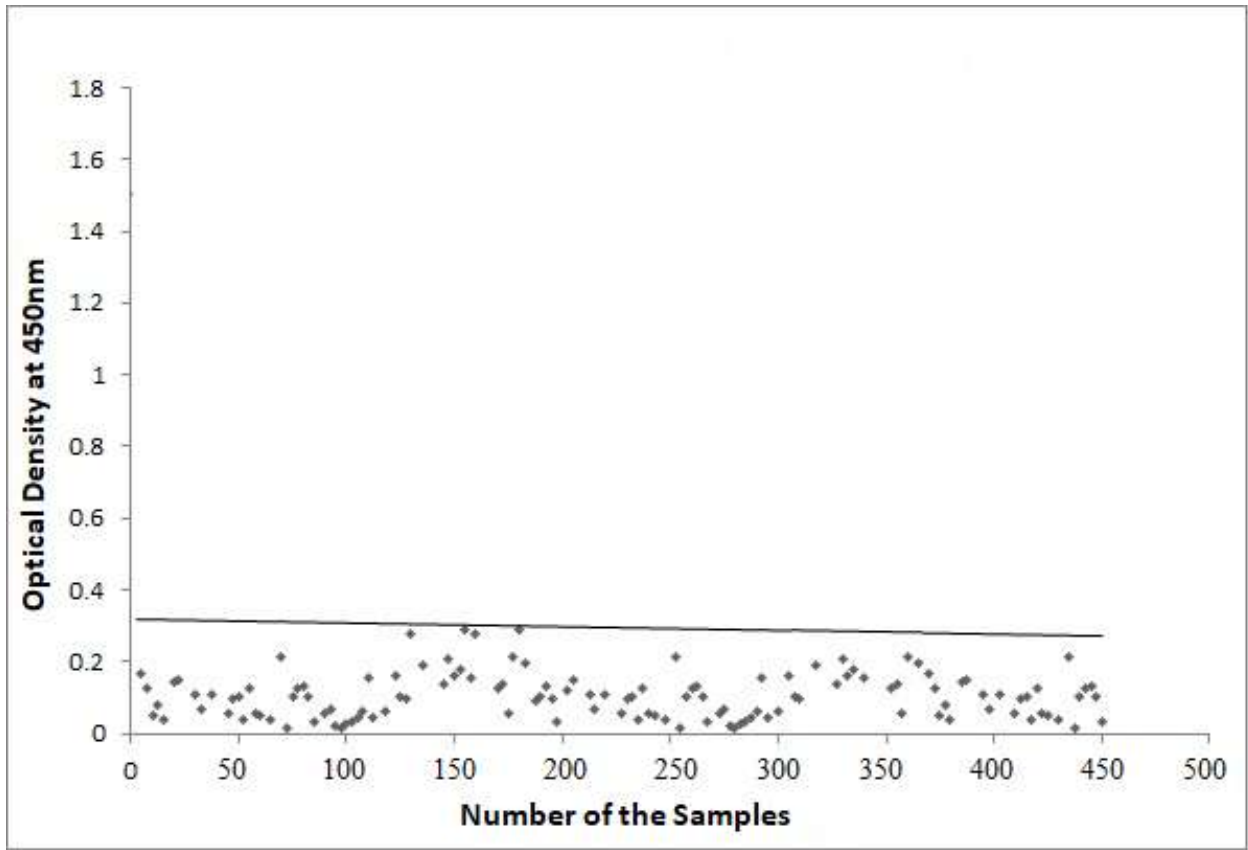

**Results:** Results were presented in figure no 1-4 and table no 1-2. While dipstick showed 87.37%, 99.67% sensitivity and specificity, iELISA displayed 98.23% sensitivity and 100% specificity. Statistical data in terms of sensitivity, specificity, PPV, NPV and efficiency were significantly differing with standard values (Table 2). Chi square statistical value is 54.3028 and the  $p$ -value is <0.00001, so, obtained results are significant at  $p < 0.05$  level.

**Fig. 1:** Silver staining gel image of sLPS obtained from *Brucella abortus* S99 strain. Lane M is Bio-Rad precision plus protein standard marker, Lane 1 to 4 are four different lots of sLPS and lane 5 is concentrated sLPS using lyophilization by pooling all the four lots.

**Fig. 2:** Dipstick lateral flow test strip tested with brucellosis positive and negative samples.

**Fig. 3: Diagrammatic representation of OD values for 450 unvaccinated animal samples for defining the negative cut off value. While X-axis shows the number of animals, Y- axis deals with the OD of 450 negative samples at 450 nm.**

**Table 1. A comparative diagnostic evaluation data of five different diagnostic assays for detection of brucellosis**

Assays	Sample Type	Total No. of Samples					
		Positive	Negative	TP	TN	FP	FN
MRT	Milk	958	4040	285	3929	673	111
RBPT	Serum/plasma	894	4104	299	4007	595	97
Culture	Milk	396	4602	396	4602	-	-
Dipstick	Milk/Whole blood	361	4637	346	4587	15	50
Indirect ELISA	Milk/Whole blood	389	4609	389	4602	-	7

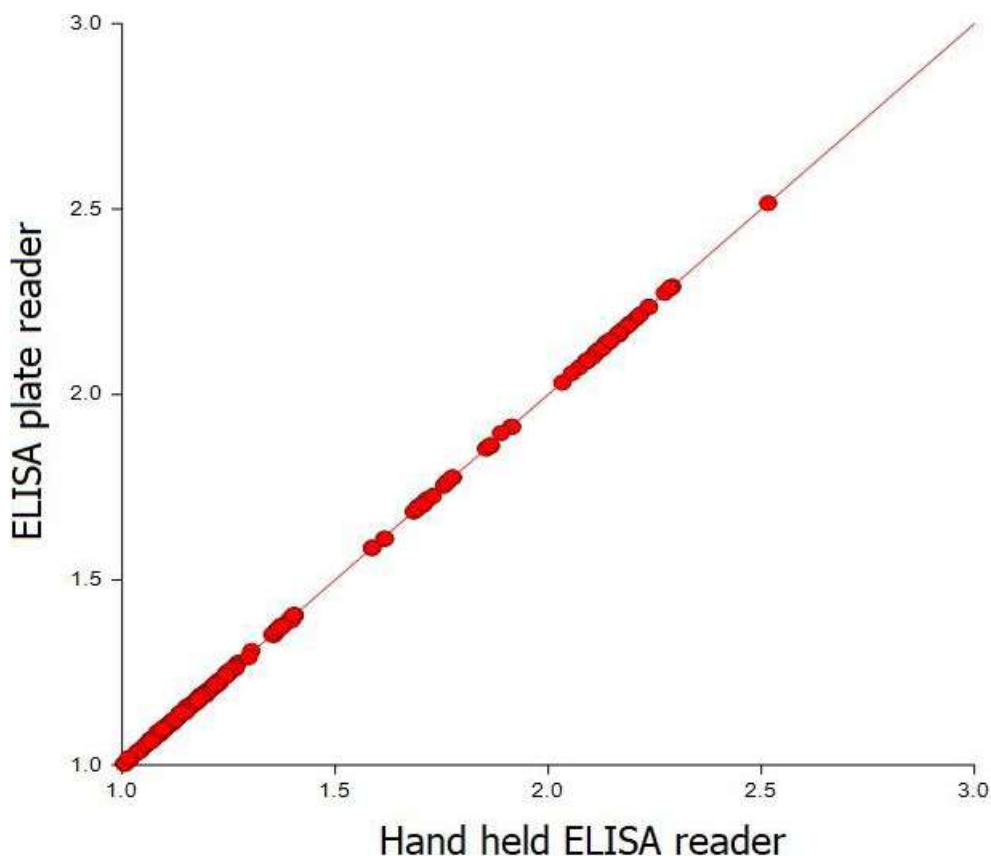

\*Note: TP- True positive (Reactive), TN- True negative (Non-reactive), FP- False positive, FN- False negative.

**Table 2. Statistical analysis of brucellosis diagnostic assays and comparison with different parameters**

Assay	Sensitivity %	Specificity %	PPV %	NPV %	Accuracy %
MRT	71.97 (0.00)	85.38 (0.75)	29.75 (15.27)	97.25 (3.09)	84.31 (0.60)
RBPT	75.51 (0.03)	87.07 (0.63)	33.45 (12.82)	97.64 (2.07)	86.15 (0.49)
Culture	100.00 (0.07)	100.00 (0.31)	100.00 (4.66)	100.00 (1.07)	100.00 (0.28)
Dipstick	87.37 (0.02)	99.67 (0.22)	95.84 (5.01)	98.92 (1.10)	98.70 (0.30)
Indirect ELISA	98.23 (0.30)	100.00 (0.18)	100.00 (4.51)	99.85 (0.48)	99.86 (0.04)

Values are represented in terms of percentage. Values in parenthesis represent 95% confidential intervals.

**Note:** PPV- Positive predictive value, NPV- negative predictive value.

### Discussion

These are widely used diagnostic assays for detection of *Brucella* specific antibodies in raw milk as well as in whole blood samples<sup>6, 34</sup>. Present study describes difference in accuracy of diagnostic method for detection of *Brucella* specific antibodies in collected samples. Relative performance of different diagnostics and obtained data by these method were shown in table 1. In-house developed method showed high sensitivity and specificity values that are also statistically significant over existing method.

Our results reveal that sensitivity and specificity of MRT was 71.97% and 85.38%, respectively. However, it is limited by milk quality and results may be false negative or false positive because of low ab concentrations, lack of fat-clustering factors<sup>25</sup> and contains colostrums or milk obtained from vaccinated or mastitis cows. Our results are in agreement with study carried out by Vanzini et al., (2001)<sup>35</sup> showed that MRT gives inaccurate results leading to misdiagnosis of brucellosis and its sensitivity and specificity is lower

than that of dipstick and ELISA<sup>22</sup>. Because of this, sLPS-based diagnostics were developed and preferentially used for detecting *Brucella* specific antibodies. RBPT is routinely used for multiple livestock species in endemic countries including India. It is a simple, cost effective, but requires refrigeration of antigen and has limitations of false positive results due to cross reacting antibodies against many gram negative bacteria<sup>7,27</sup>. Therefore, there is a great demand for development of simple tests that can be used in field with higher sensitivity and specificity.

The study proved that developed milk dipstick and iELISA are preferred as alternative method in field since existing method have limitations for individual screening of livestock affected with brucellosis<sup>12</sup>. Use of sLPS as an antigen candidate possible to detect brucellosis very rapidly and accurately and these clinical findings and results obtained were corroborate previous reports<sup>3,6,10</sup>.

### Conclusion

In present study, developed kits are very simple,

effective, inexpensive, user friendly, with high potential for POC diagnosis. Dipstick and iELISA showed 87.37%, 99.67% and 98.23%, 100% sensitivity and specificity respectively in comparison with culture as standard assay. It is proved that developed assays are highly stable, sensitive, specific and is recommended to field veterinarians to use for epidemiological studies and as complimentary diagnostic tools for detection of brucellosis under field conditions for individual dairy cattle or pooled bulk tanks at resource-limited areas.

# Effect of Recreational Therapy on Attention and Depression in School Children with Learning Difficulties

Rutuja Amit Lalingkar<sup>1</sup>, Trupti Saurabh Yadav<sup>2</sup>, Sayali Shreenivas Gijare<sup>2</sup>

<sup>1</sup>Intern, Department of Physiotherapy, <sup>2</sup>Assistant Professor, Department of Physiotherapy, Institution, Krishna Institute of Medical Sciences “Deemed to be” University, Karad

## Abstract

**Background:** Learning difficulty applies to those children who have significantly greater difficulty in learning than the majority of their age and who can't meet the “normal” requirements of a classroom. A study conducted in Chandigarh gave prevalence of learning disabilities of 3-10% among student population. There were more number of boys diagnosed with specific learning disability at a high risk for problems in attention, learning and psychological adjustment along with other associated behavioural problems. Recreational therapy utilizes leisure activities and other interest activities as interventions to address the needs of individuals with disability as a means of recovery and well-being.

**Method:** Forty school children with learning difficulties were selected and randomly divided in two groups. Group A subjects were given recreational therapy 4 times per week for 4 weeks and Group B subjects were given conventional treatment.

**Results:** Statistically significant difference in the Moss Attention Rating Scale (MARS) scores and Glasgow Depression Scale (GDS) scores were seen between the two groups. It indicated that there was significantly less inattention ( $p < 0.0001$ ) and less depression ( $p = 0.0207$ ) in the interventional group subjects.

**Conclusion:** Evidence to support the use of recreational therapy in reducing the depression and increasing the attention in school children with learning difficulties was provided in this study. This study will help in managing the associated problems like inattention and depression.

**Keywords:** Recreational therapy, Learning Disabilities, Mandala art therapy, Clay shape art therapy, School children, Attention, Depression.

**Abbreviations:** Learning Disabilities (LD), Moss Attention Rating Scale (MARS), Glasgow Depression Scale (GDS).

## Introduction

The term ‘learning difficulty’ has been applied to those children who have significantly greater difficulty

in learning than the majority of their age and who can't meet the “normal” requirements of a classroom. It is a non-categorical definition, including those who face difficulties learning one or more of the basic academic skills. Even the children with specific ‘Learning Disabilities’ are included.<sup>1</sup>

According to a study conducted in Chandigarh, the prevalence of learning disabilities (LD) is reported to be 3-10% among student population. There were more number of boys diagnosed with specific learning disability.<sup>2</sup> It is a very common problem seen in children who mostly gets ignored or underestimated by

parents and teachers. Many people think that the child is notorious or is not interested in studies and hence is having problems; but the fail to register the gravity of the situation. Awareness of this condition among parents is very important so that proper actions are taken towards the well-being of the child.

Recreational therapy in children with learning difficulty is a relatively new concept. According to previous studies, art therapy's effects on social, emotional and behavioural changes in children have been noted.<sup>3</sup> In a child with LD attention is often affected and when in company of same aged children, they feel incompetent. This incompetency may lead to an inferiority complex and depression. Recreational therapy has been reported to have healing effects. Hence we wanted to study the changes in attention and depression due to recreational therapy on children with learning disabilities.<sup>4,5</sup>

### **Materials and Method**

This study was conducted for the duration of 3 months. 100 school students of age 12 to 16 years were screened out for inattention and depression using learning disability index, of which 40 students were selected for the study. All the subjects were between 12 to 16 years of age with either one of the specific learning difficulty, their attention score was above 50 on MARS and depression score above 13 on GDS prior to the initiation of the intervention. The study was undertaken after obtaining the approval of Protocol committee and the Institutional Ethical committee of KIMS DTU. These subjects were then divided into 2 groups by simple random allocation method. Pre-treatment assessment of their attention and depression was taken with the help of Moss Attention Rating Scale and Glasgow Depression Scale respectively. Subjects in Group A were given recreational therapy intervention while subjects in Group B were given conventional treatment. In recreation therapy, the students were given a printed mandala design and they were asked to colour it and they were

also asked to make clay models of their liking and then name it. These tasks were to be performed within 30 minutes and were given for 4 days per week for 4 weeks. After 4 weeks post interventional scores of MARS and GDS were taken and statistics was done. Guardian's consent of all the participants was taken. Intra group analysis of these values within the group was done using Wilcoxon test and the Inter group analysis between the groups was done by Mann-Whitney test. INSTAT software was used for the interpretation of the data.

### **Results:**

In the present study pre-interventional mean of MARS was  $74.45 \pm 5.671$  in Group A subjects and  $74 \pm 5.191$  in Group B subjects, whereas post-interventional mean MARS was  $61.6 \pm 7.163$  in Group A and  $72.25 \pm 5.300$  in Group B. Intra group analysis of MARS revealed statistically reduction in post interventional MARS in both groups. This was calculated by using Wilcoxon test. Group A ( $p < 0.0001$ ), Group B ( $p < 0.0001$ ). Pre-interventional mean of GDS was  $14.85 \pm 0.7452$  in Group A subjects and  $14.8 \pm 1.240$  in Group B subjects, whereas post-interventional mean GDS was  $14.8 \pm 1.240$  in Group A and  $14.65 \pm 1.089$  in Group B. Intra group analysis of GDS revealed statistically reduction in post interventional GDS in group A but not in group B. This was calculated by using Wilcoxon test. Group A ( $p < 0.0001$ ), Group B ( $p = 0.2500$ ). Inter group analysis of post interventional values of MARS and GDS scores was done by using the Mann-Whitney test. Post intervention analysis of MARS showed extremely significant difference between both groups ( $p < 0.0001$ ) indicating that the subjects in group A showed less scores on attention scale when compared to subjects in group B. Similarly, post intervention analysis of GDS also showed significant difference between both groups ( $p = 0.0207$ ) revealing subjects of group A had significant decrease in depression scores when compared to subjects in group B.

**Graph 1: Age distribution**

The graph represents the distribution of number of subjects in each group according to their age. According to Fisher’s Exact test, the difference is considered as not significant (p value = 1.2589). Mean age was 15 years.

**Graph 2: Gender distribution**

The graph represents the distribution of number of subjects in each group according to their gender. According to Fisher’s Exact test, the difference is considered not significant (p value = 0.3406).

### Discussion and Conclusion

The current study is aimed to find the effect of recreational therapy on attention and depression in school children with learning difficulty when given

for 4 weeks. 40 subjects were selected based on the inclusion and exclusion criteria and were allotted in 2 groups by simple random sampling method. Objectives of this study were to find whether there is any effect of

recreational therapy on a child's attention and depression if the child is having learning difficulty; and if yes, how does it affect the child's daily activities.

School children between the age group of 12 to 16 years were screened before selecting the 40 subjects. Previously conducted research on children with learning difficulties showed that it was difficult to diagnose learning disability in early ages due to the ongoing development of the child. It was revealed that most diagnosed cases of learning disabilities were at or above the age of 11 years. Similarly, the mean age of the subjects in this study is 15 years.<sup>6,7</sup>

Learning difficulties of all types are most commonly observed in the male gender. A study conducted on British school children also suggests that there was preponderance of males over females among the group with specific reading difficulties but no difference was found in the specific arithmetic difficulties group.<sup>6,8</sup> In the present study equal number of male and female students were screened and out of them, 22 were male students and 18 were female students. When calculated by Fisher's Exact test, there was statistically no difference between the genders.

Children with learning difficulties are also associated with other problems like inattention, depression, psychological adjustment problems with behavioral problems.<sup>9</sup> Attention and depression of all the students was measured prior to the treatment. Attention of the child was measured by Moss Attention Rating Scale which has good utility as a quantitative measure of attention ( $r = 0.80$ ). This is a 22-point questionnaire which was initially used for measuring attention in children with traumatic brain injury.<sup>10</sup> Depressive symptoms of the students were also measured quantitatively by Glasgow Depression Scale which was specifically designed for subjects with learning disabilities. It has a comparatively good reliability than other tools ( $r = 0.97$ ).<sup>11,12</sup>

Treatment for both the groups was started 2 months prior to the exam period as this is the time with maximum stress on a child. In recreational therapy, the subjects were given 2 tasks to perform – 1) To color a printed mandala design and 2) To make a model from clay and name it. Both of these tasks were to be performed within half an hour.

Subjects in Group A were given recreational therapy which included mandala art therapy and clay shape therapy which was given for 4 days per week for

4 weeks. Prior to starting the intervention, the attention and depression of the child was measured using Moss Attention Rating Scale and Glasgow Depression Scale respectively. In mandala art therapy, the subjects were given a printed outline of a mandala design to color for initial 2 weeks; after that they were asked to draw and color the same design for next 2 weeks. Following that they were asked to make any model from clay and name it. According to a previous study the goals of mandala therapy include healing, focusing, stress reduction, and expression of emotions that may be too difficult to discuss verbally.<sup>13</sup> Similarly, clay shape art therapy also focuses on expression of mood and feeling, stretching the imagination, and problem solving.<sup>14</sup> Extremely significant differences in reduction of both the depressive symptoms and inattention of the students was noted after the set treatment protocol.

Group B individuals were given the conventional treatment which included academic assistance by their teachers and normal rehabilitation exercises which focused on the associated developmental coordination disorders or other developmental disorders. When compared the pre interventional and post interventional values of MARS and GDS in this group's subjects there was seen a significant reduction in the values of MARS but not so much difference or reduction in the values of GDS scores.<sup>15</sup>

After intervention for 4 weeks, post interventional measures of the MARS and GDS scores of subjects in both the groups were taken. Reduction in the values of MARS scores was seen in both the groups which indicated increased in the attention of students in both the groups. But Group A subjects showed significant difference in the values of GDS referring to decrease in the depression of those students whereas there was no difference in the GDS scores of Group B subjects indicating no effect on their depressive symptoms.

Intra group analysis of all the parameters revealed statistically increased attention in both the groups ( $p < 0.0001$ ) and decreased in depression in the experimental group ( $p < 0.0001$ ) but no difference in group B ( $p = 0.2500$ ). This was done by Wilcoxon test. Inter group analysis of all values was done using the Mann-Whitney test. Pre interventional values of MARS and GDS between both the groups showed no significant difference stating that before the initiation of intervention, the MARS scores ( $p = 0.7250$ ) and GDS scores ( $p = 0.8066$ ) of all the 40 students were similar. Post interventional

analysis of MARS showed extremely significant difference between both the groups ( $p < 0.0001$ ). post interventional analysis of GDS also showed extremely significant difference between both the groups ( $p = 0.0207$ ).

Statistically there was extremely significant difference in both the values showing significantly more improvement in subjects of Group A when compared to subjects in Group B, hence it can be stated as recreational therapy is more helpful in reducing depression and increasing attention in school children with learning difficulties.

**Conflict of Interest:** The authors of this study do not have any conflict of interests.

**Source of Funding:** This project was self funded by the author (s).

**Ethical Clearance:** The study was undertaken after obtaining the approval of Protocol committee and the Institutional Ethical committee of KIMS DTU.

Informed written consent of all parents was taken as the subjects were minor.

**Acknowledgement:** The authors would like to thank Dr. Mandar Malawade, Assistant Professor, Head of Department, Department of Pediatrics, Faculty of Physiotherapy, Krishna Institute of Medical Sciences Deemed To Be University, Karad for his contribution in the conceptin of the study and constant support throughout the study duration.

# Human Papilloma Virus Infection Status and Oral Cancer Incidence in South India–Lack of Evidence and its Current Impacts

S. Karthika Nagarajan<sup>1</sup>, Usha Subbiah<sup>2</sup>

<sup>1</sup>Reader/Research Fellow, Center for Oral Cancer Prevention and Research, Department of Oral Pathology & Microbiology, <sup>2</sup>Assistant Professor, Human Genetics Lab, Sree Balaji Dental College and Hospitals, Bharath Institute of Higher Education & Research

## Abstract

HPV status in relation to occurrence of oral and oropharyngeal carcinomas has been a less explored arena in the Indian Subcontinent. Lack of data on variation in the occurrence of high risk HPVs across India necessitates a region wise update on HPV status. The literature search shows current evidence of overall HPV prevalence to be 3.1 to 73.6% throughout the country and most frequently isolated high risk type was HPV16. The incidence of oral cancer especially posterior tongue associated cancers are on the rise and is becoming more common in non-tobacco users and further studies in this regard might open the way for further insight into head and neck cancers caused by HPVs in India. This brief report summarizes the need for a more detailed analysis in regard to the prevalence data obtained and the methodologies used to arrive at the same.

**Keywords:** *Human papilloma virus, oral cancer, oropharyngeal cancer, prevalence, South India.*

## Introduction

Head and neck squamous cell carcinoma (HNSCC) associated with Human Papilloma Virus (HPV), arise predominantly from mucous membranes in the region of the lingual and palatine tonsils<sup>1</sup>. The major risk factors are related to sexual behaviour and marijuana use<sup>2,3</sup> and occur four times more frequently among men than women in the United States<sup>4</sup>. Persons with Oral Pharyngeal Squamous Cell Carcinoma (OPSCC) in which HPV can be detected intracellularly have a better prognosis than persons with HPV cytonegative OPSCC<sup>5</sup>. Human papillomavirus type 16 (HPV16) is associated with the rapid increase in incidence of oropharyngeal cancer in USA, Sweden, and Australia, where it causes more than 50% of cases<sup>6</sup>.

**Purpose:** The purpose of this communication is to ensure a valid measurable scale on which the HPV Due to lack of organized HPV screening program, insufficient infrastructure and trained manpower and inadequacy in cancer registries, not much data available on the countrywide HPV prevalence and its type

distribution in different cancers in India. Forthcoming introduction of recently developed HPV vaccines in India has given a new urgency to know the prevalence and distribution of various HPV types in different organ sites for the management and monitoring of vaccination program and its impact on prevalence of other cancers<sup>7</sup>. The purpose of this short communication is to emphasize the need for obtaining a reliable evidence to implement the above mentioned programs.

**HPV induced Cervical Cancer Status in South India:** A study done on Indian Population subjected to cervical cancer screening reveals the prevalence of high risk HPVs in this population and the most recorded types are HPV 16 (58%), HPV 18 (16.7%), HPV 33 (2.7%), HPV 35 (5.6%), HPV 45 (5.6%), HPV 58(2.7%) and HPV 52(2.7%)<sup>8</sup>. A case-control study undertaken in Chennai, Southern India reported HPV prevalence as high as 99.4% in their invasive cervical cancer samples<sup>9</sup>

**HPV induced Head and Neck Cancer worldwide:** A recent systematic review of the literature showed oral HPV16 prevalence was 1.3% among healthy individuals

and appeared to differ by geographic region, although significant heterogeneity between studies due to in part to differences in specimen collection, processing and testing limited conclusive interpretation of the data<sup>10,11</sup>. A study done in US population revealed that incidence rates for HPV-positive oropharyngeal cancer have substantially increased among men during the past 3 to 4 decades, while rates have only modestly increased among women<sup>4</sup>. This had been attributed to the changes in sexual pattern among men<sup>12</sup>.

**HPV induced Head and Neck Cancer status in South Indian scenario:** Recent studies conducted in a region of Southern India has demonstrated lack of observance of HPV DNA in Oral cancers experienced by their population and they attribute these findings to varied cultural and religious practices prevalent in the region<sup>13</sup>. A study established that HPV-16 & 18 was the most detectable virus in salivary samples, serum and biopsy cell blocks of the patients with pre-malignant lesions & Oral Squamous cell Carcinomas<sup>14</sup>. The national registry in India on HPV datas have demonstrated that the most common types of High risk HPVs found in this population based on studies available till now are HPV-16 (2.7 to 61%), HPV 18(0.8 to 47.3%), HPV 35 (0,4%) and low risk HPVs 11,6 being 19.6, 11.3 respectively in an available single study (Table 1). The registry also points out that there are no studies available in India to demonstrate prevalence of HPV in oropharyngeal cancers<sup>15</sup>.

## Discussion

Considering the current data; there is a need for further evidence to clearly demonstrate that HPV induced Oral cancer is not prevalent in the region of Southern India as mentioned in the previous studies<sup>13</sup>. The methodology used for sample collection, the method used for processing and the analysis needs to be standardized in order to come to a uniform conclusion that can be agreed on by all authorities.

Most of the studies done within India have utilized fresh biopsy specimens to obtain material for the PCR studies followed by Paraffin embedded tissue blocks, cytology and salivary rinse. The prevalence percentage obtained from studies that have performed PCR on Paraffin embedded sections as well as one study available on salivary rinse projects a high HPV status showing 73.6, 62.2 and 62.3%. The studies where the PCR was performed on fresh tissue specimens obtained from biopsy sites showed 32.4, 15.2, 3.1 and 27.3% prevalence (Table 2). Further when there is prevalence of HPV type 16 and 18 in salivary samples<sup>16</sup>; the comparable data regarding the non-observability of these viruses in oral biopsy specimens also points out to the need for better method in retrieving these viral particles from the fresh tissues. This is possible by cross checking the various methodologies used in the previous studies.

**Table 1: Current available studies for the prevalence of HPVs in India**

Study	HPV detection method	Number of samples tested	HPV prevalence type	95% CI	Most frequent HPVs prevalent
Balaram 1995	PCR	91	73.6	63.7 - 81.6	Type 6: 13 Type 11:20 Type 16: 42 Type 18:47
Bhattacharya 2009	PCR	193	62.2	55.2 – 68.7	Type 16: 60.1 Type 18: 5.2
Chaudhary 2010	PCR	222	32.4	26.6 – 38.8	Type 16: 33.6
D'Costa 1998	PCR	99	15.2	9.4 – 23.5	Type 16:15 Type 18:0
Herrero 2003	PCR	262	3.1	1.6 – 5.9	Type 16: 3.9 Type 18: 0.8 Type 35: 0.8
Mishra 2006	PCR	66	27.3	18.0- 39.0	Type 16: 18
Kulkarni SS 2011	PCR	255	62.29	-	Type 16: 2.75 Type 18: 21.96

**Figure 1: Forest plot to show the distribution of cases in the 7 available studies**

**Table 2: Various types of samples used for testing and the method used in the previous studies**

Study	Type of Sample	Method Used
Balaram 1995	Paraffin embedded section	PCR
Bhattacharya 2009	Paraffin embedded section	PCR
Chaudhary 2010	Fresh tissues in PBS, Cytology	PCR, HC-II
D'Costa 1998	Cytology	PCR, Southern blot
Herrero 2003	Fresh tissue, cytology, serum	PCR, ELISA
Mishra 2006	Fresh tissues in PBS	PCR,
Kulkarni SS 2011	Saliva rinse	PCR

Our attempt to generate a forest plot (figure 1) with the seven available studies resulted in a picture that emphasized the difference between the seven studies and the similarities between Balaram et al. (1995), Bhattacharya et al. (2009) and Kulkarni SS (2011) which showed an average prevalence to be 66.03 and the methodology utilized were from paraffin embedded sections. The studies done by Chaudhary et al. (2010) and Mishra et al. (2006) on fresh tissue biopsied tissue stored in Phosphated Buffered Saline (PBS) showed the average prevalence of 29.9 giving a varied trail of the situation. The available data shows the need for a pooled in statistical picture that cannot be more emphasized under the current situation.

**Conclusion**

The available studies may not be sufficient to arrive at a conclusive status about the High-risk HPVs in Southern region of India. A study using more

representative samples done using reliable method that would eventually help in a meta-analysis would be beneficial under the current circumstances.

## Abstract

Assessment of Knowledge, Attitude And Practice On Immunization Among Primi Mothers of Children In Poonchery Village, KanchipuramDist, Tamilnadu, India. The Objectives of the study were to assess the existing level of knowledge, attitude and practice on immunization among primi mothers of children and to find out the association between the level of knowledge, attitude and practice on immunization and the selected demographic variables of primi mothers of children. The sampling technique was Non probability Snowball-Sampling technique with 169 samples of primi mothers. There was no significant association between the selected demographic variables. The data collection for the main study was done. The collected data was tabulated and analyzed descriptive and inferential statistics were used. The shows that primi mothers 73.3% had adequate knowledge, 14.7% had moderate knowledge, and 11.8% inadequate knowledge regarding immunization among primi mothers of children. Majority of primi mothers 92.9% had positive attitude, 7.1% had undecided attitude and no negative attitude regarding immunization among primi mothers of children. Majority of primi mothers 91.7% had desirable practice and 8.3% had undesirable practice regarding immunization among primi mothers of children.

**Keywords:** *Immunization, Primi mothers, knowledge, attitude and practice.*

## Introduction

In 1974 the globe health organisation (WHO) launched its expanded programme on protection (EPI) against six most typical preventable childhood diseases viz. Diphtheria, pertusis (whooping cough), tetanus, polio, infectious disease and contagion, from the start of the programme United Nations International Children's Emergency Fund has been providing important support

to Eysenck Personality Inventory<sup>2</sup>. United Nations International Children's Emergency Fund worked with WHO to achieved universal childhood protection of the six Eysenck Personality Inventory vaccines. As a results of international protection coverage accrued from but twenty you have to nearly eighty you curious about 1990. Nearly thirty million kids area unit still not absolutely insusceptible per annum<sup>2</sup>.

Subsequently, in 1985 the Indian government launched the Universal protection Programme (UIP) with a mission to attain protection coverage of all infants and pregnant girl by the 1990's. It become a district of kid Survival and Safe relationship Programme in 1992 and is presently one amongst the key areas below National Rural Health Mission (NHRM) since 2005<sup>4</sup>. The program consists of vaccination for seven diseases – infectious disease, diphtheria, pertussis, tetanus, acute anterior poliomyelitis, measles, and viral hepatitis. viral hepatitis was intercalary to the UIP in 2007. The

national protection schedule includes of these vaccines that area unit given freed from price to any or all kids of the country below Eysenck Personality Inventory<sup>2</sup>.

Immunization prevents health problem, incapacity and death from vaccine-preventable diseases together with cervical cancer, diphtheria, viral hepatitis, measles, mumps, respiratory disease (whooping cough), pneumonia, polio, retrovirus, diarrhea and tetanus<sup>3</sup>. Global vaccination coverage remains at eighty fifth, with no important changes throughout the past few years. Uptake of recent and under used vaccines is increasing<sup>3</sup>.

**Statement of the Problem:** A descriptive study to assess the knowledge, attitude and practice on immunization among primi mothers of children in Poonchery village, Kanchipuramdist, Tamilnadu, India.

### Objectives:

1. To assess the existing level of knowledge, attitude and practice on immunization among primi mothers of children.
2. To find out the association between the level of knowledge, attitude and practice on immunization and the selected demographic variables of primi mothers of children.

### Operational Definition:

**Assess:** It is the organized, systematic and continuous method of aggregation information from primi mothers of children regarding immunization<sup>6</sup>.

**Knowledge:** Knowledge refers to the obtained reality regarding immunization. It refers to the data on immunization among primi mothers<sup>6</sup>.

**Attitude:** Attitude refers to a plan or opinion regarding immunization<sup>6</sup>.

**Practice:** The particular application or use of a plan, belief or method, as against theories regarding immunization among primi mothers<sup>6</sup>.

**Immunization:** Immunization is that the method whereby someone is created immune or proof against associate communicable disease, usually by the administration of a vaccine. Vaccines stimulate the body's own system to shield the person against ensuant infection or sickness<sup>4</sup>.

**Primi Mother:** A women who has delivered the first child<sup>5</sup>.

**Child:** Child refers to a boy or girl from the time of birth until he or she is an adolescent<sup>5</sup>.

## Material and Method

**Research Approach:** Quantitative, Evaluative approach seems to be the most appropriate approach for this study.

**Research Design:** Non interventional descriptive design was seems to be the most appropriate design for this study.

**Research Setting:** The present study was conducted at Poonchery village in Kanchipuramdist, Tamilnadu, India.

**Sample and Sample Size:** Mothers who were having children either male or female between the age of 0-6 years available at Poonchery village, Kanchipuram District, Tamil nadu, India.

Non probability Snowball-Sampling technique was used to select the mothers of children and the sample size was 169 based on population proportion and the open-epi sample size determination.

### Sample Criteria:

**Inclusion Criteria:** The study includes the mothers of children who are:

- Having less than the age of 5 years.
- Able to understand Tamil or English.
- Available at the time of data collection.
- Willing to participate in the study.

**Exclusion Criteria:** The study excludes the mother and children who were

- More than the age of 5 years.
- Having critically ill children.

**Data Collection Procedure:** Structured interview schedule was used to assess the data of demographic variables and the level of knowledge on foreign body obstructions. Data was collected for a period of one week. The data was collected after proper information and getting informed consent from the mothers.

### Research Tool:

**Part-I:** Selected demographic variables of primi mothers of children such as age of the mother, education,

occupation, source of information, age of the child, sex of the child, number of the children, order of children, immunization status, place of immunization.

**Part-II**

**Part 2(a):** A structured questionnaire is used in this study which includes 10 multiple choice questions. Each correct answer carries “1” (one) mark and wrong answer carries “0” (zero) mark. The maximum score is 10 and minimum score is 0.

**Part 2(b):** A structured 5 point likert scale is used in this study which includes 10 questions. Each Negative statement score interpretation order is 5,4,3,2,1 and Positive statement score interpretation order is 1,2,3,4,5. The maximum score is 50 and minimum score is 10.

**Part 2(c):** A structured checklist is used in this study which includes 5 items. For each desirable answer score of “1” (one) mark is given and undesirable answer score of “0” (zero) mark is given. The maximum score is 25 and minimum score is 5.

**Score Interpretation:**

**Part 2(a):** Standardized structured interview questionnaire to assess the knowledge on immunization.

Score	Percentage (%)	Inference
1-5	<50%	Inadequate Knowledge
6-7	50-75%	Moderately Adequate Knowledge
8-10	76-100%	Adequate Knowledge

**Part 2(b):** Structured 5 point likert scale to assess the attitude on immunization.

Score	Percentage (%)	Inference
1-25	<50%	Negative Attitude
26-35	50-75%	Undecided Attitude
36-50	76-100%	Positive Attitude

**Part 2(c):** Structured checklist to assess the practice on immunization.

Score	Percentage (%)	Inference
1-12	<50%	Undesirable Practice
13-25	51-100%	Desirable Practice

**Analysis and Interpretation:** The study shows that majority of 53% mothers belong to the category of 26-30, 32% mothers belong to the category of 20-25 & 15% of mothers belong to the category of 31-35 years. Most of them 33% were belong to the category of Primary education. Very few 26.1% were belong to Daily wages. Most of them 60% were gains information through the doctor, 39% of mother gain information through Health workers & 1% of mother gains information through the family.

The study shows that majority of 42.1% of children belong to category 2-4 years, 40.8% of children belong to 4-5 years & 17.1% belong to the category of 0-2 years. Most of them 52.6% were female & 47.4% belong to male children. Majority of 91.7% having immunization card, 8.3% of children does not have card. 74% of children were fully immunized & 44% of children were partially immunized. 68.6% of children were immunized in government% & 31.4% of children were immunized in private.

The study shows that majority of 73.3% of primi mothers having adequate knowledge on immunization, 14.7% of primi mothers having moderate knowledge & 11.8% of primi mothers of having inadequate knowledge. Most them 92.9% were primimothers having positive attitude on immunization & 7.1% of primi mothers having undecided attitude on immunization. Most them 91.7% were primimothers having desirable practice on immunization & 8.3% of primimothers having undesirable practice on immunization. Regarding association with demographic variables there is no significant association with the demographic variables like occupation, age of child, sex of child, and place of giving immunization.

Figure 1: Percentage distribution of knowledge of the primi mother: N=169

Table 1: Association between Attitude on immunization & demographic variables among primi mothers of children. N=169

S.No.	Characteristics	Category	Undecided Attitude		Positive Attitude		P value
			N	P(%)	N	P(%)	
1.	Occupation	Home Maker	7	4.1	118	69.8	(P)3.84> 2.151 (X <sup>2</sup> ) Accepted at 0.05 Level (NS)
		Daily wage	5	2.9	39	23.1	
2.	Sex of Child	Male	5	2.9	84	49.7	(P)3.84> 0.645 (X <sup>2</sup> ) Accepted at 0.05 Level (NS)
		Female	7	4.1	13	7.6	
3.	Place of Giving Immunization	Government	7	4.1	109	64.4	(P)3.84> 0.609 (X <sup>2</sup> ) Accepted at 0.05 Level (NS)
		Private	5	2.9	48	28.4	

### Conclusion

This study concluded that primi mothers 73.3% had adequate knowledge, 14.7% had moderate knowledge, and 11.8% inadequate knowledge regarding immunization among primi mothers of children. Majority of primi mothers 92.9% had positive attitude, 7.1% had undecided attitude and No had negative attitude regarding immunization among primi mothers of children. Majority of primi mothers 91.7% had

desirable practice and 8.3% had undesirable practice regarding immunization among primi mothers of children. The mother’s knowledge, attitude and practice on immunization is a crucial factor for the reduction of morbidity and mortality related to immunization.

**Conflict of Interest:** Nil
