Conclusion: The present study shows that aqueous seeds extract of *Avocado* can be used efficiently for the synthesis of copper nanoparticles at room temperature. The synthesized copper nanoparticles were found to be stable at room temperature. The green synthesized method is convenient, eco-friendly and can be applied in various applications and the use of *Avocado* has added advantages that the plant has many medicinal properties.

Keywords: *Green synthesis, nano-medicine, avocado, cytotoxicity.*

Introduction

Copper is used as a magical element, as it possesses antimicrobial, anti-inflammatory, and angiogenic properties it is used in the treatment of skin injuries, most importantly wound healing [1-3]. Nanotechnology, in the present century has its own importance in several fields owing to its properties such as its ability to modify the structure of molecules at the atomic level as they show superior optical, electronic, magnetic, thermal and sensing functionalities [4,5]. Copper oxide nanoparticles, with a band gap of 2.1 eV, is of much importance in the current days owing to its intrinsic properties and its applications in several fields such as photochemical catalysis, biosensing and electrochemical sensor, gas sensor, and solar energy conversion [6,7]. They also possess several other unique properties such as high specific surface area, good electrocatalytic activity and promotes electron transport reactions at a lower overpotential. In the study conducted by Rajeshwari Sivaraj et al., copper oxide nanoparticles were synthesized by biological method using aqueous extract of *Acalypha indica* seeds and was characterised by TEM analysis which showed that the copper oxide nanoparticles established best antimicrobial and anti-cancer activity and the characterization of copper oxide nanoparticles was done by using UV visible spectroscopy, X-ray diffraction assay (XRD), FT-IR, Scanning Electron

Microscope (SEM), TEM and Energy-dispersive X-ray spectroscopy (EDX) analysis and was found out that the synthesized particles were spherical in nature and the particle size was in the range of 26-30 nm [8]. The wound healing capacity of copper oxide nanoparticles was shown in the study conducted by Mradul Tiwari et al., where the antimicrobial activity of copper oxide nanoparticles and copper sulphate were compared against Escherichia coli, Bacillus subtilis, Pseudomonas aeruginosa and Staphylococcus aureus by agar diffusion and broth dilution methods. There are several routes to synthesize copper oxide nanoparticles, such as sonochemical, microwave irradiations, alkoxide based route, sol-gel technique, one step solid state reaction at room temperature and electrochemical methods. Several studies have shown that biosynthesis of metallic nanoparticles is more useful for its biological application [9,10]. In this present investigation, we have used *Aloe vera* and *Azadirachta indica* based herbal formulations and synthesized copper oxide nanoparticles using these plant extracts. The synthesised nanoparticles was characterised using UV-vis spectrophotometer and TEM.

Materials and Method

Preparation of plant extract

Avocado seeds were collected from Chennai. The collected seeds were washed 3-4 times using distilled water. Then dried it in shade for 7-14 days (Figure 1). The well dried seeds were made into a powder by using mortar and pestle. The collected powder was stored in an air tight container. 1g of avocado powder was dissolved in distilled water and boiled for 5-10 minutes at 60-70 degree Celsius. The solution was filtered by using Whatman no.1 filter paper. The filtered extract was collected and stored at 4 degree Celsius for further use.

Synthesis of Copper nanoparticles

1 milli molar of copper acetate dissolved in 80 ml of double distilled water. The extracts of avocado seed added with the metal solution and was made into 100 mL solution. The color change was observed visually and photographed. The solution is kept in magnetic stirrer for nanoparticles synthesis.

Characterization of copper nanoparticles

The synthesized nanoparticles solution is preliminarily characterized by using UV-vis spectroscopy. 3 mL of the solution is taken in the cuvette and scanned in double beam UV-vis spectrophotometer from 300 nm to 700 nm wavelength. The results were recorded for the graphical analysis.

Preparation of nanoparticles powder

The nanoparticles solution is centrifuged using lark refrigerated centrifuge. The copper oxide nanoparticles solution is centrifuged at 8000 rpm for 10 minutes and the pellet is collected and washed with distilled water twice. The final purified pellet is collected and dried at 100-150 degree Celsius and finally the nanoparticles powder is collected and stored in an airtight eppendorf tube.

Figure 1: Avacado seeds

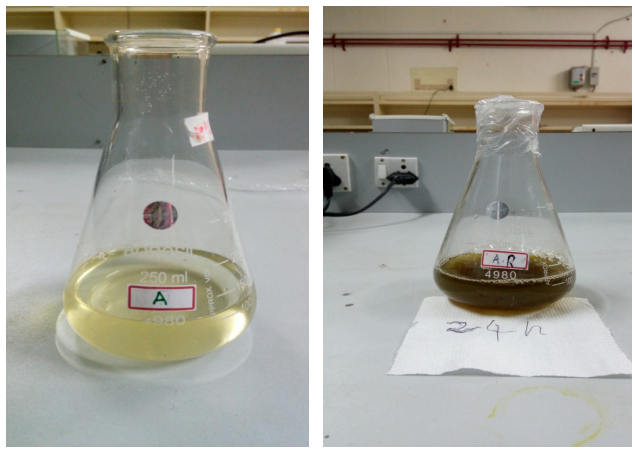

Figure 2: Visual observation

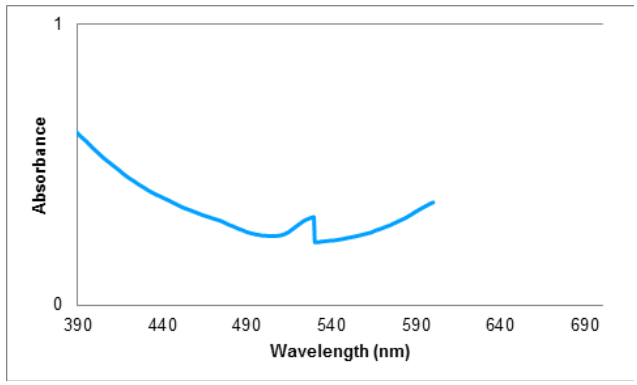

Figure 3: UV-vis Spectroscopy

Figure 4: Cytotoxic effect

Results and Discussion

Visual observation

UV-vis spectroscopy

The copper oxide nanoparticles showed strong peak at 520 nm confirms the copper nanoparticles synthesis. This may be due to the surface plasmon band of Cu colloids formation of non-oxidized CuNPs [11].

Cytotoxicity

CuO nanoparticles exhibited free radical scavenging activity that increased in 1 h, which is relatively higher in comparison with other metal oxide nanoparticles. The cytotoxic activity of the nanoparticles was found to increase in a dose-dependent manner.

When the copper oxide nanoparticles extracted from avocado seeds were injected into the culture containing shrimp larvae it was observed that it can inhibit the growth of the cells, which means that they also have the potential to inhibit the growth of normal human cell, since its growth pattern resembles that of shrimp larvae. So this can be also applied to carcinogenic cells as carcinogenic cell is also a normal cell with increased metabolic and rapid division. Thus, we come to a conclusion that it can also be used to cure cancer, as this method is purely natural and lesser side effects compared to the artificial chemical drugs and other therapy which has major side effects in the body. Thus, we conclude by saying that copper nanoparticles synthesized from avocado seed extract have high cytotoxic effects.

Conclusion

The present study shows that aqueous seeds extract of avocado can be used efficiently for the synthesis of copper nanoparticles at room temperature. The synthesized copper nanoparticles were found to be stable at room temperature. Formation of copper nanoparticles was confirmed by UV-vis spectroscopy. The sharpening of the peaks from powder diffraction study clearly indicates that the particles were spherical in nature. The green-synthesized method is convenient, eco-friendly and can be applied in various applications and the use of *Avocado* has added advantages that the plant has many medicinal properties

Anatomical Variations and Morphometry of Foramen Spinosum in Dry Adult Human Skulls-A Forensic Study

Radhika MI[1], Thenmozhi MS [2], Mahesh Ramakrishnan[3]

[1]Graduate Student, [2]Professor and head, Department of Human Anatomy, [3]Reader, Department of Pedodontics, Saveetha Dental College & Hospitals, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract

Background: Foramen spinosum is an important opening on the infratemporal surface of the greater wing of sphenoid bone and lies posterior to the foramen ovale. It transmits the middle menengial vessels and nervous spinosum. It can be identified both from the interior and exterior of the skull base.

Aim: To Understand the anatomy and Morphometry of the foramen spinosum in different skulls of South Indian population and to determine the exact range of measurement, the variations, asymmetry and inequality of size seen in foramen spinosum

Materials and method: Thirty dry skulls were examined for the foramen spinosum in the middle cranial fossa and at the extra cranial view at the skull base. The type of foramen spinosum will be classified according to its shape. The data were recorded and tabulated.

Results: The mean length of foramen spinosum was 2.534±0.610mm and the mean width was 2.36±0.57mm.

Conclusion: The study showed variations in the size and shape and irregularity affecting the margins of the foramen spinosum.

***Key words**: Foramen Spinosum, Middle Cranial Fossa, Middle Menengial Artery*

Introduction

The study of the skull and its foramen is of great importance to anatomists, anthropologists, forensic experts and clinicians. The size and measurements of the foramina and variations in the same are clinically significant keeping in mind the delicate neurovascular structures that transverse them. The parameters include frequency of occurrence, dimensions, bilateral symmetry and variations seen.

The foramen spinosum is an important landmark in skull base situated in the middle cranial fossa. It can be identified both from the exterior and interior of the skull base. It lies posterolateral to the foramen ovale and transmits the middle menengial vessels and nervous spinosum. The perfect ring shaped formation of the foramen is observed by the 8th month after birth and latest by 7 years after birth. The foramen is very small compared to foramen ovale and is usually round in shape.

The present study aims at determining the exact range of measurements, the variations, asymmetry and inequality of size seen in the foramen spinosum in the South Indian skulls in the Anatomy Lab of Saveetha Dental College.

Materials and Method

Thirty dry skulls were examined for the foramen spinosum in the middle cranial fossa and at the extra cranial view at the skull base. The type of foramen spinosum was classified according to its shape. The diameter was also measured along with the total area. The measurements were taken with the help of vernier calipers and a metal scale.

Results

The mean length of foramen spinosum was 2.534±0.610mm and the mean width was 2.36±0.57mm. (Table 1) On the individual sides, mean length on the right side was 2.55±0.61mm, mean width was 2.36±0.55 and the mean area was 4.98±1.66mm^2. On the left side, the mean length was 2.52±0.36mm, the mean width was 2.36±0.57mm, and the mean area was 4.91±1.703mm^2. (Table 2) The maximum length on the right side was 3.52mm, maximum width was 3.22mm and the maximum area was 8.55mm^2. The maximum length on the left side was 3.26mm, maximum width was 3.42mm and the maximum area was 8.04mm^2. In 6.66% of the skulls, the foramen was oval. In 90% of the skulls, the foramen was round and in 3.33% of the skulls, the foramen was absent. (Table 3) In 100% of the skulls, the foramen was singly placed.

Table 1:Length of the foramen

Class Interval	Right	Left
< 2.00	3	3

3.01 - 4.00	1	1
4.01 - 5.00	11	12
5.01-6.00	9	8
6.01-7.00	1	2
>7.00	4	3
Absent/Incomplete	1	1

Discussions

In the present study, considerable variations in the morphometry of the foramen spinosum can be observed. The characteristics of the foramen were observed both from the extracranial view of the skull base and the middle cranial fossa. The difference between the mean lengths and widths of the foramen spinosum on the left and right sides of male and female skulls is not statistically very significant.

In a study conducted by Anju L *et al* on 35 dry adult skulls, the foramen spinosum was a permanent feature on the right side of the skull but on the left side it was absent in 2 skulls. The maximum length of the foramen spinosum was 4.5mm and the minimum was 2mm. The maximum width of the foramen spinosum was 2.5mm and the minimum was 1mm [1-2]. In the study conducted by Lanprai K *et al* on 103 Thai adult dry skulls, the foramen spinosum was found on both sides of the extracranial view for only 57.3% of the skulls, whereas a unilateral foramen was seen in 52.4% of the skulls [3-5]. In a study conducted by Namita A and Rajendra S, only 4% of their skulls observed showed confluence of the foramen ovale with the foramen spinosum – both unilaterally on the left side [5-11]. In the study conducted by Kulkarni S *et al*, the length of the foramen spinosum was ranging from 2mm to 4mm [9]. Thus these results are comparable with those obtained in the present study. Foramen spinosum is utilized as a landmark for various procedures involving the middle cranial fossa, the bilateral duplication of the foramen may be disorienting to the surgeon. Thus a thorough knowledge in variations of Foramen spinosum in our Indian population will be of help to the surgeon while performing cranial surgeries.

Conclusions

Variations in the size and shape and irregularity affecting the margins of the foramen spinosum as observed in the study can be attributed to the abnormality during ossification of the sphenoid from initial to final stage of ring formation. Persistence of such morphology can be due to variation in the course of structures passing through this foramen. This is of great clinical importance, and recognition of this variation is worthwhile as it can interfere during approach to middle cranial fossa for diagnosis of various vascular diseases and for the safe surgery for trigeminal neuralgia.

Prevalence and Length of Anterior Loop of Inferior Alveolar Nerve

Prasanthi Sitaraman[1], Arvind Muthukrishnan[2]

[1]Postgraduate Student, Department of Oral Medicine and Radiology, [2]Professor and Head, Department of Oral Medicine and Radiology, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Background: Interforaminal region of mandible is often related to neurovascular complications during surgical procedures such as implant placement and during harvesting bone graft. This is due to anatomic variations such as the anterior looping of inferior alveolar nerve and the lingual vessels. Cone Beam Computed tomography (CBCT) is an imaging modality with which such anatomical variants can be visualized and necessary modifications can be made during pre – surgical phase of implant placement. This study aims at identifying the prevalence and the length of anterior loop of inferior alveolar nerve using CBCT.

Materials and Method: 50 patients scanned using Sirona Orthophos XG device for the purpose of implant placement were included in this retrospective study. Using the device's software, the inferior alveolar nerve was traced and marked in each included CBCT volume. The length of the anterior loop was measured with AutoCAD 2018 software using the reconstructed 3D model of the scan.

Results: Of the 50 selected CBCT volumes, 33 volumes had anterior looping of inferior alveolar nerve. The mean length of the loop observed in the selected patients was 0.42 ± 0.40 mm on the left side and 0.42 ± 0.31 mm on the right side. For males, the mean length of the loop was 0.42 mm on the left side and 0.42 mm on the right side. For females, the mean length was 0.40mm on the left side and 0.45mm on the right side.

Conclusion: The anterior loop of inferior alveolar nerve is quite common in south Indian population. The looping has to be assessed before implant placement in the anterior mandibular region so as to identify and prevent neurovascular complications.

***Key words**: Implant placement, Interforaminal region, CBCT Imaging, Anterior Loop, Inferior Alveolar Nerve.*

Introduction

The anterior mandibular region, commonly known as the interforaminal region, is frequently associated with neurosensory and vascular complications during implant placement and other surgical procedures like bone graft harvesting. The major cause of neuropathic complications, such as paresthesia of lower lip and chin region, is due to the damage of the inferior alveolar nerve, particularly the anterior loop. The inferior alveolar nerve, a branch of the posterior division of the mandibular nerve divides into the mental and incisive branches. After division of the incisive branch, the main branch moves anteriorly and curves back to form a '8 – like' shape when viewed on a coronal section of a radiograph before exiting through the mental foramen [1]. The anterior loop of inferior alveolar nerve is frequently

E-Mail arvindmuthukrishnan@yahoo.com
Mobile: +91-9444303303

encountered in patients as an anatomical variant. During pre – operative radiographic examination for analysis of bone width and height for implant placement, the presence of anterior loop of mental foramen should to be examined.

Panoramic radiography was initially used for the diagnosis of anterior loop [2,3]. Potential for identification of anterior loop with panoramic radiography was suggested [2,4,5]. With the advent of Cone Beam Computed Tomography (CBCT), many studies have shown that CBCT is a superior imaging modality when compared to panoramic radiography [6–9] . It is preferred for pre – surgical planning for implant placement [10–13] ¨CBCT image quality is proven to be comparable or superior to CT for the evaluation of maxillofacial region. CBCT is also demonstrated to have high precision, accuracy and reliability for the detection of anterior loop of inferior alveolar nerve with low cost and lower radiation exposure when compared to CT [14]

A 'safe distance' or 'safe margin' for implant placement in the interforaminal region has been proposed in the presence of anterior loop [15,16]. A margin of 4 to 5 mm from the anterior loop or 21mm from the genial tubercle is suggested to enable complications – free implant placement in the anterior mandible.

The present study aims to assess the prevalence and length of anterior loop of inferior alveolar nerve in south Indian population using CBCT.

Material and Method

The CBCT volumes of 50 randomly selected subjects (25 females and 25 males) who underwent CBCT for implant assessment consisting of 100 quadrants were inspected retrospectively for the presence of anterior loop of inferior alveolar nerve. All the patients were scanned using Sirona Orthophos (85 KVp, 10 – 14 mA, 5s). The inclusion criteria was all partially edentulous patients between 18-50 years who underwent CBCT examination for pre – surgical assessment for implant placement. The exclusion criteria was patients under 18 years of age, orthodontic patients, unclear mandibular canals or under diagnostic CBCT volumes and pathologies in the line of mandibular canals.

For the selected scan volumes, nerve tracing was done using the device's software (GALILEOS viewer). The screenshot of 3D reconstruction obtained from the software was imported into AutoCAD 2018. The mental foramen was traced. Two parallel lines were drawn at the anterior point of mental foramen and anterior point of anterior loop (Figure 1). The distance between the lines were measured for all the 100 quadrants and tabulated.

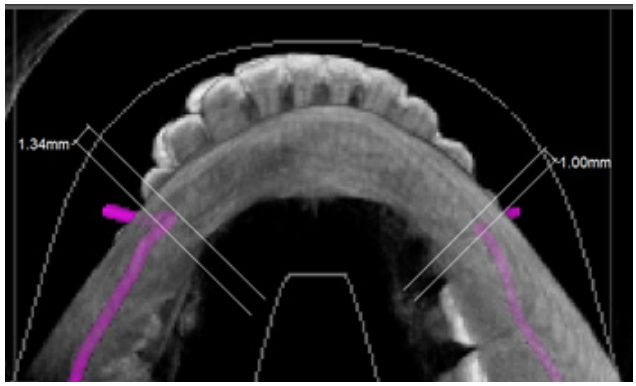

Figure 1 Measurements of anterior loop length using AutoCAD 2018

Results

Of the 100 quadrants evaluated for the prevalence of anterior loop, 62 quadrants exhibited looping of inferior alveolar nerve. 27 patients (12 females and 20 males) showed bilateral looping and 5 patients (3 females and 2 males) showed unilateral looping. The mean length of loop was 0.42 ± 0.40 mm on the left side and 0.42 ± 0.31 mm on the right side. In females the mean length was 0.41 mm on the left side and 0.48 mm on the right side. In males the mean length was 0.43 mm on the left side and 0.44 mm on the right side.

The minimum length of the loop in females was 0.14 mm on the left side and 0.15mm on the right side. The minimum length of the loop in males was 0.12 mm on the left side and 0.48 mm on the right side. The maximum length of the loop in females was 1.34 mm on the left side and 1 mm on the right side. The maximum length of the loop in males was 1.5 mm on the left side and 1.44 mm on the right side. The results are summarized in Table 1.

Table 1: Prevalence of anterior loop

Location	Presence/ Absence
Right	Present - 32 Absent - 1
Left	Present - 29 Absent - 4
Bilateral	Present – 28 Absent - 22

Discussion

Meticulous research has been done to evaluate the configuration of inferior alveolar nerve canal in the mandible [17,18]. These studies have used various methods for analysis of position of mandibular canal which includes cadaver examination and radiographic methods. Panoramic radiography is the most commonly used diagnostic modality for the localization of mandibular canal because of its availability and cost factors. As panoramic radiographs are linear measurements of a three dimensional structure such as mandible, the radiographs are not precise enough for the diagnosis of accurate location of the canal.

Cone Beam Computed Tomography (CBCT) was introduced in the year 2000. Before the emergence of CBCT, panoramic radiography was widely used for pre – operative assessment along with another intraoral imaging modality that was used to supplement the preliminary information provided by the panoramic radiograph. It provides detailed 3D images rather than 2D images from panoramic radiograph. This allows the physician to examine structures as thin slices in different planes and for exact localization and configuration of the mandibular canal. Anatomic variations in the mandible such as the anterior loop, lingual foramen can be better visualized in CBCT thereby preventing encounters of such variations during surgery [17]. Studies have shown that for accurate identification of the anterior loop CBCT is a better imaging modality when compared to panoramic radiography [2,3,5,6]. Comparative studies between CBCT and other 3D imaging modalities such as the conventional CT, spiral CT and MDCT [19–21].

The American Academy of Oral and Maxillofacial Radiology (AAOMR) recommends the use of CBCT for pre – surgical cross – sectional assessment only for potential implant sites [22]. The AAOMR also advocates the use of CBCT imaging as the current method of cross – sectional imaging as it provides greatest diagnostic yield at an acceptable radiation risk. However, the decision to carry out CBCT examination is based on the professional judgement of the clinician. Use of small FOV for examination is suggested so as to prevent excess radiation exposure than that is required.

The incidence and length of anterior loop of IAN has been widely researched in varied populations. Numerous studies have been done for estimating the frequency of occurrence of mental loop in Iranian, Malaysian, Chinese, Thai and Indian population [1,23–27]. These studies report various methods of measuring the length of the loop. They have recorded a prevalence between 32% and 94%. In the present study, the overall prevalence was 66%. The average length of the loop as reported in literature is between 0.4 to 6 mm. A maximum length of the loop ranges from 9 mm to 11 mm [28–30]. In this study, the length of mental loop range between 0 to 1.5 mm. Some studies have considered and reported measurements above 3 mm only as mental loop [24]. Variations in the sample population, methods and soft wares used for measuring have also lead to the difference in the reported lengths of the loop. Most of the studies reported methods of measurement in the reconstructed panoramic view of CBCT volumes. In the present study, reconstructed 3D model generated by the device's software was used. Also, the methods of measurement used in this study is comparatively simpler to the other studies.

Previous studies have analyzed the correlation of the anterior loop with age, sex and side[2,31] and found loop of IAN was more in males than females. In this study males had the maximum length of the length of the loop on both sides coinciding with established results.

Safety margin is the distance anterior to the loop on which implant placement is considered safe. Researchers suggest a safety margin between 3 to 6 mm from the anterior most point of the loop [15]. Placing implants 6 mm anterior to the loop leaves less space in the interforaminal area for patients requiring multiple implants such as in implant – supported complete dentures. In cases where a maximum of 9 to 11 mm loop has been reported, following the 6 mm rule still leads to damage of the nerve. Accurate estimation of the length of the mental loop can prevent injury and complications associated with nerve injury.

Conclusion

The major limitation of this study is the sample size. Due to the smaller sample size, the exact prevalence of the anterior loop could not be assessed in the general population based on the results of this study. For better assessment of prevalence, more samples should be chosen from multiple centers rather than a single center. Also, the tracing of the nerve and the measurements were done by a single observer. If the samples were reviewed by multiple examiners, the reliability estimation of the measurements could have been better. Although the method using for measuring is simpler than the other

studies, its sensitivity in exact estimation of loop has not been established. Further research is needed such that it overcomes all the above mentioned limitations and to validate a generalized safety margin for implant placement in the anterior mandible.

A Comprehensive Review on Oral Aphthous Ulcer

Sarah Banu[1], Mahesh Ramakrishnan[2]

[1]Under-Graduate Student, [2]Reader, Department of Pedodontics, Saveetha Dental College & Hospitals, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract

Mouth ulcer is a very common and painful condition, which is categorized as aphthous stomatitis. It is most commonly seen in early childhood and adolescence. These ulcers are small round with circumscribed margins with yellow floor. They are pearl coloured flakes in the mouth or inside the lips. These are oral mucosal lesions and these ulcers are commonly called as Recurrent Aphthous Stomatitis (RAS). There are also different types of ulcers like minor ulcers which are not very large in size and heal within 7-14 days, major ulcers heal slowly which can extend up to weeks or months and the third one is herpetiform ulcer which is multiple pinpoint ulcers that heal within a month. Some reason for the occurrence of ulcers could be stress, trauma, stopping smoking, menstruation and food allergy. Sometimes it could also be due to deficiency of iron, vitamin B12. In children aphthae occurs also due to periodic or high fever, pharyngitis and cervical adenitis.

Key Words: *Aphthous ulcer, minor ulcer, major ulcer, herpetiform*

Introduction

Aphthous ulcer is also called as recurrent aphthous stomatitis or canker sores. It is usually indicated by a redness and swelling or white colour lesion. It is also associated with bleeding in adverse conditions. Severe aphthous ulcer can lead to difficulty in eating [1]. There can be several reasons for the occurrence of aphthous ulcer like stress, nutritional deficiency, genetic and hormonal disturbances [1-3]. These painful lesions usually occur at irregular intervals but have the same sequence of events in every cycle [4]. There are three types of aphthous ulcer such as minor, major and herpetiform. The most common of all is the minor ulcer with an approximate of 80-85% of population [5-8]. The exact etiology and pathophysiology of aphthous ulcer is not yet discovered [9]. Use of tobacco can be said as one of the cause of aphthous ulcer, as it causes injury or chronic irritation to the oral tissues [10]. Many disease are associate with mouth ulcer like gastrointestinal diseases, Behçet's syndrome, vitamin deficiencies, cyclic neutropenia, Reiter syndrome, hematological disorders, Magic syndrome, PFAPA (periodic fever, aphthous pharyngitis and cervical adenopathy), Sweet syndrome etc [11,12].

Minor ulcers take short time to heal and are small in size. Major ulcers take long time to heal and often lead to scarring. Herpetiform are multiple pinpoint ulcers which heal within a month and are usually found on the tongue.

Definition

Aphthous ulcer is the most common and painful condition which occurs in the oral mucosa. It is basically the breaching of the oral epithelium exposing the nerve endings in the underlying lamina propria. Due to this severe pain is experienced along with soreness, swellings and redness.

Description

Aphthous ulcer is small, round or ovoid ulcers having margins around. They are yellow or grayish in colour. It usually occur only the areas where the skin is not tightly bound to the bone like the inside of lips or cheeks and the dorsum of tongue. The three different types of aphthous ulcers are classified based on the difference of their shape, size, duration and scarring.

Corresponding Author:

Department of Pedodontics, Saveetha Dental College & Hospitals, Saveetha Institute of Medical and Technical Sciences, Chennai, India

These are as follows

Minor ulcer is a mild aphthous ulcer whose size varies from 8-10 mm. It is found mostly in non keratinised mucosal surfaces like buccal mucosa, labial mucosa and the floor of the mouth. These will heal in a short period of time like 10-14 days. There may be burning sensation prior to the appearance of the lesion. These do not lead to scar while they cure.

Major ulcer is a rare condition affecting only 10-15% of the population. Its size will reach upto 1cm in diameter. The areas commonly affected by major ulcer are the lips, soft palate and fauces. Sometimes the dorsum of the tongue and gingiva will also be affected [13]. It will last for 6 weeks. This will also lead to scarring.

Herpetiform ulcer is characterized by small multiple ulcers 100 in number. They are 2-3mm diameter. These are small in size and combine to form a large irregular ulcer. These ulcers last for 10-14 days. These are common in women. These usually do not form scars.

Aphthous ulcer can affect the genitals of males and females. It is more common in females than in males. It usually occurs during adolescences or childhood. The aphthous ulcer in the genitals is called as Non Sexually Acquired Genital Ulceration.

Herpes Simplex is an infection. Depending on their position these can be classified as oral herpes or genital herpes. Oral herpes is the sores around the mouth or face. Genital herpes affects the genitals mainly. This is a sexually transmitted disease (STD). Herpes simplex is of two types - HSV-1: This type occurs usually around the mouth and can be transmitted to the genitals during oral sex.

HSV-2: This is mainly on the genitals. It is spread through sexual contact and skin to skin contact. It is a very common and contagious disease.

Associated Factors

The exact etiological reason for the occurrence of aphthous ulcer has not been found yet. But it is s considered to run in the family. In present date it is thought to be caused by the disturbance in the immune system, which will react against the protein of the mucosal tissue. Sodium lauryl sulphate is a detergent found in toothpastes that also cause the growth of ulcer in some individuals [14]. Apart from these some of the associated factors leading to ulcers are nutritional deficiency, trauma, drugs, and hormonal changes.

Nutritional deficiency

Deficiency in vitamin B12 and iron can lead to decrease in the thickness of the oral mucosa. As the thickness reduces there is maximum chance of it to get worn out and cause lesions.

Genetics

Ulcers due to genetic reasons develop at an early age and are severe in condition. This is seen in 40% of the population [15]. These will be seen at an early stage of life and causes a lot of discomforts.

Trauma

Injury in the oral mucosa due to brushing, disturbances due to teeth etc will also lead to ulcer in the mouth [16]. These reasons will lead to opening of the wound and hence expose the nerve endings leading to lesions. Trauma is basically here referred to as the abberations of the oral mucosa.

Drugs

Many drugs are considered to induce the growth of ulcers in the mouth. Drugs like propionic acid, diclofenac, piroxicam, phenobarbital, sodium hypochloride, phenindione, gold salts and nicorandil [17].

Hormonal changes

Hormonal changes in women are also associated to ulcers. During menstruation or in the luteal phase of menstrual cycle there are high chances of ulceration [18]. Also by the use of contraceptive pills there is a change in the hormonal levels.

Smoking

In contrary to the causes of ulcers, smoking helps in protection against aphthous ulcers. Smoking is usually considered to be hazardous to health and cause many oral and skin related problems but it has been found out to be protective in function in this case.

It has been found that the smokers have increased keratinization of the oral mucosa. This increase protects the oral mucosa from any kind of infection. It has been assumed that the absorbed constituents from the cigarette lead to increase in keratinization. However hyperkeratosis is considered as premalignant [19]. Even though smoking is one factor which is protective against

ulcers, it is cancerous.

Treatment

Several tests can be done to diagnose aphthous ulcer like blood test for blood count, B12, iron. The general treatments taken are use of protective pastes forming a layer on the ulcer reducing irritation and exposure of one of which is Amlexanox paste, avoiding stress, proper intake of vitamins and minerals and antibacterial mouthwash to avoid secondary infection, ignore food stuffs that aggravate ulcers. Benzydamine hydrochloride mouthwash can also be used for treating ulcers.

Topical steroids are also commonly used to treat aphthous ulcer. These include the dexamethasone ointment or to their lesion 3 times daily after meals for 5 days. Topical steroids are usually in the form of paste, cream or lotions, often triamcinolone is in pastes.

Nowadays Low Level Laser Therapy (LLT) is used to treat the aphthous ulcer as it is a fast pain relieving and heals fast. It has fewer side effects than the medicine taken for the treatment of ulcer. It is also cost-effective. It is one of the most appropriate treatments for minor ulcers.

Topical drugs and systemic drugs are used for the treatment of ulcers. Topical drugs are used to treat when the outbreaks are continuous and pain with minor aphthae. The drugs are amlexanox or topical corticosteroids such as triamcinolone acetonide are used to prevent the formation of lesions.

Systemic drugs are used when the outbreak is constant and aggressive with major aphthae and intense pain. Different drugs like colchicine, dapsone, clofazimine and the most commonly used systemic corticosteroids such as prednisone and immune modulators such as thalidomide.

Prognosis

Ulcer can range from minor to a deep one. It causes a lot of discomfort while eating, swallowing which will lead to loss of appetite and weight loss. These do not cause oral cancer or any infection. Aphthous ulcer can usually last for several years before spontaneously disappearing in later life [20].

Conclusion

Aphthous ulcer is a very painful condition which is given least importance but if left unattended can cause severe pain and impact on the quality of life. The duration of a specific ulcer might range from few days to few weeks or sometimes even can last for months. The exact cause of ulcer is unclear. LLLT is a safe, effective and fast way to get rid of ulcers. Topical drugs and systemic drugs are used as treatment.

Physicochemical Profile of Acacia Catechu Bark Extract – An Invitro Study

Trishala A[1], Lakshmi T[2], Rajeshkumar S[2], Deepa Gurunathan[3], Geetha RV [4], Anitha Roy[2]

[1]Undergraduate Student, Department of Pharmacology, [2]Associate Professor, Department of Pharmacology, [3]Professor, Department of Pedodontics & Preventive Dentistry, [4]Associate Professor, Department of Microbiology, Saveetha Dental College, SIMATS, Saveetha University Chennai, Tamilnadu India

Abstract

Introduction: *Acacia catechu* has a great importance due to its medicinal properties. It is a historical plant; widely used in traditional medicine especially in Asia. The bark of this plant is strong antioxidant, astringent, anti-inflammatory, anti-bacterial and antifungal in nature. It is used as mouthwash for mouth, gum, sore throat, gingivitis, dental and oral infections. It is also helpful in numerous women related problems. It also has abundant anti-microbial properties. This study aims at evaluating the physicochemical profile of *Acacia catechu* bark extract in order to make optimum use of the extract for therapeutic purposes.

Materials and Method: The plant material of *Acacia catechu* was shade dried at a temperature range of 20° to 30° C for about 2 weeks. The dried sample was then powdered in a grinding mill. The obtained powder was used for physico chemical analysis and for extraction using solvents.

Results: Ash value was found to be 12.7%. Acid insoluble & soluble content of the plant material was found to 1.67 & 6.26 %. The percentage weight of loss on drying or moisture content was found to be 7.245%. Extractive values found, are tabulated for different solvent systems. Ethanol 95 % showed 2.436 %.

Conclusion: *Acacia catechu* was characterized on the basis of the physicochemical parameters. The present work will, thus, provide helpful information on the quality of these herbal materials to ensure genuineness, safety and efficacy prior incorporation in pharmaceutical formulations.

Keywords: *Acacia catechu, solubility, applications*

Introduction

For centuries, plants and plant products have been used for treating various ailments. Several medicinal trees and their products are still widely used by the traditional medical practitioners for curing various diseases in their day to day practice. Various parts of the plants such as roots, stems, bark, gum, leaves, fruits, seeds and flowers are used for medicinal purposes.[1]

Acacia catechu belongs to family *Fabaceae* which is also called pea family or legume family due to presence of single chambered legume in all species of this family. *Acacia catechu willd* is a small to moderate sized plant widely distributed throughout Asia. The main origin of this plant is Pakistan, India, Thailand and Bangladesh. It contains polyphenolic components, tannins, alkaloids, carbohydrates, flavonoids and seeds of this plant are good sources of protein.[2] Various parts of the of the plant leaves, bark, heartwood possess diverse pharmacological actions for management of various disorders. The pharmacological activities in various parts of the plant has been extensively studied. The plant extract has been

Corresponding Author :
Dr. T. Lakshmi
Associate Professor, Department of Pharmacology
Saveetha Dental College ,SIMATS
Saveetha University,
Email : lakshmi@saveetha.com

reported reported to have anti-pyretic, anti-inflammatory, anti-diarrhoeal, hypoglycaemic, hepatoprotective, anti-oxidant and anti-microbial activites including anti caries and anti plaque activity.[3] Bark of Acacia catechu contain alkaloids and many other very potent active components which shows anti-microbial activity so management of wounds and burns it also acts as a disinfectant which reduces the chance of infection at the site of the wound.[4]

The increasing search for therapeutic agents derived from plant species is justified by the emergence of diseases, yet without proper treatment, and the growth of scientific knowledge about the herbal medicines as important treatment alternatives. Therefore, the quality and safety of herbal preparations are also of great concern.[5] To ensure the standard of research on herbal medicines, the quality of the plant materials or preparations is of utmost importance. With the ever increasing use of herbal medicines and the global expansion of the herbal medicines market, safety has become a concern for both health authorities and the public in many countries. Microbial contamination of medicinal herbal plants can be influenced by environmental factors such as temperature, humidity and extent of rainfall during pre-harvesting and post-harvesting periods, handling practices and the storage conditions of crude and processed medicinal-plant materials. The presence of microbial contaminant in non sterile pharmaceutical products can reduce or even inactivate the therapeutic activity of the products and has the potential to adversely affect patients taking the medicines.[6]

The Indian system of medicine, mainly comprising of Ayurveda, Siddha and Unani, is one of the oldest holistic management system with thoroughly documented remedies. Ayurveda, a part of cultural heritage of India, is widely respected for its uniqueness and global acceptance as it offers natural ways to treat diseases and promote healthcare.[7] Unfortunately, standardization and quality control have remained grey areas in the preparation of Ayurvedic medicines. Till date, most of the ayurvedic formulations are lacking in their defined quality control parameters and method of its evaluation.[8] On this background, standardization is an important step for the establishment of a consistent biological activity, a consistent chemical profile, or simply a quality assurance program for production and manufacturing of a herbal drug.[9]

In order to improve the purity and safety of the products, observation of basic hygiene during preparation, standardization of some physical characteristic such as moisture content, pH and microbiological contamination levels are desirable.

Hence this study aims at evaluating the physicochemical profile of *Acacia catechu* bark extract in order to make optimum use of the extract for therapeutic purposes.

Materials and Method

Plant collection and extract preparation:

Acacia catechu bark (ACB) was collected during the month of December 2015 from Hosur, Tamil Nadu, India, authenticated by Green Chem Lab, Bengaluru, Karnataka, India. Barks were shade dried and was milled to fine powder. This bark powder was passed through 100 mesh sieve, and 2.5 kg of powdered ACB were extracted with 10 L of ethanolic, at 65°C, for 1 h. After 1 h of extraction, the extract were filtered and collected. The marc, an insoluble residue was extracted repeatedly with 10 L of ethanolic, twice. The extract was evaporated in a Buchi rotary evaporator (Switzerland) at 65°C, to obtain 150 g of powder extract. The w/w yield of the prepared extract was 6%.

Chemicals:

3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium Bromide (MTT), dimethyl sulfoxide (DMSO) was purchased from Sigma Chemical Co. India. The other chemicals used in this study were purchased locally and were of analytical grade.

Physicochemical analysis:

The plant material of *Acacia catechu* was shade dried at a temperature range of 20° to 30° C for about 2 weeks. The dried sample was then powdered in a grinding mill. The obtained powder was used for physico chemical analysis and for extraction using solvents.

Determination of Moisture (Loss on drying):

Procedure:

➢ Weighed about 1.5g of the powdered drug into a tarred porcelain dish.

➢ Dried it in the oven at 100°C or 105°C.

Cooled in desiccators and the loss in weight was recorded as moisture

Determination of Total ash value:

About 2gm of powdered drug was weighed accurately into a tarred silica crucible. Incinerated at 450°C in a muffle furnace until free from carbon. The crucible was cooled and weighed. Percentage of total ash was calculated with reference to air-dried substance. Determination of total ash value formula:

Total ash value of the sample = 100 (Z-X)

---------- %

Y

X= weight of empty dish

Y= weight of the drug taken

Z= weight of the dish + ash (after complete incineration).

Determination Acid Insoluble ash:

Ash obtained from the total ash was boiled with 25ml of 2N HCl for a few minutes. Filtered through an ash less filter paper. The filter paper was transferred into a tarred silica crucible. Incinerated at 450°C in a muffle furnace until free from carbon. The crucible was cooled and weighed. Percentage of acid insoluble ash was calculated with reference to air-dried substance.

Determination of Water soluble ash:

Ash obtained from the total ash was boiled with 25 ml of distilled water for a few minutes and filtered through an ash less filter paper. The filter paper was transferred into a tarred silica crucible. Incinerated at 450°C in a muffle furnace until free from carbon. The crucible was cooled and weighed. The percentage of water-soluble ash was calculated with reference to air-dried substance.[10-15]

Results

Table 1: Physicochemical analysis of *Acacia catechu* bark extract.

S.No.	Physiocochemical parameters	% W/W
1)	Ash value	
	Total ash % w/w	12.7
	Acid insoluble ash % w/w	1.67
	Water soluble ash % w/w	6.26
2)	Extractive value % w/w	
	Ethanol 95%	2.436
3)	Loss on drying	7.245

Physicochemical analysis of *Acacia catechu* bark:

The authentication of the plant material was proved through the physicochemical characteristics of the plant material. The results for physicochemical parameters are shown in the table 1.

Ash value is an important quantitative tool used to determine the authenticity and purity of drug. It was found to be 12.7%. Acid insoluble & soluble content of the plant material was found to 1.67 & 6.26 %. The percentage weight of loss on drying or moisture content was found to be 7.245%.The less value of moisture content could prevent bacterial, fungal or yeast. Extractive values found, are tabulated for different solvent systems. Ethanol 95 % showed 2.436 %.

Discussion

Herbal preparations like herbal medicines, herbal teas, herbal oils etc. may be having the plant material as the starting material. Now a days in developing countries, large number of people are unable to afford pharmaceutical drugs and they continue to use their own systems of indigenous medicine that are mainly plant based, because of their safely comparing to

that of synthetic drugs. According to World Health Organization (WHO); traditional, complementary, alternative, or non-conventional medicines are used by 70–95% of global population particularly in developing countries for their healthcare.[16]

Standardization is the code of conduct in order to ensure the consistent efficacy that manufacturers should use to ensure consistency of their products. The quality of herbal drugs is the sum of all factors which contribute directly or indirectly to the safety, effectiveness and acceptability of the product.[17,18]

Hence it is essential to develop scientific and clinical search to investigate the safety, quality and efficacy of these herbal therapies.

Established preliminary and physicochemical standards give important information for further investigations and facilitate the identification of formulations in routine industrial production. The test for percentage of moisture content (loss on drying) determines both water and volatile matter. Total ash measures the amount of materials remaining after ignition. Acid insoluble ash measures the amount of silica present especially, sand and siliceous matter. Extractive values are useful for evaluation consistency of nature and amount of chemical constituents present in drug.[19]

Considering the importance of these physicochemical parameters, *Acacia catechu* was characterised by evaluating water soluble extractive, ethanol soluble extractive, total ash content, acid insoluble ash and loss on drying at 105 °C.

Conclusion

Acacia catechu was characterized on the basis of the physicochemical parameters. The analytical specifications were established for the product with respect to quality based raw materials.[20] This study may serve as standard reference and the standard operating procedures to be adopted for quality control analysis of various *Acacia catechu* formulations.

The present work will, thus, provide helpful information on the quality of these herbal materials to ensure genuineness, safety and efficacy prior incorporation in pharmaceutical formulations.

Insilico Interaction of Selected Five Indole Alkaloids Against Oral Carcinoma Drug Targets

Nivedhaa Chezhian[1], Lakshmi Thangavelu[2], Rajeshkumar S[2], Deepa Gurunathan[3], Geetha RV[4], Anitha Roy[2]

[1]Undergraduate Student, [2]Associate Professor, Department of Pharmacology, [3]Professor, Department of Pedodontics & Preventive Dentistry, [4]Associate Professor, Department of Microbiology, Saveetha Dental College, SIMATS, Saveetha University Chennai, Tamilnadu, India

Abstract

Aim: The aim is to study the interaction of Indole alkaloids against 2 oral carcinoma drug target by insilico docking using iGemdock tool.

Background: In this generation, technology has become so advanced that we are able to now achieve what was believed 20 years ago to be impossible. One such advancement is the in silico interactions. It is a virtual screening which enables us to bind two compounds and check the affinity of the binding. This helps us to first screen the activity of the two compounds before money, time and energy is spent in manually performing the activity and then arriving at a failure. We will be able to concentrate on the compounds which show us positive results in the in silico interactions, thus helping us in conserving time, expenditure and energy.

Materials & Method: The Oral carcinoma drug targets were identified by literature search and its 3D structure was downloaded from RCSB PDB (Protein Data Bank), which is a crystallographic database for the three-dimensional structural data of large biological molecules.

Results: From the above analysis it shows that ajmalicine shows good interaction with both the receptors also shows best fitness energy.

Keywords : *Indole alkaloids ,Oral carcinoma,Drug target, Insilico docking ,Medication*

Introduction

Indole subordinates have the exceptional property of mirroring the structure of peptides and to tie reversibly to enzymes, which give enormous chances to find novel medications with various methods of activity [1]

Among the advanced scourges, oral malignancy is the second most basic reason for death [2]. In creating nations, oral malignancy is one of the main ten most basic reasons for death [3]. India has one of the most astounding pervasiveness of oral tumor on the planet. As per WHO, 40% of the analyzed oral growths over the world happens in India, Pakistan, Bangladesh and Srilanka .[4] WHO additionally evaluated that 90% of Indian guys who were determined to have oral tumor were ascribed to tobacco directin. Most complex diseases are caused by a complicated interplay of various biological processed and dysfunctional systems. However, traditional drug discovery paradigm , the single drug , single target has limitations in many aspects of the complex disease.[5]Compared to single drug treatments, it is evident that drug combinations have a number of advantages such as increase of therapeutic effects, reduction of drug dosage and decrease of toxicity and side effects.[6]However unexpected adverse ffects may also occur due to drug interactions (DDIs) resulting from various processes. Significant attention to overall phenotypic effects of drug interacations is necessary to discover drug combinations with increased therapeutic effects and reduced adverse effects.[7]

The protein–ligand docking problem is the prediction of a ligand conformation and orientation relative to the active site of a target protein. A computer-aided docking process, identifying the lead compounds by minimizing the energy of intermolecular interactions, is an important approach for structure-based drug designs.[8]Using a com- puter method to find a solution to a protein–ligand docking problem involves two critical elements: a good scoring function and an efficient algorithm for searching conforma- tion and orientation spaces.[9,10]

Materials and Method

Target Identification And Retrival:

The Oral carcinoma drug targets were identified by literature search and its 3D structure was downloaded from RCSB PDB (Protein Data Bank), which is a crystallographic database for the three-dimensional structural data of large biological molecules, such as proteins and nucleic acids. The data, was typically obtained by X-ray crystallography, NMR spectroscopy, or, increasingly, cryo-electron microscopy. The PDB ID of the targets are as follows,

Results & Discussion

Active Site Residues:

Residues showing Bonded interaction: HIS 198, ARG 61, GLY 199, ARG 10

Residues showing Non Bonded interaction: GLY 89, ASN 17, HIS 11

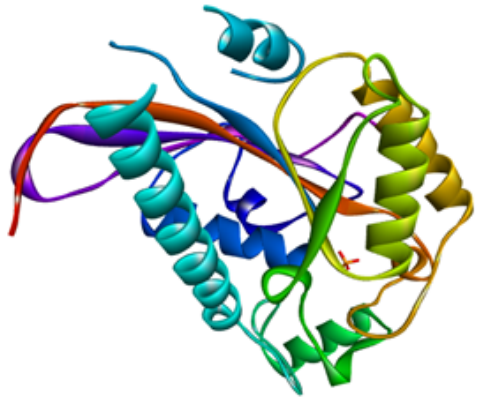

Fig 1 : PDB ID: 3DCY (Crystal Structure a TP53-induced glycolysis and apoptosis regulator protein)

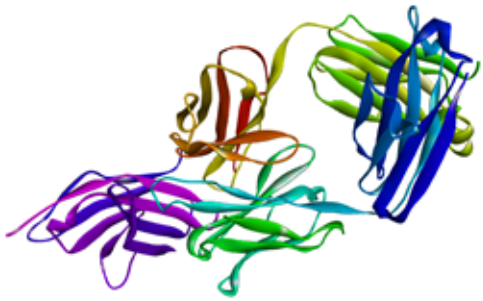

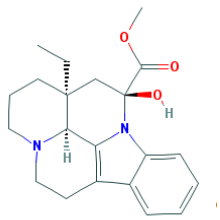

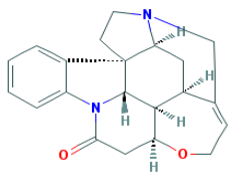

Fig 2 : PDB ID: 5GGV (CTLA-4 in complex with tremelimumab Fab)

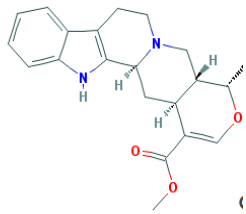

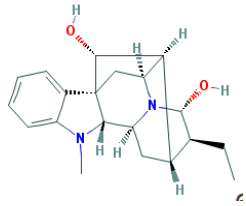

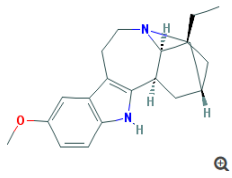

Ligand Retrival:

The indole alkaloids with anticancer property were identified by literature search and their 3D structure was

Table 1 : The list of Indole alkaloids and its structures are as follows,

PUBCHEM ID	COMPOUND NAME	STRUCTURE
15376	Vincamine	
441071	Strychnine	

Cont... **Table 1 : The list of Indole alkaloids and its structures are as follows,**

441975	ajmalicine	
6100671	ajmaline	
197060	Ibogaine	

Docking:

The docking was carried out using iGEMDOCKv2.1, a Graphical-Automatic Drug Design System for Docking, Screening and Post-Analysis. Fitness is the total energy of a predicted pose in the binding site. The empirical scoring function of iGEMDOCK is estimates as:

Fitness = vdW + Hbond + Elec

Here, the vdW term is van der Waal energy. Hbond and Elect terms are hydrogen bonding energy and electro statistic energy, respectively.

To start docking protein file and ligand file was prepared. The active site was defined using "by bounded ligand" in case of cocrystal structure and "by current file" in case of non-cocrystal structure. The igemdock accepts ligand in mol2 format, so the ligands were converted from sdf to mol2 format.

Results and Discussion

COX2 Inhibitory activity of *Abutilon indicum –An Invitro Study*

Cinthura.C[1], Lakshmi Thangavelu[1], Rajeshkumar S[1], Deepa Gurunadhan[2], Pradeep Kumar.R[3], Anitha Roy[1]

[1]Undergraduate Student, Department of Pharmacology, [1]Associate Professor, Department of Pharmacology , [2]Professor, Department of Pedodontics & Preventive Dentistry, [3]Professor, Department of Public Health Dentistry , Saveetha Dental College, SIMATS, Saveetha University Chennai, Tamilnadu, India

Abstract

Aim : To analyse the COX2 inhibitory activity of *Abutilon indicum.*

Objective : The main objective of this study is to analyse the COX2 inhibitory activity of *Abutilon indicum*

Background : Prostaglandins are important mediators of the body's response to pain and inflammation, and are formed from essential fatty acids found in cell membranes. This reaction is catalysed by cyclooxygenase, a membrane associated enzyme in two isoforms- COX-1 and COX-2. *Abutilon indicum* ,commonly known as the Indian mallow is well known for its therapeutic values and further study of its COX-2 inhibitory activity is beneficial.

Conclusion : Medicinal plants and shrubs which have little or no side effects have to be further investigated. Further study on its COX-2 inhibition will increase its therapeutic value also as an anti-inflammatory with added benefits .

Keywords: *Ethnomedicinal, anti-arthritic, COX2 Inhibition, medicinal uses, Prostaglandin*

Introduction

Prostaglandins (PGs) are hormone-like bioactive substances mediating autocrine and paracrine signalling over the short distances and are involved in many physiological and pathological processes. They act via high-affinity G protein-coupled receptors: four EP receptors for PGE2 termed EP1-EP4, IP receptor for prostacyclin, DP receptor for PGD2, FP receptor for PGF2α. These receptors are linked to the different signal transduction pathways [1] .In addition, peroxisome proliferator-activated receptors (PPAR) have been identified as novel intracellular PG receptors [2] . Once a prostanoid is formed, it exits the cell and then interacts with G protein-coupled receptors, either on the parent cell or on closely neighbouring cells to modulate the second messenger levels [3] .Although their tissue distribution depends on the cellular enzymatic material, prostanoids are involved in a very broad range of physiological and pathophysiological responses [4] .Despite the wide use of NSAIDs over the last century, their mechanism of action was not fully understood until 1971 when Vane identified their molecular target, the COX enzyme. In the early 1990s, a second isoform (COX-2) was discovered, distinct from the first one, then renamed COX-1. COX-1 and COX-2 are isoenzymes [5] .

Abutilon indicum (Linn.) Sweet (Malvaceae) is a shrub distributed throughout India, SriLanka, topical regions of America and Malaysia [6] . It is known as Atibala in Sanskrit. It grows as weeds that are found abundant in wastelands and seashores.

Various parts of the plant like leaves, roots, seeds and seed oil are widely used by various tribal

Associate Professor, Department of Pharmacology,
Saveetha Dental College, Saveetha University ,
Chennai ,Tamilnadu ,India.
Email : Lakshmi@saveetha.com

communities and forest dwellers for the treatment of variety of ailments [7].

From the ancient times, leaves of A.indicum are used for piles, toothache. Decoction of A.indicum leaves is used in catarrhal bilious diarrhoea, bronchitis, gonorrhoea, fevers and in ammation of bladder [8] .The decoction is prescribed as a mouthwash in various cases of tender gums and toothache. Bark of A.indicum is used in strangury and urinary complaints and is valued as a diuretic. Seeds are used as tonic [9] .

A recent study suggests that the aqueous alcoholic extract of A. indicum aerial parts contains promising antibacterial substances which are having activity against E. faecalis. E. faecalis being one of the major threats for root canal failure during endodontic treatment which is beneficial to dentists [10] .

Thus, the plant's COX2 inhibitory activity can be studied and further used for added benefits as medicinal plants have lesser side effects than other allopathy medicines .

Materials and Method

Plant materials-

Abutilon indicum extract used in the study were obtained from Green Chem Herbal extracts and formulations,Bengaluru,India.

Chemicals used-

DMEM, FBS,pioglitazone were obtained from Sigma Aldrich.co.India .All the other chemicals used in the study were up to analytical grade.

Assay for Screening of Cyclooxygenase (COX) Inhibition

The COX Inhibitor Screening Assay directly measures $PGF_{2\alpha}$ by stannous chloride reduction of COX-derived PGH_2 produced in the COX reaction. The reaction system consists of reaction buffer, haem, enzyme and plant extract pre-incubated at 37 ˚C for twenty minutes with background and enzyme controls. The reaction was initiated with the addition of arachidonic acid and incubated for two minutes at 37 °C. The reaction was stopped with addition of saturated stannous chloride solution and five minutes at room temperature. The prostaglandins are quantified by EIA. An aliquot of these reactions were added to the pre - coated plates in triplicates together with AChE tracer and antiserum and incubated for 18hours at room temperature on an orbital shaker. The plate was then finally developed with Ellman's Reagent and kept on an orbital shaker in the dark at room temperature for 60 minutes. The absorbance was read at 420 nm. The data was plotted as %B/B0 (Standard Bound / Maximum Bound) versus log concentration using a 4-parameter logistic curve fit. The concentration of each sample was determined from a standard curve with appropriate dilutions and used to calculate the percent inhibition as per the formula given below:

Percent Inhibition (%) = (Activity of Control – Activity of Test)/ Activity of Control x 100

The percent inhibition was plotted against the inhibitor concentration to determine the IC_{50} value (concentration at which there was 50% inhibition) [11] .

Result

As illustrated in figure 1, different concentrations (15.625, 31.25, 62.5, 125, 250, 500, 1000µg/ml) of *Abutilon indicum* extract was evaluated for the inhibitory effect on the activity of COX. The plant extracts exhibited potent inhibition of the COX – 2 enzyme. Concentration based inhibition was observed against COX – 2 activity. The IC_{50} was found to be 116.6µg/ml. Maximum inhibition was found to be 95.33% at 1000µg/ml represented in figure 1.

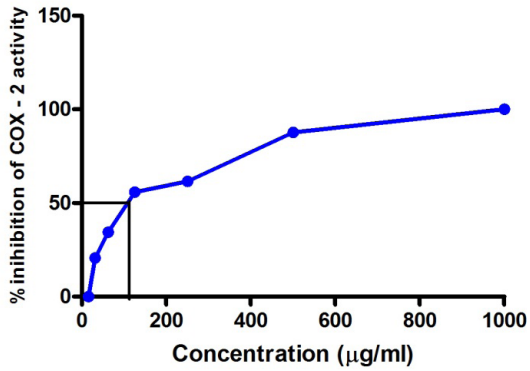

Figure 1:COX2 inhibitory assay

Discussion

Malvaceae family encompasses approximately 244 genera with 4225 species of herbs, shrubs and trees [12] .Around 22 genera of the family are reported from India, many of which have ethnomedicinal value e.g., *Abutilon indicum,* Gossypium herbaceum, Hibiscus mutabilis, Hibiscus sabdariffa, Hibiscus rosa-sinensis, and several others [13]

Phytoconstituents isolated from Malvaceae members belonging to categories such as flavonoids, phenolics, acids, and polysaccharides exhibit therapeutic activities.

More than 15 phenolics have been identified in A. indicum [14] and out of these, eugenol was shown to possess analgesic activity [15] while syringic acid and methyl caffeate were reported to be cytotoxic .

Aqueous and alcohol extracts of leaf of A. indicum promoted insulin production in moderately diabetic rats [16] .

In a study by Vallabh et al, the plant extract of A. indicum has been tested in vitro for anti arthritic activity which showed a dose dependant effect on protein denaturation, membrane stabilisation and inhibition of proteinases. The herbal extract exhibited more potent analgesic activity than acetyl salicylic acid, a well-established analgesic drug, for arthritis [17]

In another study conducted by Pingale et al ,the Acute toxicity of dried powder of aerial parts as well as fresh juice of leaves of A. indicum was measured in Swiss mice. Administration of either of the above plant material did not show any significant effect on body weight [18] .Acute oral toxicity of the aqueous extract and aqueous suspension of the ethanolic extract of A. indicum leaves was measured in Swiss albino mice. These were found to be safe at dose of 4000 mg/kg and 2000 mg/kg respectively and did not show mortality in mice. Therefore it proves that Abutilon indicum being a natural plant doesn't have much toxic effect unlike its counterparts .A firm proof that A.indicum extract shows anti-inflammatory property is a study conducted by Surendra Sharma and Naveen Goyal with the root extract on Carrageenan induced rat paw oedema model[19].

Proteinases have been implicated in arthritic reactions. Neutrophils are known to be a rich source of proteinases which carry in their lysosomal granules many neutral serine proteinases. It was previously reported that leucocyte proteinases play an important

role in the development of tissue damage during inflammatory reactions and significant level of protection was provided by proteinase inhibitors. In a study done by Vallabh.D and Varsha.M , *Abutilon indicum* exhibited significant anti- proteinase activity [20] .

In the present study , as illustrated in Fig 1 ,Different concentrations of Abutilon indicum extract was evaluated for the inhibitory effect on the activity of COX. Concentration based inhibition was observed against COX – 2 activity. The IC_{50} was found to be 116.6µg/ml. Maximum inhibition was found to be 95.33% at 1000µg/ml.

Conclusion

Medicinal plants and shrubs which have little or no side effects have to be further investigated. Selective COX2 inhibitors are used to treat pulpal pain because after long-term use, non-selective NSAIDs increase the risk of developing peptic ulcer disease, GI bleeding and renal toxicity .The primary purported safety advantages of COX- 2 inhibitors over non- selective NSAIDs are related to their theoretical lack of associated gastropathy [20].Since *Abutilon indicum* shows the aforementioned benefits. Further study as seen in figure 1 was done and proved on its COX-2 inhibition to increase its therapeutic value also as an anti-inflammatory with added benefits . mortality in patients on whom OPMDs are not treated.

Abstract

Introduction: *Ficus racemosa* is widely used in ayurvedic medicine in India, mostly as fruits and bark decoction to treat uncontrolled diabetes, the objective of this study is to study the uptake of glucose in L6 myotubes by *Ficus racemosa.*

Background: Diabetes is a common metabolic disease characterized by abnormally high plasma glucose levels, leasing to major complications, such as diabetic neuropathy, retinopathy and cardiovascular disease. Presently available oral hypoglycaemic agents exhibit several side effects. Therefore, there is a need for more effective oral antihyperglycemic agent, particularly those that normalize both insulin and glucose levels.

Method: Cell culture: L6, a mono layer myoblast culture (obtained from NCCS, Pune-Passageno-19) was cultured in the DMEM. In vitro glucose uptake activity: Glucose uptake assay was followed by the methodology of (Gupta et al)

Result: It was observed from the results that *Ficus racemosa* extract at different concentrations exhibited substantial degree of glucose uptake in skeletal muscle cells, which was compared with that of Standard Metformin. A maximum glucose uptake of 53% was observed for ficus 30mg/ml, whereas metformin exhibited 61% of glucose uptake. The IC50 of ficus extract and metformin was found to be 2.57mg/ml and 1.79mg/ml respectively.

Conclusion: From the study that was conducted above it can be concluded that *Ficus racemosa* had a better glucose uptake compared to the with that of Standard Metformin used by diabetic patients.

Keyword: *Ficus racemose, glucose, l6 myotube, uptake, myoblast.*

Introduction

Diabetes mellitus is a group of metabolic disorders - defects in insulin secretion, or insulin action. [1] The chronic diabetes mellitus (DM) and uncontrolled diabetes lead to many diabetic complications such as diabetic cardiomyopathy, nephropathy, neuropathy, etc .The number of people with diagnosed diabetes is expected to increase by 55% between 2015 and 2040 to reach 642 million people, with the majority of cases in low- and middle-income countries Diabetes is fast gaining the status of a potential epidemic in India with more than 62 million diabetic individuals currently diagnosed with the disease [2,3] In 2000, India (31.7 million) topped the world with the highest number of people with diabetes mellitus followed by China (20.8 million) with the United States (17.7 million) in second and third place respectively. Rough estimates show that the prevalence of diabetes in rural populations is one-quarter that of urban population for India and other Indian sub-continent countries such as Bangladesh, Nepal,

Bhutan, and Sri Lanka [4,5] Insulin resistance is defined as a reduced responsiveness of insulin on a target cell or a whole organ [6], Insulin resistance is not only the major pathophysiological condition of type 2 diabetes (non-insulin-dependent diabetes mellitus) [6] but also present in type 1 diabetes (insulin-dependent diabetes mellitus) [7]. Impaired glucose uptake in skeletal muscle is present in insulin resistance diabetes. [8] The rate-limiting step in muscle glucose uptake is the transmembrane transport of glucose mediated by glucose transporter 4(GLUT4). GLUT4, a protein stored in intracellular vesicles, plays a pivotal role in regulating insulin-stimulated glucose transport into skeletal muscle and adipose tissue [9,10] The insulin-signalling pathway is one of the key pathways responsible for blood glucose regulation. When binding to its receptor, insulin triggers the autophosphorylation of the insulin receptor and insulin receptor substrates (IRS). The conditional depletion of GLUT4 caused insulin resistance and chronic hyperglycaemia [11]This activates several signaling cascades, leading to biological responses such as glucose uptake into the cell and glycogen synthesis. The plant kingdom represents a largely unexplored reservoir of biologically active compounds. Growing epidemiological studies suggests that the consumption of fruits, vegetables and few medicinal herbs decreases the incidence of diabetes.

Materials and Method

Cell culture

L6, a mono layer myoblsst culture (obtained from NCCS, Pune-Passageno-19) was cultured in the DMEM with 10% foetal bovine serum (FBS) and supplemented with penicillin (120 units/ml) streptomycin (75 microgram/ml) gentamicin (160 microgram/ml) and amphotericin B (3 microgram/ml) in 5% CO2 environment. From differentiation, the L6 cells were transferred to DMEMwith 2% FBS for 4 days, post confluence.

In vitro glucose uptake activity

This invitro study was conducted by using ethanolic extract of *Ficus racemose* which was obtained from Green Chem Herbal Extracts and Formulations, Bengaluru

Glucose uptake assay that was performed in the article published by (Gupta et al,2009) was performed.

L6 myoblasts grown in 48 -well plate was subjected to glucose uptake as reported. When semi confluent monolayer was formed, the culture was renewed with the respective differentiation media. After attaining complete differentiation, the differentiated cells were incubated with KRP + 0.2% BSA FOR 18 h at 37ºC in the CO2 incubator. After 18h, the media was discarded and the cells were washed with KRP buffer once. The cells were treated with metformin and ficus extract of different concentration (0.01,0.03,0.1,0.3,1,3,10 and 30 mg/ml) and added 2-deoxy glucose (1mM), incubated for half an hour. The supernatant was collected for glucose estimation and glucose uptake was terminated by washing the cells thrice with 1ml ice-cold KRP buffer. Cells were subsequently lysed by freezing and thawing thrice. Cell 1ysate was collected for glucose estimation. Glucose uptake was calculated as the difference between the initial and final glucose content in the incubated medium by **GODPOD** method as follows: Mix 10µl of sample and 1ml of reagent, incubate for 25 min at 15-25□C or `10 min at 37□C. Measure the absorbance of the standard (A standard) and the sample (A sample) against the reagent blank within 60 min, the time interval from sample addition to media was discarded and cells were washed with KRP buffer once. The cells were treated with Metformin and ficus extract of different concentration (0.01,0.03,0.1,0.3,1,3,10 and 30 mg/ml) and added 2 – deoxy glucose (1mM), incubated for half an hour. The supernatant was collected for glucose estimation and glucose uptake was calculated as the difference between the initial and final glucose content in the incubated medium by **GODPOD** method as follows : Mix 10µl of sample and 1ml of reagent, incubate for 25 min at 15-25□C or `10 min at 37□C. Measure the absorbance of the standard (A standard) and the sample (A sample) against the reagent blank within 60 min, the time interval from sample addition to read time must be exactly the same for standard control and sample. All treatments were performed in triplicate with two replicates.

Results

Postprandial blood glucose level is known to be regulated by glucose uptake, a rate limiting step for glucose metabolism. In the present study, we used differentiated L6 myotubes because it was previously established that glucose uptake was higher in differentiated cells than in undifferentiated one, which is probably due to the presence of glucose transporter-4 (GLUT4) in their expression. The positive controls chosen for glucose uptake due to their anti - diabetic

activity was Metformin, as it is known specifically for the affirmative effect on the translocation of GLUT4 to the cell surface thereby promoting glucose uptake. The concentrations of the tested extracts that enhanced glucose uptake in cells by 50% (IC50) were determined by a linear regression analysis between the % glucose uptake against the extract concentrations by using the Graph pad prism.

It was observed from the results that *ficus racemosa* extract at different concentrations exhibited substantial degree of glucose uptake in skeletal muscle cells, which was compared with that of Standard Metformin. A maximum glucose uptake of 53% was observed for ficus 30mg/ml, whereas metformin exhibited 61% of glucose uptake as depicted in fig:1. The IC50 of ficus extract and metformin was found to be 2.57mg/ml and 1.79mg/ml respectively.

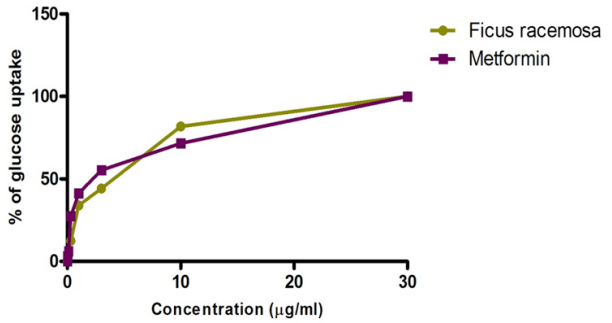

FIG:1 Glucose uptake of *Ficus Racemosa*

Discussion

Diabetes mellitus is regarded as a non-curable but controllable disease. Progressive nature of the disease necessitates constant reassessment of glycaemic control in people with diabetes and appropriate adjustment of therapeutic regimens .[12,13] α-amylase catalyses the hydrolysis of α-1,4-glucosidic linkages of starch, glycogen, and various oligosaccharides and simplifies the availability of sugars for the intestinal absorption. Inhibition of this enzyme activity in the digestive tract of humans is considered to be effective to control diabetes by diminishing the absorption of glucose decomposed from starch by this enzyme.[14,15] Diabetic patients however cannot control their postprandial blood glucose efficiently due to the insufficient insulin secretion or response, which results in postprandial hyperglycaemia and it is an important contributing factor for diabetic complications .[16]

L6 myotubes is a well-established skeletal muscle model for studying glucose uptake process and it is one of the key insulin targeted tissues in maintaining whole body glucose homeostasis, through the stimulation of glucose uptake mediated by GLUT4 translocation .[17] Skeletal muscle is one of the key insulin targeted tissue in maintaining whole body glucose homeostasis, through the stimulation of glucose uptake mediated by GLUT4 translocation.[18]Plant derived natural compounds have established a platform for developing new drug synthesis with fewer side effects .[19] Plants have been used by men from prehistoric times to get rid of suffering &curing ailments. [25]The folk medicines of almost around the world rely chiefly on herbal medicine even today. The studies conducted by (Cavalheira jbc et al) and (Shepherd pr et al) suggested that through an intracellular cascade reaction, insulin stimulates translocation of glucose transporters (GLUTs) into the cell membrane of the cells responsive to this hormone with subsequent internalization of glucose molecules [20,21] this can be compared with our study as well . In fact, considering all the effects of insulin on glucose metabolism, the regulation of GLUT4 trafficking and consequently glucose uptake is the most important of them .[22]

In addition, the study conducted by (Rothman dl et al) said that glucose transport is the key step in insulin-regulated glucose metabolism, including glycolysis, glycogen synthesis and lipogenesis, and it is clear that a dysfunction in this process in muscle and adipose tissue represent an important defect in the insulin action.[23] Natural products play a major role in the development of drugs for the treatment of human disease.[24] From the study that was conducted above It was observed from the results that *Ficus racemosa* extract at different concentrations exhibited substantial degree of glucose uptake in skeletal muscle cells, which was compared with that of Standard Metformin. A maximum glucose uptake of 53% was observed for Ficus 30mg/ml, whereas metformin exhibited 61% of glucose uptake as depicted in fig:1. The IC50 of Ficus extract and metformin was found to be 2.57mg/ml and 1.79mg/ml respectively.

Conclusion

From the study that was conducted above it could be concluded that *Ficus racemosa* had a better glucose uptake compared to the with that of Standard Metformin used by diabetic patients.

Abstract

To investigate seed germination assay of hemidesmus indicus ethanolic root extract by an invitro study.It is a slender, laticiferous, twining, sometimes prostrate or semi-erect shrub. Roots are woody and aromatic. The stem is numerous, slender, terete, thickened at the nodes. The leaves are opposite, short-petioled, very variable, elliptic-oblong to linear- lanceolate. The flowers are greenish outside, purplish inside, crowded in sub-sessile axillary cyme.Seed germination study is an novel cost effective method in tissue culture techniques .

Keywords *: Seed Germination ,Hemidismus Indicus ,Ethanolic root ,Novel technique*

Introduction

Hemidesmus indicus R. Br. (Family - Asclepiadaceae), commonly known as 'Indian sarsaparilla', is a well known drug in Ayurveda. The taxonomic description are perennial prostrate or twining shrub; root-stock woody, thick, rigid, cylindrical; bark brownish corky, marked with longitudinal furrows and transverse fissures, with aromatic smell. Stems woody, slender, thickened at the nodes. Leaves opposite, petiolate, much variable, linear to broadly lanceolate, acute or ovate, entire, smooth, shining, dark green, later variegated with white above. Flowers in racemes or cymes in opposite axils, small, green outside, purple within corolla tubula. Fruit of two follicles, long, slender, tapering, spreading. Seeds with silvery white coma. According to Ayurveda, root is cooling, aphrodisiac, antipyretic, alexiteric, antidiarrhoeal, astringent to bowels and useful in treatment of fevers, foul body odour, asthma, bronchitis, blood disorders, leucorrhoea, dysentery, diarrhoea, thirst, burning sensation, piles, eye troubles, epileptic fits, poisoning, rat bites etc. According to Unani system of medicine, root and stem are laxative, diaphoretic, diuretic and useful in treatment of syphilis and leucoderma. Isolation of nine pregnane glycosides viz. desinine,[1] indicine, hemidine,[2] indicusin,[3] hemidescine, emidine,[4]medidesmine, hemisine, and emicine [5] from H. indicus have been reported along with certain important triterpenoids (including alpha-amyrin, beta-amyrin, lupeol, lupanone, hexadecanoic acid) and 3-hydroxy-4-methoxy benzaldehyde.[6]

Roots of *H. indicus* are considered to be tonic and diuretic. Roots are useful in hemicrania, joint pains and syphilis whereas stem is good in treatment of brain, lever and kidney related diseases. It is also useful in treatment of urinary discharges, uterine complaints, paralysis, cough, asthma etc. Various classical formulae include an infusion or decoction of root or powdered root mixed with cow's milk that give benefits in cases of scanty and highly colored urine and in those of gravel and strangury .[7,8] Root decoction helps in skin diseases, syphilis, elephantiasis, loss of sensation, hemiplegia, loss of appetite, blood purification and for kidney and urinary disorders .[9]

Pharmacologically, the herb is mildly immuno-suppressant. The aqueous, alcoholic and steam distilled fractions of the crushed roots had no significant diuretic

activity. The 50% ethanolic extract of the whole plant did not exhibit any effect on respiration, normal blood pressure and also on vasopressor response to adrenaline and depressor response to acetylalcholine and histamine in experimental animals. The extract also had no antispasmodic effect on guinea pig ileum. It is shown to possess antinociceptive, antioxidant, renoprotective, and hepatoprotective activity .[10-12]

Germination is affected by intrinsic (species and seed size) and environmental (temperature and water availability) factors; however, the seed germination of species adapted to dry environments and cultivars selected for drought tolerance are less affected by low substrate than those adapted to wet environments or classified as drought-sensitive. Seed germination is a key component of pathogenicity of obligate parasitic weeds. This step is controlled allelochemically in the rhizosphere. After a short conditioning period under sufficient warm and wet conditions, seed germination is triggered by stimulant molecules which are released by the roots of neighboring host plants. Many secondary metabolites were identified as germination stimulants. Most of them corresponds to strigolactones (SLs) [13] but isothiocyanates [14,15], dehydrocostus lactone [16] peagol, peagoldione [17] chalcones, peapolyphenols [18], soyasapogenol B and trans-22-dehydrocampesterol [19]have been also identified as stimulants. This experiment is financially cheap, easy to conduct, and the results are highly reproducible.

The toxicity of herbal extracts can be evaluated through many methods. Assays against cell lines enables the identification of toxic effects of plant extract under study .Phytotoxicity deals with temporary or permanent damage in plants that includes damage of seed germination , elongation of root length. To evaluate the phytotoxicity, study was conducted in *Hemidesmus Indicus* root extract against the seed germination of *Raphanus sativus*.

Evaluation of Germination of Seeds:

Seeds of *Raphanus saticus*, procured from the local market, are sterilized with 0.1% Mercuric chloride and then washed with water. The damaged seeds are to be rejected. About 20 seeds are subjected to 5 ml of the nanoparticle solution synthesized. The soaking of seeds is to be maintained for about 2 hours, after which rinsing of seeds is to be performed. This is to be followed by placing the seeds over filter paper as the support, in a petriplate. The seeds should be spaced from each other so that growth of one seed does not cross over the other. Moisture has to be retained in the filter paper always. A positive control of seeds soaked in water is to be maintained for reference.

The experiment, is performed in triplicates, is to be left undisturbed for 3-5 days, after which, the germination of the seeds is noted. The germination rate of the seed is calculated upon applying statistics.

SG Gs Gc

SG = (Gs – Gc) / Gc

Gs: Seed germination rate

Gc: Average number of germinated seeds in the sample (in %): Average number of germinated seeds in the control (in %)

The indices are designed in such a way that their values can vary from −1 (maximum phytotoxicity) to >0. In addition, if there is a reduction of 50% in the variable studied (SG) in relation to the blank control, it is considered as a measurement of potential chronic toxicity, which denotes the long-term influence of the nanoparticles on the plants. The following scale indicates the stimulation of the seed growth in the presence of the nanoparticles.

(a) 0 to −0.25: low toxicity

(b) 0.25 to −0.5: moderate toxicity

(c) 0.5 to −0.75: high toxicity

(d) 0.75 to −1: very high toxicity

Table 1 : Germination of seeds of *Raphanus Saticus*

Sample	Cucumbers sativis	Raphanus sativus	Zea mays
HI extract	60	50	35
Ac bark	40	60	35
Control	85	75	55

Discussion

The influence of stem aqueous extract on seed germination and seedling growth was observed and compared. The inhibition of seed germination and

seedling growth was dose-dependent. Table 1 shows the effect of different concentrations of stem extract (SE) on seed germination at low concentration were efficient to interfere with germination and radicle length. The SE significantly reduced % germination over control.

Conclusion

Seed germination is a novel technique for analysis of phytotoxicity. In this study its clearly evident that the hemidesmus Root ethanolic extract is safer when tested invitro and shows no toxicity .

[1]Undergraduate Student, Department of Pharmacology ,[1]Associate Professor, Department of Pharmacology, [2]Professor, Department of Pedodontics & Preventive Dentistry, [3]Associate Professor, Department of Microbiology, [4]Professor, Department of Public Health Dentistry, Saveetha Dental College, SIMATS, Saveetha University Chennai, Tamilnadu, India

Abstract

Introduction: Drug abuse is an extreme desire to obtain and use increasing amounts of one or more substances. Drug abuse indicates the following risk factors for developing drug abuse problems include poor relationships with parents, inadequate supervision over adolescent activities, poor achievement in schools and so on.

Materials & Method: An online survey comprising 17 questions was administered to the participants of age group 14-19.The results are statistically analysed.

Results and Discussion: From the survey conducted, it is analysed that 67%of the adolescents have attended many drug awareness programmes.45%of them say that alcoholism and drug addiction are genetically inherited.

Conclusion: The abuse of alcohol and drugs has resulted in significant morbidity and mortality among adolescents worldwide.School-based health centers should have the capacity to counsel students who are in need of such treatment plans and connect students to available community resources.

Keywords: *Drug abuse, poor relationship, marijuana, health centre ,community*

Introduction

Adolescence is a critical stage in the life-course and can be considered the most transformative period in the individual's life. The use of substances among adolescents is a public health concern and has been studied extensively in many parts of the world. Substance Abuse and Mental Health Services Administration's data for 2012 from the US showed that approximately 173,654 subjects aged above 12 years used tobacco products, 111,239 used marijuana and hashish and 78,034 used illicit drugs other than marijuana and hashish in their lifetime. Several studies from other countries reported that teenagers were found to be involved in substance use at an early age, approximately between 11 and 14 years. Studies have identified many factors that increase the risk for substance use such as experimental curiosity, peer and family influence, lack of parental supervision and personality problems. [1] On the other hand, factors that were found to prevent substance abuse included functional family communication, effective family socialisation and the ability to notice early warning signs for substance use. [3,4]Religiosity has also been considered by many studies as an important protective factor against drug use, preventing individuals from using drugs even

if they live in perilous environments.

It is considered a brain disease because drugs change the brain .[2] They change its structure and how it works. These brain changes can be long – lasting and lead to the harmful behaviours seen in people who abuse drugs. In all countries illegal drug economy plays a prominent role in national decisions .[5]Various countries have taken measures at society level to change knowledge and attitude of the society toward illegal drugs.[6 -8]

Knowledge and attitude toward this problem and it's easy access to such drugs and the nature of the abused drug are among other effective factors.[9] Drug abuse as a psychological, social, biological issue in adolescents is one of the most critical issues for countries nowadays.[10] This problem involves new chemical drugs besides traditional ones.[11]

The most common age range of drug abusers in the world is 18 to 25 years .[12] Lots of students are at these ages and drug abuse rise has been proved in them.[13]Among illicit abused drugs, marijuana with consumption of 3.8% is the most common abused drug in the world [14]. Race, gender, social class, religion and government rules, availability persuading or pressure of friends, education and job stress and curiosity are the most common reasons of drug abuse among general population .[15,16]

Prevention of substance abuse among adolescents requires awareness of characteristics that place youth at risk and targeting risk factors that are modifiable. Many studies have attempted to identify risk factors associated with adolescent drug and alcohol usage.

Materials and Method

A cross sectional survey was created.Totally 100 participants took part in the survey.The questionnaire comprising 17 questions was administered to the participants through survey planet link.Many questions are mostly knowledge and awareness based. The responses are collected from them and the results are statistically analysed.

Results and Discussion

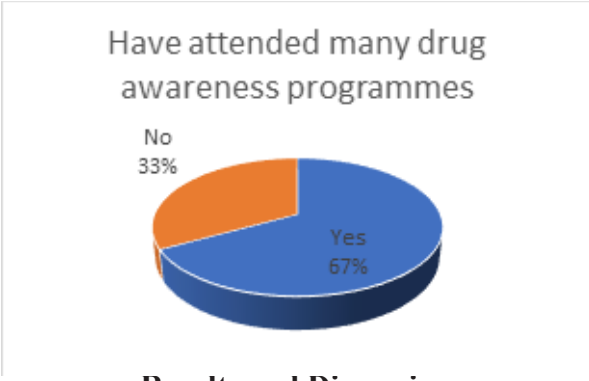

Fig:1 Drug awareness program

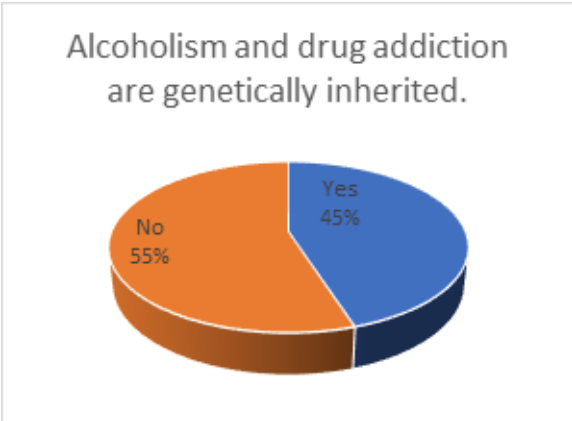

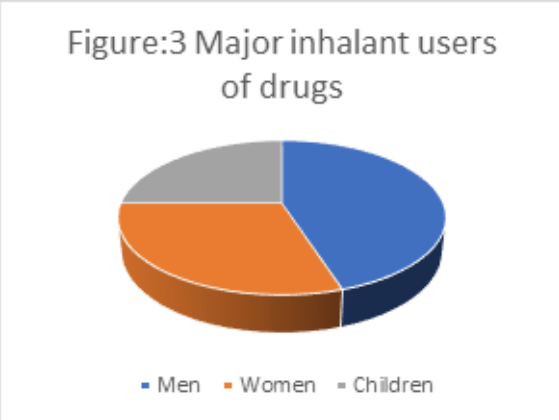

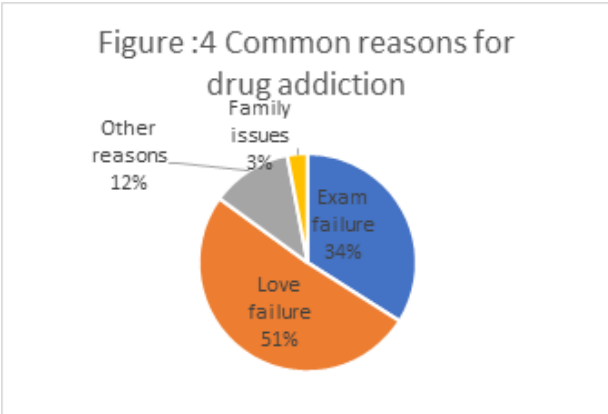

Fig 2 : Drug addiction

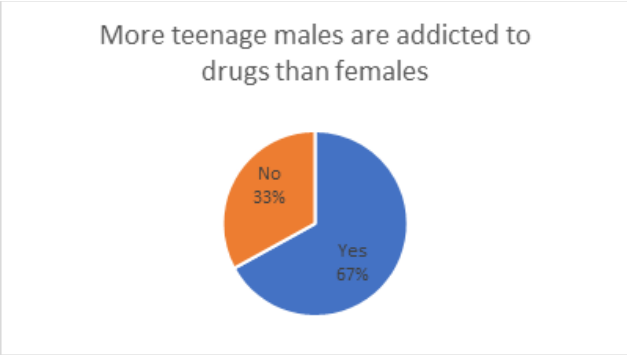

Figure:5 More teenage males are addicted to drugs than females

From the survey conducted, it is analysed that 67%of the adolescents have attended many drug awareness programmes.45%of them say that alcoholism and drug addiction are genetically inherited.Many of them say that men are the most inhalant users of drugs.67% of the participants say that more teenage males are addicted to drugs than females.51%of the participants say that love failure is the common cause for drug addiction.34% of them said that exam failure is the common cause for love failure.

The abuse of alcohol and illicit and prescription drugs continues to be a major health problem internationally. We live in a world where addiction is as much a trend as a disease. Statistics show that death by overdose has been steadily increasing since the early 2000's. By raising drug abuse awareness and backing it with irrefutable facts, we can fight this statistic through the implementation of prevention programs for impressionable kids and teens. For those of you currently struggling with a substance abuse problem, it isn't too late. There is hope for individuals who are already consumed by the cycle of addiction through methods used in addiction treatment. School-based health centers should have the capacity to counsel students who are in need of such treatment plans and connect students to available community resources. [17,18] Schools are appropriate settings for drug prevention programs for 3 reasons: (1) prevention must focus on children before their beliefs and expectations about substance abuse are established; (2) schools offer the most systematic way of reaching young people; and (3) schools can promote a broad spectrum of drug-related educational policies. Resources for the preparation of teachers, counselors, and other school personnel may be a valuable adjunct. Educators are challenged to make the facts about drug abuse meaningful to children and adolescents without enticing them to try drugs. There are many curricula designed for school use that have been proven to be effective and are delivered to students in ways that are interesting, interactive, and developmentally appropriate. Although many program approaches are available, some effective programs focus on enhancing students' problem-solving skills or aiding them to evaluate the influence of the media. Other effective programs help improve students' self-esteem, reduce stress and anxiety, or increase activities. These skills are taught by using a combination of methods including demonstration, practice, feedback, and praise.

Conclusion

The study findings would suggest that multifactorial prevention programmes that address social norms, gender role and image, and incorporate drug policy, religion, family and school would be more effective and would have better protective outcomes.

The abuse of alcohol and drugs has resulted in significant morbidity and mortality among adolescents worldwide. Many of these youth will lose their lives to drugs and alcohol and a significant number are likely to grow up to become problem drug users. Although, the substance abuse problem is complex and large in magnitude, there is a substantial amount of evidence-based research available to physicians community leaders and schools to implement interventions that can decrease adolescent substance abuse rates. Because this issue is not peculiar to any one community or culture, we recognize that individual interventions may not be universally effective.

Antibacterial Activity of Taxifolin Isolated from Acacia Catechu Leaf Extract – An *Invitro Study*

Tanish Ahamad S[1], Lakshmi T[1], Rajeshkumar S[1], Anitha Roy[1], Deepa Gurunadhan[2], Geetha RV[3]

[1]Undergraduate Student, Department of Pharmacology, [1]Associate Professor, Department of Pharmacology , [2]Professor,Department of Pedodontics & Preventive Dentistry, [3]Associate Professor,Department of Microbiology,Saveetha Dental College, SIMATS, Saveetha University Chennai, Tamilnadu, India

Abstract

Aim: To evaluate Anti-Microbial Activity of taxifolin isolated from Acacia catechu leaf extract against *Streptococcus mutans* and *Lactobacillus acidophilus*

Objectives: The study is to determine the antimicrobial activity of taxifolin isolated *Acacia catechu* leaf extract against *Streptococcus mutans* and *Lactobacillus acidophilus*

Background : An anti microbial is a agent that kills or inhibits the growth of micro organism such as bacteria and fungi. *Acacia catechu* also commonly called *Mimosa catechu*, is a deciduous, thorny tree which grows up to 15 m (50 ft) in height. *Acacia catechu* traditionally used for curing many diseases and commonly for mother and child healthcare. Taxifolin is the main constituent of Acacia catechu which possesses antifungal, antiviral, antibacterial, anti-inflammatory and anti-oxidant activity.

Reason: This study is to evaluate the anti microbial activity of *Acacia catechu* against micro organisms such as *Streptococcus mutans* and *Lactobacillus acidophilus*. This may help in development of health products without artificial chemical agent.

Keywords: *Antimicrobial,herbal,antibacterial,Acacia, S.mutans, L.acidophilus*

Introduction

Plants have been used as medicine throughout the world for centuries. The development of bacterial resistance to presently available antibiotics has necessitated the search for new antibacterial agents .[1,2]Anti microbial activity of certain plants has a significant effect over various microorganisms.

An antimicrobial is an agent that kills microorganism or inhibits their growth. Anti microbial agents play a major role in maintaining good health. Antimicrobial resistance is threatening the management of infections such as pneumonia, tuberculosis, malaria, and AIDS. So it is important to develop Antimicrobial resistant which is achieved by various anti microbial agent. One such antimicrobial agent is taxifolin which is isolated from many trees such as Acacia catechu, conifers like the Siberian larch, *Larix sibirica* in Russia, and Chinese yew .[3]

Acacia catechu commonly known as catechu is a medicinal plant used for varied purposes . The bark of this plant is strong antioxidant astringent, anti-inflammatory, anti-bacterial and antifungal in nature [4]. The extract of this plant is used to treat sore throats and diarrhoea, also useful in high blood pressure, dysentery, colitis, gastric problems, bronchial asthma, cough, leucorrhoea and leprosy [5,6]It is used as mouthwash for mouth, gum, sore throat, gingivitis, dental and oral infections. The study is done to assess the anti microbial activity of taxifolin isolated from *Acacia catechu* against *Streptococcus mutans* and *Lactobacillus acidophilus*

Taxifolin is a flavanonol, a type of flavonoid. They are isolated from many tress. Once such tree is Acacia catechu [7] Taxifolin is an anti cancer drug. By inhibiting the fatty acid synthase in cancer cells, they are able to prevent the growth and spread of cancer cells. The capacity of taxifolin to stimulate fibril formation and promote stabilization of fibrillar forms of collagen can be used in medicine.

Streptococcus mutans and Lactobacillus acidophilus is the most important microbe present in the oral cavity. They are one of the major reason for the dental caries. They are gram positive bacteria [8,9] The lactobacilli and streptococci are major genera of the category of bacteria generally referred to as the lactic acid bacteria, so it is no surprise that microbial species within these genera have been proposed as specific agents of the acid production that is primary to the dental caries process .[10]

The study is done to assess the anti microbial activity of taxifolin isolated from *Acacia catechu* against *Streptococcus mutans* and *Lactobacillus acidophilus*

Drugs

Taxifolin was purchased from Sigma-Aldrich, India.

Acacia catechu – obtained from green chemical herbal extracts and formulation, Bengaluru.

Test microorganism

Streptococcus mutans - ATCC 25175 *Lactobacillus acidophilus* - ATCC 4356 from Himedia, Mumbai.

Materials and methods

Antibacterial activity

Active cultures for screening their susceptibility were prepared by transferring loop full of cells from stock cultures to test tubes containing Mueller Hilton Broth and were incubated at 37˚C for 24 hours .[22,23]

Disc diffusion method

Onto the plates containing sterile Mueller Hinton Agar, 0.1mL of the bacterial culture was swabbed uniformly. Different concentrations of the sample were loaded prior a day on 5 mm sterile discs. These discs were placed on the bacteria inoculated plates. The plates were incubated at 37˚C for 24 hours. After incubation period, the diameter of inhibition zones formed around the discs was measured in millimeter. The study was performed in duplicates for all the samples.

Results

Taxifolin –Antibacterial activity

Table1 – shows antibacterial activity of taxifolin against *S. mutans* and *L.acidophilus*

Concentration (mg/ml)	Streptococcus mutans			Lactobacillus acidophilus		
	Zone of inhibition (in mm)			Zone of inhibition (in mm)		
	Plate 1	Plate 2	Average	Plate 1	Plate 2	Average
1.5	18	16	17	7	7	7
2.0	19	17	18	7	8	7.5
2.5	22	24	23	13	16	14.5

Control

Table 2 shows antibacterial activity of chlorhexidine

Concentration (mg/ml)	Chlorhexidine		
	Zone of inhibition (in mm)		
	Plate 1	Plate 2	Average
1.5	24	26	25
2.0	25	20	22.5
2.5	24	22	23

The antibacterial activity of the Taxifolin from Acacia catechu leaf were tested against *S. mutans* and *L.acidophilus* using the disc diffusion method. as shown from Table 1, Three different concentration 1.5mg/ml ,2mg/ml ,2.5mg /ml were used in the study. Taxifolin inhibits Streptococcus mutants significantly when compared to Lactobacillus acidophilus. Chlorhexidine is gold standard drug for maintain oral hygiene with its antibacterial effect. The Taxifolin showed moderate antibacterial efficacy against *S. mutans & L.acidophilus* when compared to the control chlorhexidine.

Discussion

Taxifolin which is isolated from *Acacia catechu* has various medical properties. Various studies have been done to disclose the medical property of taxifolin. Taxifolin has been found as anti cancer drug. The therapeutic promise of dihydroquercetin(taxifolin) in major inflammatory disease states such as cancer was recently reviewed by Farid Menaa et al.[11,12] Further studies are done and the results says that Taxifolin and possibly other flavonoids with a similar molecular structure may act as "enhancers" in combination with Andro to treat prostate cancer which was done by Zhong Rong Zhan at al[13].

Taxifolin is said to have a dose-dependent effect on inhibiting the ovarian cancer cells.It also has a strong correlation between the antiproliferative effects of DHQ derivatives on murine skin fibroblasts and human breast cancer cells.[14] They are used positively to treat patient infected with strains of methicillinresistant S. aureus (MRSA).[15] They increase the efficacy of certain antibiotics such as ceftazidime and levofloxacin.

A study was done at 2011 by Anitha Roy et al [16] and found that Heart wood of *Acacia catechu* is said to have anti fungal activity.The results obtained were the higher concentration of the extract showed good antifungal activity against all the fungal strains tested and the the lower concentration showed very weak or no activities.

Acacia catechu thus have various medical property.[17] Studies were done in 2010 to assess the Antimicrobial activity of the *Acacia catechu* against organism causing dental caries. The results were *Acacia catechu* willd is proved to be a potent Antimicrobial agent against Dental infections like Dental caries caused primarily by *Streptococcus mutans* which is similar to our result.

Another study was done by Lakshmi et al to evaluation of antibacterial activity of heartwood extract of *Acacia catechu* willd. The results says that The antibacterial activity of the extracts (Ethanolic and Aqueous) at different concentrations was determined by measuring the zone of inhibition. [18]The ethanolic extract was more effective against *Staphylococcus aureus* with a zone of inhibition of 24 mm diameter (at conc200 g.) and was least effective against *Pseudomonas aeruginosa and Bacillus subtilis* with zone of inhibition of 10mm (at conc. 200 g.) and 11mm (at conc. 200 g.) respectively. Among the other bacterial species studied E.coli showed a zone of inhibition of 19mm diameter (at conc. 200 g.) and *Klebsiella pnuemoniae* showed inhibition zone of 16mm diameter (at conc. 200 g.). They concluded that the *Acacia catechu* willd heart wood extracts has got antibacterial activity

Mohan Lal Saini et al performed a study on the Antimicrobial property of *Acacia* species. The results concluded that *A.nilotica* (pods) and *A.catechu* (bark) were reported to be most active against different bacterial and fungal strains. The mathanolic extract of *A. nilotica* (pods) showed highest activity against *E.coli,* S. aureus and *A.niger*, whereas *A. catechu* exhibited its prominent activity against *S.aureus* and *C.albicans* [19,20] However, the hexane extract of A. nilotica was also found most active against *S.typhi*. In whole antimicrobial experiment, *Acacia Jacquemonti* was reported with weakest or no activity.

There is increasing evidence to support that the plants of genus *Acacia* are relatively high in bioactive secondary compound and are thus likely to hold promise for drug discovery. Secondary compounds in *Acacia* are important for a variety of functions, chief among these are Anticancer (triterpenoid and saponins), diuretic (glucosides), natriuretic (glucosides), important nutraceutical (polysaccaride and gum) anti-digestive disorder (saponins, tannins and flavanoids), anti-oxidant (polyphenols), antiplasmodial (treptamine, tannins, organic acids and saponins [21]

As the above discussion says that *Acacia catechu* has high medical value. One such property is anti microbial activity. Various studies reported the anti bacterial activity of the plant. They showed a great response against streptococcus mutants and lactobacillus acidophilus. These two organisms plays a major role in the dental caries. The anti bacterial activity of Acacia catechu is positivity high against *S.mutans* than the later

L.acidophilus. Acacia catechu showed less activity on these organisms when compared to chlorhexidin but the former is a herbal drug with no side effects.

Conclusion

Taxifolin isolated from *Acacia catechu* leaf was found to be effective as antibacterial against different bacterial pathogens, providing the scientific basis for its traditional application in Indian folk medicine against many Oro dental infections. Further studies should be done to find out the active compound responsible for antibacterial effects and other necessary pharmacological studies to use in modern drugs developments.

mortality in patients on whom OPMDs are not treated.

Awareness of Cataract among Females – A Questionnaire Study

Kayalvali S[1], Mahesh Ramakrishnan[2]

[1]Undergraduate Student, [2]Reader, Department of Pedodontics, Saveetha Dental College & Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India

Abstract

Background: Cataracts are the most common cause of vision loss in people over age 40 and is the principal cause of blindness in the world. A cataract is a clouding of the lens in the eye leading to a decrease in vision. Clumps of protein in lens clouds the lens and reduces the sharpness of the image reaching the retina, It can affect one or both eyes. Often it develops slowly. Most cataracts are related to aging. Knowledge regarding cataract can help in early diagnosis and can prevent further complications like blindness.

Aim: A questionnaire based study to know the awareness of cataract among female patients visiting Saveetha Dental College and Hospitals from 40-50 age group.

Materials and Method: Questionnaire regarding the knowledge regarding cataract was distributed to the female patients aged 40-50yrs who agreed to participate in the study. The results were tabulated.

Results: The overall knowledge and awareness of cataract among female patients is poor. The study found poor understanding of the definition, risk factors, signs, symptoms, and treatment of cataract.

Conclusion: The study identified lacunae in awareness of cataract among female patients. The basic knowledge in early identification and treatment of cataract can prevent most of the complications.

Keywords: *Awareness, cataract, blindness, females*

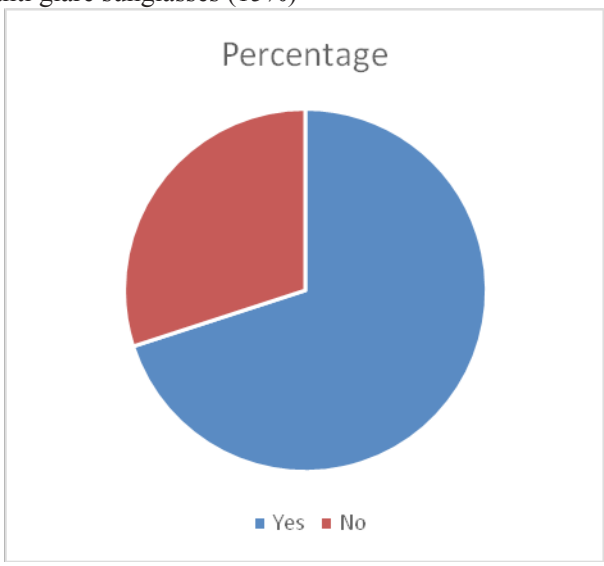
Introduction

Cataract is opacity, or clouding, of the lens of the eye. The lens of an eye is normally clear and when the lens becomes cloudy or is pacified, it is diagnosed as cataract. Human lens allow light to pass through to the back of your eye, helping you to see sharp images. If parts of the lens become cloudy (opaque), light cannot pass through the cloudy patches. But as we age, some of the protein may clump together and start to cloud a small area of the lens. Over time, the cataract may grow larger and cloud more of the lens, making it harder to see. As less light is able to pass through the lens, vision may become blurry or cloudy. The cloudier the lens becomes, the more sight will be affected. Cataracts develop slowly to cause loss of vision, and can render the person completely blind if it is left untreated.(1)Senile cataracts (cataracts that develop in the elderly due to the ageing process) usually start with initial opacity in the lens, followed by swelling of the lens, and then shrinkage of the lens resulting in a complete loss of transparency. (2) Symptoms may include faded colours,blurry vision, halos around light, trouble with bright lights, and trouble seeing at night.(3) This may result in individual having difficulty in driving, reading, or recognizing faces.(4) Poor vision may also result in an increased risk of falling and depression.(5)Cataracts are the cause of half of blindness and 33% of visual impairment worldwide.(6,7) Some forms of cataracts may also occur due to trauma, radiation exposure, be present from birth, or occur following eye surgery for other problems.(3,8) Most of the

Corresponding Author:
Mahesh Ramakrishnan
Reader Department of Pedodontics & Preventive Dentistry, Saveetha Dental College & Hospitals, 162, Poonamalle High Road, Chennai 600077 Tamil Nadu, India

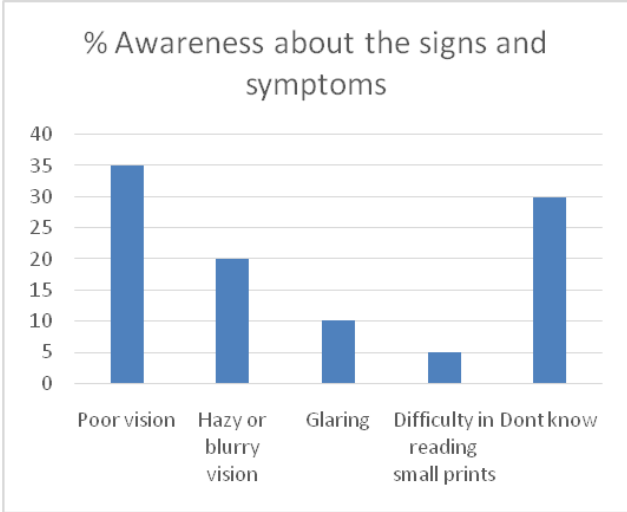
complications of cataract can be prevented if diagnosed at a much earlier stage, since the awareness among the population is not adequate, there is an urgent need in educating the general population with regards to early diagnosis and prevention. The study aimed to estimate the knowledge among the female patients regarding cataract and its complications.

Materials and Method



A questionnaire based study was conducted among 50 female patients visiting Saveetha Dental College and Hospitals from 40-50 age group. The questionnaire tested the basic knowledge about cataract. The questions were simple and direct. Females were chosen because as women live longer than men, they are more likely to be affected by conditions such as cataracts.[1] Females of 40-50 age group is selected because aging is the main cause of cataract and many eye problems begin around the age of 40. Awareness of cataract will help them as well as motivate others to seek treatment if they have visual problems due to cataract.

Questionnarie and Study Design



Informed consent was obtained prior inclusion in the study. The patients were interviewed by a single examiner. The questionnaire was administered in local language (Tamil) and the details were recorded. It included the commonly etiology, signs and symptoms, management protocol for cataract. The source of information and the investigations for cataract was also recorded.

Results

From our study, 65% were aware about the causes of cataract in which aging (40%) was the most common cause of cataract followed by trauma (20%) and clumping of protein in the lens.(Graph 1) The study showed that 70% were aware about the signs and symptoms of cataract, for which poor vision (35%) was the most common sign of cataract followed by hazy or blurry vision (20%), glaring (10%) and difficulty on reading small prints (5%).(Graph 2) From our study, 50% of the female patients were aware about the investigation of cataract, from which visual acuity (30%) was the most common way to investigate cataract followed by Opthalmoscopy (15%) and Tonometry (5%).Most of the respondents 53.5% were aware about the treatment of cataract, for which magnifying glasses (22.5%) was the most preferred treatment followed by surgery (16%) and anti glare sunglasses (15%)

Graph 1: Shows the awareness among 50 female patients, 70% of the them were aware of cataract.

Graph 2: Response when asked about signs and symptoms of cataract

Discussion

The knowledge and awareness of cataract among female patients is not adequate. The study found poor understanding of the definition, risk factors, signs, symptoms, and treatment of cataract.The incidence and prevalence of age related cataract is increasing worldwide.[2-5] In developing countries the lack of awareness of cataract and the treatment options available is one of important factor for the increased prevalence of cataract. Among 50% female patients, do not know the test to investigate cataract whereas 30% of them responded that visual acuity test can be the test. In one study it has been estimated that in India alone 3.8 million people become blind from cataract each year.[(9)] Among 50 female patients, 46.5% of them are not

aware regarding the treatment of cataract. In developing countries like India, studies have shown that incidence of cataract is high and occurs earlier in life.[10,11]

Cataracts are very common, especially among people in the age group of 40 and older.[10] Among the estimated amount of population with blindness the world today, 64% are female.[7] This is because in many countries women live longer than men and are at greater risk of blindness from causes related to age.[1] It is clear that there is a gap between the population and health-care providers, which limits the role of public health and eye education. It is thought that misconception of eye disease and limiting it to the "eye sight" is an important factor that decreases population desire for eye follow-up and education.[11]

Moustafa S Magliyah et al believed that eye education is away from media and commercial focuses with the exception of television adverts for glasses, contact lenses, or laser eye treatment.[12] In conclusion, our data suggest that there is an urgent need for health education in the study population in order to increase their level of awareness and knowledge about common diseases. This is particularly important in a developing country such as India, with considerable investment in tertiary eye care. Increasing the awareness and knowledge of common eye diseases could lead to an increase in understanding and acceptance of the importance of routine eye examination for early detection and treatment of such conditions, thereby reducing visual impairment and cost of eye care. Carol H et al mentioned that these data could help to develop effective health education and information programmes to reduce visual impairment among the population.[13]

Conclusion

The overall awareness of cataract among female patients aged 40-50 is 59.6%. Around 40.4% of the female patients are not aware of cataract, mainly with regards to investigation and treatment. It is recommended to develop a targeted public health awareness raising campaign around eye health and the importance of attending regular site test. The program should be developed and delivered in partnership with the community, engaging key health professionals to work with the community to promote eye health message and provide public education about common eye diseases. Therefore, efforts should be made to increase the knowledge and awareness of the general public about the disease.

Assessment of Diagnostic Accuracy of Intraoral Digital Radiography When Compared to Cone-Beam Computed Tomography for Assessment of Vertical Defect Depth in Grade 2 Furcation Defects

Darshanaa Arunachalam[1], Sheeja S Varghese[2]

[1]Postgraduate Student, Department of Periodontology, [2]Department of Periodontology, Saveetha Dental College, Saveetha Institute of Medical and Technical Science, Saveetha University, Chennai, India

Abstract

Background: Periodontal disease is a chronic inflammatory condition resulting in attachment loss and alveolar bone loss. This destruction progresses apically exposing the furcation of multirooted teeth. Although we routinely employ conventional two-dimensional (2D) radiographs for diagnosing bone levels in periodontal disease, inaccuracy caused due to overlap of structures makes diagnosis almost impossible.

Aim: To assess the diagnostic accuracy of digital intraoral radiography technique when compared to the cone beam computed tomography in detecting vertical defect depth in grade 2 furcation defects.

Materials and Method: A total of 41 grade 2 furcations including 21 buccal and 20 lingual furcations were included. Vertical defect depth was assessed using IOPA and CBCT and then compared.

Results: There was a variation between the IOPA measurements and the CBCT measurements of vertical defect depth. The variation ranged from 0.04 to 5.9 mm. The mean variation between the 2 groups was found to be 1.77 ± 1.39. The mean VDD measured in CBCT was 2.85 ± 1.58 and the mean VDD measured in IOPA was 2.85 ± 1.74.

Conclusion: IOPA is not an accurate method to measure vertical defect depth in grade 2 furcation defects as compared to CBCT.

Key Words: *Furcation, Periodontitis, Intrabony defect, Multirooted teeth*

Introduction

Periodontal disease is an inflammatory condition primarily infectious in nature perpetuating attachment loss and alveolar bone loss. This destruction progresses apically exposing the furcation of multirooted teeth causing irreversible bone loss in interradicular area.(1)

Limited accessibility through furcation entrances combined with complex anatomy and morphology of molar teeth pose complications like plaque accumulation, difficulty in effective instrumentation and oral self-care leads to it having poorer prognosis than the teeth without furcation defects.(2) A thorough knowledge of furcation anatomy and precise assessment of its degree is important for accurate assessment of the etiological factors, diagnosis, prognosis and treatment of involved teeth.

Although we routinely employ conventional two-dimensional (2D) radiographs for diagnosing bone levels in periodontal disease, inaccuracy caused due to overlap of structures makes diagnosis almost impossible. These 2D radiographs generate images with tooth roots

superimposed on region of interest, thus obscuring furcation defects.[3]

More recently, limitations of 2D radiographs can be overcome by the use of cone-beam computed tomography (CBCT) imaging technique, which provides 3D volumetric images with multiplanar reconstruction in axial, coronal and sagittal planes without magnification. CBCT collects high-resolution 3D data at lower cost and reduced radiation doses than conventional Computed Tomography (CT). Hence, this study is aimed to assess the diagnostic accuracy of digital intraoral radiography technique when compared to the cone beam computed tomography (CBCT) in detecting vertical defect depth in grade 2 furcation defects.

Materials and Method

Patients between age group of 25-59 years (mean age 39.96 ± 10.92) reporting to the Department of Periodontics, Saveetha dental College, Chennai, India were considered for the study. Patients clinically and radiographically diagnosed with chronic periodontitis based AAP criteria with a horizontal pocket depth of ≥3 mm in buccal or lingual aspect of atleast one mandibular molar with Grade 2 furcation defect were included in the study. Mandibular third molars, teeth with furcation caries, teeth indicated for extraction and teeth with Grade 1, Grade 3 or Grade 4 furcation defects were also excluded from the study. Thirty patients with 4 sites who complied with the above inclusion and exclusion criteria were recruited for the study. Informed consent was obtained from all participants before the study. The study period was from January 2016 to December 2017. Ethical clearance for the study was obtained from the Institutional Ethics Committee.

Probing pocket depth was measured using UNC 15 (Hu-Friedy, Chicago, IL, USA) probe at baseline. Furcation defect was measured at two sites (Buccal and Lingual) using Nabers Periodontal Probe and UNC 15. Grading of furcation was done according to Glickman's classification system. All the clinical parameters were assessed by a single calibrated examiner.

Intraoral periapical radiograph (IOPA) was taken on the selected mandibular molar using film positioner to standardise the distance and angulation of the cone from the film. The film was super imposed with a counting grid to standardise the magnification and to help measure the radiolucency. The linear number of grids at (number of rows of grids) vertically in the radiolucency at the furcation defect is counted. Radiographic defect depth measurements were evaluated according to the "absolute technique" on Digital radiographs, where a partially radiolucent grid is either completely excluded or included.[4]

CBCT measurements were performed by measuring the deepest vertical depth of the furcation defects at the specified furcation entrance. The furcation entrance served as anatomical starting point for measurements. The measuring tool provided within the Kodak software (Galilios Galexis viewer) was used for the measurements. CBCT measurements were analyzed in tangential sections that made the vertical depth of the defect most visible and easily measurable. The different sections were aligned using the furcation entrance as anatomical landmark. Back and forth scrolling in the tangential planes allowed to identify and measure the deepest vertical extent of bone loss.

These measurements were then recorded and compared to intraoral periapical radiograph measurements.

Statistical analysis

SPSS software was used for the statistical analysis.

Paired t test was used to compare the Vertical Defect Depths (VDDs) of all the defects measured in CBCTs and in IOPAs.

The VDDs measured in CBCTs was taken as the gold standard and the variation of the VDDs measured in IOPAs from that of the CBCT was calculated by taking the difference of both the values in each defect. One sample t test was used to assess the significance of the mean variation between the 2 groups.

Results

In the present study, a total of 41 grade 2 furcations including 21 buccal and 20 lingual furcations were included. There was a variation between the IOPA measurements and the CBCT measurements of vertical defect depth. The variation ranged from 0.04 to 5.9 mm. The mean variation between the 2 groups was found to be 1.77±1.39. The variation was significant at a p value of 0.00. IOPAs of 48.78% of the defects overestimated the defect depths and 51.22% of the defects underestimated the defect depths when compared to measurements made in CBCT. (Table 1) The mean VDD measured in CBCT was 2.85±1.58 and the mean VDD measured in IOPA

was 2.85±1.74. The difference was not significant at a *p* value of 1. (Table 2).

Discussion

This study aims to assess the accuracy of IOPA in measuring the vertical defect depth in grade 2 furcation defects when compared to CBCT.

In the present study, the mean variation of the IOPA when compared to CBCT was found to be 1.77±1.39. The variation between the VDDs measured IOPA and CBCT was significant at a *p* value of 0.00. A study

by Ashwinirani et al[5] where IOPA and intra surgical measurements of intrabony defect depths were compared and the variation was found to be between 1.5 to 2.5 mm.This variation in VDDs measured in IOPA and CBCT could be due to the defect being unappreciable in a 2 dimensional radiographic modality like IOPA due to overlapping of buccal and lingual cortex. The variation may also be due to the use of absolute technique[4] where the partially radiolucent grids were excluded, while measuring the VDDs in IOPA, whereas VDD in CBCT was measured from end to end to its decimal point and hence more accurate.

In the present study, IOPAs of 48.78% of the defects overestimated the defect depths and 51.22% of the defects underestimated the defect depths when compared to measurements made in CBCT. But a study by Ashwinirani et al[5] stated that IOPA consistently underestimates alveolar bone loss when compared to intra surgical measurements. The present study assessed the accuracy of IOPA in furcation defects whereas the previous study assessed the intrabony defects which could be the reason for the difference in the results.

In the present study, the mean of the VDD measurement in CBCT was 2.85±1.58 and the mean in IOPA was 2.85±1.74. There was no statistically significant difference between them. This should not be misinterpreted as no variation because the mean values are misleading as in almost half of the sites, IOPA tended to overestimate the CBCT measurements which gave a negative value whereas in the rest half, it underestimated the CBCT measurements. Hence, even though the variation between the groups is 1.77±1.39, the mean VDDs measured in IOPA and CBCT were almost same.

A prevalence study by Larato et al[6] has reported that buccal furcations are more prevalent than lingual furcations among the furcation defects mandibular molars. But, in the present study, the defects distributions were almost equal such as 21 buccal furcations and 20 lingual furcations.

Mootha et al[7] in their study, compared direct intraoperative ridge measurements (DIRM) using vernier calipers to measurements taken by alveolar ridge mapping (RM), Computed Tomography (CT) and Cone-Beam Computed Tomography (CBCT) for measuring alveolar bone dimensions prior to implant placement and concluded that detailed three-dimensional information of the surgical site prior to implant placement can only be obtained from a CT or CBCT. A study by Bagis et al[8]tunnel, and fenestration concluded that, CBCT has the highest sensitivity and diagnostic accuracy for detecting various periodontal defects among the radiographic modalities examined. Hence, in the present study, CBCT was held as the standard to assess the accuracy of IOPA in measuring the vertical defect depth in grade 2 furcation defects.

The strength of the study lies in the fact that the measurements of the IOPA was compared with that of the CBCT, which is the most accurate non invasive radiographic diagnostic method. Hence, it is as good as intra surgical measurements without having to surgically enter the site. In the present study, we did not subcategorize and evaluate the mandibular furcations into its buccal and lingual involvement sites. The accuracy greatly varies between the sites, due to superimposition, causing difficulty in assessing the defect sites. Hence, we do not know if the variation of IOPAs in measuring the VDD is more in buccal or lingual defects from the present study. Further studies are required to validate the most accurate radiographic method in measuring furcation defects.

Conclusion

IOPA is not an accurate method to measure vertical defect depth in grade 2 furcation defects as compared to CBCT.

Considerations for Management of Candida – Associated Leukoplakia

Prasanthi Sitaraman[1], Arvind Muthukrishnan[2]

[1]Postgraduate Student, [2]Professor and Head, Department of Oral Medicine and Radiology, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Oral candidiasis is the most frequently encountered white lesions of the oral cavity of fungal etiology. It usually presents with a curdy white scrapable lesion that leaves an inflamed, bleeding area when scrapped off. Oral leukoplakia, the commonest oral potentially malignant lesion is caused by the use of tobacco. The management strategies for oral leukoplakia and candidiasis are contrasting. Many studies have shown the presence of invasion of candida species in premalignant lesions which includes oral leukoplakia. This article reviews the clinicopathological diagnosis of leukoplakia super imposed with candidiasis and the management of such lesions.

Keywords: *Chronic hyperplastic candidiasis, candidal leukoplakia, candida – associated leukoplakia, candidiasis, oral leukoplakia*

Introduction

Candidiasis is a common opportunistic infection of the oral cavity usually seen in extremities of age – infants and geriatric patients and in immunocompromised patients [1]. Leukoplakia is considered to be most common potentially malignant lesion of the oral cavity [2]. Candidiasis and leukoplakia are two different entities that require treatment individually. The presence of candida species in oral premalignant lesions have been frequently researched as it is implicated in its malignant transformation [3,4]

Candidiasis and Leukoplakia

Candidiasis is caused by Candida species which is an endogenous commensal. The occurrence of oral candidiasis is often a sign of impaired immune mechanisms of the body. Candida Albicans is the most common species of candida associated with candidiasis. However, other species like C. glabrata and C. tropicalis are other non albicans related to the disease[5] The ability of the candida species to infiltrate and invade the mucosal surfaces of the host is facilitated by the presence of epithelial changes that are induced by premalignant lesions. One such lesion is oral leukoplakia [3,4,6,7].

Oral potentially malignant disorders (OPMD) is defined as any lesion or condition of oral mucosa that has a potential for malignant transformation. The term OPMDs was recommended by Working group of WHO in 2005 [8]. Leukoplakia is a potentially malignant disorders whose definitions have been modified regularly. The WHO defined oral leukoplakia as 'a white patch or plaque that cannot be characterized clinically and pathologically as any other disease'. In 1984, an addition of 'oral leukoplakia is not associated with any physical or chemical causative agent except the use of tobacco' was made. In 1986, a description of 'a predominantly white lesion of the oral mucosa that cannot be characterized as any other definable disease' which was later modified as 'any other definable lesion' in 1997. In 2005, WHO changed the definition to 'a white plaque of questionable risk having excluded known diseases or disorders that

carry no increased risk of cancer' [9] [10].

Candida plays an important role in malignant transformation potential of the existing OPMD [11] . It induces carcinogenesis by elaborating nitrosamines that activate proto – oncogenes. Oral malignancies are always preceded by premalignant lesions of which leukoplakia is predominant. Many studies have been done to evaluate the presence of candida species in oral leukoplakia and to assess the change in malignant transformation potential of the lesion [3–5,9,12].

The fact that leukoplakia is infected with species of candida was first reported by Cernea et al and Jepson and Winther in 1965. The term 'candidal leukoplakia' was introduced by Lehner in 1967. Candidal leukoplakia and chronic hyperplastic candidiasis were used synonymously until mid -1980s. Chronic hyperplastic candidiasis is the term used by some authors to describe candidiasis of skin and other mucosa in patients with endocrine and immune defects. Histopathologically, chronic hyperplastic candidiasis is used when specimens show hyperkeratosis, epidermal hyperplasia and fungal hyphae invading the superficial layers of mucosa [6] . The hyperplasia of the epithelium has been postulated as a protective response of the host to candidal infection [13]. Recently, some authors refer candidal leukoplakia as 'candida – associated leukoplakia'[7,9].

Clinical Presentation

Based on the clinical presentation, oral leukoplakia is divided into categories and subcategories. Categories include homogenous and non – homogenous types. Non – homogenous type is further sub – classified into nodular, speckled and verrucous leukoplakia. Proliferative verrucous leukoplakia is a type of verrucous leukoplakia. Non – homogenous lesions have a much higher risk of malignant transformation potential when compared to homogenous counterparts. Presence of candida has been frequently seen in non – homogenous leukoplakia.

Candida associated leukoplakia appears as well demarcated, palpable, raised, small whitish areas to large opaque plaques that cannot be rubbed off. Smooth homogenous areas of the lesion are often confused with homogenous leukoplakia. Some areas of the lesion can be interspersed with erythematous areas and these lesions are referred to as specked leukoplakia [6,14] . The lesions are often evident in the retrocommissural area, extending from the commissure of the lip and into the buccal mucosa.

Diagnosis

A provisional diagnosis of leukoplakia is primarily based on the clinical presentation of the lesion. As the definition of leukoplakia suggests 'excluding known diseases or disorders', any other white lesion with corresponding diagnostic features have to be excluded based on etiology, anatomical site or sub – site and extent of the lesion [9,15,16]. One of the prevalent white lesion to be excluded is candidiasis. Other lesions that have to be excluded for provisional diagnosis of leukoplakia are [10]:

1. White sponge nevus
2. Frictional keratosis
3. Morsicatio buccarum
4. Chemical injury
5. Leukoedema
6. Plaque type lichen planus
7. Lichenoid reaction
8. Discoid lupus erythematosus
9. Hairy leukoplakia
10. Leukokeratosis nicotina palate

Some authors suggests therapeutic diagnosis by inferring that lesions which regress with antifungal treatment are chronic hyperplastic candidiasis and those which remain are candidal leukoplakia or candida – associated leukoplakia [9,13,17].

The gold standard for the diagnosis of OPMDs is biopsy. The proposed diagnostic protocol suggests taking biopsy for lesions that do not respond to treatment given to eliminate possible etiology [9,10,15].

For diagnosis of candida associated leukoplakia, smear and swab of the lesion are simple chairside procedures that are used to detect budding yeasts and fungal hyphae. However, these procedures are not conclusive of Candida species. The specimen can be cultured in Sabouraud's agar and incubated for the assessment of fungal growth. The tissue specimens taken by incisional or excisional biopsy can be stained using Periodic – Acid –Schiff stain or Gomori's methanamine silver stain for detection of candida invading the epithelial layers.

Use of Certainty factor (C – factor) for diagnosis of leukoplakia was suggested by Brouns et al[9] .

1. Certainty factor 1 was assigned to provisional diagnosis of lesions suspected of leukoplakia.

2. When negative response is elicited for initial elimination of suspected etiological factors that include smoking and infection with candida, certainty factor 2 is given.

3. Certainty factor 3 is designated to lesions whose histopathological examination of incisional biopsy specimen does not show a definable lesion.

4. In cases when complete excision of the lesion is performed, certainty factor 4 is given for the evidence obtained from the histological specimen.

The risk factors that are associated with malignant transformation of leukoplakia are [15,18] :

1. Female gender
2. Longer duration
3. Idiopathic leukoplakia
4. Size> 200 mm^2
5. Non – homogenous type
6. Presence of invasive Candida
7. Presence of epithelial dysplasia
8. DNA aneuploidy
9. History of previous head and neck carcinoma

These factors are known to affect the treatment outcome of leukoplakia.

Management

The treatment of candida associated leukoplakia includes use of antifungal drugs, either topical or systemic depending upon the severity of the lesion and by surgical management.

The most commonly used antifungal drugs include [19,20] :

Topical medications

1. Nystatin suspension (100,000 units/mL) swished 4 – 5 times a day

2. Clotrimazole troches (10 mg) dissolved in the mouth 4 – 5 times day, for 7 – 10 days.

3. Miconazole gel over the denture wearing surface, every 8 hours, for 7 – 14 days

Dentures should be soaked in 3% sodium hypochlorite diluted in water (1:10) or chlorhexidine digluconate 0.12%. Patients should be advised against wearing dentures overnight.

Systemic therapy with fluconazole 100–200 mg daily for 7 days.

Newer antifungal drugs have also been used in cases of candidiasis caused by fluconazole resistant candida species [21].

Such lesions have been named as chronic hyperplastic candidiasis refractory to systemic antifungal therapy or candidal leukoplakia.

Other modality of treatment for candida associated leukoplakia is by surgical management. Surgical management includes cold-knife surgery, laser therapy, and cryosurgery. It is recommended if associated with epithelial dysplasia. This assures reduction in the malignant transformation potential of the lesion [22].

Conclusion

All potentially malignant lesions suspected of superficial candidiasis should be investigated for candidal infection. Removal of risk factors including candida is essential before a biopsy is performed. If candidal hyphae are detected, antifungal therapy should be given for a period of 2 – 4 weeks and biopsy should be performed only when the lesions fail to respond to the treatment. Following accepted guidelines and protocols for the treatment of oral potentially malignant lesions can result in better treatment and prognosis of the lesion. Preventing malignant transformation of OPMDs is crucial as it helps in reduction of morbidity and mortality in patients on whom OPMDs are not treated.

Comparative Evaluation of Maleic acid and EDTA as a Desmearing Agent - An In-Vitro Study

Danalakshmi J[1], Subash Sharma . S[2]

[1]Undergraduate Student, [2]Reader Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, TN, India

Abstract

Aim: To compare the desmearing effect of 7% maleic acid with 17% EDTA on intra-radicular smear layer removal using Scanning Electron Microscopy (SEM).

Materials and Method: Fifteen maxillary incisors were collected and decoronated. Each tooth was randomly split into 3 groups, each assigned to saline, 17% EDTA and 7% Maleic acid respectively and irrigated. Each tooth was split into halves and subjected to scanning electron microscopy for evaluation of smear layer removal.

Results: Average grading for saline was 5.16 and that of EDTA was 2.32 and Maleic acid was 3.16. Maleic acid was significantly better than saline. But maleic acid was significantly not as effective as EDTA on the smear layer removal.

Conclusion: This study proves that Maleic acid though better than saline fell short in comparison to EDTA in terms of smear layer removal. This difference in desmearing effect was significant.

Keywords: *Maleic acid, root canal irrigant, surface roughness, scanning electron microscopy*

Introduction

The primary objective of endodontic treatment is the achievement of a clean environment in the root canal and minimize the risk for unsuccessful treatment outcomes [(1)]. Because of the complex root canal anatomy, irrigants supplement the mechanical preparation of canal [(2)] . An amorphous irregular smear layer covering the radicular dentinal surfaces and plugging the dentinal tubules occurs during mechanical preparation of the root canal [(3,4)]. An ideal irrigant should be capable of penetrating and disinfecting the entire root canal system by removing both organic components which includes necrotic and non-necrotic pulpal tissue, predentin and microorganisms and inorganic components like mineral content of the dentinal tubules which form the smear layer [(5,6)]. In addition, the irrigant should mechanically flush the loose debris while also lubricating canals during biomechanical preparation, and have low tissue toxicity [(7,8)]. The role the irrigant plays is a vital role in the ideal preparation of the dentinal surface for bonding [(9)]. Root canal instrumentation and irrigation cannot fully eradicate endodontic infection [(10)] as bacteria can propagate to lateral canals, apical deltas and dentin tubules which are areas of difficult access [(11)]. This can hinder the elimination of infection from the root canal system that is vital for maintaining an environment favourable for the healing of apical periodontitis [(12)]. Persistence of microorganisms after treatment is the main cause of failure in endodontic therapy [(13)]. Mechanical and chemical effects that the irrigant solution possesses are crucial during irrigation. Mechanical effects are generated by the flow and backflow of irrigant solutions in the root canal [(14)].

Root canal preparation alters the biological, mechanical and chemical properties of the radicular dentine. The changes in mechanical properties of dentine due to irrigants are because of the changes in the chemical and structural composition of the surface of radicular dentinal thereby changing its permeability and solubility characteristics, and hence affecting the adhesion of materials to dentin surfaces [15,16]. These changes will affect the long-term integrity of the tooth structure [17]. Irrigants can also change other surface properties of dentin like wettability and the dentin and restorative material interaction [18]. Wettability is strongly dependent on chemical composition, roughness and hydration state and could be influenced by tubule density [19]. And it is a crucial factor which might influence the adhesion [20]. Roughness is an important factor in adhesion [21].

Ethylenediamine-tetra-acetic acid (EDTA) is a calcium chelating agent that is being used in endodontic treatment routinely for the removal of smear layer [22]. The removal of organic and inorganic debris has been successfully demonstrated on using a combination of sodium hypochlorite (2.5%–5%) and EDTA (10%–17%) [23,24]. A final irrigation of the root canal with EDTA has proven the ability to open up the dentinal tubules thereby increasing the number of lateral canals to be filled consequently by the sealer [25].

Maleic acid has been used in adhesive dentistry as an acid conditioner [26]. Maleic acid is a mild organic acid and it has been found to remove smear layer from the root canal surface [27]. A study by Ballal et al. has shown that 7% maleic acid performed better than using EDTA on smear layer removal from the apical third of the root canal [28].

In this study we assess the surface roughness of root canal dentin on using maleic acid as an irrigant.

Materials and Method

15 single rooted teeth was collected from Saveetha Dental College and Hospital for this study.

- **Sample preparation**

Diamond disc was used to decoronate the teeth at the level of the CEJ and apical third is also cut using a diamond disc. Teeth are randomly divided into 3 groups and each group is assigned to a specific irritant, Saline, 17% EDTA and 7% Maleic acid respectively. Cleaning and shaping was done using hand files and between each file each tooth was irrigated with their respective irrigant. Apical preparation was done till size 50 and step back preparation done till size 80. Further enlargement of the canals were done using Gates Glidden drills till size 5. Chisel and mallet was used to section the tooth longitudinally into 2 halves after grooving using diamond disc. Sectioned teeth were then immersed in their respective irrigant for 30 minutes and washed in distilled water and dried.

- **Scanning Electron Microscopy**

Samples were mounted on metallic stubs followed by gold sputtering and placed in a vacuum chamber. The samples were then subjected to scanning electron microscopy at 2000x and 3000x magnifications to check for the presence or absence of smear layer and graded based on study by Jeerphat et al and the results tabulated.

- **Data analysis**

Data tabulated and subjected to statistical analysis and significance calculated at $p<0.05$.

Results

The resultant images were graded according to scoring system summarised in table 1 based on a previous study [29].

Table 1: Smear layer scoring criteria

SCORE	CRITERIA
SCORE 0	No smear layer and smear plug; no smear layer of the root canal. All dentinal tubules were cleaned and opened.
SCORE 1	No smear layer but mild smear plug; no smear layer of root canals, small amount of smear plug in some dentinal tubules.

Cont... **Table 1: Smear layer scoring criteria**

SCORE 2	No smear layer but moderate smear plug; no smear layer of root canals. Most of the dentinal tubules had smear plug.
SCORE 3	Moderate smear layer; moderate smear layer covered the surface of the root canals; only few dentinal tubules were opened
SCORE 4	Heavy smear layer; complete root canal wall covered by homogenous smear layer and no opening of dentinal tubules
SCORE 5	Heavy smear layer; complete root canal wall covered by a heavy non-homogenous smear layer and no opening of dentinal tubules

Grading of the images obtained by SEM were tabulated and average values calculated at 2000x and 3000x. the resultant data was subjected to statistical analysis,

Average grading for saline was 5.16 and that of EDTA was 2.32 and Maleic acid was 3.16.

The statistical analysis of the resultant data is summarised in table 2,3.

Table 2: Kruskal-Wallis test among test groups

Group	N	Mean Rank
17% EDTA	5	7.90
7% MALEIC ACID	5	17.30
SALINE	5	21.70

Table 4: Mann-Whitney test among test group and saline

Group	N	Mean Rank	Sum of Ranks
7% Maleic Acid	5	3.70	18.50
Saline	5	7.30	36.50

According to Kruskal-Wallis test EDTA was significantly better than Maleic acid. However Maleic acid was significantly better than saline. This was further confirmed by Mann-Whitney test which showed that Maleic acid was indeed better than saline.

Discussion

The complex root canal system, prevalence of various types of root canals, the effect of irrigants and the irrigant protocols on the dentinal surface needs to be assessed [30,31]. Because of the patency of the dentinal tubules, the surface of the dentine is rendered porous. However, quite infrequently, they may also be found to be sclerosed. The features of the dentinal tubules such as their presence, their density and their diameter differ in regards to their relation with the corono-apical site of the tooth as well as with age and insult [30,31]. The density of the dentinal tubules along with their direction appears to be erratic and non-uniform in the apical regions of the roots, provided the presence of the tubules is established. The root canal system can serve the necrotic tissue remnants as a nutrient source to any remaining microorganisms [32].

Microorganisms and their by-products are found to be contained in the layer of material which comprises of both organic and inorganic substances, produced as a result of preparing the root canal in the biomechanical way. In said layer of material, a larger proportion is composed of mineralised collagen matrix, whose particles tend to be on the smaller side of the spectrum. This layer is spread to cover the cut surface of the dentin in all its entirety which results in the formation of what is known as the smear layer. Any openings of the dentinal tubules and also any depressions in the canal wall, if present, are cloaked and covered by debris, which is evidenced at an ultrastructural level as sludge-like material that is neither organised nor regular [33,34]. As a matter of fact however, the presence of such a smear layer has long been postulated to provide an avenue for possible leakage while also being a favourable source of substrate enabling bacterial growth and their ingress. Upon obturation of the canals, the frequency of penetration by bacteria was diligently studied and that frequency was shown to be significantly much higher when the smear layer was present as opposed to the bacterial penetration in the absence of such a smear layer [35,36]. In addition to this, the penetration of gutta-percha into the tubules as well as the adhesion and penetration of the sealers of root canal into the dentinal tubules may be interfered by the smear layer, which would ultimately lead to microleakage [37,38]. In order to remove tissue debris and microorganisms, irrigating solutions were employed which also facilitated the prevention of formation of dentine mud produced during the process of instrumentation since that can block the root canal. They also have the added benefit of removing the smear layer while also increasing the efficiency of cutting. This is done by decreasing the chance for fracture of the instruments. An irrigant for root canal is said to be ideal if it is compatible biologically, is able to successfully remove both organic and inorganic substrates chemically, is antibacterial, demonstrates good wetting of the surface, is proven to have not any adverse effects on the structure of the tooth that remains and also enables easy usage and is effective within the

parameters of the clinical therapy. Conversely, all these aforementioned criteria have not been met even by a single agent [39]. Hence the sequential use of organic and inorganic solvents has been recommended for successful irrigation of the root canal system [40]. Newer methods wherein photodynamic therapy and irrigants used in combination have a better effect in disinfecting the canals, even in cases of endodontic failure [41]. Current methods of smear layer removal include chemical, ultrasonic and laser techniques, none of which are totally effective or have received universal acceptance [42,43].

Nevertheless, through time, introduction of a wide array of irrigants has taken place each of which catering to specific predetermined actions such as chelation, capacity of dissolution, antibacterial action and substantivity to name a few. In more recent formulations are found combinations of detergent, acid and antibiotic while also focussing on the reduction of the surface tension which enables the achieving of a better penetration into the tubules [44,45,46].

Therefore, so as to achieve a ideal preparation of the dentinal surface, usage of irrigants can be employed in a sequence with the importance being levied to the volume of irrigation, time of exposure and mode of delivery. In recent times, with the use of high-resolution computed tomography, the proportion of the surface of dentine in the root canal that is planed by the instruments during the biomechanical preparation has been quantified and an observation has been made that about 35-53% of the surface of the root canal was left uninstrumented [47,48]. Over and above its flushing action, the debridement of the uninstrumented walls of the canal constitute the primary role of the irrigant solution. A result to this effect can be accomplished by an irrigant that is adept in the dissolving of organic tissues and also by exercising an appropriate method for its delivery to the surfaces that are uninstrumented. The modification of the chemical and structural composition of the radicular surface of the dentine results in changes in mechanical properties of the dentine. This thereby changes its permeability and solubility characteristics, hence affecting the adhesion of materials to the surfaces of the dentine [49,50]. The requirement for optimum adhesion is intimate contact between the adhesive material and the substrate which would enable molecular attraction and further permit chemical adhesion or penetration for micromechanical surface interlocking. An imperative feature is adhesion as it helps in the effective sealing of the canal as well as preventing at the dentin-sealer interface and at the interface with the obturating material by the root canal sealers [45]. Studies also show that the interaction between the resin sealer to the dentin collagen is invariably affected by irrigation protocols and it consequently influences the bond strength of sealers [51]. In this study saline, 17% EDTA and 7% maleic acid were used as irrigants to check their effect on intra-radicular dentin.

Straight single-rooted maxillary incisors were selected for this study with root length of approximately around 20-22 mm and minimal root curvature of 5 degrees or lesser. The samples were selected in such a way according to Schneider in order to maintain standardization and avoid an atomic variation [52]. Standardized step back technique was followed for root canal preparation using hand files up to k- file size 50 reaching full working length which helps the irrigants penetrate till the apical third. This lowers the bacterial content and dentinal debris to a greater extent on comparison with smaller preparation [52]. Since wider canals help in greater penetration of the irrigants, the canals were further enlarged with gates glidden drills in this study.

With regard to the study at hand, common-practice saline did not prove to alter the surface of dentine with any noteworthy significance, though they can be used for their actions of flushing and lubrication. Maximum efficiency was exhibited by 17% EDTA comparatively for cleaning the surface of the dentine. Although in another study EDTA demonstrated loss of intertubular and peritubular dentin as a consequence of erosion in some areas [53]. One study reported that maleic acid was more effective than EDTA in smear layer removal although apical preparation was done till ISO size 40. This could be attributed to the high surface tension of 17% EDTA (0.0783 N/m) on comparison with that of 7% maleic acid (0.06345 N/m). The efficiency of EDTA decreases over a time as there is a decrease in pH. But maleic acid being highly acidic ,has a greater demineralizing effect in a shorter period of time [54]. The irrigating needle was introduced 1 mm short of working length for all the samples [55]. even though it is difficult to standardize due to the control of fluid flow rate during syringe needle irrigation [56].

EDTA on reaction with the calcium ions in dentine, forms soluble calcium chelates. The efficiency of a chelating agent such as EDTA depends on various factors such as application time, pH, concentration, and amount of the solution [57]. The relationship between the

application time and the concentration of the chelating agent is said to be important because it was found that higher concentrations of solutions applied for a long periods can cause roughness of dentin surface [58]. EDTA has been reported to decalcify dentin to a depth of 20–30 μm in 5 min [59]. A 1-min application of 17% EDTA combined with ultrasonics is efficient for smear layer and debris removal in the apical region of the root canal [60]. EDTA performed significantly better than NaCl and NaOCl in smear layer removal and dentinal tubule opening [61]. Hasheminia et al., showed that 17% EDTA applied for one min was more effective than erbium-yttrium aluminium garnet (Er:YAG) laser in smear layer removal [62]. Calt and Serper's investigated 1 and 10 min application time of 17% EDTA and concluded that 17% EDTA in 1 min application time is effective and avoids harmful consequences like excessive erosion, widening of dentinal tubule openings and deterioration of the dentin surface [63]. Maleic acid has been reported to be a mild organic acid used as an acid conditioner in adhesive dentistry [64]. Ballal et al. reported that final irrigation with 7% maleic acid for 1 min was more efficient than 17% EDTA in the removal of smear layer from the apical third of the root canal system [64]. Studies have reported that maleic acid when administered at a concentration higher than 7% caused damage to the inter-tubular dentin and that concentration of 7% was adequate in removing the smear layer [65]. Thus in this study a concentration of 17% EDTA and 7% Maleic acid was used.

Methods available for smear layer evaluation other than the conventional SEM are digital image analysis, micro-computed tomography, atomic force microscopy, environmental SEM, and co-site optical microscopy (66). Reduced potential evaluator bias, reduced time requirement, and other parameters like density and average diameter of dentinal tubules can be measured when using digital image analysis. SEM was chosen in this study as it is a commonly available device for evaluating the smear layer (67).

Studies have shown that though the apical preparation was performed till ISO size no. 40, EDTA was not able to remove smear layer as effectively as 7% maleic acid [68]. EDTA is a chelating agent that is effective at a neutral pH and hence it is independent of the higher concentration of hydrogen ion to cause decalcification. A fall in pH in the dentin is because of the exchange of calcium by hydrogen and thus in turn is responsible for the reduced effectiveness of EDTA over time [69]. It has been reported in a study by Paqué et al. that the apical third of root canal the dentin is sclerosed and this will invariably minimise the action of EDTA [69]. Studies have stated a reduced mineral and non-collagenous protein (NCP) content of the dentin by EDTA followed by a lower degree of decalcification effect in the apical part of the root canal system by EDTA [70]. Studies show that 7% maleic acid has demonstrated better smear layer removing ability in the apical third than 17% EDTA and 18% etidronic acid. This is in agreement with several studies that have claimed EDTA to be effective in the coronal and middle thirds for smear layer removal but not in the apical third [71].

Even though in this study, 7% Maleic acid was inefficacious in removal of the smear layer when compared to EDTA. This was in contrast to other studies who investigated the effects of 7% maleic acid and EDTA on the removal of smear layer and found comparable results between the irrigants. The choice and use of the appropriate and most efficient irrigating agent, however, requires better understanding of their action. Moreover, smear layer removal is controversial and not the only factor affecting root canal therapy (72).

Conclusion

This study shows that 7% maleic acid is not an effective desmearing agent even though it has been reported otherwise in many studies. Hence it can be used as a final flush irrigant along with EDTA as EDTA's effect decreases over long duration and due to its improved efficacy of smear layer removal at the apical third of the root canal system. As this present study was done in vitro, the results obtained do not necessarily represent the actions of the tested irrigants in situ as the presence of blood, tissue remnants, and various other factors can affect the actions of the tested irrigants on the root canal system. Effective cleaning of the root canal system becomes more difficult as curved canal proves to be more challenging than straight canals. The needle can penetrate deeper in the single-rooted premolar tooth because it possesses wider canals. Therefore, in posterior teeth with narrow canals the results can vary. Further long-term clinical studies are necessary to confirm these results and evaluate their relevance to treatment outcome.

Antimicrobial Activity of Silver Nanoparticles Synthesized Using Marine Brown Seaweed *Spatoglossum Asperum* Against Oral Pathogens

M Jeevitha[1], S Rajeshkumar[2]

[1] Senior Lecturer, [2]Associate Professor, Department of Pharmacology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, Tamil Nadu, India

Abstract

Background : Green synthesis of nanoparticles using plant extract, bacteria, fungi and enzymes are eco-friendly and cost effective which do not need high pressure, energy, temperature and toxic chemicals for its synthesis protocol.

Materials and Method: In this report, we used the extract of marine brown algae *Spatoglossum asperum* to synthesize silver nanoparticles and were characterized using UV-visible spectrophotometer, TEM, XRD and FTIR and were also tested for their antimicrobial activity.

Results : These biosynthesized silver nanoparticles exhibited potent antimicrobial activity against oral pathogens namely, *Streptococcus mutans*, *Enterococcus faecalis*, *Pseudomonas aeruginosa* and *Candida albicans* and can be developed as a novel medicine against pathogenic oral diseases.

Conclusion : With increasing demand in advancements in diagnosis and treatment modalities, green synthesis of silver nanoparticles using marine brown algae *Spatoglossum asperum* has potent antimicrobial action have wider applications in dentistry.

Keywords: *Spatoglossum asperum, Silver nanoparticles, Marine algae, Green synthesis, Antimicrobial activity*

Introduction

Nanomedicine is an emerging field of research which incorporates the application of nanotechnology in medicine. It involves the use of nanoscale materials, such as biocompatible nanoparticles. Biological synthesis of metallic nanoparticles is more demanding and an emerging approach in the field of nanomedicine. A wide variety of biological resources have been used for the synthesis of silver nanoparticles such as fungus, bacteria, plants and marine algae [1-5]. As a natural material, silver is known to be safe to human and it has been shown that it produces little-to-no allergic reactions when tested for curing various diseases [6]. The silver nanoparticles have been reported to show better wound healing capacity with no scarring when tested using an animal model [7]. Silver impregnated medical devices like surgical masks and implantable devices show significant antimicrobial efficacy [8]. Green synthesis of silver nanoparticles by algae extract has more advantages than other biological resources such as bacteria and fungi because it eliminates the cell culture maintaining process and also it is more suitable for large scale production of silver nanoparticles [9]. The biological evaluation of marine algae belonging to Dictyotales has shown antibacterial, antiviral and cytotoxic activities [10]. The genus Spatoglossum are widely distributed in tropical to temperate regions [11]. *Spatoglossum asperum* are rich in protein content,

polyunsaturated fatty acids, vitamin C, niacin, folic acid, vitamin E and macro mineral (i.e., Na, K, Ca and Mg) contents [12]. The methanolic extract of *S. asperum* has shown high antibacterial activity against gram positive bacteria, namely, *Bacillus cereus, Bacillus subtilis, Staphylococcus aureus* and gram negative bacteria, namely, *Klebsiella pneumonia, Pseudomonas aeruginosa, Salmonella typhi* [13]. In this study, we used very low cost and medicinally significant marine brown seaweed *S. asperum* for the biosynthesis of silver nanoparticles. The synthesized silver nanoparticles were characterized using UV-visible spectrophotometer, TEM, XRD and FTIR. Antimicrobial activities of the medicinally valid algae mediated nanoparticles were also examined.

Materials and Method

The algae *S. asperum* was collected from Mandapam coastal area in South India. 0.25g of dried *S. asperum* powder transferred into 25 mL of double-distilled deionized water in a 250 mL Erlenmeyer flask and boiled the mixture for 5 minutes. This process extracted the components of the algae into water. Whatman filter paper was used for the filtration of boiled material to remove any suspended particles. Finally, a clear filtrate was obtained and used for the metal nanoparticle synthesis.

Biosynthesis of silver nanoparticles (AgNPs) using leaf extract 1 mM of $AgNO_3$

The aqueous extract of *S. asperum* was used for the bioreduction process. For the biosynthesis of AgNPs, 10 mL of aqueous extract was carefully added to 90 mL of 1 mM of aqueous $AgNO_3$ solution in 250 mL Erlenmeyer flasks. The flasks containing the extract was incubated in a shaker. The color changes in the reaction mixture was observed continuously at various periods of time by double beam UV-vis spectrophotometer at different wavelength region from 350 to 550 nm. The biosynthesized silver nanoparticles were centrifuged at 8000 rpm for 10 min and nanoparticles were collected.

Characterization of prepared nanoparticles

The synthesized nanoparticles were optically measured using double beam UV –vis spectrophotometer at different wavelength range of 350 to 550 nm. Morphological characterization of prepared nanoparticles was done using Transmission Electron Microscope (TEM). Crystalline nature of the nanoparticles was determined by X-ray diffraction assay (XRD). The functional groups of synthesized nanoparticles were analysed by Fourier Transform Infrared Spectroscopy (FTIR).

Antimicrobial Activity

The silver nanoparticles synthesized using *S. asperum* was tested for antimicrobial activity by agar well diffusion method against pathogenic bacteria *S. mutans*, *E. faecalis* and *P. aeruginosa*. The pure culture of the bacterium was subcultured on Mueller Hinton agar. Wells of 9 mm diameter were made on Muller Hinton agar plates using gel puncture and each strain was uniformly swabbed onto the individual plates using sterile cotton swabs. Using a sterile micropipette, a standard antibacterial agent was loaded on one well and three different concentration of silver nanoparticles sample solutions (25 µl, 50 µl and 100 µl) were poured onto three other wells on all plates. The isolates of *C. albicans* were subcultured onto Rose Bengal agar. A standard antifungal disc (voriconazole) was placed on the agar plate and then nanoparticles sample solutions (25 µl, 50 µl and 100 µl) were poured onto three other wells on the plate. After incubation at 37°C for 24 hours, the different levels of zone of inhibition of bacteria were observed and measured.

Results and Discussion

Visual identification

The present study shows the synthesis of silver nanoparticles by using marine algae *S. asperum*. The color changes in the reaction mixture was observed continuously at various periods of incubation time. The silver nitrate was reduced into silver nanoparticles visually identified by color change (Figure 1). The color of the solution was changed to brown color at 1 h incubation time. The intensity of brown color raised with increase in incubation time. The color was changed to dark brown after 24 h of incubation. There was no color change observed after 24 h which indicated that the silver nanoparticles synthesis process was completed. Green synthesis of silver nanoparticles using marine brown algae *Turbinaria conoides* also showed dark brown colour after1 h of incubation [14].

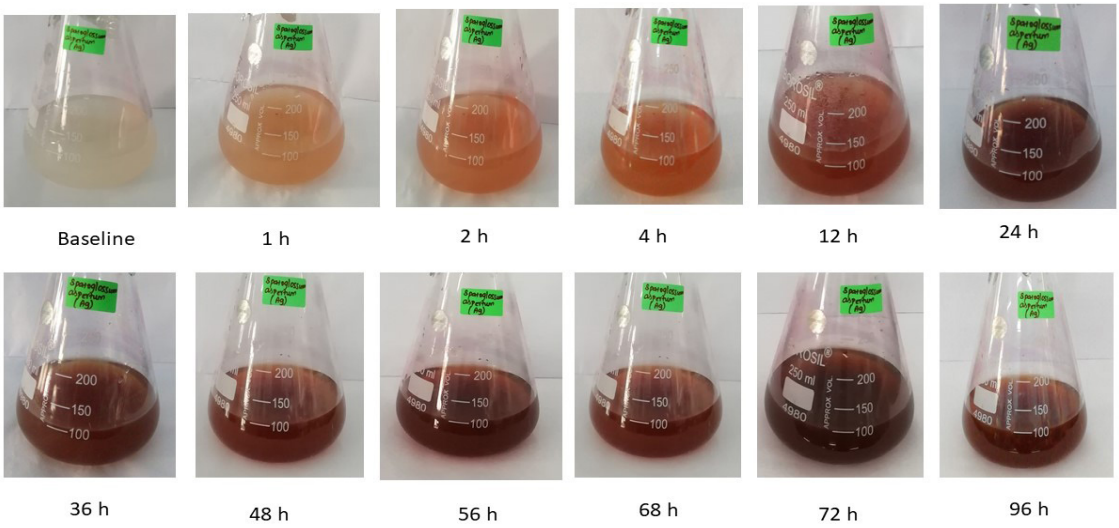

Figure 1: Reduction of silver ions to silver nanoparticles visually identified by color change at various periods of incubation time

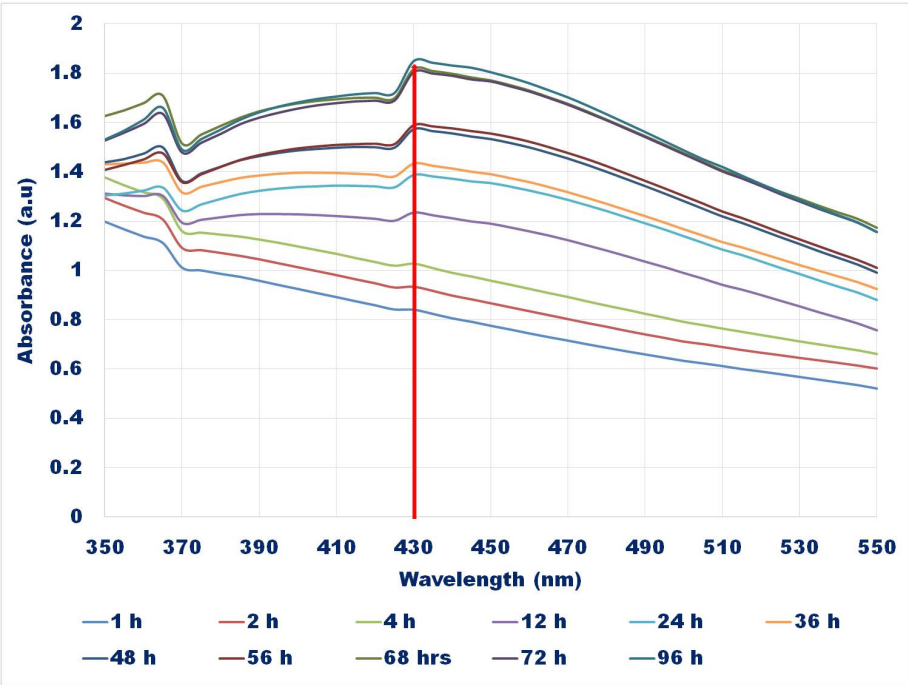
UV-vis spectrophotometer analysis

UV-vis spectroscopy analysis depends on the arising of color in the reaction due to the excitation of surface plasmon resonance band in a reaction mixture at different wavelength regions from 350 to 550 nm and was recorded at various time periods. Figure 2 shows the UV absorption spectra of the synthesized silver nanoparticles using the extract of marine algae *S. asperum.* The spectrum clearly shows that the absorbance steadily increased with increase in incubation time. The plasmon resonance band for silver nanoparticles was peak positioned at 430 nm. Synthesis of silver nanoparticles using marine brown seaweed *Padina tetrastromatica* showed high absorption at 460 nm [15].



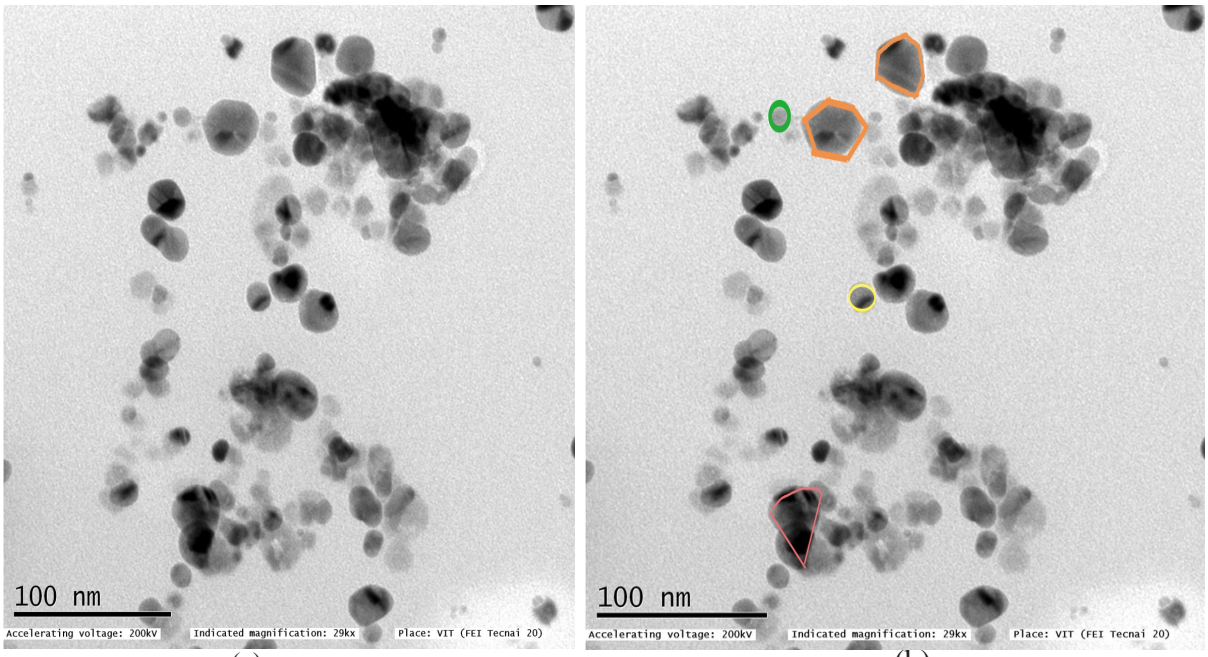


Figure 2: UV Spectroscopic analyses of silver nanoparticles synthesized from extract of *Spatoglossum asperum* recorded as function of time.

Transmission Electron Microscopy

The structure of the AgNPs of *S. asperum* was studied under TEM which has shown that particles are mostly hexagonal and spherical in shape, whereas some showed triangular and ellipsoidal shapes as well (Figure 3). The morphology of the AgNPs was highly variable with the size range of 10 - 35 nm. The silver nanoparticles synthesized from marine macro-algae namely, *P. capillacae, J. rubins, U. faciata* and *C. sinusa* were predominantly spherical in shape [16].

(a) (b)

Figure 3: TEM image of AgNPs synthesized using *S. asperum* (a) TEM image at 100 nm scale bar (b) outline of shapes highlighted

X-ray diffraction analysis

XRD is an analytical technique in which a beam of X-rays is projected onto the crystal and the incident beam is scattered by the atoms which lead to the formation of diffraction patterns. This interference observed determine its crystalline nature. Figure 4 shows the XRD pattern with peaks corresponding to the planes (1 1 1), (2 2 0) and (3 1 1). The result reveals that the silver nanoparticles synthesized using *S. asperum* are crystalline in nature. The XRD patterns of AgNPs synthesized using marine alga *Padina tetrastromatica* and *Turbinaria conoides* formed peaks assigned to (1 1 1), (2 0 0) and (2 2 0) which has also determined its crystalline nature [14, 15].

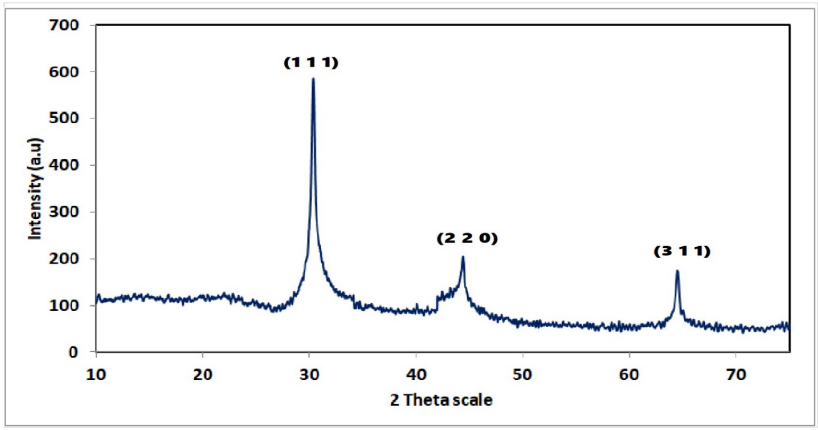

Figure 4: XRD analysis of biosynthesized silver nanoparticles using *S. asperum*

Fourier Transform Infrared Spectroscopy

S. asperum are rich in protein content, polyunsaturated fatty acids, vitamin C, niacin, folic acid, vitamin E and macro mineral (i.e., Na, K, Ca and Mg) contents [12]. FTIR was used to identify the biomolecules in *S. asperum* responsible for the silver ions reduction and stabilization of reduced silver ions (Figure 5). FT-IR transmittance show peaks at 3409.53 cm^{-1} which correspond to the chemical groups of hydrogen bonded O-H stretch of phenols and alcohols, at 2922.59 cm^{-1} which correspond to the chemical groups of hydrogen bonded O-H stretch of carboxylic acids, at 2853.17 and 1628.59 cm^{-1} which correspond to the chemical groups of C=O stretch of ketones and aldehydes, at 1382.71 cm^{-1} which correspond to the chemical groups of N=O bend of nitro groups, at 1115.62 and 1035.59 cm^{-1} which correspond to the chemical groups of C-O stretch of esters. The functional groups of AgNPs synthesized using fucoidan extracted from seaweed *Padina tetrastromatica* were found to have weak bands at 2982, 2653 and 2334 cm^{-1} which indicated the presence of O-H stretching carboxylic acid group [17].

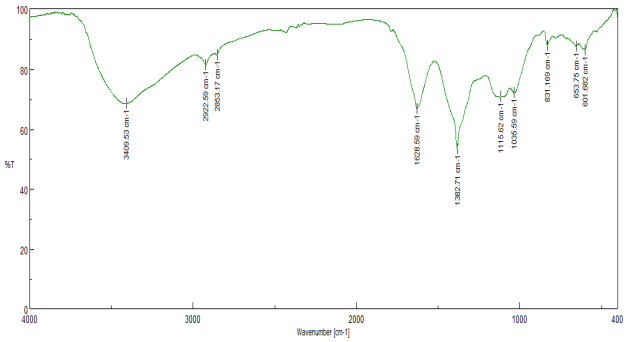

Figure 5: FTIR shows the functional groups associated with silver nanoparticles synthesized from extract of *S. asperum*

Antimicrobial activity of silver nanoparticles against oral pathogens

The antimicrobial activity of AgNPs of *S. asperum* assayed by well diffusion method against oral pathogens showed minimum inhibitory concentrations at different concentrations. Table 1 shows the inhibition of bacterial growth in various concentrations of biosynthesized AgNPs of *S. asperum*. The antimicrobial activity of the silver nanoparticles increased as the concentration has increased. The antimicrobial potential of silver nanoparticles synthesized using *S. asperum* was evaluated according to their zone of inhibition and the results were compared with the activity of the standard antimicrobial agent. The antibacterial activity of AgNPs against gram positive *S. mutans* showed zone of inhibition of 16.16±0.31 at the concentration of 100µl. The antibacterial activity was high against *E. faecalis* and *P. aeruginosa* at the concentration of 50 µl. These results indicate that AgNPs of *S. asperum* were assuring as an antibacterial agent against the pathogens employed. Some researchers have reported that the positively charged AgNPs accumulate on negatively charged bacterial cell membrane to bring about structural alterations in the membrane. This leads to cell death due to uncontrolled transportation through the membrane Various mechanisms attribute to its antimicrobial activity such as generation of reactive oxygen species and bacterial protein denaturation [18].

Table 1: Antimicrobial activity of AgNPs against oral pathogens

Oral pathogens	Zone of inhibition (mm)			
	25 µl	50 µl	100 µl	Ab
S. mutans	16.15±0.40	16.16±0.31	14.03±0.41	26±0.21
E. faecalis	18.03±0.34	18.95±0.23	16.88±0.42	19.14±0.26
P. auruginosa	16.15±0.21	17.92±0.26	17.16±0.23	16.19±0.33
C. albicans	8.99±0.50	11.07±0.19	11.85±0.26	29.87±018

Conclusion

The present study has demonstrated an eco-friendly and cost-effective synthesis of silver nanoparticles using marine brown alga *S. asperum*. AgNPs synthesis was initially identified by stable dark brown colour and the surface plasmon resonance was peak positioned at 430 nm. The shape of these AgNPs were mostly hexagonal and spherical in shape with size range of 10-35 nm as examined by TEM. The crystalline nature was clearly determined in the XRD pattern and the functional groups responsible for reduction of silver ions were identified by FTIR. These AgNPs showed potent antimicrobial activity against oral pathogens assuring its effective therapeutic application in several infectious diseases. In future the green synthesized silver nanoparticles may be used as a coating material for antiseptic dressing materials and suture materials which can aid in wound healing.

Fluctuating Asymmetry of Dermatoglyphics and DNA Polymorphism in Breast Cancer Population

Lavanya Prathap[1], Prathap Suganthirababu[2], Deepthi Ganesan[3]

[1]Assistant Professor, Department of Anatomy, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, Chennai, Tamilnadu, India,[2]Associate Professor, Department of Health Science, College of Health Sciences, Gulf Medical University, Ajman, UAE,[3]Lecturer, School of Physiotherapy, Faculty of Allied Health professions, AMIST University, Malaysia

Abstract

Fluctuating asymmetry of dermatoglyphics can be represented as a biomarker of genetic instability of DNA. The difference in the dermatoglyphic pattern between right and left hands may express the existence of defective gene and the developmental stress of an individual. Thereby Fluctuating asymmetry of dermatoglyphics can be used to screen population with defective gene causing Breast cancer. To investigate this hypothesis the present study has taken an attempt to prove the genetic basis of asymmetry of dermal ridges by analyzing its association with specific DNA repair genetic variants in breast cancer.

Method: The cross-sectional study is being conducted among 150 females in three groups, each comprising of 50 participants. The distinct variables of dermatoglyphics are Fluctuating Asymmetry (FA) of Finger Rindge Count Thumb, Index, Middle, Ring, and Little finger, Fluctuating asymmetry of A-B Ridge count, ATD angle and Main Line Index. All the dermatoglyphic parameters are assessed individually for its association with the Single Nucleotide Polymorphism status of four DNA repair genetic variants namely XRCC1 Arg194Trp, XRCC3Thr241Met, ERCC4Arg 415Gln, and ERCC5 Asp1104His. The frequencies of appearance of all the genotype for each distinctive dermatoglyphic variables are analyzed. The statistical procedure used to analyze the frequency of association is odds ratio and relative risk ratio.

Results: The relative risk is about 2 to 4 times for dermatoglyphic variable FA thumb, FA ring and FA A-B Ridge Count with statistical significance for XRCC1 Arg194Trp and ERCC4 Arg 415Gln variant allele in breast cancer, XRCC1 Arg194Trp and ERCC4 Arg 415Gln and ERCC5 Asp1104His in high risk group in their dominant model.

Conclusion: Results confirms that the Fluctuating Asymmetry of dermatoglyphics can be recommended and used as an effective biomarker of genetic instability in breast cancer.

Keywords*: Dermatoglyphics, Fluctuating Asymmetry, DNA repair gene, Single Nucleotide Polymorphism, Genetic Instability, Breast Cancer*

Introduction & Background

Breast cancer is a complex disease which is expressed as a result of genetic instability. The genetic instability may be due to inheritance which accounts for about 5% - 10% or due to environmental disturbance during development in the womb or may be due to lifetime acquired factors. Fluctuating asymmetry is a concept in dermatoglyphics which is aided to reflect the genetic instability and the environmental disturbance during development. The bilateral asymmetry of dermal ridge patterns, the pattern size, and number of tri-radii reflects the instability of DNA. The stability of DNA repair genes acts as a backbone in maintaining the stability of other genes involved in the process of carcinogenesis. Any instability of DNA repair gene

results in aggravating the process of carcinogenesis. Oxidative stress causes DNA damage which becomes the initial step in carcinogenesis. Studies suggest that environmental factors, high psychological stress and lack of balanced nutrition raise the Reactive Oxygen Species (ROS) level. This gene - environment interactions play a vital role in the development of breast cancer. The normal cell function is maintained by the effective DNA repair proteins, consequently any deficiency in its function may result in irrevocable harm. Maintaining the level of Oxidative stress proteins and the DNA repair protein protects the normal cells from destructing effects of Reactive Oxygen Species [1-4]. The specific areas of dermal ridges of palm is said to reflect the stability of genes. The Fluctuating asymmetry of dermal ridge can be represented as a biomarker of genomic instability of DNA and the developmental environmental stress of an individual. To investigate this hypothesis the present study has taken an attempt to prove the genetic basis of dermal ridges by analysing its association with specific DNA repair genetic variants in breast cancer.

Material and Methods

The cross-sectional study is being conducted among 150 females in three groups, each comprising of 50 participants. The participants are age matched between 35-60 years. The study commenced after getting approval from the Institutional Human Ethical Committee. The participants are given detailed explanation about the procedure and their co-operation and willingness is obtained with an informed consent. The participants are grouped based on selection criteria. Group-I includes females diagnosed histopathologically for breast cancer as their primary site of carcinoma. Group-II includes females who are categorized as high risk for breast cancer based on their family history for breast cancer (mother, sister or daughter) or any two criteria based on their endogenous exposure to estrogen which includes Menstrual history (early menarche below 12 years, late menopause above 50 years) Parity status (first full term pregnancy (FFTP) above 30 years of age, Nulliparity), Personal history of fibro-adenoma, obesity, hormone replacement therapy (HRT). Group-III includes healthy females.

The data for dermatoglyphic analysis is collected using digital photography and the different variables are analyzed using computer. After detailed analysis of various quantitative parameters presenting Fluctuating Asymmetry of dermal ridge patterns, distinct variables are selected as an outcome measure to assess its association with single nucleotide polymorphism (SNP) status of four DNA repair genes. The DNA repair variants namely XRCC1 Arg194Trp, XRCC3Thr241Met, ERCC4 Arg415Gln, ERCC5 Asp1104His are analyzed for the study population. The data collection procedure includes collection of 3ml of peripheral blood in EDTA coated test tubes through venipuncture. The procedure includes extraction of DNA, followed by amplification of specific gene segments using Polymerase Chain Reaction and identification of polymorphism using Restriction Fragment Length Polymorphism. Their frequency of appearance of all genotypes namely homozygous wild, heterozygous mutant and homozygous mutant genotypes are assessed and the frequency of breast cancer and high-risk population are compared with control group. The distinct variables of FA of dermal ridges are Fluctuating Asymmetry (FA) of Finger Ridge Count of Thumb, Index, Middle, Ring, and Little finger, FA A-B Ridge Count, FA of ATD angle, FA of Main Line Index. All the dermal ridge parameters are analyzed individually for its association with all the four SNPs. The frequencies of appearance of all the genotype for each distinctive dermal ridge variables are analyzed.

Findings

The statistical procedure used to analyze the frequency of association between Fluctuating Asymmetry and Variant Allele of DNA Repair Gene is odds ratio, relative risk and the level of significance using P- value. The Fluctuating Asymmetry of Finger Ridge Count of thumb, ring finger, A-B ridge count and main line index are associated with significant difference with XRCC1 Arg194Trp, ERCC4 Arg415Gln, and ERCC5 Asp1104His in their homozygous wild and heterozygous mutant type. FA Index is associated with significant difference with XRCC1 Arg194Trp, XRCC 3 Thr241Met, ERCC4 Arg 415, Gln, ERCC5 Asp1104His in their homozygous wild and heterozygous mutant type, ERCC5 Asp1104His is associated with homozygous mutant type. FA middle finger is associated with significant difference with XRCC1 Arg194Trp, XRCC 3Thr 241Met ERCC4 Arg 415 Gln, ERCC5 Asp1104His in their homozygous wild and heterozygous mutant type, XRCC1 Arg194Trp and ERCC5 Asp1104His are associated with homozygous mutant type. FA little finger and ATD Angle are associated with significant difference with XRCC1 Arg194Trp, XRCC 3Thr 241Met ERCC4 Arg 415 Gln, and ERCC5 Asp1104His

in their homozygous wild and heterozygous mutant type (Ref- Fig-I & Table-1).

RR – Risk ratio, OR- Odds ratio

The Relative risk (RR) for FA thumb is 2 for ERCC4 Arg 415 Gln in both breast cancer and high-risk group with statistical significance. The XRCC1 Arg194Trp and ERCC5 Asp1104His though not statistically significant, the RR is 2 and 4 for breast cancer and high risk respectively. The RR for FA ring is 2 for XRCC1 Arg194Trp and ERCC5 Asp1104His in breast cancer group with statistical significance. The FA Ring finger though statistically not significant the RR for ERCC5 Asp1104His is 9 in breast cancer group. The RR for XRCC 3Thr 241Met is <1 with significant difference in breast cancer population. The RR for ring finger is 2 for XRCC1 Arg194Trp, ERCC4 Arg 415 Gln, and ERCC5 Asp1104His for high risk group with significant difference. The RR for A-B RC is 2 for XRCC1 Arg194Trp and ERCC4 Arg 415 Gln with significant difference for breast cancer population and though not statistically significant the RR is 9 for ERCC5 Asp1104His in breast cancer group. The RR for A-B RC in high risk population is 3 for XRCC1 Arg194Trp and ERCC5 Asp1104His and 4 for ERCC4 Arg 415 Gln with significant difference (Ref –Table -2).

During early pregnancy the intrauterine growth disturbances caused by both genetic and environmental factors may be accompanied by abnormal dermatoglyphics. The dermatoglyphics can be used to strengthen the diagnostic procedure and screen population for the diagnosis. Evidences suggest that the dermatoglyphic traits reflect the prenatal development. Developmental noise is reflected in dermatoglyphic traits as asymmetry in the ridge configuration. Presence of 10 digital whorls is associated in women having multiple spontaneous abortions. Babler 1978 reported in a prenatal study of fetus that spontaneous abortuses free of gross or chromosomal defects and no confirmed indication of any abnormality has increased frequency of arches than normal. Suzumori 1980 reported the development of ridge is delayed by more than two weeks in chromosomal disorders. The ridge depth is suggested to be associated with ridge pattern. The spontaneous abortuses are found to have reduced ridge depth compared to normal. Increased fluctuating asymmetry reflects imbalance in developmental homeostasis at molecular, chromosomal and epigenetic level. The dermatoglyphic traits are suggested to contain more developmental information. Whorl pattern presented to have increased depth compared to the arch pattern which is associated with less ridge depth. Dermatoglyphics is the living history of prenatal development. A cross-sectional study conducted in oral carcinoma suggested that palmar dermatoglyphics has immense clinical significance to isolate the population at risk for developing oral carcinoma. They reported increased frequency of arches and reduced frequency of whorls in oral carcinoma [5-11].

Fluctuating Asymmetry is one of the important concepts in Dermatoglyphics. Number of studies reported the association between Dermatoglyphics and breast cancer, but only very few studies reported the association between FA of dermal ridge pattern and breast cancer [12]. The concept of genomic instability is one of the important causes for carcinogenesis of breast cancer. The instability of gene is present within the DNA, but it may not be expressed. Only when it is stimulated by the lifetime acquired factors like poor life style habitations, lack of exercise, sedentary life, obesity, and increased exposure to estrogen which is called as hormone based life events the genomic instability is expressed resulting in carcinogenesis [13]. FA is a factor reflecting the genomic instability which is still under research. It is suggested that there can be a common genomic instability causing Breast cancer and reflecting in FA of dermal ridges. Breast cancer is expressed only after the process of carcinogenesis, but FA of dermal ridges is formed in the womb and it remains unchanged forever [14]. So ever before the visible tumor appears, and even before the carcinogenesis begins, through the FA of dermal ridges one can be screened as high risk or not possibly, and so the preventive measures and early therapeutic strategies can be introduced. The relative risk is about 2 to 4 times for dermatoglyphic variable FA thumb, FA ring and FA

A-B RC with statistical significance for XRCC1 and ERCC4 variant allele in breast cancer, XRCC1, ERCC4 and ERCC5 in high risk group in their dominant model.

Thus, the FA can be used as a powerful tool to screen the high-risk population for breast cancer and aid in early therapeutic measures. To investigate this hypothesis the association of FA of dermal ridge pattern and various SNPs are analyzed. On observation, the single nucleotide polymorphisms rs1799782, rs1800067 and rs17655 are associated significantly with FA thumb, index, middle, ring and little finger, A-B ridge count, ATD angle and main line index. SNPs rs 1799782 is observed to be associated with FA middle finger in homozygous mutant type and rs17655 is observed to be associated with FA middle and little finger in homozygous mutant type. SNP XRCC3 rs 861539 is observed to be associated with FA index, middle, little and ATD angle.

Conclusion

The results of the present study confirmed the involvement of XRCC1 Arg194Trp, ERCC4 Arg 415 Gln, and ERCC5 Asp1104His in breast cancer particularly in population with distinct dermal ridge pattern. The study confirmed the involvement of distinct Fluctuating Asymmetry of dermal ridge variables in breast cancer and its association with DNA Repair genetic variants which reflects its instability. It can be suggested the FA of dermal ridges can be used as an effective biomarker of genomic instability in breast cancer. Thus, the study aimed to investigate the genetic background of association between breast cancer and distinct palm ridge pattern. It can be suggested that the Fluctuating asymmetry of dermal ridge patterns can be used as a biomarker of specific DNA Repair gene polymorphism there by reflecting the genetic instability and can serve as a mass screening procedure.

Teratogenic Potential of Drugs Used – A Systematic Review to Aid in Evidence Based Practice And Decision Making

Sara Banu[1], Mahesh Ramakrishnan[2]

[1]Graduate Student,[2]Reader, Department of Pedodontics & Preventive Dentistry, Saveetha Dental College & Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India

Abstract

Drugs taken during pregnancy can have positive as well as negative effects on the developing embryo. Many drugs are prescribed by the doctor for the benefits of the foetus like the multivitamin supplements which reduce the risks of cardiovascular defects; oral clefts and urinary tract defects in their infants.Some drugs can also have many complicated effects on the foetus. Mother suffering from diseases and the medications taken for the treatment of such diseases during pregnancy will lead to abnormal changes in the baby. Anticonvulsant drugs have been known to be one of the most commonly used drugs which is unavoidable and hence the harmful effect of the drug on the foetus. The drugs which are known to cause harmful effects on the foetus are phenobarbital, phenytoin, carbamazepine, tetracycline, thalidomide, warfarin. The complications of the drugs do not only depend on the type of drug taken but also on the the dosage, gestation time, number of times the drug taken and various other factors.This review addresses some of the routinely used drugs on their teratogenic effects.

Keywords: *Teratogenic drugs, Embroyo, foetus*

Introduction

Pregnant women face many health complications like diabetes mellitus, hypertension, or psychiatric disorders or other unavoidable diseases which require medical treatment.Various drugs are prescribed during pregnancy for the proper development of the foetus and the nutritional benefits of the mother. Drug-induced birth defects(teratogenesis) represent unique adverse drug reactions. Teratogenicity is defined as the permanent abnormality in the function and structure of an organism due to its exposure to drugs during the embryonic developmental stages[1]. Therefore, the drugs administered during pregnancy have to be carefully weighed to prevent any abnormal affect on the mother, the growing foetus and also the risks during breast-feeding. The frequently used drugs during pregnancy which are known to treat the different symptoms of pregnancy also have detrimental effects on the developing foetus. Drugsused for epilepsy and cancer are known to cause the highest teratogenicity[2]. This review addresses some of the inevitable drugs even used today which have teratogenicity in pregnant women.

History

In the 1930s, a study was done by feeding the pregnant pigs with a diet deficient of vitamin A which showed teratogenicity[3]. A study was done on the experimental animals on the biological molecules like the amino acid mimic azaserine and its susceptibility to the mammalian embryos to toxicity from xenobiotics[4]. The experiment results after the use of aminopterin in 1950s led to abortion and in cases where abortion was not seen showed malformed children[5]. In the early 1960s the teratogenic effect of thalidomide was increasingly understood[6].

Stages of drug induced teratogenicity

All drugs administered during pregnancy do not lead to teratogenicity. The teratogenic effect of any

drug depends on various factors.The first factor is the genotype of the conceptus meaning the variation in the phenotype of the affected infant causes teratogenicity which is not seen in all the infants exposed to the drug. The infants who are not affected shows that these infants are susceptible to it. The exposure of the drug during different developmental stages of the embryo defines the extent of the malformation or the deformity. This is the second factor. In the initial stage, that is the stage after fertilization and before implantation is less affected by the drug. The mechanism of action of the drug on the developing embryo is the third factor. The initiation of the effect of the drug refers to the mechanism of action. The radiations can initiate the mutation of the genes or the mitotic interference or the enzyme inhibition. The access of the drug to the developing embryo from the mother's body is the fourth factor. The drugs given to the mother need to undergo metabolic processes. The factors which determine the reaching of the drug to the embryo include the dose of the drug taken by the mother, the physical properties, the route of entry, the absorption into the systemic circulation and the transfer through the placenta.The dosage of the drug is the fifth and important factor. The drug dose if exceeded the normal will cause harmful effects on the foetus[7].

The most commonly affecting drugs are phenobarbital, phenytoin, carbamazepine, tetracycline, thalidomide, and warfarin. Newer drugs for anti epilepsy like Lamotrigine, Topiramate, Levetiracetam are also known to cause teratogenic effects. Synthetic retinoids similar to vitamin A is said to cause teretogenecity. The antipsychotic drugs like olanzapine, quetiapine, risperidone, aripiprazole are also known to cause teratogenicity. Methotrexate is an antimetabolite and an antifolate drug causing birth defects.The chemotherapeutic agents like cisplatin, cyclophosphamide, mitomycin C and procarbazine drug causing teratogenicity.Isotritoin is used in case of severe acne and recently it has been identified for its harmful effect on the foetus. Enalapril is used commonly for hypertension, chronic heart failure and in diabetic nephropathy, it is also known to cause teratogenic effects[2].

The psychopharmacological medications used during pregnancy are more prevalent to cause harmful effects on the baby. Thalidomide has been found to be the most perfect drug for the treatment of morning sickness in pregnant women [8]. Various studies done on thalidomide stated that this drug caused deformity in the formation of the limbs in the infants by inducing oxidative stress and apoptosis and inhibiting angiogenesis[9-13]. The blood vessels in the limbs of the thalidomide affected infants are immature when compared to the blood vessels of the other body parts[10]. It has been stated that the recovery of the thalidomide induced deformities but the efficacy and the description for this was not given in an informative manner [11].

Valproate and carbamazepine are widely associated to cause congenital abnormalities [14].

Phenytoin is the most commonly used anticonvulsant drug. It was reported to cause the craniofacial dysmorphia, limb defects, developmental defects and facial abnormalities like short nose with anteverted nostril, long philtrum and bowed lips. These risks have been concluded after several studies, both prospective and retrospective[15,16].

Benzodiazepines are known to cause abnormalities in the foetus. There has been noted flaccidity, respiratory and feeding difficulties in children who are born to mothers who take these drugs during the late pregnancy. The use of diazepam in women suffering from convulsions is said to cause these defects in their child along with hypothermia and hypotonia[17,18].

Lithium has been widely used as a first line treatment in cases of bipolar disorders and also in cases of depression and mania[19]. Lithium is also said to be a good mood-stabilizer and protective to women who are at high risk of relapse during the postpartum period[20-22]. However some studies have reported to show cardiogenecity and Ebstein's anomaly in the children of the mothers who have been reported to be taking lithium during pregnancy [23-27].

Warfarin has been widely used as an oral anticoagulant which inhibits the synthesis of vitamin-k dependent clotting factors. For many years the use of oral anticoagulants has known to cause foetal loss and neonatal bleeding [28,29]. But it has also led to discovery of its cause to form congenital deformities. These have been noted to show the deformed facial features with mental retardation[30,31].Since the discovery of anticoagulants it has been used for the treatment of thromboembolism which occurs in the second and third trimester of pregnancy[32]. Becker*et al.* had reported of the use of warfarin by the mother led to the "ectopic nasal lacrimal duct orifice" in the child[33]. The exposure of the foetus to vitamin k antagonist will lead to Conradi's

syndrome which includes a combination of hypoplastic nose, stippling of the epiphyses and skeletal and ocular abnormalities. The use of the drug especially during the early pregnancy leads to this condition [30,31].

The treatments for cancer has increased over the recent times so much that it has increased the survival rates of the cancer patients. The main treatment for cancer includes the radiotherapy and chemotherapy which are known to be the potential cause of mutation of genes and genotoxicity which further leads to the development of secondary cancers and also lead the predispose survivors to various nonmalignant diseases[34]. There has been alot of use of anticancer drugs for the treatment of cancer. Cisplatin is one of the anticancer drugs said to cause dwarfism and many severe birth defects[35].

Conclusion

The drugs which had been used for the benefits of the mother and foetus have now been discovered to cause various harmful effects on the child with least or no harm to the mother. The effects on the foetus can range from deformities due to the improper development of the organs or improper functioning of the organs. The effect of the drug on the foetus is mainly dependent on the dosage of the drug, the stage of development at which the drug is given and the various other factors. Hence any drugs taken during pregnancy have to be taken with utmost care. Not all drugs taken during pregnancy cause teratogenicity. The drugs to be used during pregnancy should be prescribed by a physician expert in this field and a proper dose and use of the drug should also be given proper information.

Abstract

Drugs taken during pregnancy can have positive as well as negative effects on the developing embryo. Many drugs are prescribed by the doctor for the benefits of the foetus like the multivitamin supplements which reduce the risks of cardiovascular defects; oral clefts and urinary tract defects in their infants.Some drugs can also have many complicated effects on the foetus. Mother suffering from diseases and the medications taken for the treatment of such diseases during pregnancy will lead to abnormal changes in the baby. Anticonvulsant drugs have been known to be one of the most commonly used drugs which is unavoidable and hence the harmful effect of the drug on the foetus. The drugs which are known to cause harmful effects on the foetus are phenobarbital, phenytoin, carbamazepine, tetracycline, thalidomide, warfarin. The complications of the drugs do not only depend on the type of drug taken but also on the the dosage, gestation time, number of times the drug taken and various other factors.This review addresses some of the routinely used drugs on their teratogenic effects.

Keywords: *Teratogenic drugs, Embroyo, foetus*

Introduction

Pregnant women face many health complications like diabetes mellitus, hypertension, or psychiatric disorders or other unavoidable diseases which require medical treatment.Various drugs are prescribed during pregnancy for the proper development of the foetus and the nutritional benefits of the mother. Drug-induced birth defects(teratogenesis) represent unique adverse drug reactions. Teratogenicity is defined as the permanent abnormality in the function and structure of an organism due to its exposure to drugs during the embryonic developmental stages[1]. Therefore, the drugs administered during pregnancy have to be carefully weighed to prevent any abnormal affect on the mother, the growing foetus and also the risks during breast-feeding.

The frequently used drugs during pregnancy which are known to treat the different symptoms of pregnancy also have detrimental effects on the developing foetus. Drugsused for epilepsy and cancer are known to cause the highest teratogenicity[2]. This review addresses some of the inevitable drugs even used today which have teratogenicity in pregnant women.

History

In the 1930s, a study was done by feeding the pregnant pigs with a diet deficient of vitamin A which showed teratogenicity[3]. A study was done on the experimental animals on the biological molecules like the amino acid mimic azaserine and its susceptibility to the mammalian embryos to toxicity from xenobiotics[4]. The experiment results after the use of aminopterin in 1950s led to abortion and in cases where abortion was not seen showed malformed children[5]. In the early 1960s the teratogenic effect of thalidomide was increasingly understood[6].

Stages of drug induced teratogenicity

All drugs administered during pregnancy do not lead to teratogenicity. The teratogenic effect of any drug depends on various factors.The first factor is the genotype of the conceptus meaning the variation in the phenotype of the affected infant causes teratogenicity which is not seen in all the infants exposed to the drug. The infants who are not affected shows that these infants are susceptible to it. The exposure of the drug during different developmental stages of the embryo defines the extent of the malformation or the deformity. This is the second factor. In the initial stage, that is the stage after fertilization and before implantation is less affected by the drug. The mechanism of action of the drug on the developing embryo is the third factor. The initiation of the effect of the drug refers to the mechanism of action. The radiations can initiate the mutation of the genes or the mitotic interference or the enzyme inhibition. The access of the drug to the developing embryo from the mother's body is the fourth factor. The drugs given to the mother need to undergo metabolic processes. The factors which determine the reaching of the drug to the embryo include the dose of the drug taken by the mother, the physical properties, the route of entry, the absorption into the systemic circulation and the transfer through the placenta.The dosage of the drug is the fifth and important factor. The drug dose if exceeded the normal will cause harmful effects on the foetus[7].

The most commonly affecting drugs are phenobarbital, phenytoin, carbamazepine, tetracycline, thalidomide, and warfarin. Newer drugs for anti epilepsy like Lamotrigine, Topiramate, Levetiracetam are also known to cause teratogenic effects. Synthetic retinoids similar to vitamin A is said to cause teretogenecity. The antipsychotic drugs like olanzapine, quetiapine, risperidone, aripiprazole are also known to cause teratogenicity. Methotrexate is an antimetabolite and an antifolate drug causing birth defects.The chemotherapeutic agents like cisplatin, cyclophosphamide, mitomycin C and procarbazine drug causing teratogenicity.Isotritoin is used in case of severe acne and recently it has been identified for its harmful effect on the foetus. Enalapril is used commonly for hypertension, chronic heart failure and in diabetic nephropathy, it is also known to cause teratogenic effects[2].

The psychopharmacological medications used during pregnancy are more prevalent to cause harmful effects on the baby. Thalidomide has been found to be the most perfect drug for the treatment of morning sickness in pregnant women [8]. Various studies done on thalidomide stated that this drug caused deformity in the formation of the limbs in the infants by inducing oxidative stress and apoptosis and inhibiting angiogenesis[9-13]. The blood vessels in the limbs of the thalidomide affected infants are immature when compared to the blood vessels of the other body parts[10]. It has been stated that the recovery of the thalidomide induced deformities but the efficacy and the description for this was not given in an informative manner [11].

Valproate and carbamazepine are widely associated to cause congenital abnormalities [14].

Phenytoin is the most commonly used anticonvulsant drug. It was reported to cause the craniofacial dysmorphia, limb defects, developmental defects and facial abnormalities like short nose with anteverted nostril, long philtrum and bowed lips. These risks have been concluded after several studies, both prospective and retrospective[15,16].

Benzodiazepines are known to cause abnormalities in the foetus. There has been noted flaccidity, respiratory and feeding difficulties in children who are born to mothers who take these drugs during the late pregnancy. The use of diazepam in women suffering from convulsions is said to cause these defects in their child along with hypothermia and hypotonia[17,18].

Lithium has been widely used as a first line treatment in cases of bipolar disorders and also in cases of depression and mania[19]. Lithium is also said to be a good mood-stabilizer and protective to women who are at high risk of relapse during the postpartum period[20-22]. However some studies have reported to show cardiogenecity and Ebstein's anomaly in the children of the mothers who have been reported to be taking lithium during pregnancy [23-27].

Warfarin has been widely used as an oral anticoagulant which inhibits the synthesis of vitamin-k dependent clotting factors. For many years the use of oral anticoagulants has known to cause foetal loss and neonatal bleeding [28,29]. But it has also led to discovery of its cause to form congenital deformities. These have been noted to show the deformed facial features with mental retardation[30,31].Since the discovery of anticoagulants it has been used for the treatment of thromboembolism which occurs in the second and third

trimester of pregnancy[32]. Becker*et al.* had reported of the use of warfarin by the mother led to the "ectopic nasal lacrimal duct orifice" in the child[33]. The exposure of the foetus to vitamin k antagonist will lead to Conradi's syndrome which includes a combination of hypoplastic nose, stippling of the epiphyses and skeletal and ocular abnormalities. The use of the drug especially during the early pregnancy leads to this condition [30,31].

The treatments for cancer has increased over the recent times so much that it has increased the survival rates of the cancer patients. The main treatment for cancer includes the radiotherapy and chemotherapy which are known to be the potential cause of mutation of genes and genotoxicity which further leads to the development of secondary cancers and also lead the predispose survivors to various nonmalignant diseases[34]. There has been alot of use of anticancer drugs for the treatment of cancer. Cisplatin is one of the anticancer drugs said to cause dwarfism and many severe birth defects[35].

Conclusion

The drugs which had been used for the benefits of the mother and foetus have now been discovered to cause various harmful effects on the child with least or no harm to the mother. The effects on the foetus can range from deformities due to the improper development of the organs or improper functioning of the organs. The effect of the drug on the foetus is mainly dependent on the dosage of the drug, the stage of development at which the drug is given and the various other factors. Hence any drugs taken during pregnancy have to be taken with utmost care. Not all drugs taken during pregnancy cause teratogenicity. The drugs to be used during pregnancy should be prescribed by a physician expert in this field and a proper dose and use of the drug should also be given proper information.

Nicotine Replacement Therapy for Smoking Cessation- An Overview

Harini .G[1], L.Leelavathi[2]

Graduate Student, [2]Senior Lecturer, Department of Public health dentistry, Saveetha dental college and hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai.

Abstract

Tobacco products are products made of leaf tobacco and contain the highly addictive ingredient, nicotine. Tobacco use is one of the main risk factors for cancer, cardiovascular diseases and lung diseases. Nicotine replacement therapy (NRT) help the tobacco users to quit the usage of tobacco products. They provide nicotine to the tobacco users thus temporarily replace much of the nicotine from cigarettes to decrease motivation to smoke and nicotine withdrawal symptoms, thus easing the transition from cigarette smoking to complete abstinence. Tobacco users may quit tobacco without using NRT, but most of those who attempt quitting do not succeed on the first try. NRT only deals with the physical dependence. It's not meant to be the only thing you use to help you quit smoking. Nicotine replacement therapy along with behavioral counselling help the persons who find difficult to quit the habit. Hence, a review was done about the different types of nicotine replacement therapies.

Key Words: *nicotine, patches, gum, lozenges, tobacco use*

Introduction

Smoking is a major public health concern particularly in young adults between the ages of 13 and 25 years. Most initiation of cigarette smoking occurs by the age of 21 years. Tobacco use is the largest preventable risk factor for morbidity and mortality. Nicotine is a stimulant and potent para sympathomimetic alkaloid that is naturally produced in the nightshade family of plants and used for the treatment of tobacco use disorders as a smoking cessation aid and nicotine dependence for the relief of withdrawal symptoms. (1) Nicotine is highly addictive. It is one of the most commonly abused drugs. An average cigarette yields about 2 mg of absorbed nicotine; huge amounts can be harmful. Nicotine induces both behavioral stimulation and anxiety in animals. Nicotine craving involves drug-reinforced behavior, compulsive use, and relapse following abstinence. (2) Nicotine withdrawal symptoms include depressed mood, stress, anxiety, irritability, difficulty concentrating, and sleep disturbances. (3) Mild nicotine withdrawal symptoms are measurable in unrestricted smokers, who experience normal moods only as their blood nicotine levels peak, with each cigarette. On quitting, withdrawal symptoms worsen sharply, then gradually improve to a normal state. Tobacco use is often incorrectly perceived to be solely a personal choice. This is contradicted by the fact that when fully aware of the health impact, most tobacco users want to quit but find it difficult to stop due to the addictiveness of nicotine. (4)

Nicotine replacement therapy (NRT) aims to reduce motivation to consume tobacco and the physiological and psychomotor withdrawal symptoms through delivery of nicotine. (5, 6) This review aims to summarize literature on various modes of nicotine replacement therapy methods currently used to treat nicotine dependence.

Effect of Tobacco on Health

Tobacco use has a great impact on general health and is a primary cause of many oral diseases and adverse oral conditions. [7] Tobacco is a risk factor for oral cancer, oral cancer recurrence, adult periodontal diseases, and congenital defects such as cleft lip and palate in children whose mother smokes during pregnancy. [7, 8]

Tobacco smoke is a toxic mix of more than 7,000 chemicals. When these chemicals get deep into body's tissues, they cause damage. Over time, the damage can lead to disease. The chemicals in tobacco smoke reach lungs quickly when inhaled, then from the lungs to the blood and through the arteries, the chemicals are carried to tissues in all parts of body. [9]

Tobacco Use and Nicotine

Nicotine is a neuroendocrine stimulant and depressant, addicting drug. [10] Addiction to nicotine changes the chemical balance in the brain. Addiction keeps people smoking even when they want to quit. [9] There is considerable evidence suggesting that former smokers have smaller risks of tobacco related oral diseases than current smokers. [11]

Tobacco dependence is a chronic condition that often requires repeated intervention. Except in the presence of contraindications, these should be used with all patients who are attempting to quit smoking. [12]

Mechanism of Action of Nicotine

Nicotine acts by stimulation of neural nicotinic acetylcholine receptors (NAChRs) in the ventral tegmental area of the brain. This causes release of dopamine in the nucleus accumbens, which lead to reduction in nicotine withdrawal symptoms in regular smokers who abstain from smoking. [13] NRT may also provide a coping mechanism, making tobacco products less rewarding. It does not completely wipe out the symptoms of withdrawal because none of the available nicotine delivery systems give the fast and great levels of arterial nicotine achieved when cigarette smoke is inhaled. [14]All the available medicinal nicotine products rely on systemic venous absorption and do not therefore achieve such rapid systemic arterial delivery. [15] It takes a few seconds for large doses of nicotine from a cigarette to reach the brain; medicinal products achieve lower levels over a period of minutes for nasal spray or oral products such as gum, inhalator, sublingual tablet, or lozenge and it takes hours for transdermal patches. [16]

Replacement Therapy Delivery System

The US Food and Drug Administration (FDA) has approved 5 forms of nicotine replacement therapy (NRT) which includes patch, gum, nasal spray, inhalers and lozenges. [17]

Nicotine Patch- Transdermal Patches

Nicotine patches are applied to the skin and deliver nicotine through the skin at a relatively steady rate. [18] The transdermal patches are available in the different concentrations based on the usage of the nicotine. Dosage depends on the frequency and the amount of usage of nicotine. [19]

The 16-hour patch works well for the persons who are a light-to-average smoker. It's less likely to cause side effects. But it doesn't deliver nicotine during the night, so it may not be right if the person have early morning withdrawal symptoms. [20] It was stated that the 24-hour nicotine patch provides a steady dose of nicotine and helps with early morning withdrawal, but there may be more side effects. [21]

Depending on body size and smoking habits, most smokers should start using a full-strength patch (15-22 mg of nicotine) daily for 4 weeks, and then use a patch with decreased strength (5-14 mg of nicotine) for another 4 weeks. The patch is changed every day. It should be put on in the morning on a clean, dry area of the skin without much hair. It should be placed below the neck and above the waist – for instance, on the upper arm or chest. The FDA has approved using the patch for a total of 3 to 5 months. [15]

The most frequently reported side effects are local skin reactions. [22] Moving the site of patch application daily as instructed can reduce the incidence of skin reactions to the patch. Sleep disturbances have also been commonly reported with 24-hour patches

Nicotine Gum

Nicotine gum is a type of chewing gum that provides nicotine to the body. The nicotine is delivered to the bloodstream via absorption by the tissues of the mouth. Nicotine content of the gum is usually either 2 or 4 mg, roughly the nicotine content of one sixth to one third of a cigarette, with the appropriate content and dosage depending on the smoking habits of the user.

Nicotex, Nicorette, Nicogum, Nicotinell and Zonnic are the common brands of nicotine gum. [23]After a few weeks or months, the number of doses per day is reduced gradually until it is no longer required. [24] Acidic beverages have been shown to interfere with buccal absorption of nicotine; therefore, patients should avoid acidic beverages (eg, soda, coffee, beer) for 15 minutes before and during chewing gum. [25]

Nicotine Lozenge

The lozenge is available in 2mg and 4mg formulations. Instructions for use and dosing are similar to nicotine gum, but the lozenge is not chewed; it dissolves in the mouth over approximately 30 minutes with some variation across individuals. As with nicotine gum, nicotine from the lozenge is absorbed slowly through the buccal mucosa and delivered into systemic circulation. [24] The lozenge provides an alternative to the gum for persons who need intermittent and controllable nicotine dosing, but who do not find gum chewing acceptable. The amount of nicotine absorbed per lozenge appears to be somewhat higher than that delivered by gum. [26] The recommended dose is 1 lozenge every 1 to 2 hours for 6 weeks, then 1 lozenge every 2 to 4 hours for weeks 7 to 9, and finally, 1 lozenge every 4 to 8 hours for weeks 10 to 12. The lozenge makers also recommended. [27] The side effects usually includes hiccups, nausea, trouble during sleep, fast heart rate etc,

Nasal Inhaler

The nicotine inhaler comprises thin plastic tube with a nicotine cartridge inside. Unlike other inhalers, which deliver most of the medicine to the lungs, the nicotine inhaler delivers most of the nicotine vapor to the mouth where it's absorbed into the bloodstream. Nicotine inhalers are the FDA-approved nicotine replacement method that's most like smoking a cigarette, which some smokers find helpful. [18]

It consists of a mouthpiece and a plastic cartridge containing nicotine. The vapour inhaler was designed to satisfy behavioral aspects of smoking, namely, the hand-to-mouth ritual, while delivering nicotine to reduce physiological withdrawal symptoms produced by tobacco withdrawal. It is important to note that although termed an "inhaler" the majority of nicotine is delivered into the oral cavity (36%) and in the oesophagus and stomach (36%). Very little nicotine is delivered to the lung (4%). Each inhaler cartridge contains 10mg nicotine, of which up to 4 mg can be delivered and 2 mg can be absorbed following frequent "puffing". [28]

Recent Advances

E-Cigarettes or Electronic Nicotine Delivery System (Ends)

ENDS are devices whose function is to vaporize and deliver chemical mixture typically composed of nicotine to the lungs of the user. E Cigarettes contains an electronic vaporization system, electronic controls, rechargeable batteries, and cartridges of the liquid that is vaporized. [21] The liquid usually contains glycerol, propylene glycol, water, nicotine and a variety of flavors that the user can choose. Nicotine content differs among products, ranging between 0 and 34 mg/mL, but recent studies have found discrepancies between labelled and measured nicotine content. E-cigarettes are becoming a preferred substitute for nicotine delivery among many smokers because of their realistic look, feel, and taste compared to traditional cigarettes. [29] The current evidence suggests that ENDS are an effective smoking cessation tool, but more research is needed to confirm its long-term effectiveness and safety. [30]

Nicotine Vaccine

Nicotine vaccines represent a new approach to the treatment of nicotine dependence and are currently under investigation. Because nicotine is a small molecule and an incomplete antigen, it is linked to a carrier protein order to stimulate the necessary immune response. Nicotine-based vaccines can prime the immune system to recognize nicotine as foreign and to mount an immune response against the drug. In doing so, vaccines may reduce the amounts of nicotine delivery. A potential drawback of vaccines to treat tobacco dependence is the fact that smokers will often compensate for decreases in the actions of nicotine, as would be expected when a vaccine decreases concentrations of nicotine penetrating into brain tissues, by increasing their tobacco consumption to overcome this effect. [31]

Patient Compliance with NRT

Most of NRT users discontinue treatment prematurely. Misinformation about NRT is a common cause of poor compliance. Several causes of poor compliance with NRT identified; Concerns about safety, addictiveness of NRT, lack of confidence in efficacy, side effects, cost, relapse and 'Should be able to quit on my own'. It was identified that one of the most common

reasons for poor compliance with NRT is because it is effective. When craving and withdrawal are well controlled through treatment, patients may mistakenly believe that the treatment is no longer necessary. These beliefs undermine the effectiveness of NRT. This can be tackled majorly by providing scientific information by health professionals to the patients undergoing NRT. [18]

Conclusion

Nicotine addiction is the major factor preventing smoking cessation and long-term abstinence. Today, several nicotine medications are available in different doses, forms and flavors and their use has been suggested for all tobacco consumers who do not have contraindications. The choice of NRT product should normally be guided by the patient's preference and it is been reported that, all of the commercially available forms of NRT increase their chances of successfully stopping smoking. These new modalities require more quality research to bring it from bench to bedside. Considering the potential capacity of NRT, it's essential for health professionals to become familiar with all forms of NRT to be able to explain the questions and needs of tobacco users who are interested in quitting the tobacco habit.

Papillary Reconstruction Using Sub Epithelial Connective Tissue Graft - A Case Report

Darshanaa Arunachalam[1], Sheeja S Varghese[2]

[1]Postgraduate Student, [2]Professor and Head, Department of Periodontology, Saveetha Dental College and Hospitals,Saveetha Institute of Medical and Technical Sciences, Saveetha University Chennai.

Abstract

The shape of an interdental papilla play an important role in esthetics. Interdental papilla may be lost due to various reasons such as periodontitis, pathological migration or even as a result of periodontal therapy. This results in formation of black triangle between the teeth causing esthetic concerns. The spaces created also tends to cause food accumulation and further bone loss. Several techniques for papilla reconstruction have been proposed. This case report attempts to report a case of papillary reconstruction procedure done by the Hans and Takei technique, that resulted in good outcome in 6 months.

Key Words: *Interdental papilla, Esthetics, Black triangle, Reconstruction*

Introduction

Interdental papilla (IDP) is the part of gingiva that occupies the embrasure under the contact point of two teeth. The shape of an interdental papilla play an important role in esthetics.

IDP may be lost due to various reasons such as periodontitis, pathological migration or even as a result of periodontal therapy. The papilla tends to lose its pyramidal shape and become blunt thus causing black triangles between the teeth causing esthetic concerns. The spaces created also tends to cause food accumulation and further bone loss. Papillary reconstruction procedures are the most unpredictable surgeries of all periodontal surgeries that are done in anattempt to restore the lost papillary structure and close the black spaces.

Several techniques for papilla reconstruction have been proposed. Cortellini et al[(1)] provided a modified papilla preservation flap technique with releasing incisions in the papilla thus allowing placement of barrier membrane beneath the papilla to prevent it from getting collapsed from its new position. Azzi et al[(2)] described various techniques to gain access to the papillary area.

All the techniques that involved releasing incisions cause hindrance in blood supply. Connective tissue grafts, bone grafts and barrier membranes require adequate vascular area to surrounding recipient in order for it to be taken up and heal in an uneventful manner. The importance of vascular supply in the event of grafting is highlighted by Miller.[(3)]

Releasing incisions also cause tissue morbidity, scarring and even further recession in some cases. In the case of thin gingival biotype, it may even cause severe impairment in healing. Releasing incisions may also cause tenting, and poses a high risk of graft exposure and membrane exposure.

Procedures that give more predictable outcomes were found to have adequate blood supply to the recipient tissues.[(4)] Studies have shown that, tunnelling techniques that don't require releasing incisions, although technique sensitive provide predictable post-surgical outcomes and better wound healing.[(5)] This case report attempts to report a case of papillary reconstruction procedure done by the Hans and Takei[(6)] technique, that resulted in good outcome in 6 months.

CASE REPORT

Corresponding Author:
Dr. Darshanaa Arunachalam

A 30 year old systemically healthy male, came to the outpatient department with complaint of deposits all over his teeth. He also reported bleeding gums, food lodgement between his upper central incisors. On examination, generalised bleeding on probing, presence of subgingival calculus and general lack of oral hygiene was evident. He was also found to have midline diastema with respect to 11, 21 and class 3 papillary loss in the same region. A probing pocket depth of 6 mm was present at the interdental area. Radiographic examination revealed mild horizontal bone loss in the area and an interdental crater was suspected. He was diagnosed with generalised chronic gingivitis with localised chronic periodontitis with respect to 11, 12. A full mouth scaling and root planning and flap surgery with respect to 11, 21 region was planned. SRP was done in 2 sittings at an interval of 1 week.

Flap surgery

Sulcular incision was given from 22 distal to 12 distal region. An envelope flap was reflected. Due to the presence of midline diastema, a papilla preservation flap was raised. After thorough debridement, the interdental area was found to have a crater like bone loss. A compromised osseous reshaping was done. The flap was sutured back in place. Direct loop suture was used in the remaining areas. At 1 week post op, suture was removed. At 4 weeks of recall visit, probing depth was 3 mm. He was found to have blunt papilla with black triangle in relation to 11, 21. A papillary reconstruction procedure was planned due to his aesthetic concern.

Preparation of the preoperative site

The classification system for loss of papillary height by Nordland and Tarnow[7] helps in determining the amount of graft volume required.

The diastema was closed by composite build up to create a contact point such that the distance from the contact point to the crest of the papilla was kept at 5 mm.

The interdental papilla was anesthetized using Lignocaine with adrenaline. A thorough manual root planning was done at the exposed cemental surfaces. The patient was instructed to do a preprocedural oral rinse with chlorhexidine digluconate solution for 30 seconds.

Papilla reconstruction procedure

A partial thickness semilunar incision was given from the distal line angle of 11 to the distal line angle of 21 at 6–10 mm apical from the gingival margin extending into the alveolar mucosa using 15C blade.

Sulcular incisions were placed at the mesial half of the two adjacent teeth to relieve the connective tissue from the root surface. The connective tissue graft was harvested from the palate and the donor site was sutured back with 3-0 black silk suture. The graft was trimmed according to the requirements at the recipient site. It was then tucked in through the semilunar incision and pushed coronally to the interdental site and provide bulk. Then the flap was stabilized with 5-0 vicryl sutures and a horizontal mattress suture was given.

The patient was put on analgesics and 0.2% chlorhexidine digluconate mouthwash twice daily for 2 weeks was advised with no mechanical cleaning of the surgically treated interproximal areas.

Post operative follow up

At 1 week post op, healing was found to be satisfactory. The patient was recalled and reviewed at regular intervals. Complete reconstruction of the IDP was achieved after 6 months.

Figure 1:Persistent pocket after SRP

Figure 2:Immediate post op after open flap debridement with compromised osseous reshaping

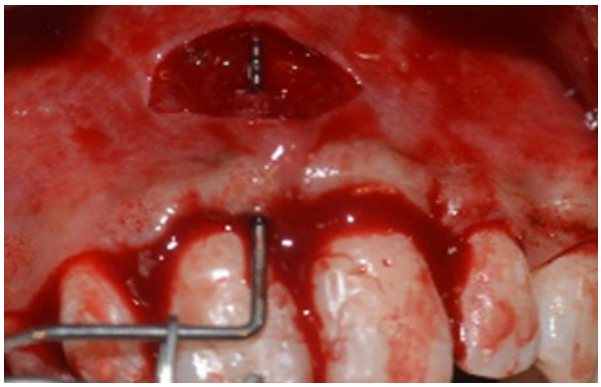

Figure 3:Bridge flap raised

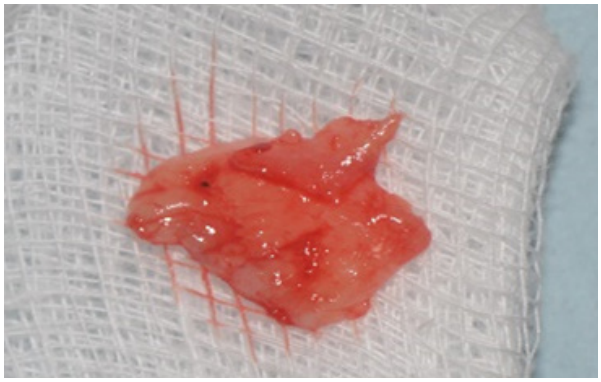

Figure 4:Connective tissue graft (CTG) procured

Figure 5:CTG tucked inside

Figure 6: 6 months post op

Discussion

The IDP depends on various factors such as crestal bone height, contact area and dimensions of the interproximal space.[8]

When the distance between the bone crest and contact point is <5 mm, surgical interventions to reconstruct the IDP is predictable.[9] When it is >5 mm a restorative or orthodontic closure is indicated before surgical interventions.

Most techniques include horizontal incisions.[10] This cuts off the vascular supply that arises from the connective tissue to the IDP.[11] This report describes a procedure where horizontal incision is avoided to preserve vascularity to the site and improve postoperative outcome.

This technique described by Han and Takei[6] provides good vascular supply to the connective tissue graft avoiding necrosis. The procedure was done after a diastema closure with composite build up thus reducing the distance from the crest of the papilla to the contact point, to provide good papilla integrity.

Conclusion

This report shows a successfully treated case due to proper planning and evaluation of tissues that are required for predictable outcomes in papilla reconstruction techniques.

A Gender Specific Comparative Study of Oral Self Care and Oral Health Attitude between Dental Undergraduate and Post Graduate Students

Darshanaa Arunachalam[1], Sheeja S Varghese[2]

[1]Postgraduate Student, Department of Periodontology, [2]Department of Periodontology, Saveetha Dental College, Saveetha Institute of Medical and Technical Science, Saveetha University, Chennai, India.

Abstract

Background: Oral health constitutes an important determinant of overall health and well-being, yet oral diseases remain among the most prevalent problems in our society. Dental school students' knowledge, beliefs and attitudes about dental health greatly determine the oral health care level of their future patients.

Aim: The purpose of this study was to compare the oral self care practices among dental undergraduate and postgraduate male and female students.

Methods: A study questionnaire consisting of 14 questions was formulated and distributed to 200 dental students for this cross sectional study, out of which 166 questionnaires were returned after completion. The students consisted of 82 postgraduate females, 12 postgraduate males, 42 undergraduate females and 30 undergraduate males. The questionnaire comprised of questions to assess the aptitude on oral health, self care practices, presence of deleterious habits and frequency of dental visit.

Result: There was no significant difference in dental health, oral self care and dental visits neither between the post graduate and undergraduate dental students nor between the male students and female dental students. However, there was a significantly higher number of smokers with relatively greater frequency and longer duration among postgraduate male dental students compared to other groups, followed by the undergraduate male dental students. Also there was a higher number of smokers in males than in female dental students.

Conclusion: The number of years in dental education does not influence the attitude and behavior among the dental students with respect to oral self care practices. However their age and gender influences their intensity of deleterious habits.

Key Words: *Oral health, Smoking, Mouthwash, Dental floss*

Introduction

Self care is the best health care. Oral self care goes a long way in maintaining the oral health of the population in general as well as in the success of the treatment of dental patients.

In order to motivate the patients, it's imperative for a dentist to have a healthy set of dentition and to follow good oral self care himself. A dentist with a good oral self care practice can motivate the patient more efficiently and will be willing to instil the practice among his patients. Further, the dentist serves as a role model for his patients to follow.

As already established, dental education plays a major role in oral hygiene. Innumerable studies have

Saveetha University, Chennai, India.
Email Id: drsheeja@rediffmail.com

proved that good health education leads to better motivation among patients to maintain the oral health. [1] So the oral self care practices and aptitudes among dentists are a topic of interest.

Education on dental diseases get refined and advanced when the dentist enters his/her post graduate level, so a question arises if there is improvement in oral self care practices in postgraduate dental students in comparison to undergraduate dental students.

Gender specific studies on the oral self care practices among under and post graduate dental students in India are not carried out to the best of our knowledge.

Thus, the aim of this study was to compare and assess the oral self care practices among dental undergraduate and postgraduate male and female students.

Materials and Method

This cross sectional questionnaire survey was conducted in Saveetha Dental College. The research protocol was approved by the Institutional Review Board. The questionnaire consisted of 14 questions (8 dichotomous questions, 5 multiple choice questions and 4 open ended questions). The questions were aimed to assess the aptitude on oral health, self care practices, presence of deleterious habits and frequency of dental visit. 200 questionnaire forms were distributed randomly among both undergraduate and postgraduate students of both genders. The aim of the study was explained. Only voluntary students were included. Participant confidentiality was maintained. Basic demographic details were obtained. Students were asked to fill out the forms individually and return. 166 forms were returned after complete filling. The data was collected, segregated and percentage calculation was done.

Results

The participants were found to consist of 82 postgraduate females, 12 postgraduate males, 42 undergraduate females and 30 undergraduate males based on their demographic details.

Colour of teeth

A majority of both post graduate and undergraduate males and females were found to be concerned about their color of the teeth. (Table 1)

Bad breath

A majority of both post graduate and undergraduate males and females were found to be concerned about their bad breath. (Table 1)

Bleeding gums

A minority of the post graduate and undergraduate males and females were found to have bleeding gums while a marginally higher number of students in postgraduates were found to have bleeding gums. (Table 1)

Teeth health

A major portion of the students were generally satisfied with their oral health whereas marginally higher number of undergraduates were found to be not satisfied with their oral health. (Table 1)

Frequency of tooth brushing

More number of postgraduate males brushes twice a day followed by undergraduate females, postgraduate females and undergraduate males. The rest brushes once a day. A negligible number of undergraduate females brushes thrice a day. (Table 2)

Type of toothpaste

Most students prefer paste form while a marginal number of females preferred gel form and a noticeable increase in the number of post graduate males preferred medicated toothpaste. (Table 2)

Type of tooth brush

A majority of both post graduate and undergraduate males and females preferred manual over powered toothbrushes. (Table 2)

Regular usage flossing

A major portion of the students did not floss regularly. Undergraduate males were found to be the least followed by postgraduate females, post graduate males and undergraduate females. (Table 2)

Frequency of flossing

Almost all of them had a low frequency of using floss. (Table 3)

Regular usage of mouthwash

More than half of the students do not regularly use mouthwash and there was no significant difference

between groups. (Table 3)

Frequency of mouthwash usage

All the students had insufficient frequency of mouthwash usage. (Table 3)

Smokers

There were smokers only among males and among them more number of smokers (50%) existed in postgraduates. (Table 3)

Frequency of smoking

A majority never smoked while a minority among postgraduate males smoked everyday, every weak and during socialising. A minority among undergraduate males smoked everyday. (Table 4)

Duration of smoking

Around 30% of postgraduate males smoke for more than 5 years while the rest smoke for less than 5 years whereas all undergraduate males smoke for less than 5 years. (Table 4)

Dental visit

Almost all the students in both postgraduate and undergraduate levels irrespective of genders have visited a dentist before. (Table 4)

Frequency of dental visit

There is invariable equal distribution in frequency among all students irrespective of being an undergraduate or a post graduate male or female. (Table 4)

Discussion

The participants were found to consist of 82 postgraduate females, 12 postgraduate males, 42 undergraduate females and 30 undergraduate males based on their demographic details.

A majority of both post graduate and undergraduate males and females were found to be concerned about their color of the teeth. A majority of both post graduate and undergraduate males and females were found to be concerned about their bad breath. A minority of the post graduate and undergraduate males and females were found to have bleeding gums while a marginally higher number of students in postgraduates were found to have bleeding gums.

A major portion of the students were generally satisfied with their oral health whereas marginally higher number of undergraduates were found not satisfied with their oral health. Polychronopoulou A et al[2] showed contradicting results during the years of university study, the score variation and favorable attitudes/ behavior

toward oral health appear to reflect the variation in the student's educational training experience. Iwuala SO et al[3] proved that the distribution of participant's responses to the statement "I would rate the state of my oral health as excellent." Among the respondents, 16.5% (*n* = 18) strongly agreed, 41.3% (*n* = 45) agreed, 22.9% (*n* = 25) were neutral and the remaining 12.8% (*n* = 12) disagreed with the statement.

More number of postgraduate males brushes twice a day followed by undergraduate females, postgraduate females and undergraduate males in that order. The rest brushes once a day. A negligible number of undergraduate females brushes thrice a day. Bashiru BO et al[4] reported that brushing habits of the study population were at least once a day (90%), 8.1% twice a day and 1.9% more than twice a day. Regarding knowledge on oral hygiene practice, approximately 60% of students knew that they have to brush the teeth twice daily, 31% knew that there is a need to visit the dentist twice a year and only 18% knew what was dental floss. Naveenkumar PG et al[5] in a similar study observed that a majority practiced toothbrushing twice a day (69.47%).

In the present study, most of the students preferred paste form while a marginal number of females preferred gel form and a noticeable increase in the number of post graduate males preferred medicated toothpaste. A majority of both post graduate and undergraduate males and females preferred manual over powered toothbrushes. Naveenkumar PG et al[5] in a similar study stated that merely, 2.1% used the electric toothbrush.

A major portion of the students did not floss regularly. Undergraduate males had the least number of flossers followed by postgraduate females, post graduate males and undergraduate females in that order and almost all of them had a low frequency of using floss. More than half of the students do not regularly use mouthwash and there was no significant difference between groups. All the students had insuffecient frequency of mouthwash usage.

This echoed the result by Bashiru BO et al[4] which showed very less people using other oral hygeine aids. Also Iwuala SO et al[3] proved that with regards to the oral cleaning aids, toothbrush with toothpaste either alone or in combination with other cleaning aids was used by almost all (99.1%); one respondent used only chewing stick. The combination of toothbrush, toothpaste and chewing stick was used by 12.8% (*n* = 14) of the respondents. 1 respondent (0.9%) reported using mouthwash in addition to toothbrush and toothpaste. 22 (20.2%) respondents reported using dental floss regularly.

There were smokers only among males and among them more number of smokers (50%) existed in postgraduates. A majority never smoked while a minority among postgraduate males smoked everyday, every weak and during socialising. A minority among undergraduate males smoked everyday. Around 30 % of postgraduate males smoke for more than 5 years while the rest smoke for less than 5 years whereas all undergraduate males smoke for less than 5 years.

Almost all the students in both postgraduate and undergraduate levels irrespective of genders have visited a dentist before. A study by Bashiru BO et al[4] reported that most of the students had never visited the dentist (71.6%). Rest of the study population visited dentist as a result of dental pain (18.1%), extraction (8.1%) and hole in the tooth (2.2%). According to Iwuala SO et al[3] nearly 70% (*n* = 76) reported a history of dental attendance. Of these, 51.3% (*n* = 39) reported dental pain as the reason for their dental visit while 25% (*n* = 19) indicated their dental visit was for a routine check-up. Other reasons included professional dental cleaning 8.9% (*n* = 7), dentures 1.3% (*n* = 1), tooth fracture1.3% (*n* = 1), dental cosmetics 1.3% (*n* = 1) and halitosis 1.3% (*n* = 1).

The present study showed female dominance. Naveenkumar PG et al[5] and many other similar studies throughout the world showed female dominance. It is because prevalence of female students among dental colleges is high.

Not only for the Indian dental students, but overall for those from different countries, it can be summarized that improvement is required in the areas of increasing the frequency of toothbrushing, use of mouthwash and interdental aids, regularizing the dentist visit for routine checkup and taking treatment for dental problems.

Conclusion

There was no significant difference in dental health, oral self care and dental visits neither between the post graduate and undergraduate dental students nor between the male students and female dental students. However, there was a significantly higher number of smokers with relatively greater frequency and longer duration

among postgraduate male dental students compared to other groups, followed by the undergraduate male dental students. Also there was a higher number of smokers in males than in females dental students.

Conflict of Interest: The authors declare that there is no conflict of interest

Analysis and Assessment of YouTube Uploads as a Source of Information for Oral Sub Mucous Fibrosis

G. Sneha Bokadia[1], Sreedevi Dharman[2]

Graduate Student[1], Reader[2], Department of Oral Medicine and Radiology, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Science, Saveetha University, Chennai.

Abstract

Aim: Social media is becoming one of the most popular sources of information among the general public. YouTube being the most popular is one of the key sources of medical information. This study aims to assess the overall quality of information of Oral Sub mucous Fibrosis presented on YouTube.

Methodology: The study analysed 100 YouTube videos using search terms 1) oral sub mucous fibrosis, 2) OSMF, 3) oral sub mucous fibrosis diagnosis, 4) oral sub mucous fibrosis symptoms, 5) oral sub mucous fibrosis treatment. A quality assessment checklist was prepared and two individuals scored each video independently based on information present. Videos were grouped into poor, moderate and excellent quality based on scores.

Result: After viewing 100 videos with information about OSMF awareness to general public,90%(n=90) of the videos available on YouTube are not helpful for patients seeking information regarding OSMF. 51%(n=51) of videos are completely irrelevant, depicting scarcity of useful videos. Among 10%(n=10) relevant videos (Awareness 3%, Educational 7%) videos, only 2%(n=2) was with excellent quality of information,4%(n=4) moderate quality,4%(n=4) showing the poor quality of videos available. Among the 10% useful videos, 5%(n=5) videos were uploaded by health care units and organisations and 1%(n=1) videos by universities and 4%(n=4) by private health care professionals.

Conclusion: The present study shows there is lack of information presented on YouTube regarding OSMF and also the available useful videos are of poor quality. However, YouTube could serve as a valuable platform for communicating, hence there is high need to upload good educational videos to create awareness and further guide patients with OSMF.

Keywords: *Oral sub mucous fibrosis, YouTube, areca nut, social media*

Introduction

Oral Squamous cell carcinoma is a major cause of morbidity and mortality in the Indian subcontinent.[1] Tobacco and betel quid chewing are the major contributory factors for high incidence of oral carcinomas in India.[2] Oral submucous fibrosis is a potentially malignant disorder characterized by fibrosis of connective tissues in oral cavity caused by chewing of Areca nut. The habit being most popular in Asian countries, OSMF is more prevalent in India, Bangladesh, Srilanka and China with 0.4% prevalence in Indian rural areas. [3] Malignant transformation of OSMF to squamous cell carcinoma is in the range between 2% and 8%.[4]

The etiology of OSMF is the consistent use of Betel nut used by 600 million people worldwide, yet is unknown to most Western physicians.[5] The major areca nut alkaloids include Arecoline, Arecaidine, Guyacoline and Guacine and important flavonoid components

Telephone number-9841009003

are tannins and catechins. These alkaloids undergo nitrosation and give rise to N-nitrosamine, which have cytotoxic effect on cells.[6] The betel quid is placed in the buccal vestibule for about 15 minutes to an hour and repeated 5 to 6 times a day which forms a constant contact between the mixture and oral mucosa. The alkaloids from the quid are absorbed into the mucosa and undergoes metabolism resulting in quantitative and qualitative alterations of collagen deposition within the sub epithelial layer of the oral mucosa leading to fibrosis.[7] Commercially existing arecanuts and tobacco have shown a higher severity in clinical grading.[8]

The signs and symptoms of OSMF includes progressive inability to open mouth, marble like pallor of mucosa, development of fibrous bands, xerostomia, masticatory problems, speech, burning sensation, increased salivation, nasal tonality to voice, recurrent ulcers, pain in ears, shrunken uvula and stiffening of lips.[9] It is clinically classified in three stages, stomatitis, fibrosis and sequelae of OSMF.[10] Diagnosis is by clinical and histological means. Histopathological investigations are characterized by epithelial atrophy with loss of rete ridges and hyalinization of the lamina propria and the underlying muscle. Treatment plan mainly includes quitting of betel chewing, oral hygiene, good health education, forgoing hot fluids, alcohol. Medical therapy includes Antioxidants, hydrocortisone tablets and hyaluronidase as intra lesional injections, pentoxifylline, Interferon gamma and surgery.[11]

Internet has become a popular source for health care information[12] with YouTube the most popular. Along with various fields like sports, entertainment and news general public also looks information on health care. YouTube has an estimated one billion unique views per month and six million hours of video watched monthly. The health information obtained through YouTube can have a substantial impact on the patient-physician relationship and mutual trust. Eighty-five percent of physicians have experienced patient have brought up information they obtained through various websites over the Internet[13,14]. Given the popularity of YouTube, several studies have assessed the quality of information in YouTube videos related to health conditions and behaviours, including immunizations[15], prostate cancer[16], kidney stone disease[17], cardiopulmonary resuscitation[18], paediatric tumors[19], inflammatory bowel disease[20] and epilepsy[21]. Therefore, the aim of this study was to assess the quality of selected videos uploaded on YouTube regarding OSMF.

Methodology

A YouTube search was performed for videos related to OSMF. Following search terms were used 1) oral submucous fibrosis, 2) OSMF, 3) oral submucous fibrosis diagnosis, 4) oral submucous fibrosis symptoms, 5) oral submucous fibrosis treatment. The standard YouTube filter were applied displaying videos by relevance. Videos providing awareness and educational videos were included. Awareness videos are explaining issues and impart knowledge to people so that they can make their own decisions. Educational videos are teaching videos and are merely descriptive.

Non-educational, surgical videos, patient review, Non English, videos without audio and subtitles, Duplicate videos, and irrelevant videos were excluded (Figure 1). Videos on same topic with 2 parts were considered as one. The following information for each video was recorded 1) date of upload, 2) number of views, 3) number of likes and dislikes, 4) URL. The first 100 videos were included assuming people would not search in further. Source of upload are categorised into health care units and organisations, universities, private health care professionals, TV channels. There was no instituitional review board approval required for the present study.

Interaction index was evaluated based on viewers interaction with videos.

$$\frac{\text{Number of likes-Number of dislikes}}{\text{total number of views}} \times 100\%$$

Viewing Rate

$$\frac{\text{Number of views}}{\text{Number of days since upload}} \times 100\%$$

Content of videos were evaluated based on etiology, pathogenesis, signs and symptoms, prevention and management. In order to assess the videos, grading system similar to Ulrich Koller et al[22] was used with expert opinions. Two independent observers assessed all the videos using the scoring criteria and each video was independently given a score. Scores were based on the amount of information presented and average of scores of both individuals were considered. Videos were

considered of good quality if they provided high amount of accurate information, depending on weighting of items, 0.5 points were given for each mentioned item in checklist. (Table1). Usefulness score was calculated, they were categorized as slightly useful for scores 1-3, moderately useful for scores 4-7 and very useful for scores 8-10.

Statistical Analysis

Descriptive statistics were performed. Video length, Interaction index, Viewing rate, Usefulness videos were determined. To compare variables between groups Mann Whitney test is applied. Data entry and analysis were done using the data SPSS Statistics for Windows, Version 23.0 is used. Significance level is $\alpha = 0.05$.

Result

Applying the search term "oral submucous fibrosis" resulted in 1,090 results comprising of 915 individual videos, 92 playlists and 22 channels. Of all the videos presented only first 100 videos were analyzed in this study assuming viewers would not search in further. Analysing the videos according to search terms it was found that the search terms "oral submucous fibrosis, oral submucus fibrosis symptoms, oral submucus fibrosis diagnosis and oral sub mucus fibrosis treatment" resulted in same 1090 videos in a different order, which are taken into consideration After viewing 100 videos, 3%(n=3) were videos aiming to create awareness, 7%(n=7) of videos were educational videos with good information, 14%(n=14) demonstrated laser therapy, 5%(n=5) demonstrated intra lesional injections, 13%(n=13) videos were surgical videos explaining OSMF from surgical aspect, 1%(n=1) of videos uploaded by private professionals on patient review post treatment, 2%(n=2) videos explaining histopathology of OSMF, 3%(n=3) of videos in Hindi. and 51% of videos completely irrelevant. Among them awareness (videos aiming to create public awareness) and educational videos (videos with information like etiology, signs and symptoms,prevention,management) were taken into consideration for scoring criteria(10%).

In these 10 relevant videos mean number of views was 9912, mean number of likes was 307 and dislikes was 81. (Figure 2) shows the flow chart of various categories of videos found. 90 videos being irrelevant (not useful for general public).

Characteristics of the videos

Analysing those 10 relevant videos it was found that only 7%(n=7) videos had OSMF defined, 7%(n=7) videos mentioned the etiology with only one videos explaining about areca nut in detail. Only 5%(n=5) videos explained the pathogenesis, and only 3%(n=3) videos explained the signs and symptoms which the general public must be aware of. Diagnosis of OSMF was explained in 7%(n=7) videos, with only 1%(n=1) video having good treatment information. Figure 3, shows the Bar diagram demonstrating number of videos, which contained information in each category. A Vast majority of videos lack the basic general information on oral sub mucous fibrosis.

Out of 100, 90%(n=90) of videos were found to be non useful for general public seeking information on OSMF. Only the educational and awareness videos were taken into consideration for scoring. As scoring of videos were based on the information they contained. Each video was given an overall score as shown in the (figure 4).

The scoring showed among 10%(n=10) videos, 2%(n=2) videos was very useful with score of 8 and 10, 4%(n=4) videos moderately useful with score of 4.5, 6, 6.5 and 7, 4%(n=4) videos slightly useful with scores of 2.5, 2.5, 1 and 1.

Among the 10%(n=10) useful videos, 5%(n=5) videos were uploaded by health care units and organisations and 1%(n=1) videos by universities and 4%(n=4) by private health care professionals.

Viewing rate for awareness videos was (25.6min+_30.0) and educational videos was (12.3min+_10.4) ($p>0.05$) showing higher viewers for awareness videos. People prefer watching awareness videos for quality of information presented. Mean usefulness score was (7.7+_2.0) for awareness videos and (3.1+_2.4) ($p<0.05$) for educational videos which explains the fact of higher viewing rate for awareness videos. Therefore, viewers found public awareness videos more useful and it has a higher viewing rate. Viewers interaction with videos were positive, mean interaction index score for awareness video was (0.88% +_0.97) and educational video were (0.70%+_0.64) ($p>0.05$). The mean length of awareness video was (5.50 +_1.4) was comparable to (3.7+_2.1)($p>0.05$).Table 1

Table 1: awareness regarding descriptive videos among study subjects

Score 0 = not useful, score 1-3 slightly useful, score 4-7 = moderately useful, scores 8-10 = very useful.

Discussion

In this fast moving world patients increasingly access YouTube for medical information in order to play a more active role in personal health care decisions. As YouTube is non peer reviewed platform, physicians and patients should be aware of the variable quality of information and different sources of health information. The quality of YouTube information has already been evaluated for different medical specialties such as urology, otorhinolaryngology and orthopedic fields. More youngsters fall into the prey of chewing pan and

in turn get addicted, leading to potentially malignant disorders like OSMF without knowing the risk of them transforming into oral cancer. Hence increased public awareness is required projecting the consequences of potentially malignant disorders like OSMF, thus helping the patients to quit the habit at once. YouTube is a social media, and the quality concerning the Oral sub mucous fibrosis in Youtube has not been previously studied. To the best of our knowledge, this is the first study that has analyzed and assessed the content and quality of uploaded videos about OSMF.

The signs and symptoms of OSMF appear gradually with vesicle, ulceration, blanching and restricted mouth opening. For patients it may be confusing and in curiosity may asses YouTube to gather information.

The present study is relevant for physicians and patients alike. It demonstrates lack of information about OSMF on YouTube and also the poor information quality of present videos.

In this study initially when 100 videos were to be taken into consideration and scoring, later only 10 videos were found to be eligible to fit into the relevant category depicting the lack of information on OSMF. Most of the videos were irrelevant due to language discrepancies or irrelevant topic. The majority of information present demonstrates the surgeries done by private surgeons, which is not useful for patients seeking for information about the disease. Few videos present were patient reviews post treatment and few videos demonstrated clinically how the lesion looks with either no audio or poor information quality. These videos maybe useful for patients searching for visual examination of lesion but does not provide the general information about OSMF.

Among the relevant 10% of videos, there was only 2 videos with excellent quality (8-10) points . The video contained maximum features with respect to the checklist (Table 1). 4 videos were of average quality (4-7) points, 4 videos were of poor quality (1-3) points. It was found that among the relevant videos information on diagnosis and pathogenesis was least. Information regarding etiology being Arecanut chewing was also average. All possible treatment mentioned in checklist was mentioned only in one video showing poor treatment information also.

Mean viewing rate, useful score, interaction index, video length were more for awareness video though less in number, compared to educational video, suggesting the need for uploading good public awareness videos with all informations, rather than teaching videos that gives merely descriptive information that may be useful only for dentists and oral medicine specialists.

The present study demonstrates that there are insufficient videos online on YouTube about OSMF and the present videos do not provide sufficient information. Since OSMF occurs from early age as 20, YouTube must provide enough awareness about arecanut being the causative agent for OSMF and its possible consequences. This might be helpful for younger generation to create awareness on its harmful effects. Only 5 videos had accurate information about arecanut being the etiologic factor. Patient might assess YouTube to self diagnose when facing the signs and symptoms, but the quality of diagnosis was found to be poor. Patients also try to find the various treatment options available to them through YouTube. This study showed that there are very few videos providing good quality of information about them. Apart from lack of videos available, the available videos provide a very narrow information therefore very less information reaching to general public. Consequently, YouTube is not helpful for patients seeking information on OSMF. Our study is a good example of what future videos could be uploaded.

Similar results were obtained by a study conducted by Ulrich Kohler et. al who concluded YouTube provided insufficient information on diagnosis and treatment possibilities of Hip Arthritis[22]. Another study on quality of information present on YouTube about Distal radius fracture immobilization was conducted by Abdulah Addar et . al also concluded scarcity of good information and need to promote high-quality educational videos[23]. Craig Hansen et al study showed the YouTube video content they reviewed did not adequately reflect what is known about the safety of use of medicines in pregnancy[24]. Nancy Gupta et al conducted a study on assessment of YouTube information and colonoscopy and concluded patients searching for information regarding colonoscopy on YouTube will be presented with overall poor quality and non peer reviewed content. The study highlights the need on YouTube for evidence based, easy to understand videos addressing various aspects of colonoscopy, possibly sponsored by professional medical societies[13]. On the contrary Sood A et. Al, found that YouTube had sufficient information on kidney stone disease and may influence patient's attitude positively[24].

We acknowledge the limitations in our study: there were no validated tools to asses the quality of information therefore we followed the MacLeod et al and Ulrich Koller et al, a new quality assessment checklist was prepared. The grading scale had excellent inter and intra observer reliability demonstrating high consistency of grading scale. Only English language were analyzed in this study. Knowledge available on YouTube is constantly evolving, yet the present situation of only 10% of relevant videos shows the poor quality.

Conclusion

OSMF being one of the commonly occurring pre cancerous condition which leads to malignancy requires special attention. Occurrence of OSMF is more prevalent in younger age group as peer influence by friends and colleagues are key factors to acquire the habit of pan chewing. Social platforms like YouTube, google and Facebook can play key role in creating awareness about the consequences and harmful effects of pan. The present assessment of YouTube videos demonstrates that information regarding Oral sub mucous fibrosis is overall insufficient. Along with scarcity of useful videos the present available videos also are of poor quality. Use of YouTube for seeking information is going to grow rapidly within next few years and videos are going to become primary source of information. Therefore, there is high need to upload videos with good quality information to further guide patients. The medical communities can use this opportunity to define gold standards for comprehensive and innovative evidence based educational videos on OSMF.

CBCT Analysis of Maxillary Canine Impactions- A Cross Sectional Study

Kalyani. P[1], Jayanth Kumar V[2]

[1]Graduate Student, [2]Reader, Department of Oral Medicine and Radiology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Aim : To study the positions and angulations of Maxillary canine impactions.

Materials and Method: The CBCTs of 30 patients who reported with Maxillary canine impactions to the outpatient department of Saveetha Dental College was assessed. The impactions were assessed based on the following variables: Age, Gender, Type of impaction – Buccal/Palatal/In arch, Unilateral or bilateral, Canine angulation, Vertical height, Erikson and Kurol root resorption, Power and Short's Vertical position .

Results: The p-value generated for Vertical height was 0.0167<0.05 indicating a statistically significant vertical height, while that for canine angulation was 0.374>0.05, indicating a statistical insignificance.

Conclusion: From this study,it was observed that an angulation exceeding 31 degree of the impacted canine decreased the chances of eruption. Also the vertical height of the canine was a factor in determining the impaction of canines.

Keywords: *Cone Beam Computed Tomography, Maxillary canine impactions, angulation, Vertical height, root resorption.*

Introduction

An impacted tooth can be defined as one whose eruption is considerably delayed, and for which there is sufficient clinical and radiographic evidence that eruption will not take place (Thilander and Jakobsson, 1968).[1] The most common impactions in almost all populations are the maxillary and mandibular third molars. This is followed by Maxillary canines whose incidence of impactions vary among different populations. There are many reasons attributable to the impaction of Maxillary canines.the eruptive pathway of Maxillary canines which is not only the longest but also the most torturous of all. The path starts from its site of formation lateral to the piriform fossa to its final position in the arch. crowding, dilaceration, abnormal position of tooth bud, cystic formations, iatrogenic positioning of adjacent tooth into canine's pathway.[2] Timely intervention of these impactions prevents the occurrence of resorption of roots of adjacent tooth and cystic transformation. Surgical and orthodontic treatment interventions can bring the impacted tooth to a normal position in the arch. However, before intervention the clinician largely depends on diagnostic aids to study the positions and angulations of these impactions. This is because there are various factors like the position of impaction, surgical accessibility, prognosis of the interventions both on the impacted tooth and adjacent teeth that decide the type of treatment to be provided.[3]

Initially the conventional diagnostic aids such as Panoramic radiograph and Orthopantomographs were used for the diagnosis of Canine impactions. However, these aids had a major disadvantage in that they were 2 – dimensional. But a 3-dimensional positional analysis of

the impactions was required. So diagnostic aids such as Computed Tomography (CT) and Cone Beam Computed Tomography (CBCT), came into usage for assessing the positions of Maxillary canine impactions. Further, two important indices were developed for the assessment of canine impactions. They are the Erikson and Kurol's root resorption index and the Power and Short's vertical position index.

Thus, the current study was aimed at studying the positions and angulations of impacted Maxillary canines using CBCT and based on the indices by Erikson & Kurol and Power & Short. [4,5]

Materials and Method

The CBCT scan's of 30 patients who reported with Maxillary canine impactions to the outpatient department of Saveetha Dental College were accessed after approval from the Institutional Ethics committee. Of the 30 scans, 24 were selected based on the following inclusion and exclusion criteria.The inclusion criteria was - Age group between 15 – 60 years, Both genders, Patients with Maxillary canine impactions, and Patients with unilateral or bilateral impactions in the maxillary arch. The exclusion criteria was - Mandibular canine impactions, Resorbed canine impactions, and Age below 15 years and above 60 years. This yielded a total of 24 scans with 33 Maxillary canine impactions. Informed consent was obtained from the patients and the study was approved by the institutional ethical committee.

The impactions were assessed based on the following variables:

- Age
- Gender
- Type of impaction – Buccal / Palatal / In arch
- Unilateral or Bilateral.
- Canine angulation
- Vertical height
- Erikson and Kurol root resorption
- Power and Short's vertical position

The Canine angulation was measured between the long axis of canine and the mid Sagittal plane. The Vertical height was measured as the length of the perpendicular drawn between the deepest concavity in the canine and a line connecting incisal edges to premolars. Erikson and Kurol root resorption index can be explained as folllows:

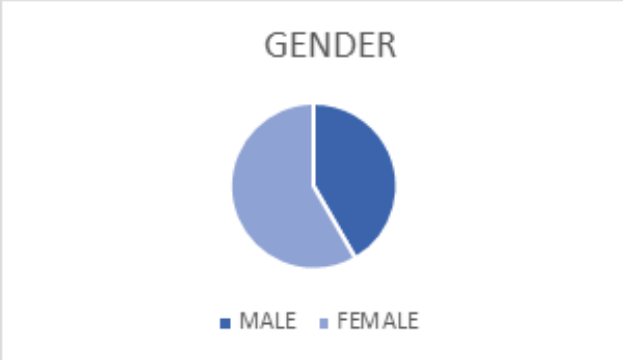
1. No resorption – Intact root surfaces except for loss of cementum
2. Slight resorption – Upto half of the dentin thickness to the pulp
3. Moderate resorption – Half way to the pulp or more ; the pulp is covered with dentin
4. Severe resorption – The pulp is exposed

The Power and Short's Vertical position is as follows:

Stage 0 – No overlap

Stage 1 - <1/2 incisor root width

Stage 2 - >1/2 incisor root width



Stage 3 – Complete overlap and beyond

Results

The recorded measurements for each variable was subjected to statistical analysis. Of the 24 participants, 10 were Male and 14 were Female.(Fig 1) The type of impactions was calculated as 9 bilateral, 8 unilateral left and 7 unilateral right impactions.This gave a total of 33 impactions of which 6 were in arch, 9 were palatal and 18 were buccal impactions. (Fig 2)

Erikson and Kurol root resorption observed in 34 scans, that 15 impactions had no root resorption, 5 had mild resorption and another 5 had Moderate resorption while Severe resorption was recorded in 9 impactions. (Fig 3) Power and Short's Vertical position- there was Stage 1 overlap in 2 impactions, Stage 2 in 1 impaction, Stage 3 and no overlap in 11and 21 respectively. (Fig 4)

The vertical height and canine angulation measurements were subjected to ANOVA. The p-value generated for vertical height was $0.0167 < 0.05$ indicating a statistically significant vertical height, while that for canine angulation was $0.374 > 0.05$, indicating a statistical insignificance.

Discussion

Impaction can be defined as failure of tooth eruption at its appropriate site in the dental arch, within its normal period of growth.[6] Impacted tooth / teeth are one of the most frequently encountered problems in dentistry. The most common impactions being mandibular third molar, Maxillary third molar, Maxillary canine, Mandibular premolar, Maxillary premolar, Mandibular Canine, Maxillary central incisor, and Maxillary lateral incisors in the decreasing order of their frequency of occurrence. The etiological factors for an impaction can be classified as local and systemic factors. Systemic factors includes febrile illness, endocrine disorders such as hypo- or hyperthyroidism, and irradiation. Local factors that impede with normal tooth eruption can be the arch length tooth material discrepancy, prolonged retention of predecessor, abnormal position of tooth bud, ankylosis, alveolar cleft, cystic or neoplastic transformation, dilaceration, idiopathic and iatrogenic factors.[7]

The incidence of Maxillary canine impactions is around 0.8-2.8%.[8] Many reasons have been proposed for the incidence of Maxillary canine impactions. But to understand these, one must have thorough knowledge about the normal eruption pathway of a Maxillary canine. Initially the eruptive pathway of canine was popularly known as the Broadbent phenomenon which also causes a transient midline diastema. This has further been clearly explained by J. Coulter and A. Richardson in their article.[9] Accordingly, movement of the eruptive canine occurs in 3 different planes during different time periods. Between 7 and 13 years, there is posterior movement and vertical movement between 5 and 13 years. Lateral movement occurred in a palatal direction for upto 2 years before eruption. This was followed by movement in the buccal direction in the year before eruption, year of eruption and the year after eruption. Any impedance during these movements can be one of the reasons for inarch, palatal and buccal

impactions respectively. However, this study was done using Lateral and Posterior – Anterior Cephalometrics, which are 2-dimensional imaging systems. An exact object localization is difficult to achieve using these systems of imaging. Hence, 3-dimensional imaging systems are used currently for studying impactions. One of the most preferred imaging technology particularly for the maxillofacial region is the CBCT imaging – Cone Beam Computed Tomography. CBCT helps in accurate localization of ectopically erupting tooth and for assessing the location and extent of root resorption of adjacent teeth, in this case, the Maxillary lateral incisors.[10] Hence, this was the imaging of choice in our current study. CBCT also helps in the accurate localization of the type of impaction I.e., inarch, palatal or buccal. In the current study, of the 33 impactions studied, 6 were inarch, 9 were palatal and 18 were buccal. There are several research works that reveal the possible theories behind buccal and palatal impaction of Maxillary canines. Buccally displaced canines are thought to arise as a result of crowding and arch length tooth material discrepancy. For palatal canine impactions there are various schools of thought, explaining the etiology. Of these, there are 2 most accepted theories – 'guidance' theory and 'genetic' theory. According to guidance theory, the root of Maxillary lateral incisor serves as a guide for the eruption of canine, but in its absence or hypoplasia, this is hampered. Hence, the canine is palatal disolaced due to the lack of a proper eruptive guide. According to the genetic theory, a complex of genetically determined tooth anomalies together with developmental disturbances to the dental lamina lead to a palatal position of the Maxillary canine.[11, 12] However, according to Yan et al., the relative rate lower of migration in the vertical and transverse directions is also a critical factor for palatally placed canines. The results of Yan et al's study have revealed that a faster migration rate in the occlusal than in the mesiopalatal direction lead to a normal canine eruption inspite of the presence of lateral incisor anomalies, whereas, a faster migration rate in the mesiopalatal than in the occlusal direction, interfered with the eruption of canines even in the absence of lateral incisor anomalies.[13]

In the current study, two important indices were chosen to determine the positions and angulations of the impacted canines, namely, the Power and Short Vertical position index & Erikson and Kurol root resorption index.

The Power and Short Vertical position was used to determine the amount of horizontal overlap of the impacted teeth to the adjacent lateral and central incisors. This was done in 3 stages as mentioned previously. Around 58.3% of the impactions had no overlap, while Stage 3 overlap was seen in 30.5% of the impactions. According to Power and Short, a horizontal overlap of more than half the incisor root width has a poor prognosis of returning to the original position.[5] Also, when the canine angulation to the midline exceeds 31 degree the chances of eruption decrease.[14] In our study, more than 85% of the impactions had angulations that exceeded 31 degrees, which can also be held as a cause for their failure to erupt.

The pressure of the impacted canines on the roots of lateral incisors lead to their resorption. This is partly influenced by the position of canine, wherein a more mesially positioned canine stands greater chances of resorbing the root of lateral incisor. Also the root development of canine is also an attributable factor as it is related to its eruption and migration. [6,15,16] Based on the extent of root resorption, this was staged by Erikson and Kurol into 3 stages. Around 27.3% of the study population had Severe resorption (involving the pulp). The results are comparable to that of Walker, Erikson and Mah, incisor resorption adjacent to the deciduous canines was seen in 66.7% of laterals and 11.1% of the central incisors. [17]

Comparing the vertical height and canine angulation, vertical height was more significant in the current study. This is an indicator that the vertical height of the impacted canine plays a vital role in determining its eruption and prognosis. This goes in accordance with the results of Sajnani and King, according to whom the vertical distance of the tip of Maxillary canine from the occlusal plane is a good predictor of canine impaction.[18]

In the future more such studies need to be carried out on Maxillary impacted canines using advanced diagnostic aids like CBCT, as this can change the course of treatment to a more successful pathway. [19,20]

Conclusion

The study reveals that an angulation exceeding 31 degree of the impacted canine decreased the chances of eruption and a good prognosis. Further, the vertical height of the canine is a factor of higher significance than the canine angulation, in determining the eruption of impacted canines. More such studies need to be

initiated in the future with larger sample size to support the results.

Micronutrient Levels in Saliva of Chronic Periodontitis Patients Pre and Post Non-Surgical Periodontal Therapy

U. Santo Grace[1], M.Sankari[2], S.Swarna Meenakshi[3]

[1]Post Graduate Student, [2]Professor, Department of Periodontics, [3]Post Graduate student, Department of Periodontics, Saveetha Dental College,Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Background: Saliva, being the major fluid of the oral cavity is composed of various ions, electrolytes, enzymes, micronutrients and microorganisms which contribute to the homeostatic environment of the oral cavity. The micronutrients of the saliva attribute to the nature of the saliva by influencing the pH or by altering the oral microflora. The disturbance in micronutrient status and increased oxidative stress may favor periodontal disease progression. Therefore, the aim of this study was to evaluate the micronutrient levels in saliva in patients with chronic periodontitis pre and post non-surgical periodontal therapy.

Keywords: *biomarker, saliva, prognosis, periodontitis, non-surgical management*

Aim: The aim of this study was to evaluate the micronutrient levels in saliva in patients with chronic periodontitis pre and post non-surgical periodontal therapy.

Materials and Method: The study comprised of 30 patients divided into 2 groups. Group 1 consisted of 15 patients with chronic periodontitis and group 2 consisted of 15 healthy individuals. Phase 1 therapy was done for all subjects. Micronutrient levels (zinc, magnesium and copper) and clinical parameters such as gingival index, pocket depth and clinical attachment loss were evaluated at baseline and 1 month after periodontal therapy.

Results: The results of the study showed that on comparing baseline parameters between the test and control group, there is a marked decrease in micronutrient level of Zinc in the test group when compared with the control group and a marked increase in micronutrient level of Copper in the test group when compared with the control group. On comparing the effect of non-surgical therapy on micronutrient levels in the test group, our results showed improvement in the micronutrient levels. Compared with baseline, the levels of copper showed a decrease after treatment and the levels of zinc showed an increase in response to treatment.

Keywords *Micronutrients, Salivary micronutrients, Periodontitis, Zinc, Copper*

Introduction

The integrity of body tissues mainly depends on the adequate source of both macro and micro nutrients available to the host. Additionally, they are also essential for the better functioning of the various biochemical processes operating within a human system.[1,2] Changes in life style and diet alterations plays a major in altering the macro and micro nutrient levels with the human body. A chronic deficiency of one or more nutrients may produce pathological alterations leading the tissue loss resistant to injuries.[3]

Nutrients can be classified either as macro or micro depending on their requirements.[4] The micronutrients mainly include vitamins and minerals and adequate

Corresponding Author:
M.Sankari,
Professor, Department of Periodontics,
Saveetha Dental College,Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai
Email:msankari@gmail.com

amount required are to be taken in diet for the performance of biochemical functions. Minerals like iron, zinc, copper, iodine, selenium, chromium etc have been found to be essential to perform various biological activities.[5]

Several studies have shown that there is an alteration in the level of these nutrients in disease conditions like Diabetes Mellitus, rheumatoid arthritis, obesity, cardiovascular disease.[6-8] A study by Frithof L[9] has shown that decreased serum zinc levels might be related to increased alveolar bone resorption. Similarly, a study by Enwonwu[10] has shown that malnutrition which usually involves concomitant deficiencies of macro and micro nutrients has the potential to adversely influence the prognosis of periodontal infections.

Saliva, being a vital fluid in the body, has various functions which includes protection and integrity maintenance of oral mucosal health through lubrication, buffering action, antibacterial and antiviral activity, and food digestion.[11] Recent proteomic studies have identified and characterized more than 1000 salivary proteins and peptides. Most of these are commonly found in plasma and some are solely produced and secreted by salivary glands having no correlation with blood levels.[12] Saliva also contains electrolytes, immunoglobulins, metabolites, enzymes, hormones and vitamins.[13,14]

Progress in salivary diagnostics are more likely to depend upon establishing clinical utility of macromolecules and low molecular weight components. In this regard, salivary variations observed in specific pathological conditions have been compared with blood or other body fluids.[15-19]

Materials and Method

30 subjects were enrolled in the study. The study was approved by the University Ethical Committee (SRB/ MDS/ PERIO/18-19/0043). Convenient sampling was done. Subjects who visited Saveetha Dental College for treatment were include in the study. Written informed consent was obtained from each participant. They were allocated to groups based on the diagnosis. Group 1 consisted of healthy individuals and group 2 consisted of patients with chronic periodontitis. Each patient of group 2 received scaling and root planning. Periodontal parameters as probing depth and attachment loss were recorded at baseline and1 month.

Inclusion Criteria

1. Patients diagnosed clinically as having chronic periodontitis according to the American Academy of periodontics criteria 1999

2. Patients aged between 28-70 years

3. Periodontal probing depth of ≥ 4mm

Exclusion Criteria

1. Patients with history of any systemic diseases like diabetes mellitus, cardiac problems etc.

2. Patients with previous history of hospitalization/ surgery in the past one year

3. Pregnant or lactating women

4. Patients with an history of antibiotic, anti-inflammatory drug intake in the past 6 months

5. Patients on treatment with steroids

6. Patients with congenital abnormalities were also excluded from the study.

Sample collection: Unstimulated saliva was collected from subjects in both groups at baseline. Group 2 subjects who underwent scaling and root planing were recalled after 1 month and saliva was collected. Salivary micronutrients such as Zinc and copper were analysed using a digital analyser.

Statistical analysis: Statistical analysis was done using SPSS v20. Comparison between the two groups at baseline was done using independent T test and comparison between baseline and 1 month was done using Paired T test.

Results

Table 1 shows intergroup comparison between healthy and periodontitis group. This reveals a statistically significant differences among all clinical parameters such as bleeding on probing, probing depth and clinical attachment levels. Similarly, a statistically significant difference was found on comparing the levels of Zn and Cu between healthy and periodontitis group. (p value – 0.00)

On comparing the clinical parameters among chronic periodontitis patients, pre and post non-surgical periodontal therapy, a statistically significant difference

was seen with a p value of <0.05. (Table 2) The salivary micronutrient levels were also found to show a statistically significant difference comparing pre and post levels (p value – 0.00)

Comparison between healthy and post-treatment levels also revealed a statistically significant difference on all clinical and bio-chemical parameters suggesting that non-surgical periodontal therapy may not be sufficient to revert the disease state to health. (Table 3) Additional surgical therapy with long term follow up period might be necessary to prevent disease progression and establish periodontal health.

Correlation of clinical parameters with Zn was statistically significant in relation to probing depth of healthy individuals, clinical attachment levels at baseline of chronic periodontitis patients and post-operative bleeding on probing of chronic periodontitis patients. (Table 4) However, correlation of copper levels was statistically significant only in relation to the baseline clinical attachment levels of chronic periodontitis patients.

Table 5 shows correlation of Zinc and Copper levels. A negative correlation was found between zinc and copper levels of group 1(Graph 1). Correlation of zinc and copper levels of group 2 revealed a weak positive correlation (Graph 2). Correlation of Zinc and Copper levels of Group 3 also showed a negative correlation and is represented in graph 3.

The results of the study showed that on comparing baseline parameters between the test and control group, there is a marked decrease in micronutrient level of Zinc in the test group when compared with the control group and a marked increase in micronutrient level of Copper in the test group when compared with the control group. On comparing the effect of non-surgical therapy on micronutrient levels in the test group, our results showed improvement in the micronutrient levels. Compared with baseline, the levels of copper showed a decrease after treatment and the levels of zinc showed an increase in response to treatment.

Table 1: Comparison of clinical and biochemical parameters among healthy and chronic periodontitis patients (Independent T Test)

Parameters	Group 1 (healthy)	Group 2 (periodontitis)	P value
Bleeding on probing	0.08±0.14	1.71±0.29	0.00*

Discussion

Micronutrients such as Zn and Cu play an important role to maintain adequate immune response as well as to combat oxidative stress. When malnourished individuals are exposed to infections, the host responds not only by mounting appropriate specific and nonspecific immune responses but also by initiating a well-characterized series of metabolic adjustments.20 Inflammatory stimuli from dental plaque promote release of reactive free radicals and also exhibit metabolic changes that are modulated by potent soluble mediators known as cytokines. Many studies have assessed the levels of micronutrients in patients with periodontitis.21,22 However, ours is the first study to explore the effect of nonsurgical periodontal therapy on the level of micronutrients and compare the pre and post values.

Cross sectional studies done by Grossi et al. have shown that diabetic subjects were twice as likely as nondiabetic subjects to have clinical attachment loss.23 In another cross sectional study done by Bridges et al., it was found that Diabetes Mellitus affected all periodontal parameters. The improvement in all the clinical parameters in this study was similar to a study done by Rodrigues et al.24 Deficiency of Zn, Mg, and Cu increases the susceptibility to infection, impairs the function of neutrophils and macrophages, and reduces the antibody-mediated, cell-mediated, phagocytic and delayed type of hypersensitivity reactions and depletion of antioxidants. A study by Freeland et al. also showed that serum copper levels were increased in individuals with chronic periodontitis25.

Turnlund and associates reported immune function and antioxidant status can be modulated by increased serum concentration of copper. Studies on animal models have shown that increased serum copper levels reduce several aspects of immune response, including neutrophil numbers, lymphocyte proliferation, and antigen-specific antibody production.26 It has also been reported that elevated serum copper levels alter collagen metabolism and hence can promote periodontitis.27 Frithiof et al. and Tulin et al. in separate studies found decreased serum zinc levels in individuals with periodontitis when compared to healthy controls.28,2[9]

The present study shows that non-surgical therapy improves the micronutrient levels in patients with chronic periodontitis. This study is limited primarily by its short follow up period, which prevents the establishment of a temporal relationship between micronutrients and periodontitis. Another limitation is that salivary concentrations are perhaps not the best index of micronutrient levels in periodontal tissues. More longitudinal studies with a larger sample size should be carried out to have a better understanding of the interrelationship between micronutrient imbalance and chronic disease processes like periodontitis.

Conclusion

In the last decades, the impact of micronutrients on human physiology has begun to be elucidated. Imbalance in zinc and copper levels are evident in patient with chronic periodontitis. Non-surgical therapy improves the micronutrient levels on patients with chronic periodontitis. However, more longitudinal studies with a larger sample size and longer follow up period should be carried out to have a better understanding of the interrelationship between micronutrient imbalance and chronic disease processes like periodontitis.

Antioxidant and Antifungal Activity of Bacteria Mediated Silver Nanoparticles Using *Rhizobium* sp

Sowmya B[1], Venkat Kumar S[1], Karpagambigai S[2], Jacquline Rosy P [3], Santhoshkumar J[1], Rajeshkumar S[4]

[1]Nanotherapy Lab, School of Biosciences and Technology, Vellore Institute of Technology, Vellore, India, [2]Assistant Professor, Departmant of Chemistry, Global Institute of Engineering and Technology, Vellore,, TN, [3] Assistant Professor, Dept. of Chemistry, IFET College of Engineering, Villupuram, TN, [4]Associate Professor, Department of Pharmacology, Saveetha Dental College and Hospitals, SIMATS, Saveetha University, Chennai, TN, India

Abstract

Background: The silver nanoparticles (AgNPs) have a significant range of application in the field of biomedical technology. This can be subjected in agriculture by biological synthesis method using microbes which may inhibit disease-causing pathogens in agriculture, typically it confused on management of pathogens.

Materials and Method: In this present investigation, *Rhizobium* sp. was isolated from cultivable soil sample for the synthesis of AgNPs. The synthesized silver nanoparticles were characterized using UV-Visible spectroscopy, Scanning electron microscopy shows regular circular shape of AgNPs followed by energy dispersive X-ray (EDX) spectrometers confirms the presences of elemental composition of materials. Transmission electron microscopy was done for the structural analysis and the surface study of synthesized AgNPs was studies by Atomic forced microscopy.

Results: The surface plasmon resonances at 425 nm confirm the AgNPs formation and morphology of the nanoparticles are polydispersed with 25–70 nm in size confirmed by the microscopic techniques. The synthesized silver nanoparticles were examined against disease-causing fungal pathogens such as *Aspergillus niger*, *Candida albicans*, and *Aspergillus fumigatus* in which *Candida Albicans* showed a maximum zone of inhibition of 15 mm at 75 µL of AgNPs.

Conclusion: Finally, the silver nanoparticles were used to perform free radicals scavenging activity.

Keywords: *Antifungal activity, Antioxidant activity, Biosynthesis, Rhizobium sp, Silver nanoparticles.*

Introduction

Nanotechnology exhibits fabulous characteristic features based on their properties such as size, morphology and other size-dependent properties [1]. Application of nanoparticles is hasty impetus due to their chemical, optical and mechanical properties. Some of the noble metals like palladium, silver, platinum, and gold have a wide range of material behavior along the atomic to bulk transition [2]. Among these noble metals, silver has a wide range of applications in making of jewels, dental alloy and health additive in traditional Chinese and Indian Ayurvedic medicine [3]. Silver nanoparticles exhibit tremendous applications in drug delivery, wound healing, sensor applications, cosmetics, textile industry and also used an antimicrobial agent in paints [4]. Silver nanoparticles have huge application in the field of medical sciences due to its antimicrobial property against *Staphylococcus aureus, Escherichia coli, Bacillus subtilis, Klebsiella mobilis,* and *Pseudomonas* [5]. The metal nanoparticles are extensively used in biomedical and bio-electrochemical applications due to their extraordinary electro-catalytic activity [6]. The

metals are poor in catalytic activity when used in huge quantities but exhibit excellent catalytic activity [7]. While using in nanometer level due to their relatively high surface area to volume ratio property [8]. The significance of nanotechnology is to produce nanoparticles without affecting the environment and to reduce the cost to an acceptable level [9]. Some of the microbes have the ability to grow in high drought, acid as well as saline conditions or rapid change in the environment which can cause beneficial effects for both nature and mankind. Among these categories, most of the microbes come under *Rhizobium* sp. The *Rhizobium* sp has mutualization between plant and soil,which will cause infection to the root of the plant which helps in nitrogen fixation. This process helps the crops to fix soil and fertile soil [10]. In this present investigation, the potential activity on antioxidant and antifungal of AgNPs using *Rhizobium sp* were demonstrated.

Materialsand Method

The chemicals used, $AgNO_3$, nutrient agar, mueller-hinton agar, ascorbic acid (1%) and were purchased from Hi-media Laboratories Pvt. Ltd, Mumbai, India. DPPH from Sigma-Aldrich and the fungal cultures *Aspergillus niger*, *Aspergillus flavus*, *Aspergillus fumigates* were collected from Vellore Institute of Technology, School of Bio Sciences and Technology (SBST), Vellore, Tamil Nadu, India.

2.1 Isolation of the bacteria

The cultivable soil sample was collected in peanut field in the month of November from Karnampet Village, Vellore District, Tamil Nadu, India. 1 g of soil sample was serially diluted and spread on nutrient agar plates aseptically. The plates were incubated at 37°C for 48 h. [11, 12].

2.2 Biosynthesis of silver nanoparticles

The isolates were identified in terms of gram straining and biochemical characterization according to Bergey's Manual of Determinative Bacteriology (Holt *et al*., 1994) in which most of the isolates were gram negative. The selected culture was subcultured once in 15 days for further use. The selected strain was inoculated in freshly prepared nutrient broth and incubated for 24 h. 1 mM $AgNO_3$ was added to the bacterial culture after 24 h followed by the characterization of the biosynthesized AgNPs [13].

2.3 Characterization of nanoparticles

The reduction of silver ions to silver nanoparticles produced by cell-free supernatant of the bacterial isolate was spectrometrically identified using UV-Vis spectrophotometer at wavelength between 360 on electron microscopy (TEM) analysis the topological studies of the synthesized AgNPs. The nano-size range from 10-100 nm thickness of sample can be captured using Transmissis was studied using Scanning electron microscopy (SEM), Energy Dispersive X-ray spectroscopy (EDX) which is used to find out the elemental analysis of AgNPs [14.]

The atomic arrangement and the physical properties of AgNps were characterized by Atomic Force Microscopy (AFM). Finally, antioxidant activity and antifungal activity was performed to examine the potency of the AgNPs synthesized from *Rhizobium sp.* The antifungal activity of silver nanoparticles against *Candida albicans, Aspergillus flavus and Aspergillus fumigates* was done.

2.4 Antioxidant activity

The antioxidant is the substance which reduces the damage of oxidative stress by balancing the production and neutralization of reactive oxidative species (Paulkumar *et al*., 2013). The free radical scavenging activity of DPPH was evaluated for AgNPs synthesized from Rhizobium sp. 50 µl of the silver nanoparticles dissolved in methanol, which yield to 100 µg/ml in each reaction mixture, this was mixed with 1 ml of 0.1 mM DPPH in methanol solution and 450 µl of 50 mM Tris-HCl buffer (pH 7.4) and ascorbic acid was used as control. Incubation was done at room temperature for 30 min; the reduction in the number of DPPH free radicals was measured, by reading the absorbance at 517 nm. The percent inhibition was calculated from the following equation;

% Inhibition = (Absorbance of control – Absorbance of test sample/Absorbance of control) 100

2.5 Antifungal activity

Antifungal agents are the compound or chemical group which has the property to destroy or to inhibit the growth of fungal pathogens. In this activity some of the pathogenic fungal strains are selected as the test organisms such as *Aspergillus niger*, *Candida albicans*, and *Aspergillus fumigatus* and the control is used as

the common existing drug fluconazole. Potato dextrose agar was prepared and poured on to the sterile Petri plates. After that 0.1 ml of the above-mentioned fungal spores were aseptically spread using the sterile cotton swabs. Spherical shape wells of about 5 mm were made and added with 25 µl, 50 µl and 75 µl of synthesized silver nanoparticles. The plates were incubated at room temperature for 24-48 hrs. After incubation period, the zones of inhibition were measured. The statistical analysis of standard error was calculated using triplicates of experiments (n=3) [15].

Result and Discussion

Generally, microorganisms play a vital role in the bioremediation for the removal of heavy metals, but now a days nanobiotechnology were used in the field of biomedical such as nanocarriers in drug delivery systems and reducing agents for the development of new drugs [16]. Based on the previous studies, the synthesized silver nanoparticles using *Rhizobium* sp was analyzed by UV-vis spectroscopic which demonstrate the synthesized pattern by absorbance spectrum and was confirmed by SEM, EDX, TEM and AFM which gives the clear size, the shape of the synthesized AgNPs and also other elements like secondary metabolites synthesized by microbes. The characterization results reveal the confirmation of the AgNps further it was used for the activity studies which include DPPH assay to evaluate the antioxidant activity and antifungal activity against disease-causing fungal strains

3.1 UV spectrophotometry

The light absorption pattern of the cell-free filtrate was monitored in the range of 360-560 nm using UV-vis spectroscopy and was done for 24 h [16]. Initially, for the 2 h and 6 h, there was no rise in the spectrum but at 12 h, the absorbance peak raises at 410 nm. The maximum absorption is directly proportional to the total amount of the surface Plasmon resonance. This maximum surface area shows the higher absorption at a particular wave length for the compound A clear high absorption spectrum was observed at 420 nm which was taken at 24 h Z. [17] that confirms the AgNPs and gradually decreases in the spectrum.

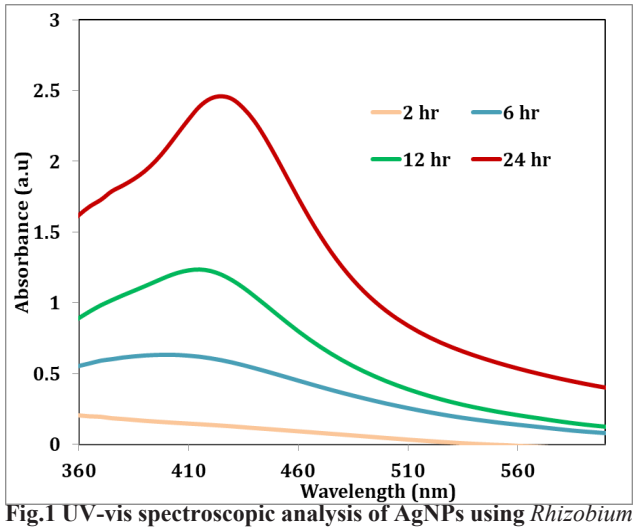

Fig.1 UV-vis spectroscopic analysis of AgNPs using *Rhizobium* sp

3.2 Scanning Electron Microscopy Analysis

The SEM image clearly indicates the particles are predominantly spherical in shape and aggregates into larger particles with no well-defined morphology. The biomolecules present in the surface of nanoparticles leads to agglomeration structure. Analysis through energy dispersive X-ray (EDX) spectrometers confirmed the presence of an elemental silver signal of the silver nanoparticles [18]. The vertical axis displays the number of x-ray counts whilst the horizontal axis displays energy in keV. The EDX spectrum (Figure 2) observed a strong signal from the silver atoms in the nanoparticles at 3 keV and a weak signal from slightly above the basal line are from microbial extracts. This analysis revealed that the nanostructures formed were solely of silver.

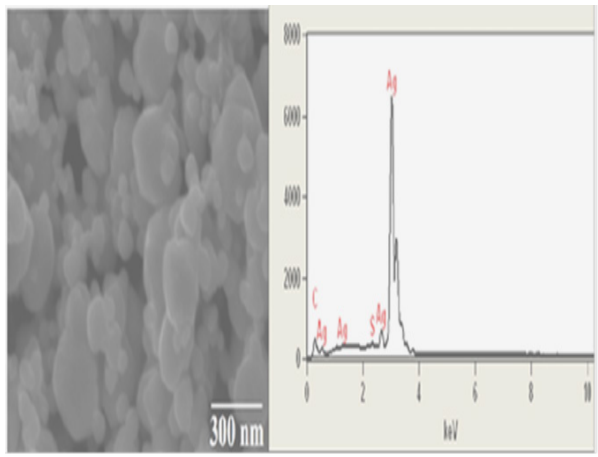

Fig. 2: SEM and EDX spectrum images of AgNPs synthesized using *Rhizobium* sp

3.3 Transmission electron microscopy Analysis

The Transmission electron microscopic (TEM)

image shows the synthesized AgNPs with variable size and shape but most of them are spherical in nature and few are irregular in shape (figure 3). The size of the particle ranged from 5 to 25 nm**.** Majority of the AgNPs were scattered with circular in shape and few of them showing aggregates with various shapes, this is responsible for the synthesis of silver nanoparticle [19].

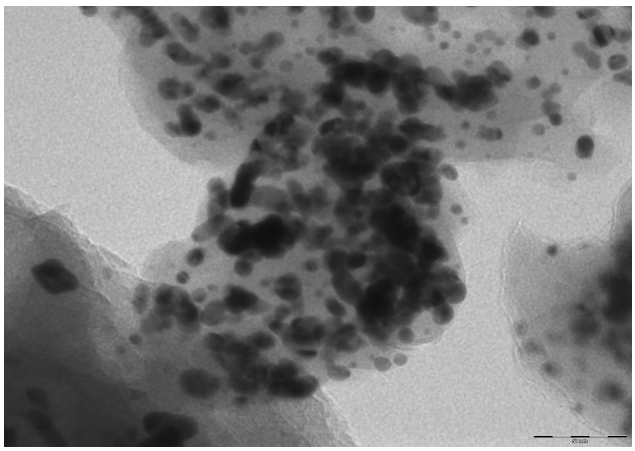

Fig.3: TEM images of AgNPs synthesized using *Rhizobium* sp

3.4 Atomic Force Microscopy Analysis

The morphology and the surface roughness of synthesized AgNPs was monitored using atomic force microscopy (Figure 4). The enhancement of the synthesized AgNPs is proportional to the tangled particle size [20]. The AgNPs are interacting together and form aggregates which are shown in the micrograph and the 3D images as white patches, these aggregates were increased the size of the nanoparticles and shows the surface roughness which might be the presence of secondary metabolites produced by *Rhizobium* sp.

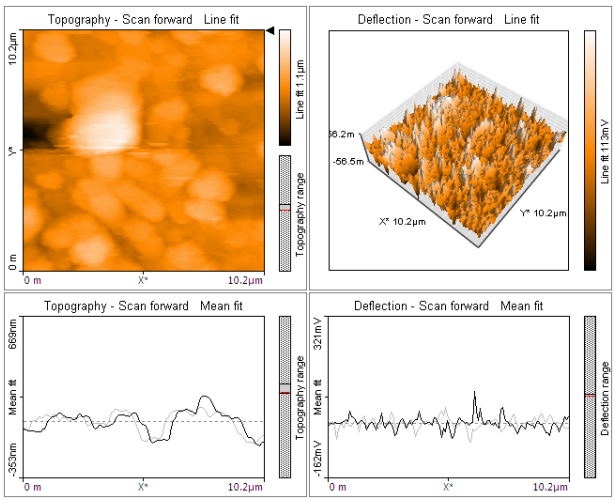

Fig.4: AFM images of AgNPs synthesized using *Rhizobium* sp

3.5 Antifungal activity

Nowadays fungal strain are more resistance against many drugs and which results in high existence of pathogenic organisms [21]. To overcome this predicaments, researchers have came with the biologically synthesized nanoparticles as therapeutic agents. So in this investigation the AgNPs synthesized using *Rhizobium* sp shows a higher zone of inhibition 15 mm for *Candida albicans* as test strain when a higher concentration of AgNPs is added at a concentration of 75µL. And for the strain, *Aspergillus flavus* shows the least zone of inhibition around 6.50±0.29 for 25 µL concentration.

Table:1 Antifungal activity of *Aspergillus niger, Candida albicans*, and *Aspergillus fumigates*

Fungal Strain	Zone of inhibition (mm in diameter)		
	25 µL	**50 µL**	**75 µL**
Candida albicans	011.00±0.00	13.00±0.00	15.00±0.00
Aspergillus flavus	6.50±0.29	8.17±0.17	11.00±0.58
Aspergillus fumigatus	10.67±0.33	11.80±0.20	12.00±0.00

The test strain *Aspergillus fumigates* shows the gradual increase in the zone of inhibition but not at the extreme; generally it describes that the particular concentration range the zone of inhibition occur not like other strains which will increase the ZOI when the concentration of nanoparticles increases (Table 1). From the above study, it was confirmed that the synthesized silver nanoparticles from *Rhizobium* sp have a potent antifungal activity against disease-causing fungal pathogens.

3.6 Antioxidant activity

The free radical scavenging activity of the synthesized AgNPs using *Rhizobium* sp was studied by its ability to reduce the DPPH, which is stable free radical (Figure 5). Any molecule which donates an electron or hydrogen to DPPH, it reacts and which results in a change of color [22]. As the concentration increases, there is a gradual fall in the absorbance and no dramatic change when compared to the standard curve of AgNPs . Hence, this result confirms the effect of the antioxidant activity of synthesized AgNPs using *Rhizobium* sp.

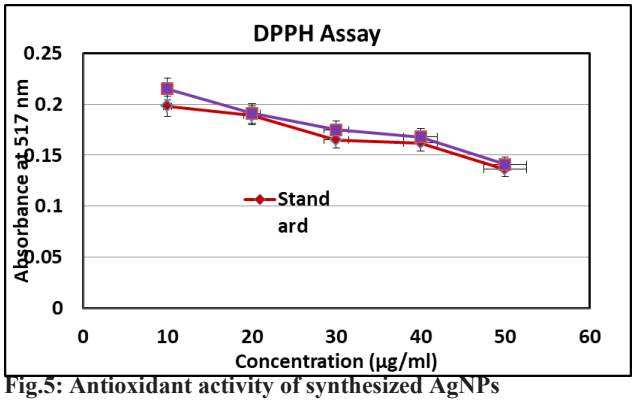

Fig.5: Antioxidant activity of synthesized AgNPs

Conclusion

In this study, the silver nanoparticle synthesized using *Rhizobium sp* were characterized and the potency of synthesized silver nanoparticle was found to possess effective antifungal activities against fungal pathogens. The silver nanoparticles showing good antioxidant results may use as a biomedicine and related to modern medicine preparations. In future, the synthesized nanoparticles can also be used for bio fertilizers for the enhancement of disease free crops production.

Abstract

Background: Among the metal nanoparticles Zinc oxide nanoparticles have more applications in many areas, including biomedical, materials science, and environmental technology. Soybean is one of the important commercial crops due to the presence of protein, oil, carbohydrates, minerals, saponins and isoflavonoids such as genistein and daidzein.

Materials and Merhod: In this present study we synthesis the Zinc oxide nanoparticles by using *glycine max seed* extract. We examine the size and morphology of synthesized Zinc oxide nanoparticles by using UV-visSpectrophotometer, X-ray Diffraction (XRD).

Results: Herein, the Zinc oxide nanoparticles were synthesized by using seed extracts of *glycine max* with in 6h and the size of the Zinc oxide nanoparticles ranges from 70-90 and predominantly spherical shapes with crystalline nature. Elemental analysis of Zinc oxide nanoparticles was characterized by EDX.

Conclusion: The synthesized Zinc oxide nanoparticles from *glycine max* exhibit excellent antimicrobial activity against different clinically isolated fungi such as *Aspergillus flavis*, *Aspergillusniger*, *Candida albicans*, and *Fusarium* sp.

Keywords: *Zinc oxide nanoparticles; Green synthesis; antifungal; Microscopy*

Introduction

The zinc oxide is an inorganic compound with the molecular formula Zno and nearly insolouble in water and appears as a white powder. The zinc oxide nanoparticles were synthesized using zinc acetate, zinc nitrate and zinc sulphate [1,2]. It is widely used as an additive in numerous materials and product include glass, cement, rubber, lubricants, paints, fire retardants and food additives etc. Zinc oxide play on important role in controlling of microbial growth and apoptosis [3, 4]. The excess zinc may cause cell death due to apoptosis or necrosis, zinc also reduces oxidative stress in cells. In the ever expanding field of nanomaterial research, metal nanoparticle receivedparticular attention due to their wide application in catalysis, electronics, sensing, photonics, environmental cleanup, imaging, and drug delivery [5, 6]. ZnO probably has the richest family of nanostructures among all materials, both in structures and in properties. The nanostructures could have novel applications in optoelectronics, sensors, transducers and biomedical sciences [7, 8].

Glycine max, commonly known as soybean in North America or soya bean, is a species of legume native to East Asia, widely grown for its edible bean which has

numerous uses. The plant, classed as an oilseed rather than a pulse by the UN Food and Agriculture Organization, produces significantly more protein per acre than most other uses of land. Fat-free (defatted) soybean meal is a significant and cheap source of protein for animal feeds and many packaged meals. For example, soybean products, such as textured vegetable protein (TVP), are ingredients in many meat and dairy substitutes. The beans contain significant amounts of phytic acid, dietary minerals and B vitamins. Soy vegetable oil, used in food and industrial applications, is another product of processing the soybean crop. Traditional non-fermented food uses of soybeans include soy milk from which tofu and tofu skin are made. Fermented soy foods include soy sauce, fermented bean paste, natto and tempeh [9], The glycine max used in many commercial applications in various forms such as soybean oil (seed contains 18-19% oil), soybean meal, livestock fees, (rich in omega-3 fatty acids), widely used for food for Human consumption, soy based infant's formula contains rich nutrition for human development, growth and reproduction and it is avery good alternate for meat in the form of butter, *Coffee substitute* [10], used for the manufacturing of brand of votka [11, 12]. In this present study we prepared the *Glycine max* extract and screened for phytochemical constituents. The synthesis the Zinc oxide nanoparticles by using *Glycine max* seed extract and its examined for the characterization using UV-vis spectrophotometer, X-ray Diffraction (XRD), Scanning Electron Microscope (SEM), Energy Dispersive X-ray analysis and Fourier Transform Infra-Red Spectrophotometer (FT-IR). Finally the nanoparticles were tested for antifungal activity against fungal strains *Aspergillus fumigatus*, *Aspergillus niger*, *Candida albicans*, and *Fusarium* sp.

Materials and Method

Plant mediated synthesis of Zinc oxide nanoparticles

Collection of plant materials

Glycine max seeds were collected from Villupuram surrounding Area.

Preparation of seed extract

Aqueous extract were prepared from freshly collected glycine max seeds. 10 g of fresh glycine max seedss were surface sterilized using Tween 20 and double distilled water. Then the seeds were grind and dispersed in 100 ml distilled water and boiled for 15 min at 60 °C. After that, the solution was filtered through Whatmann No1 filter paper and stored at 4°C in refrigerator for further studies.

Phytochemical Analysis of Secondary Metabolites

Phytochemical analysis tests were done to find the presence of the active chemical constituents such as alkaloid, glycosides, terpenoids and steroids, flavonoids, reducing sugars, triterpenes, phenolic compounds and tannins by the following procedure.

Synthesis of ZnO NPs

The synthesis of ZnO NPs using soybean was performed according to the method of Nouroozi and Farzaneh. In brief, freshly extracted 50 ml soybean seed extract of (5 mg ml−1) were prepared in mixed milli-Q (MQ) water and mixed drop-wise into 50 ml of aqueous zinc acetate [Zn(CH3COOH)2C2H2O] solution. In order to maintain the pH 12, 2.0 mol□dm−3 sodium hydroxide was used which resulted in a pale white aqueous solution. This was then placed in a magnetic stirrer for 2 hrs. The pale white precipitate was then taken out and washed over and over again with distilled water followed by ethanol to get free of the impurities. Then a pale white powder of zinc oxide nanoparticles was obtained after drying at 60˚C in oven over night to give yield of 96.7%. Graphical representation of the procedure.

Characterization studies

The reduction of Zinc oxide ions was monitored by using double beam UV-vis spectrophotometer (Perkin Elmer, Singapore) of the reaction medium in the wavelength range of 300-700 nm with 1000 mm quartz cell. The resolution of the UV-vis spectrophotometer was 1 nm. The UV-vis spectra of resulting solution were recorded. The graph of wavelength on X-axis and absorbance on Y-axis was plotted. The obtained Zinc oxide nanoparticle was purified by repeated centrifugation at 15,000 rpm for 15 min. Then the colloidal form of pellet was collected and dried at 100°C. After heat drying of the purified Zinc oxide nanoparticle structures and compositions were analyzed by XRD (Philips PW 1830). The morphology and size of the Zinc oxide nanoparticles was found by Scanning Electron Microscope (Philip model CM 200). Elemental analysis of Zinc oxide was carried out by EDAX (Philips XL-30).

Antimicrobial activity of biosynthesized Zinc oxide nanoparticles

Antifungal Assay of Zinc oxide Nanoparticles

Clinical Fungal Pathogens.

The three fungal pathogenicstrains used in the present study were isolated from clinicalsamples and identified from Microlabs, Vellore District,India, which were *Aspergillus fumigatus, Aspergillus niger*, *Candida albicans*,and *Fusarium* sp.

Assay of Antifungal Activity.

The antifungal activity ofgreen synthesized Zinc oxidenanoparticles against various fungal strains was assayed by Agar well diffusion method. The fungicidal effect of the Zinc oxide nanoparticles could be assessed by the formation of zone around the well. 90ml of sterilized Sabouraud Dextrose Agar medium was poured into three sterilized Petri dishes. The fungal strains were grown in RoseBengal agar and their spores weremixed into the 10mL sterile distilled water and swapped on the agar.Three wells of 5mm diameter were prepared and loaded with Zinc oxide nanoparticles at different concentrations (30,60,90,150 □L). The plates loaded with the fungal and Zinc oxide nanoparticles were incubated at 37°C. The antifungal activities against the fungal strains were confirmed by forming the zone around the wells and measured after 24 hrs of incubation. The zone of inhibition was expressed in mm diameter. The experiments were repeated three times to find the standard deviation and standard error

Visual Analysis

Zinc oxide nanoparticles formation was primarily identified by color change visually. Medically important plants have high phytochemicals which is involved in the reduction of Zinc oxide ions to Zinc oxide nanoparticles. When the seed extracts are exposed to Zinc acetate solution the biosynthesis of nanoparticles started within few minutes is identified by colour change. Reduction silver ion to Zinc oxide r nanoparticles was visually identified by color change from yellow to brown in the aqueous solution of reaction mixture at 1 hr incubation time (Figure 1).Intensity of brown colour increases while increasing the incubation time. It may be due to the excitation of surface plasmon resonance effect of Zinc oxide nanoparticles. Previously, increasing colour intensity with in 30 min was observed using leaf extract of *Acalypha indica* [13]. The colour intensity is directly proportional to incubation time. After 24 h, dark brown color and precipitation forms indicate completion of reaction.

UV–visible spectroscopy analysis

UV–visible spectroscopy is one of the most widely used techniques for structural characterization of nanoparticles. The biosynthesized SNPs were measuredby UV–visible spectroscopy at different time intervals to study the change in light absorption and increase in intensity (Figure 1 right). The absorption spectrum was recorded for the sample in the range of 280 - 420 nm. The spectrum showed the absorbance peak at 340 nm corresponding to the characteristic band of zinc oxide nanoparticles.This indicates the presence of Zinc oxide NPs, which is due to the excitation of surface plasmons. After 36 h, no further increase in intensity was recorded, indicating the complete reduction in Zinc oxide ions

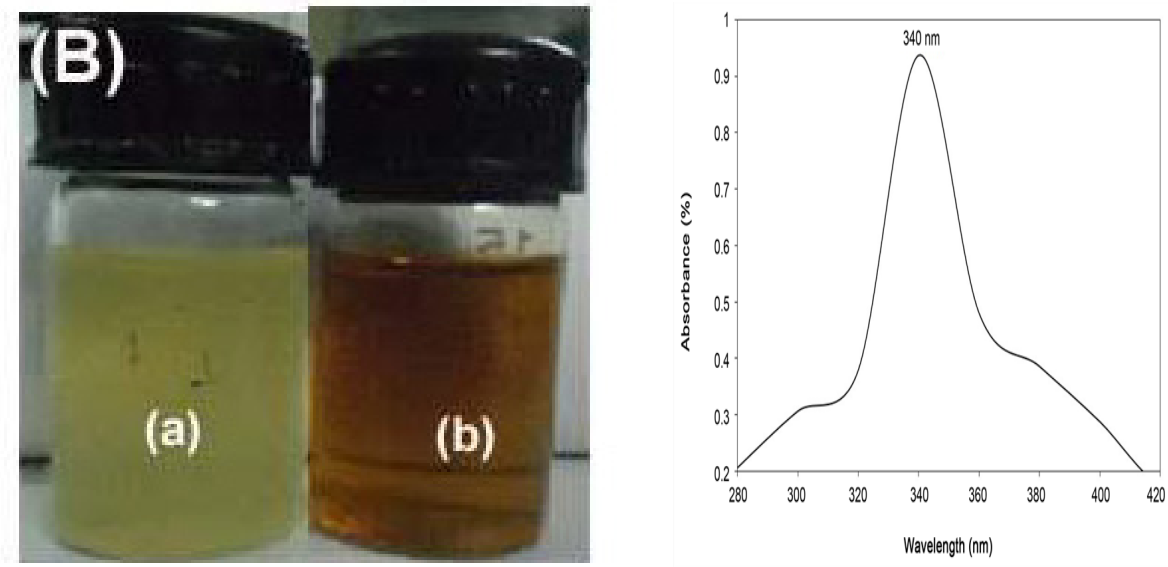

Figure 1: Visual observation and UV-vis spectra of synthesis of zinc oxide nanoparticles by seed extract of glycine max .

X-ray Diffraction Analysis

Crystalline size and structure of the Zinc oxide nanoparticles were determined by XRD in the whole spectrum of 2θvalues ranging from 20-80. The green synthesis of Zinc oxide nanostructure by employing seed extract of *glcine max* was further demonstrated and confirmed by thecharacteristic peaks observed in the XRD image (Figure 2) the peak found at 2 theta scale of 29.01 indicates the zinc oxide nanoparticles, while other diffraction peak shows much weak. A comparison of ourXRD spectrum with the standard confirmed that the zinc particles formed in ourexperiments were in the form of nanocrystals. A few unassigned peaks were also observed that suggest the crystallization of bio-organic phase occurson the surface of the zinc nanoparticles. Similar results was obtainedby using plant systems [14]

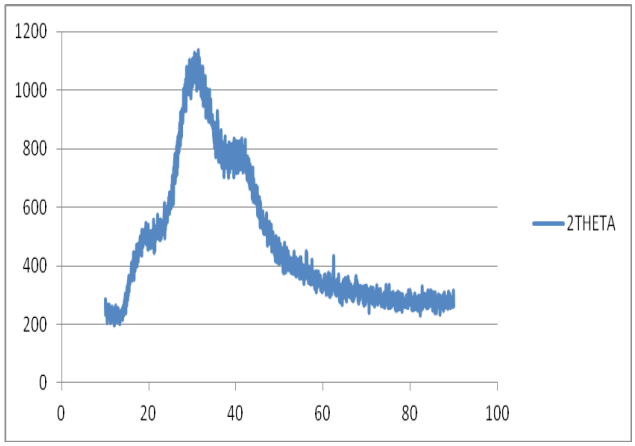

Figure 2: XRD spectrum of synthesized Zincoxide nanoparticles

Scanning Electron Microscope

The surface morphology and size of the zinc oxide nanoparticles was identified byScanning Electron Microscope. SEM image had shown shape and size of the Zinc oxide nanoparticles synthesized by using seed extract of *Glycine max* (Figure 3). Figure 8 shows individual Zinc oxide nanoparticles as well as number of aggregates synthesized using seed extract of *Glycine max*The spherical and rod shaped nanoparticles are present with so many agglomerations was formed due to reducing agent we used. 70 – 90 nm sized nanoparticles are synthesized using seed extracts. The reducing we used is seed extract have more number of protein molecules may responsible for the agglomeration of nanoparticles in the SEM image**.**

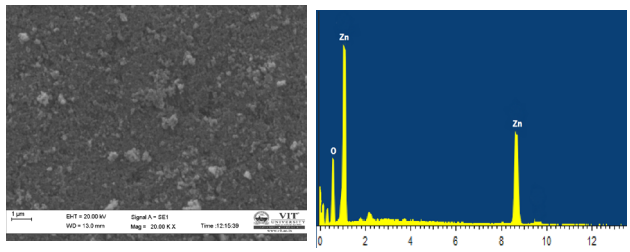

Figure 3: SEM and EDX image of synthesized Zinc oxide nanoparticles

Similar result was reported by using *orange peel* extract (Rajeshkumar *et al*., 2018)and by using *plant* leaves (Santhoshkumar *et al*., 2017).The surface of theaggregates is rough. Similarly aggregation of nanoparticles was earlier reported by Santhoshkumar *et al*., (2017) by using the plant extract.

Energy Dispersive X-ray analysis

Analysis through Energy dispersive X-ray (EDX) spectrometers confirms thepresence of elemental zinc and oxygen in the solution (Figure 3 right). The *Energy-dispersive X*-rayspectroscopy shows the elements of zinc and oxygen indicates the presence of zinc oxide nanoparticles in the prepares nanoparticles powder from seed extracts.

Antifungal activity

The antifungal activity of green synthesized Zinc oxide nanoparticles against pathogenic fungus are *A.niger, A. flavu, Candida albicans,* and *Fusarium spp* was investigated by well diffusion method. Synthesized Zinc oxide nanoparticles showed high inhibition zone against all the pathogenic fungus at different concentration of Zinc oxidenanoparticles (Figure 4 and Table 2). As increasing the concentration of Zinc oxide nanoparticles the zone of inhibition against fungi also increased. Maximum zone of inhibition was found to be *Fusarium sp* (18.43±0.54 mm), *Candida albicans* (22.70±0.51 mm), *Aspergillus niger* (14.03±0.20 mm), *Aspergillus flavus* (19.57±0.23 mm) and minimum inhibition zone was found to be *Aspergillus niger* (13.37±0.20mm) at the 90 µl concentration of Zinc oxide nanoparticles solution. The minimum inhibition concentration is 90µL/ ml. *Aspergillus sp* have more pathogenic and virulence, it produces mycotoxins and aflatoxin. Toxin segregation was controlled and decreased while treating with Zinc oxide nanoparticles. Similarly, Govindaraju et al reported the inhibitory action of Zinc oxide nanoparticles against *A. niger* and *A. flavus* are 14.8 mm and 15.2 mm, respectively at 100 µl concentration. Prasad et al studied the antimicrobial

activity of Zinc oxide nanoparticles against *C. albicans* was found to be 10 mm of inhibition. In this study, synthesized Zinc oxide nanoparticles from algae are toxic to multi drug resistant microorganisms. It shows that they have great potential in biomedical applications.

Conclusion

The obtained zinc oxide nanoparticles were measured for its maximum absorbance using UV-Vis spectrophotometry. The optical property of zinc oxide nanoparticles was determined via ultraviolet and visible absorption spectroscopy in the range of 280 - 420 nm. Structure of zinc oxide nanoparticles was analyzed by using X-Ray Diffraction (XRD) analysis. Particle size of synthesized nanoparticles was obtained by Dynamic light scattering analysis (DLS) and stability of the nanoparticles was checked by zeta potential measurement. External morphology i.e. shape of the nanoparticles were characterized by Scanning Electron Microscope (SEM). Elemental analysis was obtained from energy dispersive X-ray diffraction (EDX), which was attached with SEM. This manuscript focuses on the formation of biocompatible zinc oxide nanoparticles by plants material. Green methods of synthesis of ZnoNPs shows more compatible, eco-friendly, low cost and less time consumes process.

Evaluation of Methylcellulose Gel as A Vehicle for Metronidazole Compared to Commercially Available Topical Metronidazole Gel - An In Vitro Study

Darshanaa Arunachalam[1], Sheeja S Varghese[2]

[1]Postgraduate Student, [2]Professor and Head, Department of Periodontology, Saveetha Dental College and Hospitals, Chennai

Abstract

Background: The pathogenesis of the periodontal disease is primarily due to the gram-negative bacteria found in the plaque. Adjunctive to the routine mechanical debridement, use of systemic and local antimicrobials for reduction and eradication of specific periodontal pathogens have also been used for quite some time. Various locally delivered therapeutic drugs have been used. The success of the locally delivered therapeutic drugs are determined by the usage of vehicles.

Aim: The purpose of this study was to evaluate the efficacy of carboxy methyl cellulose gel as a vehicle for metronidazole when compared to commercially available Metrogyl® DG gel in an in vitro condition.

Methods: 20 patients with chronic periodontitis were selected and subgingival plaque samples were collected using curettes and then subjected to anaerobic culture. The samples were inoculated on Brucella Blood Agar (BBA) plates by streaking the plate with the swab sticks within 12 hours from sample collection. A well with a diameter of 8 mm is punched and 100 µm of the 1.5% metronidazole with the 2 different vehicles ((methyl cellulose gel, Metrogyl® DG gel) were introduced into the wells. These plates were kept in an an anaerobic jar along with an aero gas pack and incubated at 37°C for 48 hours to 72 hours. The antimicrobial activity was quantitatively assessed by the presence or absence of inhibition zone and zone diameter.

Result: It was found that anaerobic bacteria found in subgingival plaque, showed sensitivity to the drug released from both the vehicles. The inhibition zone diameter present around methylcellolose gel + metronidazole was 23.85±1.73 mm and that around Metrogyl® was 14.4±1.76 mm.

Conclusion: Methylcellulose gel is a more effective vehicle than commercially available vehicles in releasing metronidazole for use in subgingival delivery in the management of chronic periodontitis.

Key Words: *Methylcellulose, Metronidazole, Periodontitis, Anaerobes*

Introduction

Periodontitis is an inflammatory disease of the soft and hard tissues surrounding the teeth leading to its destruction. The pathogenesis of the disease is due to the predominantly gram-negative bacteria found in the plaque, which often leads to host mediated inflammatory response with release of inflammatory mediators causing destruction of periodontal tissues. Adjunctive to the routine mechanical debridement, use of systemic and local antimicrobials for reduction and eradication of specific periodontal pathogens have also been used for quite some time.[1–4] Various locally delivered therapeutic drugs have been used. The success of the locally delivered therapeutic drugs are determined by the usage of vehicles. Metronidazole, an antibiotic of nitroimidazole family are widely used as local drug

Corresponding Author:

delivery against anaerobic periodontal pathogens.[5]

Efficiency of these drugs depends on a great extent on the vehicle used in local drug delivery.[6] Extensive research has been carried out to identify the most efficient vehicle for drug release.[7–9]Yet, the need for adequate accumulation of drugs at a target site has not always been met.

Carboxymethyl cellulose (CMC) or cellulose gum is a cellulose derivative with carboxymethyl groups bound to some of the hydroxyl groups of the glycopyranose monomers that make up the cellulose.[10]CMC was proven to be nontoxic as well as biodegradable and can be used for drug delivery.

Methylcellulose gel has been used extensively as a drug vehicle in pharmaceutical and topical applications and is generally recognized as safe by the Food and Drug Administration.[11] However, it has not been well characterized as a vehicle for drug delivery into closed tissue compartments.[6]

Hence, the present study was aimed to evaluate the efficacy of carboxy methyl cellulose gel as a vehicle for metronidazole when compared to commercially available Metrogyl® DG gel in an in vitro condition.

Materials and Method

20 patients with chronic periodontitis were selected. After removal of supragingival plaque, subgingival plaque sample was collected from the selected patients. Plaque was collected using curettes and then transported to the microbiological lab in swab sticks following precautions of asepsis.

For anaerobic culture, the samples were inoculated on Brucella Blood Agar (BBA) plates by streaking the plate with the swab sticks within 12 hours from sample collection. A well with a diameter of 8 mm is punched aseptically with a sterile cork borer or a tip into the agar medium.

For the formulation of the test vehicle (methyl cellulose gel), 500 mg methyl cellulose powder and 300mg ground metronidazole (Flagyl®) were weighed in a microweighing machine. 20 ml of distilled water was taken in a beaker. It was heated to a temperature of 60°C in a waterbath. The metronidazole (MTZ) was added to the water. It was continuously stirred in a magnetic stirrer as the methylcellulose gel was added slowly in increments. The temperature was left to gradually cool down. Stirring was done till the desirable consistency is attained. 1.5% MTZ gel is thus prepared.

The control vehicle used was a commercially available metronidazole gel, Metrogyl® DG gel. It is used as an oral topical gel. It contains 1.5% w/v metronidazole, 0.5% chlorhexidine gluconate as a preservative in a water soluble gel base.

A volume of 100 μm of the 1.5% MTZ with the 2 different vehicles were introduced into the wells. These plates were kept in an an anaerobic jar along with an aero gas pack and incubated at 37°C for 48 hours to 72 hours. Antimicrobial activity was evaluated by measuring and recording the diameter of inhibition zone and compared against the control well.

The antimicrobial activity of the extracts and their potency was quantitatively assessed by the presence or absence of inhibition zone and zone diameter.

Results

Greenish black colonies were found throughout the streaks in the blood agar.

It was found that anaerobic bacteria found in subgingival plaque, showed sensitivity to the drug released from both the vehicles. The inhibition zone diameter present around methylcellolose gel + metronidazole was 23.85±1.73 mm and that around Metrogyl® was 14.4±1.76 mm.(Table 1)

However, a few resistant strains were found near the outer margin of the inhibition zone around the methylcellolose gel + metronidazole well.

Discussion

The significance of vehicles in drug delivery has been well established over the years. Thus the present study was aimed to study the drug release in 2 different vehicles for the release of metronidazole.

In-situ gel formulations is a very recent novel trend that delivers drugs in a liquid form.[12] They also achieve sustained release of the drug. Although different polymer-based delivery systems have been invented, they haven't been able to form gels after delivery to the subgingival site. In-situ gels, are the water soluble polymers that is found to have this property. This has been of great interest in recent times. They are easily applied in a liquid form, after absorption it forms gel like consistency at the target site. In this way, they help to prolong the release of the drug. Hence this study employed methylcellulose gel, an in-situ gel as a vehicle and compared it against a water soluble vehicle found in a commercially available oral topical metronidazole gel.

Metronidazole is a very common broad spectrum antibiotic. It is effective against a range of periodontal pathogens. Since periodontal pathogens are predominantly anaerobic, metronidazole is commonly used in the treatment of chronic periodontitis.[3] Hence, the present study employed the use of metronidazole as its drug of choice.

20 patients with chronic periodontitis with the presence of subgingival plaque and calculus were employed. Thus, a comprehensive collection of subgingival pathogens have been obtained. This has lead to good amount of colony formations.

Brucella Blood Agar is an enriched non-selective agar medium. It is intended for the isolation, quantification and partial identification of obligate anaerobic bacteria from clinical specimens. This explains the use of the mentioned agar plate for use as a culture medium for the present study.

In the present study, well method has been used. This is because of the high flowability and high diffusion rate of the methylcellulose gel.

The inhibition zone diameter present around methylcellolose gel + metronidazole was 23.85±1.73 mm and that around Metrogyl® was 14.4±1.76 mm. This may be due to methylcellulose (MC) having been proven to be able to show good water solubility in water at low temperatures. MC molecules are bonded to the water molecules through hydrogen bonding. These bonds surround the methyl groups.[13] Thus, a cage-like water structure is formed. This is why there is less intermolecular hydrogen bonding between MC molecules. This, in turn, causes higher gelation temperature at low concentration.[14] Thus, the more efficient drug release at the methylcellolose gel + metronidazole well compared to the commercial gel is justified.

Some resistant strains were found in the inhibition zone around the methylcellulose gel + metronidazole well. This is in accordance with the findings by Serrano et al[15] who has shown that all the periodontal strains were resistant to metronidazole due to indiscriminate use of the antibiotic.

The strength of this study lies in the fact that it employs two in-situ delivery systems, which has spawned greater attention among scientists in the last 30 years. Thus comparing its efficacy in an in vitro condition, provides aa useful tool to understand the drug releasing capacity of different water soluble gels.

But, this study does not test the sustainability of the drug release. Hence, we do not know if methylcellulose is better than the commercial vehicle in terms of its drug releasing property over a prolonged duration of time.

Further studies are required to study the rate of dispersion of drugs over a long period of time.

Conclusion

Methylcellulose gel is a more effective vehicle than commercially available vehicles in releasing metronidazole for use in subgingival delivery in the management of chronic periodontitis.

Titreated Case of Oral Lichen Planus: 18 Months Follow Up Report

Darshanaa Arunachalam[1], Sheeja S Varghese[2]

[1]Postgraduate Student, Department of Periodontology,[2]Professor and Head, Department of Periodontology, Saveetha Dental College and Hospitals, Saveetha Institute of Medical and Technical Sciences, Chennai.

Abstract

Oral Lichen planus (OLP) is a common chronic immunological inflammatory mucocutaneous disorder. The different etiological factors considered for OLP are genetic background, dental materials, drugs, infectious agent, autoimmunity, immunodeficiency, food allergy, stress, habits, trauma, diabetes, hypertension, malignant neoplasm. The treatment goal is 2-fold, that is, alleviation of symptoms and monitoring of dysplastic changes. This case report attempts to report a case of oral lichen planus, successfully treated with 18 months follow up.

Key Words: *Lichen Planus, Autoimmunity, Immunodeficiency, Desmoglein*

Introduction

Oral Lichen planus (OLP) is a common chronic immunological inflammatory mucocutaneous disorder that varies in appearance from keratotic to erythematous and ulcerative.[1] It is a common disorder that affects stratified squamous epithelium exclusively. It is seen worldwide, mostly in the fifth to sixth decades of life and is twice as common in women than in men. The oral manifestations include the red and white components of lesion which can be part of following textures – Reticular, Papular, Plaque-like, Erythematous/Atrophic. The history of OLP dates back to 1869, when Erasmus Wilson[2] first delineated and named the disease. About 1-2% of world population suffer from OLP. 1.5% of Indians suffer from this disorder, age range of occurrence is 30–70 years, with female predilection (Male:Female-1:1.4).[3] The different etiological factors considered for OLP are genetic background, dental materials, drugs, infectious agent, autoimmunity, immunodeficiency, food allergy, stress, habits, trauma, diabetes, hypertension, malignant neoplasm, and bowel diseases.[4)] The pathogenesis is thought of from four mechanism: antigen specific cell mediated immune response (heat shock proteins, CD4+ T helper cells, CD8+ cytotoxic T cells), nonspecific mechanism (epithelial basement membrane, mast cells, chemokines, matrix metalloproteinases), autoimmune response, humoral immunity (circulating autoantibodies to desmoglein 1 and 3).[5]

Case Report

A 50 year old Indian female patient reported to the Department of Periodontics with a complaint of burning sensation of gums and inability to eat foods from the past 1 month. Burning sensation was gradual in onset, continuous in nature, aggravated on eating spicy foods and no relieving factors. Patient had no relevant medical and dental history. She was not associated with any extra-oral lesions. On intra oral examination, there was found to be gingival desquamation, characterized by diffuse reddish discolorations with isolated white patches in marginal gingiva, attached gingiva and interdental papilla with respect to 24, 25, 26, 34, 35, 36, 44, 45, 46. (Figure 1, 2, 3) An OPG was taken which showed no abnormality in hard tissues and an incisional biopsy at the site of 24, 25 gingival region was done and the specimen was sent for histopathological examination.

The histopathological section showed parakeratinized stratified squamous epithelium of

variable thickness with foci of basal cell degeneration with subjacent subepithelial band of lymphocytic infiltrate. The underlying connective tissue stroma showed moderate vascularity along with chronic inflammatory cell infiltrate and evidence of haemorrhage. (Figure 4) Correlating with clinical findings, it was suggestive of Lichen Planus.

The final diagnosis was Oral Lichen Planus of the gingiva with respect to 24, 25, 26, 34, 35, 36, 44, 45, 46

Management

Oral prophylaxis was done. Oral retinoid supplements for 15 days was prescribed; topical anesthetic was advised before food to relieve burning sensation. Topical antibiotic and corticosteroids (Kenalog) was prescribed. Regular follow up and review was done.

Outcome

A completely healed, pale pink, firm and resilient gingival tissue was found during 18 months follow up. (Figure 5) Patient reported complete relief from burning sensation.

Figures

Figure 2: Gingival desquamation in 34, 35, 36 region

Figure 3: Gingival desquamation in 44, 45, 46 region

Figure 4: Histopathological findings under 10x magnification

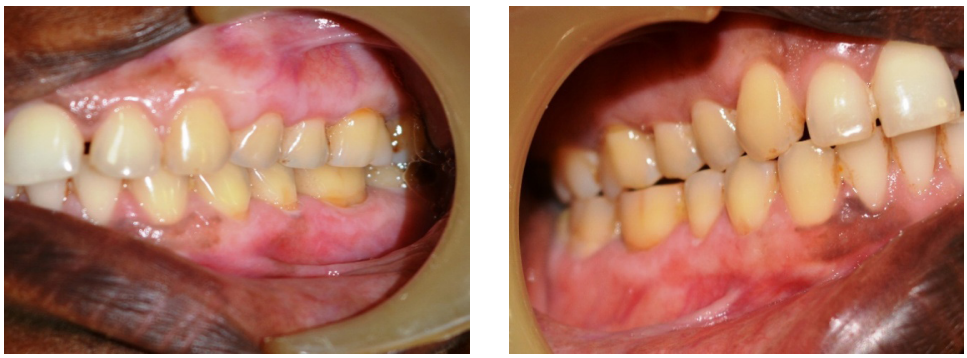

Figure 5: 18 months follow up 24, 25, 26, 34, 35, 36, 44, 45, 46 region

Discussion

To date no cure for OLP or dermal counterpart has been discovered. The treatment goal is 2-fold, that is, alleviation of symptoms and monitoring of dysplastic changes.[6] Corticosteroids have shown to be predictable and effective medications for controlling signs and symptoms.[7] Triamcinolone acetonide 0.1% in orabase showed better results than cyclosporine,[8] Pimecrolimus 1% cream,[9] Betamethasone oral minipulse therapy, Fluocinoloneacetonide 0.1% orabase,[10] in the treatment of OLP. In lesions recalcitrant to topical therapy, intralesional corticosteroids can be effective, often triamcinolone acetonide 5 mg/ml combined with local anesthetic.[11] Retinoids are useful and are frequently used in combination with topical steroids as adjuvant therapy.[12]Apart from these, other treatment modalities are Dapsone 100 mg once daily for 3 months, PUVA (Psoralen and ultraviolet A) therapy, Azathioprine 150 mg/day, Levamisole 150 mg/day for 3 consecutive days in 1 week, Thalidomide 200 mg/day or topical 1% paste, Griseofulvin. Griseofulvin have reported to be effective in treatment of OLP in various case reports in literature, unfortunately randomized control studies are lacking in this aspect.[12] The possible premalignant character of OLP is subject of controversy and ongoing debate in literature, but the range of malignant transformation is reported to be between 0.4% and 5% over period of observation from 0.5 to 20 years.

Conclusion

The term OLP is a heterogeneous group of patients afflicted with mucosal disease, identifying and eliminating multifactorial agents associated with the disease is essential. Relief can be achieved in most of patients with topical steroids alone or in combination with other immunomodulatory topical agents. Infrequently, patients require prolonged use of systemic medications. Patient should also be kept under long-term follow up due to malignant tendency of OLP. All treatments are nonspecific and directed at eliminating inflammation and therefore are partially successful.

Conflict of Interest: The authors declare that there is no conflict of interest

Comparison of Effectiveness of COE PAK and Barricaid with Respect to Wound Healing and Patient Satisfaction

Darshanaa Arunachalam[1], Sheeja S Varghese[2]

[1]Postgraduate Student, [2]Professor and Head, Department of Periodontology, Saveetha Dental Collegeand Hospitals,Saveetha Institute of Medical and Technical Sciences, Chennai.

Abstract

Background: Periodontal dressing is a physical barrier placed post operatively to cover and protect the surface of surgical wound created by periodontal therapy. Conventional periodontal dressings set chemically, requires manual kneading and are not very esthetic in terms of colour. Visible light cure periodontal surgical dressing, Barricaid®, is a single- component, light-activated periodontal dressing, tinted pink with a translucent character.

Aim: To assess the effectiveness of 2 different periodontal dressings (Coe-pak®, Barricaid®) after periodontal flap surgeries with respect to wound healing and patient satisfaction

Materials and Method: The study was conducted in 16 surgical sites (8 matched pairs) among 8 systemically healthy adults aged between 18 – 55 (mean age 31.68±11.11) requiring open flap debridement. Smokers were excluded from the study. Informed consent was obtained. All sites were randomly allocated to 2 different groups with 8 sites in each group. Flap surgery was done and either COE PAK or Barricaid was used. Parameters such as color, consistency, VAS score, healing index and post operative discomfort were recorded 1 week post operatively.

Results: The data showed favourable results in parameters such as in color, consistency, VAS score, healing index and post operative bleeding towards the use of Barricaid ® group, and in parameters such as post operative ease in mastication and facial swelling towards the use of COE PAK® group. But, the difference was not statistically significant in any of the clinical parameters.

Conclusion: It can be concluded that there was no statistically significant difference between the 2 periodontal dressings (COE PAK ®, Barricaid ®) in terms of wound healing and patient satisfaction.

Key Words: *Periodontitis, Periodontal Dressings, Coe-Pak, Barricaid, Wound Healing*

Introduction

Periodontal surgeries are used for various needs such as pocket elimination, regeneration of defects, reshaping of bony contours, other esthetic and prosthetic concern. Such surgeries usually lead to post operative pain, bleeding, inflammation and general discomfort. Many dentists prefer the use of some form of protection protect it from further stress.[1] Such protection are periodontal dressings that cover the wound area from stress, irritation, food, contamination and thus assist healing and reduce pain. [2]

The first periodontal dressing, Wondrpak, was introduced by Ward in 1923.[3]The earliest periodontal packs were based on zinc oxide eugenol systems. However, it was found to have various side effects such as irritation and tissue morbidity. Later, non-eugenol packs were discovered.[4]COE-PAK was one such pack, but it was found to have disadvantages such as, difficult manipulation and poor esthetic appearance.[5]"container-

Barricaid is a recently developed visible light curing periodontal dressing material, based on a polyether urethane dimethacrylate resin.[6] It has superior properties such as, easy manipulation, pleasing esthetic appearance, better surface smoothness, interdental retention and mechanical stability. Additionally, it gives the dentist complete control over its setting time.

The aim of the present study was to assess the relative efficiency of 2 different periodontal dressings (Coe-pak®, Barricaid®) after various periodontal flap surgeries with respect to wound healing and patient satisfaction.

Materials and Method

The study was conducted in 16 sites (8 matched pairs) among 8 systemically healthy adults aged between 18-55 requiring different periodontal surgical procedures. All the patients visited the outpatient department of Saveetha dental college, Chennai. The study was approved by the scientific review board of Saveetha dental college. Patients with systemic conditions were excluded from the study. Informed consent was obtained. They were randomly allocated to 2 different groups (Group 1-COE PAK, Group 2-Barricaid) with 8 sites in each group. The following parameters were noted in the performa of the study: 1. demographic details 2 chief complaint 3. drug history 4. past medical history 5. past dental history. Probing depth, bleeding index (Muhlemann and Son, 1971) and plaque index (Sillness and Loe, 1964) was assessed on the day of surgery. Flap surgery was done under local anaesthesia (2% lignocaine). Conventional scalpel was used in all procedures. Either COE PAK or Barricaid was used according to the group in which the patient was allocated to. Following parameters were recorded 1 week post operatively: 1. Colour of gingiva (reddish pink/pale pink) 2. Consistencyof the gingiva (firm and resilient/swollen and edematous) 3.early healing index (Watchell et al 2005) (Score 0 - 5) 4.VAS scorefor pain (By Scott and Huskinson 1979) (Score 0 - 10). The patients were asked questions on their postoperative discomfort on the first 3 days after surgery and the following symptoms noted: bleeding (Yes/No), ease of nutrition (Yes/No) and facial swelling (Yes/No)

Method of using COE PAK

A spatula and a glass slabwas used. Equal lengths of paste from catalyst and base tubes was extruded. It was spatulated for 30-45 seconds or until the mix had a uniform color. The mixed pastes were immersed in saline till it loses its tackiness. The fingers were lightly lubricated with a thin film of saline. Using fingers the mixed pastes are formed into a cylindrical shape.It was placed against the teeth and gums in the operative area and muscle moulded.(Figure 1)

Method of using Barricaid

Using a sterile, dry gauze, the buccal or lingual tooth surfaces adjacent to the surgical sitewas dried. The tip from the disposable syringe was removed. The material was dispensed at the juncture of the cervical one-third of the teeth and the margin of the surgical site. It wascontoured with a wet gloved fingers and muscle moulded.Excess material was removed. It was exposed to a visible light-curing unit for 30 seconds per tooth per side. Exposure was repeated, until the entire dressing was cured. Excess material was added if needed and cured in increments.(Figure 2)

Statistical methods

The data was analysed using SPSS software(Statistical Presentation System Software, 1999, SPSS Inc, New York, version 10.0). Chi - square test was done to compare the percentage of difference incolor, consistency, post operative bleeding, ease of nutrition and facial swelling among the 2 groups. Student t test was used to compare the mean VAS scores and healing index between the 2 groups.

Results

All the patients completed the study. There were no drop outs in the follow up. There were no adverse reactions observed.

Generally, it was found that both the barricade and COE PAK groups had a predominantly positive wound healing and patient response. It was found that a greater percentage of sites showed the more favourable response in all the parameters in both the groups. However, when the differences between the two groups were compared, the difference was not found to be statistically significant.

On comparison between the 2 groups, all the sites (100%) in the Barricade showed pale pink gingival color whereas only 75% of the sites showed the same in the COE PAK group (Table 1). In terms of gingival consistency, barricade group was again found to show firm and resilient consistency in all the sites (100%) whereas only 62.5% of the sites showed the same in the COE PAK group (Table 1). On comparison of early

healing index score between the two groups, there was a lesser mean score (1.25 ± 0.46) in the barricade group than in the COE PAK group (1.5 ± 0.54) (Table 2).On comparison of VAS scores for pain assessment between the two groups, there was a lesser mean score (1.75 ± 0.89) in the barricade group than in the COE PAK group (2.5 ± 0.76) (Table 2). In terms of post operative bleeding, no patient reported its presence in the barricade group, whereas 25% of the patients reported its presence in the COE PAK group (Table 3).

There was a greater percentage of patients who reported ease of post operative mastication in the COE PAK group (87.5%) than in the Barricade group (37.5%) (Table 3). In terms of post operative swelling, there was a marginally greater percentage (12.5%) of patients reporting presence of swelling in the Barricaid group, whereas no patient reported swelling in the COE PAK group.(Table 4)

However, none of the above comparisons between the groups, showed statistically significant difference.

To summarize, when the results were compared between the groups, it was found that, favourable results were found in parameters such as in color, consistency, VAS score, healing index and post operative bleeding towards the use of Barricaid® group and in parameters such as post operative ease in mastication and facial swelling towards the use of COE PAK® group. But, the difference was not statistically significant in any of the clinical parameters.

Figure 1: Appearance of COE PACK

Discussion

Use of periodontal dressings have always been controversial. There are different schools of thoughts in whether or not to use a periodontal dressing. COE PAK is the most widely used periodontal pack and is considered a standard to which other dressing materials can be compared. It is a non eugenol pack. When comparing the efficiency of newer dressing materials, it is always wise to compare it against the established dressing material.[5]"container-title":"Journal of Clinical Periodontology","page":"188-193","volume":"23","issue":"3 Pt 1","source":"PubMed","abstract":"2 periodontal dressings, Coe-pak and RD8 (a product under development Barricaid® is a light cure periodontal dressing with superior esthetics and offers complete control over its setting time. It is based on polyether urethane dimethacrylate resin. Histological studies by Alpar et al[7] and Gilbert et al[8] with the extracts and solid specimens of polymerised Barricaid® have proven its biocompatibility. Hence, the present study is aimed to compare the light cure dressing Barricaid against the age old dressing, COE PAK in wound healing and patient accceptibility.

There was a predominantly healthy gingiva in both the groups as determined by gingival color and consistency. This may be attributed to the reduction of inflammation that usually follows after a periodontal flap surgery. Selvig KA et al[9] has reported that slight redness at the site of suture after surgery is not uncommon. This may provide justification for the marginal percentage of sites that reported gingival redness and edematousness. Also, the protection offered at the wound site by the periodontal dressing may have led to decreased tissue irritation. No untoward reactions was found in any of the groups.

There was good wound healing and less pain perception, as determined using the VAS score and early wound healing index. Amler MH et al[10] and Farina R et al[11] have reported that epithelialization from the peripheral gingival margins starts within 24 hours and becomes complete after 1-5 weeks in relation to socket width and local traumatic factors, smoking, tooth location and concomitant extraction of adjacent teeth. This may explain the superior wound closure in both the groups after 1 week. Also, the periodontal dressing protect the wound site from salivary contamination leading to faster wound healing. The less perception of pain in both the groups may be attributed to the analgesics prescribed for the first 3 days. Also, the wound closure provided by the periodontal dressings may have contributed to the psychological satisfaction of the patients leading to reduced perception of pain.

There was less post operative bleeding in both the groups. Tan WC et al[12] has reported that light bleeding is common for the first few hours after surgery but it may occur after hours or continue for 2-3 days. This may explain the lesser percentage of patients who reported presence of post operative bleeding. Less post operative swelling was also reported in both the groups. Tan WC et al[12] and Yao J et al[13] reported that soft tissue painless swelling usually occurs at the surgical site from the second day. This explains the few number of patients who reported swelling. The less number may be attributed to care taken to cause less tissue trauma duringthe procedures. Greater ease of mastication was reported in both the groups. This may be due to the splinting effect that hardened periodontal dressings provide, that reduces mobility and tenderness.

Thus, the above findings indicate that, both the dressings provide equally good wound healing properties and patient comfort. Hence, either of the two dressings can be used depending on the clinician's convenience.

Conclusion

It can be concluded that there was no statistically significant difference between the 2 periodontal dressings (COE PAK®, Barricaid®) in terms of wound healing and patient satisfaction.

Assessment of Precipitate Formation on Interaction of Chlorhexidine with Sodium Hypochlorite, Neem, Aloevera and Garlic: An *in vitro* Study

Riluwan Siddique[1], S Jayalakshmi[2]

[1]Postgraduate Student, [2]Senior Lecturer, Department of Conservative Dentistry and Endodontics, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India, Chennai, Tamil Nadu, India

Abstract

Introduction: Irrigants play an important role in debridement and disinfection of root canal space. Precipitate formed from combination of irrigants during root canal treatment may affect the properties of intracanal medicaments and adaptation of obturated materials to the root canal walls.

Aim: To check for precipitate formation from various irrigant combinations and to weigh the amount of precipitate formed.

Methods and Material: Five different irrigants namely 2% CHX gluconate, 3% NaOCl, 5% Neem, 5% Aloevera, and 5% Garlic were taken in different test tubes. 1mL each of two different irrigants were mixed in 10 test tubes and observed for 2 min for formation of any precipitate and the formed precipitate was weighed.

Results: 1mL 2% CHX +1mL 3% NaOCl and 1mL 2% CHX + 1mL 5% Neem showed precipitate formation immediately. Through statistical analysis it was observed that more amount of precipitate was seen in 1mL 2% CHX + 1mL 5% Neem followed by 1mL 2% CHX + 1mL 3% NaOCl.

Conclusion: Precipitate formation is seen more with the 2% CHX-5% Neem when compared with the control group (2% CHX-3% NaOCl).

Key words: *Aloevera, Chlorhexidine, Garlic, Neem, Precipitate, Sodium hypochlorite*

Introduction

Microorganisms are the main aetiological cause for pulpal and periapical pathology. Mechanical instrumentation may not be enough to remove microorganisms and necrotic tissue from root canal space because of its complex anatomy[1].Therefore irrigation is necessary with mechanical instrumentation to disinfect root canal space.

No irrigants so far possess all ideal properties so irrigants can be used in combination to achieve maximum benefits. Even though certain combinations proved to be synergistic, some combination of irrigants form precipitate which blocks dentinal tubules and compromises the seal of obturated canal[2]. Precipitate is formed from acid-base reaction which occurs when irrigants are combined together[3].

Most commonly used conventional irrigants during root canal treatment are sodium hypochlorite (NaOCl) and chlorhexidine (CHX). NaOCl shows both antimicrobial and tissue dissolving properties. CHX

is well known for its prolonged antimicrobial activity due to its substantivity[4]. Since it lacks tissue dissolving capacity it can be used in combination with NaOCl. However it has been suggested that Sodium hypochlorite and Chlorhexidine shouldn't be mixed within root canal space, as it produces reddish brown precipitate which may cause discolouration of dentin structures[5].

Increasing microbial resistance towards commonly used drugs and side effects, prompted researchers to find herbal alternatives. Natural irrigants like Neem, Aloevera and garlic are used because of their known antimicrobial effect and biocompatibility. Neem showed its biological effect mainly due to its active component nimbidin and other isolated components such as nimbin, nimbinin, nimbidinin, nimbolide, and nimbidic acid[6]. Aloevera shows both good anti-bacterial and anti-fungal activity due to constituents of alloins and barbadoins[7]. The main active component of garlic is allicin which destroys the cell wall and cell membrane of root canal bacteria and can be used as an irrigant alternative to NaOCl. Concentrated garlic (95%) extract contains 34% allicin,44% total thiosulfinates and 20% vinyldithins[8].

In this study, we have used Neem, Aloevera and Garlic as herbal irrigants. These herbal irrigants were mixed with most commonly used irrigants such as CHX and NaOCl and evaluated for any precipitate formation before being tried as root canal irrigants. Therefore the aim of this study is to check whether the combination of herbal irrigants with CHX and NaOCl forms precipitate and to weigh the amount of precipitate formed.The null hypothesis of this present study is that any irrigant mixed with Chlorhexidine will form a precipitate.

Material and Methods

The study was carried out in biochemistry laboratory. Five different types of irrigants namely 2% CHX gluconate (STEDMAN PHARMACEUTICALS PVT LTD) 3% NaOCl (VENSONS INDIA), 5% Neem, 5% Aloevera, and 5% Garlic were used in this study.

Neem, Aloevera and Garlic extracts were supplied in the form of powder which were readily soluble in water. These extract dilutions were prepared in 5% concentration by 5 grams of powder in 100ml of distilled water and kept for 24hrs. These solutions were filtered using Whatman's filter paper No1. These five irrigants were grouped into 10 of various combinations [Table 1]. Sample size selected for each group is 10. In a test tube, 1ml each of two irrigants was added and were observed for 2 min for precipitate formation [Figure 1 and Figure 2]. The formed precipitate was filtered; air dried and weighed using weighing electronic balance. The data obtained were statistically analyzed using One-way ANOVA test.

Results

Group 2 containing 1 ml 2% CHX + 1 ml 5% Neem and Group 1 containing 1 ml 2% CHX + 1 ml 3% NaOCl showed precipitate formation immediately

Group 1 containing 2% CHX + 3% NaOCl showed reddish brown precipitate whereas Group 2 containing 2% CHX + 5% Neem showed greenish precipitate.

Oneway Anova test revealed more amount of precipitate was seen in 1ml 2% CHX + 1ml 5% Neem with mean weight 11.80 followed by 1ml 2% CHX + 1ml 3% NaOCl with mean weight 4.400. [Table 2 and Graph 1]

Table - 1

Group 1 (Positive control)	1ml 2% CHX + 1ml 3% NaOCl
Group 2	1ml 2% CHX + 1ml 5% Neem
Group 3	1ml 2% CHX + 1ml 5% Aloevera

Discussion

Successful endodontic treatment is achieved by using both mechanical instrumentation and antimicrobial chemical agents. This is due to complex anatomy of root canal. These chemical agents used for irrigation helps in removing tissue debris, microbes, and also helps in removal of smear layer during root canal preparation[9]. While selecting any irrigating solution or medication, one should know its mechanism of action on predominant bacteria. The knowledge about chemical and biological dynamics of antimicrobial irrigants or medications along with interrelation between micro-organism and host constitutes the first step in endodontic treatment.

No single irrigant possesses all ideal properties for the success of endodontic treatment. So, there is a need for combination of irrigants to enhance their antimicrobial effect. However, there are chances of precipitate formation that will hinder their antimicrobial effect and could compromise dentin permeability, the intracanal medication diffusion and obturation sealing [10].

In this study, Sodium hypochlorite (NaOCl) and Chlorhexidine (CHX) formed a reddish-brown precipitate. This brownish floculates formed due to the presence of Ca, Fe, and Mg that are easily oxidized, which is confirmed in another study by analyzing the metals from this association in different concentrations by atomic absorption spectrophotometer[11]. The precipitate formed is an insoluble neutral salt formed by the acid-base reaction between NaOCl and CHX. Chlorhexidine has the ability to donate protons since it is a dicationic acid (pH 5.5-6.0) whereas NaOCl is alkaline being able to accept protons from the dicationic CHX. This exchange between protons led to formation of insoluble and neutral substance called precipitate[12]. Some studies have detected the presence of a toxic compound called para-chloroaniline (PCA) on interaction of chlorhexidine with sodium hypochlorite[13-17]. In contrary to these studies some studies failed to detect presence of para-chloroaniline (PCA) in precipitate [18,19]. Para-chloroaniline (PCA) is produced by the hydrolysis of CHX as a function of time, alkaline environment (High pH) and heat[20].

Recently, in our previous study, it was demonstrated that a combination of CHX with NaOCl/neem/tulsi, not only formed a precipitate each but also contained PCA as well[21]. The HPLC analysis showed the percentage dry weight of PCA as 14.00 ppm (CHX + NaOCl), 10.57 ppm (CHX + neem) and 9.00 ppm (CHX + tulsi).

According to International Agency for Research on Cancer (IARC), para-chloroaniline (PCA) is used as an intermediate block in the manufacture of dyes, pigments, agricultural chemicals and pharmaceuticals. PCA is a persistent environmental degradation product of some herbicides and fungicides which presents potential long-term toxicity and carcinogenicity in rats and mice and can cause methemoglobinemia. PCA is found to induce DNA damage in bacteria. Kacmar et al. evaluated PCA metabolite of herbicide monolinuron for its toxic and immunotoxic effects in peripheral blood of leukocyte suspension of 5 sheep by using a migration-inhibition test where toxic and immunotoxic effects were recorded at concentration from 1.0 – 0.1 mg/ mL^{-1} and 0.01-0.001 mg/ mL^{-1} respectively[22]. Future studies should determine the concentrations of PCA generated from 0.1%-2% concentrations of CHX. There is sufficient evidence in experimental animals for the carcinogenicity of PCA but inadequate evidence to prove its carcinogenicity in humans. However, The International Agency for Research on Cancer (IARC, 2006) classified PCA in their 2B group which is a potential carcinogenic to human[23].

Krishnamurthy and Sudhakaran (2010) showed that precipitate formation can be prevented by using intermediate flushing with absolute alcohol, citric acid and saline.

In our study, we used herbal extracts since there are limited studies regarding interaction of Chlorhexidine (CHX) with herbal extracts.

Phytochemical screening of neem revealed that it contains alkaloids, steroids, flavonoids, tannins,

saponins and amino acid[24]. Greenish precipitate may be due to interaction of steroids with Chlorhexidine

Phytochemical screening of Aloevera revealed the presence of saponins, glycosides, flavonoids, alkaloids, tannins, proteins but failed to detect the presence of steroids and cardiac glycosides[25]. Interestingly, there was no precipitate formed on interaction of Chlorhexidine with Aloevera. This may be due to the absence of steroids in aloevera.

Phytochemical screening of Garlic (Allium sativum) showed the presence of flavonoids, alkaloids, saponins, tannins and cardiac glycosides although steroids were not detected[26]. Absence of steroids in garlic may be one of the reasons for not forming precipitate with Chlorhexidine (CHX). In our study, null hypothesis was rejected because chlorhexidine didn't form precipitate when used along with aloevera and garlic.

Furthermore, studies need to be done to check for the presence of toxic compound called para-Chloroaniline (PCA) in greenish precipitate formed on interaction of Chlorhexidine with neem.

Conclusion

Considering the results of our study, we can conclude that chlorhexidine forms precipitate with sodium hypochlorite (reddish brown precipitate) and neem (greenish precipitate). It indicates that ingredients in chlorhexidine (CHX) are responsible for precipitate formation. Further it should be noted that herbal extracts like aloevera and garlic on combination didn't form precipitate and also with sodium hypochlorite.

Comparison of Coca Cola and Diet Coca Cola on the Surface Enamel Roughness

Sindhu Priya Kuppusamy Sundaram Murthy[1], L. Leelavathi[2]

[1]Under graduate Student, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, [2]Senior Lecturer, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Aim: To assess the effect of coca cola and diet coca cola on surface enamel roughness.

Materials and Method: In this vitro study, there were 8 teeth extracted and these specimens were prepared with 4 teeth immersed with coca cola and 4 teeth in diet Coca Cola of 40ml at room temperature for 5 minutes each. The enamel micro hardness of enamel was tested using Vickers hardness test. On each specimen, one indentation of 100 μm were made using a load of 25 gf for 5 s in a micro durometer and it was done as a single-blind test and the final results were further compared using t-test.

Results: There has been considerable reduction in enamel hardness when the teeth are dipped in coca cola and slight and negligible reduction in hardness when dipped in diet coca cola. Mean Difference in Coca Cola - 84.05 and DIET Coca Cola - 16.725. All the teeth except those exposed to Coca Cola showed a statistically significant decrease in the surface VHN ($p < 0.05$).

Conclusion: The results of this study showed significant reduction in the enamel hardness after treating with coca cola, whereas very minimal reduction in enamel hardness when treated with diet coca cola.

Keywords: *Coca Cola, Vickers hardness test. Surface roughness, micro hardness, statistically significant.*

Introduction

The hardest substance in the body is enamel, and it protects the teeth. However, it is vulnerable to demineralisation from acids produced by certain bacteria that colonise the tooth surface with digested carbohydrates. If this process proceeds, it may eventually lead to carious lesions on enamel and dentin. Another source of acid comes from foods and beverages that also can lead to demineralisation of the enamel. Tooth enamel contains billions of crystals of hydroxyapatite that are packed in prisms winding from enamel-dentin border to the tooth surface.

Tooth gets damaged under the influence of various factors including infective and non-infective [1, 2]. The soft drinks and carbonated drinks comes under non-infective source of tooth damage.

Dental erosion is known as "an irreversible loss of dental hard tissue due to acidic process without involvement of microorganisms."[3] Another way to classify dental erosion are extrinsic or intrinsic factors. Extrinsic erosion is due to exogenous acids. One of the main causes of extrinsic erosion is consumption of carbonated beverages, citric juices, high-energy drinks, and candies. Most of these drinks have low pH, or acidic

in nature. [4, 5, 6]

Soft drink consumption has increased exponentially over the past 20 years. In these years, there is an increased consumption of soft drinks by adolescents. [7, 8] The commercial sale has also been increased over the past years [9] Enamel solubility is pH dependent. The critical pH of enamel is 5.5, any lower pH will cause erosion, especially if the tooth is exposed to the enamel over a long period of time. The sum of titratable acidity of acidic drinks is more important than the pH alone as it indicates the concentration of damaging hydrogen ions present to interact with the tooth surface.[10]

The final erosive capacity of food and drink depends on the chemical factors, such as; pH, titratable acidity, amount of calcium and phosphate, biological factors, such as; salivary flow rate, buffering capacity, pellicle formation, tooth composition, and soft-tissue structure and behavioural factors, such as; eating and drinking habits. [11] Hence a study was conducted to compare the surface micro-hardness of the tooth after exposure to carbonated soft drinks.

Materials and Method

An in vitro study was conducted on 8 healthy permanent premolar teeth that were extracted for orthodontic reasons. The teeth that were included in the study did not have any caries, enamel defects, erosion, or cracks according to clinical examination. The extracted teeth that did not meet the inclusion criteria were excluded from the study. These teeth were stored in containers, filled with tap water and were kept at room temperature. The surfaces of the teeth were polished and evaluated for the presence of any enamel defects.

Extracted permanent teeth was randomly subdivided into two groups of four teeth, the one group immersed in Coca cola and the other group in Diet cola. These specimens were prepared with 4 teeth immersed with coca cola and 4 teeth in diet Coca Cola of 40ml at room temperature for 5 minutes each. The enamel micro hardness of enamel was tested using Vickers hardness test. The micro vickers hardness is tested on the enamel portion of the teeth after cutting, moulding and polishing the same in quick set acrylic mound. One specimen per tooth crown was prepared by cutting the labial surface with a double-sided steel disc, followed by smoothening with diamond tips. On each specimen, one indentation of 100 μm were made using a load of 25 gf for 5 s in a micro durometer and it was done as a single-blind test and the final results were further compared using t-test.

Findings

Results showed that micro hardness reduction was greater after immersion in Coca-Cola than after immersion in diet cola. In table 1, comparison of before and after treatment with diet coca cola, the calculated t value is smaller than critical value (3, 165<3.182), so the means are not significantly difference between the reading of diet coca cola and water. In table 2, comparison of before and after treatment with coca cola, the calculated t exceeds the critical value (48.5193>3.182), so the means are significantly different. In table 3, there has been considerable reduction in Hardness when the teeth are dipped in Coca Cola and slight and negligible reduction in Hardness when dipped in DIET Coca Cola. Mean Difference in Coca Cola - 84.05 and DIET Coca Cola - 16.725. All the teeth except those exposed to Coca Cola showed a statistically significant decrease in the surface VHN ($p < 0.05$).

Table 1: Micro-hardness of teeth before and after immersion in Coca cola

Micro vickers hardness in Hvo.1 (as polished condition)	Micro vickers hardness in Hvo.1 (after 5 minutes dip in Coca cola)
322.3	242.4
324.6	241.2
335.2	246.9
329.4	244.8

Table 2: Micro-hardness of teeth before and after immersion in diet Coca cola

Micro vickers hardness in Hvo.1 (as polished condition)	Micro vickers hardness in Hvo.1 (after dip in 5 minutes diet Coca cola)
327.6	323.9
338.6	322.8
335.7	306.2
328.0	310.1

Table 3: Comparison of micro hardness of teeth after immersion in Coca cola and diet cola

t	3.165	48.5193
Degree of freedom	3	3
Critical value	3.182	3.182

Discussion

Over the last few decades, there was an increased prevalence of erosion due to increased consumption of fruit juices and soft drinks. Soft drinks has been marketed directed at the younger generation by relating these beverages with acceptance of the peer group. Also these soft drinks have also been marketed as healthy and linked to celebrities. Erosion is linked to high intake, frequency and method of consumption of acidic beverages. Excessive exposure of the tooth structure with acidic food leads to loss of dental hard tissues. [12]

Certain beverages induce demineralisation and hence therefore affecting the hardness of tooth structure. Surface demineralization and remineralization processes have an important role for mineralized tissues, such as teeth and bone. Enamel softened by erosion is likely to be more susceptible to abrasion and attrition. [13]

The frequency of acidic food or carbonated drinks consumption is an important factor in the cause of dental erosion compared to that of quantity, resulting in demineralization of hard tissues. The erosive factors are derived from their acid content, which is mainly citric acid and carbonic acid. Meurman et al also proved that the strong decalcifying properties of isotonic drinks also lead to loss of enamel. [14]

In a study done by Annapurna Kannan et al it was said that there was no sex predilection in the consumption level, quantity, type, frequency of intake and favourite brand of soft drinks. The presence of erosion was more apparent in individuals who consume soft drinks than those individuals who did not. The study findings reported that there exists a significant difference in the amount of erosion experienced by the study participants varied with the type of soft drink consumed. It was also said that the study subjects who preferred carbonated soft drinks had an increased erosion when compared to those who consumed non-carbonated soft drinks. Those who consumed both carbonated and non-carbonated drinks had a relatively lesser erosion than those who consumed only carbonated drinks. [15]

In the present study, there has been considerable reduction in enamel hardness when the teeth were immersed in Coca Cola and slight reduction in hardness when immersed in DIET Coca Cola. This is similar to the conducted by Wongkhantee S et al.,where it was reported that the softening effect on enamel by cola was significantly higher than the sports drink . [16] Also in a study done by Tadakamadla J et al., carbonated drinks were observed to have more enamel dissolution than fruit juices and the justification was explained as the viscosity of a drink, together with contact angle and surface tension, determines its ability to penetrate a capillary space such as pores in enamel. [17]

Soft drinks contain acidulants such as citric, phosphoric, tartaric, malic, and other organic acids. These acids exhibit buffering capacity and can maintain the local pH at the tooth surface below the threshold value. Carbonated drinks supplemented with refined carbohydrates and the additives may be contributing factors to tooth demineralisation. [18]

In another study, the data showed that Coca-Cola contains phosphoric acid, compared to citric acid, phosphoric acid is stronger. [19] Phosphoric acid causes an etched zone which is permanently lost from the tooth surface. [20] Whereas, citric acid acts as a chelator by binding to the calcium from enamel or dentine, therefore increasing the degree of demineralization. [21, 22]

In another study, the presence of fluoride was also noted as it is believed to play a negative role against decay and it promotes remineralisation and inhibits demineralisation by deposition in the form of CaF2. [23] Hydroxyapatite (HAP) gives rise to the fluor apatite Ca10(PO4)F2, when the hydroxyl ions are substituted by the fluoride ions. The presence of fluoride ions in the lattice allows it to resist the acid challenge. [24]

Any beverage or food with intrinsically lower pH [25], including carbonated drinks may cause decay. The severity of the erosive potential is thought to be related to pH, titratable acidity, buffering capacity and calcium chelating property of the beverages. [26]

The presence of various acids can explain the differences in the erosive potential of Coca-Cola and citric fruits. According to information from the manufacturers, Coca-Cola contains phosphoric acid, whereas citric fruits contain citric acid. Compared to citric acid, phosphoric acid is stronger [27]. The effect of phosphoric acid results in an etched area which might be permanently lost from the tooth surface [28]. On the other hand, citric acid may act as a chelator capable of binding the calcium from enamel or dentin, thus increasing the degree of under saturation and favouring demineralization.

Conclusion

The results of this study showed significant reduction in the enamel hardness after treating with coca cola, whereas very minimal reduction in enamel hardness when treated with diet coca cola. It is duty of dental care professionals to educate patients about the harmful effects of soft drinks on oral health as well as general health and to advise them to choose a low erosive soft drink, such as a non-carbonated soft drink to alleviate dental erosion.

Relationship Between Obesity and Periodontal Diseases - A Short Study

Sisira Padavala[1], L. Leelavathi[2]

[1]Undergraduate Student, [2]Senior Lecturer, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Background: Obesity has been described as one of the most neglected public health problems, affecting both developed and developing countries. The prevalence of obesity has increased substantially in the last few decades. Obesity has been suggested to be a risk factor for periodontitis.

Aim: The aim of this study was to assess any possible relationship between obesity and periodontal diseases in patients attending Saveetha Dental College.

Materials and Method: This study was conducted on patients in Saveetha Dental College, Chennai. Both male and female patients were included in the study. The body mass index was calculated for each patient along with the Russell's periodontal index. Statistical Analysis was done.

Results: More than half of the study participants were obese. An association between obesity and periodontal disease was found. The obese subjects were found to have destructive periodontal disease.

Conclusion: It was found from the study that there exists a relation between obesity and periodontal disease. It is the duty of the dental professionals to create awareness among the patients about the relationship of oral health and general health.

Keywords: *obesity, periodontitis, oral care, over weight*

Introduction

According to the World Health Organization (WHO), obesity is the fastest-growing and most significant health hazard in developing and also in developed countries. [1, 2] Obesity has been described as one of the most neglected public health problems, affecting both developed and developing countries. The prevalence of obesity has increased substantially in the last few decades. In 2014, the World Health Organization (WHO) estimated that around 600 million adults worldwide were obese and a further increase is expected in the future due to increased consumption of high-calorie diets and a sedentary lifestyle. [3] Obesity is usually defined as body mass index (BMI = kg/m2).

Specifically, overweight is defined as a BMI between 25.0-29.9 kg/m2 and obesity is defined as a BMI of ≥ 30.0 kg/m2 . The exception is found in Asian regions, where overweight is defined as BMI ≥ 23 kg/ m2. [3] Obesity is a chronic metabolic disease that predisposes to a variety of comorbidities including arterial hypertension, type 2 diabetes mellitus, atherosclerosis and cardiovascular diseases. Obesity has been associated with many serious, life–treating medical conditions. Besides being a risk factor for cardiovascular diseases, type II diabetes and certain cancers, obesity has also been suggested to be risk factor for periodontitis. [4, 5]

Periodontal disease is an infectious and inflammatory disorder of tooth-supporting structures resulting from the interaction between pathogenic bacteria and the host immune response. [2] Human periodontal disease is associated with a complex microbiota containing Actinobacillus actinomycetemcomitans, Porphyromonas gingivalis and other periodontopathic bacteria. These microorganisms are unique to the oral cavity and they may disseminate to other body sites. However, systemically healthy individuals seem to be at low risk of getting acute non-oral diseases from direct infections by periodontal pathogenic microorganisms. Its been reported that periodontal infections as a risk factor for chronic medical disorders, including cardiovascular disease, cerebrovascular accidents and low-birth-weight infants. [6] Maternal periodontal disease has been linked to low birth weight, preterm birth, and preterm low birth weight.[7].Activation of the host immune system, primarily for protective purposes, eventually leads to destruction of tissues through the synthesis and release of cytokines, proinflammatory mediators and metalloproteinases [8]. It is known that obesity has several harmful biological effects that might be related to the pathogenesis of periodontitis. [9] Adipose tissue releases proinflammatory cytokines and hormones globally referred to as adipocytokines, which induce inflammatory processes and oxidative stress disorders, generating a similar pathophysiology between the both diseases. [4]

Although some studies have shown an association between obesity and periodontal disease in different populations, there have been only few studies documented in literature, in this part of southern India. Hence, an attempt was made to explore the relationship between obesity and periodontitis among the patients. The aim of the current study was to investigate whether there were associations between obesity and periodontal status in population aged 28 yrs and above.

Materials and Method

A comparative study was conducted among participants attending Outpatient Department of Saveetha Dental College and Hospitals in Chennai. The study was carried out under the guidance of the Department of Public Health Dentistry. A pilot study was conducted among 50 participants aged 28 years and above. Exclusion criteria for all subjects included: periodontal or antibiotic therapy ; any systemic condition which might have influenced the course of periodontal disease or treatment for example patients with diabetes and cardiovascular disease; any systemic condition which needed antibiotic coverage for regular periodontal procedures. Obesity was measured by calculating body mass index (BMI). Data were collected through oral examination by one of the author. Patients were asked to take off their footwear. Height was measured using wall-mounted height rods and recorded in centimeters, then converted to meters and weight was measured in kilograms using a mechanical scale.

The BMI is calculated by dividing the body weight (in kilograms) by the height (in meters) squared (BMI = weight/ height2). The BMI measured was categorized using the World Health Organization: normal weight (<24.9 kg/m2), overweight (25-29.9 kg/m2) and obese (>30 kg/m2).

Russell's periodontal index was used to check the periodontal status. Periodontal Pocket was determined by inserting the tip of the probe into the pocket along the longitudinal axis of the tooth and measuring the distance from the gingival margin to the depth of the pocket. All the teeth present were examined. The scoring values were 0, 1, 2, 4, 6, 8. The scoring criteria was[10]

0-Negative: There is neither overt inflammation in the investing tissues nor loss of function due to destruction of supporting tissue.

1-Mild gingivitis: There is an overt area of inflammation in the free gingiva, which does not circumscribe the tooth.

2-Gingivitis: Inflammation completely circumscribed the tooth but there is no apparent break in the epithelial attachment.

4-Used only when radiographs are available.

6-Gingivitis with pocket formation: The epithelial attachment has been broken and there is a pocket. There is no interference with normal masticatory function, the tooth is firm in its socket and has not drifted.

8-Advanced destruction with loss of masticatory function: The tooth may be loose; may have drifted; may sound dull on percussion with a metallic instrument;

may be depressible in its socket.

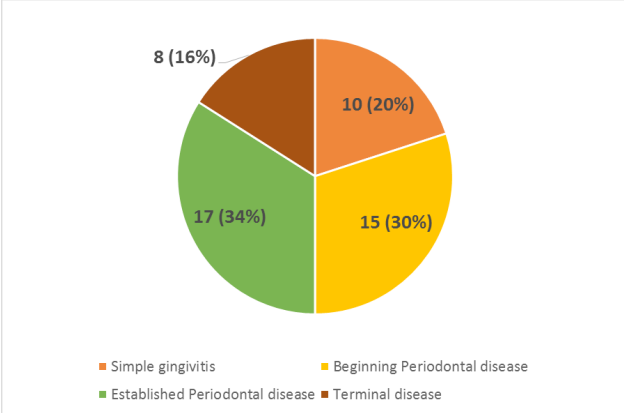
The Periodontal Index score per individual is obtained by adding all the individual scores and dividing by the number of teeth present or examined and interpreting the clinical condition into the following:[10]

0-0.2- Clinically normal supportive tissues

0.3-0.9- Simple gingivitis

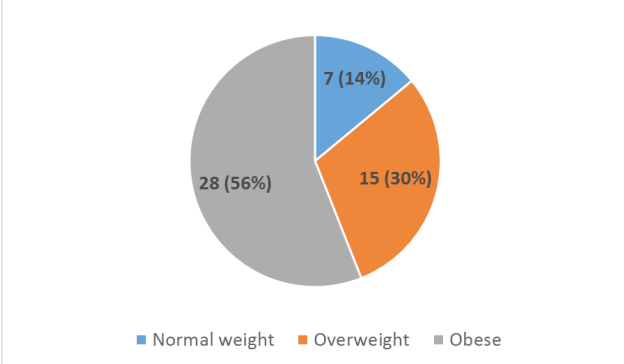
1.0-1.9- Beginning destructive periodontitis

2.0-4.9- Established destructive periodontal diseases



5.0-8.0- Terminal disease. [10]

Data collected were entered and descriptive statistics tabulated. Chi-square test was used to assess the relation between BMI and periodontal health status of the study participants.



Findings

A total of 50 subjects were evaluated including 25 males and 25 females. The age of patients was in the range of 28-65. Out of these, 14% subjects had normal BMI (18.5-24.9 kg/m2), 30% were overweight (25-29.9 kg/m2) and 56% were obese (>30 kg/m2). (Graph 1) The mean BMI was 30 and it was higher in females (31%) and in males (29%). Russells Periodontal index showed that 20% subjects had simple gingivitis, 30% had beginning destructive periodontal disease, 34% had established destructive periodontal disease and 16% had terminal disease. (Graph 2)

Simple gingivitis was found to be common among study subjects with normal weight when compared with obese study subjects. The obese subjects were found to have destructive periodontal disease when compared with study participants with normal weight and overweight. This difference was found to be statistically significant.

Graph 1: Distribution of BMI of study participants

Graph 2: Distribution of periodontal health status of study participants

Table 1: Relationship of BMI and periodontal disease among study participants

		Periodontal health condition of the participants				P value
		Simple gingivitis	Beginning destructive pdl disease	Established destructive pdl disease	Terminal disease	
BMI of the study participants	Normal	7 (70%)	0.0%	0.0%	0.0%	< 0.001
	Overweight	3 (30%)	7 (46.7%)	5(29.4%)	0.0%	
	Obese	0.0%	8 (53.3%)	12(70.6%)	8 (100%)	

Discussion

The present study was done to assess the relationship of obesity and overweight with oral health among outpatients attending a dental college.

It was found from the study results that there exists a relation between the person's body weight and the periodontal health. The results of this study showed that obesity was associated with periodontitis but much lower than normal weight. The relationship of obesity was found to be much higher in individuals with established periodontal disease than in the study participants with beginning periodontal disease. This was in keeping with a number of studies which have suggested that obesity is associated with oral diseases, particularly periodontitis [11]. Obesity is a complex disease, and its relationship with oral status has been realised by the scientific community in the recent years. Previous studies found a strong association between obesity and periodontal disease. The relationship between obesity and periodontal disease was first reported in 1977, when histopathological changes in the periodontium in hereditary obese Zucker rats was observed by Perlstein et al. [12].

In case of periodontitis with periodontal pockets of 5 mm or deeper, BMI increases[8]. In this study, the obese subjects had beginning destructive periodontal disease and establishes destructive periodontal disease. The overweight and healthy subjects had simple gingivitis. This analysis showed a positive association between BMI and periodontal pockets (5 mm or more). This finding could be interpreted that body weight has an effect on the extent of periodontal infection among subjects with periodontal infection.

Saito et al did a study among 241 healthy Japanese individuals and showed, for the first time, an association between obesity and periodontal disease in humans. In addition, studies have indicated that the fat distribution pattern plays an important role in the association with periodontitis [13,14]. Study done by Saito et al concluded that obesity is associated with deep periodontal pockets and is independent of glucose tolerance status. National Health and Nutrition Examination Survey (NHANES III) data reported that BMI was positively correlated with the severity of periodontal attachment loss; they found that this relationship is modulated by insulin resistance[15].

Some of the reviewed studies analysed proinflammatory molecules in serum, in an attempt to find a possible causal mechanism relating obesity to periodontal disease and it was reported inflammatory process was the possible cause. In obese individuals, adipocytes secrete proinflammatory cytokines such as TNF-α and IL-6, which stimulate the hepatic production of acute phase reactants such as C-reactive protein and cause alterations in the host's immune response – increasing the susceptibility to bacterial infection[16]. TNF-α is one of the first proinflammatory cytokines induced by the periodontal pathogens. TNF-α stimulates osteoclast formation, inducing alveolar bone destruction and connective tissue degradation contributing to the onset of periodontal problems [17]. It is therefore believed that TNF-α mainly contributes to the early stages in the development of periodontal disease in obese individuals, not to the worsening and/or progression of already established periodontal diseases.

Blood vessels of periodontium in obese individuals have thickenings on the most inner walls, which is a symptom of decreased blood flow. It is considered that this could be the effect of action of the PAI-1 –adipokine, the level of which is markedly increased in visceral fat in obese individuals[16]. The reduction of blood flow in periodontal vessels is one of the pathogenic mechanisms of the development of periodontal disease[19].

Age has also been considered as a risk factor for periodontitis and has been observed that the prevalence and severity of periodontitis increase with age, probably as a consequence of the longer exposure of the periodontal tissues to bacterial plaque[20].

Also some studies indicate that males are at a greater risk of developing periodontitis than females, while other articles suggest that females may be more vulnerable to periodontitis, due to hormonal fluctuations that increase gingival inflammation which is in accord with the results of this study[21, 22]. Though there exists statistical significance in the present study, the study was conducted as a pilot study and it has to be conducted among the study population with increased sample size.

Conclusion

The study concluded that the periodontal disease

was related with obese persons when compared with persons with normal weight. Dentists must be aware of the increasing numbers of obese persons and of the significance of obesity as a multiple-risk factor syndrome for overall and oral health. This could affect the delivery of dental care in future. Dentists should counsel obese persons regarding the possible oral complications of obesity with periodontal risk assessment on a regular basis.

Anticariogenic Activity of Fresh *Aloe Vera* Gel Mediated Copper Oxide Nanoparticles

S Rajeshkumar[1], M Tharani[2], M Jeevitha[3], J Santhoshkumar[4]

[1] Associate Professor, [2] Researcher, Department of Pharmacology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, Tamil Nadu, India, [3]Senior Lecturer, Department of Periodontics, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, Tamil Nadu, India, [4]Researcher, Department of Biotechnology, School of Biosciences and Technology, VIT, Vellore, Tamil Nadu, India

Abstract

Background: Biosynthesis of metallic nanoparticles for its medical applications has become a major focus in nanotechnology in the recent years. *Aloe vera* has a wide spectrum of medicinal applications due to its anti-inflammatory, antimicrobial, anticancer and wound healing properties. Copper oxide nanoparticles have effective antimicrobial action against a wide range of pathogens and also dug resistant bacteria.

Materials and method: In the present study, *Aloe vera* gel is used to synthesize copper oxide nanoparticles and were characterized using UV-visible spectrophotometry and FT-IR. The anticariogenic activity of oral pathogens namely, *Staphylococcus. aureus, Streptococcus mutans, Enterococcus faecalis*, *Pseudomonas sp*, were also tested

Results: UV absorption spectra of the synthesized nanoparticles revealed an intense surface plasmon resonance between 250 and 300. The functional groups in the copper oxide nanoparticles were determined by FT-IR and these also shown to have potent anticariogenic activity.

Conclusion: Copper oxide nanoparticles synthesized using *Aloe vera* gel shown to have an excellent anticariogenic activity and has a wide array of dental applications.

Keywords: *Copper oxide nanoparticles, Aloe vera, green synthesis, anticariogenic*

Introduction

Recent advances in the field of science & technology, particularly nanotechnology, have led to a new conception of synthesizing nanosized particles of desired size and shape [1, 2]. CuO is a P-type semiconductor material with a narrow band gap of 1.2ev. Last few years, it is receiving a lot of attention for its multifaceted properties and prospective use as gas sensors, solar cells, lithium ion batteries, miscellaneous catalysts & antibacterial agents. Besides, CuO nanoparticles are stable, robust & have a longer shelf life compared to organic, antimicrobial agents [3-6].

Copper oxide nanoparticle is the elementary member of the Cu compounds that divulge a range of potential physical properties and is much inexpensive than silver oxide. It can be assorted easily with polymers to render the composites with distinctive physio-chemical properties. Also, these nanoparticles have high surface areas & atypical crystalline structures to give copper oxide nanoparticles with antimicrobial activity that is dose dependent [7].

In the present study, *Aloe vera* plant is used for the green synthesis of CuONPs as it contains 75 potentially active constituents which have been reported to

possess immunomodulators, anti-inflammatory, anti-parasitic and wound or burn healing properties [8]. Though there are reports on the antibacterial activity of CuONPs against selected human pathogens[5], no studies are available for anticariogenic activity of fresh *Aloe vera* gel mediated CuONPs so far.

Metal nanoparticles and other nanoparticles are being integrated with polymers (such as dental composite) or coated onto surfaces which obtained the potential applications within the oral cavity [9,10]. This is why the present study stands remarkable as it deals with green synthesis of CuONPs employing *Aloe vera* gel extract and testing their efficiency as anticariogenic agents against oral pathogens such as *S. aureus, S. mutans, E. faecalis*, *Pseudomonas sp*, which are reported to be responsible for causing tooth caries (tooth decay) and nosocomial infections.

Materials and Method

All the chemical reagents (analytical grade) were purchased from sigma-aldrich chemicals, India. The oral pathogens were isolated from the dental outpatients in Saveetha Dental College and Hospitals, Poonamallee, Chennai, Tamil Nadu. Oral pathogens namely *S. aureus, S. mutans, Pseudomonas sp, E. faecalis* were identified using a biochemical assay and these pathogens were maintained in the respective medium.

Synthesis of copper oxide nanoparticles

Figure 1: Synthesis of fresh *Aloe vera* gel mediated Copper oxide nanoparticles.

Aloe vera leaves were collected from Nanobiomedicine Laboratory, Department of Pharmacology, Saveetha Dental College, Saveetha Institute Medical and Technical Sciences, Chennai. *Aloe vera* leaves were washed with tap water and about 10g of fresh *Aloe vera* gel was taken out from the leaves and then boiled with 100mL of de-ionized water for 5 minutes at 60°C-80°C. The product was then filtered using Whatman no. 1 filter paper and stored in refrigerator for further investigations. (Figure 1) 4mM copper sulphate solution was prepared using 40 mL de-ionized water and 10 mL of fresh *Aloe vera* gel extract was added. The mixture of this solution was kept under constant stirring using magnetic stirrer at 450 rpm and orbital shaker at 65 rpm for 48 hrs. After this process, the synthesized fresh *Aloe vera* gel mediated copper nanoparticle solution was centrifuged at 10000 rpm for 10 minutes. The pellet obtained was washed twice with de-ionized water and dried at 80°C for 1 hour. Finally, the dried powder was stored in properly labelled eppendorf and used for further studies.

Characterization of copper oxide nanoparticles

UV-vis spectrophotometer (uv-2450 Shimadzu) was used to determine the optical property of copper oxide nanoparticles in 250-650 nm wavelength range. The functional groups in the copper oxide nanoparticles were analysed by Fourier Transform Infrared (FT-IR) Spectroscopy (Perkin Elmer 1725X).

Determination of anticariogenic activity of copper oxide nanoparticles

The antimicrobial activity was determined by well diffusion method. The Mueller Hinton agar plates were prepared and each plate was swabbed with four different dental pathogens such as *S. mutans, S. aureus, Pseudomonas sp, E. feacalis*. A gel puncture was used to cut four wells on each petriplates. To the first three wells, copper oxide nanoparticles was added in different concentration range of 40µL, 80µL and 120µL respectively. The effects were compared with that of the standard antibiotic (Amoxicillin) at a concentration of 10 µg/mL. The plates were incubated at 37°C for 24hours. The assessment of the antimicrobial activity was based on the measurement of the diameter of the inhibition zone formed around the well and the mean values were recorded.

Results and Discussion

UV- visible spectrometry

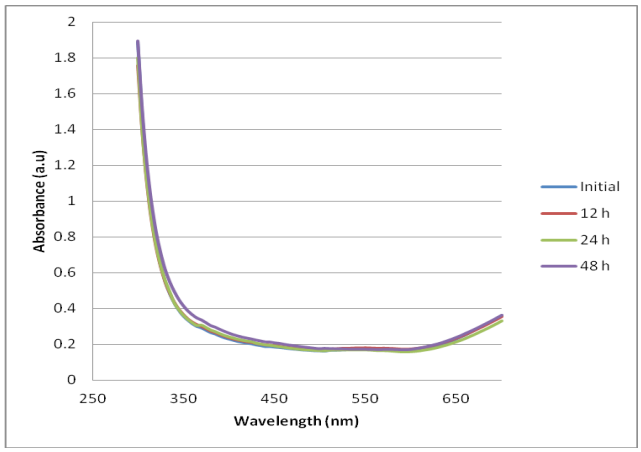

Figure 2 : UV spectroscopic analysis of fresh *Aloe vera* gel mediated copper oxide nanoparticles

Figure 2 shows the UV-visible absorption spectrum of fresh *Aloe vera* gel mediated copper oxide nanoparticles. An intense surface plasmon resonance between 250-300 nm in the UV-vis spectrum clearly reveals the formation of copper oxide nanoparticles.

Fourier Transform Infrared Spectrometry

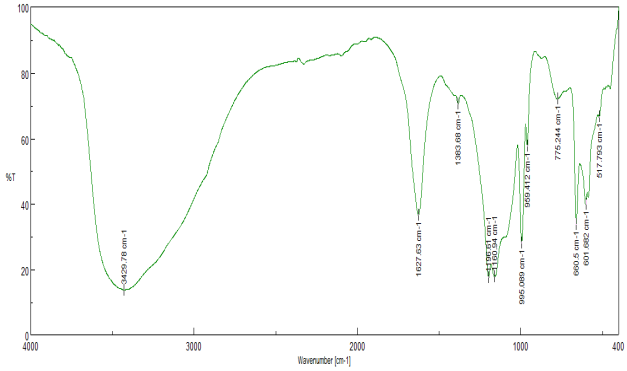

Figure 3: FT-IR spectrum of fresh *Aloe vera* gel mediated copper oxide nanoparticles.

FT-IR spectra of green synthesized copper oxide nanoparticles is shown in figure 2. The spectrum showed band at 517 cm^{-1} indicated the formation of CuO nanostructures. The bands at 601.682 and 660.5 cm^{-1} corresponds to the vibrational modes of CuO nanostructures. The bands at 1383.68 and 1627.63 cm^{-1} refer to C=O stretch and N-H bending mode. The bands at 1160.94 and 1196.61 cm^{-1} corresponding to C-O-C stretch was also obtained. The synthesized copper oxide nanoparticles shows peak at 3429.78 cm^{-1} which corresponds to phosphorus compounds.

Anticariogenic activity

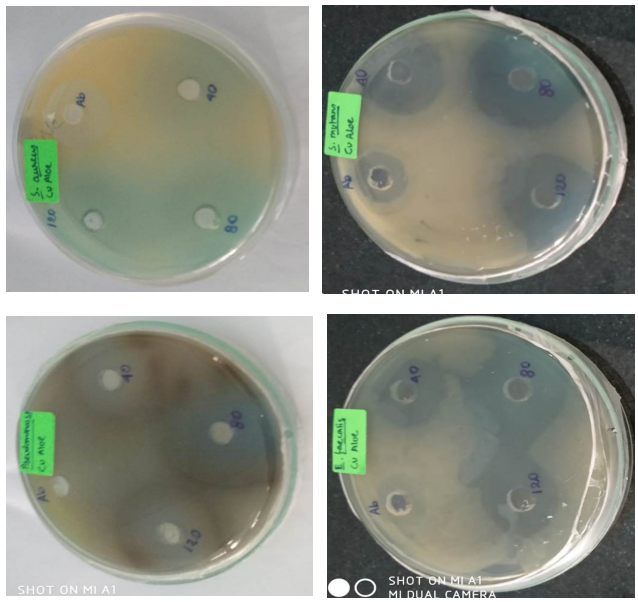

Figure 4: Anticariogenic activity of Fresh *Aloe vera* gel mediated copper oxide nanoparticles against oral pathogens.

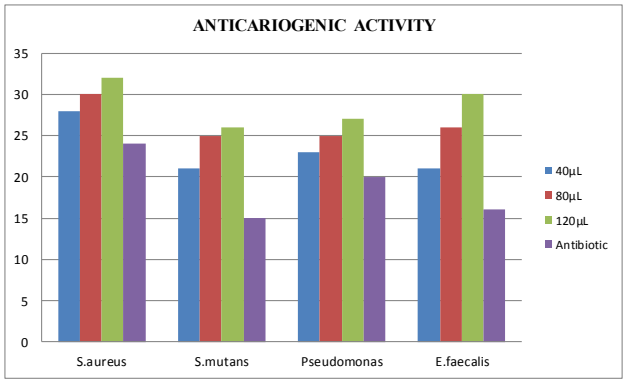

Figure 5: Histogram of anticariogenic activity of CuNPs which showed that *S. aureus* was the most sensitive bacterium followed by *E. faecalis, Pseudomonas sp and S. mutans.*

Figure 5 shows maximum zone of inhibition obtained in gram positive bacteria *S. aureus* with a zone diameter of 32±1mm a concentration of 120 µL and lowest zone of inhibition was observed in *S. mutans* with a zone diameter of 26±1mm at same concentration.

Maximum zone of inhibition obtained in gram negative bacteria *E. faecalis* with a zone diameter of 30±1mm at a concentration of 120 µL and lowest zone of inhibition was observed in *Pseudomonas sp* with a zone diameter of 27±1mm at same concentration. The results revealed that *Aloe vera* gel mediated copper oxide nanoparticles show effective anticariogenic activity.

Conclusion

The present study reported that copper oxide nanoparticles can be synthesized in a simple method using *Aloe vera* gel extract. Fresh *Aloe vera* gel mediated copper oxide nanoparticles showed excellent anticariogenic activity. The explored biosynthetic preparation of copper oxide nanoparticles has potent applications in biomedical and biotechnological applications with numerous advantages such as cost effectiveness and pharmaceutical applications as well as for large scale commercial productions. Further research on this study assign possible applications in dental field which will be efficient to cure dental pathosis.

Conflict of Interest: The authors declare there is no conflict of interest.

Dental Anxiety among Children Regarding Different Dental Treatment- Modified Child Dental Anxiety Scale (MCDAS)-A Cross Sectional Study

Vane Swetah CS[1], Mahesh Ramakrishnan[2]

[1]Under-Graduate Student, [2]Reader, Department of Pedodontics & Preventive Dentistry, Saveetha Dental College & Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai, India

Abstarct

Aim: To understand the levels of anxiety among children for various dental procedures using MCDAS

Materials And Method: The study was conducted in Saveetha dental college, Chennai with 100 outpatient children who reported to the clinics. They were given a questionnaire to fill with the help of Modified Child Anxiety Scale- Faces Version. The results were then tabulated and calculated

Results: The results showed that children are more anxious about getting injections or having their tooth extracted. On the other end of the spectrum, they appear more composed when the dentist merely cleans their teeth. The results show a decrease in anxiety levels with age.

Conclusion: The MCDAS is a reliable parameter to measure the anxiety levels in children. The study also showed increased levels of fear during invasive procedures such as extraction and getting injections.

Key Words: *Dental Anxiety, MCDAS, Children, Phobia*

Introduction

Dental fear usually refers to a normal unpleasant emotional reaction which is specific to threatening stimuli occurring in situations associated with dental treatment, while dental anxiety is just an unreasonable negative emotional state experienced by patients. Dental fear and anxiety (which is dental fear and anxiety, DFA) are major problems for a wide proportion of children and adolescents. The incidence rate can vary between countries by 5-20% where in some cases can be called as a dental phobia due to its extreme nature [1, 2,3]. Children and adolescents with DFA are often uncooperative and restless during dental visits, thus rendering treatment difficult or impossible [3] . Such behavior compromises the treatment outcome and can create occupational stress among dental staff, and is often a cause of disconnection between dental professionals and patients or their parents [4]. Due to their anxiety or fear, the children and adolescents may try even possible means to avoid or delay the treatment. This negative behavior correlates to non-attending patterns, which leads to irregular attendance to eventual drop out. This deteriorates their oral heath [4,5,6]. This can also have greater effects on a child's sleep, daily life and can leave a mark on one's normal functioning [7,8]. This can also interfere with their dental visits as an adult [9,10]. Thus, Pinpointing dental anxiety at a young age can help the individual gain a more positive outlook towards dentists.

Previous studies into dental anxiety drew predominantly upon quantitative instruments such as questionnaires [3]. These instruments are however largely based on the individual professionals' presumptions and may not capture the entire spectrum of the individual's perceptions and views [11]. These quantitative methods will focus mostly statistics and does not go deeper into

uncovering complex mechanisms. Qualitative research is considered an important complement to quantitative methods, especially for an in depth understanding of the human behaviors.

Self-reported measures are commonly used in the assessment of dental anxiety. One significant advantage of self-report measures is the ease of administration, especially in larger case trials, i.e. taking a relatively shorter period of time to complete. They can also assess the response to different aspects of the dental experience in a comparatively shorter duration of time. Corah's Dental Anxiety Scale (CDAS) is one of the most popularly used methods of dental anxiety assessment in adults. When applied to children the wordings of the CDAS is considered too complex and the need for modified or simpler versions of the scale came up [11, 12, 13, 14]. As a result of this, Wong et al [15] came about the Modified Child Dental Anxiety Scale (MCDAS) based on CDAS. The MCDAS includes eight questions to assess the dental anxiety about varied dental procedures. The scale includes a question about local anesthetic, and other dental procedures that commonly stress out the children, such as extraction, dental general anesthesia (DGA), and restorations or 'fillings'[16].

A five-point scale is used to assess dental anxiety with scores from 'relaxed/not worried' (scored as 1) to 'very worried' (scored as 5). The total scores on the MCDAS range from 5 (little or no dental anxiety) to 40 (extreme dental anxiety). The MCDAS has been used and experimented in 8- to 15-yearolds and has been shown to be a reasonable and comparatively reliant measure of child dental anxiety exhibiting good internal consistency and validity according to literature [16, 17,18]. Normative data are available for both English [16] and Greek–Cypriot school children [17]. Although the MCDAS has shown increased rates of success and reliability in comparison to the Children's Fear Survey Schedule-Dental Subscale [CFSS-DS] [16] and other dental scales, Buchanan [18] reported an improved completion rate and accepatbility with the Smiley Faces Program (SFP) which is a computer based face version of the dental anxiety scale; when compared to the previously popularly used CFSS-DS and the MCDAS, which suggests that numeric rating scales are too difficult for anxious or younger children to understand and complete . A numeric rating scale or heavily worded rating scale is usually understood by children who are capable of good cognitive functioning; however, under the potentially anxiety-provoking environment of the dental situation the child may regress and experience a lowering of their cognitive ability [19]. With a reduction in cognitive functioning the MCDAS may be even more difficult for the regressed child to understand due to its dependence on understanding of the various parameters. An important disadvantage of self-report measures and other scales with a numeric rating scale is their unsuitability in the assessment of dental anxiety in the very young, uneducated children and children who are unfamiliar with the given language. In order to overcome these potential difficulties a pictorial version with faces of the MCDAS was developed for use in 7- to 9-year-old children (or even younger individuals), substituting pictorial response scales for the original worded response scale [20].

Very limited information is available for the reliability and validity of the pictorial modification of the CDAS. Other assessments adopting a faces approach include the Facial Image Scale (FIS), the Dental Anxiety 5 Scale and a computerized Smiley Faces Program (SFP). The Facial Image Scale[18] has been validated in the assessment of anxiety in children immediately prior to entering the various dental procedures. The limitation was that it only used a single construct which makes it difficult. The DA5 is a dental anxiety scale designed specifically for use with 5-year-old children [21] where in the responses are noted using a four item face rating scale. Some evidence has been presented for the reliability and validity of the DA5; however, its application is limited to younger children (especially around 5 years of age) . More recently, a four-item computerized SFP has shown good reliability and criterion validity[18] however, this method is very likely to be limited by the fact that the needs to be an access to computer equipment, which is not financially possible in all cases. Therefore, there will always remain a need for a simple and valid method of assessing dental anxiety in the young and/or nervous child. The MCDAS appears to be a comparatively useful measure of dental anxiety in this regard. It is, however, limited by the level of cognitive functioning required by the child to complete the numeric rating scale. It would seem reasonable that the inclusion of faces, based on the above literature, to correspond to the like scale could be useful in assessing dental anxiety in the young as well as the anxious older child. Therefore, there is a need to modify the MCDAS with the addition of a faces analogue scale while anchored above the original numeric form to allow for any decrease in age adequate functioning,

understanding related and cognitive function.

Similar studies have been conducted in the Iranian [22] and Kuwaiti[23] population. To the author's knowledge, no information on this topic is available for a south Indian population.

Thus, the aim of the study understand the levels of anxiety among children for various dental procedures using MCDAS in the South Indian population.

Materials and Methods

A total of 100 children who visited Saveetha Dental College and Hospitals, a private institute in South India, were selected using Random sequence generator from the whole list of patients reported. Each children were shown the MCDAS-faces version and asked to mark their responses. Verbal parental consent was procured prior to the interaction.

Inclusion Criteria:

1. Age of 5-18

2. South Indian ethnicity

3. Children who are not physically or mentally challenged

4. No disclosed learning difficulty

Exclusion Criteria:

1. Other ethnicity.

2. Uncooperative children

3. Children with no prior dental visit history

The participants' gender, age, source of referral and reason for visiting the dentist were recorded. They were then categorized into age groups 5-10 and 10-15. The responses from the questionnaire with response using faces was tabulated and compared.

Results

The results for visiting a dentist showed increased levels of fear the younger age group(35.19%) compared to the older age group (19.57%). The similar pattern was seen in response to the question of having their teeth looked at wherein increased levels of fear was seen in younger age group(24.07%) compared to the older age group (10.87%). The results for having teeth polished or cleaned showed increased levels of fear the younger age group (24.07%) compared to the older age group (10.39%). However, the opposite response was noted for the question about getting injections where in the older age group was more anxious (69.57%) than the younger age group (28.26%) and also for getting the tooth pulled out (64.81% as compared to 82.61%). The results for getting a filling showed increased levels of fear the younger age group(35.19%) compared to the older age group (28.26 %).

Table 1 shows the response to the question if children are afraid of visiting the dentist

Responses	Age Group: 5-10	Age group : 11-15
1	24.01%	14.81%
2	5.56%	3.70%
3	9.26%	11.12%
4	25.92%	16.67%
5	35.19%	53.70%

Table 2 shows the responses to question on having the teeth looked at

Responses	Age Group: 5-10	Age group: 11-15
1	37.04%	50%
2	9.26%	15.22%
3	7.41%	4.35%
4	22.22%	30.43%
5	24.07%	19.57%

Table 3 shows the responses to the question having your teeth scraped and polished

Responses	Age Groups: 5-10	Age Groups: 11-15
1	37.04%	47.83%
2	14.81%	13.04%

3	12.96%	10.87%
4	16.67%	10.87%
5	18.59%	17.39%

Table 4 shows the response to the question of receiving an injection

Responses	Age Groups: 5-10	Age group: 11-15
1	14.81%	10.87%
2	3.70%	2.17%
3	11.12%	13.04%
4	16.7%	4.35%
5	53.70%	60.57%

Table 5 shows the response to the question of having a filling

Responses	Age Groups: 5-10	Age groups: 11-15
1	18.52%	32.61%
2	14.81%	10.87%
3	7.41%	15.22%
4	24.07%	13.04%
5	35.19%	28.26%

Table 6 shows the response to having the tooth pulled out

Responses	Age Group: 5-10	Age Group: 11-15
1	11.11%	8.70%
2	5.56%	4.35%
3	7.41%	2.17%
4	11.11%	2.17%
5	64.81%	82.61%

Discussion

Dental fear in children has continued to produce numerous interests in pediatric dentistry. This is owing to the fact that there are possibilities of associated complications. It causes stress for many dentists who should manage such children particularly those who have associated behavioral problems. Additionally, the chair time needed to manage these children is lengthy and some specialized training is also required in successful management of these children. None the less, to efficiently manage this problem, it is essential to determine its prevalence in a population to facilitate scheduling of public health services.

On the other hand, tools are required to assist diagnosing its presence and the severity in individuals to help modify individual treatment. At last, there is also a need for tools which can measure treatment required and successes of management. This would be facilitated with monitoring and assessing treatment outcomes.

When asked about visiting the dentist, a remarkable percent of them reported to be anxious (35.19% for younger children and 19.57%). This stands parallel to the research of Honkala S et al[23]who reported a third of the girls and 6% of boys reported being very much afraid of visiting a dentist. This could stem from the fear of the unknown, negative experiances shared by peers or siblings, the fear of invading their personal space, feeling helpless and constrained, lack of trust, fear of pain and even personal previous dental experience. Thus, communication and establishing a good rapport with the child is important to build a foundation of trust and comfort.

When asked about getting their teeth looked at, 24.07% of young children and 10.87% of older children reported feeling anxious. This could stem from invasion of their personal space and feeling restrained in the dental chair. It could also stem from having unknown instruments placed in their mouth for examination. In such cases, a prior explanation will help alleviate the fear of routine examinations.

The results to having their teeth cleaning and polished showed the lowest levels of anxiety (18.52% in young children and 17.39% in older children). This starts in accordance to Honkala S et al' research as well. This could be due to their association of cleaning with brushing which is a routine activity and not painful, excitement for a cleaner set of teeth and their understanding of the procedure when explained.

The results to having injection showed, as expected, a very high levels of anxiety (53.70% in young children and 69.57% in older children). This stands in accordance with Honkala et al who concluded the same. The trypanophobia could arise from negative life

experiences or previous trauma brought on by a specific object or situation, relatives who've had phobias (which may be suggesting genetic or learned behavior), a sensitive, inhibitive, or negative temperament, learning about negative information or experiences. This can be managed by not showing the syringe to the child, being honest about the pain levels but not entirely graphic, substituting anesthesia to simpler words for easy communication, keeping or removing the parental figure from the vicinity based on the reaction. By rewarding the child after the procedure, the dentist ensures a positive reinforcement and brings about a more positive outlook towards dental visits.

When asked about getting fillings, there was a high level of anxiety as well (35.19% in younger individuals and 28.26% in older individuals). This can be attributed to the invasion of personal spaces, loud sounds from the aerator and compressor, prolonged mouth opening time or uncomfortable mouth opening, and in some cases sensitivity and pain as well.

The highest levels of anxiety was associated with dental extraction (64.81% in young children and 82.61% in older children). This is primarily due to involvement of the administration of local anesthesia with a syringe. The other reasons include the inability of the child to differentiate between pain and pressure, the visual pressure of seeing blood, negative experiences as shared by friends and siblings and their own experience with post-operative pain or negative experiences. Thus, to limit this fear, faster, atraumatic extractions should be performed.

Conclusion

Despite the complexity and time constrains, the researches for over nearly 60 years have focused almost exclusively on the endpoints of the paradigm; that is, normative research has tried to identify fear stimuli. Virtually all of the variables between, observable and inferred, have been left unexplored and intact, leaving one with little understanding of fear processes in children. Future research will do well to follow the present literature's hints and look more closely at the unexplored areas identified, such as the possible adaptive values of children's fears, fear-prevention strategies, cognitive self-control variables, and other developmental and influencing factors. In short, we must recognize and test far more complex paradigms of the fear process. And finally, we clearly must identify the ways to counteract this fear in the individuals by a personalized and targeted approach.

In conclusion, our study proved that:

1. Younger children are generally more anxious than older children.

2. The highest anxiety levels were reported with getting a tooth pulled out followed by receiving an injection.

3. The lowest anxiety levels were reported with having their teeth cleaned and looked at.

4. MCDAS(faces) is s valid tool for anxiety assessment in the South Indian population.

Surface Analysis of Citric Acid and EDTA on Root Canal Dentin- An In Vitro Study

Varshitha A[1], Subash Sharma[2]

[1]Undergraduate Student, [2]Reader, Department of Conservative dentistry and Endodontics, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Chennai, TN, India

Abstract

Aim: To analyse the effect of 10% citric acid and 17% EDTA in removing the smear layer on root canal dentin using scanning electron microscope

Materials and method: 15 Single rooted extracted teeth were decoronated and randomnly divided into 3 groups based on the irrigant used, 10% citric acid, 17% EDTA and saline. Root canals were enlarged till size 80 K file and Gates glidden drill No 5 with the respective irrigant. Longitudinally teeth were split into two halves. Final irrigation with their respective irrigant for 30 minutes, washed in distilled water and dried. Samples were examined under scanning electron microscope and photographs were taken at 2000x and 3000x magnification. Images were scored based on the presence of smear layer. Scores were statistically analysed by kruskal wallis test and Mann-Whitney test and considered to be significant when $p<0.05$

Results: Kruskal- wallis and Mann- Whitney test between the test samples show that there is a significant difference between the effect of saline and Citric acid. The difference between citric acid and EDTA is minimal ($p= 0.008$).

Conclusion: This study can be concluded that the use of 10% citric acid could be a good alternative to EDTA as a root canal irrigant because of the similar desmearing properties. Citric acid has added advantages like less cytotoxicity, anti microbial property and the weakening of root canal dentin is less.

Keywords: *Citric acid, EDTA, root canal irrigation, smear layer*

Introduction

Dental caries is one of the most prevalent diseases leading to demineralisation of the teeth. The microbes infiltrate into dentin and the vitality of the pulp is affected [1] .Microbes in the root canal play a significant role in pathogenesis of periapical periodontitis [2, 3] .There is a high possibility for teeth to have extra root canals. These extra root canals must be identified and cleaned to prevent root canal failure [4] . The primary goal of three dimensional cleaning and shaping is to obtain complete debridement of root canal and to achieve a successful outcome of the root canal treatment [5] . The formation of smear layer due to mechanical instrumentation of the root canal might prevent the penetration of intracanal medicaments into the dentinal tubules, disinfection of intracanal dentin and it also impairs the adherence of the obturating material to the dentinal tubules to create a proper tight seal by reducing the coronal and microleakage of the sealers used in root canal treatment [6, 7, 8] . Hence, the treatment should not limit to the removal of remnants of pulp and root canal widening [9] . It is recommended to remove the smear layer as it may consist of a mixture of organic components like

Telephone number: 9884533118

microbes and their products, pulp tissue, necrotic debris as well as the inorganic components such as mineral content of dentin [10, 11].

Several methods like ultrasonics, lasers and organic acids are employed in removing smear layer but the most commonly used method is by using chelating agents during irrigation or it is used in combination with other irrigants having tissue dissolving properties [12]. The principal cause of failure of endodontic treatment is due to the presence of persistent infection in the root canals which impairs the periapical area healing [13] .An ideal irrigant should be capable of removing the organic and inorganic components of the smear layer and also be capable of penetrating and disinfecting the entire root canal system. Irrigant should also be able to clear the loose debris in the canal during cleaning and shaping of root canal [14] .Irrigant can change the surface properties of the dentin like wettability and also enhance the bonding between the dentin and restorative material [15]. These irrigants should also be compatible with the periodontal tissues and it should not heal with the healing of the periodontal tissues after root canal treatment [16, 17].

Ethylenediaminetetraacetic acid (EDTA) is a calcium chelating agent which is commonly used in endodontics for the removal of smear layer [18]. Studies state that final rinse of EDTA can open up the dentinal tubules and increases the number of lateral canals that will eventually get filled by the sealer [19] .Various studies have shown that a combination of EDTA and sodium hypochlorite is effective in removal of organic and inorganic components of the smear layer [20, 21] .But some reports show that the use of sodium hypochlorite and EDTA can cause dental erosion in the root canal wall [22, 23].

Citric acid is a cleansing and decalcifying solution. Citric acid is a chelating agent which forms a non-ionic soluble chelate when it reacts with the metal ions [24]. Few studies have reported that the effects of citric acid on removal of smear layer were similar to EDTA [24, 25] . Also citric acid is less cytotoxically irritable to tissue when compared to EDTA [26].

The principle aim of this study is to compare and evaluate the effectiveness of 10% citric acid, 17% EDTA as root canal irrigant to remove smear layer following biomechanical preparation of the root canal

Materials and Method

Sample collection and preparation

15 Single rooted, non carious, anterior extracted teeth with straight roots were collected from Saveetha dental college and hospitals. The soft deposits on the teeth were removed by ultrasonic scaling at a very low speed and the teeth were stored in distilled water. Diamond disc was used to de-coronate the teeth at the level of cemento enamel junction and the apical third of teeth was also cut to achieve a standardised root length. The samples were randomly divided into three experimental groups based on the irrigant used. Three groups were 17% EDTA, 10% Citric acid and saline respectively. Root canals were enlarged using stainless steel hand instruments till size 80 K file and Gates glidden drill No 5. The canals were irrigated with their respective irrigant throughout the root canal preparation. Final irrigation was done by immersing each sample in their respective irrigant for 30 minutes, washed in distilled water and dried with sterile paper points. Longitudinal grooves were made on the buccal and palatal/ lingual surfaces of all the roots by using a diamond disc at a slow speed and care was taken to not penetrate the root canal. Chisel and mallet was used to split the tooth into two halves.

Scanning electron microscopy

Samples were mounted on metal stubs and gold sputtering was done using ion sputter. These samples were placed in vaccum chamber and examined under scanning electron microscope to observe the smear layer. Several photographs were taken at 2000x and 3000x magnification to analyse the surface of the root canal walls.

Image scoring

The images were graded by an independent examiner unaware of the experimental groups to which the sample belonged.

Images were scored according to the scoring system below. [27]

Score 0 - No smear layer and smear plug; no smear layer of the root canals. All dentinal tubules were cleaned and opened.

Score 1 - No smear layer but mild smear plug; no smear layer of the root canals, small amount of smear

plug in some dentinal tubules.

Score 2 - No smear layer but moderate smear plug; no smear layer of the root canals. . Most of the dentinal tubules had smear plug.

Score 3 - Moderate smear layer; moderate smear layer covered the surface of the root canals; only few dentinal tubules were opened

Score 4 - Heavy smear layer; complete root canal wall covered by a homogenous smear layer and no opening dentinal tubule

Score 5- Heavy smear layer; complete root canal wall covered by a heavy non-homogenous smear layer and no opening dentinal tubule

Data analysis

The scores were tabulated, mean and standard deviation was calculated. The data of the scores were compared within the groups to evaluate the effect on smear layer removal. It was statistically analysed by kruskal Wallis test and Mann-Whitney test. It was considered to be statistically significant when $p < 0.05$.

Results

Table 1: Mean and standard deviation of scores for all the test samples

Sample	N	Mean	Std. Deviation	Std. error	95% Confidence Interval for Mean		Maximum	Minimum
					Lower Bound	Upper bound		
Saline	5	3.96	1.1437	0.5115	2.5399	5.3801	2	5
17% EDTA	5	1.32	1.3971	0.6248	-0.4148	3.0548	0	3.6
10% Citric acid	5	1.48	0.3033	0.1356	1.1033	1.8566	1.2	3

Table 2: Kruskal-Wallis Test for the samples

GROUP	N	Mean rank
17% EDTA	5	7.90
10% Citric acid	5	9.70
Saline	5	21.70
Chi square- 14.162		P = 0.007

In Mann- Whitney test, there is no significant difference between EDTA and citric acid but there is a marked significant difference between saline and citric acid

Table 3: Mann- Whitney Test for the samples

GROUP	N	Mean Rank	Sum of ranks
17% EDTA	5	3.20	16.00
10% Citric acid	5	3.10	15.50
saline	5	7.90	39.50
		P= 0.008	

Kruskal- Wallis test between the test samples show that there is a significant difference between the effect of saline and Citric acid. The difference between citric acid and EDTA is minimal.

Examination of dentinal surface of root canal in 10% citric acid shows absence of smear layer and mild smear plug along the complete length of the canals.

Examination of dentinal surface of root canal in 17% EDTA shows absence of smear layer and smear plug along the complete length of the canals. The dentinal tubules were clearly visible in most of the samples.

The examination of the dentinal surface of root canals in saline (control group) shows the presence of heavy smear layer along the complete length of the root canals. The dentinal tubules were not even visible in few samples.

Discussion

Presence of non homogenous structure like smear layer on root canal walls may disintegrate leading to the formation of voids between the obturating material and the root canal wall [28] . Various methods like micro-radiographic assessments, micro hardness analysis, atomic force microscopy, spectrometry studies and scanning electron microscopic studies are employed to check the efficacy of various root canal irrigants used to demineralise, remove smear layer and soften the root dentine during endodontic [29, 30, 31]. . The de-smearing efficacy of the chelating agents and acids depends on pH of the solution, time of application, diffusion into the dentine, concentration of solution [32, 33] . Uzunoğlu et al. reported that the irrigation procedures affect the fracture resistances of root endodontically treated teeth [34]. Ideally, after the irrigation during endodontic treatment, mechanical properties of dentin like composition, hardness and strength should be minimal and it should not be affected in any negative aspect. But, the use of EDTA and sodium hypochlorite causes dissolution of dentin at the peri-tubular and inter-tubular areas [35].

Citric acid is shown to be effective when the pH values are between 0.8–1.9. [36] . Wayman et al. reported that use of 10% citric acid as root canal irrigant is effective in removal of smear layer [37]. Chan et al. stated that increase in the acidity of citric acid will show an increase in the cell death. 10% citric acid was employed in this study because of its better biocompatibility and it does not weaken the root canal dentin [38]. . Citric acid solution have strong antimicrobial activity against facultative and obligate anaerobes like *P. anaerobicus, E. lentum, V. parvula, F. nucleatum, A. naeslundii, B. bifidum, P. avidum* [39].

EDTA at 17% concentration with neutral pH is more commonly used as an irrigant in root canal treatment [40] .Patterson stated that 3% and 10% EDTA solutions showed antibacterial effect again streptococcus and staphylococcus .Exposure of 0.03% EDTA on soft tissue causes minimal tissue damage and increase in concentration of EDTA will further increase the degree of inflammation .Studies have stated that 15% and 17% EDTA is toxic in invitro studies [41] . EDTA is more cytotoxic when compared to citric acid [42] .

In this study, 10% citric acid completely removed the smear layer. The effect of 17% EDTA is superior to the effect of 10% citric acid. Tugba et al. stated that 2.25% citric acid was effective in removal of smear layer but it causes erosion of the root canal dentin [43] . Perez et al. stated that 15% EDTA and 15% citric acid causes root dentine decalcification, especially during the first 5 minutes of action and also the efficacy of these solutions were significantly high [44] . Di lenerda stated that there was a negligible difference in the de-smearing properties of EDTA and citric acid [45] .Mohammed et al. stated that de-smearing capability of MTAD (mixture of tetracycline isomer, an and a detergent) is better than citric acid near the apex of the root canal probably due to reduction in root canal diameter which impairs of the flow of irrigant in that area [46] .But the substantivity of the solution can be altered when it is used along with sodium hypochloride and it also has a weakening action on dentinal tubules [47, 48] . Yogendra et al. stated that 10% citric acid is more effective than 17% EDTA in demineralisation of root canal dentin [49] . Study by Miriam states that there was no significant difference between the effect of 10% citric acid and 17% EDTA on old and young root canal dentin [50] .

In this study, 17% EDTA is found to be superior when compared to the effect of 10% citric acid on root canal dentin. But this difference is negligible when compared to the effect of control group (saline).

Conclusion

This study can be concluded that the use of 10% citric acid could be a good alternative to 17% EDTA as

a root canal irrigant because of the similar desmearing properties. Citric acid has added advantages like less cytotoxicity, anti microbial property and the weakening of root canal dentin is less.

Conflict of Interest: Nil

Ethical Clearance: Ethical clearance wasobtained from the institutional Ethics Committee, Saveetha University (SDC/IHEC/061)

Comparing the Clinical Accuracy of Orientation Jaw Relation Recorded with Various Commercially Available Facebows - An in Vivo Study

Pon kirubha Robin[1], Deepak Nallaswamy[2], M.Subha[3],

[1]Post graduate, [2]Professor, Department of Prosthodontics, [3]Associate Professor, Department of Oral Medicine & Radiology, Saveetha Dental College, Chennai, India

Abstract

Articulators and facebow are an integral part of prosthodontics therapy that ensures accurate reproduction of the patients maxillomandibular relationship. Facebow has been regarded as as indispensable accessory of semi adjustable articulators for transferring the maxillary relation to the articulator. Facebows are of two basic types. They are Arbitary and the Kinematic facebow. Arbitrary facebows are popular, their level of accuracy has always been a topic of debate for reasons such as variable anterior reference points, operator variability and arbitrary posterior point of reference. There are numerous studies that have evaluated the accuracy of a facebow. The present study aims to the study and compare the clinical accuracy of orientation jaw relation recorded with various commercially available facebows.

Key words: *Factor, jaw relation, occlusion, arbitrary face bow, Kinematic face bow*

Introduction

Face bow is defined as "A caliper that serves to record the spatial relationship of the maxillary dental arch to some anatomical reference points and to transfer this relationship to an articulator. This procedure ensures that the cast of the maxillary dental arch is oriented in an equal or at least comparable distance to the hinge of the articulator as are the natural maxillary teeth to the assumed "axis of rotation" of the temperomandibular joint"(GPT-8)[1].

Articulators and facebows are an integral part of prosthodontics therapy that ensures accurate reproduction of the patients maxillomandibular relationship in a laboratory setting. Facebow has been regarded as an indispensable accessory of semi adjustable articulators for transferring the maxillary relation to the articulator.[2]

Facebows are of two types, Arbitrary and Kinematic facebow. Arbitrary facebows could be classified as the facia and earpiece type. They orient the relationship of the maxilla to an arbitrary hinge axis[3] demonstrated that an arbitrary facebow orients the maxilla to the hinge axis with a 5mm degree of error. Kinematic facebow orients the jaw to the actual hinge axis with a 2mm degree of error. However, Arbitrary face bows are commonly used because of its ease of use and minimal demand for chair time.

Although, Arbitrary facebows are popular, their level of accuracy has always been a topic of debate due to variable anterior reference points, operator variability and arbitrary posterior point of reference. There are numerous studies that have evaluated the accuracy of a facebow. These studies have either evaluated a particular system for its accuracy in transferring the angle of the plane of occlusion or anteroposterior relationship of maxilla to the hinge of the articulator. Many studies have used Cephalometric analysis as a reliable method to verify whether the maxillary relationship transfer made by a facebow in closest as it is present in the human skull. The limitation of Lateral Cephalograms is that it only aids in accessing the transfer in a two dimensional

manner. Cone Beam Computed Tomography (CBCT) has been widely used in dentistry for three dimensional Implant Surgical planning. However, there is no study that has analysed and compared currently popular five articulators and facebow systems for the accuracy of transferring anteroposterior relationship of the maxilla to the hinge of the articulator using CBCT.

The present study aims at study and compare the clinical accuracy of orientation jaw relation recorded with various commercially available facebows.

Materials and Method

A controlled cohort study as Randomised control trial is not possible due to limitation in blinding or randomising the subjects and the operator.Three participants were chosen CBCT was taken and the intercondylar distance (ICD) is measured. ICD more than 125 is labeled as large, more than 110 and less than 124 was labeled as medium, more than 90 and less than 109 was labeled as small. Power and sample size was calculated using G Power version 3.0.10 software based on a closely related study that evaluated similar parameters. The ad hoc power calculation revealed that a sample of six repeated transfers were required to eliminate the statistical probability of errors in facebow transfer.

Groups

A total of five articulator facebow systems were evaluated in this study. Each system was evaluated for accuracy in three subjects in order to evaluate the accuracy of the facebow, each transfer was repeated 6 times. Hence, the sample size for each group was 6 with the total of 18 data points .A written consent was obtained from the subjects prior to commencement of the study

The armamentarium include indelible pencil, normal pencil, permanent marker, divider, rubber bowl, plaster mixing spatula, impression trays, type III Dental stone, plaster of paris, bite registration paste, Artex facebow and Articulator system, Denar facebow and Articulator system, Hanau facebow and Articulator system, Stratos facebow and Articulator system, Whipmix facebow and Articulator system and CBCT.

Artex facebow and Articulator system:

The participants were positioned as according to the protocol. The bite fork was positioned at the midline of the maxillary arch and indexed in place with the blue mousse bite registration paste. The participant was asked to bite on cotton rolls to stabilise the bite fork against the mandibular teeth. The nasal bar was locked and stabilised in the preferred position using the nasion set screw. The three dimensional universal joint was attached to the bite fork with the connecting screw which was locked by turning the toggle lever. Then the universal joint was detached from the facebow and transferred to the transfer platform and secured in position using bite registration paste. Later, the magnetic table was detached along with the bite fork and positioned in the articulator. The maxillary model was positioned over the bite registration paste and mounted using low expansion type III dental stone. Once the stone had set , The distance between the medial pole off the condylar element to the marking made on the distobuccal cusp of the last molar(Molar Condylar Distance MCD) was measured and calibrated over a ruler in millimetres.

Denar facebow and Articulator system:

The participants were positioned in a similar way and the bite fork was indexed to the maxillary cast as described before. The bite fork was inserted to the participants mouth and stabilised against mandibular teeth with cotton rolls. The anterior reference points were marked approximately 43mm superior to the incisal tip of the maxillary central incisor with the help of the reference plane indicator. The locking screws of the "U" shaped frame were unfastened and adjusted to fit into the external auditory meatus. The frame was positioned parallel to the patients Frankforts horizontal plane. The centre of the face was verified with the participant's midline. Later, the set screw number was unfastened and the bite plate was aligned in position. The vertical bar was also secured tight. Finally, the vertical assembly along with the bite fork was alone removed with the "U" shaped frame and transferred to the articulator with the help of the transfer jig, which was placed in the place of the incisal guide table. The vertical portion of the transfer assembly was secured tight with the help of the set screws. Following which, the model was positioned over the bite fork index and mounted as described before and the MCD measurement was made as described previously.

Hanau facebow and Articulator system:

The participants were positioned as per standard protocol. The bite fork was indexed over the midline of the maxillary model. Inserted in the patient's mouth and stabilised against the mandibular teeth with cotton rolls. The anterior reference points. Orbitale was marked with the marker pen after palpation of the infra orbital rim. Following which, the self centering "U" shaped spring frame was opened wide and positioned into the EAM. The "U" shaped frame was positioned parallel to the Frankfort's plane with the help of the orbital indicator levelled at the orbital off the subject. The bite fork was attached to the "U" frame with the transfer assembly and locked in place by sequentially tightening the numbered thumbscrews. Finally, the entire facebow assembly was carefully removed from the participant and positioned on the articulator. The bite fork stabilised with the maxillary cast support. The maxillary model was positioned and mounted as described before and the MCD was measured as described previously.

Stratos facebow and Articulator system:

The participants were positioned as per the standard protocol mentioned above. The universal transfer bow system (UTS) BD frame was aligned properly in the EMA to the comfort of the participant. The adjustable nose piece was positioned according to the reference point and locked with the help of a universal lock. Participant was instructed to bite and hold the device in position and the width setting screw was tightened. The bite fork was later, attached to the face bow with the registration joint. It was aligned in horizontal positions and the joint was locked tight with the tommy screw. Finally, the facebow was transferred to the articulator and held in position with the help of adjustable support pins. The maxillary model was mounted and the MCD measurement was made as previously mentioned.

Whipmix facebow and Articulator system:

The participants were positioned as per standard protocol. The "U" shaped frame was oriented in the external auditory meatus and the nasion relator was positioned at the glabelle. The thumb nuts were secured in the desired position. The horizontal screw was tightened first, followed by the vertical screw. The relationship was transferred to the articular and the maxillary model was mounted. The MCD was measured as described previously.

CBCT:

The participant setup was done according to the instructions for the Cone beam computed tomography machine. The parameters were adjusted according to the participants skull size. Head restrained was used to stabilise the head. The participants mid plane was oriented to the vertical laser beam of the machine. The time taken for the scan varies from 14 to 18 seconds. The multiplanar reformatted image of CBCT helps to view the images in axial, coronal, sagittal planes . SIRONA ORHTOPHOS XG was the CBCT machine used for this study. The MCD measurement was made with the help of the CBCT software by the radiologist. And the results were submitted in the form of report.

Statistical Calculation SPSS Software version 20 was used. The values obtained followed a normal distribution and so were analysed with parametric test(One way ANOVA). Post hoc Bonferronni test was applied to compare intergroup variability. A blinded observer performed data analysis. The MCD data were collected in standard proformas.

Results

The findings of this study reject the null hypothesis H0 and support the alternate hypothesis Ha and are presented in the following sections:

Demar and Artex facebow articulator systems have the least variation in subjects with large ICD(Table 1). Although, the Hanau and Stratos facebow showed negative variation in subjects with large ICD these facebows offered the most accurate facebow transfer. The Whipmix facebow appears to be least accurate. Hanau and Stratos facebow articulator system showed negative variation in subject with medium ICD these facebows offered the most accurate facebow transfer (Table 2). The Whipmix facebow appears to be least accurate.Stratos and Hanau facebow articulator systems have the least variation in subjects with small ICD (Table 3). The Denar facebow appears to be least accurate.(One way ANOVA, post hoc Bonferronni test).

Hanau and Stratos facebow articulator systems have the least variation in subjects with small and large ICD. Although , the Hanau and Stratos facebows showed negative variation in subject with medium ICD, these facebows offered the most accurate facebow transfer. The Whipmix facebow appears to be the least accurate.

Comparison of Variation in MCD across the five facebows(Table 4): The Hanau and Stratos facebows had the least variations in MCD P<0.001.(One way ANOVA, post hoc Bonferronni test).

Table 1: Comparison of patients with large ICD using various face bow

Group	Mean ± SD	Significance
Artex	0.9033 ± 0.04082	P<0.000
Denar	0.7617 ± 0.23752	
Hanau	-0.2933 ± 0.15513	
Stratos	-0.5550 ± 0.11726	
Whipmix	1.5617 ± 0.14634	

Table 2: Comparison of patients with medium ICD using various face bow

Group	Mean ± SD	Significance

Hanau	-0.15 ± 0.18	
Stratos	-0.23 ± 0.33	
Whipmix	1.25 ± 0.31	

Discussion

According to the results of the present study, Hanau and Stratos facebow articular systems have the least variations in MCD P<0.001(One way ANOVA, Post hoc Bonferronni test).The following factors could have confounded the results of this study.

Accuracy and reliability of CBCT imaging:

The advent of CBCT has offered promising results for multiplanar imaging in the field of dentistry[4]. This study demands the need for an accurate three dimensional imaging system. Various studies evaluated the reliability and accuracy of dental measurements recorded with CBCT.[4] One such study reported that CBCT is a reliable tool for linear measurements of structures closely associated with dentofacial imaging.[5,6]

Repeatability of bitework positioning/facebow transfer:

Numerous studies have evaluated the accuracy of facebow transfer and its implications in clinical outcome[7], since the transfer done using an arbitary facebow is based on variable reference points, its credibility as always been a topic of debate[7,8], although, this instrument has been reported to transfer the maxillary relationship to the inch of the articulator as truly as possible to that present in human skull.[9]

Bitefork carries the valuable information of the occlusal contours and the plane of maxillary in both horizontal and vertical plane.[10] Even a mild shift from the patient's facial midline during the placement of the bitefork can cause an error in orienting the maxilla accurately.[11] To avoid repeatability bias all the facebow transfers were done by a single operator, the procedure was subjected for six times with each facebow system for every participant and the mean was obtained, the bite was recorded only once for every system and the same bite was used for repeated transfer.

One of the main reasons is because of the improper locking of the thumbscrews could lead to minor movement of the bite fork and ultimately an error in facebow transfer.

Dimensional Stability of the Bite record :

There are various materials available for bite registration such as,waxes, Vinyl polysiloxane (VPS) material in paste or injectable forms. Not all materials satisfy the criteria for an ideal bite record . A study by millstein and HSU evaluated most popular and commercially available bite registration VPS materials and reported that blue moose was one among the highly accurate and dimensionally stable materials. Hence, the blue moose bite registration paste, was used as it satisfied the primary need of the bite record to be rigid and stable.

Errors in mounting the model:

Model plaster has reported to produce inaccuracy when used for mounting the models in the articulator[12] are the studies that have concluded that low dentrite mounting stones produces minimum setting expansion. In this study, Kalabai ultra articular mounting stone was used for mounting the maxillary models to the articulator.

Intercondylar distance:

One another confounder bias would be the distance between both the condyles.In a subject with small ICD Hanau and Stratos facebow systems showed less variation in the MCD value obtained from CBCT imaging. In a subject with medium ICD Artex and Whipmix facebow lesser variation in the MCD value obtained from CBCT imaging. In a subject with larger ICD Denar and the Artex facebow systems showed lesser variations in the MCD value obtained from CBCT imaging. While calculating cumulatively Hanau and Stratos showed less variation in the MCD value obtained from CBCT compared to other facebow systems.

Operator bias:

Operator bias could have occurred in this study if the MCD measured from CBCT were made prior to the MCD measurement made following facebow transfer. MCD measurements from CBCT could have influenced the operator to measure the MCD on the articulated models with a bias. This bias was prevented in the study by measuring the MCD from the articulator models first. Additionally the operator was not involved in measuring the MCD from CBCT but merely collected the reports from the radiologist and entered them in the proforma for further analysis.

Conclusion

Hanau and Stratos facebow articulator systems

appear to be significantly more accurate compared with the Artex, Denar and Whipmix facebow articulator systems and so can be considered as the system of choice to fabricate complex dental restorations.**Conflict of Interest: Nil**

Abstract

Introduction: Prosthetic complete dentures are commonly used by elderly people. These dentures on exposure to the oral environment forms biofilms. This harbours microorganisms and cause bacterial and fungal infections in the oral mucosa. Also cleansing the denture itself is a task for the elderly people. Any solution which clears the adhered component would help them better. Hence effervecense is a better choice to remove the biofilm.

Aim: To prepare effervescent denture cleansing granules with clove oil and to evaluate its antibacterial activity.

Materials and method: The effervescent granules were prepared from citric acid, tartaric acid and sodium bicarbonate in a ratio of 1: 2: 3. Different concentrations of essential oil were mixed with sodium bicarbonate initially. The citric acid crystals were initially powered and then mixed with tartaric acid .Both these powders were mixed using geometric dilution, further sieved and packed in air tight glass container. The prepared clove effervescent denture cleansing granules were tested against *Streptococcus mutants and Enterococcus faecalis* after dissolving in sterile water. The fresh bacterial suspension was dispersed on the surface of nutrient agar plates. Different concentration of clove effervescent denture cleansing solution (50, 100 and 150 µL) was incorporated into the wells and the plates were incubated at 37°C for 24 h. Zone of inhibition was recorded in each plate. Similarly the antifungal activity was evaluated using rose Bengal agar medium after inoculating with *Candida albicans* and incorporating the prepared effervescent denture cleansing solution.

Result: Clove mediated effervescent granules showed a dose dependent antibacterial activity against the tested microorganism with a maximum effect on *Streptococcus mutans* followed by *Enterococcus faecalis*. The different concentration showed similar inhibition in case of *C.albicans*.

Conclusion: The prepared clove mediated effervescent denture cleansing granules were found to be effective against *S.mutans*, *E. faecalis* and *C. albicans* . Hence it may be used for routine cleansing of denture to protect the denture users from infections such as denture stomatitis.

Key words: *Clove oil, effervescent granules, Denture Cleanser, Denture stomatitis*

Introduction

Recent fast development of dentistry has restored the aesthetic, phonetic and masticatory functions of an individual with prosthetic complete dentures whenever there is a need for complete denture especially in elderly and physically challenged people. It is natural that these

dentures acquire biofilm from the oral environment as they are exposed to variety of food materials and fluids[1]. These bacterial adherence or biofilm formation in the denture can ultimately lead to infections with *candida* as well as *Streptococcus mutans*. Denture stomatitis is often reported in many complete denture users[2-5]. Though more than 60% of the healthy adult have *C. albicans* as a common component of oral bacteria[6]. Hence, denture cleansing that includes removal of *Candida* from its surface is necessary to protect the denture users from denture stomatitis. The normal cleansing solutions may have cleansing ability but a preparation with components which directly have an effect on the infective microorganism may be of great reputation to avoid or prevent infection with prosthetic complete dentures.

Studies have reported the use of plants and seeds as raw materials for manufacturing soaking solutions for their antimicrobial activity[7] .Denture cleansers have chemical or abrasive action. Chemical cleansers include alkaline hypochlorites, alkaline peroxides and dilute acids. Hypochlorites have ability to dissolve organic matrix upon which tartar forms. Alkaline peroxide based powder and tablets when dissolved in water becomes alkaline solution of hydrogen peroxide. The liberation of bubbles of oxygen from this solution exerts a mechanical cleaning effect[8]. The search for alternative products continues as commercially available chemicals have undesirable side-effects though these agents can alter oral microbiota. Hence, natural phytochemicals isolated from plants are considered as good alternatives. Moreover, literature shows that commercially available mouthwashes with essential oils are preferred to those containing chlorhexidine for long-term control of plaque and mild- to-moderate gingivitis[9]

Spoorthi Banavar Ravi *et al*. has recommended the use of *Mangifera indica* and eucalyptus

in oral rinses, dentifrices, cavity liners, and varnishes to improve oral hygiene and cleanliness because of their antibacterial activity against *S.mutans*[10] .In the present study, clove oil is used for the preparation of effervescent denture cleansing granules. Clove extract from *Syzygium aromaticum*, (family *Myrtaceae*) is reported to have good antibacterial effect on *S.mutans*[11,12] .Clove oil contains eugenol ,β-cariofileno ,α-humulen, β-pinene, limonene, farnesol, benzaldehyde, 2-heptanone and ethyl hexanoate[13]. Since the clove oil is known for its antibacterial effect, in this study, its antibacterial effect was evaluated after preparing clove oil based effervescent denture cleansing granules.

Materials and Method

Preparation of Effervescent Denture cleansing granules with Clove oil:

The components such as citric acid, tartaric acid and sodium bicarbonate are taken in a ratio of 1: 2: 3. The citric acid crystals are initially powered and then mixed with tartaric acid. Different concentrations of essential oil were mixed with sodium bicarbonate initially. Both the powders are combined using geometric dilution which is further sieved and packed in air tight airtight containers for use.[figure 1]

Antibacterial activity of Clove oil mediated effervescent Denture cleansing solution

Agar well diffusion method was used to determine the antibacterial activity of clove oil mediated effervescent denture cleansing granules[14]. Different concentrations of the prepared clove effervescent denture cleansing solution was tested against *Streptococcus mutants and Enterococcus faecalis* The fresh bacterial suspension was dispersed on the surface of nutrient agar plates. Different concentration of clove effervescent denture cleansing solution (50, 100 and 150 µL) was incorporated into the wells and the plates were incubated at 37°C for 24 h. Zone of inhibition was recorded in each plate. [Figure 2]

Antifungal activity

Antifungal activity of clove oil mediated effervescent denture cleansing granules was also evaluated using agar well diffusion method. Different concentrations of the prepared clove effervescent denture cleansing solution were tested against *C.albicans*. The fresh fungal suspension was dispersed on the surface of rose bengal agar plates. Different concentration of clove effervescent denture cleansing solution was incorporated into the wells and the plates were incubated at 37°C for 48 h. Zone of inhibition was recorded in each plate. [Figure 3]

Result and Discussion

Figure 1: Schematic representation of the preparation of Effervescent Denture cleansing granule with Clove oil

Antibacterial activity

The antibacterial activity of clove oil based effervescent cleansing granules showed very good zone of inhibition against the oral pathogens *E. faecalis* and *S. mutants*. The preparation showed a dose dependent inhibitory effect on both the tested organism with significant effect on *S. mutans* at the highest concentration used.(Figure 2, Figure 3).

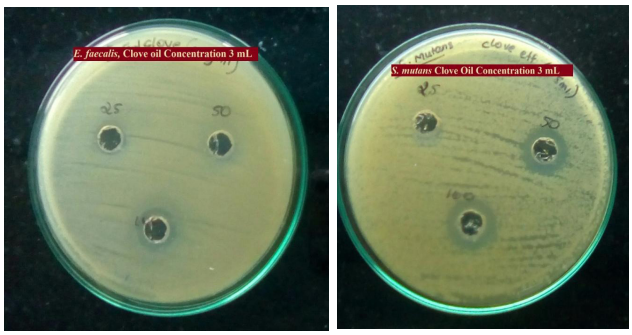

Figure 2: Antibacterial activity of effervescent oil against *Enterococcus faecalis and Streptococcus mutants*

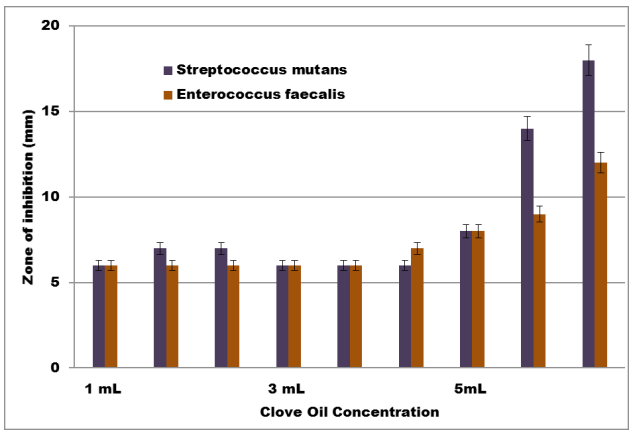

Figure 3: Graph for Zone of inhibition

Antifungal activity of Effervescent oil against *Candida albicans*

In this study three different concentrations of clove oil effervescent granules were tested against *C albicans*. The antifungal activity activity was similar in all the three preparations. The figure 4 clearly shows the concentration of clove oil concentration will not influence the inhibition of fungal growth.

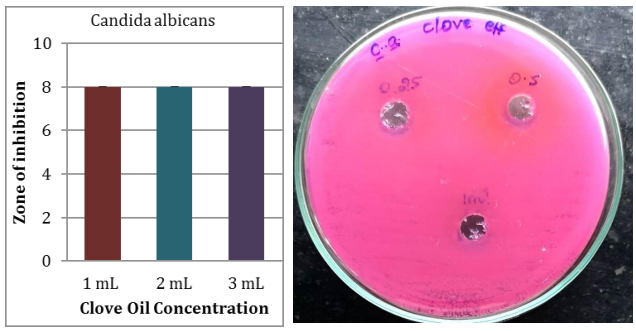

Figure 4: Antifungal activity of clove oil effervescent against *Candida albicans*

The choice of ingredients for effervescent granules depends upon the need of the preparation which should dissolves readily in water. Effervescence granules can be prepared by incorporating an acid and a base so that the base will release carbon dioxide in presence of water upon reaction with acid. Processes like wet granulation, dry granulation or fusion method can be used for the preparation[15].

Antibiotics, plant and herb derived compounds, mouth washes, tooth pastes, gels, varnishes, and the caries vaccines are used for years together for the prevention of dental caries[16] .To preserve oral health and to maintain the prosthetic devices, there is a need to improve the properties of the hygiene products with antimicrobial activity[17]. The effervescent denture cleansing granules with clove oil was prepared by direct dry granulation method. The essential oil clove is used because of its known antimicrobial activity.

The methanolic extract of clove is reported to have activity against *S. mutans* PTCC 1683and S. salivarius PTCC 1448 with zones of inhibition ranging from 14 to 24 mm[18].Clove oil is also effective against *E faecalis* and *Candida albicans*[19]. The evaluation of the prepared granule against the *S.mutans*. *E. faecalis* and *Candida albicans* showed good antimicrobial effect in the present study. Since, prosthetic denture users are often infected by these micro-organisms, the formulation of clove mediated effervescent denture cleansing preparation

will be highly effective to get rid of infections caused by such organisms including denture stomatitis.

Conclusion

The prepared, clove mediated effervescent denture cleansing granules were found to be effective against *S. mutans*. *E. faecalis* and *C. albicans.* Hence, these effervescent granules may be recommended for regular denture cleansing as it can have a good mouth feel because of the good flavour of clove oil and its antimicrobial effect and thereby prevent infections such as denture stomatitis in denture users.

Abstract

Aim: To evaluate the antibacterial activity of dill oil mediated effervescent denture cleansing granules .

Materials and Method: The components such as citric acid, tartaric acid and sodium bicarbonate were taken in a ratio of 1: 2: 3 to prepare the effervescent granules by dry method. The citric acid crystals were powered first and then mixed with tartaric acid. Dill oil was mixed with sodium bicarbonate initially. Both the powders were mixed using geometric dilution, further sieved and packed in air tight containers. Different concentrations of the prepared dill effervescent denture cleansing solution was tested against *Streptococcus mutants* and *Enterococcus faecalis* and *Candida albicans* in their respective medium and the zone of inhibition was was recorded after incubation over night at 37^0 c.

Result: The effervescent granules prepared with dill oil showed good antibacterial activity against the tested microorganism such as *Streptococcus mutans*, *Enterococcus faecalis* and *Candida albicans.*

Conclusion: The effervescent denture cleansing granules prepared with dill oil were found to be effective against *S.mutans*, *E. faecalis* and *Candida albicans* . Hence it may be used for routine cleansing of denture to protect the denture users from infections such as denture stomatitis.

Key words: *dill oil, effervescent granules, Denture Cleanser, Denture stomatitis*

Introduction

The overall health, especially among older individuals is very important. Hence, denture care and mucosal tissues of the edentulous mouth is a must[1]. Replacing missing teeth helps individuals to overcome the social stigma and enable the individual to enjoy the quality of life. The missing teeth among many individuals are replaced with a complete denture and removable partial denture. Reports show that around 50% of individuals are wearing complete dentures and 13% removable partial dentures. The most common inflammatory condition that affects denture wearers is denture stomatitis. The pathogenesis of denture stomatitis shows microbial plaque on tissue surface of dentures[2]. The dental prostheses create a favorable microenvironment for the candida organisms to thrive[3]. *Candida albicans* is the most commonly implicated microorganisms in denture stomatitis. Around 65% of complete denture wearers are predisposed to candida infection. It may be due to inadequate hygiene, decreased saliva flow under the denture surfaces or enhanced adherence of candida to the acrylic, ill-fitting appliances[4]. Though, denture

Corresponding author:

E-mail: anitharoy2015@gmail.com

stomatitis can be treated with antifungals agents such as miconazole, nystatin, and fluconazole, recurrence is very common[5] . *Streptococcus mutans* is considered as a chief and pioneer micro-organism for most of the dental infections whereas *Enterococcus faecalis* is the most isolated or detected species from oral infections. There are evidences that denture stomatitis as an outcome of multispecies biofilms that may include *Streptococcus mutans* and *Staphylococcus aureus*[6] *Streptococcus* spp collaborates with *Candida* spp in the etiology and pathogenesis of denture stomatitis. *Streptococcus mutans* is a frequent member of acrylic dentures surfaces. However, proper denture cleansing can prevent such infections. Hence, effervescent denture cleansers formulated with natural essential may be a better option to remove such causative organisms. In this study the effect of Dil oil mediated effervescent denture cleansing granules were evaluated against *C.albicans* , *S.mutans* and *E.faecalis*.

Dil oil is obtained from *Anethum graveolens* seed. *Anethum graveolens* L. is a popular aromatic herb belonging to the family *apiaceae*. It has antimicrobial, antiinflammatory, analgesic, gastric mucosal protective and anti-secretory, smooth muscle relaxant and hyperlipidaemic activity. The seed contains constituents such as carvone, d-limonene α-phellandrene, myristicin. The seed also coumarins, flavonoids, phenolic acids and steroids[7-9].

As dill oil is having antimicrobial activity, in this study, a dill mediated effervescent denture cleansing granules was prepared and evaluated further for its antimicrobial activity against *C.albicans, S.mutans* and *E.faecalis*.

Materials and Method

Preparation of Effervescent Denture cleansing granules with Dill oil:

The components such as citric acid, tartaric acid and sodium bicarbonate are taken in a ratio of 1: 2: 3. The citric acid crystals are initially powered and then mixed with tartaric acid. Different concentrations of essential oil were mixed with sodium bicarbonate initially. Both the powders were combined using geometric dilution which was further sieved and packed in air tight containers for use. [Figure 1]

Antibacterial activity of Dill oil mediated effervescent Denture cleansing solution

Agar well diffusion method was used to determine the antibacterial activity of dill effervescent oil[10]. Different concentrations of prepared dill effervescent denture cleansing solution was tested against *Streptococcus mutans and Enterococcus faecalis.* The fresh bacterial suspension was dispersed on the surface of nutrient agar plates. Different concentration of dill effervescent denture cleansing solution (50, 100 and 150 µL) was incorporated into the wells and the plates were incubated at 37°C for 24 h. Zone of inhibition was recorded in each plate. [Figure 2]

Antifungal activity:

Antifungal activity of dill oil mediated effervescent denture cleansing granules was tested against *Candida albicans* using agar well diffusion method. Different concentrations of the prepared dill effervescent denture cleansing granules were used after dissolving it in sterile water. The fresh fungal suspension was dispersed on the surface of rose bengal agar plates. Different concentration of dill effervescent denture cleansing solution was incorporated into the wells and the plates were incubated at 37°C for 48 h[11]. Zone of inhibition in each plate was recorded.

Result and Discussion

The antibacterial activity of dill oil based effervescent cleansing granules showed good zone of inhibition against the oral pathogens especially to *S. mutants* compared to *E. faecalis* at the low concentration used whereas *C.albicans* showed a higher zone of inhibition at the maximum dose used in the study (figure 2 and 3).

The tested organisms are related to dental infections. *C. albicans* is the fungi species most frequently found in denture biofilm. *S. mutans* was chosen for its role as a primary oral biofilm and *E. faecalis* is associated with apical periodontitis and endodontic infections[12].

Denture cleansers are highly useful to individuals with partial or complete dentures for their missing tooth. Since improperly cleaned dentures on continuous use can end up in denture stomatitis with susceptible microorganism, regular and proper cleaning of dentures are mandatory. However, the currently available cleansers have many disadvantages. Therefore cleansers

with natural ingredients may aid in good and complete removal of the causative organisms of oral infections with less side effects.

In a cross-sectional study with eighty-four geriatric denture wearers recruited from geriatric denture wearers, there was a 54% prevalence for at least one denture-related mucosal lesion such Angular cheilitis, traumatic ulcers and denture stomatitis[4].

Though there are reports showing high prevalence of denture stomatitis (65%) among geriatric denture wearers, study by Mubarak *et al* this percentage decreased significantly 3.33% due to proper patient education and maintenance of good oral hygiene[13]. Plant extracts and essential oils are known for their antibacterial and antifungal activity [14-18].Hence denture cleansing with appropriate agent is mandatory to protect the denture wearers from oral infections.

Conclusion

The present study has proved that dill mediated effervescent denture cleansing granules have good antimicrobial activity. Hence, it may be used for proper and regular denture cleansing to protect the users from oral infections and denture stomatitis.

Evaluation of Faculty Performance on Introduction of Continuous Annual Faculty Evaluation Score (CAFE)

Deepak Nallaswamy[1], R.V. Geetha[2], M. Subha[3]

[1]Professor, Department of Prosthodontics, [2]Associate Professor, Department of Microbiology,[3]Associate Professor, Department of Oral Medicine & Radiology, Saveetha Dental College, Chennai, India

Abstract

Faculty development programme is a protocol followed by every institution for the betterment of the faculty. However, it's not been standardised. This can be achieved only by assessing the faculty performance in a 360 degree way..Performance evaluation of faculty members is a challenge for the management. Any growing institution incorporates new innovations that becomes a task for the faculty. Hence, it is essential to have a standard and integrated appraisal system. It identifies strengths and weaknesses of teachers on all aspects, such as academic responsibilities, research profile, student evaluation, publications, acquiring research grants etc. Continuous Annual Faculty Evaluation was introduced to develop an inclusive and dynamic system of evaluation addressing all the activities and responsibilities of faculty members. After the introduction of CAFÉ system, the overall performance of the faculties showed a significant increase. This article describes in detail the performance of the faculty in all aspects after introducing CAFÉ.

Key Words: *Faculty performance, CAFE, evaluation*

Introduction

Evaluations are used as a diagnostic feedback tool for faculty improvement and teaching effectiveness. Faculty evaluation is considered to be one of the most important objectives for any academic institution. It identifies strength and weakness of faculty on all aspects, such as academic responsibilities, research profile, student evaluation, publications, acquiring research grants, patents etc. This information may also be used by higher authorities of the institute to form appropriate teams of faculty members for different academic and administrative activities of the institute. A criterion-referenced system that appraises faculty members according to a set of transparent standards that encourages professional development is preferable to a system that rank-orders faculty on a particular set of items.[1] The purpose of faculty performance evaluation includes, to assess and promote excellence in the teaching-learning process, to meet the educational needs of students, to provide a constructive framework for evaluating faculty performance by identifying areas of strength and areas for improvement in classroom instruction and service to the institution and to provide a basis for professional growth and development. [2,3]

If there are no fixed standards of evaluation, then it may create negative impact in the performance of the faculty and in turn, the organization. Hence, it is necessary to set the right standards to evaluate the performance of the faculties.[4] It is essential to have an unbiased performance evaluation to measure faculty contribution to the institution. Effective monitoring should also include giving timely feedback, reviewing the performance according to predetermined standards and timely recognition of the accomplishments, that motivates the employee to perform better each day. [5]

Traditional methods like ranking method, graphic rating scale method, forced choice distribution method, behavioural checklist method etc. are not in use these days. There are many other modern techniques such as 90 degree,180 degree,360 degree, 720 degree, balanced scorecard, mixed standard scale, paired comparison,

Corresponding author:
Dr.Deepak Nallaswamy
Professor & Head, Department of Prosthodontics
Saveetha Dental College, Chennai, India

mixed standard scale, electronic performance monitoring, confidential reports etc,[5,6,7,8] 90 degree is the most basic form of appraisal, where the appraiser gives their evaluation of the faculty. There is no self-evaluation and its one way. 180 degree appraisal process involves the appraise completing a self-evaluation form. The employee rates him/herself and gives feedback on their own performance. The self-appraisal is discussed and agreed with the appraiser during an appraisal review meeting. 360 degree appraisal involves 4 groups of people. The appraiser/manager, the appraise (self-appraisal) plus feedback gathered from peers and subordinates or customers/clients. 720 degree appraisal is basically a 360 degree appraisal performed twice.[9] A second 360 degree is performed at a timely interval and compared against the results of the first 360 degree appraisal. These methods have their own advantages and shortcomings. Depending upon the needs of an organization, a performance appraisal method needs to be selected.

Faculty evaluation has been conducted in Saveetha Dental College and Hospitals for more than 25 years. Its purpose is to provide feedback to the faculty to help them improve their teaching skills, to provide information for promotion and merit, and to identify problems in teaching. Various evaluation techniques from traditional methods to modern techniques like 180 degree and 360 degree evaluation were followed. But all these methods have its own pros and cons. We formulated a customised evaluation system based on our curricular requirement. Continuous Annual Faculty Evaluation (CAFE) an evaluation system addressing all the activities and responsibilities of faculty members. After the introduction of CAFÉ system, the overall performance of the faculties showed a significant increase. This article describes in detail the performance of the faculty in all aspects after introducing CAFÉ.

Methodology

This study was set out to empirically study the faculty performance. It was conducted in Saveetha Dental College and hospitals, Chennai. All the teaching faculty members were part of the study. CAFE was introduced during the year 2017 to facilitate self-improvement by identifying specific behaviours and relative strengths and weaknesses that can be modified or further developed. It is calculated based on various criteria like academic performance indicator score (API), event organizer, event management, punctuality and workaholic, students performance in the university exam, conference motivation, student ranking and research grants. The scores were collected from the faculty affairs office and comparison of results were done before and after introduction of CAFÉ among faculty member

Result and Discussion

In a competitive world of education it is essential to train students in a holistic way. An effective teaching and learning environment is essential both inside and outside the classroom. They expect effective lecturers to help raise the level of students' motivation to learn so that students' academic and non-academic achievements can be further enhanced.[10,11] This would significantly contribute to the satisfaction of students in learning which would contribute to institutional growth also. Faculty members are currently facing an increasing demands to be creative and effective teachers, successful investigators, and productive clinicians. These pressures are mainly due to contemporary curriculum development, competition in the health care institutions, and from the limited resources for research.

Details of CAFÉ criteria were collected from faculty affairs office for the year 2016, when CAFÉ system was not introduced and scores were calculated. These scores were compared with the scores of the year 2017, after the introduction of CAFÉ system**.**

API score [Academic performance indicator]

API score is the index of the research activities of the faculty which includes participation, paper/ poster presentation in national / International conferences and seminars, guest lectures given, scientific sessions chaired, National/International awards won, number of research projects guided and publications in various indexed journals etc. Each criteria has different scores, for example participation in international conference carries a score of 10 and paper/poster participation in international conference carries 30 points. So if a faculty has participated in N number of conference their score will be 10 times the number of conference attended (NX10). Likewise scores are calculated for other criteria also. Figure 2 shows the average API score of all faculties during the year 2016 before introduction of CAFÉ and 2017 after introduction. The average API of all faculties taken during the year 2017 shows a double fold increase when compared with 2016 showing increased interest of

the faculty in research activities.

Event organizing and Management

Organising a seminar or conference is an effective way that provides an opportunity to share and exchange knowledge with other experts. It creates a platform for discussion pertaining to the current problems or issues and hearing about other ideas on the same topic. Participants can share their insights and thoughts on how to resolve the problem, which can offer a fresh perspective when dealing with the problem. Conferences also helps to share learning and best practice from experts. Faculty organising conference, seminar or workshops and faculty who help in the management of the event are given points. The Chief organiser gets 500 points and top five faculty who actively help in organising the event are chosen by the chief organiser and they are given points ranging from 500 to 100. This has led faulty to organise more number of conferences, seminars and workshops. The Figure 3 shows the average scores of chief organiser of the event and an average scores of faculty who played a key role in Event management. The data shows a marked increase in the 2017 when compared to average scores of 2016.

Punctuality and Workaholic

Reliable, consistent attendance is a requirement and essential function of all faculty positions. Faculty are expected to be punctual and dependable in order to meet the needs of their department and the College. When they are absent or tardy, work and service are interrupted and an additional burden is placed on colleagues. Attendance and reliability are important factors in evaluating individual performance. The average in time and total working hours of each faculty was calculated and the scores are given to most punctual and workaholic faculty for which they are also given awards and rewards. After including this criteria in CAFÉ score calculation, there was a significant difference in the average in time and total working hours. The figure 4 shows the average in time of faculties during the year 2016 was 8.27 AM which reduced to 8.17 in 2017 and the average of total working hours increased to 1380 hours per annum during the year 2017 form 1305 hours in the year 2016.

Student's performance in the university exam

Effective teachers use their pedagogical skills and enable students to comprehend the content, perform better, and increase their achievement. The evaluations of superiors, peers and students, when taken together with exam scores, present a more complete teacher profile. Faculties are given scores based on number of distinctions taken by the student in their respective subjects. Analysing and comparing the results of student, during the years 2016 and 2017, the number student with distinction is found to be more in 2017 when compared to 2016.

Conference motivation

Conferences and seminars offers opportunity for the students to mix and mingle, form new relationships and strengthen existing ones. By attending other presentations, the student will learn from others and improve their own skills and knowledge in their field. Students are motivated to attend conferences or seminars and also to present papers/posters, which helps to learn new ideas and approaches to make them more effective and efficient at work. For motivating students to participate in conferences the faculties are given points. This has shown a marked increase in the number of students participating in various conferences in the year 2017 compared to 2016.

Student ranking

One suitable method to measure teaching effectiveness is students' evaluation of faculty performance, which is often carried out at the end of the semester or at the end of a course/programme in most institutions of learning. Student opinion continues to be a major factor in the evaluation of teacher effectiveness.[12] Most higher education faculty believe that the teaching-learning process is an active, ever-changing interaction between the student, teacher, and environment (input and process within context) that should be focused on a particular outcome. It is therefore reasonable to expect students to make important contributions to this system and it is imperative that teachers be receptive to student feedback. In CAFÉ system of evaluation, the faculty members are ranked by the students on online ranking system.

Research grants

Research Grants are designed to support scientists and clinicians (investigators) by funding proposals in basic and clinical research in the field of reproductive medicine. It is a competitive process, in which potential

research projects are evaluated and only the most promising receive funding. Such processes, which are run by government, corporations or foundations. Faculty members are given scores based on the grant they have for their research proposal. Honest feedback can help the employee better understand his/her strengths and motivate him/her toward improvement.

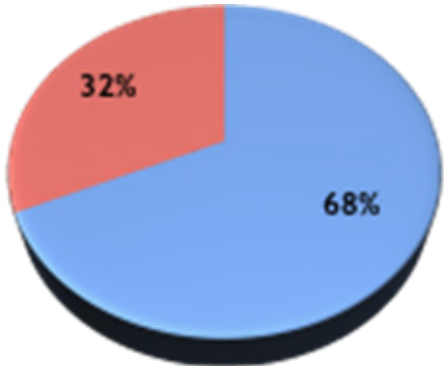

FIg 2: Average API score- 2016 and 2017

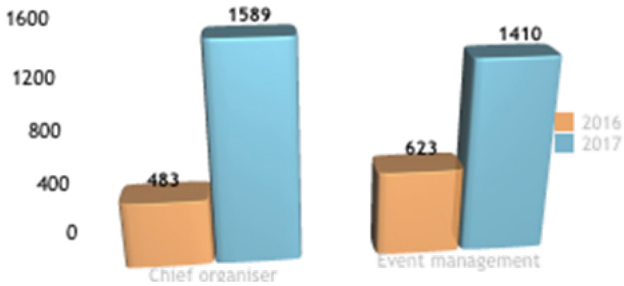

Fig 3: Average score of event organiser &management

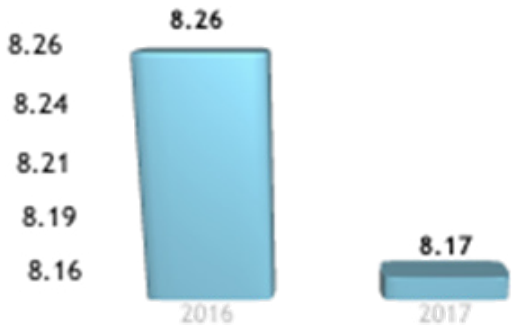

Fig 4:Average Intime

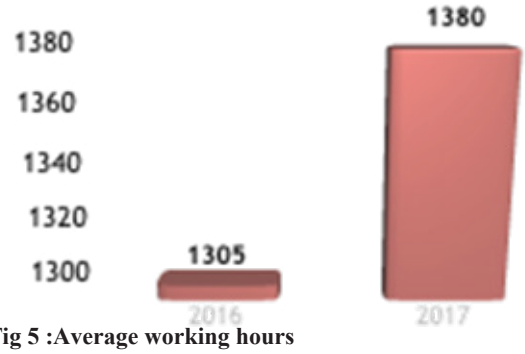

Fig 5 :Average working hours

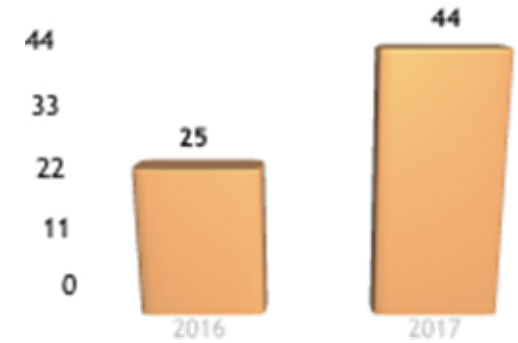

Fig 6:Percentage of distinction

Conclusion

In a competitive world of education today in most educational institutions demand for effective teaching and learning to take place, both inside and outside the classroom. They expect effective lecturers to help raise the level of students' motivation to learn so that students' academic and non-academic achievements can be further enhanced. This would significantly contribute to the satisfaction of students in learning which in turn affects the image of the learning institution. Faculty members are currently faced with increasing demands to be creative and effective teachers, successful investigators, and productive clinicians. These pressures are mainly due to contemporary curriculum development, competition in the health care institutions, and from the limited resources for research.

Activity of Coconut Oil Mediated Effervescent Granules as a Denture Cleanser Against*C.albicans*, S.mutans and *E.faecalis*

VeeraiyanNallaswamy Deepak[1], ArivarasuLakshminarayanan[2], RoyAnitha[2], S. Rajeshkumar[2], Thangavelu Lakshmi[2], DevarajEzhilarasan[2], M.Subha[3]

[1]Professor, Department of Prosthodontics, [2] Associate Professor, Department of Pharmacology, [3]Associate Professor,Department of Oral Medicine & Radiology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Tamil Nadu, India

Abstract

Aim: To prepare and evaluate the antibacterial activity of Coconut oilmediated effervescent denture cleansing granules.

Materials and Method: The components such as citric acid, tartaric acid and sodium bicarbonate were taken in a ratio of 1: 2: 3 to prepare the effervescent granules by dry method. The citric acid crystals were powered first and then mixed with tartaric acid. Coconut oil was mixed with sodium bicarbonate initially. Both the powders were mixed using geometric dilution, further sieved and packed in air tight containers. Different concentrations of the prepared Coconut oil effervescent denture cleansing solution was tested against *Streptococcus mutans*and*Enterococcus faecalis*and *Candida albicans*in their respective medium and the zone of inhibition was recorded after incubation overnight at 37^0 c.

Result: The effervescent granules prepared usingCoconut oil showed good dose dependent antimicrobial activity against the tested microorganism such as *Streptococcus mutans*, *Enterococcus faecalis*and *Candida albicans.*

Conclusion: The effervescent denture cleansing granules prepared with Coconut oil were found to be active against *S.mutans*, *E. faecalis* and *Candida albicans*at higher concentrations. Hence it may be used for routine cleansing of denture to protect the denture users from infections such as denture stomatitis.

Key words*: Coconut oil, effervescent granules, Denture Cleanser, Denture stomatitis*

Introduction

Denture care is indispensable for maintaining general oral health.Unsatisfactory hygiene can make way to the formation of biofilms and cause oral infections such as denture stomatitis. Several methods are available such as brushing the dentures with toothpaste and toothbrush, Regular usageof acrylic resins used for fabrication of complete denture are composed of PMMA(Polymethyl methacrylate), a material with a low level of hardness and this material is prone to minute damages by vigorous brushing and these scratches can be a breeding ground for oral pathogens1.

The antibacterial agents that are currently used for treatment of oral health problems are reported to cause several side effects such as diarrhea, vomiting and so on. Increasing bacterial resistance to the drugs is also a major concern and there is a need to explore new therapeutic agents and conduct further investigations on traditional medicines obtained from various plant sources2. Hence, a novel denture cleanser that causes minimum damage to the resinous surface is needed. Oils extracted from plants such as coconut oil, gingelly oil andpatchouli oil

Corresponding author:
A.Lakshminarayan, Assistant Professor, Department of Pharmacology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, 162, Poonamallee High Road, Chennai – 600077, Tamil Nadu, India.
E-mail: lakshminarayan512@gmail.com

has proven to be the best for oil pulling .They are active against several oral pathogens and thereby reduce the accumulation of dental plague but their role as a denture cleanser is an area yet to be explored.

Coconut oil ,an important edible oil,has been used in the food industry for many years and is normally termed or classified as a lauric oil, a tropical oil, or a confectionery fat3. It contains about 90% of saturated fats predominantly triglycerides with 85.5% of saturated fatty acids, 5.8% of mono-saturated fatty acids and 0% of Cholesterol4. Coconut oil is of high medicinal and therapeutic uses. It is said to have antibacterial activity, antiviral activity and in dentistry coconut oil is said to have anticaries activity. Oil pulling with coconut oil reduces the risk of caries and slows the accumulation of dental plaque 5. Coconut oil facilitates absorption of calcium by the body and also helps to stop tooth decay6. Further it is said to have anti-inflammatory properties. It shows soothing effect on skin rashes and reduces inflammation due to rashes or contact with foreign substances. It is very effective in curing and relieving bruises and small cuts.

As coconut oil is having antimicrobial activity, in this study, coconut oil mediated effervescent denture cleansing granules were prepared and evaluated further for its antimicrobial activity against *C.albicans, S.mutans* and *E.faecalis*

Materials and Method

Preparation of Effervescent Denture cleansing granules with Dill oil:

The components such as citric acid, tartaric acid and sodium bicarbonate were taken in a ratio of 1: 2: 3. The citric acid crystals were initially powered and then mixed with tartaric acid. Different concentrations of essential oil were mixed with sodium bicarbonate initially. Both the powders were combined using geometric dilution which was further sieved and packed in airtight containers for use. [Figure 1]

Antibacterial activity of coconut oil mediated effervescent Denture cleansing solution

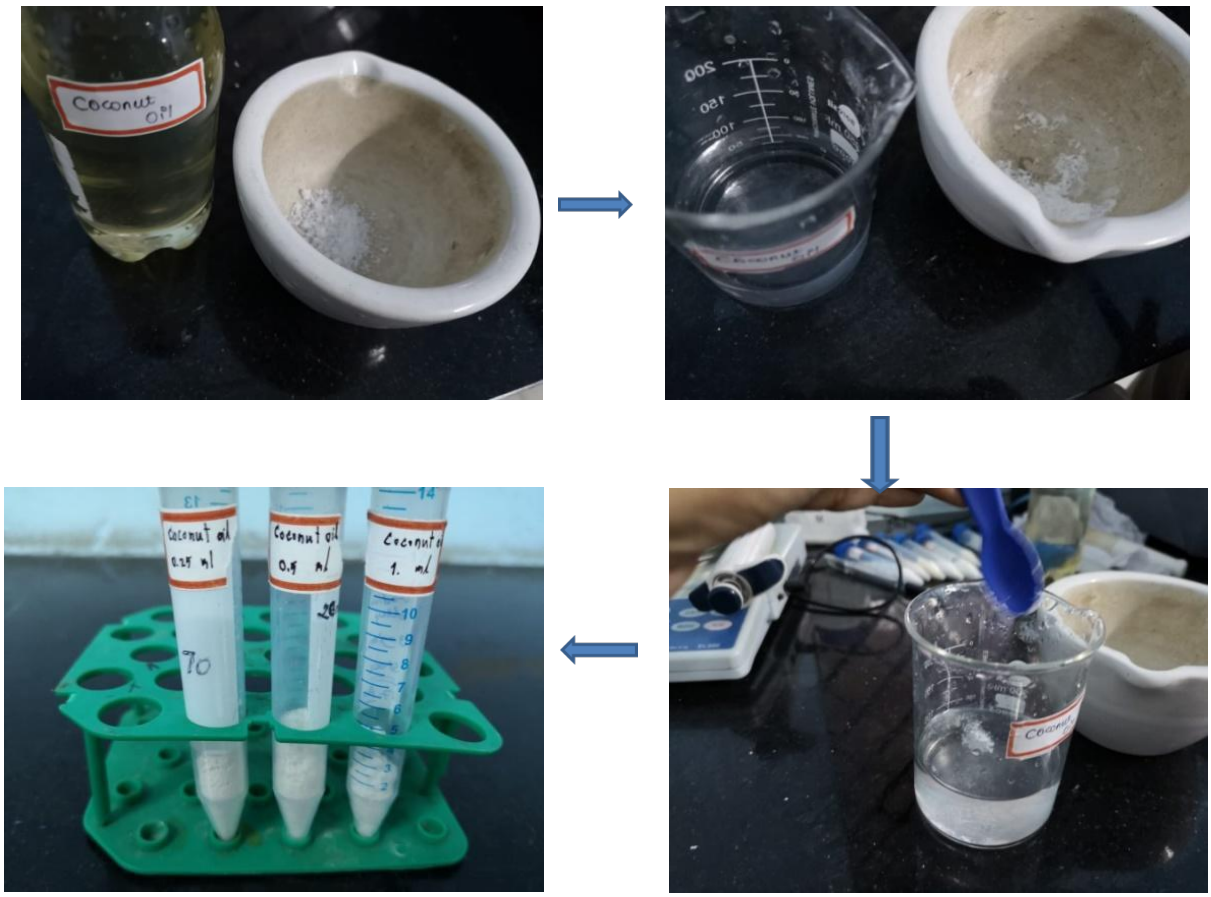
Agar well diffusion method was used to determine the antibacterial activity of coconut effervescent oil[7]. Different concentrations of the prepared coconut oil mediated effervescent denture cleansing solution was tested against *Streptococcus mutans and Enterococcus faecalis.* The fresh bacterial suspension was dispersed on the surface of nutrient agar plates. 0.25, 0.5 and 1.0 mL of the denture cleansing solution was incorporated into the wells and the plates were incubated at 37°C for 24 h. Zone of inhibition was recorded in each plate. [Figure 2]

Antifungal activity:

Antifungal activity of coconut oil mediated effervescent denture cleansing granules was tested against *Candida albicans* using agar well diffusion method. Different concentrations of the prepared coconut oil mediated effervescent denture cleansing granules were used after dissolving it in sterile water. The fresh fungal suspension was dispersed on the surface of rose bengal agar plates. 0.25, 0.5 and 1.0 mL of freshly prepared denture cleaning solution was incorporated into the wells and the plates were incubated at 37°C for 48 h[8]. Zone of inhibition in each plate was recorded.

Result and Discussion

The antibacterial activity of coconut oil based effervescent cleansing granules showed good zone of inhibition against the oral pathogens especially to *S. mutants* and*E. faecalis* at the higher concentrations used(figure 2 and 3) . It also showed a higher zone of inhibition at the maximum concentration used in the study against *C.albicans* (figure 4 and 5).



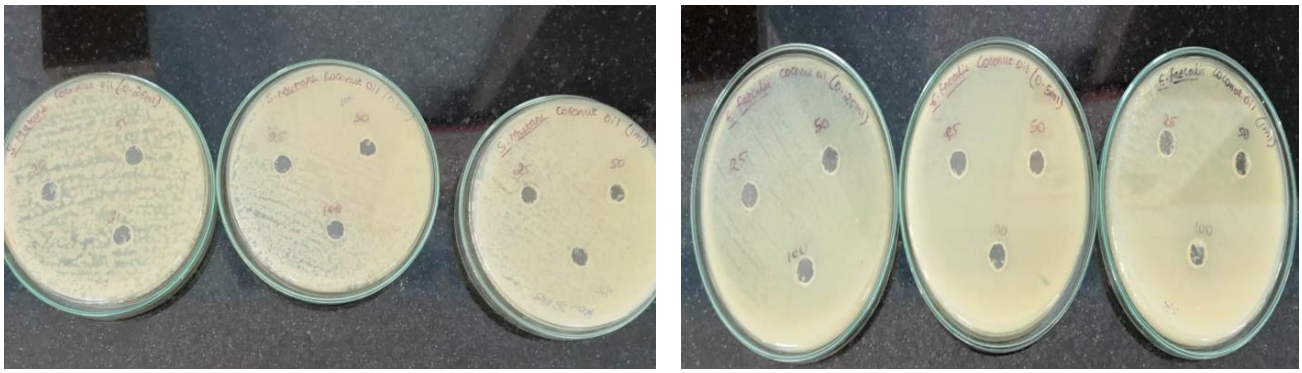


Figure 1: Schematic representation of the preparation of Effervescent Denture cleansing granule with coconut oil

(a) (b)

Figure 2: Antibacterial activity of effervescent oil against *Streptococcus mutans*(a)and *Enterococcus faecalis*

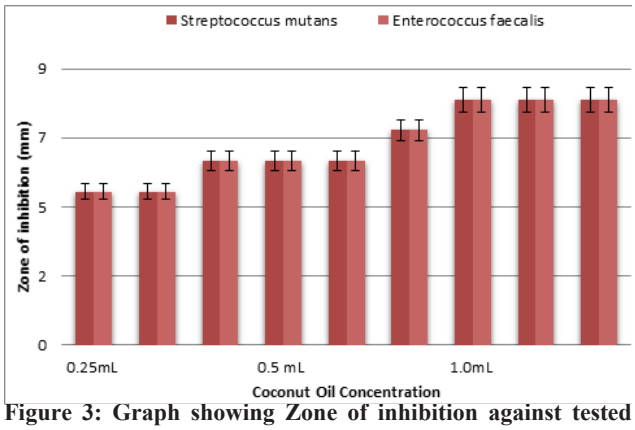

Figure 3: Graph showing Zone of inhibition against tested microorganism

Figure 4: Antifungal activity ofCoconut effervescent oil against *Candida albicans*

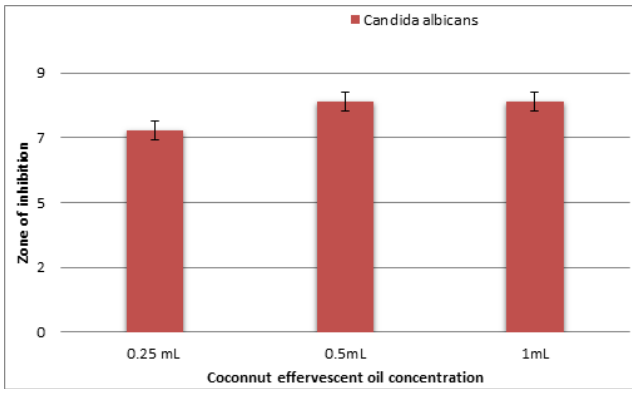

Figure 5: Graph showing Zone of inhibition against tested *Candida albicans*

The Patients with partial or complete denture still remains with a drawback of not being devoid of microbial flora because of poor maintenance which ends up with concomitant infectious states like stomatitis where irregular and improper cleaning becomes a major issue. Azole antifungal agents and their derivatives continue to dominate as the drugs of choice for treating Candidal infections by topical applications or as oral drugs 9,10. The denture cleansers currently available are not able to provide sufficient support. Natural products can be an alternative to synthetic chemical substances and the interest in medicinal plants as a source of antimicrobial agents11,12. Hence, preparations with natural compounds pose to have marked effects in terms of eradicating the primary causative organism associated with dentures.

Removable dentures can injure oral tissues and the use of dentures is associated with a high frequency of oral mucosal lesions [13,14]. Coconut oil is known to possess long chain fatty acids, dietary bioactive compounds, polyphenols, lauric acid which is known to have antioxidant property[15], this study exhibited a marked antimicrobial activity especially against*C. albicans* species. The lack of knowledge and awareness of the importance of the denture hygiene; created barriers to regular and preventive dental care of denture wearers the duration of use, dietary limitations, maintenance, storage methods and follow-up visits are also to be taken care of.

Conclusion

It is mandatory to maintain the cleanliness of partial or complete dentures like natural tooth to avoid oral infections and other health conditions. The denture cleansers currently available are not able to provide sufficient support. Natural products can be a template to synthetic chemical substances. Hence natural edible oils with antimicrobial activity such as coconut oil may be used as a denture cleansing agent in appropriate concentration to get rid of infecting microorganisms.

Effect of Oregano Oil Mediated Effervescent Denture Cleansing Granules Against Oral Pathogens

Veeraiyan Nallaswamy Deepak[1], Arivarasu Lakshminarayan[2], Roy Anitha[2], S. Rajeshkumar[2], Thangavelu Lakshmi[2], Devaraj Ezhilarasan[2], M.Subha[3]

[1]Professor, Departmentof Prosthodontics, [2]Associate Professor, Department of Pharmacology ,[3]Associate Professor, Department of Oral Medicine & Radiology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Tamil Nadu, India

Abstract

Aim: To evaluate the antimicrobial activity of oregano oil mediated effervescent denture cleansing granules.

Materials and Method: Effervescent granules were prepared using citric acid, tartaric acid and sodium bicarbonate in a ratio of 1: 2: 3 by dry method. The citric acid crystals were powdered first and then mixed with tartaric acid. Oregano Oil was mixed with sodium bicarbonate and incorporated with the acid by geometric dilution. It was then sieved and packed in airtight containers. Different concentrations of the prepared oregano effervescent denture cleansing solution was tested against *Streptococcus mutans* and*Enterococcus faecalis* and *Candida albicans* and the zone of inhibition was measured.

Result: The effervescent granules prepared with oregano oil showed good antimicrobial activity against the tested microorganisms such as *Streptococcus mutans*, *Enterococcus faecalis and Candida albicans.*

Conclusion: The effervescent denture cleansing granules prepared with oregano oil were found to be active against the test organisms especially against *E faecalis.*Hence it may be used for routine cleansing of denture to protect the denture users from infections such as denture stomatitis.

Key words: *OREGANO oil, effervescent granules, Denture Cleanser, Denture stomatitis*

Introduction

The trait of denture fitting surface, occlusal relations, denture age and hygiene are key factors contributing to the incidence of oral mucosal lesions concomitant with denture use[1].The overall health, especially among geriatric patients is very important. Hence, denture care and mucosal tissues of the edentulous mouth is must[2] .Regular Maintenance of denture is recognized as a vital part of oral hygiene for denture wearers. Dentures predispose the wearer to denture stomatitis[3]. Studies report prevalence of denture stomatitis among denture wearers as 15% to over 70% in various population samples. Etiological factors also include poor denture hygiene, continual and nighttime wearing of removable dentures, accumulation of denture plaque with bacterial and yeast contamination of denture surface[4]. All these factors contribute to increase the capability of *Candida albicans* to colonize both the denture and oral mucosal surfaces, though antifungal treatment can eradicate C.*albicans* contamination and relieve stomatitis symptoms. Early identification of the lesion is essential to assure rational therapy[5]. Evidences show that denture stomatitis is an outcome of multispecies biofilms and*Streptococcus mutans and Enterococcus faecalis* is considered as the primary micro-organism isolated or detected species from oral infections[6]. However, proper denture cleansing can prevent such infections. Hence, effervescent denture cleansers formulated with natural essential oils may be a better option to remove

Assistant Professor, Department of Pharmacology, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, 162, Poonamallee High Road, Chennai – 600077, Tamil Nadu, India. E-mail: lakshminarayan512@gmail.com

such causative organisms. In this study the effect of Oregano oil mediated effervescent denture cleansing granules were evaluated against *C.albicans*, *S.mutans* and *E.faecalis*.

Oregano is generally recognized for their antimicrobial properties. Recent investigations have demonstrated it has potent antioxidant, anti-inflammatory, anti-diabetic and cancer suppressor properties[7]. The main components identified from oregano oil are carvacrol and thymol, which are responsible for the characteristic anti odor, antimicrobial, and antioxidant activity. These substances as antibacterial agents make the cell membrane permeable due to its impregnation in the hydrophobic domains, this effect is higher against gram positive bacteria[8]

As oregano oil is having antimicrobial activity, in this study, oregano oil mediated effervescent denture cleansing granules were prepared and evaluated further for its antimicrobial activity against *C.albicans, S.mutans* and *E.faecalis*.

Materials and Method

Preparation of Effervescent Denture cleansing granules with Oregano oil:

The components such as citric acid, tartaric acid and sodium bicarbonate are taken in a ratio of 1: 2: 3. The citric acid crystals were initially powered and then mixed with tartaric acid. Different concentrations of essential oil were mixed with sodium bicarbonate initially. Both the powders were combined using geometric dilution which was further sieved and packed in airtight containers for use. [Figure 1]

Antibacterial activity of Oregano oil mediated effervescent Denture cleansing solution

Agar well diffusion method was used to determine the antibacterial activity of oregano effervescent oil[9]. The freshly prepared oregano effervescent denture cleansing solution was tested against *Streptococcus mutans and Enterococcus faecalis*. The fresh bacterial suspension was dispersed on the surface of nutrient agar plates. 25, 50 and 100 µL of oregano denture cleansing solution was incorporated into the wells and the plates were incubated at 37°C for 24 h. Zone of inhibition was recorded in each plate. [Figure 2]

Antifungal activity:

Antifungal activity of oregano oil mediated effervescent denture cleansing granules was tested against *Candida albicans* using agar well diffusion method. Different concentrations of the prepared oregano oil effervescent denture cleansing granules were used after dissolving it in sterile water. The fresh fungal suspension was dispersed on the surface of rose bengal agar plates.The oregano oil mediated effervescent denture cleansing solution was incorporated into the wells and the plates were incubated at 37°C for 48 h [10]. Zone of inhibition in each plate was recorded.

Result and Discussion

The antibacterial activity of oregano oil based effervescent cleansing granules showed good zone of inhibition against the oral pathogens especially against *E. faecalis compared* to other microorganisms.All the tested organisms such as *C.albicans,S. mutans andE. faecalis* showed a higher zone of inhibition at the maximum dose used in the study (figure 2 and 3).

The tested organisms are related to dental infections. *C. albicans* is the fungi species most frequently found in denture biofilm. *S. mutans* was chosen for its role as a primary oral biofilm and *E. faecalis* is associated with apical periodontitis and endodontic infections[11].

Figure 2: Antibacterial activity of effervescent oil against *Streptococcus mutans*(a)and *Enterococcus faecalis*

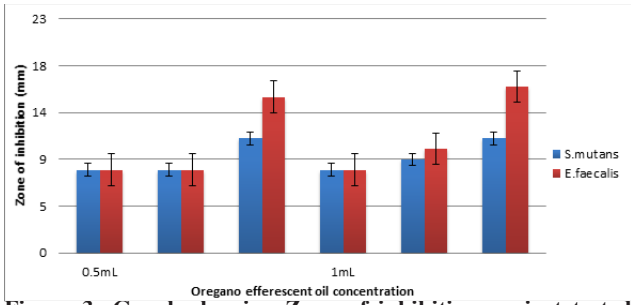

Figure 3: Graph showing Zone of inhibition against tested microorganism

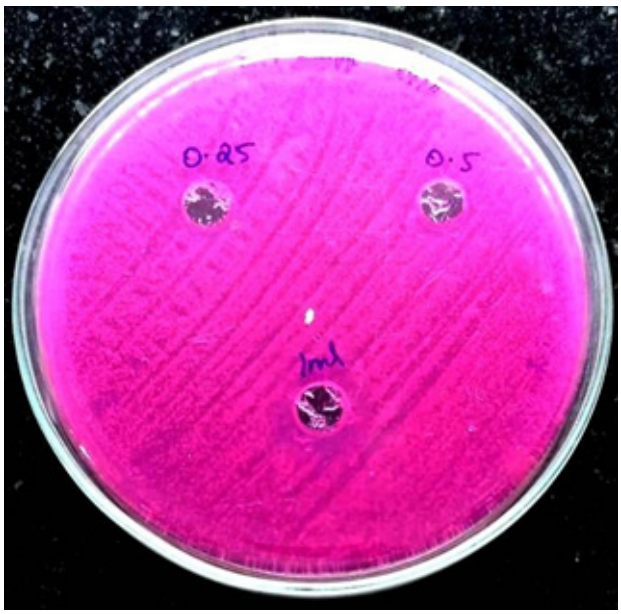

Figure 4: Antifungal activity of Oreganoeffervescent oil against *Candida albicans*

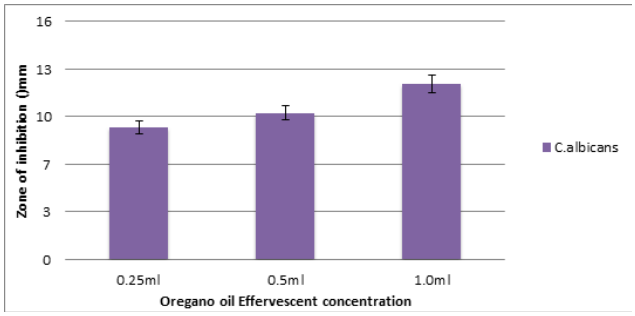

Figure 5: Graph showing Zone of inhibition

Denture cleansers with natural active ingredients are highly useful to individuals on partial or complete dentures. Routine denture management is mandatory to avoid susceptible microbial attack. Therefore cleansers with natural ingredients may aid good and complete eradication of the causative organisms of oral infections with lesser side effects.Several reports suggest that natural essential oils have good antimicrobial activity[12]. The Present study also suggests that the oregano effervescent cleansing solution containing micelle suspensions of bioactive compounds like terpenoids, carvacrol that may be responsible for the anti microbial activity.

The pathogenesis, clinical presentation, and management strategies of candida-associated denture stomatitis is commonly encountered in dental practice[13]. Though there are reports showing high prevalence of denture stomatitis (65%) among denture wearers, this percentage decreased significantly 3.33% due to proper patient education and maintenance of good oral hygiene[14]. Plant extracts are well established for its antimicrobial effect [15-18]. Hence, plant extracts may be incorporated for the preparation of denture cleansers.

Conclusion

The present study has proved that oregano oil mediated effervescent denture cleansing granules have good antimicrobial activity especially against *E .faecalis*. Hence, it may be used for regular denture cleansing to protect the users from oral infections and denture stomatitis.

Rehabilitation of a Dentition with Attrition – A Case Report

Vinay Sivaswamy[1], Marian Anand Bennis[1], Deepak Nallaswamy[2], M.Subha[3]

[1]Senior Lecturer, [2]Professor, [3]Associate Professor, Department of Prosthodontics, Saveetha Dental College, Chennai, India

Abstract

Worn-out teeth are a common finding in routine dental practice. Tooth wear results in discomfort during mastication, poor aesthetics and reduced vertical dimension[1]. Cases of generalized attrition usually require full mouth rehabilitation with crowns and bridges to restore function, aesthetics and self-esteem of the patient. The following case report describes the complete oral rehabilitation of a patient with mutilated dentition and reduced vertical dimension resulting from attrition. A detailed treatment plan was chalked out involving restorations and endodontic therapy followed by crowns and bridges along with institution of optimal oral hygiene measures.

Key words: *Attrition, FMR, Easthetic rehabilitation*

Introduction

Cases of generalized attrition usually require a combined approach involving endodontic procedures, periodontal and prosthodontic therapy to provide optimal dental care. There are a multitude of reasons and consequences resulting from the loss of dental hard tissue[2]. A common complaint from geriatric patients is the attrition of their teeth which causes difficulty in mastication and a depressed/collapsed lower facial appearance. Severe attrition leads to reduced vertical dimension of occlusion, loss of teeth and other potential problems related to unfavourable neuromuscular coordination of the stomatognathic system. Understanding vertical dimension and how and when it should be altered is a situation commonly faced by the clinician. It involves a number of prosthodontic considerations such as analysis of the existing occlusion and occlusal plane, availability of freeway space, size and location of edentulous areas, position and condition of the teeth in each arch, neuromuscular co-ordination and adaptation threshold of the patient. For all the complications resulting from attrition, the condition itself is simply a consequence of an underlying cause such as a deranged temporomandibular joint, CR-CO discrepancy, Gastric reflux disorder, occupational habits, and so forth[1].

This clinical report describes the aesthetic and functional rehabilitation of a patient with severe attrition. Complete oral rehabilitation was successfully done by integrating concepts of fixed prosthodontics supported by valid scientific literature[3].

Case Report

A 54-year-old female reported to the Department of Prosthodontics, Saveetha dental college, Chennai with a chief complaint of difficulty in chewing food and sensitivity to hot and cold food substances. History taking revealed no significant medical history or the usage of medications for disorders nor any symptoms of temporomandibular joint disorders. Intraoral examination **(Fig.1 – 3)** revealed a partial edentulous mandible which was classified as a Kennedy's Class 3 situation with missing 36, 37, 46 & 47 in the left and right sides respectively. Third molars (38 and 48) were present but exhibited a flat occlusal surface indicating severe attrition. The maxillary molars had supra erupted into the edentulous space due to the lack of opposing teeth. Clinical inspection also revealed generalised attrition in the remaining natural dentition. The anterior

teeth had were worn flat incisally due to the loss of posterior support. The patient had been provided with a removable partial denture 6 years earlier which she had neglected to use. The patient reported that she had been using her anterior teeth for mastication which had resulted in attrition of her remaining natural dentition. The lack of posterior teeth along with the patient's neglect to use her removable partial denture had resulted in severe wear of her remaining teeth. The condition was explained in detail to the patient along with possible treatment options. The patient was apprehensive about dental implants and requested a treatment plan which precluded their usage. The patient volunteered to undergo full mouth rehabilitation using tooth supported crowns and bridges for which informed consent was obtained.

Treatment Procedure

The Periodontal status of the supra-erupted maxillary molars were evaluated and deemed to possess a good prognosis. Endodontic therapy was performed for the maxillary molars to enable reduction of the occlusal surface and restore plane of occlusion. Primary impressions were made using irreversible hydrocolloid (Tulip, Cavex Inc., Holland) and models were made using type 3 gypsum. A face bow record made with the Quickmount recording system (Whipmix Corp, USA) was used to mount the upper model to a semi-adjustable articulator (Whipmix 8500 series Articulator; Whip Mix Corp., Louisville, USA). The vertical dimension at rest was determined by measuring the distance between two points marked at the nose and the chin using a caliper with the patient's lips at rest position. The vertical dimension of occlusion (VDO) was measured and the freeway space was found to be 3mm greater than the normal maximal limit (4mm). A Lucia jig was made using autopolymerising resin to verify centric relation position without posterior interferences and the centric relation position was recorded with bite registration addition silicone material. The vertical dimension at occlusion was increased by 4mm using the jig itself and verified using calipers again prior to recording the centric relation position. A Michigan splint was fabricated to optimize occlusal contacts at the restored vertical dimension[4] in accordance with the mutually protected occlusal scheme. The splint was designed to offer bilateral contacts of all posterior teeth in centric relation (CR) and no posterior tooth contact during excursive movements. The occlusal contacts were verified intraorally at centric and eccentric position using 40 micron articulating paper. The patient was instructed to wear the splint for the entire duration of the day except during mealtimes and sleep. The adaptation of patient to the restored VDO position was evaluated during 1-month trial period. The patient exhibited no signs of muscle tenderness or temporomandibular discomfort on palpation.

A wax up **(Fig.4a&b)** was completed on the articulated models at the restored VDO position and an index made over the waxed up models using addition silicone material in putty consistency. The patient's teeth were prepared **(Fig.5a&b)** to receive porcelain fused to metal (PFM) crowns and bridges with shoulder margins. Crown lengthening using an Nd:YAG laser was performed for the mandibular third molars to obtain sufficient crown height[5]. The maxillary third molars were left unprepared and were planned to be removed following completion of full mouth restorations. Provisional restorations were provided for the patient using the index and Bis-Acryl resin (ProTemp, 3M ESPE, USA) and cemented using non-eugenol temporary luting cement (Tempbond NE, 3M ESPE, USA).

The patient used the provisional restorations for a period of 2 weeks and reported no discomfort in terms of oral function. The provisional restorations were removed and the teeth were cleansed of the luting cement using a rubber cup and polishing paste. Gingival retraction (Ultrapak, Ultradent, USA) was done using the double cord method and master impressions **(Fig.6a&b)** were made using hydrophilic vinyl polysiloxane material (Aquasil, Dentsply, USA) with the two stage putty-wash method[6].

The provisional restorations were replaced intraorally on the right side quadrants and an interocclusal record was made of the left side using bite registration paste (ExaBite, GC America). The same procedure was repeated for obtaining an interocclusal record of the right side quadrant. A facebow record **(Fig.7)** was made (Quickmount, Whipmix Corp, USA) and used to mount the upper model to the semi-adjustable articulator (Whipmix 8500 series Articulator; Whip Mix Corp., Louisville, USA). The lower model was mounted using the interocclusal records and metal copings were fabricated **(Fig.8a&b)**.

The metal copings were verified for marginal fit

intra-orally using a sharp tined explorer. Definitive restorations were provided for the patient during the subsequent visit. The occlusal contacts were verified at the centric and eccentric positions using 40 micron articulating paper and were found to be in accordance with the mutually protected occlusal scheme. The crowns and bridges were cemented using type 1 GIC luting cement **(Fig.9)**. Impressions were made using alginate material and a night guard splint was delivered to the patient. The patient reported at 1 week and 1 month post-cementation and presented with no symptoms and signs of discomfort.

Fig.9: Definitive restorations

The lack of awareness on maintenance of oral hygiene and on replacement of missing teeth is a contributory factor for many individuals with a mutilated dentition requiring full mouth rehabilitation [7] [8]. The individual in this case had not been observing proper oral hygiene measures which resulted in a weakened periodontium around her mandibular molars. The molars were extracted since they had a poor prognosis but the patient had refused to replace her missing teeth citing poor socioeconomic status as a reason. The patient had been using her remaining dentition for mastication which had resulted in increased wear on the occlusal surfaces of her natural teeth. The maxillary molars had also supra-erupted into the edentulous space due to the lack of opposing occluding units. The resulting attrition had proceeded to such an extent that vertical dimension was reduced and the patient experienced sensitivity on intake of hot and cold food substances[9]. This symptomatology had induced the patient to seek professional care for her condition. This entire cycle could have been avoided if the dental practitioner. The patient was counseled on the maintenance of oral hygiene which she followed stringently following her full mouth rehabilitation. Awareness on dental hygiene measures and review visits to clinicians should be enhanced for the general populace to improve their understanding on the importance of preventive dental care[10]. Most patients are not aware of the consequences of dental hygiene negligence and seek dental care only after a painful episode. A common reason to refuse comprehensive dental care is the lack of financial support. However, the costs of treating the complications are higher manifold which should be conveyed to the patient at the time of treatment planning. In this case, a four unit bridge for replacing her missing teeth on either side along with non-surgical periodontal prophylaxis would have cost the patient much less than a Michigan splint and full mouth restorations together.

Loss of vertical dimension was observed in this case with visibly reduced lower facial height. The difference between VD at rest and occlusion was observed to greater than the average range of the freeway space. Hence the decision was made to restore the lost amount of vertical height with the new restorations [4] [11] . There was no passive eruption by the remaining natural dentition to compensate the reduced vertical height. This situation provided adequate interarch space to fabricate a splint and the following restorations without inducing any form of discomfort. The VD and CR was optimized through the use of the Michigan splint which was customized to obtain occlusal contacts according to the mutually protected occlusal scheme. The patient displayed no signs or symptoms of discomfort which drastically brought down the treatment duration from a period of 3 months with the splint to a single month. Provisional restorations were designed at the restored VD which enabled us to visualize the patient's facial appearance and smile aesthetics. The patient was provided an adaptation period of 2 weeks with the provisional restorations following which she reported satisfactory oral function and appearance.

A minimal crown height of 4mm is required for crowns to be retained on teeth and to function in a predictable manner. Crown lengthening to obtain sufficient crown height should be considered in cases of short clinical crowns[12] [13]. The advent of lasers in soft tissue contouring procedures drastically reduces the duration of healing and improves accessibility to deep marginal finish lines[14].

The occlusal scheme for fixed crowns and bridges should be mutually protected occlusion. This scheme dictates that the posterior teeth contact only in centric relation and should be separated during protrusion and lateral excursive movements. The use of a customized incisal table is required in cases where vertical dimension of the planned prostheses is the same as that of the patient's existing VD. For the case mentioned in this report, the provision of incisal guidance was made easier by the increased interarch space. The wax-up made for provisional restorations displayed sufficient posterior separation during excursive movements in the articulator. The provisional restorations were subsequently verified to possess the same occlusal contacts in centric and eccentric positions intraorally[15] [16]. An index was made of the incisal table with the incisal rod in centric and eccentric positions and sent to the dental laboratory

along with the impressions to replicate the occlusal scheme provided in the provisional restorations. The definitive restorations were cemented after confirmation of the desired occlusal scheme intraorally[17].

Conclusion

Oral health education and motivation to maintain oral hygiene should be actively promoted to improve awareness of the general populace on the common conditions resulting from negligence of oral health. Tooth wear should be recognized as a complication resulting from a multitude of factors and exacerbated by a negligent attitude to professional care. The causes of this condition should be identified and treated along with the resulting clinical condition to prevent further complications. Cases resulting from generalized attrition and requiring full mouth rehabilitation should be managed using scientifically proven procedures to achieve predictable long term results.

Knowledge, Attitude and Practice Towards Evidence based Practice among Medical and Dental Students

Nirisha Sriram[1], L. Leelavathi[2]

[1]Under graduate Student, [2]Senior Lecturer, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Aim: Evidence based medicine can be used to increase the confidence and overall outcome of the treatment offered to the patients. Hence the study was conducted to assess the knowledge, attitude and practice among medical and dental students towards evidence based medicine and dentistry.

Materials and Method: A questionnaire based study was conducted among dental and medical students in Chennai to assess the importance and the need for evidence based medicine. A total of 50 dental and medical students each was included in the study. Data was collected and descriptive statistics was done.

Results: It was found from the study that about 7% of the medical students used PubMed journal as a referral in their daily practice while 6% of the dental students used PubMed journal as a referral in their daily practice. About 8% of the medical students understood the terms used in study while 6% of the dental students understood the terms used in studies. 41% of the medical students and 38% of the dental students were welcoming to practising evidence based medicine

Conclusion: Medical and dental students almost have the same amount of knowledge when it came towards understanding and practising evidence based medicine. Though the study participants reported that they were aware of PubMed and Cochrane only few of them used them in decision making. EBD approach empowers clinicians to question and consider the use of the current best evidence in decision-making on the management of individual patients.

***Keywords**: Evidence based medicine, medical curriculum, dental curriculum, journals*

Introduction

Evidence-based medicine (EBM) is the new prototype of amalgamating the superlative external clinical affirmation with an individual's clinical proficiency and the involvement of patient's preferences and choices in the decision process [(1)]. Three components of EBD are evidence, clinical expertise, and patient preferences and needs. [(2)] This entire process clinches that both the practitioner and patients are benefitted. Hence it is the usage of literature studies to increase the productivity with which the clinical outcome is obtained. It requires a great deal of dedication from the researchers part to conduct clinical studies and to formulate results in an unbiased manner to ensure that these trials when they turn up positive they can be utilised by the practitioners on patients on a day to day basis. In an era of digital world, where everybody seeks validation and authentication, it has become very essential to provide the same in the medical field. This is where evidence based medicine plays a very important role as they serve as a means of documentation that is authenticated after being performed clinically or by conduction surveys and

Corresponding author:

Contact no: 8220870849

seeking option of their fellow colleagues or professionals from other departments when and where needed. It is hence used judiciously as the best evidence that can offer the best treatments to the patients [3].

As nothing in the world is stable so is the field of medicine. In the fast moving universe where proven facts also keeps changing, the quest for more knowledge is at its peak which can be solved only by conducting more and more studies which inevitably results in adding up more evidence based studies in the field of medicine. However a practitioner should always keep in mind to not blindly follow whatever is inscribed as each and every patient's problem and condition in the field of medicine is always different and the doctor has to consider even the emotional status of the patient before suggesting or carrying out a treatment on the patient. Competent physicians however use both their clinical experience with the best external evidence that is available there by bring out the best of the both [4].

Evidence based dentistry serves to decrease the variation in opinion between dental professionals in the diagnosis, prognosis, treatment outcomes and cost of care for patient with similar diseases and it depends on four different factors namely quality of science underlying clinical evidence, quality in making clinical decisions, variations in the level of clinical skill and large and increasing volume of literature. [5]

In spite of so many researches being conducted if the practitioner fails to be updated with what is going on currently due to his or her busy schedule, the use of so many such studies being conducted and proven becomes invalid. In a study conducted by Masaic et.al. where the author states that 19 articles is to be read by a general practitioner[3], which however due to lack of time and busy schedule of the practice now becomes very difficult most of the time. Lack of time hence serves as a hurdle for the practitioners to keep in touch with what is happening in and around them in depth. At the end of the day the goal to be achieved is to offer whatever is best for the patient to them.

As the saying goes in medical or dental field, more than experience more better the quality of care provided which however in reality is inversely proportional [6], where satisfaction of the patient becomes the prime motto of health care provider [7]. In this fast moving world where sophistication's are no exception to the medical field it is important from the side of the practice now to keep in touch with the new evolution that is happening around them and this comes through constant literature reading. Hence the aim of this study is to assess the knowledge, attitude and practice of dental and medical students towards evidence based medicine and dentistry.

Materials and Method

A cross sectional study was conducted in a medical and dental college. A total of 50 dental and medical students each from 3rd year to internship was included. Convenient sampling methodology was followed. All the other students were excluded.

Group I: Medical students from 3rd year to internship

Group II: Dental students from 3rd year to internship

Pre-tested, validated, self-administered closed ended questionnaire previously used to assess knowledge, attitude towards practice of evidence based dentistry. The questionnaire was prepared using the questions used in the study conducted by Amira Abdel-Kareem et.al and Parul Rawat et.al. [1, 8] The questions were split into following sections namely: demographic details, questions related to knowledge of evidence based practice, questions for attitude and practise towards EBP. Filled questionnaires were collected. Only completely filled forms were considered for analysis. The data collected was analysed and frequency distribution was done.

Findings

The study was done among 50 dental and medical students from third year to internship to assess the knowledge, attitude regarding evidence based practice.

Awareness towards evidence-based practice

About 14% of the medical students were aware of PubMed journal, and 7% of the medical students used PubMed journal as a referral in their daily practice while 1% of the dental students were unaware of PubMed journal, 8% of the dental students were aware of PubMed journal, while 6% used PubMed journals as reference in their daily practise. About 14% of the medical students were aware of Cochrane journal and 36% of the medical students read Cochrane journals while 2% of the dental students were unaware of Cochrane journal, 18% of the dental students were aware of Cochrane journals and

30% of the dental students read from Cochrane journal. (Figure 1 and 2) About 20% of the medical students were aware British Medical journal and 30% of the medical students read from British Medical journal while 2% of the Dental students were unaware about British Medical journal, 16% of the Dental students were aware about British Medical journal and 32% of the dental students read from British Medical journal. About 42% of the medical students were unaware about the Center for disease control and prevention journal, 7% of the medical students were aware about Center for disease control and prevention journal, 1% of the medical students use Center for disease control and prevention journal in their daily practice while 38% of the dental students were unaware about Center for disease control and prevention journal, 9% of the dental students were aware about Center for disease control and prevention journal and 3% of the dental students used Center for disease control and prevention journal as a referral in their daily practice. 48% of the medical students were unaware about Eastern Mediterranean health journal, 1% of the medical students were aware about Eastern Mediterranean health journal 1% of the medical students read about Eastern Mediterranean health journal while 43% of the Dental students were unaware about Eastern Mediterranean health journal, 4% of the Dental students were aware about Eastern Mediterranean health journal, 3% of the Dental students read about Eastern Mediterranean health journal. The results also showed that the students don't use any other journals apart from the mentioned ones in their practice for referral.

Knowledge regarding key terms in evidence-based practice

The results showed that 28%, 14%, 8% of the medical students felt they found the presence of relative risk, systemic reviews, odds ratio, meta-analysis type of design, and necessity if confidence interval not helpful, helpful and understanding while 37%, 7%, 6% of the dental students felt they found the presence of relative risk, systemic reviews, odds ratio, meta-analysis type of design, and necessity if confidence interval not helpful, helpful and understanding.

Attitude toward evidence-based practice

It was found that 41% of the medical students and 38% of the dental students were welcoming to practising evidence based medicine. (Figure 3) 46% of medical and dental students said they feel evidence based medicine is essential in their daily practise and they follow in their day to day life. However 48% of both medical and dental students felt lack of World Wide Web access and journal could be a cause for lack in practising evidence based medicine.

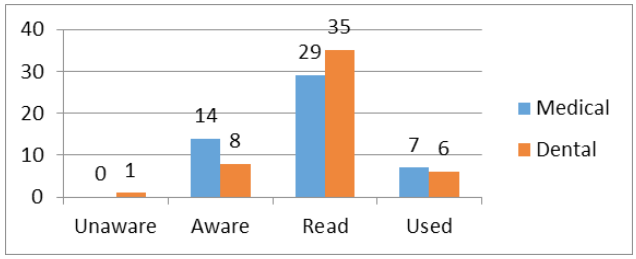

Figure 1: Distribution of respondents based on the responses related to PubMed journal

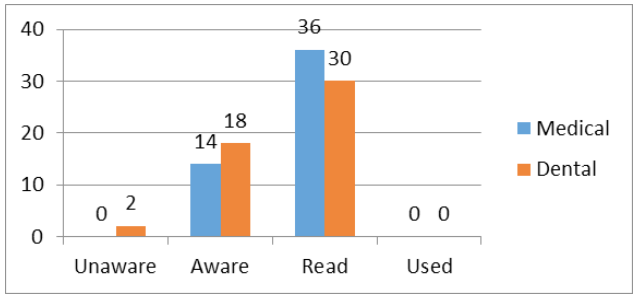

Figure 2: Distribution of respondents based on the responses related to Cochrane journal

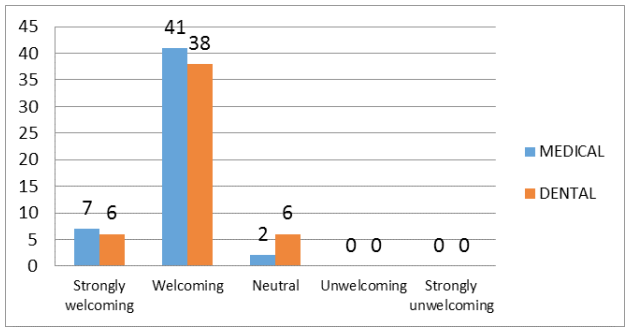

Figure 3: Attitude of study participants towards practising evidence based medicine

Discussion

The practice of dentistry is becoming more complex and challenging. Changing socio-economic patterns, knowledgeable health care consumers, rapid technical advances and the information 'explosion' all place greater demands on clinical decision making [9]. The American Dental Association defined Evidence Based Dentistry as an approach to oral healthcare that requires the judicious integration of systematic assessment of clinically relevant scientific evidence relating to the patients oral and medical conditions and history, with the dentists clinical expertise and the patients treatment

needs and preferences [10].

To provide the best treatment to the patients it is not just sufficient to completely cover up a set of books but also important from a practitioner's point of view to keep themselves updated about the changes and the new advancements in the field of medicine. This will not just help in offering a better treatment to the patients but also will aid towards a correct diagnosis. The best place to keep oneself updated is through Internet or journal books. However the practice of evidence based medicine should begin the moment they enter medical school. The institute plays a major role in deciding how the future doctors will shape up and should begin as early as possible in their curriculum (11). This will ensure that a good teamwork is also attained at the ground level which is again essential in practising evidence based medicine (12) as the presence of peers practising will motivate the others to practice it too.

A study conducted in Saudi comparing the knowledge of evidence based medicine among the medical and dental students has shown that dental students have more knowledge towards evidence based medicine compared to the medical students which is attributed to the curriculum that is followed (13). It was reported in a study that the overall general knowledge of the respondents to EBP is substandard to the competency standards that minimally call for skills in critically appraising the evidence. (14)

Less than half of the study participants were interested to practise evidence based medicine in the current study. This is similar to the study conducted by Bhate PM et al, among dentists in Davangere city, Karnataka. (15)

From the present study it can be concluded that the medical and dental students have almost the same amount of knowledge when it comes to evidence based medicine. Only few of the study participants in the present study used Evidence based approach. It was stated in a study that despite being familiar with the EBD approach and having access to evidence-based specialized sites such as Cochrane library, students did not use this approach in their diagnostic and therapeutic procedures (16)

Evidence-based practice is recognised as a foundational element of healthcare professional education. The effective development and implementation of professional education to facilitate EBP remains a major and immediate challenge. (17)

In the present study only 2 % of respondents were unaware of Pubmed journals whereas in a study it was reported that 10% of respondents were unaware of Pubmed journals. (18, 19)

The limitations of the present study was that it was cross-sectional survey and hence the responses were participants self-report, also the frequency of use in solving the clinical problems were not recorded. Further studies with larger sample size are needed to assess the attitude, knowledge about evidence based practice.

Conclusion

Medical and dental students almost have the same amount of knowledge when it came towards understanding and practising evidence based medicine. EBP and its related concepts to be included into the curricula of the medical and dental institutions so that students are taught the concepts at an undergraduate level as well as they learn how to put this application into daily clinical practice. Therefore, the importance of evidence-based dentistry as well as the skills needed to apply it in practice need to be developed.

Knowledge about Consumer Protection Act and Informed Consent among Dental Students

Prashaanthi. N[1], L. Leelavathi[2]

[1]Under graduate Student, [2]Senior Lecturer, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Background: Doctor and patient's relationship is always based on trust and confidence. In today's world patients have become more aware of their right-legal literacy. The dental profession requires knowledge and skill which serves the individuals. It's the responsibility of the dental health professional to provide accurate health services to the patients and the society.

Aim: To assess the knowledge about consumer protection act and informed consent among dental students.

Materials And Method: A total of 198 dental students were taken into study. A questionnaire consisting of 18 questions was framed and was circulated using online survey link. The results were tabulated and analysed.

Results: About 8% of the students have told immigrants does not require consent form and 39% have said both verbal and thumbprint as consent for illiterate people. At about 11% have said they are not aware about professional indemnity insurance. While 39% have said both verbal and thumbprint as consent for illiterate people.

Conclusion : The results showed that the dental students had an average knowledge on CPA and informed consent while their knowledge was below average about professional indemnity insurance.Majority had awareness regarding CPA but practice of taking consent and utilisation of professional indemnity insurance among dental students were less than adequate.

Keywords: *Informed consent, consumer protection act, indemnity insurance, dentists, legal literacy*

Introduction

The relation between the doctor and patient relies on faith and confidence. There is an increasing awareness among public about medical negligence in Asian countries. Institutes and hospitals are increasingly facing complaints relating to facilities, standards of skilled ability and appropriateness of therapeutic and diagnostic method. [1, 2]

On 24th December, 1986, the government of India, to secure the interest of the patron, enacted a comprehensive legislation, the 'Consumer Protection Act, 1986' brought up as 'The Act'. It was later changed and the amendments came into impact on March 15th, 2003. [3] It absolutely was an act to produce higher protection of the interests of the customers and for that purpose to make provisions for institution of consumer councils and alternative authorities for the settlement of consumers. [4]

Informed consent is the process by which the treating health-care provider discloses appropriate information to a competent patient so that the patient may make a

voluntary choice to accept or refuse treatment. [5]

Consent may be a voluntary acceptance or agreement of what's planned or done by another person. Not taking consent is taken into account as deficiency in Medical Services below the Section 2 (i) of the consumer Protection Act. Consent may be a basic and established principle within the Indian Law. Everyone has the right to work out what shall be done to his/her body. Self-defence of the body (under IPC Section 96–102, 104, and 106) provides right to the protection of bodily integrity against invasion by others. [2, 5, 6]

At present, the extent of knowledge given to the patients regarding an informed consent (IC) will vary in practice among dental practitioners. Patients are exacting higher services and a lot of information concerning their treatment set up in health-care disputes between each of them range from inadequate and inappropriate treatments to serious issues of dental malpractice and neglect. [7] The Indian Dental Association introduced the first professional indemnity insurance Legal liability arising from errors on the A part of Registered Dental Practitioners whereas rendering professional service is covered by this insurance. [8]

Doctors practicing ethically and honestly should not have any reason for fear. Civil law, criminal law or consumer law, can only set the outer limits of acceptable conduct i.e. minimum standards of professional care and skill. The acceptable limit of professional conduct is to be decide by the profession itself. [9, 10]

The term "indemnity" means that compensation or to compensate. The principle of indemnity is strictly determined in liability insurances. These insurances are designed to produce the insured person protection against the financial consequences of legal liability. This policy is supposed for professionals to cover liability falling on them as a results of errors and omissions committed by them while rendering professional service. The indemnity applies solely to the claim arising out of bodily injury and/or death of any patient caused by or speculated are caused by error, omission or negligence in professional service accomplished or that ought to are rendered by the insured or the assistants or the team of individuals used by the insured. [9, 11, 12]

Studies showed that the awareness of the consumer protection act has increased [4, 13] and utilization of the professional indemnity insurance was less and related to higher age, year of practice, and gender. [4, 13]

In this current era of consumer satisfaction, dentists are facing legal challenges from discontented patients. With this ever-changing situation, doctors need to adapt to matters and should face such legal tangles. Hence a study was done to assess the awareness about the Consumer Protection Act (CPA) and informed consent among dental students.

Materials and Method

A cross-sectional study was conducted among dental students. A total of 198 dental students were included in the study.

An online survey link was created which had pre-tested structured questionnaire, comprising of multiple choice questions, to assess their knowledge about consumer protection act and informed consent among dental students.

Questionnaire consisted of 18 multiple choice questions. The students received a full explanation on how to fill in the questionnaire. It was made sure that all the questions were attempted. On the basis of the responses received through questionnaires, the data obtained were analysed by using statistical data. The total number and percentage were calculated and it was then analysed.

Results

A cross sectional study was carried among dental students to assess the knowledge about consumer protection act and informed consent. About 84% of the respondents were aware of consumer protection act. About 58% of the students said that a doctor can sue a patient with respect to payment or service. About 18% of the students have told they didn't know when and to whom the consent form is not required. (Table 1)

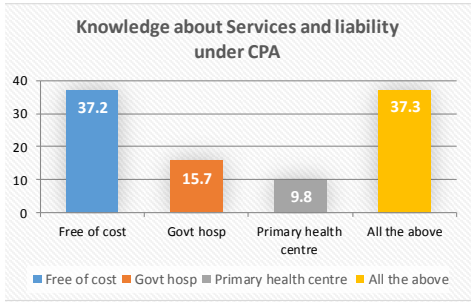

Figure 1: Distribution of study participants based on their knowledge about liability of services in CPA

About 37% have said services done under free of cost are not covered under CPA (Figure 1)

About 74% of the study participants said it was necessary to obtain informed consent for clinical examination and routine radiography. (Table 2)

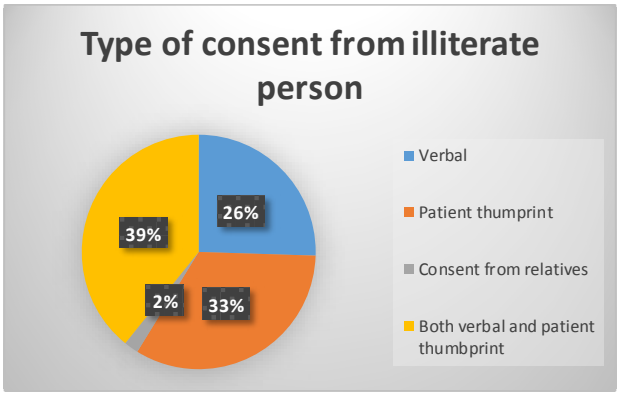

Figure 2: Distribution of study participants based on their knowledge about types of informed consent that to be obtained from illiterate person

About 33% of the respondents have said patient thumbprint can be considered as consent for illiterate people. (Figure 2)

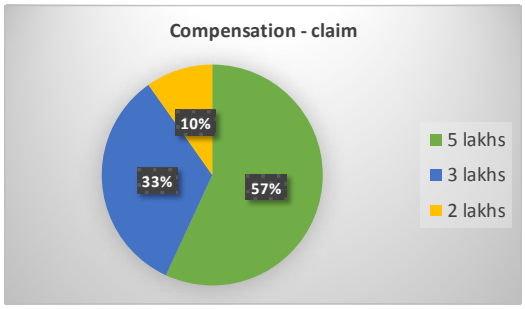

Figure3: Distribution of study participants based on their knowledge about compensation claim

For the question, the amount that can be claimed as compensation under district forum, about 57% have said can claim up to 5 lakhs and 10% have said can claim up to 2 lakhs. (Figure 3)

About 52 % have told only dental and medical professionals are covered under PII while 7% and 2% have said engineers, architects, solicitors and chattered accountant were covered under PII. About 11% have said they are not aware. About 28% have said all of them are covered under PII. About 36% didn't know about the services not covered under PII, while 27% have told that criminal acts are covered, 7% said civil claims and performance under GA unless in hospitals are the services not covered under PII, 16% have said performance by dentist under GA unless in hospitals are not covered under PII, 3% have said group policies are not covered under GA.

Table1: Knowledge about consumer protection act among dental students

S.no	Questions	Options	Students Responses (N)	Students Responses %
1.	A complaint filed by a consumer should be decided within how many days from date of notice issued to the opposite party	90 days	69	35%
		60 days	75	38%
		120 days	34	17%
		100 days	20	10%
2.	Location of consumer forum in your area	Aware	71	36%
		Unaware	127	64%
3.	The hospital and the doctor is liable for negligence of its employee in case of govt or private hospital	Yes	131	66%
		No	36	18%
		Don't know	51	26%
4.	Every health professional should maintain his/her patient records for a minimum of	3 years	83	42%
		5 years	75	38%
		2 years	12	6%
		Don't know	28	14%
5.	In a mishap of a minor case, beneficiaries are both patient parents/guardian	Yes	107	54%
		No	36	18%
		Don't know	55	28%

Table 2: Knowledge about consent form among dental students

S.no	Questions	Options	Students Responses (N)	Students Responses %
1.	Situation where consent may not be obtained	Child	79	40%
		Disabled individuals	16	8%
		Immigrants	16	8%
		All of the above	51	26%
		Don't know	36	18%
2.	Do you provide a copy of consent form to the patient	Willingly	103	52%
		Ask for a reason	67	34%
		Refuse	28	14%
3.	Is it necessary to obtain informed consent for clinical examination and routine radiography	Yes	147	74%
		No	35	18%
		Don't know	16	8%
4.	Consent is invalid when	Given under 12 years of age	119	60%
		Given above 12 years of age	47	24%
		Don't know	32	16%

Discussion

Awareness about medical and dental negligence among public is growing in India. With this changing scenario, health care professionals have to adapt to the situation and may have to face such legal tangles, which is intangible and disturbing sometimes. It is mandatory that all health care professionals including dentists should be aware of the medico legal aspects of the field. [14, 15]

In 1986, the Indian Parliament passed CPA to protect, safeguard and preserve the interest of consumers. Before the amendment of this Act, civil courts and the Indian Contract Act handled the cases against dentists. But it was more time-consuming and the other disadvantage of the latter was cost efficiency. [1]

Patient's rights have always been a subject of debate around the world. Countries worldwide are legalizing patient's rights. However, awareness among health professionals about such laws is observed to be varied. [16, 17, 18, 19] About 86% of the respondents were aware about Consumer protection act in this study whereas in a study did by Sikka et al 69.6% reported that they were aware about CPA. [16]

The indemnity applies only to the claim arising out of bodily injury and/or death of any patient caused by or alleged to have been caused by error, omission or negligence in professional service rendered or which should have been rendered by the insured or the assistants or the team of people employed by the insured. An important level of protection against outcome of litigation would be to go for Insurance cover. Profession indemnity insurance, not only meets the claim of compensation awarded against health professional or hospital but also gives a sense of mental security that even if some negligence is proved the insurance company will take care of it. Professional Indemnity Insurance cover became available for doctors and medical establishments only from December, 1991. [12]

In the present study, 65% dental students were aware about professional indemnity insurance, which was higher than the study done among dental practitioners in Mumbai city. [13]

Professional indemnity insurance was associated to age, year of practice, and gender. The utilization of

professional indemnity insurance was significantly related to the educational standards of dental practitioners. Knowledge of CPAs and practice of IC showed a positive correlation that better knowledge leads to better practice. [13]

About 64% of them were unaware about the location of consumer forum in their locality. It is necessary or in need to know about the consumer forum in his/her locality to verify about the status of their own private practice. About 8% have told that consent cannot be obtained if their immigrants. The dentist should be aware about the protocol for getting consent for immigrants as it may differ from the normal procedures. The current study showed 33% have agreed that they had sufficient knowledge about verbal consent while Gupta et al. had stated that only 68.6% of the dentists had satisfactory knowledge about verbal consent. According to the results of this study, verbal consent and patient thumbprint was the favourable method to obtain informed consent. [5]

In the present study, 74% of the study participants stated that obtaining informed consent was necessary. This is in accordance with the study conducted by Priyanka Goel et al where approximately 80% of the dental professionals take consent from the patients prior to the start of any procedure. [20]

In a study conducted by Sumanth.et.al said any patient suffering from symptoms as a result of treatment received from dental professionals, a claim for compensation could be carried out. [21] In the present study, it was seen that few participants were aware of the compensation that could be claimed by the consumers.

In the present study it was reported that 42% of the respondents knew that CPA was not applicable when free treatment provided. This is similar to the study did by Radhika et al, 46.9% knew that a charitable hospital that provides free treatment to all patients does not fall within the ambit of CPA. [22]

Conclusion

The results of the study showed that there was no adequate knowledge on consumer protection act and informed consent. We must upgrade our knowledge on consumer protection act at all levels of our profession and change our attitude by inculcating a practice to spread the message of consumer protection act for delivering quality dental care.

Assessment of Depression and Attitude Towards Missing Teeth Replacement in Geriatric Patients

Sangeetha Shankar[1], L.Leelavathi[2]

[1]Graduate Student, [2]Senior lecturer, Department of Public health dentistry, Saveetha dental college, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Chennai

Abstract

Aim: To assess depression and attitude towards replacement of missing teeth in Geriatric patients attending a dental college.

Materials and Method: The study was conducted in a private dental college, Chennai. For this study, 100 geriatric patients was randomly selected. Geriatric patients with physical and mental disabilities were excluded for the study and those above 60 years or above were included for the study. Two sets of questionnaires were used for the study - One was the Geriatric Depression Scale (GDS) and the other was a questionnaire based on attitude towards replacement of missing teeth. All the data were collected, analysed and frequency distribution of the data was calculated.

Results: From this study, it was found that 63% of the old aged participants were leading a depressed life and around 61.2% of them were not interested in replacement of missing tooth/teeth. Out of which, 45.6% of them showed lack of interest towards the same which indicates the fact that depression indirectly affects their attitude to address their needs such as replacement of missing tooth/teeth.

Conclusion: The above study clearly states a relation between depression and replacement of missing tooth/teeth in geriatric patients. The clinical significance of this study is that it is essential to create awareness regarding depression and old age and importance of replacement of missing tooth/teeth among the general public. It is necessary to educate the society regarding the various replacement techniques.

Key words: *Geriatric, Depression, Patients, Replacement, Teeth.*

Introduction

Depression is one of the most common psychological problems faced in old age.[1]According to the World Health Organization (WHO), depression can be defined as "a common mental disorder, characterized by persistent sadness and a loss of interest in activities that you normally enjoy, accompanied by an inability to carry out daily activities, for at least two weeks"[2]. Depression has a detrimental effect on the individual's mental health. And this becomes a serious health concern especially in geriatric patients[3-5]. It may also provoke suicidal thoughts. Therefore, have a higher risk of mortality[6-8]. Depression is usually higher or more prevalent among old age patients living in isolation, away from their families such as those living in old age homes. Some of the common symptoms of depression among old age patients are:- Feeling of persistent sadness, decline in daily activities, loss of appetite, loss of weight, insomnia, difficulty in socializing, persistent feeling of tiredness, reduced level of self-respect and self-confidence and increased fear towards death [6,9,10-13].

Teeth are important for a variety of functions such as speech, mastication, aesthetics which in turn will

have an impact on self-respect and self-confidence. All the above mentioned are applicable to old age patients as well. And missing tooth/teeth is one of the common intra-oral findings among geriatric patients. Irrespective of age, replacement of missing tooth/teeth is/are important. Oral health also influences general health. Though there is a wide array of options for replacement of missing tooth/teeth, the attitude of geriatric patients towards replacement of missing teeth is what makes the process of treatment planning difficult and challenging for dentists[5]. With increasing age, the need and attitude towards replacement of missing teeth may change and this change may vary among different individuals. This attitude is usually affected by a wide number of factors such as: Time, Age, Function, Aesthetics, Gender, Depression, etc.

Out of the above mentioned factors, the most uncommon factor is depression. It is not a part of the aging process. It makes them to lose interest in everything including the prosthesis for replacement of their missing teeth even if this has a negative impact on their day to day activities such as speech, mastication, etc. Eventually, they lose their appetite which may cause imbalance in their metabolism. This in turn may lead to various diseases in these patients. Hence, this study is focused to assess the relation between depression and attitude towards replacement of missing teeth in geriatric patients in South India.

Materials and Method

The study was conducted in Saveetha Dental College and Hospitals, Chennai. For this study, hundred geriatric patients were randomly selected. Two sets of questionnaires were used for the study. Geriatric Depression Scale (GDS) was used to assess the depression and a questionnaire was used to assess the attitude towards replacement of missing teeth among the study participants.

Inclusion criteria

- Geriatric patients above 60 years or above
- Single or multiple missing teeth

Exclusion criteria

- Patients under 60 years
- Geriatric patients with physical and mental disabilities
- Systemic complications

Questionnaire

As already mentioned above, two sets of questionnaires were used for the study - One was the Geriatric Depression Scale (GDS) and the other was a questionnaire based on attitude towards replacement of missing teeth. Both the questionnaires were multiple choice questions. Apart from these demographic details such as name, age and gender were also collected. The Geriatric Depression Scale (GDS) Short Form was used for the study which consisted of 15 questions. It is usually used to identify depression in older people who are in hospitals or old age care homes[14]. The answers that are in bold indicate depression. A Score of 1 point is given for each bolded answer. A score less than 5 points is suggestive of depression and should warrant a follow-up comprehensive assessment. A score less than 10 points is almost always indicative of depression[15]. The second set of questionnaire was to assess the attitude towards replacement of missing teeth. It consisted of 10 multiple choice questions.

Results

The questionnaires from the participants were collected, the results were tabulated and analyzed statistically. From the Geriatric Depression Scale, out of 100 geriatric patients, it was found almost 75% of them were not happy with their life. Only 25% of them reported to be leading a happy and satisfied life. About 68.7% of the patients have dropped many of their activities and interests. Life feels very empty for 59.2% of the geriatrics. About 66.7% of them often get bored and have none to share their feelings with. Most of them (66.7%) are not in good spirits or in a happy mood. A majority of the participants (62%) are anxious about their future and are in fear thinking whether something bad would happen to them. The old aged patients also reported a feeling of helplessness (56.9%). Around 60% of them prefer to stay at home and dislike going out. Only 12% of them feel happy to be alive. About 66.7% of them feel they are worthless to others. Almost 68% feel unlucky or have a thought that others are better off than themselves.

According to the questionnaire handed over to evaluate the attitude of replacement of missing teeth,

almost 66.7% of them were not even aware of a missing tooth/ teeth. Around 86.7% of the patients did not replace their missing tooth/teeth. Among those who did not replace the missing tooth/teeth the duration of edentulousness recorded for several years is 55.6%, few years is 22.2, few months is 7.9%, and few weeks is 1%. Most of the geriatric patients of the study, which accounts to 61.2% of them felt there was no need or in other words were not interested to replace the missing tooth/teeth. (Figure 1) The reason for the above response was due to time (5.2%), high cost (10.2%), age (0.2%) and lack of interest (45.6%). (Figure 2) But 38.8% of the participants felt replacement of missing tooth/teeth is/are vital because it improves their speech (10.6), improves mastication (14.3) and improves their aesthetics (13.9%). Almost 86.6% felt replacement of missing tooth/teeth boosts up their confidence and changes the way they are treated in the society. Almost 75% were not aware of the various treatment modalities available for the replacement of missing tooth/teeth. About 80% of the population feel artificial teeth cannot replace the function of the missing tooth/teeth. Out of the remaining 20% of the geriatrics, 18.6% of them preferred fixed prosthesis whereas only 1.4% preferred removal over fixed prosthesis. From all of the above an average of 63% of the participants are under depression.

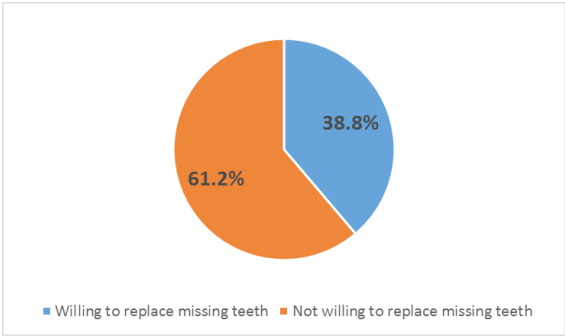

Figure 1: Distribution of study participants based on their willingness to replace the missing teeth

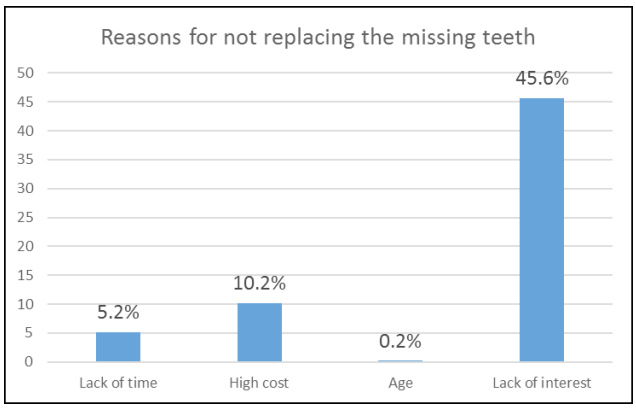

Figure 2: Distribution of study participants based on their reasons for not replacing the missing teeth

Discussion

Old age and depression

Old age can be defined as the last or end stage of normal human life[15]. It is a period, secondary to childhood, which requires care and affection. If people belonging to this stage, called as old aged or geriatric individuals if not given the required care and attention, they may often fall into a state of depression. According to WHO, depression can be defined as a mental disorder which is characterized by sadness, loss of interest in daily activity, feelings of guilt or low self-worth, disturbed sleep or appetite, tired feeling, and lack of concentration [5,16].Depression continues to be considered as a major health issue worldwide[5,17,18]. The various types of depression are as follows[19]:- Major Depressive Disorder (MDD), Persistent Depressive Disorder, Bipolar Disorder, Postpartum Depression, Premenstrual Dysphoric Disorder (PMDD), Seasonal Affective Disorder (SAD) and Atypical Depression. It can result in a lot of other complications such as sleep disorders, addiction towards drugs and alcoholic drinks, complicate or worsen critical health problems such as heart attack, etc[20]. It is usually common for geriatric individuals to be affected with depression due to lack of adequate care and affection from their loved ones or society. From this study, it was found that 75% of the geriatric individuals were under depression. A similar study conducted by Kohli S et al concluded that 29.8% of the 104 participants were under depression[5].

Need for replacement of missing teeth

With age, it is quite natural to lose teeth. But proper replacement is required to restore the function of the lost tooth/teeth. Geriatric patients suffering from depression may usually neglect the need to replace their missing teeth/tooth. From the study, it was found that 66.7% of the geriatric individuals were not even aware of a missing tooth/teeth. Some geriatric patients may be genuinely interested in replacement of missing tooth/ teeth but may quickly loose interest if the procedures for replacement are time taking or very expensive. Around 14.3% showed lack of interest towards replacement of missing tooth/teeth due to time, 14.3% refused due to high cost and 7.1% due to factors associated with age such fatigue, weakness, etc. Sometimes, the lack of interest towards replacement of missing tooth/teeth might be due to the inadequate knowledge regarding

the prosthodontic treatments or replacement techniques. They may not be aware of the consequences of no or delayed replacement of missing teeth. The consequences of not replacing the missing tooth/teeth over long time are explained briefly below: [21, 22]

Teeth, Tongue and the oral musculature play a vital role in speech. Loss of multiple teeth will make it hard for the patients to pronoun the words clearly thus, affecting their speech. In geriatric patients, this disturbance in speech will make it difficult for others to address their needs.

It is essential for humans to have a balanced, nutritious diet. With age, importance to health and nutrition increases. Teeth play the most critical role in mastication which in turn will help in proper digestion. Therefore, lack of replacement of missing toot/teeth may affect the mastication process leading to digestion problems in elderly patients hence, making them loose their appetite which ultimately affects their health.

When missing tooth/teeth are not replaced for a period of several months to years, the bone around the missing teeth gradually tends to undergo atrophy. This may even affect the treatment planning for prosthodontics treatments.

Normally, with age, the appearance drastically changes and loss of teeth will even more worsen the existing scenario. It will result in hollowing of cheek resulting in wrinkles, drooping of the smile line, sinking of the lips, etc.

All of the above factors, such as inability to masticate resulting in loss of appetite, atrophy of bone, negative impact on esthetics will all together affect their self-confidence which will eventually lead them to fall into depression which in turn will have a major impact on their life expectancy.

Various replacement techniques

Basically, replacement treatment or techniques are classified into fixed, removable, semi-fixed prosthesis. In my knowledge, some of the most common prosthesis used among geriatric patients are fixed partial dentures, implants, overdentures, complete dentures, temporary partially dentures, etc. Hence, from the above stanzas, it is well evident that it is necessary for geriatric individuals to replace missing teeth/tooth and depression which is a common mental disorder among these individuals may affect their interest towards the same.

From this study, it was found that 63% of the old aged participants were leading a depressed life and around 61.2% of them were not interested in replacement of missing tooth/teeth. Out of which, 45.6% of them showed lack of interest towards the same which indicates the fact that depression indirectly affects their attitude to address their needs such as replacement of missing tooth/teeth. A similar study conducted by Kohli S, et.al aimed at finding out the relation between depression and dentition among geriatric patients in Malaysia, showed a statistical significance between depression and dentition[5]. In a study done to evaluate the attitude towards replacement of missing teeth among patients in Karnataka, expressed that most of them were not aware about various treatment modalities with respect to replacement of missing teeth and lacked knowledge regarding the same[23].

Conclusion

The above study clearly states a significant relation between depression and replacement of missing tooth/teeth in geriatric patients. The clinical significance of this study is that it is essential to create awareness regarding depression and old age and importance of replacement of missing tooth/teeth among the general public. It is necessary to educate the society regarding the various replacement techniques. At the same time, it is important for dentists to realize the prevalence of depression among geriatric patients which will enable them to provide better care, shorter waiting/treatment duration, hence, encouraging more and more aged patients to opt for replacement of missing teeth which in turn will bring about a significant impact in their life.

Knowledge and Attitude Among Dentist Regarding CPP-ACP as a Preventive Tool

Sophiya Juliet G[1], Deepa Gurunathan[2]

[1]Department of Pedodntics and Preventive Dentistry,[2]Professor, Department of Pedodntics and Preventive Dentistry, Saveetha Dental college and Hospitals, Saveetha Institute of Medical and Technical Sciences, Saveetha University, Tamil Nadu, Chennai, India

Abstract

Background: Dental caries is a dynamic process that occurs due to the dental plaque that is present on the tooth surface, causing demineralization. To prevent greater destruction of tooth surfaces, remineralization can be done. CPP-ACP acts as a remineralizing agent

Aim: To assess the knowledge and attitude among the dentists regarding CPP-ACP as a preventive tool.

Material and Method: 120 dentists were included in the questionnaire survey. The questionnaire contains 17 close-ended questions. The questions were based on the knowledge, attitude and practice among dentist on usage of CPP-ACP containing products as a caries preventive tool.

Result: Among the 120 dentists, 83 were postgraduates and 37 were undergraduates. The postgraduate practitioners (80%) had better knowledge about the basics of CPP-ACP than the undergraduate practitioners (40%).

Conclusion: The postgraduate practitioners have better knowledge than undergraduate practitioners. Most of the dentists are unaware about CPP-ACP in most of the aspects.

Keywords: *CPP-ACP, Remineralization, Pediatric dentistry.*

Introduction

Dental caries is a dynamic process that occurs due to the dental plaque that is present on the tooth surface, causing disturbance in the equilibrium resulting in loss of mineral from the tooth surface[1]. It forms as the result of a process where the mineral constituents of the tooth, principally the calcium and phosphate, are demineralized by organic acids that are produced by bacteria which are lodged in the biofilm adhering to the tooth surface. The destruction starts from the first atomic level of demineralization, through the initial enamel followed by dentinal involvement, to eventual cavitation[2]. Calcium and phosphate are lost from the subsurface enamel, which eventually aids in the formation of subsurface lesion. At this early stage, the caries lesion is reversible via a remineralization process involving the diffusion of calcium and phosphate ions into the subsurface lesion to restore the lost molecular structure.

Casein, a bovine milk phosphor-protein that interacts with calcium and phosphate and is a form of the natural food component. Its technical name is casein phosphor-peptides-amorphous calcium phosphate, or CPP-ACP. The concept of using CPP-ACP as a remineralizing agent was introduced in 1998[3] use of casein as caries prevention was developed in the early 1980s[4]. The mechanism of anticariogenicity in casein phosphopeptides is that, as

Corresponding Authour:
Deepa Gurunathan

Email ID: drgdeepa@yahoo.co.in

colloidal calcium phosphate complexes are in colloidal form, they considerably increase the calcium phosphate levels in plaque, intensify remineralization and lessening enamel demineralization[5]. In recent years casein phosphopeptide-amorphous calcium phosphate (CPP-ACP) nanocomplexes have also been demonstrated to have anticariogenic properties in both laboratory animal and human in situ experiments[6-13]. To the knowledge of the authors there is very sparse literature regarding the knowledge of CPP-ACP among dentists. Hence, the study was conducted to assess the knowledge, attitude and practice among dentists regarding CPP-ACP as a caries preventive tool.

Materials And Method

A pilot study was carried out prior to the main study. The study protocol was approved and received ethical approval (STP/SDMDS15PED2b) from institutional review board of Saveetha Dental College. A computerized questionnaire survey of general dental practitioners in Chennai was carried out to investigate the knowledge about CPP-ACP. A questionnaire in English was framed and piloted by sending it to 20 general dental practitioners. The questionnaire was based on the knowledge about CPP-ACP among dentists. According to the replies, the questionnaire was modified by adding few questions. The modified questionnaire was sent to all registered general dental practitioners (n=120) including private practitioners and those working in institutions. The survey was done online and questionnaire was sent to around 210 dentists whose mail id was known. The demographic details were collected to check the qualification, specialty, years of experience. The questionnaire consisted of 19 questions concerning to the knowledge about CPP-ACP which includes the available forms, remineralization ability, effectiveness along with fluoride and reduction in the streptococcus mutans count. The collected data were entered in excel sheet and analyzed using the statistical package SPSS version 16. Simple descriptive statistics were used together with Chi-square (χ^2) test. The chosen level of significance was set at $P < 0.05$. Unanswered questions were treated as missing values.

Results

The qualification details are described in table 1. Of the 120-questionnaire that was sent, the response was at a rate of 100%.

Out of the 120 dentists, 58 dentists (59.2%) knew the abbreviation of CPP-ACP was Casein phosphopeptide amorphous calcium phosphate, while 28 dentists (29%) gave the wrong answer and 12 dentists (11.8%) did not know what CPP-ACP was. 80 dentists (69%) knew that CPP-ACP works on the remineralization and 27 dentists (23.2%) were wrong about the mode of action by CPP-ACP and 9 dentists (7.8%) don't know. 55 dentists (47.8%) knew that both calcium and phosphate were the ideal ion for caries prevention while 42 dentists (36.5%) and 14 dentists (12.2%) think calcium and phosphate were separately the ideal icon for remineralization and 4 dentists (3.5%) don't know. 74 dentists (64.3%) knew remineralization occurs only in enamel lesion while 20 dentists (17.4%) and 14 dentists (12.2%) think it helps in dentinal lesion and both enamel and dentinal lesion respectively and 7 dentists (6.1%) don't know. 94 dentists (82.5%) knew that CPP-ACP helps in reversal of white spot lesion, 7 dentists (6.1%) say that CPP-ACP do not help in reversal of white spot lesion and 13 dentists (11.4%) are not aware about the reversal mechanism of white spot lesion by CPP-ACP.

Out of 120 dentists 48 dentists (41.7%) knew CPP-ACP can reduce the levels of streptococcus mutans and 44 dentists (38.6%) knew that it doesn't reduce the levels of lactobacillus count. 83 dentist (72.2%) knew that CPP-ACP can be used in orthodontic decalcification. 85 dentists (74.6%) knew that CPP-ACP is effective along with fluoride. 87 dentists and 80 dentists (70.2%) knew that CPP-ACP had synergistic remineralization and counteracts the action of acid in case of erosion respectively. 47 dentists (41.2%) were aware that CPP-ACP should not be used in children with lactose intolerance.

The knowledge about CPP-ACP among undergraduate and postgraduate practitioners were evaluated. The Postgraduate practitioners had better knowledge about the basics of CPP-ACP than the undergraduate practitioners. There was better knowledge about CPP-ACP among the Paedodontists and Endodontists than any other specialties. To evaluate the basic knowledge about CPP-ACP the main important questions were considered as the key indicators for CPP-ACP (Table 1)

The attitude among the dentist towards CPP-ACP was above average. The use of CPP-ACP was preferred by 68 dentists (82.4%) in their practice. 68 dentists (59.6%) were interested in attending upcoming CDE

programs on CPP-ACP as a preventive tool.

Discussion

The study was carried out to assess the knowledge of the dentist about CPP-ACP as a preventive tool, closed ended questionnaire is more effective. This study highlighted that dentists are unaware of the importance of CPP-ACP as a preventive tool. The knowledge about CPP-ACP among the participation as a prevention of dental caries was found to be poor.

Longbottom, stated that Ideal caries preventive restorative material should release calcium and phosphate in the oral environment[13], this proves that CPP-ACP is an ideal caries prevention material and helps in remineralization.

It has been proposed that the anticariogenic property is established by CPP-ACP as ACP is localized at the tooth surface which then reinforces the free calcium and phosphate ion activities, thereby helps to maintain a state of supersaturation to the enamel, so reducing the levels of demineralization and increases remineralization[6],

Kumar et al, in his study has proved great efficiency of CPP-ACP in remineralization of early enamel lesions[14], which is more effective when used after the use of toothpaste with fluoride (1100ppm) which shows that CPP-ACP helps in remineralization of enamel lesion and reversal of white spot lesion and proves to be more effective when used along with fluoride.

Schupbach P et al, proved that Casein phosphopeptide reduces the count of streptococcus mutans as it has the ability to integrate in the pellicle[15] which shows CPP-ACP has ability to reduce the Mutans count in the oral micro flora. Therefore, CPP-ACP can be expected to be effective in high-risk children who have not developed good oral hygiene habits.

Mazzaoui et al stated that CPP-ACP with fluoride produced synergistic potential for remineralization[16], which was unaware of most of the dentist about CPP-ACP.

Kariya et al, stated that when fluoride was added to the CCP-ACP the acid-resisting effect was improved[17] , which proves CPP-ACP along with fluoride is more effective and long standing.

The CPP-ACP have been incorporated into sugar-free chewing gums, fluoride varnish, and dental cream (GC corporation) and is commercially available as Tooth Mouse (Asia/Australia) and MI paste (USA) and the fluoride containing CPP-ACFP (with 900-ppm fluoride) as Tooth Mouse-plus and MI paste-plus and MI varnish (USA).

Conclusion

The post graduate practitioners have better knowledge than BDS practitioners. Most of the dentists are unaware about CPP-ACP in most of the aspects. CPP-ACP provides a new direction to preventive dentistry. It is safe. CPP-ACP is considered as the novel carrier for calcium, phosphate and fluoride ions and promote enamel remineralization. It can be used as an adjunctive treatment to fluoride therapy. It mainly is a non-invasive management of dental caries. CPP-ACP has higher remineralizing potential when used along with a fluoridated toothpaste than when used alone. CPP-ACP should be used as a topical coating after brushing the teeth with a fluoridated toothpaste by children who have a high caries risk.

Dental Aesthetics, Self Awareness and Perception of Personal Dental Appearance in Young Adults

S.Jayajanani R[1], R. Pradeepkumar[2], P.Jayashri[3]

[1]Graduate Student, Saveetha Dental College, Saveetha University, Chennai, India,[2]Professor, [3]Senior Lecturer, Departmentof Public Health Dentistry, Saveetha Dental College, SIMATS, Saveetha University, Chennai, India

Abstract

Background: Dental aesthetics,self awareness and perception of the personal appearance plays a vital role among young adults. Dental esthetics and appearance is important among young adult patients because judgment concerning their personal characteristics is influenced by their dental appearance in the absence of other information. Hence, it is very essential to seek Knowledge about the young adults awareness and perception of personal appearance to know about their expectations and provide treatment.

Aim: The aim of this study is to assess the dental aesthetics,self awareness and satisfaction with the dental appearance in young adults.

Materials and Method: A cross-sectional survey was conducted among 19 to 25 years old young adult patients reported to Saveetha dental college and Hospital, Chennai. Following simple random sampling 150 patients were selected. This survey was conducted from December 2015 to March 2016. A Self administered questionnaire was distributed and descriptive data in terms of frequency and percentage were analysed using SPSS software (Version 17.0).

Results: The study sample consisted of 150 subjects of which 73(48.7%) were males and 77 (51.3%%) were females. 65(43.3%) subjects were between 19 to 21years, 85(56.7%) were between 22 to 25years of age group. About 78.6% expected their teeth to be white. Maximum number of study participants (65.3%) considered that straight and beautiful teeth have significant impact on their general appearance and 63.3% responded that straight and beautiful teeth promotes better career opportunities. About 78% of the subjects were influenced by looking at the models in the magazine. Only 46.6% were willing for orthodontic treatment for correction of mal-aligned teeth.

Conclusion: Most of the participants in the present study were very much aware about the importance of straight, aligned and beautiful teeth have a significant impact on their general appearance and better career opportunities, but their willingness for orthodontic treatment is less.

Key words: *Self awareness, Dental esthetics, Dental appearance, Perceived need, young adults.*

Introduction

The concern over dental appearance is highly increased which has been observed during childhood and adolescence to early adulthood. The decision to start orthodontic treatment is primarily influenced by such concerns and psychosocial well-being[1]. Esthetics in dentistry aims to improve the patients' self-esteem and satisfaction regarding how beautiful and attractive they feel. However, patients and dental professionals may perceive the concept of esthetics differently instead, which may cause the dissatisfaction of the patient with the results of the treatment[2]. A "good dental appearance" has been shown to be related to a person's social and intellectual competence, peer group acceptance and

Corresponding author:
P. Jayashri,
Senior lecturer, Department of Public Health Dentistry, Saveetha Dental College, Saveetha University, Chennai, India, E-Mail: shrijaya2009@gmail.com

hence related to a successful life outcomes than people with lower attractiveness[3,4].

Van der Geld et al [5]reminds us that the mouth is the center of the communication in the face, calling the attention of the interlocutor. Studies have analyzed the influence of the oral health of youngsters on the perceived quality of life, and have identified a significant impact of the dental esthetics on this outcome[6]. The Oral health quality of life by definition, includes the absence of negative impacts of oral conditions on social life, and a positive sense of dento-facial self confidence[7]. The individuals with malaligned teeth might develop feelings of shame about their dental alignment, and may feel shy in social contacts, and that facial appearance related body self concept might be affected [8]. Therefore, there exists an inter-relation ship between physical attractiveness and social success, higher self esteem[9].

Facial features may be viewed differently in different races and what is considered as pleasing in one race might not be so in another race[10].The perception of beauty not only is an individual preference, but also might have cultural and ethnic biases[11-13]. Therefore, physical attractiveness plays animportant function towards social interaction which in turn influences the impression of an individual's social skill[14,15].

The dental appearance satisfaction is influenced by gingival architecture, tooth color, size, shape, strength and arrangements[16-18].It has been shown that persons exhibiting raised private self-consciousness have a better knowledge of their own personality, and have a more distinctive concept of their personal values[19]. It has been recognized that dissatisfaction with dental appearance is broadly related to the severity of the occlusal irregularities, there are differences in the recognition and evaluation of the dental features[14,20]. Due to this reason, professional opinions regarding evaluation of facial esthetics may not coincide with the perceptions and expectations of patients[21,22]. Hence, the relationship between professionally assessed and self-perceived treatment need is of interest to providers of orthodontic services.

Based on the self- regulation theory of self- awareness [23], in day today life, maximum attention of an individual has been directed towards the environment, and patient's behavior is mostly automatic and habitual without an awareness of personal appearance or emotions. Some people might perceive their own physical appearance as less perfect than that of attractive appearances portrayed in the movies and magazines. This may prove discouraging and upsetting[24].

Any deviation from the normal may result in feeling of insecurity related to appearance, poor social interaction and comparison of self with others, all of these may negatively affect the quality of life of the individual[25]. The aesthetic impact of smile can be divided into 4 specific areas: Gingival aesthetics, facial aesthetics, microesthetics, and macroesthetics[26]. The objective of orthodontic treatment is to improve dental occlusion, which, could result in a good functioning and aesthetically pleasing dentition in harmony with the face[27].

Individuals who are aware of their malocclusion may focus more on it and may even develop anxieties and psychological disturbances. As a result there is increased private self-consciousness that may predispose to self-criticism and dissatisfaction which manifests as low dental self-confidence[28].

Therefore, the purpose of this present study aimed to investigate the dental aesthetics, self-awareness and perception of personal dental appearance in young adults.

Material and Method

*Study design:*A cross sectional study

Study area: Saveetha dental college and hospital, Chennai

Study population: Following simple random sampling 150 young adults in the age group of 19 to 25 years old were selected. A self-administered questionnaire were distributed to the selected number of patients reported to the hospital.

Ethical clearance:

A)Prior to the start of the study ethical clearance was obtained from the institutional ethics committee, saveetha university.

B)Written informed consent was obtained from the study participants.

C)The anonymity of the participants was maintained.

Scheduling:

Data collection was scheduled from december to

march 2016.

Sample size:

N= 150 (95% power @ 5% alpha). Based on the study done by Ulrich Klages[29].

Survey instrument:

The survey tool consisted of several parts. The first section collected demographic information of the participants such as name,age, gender, address, occupation, highest level of education, income.

The second part of the questionnaire consisted of 10 questions to assess the participant's levels of knowledge towards dental aesthetics, self-awareness and perception of personal dental appearance

Survey methodology:

After a brief introduction on the purpose and intent of the study with the help of patient information sheet. Questionnaires were distributed to the participants and filled questionnaires were collected. Only completely filled forms were considered for analysis.

Statistical analysis:

Data was entered in microsoft excel spreadsheet and descriptive data in terms of frequency and percentage were analysed using spss software (version 17.0).

Results

The study sample consisted of 150 subjects of which 73(48.7%) were males and 77 (51.3%%) were females (refer Figure 1). 65(43.3%) subjects were between 19 to 21years, 85(56.7%) were between 22 to 25years of age group (Table 1).

About 55.3% of the study participants were self confident about smiling and 65.3% admire their smile in the mirror. 78% of the subjects were influenced by looking at the models in the magazine. About 78.6% expected their teeth to be white. 61.3% of the study subjects were satisfied with their shape of the teeth. About 60.6% of the respondents perceived healthy teeth is important for appearance. Maximum number of study participants (65.3%) considered that straight and beautiful teeth have significant impact on their general appearance and 63.3% responded that straight and beautiful teeth promotes better career opportunities. Only 46.6% were willing for orthodontic treatment for correction of mal-aligned teeth (Table 2).

Table 1:- Distribution of study subjects according to Age and Gender

Age group (in years)	Gender				Total	
	Male		Female		N	%
	n	%	n	%		
19-21	27	18	38	25.3	65	43.3
22-25	46	30.7	39	26	85	56.7
Total	73	48.7%	77	51.3%	150	100%

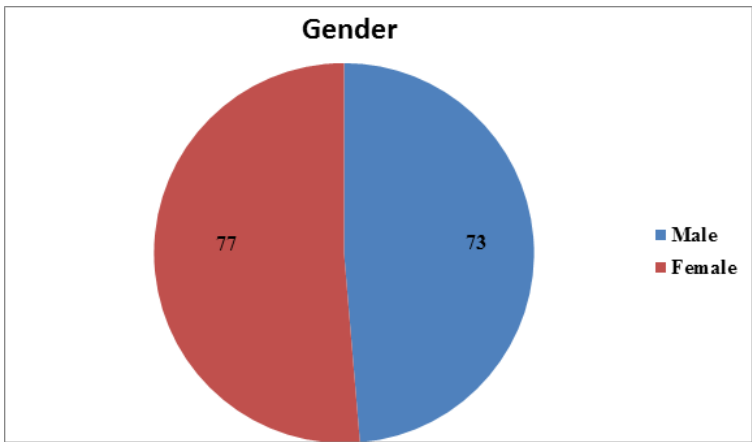

Figure 1: Gender wise distribution of study subjects

Table 2:- Distribution of study subjects by questions and score

Questions	Yes n(%)		Total N(%)
	Female(77)	Males(73)	
self-confident about smiling	43(55.8%)	40(54.7%)	83(55.3%)
Look at models in the magazine	62(80.5%)	55(75.3%)	117(78%)
Admire their smile in the mirror	50(64.9%)	48(65.7%)	98(65.3%)
Expecting their teeth to be white	61(79.2%)	57(78%)	118(78.6%)
Satisfied with their shape ofthe teeth.	51(66.2%)	41(56.1%)	92(61.3%)
Healthy teeth is important for appearance.	50(64.9%)	41(56.1%)	91(60.6%)
Expectsorthodontic treatment.	49(66.6%)	21(28.7%)	70(46.6%)
Straight and beautiful teeth promote dental health.	50(64.9%)	37(50.6%)	87(58%)
Straight andbeautiful teeth promote career.	52(67.5%)	43(58.9%)	95(63.3%)
Straight and beautiful teeth have significant effect on yourgeneral appearance.	51(66.2%)	47(64.3%)	98(65.3%)

Discussion

According to WHO, a good oral health is not only the absence of disease and dysfunction but it also includes its influence on person's social life and Dento-facial self-confidence[30].

Self-awareness and Self-evaluated dental appearance is increasingly receiving attention because of its influence on dental care and patient-oriented healthcare delivery-favored trend[31]. On the other hand, subjects exhibiting raised public-self awareness tend to focus on the social impact of their own behavior and appearance, and might be more vulnerable to feelings of shame and negative self-regard when they register minor deviations of their own physical appearance from the ideal norm[29].

Therefore, Self-perception of the dentofacial region exhibits an significant predictor for the global, competence, affect, academic and physical domains of self-concept[32].

Shaw (1981) stated that decrease in satisfaction with dental appearance is associated with increasing age[33]. In the present study under discussion, since the majority of patients were adolescents aged 22-25years, the high demand for enhancement in facialesthetics may be associated with the psychological changes experienced by teenagers[34]

In our study, 55.3% of their adults are self-confident about smiling in which 55.8% are females and 54.7% are males. This clearly shows that majority of therespondents were satisfied with their smile, this was in accordance with the study conducted by ShaistaAfroz et al[35]among dental students.It is apparent from the present study that 78% of adults wish that they had a pretty smile as the models in which 66.2% are females and 56.1% are males.65.3% admire their smile in the mirror. This data shows that more than half of the respondents were satisfied to see theirteeth in the mirror ; basically this explains the self-awareness and satisfaction of the

individuals. When they observe themselves in the mirror they become more self-aware[35,36].

A study done on the finalists of a beauty pageant for two years also reveals that about 80% of them felt the need to improve the appearance of their mouth and 28% felt that the teeth detracted from their smile[37]. Therefore, this study also shows that 60.6% of the adults feel that healthy teeth is important for appearance in which 64.9% are females and 56.1% are males. 58% feel that straight and beautiful teeth promote dental health in which 64.9% are females and 50.6% are males.63.3% feel that straight and beautiful teeth promote career in which 67.5% are females and 58.9% are males and 65.3% feel that straight and beautiful teeth have significant effect on their general appearance in which 66.2% are females and 64.3% are males. The results of the present study showed that improved dental appearance undoubtedly increases the general appearance as well as the career opportunities. On the other hand, only 46.6% expects orthodontic treatment in which 66.6% are females and 28.7% are males.This may be due to the fact that, most of the patients were unaware the orthodontic treatment modalities and its long term benefits on facial and dental appearance.

Conclusion

A positive esthetic self-perception was observed in young adults when it comes to their smile. The young adults are very much concerned about their dental appearance. Most of the participants in the present study were very much aware about the importance of straight, aligned and beautiful teeth have a significant impact on their general appearance and better career opportunities, but their willingness for orthodontic treatment is less. Hence, it is the role of practicing orthodontists to educate and motivate the patients about the importance of placing braces and they should build interpersonal rapport with the patients.

Knowledge, Awareness and Risk factors for Hypertension among Non-Medical Studentsin Chennai- A Cross-sectional survey

S.Jayajanani[1], Jayashri.P[2]

[1]Graduate Student, [2]Senior Lecturer, Department of Public Health Dentistry, Saveetha Dental College, Saveetha University, Saveetha Institute of Medical and Technical Science

Abstract

Background: Hypertension also known as high blood pressure or arterial hypertension is a chronic medical condition in which the blood pressure in the arteries is elevated. Hypertension is one among the silent killer diseases worldwide and is a major risk factor for many other diseases like cardiovascular diseases, stroke, renal diseases, and many other. Increasing the knowledge, awareness, and control of risk factors associated with hypertension will reduce the morbidity and mortality. Therefore the aim of this study is to assess the level of Knowledge, Awareness and Risk factors for Hypertension among Non-Medical Adults in chennai

Materials and Method: A cross-sectional survey was conducted among non-medical students of Saveetha University, Chennai. A two stage simple random sampling was performed. In the first stage, three colleges (Saveetha school of law, saveetha school of management, saveetha engineering) were selected.Following simple random sampling 150 non-medical students were selected. A Self-administered questionnaire was distributed to all the selected participants and descriptive data in terms of frequency and percentage were analyzed using SPSS software (Version 17.0).

Results: In the present study, only 34% of the participants were aware that males are prone for hypertension and only 4%were aware that diabetes is the major risk factor for hypertension. 41% of people have knowledge about hypertension and 59% of people do not have knowledge on hypertension.

Conclusion: To conclude, very few participants have sufficient knowledge and awareness about the etiology and risk factor associated with hypertension. Hence, considerable education is needed to increase awareness in modern concepts of particularly about risk factors and warning signs.

Key Words: *Knowledge, Awareness, Hypertension, Non-Medical Students, Cross- Sectional Survey*

Introduction

Hypertension is becoming an important public health problem worldwide. A recent report on the global burden of hypertension indicates that nearly 1 billion adults (more than a quarter of the world's population) had hypertension in 2000, and this is predicted to increase to 1.56 billion by 2025[1]. Subjects with hypertension are known to have a two-fold higher risk of developing coronary artery disease (CAD), four times higher risk of congestive heart failure and seven times higher risk of cerebrovascular disease and stroke compared to normotensive subjects[2]. Hypertension has been identified as one of the leading risk factors for mortality, and is ranked third as a cause of disability-adjusted life-years[3]. Existing data suggests that the prevalence of hypertension has remained stable or has decreased in economically developed countries during the past decade, while it has increased in developing countries[4].

According to WHO, in 2008, an estimated 36 million of the 57 million worldwide deaths were due to non-communicable diseases (NCD). These diseases included primarily cardiovascular diseases, cancers, chronic respiratory diseases and diabetes, including approximately 9 million deaths before the age of 60, with nearly 80% of these deaths occurring in developing countries [5]. Hypertension had a prevalence of 26.4% in the worldwide adult population in 2000 (26.6% in men and 26.1% in women). The total number of hypertensive adults was 972 million: 333 million were in more economically developed countries, and 639 million were in less economically developed countries [6]. Furthermore, hypertension is one of the leading causes of premature death worldwide, accounting for 7.6 million deaths in 2001 [7]. The number of adults with hypertension in 2025 was predicted to increase by 60% to a total of 1.56 billion adults [6]. Hypertension is the most common chronic disease with sudden onset, and it is called the "silent killer" because it progressively and permanently damages organs. Hypertension causes several heart, brain and kidney diseases, resulting in severe and life-threatening complications, as well as death [8].

The 8th Report of the Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High BP (JNC-8) reports that Hypertension affects 1 billion people worldwide A 55 year normotensive person has up to a 90% lifetime risk of developing hypertension and it is the number one reason listed for office visits and also causes or contributes to 457,000 admissions per year and a leading cause/contributor to death (myocardial infarction, stroke, vascular disease) [9,10].Worldwide analysis of global burden of hypertension revealed that 25% of the adults are suffering from hypertension and 9.2% of total deaths as a result of hypertension related events[11]. The number of hypertensive patients with has been increased from 600 million cases in 1980 to 1 billion in 2008; over 40 percent of adults were known to have hypertension [12]. Also, it was suggested that, by 2025,1.54 billion adults will suffer from hypertension [13].

The chief risks of developing cardiovascular diseases are same including smoking, overuse of caffeine, heredity factors, stress induced, age, unhealthy lifestyle habits and inappropriate or inadequate nutrition leading to obesity, diabetes, hypertension, hyperlipidemia[14]. Therefore, it is very essential to control hypertension by minimize the factors associated with hypertension. Rates reported for hypertension control were disappointing [15], which were suggested to be 13 to 56 percent around the world[16,17,18,19]. The knowledge and awareness are important component to control hypertension, which is relative to lower rates of ceasing interventions, following the interventions behavior and better disease control.

A proper and systematic assessment and understanding of risk and predisposing factors is particularly helpful in the area of chronic conditions such as hypertension, for which prevention and control requires a lifelong adoption of healthy lifestyle. Although hypertension characteristically occurs in middle age or old age, the changes are induced in the Cardiovascular System (CVS) since adolescence as a result of adoption of sedentary life style behavior in young age leading to hazardous impact in later years. Hence, Most of the students were unaware and ignorant about healthy dietary guidelines and consumption of food high in fats, sugar and sodium with minimal intake of fruits and vegetables [20]. A cross sectional study which was conducted in Hyderabad between the ages of 14–18 years assessing the risk factor of Cardiovascular diseases in adolescence, reported that unhealthy dietary habits were found in 31% of students while 29% of students didn't take part in anyphysical activity[21]. Awareness of the early warning signs and symptoms of CVD is a key to eliminate sudden cardiac death[22].

Medical students have a clear knowledge and awareness regarding hypertension and its risk factors , but there has been inadequate information and studies towards hypertension among non-medical students of chennai, the aim of this study is to assess the To assess the level of Knowledge, Awareness and Risk factors for Hypertension among Non-Medical students in Chennai.

Materials and Method

*Study design:*A cross sectional study

*Study area:*Saveetha School of law, Saveetha School of management, Saveetha engineering college, Chennai.

Study population: A two stage simple random sampling was performed. In the first stage, three colleges (Saveetha school of law, saveetha school of management, saveetha engineering) were selected. Following simple random sampling 150 non-medical students were selected.

Ethical clearance:

A)Prior to the start of the study ethical clearance was obtained from the institutional ethics committee, Saveetha University.

B)Written informed consent was obtained from the study participants.

C)The anonymity of the participants was maintained.

Scheduling:

Data collection was scheduled from November 2015 to January 2016.

Sample size:

N= 150 (95% power @ 5% alpha). Based on the study done by Marium Mustaqeem et al[15].

Survey instrument:

The survey tool consisted of several parts. The first section collected demographic information of the participants such as name, age, gender, address, occupation, highest level of education, income.

The second part of the questionnaire consisted of 10 questions to assess the participant's level of Knowledge, Awareness and Risk factors for Hypertension among Non-Medical students.

Survey methodology:

After a brief introduction on the purpose and intent of the study with the help of patient information sheet. Questionnaires were distributed to the participants and filled questionnaires were collected. Only completely filled forms were considered for analysis.

Statistical analysis:

Data was entered in Microsoft excel spreadsheet and descriptive data in terms of frequency and percentage were analyzed using SPSS software (version 17.0).

Results

Figure 1 shows the awareness about the risk factors for hypertension where majority of the study participants reported that stress (35%) is the main risk factor which leads to hypertension followed by obesity (26%). It is relevant from the figure 2 that 34% of the participants reported that males are more prone for hypertension than females and 36% of the participants answered that both the gender are prone for hypertension. Figure 3 shows that 50% of people feel that high cholesterol level affect BP.11% of people have said that kidney problems cause hypertension.36% of people feel that diabetes mellitus is one of the causes of hypertension.46% of people said that high salt intake causes hypertension.22% people presume that fried items causes hypertension.25% of people said that headache is the major symptom of hypertension.38% of people feel that dizziness as a major symptom of hypertension.22% of people think that fatigue as a major symptom of hypertension. Figure 4 depicts the awareness about signs and symptoms of hypertension where 25% of people said that headache is the major symptom of hypertension.38% of people feel that dizziness as a major symptom of hypertension.22% of people think that fatigue as a major symptom of hypertension.

Discussion

Hypertension is one of the major risk factors for cardiovascular diseases and an important cause of morbidity and mortality accounting for a large proportion of coronary heart diseases[23]. It is one of the non-communicable diseases imposing a double a double burden on the developing countries already combating the challenges of existing problems with infectious diseases[24,25,26].

Hypertension is a rapidly emerging disease worldwide and contributes highly to morbidity and mortality. Risk factors not only include obesity, sedentary lifestyle, and age but also genetics and environmental factors contribute to it. Hypertension is usually asymptomatic and the patient presents to the hospital with one of the complications especially in developing countries where very minimal importance and minimal resources are allocated to noncommunicable diseases.

A study showed that 80% of deaths that result from noncommunicable diseases occur in the developing world [27]. Another study has predicted an increase of 80% in the number of hypertensives by 2025 [28]. Studies from South Africa have shown that obesity and hypertension are the most prevalent cardiovascular risk factor [29]. As a result, the most common presentation with chronic heart failure is due to hypertensive heart disease [30]. By 2030, 85% of the 23 million cardiovascular deaths projected will be in low and middle income countries [31].

In Cameroon, 29.7% of all participants in a study had hypertension [32] while it was a staggering 47% among females in South Africa [33]. Treatment of those who were known to have hypertension was a mere 10% in Cameroon [34] . Out of those using medicines, only between 0.4% and16.8% had optimal control [33,34]. In another study conducted in Cameroon, 47.5% of people had hypertension, from which only 31.7% were aware of their status [36]. A study done in Kilimanjaro showed prevalence of hypertension to be 30% in males and 28.6% in females of which under 20% of the patient with hypertension were aware of their status. Only 10% were on medication and less than 1% had optimal controlled blood pressure [34].

Conclusion

Hypertension is a repeatedly elevated blood pressure and the symptoms occur suddenly which requires immediate hospitalization. Considerable education is needed to increase awareness in modern concepts of particularly about risk factors and warning signs. Home readings of blood pressure tend to be better correlated with both the extent of target organ damage and the risk of future mortality than are readings taken in the physician's office. Many machines are now available for the purposes that are convenient, inexpensive and relatively accurate. The ultimate goal in treatment of the hypertension patient is to achieve the maximum reduction in the long-term total risk of cardiovascular morbidity and mortality.

Bleaching Efficacy of Carbamide Peroxide, Fluoridated Carbamide Peroxide against Nanohydroxyapatite reinforced Carbamide Peroxide- An In Vitro Study

S.Shreelakshmi[1], Srisakthi Doraikannan[2], I.Meignana Arumugham Indiran[3], S. Rajeshkumar[4]

[1]Post Graduate Student, [2]Reader, [2]Professor, [3]Nano Bio Science Lab, [4]Reader, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract

Aim: This study was conducted to comparatively evaluate the bleaching efficacy of Carbamide Peroxide, Fluoridated Carbamide Peroxide and Nanohydroxyapatite reinforced Carbamide Peroxide

Material and Methodology: An in-vitro experimental study was carried out on 18 sound human maxillary fully erupted

Premolars extracted stored in phosphate buffer saline solution (PBS). They were segregated in to

3 Groups (Group I , Group II and Group II) consisting of 6 samples in each group. Their UV transmission wavelengths between 380-780 were determined using Spectrophotometer. The samples of the three groups were subjected to bleaching treatments with 10% Carbamide Peroxide, Fluoridated Carbamide Peroxide and Nanohydroxyapatite reinforced Carbamide Peroxide respectively. Spectrophotometric analysis was carried out and data were tabulated in Microsoft Excel for transferred to SPSS for analysis.

Results: It was observed that the bleaching procedure significantly changes the enamel translucency, making it opaquer. It was found in our study that Fluoridated Carbamide Peroxide has a superior bleaching efficacy showing a mean value of 0.4±0.88 prior treatment which increased to 3.3±2.32 post treatment with the bleaching agent than Nanohydroxyapatite reinforced Carbamide Peroxide. The efficacy of 10% carbamide peroxide was found to have least efficacy. The study showed that the mean value of samples in group III was the highest (3.3±2.32) followed by group II (1.9±0.43) and group I (1.7±2.26).

Conclusion: Fluoridated Carbamide Peroxide had superior bleaching effect compared with Nanohydroxyapatite reinforced Carbamide Peroxide.10% carbamide peroxide was found to have the least efficacy than other combinations

Keywords: *Nanohydroxyapatite, Fluoridated Carbamide Peroxide, Human extracted premolars, Teeth bleaching, Invitro trial*

Introduction

Dental caries is the most common oral diseases affecting a majority of the community. It is caused as a result of unbalance between remineralization and demineralization process. Hence control of demineralization and addition of effective remineralization agents is the key to preventive dental programmes [1].

Technological advancements in today's world have led to evidence based dental researches involving nanotechnology in Dentistry for widening the accuracy of diagnosis and novel treatment modalities.

The terminology 'Nanotechnology' is derived from the Greek word "Nanos", meaning dwarf and was introduced by Norio Taniguchi in 1974. Present-day Nanotechnological research falls under two approaches namely the bottoms-up and the top-down. The first deals with the creation and development of new 'intelligent' materials or devices while the latter deals with the enhancement of existing materials [2, 3].

Hydroxyapatite is a biomaterial that forms the bulk of human teeth and is responsible for production of white appearance. It is the main source for calcium and phosphate [4]. It was first proposed to synthesize for its reparative activities by NASA when astronauts lost mineral content in their teeth and bones in the absence of gravity as it is a major constituent with proven biocompatibility. It was first replaced in fluoridated dentifrices in Europe [5,6].

It is well known for its remineralization capacity, desensitizing ability in addition to role of bone growth stimulator due to the fact that its exhibits direct actions on osteoblasts without emergence of inflammation and toxicity. It also detection and destruction of cancer cells It also contributes to protection of dental implant surfaces by protecting it against oxidative processes by reduction of roughness offering aiding in preventing plaque accumulation. It is also popularly regarded for its guided tissue, nerve and pulpal regenerative features and its uniqueness in tissue engineering [7].

Nanohydroxyapatite has unique characteristics such as solubility, higher surface energy, and more biological activity than larger particles compared to hydroxyapatite [8,9]. Esthetic concern among the general public is increasing now a days as they wish to enhance the appearance of theirsmiles and has led to great demand for treatment of discolored teeth such as bleaching, laminates, veneers, microabrasion, and porcelain jacket crowns.

At home vital tooth bleaching is gaining popularity and is well accepted owing to its effectiveness, least cost, and invasiveness. This is also due to another fact that external bleaching techniques do not create the need for teeth preparation so that sound dental structures are untouched with reduced or zero chairside time and minimal gingival irritation and pulpal involvement comparatively [10].

The American Dental Association has declared a seal of 10±1% concentration of

Carbamide peroxide as at home whitening agent with assured safety. However, bleaching with

10% carbamide peroxide is found to reduce mineral content of dental tissues leading to alteration in the structural, chemical, and mechanical properties. It may also cause loss of micro hardness. Increased susceptibility to erosion, sensitivity reduced fracture stability or decreased abrasion resistance and promotion of dental caries formation may be the consequences of bleaching [11].

In order to improvise the above pitfalls, a whitening system that also fights decay which is of a higher value than the one that only whitens teeth evolved using fluorides during or after bleaching [12].

The most commonly remineralizing material used in dentistry is fluorine [13, 14]. However its disadvantages include fluorosis, respiratory and digestive disorders on chronic exposure [15, 16]. It does not have the ability to remineralize demineralized dental lesions and moreover each unit of fluoroapatite is composed of calcium and phosphate in addition to fluoride [17].Thus, there is a need to replace fluoride with other substances to repair demineralization lesions for which different compounds could be tried. Evidence based dental research has led to the finding that addition of fluoride does not interrupt with the whitening producing capability despite exhibition of remineralizing effect.

Numerous studies have been carried out so far among dental practitioners and students to evaluate the prevalence, knowledge, attitude and practice regarding various aspects in different fields to apply the results in practical ways which is the need of the hour [22-29].

Lack of adequate information exists regarding the exact potential of new dental materials when used in combinations. With the emergence of success rate on using nanohydroxyaoatite in the field of dentistry, this study is conducted with an aim to conduct a qualitative assessment in detecting the role of nanohydroxyapatite powder incorporation in to carbamide peroxide and fluoridated carbamide peroxide.The findings of this study would pave way to the formulation of Bleaching

agents with better remineralizing agent that will be beneficial to the community since functional and esthetic concerns would be addressed simultaneously

Materials and methods: Study design:

An in-vitro experimental study on sound human maxillary fully erupted Premolars extracted for periodontally compromised reasons and therapeutically for orthodontic treatment purpose.

Sample size estimation:

The sample size N=18 was estimated based on the study done by Roza Haghgoo et al (2016) using

G power 3.1[30] Sample size was estimated to be 6 per group (95% power and 5% α error)

Sample Collection

Sound human maxillary fully erupted Premolars extracted for periodontally compromised reasons and therapeutically for orthodontic treatment purpose were collected from the department of Oral surgery, Saveetha dental college, Chennai. They were microscopically examined for caries and other possible microcracks or defects.

Sample Selection: It was based on the below criteria

Inclusion criteria:

➢ Extracted sound human maxillary premolar.

Exclusion criteria:

➢ Conservatively restored tooth

➢ Endodontically and treated teeth.

➢ Teeth affected with fluorosis

➢ Teeth with enamel defects

➢ Teeth affected with wasting diseases such as attrition, abrasion and erosion,abfraction

➢ Fractured teeth

The specimen that were not fulfilling the inclusion criteria were rejected while those fulfilling the criteria were subjected to storage.

Ethical Clearance: Ethical clearance was obtained from the Ethics committee, Saveetha Institute of Medical and Technical Sciences.

Sample Storage: The extracted sound fully erupted human maxillary premolars were stored in phosphate buffer saline solution (PBS).

Group Segregation: The total 8 teeth were randomly assigned to three experimental groups consisting of 6 samples in each (Group I , Group II and Group III)

Armamentarium:

➢ Extracted sound human maxillary premolar

➢ Chemical balance

➢ Micro pipette

➢ Measuring flask

➢ Glass beaker

➢ Separating funnel

➢ Magnetic stirrer

➢ Magnetic bead

➢ Calcium hydroxide powder

➢ Orthophosphoric acid (88%)

➢ Deionised water

➢ Calcium chloride

➢ Sodium phosphate

➢ Acetic acid

➢ Potassiun hydroxide

➢ Hard tissue microtome

➢ pH meter

➢ Centrifuge

➢ Hot air oven

➢ Disposable centrifuge tubes

➢ Test tubes and conical flask

➢ Surgical gloves

➢ Mouth mask

Methodology

Preparation of Nano hydroxyapatite reinforced Carbamideperoxide:

It was prepared using the following chemicals: 1.5 mM calcium chloride, 0.9mM sodium phosphate and 0.15 M potassium chloride which had a pH of 7.152 ml of distilled water was taken and 0.1665 gm of calcium chloride, 0.108 gm of sodium hydrogen phosphate and 11.25 gm of potassium chloride was added to it. It was further reinforced with 10% Carbamideperoxide.

Data Analysis

Results

Table 1 : Table 1 shows the mean with standard deviation of wavelength values obtained using UV-Spectrophotometer among the three groups between pre and post bleach treatment.

Groups		N	Mean	Std. Deviation	p VALUE
Pre Bleach Treatment	Group-I	6	8.5	18.4	0. 327
	Group-II	6	0.3	0.2	
	Group-III	6	0.4	0.8	
Post Bleach Treatment	Group-I	6	1.7	2.2	0.248
	Group-II	6	1.9	0.4	
	Group-III	6	3.3	2.3	

*Kruskal Wallis Test

Table 2 : Table 2 shows the comparison of mean with standard deviation of wavelength values obtained using UV-Spectrophotometer during pre and post bleaching analysis.

Groups	Sanitization	Mean±SD	Wilcoxon Signed Ranks Test	p-Value
Group-I	Pre Bleach Treatment	8.5±18.43	39	1
	Post Bleach Treatment	1.7±2.26		
Group-II	Pre Bleach Treatment	0.31±0.24	21	.004
	Post Bleach Treatment	1.9±0.43		
Group-III	Pre Bleach Treatment	0.4±0.88	23.5	.012*
	Post Bleach Treatment	3.3±2.32		

*Wilcoxon Signed Ranks Test

*Wilcoxon Signed Ranks Test

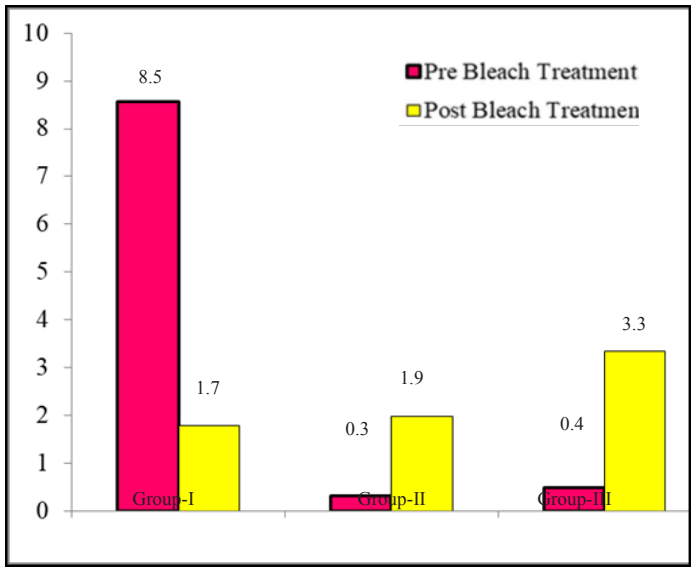

Figure 1: Figure 1 shows the mean differences in wavelength between pre and post bleaching treatments among the three groups.

Figure 1 shows that the study showed that the mean value of group III (3.3±2.32) and II (1.9±0.43) had a significantly higher mean depth than group I (1.7±2.26). It also shows that the mean value in Group III (3.3±2.32) is the highest followed by Group II (1.9±0.43) and Group I (1.7±2.26).

Discussion

Individual with discolored teeth may have a psychological impact that drives them to dentists for esthetic treatments. They seek such procedures for pleasing appearances that enhance their self- esteem and confidence. There is an increased emphasis on beauty and health and cosmetic dentistry has been thrust to the forefront of many practices.

Carbamide peroxide is an unstable compound, which breaks down into hydrogen peroxide and urea. Hydrogen peroxide is a strong oxidizing agent which can result in a change into a lighter spectrum of the compound.

Varying concentrations of carbamide peroxide ranging from 2-30% have been tried as bleaching agent [34]. However, 10% is considered as the standard. Despite its most common side effects like tooth sensitivity and gingival irritation, Lima et al found that no toxic effects were observed after the successive application of 10 percent carbamide peroxide [31].

Most of the clinical studies done to evaluate the efficacy of tooth whitening agents were using shade guides. It is a method that is a highly subjective one and variables such as observer's experience, eye fatigue, ambient light conditions, and the background against which a tooth is compared may lead to inconsistencies [32]. More particularly, there are numerous existing literatures that have attempted to quantify tooth colour changes by using the Vita shade tab system or a colorimeter [33]. The disadvantage of using it includes the requirement of technique sensitivity plus need for a flat surface respectively. In addition, small increments of change that could perhaps be measured by instruments such as a colorimeter would not necessarily indicate a clinically significant result. Moreover, there are very few studies using spectrophotometer [34-36].

In a clinical study, Brantley et al. used 10 percent carbamide peroxide to bleach traumatized discolored primary teeth which coincides with the result of study done by Ho and Goerig et al and reported effective bleaching outcomes after only two weeks [37,38]. In a study conducted by Ganesh et al. it was found that teeth bleached using 10 percent carbamide peroxide reached the original shade only after 21 days [39].

There are studies that have reported satisfactory bleaching outcomes in shorter duration. When

Perrine et al used 10 percent carbamide peroxide intracoronally for whitening discolored permanent teeth and found that only 65 percent of the teeth returned to their original shade after14 days [40].

To overcome these problems, an attempt was made to quantify the degree of whitening achieved using spectrophotometric assessment of tooth shade and so it was selected as a colour measurement approach in the current study.

It was determined in our study that the bleaching effect was produced on using all the three different bleaching agents namely 10% carbamide peroxide, Fluoridated Carbamide Peroxide and Nanohydroxyapatite reinforced Carbamide Peroxide.

It was found in our study that Fluoridated Carbamide Peroxide has a superior bleaching efficacy showing a mean value of 0.4±0.88 prior treatment which increased to 3.3±2.32 post treatment with the bleaching agent than Nanohydroxyapatite reinforced Carbamide Peroxide. The efficacy of 10% carbamide peroxide was found to have least efficacy. All the above finding showed statistical significance as well.

The variation in the duration of application between the earlier studies and the present one could be related to the severity of tooth discoloration.

Limitations

The study has measured only the short-term effect of the whitening agent

Conclusion

The evidence presented in this study suggests the following conclusion

➢ 10% carbamide peroxide, Fluoridated Carbamide Peroxide and Nanohydroxyapatite reinforced Carbamide Peroxide have immediate whitening effect on human teeth.

➢ Fluoridated Carbamide Peroxide has superior

bleaching effect which compared with

Nanohydroxyapatite reinforced Carbamide Peroxide and also 10% carbamide peroxide.

➢ 10% carbamide peroxide is found to have least efficacy than other combinations

Clinical Signficance

As cosmetic dentistry is a growing field, knowledge regarding the best bleaching agents available in the markets is essential for dentists and this study would help gain clarity on the same so that the right dental material for optimal effect could be used. This inturn would enable individuals boost their self-esteem and confidence that will result in an improved pshycological impact.

Recommendation

➢ There is a need for creation of awareness among dentists about various bleaching agents

➢ Further extensive studies are required in which the wavelengths of the samples must be subsequently measured to determine the longevity of the post bleaching treatment effect.

Abstract

Oral health is an integral portion of overall general health. Oral diseases qualify as a global and major public health problem owing to their high prevalence and incidence in all regions of the world. Oral health in India is usually not considered as an issue with priority by the public health sector. The main hindrance that deprives people of availing services is the high cost. The year 1929 is considered remarkable as birth of modern health insurance took place. Though India has accomplished a lot in terms of General Health Insurance, achievements are not made as far as comprehensive dental insurance system is concerned which is virtually nonexistent. Increasing awareness about various available modalities for dental care among public necessitates dental coverage which still remains a large untapped market. Effective dental insurance system will help people get minimum essential dental treatments at affordable prices. It reduces global economic burden of oral diseases. This creates awareness regarding preventive and prophylactic procedures percolating at the grass root levels which further enables to instill positive dental attitude. Hence it is a good tool for oral health promotion as well. A state of enormous transition exists in the oral healthcare delivery system of India. The biggest challenge of the present time is the need for dental health providers to serve the rural population with care and also understanding the insurance sector.. A better apprehension regarding dental insurance in India is needed to gain clarity. This review was carried out with an aim to explore the factors associated with its operation.

Keywords: *Health Insurance, Dental insurance, India, Dental health insurance companies, Dental health insurance Schemes, Benefits of dental insurance.*

Introduction

Dental caries, fracture of teeth as a result of trauma, malocclusion, gingivitis and periodontitis are the common dental problems. Dental diseases causes tooth pain, infection or dysfunction that limits the necessary ingestion of energetic foods, affecting the growth, learning, communication skills and recreational activities.People suffering from poor oral health are more likely to have more restricted- activity days than those who are unaffected. Poor oral health is commonly associated with many systemic diseases [1-4].Numerous studies have been carried out so far to various aspects in different fields expecting ethics to be followed which is the need of the hour [5-11]. Dental Insurance still remains a large untapped market. Hence this review is done for better apprehension and further exploration.

Importance of Oral Health

Oral health is an integral portion of overall general health. Dental care is a significant part of today's modern life. Good oral health is required for mastication, speech and pleasing appearance since a great healthy smile instills self-confidence in an individual which is essential for accomplishments in life. Thus oral health affects one's esthetics, communication, biologic, psychological and social projection.

Factors affecting Oral Health Condition

Variations in numerous factors like gender, age, races, genetic pattern, geographical locations, dietary habits, nutritional status, hygiene practice, exposure to stress, personal habits including smoking and alcohol consumption and so on are linked to a wide range of dental problems forming common responsible risk

factors for dental problems

Factors associated with access to oral health care services

Lack of knowledge on the consequences of delayed treatment and available modalities, ignorance, poverty, preoccupation, financial constraints, inaccessibility to dentists, inappropriate guidance and care, self-medication, fear, anxiety, misinterpretation and misconception about effects of dental treatment and dissatisfaction with the quality of oral health care services are the prohibitive reasons from dentistry [12, 13].

Oral Health in India

Oral diseases qualify as a global and major public health problem owing to their high prevalence and incidence in all regions of the world.

India is no exception and due to its enormous population size with large percentage below the poverty line, the absolute burden of oral diseases is immense [14].

People living in developing countries like India, especially those belonging to lower socio- economic status has lacunae in awareness regarding oral healthcare which is mirrored in their practice of oral hygiene habits and reflected on oral health status[15].Oral diseases hence creates burden mainly onsuch disadvantaged population groups of society [16].

Oral health in India is usually not considered as an issue with priority by the public health sector. Despite the fact that oral diseases are largely preventable, oral healthcare is still remains as an area which is neglected with least concern [17].

Current scenario of health system in India

Health service is one of the human basic and social rights of an individual. It is the responsibility of health care system to address the needs of respective population without discrimination.

It is the duty of every respective Government for active participation in provision and increment of appropriate necessary facilities for further approaches with to healthcare system so that health for all is achieved.

India is the largest democracy and the second most populated country in the world with more than

70% of Indians residing in rural areas and 26.1% is below poverty level [18]. Their low educational levels results in unemployment and is indicative of poor socio economic conditions. Scarce income is a significant factor associated with less frequencies of dental visit [19].

Apart from religious and ethnic disparities, the level of payment to dental professionals is a prominent factor responsible for utilization of oral health care services [20-23].

Despite the fact that the overall funding level allocated for healthcare is nationally higher, the

Government's funding is found to be lower in comparison with other emerging nations [24].Private health market bridges the gap between the requirements of the people and offerings of the Government dominating the health care delivery segment as it is rapidly progressive. However, the National Urban Health Mission scheme was proposed by the Central Government to improve affordability and accessibility of health care services. Despite the efforts in provision of many health programs to the poor by various State Governments during the Five years plan, lack of resources especially insufficient basic facilities in remote areas hinders the equal degree of health services rendered to the needy persons irrespective of caste, sex, creed and so on[25] .

The main hindrance that deprives people of availing services is the high cost. Increase in the demand for health services by the public, incorporation of rapidly progressive technological advancements in health profession that is ever growing, general inflation characterized by adequate and enhanced quality of services may be the reasons for elevated health expenditures. Majority of the population visit dentists occasionally for curative services while utilization of dental care for preventive procedures remains low with least priority given by majority of the population even for restorative due to financial constraints.

Thus the avoidable and unfair differences in health statuses of populations have to be resolved by addressing the issue called health inequalities at the earliest. One of the strategies to overcome is getting acclimatized to adoption of appropriate insurance system so that a large segment of the population is affordable for dental procedures.

Statistics regarding oral health status and awareness among India

According to the National Oral Health Survey of India (2002-03), the prevalence of periodontal diseases was 57.0%, 67.7%, 89.6% and 79.9% in the age groups 12, 15, 35-44 and 65-74 years, respectively [9]. The standardized age for incidence of oral cancer in India is 12.6% per 100,000 populations, 0.5 in the age range of 65-74 years. It is estimated that 19% of Indians are toothless [26].

According to a survey by the Indian Market Research Bureau (IMRB), around 60–90% of school children and nearly 85-90% of adults have dental cavities and nearly half of Indians do not use toothbrush and toothpaste. It also revealed that 34% believed that brushing once a day was more than enough and only 28 % brushed their teeth twice a day. The same study revealed that about 65% of people had no clue that eating habits could cause dental problems. It was also found that only 47 percent of total treatments received are by dentists while more than 50% having dental problems prefer to take advice from chemists and general practitioners, or use home remedies. People in rural areas still use their fingers, brick powder or neem sticks for brushing teeth.

Health insurance

Health insurance in India is a growing segment of India's economy. Numerous achievements are accomplished in India in terms of General health insurance.

An introduction to dental insurance

It is a kind of contract between and a client and an insurance company. It is designed in order to pay costs associated with dental procedures. It ma y n ot co ve r th e t otal c ost of t he bill. Most plan s t yp ic all y co ve r b etw e en 5 0 and 80 p e rc ent of th e cost of sp eci fi c dent al se rvi ces .

Is dental insurance worth the cost?

Even though some policies which restrict coverage for cosmetic procedures, majority of the dental plans do not bar coverage for procedures involving pre-existing oral health conditions which is contrary to health insurance. Owing to increasing literacy status among population introduction of effective dental insurance system will help people get minimum essential dental treatments at affordable prices.

Need for Dental Insurance

Most of the dental problems are preventable. Gone are the days when people visited dental professionals only for emergencies suffering pain .Dental insurance system reduces global economic burden of oral diseases. It increases the frequency of visits. This creates awareness regarding preventive and prophylactic procedures percolating at the grass root levels which further enables to instill positive dental attitude. Hence it is a good tool for oral health promotion as well.

Ideal dental insurance scheme

It must give freedom to choose dentist permitting patients to control treatment decisions and opt for appointment schedules according to individual needs based on convenience covering diagnostic, preventive and emergency treatments without limitations including referral.

Types of dental insurance plans around the World

Indemnity is a type of dental insurance that permits an individual to visit any dentist of choice who accepts it. The insurance company receives a premium every month end from its clients and this amount reimburses the dentist for the services rendered. Indemnity plans limits the amount of services covered within a given.

Preferred Provider Organization dental plan is a type of dental insurance in which a dental professional signs a contract with company to agree for provision of service according to their scheduled fee. The advantage is that patients are required to pay to a group of dentists at a deeply discounted rate which offers them substantial savings as long as he/she stays in their network. The disadvantage of this plan is payment of greater share of the fee-for-service by patients who chooses to visit a dentist who is not designated as a "preferred provider".

Dental Health Maintenance Organization is a type of dental insurance in which clients are assigned to dentists in a network for receiving benefits. It is an example of insurance based on capitation plan. The dentist is paid on per person basis rather than for actual treatment provided. Participating dentists receive a fixed monthly fee based on the number of patients assigned to them. Monthly premiums options, free preventive or routine care, selection of dentist from an approved network of

dentists are the advantages of this system.

Dental discount plan has several advantages over traditional dental insurance plans. The most important is that coverage is applicable with no exclusions for pre-existing conditions. The benefits for the patient include obtaining immediate coverage without meeting any waiting period.

A direct reimbursement plan is a self-funded benefit plan. An employer pays for dental care with own funds instead of paying premiums to an insurance company or third party administrator. A receipt detailing the services rendered is handed over to the patient who pays the full amount directly to the dentist who receives it later.

Review of the process involved in dental insurance

The dental insurance process involves three parties namely patient, dental professional and insurance provider who is the carrier involved. The primary commitment of dental service providers is discussion and provision of required standard treatments. Most of the dentists are associated with administrative assistants whose role is a key partner working with carriers to help patients make the best use of their benefits. Carriers are in the form of dental service corporation and constitute third party administrator who select the benefits, levels of coverage, payment model, and administer the program. The beneficiaries may also be employers who belong to associations or unions headed and represented by an individual whose responsibility is the purchase of comprehensive treatments at the lowest price.

Effective communication and sharing of information among the above personnel involved in the process are requisites to succeed in dental insurance system.

Various dental coverage's offered

- Preventive dental plans cover dental consultation, radiographs, scaling, topical fluoride and pits and fissure sealant application.
- Basic or restorative dental plans include insurance benefits involving operative dental surgery with root canal treatments and simple extractions as well
- There is one another category which provides similar advantage for crowns, implants, prosthetic procedures and complex surgeries.

Exclusions under dental policies

Dental procedures which are not covered by insurance include porcelain veneers due to the cosmetic nature of this procedure. However, they may be covered by dental discount plan. It also does not cover for teeth whitening procedure for removal of stains or discoloration. Similarly insurance is not offered when the dentist performs a composite restoration to correct a space between teeth by bonding to close the gap.

Health Insurance in India

The first marketed health insurance was Mediclaim in 1986. Health insurance in India is a growing segment of India's economy. Financial coverage is available for health expenditures at both individual and family levels.

Dental Health Insurance in India

Dental Insurance is not very popular and is usually integrated with general health insurance schemes in India since they supplement each other in case of accident or injury. Comprehensive dental insurance is non-existent.

The Indian dental insurance sector is almost in its nascent stages as presently only a handful of dental plans are available [27]. Despite stability in the Indian economy with the advent of 21st century, prospects of dental insurance is still unexplored.

The major form of payment towards dental treatments is fee for service which has replaced the traditional dental insurance system in which premium was paid on monthly basis and then deductible was met and then the company accounting for treatment costs.

Presently, limited financial coverage for few dental procedures is available India. There are some common features of various insurance companies in India.

A plan called stand-alone covers expenses only for extraction of permanent grossly decayed teeth and periodontitis and provides reimbursement within fixed period.

The other plan is coverage offered by companies under General health insurance plans. This is more particularly provided only for treatments involving hospitalization beyond 24 hours or life threatening situations with an added advantage that claim could be obtained for cost of medicines and hospitalization apart

from dental expenses with tax benefits.

The benefit of another plan called fee for service dental insurance coverage is payment of discounted service to any dentist of choice licensed by the insurance company.

The awareness among Indian population regarding oral health is increasing creating a need for dental coverage to overcome high expenditures towards healthcare due to propagation of technologies used in the field with elevation in general price.

Dental Insurance Schemes in India

Pepsodent Dental Insurance in partnership with New India Assurance launched by Hindustan Lever (HLL) in 2002 offered their consumers of their toothpastes on every purchase Rs.1, 000 worth of free dental against expenses for the extraction of permanent tooth due to severe caries and periodontitis including cost of medication. The disadvantage of this scheme was that claim was applicable for those up to 50 years without coverage for esthetic and rehabilitation procedures post-trauma. This scheme was not successful on a long run and hence discontinued.

ICICI Lombard Dental Insurance plan included coverage for all up to 65 years on OPD basis for all treatments except cosmetic procedures like bleaching and those involving orthodontics, prosthodontics until Rs.9, 500.

Apollo DKV Health Insurance offers coverage for all dental treatment on similar basis up to a maximum of Rs.5, 000 but with a waiting period of 3 years.

Few Dental insurance providing companies

Apollo Munich Maxima Health plan covers dental treatment and injury but the hospitalization cost is excluded. Bharti Axa Smart Health plan covers any dental injury while the policy holder suffers from any kind of accident. LIC Health Protection Plus provides coverage to all dental expenses. Chola MS Travel Insurance covers damage to the dental health of the policy holder while on any travel route.

International Scenario

The policy framework in US ensures that dental procedures are reachable to the lower income generating people. In United Kingdom, treatment facilities are being provided under the jurisdiction of safety and health services are one of the most cost efficient procedures in the world. Community dental Service forms an essential part of health promotion scheme in UK. Special concern is being shown for oral care of old aged people, handicapped and the poor by various target groups have been formed in Sweden and a similar scenario exists in Norway as well. Complete dental care is being provided to the individuals aged less than 19 years of age without charges under its policy of National Dental Insurance in Netherlands. The government of Brazil included oral health care mission in Family Health Program in 2000 as an initiative to benefit more of its population. Services are rendered collectively by the public and private practitioners in most of the most of the Latin countries.

Benefits of dental insurance in India

Oral health care workers are in a position to reach every class and village across the country. Dental insurance will enable create awareness which will serve to pass on the benefits of longevity of teeth across the society. It could contribute to a massive reduction.

Problems concerned with ineffective insurance systems

A review by Bennett, Cresse et al indicates that several community-based insurance schemes suffer from poor design and management. It fails to include the poorest-of-the poor with low membership and requires extensive financial support. Sustainability and replication of such schemes are the other issues related to it [28].

Strategies to be adopted

Effective utilization of services is a concept of expressing the enhanced interaction extent between the service provider and the people for whom it is indented.

Preservation, restoration and promotion of public health with equitable distribution is the prime duty of every healthcare provider .Hence health professionals, policy makers and insurance organizations must work communally so that different strategies could be adopted to address various influencers of social disparities to resolve and result in fair distribution of services through a suitable planning .

Formulation of universal care system can create an effective health sector for which existing inequalities in approaching the delivery system needs to be resolved.

Provision of a framework for actions across multiple sectors for human development with the most suitable use of resources must be adhered. Recognition of close links with development sectors and appropriate responsiveness to the challenges of global health transition and placement of the framework for sustainable development at a central position should be given concentration.

A thorough understanding of the barriers is thus essential for appropriate planning and consequence of improving access should be elimination of economic, systemic, social, cultural and behavioral barriers to use health services [29].Provision of "appropriate services in the right place and at the right time" is the true meaning of creating good access to health services which is the need of the hour [30].

It is estimated that nearly 85% of Indians residing in rural areas are served by 15% of all the country's dentists. Successful dental insurance system is feasible only when there is equal distribution of dentists between urban and rural areas so that there is accessibility and more the awareness more will be the effect of such a move.

Therefore it is important to educate and motivate people. Medical and dental insurance should also be made compulsory in which case each individual of India can enjoy it's benefits in his/her fullest health.

Limitations of dental plans

Coverage may not extend to your every dental need as it varies for every individual. Dental plan has limitations such as the number of times one can receive consultation and procedures each year with age restrictions as well. In addition, some procedures may not be covered under plan, which is referred to as exclusion.

An instance is a sit ua tion in whi ch th e in sur an ce co mpa n y s to ps p a yin g for fl uori d e tre atm ent when the protocol for better caries prevention in children is by topical application of fluoride twice a year. A n othe r su ch ci rc umst an ce would b e c hoosi n g lar ge filli n g f or w hic h insur an ce ma y o ff er r eimbu rs eme nt wh en t he d ent al p ro fe ssion a ls r ec ommen d a c ro w ns or o nla y th at ar e u nco ver ed und e r d ent al pl ans.

Claims settlement being a key service parameter for its reach hence speedy settlement of claims should be organized minimizing long waiting periods.

Insurance Fraud

t is estimated that approximately Rs.600-Rs.800 crores incurred on fraudulent claims annually is lost in Healthcare Industry of the country. Hence in order to make Insurance a viable sector, it is essential to concentrate on elimination of fake claims.

Actions like misrepresentation of treatment, fees, date of service delivery and billing for those which are not rendered for financial benefits whether deliberate or unintentional constitute fraud and those involved are liable to legal prosecution. Any act aimed at making profit from an Insurance contract constitute "Insurance fraud".

A culture of ethics where it becomes difficult to commit fraud has to be created by appropriately using indicators for detection like careful examining documents of doubtful nature, un-witnessed and not promptly reported cases.

Peer Review for Dispute Resolution

Many plans provide a peer review mechanism through which disputes between third parties, patients and dentists can be resolved, eliminating many costly court cases. The role of peer reviewing is immense ensuring fairness, consideration for every case with thorough examination of records, treatment procedures and results so that most disputes can be resolved satisfactorily for all parties.

Conclusion

Dentistry faces serious problems regarding accessibility of its services to all of India but the major missing link is the absence of a primary health care approach and affordability for utilizing oral healthcare services. A state of enormous transition exists in the oral healthcare delivery system of India. The biggest challenge of the present time is the need for dental health providers to serve the rural population with care and also understanding the insurance sector. There is a lack of an organized system for implementation and monitoring of dental insurance system.

Dental insurance can be used as an essential part of the oral health programmes to provide a better guidance tool for the dentists and a better oral health care to all, especially to the weaker sections of the society.

Oral physicians should forward and promote dental health insurance in the country by becoming a bridge between the insurance companies and the patients so that dental treatment becomes accessible to one and all.

Knowledge Attitude and Practice Regarding Informed Consent Among Dental Professionals in Chennai

S.Shreelakshmi[1], D.Srisakthi Doraikannan[2], I.Meignana Arumugham Indiran[3], Pradeep Kumar Rathinavelu[2]

[1]Post Graduate Student, [2]Reader, [3]Professor, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences,, Chennai, India

Abstract

Introduction: Dentistry, being one of the healing professions, has an obligation to society that its members will stick on to high ethical standards of conduct. In India, studies done to assess whether the dental practitioners adhere to ethics in their line of work are very meager.

The consent is integral as it enables in mutual communication to establish a good dentist-patient rapport that enables maintenance of dental patient record which is legal evidence that documents professional care provided to the patient. Informed consent is an essential tool of standard ethical dental practice.

Materials and Method: A cross-sectional survey was conducted among private dental practitioners in Chennai City. A self- administered structured questionnaire consisting of 21 items was used to assess their knowledge, attitude and practice regarding informed consent. The response format was based on a 2-point Likert scale. Descriptive statistics using frequency and percentage, inferential statistics using Pearson's Chi-square test to check the level of significance and association between variables, Pearson's correlation were utilized for statistical analysis.

Results: The mean scores for knowledge and attitude were 8.83 ± 1.635 and 3.28 ± 0.734 respectively. Analysis revealed that qualification and years of experience was statistically significant among both dependent variables ($p \leq 0.05$). Statistically significant differences were found in the mean knowledge and practice scores among graduate dentists and specialists.

Conclusion: A significant association between the knowledge and practice scores was observed, implying that with an increase in knowledge, there was also an increase in the practices of ethics among study population.

Keywords: *Awareness, Perception, Dental ethics, Informed consent, Registered dentists.*

Introduction

Hospitals and their managements are increasingly facing complaints regarding the facilities, standards of professional competence, and the appropriateness of their therapeutic and diagnostic methods [1]. Informed consent is an essential tool of standard ethical medical practice. A dentist-patient relationship can only work if there is good communication between them [3]. The patient's comfort is more vital to the acceptance of any intervention [2]. A major component of quality of health care is patient satisfaction [3]. Patient management is one of the key components in any health profession especially in one as professional as dentistry. The consent is integral as it enables in mutual communication to establish a good dentist-patient rapport. The dental patient record is legal evidence that documents professional care

provided to the patient [4]. It is the process of sharing information with patients that is essential to their ability to make rational choices among multiple options in their perceived best interest [5]. There is an important need to implement educational instruction in research ethics with special emphasis on informed consent as well [6]. There was paternalism in the oral health care delivery system of India over the last few decades. Presently, the patient's autonomy is considered significant in the contribution of planning treatment. Internet has replaced physicians as the primary or first source of information about a disease leading to an imbalance in the maintenance between patient's autonomy and doctor's beneficence often causes conflicts. Numerous studies have been carried out among dental practitioners and dental students so far to evaluate knowledge, attitude and practice regarding various aspects in different fields expecting ethics to be followed which is the need of the hour [7-11]. Many studies have revealed that majority of the dentists consider obtaining consent from the patient is important but they do not take in practice.

Lacunae in previous original researches are that the identification of reasons for not using informed consent among dental professionals for every patient on regular basis/routinely in practice is not revealed. This study will be revealing factors influencing or hindering the usage of consent in reality which lacked in the previous researches and thereby leading to formulations of strategies accordingly, that could easily be adopted in order to increase optimal usage of the consent form preserving autonomy of the patient and safeguarding the dentist from medico-legal issues as well aiding to carry out standardized ethical dental practice.

To the best of knowledge such study is not been conducted in South India, hence the aim of this study is to assess the knowledge , attitude and practice regarding informed consent among dental professionals in Chennai and aid in formulations for an effective usage of consent form.

Materials and Methodology

Study design

Descriptive cross-sectional study

Study area

Chennai, the capital city of Tamil Nadu is the selected area for conducting this study. Tamil Nadu in India has a diverse population of around 67.86 million (as of 2012) [12]. Chennai is said to be India's health capital providing health care through various government and private hospitals and a place with everyday advancements in medical research where healthcare professionals are the most respected and trusted.

Crowding of registered dental practitioners in metropolitan cities leads to unhealthy competition and commercialization. The latter leads to violating the code of conduct put forth by the state dental councils and many of the norms are openly flouted and rules randomly bent [8]. In order to see the awareness of standard ethical dental practice in Chennai, this population was selected.

Study population

There are 19680 private dental practitioners in Tamil Nadu and 7016 dental professionals in Chennai City [13]. Dental practitioners are selected by simple random sampling constituted the study population.

Inclusion criteria

Registered dental practitioners in Chennai were included.

Exclusion criteria

Dental practitioners who were not willing to participate were not included.

Approval and informed consent

Ethical clearance was obtained from Institutional ethics committee, Saveetha University.

An approval was granted (STP/SD MDS17PHD02) and study protocol was reviewed.

The anonymity of the participants was maintained.

Scheduling

Scheduling data collection was scheduled in the month of July 2017.

Sample size

Sample size was calculated based on the study done by Vivek V. Gupta et al; 2014, N=192 (using the sample size formula $Z\alpha^2$ PQ/ L^2.

Sample calculation

Formula:

$$N = \frac{Z\alpha^2 PQ}{L^2}$$

$P = 66.7$

$Q = 100\text{-}66.7 = 33.3$

$Z\alpha^2 = 3.84$

$L = 10\%$ of power

$$N = \frac{3.84 \times 66.7 \times 33.3}{(6.67)^2}$$

$$= \frac{8,529.06}{44.48}$$

N = 191.75

Sampling

Dental practitioners were randomly selected in Chennai, Tamil Nadu. The study was conducted for a period of two months and four to five dental practitioners were be involved each day.

Questionnaire

A questionnaire, designed to obtain dental professionals' knowledge, attitudes and practices towards informed consent, consisted of three sections. Section I solicited general demographic and professional background information. Section II comprised 11 questions to collect information about knowledge regarding informed consent. Section III consisted of 4 questions that aimed to assess the attitude towards the use of informed consent. Section IV comprised 7 questions that aimed to assess their practice of informed consent. The participant's responses for Sections II, III, and IV were recorded using Likert scale.

Pretesting of questionnaire

A self-administered structured questionnaire consisting of 21 items was developed and tested among a convenience sample of 10 dentists, who were interviewed to gain feedback on the overall acceptability of the questionnaire in terms of length and language clarity. Based on their feedback, the questionnaire did not require any corrections. Cronbach coefficient was found to be 0.5, which showed an internal reliability of the questionnaire and the split validity was found to be 0.65.

Methodology

The list of private practicing dentists from local sources (local Tamil Nadu Dental website). Among the total 192 dental practitioners, a pilot study was conducted on 10 dental practitioners. These were later excluded from the main study and the final sample size was arrived at 192. On the predecided days, there was a visit to the private clinics, according to area distribution, for getting the questionnaire filled. Questionnaires were distributed among all dentists (n = 192) who were requested to fill in the form. Their acceptance to rate each item of the questionnaire choosing the most appropriate response was considered as obtaining consent from them. There was revisit to the clinics after two days to collect the filled questionnaires. One hundred percent response rates were achieved by two follow-ups.

Statistical method used

Descriptive statistics using frequency and percentage was used. Inferential statistics using Pearson's Chi-square test was done to check the level of significance and association between variables. Correlation was done using Pearson's correlation. P value of < 0.05 was said to be significant.

Results

Table 1: Distribution of study subjects according to Age and Qualification

Age	BDS	MDS	Total	
			N	%
<40	51	118	169	88
40-50	0	18	18	9.4
>50	1	4	5	2.6

Table 1 depicts the distribution of study subjects according to age and qualification .Among the 192 study subjects, 169(2.6%) study subjects were aged less than 40 years, 18(9.4%) study subjects were aged 40-50 years and 5(2.6%) were aged >50 years. It also shows that 52(27.1%) study subjects were undergraduates and 140(72.9%) study subjects were postgraduates.

Table 2: Association between knowledge regarding informed consent and age among

x^2 -3.112 df-2 p<0.005

Table 7 depicts the association between attitude regarding informed consent and institutional attachment among dental professionals. Out of 192 study population, 153 of them were attached to a dental institution. Among the 153 dental faculties 134(69.8%) had positive attitude and 19(9.9%) had poor attitude. Among 39 dental surgeons who were not associated with dental institutions, 34(17.8%) had positive attitude and 5(2.6%) had negative attitude.

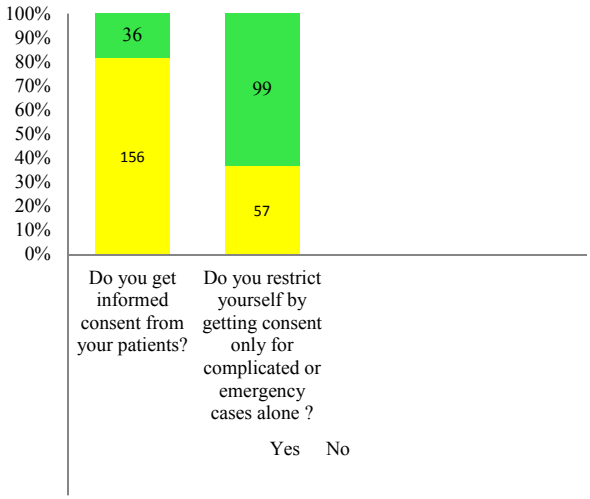

Figure 1: Distribution of study subjects based on the practice regarding informed consent.

Figure 1 shows the distribution of study subjects according to the practice regarding informed consent. Among the 192 study subjects, 156(81.3%) study subjects are getting informed consent from patients and 36(18.8%) had not been getting informed consent from patients. It also shows that

57(29.7%)of the dental professionals restrict themselves from getting informed consent for complicated or emergency cases and 99(51.6%) were not restricting by getting informed consent for complicated or emergency cases as well.

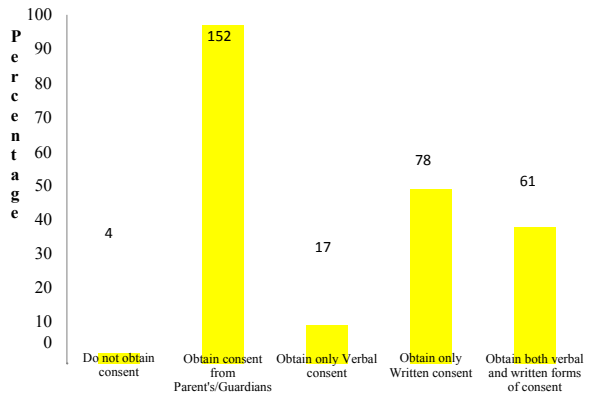

Figure 2: Distribution of study subjects based on the response and mode utilized for obtaining informed consent from disabled persons, minors and general population respectively.

Figure 2 shows the distribution of study subjects according to the practice followed for obtaining informed consent from disabled persons, minors and the mode of informed consent obtained in practice. Among the 192 study subjects, 156 dentals surgeons received informed consent and out of them 152(97.4%) were getting informed consent from the parents or guardians of minors, special children and disabled adults. It also shows that 4(2.6%) of them did not obtain for such differently abled population at all. It depicts 156 dentals surgeons got informed consent and out of them

17(10.9%) were getting verbal informed consent, 78(40.6%) obtained written consent and

61(39.1%)got both verbal and written informed consent.

Self Intenet Workspot Text Book Peers IDA Articles Not aware

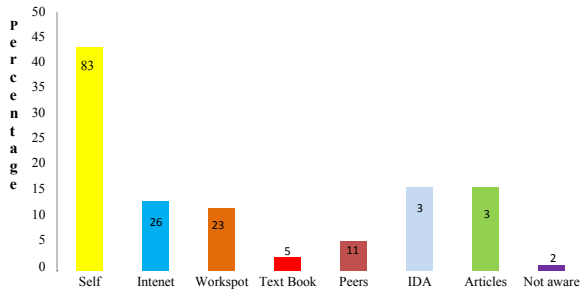

Figure 3: Distribution of study subjects on the basis from where the design of the informed consent was obtained.

Figure 3 shows the distribution of study subjects based on the mode of informed consent obtained in practice. Among the 192 study subjects, 156 dentals surgeons obtained informed consent and out of them 83(43.2%) used self-framed informed consents, 26(13.5%) obtained the design from internet,

23(12%) got from their work spot, 5(2.6%) used the format from standard text books, 11(5.7%) were utilizing the one received from their peers or colleagues. Nearly 3(16%) obtained the design of informed consent from Indian Dental Association and published articles while 2(1%) of them were not aware of the information regarding designing of the informed consents they had been using.

Discussion

Informed consent is the educational process which focuses on patient's absolute right to understand their status and proposed treatment plan. It is necessary for every examination and surgical procedure in health sector. In this cross-sectional descriptive study carried among dental surgeons in Chennai, a self-administered questionnaire comprising of 21 questions to investigate the knowledge, attitude and practices of dental professionals in matters relating to informed consent were explored.

The reputation of being a dentist comes with a responsibility to society and to fellow affiliates of profession to carry out one's professional activities in a highly ethical manner[14,15] .Hence age, professional experience, qualification are the factors which influence the outcome of this study.

Three parameters are found as a result of conducting this study. Levels of knowledge, attitude among registered dental practitioners are assessed followed by obtaining information regarding usage of informed consent in practice.

The information obtained suggested that among the 192 study subjects, 130(67.7%) had good knowledge, 54(28.1%) had fair knowledge and 8(4.2%) had poor knowledge of the informed consent. This suggested that at least the significance of informed consent has been included in the academic curriculum. It shows that a qualified dentist know the importance of informed consent in their dental practice. This result is in agreement with studies that emphasize the importance of informed consent in dental practices[16] .

The dentist should explain the risks and side effects associated with any of the treatment procedures, which have to be conveyed prudently. In the present study only 17(10.9%) were getting verbal informed consent.

The written form of informed consent is recommended in almost all of the studies carried out on this topic [17-19]. A patient giving oral informed consent may change his stance in case of any legal complication. Therefore the oral informed consent only has ethical value but written informed consent carries legal value as well [20].78(40.6%) obtained written consent alone while 61(39.1%) obtained both verbal and written informed consent in this study.

About 32(16.7%) BDS and 98(51%) MDS graduates had good knowledge about informed consent. The reason could be because of the fact that, specialists are exposed to additional ethical training during their postgraduate studies.

In current study, by attitude only, 82(42.7%) and 86(44.8%) had good and fair attitudes respectively. Nearly 24(12.4%) had poor attitude and did not consider informed consent to be an essential step in the dental care services. However to examine, treat, manage or operate upon patient without consent is assault in law, even if it is beneficial and done in good faith.

In this study, there was a wider gap of 36(18.8%) who still did not obtain informed consent as a routine protocol. This could probably be due to hurry, lack of time or negligence on the part of the dental professionals.

It is also very important that patient or parents in case of minors should completely understand what they are consenting for. Interestingly in this study, importance of informed consent was not uniformly realized for all procedures since 57(29.7%)of the dental professionals restricted themselves from getting informed consent only for complicated or emergency cases and 4(2.6%) of them did not obtain for such differently abled population at all. As the degree of invasiveness decreases they do not bother to take the consent from the patient. This result is in contrary to many studies which emphasize that informed consent should be taken in all cases without the degree of invasiveness [21-22].

In recent years there have been an increased number of petitions being filed in the courts regarding medical negligence, which in turn might be the reason for taking consent from patients [23].

It can also be discussed that in a survey there is always a chance that whether or not the respondent answer the questions truthfully, either they give the answer that they feel will please the researcher or give what they think is right even if it is not what they do on daily basis so this possibility must be considered.

It is an important medico legal concern in improper consent and withholding of complete information from the patients and also been the subject of judicial scrutiny. It is important to bear in mind patients informed consent is a part of patient's general right and has legal and ethical values. It should be based on information that patients can easily understand [24].

Conclusion

A significant association between the knowledge and practice scores was observed, implying that with an increase in knowledge, there was also an increase in the practices of ethics among study population.

Financial support and sponsorship: Self

Conflicts of Interest: Nil

Ethical Clearance: Ethical Clearance has been obtained for this article through Institutuional Human Ethical Committee (SDC/IHEC/ 093)

Recommendations

Emphasis should be given on undergraduate and post-graduate curriculum about informed consent for the dental students. It is also essential for dentists to protect themselves from civil litigation and even criminal proceedings for any malpractice. All dentists should incorporate informed consent into their regular dental practice for all cases.

Effectiveness of Oral Health Education Given in Private Dental Institutions in Chennai

S.Shreelakshmi[1], I.Meignana Arumugham Indiran[2], Pradeep kumar Rathinavelu[3], D.Srisakthi Doraikannan[3]

[1]Post Graduate Student, [2]Professor, [3]Reader, Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract

Introduction: Oral health is an integral part of general health. Despite the fact most of the oral diseases are preventable; least priority is given for oral care among public. As knowledge is considered to be an essential prerequisite for related behavior and educational intervention is easy in administration logical at community level for promotion, this study was conducted to evaluate the impact of oral health education.

Materials and Method: The used questionnaire in this cross-sectional survey consisted of 12 items to obtain data through telephonic interview. The study was conducted among 100 people who had received oral health education counseling during their dental visit. They were selected from the records management system in a private dental institution in Chennai city. Descriptive statistics using frequency and percentage and inferential statistics using Pearson's Chi-square test to check the level of significance and association between variables were utilized for statistical analysis.

ResultsThe mean age was found to be 35.6±12.303. Most of them were aged 21-40 years perceived the intervention to have a moderate impact developed greater expected behavior as a result of counseling. Males were higher in proportion than females. However, the practice of oral hygiene post intervention was greater among women. Higher proportions in different age groups perceived moderate impact. No matter whatever was the educational status of the individuals, oral health education created desirable behavior for healthy oral cavity.

Conclusion: Effective educational interventions with motivation contribute to positive behavior change.

Keywords: *Effectiveness, Oral health education, Oral health promotion, Program, Impact*

Introduction

Oral diseases qualify as major public health problem owing to their high prevalence and incidence in all regions of the world .The World Health Organization in 2003 indicated that the focus of Oral Health Education (OHE) actions should be on behaviors and conditions that promote oral health or that decreases the risk of oral diseases; health promotion at school should encourage daily tooth brushing, supervised tooth brushing, use of fluoride, and promotion of good nutrition, among other strategies[1,2].

India is no exception and due to its large population size, the absolute burden of oral diseases is immense[3]. People living in developing countries, and concomitantly, of lower socio- economic status have a lacunae in oral health awareness mirrored in their practice of oral hygiene habits[4].

There is stagnation in providing dental public health services and inadequate resources especially financial

constraints. Most of the oral problems are preventable.

Health education has emerged as one of the fundamental approaches in primary prevention [5]. Education is an essential part of health services. Among the many different approaches to the prevention of dental diseases, the most cost-effective method is health education [6].

Educational intervention is easy in administration logical at community level for promotion of health when limited resources exist. It not only improves the physical health but also ensures broadening the mindset of closeted society as well. Health education can bring about changes in life styles and risk factors of diseases [7].

Oral health is an integral part of general health. Poor oral health is commonly associated with many systemic diseases [8-11]. According to the World Health Organization, many factors like nutritional status, hygiene, stress, smoking and alcohol habits etc. are linked to a wide range of oral diseases forming the fundamental basis of the common risk factor approach to prevent the oral diseases [12]. Among these, oral hygiene is the most significant factor in terms of prevention of oral disease, accessible to personal control.

Oral hygiene which is a modifiable risk factor of oral problems affects one's esthetics, communication, biologic, psychological and social projection. Oral hygiene which is a modifiable risk factor of oral problems affects one's esthetics, communication, biologic, psychological and social projection. Inability to maintain proper oral hygiene practices lead to increase in the prevalence of dental diseases.

Oral health knowledge is considered to be an essential prerequisite for oral health related behavior [13]. The oral health literacy status deserves recognition as an important determinant of oral health. It is mandatory to enhance the knowledge and instill a positive attitude of the population regarding prevention of diseases in order to achieve successful community programs

The role of Public Health dentists is imperative since they bridge the gap between various sections of people and health sector. Dentists with good communicating skills are in a unique position serving as role models to educate inculcating minds to adopt healthy lifestyle.

The dental health messages should be practical, informal and culturally sensitive [14].Thus Oral health education is not only directed at reducing disease and injury to the teeth and their supporting structures rather it influences on general health and promotes a feeling of well – being[15].

Numerous studies have been carried out among dental practitioners and dental students so far to evaluate knowledge, attitude and practice regarding various aspects in different fields excepting the impact of health education which is the need of the hour for better apprehension to adopt the appropriate principles for an effective oral health educational intervention [16-22]. Until and unless, the impact of a program on the targeted population is not determined, the success of the program cannot be assessed. Keeping this in mind, the present study was undertaken with an aim to determine the impact of oral hygiene education program on oral health status of individuals in Chennai.

Study design

Descriptive cross-sectional study

Study area

India, the second largest in Asia and the seventh largest most populous country has a diverse population of around 1.3 billion. Tamil Nadu in India has a diverse population of around 67.86 million (as of 2012) [23]. Chennai covers an area 32, 8263 of Tamil Nadu .Hence the capital city of Tamil Nadu is the selected area for conducting this study.

Chennai is said to be India's health capital providing health care through various government and private hospitals and a place with everyday advancements in medical research where healthcare professionals are the most respected and trusted. There are nearly 13 dental institutions in Chennai [24].

In today world of stress with hectic work schedule for decent living, care and importance for one's own health is not taken leading to delayed diagnosis. As far as oral health is concerned, lack of knowledge and ignorance among population is still the reason for increase in prevalence of oral diseases. In order to see the effectiveness or impact of oral health education counseling given by dental professionals at private hospitals in Chennai, this population was selected.

Study population

Those who received oral health education counseling over the past 4 years selected by simple random sampling constituted the study population.

Inclusion criteria

People given oral health counseling in Chennai who gave verbal consent to take part in the study were included.

Exclusion criteria

Patients who were not willing to participate were not included.

Approval and informed consent

Ethical clearance was obtained from Institutional ethics committee, Saveetha University.

· An approval was granted and study protocol was reviewed.

· The anonymity of the participants was maintained.

Scheduling

Scheduling data collection was scheduled in the month of December 2017.

Sample size

Sample size was calculated using N power software based on values obtained from similar studies and rounded off to 100 for convenience.

Sampling

Patients who were given oral health education counseling during their visit to dentists over the past 4 years were randomly selected from the records management system maintained in a leading dental college and hospital at Chennai. The study was conducted for a period of one month and 4-7 study participants were involved each day.

Questionnaire

A questionnaire designed was used to obtain information among oral health education recipients. It was framed consisting of 12 questions consisting of few sections to analyze how the counseling is given followed by its impact in reality.

Pretesting of questionnaire

A self-administered structured questionnaire consisting of 12 items was developed and tested among a convenience sample of 10 dentists, who were interviewed to gain feedback on the overall acceptability of the questionnaire in terms of length and language clarity. Based on their feedback, the questionnaire did not require any corrections.

Methodology

The list of patients who had received health education was collected from the record management system maintained at a private dental institution in Chennai Among the total 100 study participants; a pilot study was conducted on 10 recipients of counseling. These were later excluded in the main study and the final sample size was arrived at 100. On the pre-decided days, there were telephonic conversations to patients who had undergone oral health education counseling over the past four years, for getting the questionnaire filled. Questions were explained to the study participants until they could understand it with clarity (N = 100) .They were requested to give response after listening carefully the options. Their acceptance to answer each item of the questionnaire choosing the most appropriate response was considered as obtaining consent from them. One hundred percent response rates were achieved by two follow-ups. **Statistical method used**

Descriptive statistics using frequency and percentage was used. Inferential statistics using

Pearson's Chi-square test was done to check and association between variables.

Result

Table 1: Distribution of study subjects according their age.

Age	n	%
≤20	5	5
21-40	59	59
41-60	32	32
>60	4	4
Total(N)	100	100

Table 1 depicts the distribution of study subjects according to age. It shows that among the 100 study subjects, 5(5%) study subjects were aged 20 years or lesser, 59(59%) study subjects were aged within 21-40 years and 32(32%) were aged between 41-60 years. It also shows that 4(4%) study subjects were 60 years or above.

Table 2: Distribution of study subjects based on the gender of study participants.

Gender	n	%
Male	59	59
Female	41	41
Total (N)	100	100

Table 2 depicts the distribution of study participants based on their gender. It shows that among the 100 study subjects, majority of them i.e. 59(59%) of them were males and 41(41%) were females.

Table 3: Distribution of study subjects based on educational qualification of study subjects.

Educational status	n	%
No formal education	2	2
Primary school	2	2
Middle school	27	27
Higher Secondary school	13	13
Graduate	56	56
Total(N)	100	100

Table 3 depicts the distribution of study subjects according to their educational status. It shows that among the 100 study subjects, 2(2%) of them did not undergone formal education. Nearly

2(2%) of them had done only primary schooling while 27% had attended middle school. Around

13% of them had finished their higher secondary education and 56(56%) were graduates. consumption demonstration

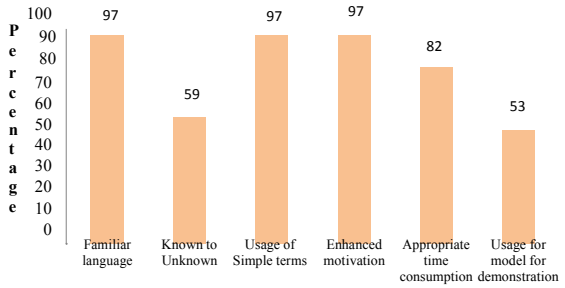

Figure 4: Distribution of study subjects based on how health education counseling was given.

Figure 4 depicts the distribution of study subjects based on the health education counseling was given. It shows that 97% of our study participants have accepted that oral health education was delivered in a language that they could apprehend and majority of them comprising 59% were informed facts about oral hygiene maintenance at the commencement of counseling session which they were aware earlier. However 41% of them were given instructions from unknown content. Around 97% perceive that the oral hygiene instructions were given by dentists using simple words and found it interesting while 3% have reported that jargons were utilized finding the counseling session not that appealing. Out of the total 100 people for whom health education was given, 82% of felt that it was given within appropriate time. Approximately 18% of them recognized it that either time consuming or less period was used making it ineffective. About

53% of the patients who had received oral health education were demonstrated the correct tooth brushing technique using mannequin of oral cavity while 47% of them were not shown.

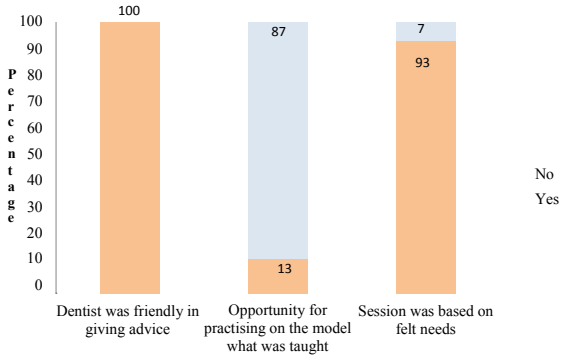

Figure 5: Distribution of study subjects based on approaches carried out by the dentist in conducting oral health education.

Figure 5 depicts the distribution of study subjects based on approaches carried out by the dentist in conducting oral health education. It shows that health education was given in a friendly manner by all the dentists who taught them. Most of them consisting 87% were not given opportunity to practice on the teeth model the technique after it was taught. Merely 13% were given chance to do after instructions were told and showed. Among the 100 participants, despite the fact that 7% of them perceive that were not helped with guidance for what they really wanted, nearly 93% of them were found to be satisfied for receiving oral health awareness counseling because they feel it is really given according to their felt needs.

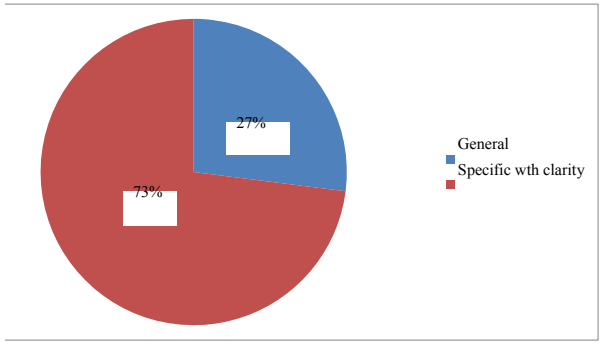

Figure 6: Distribution based on the type of information delivered through oral health education counseling a perceived by those received.

Figure 6 shows the distribution based on the type of information delivered through oral health education counseling a perceived by those received. Out of the total 100 for whom health education was given nearly 73% of them were provided with specific oral hygiene tips with clarity while 27% had received general

instructions.

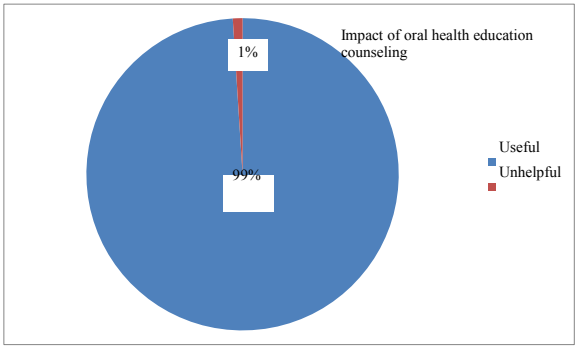

Figure 7: Distribution of study subjects based on efficacy of oral health education as perceived.

Figure 7 shows the distribution of study subjects based on efficacy of oral health education as perceived. Around 99% of the study participants found the health education counseling given by dentists very useful for maintenance of oral care. However 1% felt that the given instructions were not helpful to them overall.

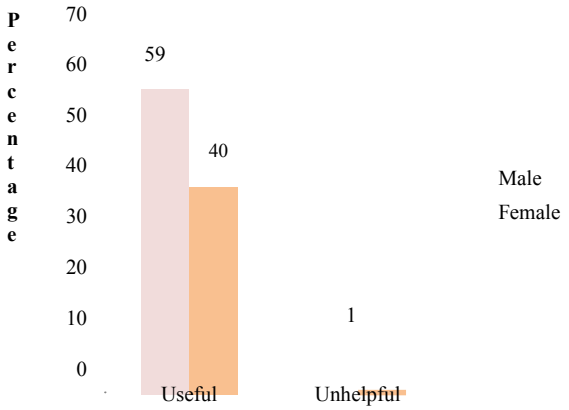

Figure 8: Distribution of study participants based on gender and their perception regarding efficacy oral health counseling.

Figure 8 depicts the distribution of study participants based on gender and their perception regarding efficacy oral health counseling. It shows that nearly 59% male found the information beneficial while 40% of the female study subjects felt the same and around 1% of them perceived the oral health education counseling session to be unhelpful.

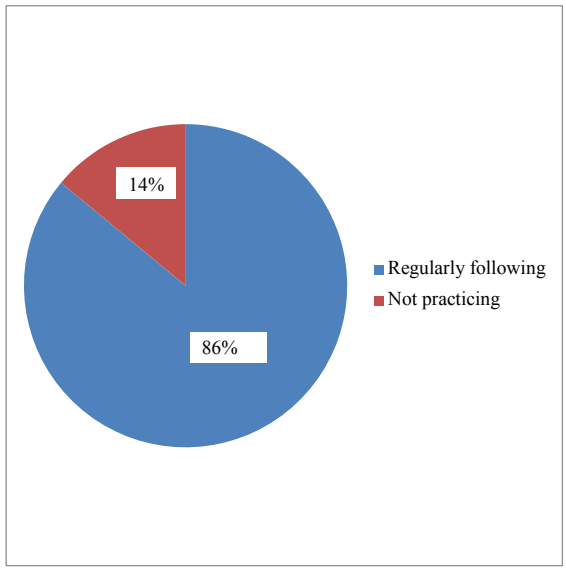

Figure 9: Distribution of study subjects based on effectiveness of oral health education as perceived.

Figure 9 shows the distribution of study subjects based on effectiveness of oral health education as perceived. Among the 100 study subjects, 86% of them follow the oral hygiene instructions in reality. The health education counseling is ineffective to 14% of the 100 participants.

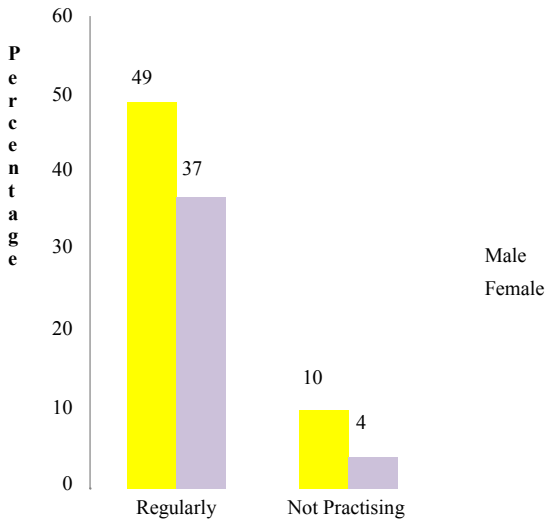

Figure 10: Distribution of study subjects depicting the impact of health education

Figure 10 depicts the distribution of study subjects representing the impact of health education. It shows that 49% male follow the oral hygiene instructions regularly while 10% do not. It also shows that 37% and only 4% of female study participants maintain oral hygiene as advised by the dentist and do not adhere to it respectively.

Table 4.1: Association between perceived impact level of educational intervention and age

Perceived impact of oral health education	Age in years								Total
	≤20		21-40		41-60		>60		
	n	%	n	%	n	%	n	%	N
Adequate	0	0	5	8.5	0	0	0	0	5
Moderate	5	100	44	74.6	29	90.6	4	100	82
Inadequate	0	0	10	16.9	3	9.4	0	0	13
Total	5		59		32		4		100

x^2 -6.718, df=6, p=0.348

Table 4.1 depicts the association between perceived impact level of educational intervention and age. It shows that among the 100 study participants, 5% of them aged twenty years and below felt that the given health education counseling was moderate. Among the majority of 59%, nearly

44(74.6%) aged between 21-40 years, of them found the session moderately effective while

5(8.5%) perceived to have an adequate impact. About 10(16.9%) of them found it inadequate. Around 29(90.6%)aged 41-60 years and all those aged 60 years and above found the program to have moderate impact as well. It was inadequate for very meager of them constituting 3(9.4%) who were 41-60 years old.

Table 4.2: Association between oral health behavior and educational intervention according to age

Age	Oral hygiene Practice behaviour				Total
	Positive		Negative		
	n	%	n	%	N
≤20	4	80	1	20	5
21-40	49	83.1	10	16.9	59
41-60	29	90.6	3	9.4	32
>60	4	100	0	0	4
Total	86		14		100

x^2=1.795, df=3, p=0.616

Table 4.2 depicts the association between oral health behavior and educational intervention according to age. It shows that majority of them 49(83.1%) of the study subjects in the age group

21-40 years had been following the instructed oral hygiene instructions post educational intervention while only 10(16.9%) did not adopt good oral hygiene practice. Around 29(90.6%) aged 41-60 had also improved oral hygiene maintenance while 3(9.4%) did not .It also shows that all of them who are 60 years and above had change in oral health behavior after counseling. It is clear that 4(80%) young adults developed positive desirable behavior after oral health education.

Table 4.3: Association between perceived impact levels of educational intervention according to gender.

Perceived impact of oral health education	Gender				Total
	Male		Female		
	n	%	n	%	N
Adequate	3	5.1	2	4.9	5
Moderate	47	79.7	35	85.4	82
Inadequate	9	15.3	4	9.8	13
Total	59		41		100

x^2=0.661, df=2, p=0.719

Table 4.3 depicts the association between perceived impact levels of educational intervention according to gender**.** It shows that shows that 47(79.7%) and 35(85.4%) of males and females perceived that dental education generated in them a moderate impact while 3(5.1%) and 2(4.9%) found it adequate respectively. However, around 9(15.3%) males and 4(9.8%) found it to be inadequate. This table also shows that both male and female felt moderate impact was the outcome of oral education counseling. It also shows that the expectation or satisfaction level for adequacy of the program is higher among females comparatively.

Table 4.4: Association between oral health behavior and educational intervention according to gender

Gender	Oral hygiene Practice behavior				Total
	Positive		Negative		
	n	%	n	%	N
Male	49	83.1	10	16.9	59
Female	37	90.2	4	9.8	41
Total	86		14		100

x^2=1.040, df=1, p=0.308

Table 4.4 depicts the association between oral health behavior and educational intervention according to gender**.** It shows around 86% of the study participants have developed positive oral health behavior while 14% never did .Among 59 males,49(83.1%) men and out of 41 females,37(90.2%) were following oral hygiene instructions. However 10(16.9%) and 4(9.8%) of men and women still had negative behavior towards oral health respectively.

Table 4.5: Association between perceived impact level of educational intervention and educational status

Perceived impact of oral health education	Educational status										Total
	No formal education		Primary school		Middle school		Higher Secondary school		Graduation		
	n	%	n	%	n	%	n	%	n	%	N
Adequate	0	0	0	0	2	11.1	0	0	3	5.4	5
Moderate	2	100	2	100	22	81.5	12	92.3	44	78.6	82
Inadequate	0	0	0	0	3	7.4	1	7.7	9	16.1	13
Total	2		2		27		13		56		100

x^2=2.867, df=8, p=0.942

Table 4.5 depicts the association between perceived impact level of educational intervention and educational status. It shows that 2(100%) who did not receive formal education and those with an educational qualification till primary level, 22(81.5%) who had attended middle school,

12(92.3%) who had completed higher secondary level of education and 44(78.6%) of graduates felt the impacted was moderate. Nearly 2(11.1%) and 3(5.4%) of them done with their middle schooling and graduation felt that dental education was adequate and around 3(7.4%) of them with 9(16.1%) graduates found it inadequate.

Table 4.6: Association between oral health behavior and educational intervention according to educational status

Educational status	Oral hygiene Practice behaviour			
	Positive		Negative	
	n	%	n	%
No formal education	2	100	0	0
Primary school	2	100	0	0
Middle school	26	96.3	1	3.7
Higher Secondary school	11	84.6	2	15.4
Graduation	45	80.4	11	19.6

x^2=4.530, df=4, p=0.339

Table 4.6 depicts the association between oral health behavior and educational intervention according to educational status. It shows that among the 100 study participants, about 2(100%) did not have formal education and possessed minimum qualification till primary level. It was observed that they had positive oral health behavior. Around 26(96.3%) of them who had educational qualification till middle school level had good oral hygiene practices post counseling while only 1(3.7%) had not showed any improvement at all. It also shows that 11(84.6%) who were qualified until higher secondary level followed oral hygiene routinely post session while and 2 (15.4%) did not. Most of the graduates 45(80.45%) had improved oral health behavior after knowledge was inculcated through educational intervention while there was no difference in 11(9.6%) even with highest educational qualification of all in this study.

Figure 11: Association between perceived impact of oral health education and oral health behaviour.

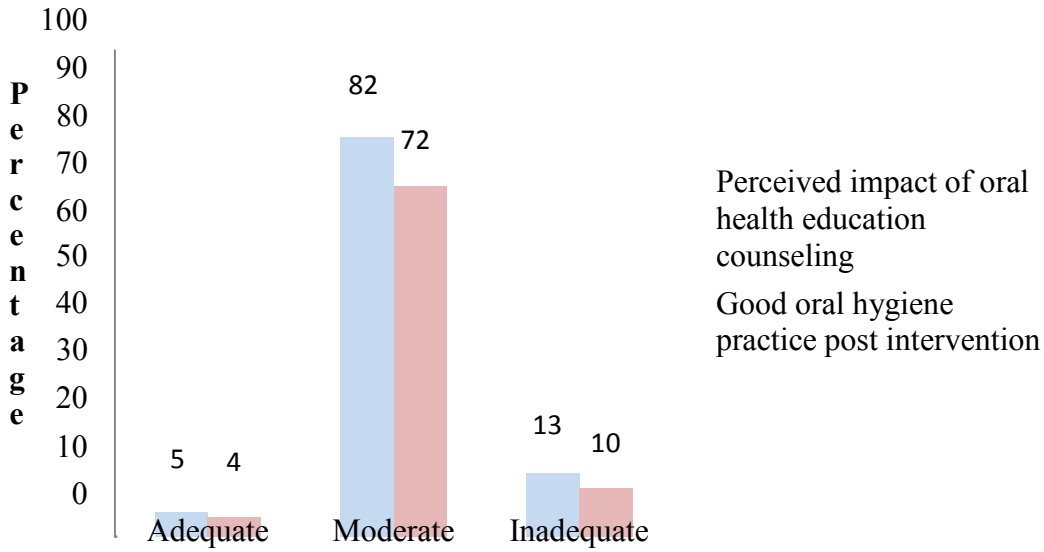

Figure 11 depicts the association between perceived impact of oral health education and oral health behavior. It shows that out of study participants who had perceived that the educational intervention generated positive and adequate impact in them, about 4(80%) of them followed oral hygiene practice in reality. However, among 82 subjects who strongly believed that the oral health education counseling created in them a moderate impact, nearly 72(87.8%) of them followed taught oral health instructions. Though 13 persons found that the received counseling was inadequate to impose impact, around 10(76.9%) of them adopted good oral hygiene practices post intervention.

In our study around 97% of the have agreed that oral health education was given in a language that they could apprehend by almost all the dentists in a friendly manner. Nearly 59% of them were taught by discussing facts about oral cavity and hygiene maintenance at the start of counseling session which was already known to them and were familiar. However 41% of them were given instructions from unknown content. It is perceived by 97% of the people who had received health education that the instructions by dentists were given using simple words .The same percentage of study subjects found it interesting. However 3% have reported that professional words were utilized finding the counseling session not that appealing. Approximately 82% of felt that oral health education was delivered within appropriate time and

18% of them recognized it to be either time consuming or suggested that less period was used making it ineffective. Among the 100 participants, despite the fact that 7% of them perceive that were not helped with guidance for what they really wanted, nearly 93% of them were found to be satisfied for receiving oral health awareness counseling because they feel it is really given according to their felt needs. About 53% of the patients who had received oral health education were demonstrated the correct tooth brushing technique using mannequin of oral cavity while

47% of them were not shown. However, most of them consisting 87% were not given opportunity to practice on the teeth model the technique after it was taught. Merely 13% were given chance to do after instructions were explanation and demo. Out of the total 100 for whom health education was given nearly 73% of them were provided with specific oral hygiene tips with clarity while 27% had received general instructions. Around 99% of the study participants found the health education counseling given by dentists very useful for maintenance of oral care. However 1% felt that the given instructions were not helpful to them overall. Nearly 59% male found the information beneficial while 40% of the female study subjects felt the same and around 1% of them perceived the oral health education counseling session to be unhelpful. It is estimated that only 86% of them follow the oral hygiene instructions in reality. The health education counseling is ineffective to 14% of the 100 participants. Though majority of the men found oral heath advice from their dentists useful comparatively, only 49% male follow the oral hygiene instructions regularly while 10% do not. It also identified that 37% and only 4% of female study participants maintain oral hygiene as advised by the dentist and do not adhere to it respectively.

The factors that influenced the outcome of this study included age, gender and educational qualification. Most of them were aged 21-40 years perceived the intervention to have a moderate impact developed greater expected behavior as a result of counseling. Males were higher in proportion than females. However, the practice of oral hygiene post intervention was greater among women. Higher proportions in different age groups perceived moderate impact. No matter whatever was the educational status of the individuals, oral health education created desirable behavior for healthy oral cavity.

Thus the above three factor and various modes and approaches utilized for counseling which are discussed above have influenced the outcome of the study.

There are different styles of learning and various characteristics of perceiving information upon which the effectiveness of health education depends [25]. Knowledge is a pre- requisite for bringing about a change in behavior playing a key determinant role.

Oral health education is a prearranged package of information delivery with activities for learning and experiences which are intended to proportion of oral health [26].Providing information indicated that educational intervention could improve all aspects of oral health maintenance in a study conducted by Solhi et al [27].

It is found in a study that a strategy called information persuasion adopted in oral health education programs in accordance to communication-behavior change model has a positive influence on knowledge and attitude of individuals [28].Another study has even led to the finding that a person's behavior could be changed by health messages through educational materials [29]. Gained knowledge of expected behavior has resulted in an increase in the use of oral hygiene aids and its maintenance [30-38].

The target of educational intervention comprises of strategies to change the personal behavior of individuals from damaging factors of health to promotion [39–41].

Conclusion

The outcome of this study supports the use of educational intervention to inculcate appropriate behavior for prevention of oral diseases. Oral health education is effective only when it is given with simple terms making it interesting. Satisfaction level of females is more than that of males. Specific instructions delivered to receivers are better understandable.

Financial support and sponsorship: Self

Conflicts of Interest: Nil

Ethical Clearance: Ethical Clearance has been obtained for this article through Institutuional Human Ethical Committee (SDC/IHEC/ 094)

Limitations: At the time of data collection, as the researcher was directly involved in telephonic conversations there are chances that a favorable response could have been obtained. Another possibility is that the study participants answering with socially acceptable responses.

Recommendations

Few dentists need to be taught that oral hygiene counseling could be effective only when delivered in a language that the receiver is able to comprehend. Dental institutions must incorporate principles of health education in curriculum and train dental students to acquire effective communication skills. Awareness among dentists should be created by conducting lot of continuing dental Education Programs regarding the delivery of valuable content based on felt needs of the patient within suitable time using appropriate means. Concern should be taken while teaching oral health tips until females are satisfied realizing significance of oral care and males are motivated to adopt in reality what is was taught.

Abstract

Backgroud: Oral Health is a fundamental human right. It is an integral portion reflecting the status of overall general health. Poor oral health is commonly associated with many systemic diseases. Oral diseases qualify as a major public health problem at global level owing to its high prevalence. India is no exception and due to its large population size, the absolute burden of oral diseases is immense. Oral health is not usually considered as a matter of concern and given priority in most of the developing countries.

Aim: To assess the status of oral health of residents in Chennai for formulating a draft oral health policy.

Materials and Method: A cross-sectional survey was carried out using convenient sampling methodology. Data were collected according to the World Health Organization oral health assessment criteria 2013. The data tested for significance using statistical software packages, SPSS Software version 17.0.Frequency tables were computed. Chi square test was done to test whether the difference in the various parameters is statistically significant.

Results: Out of 318 males, 117(36.79%) require scaling and 250 (78.61%) of them need restorative treatments. Extraction is indicated for 27 (8.49%).Prosthetic treatment is recommended for nearly 50 (15.72%) of them. It also shows that out of 282 females, around 178 members comprising of 63.12% require scaling,220 (63.12%) need restorative treatments while extraction is indicated for 78(27.65%) of them and 50(15.72) women were recommended prosthetic treatments.

Conclusion: The study population was characterized by high prevalence of dental caries.

Keywords: *Oral Diseases, Prevalence, Residents, Oral Health Status, Oral Health Policy*

Introduction

Oral Health is a fundamental human right. It is an integral portion reflecting the status of overall general health. Poor oral health is commonly associated with many systemic diseases [1-4]. Complication of dental caries, malocclusion, periodontal diseases or oral cancer diminishes the quality of life of individuals causing orofacial discomfort, pain and loss of teeth.

Oral diseases qualify as a major public health problem at global level owing to its high prevalence. India is no exception and due to its large population size, the absolute burden of oral diseases is immense [5]. Oral health is not usually considered as a matter of concern and given priority in most of the developing countries .

Despite the fact that oral diseases are largely preventable, oral healthcare still remains as an area which is neglected [6]. People belonging to lower socio-economic status have lacunae in oral health awareness which is mirrored in their practice of oral hygiene habits [7]. Oral diseases hence creates burden mainly on such disadvantaged population groups of society [8].

However intake of junk foods and carbonated drinks at frequent intervals with sedentary lifestyle currently contributes to oral diseases as well. Lack of knowledge on the consequences of delayed treatment and available modalities, ignorance, poverty, preoccupation, financial constraints, inaccessibility to dentists, inappropriate guidance and care, self-medication are the factors that affect dental care.

Other reasons for the same include fear, anxiety, misinterpretation and misconception about effects of dental treatment and dissatisfaction with the quality of oral health care services [9, 10].

In addition to variations in numerous factors like gender, age, races, geographical locations, accessibility to oral health care services and dietary habits responsible for oral diseases, the World Health Organization has affirmed that nutritional status, hygiene, stress, smoking and alcohol habits and so on are linked to a wide range of dental problems and forms the fundamental basis of the common risk factor approach to prevent oral diseases. [11].

Among these, oral hygiene is the most significant factor in terms of prevention of oral disease, accessible to personal control. Hence it is a modifiable risk factor of oral problems affecting one's esthetics, communication, biologic, psychological and social projection. It is highly influential through effecting counseling sessions.

Health is one of the basic human and social rights of an individual. It is the duty of every respective Government to provide oral health service and increase health care awareness [12]. Effective utilization of services is a concept of expressing the enhanced interaction extent between the service provider and the people for whom it is intended [13].

The role of Public Health dentists is imperative since they play a crucial role in bridging the gap between various sections of people and health sector. Dentists with good communicating skills are in a unique position serving as role models to educate inculcating minds to adopt healthy lifestyle.

Preservation, restoration and promotion of public health with equitable distribution is the prime duty of every healthcare provider .Hence health professionals, policy makers and insurance organizations must work communally so that different strategies could be adopted to address various influencers of social disparities to resolve and result in fair distribution of services through a suitable planning.

Provision of "appropriate services in the right place and at the right time" is the true meaning of creating good access to health services [14]. Several studies done in different parts of India have revealed high prevalence of dental problems necessitating the creation of appropriate National Oral Health Policy [15-21].

Early detection is the key to the practice of minimally invasive dentistry and assessment of oral health status is essential to plan programs focusing appropriate treatment procedures followed by preventive services and effective health education counseling to improve oral hygiene practices.

Numerous studies have been carried out so far among dental practitioners and students to evaluate the prevalence, knowledge, attitude and practice regarding various aspects in different fields to apply the results in practical ways which is the need of the hour [22-26]. Hence this study is conducted with an aim to assess the oral health status and formulate draft oral health policy for the residents of Chennai city, TamilNadu. Hence this study is conducted with an aim to assess the oral health status and formulate draft oral health policy for the residents of Chennai city, TamilNadu.

Materials and Method

Study Design

A cross sectional study

Study Area

Chennai is the capital of Tamil Nadu State of India. It is the 4th largest metropolitan city with a population of about 46, 81, 087 people according to 2011 census report.

Study population

The study population comprised of the Residents of Chennai City.

Inclusion criteria

- All the residents who were willing to participate in the study
- All the residents who were present on the day of examination

Exclusion criteria

- Terminally ill and mentally compromised residents in Chennai
- Residents of Chennai city who were unavailable even after three visits.

Approval and Informed Consent

- Ethical approval was obtained from the Institutional Scientific Review Board of Saveetha University.
- Informed consent from the residents of Chennai was obtained prior study.

Sample Size Calculation

The sample size was calculated using the formula

$$N = \frac{Z\alpha^2 PQ}{L^2}$$

$Z\alpha^2 = 3.84$

P=40

Q=100-40=60

L=10% of 40=4

$$N = \frac{3.84 \times 40 \times 60}{4^2}$$

N=576

The sample size was approximated to **600. Sampling Methodology**

Convenience sampling was done to include the residents of Chennai

Survey Instrument

A survey performa was prepared with the help of WHO Oral Health Assessment Form (2013).It was used to collect information about patients' demographic data, oral health status and oral health needs.

Armamentarium

1. Mouth mirror
2. Explorer (No.5)
3. Tweezers
4. Kidney Tray
5. Sterilized cotton
6. Disposable gloves
7. Disposable mask and head cap

Sterilization and Infection control

Instruments used for oral examination were sterilized using an autoclave at 121^{o} for 15 minutes a

15lbs pressure.

Survey Methodology

After a brief introduction on the purpose of the study, oral examination was conducted by a single examiner who had been trained through a series of clinical training sessions at the Department of Public Health Dentistry, Saveetha Dental College, Chennai.

Demographic information was collected followed by clinical examination. Completed filled forms were considered for analysis.

Based on the treatment needs, draft oral health policy was framed for the residents of Chennai.

Clinical Examination

A single examiner conducted intraoral examination under torch light using mouth mirror, explorer (No.5) and assessed the oral health status and treatment needs. One dental surgeon assisted the examiner in recording the findings on the performa.

Statistical Analysis

The data collected was analyzed and tested for significance using statistical software packages, SPSS Software version 17.0.

Frequency tables were computed. Chi square test was done to test whether the difference in the various parameters is statistically significant. For all the tests ($p<0.05$) is considered statistically significant.

Results

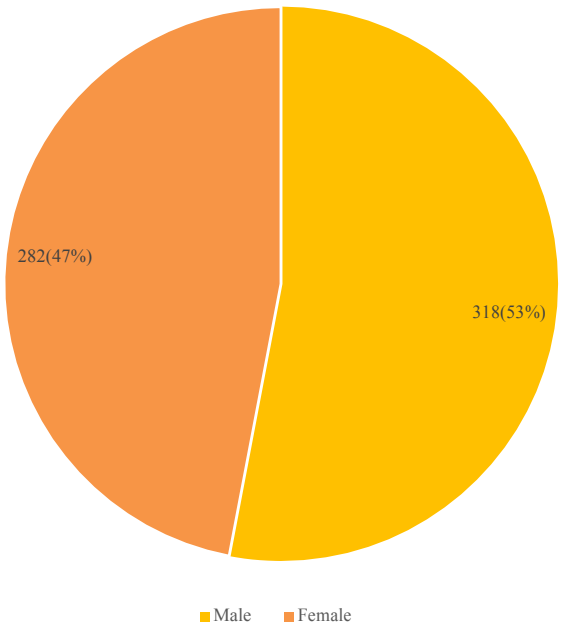

Figure 1: Distribution of study subjects according to Gender

Figure 1 depicts the distribution of study subjects according to their gender. Among the 600 study participants, 318(53%) of them were males and 282(47%) were females.

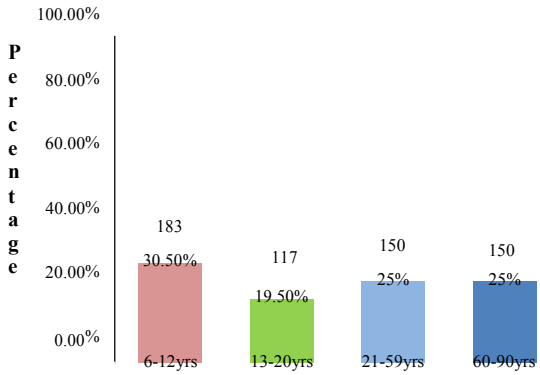

Figure 2: Distribution of study subjects according to Age

Figure 2 depicts the distribution of study subjects according to age. Among the 600 study subjects, 183 (30.50%) were between 6-12 years, 117 (19.50%) were belonging to age group in the range 13-20 years while 150 (25%) were of the age 21-59 years and 60-90 years.

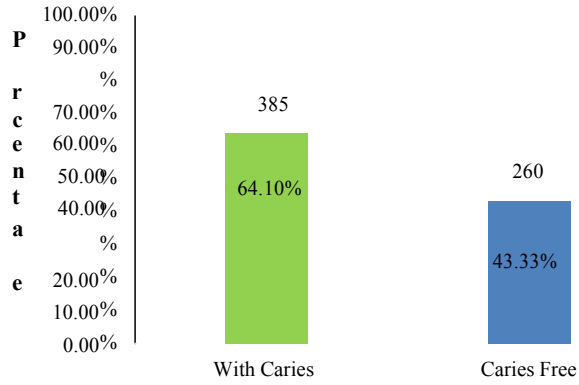

Figure 3: Distribution of study subjects according dental caries status

Figure 3 depicts the distribution of study subjects according to dental caries status. Among the 600 study subjects, 385(64.10%) are found to have dental carious lesions and 260 (43.33%) are detected to be caries free.

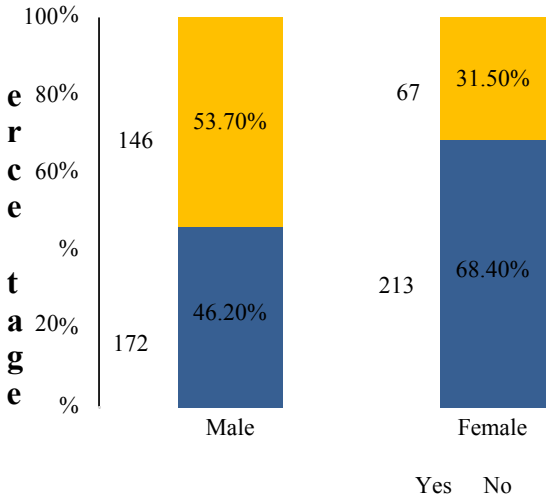

Figure 4: Distribution of study subjects based on dental caries status and gender

Figure 4 depicts the distribution of study subjects according to dental caries status and gender. Among the 600 study subjects, majority of the males comprising 172(46.20%) and 213(68.4%) among females were found to have dental carious lesions.

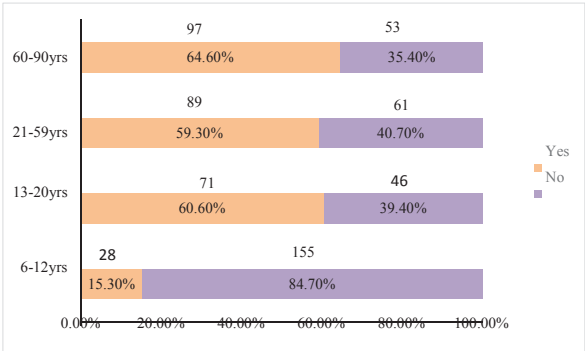

Figure 5: Distribution of study subjects requiring scaling based on age groups

Figure 5 depicts the distribution of study subjects requiring oral prophylaxis based on age groups. Among the 600 study subjects, 28(15.30%) of them belonging to 6-12 years, 71 (60.6%) of the individuals belonging to 13-20 years, 89(59.3%) of them between 21-59 years old and

97(64.6%) of them between 60-90 years were suffering from chronic generalized gingivitis and hence require scaling.

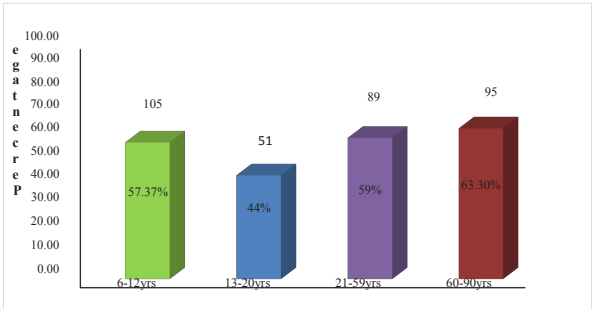

Figure 6: Distribution of study subjects requiring dental restorations based on age groups

Figure 6 depicts the distribution of study subjects requiring dental restorations based on age groups. Among the 600 study subjects, 105 (57.37 %) of them belonging to 6-12 years, 51 (44%) of the individuals belonging to 13-20 years, 89(59%) of them between 21-59 years old and

95(63.30%) of them between 60-90 years were suffering from dental carious lesions and thus require restorative treatments. Among the 600 study subjects, majority of the males comprising 53.7% and 68.4% among females were found to have dental carious lesions.

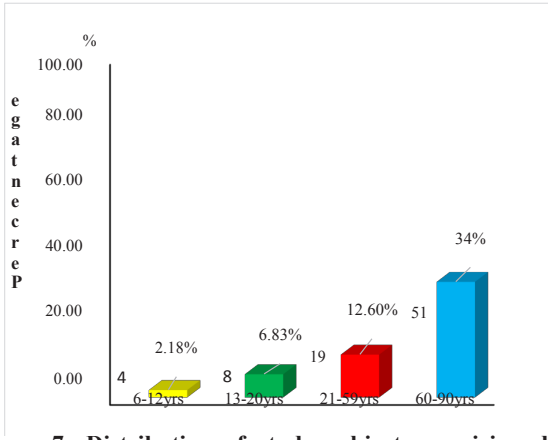

Figure 7: Distribution of study subjects requiring dental extraction based on age groups

Figure 7 depicts the distribution of study subjects requiring dental extractions based on age groups. Among the 600 study subjects,4(2.18%) of them belonging to 6-12 years, 8(6.83%) of the individuals belonging to 19(13-20 years), 51(12.6%) of them between 21-59 years old and 34% of them between 60-90 years were having root stumps and grossly decayed teeth and thus require extraction.

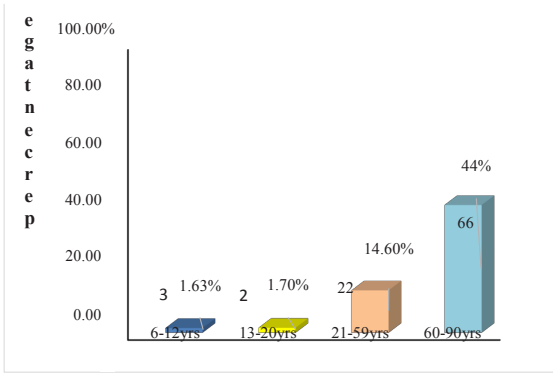

Figure 8: Distribution of study subjects requiring dental prosthetic treatment based on age groups

Figure 8 depicts the distribution of study subjects requiring dental prosthetic treatment based on age groups. Among the 600 study subjects, 3(1.63%) of them belonging to 6-12 years, 2(1.7%) of the individuals belonging to 13-20 years, 22(14.6%) of them between 21-59 years old and 66(44%) of them between 60-90 years were diagnosed to be partially edentulous thus require prosthetic treatments.

Table 1: Distribution of study subjects based on treatment needs according to gender

Gender	**Oral Prophylaxis**		**Restoration**		**Extraction**		Prosthesis	
	n	%	n	%	n	%	N	%
Male	117	36.79	250	78.61	27	8.49	50	15.72
Female	178	63.12	220	78.01	78	27.65	66	23.40

Table 1 shows the distribution of study subjects based on treatment needs according to gender. It shows that out of 318 males, 117(36.79%) require scaling and 250 (78.61%) of them need restorative treatments. Extraction is indicated for 27 (8.49%).Prosthetic treatment is recommended for nearly 50 (15.72%) of them. It also shows that out of 282 females, around 178 members comprising of 63.12% require scaling,220 (63.12%) need restorative treatments while extraction is indicated for 78(27.65%) of them and 50(15.72) women were recommended prosthetic treatments.

Oral Prophylaxis Restoration Extraction

Prosthesis

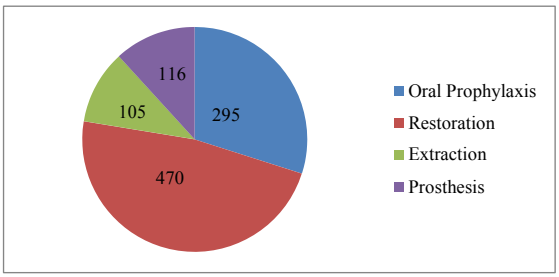

Figure 8: Distribution of study subjects based on treatment needs

Figure 8 depicts the distribution of study subjects based on treatment needs. It shows that restorative needs is the highest followed by scaling. Around 116 (39.12%) of them require rehabilitative treatments while 105(36.14%) need dental extractions.

Discussion

In our study, majority of the males comprising 318(53.7%) and 282(68.4%) among females were diagnosed to have dental carious lesions. This is in accordance with the finding that females had higher level of caries than males at both the ages in a previous study conducted by Fotedar Shailee et al in Shimla city, Himachal Pradesh [27]. It was found in the study that the prevalence of dental caries was 32.6% among population belonging to 12 years but in our study,105(57.37%) belonging to 6-12 years are affected. The same study also reveals that 42.2% of 15 years old individuals had the same dental problem while 51(44%) belonging to 13-20 years are detected with it in the current study. This shows that the prevalence of dental caries among population belonging to both categories is comparatively in higher proportion at Chennai City.

Around 95(63.30%) of the population belonging to 60-90 years affected with dental caries was found to be the highest in the present study. This shows that most of the residents in Chennai neglect oral health care as age increases as well.

In a similar study conducted by Saurabh P et al in 2016 at Maharashtra, about 336 (53.8%) participants were with the presence of calculus and this was found to be highest in the 12-15 years old and pockets were seen to be highest in 35-44 years old[28]. This is in contrast to our study in which the major proportion 97(64.6%) affected with calculus and pockets belong to geriatric group. However, the percentage of people affected with gingival and periodontal problems 295(49.1%) in our study in Chennai remains lower than in Pune. This survey reported levels of gingival bleeding and calculus and high scores of advanced periodontal symptoms. These conditions are preventable, primarily through proper oral hygiene practices.

In a study conducted by B. K. Sujatha et al in 2016 at Bangalore, 42% of subjects belonging to

65–74 year-old were edentulous while 66(44%) of them between 60-90 years in our study were diagnosed to be partially edentulous indicating that importance and priority for functional efficiency is not given priority among geriatric population in Chennai and there are no

appropriate policies in TamilNadu as in Bangalore to meet the rehabilitative treatment needs of elderly people [29].

Shaheen *et al* in their study found that (64.0%) of the elderly study participants had oral mucosal lesions. Surprisingly, no oral mucosal lesions were found in our study in any age group [30].

In spite of its tremendous, potential manpower resource and growing economy, India stands behind in terms of education, standard of living and in particular health [31]. Over decades, health in India is gaining less importance and oral health, the least [32].

The Government of India put a step forward to enhance the healthcare system by introducing National Health Policy (1983) which was reformed to lay down a new policy structure for the speedy achievement of the public health goals in 2002[33] and in 2015[34] However, to reduce the morbidity of the oral-related diseases, no much work has been done till date [35].

National oral health policy was conscripted by the Indian Dental Association (IDA) in 1986 and was accepted as an integral part of National Health Policy (NHP) by the Central Council of Health and Family Welfare in one of its conferences in the year 1995.

As recommended by WHO, health for all is possible only when every country spends 5% of gross national product (GNP) for healthcare but India is spending only 3% [36]. Health expenditure by the Government of India is amongst the lowest in the world where as that by the private sector is one of the highest [37].

This study aimed at framing a draft sustainable oral health policy for the natives of TamilNadu taking in to account the oral health status findings of residents in Chennai.

Conclusion

The present study demonstrated that residents in Chennai City suffer from high prevalence of dental caries and treatment needs as well as poor oral hygiene and gingival health status.

Good oral health is an essential to improve individual overall health and well-being. Implementation of suitable oral health programs at early age would help in improving preventive dental behavior, attitude and also minimizes the impact or cost of the treatment if intercepted at the right time.

It is high time that the responsibilities of oral healthcare of citizens are to be in the hands of governments. All the queries in attaining oral health for all can be answered by oral health policy. The TamilNadu State Government needs to set up a committee by involving dental professionals to plan for reduction of the oral disease burden of the State in a more comprehensive and practical approach. Political, social, organizational (both government and nongovernmental), professional dedication and support are needed to make oral health of this country comparable with general health.

Financial support and sponsorship: Self

Conflicts of Interest: Nil

Ethical Clearance: Ethical Clearance has been obtained for this article through Institutuional Human Ethical Committee (SDC/IHEC/ 095)

Future Scope

1. The Community Dentistry Department at all colleges in TamilNadu can unite to carry out periodic field practice areas under rotation basis in harmony with the institution in proximity. The TamilNadu State Government can support by offering sponsorship for dental materials and mobile dental vans that can be used to reach rural areas of the state thus reducing the difficulty in accessing oral health service for those belonging to the underserved sections of the community who are basically unaffordable.

2. Dentist to population ratio of 1:10 271 which is less than that recommended by WHO for rising nations (1:7500) [38] .This has to be considered seriously by the State Government by increasing job opportunities to deserving dental graduates at all Primary health Centers across the State.

3. Private practitioners in TamilNadu can be involved to ensure regular school oral health services by giving area wise responsibility in an urban set up with communal support and appropriate legislations.

4. The Dental curriculum should highlight and reinforce the importance of budding dentist's role and responsibilities in treating people without discrimination thus creating a positive attitude in serving people with low socio-economic background.

5. As oral health is an essential component for systemic well-being, all the medical and paramedical professionals belonging to both the Government and Private sectors in TamilNadu should be taught to diagnose basic oral disease by making oral examination mandatory as a part of general examination. This should be followed by timely referrals to dentist that will further help in timely interception of advanced oral diseases in the community.

6. Health insurances must persuade the coverage of dental treatments. Dental insurance can appreciably manage the increasing costs of oral healthcare and it can eliminate many reasons for neglecting oral health.

7. Smoking cessation counseling can be merged into other public health programs like tuberculosis, HIV/AIDS, family planning and maternal health programs to reduce mortality due to oral cancer.

8. Reduction of tax for oral hygiene products thus making it affordable to all.

9. Joint ventures adopting innovative oral health promotion strategies by Government, private and Nongovernmental organizations can help overcome disparities in the delivery of oral health service between rural and urban areas.

10. The State Government can help by periodic distribution of free fluoridated tooth paste and brushes to all the Government School Children.

11. Geriatric dental programs should be concentrated as a part of geriatric medicine specialty. Provisions of free dentures for all the needy senior citizens of the state can help the geriatric population by enabling functional efficiency. The rehabilitation program will also improve their quality of life.

12. The Tamil State Government can take initiatives with adequate fund allocation for oral health programs and set an example being a role model for other states.

Limitations

Study was carried out on small number of population and purposive sampling technique was used so, generalizability cannot be done.

Impact of Professional Health Education on Dental Plaque Status and Comparative Evaluation of Effliciency between V-BEAT and Routine Toothbrush

S. Shreelakshmi[1], Pradeep Kumar Rathinavelu[2], Meignana Arumugham Indiran[3], Srisakthi Doraikannan[2]

[1]Post Graduate Student, [2]Reader, [3]Professor Department of Public Health Dentistry, Saveetha Dental College, Saveetha Institute of Medical and Technical Sciences, Chennai, India

Abstract

Background: Toothbrush is the widely used personal and the most cost effective oral hygiene maintenance aid. Hence it must be appropriately selected.

Aim: To determine if professional health education or following brushing technique after reading instructions given by the manufacturer has an impact on dental plaque levels.

Method: The present trial was examiner blind, randomized and two visit study with 100 volunteers. The total sample consisted of 100 subjects and they were equally divided in to 4 groups. Group I were given health Education and instructed to use V-Beat Toothbrush. Group II were taught health education and instructed to use normal toothbrush. Group III and IV were instructed to use V-Beat and normal toothbrushes respectively. Participants were assessed for dental plaque status according to Turesky's Gilmore modification of Quigley-Hein plaque index using two-tone disclosing agent at baseline and first visit (7 days) which were subjected to comparisons. Data were entered in Excel and transferred to SPSS (Version 23) and correlation between and within the groups were determined for analysis.

Results: Group-I was found to be statistically significant than other groups compared in the study. On comparing Group-I and IV, least correlation was shown. However, greater significance was observed in Group-I. Further Comparisons of Groups I & II with III & IV led to the finding that significant difference was observed in the groups to which health education was given.

Conclusion: Health education intervention followed by usage of V-Beat tooth brush was most effective in reducing plaque.

***Key words**: Dental plaque, Oral health education, Plaque scores, toothbrush design, toothbrush selection*

Introduction

Oral diseases qualify as major public health problem owing to their high occurrence and incidence in all regions of the world. Oral health status is an integral part reflecting the overall well-being of an individual. As both are interlinked, oral hygiene maintenance is a requisite for a healthy living.

According to the World Health Organization, many factors like nutritional status, hygiene, stress, smoking and alcohol habits etc. are linked to a wide range of oral diseases forming the fundamental basis of the common risk factor approach to prevent the oral diseases [1]. Among these, oral hygiene is the most significant factor in terms of prevention of oral disease, accessible to personal control. Oral hygiene is a modifiable risk factor of oral

problems that affects one's esthetics, communication, biologic, psychological and social projection.

Dental plaque is considered as the possible causative agent for formation of dental caries and bleeding gums which leads to periodontal diseases when it is not intervened at the right time. It was first identified by Loe et al in 1965 and it was demonstrated that there was development of gingivitis within a 10 days of stopping oral hygiene practices. It was noted that gingivitis was reversible when patients resumed their oral hygiene procedures. This proves that inadequate plaque removal on daily is the prime reason for development of common dental diseases and oral hygiene practice plays a significant role in prevention.

Mechanical plaque control method is well known for its effectiveness. Oral hygiene is maintained by various techniques like tooth brushing, tongue cleaning, flossing, and mouth rinsing with disinfectant mouth washes. Among these, toothbrush is the widely used personal oral hygiene aid. It was Mr. William Addis in 1780 from England who discovered manual toothbrush and was first introduced in China as early as 1600 B.C.

Improper tooth brushing causes gingival alterations. Acute lacerations are characterized by scuffled epithelial surface, punctate lesions that appear as red pinpoint spots and diffuse redness and denuded attached gingiva. Chronic alterations are found to appear as recession, changes in contour. It may also be manifested as rolled, bulbous, hard firm marginal gingiva in 'piled up' or festoon shape or with gingival cleft which would ultimately lead to periodontitis.

Researchers examined oral health status of individuals who had not performed tooth brushing and concluded that inflammation and exudate were present in the gingival tissues [2] after 4 days. However it subsided within 7 days at once the habit was resumed. Salzer et al suggested that tooth brushing once per day is an adequate measure to prevent the development of inter-dental caries [3].In a study of tooth brushing frequencies, tooth brushing at 48- hour intervals prevented gingivitis[4].

The above findings suggest us that optimal manual tooth brushing technique for an ideal duration is essential for the prevention of oral diseases. However high prevalence of oral diseases recorded may be attributed to the fact that inappropriate and inadequate oral hygiene practice which is common among the public due to lack of knowledge and motivation.

The World Health Organization in 2003 indicated that the focus of oral health education actions should be on behaviors and conditions that promote oral health or that decrease the risk of oral diseases; health promotion at school should encourage daily tooth brushing, supervised tooth brushing, use of fluoride, and promotion of good nutrition, among other strategies [5, 6].

Health education is an essential part of health services and has emerged as one of the fundamental approaches in primary prevention [7].It is found to be the most cost-effective method in comparison with other adopted methodologies [8]. Educational intervention is also easy in administration and logical at community level for health promotion when limited resources exist. It not only improves the physical health but also ensures broadening the mindset of closeted society as well enabling them to bring about life styles changes with avoidance to exposure of risk factors responsible for diseases [9].

Oral health knowledge is considered to be an essential prerequisite for oral health related behavior [10].The oral health literacy status deserves recognition as an important determinant of oral health.

An essential element in a preventive dental program, for both the individual and the group, is a well-organized plaque control program [11, 12]. Comprehensive home oral hygiene is the core of preventive regimen for which enhancement of knowledge is mandatory followed by instillation of positive attitude in order to achieve successful programs [13].

The role of Public Health dentists is imperative since they bridge the gap between various sections of people and health sector and all dental professionals should emphasize the need to take precautionary measures for maintaining good oral health with adequate reinforcement which is a requisite for inculcating a habit on long term [14].

Audio-visual education aids are found to be effective in improving learning skills of individuals. The uniqueness of this study is that it will reveal the existence of correlation in the psychological impact on receiving professional advice and using an audio assisted aid with adoption of precise oral hygiene practice.

This study would help educate the public on choosing the rightly designed toothbrush out of numerous different ones available in market.

Numerous studies have been carried out so far among dental practitioners and students to evaluate the prevalence, knowledge, attitude and practice regarding various aspects in different fields to apply the results in practical ways which is the need of the hour [15-19].

The aim of this study was to determine if professional health education or following brushing technique after reading instructions given by the manufacture has an impact on dental plaque levels and to compare the evaluation of efficiency between routine toothbrush and V-BEAT toothbrush available in markets with a sound producing attachment to guide as audio aid for brushing technique in relation to plaque removing efficacy over a couple of weeks timeline.

Materials and Methodology

Study Methodology: The present trial was examiner blind, randomized and three visit study with volunteers using either of the two types of tooth brushes. Participants were randomly selected from a Management college at Chennai.

Study Period: This study commenced in December 2018 and took place for a period of 1 week.

Study Place: Chennai

Sample Size Estimation: The sample size was evaluated by using G-power Software and values from a study conducted by Vandana K La et al [20].

Sample Size (N) for rounded off to 100

Inclusion Criteria

➢ Students who had minimum 24 natural teeth with scorable buccal and lingual surfaces on indexed teeth (16, 21, 24, 36, 41, and 44).

➢ Students who were available to attend both the visits.

➢ Students having a minimal plaque score of 1

Exclusion Criteria

➢ Students having active caries lesions and periodontal diseases requiring treatment

➢ Students who were under periodontal, prosthetic and active orthodontic treatment

➢ Students who had systemic debilitating condition.

Materials Used:

➢ Teeth Model

➢ V-Beat Magic Tooth Brush

➢ Colgate Dentifrice with active Salt

➢ Colgate Soft Bristles tooth Brush

➢ Head cap

➢ Mouth mask

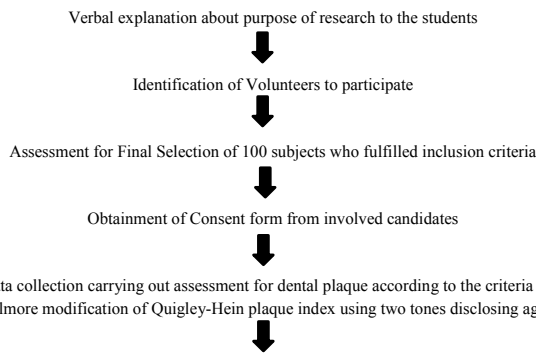
➢ Gloves

➢ Ears buds

➢ Two tone Disclosing agent

➢ Cheek Retractor

➢ Mouth Mirror



➢ Torch Light

➢ Tray Sheets

➢ Disposing bin

Clinical evaluation: A single examiner evaluated all the subjects for plaque assessment using Turesky-modified Quigley–Hein index from six index teeth (16, 21, 24, 36, 41, and 44) under artificial light.

Flowchart of Adopted Methodology

The total 100 subjects were divided equally in to four groups namely Group- I: Health Education+ V-Beat Toothbrush, Group- II: Health education+ Normal toothbrush, Group- III: V-Beat Toothbrush, Group- IV: Normal toothbrush

⬇

Standardized dentifrice was distributed to all in both the groups

⬇

Coding was done by Recording Clerk for the two types of toothbrushes

⬇

The two differently coded brushes were equally distributed for the four Groups

⬇

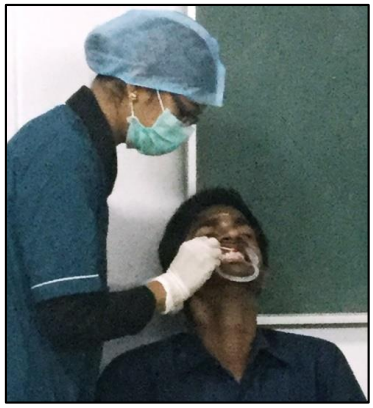
Group I and II was taught Modified Tooth Brushing Technique using Model

⬇

Groups I and III were informed that manual vertical stoke produces sound

⬇

Instruction was reinforced to use the given dentifrice and randomly allotted toothbrush for the next 7 days for both groups



Pictorial Representation:

(a)Armamentarium and arrangement of sample kit prior commencement of the study

(b)Verbal Explanation regarding the research was given to a group of students for identification of volunteers

(c)Assessment for baseline dental plaque according to the criteria of Turesky's Gilmore modification of Quigley-Hein plaque index using two tones disclosing agent.

(d) Demonstration of Modified Tooth Brushing Technique using Model to individuals belonging to Group-I

(e). Assessment for dental plaque on the 7th day or first follow-up according to the criteria of Turesky's Gilmore modification of Quigley-Hein plaque index using two tones disclosing agent.

Statistical analysis

Data was entered on to Microsoft Excel and statistically analyzed using statistical package for social sciences (SPSS), 23.0. In order to find whether all the 4 groups are efficient F-Test was used. One-way Anova was used to find the interrelationship between groups.

Results:

Table 1: Distribution of Study Subjects based on their demographic details

Groups	Number of Subjects		Age
	Male	Female	Mean
Health Education+ V-Beat Toothbrush	14	9	24
Health education+ Normal toothbrush	16	6	23
V-Beat Toothbrush	17	7	23
Normal toothbrush	21	10	24

Table 2: Dental Plaque scores assessed using Modified Quigley-Hein plaque index of the study subjects

Groups	N	Plaque Score Mean	
		Baseline	After 7 days
Health Education+ V-Beat Toothbrush	25	0.51	0.3
Health education+ Normal toothbrush	25	0.41	0.42
V-Beat Toothbrush	25	0.60	0.44
Normal toothbrush	25	0.66	0.40

Statistical Analysis

Data was entered on to Microsoft Excel and statistically analyzed using statistical package for social sciences (SPSS), 23.0. In order to find whether all the 4 groups are efficient F-Test was used. One-way Anova was used to find the interrelationship between groups.

Results:

Table 1: Distribution of Study Subjects based on their demographic details

Groups	Number of Subjects		Age
	Male	Female	Mean
Health Education+ V-Beat Toothbrush	14	9	24
Health education+ Normal toothbrush	16	6	23
V-Beat Toothbrush	17	7	23
Normal toothbrush	21	10	24

Table 2: Dental Plaque scores assessed using Modified Quigley-Hein plaque index of the study subjects

Groups	N	Plaque Score Mean	
		Baseline	After 7 days
Health Education+ V-Beat Toothbrush	25	0.51	0.3
Health education+ Normal toothbrush	25	0.41	0.42
V-Beat Toothbrush	25	0.60	0.44
Normal toothbrush	25	0.66	0.40

Table 3 shows One-way ANOVA to find the interrelationship between and within groups

Groups	Variance
Health Education+ V-Beat Toothbrush	0.18
Health education+ Normal toothbrush	0.18
V-Beat Toothbrush	017
Normal toothbrush	0.066

Table 3 shows one way ANOVA to find the interrelationship between and within groups. It reveals that P-value with 0.056 between the groups appears to be statistically significant.

Discussion

Tooth Brushing is the most regular oral hygiene habit performed by common man which is relatively inexpensive comparatively to the cost of dental treatment procedures. The selection of an important oral hygiene aid starts with appropriate selection of the type or design based on which different purposes depend upon.

It is however regarded complicated since, many factors such as duration of tooth brushing; manual dexterity, motivation, the frequency of tooth brushing and the novelty effect influence the results.

Knowledge is a pre-requisite for bringing about a change in behavior playing a key determinant role in influencing the attitude as well. Providing information indicated that educational intervention could improve all aspects of oral health maintenance in a study conducted by Solhi et al [21].

Although several workshops and reviews have consistently concluded that there is no superior design of manual tooth brush, yet different companies are coming out with different designs, each claiming superiority, backed by the results of their own clinical research team. Further, gained knowledge of expected behavior has resulted in an increase in the use of oral hygiene aids and its maintenance [22].

A commercially available toothbrush named V-BEAT with a novel bead device attached capable of producing sound on vertical manual stokes thus aiding in audio effect to guide the general public for modified brushing technique was considered for evaluation in this study. The purpose of conducting this study

was to compare the evaluation of efficiency between V-BEAT and routine manual toothbrush in relation to plaque removing efficacy and also determine the role of professional dental health education with it.

TMQHPI was used in our study to determine the plaque accumulation and it is a well-established index in clinical trials assessing the efficacy of tooth brush in plaque control [23].

Out of the total 100 subjects , Group I and II were demonstrated modified Bass method of brushing at the initial visit, professionally educated regarding other oral hygiene measures for maintenance and were instructed to use the V-Beat and Normal toothbrush with the given standard dentifrice. The same was carried out to Groups III and IV respectively without health education intervention delivered prior.

Comparisons with previous literatures are not feasible owing to the uniqueness of this study taking health education intervention and such an audio assisted device as oral hygiene aid in to consideration. A difference appreciable between the recorded baseline plaque scores and those observed during follow-up in all the four groups could be due to Hawthorne effect. It was found that Group I was found to be statistically significant than other groups from which an inference that the combined effect of health education and V-BEAT has a better plaque removal effect.

Conclusion

Health education intervention followed by usage of V-Beat tooth brush was most effective in reducing plaque.

Financial support and sponsorship: Self

Conflicts of Interest: Nil

Ethical Clearance: Ethical Clearance has been obtained for this article through Institutuional Human Ethical Committee (SDC/IHEC/ 097)

Limitation: Study carried out for a short period on a relatively smaller population may be the reasons for decreased reliability of the derived conclusion.

Future Scope and Public Health Relevance:

This study shows that professional health education and guidance of dentists in choosing the right toothbrush plays a significant role in inculcating a good oral hygiene practice among the public. This inturn also helps the community to protect themselves from oral diseases by adopting the most cost effective and efficient ways.

Recommendations: Similar study on a larger population with extensive duration is recommended for increased reliability of results.

Volume of the Brain Tumour Regions with Hybrid Segmentation

Jayanthi S[1], Ranganathan H[2], Palanivelan M[3]

[1]Assistant Professor SG, Department of ECE, Saveetha School of Engineering, Chennai, India, [2]Professor, Department of ECE, Jerusalem College of Engineering, Chennai, India,[3]Professors, Department of ECE, Rajalakshmi Engineering College, Chennai, India

Abstract

MR imaging gives the normal and abnormal anatomy of the brain. MR imaging plays a vital role in diagnosis, localization, quantifying the volume of the tumour and in treatment planning for the radiologists. In this we propose a method for segmentation of tumour regions of brain from a two dimensional (2D) cross sectional magnetic resonance (MR) images. In this an active contour segmentation algorithm is done regions. It uses the hybrid technique of intensity and fuzziness to segment the tumour region. The Flair MR image is used to estimate the whole region of the tumour. The MR images have a complex intensity which will not be able to give a proper segmentation if a single method is used. The segmentation is done without any training dataset. From the segmented results, the Radiologists can find the intensity of whole tumour. This method shows the significant improvement in segmentation compared to manual segmentation.

Keywords*: Active conyour, Brain Tumour, FCM, Magnetic Resonance Imaging, 3D reconstruction*

Introduction

Automatic or semi-automatic image segmentation techniques of medical images are considered to provide significant improvement in turnaround times and cost-effectiveness of applying such techniques in an actual medical environment. Segmentation of medical images inherently becomes a difficult problem because of the variations in image modalities due to scanning parameters variations and biological variations.

MRI is the preferred method of brain tumour diagnosis and prediction of tumour growth rate. However brain tumours and the edema caused by it cause the image to be diffused with the background with poor contrast making it hard to localize a tumour using MRI images.

The main objective of brain tumour detection is to detect and identify the regions of the tumour, namely active tumour tissue, necrotic tissue, and edema. Glioblastomas tumours are notably harder because of their infiltrative nature, and their borders are fuzzy. By using more than one modality, like T1, T2, and MRI Flair, the contrast between modalities is used to distinguish the tumour tissue.

Related Works

The structure of the brain is very complicated. MR images have high soft tissue contrast . Magnetic resonance imaging or MRI is a valid medical imaging technique for diagnosis and therapy of brain tumours. Hence segmentation is necessary for detecting tumours and its effects such as the surrounding edema and necrotic tissue. Segmentation of MRI images of brain tumours has been the focus of many works. However, the segmentation task is hard in this case because of the complex nature of MRI image intensities.

Clustering, thresholding, and other simple image processing techniques are not very effective. For detecting the regions of a tumour, it is hard to find threshold values as the intensity distribution in the image of a tumour and surrounding brain tissue is very complicated. Thresholding methods have to be applied in combination with other methods [1]. A common and straightforward region-based technique proposed is region growing [2]. In this technique, a pixel or few pixels inside the region of interest is selected as seed pixel to initialize the growing. This process terminates when no new pixel can be added to the region. Even though

this technique is less computation-intensive and fast, region growing techniques have limited accuracy when it comes to segmentation because of the partial volume effect [3]. At the edges of different types of tissue, the intensity difference is blurred because of this partial volume effect. Segmentation using statistical properties of tissue classes was proposed [4]. Segmentation was observed to be better using a fuzzy fusion framework by combining fuzzy knowledge and seeded region growing [5]. Using unsupervised FCM clustering algorithm as a segmentation technique to derive clinically relevant anatomical and pathological information, a Brain tumour was segmented into tissue classes, including active cells, edema, and necrotic tissues [6]. In [7] level set method while segmenting the image, bias field correction was found. They found that the bias field is used for the intensity in homogeneity correction.

For actual clinical application, segmentation performance has to be very high.

Liu et al. propose constructing the region of interest as a rectangular volume, using fuzzy connected framework for segmentation to identify the tumour region from the first and last slice [8].In Shen's FCM algorithm, neighbourhood attraction is based on the relative location and features of adjacent pixels [9]. Deformable models such as active contour are more robust to deal with the biological differences between different tissues. The snake model can find object contours well if initialization is done correctly [10] [11] [12], but with the consideration that snakes or active contours can lead to missing boundaries if the initialization is not proper. Hence it is not sufficient to use such deformable models alone.

Different level set methods [LSM] are found in energy minimization approaches that are used in segmenting an object. Level set methods used in image segmentation is classified as edge-based models or region based models. The image gradient information is used in edge based models, whereas the region descriptors are used in region-based models for the propagation of active contour. Pratondo [13] et al. used the region growing algorithm in which the initial seed is selected using the global threshold and by comparing the neighbourhood pixel intensity with the global threshold. Yang et al. used the different level set functions that are used in the segmentation [14-16]. Mukherjee et al. [17] used known basis functions to do region based segmentation in the presence of noise. Bastan [18] used local continuity and smoothness cues provided by strong edges to grow weak edges or missing edges.

Li [19] used a fuzzy active contour model where the edge and local information are combined. The active contour uses fuzzy energy as motivation power. In Alaa's [20] weighted level sets, the weighing energy forces using logical edge features are used to reduce the leakage along contours. Zarpalas [21] used the blending of image information. Ortiz [22] suggested an improved brain MRI segmentation method using self-organizing maps and entropy gradient clustering. Agus pratondo [23] et.al used gradient information and probability scores from a standard classifier to construct the edge stopping function for medical image segmentation. Several hybrid models have been implemented to make use of both local (edge based) and global region-based segmentation[24]. Segmentation using multiphase approach is useful in the study of anatomical tissue variations [25]. Much work has been developed on Multiphase contours with complex formulation but with reduced complexity [26, 27].In this work, we have proposed an algorithm where region-based active contouring is followed by a distance-based fuzzy contouring method to segment the tumour region.

Proposed Work

The purpose of this work is to develop a semi-automated segmentation method to be applied on a variety of MRI images to segment the tumour regions. A region based snake is used to segment the whole tumour region from a MRI slice. It is followed by using fuzzy segmentation on the segmented region, to segment the tumour region more effectively compared to other methods. The segmented FLAIR image contains the edema region. At the end of the procedure, the volume of the fuzzy connected object was found as the FLAIR volume.

Region Based Snake Models

In a simple snake model by Kass, the contour is obtained from the changes in grey levels at the edges present in the image. Another type of active contour model is the region based snake model represented by Chan and Vese.

A common type of region based snake model where the grey level values of a pixel is represented as a Gaussian distribution with variance σ^2. The model

also states that the pixels have two different mean grey values, μ_0 if a pixel is part of the background and μ_1 if it is considered to be inside the object. So, for an image I if ext(u) is all the pixels x on the outside of the contour given by u, and int(u) all the pixels inside the contour u, the snake problem is equivalent to the the optimization of the functional enquation (1),

This model can be viewed as computing snake using the Mumford-Shah model. The objective is to minimize the above functional with respect to the two distinct optimal mean grey values μ_0, μ_1 and the contour u. So if there is have a given active contour u, the optimal mean grey levels are basically the mean intensity of the image on the outside and the inside of the contour. The user supplies an initial contour. Gradient descent is applied on E with that supplied contour.

Applying the Chan-Vese model which has a piecewise constant form, we obtain the gradient descent equations of the desired active contour. Gradient descent ensures that the snake gradually changes shape such that the energy function decreases steadily. Another property of the region based snake given by E is that the contour always moves perpendicular to itself as the gradient descent evolves. The name active contour basically signifies that the snake gradually changes shape.

Region Based Snake Model with Anchor Points followed by Improved Fuzzy Segmentation

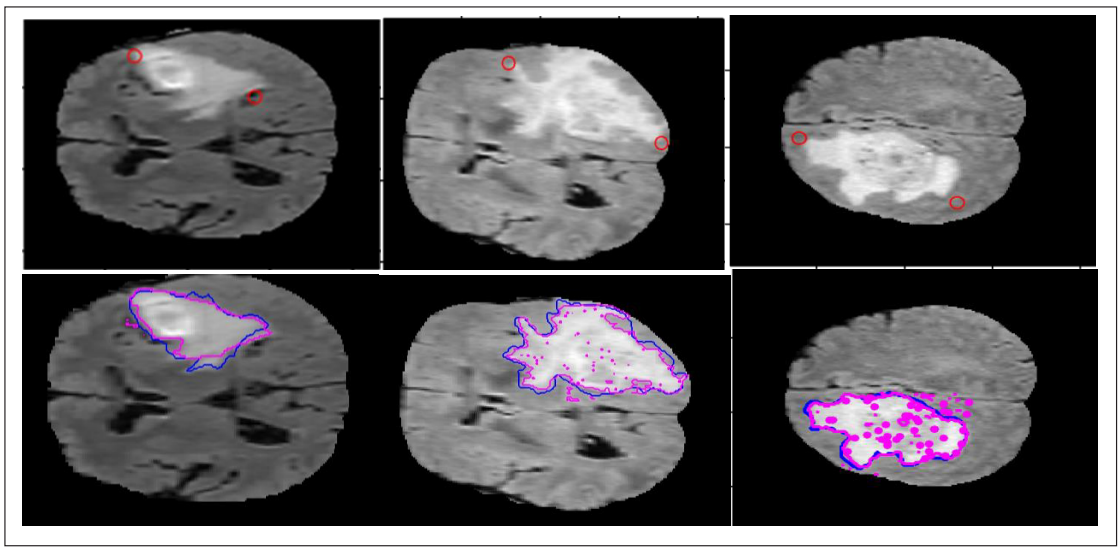

Figure 1: Examples from BRATS data,Top row shows the original flair image with anchor points of the whole tumour region. Bottom row shows the tumour regions as annotated from individual experts (blue lines) and the segmentation with the proposed algorithm (magenta lines), shows the flair image with outlines of whole tumour region.

We compute a region based snake model to obtain the required contour by completing a rectangle using two fixed anchor points as diagonal. By choosing mean grey levels $\mu_0 = 0$ and $\mu_1 = 1$, inside the snake and outside the snake respectively, we apply the Mumford-Shah model. The user initializes the snake, for example using a previous solution from a simple method.

The objective is to minimize the snake energy by changing the snake. We apply gradient descent iteratively on the partial differential equation. The termination condition is when the change in the solution is less than a predetermined tolerance between two iterations.

The similarity measurement $d^2 (x_j, y_i)$ is used to find the membership value of the FCM. The $d^2 (x_j, y_i)$ value is the difference between the intensity of a pixel and the cluster center. In the fuzzy algorithm, the neighbourhood attraction exist between the neighbouring pixels. The neighbourhood attraction depends on the spatial position and the intensities of the pixel. According to Shan Shen in his IFCM , the initialization of the membership is inherited from FCM.

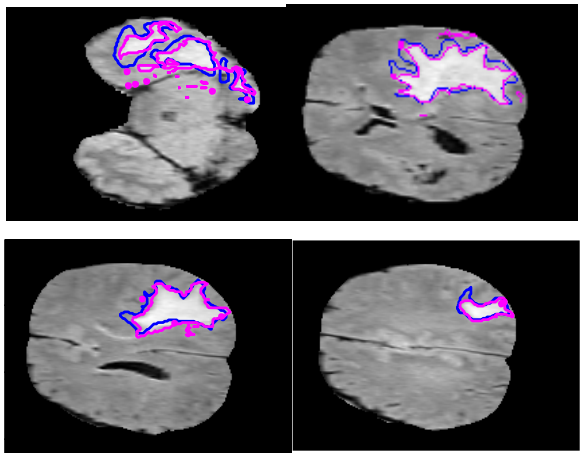

Figure 2: Sample slices of segmentation results obtained by the proposed method on the BRATS2012 HG-0008 dataset with whole tumour region annotated by expert in blue and by the proposed method in magenta.

In our proposed work, the initialization of the membership is not created randomly but inherited from Active contour region. The algorithm is:

1. The number of clusters and the degree of fuzziness is determined.

2. The cluster centers u_{ij} are initialized.

3. Calculate the improved similarity measurement $d^2(x_j,y_i)$.

4. Update u_{ij} with $d^2(x_j,y_i)$.

5. Compare u_{ij} and $u_{ij}^{(l-1)}$, If $\| u_{ij} - u_{ij}^{(l-1)} \|$ is less than the required threshold then stop otherwise go to step 2 and repeat.

Results and Discussions

The proposed method has been tested on a sequence of MR images. The MR images are taken from **BRATS 2012** database. The segmentation of the tumour region has been studied here. The whole tumour region was detected with the help of region based active contour region and followed by fuzzy C means algorithm. The image taken is a FLAIR MR image from the dataset. All the images are co-registered. The dataset contains the ground truth with segmentation labels. We worked with 2D slices of the MRI volumes.T2-weighted FLAIR image with 2D axial acquisitions used. Each image is $1mm^3$ resolution. The region is again segmented with the fuzzy c-means.

Figure 1 shows the segmentation results from the BRATS dataset on sample 2D slices. The top row shows the original FLAIR MR slices and the bottom row shows the segmented MR slices with blue lines representing expert outline and magenta line with the proposed algorithm.

Most common measures to report segmentation overlap results in brain tumour segmentation are Dice overlap(D), Jaccard index. The tumour region Jaccard index, Dice, Sensitivity and Specificity are computed between two label sets A and B is given as in equation (2),(3) ,(4)and (5).

$$Jaccard\ index = \frac{s(A \cap B)}{s(A \cup B)} \quad (2)$$

$$Dice(P,T) = \frac{|PP \cap TP|}{(|PP|+|TP|)/2} \quad (3)$$

$$Sensitivity = \frac{|PP \cap TP|}{|TP|} \quad (4)$$

$$Specificity(P,T) = \frac{|PN \cap TN|}{|TN|} \quad (5)$$

Where PP represents the predicted positive and PN represents predicted negative, then TP and TN represents the true positive and true negative from the ground truth. The 15 high grade tumour has been taken from the database and the complete tumour region is segmented from the image. The segmented region's dice score , Jaccard index, sensitivity and specificity are obtained. With BRATS 2012 dataset, it is possible to compare the algorithm's robustness.

Table I presents Dice overlap results of whole tumour segmentation for the tumours for which ground truth is available. This method is faster because the region to be processed is very limited compared to the normal fuzzy segmentation, where it has to process the whole image. The average dice score is reduced due to challenging case 5.The Dice score of whole tumour region is comparable with the other methods presented by Menze[28].

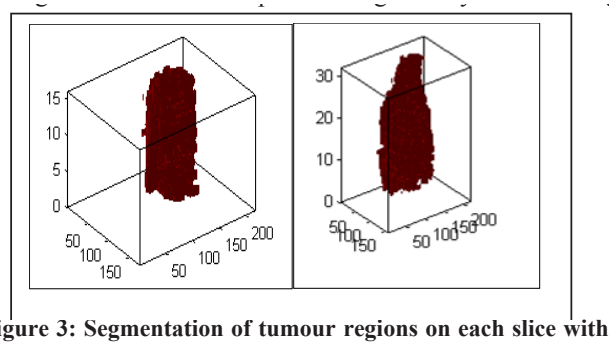

Figure 3: Segmentation of tumour regions on each slice with the proposed algorithm and 3D visualization of the tumour regions.

When compared with the dice scores of the whole tumour region as reported by different authors is given by Menze, this method has a better result. The sample slices of the tumour segmented with the proposed algorithm for the real dataset HG -0008 from BRATS 2012 are shown in Figure 2.The ground truth from the database is represented in blue colour and the magenta lines represent the segmentation with the proposed algorithm. From the figure it is clear that the proposed method follows the region more closely the tumour region than the ground truth.

Table1: Results on BRATS 2012 database by the proposed method

Real Data Case	Dice	Jaccard Coeff	Sensitivity	Specificity
HG-0001	0.8917	0.8046	0.8420	0.9971
HG-0002	0.5932	0.4217	0.4829	0.9974
HG-0003	0.8290	0.7079	0.7366	0.9962
HG-0003	0.8290	0.7079	0.7366	0.9962
HG-0004	0.8179	0.6919	0.6938	0.9998
HG-0005	0.0418	0.0214	0.9672	0.0018
HG-0006	0.6381	0.4686	0.6678	0.9948
HG-0007	0.8604	0.7550	0.8219	0.9895
HG-0008	0.9057	0.8277	0.8665	0.9937
HG-0009	0.8673	0.7657	0.8321	0.9897
HG-0010	0.7796	0.6388	0.6716	0.9989
HG-0011	0.7780	0.6367	0.6420	0.9996
HG-0012	0.7639	0.6180	0.8462	0.9994
HG-0013	0.8738	0.7758	0.8761	0.9981
HG-0014	0.8722	0.7734	0.8977	0.9856
HG-0015	0.7679	0.6233	0.8841	0.9607
Average	0.7520	0.6353	0.7819	0.9268

This result is comparable with other methods reported by Menze in the semi-automatic segmentation methods. Figure 3 displays the 3D visualization of the segmented region of the tumour for the real dataset HG -0003 and HG-0008 from BRATS 2012 database. The volume of the tumour can be found from the no of pixels in each tumour region.

Conclusion

In this, we presented an interactive brain tumour segmentation algorithm based on region-based active contour and fuzzy c-means algorithm. This hybrid segmentation technique achieves high performance. As indicated, we have used the FLAIR images for segmentation of the whole tumour region. The proposed method include simple interaction over the slices and less sensitivity to the initialization.This method works well for those imaging modalities where the lesions have high contrast over the healthy tissues. This segmentation method is faster than other methods. In future work, this method may be applied to the different modalities to segment different regions of the tumour. The main

limitation of this method is that user initiative is needed for setting the anchor points. The interaction time of the user is a few seconds and the typical computation time vary between 3 minutes to 15 minutes depending on the volume of the tumour.

Multi Sensor Approach in Structural Health Monitoring of Buildings

A. Sivagami

[1]*Associate ProfessorDept. of Electronics and Communication Engineering Saveetha School of Engineering Chennai, India*

Abstract

Structural Monitoring of buildings has a notable impact to the safety of the population. By continuously monitoring the health of the structure we may reduce the risk factor of facing the damage and provide safety for the population. Structural health monitoring is effectively carried out by placing multiple sensors for acquiring timely information. The main objective is to develop a structural monitoring and indication system based on wireless sensor network (WSN). The system continuously monitors the acceleration, vibration and the overload experienced by the building and indicates the concerned authority in case of severe damage. Furthermore, it has fire and gas alarm function which will set 'OFF' the power supply within the building. Using PIC16F877A, NRF24L01, GSM, the wireless communication between the nodes and PC monitoring is carried out which implements the control. This will help the maintenance and safety of the building. The system will be simulated and tested for its capabilities.

Index Terms— *WSN, accelerometer, vibration sensor, load cell, gas sensor, relay, GSM.*

Introduction

Structural health monitoring is estimating the state of a structure, or detecting the changes in structure that may affect its performance. Due to the absence of pre-existing model for the building stability, monitoring the structural health of historical heritage buildings may be a daunting task. Initially the assessment of integrity of such structures was manually carried out by experts. But manual monitoring is time consuming and the result may not be accurate.

The development of innovative results for the structural monitoring is originated from the large number of big buildings in the world. In [1] the factors which could affect the health status of buildings are analyzed with rational and objective performance issue assessment of structural and non-structural components. Seismic events are the major causes of structural damage and failure, which represents a serious danger for the population. For high risk environments like schools or public buildings the availability of an early warning system for the early detection of structural failures would be a primary interest.A framework for synergy between SHM and earthquake early warning for enhanced seismic protection of a target structure is being proposed by the authors in [2].

Early warning system can be defined as a multifunction system, containing sensors, signal processing and communication services aimed to provide timely information that is necessary to prepare resources and response actions for the minimization of the impact of the fore coming threat [3].The importance of early warning system in structural monitoring results in the timely measure of anomalous deformations and solicitations which could compromise the structural integrity and the cause of injury for people. The concept of distributed multi sensor approach system has significantly increased with the availability of wireless sensor networks (WSNs) which overcome problems related to wirings and network topologies.

In [4] a survey on wireless systems for the health monitoring of large structures is being discussed. An effective SHM system has been designed in [5]. It is based on the incorporation of several sensors and hardware mechanism in a modular structural design. Efforts have been made to reduce the volume of data to be transmitted, reliability and sustainability of

infrastructure is maintained. However, in the aspect of the power budget analysis, a critical issue to allow a battery power supply, has not been considered.Based on Wireless Sensor Networks (WSNs) provides a wide approach to SHM of buildings [6], [7] to provide a real-time, pervasive, low-cost, non intrusive and highly flexible data collection and analysis.

Related works

Structural health monitoring is not a new conception. Earlier structures were monitored manually. Later manual monitoring was replaced by conventional methods using sensors [10], [11] to reduce the time and to improve the accuracy. The predictable scheme uses PCs wired to piezoelectric accelerometers. But this method may disturb the normal operation as wires have to run all over the structure. This method also has other drawbacks as the cost of apparatus is high, installation due to wiring and maintenance is very expensive.

Data Acquisition System (DAQ) was used to monitor each sensor. The DAQ method is used to sample the real time physical conditions such as temperature, gas pressure, light intensity, etc. into digital numeric values. The sensors are connected to the PC serially through RS232 resulting in high cost, scarce monitoring frequency, and there is high possibility of error due to vague positioning [19]. During data collection, great effort should be made to gather data from a significant amount of recognizing spots [18].

Linear Variable Differential Transformer (LVDT) device was used to measure the relative displacement. LVDT method requires wiring of the sites that is under observation, which is highly impractical due to cost and architectural constraints. If timely prevention system is not implemented in the Buildings it may result in loss of Human lives due to disaster, gas leakage/ blast in the home.

To monitor the buildings with intermittently to preserve them from decline and to acquire more accurate restoration to fix the damages caused due to natural marvels we go for a multi sensory approach using WSN. This method uses a peripheral sensor system with wireless sensor nodes working together in common with each other, and a remote presentation infrastructure for data visualization and feedback acquisition. This can be achieved by using load cell, triaxial MEMS accelerometer sensor, inclinometer, strain gauge, temperature and humidity sensor, gas sensor and a relay circuit.

The use of Wireless Sensor Networks allows a spreading surveillance over the site of interest to lessen the potential damages caused by natural phenomena [12], [15]. In contrast to conventional approaches, our application allows for prevalent and non offensive observing, and offers precise feedback.

Multi sensor Approach

A schematic diagram of the developed system for structural health monitoring is shown in Figure. 1.

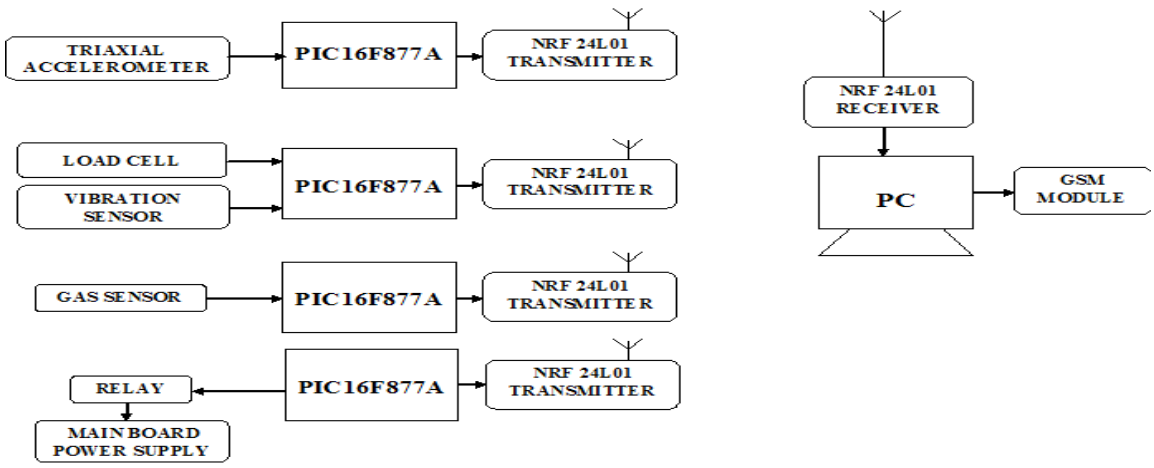

Figure 1: Block diagram of the developed integrated sensor warning system for structural health monitoring.

A. Triaxial Accelerometer

The triaxial accelerometer ADXL335 is used to sense the acceleration and change in position with resolution, of about ± 3g and 0.004º with a bandwidth of 1.6KHZ. The accelerometer sensors are placed along the beam during the initial stage of construction.The accelerometer is interfaced to the single PIC16F877A board. The high frequency data is collectively gathered from the node and continuously monitored on the PC with the help of NRF24L01.

B. Vibration Sensor

The SW-420 vibration sensor is used to sense the vibration experienced by the building. The sensor measure vibration based on the piezoelectric effect. The voltage across the crystal is created when the high impedance charge is produced when force is applied to the crystal.

C. Load Cell

The load cell is used to sense the load withstanding capacity of the building. The load cell which we use is strain gauge type. Four strain gauges are glued to the load cell which is placed along the surface of the beam. For the site under construction the strain load cell are mounted on the re-bar and then encased in concrete, which are used to measure the shrinkage and the strain on the structure. The nodes embedded by load cell similarly carry sensors for assessing vibration. The load cell and vibration sensors are interfaced with the PIC 16F877A.

D. PIC16F877A

PIC 16F877A is a 40-pin 8-Bit CMOS FLASH Microcontroller from Microchip. 5V power supply is given to this microcontroller. Its module consists of the capacitor of 22pF and the frequency range is 20MHZ.

E. Gas Sensor

The MQ5 sensor is used to sense the gas leakage. The MQ5 sensor uses Tin Oxide (Sn) Semiconductor as the sensing element which has low conductivity of clean air. The standard detecting condition is 20ºC and the resistance value of MQ-5 should be above20KΩ.

F. Relay

A Relay is connected to PIC16F877A, which senses the reading from MQ-5 and switches off the main supply if the gas is sensed. An Electromechanical relays are made of a coil, an armature mechanical, and electrical contacts. When the coil is energized, the induced magnetic field moves the armature that opens or closes the contacts. The ULN2803 consists of eight Darlington transistors with collective emitters and integral overpowering diodes for inductive loads. Each Darlington features a peak load current rating of 600mA and in offset state it can withstand at least 50V. For higher current competency the outputs may be in parallel. ULN2803A has a 2.7kW input resistor.The triaxial MEMS accelerometer sensor connected to PIC16F877A act as single node which is placed at the defected area. The load cell and vibration sensor connected to PIC16F877A act as second node. The gas sensor and relay interfaced with another PIC act as third node. NRF24L01 is connected to the each node through which data are sent to the PC. NRF24L01 is worldwide wireless standard that deals with WPAN (Wireless personal area networking). It operates at 2.4GHz ISM band. NRF24L01 tends to be more reliable and easy to use. It has ultra low power consumption.

The received data are continuously monitored in the PC and if the data sensed is above the critical value, then the indication is sent through SMS to the concerned authorities using GSM module. GSM (Global System for Mobile) TTL -Modem is SIM900 Quad-band GSM/GPRS device, occupied on frequencies 850 MHZ, 900 MHZ. It can be easy to use as a plug in GSM Modem and very compressed in size. It is intended with 3.3V and 5V DC TTL interfacing motherboard, which permits the user to interface directly with 3.3V Microcontrollers (ARM, ARM Cortex XX, etc.). The baud rate is configurable from 9600-115200 bps. It has internal TCP/IP stack to empower user to connect with internet through GPRS feature. It is well suited for SMS as well as DATA transfer applications in mobile phone to mobile phone interface.The modem can be interfaced with a Microcontroller using USART (Universal Synchronous Asynchronous Receiver and Transmitter).

Simulation Results

Simulation is done using Proteus software. Proteus combines the ISIS schematic capture and PCB layout programs. It is integrated and easy to use suite of tools for design. Simple drag and drop operations constitute a significant part of editing. The coding is being done in MPLAB IDE software for PIC16F877A.

Initially the simulation was developed for each sensor node and the readings were monitored individually for each sensor.

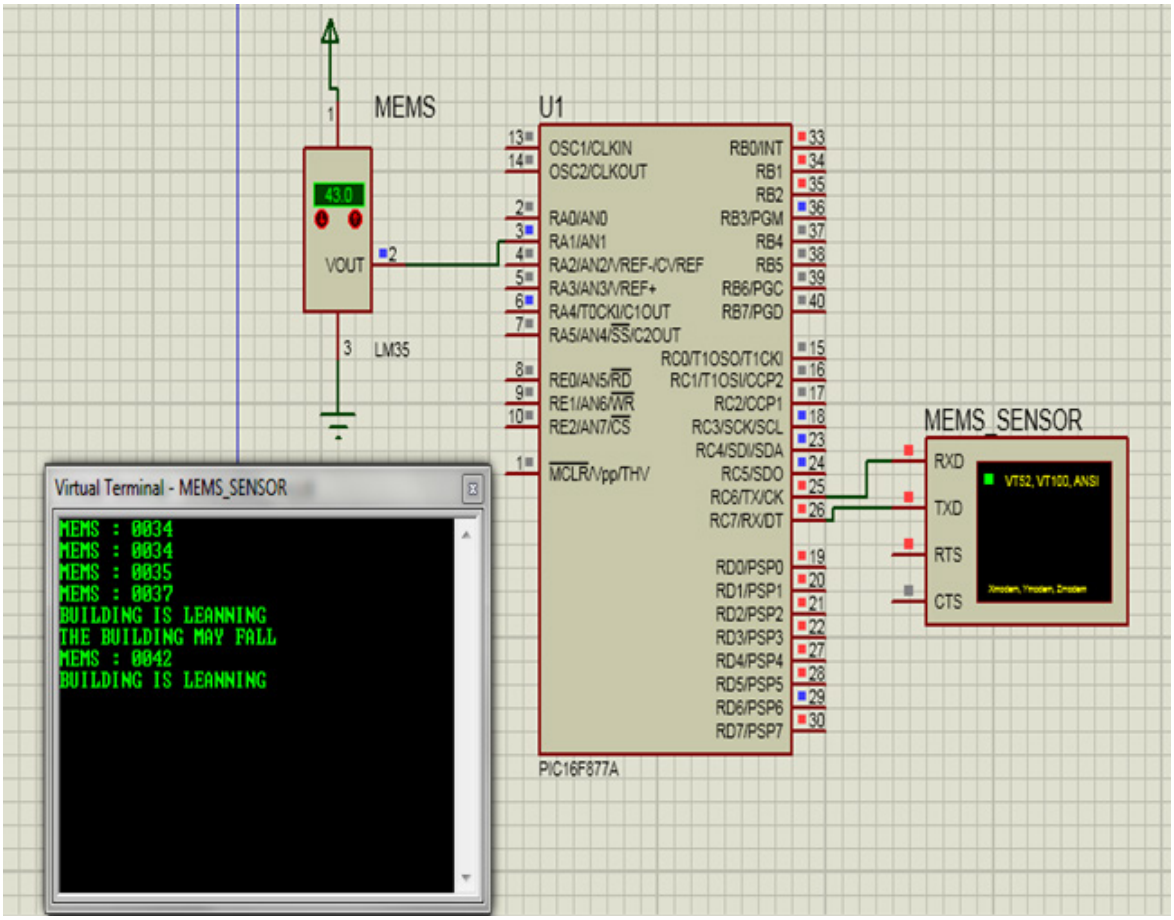

Figure 2. (a) Simulated response of node 1

(b) Hardware setup for node 1(Accelerometer).

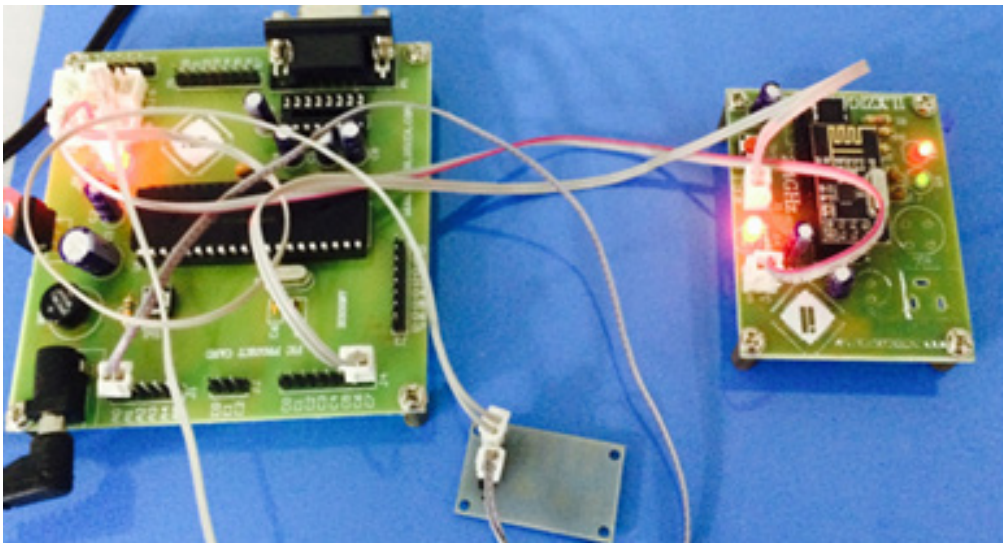

Figure 2(a) shows the MEMS accelerometer on a single PIC16F877A board and the collective display of the readings. Figure 2 (b) Shows the hardware setup for node 1. When the readings are within the threshold values mentioned in the coding, the current digital values are displayed indicating as “NORMAL”. If it is beyond the threshold value “WARNING” indication is displayed.The threshold values for normal condition mentioned for each sensor is shown in Table 1.

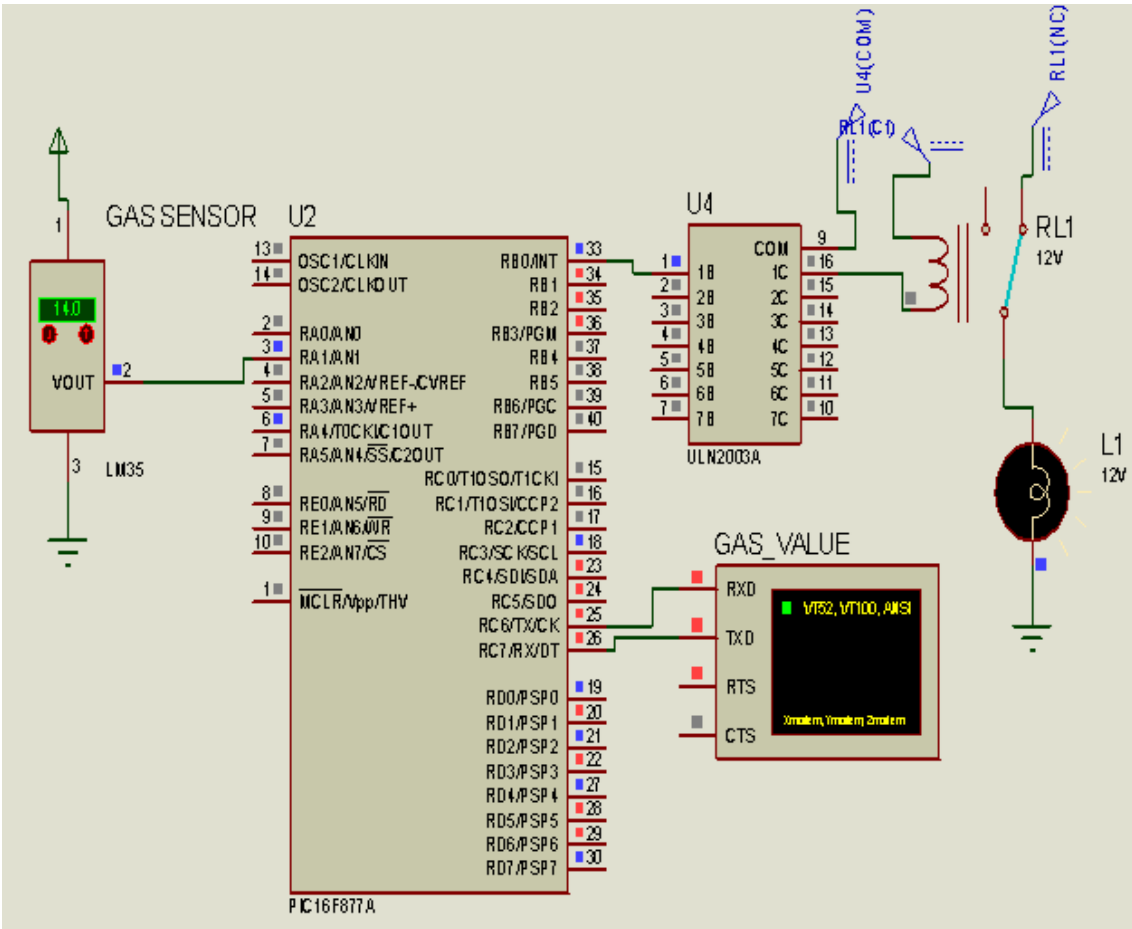
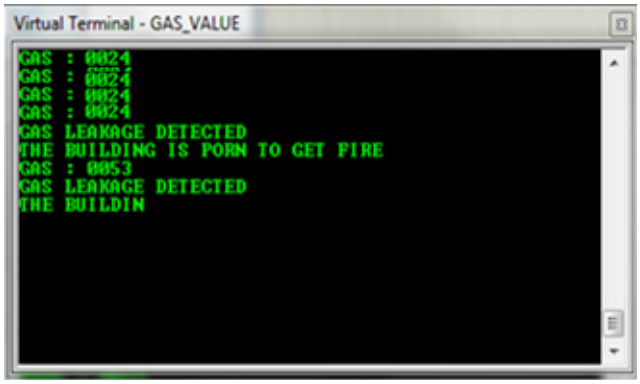
Table 1: Threshold Values of Each Sensor

Sensors used	Threshold values
Mems Accelerometer	X: 20- 30 Y: 20- 30
Gas Sensor	Below 20
Load Cell	Below 40





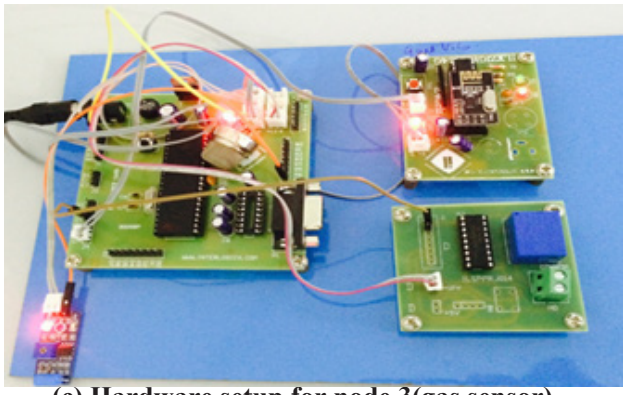


Figure 3: (a) Simulated response for node 3

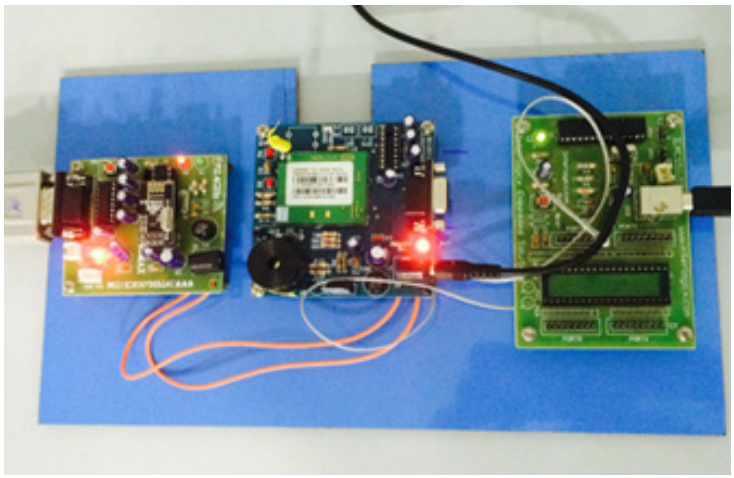
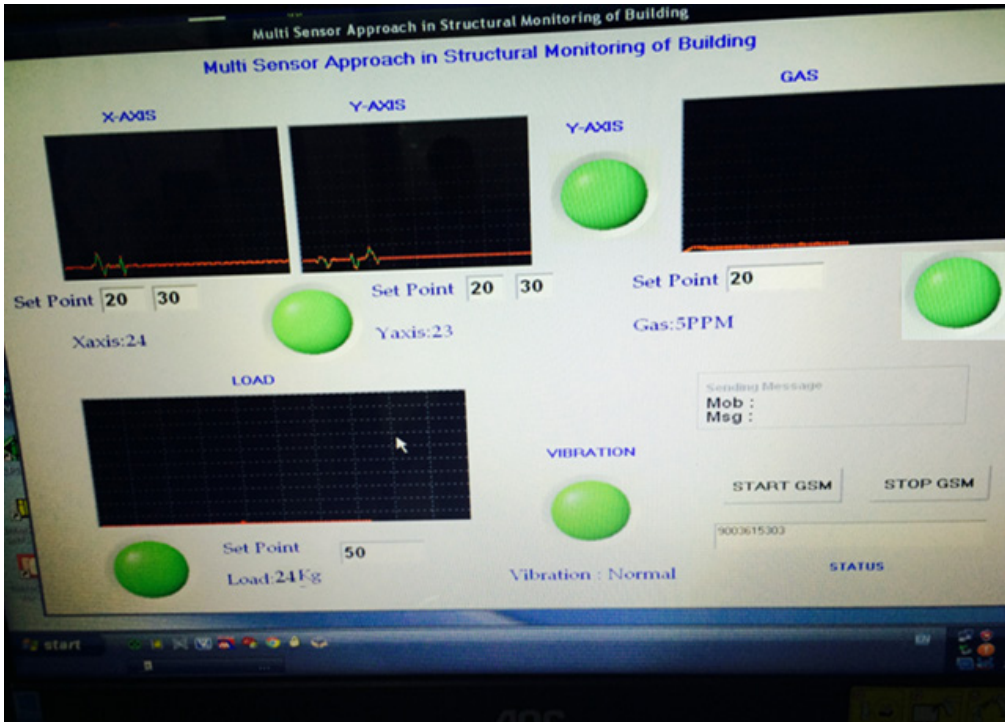
(b) Virtual Terminal for node 3(gas sensor).

(c) Hardware setup for node 3(gas sensor).

Figure 3(a) shows the simulated response of integration of gas sensor and relay to PIC16F877A. If the gas sensor value exceeds 20 then the relay put out the supply and the bulb goes OFF. Figure 3(b) shows the virtual terminal for transfer of data from the node 3 to the PC through NRF24L01. Figure 3(c) shows the hardware setup for node 3 containing the gas sensor and vibration sensor. The GSM and the NRF24L01 are connected to the PC which acts as the receiver node which collects the data from the 3 nodes and are continuously monitored in the PC. In case of variation a message is sent to the concern owner.





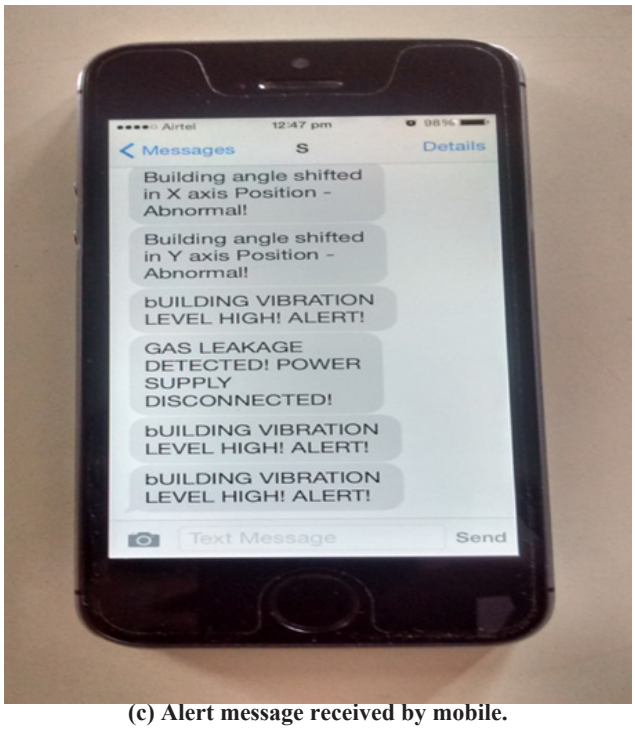


Figure 4. (a) :Hardware setup for GSM and NRF24L01 at receiver side.

(b) Monitoring system using PC.

(c) Alert message received by mobile.

Figure 4(a) shows the hardware setup for GSM and NRF24L01connected to the PC. Figure 4(b) shows the monitoring system in PC. Figure 4(c) shows the alert message to the mobile.

Conclusion

This work proposes a multi sensor approach for structural health monitoring of buildings to protect the historical heritage buildings and for the safety of the population. The proposed work involves the detection of position, vibration, overload and gas leakage in the building. The data are transmitted from each sensor node and are displayed on the PC along with the receiver through NRF24L01. If the changes are said to occur during natural phenomena or architectural constraints, then the warning indicates to the mobile through GSM. The simulation work with multiple sensors has been developed and the future work may be done on the real time implementation of the hardware.

Performance Evaluation of Various Filtering Techniques for Retinal Fundus Images

Michael Angelo Kandavalli[1], C.R.Yuvaraj[1], M. Saya Nandini Devi[2]

[1]Assistant Professor, [2]Research Scholar, Department of Electronics & Instrumentation Engineering, Annamalai University, Chidambaram, Tamilnadu, India

Abstract

De-noising of the Retinal Fundus images is a necessary pre-processing step in diabetic retinopathy, glaucoma, cardiovascular diseases treatment. This step guarantees ample quality for the Computer-Aided Diagnosing (CAD) systems. For the detection of haemorrhages, well known by the type lesions in diabetic retinopathy early identification is very useful. This paper presents an evaluation strategy for various de-noising filters, which have been affected by salt & pepper noise. In general, the Retinal Fundus images are mostly affected by salt&pepper noise and speckle noises. We have considered the salt & pepper noise for the evaluation approach, 50% of the salt & pepper noise have been added into the Retinal Fundus images. Then the noise has been removed by using various filters like Mean, Median, Weiner, Gaussian, and Adaptive Median Filters. The performance of the above filters is compared on the basis of the parameters like MSE, PSNR, and SNR. This paper concludes that among the filters evaluated, Gaussian filter is the best for removing noises in retinal fundus images and thereby it contributes well for diabetic retinopathy, glaucoma, cardiovascular disease to guarantee ample quality for the Computer-Aided Diagnosing (CAD) systems.

Keywords: *Salt & pepper Noise, MSE, PSNR, SNR, Adaptive, Mean, Median, Gaussian Filtering*

Introduction

Loss of vision would be a significant problem for specific ailments like retinal haemorrhages, glaucoma, hypertension, and diabetic retinopathy if they were not treated at the earlier stages. Hence, the analysis of retinal image is an evolution and a sophisticated scheme in current ophthalmology. In this regard, the noisy Retinal Fundus images have to be essentially restored, and this step will be the pre-processing step in any of the image analysis approaches. Retinal imaging has become a major tool in medical imaging technology to its capability to extract several knowledge that is utilized in examining numerous eye diseases , especially in particular diseases like haemorrhages.

Differing types of noise throughout its acquisition and transmission section usually corrupt digital pictures like Retinal Fundus image measure. Such degradation negatively influences the recital of the many image process techniques and CAD system performance for that a pre-processing module to filter the pictures is usually needed [1-2]. That accuracy of disease detection depends on the standard of non-inheritable Retinal Fundus image as some times it contains uneven illumination, blurry and reedy areas.

So, Illumination equalisation and noise removal are needed to boost the image quality and increase CAD system accuracy. Noise in a picture is undesirable to us because it disrupts and degrades the standard of the image. Noise removal is usually a tough task since edge preservation once the intensity of the discontinuous noise within the original image is high [3].

Here **adaptive** median be **higher** compared to **different** preprocessing **ways**, **as a result of** it, median filter have higher PSNR **value** and lower MSE **value** in **three** diabetic retinopathy retinal **pictures**, [4-5] , at **hormone replacement therapy database** and [6] used the median filter for noise removed in **Retinal Fundus** retinal **pictures**.

However, the authors in [7] planned de-noising methodology that is based on adaptive frame averaging

approach. It is a technique for modifying or enhancing a picture via smoothing, sharping, and de-blurring. Image process operations enforced with filtering embrace smoothing, sharpening, and the edge improvements. Noise removal is one amongst the most important considerations within the field of computer vision and image processing. Pictures are usually corrupted by impulsive noise because of noisy sensors or channel transmission errors or faulty storage hardware [8]. The goal of removing impulsive noise is fundamentally to quell the noise additionally on conserve the integrity of edges, and accurate data. In the digital image-processing field, two applications of great importance are noise filtering and image enhancement.

In Retinal Fundus image, initiative was to evaluate the noise within the image, then to estimate noise kind. Salt pepper noise is that the main noise that affects the retinal image. In salt pepper noise, random prevalence of black and white pixel occur [9].

The organization of this paper is as follows. In Section two, the materials and methods that contain the filter types have been introduced very well. In Section three, result analysis is presented and in the final section experimental results and the conclusion have been presented.

Materials and Method

Database:

The DRIVE database is an open free online available database that enables comparative studies on segmentation of blood vessels in retinal pictures. The analysis community is invited to check their algorithms on this information and share the results with alternative researchers through this internet site. On this page, directions are often found on downloading the information and uploading results, and therefore the results of different methods are often inspected. The screening population consisted of four hundred diabetic subjects between 25-90 years archaic. Forty images are at random hand-picked, thirty three don't show any sign of diabetic retinopathy and seven show signs of delicate early diabetic retinopathy. Every image has been JPEG compressed.

Eight bits per colour plane at 768 by 584 pixels have captured every image. The FOV of every image is circular with a diameter of roughly 540 pixels. For this information, the photographs are cropped round the FOV. For every image, a mask image is as long as delineates the FOV.

Different Types of Filters Used to Remove Noises:

Salt & pepper Noise:

The image that's low in quality, has bright and dark pixels presence in it that causes noise in it, together remarked as Salt Pepper noise. Black and white dots **seem within the** image [9]. **Because of** sharp and **sudden** changes of image signal, the noise arises. Dead pixels, **digitizer** errors, bit errors in transmission, etc. **are** caused **because of** the presence of Salt Pepper noise **within the** image.

Filters:

Median Filter:

Median filters help to reduce random noise, particularly once the noise amplitude probability density has massive tails and periodic patterns. The median filtering methodology is accomplished by sliding a window over the image. The filtered image is obtained by inserting the median of the values at intervals the input window, at the center position of that window; thereby the output image is obtained. The median is that the most chance reckoner of location within the case of the Laplacian noise distribution. As an edge is crossed, one aspect or the opposite dominates the window, and the output switches sharply between the values. Thus, the edge isn't blurred. The disadvantages of such filters are that within the presence of tiny signal-to-noise ratios they have a tendency to interrupt image edges and turn out false noise edges. The other disadvantage is that they cannot suppress medium-tailed (Gaussian) noise distributions.

Algorithmic median filters were shown to be a lot of economical than those of the non-recursive kind. Helpful particular categories of median filters are the separable median filters. These filters are significantly straightforward to implement, by performing a continuous operation over the rows and columns of the image.

Median Filtering looks nearly customized for Removal of Salt & pepper Noise. The Median of a collection is that the Middle value once they are sorted in

ascending order. If there are an even number of values, the Median is that the Mean of the center 2 which is discussed in equation (1). A median Filter is an Example of a Non-Linear Spatial Filter [10].

$$(x,y)=\{g(s,t)\},s,t\in Sxy \quad (1)$$

Let S xy represents a set of rectangular sub image with window size (m x n) centered at (x, y).

Mean Filter:

The idea of mean filtering is to switch every picture element in an image with the mean (`average') worth of its neighbours, as well as itself. The mean filtering has the impact of eliminating pixel values that are untypical of their surroundings. Mean filtering is sometimes thought of as a convolution filter. Like alternative convolutions, it's based mostly around a kernel, that represents the form and size of the neighbourhood to be sampled once hard the mean. Usually a 3×3 sq. kernel is employed, though larger kernels (e.g. 5×5 squares) can be used for additional severe smoothing. Computing the natural convolution of a picture with this kernel carries out the mean filtering method.

Weiner Filter:

This filtering technique relies on a statistical approach to filter the noise. Typical filters are designed for needed frequency response, and Weiner filter is that the exemplar for this sort of approach. This filtering technique approaches filtering from a unique angle. Before starting with this method, one ought to have the data of the spectral properties of the first signal and the noise present in the image. One seeks the LTI filter (Linearity and Time-Invariance) whose outcome is nearer to the first signal present within the image as realizable. Wiener filter may be a technique that performs the best trading between inverse filtering and noise smoothing. It removes the blurring and additive noise present within the image and it's conjointly very best in relevancy.

Gaussian:

A Gaussian filter is a linear filter. It is usually used to blur the image or to reduce noise. In this technique, the average value of the surrounding pixel or neighbouring pixels replaces the noisy pixel present in the image which is based on Gaussian distribution. The value of the sigma or the variance affect inversely to the filtering, smaller values of sigma means more frequencies are suppressed and vice versa.

Adaptive Median:

The adaptive Median Filter performs spatial filtering to preserve detail and smooth non-impulsive noise. The most advantage to the current adaptative against the median filtering is that perennial applications of this adaptative Median Filter don't erode away edges or different tiny structure within the image.

Method

Error Analysis

The image quality assessment based on picture element (pixel) distinction methodology has been done by calculative PSNR, SNR and MSE values. These are the error metrics, which are used to compare pictures.

Mean square Error (MSE): It is the additive square error between the initial image and the noise noisy image. The lower the amount of MSE, lower the error in equation (2).

$$MSE = \frac{\sum M_i N[I_1(M.N)-I_2(M.N)]^2}{M.N} \quad (2)$$

Here M and N are the no of rows and columns within the input image severally. Hence, to gauge PSNR first MSE worth ought to be calculated.

Peak Signal to Noise Ratio (PSNR) and signal to noise ratio (SNR) are mathematical measure for image quality assessment between original image and noise value-added image. It shows the measure of peak error which is explained equation (3).

$$PSNR=10\log_{10}\frac{R^2}{MSE} \quad (3)$$

Here R is maximum fluctuation in input image data. PSNR measures the peak error

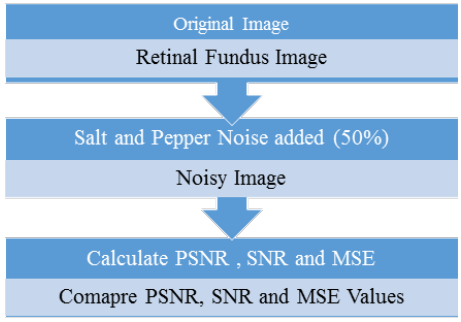

Figure 1: Image Quality estimation block diagram

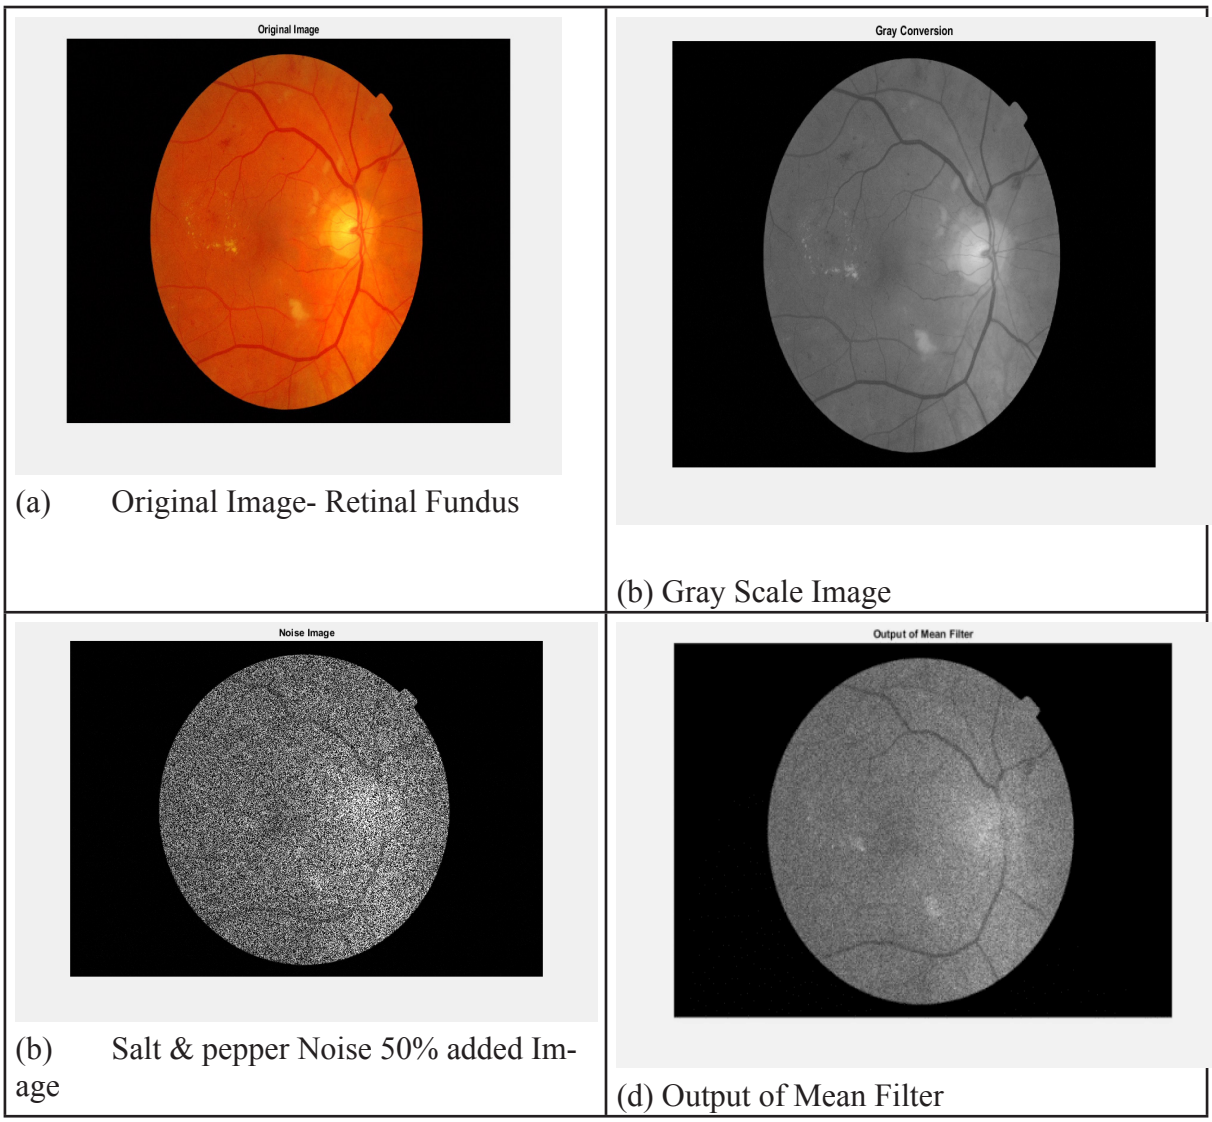

Figure 1 expresses the image quality estimation block diagram for Retinal Fundus Images The implementation of the proposed method is as follows:

- Initialize the filter and generate variable correlation coefficient values based on speckle noises added in the original medical image.
- MSE = (sum(sum(err .* err)))/(M * N)
- SNR = 10*log10((1/M*N)*sum(sum(A*B))/(MSE))
- PSNR = 10*log10(255*255/MSE)
- Compare the values of MSE, SNR,PSNR
-
- Repeat the previous steps for retinal fundus images and then compare the performance of filters.

4. Results and Conclusion:

In this paper, Salt & Pepper noise has been added to the Retinal Fundus image. 50% value of the noise has been added for the images. Various filtering techniques linear (Gaussian, Mean), Non-linear Filtering (Median), adaptive Median filtering [10], Weiner Filtering are explained to the images with noise. The output images are presented below. At the end, MSE, PSNR and SNR parameters have been used to analyze the performance of filters. Figure 2 are discussed about De-noising using Mean Filter.

Mean Filter

Figure 3 explain about Figure 3(a) Original Retinal Fundus Image, Figure 3(a (b) Grey Scale Image, Figure 3 (c) 50% Salt & pepper Noise added Image, and Figure 3 (d) Filtered Output.

Wiener Filter

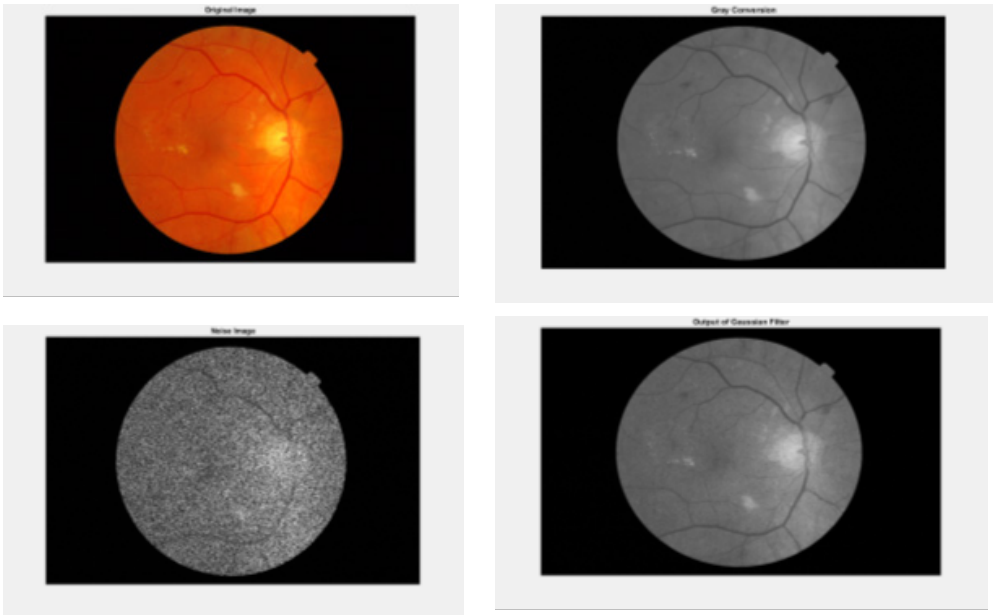

Figure 4: De-noising using Weiner Filter

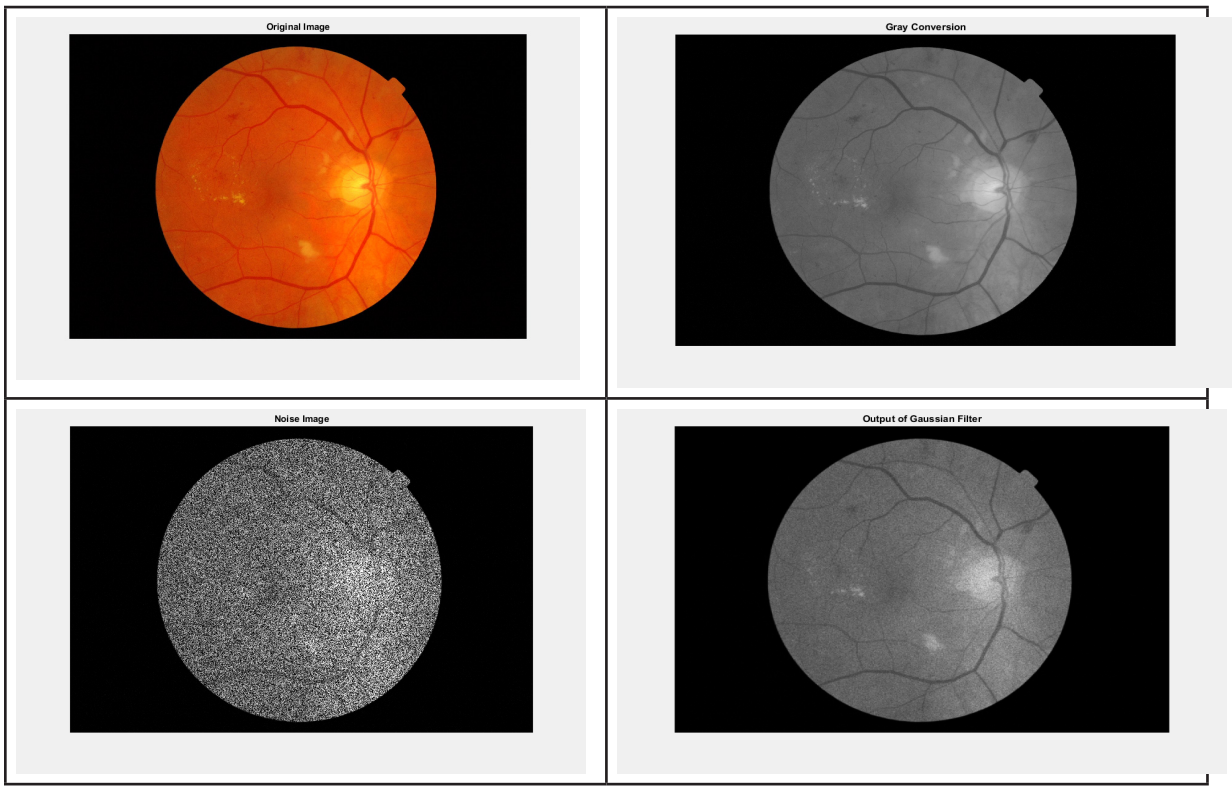
Figure 4 elaborates about De-noising using Weiner Filter Figure 4. (a) Original Retinal Fundus Image, Figure 4 (b) Grey Scale Image, Figure 4 (c) 50% Salt & pepper Noise added Image, and Figure 4.3 (d) Filtered Output.

Gaussian Filter



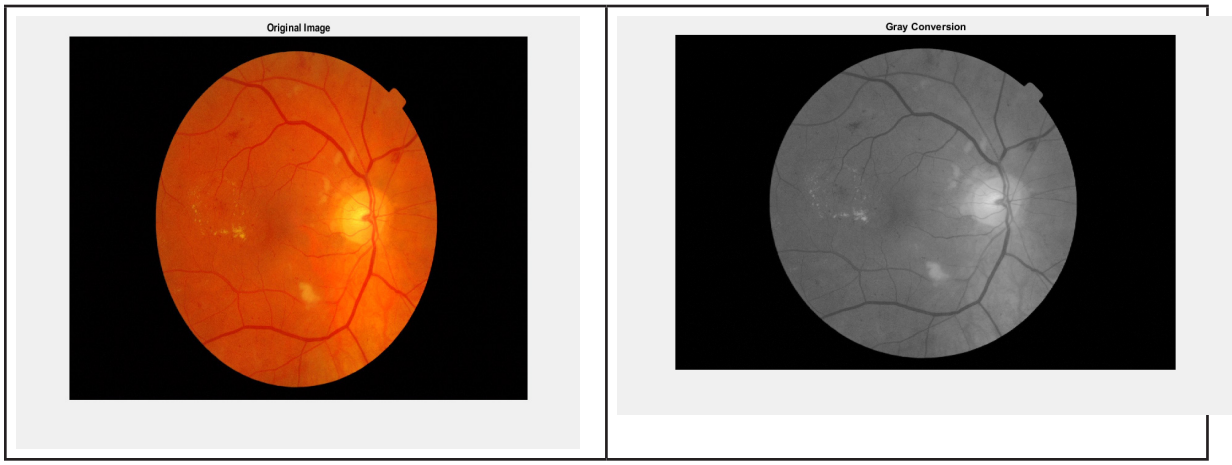


Figure 5: De-noising using Gaussian Filter

Figure 5 explains about De-noising using Gaussian Filter in Figure 5 (a) Original Retinal Fundus Image, Figure 5(b) Grey Scale Image, Figure 5 (c) 50% Salt & pepper Noise added Image, Figure 5 (d) Filtered Output

Adaptive Median Filter

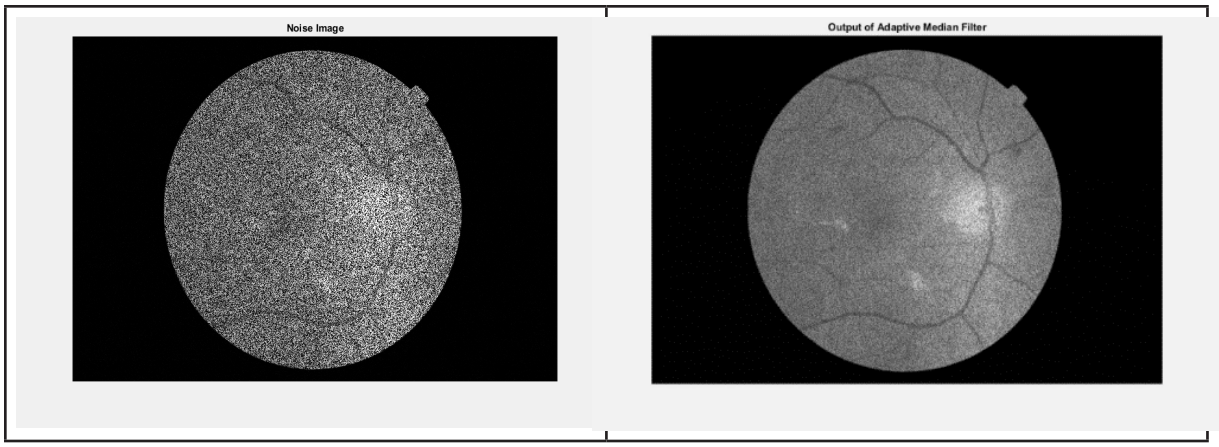

Figure 6: De-noising using Adaptive Median

Figure 6 elaborates about De-noising using Adaptive Median in Figure 6(a) Original Retinal Fundus Image, Figure 6(b) Grey Scale Image, Figure 6 (c) 50% Salt & pepper Noise added Image, Figure 6(d) Filtered Output

Table 1: Performance Evaluation

Filter Name	MSE	SNR	PSNR
Mean	0.0044	79.8085	71.6849
Median	0.0114	75.6968	67.5623
Weiner	0.0030	81.4747	73.3324
Gaussian	4.2895e-04	89.9462	81.8067
Adaptive Median	0.0051	79.2149	71.0732

The Figure shows the input Retinal Fundus images which are then converted to gray scale. Upon the conversion salt & pepper, noise has been added to the gray scale image. Then Mean, Median, Weiner, Gaussian, Adaptive Median Filters have been used for noise deduction and the obtained output is shown the figures above. The Table 1 gives the performance evaluation of the filters by using parameters MSE, SNR, PSNR. For Salt & pepper, noise in the case of Retinal Fundus images

Conclusion

This paper presents an evaluation strategy for various de-noising filters, which have been affected by salt & pepper noise. In general, the Retinal Fundus images are mostly affected by salt&pepper noise and speckle noises. We have considered the salt & pepper noise for the evaluation approach, 50% of the salt & pepper noise have been added into the Retinal Fundus images. Then the noise has been removed by using various filters like Mean, Median, Weiner, Gaussian, and Adaptive Median Filters. The tabulation gives the performance evaluation of the filters by using parameters MSE, SNR, PSNR. For Salt & pepper, noise in the case of Retinal Fundus images in case of haemorrhages, disease the Gaussian filter is giving better performance. Depending upon the PSNR measurement, we conclude that the Gaussian filter gives better performance than other filtering technique in haemorrhage disease images.

Skin Disease Detection Using Artificial Neural Network

V. Jaychandra Reddy[1], T.J.Nagalakshmi[2]

[1]UG student, Department of ECE, Saveetha School of Engineering, SIMATS, Chennai,
[2]Assistant professor, Department of ECE, Saveetha School of Engineering, SIMATS, Chennai

Abstract

Most of the health issues on human body is notified through the skin. In this paper, we proposed a framework which identifies the skin infections by using Artificial Neural Network technique. This framework effectively recognizes different types of dermatological skin illnesses. It comprises of three stages. They are, picture fixing, articulating stage, locating the stage. Strategies like shifting, partition, highlight mining, picture pre-preparing and edge identification are important. This paper introduces an overview of different skin sickness. A thorough report of various skin infections is studied.

Keywords *- Pre-processing, Edge detection, Filtering, Image processing, Skin diseases, ANN.*

Introduction

Dermatology is the part of prescription that manages skin, hair and nails in the most extensive sense. A dermatologist identifies dermatological and corrective ailments of the skin. Identification of infections is critical in this day and age situation in light of the fact that the plagues of skin ailments cause extreme misfortunes to individuals everywhere throughout the world. Particularly in creating nations there is a requirement for robotized symptomatic framework that would diminish manual endeavours and time utilization of dermatologists and patients[1]. We proposed a framework that would help the patients just as specialists to analyse the sickness to recognize the ailments of the skin by simply giving the picture of the influenced zone of skin. Not the same as the current identification frameworks depending on help vector machines or fluffy rationale systems, our discovery framework utilizes highlights removed from info picture of skin through picture preparing calculations alongside feed forward back engendering neural system for grouping and location reason. Hypersensitivities, aggravations, hereditary structure, and specific sicknesses and insusceptible framework related sway on human's day by day life, wreck certainty of a individual, stop their development, and swing to wretchedness. The most noticeably bad circumstance is that, it can even slaughter. It's a major issue that issues can create dermatitis, hives, and other skin issues. A considerable lot of the skin maladies, for example, skin inflammation, alopecia, ringworm, dermatitis likewise influence your look[2]. Skin can likewise produce numerous sorts of tumours. Picture preparing is utilized to distinguish these illnesses by utilizing different strategies like division, separating, include extraction and so on. To get an improved picture or to get significant data from a picture, it is important to change over a picture into advanced structure and afterward perform capacities onto that picture[3]. It is a piece of flag preparing. The info is a picture and it might be a video, a photo and yield is likewise another picture having same qualities as info picture. Generally Image Processing models take input tests as 2-D signals and after that they apply fixed flag preparing strategies to them. It is generally utilized innovation now days and it has different applications in the territory of business. It is another exploration region inside building and software engineering as well. The scope of skin illnesses is wide. Skin illness doesn't simply harm the skin[4]. The most noticeably bad circumstance is that, it can even slaughter. It's a major issue that should be controlled, so it is important to take skin infections all around genuinely and distinguish it at a beginning period and avoid it from spreading. Identification of an infection relies on numerous factors like which parameters are considered for sickness recognition[5]. Right off the bat, take a picture, apply channels to evacuate clamour from the picture, section the picture to remove important data, include extraction is done based on info parameters and after that arrange the illnesses by utilizing fitting

classifier. Skin infections are visit illnesses to each individual and different sort of diseases are winding up continuous. Skin maladies can without much of a stretch exchange from human to human so there is a need to control it their underlying stage to counteract it from spreading. This paper displays an execution of a skin ailments finding framework which causes client to recognize human skin ailments and gives restorative medicines opportune.

Methodology

Here, the proposed technique gives the solution for six common skin diseases. So, the patient can infer prior knowledge before going to the doctor. This can also be used in rural areas where dermatologist or specialist for skin diseases is not available. This gives the non – invasive method of skin diseases detection. Here, the patient should post the image to the consultant or to this technique. Form the image itself the further analysis is taking place. Therefore the patient no need to go to hospital in person for consultation and no need to spend time for consultant appointment. And also no piercing required. The Flow chart of detection process are described in Figure 1.

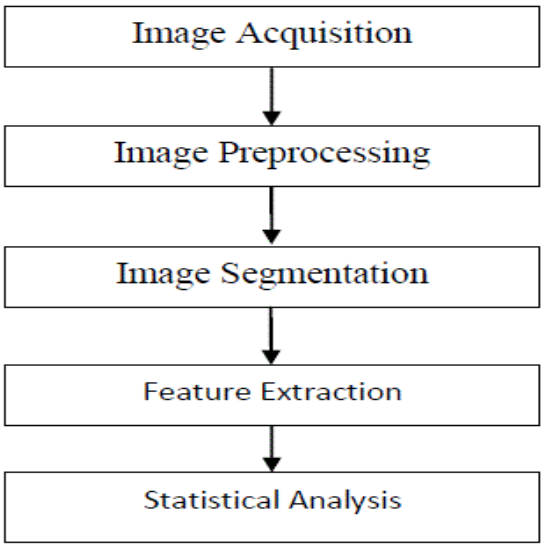

Figure 1: Flow chart of detection process

The flow chart gives the method or steps to be followed in the detection of skin diseases. The data is collected from the picture. The picture may be a video or photo that elaborated in Figure 2.

Block Diagram

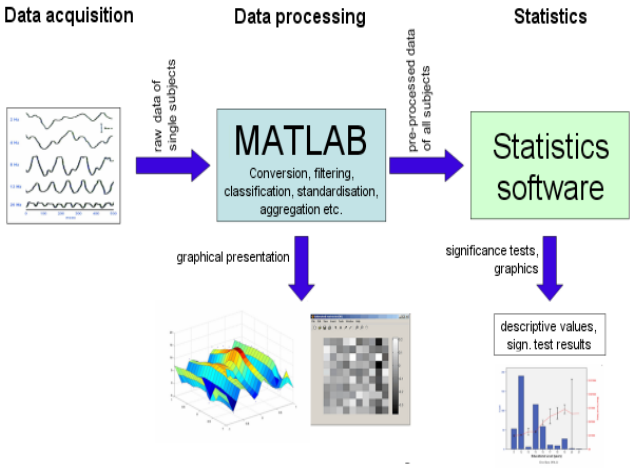

Figure 2: Processing of image

The system Pattern acknowledgment basically starts from the requirement for computerized machine acknowledgment of signs, pictures and questions or any choice based methodology, based on the arrangement of highlights. The objective of Pattern acknowledgment is to foresee the right dimension relating to given list of capabilities dependent on a superior learning acquired through preparing. The example acknowledgment can surely knew by thinking about a precedent: the person will while not a lot of a stretch distinguish the sexual orientation passionate about the face whereas machine can't, that the purpose is to arrange the machine by considering completely different highlights as: outward look, facial bone structure, hair length et al which discussed in Figure 3.

Figure 3: Skin patch

In the wake of preparing, the machine can without much of a stretch distinguish the required class the new test object has a place. From this above precedent, it is

very clear that the core of example acknowledgment framework is include extraction and characterization. The example acknowledgment framework for this arrangement task is given by the flowchart; as appeared in Here, the proposed Pattern acknowledgment framework is created with the assistance of 55 quantities of refined cell pictures.

Existing System

In the main stage, the picture is prepared by applying calculations like dark scale transformation, RGB to HSV transformation, mass location and the highlights are removed from the intrigued areas of skin image .First, we grey scale the picture, at that point obscure it. From that point forward, the HSV esteems are determined from the picture. In the wake of blurring the picture we use Blob discovery technique. Blob location is a strategy that goes for recognizing districts in a picture that contrast in properties like brilliance or shading, contrasted with encompassing areas which mentioned in Figure 4.

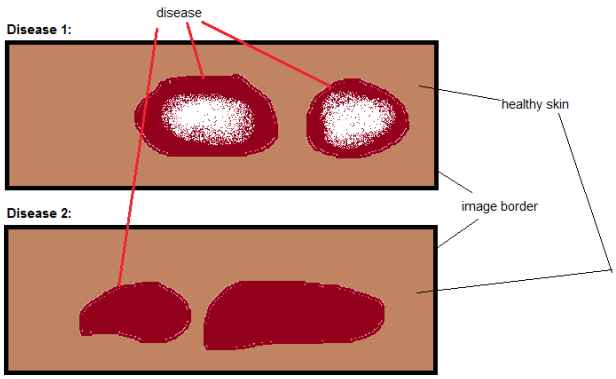

Figure 4: Identification using image processing technique

The qualities that we get in mass location is the square of intrigue (it contains square shape co-ordinates). After this we select square shape from the first picture from the directions of mass location and get their HSV esteems which were determined previously. These highlights are connected as contributions to the Artificial Neural Network Algorithm.

Proposed Technique

In this paper we proposed a framework which works in three stages. The principal stage incorporates preparing the skin picture that is contaminated with ailment to get considerable highlights like normal shading code of the district, the second stage is the preparation stage which is utilized to prepare the neural system for recognizing the dermatological maladies and the organize. Here we have introduced a total compositional plan of our framework in a nutshell

Discussion

Artificial Neural Network (ANN) is a computational model. Neural Network encourages in evaluating the most financially savvy and perfect techniques for coming to at arrangements while characterizing processing capacities or disseminations. ANNs have three layers that are Inter connected. The primary layer comprises of information neurons. Those neurons send information on to the second layer, which in turn sends the yield to neurons of the third layer. There are diverse kinds of Neural Networks, for example, Feedback, Feed-forward, Back proliferation, Classification-Prediction, and so forth. In our system, Neural Networks are utilized in the programmed discovery of skin illnesses by utilizing Back proliferation calculation. Neural system is picked as an identification device because of its outstanding strategy as an effective classifier. Fake Neural Network Algorithm contains two phases– preparing and testing stage and discovery stage. In preparing stage these highlights are prepared to the database utilizing back spread algorithm. The preparing and testing forms are among the critical strides in building up an exact procedure show utilizing ANNs. The dataset for preparing and testing forms comprises of two sections; the preparation highlights set which are utilized to prepare the neural arrange demonstrate. While a testing highlights sets are utilized to confirm the exactness of the prepared utilizing the BP arrange. In the preparation part, association loads were constantly refreshed until they achieved the characterized cycle number/reasonable blunder. In discovery stage the highlights of info picture whose ailment is to be perceived are contrasted and the includes in database utilizing Artificial Neural Network.

Pros And Cons

These sicknesses are extremely destructive, particularly if not controlled at a beginning period. Skin infections not just harm the skin. It can affect an individual's everyday life, pulverize certainty of an individual, hang their development, and swing to misery. Some of the time, numerous individuals attempt to treat these sensitivities by utilizing their very own treatment. Be that as it may, if these techniques are not proper for that kind of skin illness then it would make it progressively hurtful. This paper displays a usage of

a skin maladies analysis framework which encourages client to identify human skin maladies and gives medicinal medications auspicious. For this reason, client should transfer an ailment influenced skin picture to our framework to the side effects of the skin.

Conclusion

Thus, our technique is very easy for the implementation and it can be used by all types of peoples. Here, the disease is detected from the data set which is collected from the 2D photo or video. Then it is processed and compared with huge amount of pictures of different types of diseases and finally it is predicted. In this present work it was done with six types of diseases. In future it can be extended to all types of diseases.

A Survey of Efficient Speckle Reduction Techniques for Ultrasound Images

V.Thilakrathi[1], K.Vidhya[2]

[1]Research Scholar, [2]Professor, Department of Electronics and Communication Engineering, Saveetha School of Engineering, SIMATS, Chennai

Abstract

In this paper an exhaustive study of despeckling techniques used for ultrasound images that are available in the literature is carried out. Noise removal from Ultrasound images still remains a challenging task for the image processing experts. The huge amount of research papers published in this area stands as a testimony to it. Generally there's no unified approach for the removal of noises in US images. In this paper different types of most prominent existing speckle noise reduction techniques both in Spatial or Space domain and Frequency or Transform domain are discussed and compared.

Keywords: *Ultrasound images, Speckle noise.*

Introduction

The Ultrasound imaging always gets highest priority for rectification of diseases compared to the other methods such as X-ray, CAT scans and NMRI. It is mostly preferred due to its special facts of non-invasiveness, leverage of non ionising radiation and also has an efficient cost. Even though the ultrasound mechanism is quiet efficient in terms of imaging the image quality detoriates on encountering the backscattered echo signals known as Speckles. Speckle noises are changes which have a negative impact on the contrast of an ultrasound image. Speckle noises are viewed as results of random variation in the endurance of the back scattered waves utilises cheap and non-ionising radiation. The medical ultrasonograhpy has a meagre image quality detoriates on encountering the backscattered echo signals called Speckle. These noises is a variation which is responsible due to random variation in the potency of the back scattered wave of the tissues in the body. Speckle noise poses a great obstacle in the analysis and the diagnosis of the ultrasound report. These noises also prohibit the level of effective use in the processing of images and analysis design which are fragmentation and feature extraction. Hence, these noises must be formatted without influencing vital image characters for enhancement of diagnosis.

Speckle Noise and Its Reduction

The variation in the contrast of picture leads to the noise. It originates from random variations in the potency of the reflected and scattered waves from objects and is viewed widely in Radar and Ultrasound (US) imaging. It is a multiplicative noise, having a granular pattern. Ultrasound and SAR mark the inherent presence of speckle disturbances in images. These noise are always seen as a major hurdle during the analyses and diagnosis of the ultrasound image by the sinologist, it is also known for restricting the employment of formats for processing the image and analysis algorithm i.e., fragmentation and characteristic extraction.

Speckle Reduction Techniques

The Speckle Reduction can be either in Space and Frequency Domain. In Transform Domain the Speckle noise reduction can be either by Partial Differential equation based diffusion and Fuzzy Logic which discussed in Figure 1.

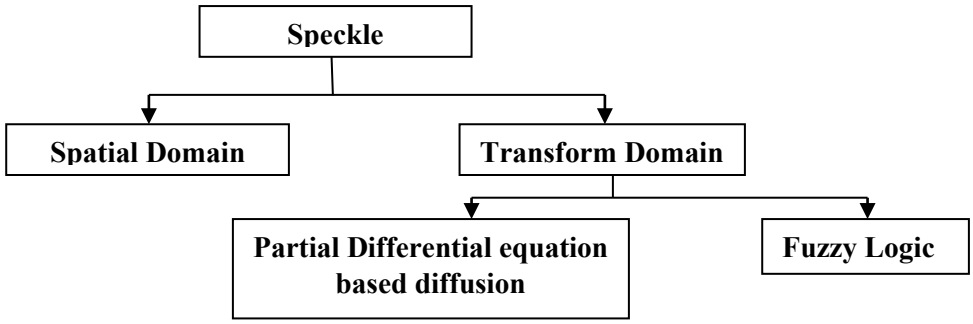

Figure 1: Classification of Speckle Reduction Techniques

Spatial Domain Filtering of Speckle Noise

It is a domain where the digital image is defined by its spatial coordinates of its pixels where filtering is based upon the local statistics in a motion window. Some of the space domain filters for despeckling are adaptive filters like Lee, Kuan, Frost and Gabor.

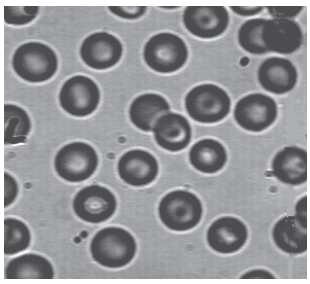
[3] Author used statistical method to define a noise model and applied local statistics noise filtering algorithm to a set of SAR images. The main disadvantage is it to avoid the speckle disturbances in regions nearer to the brim and lines. [4] Author used an adaptive method in which the image reflectivity is estimated by convolving the observed image with the impulse response of the SAR image. It has no user defined parameters.

The author [5] uses generalization of Lee filter procured by employing minimum mean square error calculation on the multiplicative model. It is poor in edge preservation. The author [6] used the method evident on heat equation and performs well in homogenous region with edge conservation for images distorted by additive noise. Performance degrades for the multiplicative speckle noise. It [7] uses a diffusion coefficient is formulated evident on the ratio of local standard deviation to mean employing four nearest neighbour window. Smoothening of the edges and structural content occurs in this format. It uses a noise mitigation method based on homomorphic denoising and non-Gaussian format of the wavelets coefficients is modelled. This advanced is computationally costly, as it requires the lineage of allocation parametric values.

Transform Domain Filtering for Speckle Noise

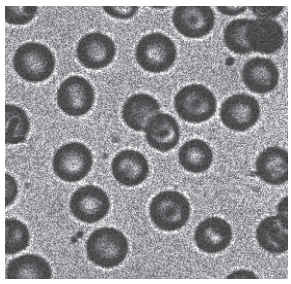
It is a domain where the digital cast is explains by crumblement down its spatial frequencies. The image is Fourier transmute, quadruple with the percolate function and then re-change into the spatial demesne. Some of the transfigurate sphere filters for speckle noise are WAVELET metamorphose, CURVELET transform, and RIDGELET transform.

SVM Partial Differential Equation (PDE) Based Diffusion for Speckle Noise Reduction:



Smoothing of the image can be achieved by brightness diffusing, in the similar way heat diffuses; hence PDE is formulated for smoothing. Diffusion takes place only in the direction of gradient. Diffusion across strong edges is inhibited when the magnitude of gradient is large.

Some of the examples of PDE based filters are AD, SRAD, CED, DPAD, OSRAD and Fourth order PDE. Another fast emerging area recently for speckle denoising is through non linear partial differential equation. Some of the diffusion methods are anisotropic diffusion, Speckle reducing anisotropic diffusion (SRAD) and fractional order anisotropic diffusion.



Speckle Noise Reduction Using Fuzzy Logic

This method logic has already been established in many fields including the processing segment of the image and has excelled very well. It has the capability to take into account the input that is approximate rather than fixed. Due to fuzziness in quality motive by speckle noise in the ultrasound appearance have, Due to fuzziness in quality motive by speckle noise in the ultrasound appearance have, wandering keenness and fences. The ultimate inference drawn is based on the vague, ambiguous non precise or disturbed noisy input is fuzzy logic which discussed in Figure 2.

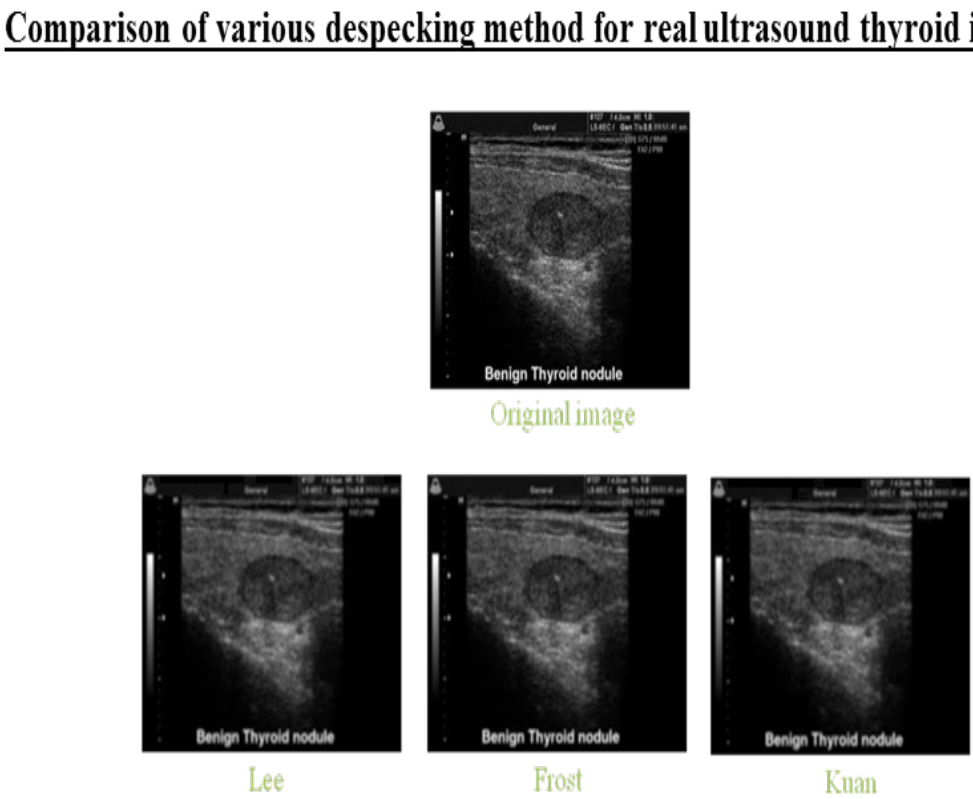

Figure 3: Speckle Reduction Techniques For Ultrasound Images

This study both spatial and transformed domain despeckling techniques have been studied for Speckle noise cutting in Ultrasound images which discussed in Figure 3. An exhaustive study shows that SWT with PSO technique has yielded better result which details are given in Table 3

Conclusion

In this study both spatial and transformed domain despeckling techniques have been studied for Speckle

noise cutting in Ultrasound images. An exhaustive study shows that SWT with PSO technique has yielded better result. It is also found that in Partial Scram Optimization technique has led to a dramatic increase in the PSNR and decrease in MSE.

A Recent Survey on Radiomics: Proceedings and Applications for Lung Cancer Detection

P.Lavanya[1], K.Vidhya[2]

[1]Research Scholar, [2]Professor, Department of Electronics and Communication Engineering, Saveetha School of Engineering, SIMATS, Chennai

Abstract

Lung cancer is the primary reason for mortalities among cancer-affected persons worldwide. We are living in a decade of emerging personalized and targeted medicine. With the help of the current advancements in the imaging hardware's, in terms of quality, sensitivity and resolution, and the computing capabilities of the vast amount of data made personalized medicine possible. Non-invasive diagnosis is often required to detect lung cancer before actual clinical treatment started. Here come the latest radiomics proceedings using the advanced imaging technologies and high throughput computing capabilities aid the radiologists to diagnosis the lung cancer at a primitive stage. This paper, we survey the latest published scientific literature on Computer-Aided Decision Support Systems (CAD), which uses the radiomics proceedings to prognosis lung cancer.

Keywords: *Radiomics, Biomarkers, Computed Tomography, Lung Cancer, Image Features, Image processing.*

Introduction

The term Radiomics means for extracting large amounts of advanced quantitative imaging features and analyzing it with the help of sophisticated computing systems (CAD). For analysis of these vast amounts of imaging features obtained from CT, MRI, and PET, Various image processing tools used. Specific disease biomarkers identified during the analysis and training of the image processing models. Primitive detection or prognosis is much essential, and that can significantly improve the survival rate of cancer-affected persons because the primitive stages are often curable. Radiomics workflow involves steps, each with its challenges [1]. Steps in the workflow are shown in Figure 1.

In this paper, we reviewed some of the latest published scientific literatures which report the use of Radiomics process to prognosis the lung cancer. We examined the published works of literature in terms of various assessing parameters mentioned in Julia Lai-Kwon et al. [2]. In addition to prognosis and diagnosis, radiomics produce "imaging biomarkers." We devised an evaluation scheme for the papers we evaluated here according to the following criterion, (a) imaging modalities used, (b) biomarker/genetic information identified, (c) segmentation algorithms used, (d) classification algorithms used, (e) feature selection/ extraction, (f) model building, (g) training the built models, (h) evaluating the performance of the developed models, (i) optimization of the developed models, (j) results and discussions.

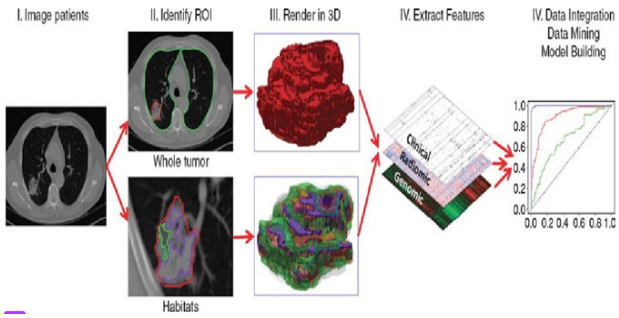

Figure 1: Workflow diagram shows the process of radiomics and the use of radiomics in computer Aided Decision (CAD) support systems[3].

Literature Review

[4]studied the fatal cause of lung cancer among patients who identified as actual positive cases of lung cancer. They further elaborated about the statistics of lung cancer affected patients with mortality rates.

Survival rates for stage IV lung cancer patients are merely 2%. Whereas the patients who are diagnosed very primitive in stage I of the disease has a 50% survival rate. Hence prognosis or primitive detection and diagnosis of lung cancer is crucial for patients. Diagnosis and primitive detection of lung cancer using CT scan place an excessive burden on radiologists since the number of slices from the CT scan to be examined for lung nodule detection is enormous. CAD systems have two stages. In the first stage detection of hundreds of lung nodules from the CT scans using double thresholds, morphological operations, and multiple selective enhancement filters as some of the techniques. Stage 2 involves the reduction of false-positive detection.

For this proposed scheme, the sample dataset obtained from LIDC (Lung Image Database consortium). The received dataset from the National Cancer Institute,1010 patient CT scan images from various hospitals are present in the dataset. Tri-linear interpolation is applied to obtain isotropic voxel of all 1mm resolution.

Lung segmentation is done by an algorithm developed by Tan is used to generate a pulmonary field. Nodule detection utilized the multi-scale nodule and vessel enhancement filters developed by Li et al. [5-8]In the final stage of the CAD system, the scheme extracted 979 features for each nodule candidates to eliminate the false positive detections. Detection of the nodule depends upon the shape features of the nodules. Figure 2 displays the outline schema of the CAD system.

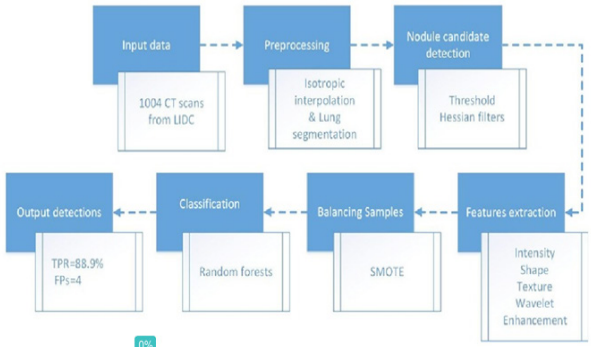

Figure 2. Schema of the CAD System

Tested on LIDC data sets of the proposed model. The datasets contain 1010 CT scans of the chest from different hospitals. Patients with various configurations and orientations are examined using the CT scanners from different manufacturers models. All 1010 scans were included, but some errors occurred in six cases. With four false positive results per scan in the test set, the proposed system achieved 88.9% sensitivity.

[9]We are living in an era of personalized and targeted medicine for patient care. To utilize the potential of modern advanced medical imaging technologies, a higher number of advanced imaging biomarkers are needed. Those biomarkers reflect the whole biology [10] of the tumour. In this work, a large number of Radiomics features obtained from CT scans along with demographics and pathology related data of the patients considered.

Two radiomic features for the forecast of Lung cancer survival are considered in this study i) External value of 1/3 of the tumour, reflecting the microenvironment of the tumour ii) Size zone variance represented intratumor heterogeneity. Prognostic performance for survival, they used three models: (i) clinicopathological data. (ii) selected Radiomics features. (iii) clinicopathological data and selected Radiomics features

Approximately half of the selected radiomics were prognosis for the survival of lung cancer. In particular, in this study[11] – [13] both independently predicted overall survival, the maximum value for the outer 1/3 of the cancer reflecting the tumor microenvironment and zone variance, which is an intratumor heterogeneity. In addition it increases the performance of discrimination and the net benefits of the clinical decision by integrating certain radiomics and clinical variables.

The pronostic performance among the three models is summarized in Table 1 for survival. The level of discrimination improved (C-index 50.772) as compared to only clinicopathological variables (C-index 50.737) with 31 selected radiomics features integrated with the clinicopathological variables.

Table 1: shows prediction models performance, including radiomics and clinicopathological variables

Prediction model	C-Index	95% CI
Radiomics features	0.628	0.550–0.706
Clinicopathological variables	0.737	0.659–0.815
Clinicopathological variables 1 radiomics features	0.772	0.694–0.850

Abbreviation: CI, confidence interval.

The results of this work show that a radiomic perspective on lung adenocarcinoma allows full potential of medical imagery to be exercised. In clinical oncology, it plays a more important role.

[13] This work mainly concentrates on primitive detection and prognosis of the vulnerable patients for recurrence of lung cancer. Radiomic textures such as Gabor, Haralick, Law, Laplace, and CoLlAGe were extracted from the whole of the digitized H&E slide tissue pictures on an initial detection set of 50 patients on CT scans and on intranuclear pathology features, specifically, Shape, Cell Cluster Graph and Global Graph features. In conjunction with machine learning algorithms the first predictive radiomic and pathomic functions were combined to forecast classification. The raptomic classification performance is estimated on a Cleveland Clinic training set (n=50) and was independently validated on images taken from the open cancer genome atlas (TCGA) (n=43) dataset. A5-year recurrence-free Survival (RFS) (AUC 0.78; p<0.005), when compared to Radiomic (AUC 0.74; p<0.01), and Pathomic (AUC 0.67; p<0.05), were clearly forecasted in the radiographic forecasts model using Linear Discriminant Analysis (lDA) classifier in conjunction with two radiomics and two pathomic shape features only.

This work is the first attempt to combine radiomic and pathomic features within a single classifier for predicting recurrence in primitive-stage NSCLC. A flowchart illustrating the various modules comprising the RaPtomic classifier

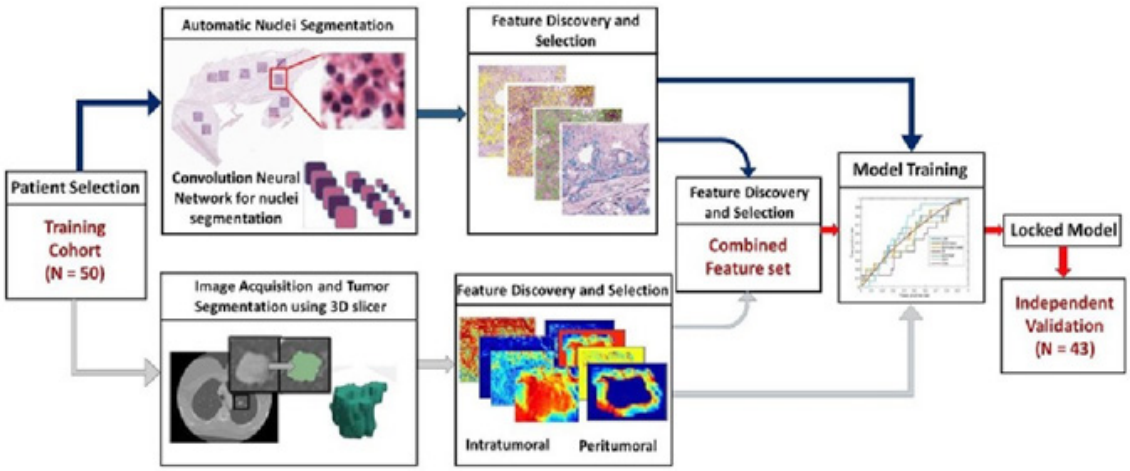

Figure 3: Workflow illustrating the procedure of training and validation of Radiomic, Pathomic, and RaPtomic classifier for distinguishing primitive versus no/late recurrence in primitive-stage lung cancer.

Linear Discriminant Analysis (LDA) classifier yielded an AUC 0.79 and accuracy of 70% on the training cohort and AUC of 0.74 and accuracy of 69% on validation cohort for discriminating primitive versus no/late disease recurrence. Kaplan Meier curves analysis was used to correlate recurrence-free survival (RFS) of the patients predicted by the model. The patients predicted as recurrent by the classifier had statistically worse disease-free survival with p<0.001 by log-rank test.

This study presented a combined radiomoic and pathomic prognostic classifier to predict the risk of recurrence of NSCLC in primitive-stage. The features derived from both pre-surgical CT scans as well as digitized H&E surgically resected tissue image [14]. Our integrated approach (RaPtomics) was found to be more prognostic of disease recurrence compared to either pathomic or radiomic features alone. [15] This paper analyses the nature of lung cancer in the US as the primary cause of mortality among cancer affected peoples. The overall survival rate of a lung cancer patient for five years is only 17.7% in the later stage. Authors take a novel method to aid decision making of the radiologists, which involves the fusion of in-depth features extracted from the CT scans of suspected patients with the classical radiomics features. Deep Learning is utilized to extract the detailed features from the CT Scans of the data set obtained from the National lung Screening Trial (NLST). Here three different pre-

tutelage CNN models are used to extract the in-depth features from the CT scan images. The extracted deep features are given to five different classifiers.

Four ways were devised for the authors to improve the CNN classifiers predictability. Included in camera photos are the CNN classifiers. The classification input is taken from CT scans of patients suspected of lung cancer and has now been found to be benign. In the first place, they examine whether the classification of the camera images using the in-depth functions derived by the CNN system can produce similar or improved results in comparison with standard radiomic features such as textures, shape and size. To monitor this features, each tutelage is based on the même data containing all color channels, extracted from three slightly different deep neural tutentive networks. Second, we speculated that the combination of standard radiomics and profound characteristics improves the solution to classification. You did not try to find the right amount of trainings features. Thirdly, because the images on the lung-nodule have been in the gray scale of nature, after examining the images on the classification, the authors analyzed the effects on the camera icon on the images of nodules by different color-channels (red / green / blue) of the CNN network tutoring. Three different architectures have been tried to gradually minimize the number of weights. While more weight can make classification systems more complex, they can overpower or train poorly with small data, and only small networks can not provide good precise data, so the spread of three classifiers. Efficiency and AUC measured on invisible data.

The authors created CNN architectures which combine deep learning with transfer learning with 76% accuracy (AUC 0.87) from Architecture 3. The authors developed the architecture. They used their own pre-tutoring CNN Architecture 3, to extract 1024-sized features from the pool of max size— layer 3. The three methods are presented here with three different approaches and results. The accuracy of 68,77 percent (AUC 0.62) was achieved by using only the in-depth features of the newly designed CNN. The accuracy was received at 76.37 per cent (AUC 0.75) when new details merged with the standard radiomics. 3. The combination of the new in-depth features and standard radiomics features. In addition, the most comprehensive features derived from the recently constructed and preserved CNN architectures were 76.79 percent (AUC 0.78), the total accuracy achieved. This precision shows that this is the best performance with radioma features compared to the previously obtained results.

Three interpretations are provided in this work that were used in future research. They recommend an effortless, production-oriented CNN architecture with less useful parameters for smaller (medical) datasets. First, they recommend. Secondly, they showed the characteristics that have been acquired by transmission from all CNN canals. Pre-tutoring of a large body of camera images is better than extracting features on any single channel. Thirdly, a new feature was created by combining quantitative elements with in-depth features which improved classification performance.

[16] have developed a new approach to detect and diagnose primitive Lung Cancer, known as Deep Radiomics. Lung cancer is the leading cause of death due to cancer, with a 5 year survival rate of 18 percent dysfunctional. In this study, the method of diagnosis of lung cancer was Low dose Computed Tomography (LDCT). The LDCT pictures of the identified nodules are used in this piece. By increasing the image of the real nodule, more images are produced to train a small CNN.

The authors analyze various texture images derived from an original image in this study. Imaging Textures provide useful data and statistics on the color intensities, structure, shape, size, and appearance of areas of interest to an image for spatial arrangement. During the author's study the NLST (National Pulmonary Screening Test) image data set was identified. NLST images are pre-processed to obtain texture images. The most frequently diagnosed cancer of the lung world is 13.3% of all cancer. The survival rate for lung cancer is 17.7% for five years. In the United States, lung cancer has been classified as Lung Small Cell Cancer (SCLC) and Lung Non-Small Cell Cancer (NSCLC). NSCLC (non-small-cell lung cancer), as compared to small-cell lung cancer, tends to expand and grow slowly. Using low-dose computed tomography, NLST is displayed and screened. Classification and categorisation profound learning.From this, 125 3D Law's features are selected using the Relief-F feature selection algorithm. Out of the 125 3D Law's feature images best 10 Law's features are chosen as an input to train the 11 layers of the CNN using Relief-F feature selection algorithm. Training image data set are obtained from NLST that taken for three years. In the beginning -year baseline screening T0, CT scan made, and in the subsequent years, follow

up scans are received, in the second year T1, and the third year T2.

Selected image data set from baseline scanning and subsequent follow up scanning are further divided into two cohorts. Cohort1 is called a training cohort, which contains 85 SDLC cases and 176 positive controls nodule. Cohort2 includes 85 SDLC cases and 152 positive nodule controls. The CNN architecture the authors devised in their previous work is used in their current work. The training of the 11 layers of the CNN is from the ten different Law's texture images, a maximum accuracy of 73% and AUC of 0.82 were found from L5E5L5 images. Classifiers of two distinct subsets are used to ensemble prediction by averaging the results. Predictions of CNN from cohort2 using the ten selected Law's feature Image gives an accuracy of 78.9% and AUC of 0.87. Predictions of the second subset using ten selected Law's specified images along with the predictions from original models give an accuracy of 79.32 and AUC of 0.81. The authors found that L5E5L5 Law's feature image has given the best classification accuracy of 73% for a single feature. Using the packaging approach, the authors further obtained an accuracy of 79.32 and AUC of 0.88. By combining the test prediction of CNN's from the ten different Law's feature images with a single obtained image. Table 2 discusses about comparative study for exisitng technique.

Conclusion

We reviewed some of the recent scientific literature

on primitive lung cancer detection or prognosis using Radiomics proceedings. Found that this is a promising modality for the efficient prognosis of non-invasive non-small cell lung cancer. Among the reviewed literature, we find that there is no standardized proceedings or procedures available for the use of Radiomics Technology. More research needs in these emerging Radiomics procedures for practical use. Targeted or personal medicine requires more advanced non-invasive prognostic techniques for successful treatment, Radiomics may fill the gap which exists now. More advanced classification, segmentation, feature extraction, and deep learning algorithms help us to use the Radiomics Proceedings to prognosis lung cancer efficiently.

Brain Image Classification Using Dual Tree M-Band Wavelet Transforms and Support Vector Machine

Shailendra Kumar Mishra[1], Hima Deepthi V[2]

[1]Research Scholar, [2]Professor, ECE Department, VelTech Rangarajan Dr. Sagunthala R&D Institute of Science and Technology, Chennai, India

Abstract

Human brain is an important organ of humans, and it is the center of the nervous system. Brain tumor causes more damage to humans, and the cause is still unknown. Hence, an early diagnosis system for a brain tumor is required. In this paper, an efficient method is presented for brain image classification using Dual Tree M-band Wavelet Transform (DTMWT). The system uses Magnetic Resonance Imaging (MRI) images of brain. REpository of Molecular BRAin Neoplasia DaTa (REMBRANDT) database is used for MRI brain image classification. DTMWT uses the Hilbert pair of wavelet for decomposition. A predefined number of DTMWT sub-band coefficients are selected and directly fed to the Support Vector Machine (SVM) classifier. Results show that DTMWT and SVM classifier provides 86% accuracy, 79% sensitivity and 93% specificity for MRI brain image classification system.

Keywords: *MRI, DTMWT, Sub band, Coefficient selection, SVM classifier, Classification.*

Introduction

Brain is the most complex and largest organ in our body. The abnormal cell in the tissues of the brain is known as brain tumor. Different wavelet analysis of MRI brain images using SVM classifier is discussed in [1]. SVM is one of the state-of-art learning methods used for the classification. The multiclass classification and binary tasks are performed by SVM classifier. An approach for brain tumor detection is discussed in [2]. At first, anisotropic filtering is used for removing the noises in MRI brain images. Then, SVM classifier is used to detect the tumor region, and morphological operations are used for separating the detected tumor regions from the normal region.

MRI brain image classification system by image mining algorithm is presented in [3]. Gray Level Co-occurrence Matrix (GLCM) based features are extracted. A hybrid approach based on SVM with Radial Basis kernel Function (RBF) and K-Nearest Neighbor (KNN) is used for classification. A technique for the detection of brain tumor is discussed in [4] using SVM classifier. The pre-processing step includes noise removal, gray level conversion of brain images and edge detection. Then, SVM classifier is used to find the tumor segmented area.

A comparative study between SVM and Artificial Neural Network (ANN) classifier for brain image classification is discussed in [5]. Initially, features of brain images are extracted by GLCM. Then, SVM and ANN classifier are used for the classification. Brain tumor detection using SVM classifier is discussed in [6]. At first, MRI brain images are pre-processed to remove noises. Then, the features are extracted from k-means clustering and fuzzy c-means clustering approaches. Finally, SVM is used for classification.

The hybrid classifier approach using SVM and KNN classifier is discussed in [7] for brain cancer classification. The preprocessing step involves the conversion of an image to grayscale and noise removal. Then the features are extracted and a hybrid classifier based on SVM and KNN are used for the classification. The primary approach for robust classification of brain tumor using KNN and SVM is discussed in [8]. At first, preprocessing stage is used for noise removal. Texture and intensity based features are extracted from the brain images. Then, the feature space is reduced by applying principal component analysis. Finally, the classification is made by SVM classifier.

Brain image classification by SVM with RBF is discussed in [9]. The input brain images are decomposed by the Discrete Wavelet Transform (DWT). Then, kernel Principal Component Analysis (PCA) is used to reduce the wavelet features. The brain tumor classification using Meta heuristic method and SVM is discussed in [10]. Features of MRI brain images are extracted by GLCM, and the dominant features are selected by simulated annealing. Then SVM classifier is used.

SVM and KNN based MRI brain image classification is discussed in [11]. Initially, the preprocessing step is applied for MRI brain images to remove noise. The texture, color and shape are used as features. Then, classification is made by SVM classifier. Segmentation and classification of brain tumor using DWT, GLCM and gabour wavelet are discussed in [12]. At first, the preprocessing is made by ostu's thresholding for noise removal. DWT features, gabour features and GLCM features are extracted, and PCA is used to reduce the feature space. Finally, SVM classifier is used for classification.

In this paper, an efficient method is presented for MRI brain image classification using DTMWT and SVM classifier. The paper is organized as follows: Section 2 describes the materials and methods of the MRI brain classification system. Section 3 gives the performance of the MRI brain classification system in terms of classification accuracy. The last section concludes the MRI brain image classification system.

Materials and Method

Classification of MRI brain images using DTMWT and SVM classifier is presented. It consists of DTMWT decomposition, feature selection and classification stages. In the feature extraction stage, MRI brain images are decomposed by DTMWT which produces low and high-frequency subbands. The subband coefficients are selected using t-test for the classification.

DTMWT Decomposition

Let us consider, the one-dimensional image belongs to the space as $P^2(K)$. The multiresolution M-band is defined by one scaling function $\psi_0 \in P^2(K)$ and *(M-1)* mother wavelets $\Psi_m \in P^2(K), m \in \{1,.....M-1\}$. The wavelets are obtained by one-dimensional dual tree decomposition by two-dimensional separable methods. In two-dimensional wavelet decomposition the two bases are used in $P^2(K^2)$ for the corresponding 2D separable wavelets from the dual wavelet basis functions. DTMWT is used in many pattern recognition approaches such as microarray data analysis [13] and person recognition [14].

The MRI brain images are decomposed by DTMWT. It produces lower and higher frequency subbands. As the dimension of DTMWT sub-bands is very high, feature selection approach is employed to reduce the feature space.

Feature Selection

From the DTMWT sub-band coefficients, informative coefficients are selected by a statistical approach named t-test. According to the rank of the features, DTMWT coefficients are selected. From the vast number of DTMWT coefficients, the first 25 top-ranked coefficients are selected to evaluate the system. Similarly, 50 and 75 top ranked coefficients are selected for further evaluation.

SVM Classification

SVM classifier is an effective machine learning algorithm. It is used in many classification systems such as ECG classification [15] and glaucoma classification [16]. SVM classification is based on the kernels and constructs the hyperplane between the two classes for the purpose of the classification. SVM training includes convex quadratic optimization. The solutions are unique and global. The convergence of other learning algorithms is avoided. Let the training set of image in class A be $\{A_1, A_2, A_3, ...A_n\}$, where $A \subset R^n$ the mapping function is ψ then $\psi : A \to F$ is the feature space. The equation is:

$$\min\left[\frac{1}{2}\|A\|^2 + \frac{1}{\nu}\sum_{n=1}^{l}\xi_k - p\right] \quad (1)$$

where $A.\Psi \geq p - \xi$, let $k = 1, 2, ...n$ and $\xi_k \geq 0$ .The ξ be the slack variable, p is the bias and k is the number of samples. In this study, SVM classifier performs the operation with the selected DTMWT coefficients and produces the output classification whether the given image is normal or abnormal.

Results and Discussion

A set of 50 brain images for both normal and abnormal categories are selected from the REMBRANDT

database [17-18] for performance evaluation. The size of images is 256x256 pixels. Figure 1 shows the brain images of abnormal and normal categories.

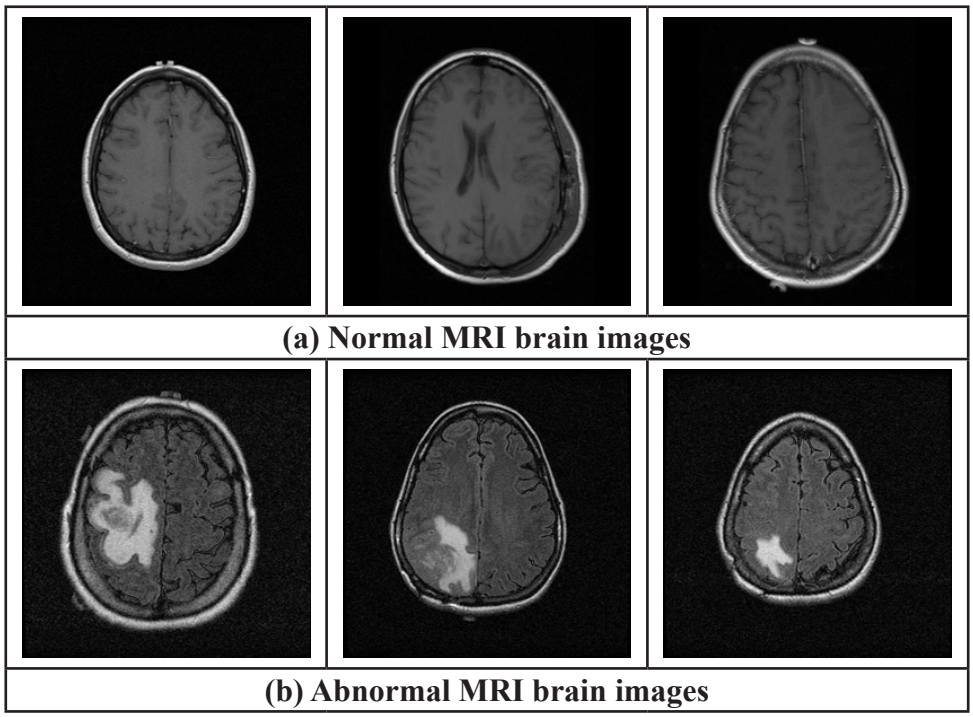

Figure 1 Sample normal and abnormal MRI brain images

Table 1 shows the obtained classification accuracy (Acc), Sensitivity (Sens) and Specificity (Spec) by the selected DTMWT coefficients (25-coefficients, 50-coefficients, 75-coefficients) using SVM classifier at 1 to 5 levels of DTMWT.

Table 1 Classification accuracies by the selected DTMWT coefficients using SVM classifier at 5 levels

Level	25-Coefficients			50-coefficients			75-Coefficients		
	Acc (%)	Sens (%)	Spec (%)	Acc (%)	Sens (%)	Spec (%)	Acc (%)	Sens (%)	Spec (%)
1	53.5	97	100	68	96	40	77	94	60
2	84.5	92	77	84.5	97	72	85	95	75
3	74	99	49	76.5	98	55	77	95	59
4	68	98	38	70	96	44	85.5	91	80
5	78.5	94	63	60.5	98	23	86	93	79

From Table 1 it is observed that the feature set which contains 75-coefficients produces the highest accuracy of 86% at 5th level of DTMWT decomposition. Also, it is observed that the other feature sets (50 and 75 coefficients) produce 84.5%. It is also observed that sensitivity is 99% at 25-coefficient in 3rd level of DTMWT decomposition, specificity is 100% in 25-coefficients at 1st level of DTMWT decomposition.

It is observed from the above confusion matrix that among 100 abnormal images, 93 images are correctly classified while using 75-coefficients extracted at 5th level of DTMWT decomposition. Also, it is noted that maximum area of the ROC curve in Figure 2 is 0.86. Table 2 shows the comparative analysis with different classifiers using DTMWT decomposition at 5 levels.

Table 2 Comparative analysis with different classifier using DTMWT decomposition at 5 levels

DTMWT Levels	Accuracy (%)		
	KNN	Naïve Bayes	SVM
1	70	72	77
2	81	83	85
3	72	74	77
4	79	81	86
5	82	84	86

It is observed from the Table 2 that the maximum accuracy of 86% is obtained by SVM classifier whereas Naïve Bayes and KNN provide 84% and 82% respectively.

Conclusion

An efficient method is presented in this paper for MRI brain image classification. It uses DTMWT algorithm for feature extraction and SVM for classification. According to the rank of the features by t-test, 25-coefficients, 50-coefficients, 75-coefficients are selected as features from the DTMWT sub-band coefficients. These selected coefficients are the input for the classification. SVM classifier is applied for the selected features at 1 to 5 levels of DTMWT decomposition. Results show that the feature set with 75-coefficients produces better classification accuracy when compared with other feature sets.

Determinants of Self-Medication Practices in Urban Area of Kancheepuram District, Tamil Nadu

P. Mohan Kumar[1], Savitha A K[1], S. Suthanthira Kannan[1]

[1]Assistant Professor, Dept. of Community Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

The idea of self-prescription has increased all inclusive acknowledgment as it urges a person to treat minor disease with successful and straightforward cures . It is even elevated in order to have self-confidence in preventive, therapeudic and rehabilitative consideration. Self-medicine can conceivably progress nicely and furthermore hurt the individuals. This is particularly huge in those nations where physician recommended medications are accessible over-the-counter (OTC) because of absence of requirement of guidelines . An enhanced danger of intensifying of existing ailment pathology just as danger of collaborations between doctor prescribed prescription and concealed dynamic elements of OTC medications are constantly present with self-medicine.

***Keywords**: medication, OTC, urban*

Introduction

Self-medicine or non-solution of medication is a person's therapeutic conduct towards self-care that can do potential health and furthermore be harmful1.The utilization of meds without earlier restorative meeting in regards to sign, measurement, and span of treatment is alluded to as self-drug. In the greater part of the ailment scenes; selfmedication is the primary alternative which makes it a typical practice worldwide[1].

In the course of recent years there has been a push-back against the paternalistic model of wellbeing, towards a more individual driven methodology including self-care and capable self-prescription with nonprescription (or over-the-counter, OTC) medications. Dependable utilization of self-care items includes utilizing the correct item for the correct sign (ailment) at the opportune time and in the correct manner. This incorporates both self-prescription utilizing self-care items for treating regular medical issues and the utilization of self-care items to help lessen the danger of ailment. Self-drug is a generally drilled part of self-care. The test and open door for government specialists, human services experts and suppliers of self-medicine items is to have a suitable system set up for capable self-medication[2].

The idea of self-prescription has increased all inclusive acknowledgment as it urges a person to treat minor disease with successful and straightforward cures . It is even elevated in order to have self-confidence in preventive, therapeudic and rehabilitative consideration. Self-medicine can conceivably progress nicely and furthermore hurt the individuals. This is particularly huge in those nations where physician recommended medications are accessible over-the-counter (OTC) because of absence of requirement of guidelines . An enhanced danger of intensifying of existing ailment pathology just as danger of collaborations between doctor prescribed prescription and concealed dynamic elements of OTC medications are constantly present with self-medicine[3]

In the creating nations like Pakistan, India, Bangladesh and Nepal, the pace of self-drug is high. Over half individuals are ingesting medications without a specialist's recommendation. So as to handle this

issue, the administrations of all the creating nations have proclaimed rules to avert self prescription . Every single medication that is enrolled to the concerned medication specialists must be carefully checked available to be purchased and solution. Wellbeing division and medication administrative authority ought to pursue the WHO rules for medication medicine and dispensing[9].

In view of this foundation, the present examination was completed to discover the Determinants of Self prescription in Urban region of Kancheepuram region in TamilNadu.

Materials & Method

Study Area:

The study was conducted in **Anakaputhur,** anUrban field practice area of Sree Balaji Medical College and Hospital in Kancheepuram district, Tamil Nadu.

Study design:

A Community based cross sectional descriptive study

Study Period:

The study was conducted between June 2017 to May 2018.

Study Participants:

According to the 2011 census, Anakaputhur urban field practice area had a total population of 48,050 of which 24,158 were males , 23,892 were females . Total number of houses in Anakaputhur is 12,146. The study was done among adolescent and adults 15 years and above residing in the study area permanently at the time of the study.

Inclusion criteria:

All participants who were 15 years and above[3] and willing to participate in the study were selected

Exclusion criteria:

Those who were not willing to participate in the study were excluded.

Psychiatric patients,pregnent mother,severly ill patients were excluded from the study.

Study area:

Kancheepuram locale is one among the 32 areas of Tamil Nadu. As indicated by the enumeration of India 2011,Kancheepuram region covers a territory of 4433sq. km with a populace of 39.98 lakhs involving 20.12 lakhs guys and 19.8 lakhs females. Kancheepuram, the sanctuary town is the central station of the region for regulatory reasons, the area has been separated into 4 income divisions including 11 taluks with 1137 income towns.

Anakaputhur is a Municipality city in the area of Kancheepuram, Tamil Nadu. It is isolated into 18 wards for which races are held like clockwork. The examination was directed in Anakaputhur which is the urban field practice territory of Department of Community Medicine of Sree Balaji Medical College and Hospital (SBMCH), situated a ways off of 7 kilometers from the foundation with a zone covering around 16 sq. Kilometers.

Sample size:

Sample size was calculated based on the study done by " Pushpa R Wijesinghe" in the year 2013 in Sri lanka which recorded the prevalence of self medication practice of 34%.[4] Using this study prevalence as reference the sample size was calculated by using $4pq / [L]^2$formula

Adding 10% refusal rate the sample size obtained is 394 which is rounded up to 400. The sample collected during the study period was 424.

Sampling method:

Anakaputhur had a total population of 48,050 as per 2011 census. As per the data available in the UHTC register There were total of eighteen wards in Anakaputhur. The number of households 12146. The sampling technique followed for this study was systematic random sampling technique.

K = sample size in our study

N = Total no of households = 12146

n = sample size = 424

$K = N / n = 12146 / 424 = 28^{th}$. Every 28^{th} house were selected.

The name and address of the person was noted and was visited for the data collection. If the person

corresponding to the number did not give informed consent or absent ,the next number was chosen and the next person was selected and interviewed. Likewise, 424 participants who gave informed consent and willingly participated in the study were identified.

Study tools:

A pre-tested structured questionnaire was used as a study tool to interview the study participants. The questionnaire was prepared in English and Tamil. It was conducted by face to face interview by the investigator himself and the responses were recorded in the questionnaire. The questionnaire consisted of 6 sections relating to the details like socio-demographic characteristics, personal history and self-medication details

Ethical approval:

The study was approved by Institutional Ethical Review Committee of Sree Balaji Medical college and hospital , Chennai .

Informed consent:

The details and purpose of the study and the confidentiality of their identity were explained to each and every participant those who were willing to participate in the study were required to sign the informed consent, after which they were included in the study . the informed consent was in Tamil ,the local language of the study participants.

Statistical Analysis:

Data entry was done and analysed using SPSS software version 22

	Christian	32	7.5
	Muslim	24	5.7

Age distribution:

The current study involves 424 study populations. In this study majority of the participant were female 66% (n=280) and 34% (n=144) of them were male. The study population belong to the age group of 20 to 70 years. About 21.7% (n=92) of them were between 31-40 years, 19.8 % (n=84)of them 51-60 years and 19.3% (n=82) of them belonged to 61-70 years. A minimum of 2.4% (n=10) of the population below 20 years and 4.7%(n=20) of them were above70 years of age.

Majority66% (n=280) of the study population were female and 34% (n=144) of them were male .Majority 45.3%(n=192) of them have completed primary school education , 33% (n= 170) of them were illiterate, 13.2% (n=56) have completed higher secondary education and 8.5% (n=36) have completed secondary school education. Majority of the study population 40.1% (n=170) was a home maker. 33.5%(n=142) of them was semiskilled worker. 9% (n=38) was skilled worker, 7.1% (n=30) was unemployed. A minimum of 4.2% (n=18) was professional by occupation.

Majority of the study population 45.8% (n=194) belonged to middle class. About 29.7% (n=126) Of them were upper middle class. About 19.3% (n=82) of them belonged to lower middle class. A minimal study population 1.4% (n=6) belonged to lower middle class.

About 96.2% (n=408) of the study population were married and a remaining of 3.8% (n=16) were unmarried. Majority 79.2% (n=336)of the study population the family had 4 members and below. About 20.8% (n=88) of them had more than 4 members in the family. Majority 86.8% (n=368) of the study population belonged to Hindu religion. About 7.5% (n=32) of them belonged to Christian and remaining 5.7% (n=24) of them belonged to Muslim religion.

Table2: **Prevalence of self-medication among the study participants**

Sl.no	Variables	Frequency N=424	Percentage %
3	TREATMENT FOR ILLNESS		
	Home remedy	24	5.7
	Sought medical care	146	34.4
	Self-medication	254	59.9

Among the study population majority 59.9% (n=254) of the study population followed over the counter medication for their treatment remedy.

Table 3: **Association between socio-demographic character and Self Medication**

(p value <0.05 significant at 95% CI)

Table 3 shows that there is an association present between age groups and self medication were the p value is 0.035. There is an association present between occupation and subjects on self medication p=0.001. An association present between education and self medication, per capita income and self medication and marital status and self medication with a p value 0.000. No statistical significant association was found between other factors like tobacco use and alcohol use with self medication.

Discussion

The present study is a cross sectional study , carried out in an urban field practicing area (Anakaputhur) of

Sree Balaji Medical college and hospital, Kanchepuram district Tamil Nadu to determine the prevalence of self medication among people residing in an urban community. The current study shows a maximum participant were female 66% and remaining 34% were male. This is similar to a study done by Kalaivani Annadurai et al. Nellikuppam Village, Kancheepuram District, Tamil Nadu (2017) where 73.13% of the participants where female . Saba HI et al. Bengaluru, Karnataka,2016 67.64% .

The current study shows a positive association between age and self medication practice (p=0.035) similar to Osemene & Lamikanra (p= 0.001)

A positive association present between education and self medication practice (p=0.000), similar to a study done by Xiaosheng HYPERLINK "https://www.ncbi.nlm.nih.gov/pubmed/?term=Lei%20X%5BAuthor%5D&cauthor=true&cauthor_uid=29300318" Lei[5] (p=o.o4), Naz Mohammed Ahmed (p=0.001)

A positive association present between occupation and self medication (p=0.001), similar to a study done by KalaiselviHYPERLINK "https://www.ncbi.nlm.nih.gov/pubmed/?term=Selvaraj%20K%5BAuthor%5D&cauthor=true&cauthor_uid=24551585" Selvaraj[6](p=0.003)

A positive association present between socio economic class and self medication (p=0.000), similar to study done by Naz Mohammed Ahmed (p= 0.004)

A positive association present between marital status and self medication practice (p=0.000)

Conclusion

Due to lack of information self medication can cause hazardous effects such as antibiotic resistance, skin problem, hypersensitivity and allergy. Hence, developing country like India where we have poor economic status, education status as well as poor health care facilities.The People have less knowledge[7] regarding risks associated with their self-medication. We are on the edge of sword whether to promote self-medication or not. Hence it is recommended that holistic approach should be taken to prevent this problem, which includes proper awareness and education regarding the self-medication and strictness regarding pharmaceutical advertising. Dispensing modes in the needs to be improved through proper education, strict regulatory and managerial strategies to make health care easily accessible and cost-effective.

A Study on Clinical Features and Dermatopathology of Palmar Lesions

Pappuri Keerthana Bhaskar[1], Jayakar Thomas[2]

[1]PG Student, [2]Professor and HOD, Dept. of DVL, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Palmar lesions may occur alone or along with involvement of soles and other areas. The most common conditions of palmar lesions are Psoriasis, Eczema, Dermatophytosis, Verruca vulgaris, Syphilis and Seasonal exfoliation. Other conditions over the palms include Druginduced, Callosities, Keratoderma and Heloma.Skin biopsies were obtained from the enrolled patients. We examined H&E-stained sections of the skinbiopsies of palmar lesions to observe the histopathologicalstudy where it was seen that in the active lesions, Parakeratosis was more uniform,Munromicroabscesses were larger and more numerous which concludes that psoriasis is the commonest palmar lesion.we conclude that the commonest palmar lesion is Psoriasis over the palms and Dermatopathology has a verysignificant role in concluding the diagnosis and Clinicopathological correlation is always the best to aid in the finaldiagnosis which helps in the proper and further managementof the patient.

Objectives: The aim of the study is to conclude the observational study of clinical and histopathological findings in 100 patients with palmar lesions attending dermatology department at Sree Balaji Medical College and Hospital .[5]

Place of Study: Skin OPD, Sree Balaji medical college and hospital, Chennai.

Study Design: Observational study. [8]

Key words: *palmar lesions, histopathology, psoriasis vulgaris*

Introduction

Palmar lesions may occur alone or along withinvolvement of soles and other areas. The most commonconditions of palmar lesions are Psoriasis, Eczema,Dermatophytosis,Verruca vulgaris, Syphilis and Seasonal exfoliation. Other conditions over the palms include Druginduced, Callosities, Keratoderma and Heloma. Skin biopsies were obtained from the enrolled patients. We examinedH&E-stained sections of the skinbiopsies of palmar lesions to observe the histopathological study.[1]

Corresponding Author:
Dr. Jayakar Thomas
Dept. of DVL, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai - 73, Email: jayakarthomas@gmail.com, Mob. No: 9841038484

Findings

Primary palmar lesions

Primary skin lesions of palms commonly seen aremacules, plaques, patch, nodule, vesicle, wheals, pustules and bulla.[2]

Secondary palmar lesions:

It is mainly "Palmar erythema" which is a symptom of many different conditions. Its appearance is often the firstsign of an underlying medical concern. About 23 percent ofpeople who have cirrhosis of the liver also experiencepalmar erythema.[4] The disparity between the present study and recognized histopathological features in a well developed lesion of psoriasis (i.e. absenceof uniform parakeratosis, presence of normal stratum granulosum and normal thickness of suprapapillary plate insome specimens and lower incidence of

Munromicroabscesses) can be explained on the basis ofbiopsies of patients from different lesions. Therefore, in our study, a skin biopsy isperfomed owing to different palmar lesions for histopathological examination, inorder to get a properdiagnosis, to know the most common palmar lesionand also to correlate clinically for better treatment.[3]

Conclusion

In our study we concluded that,

1. The commonest palmar lesion observed was PsoriasisVulgaris.

2. Histopathology was really useful in our studies to aidin the final diagnosis.

3. The authors hypothesized that the nonspecifichistologic findings could represent both a samplingerror on the part of the clinician taking the biopsy, inparticular, choosing excoriated lesions that correspondto a later stage of the disease, or the pathology, in sampling the lesion for histology,considering appropriate a progressive cutting of thetissue block.

4. Male preponderance with psoriasis Vulgaris was seenas the highest number among palmar lesions and alsoproven through histopathology.[6]

5. Most commonly affected age group was middle age.

6. We also had a few cases where the histopathologyfindings were different from the clinical diagnosis.Most of the confusion arised between eczema andpsoriasis where biopsy was done for histopathological examination to conclude the final diagnosis.

Thus we conclude that the commonest palmar lesion isPsoriasis over the palms and Dermatopathology has a very significant role in concluding the diagnosis and Clinico pathological correlation is always the best to aid in the finaldiagnosis which helps in the proper and further management of the patient.[7]

Common Dermatoses with Palmar Lesions

Pappuri Keerthana Bhaskar[1], Jayakar Thomas[2]

[1]PG Student, [2]Professor and HOD Dept. of DVL, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Palmar lesions may occur alone or along with involvement of soles and other areas. The most common conditions of palmar lesions are Psoriasis, Eczema, Dermatophytosis, Verruca vulgaris, Syphilis and Seasonal exfoliation. Other conditions over the palms include Drug induced, Callosities, Keratoderma and Heloma. Skin biopsies were obtained from the enrolled patients. We examined H&E-stained sections of the skin biopsies of palmar lesions to observe the histopathological study where it was seen that in the active lesions, parakeratosis was more uniform, Munromicroabscesses were larger and more numerous which concludes that psoriasis is the commonest palmar lesion.

Objectives: The aim of the study is to to observe clinical and histopathological findings in 100 patients with palmar lesions attending dermatology department at Sree Balaji Medical College and Hospital .[2]

Place of Study: Skin OPD, Sree balaji medical college and hospital Chennai.

Study Design: Observational study.

Materials and Method: This observational and histopathological study was carried out at Department of Dermatology, Skin Outpatient, of Department Sree Balaji Medical College and Hospital Medical Science and Research Centre, Chennai. The study included 100 palmar lesions of various patients, attending OPD of Sree Balaji Medical College and Hospital Medical Science and Research Centre, Chennai . Diagnosis of various palmar lesions was made after history taking and detailed clinical examination.[7]

Key words: *common palmar dermatoses, dermatopatghology,psoriasis*

Introduction

Palmar lesions may occur alone or along with involvement of soles and other areas. The most common conditions of palmar lesions are Psoriasis, Eczema,Dermatophytosis, Verruca vulgaris, Syphilis and Seasonal exfoliation. Other conditions over the palms include Drug induced, Callosities, Keratoderma and Heloma. Skin biopsies were obtained from the enrolled patients. We examined H&E-stained sections of the skin biopsies of palmar lesions to observe the histopathological study. [3]

Primary palmar lesions:

Primary skin lesions of palms commonly seen are macules, plaques, patch, nodule, vesicle, wheals, pustule and bulla.[8]

Secondary palmar lesions:

It is mainly "Palmar er ythema" whic h is a symptom of many different conditions. Its appearance is often the first sign of an underlying medical concern. About 23 percent of people who have cirrhosis of the liver also experiencepalmar erythema.[1]

Other possibilities includes:

- Skin conditions, such as atopic dermatitis, eczema, and psoriasis.
- Viral or bacterial infections, such as Rocky Mountain spotted fever, coxsackievirus (hand, foot, and mouth disease), and syphilis.
- Chronic Obstructive Pulmonary Disease, Pregnancy.

- Brain Tumors that are malignant or have metastasized.

Findings

Symptoms of palmar lesion:

1. General ised redness of the palms.

2. Itching.

3. Increased sweating.

4. Warmth in the palmar region.

5. Inflammation of the skin without pain or itching.

6. Blanching and mottl ing.

Therefore, in our study, a skin biopsy is perfomed owing to different palmar lesions for

histopathological examination, inorder to get a proper diagnosis, to know the most common palmar lesion and also to correlate clinically for better treatment.5

Conclusion

Subtle clinical differences exist between palmar lesions, which needs to be picked up by keen observation and histopathological examination. This helps us to arrive at the diagnosis. In our dermatopathological study, it was seen that in the active lesions, parakeratosis was more uniform,.Munromicroabscesses were larger and more numerous which concludes that psoriasis is the commonest palmar lesion.[7]

A Comparitive Study of Serum Zinc Level in Male and Female of Febrile Seizure Patients

Dunnuthala Sreenivasulu Reddy[1], P. John Solomon[2]

[1]PG Student, [2]Professor, Dept. of Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

A seizure is a temporary occurrence of signs and manifestations coming about because of strange over the top neuronal movement in the cerebrum. Roughly 30% of patients who have a first afebrile seizure later epilepsy(1).Febrile seizure are the most widely recognized type of seizures, it is 2 creases most regular in young men than in young ladies. The system of febrile seizure have multi factorial etiology, febrile seizure happens with fever (temperature>380C) and without side effects of CNS diseases. Anyway , now and again these seizure connote major basic fiery, or metabolic disarranges of the cerebrum, for example, meningitis, encephalitis, intense stroke, or mind tumor.

Objective: Febrile seizures are the most well-known sort of seizures saw in the pediatric age bunch . looking at the examination among male and female of the kid with basic febrile seizure.

Aim: The point of the present forthcoming , case-control study was to decide if there was any adjustments in serum zinc level in male and female kids with febrile spasm.

Method: Hundred youngsters matured a half year to 5 years were separated into two gatherings: bunch A, 50 male kids with febrile seizure, and gathering B, 50 female kids with febrile spasm.

Serum zinc levels for the two gatherings were assessed by nuclear ingestion spectrophotometry(AAS). The information were dissected to look at zinc level among the two gatherings utilizing suitable measurable instruments utilizing SPSS 13

Findings: serum zinc level in febrile seizure of boys children were 54% effected and girl children were 46% effected. Mean value in male children was 68.92mcg/dl, and female children was 69.03 mcg/dl . Serum zinc level of group A & group are statistically not significant.

Conclusion: Among children with febrile convulsions 46% were females 54% were males. Male children are slightly higher than girls.

***Key words**: Serum Zinc, Febrile children, Male children, Female children .*

Introduction

A seizure is a temporary occurrence of signs and manifestations coming about because of strange over the top neuronal movement in the cerebrum. Roughly 30% of patients who have a first afebrile seizure later epilepsy(1).Febrile seizure are the most widely recognized type of seizures, it is 2 creases most regular in young men than in young ladies. The system of febrile seizure have multi factorial etiology, febrile seizure happens with fever (temperature>380C) and without side effects of CNS diseases. Anyway , now and again these seizure connote major basic fiery, or metabolic disarranges of the cerebrum, for example,

Mob.No: 9444610092

meningitis, encephalitis, intense stroke, or mind tumor. A ridiculous seizure is one that isn't an intense symptomatic seizure. Remote symptomatic seizure is one that is viewed as auxiliary to removed cerebrum damage, for example, old stroke. Reflex seizures are generally encouraged by a tactile upgrade such as glimmering lights.Infants and youngsters have more opportunity to have seizures than grown-ups. This mirrors the more prominent neuronal volatility at specific ages as the excitatory glutamate framework and inhibitory GABA framework don't generally adjust one another. This outcomes in a propensity to display symptomatic seizures identified with high fever, contaminations, minor asphyxia, medicine, microbes poisons and biochemical aggravations like hyponatremia, hypernatremia, hypocalcemia etc.(1)

Materials & Method

Febrile seizure happens in 3% to 5% of paediatric age group from 6 months to 5 years [(2).] The most incidence occurs at 18 months of age and low incidences after 6 months of age or after 3 years of age. Febrile seizures arepredominantly generalized and convulsive nature, even though roughly 5% of cases have non convulsive character with cyanosis and unconsciousness [(3)]. It is most commonly seen in the Asian population , out of which Indian children contributes about 5% to 10% of total paediatric population. Febrile seizure incidence peaks by November-January , equivalent to the high incidence of viral upper respiratory infection (URI) and the next peak of incidence is during the 6^{Th} to 8^{th} month(June to August) of the year, when common viral gastrointestinal illnesses occur.[(4)]

Age of Onset

The beginning of febrile seizures for the most part pursues a chime molded example. 94% happen inside the initial 3 years old and 6% following 3 years old. Around one half shows up during second year of existence with pinnacle rate between 18-24 months. Regardless of whether Febrile seizures exist before a half year of age may expand the odds of genuine contaminations like bacterial meningitis. Febrile seizure after 5years of age ought to be overseen mindfully on the grounds that generous causes are less regular in more seasoned youngsters.

Sources of zinc [(5)]

Zinc substance of nourishment fluctuates broadly. Generally excellent wellsprings of zinc are red meat and ocean nourishments. Other great creature sources are poultry, pork and dairy items. Entire grains what's more, vegetables speak to great plant wellsprings of zinc. Poor zinc sources are leafy foods refined grains.

Febrile Seizures-Morbidity And Mortality

The mortality related with febrile seizure is amazingly low. No passings were accounted for from the National Collaborative Perinatal Project(29) or on the other hand the British Cohort Study (30). These ventures couldn't discover any proof of perpetual engine deficiencies after febrile seizures. A ongoing investigation from Taiwan (31) notwithstanding looking at insight and conduct, additionally found no distinction in memory between kids with febrile seizures including complex seizure. These investigations recommend safeguarding of memory is because of limbic inception of febrile seizure.

Method

Hundred kids matured a half year to 5 years were isolated into two gatherings: bunch A, 50 male kids with febrile spasm, and gathering B, 50 female youngsters with febrile seizure. All patients in febrile seizure gathering (first episode of single summed up febrile seizure enduring for < 15 minutes and fever gathering were experiencing viral disease

Youngsters who had mental impediment, atypical spasm, central seizure, interminable maladies, hunger, focal sensory system contamination, pneumonia, urinary tract disease, and other bacterial contaminations, the runs, hemolysis or nearby contamination were barred from study. one milliliter of fringe blood was gathered in an acid-propylene tube inside 12 hours after admission to medical clinic. All examples were centrifuged and serum was safeguarded in -80°c. serum zinc was assessed by nuclear retention spectrophotometry in cell, atomic research focus associated to the staff of essential sciences. the task was endorsed by the logical warning and moral board of trustees . Composed educated assent structures were marked by the guardians before incorporating the kids in the investigation. Serum zinc levels for the two gatherings were assessed by nuclear retention spectrophotometry(AAS). The information

were investigated to think about zinc level among the two gatherings utilizing proper measurable devices utilizing SPSS 13

Table 1: Demographic data and serum zinc level in febrile seizure children in comparison with male and female groups

Groups	% of effected children	mean (sd) serum zinc level (mcg/dl)
Febrile convulsion in Males	54	68.92
Febrile convulsion in Females	46	69.03

Findings

Demographic data is shown in table 1.

Percentage of boys are effected were 54%

The mean serum zinc level in male children with febrile convulsion was 68.92 mcg/dl.

The mean serum zinc level in female children with febrile convulsion was 81.03 mcg/dl.

Reagents

1.Glycerol Diluent: 50ml of reagent grade glycerol was diluted to 1000 ml with deionised water.

2. Standard Solution of Zinc: Zinc metal 0.5g exactly was dissolved in minimal volume of (1+1) Hcl. Then the solution was diluted to 1 litre with 1% Hcl with concentration of 500µg/ml.

3. Working standard of zinc: 80µl of stock solution was diluted to100 ml of deionised water.

4. Sample preparation: Serum sample was diluted 10 times with deionised water and analysed.

Discussion

- The serum zinc level was significantly lower in patients who suffered from simple febrile seizure .compared to patients who had normal children.
- The mean serum zinc levels were 68.92 mcg/dl, 69.03 mcg/dl in children with febrile convulsion and febrile children..
- Serum zinc level in febrile seizure of boys children were 54% effected and girl children were 46% effected. Serum zinc level of group A & group B were statistically not significant.
- Zinc, as a major element of some enzymes, has an important role in some tissues like central nervous system and can affect some inhibitory mechanisms of CNS (8).

Conclusion

- Lower serum zinc levels can predispose children aged 6 months to 6 years to simple febrile seizure.
- Among children with febrile convulsions 46% were females 54% were males. Male children are slightly higher than girls.

Ethical Clearance- No ethical clearance was necessary for this research work

A Prognostic Study of Diagnostic Laparoscopy in Chronic Abdominal Pain at SBMCH

A.Muzamil Ahmed[1], Chinni Vikram[1], R.G.Santhaseelan[2]

[1,]PG Student,[2]Professor, Dept. of General Surgery, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Diagnostic laparoscopy likewise causes the specialist to choose whether any careful administration is obligatory and furthermore to evoke the indications of inoperability if there should arise an occurrence of dispersed illnesses, for example, progressed malignancy, tuberculosisetc in which the prodromal side effects might be interminable stomach torment.

This investigation is for the most part intended to feature the criticalness of laparoscopy in diagnosing the etiology of ceaseless stomach torment , sway on the treatment and on post-usable pain relief. It additionally communicates indicative and remedial estimation of laparoscopy in ceaseless stomach torment which is a most incapacitating ailment.

Keywords: *Laproscopy, ailments,diagnosis*

Introduction

Incessant stomach torment is a typical protest which is hard to oversee by both doctor and specialist. It is the fourth regular reason for constant torment disorder by and large populace. worldwide. Although patients with ceaseless guts torment experience various clinical and radiological demonstrative stir up, distinct finding still stays a test to the surgeon. [1]This influences the patients both physically and mentally. With the presentation of the symptomatic laparoscopy new instruments has been added as far as anyone is concerned. Laparoscopy can recognize strange discoveries and improve result in lion's share of the patients with incessant stomach pain. Diagnostic laparoscopy likewise causes the specialist to choose whether any careful administration is obligatory and furthermore to evoke the indications of inoperability if there should arise an occurrence of dispersed illnesses, for example, progressed malignancy,tuberculosisetc in which the prodromal side effects might be interminable stomach torment.[2]

This investigation is for the most part intended to feature the criticalness of laparoscopy in diagnosing the etiology of ceaseless stomach torment , sway on the treatment and on post-usable painrelief. It additionally communicates indicative and remedial estimation of laparoscopy in ceaseless stomach torment which is a most incapacitating ailment.[3]

Aims & Objectives

- To correlate the laparoscopic findings with clinical and radiographic findings in all patients with chronic non-specific abdominal pain.
- Tofindthe various unrevealed aetiology for chronic abdominal pain.
- To assess the extent of the disease
- To analyse the accuracy and efficacy of diagnostic laparoscopy in chronic abdominal pain.

Materials & Method

This investigation was led in patients gave stomach torment over 3 months whose conclusion was far fetched

or couldn't be made by our directing physical, research center and imagingmodalities.[4]

Between MARCH 2017 and OCTOBER 2018, an all out number of 105 back to back patients with ceaseless stomach torment were taken a crack at this planned engaging cross-sectional investigation.

They were enrolled from the outpatient facility of General Surgery Department in SreeBalajiMedical College& Hospital, Chennai in the above said study period.

Inclusion criteria

- Age between 15 and65
- Both males andfemales
- Abdominal pain more than 3months

Exclusion criteria

- Known abdominal malignancypatient
- Known psychiatricpatient

Observation & Results

Findings	Percentage
Thickened appendix	44 (42%)
Adhesions	22 (21%)
Enlarge mesentric nodes	14 (13%)
Ovarian cyst	9(8%)
Koch's abdomen	3(3%)
Neoplasia	3 (3%)
Hernia	3 (3%)
Others	3(3%)
No abnoramality	4 (4%)

Findings

We found that appendicular pathology is the leading cause for chronic abdominal pain of unrevealed etiology and it is about 42%, followed by adhesions in about21%.[1]

Laparoscopic appendicectomy was done in all the patients with appendicular pathology like inflamed, thickened appendix and localized adhesion with caceum and abdominal wall. All the histopathological reports of appendix specimen showed chronic inflammation.

Post operatively they recovered without any complication and all of them were pain free in the follow up of 1 month.

Adhesion was found in 21% (n=22) , out of that 22 patients 13 patients had the history of previous surgery. Seven patients underwent LSCS(pfannensteel scar) and other 6 had omental adhesions in midline scar. Omentum was adherent to the anterior abdominal wall in the scar region.Laparoscopic adhesiolysis was performed in all patients successfully.[3]

Other 9 patients who didn't have the history of surgery, had the adhesion of omentum to the anterior abdominal wall with interbowel loop adhesions, laparoscopic adhesiolysis was done in that patients successfully.Koch's abdomen was diagnosed in 3% (n=3). Intra operative findings were multiple tubercles over the peritoneum, bowel and omentum. In one case we found that flimsy adhesion between the bowel loops and anterior abdominal wall. In all three cases minimal ascitic fluid was present. Omental and peritoneal biopsy

was taken, ascitic fluid was also sent for biochemical analysis. The results confirm the tuberculous abdomen. They all were started anti tuberculous drug post operatively.Malignancy was diagnosed in (n=3) 3% of the patient. One patient had ileo-caecal junction growth and laparoscopic right hemicolectomy was performed. Adnexal mass was found in two patients and hence salphingo-oopherectomy was performed in those two patients.3% (n=3) of the patients had ventral hernia and underwent hernioplasty . All three patients had small defect in the paraumbical region with omentum adherent to it. Mesh repair was done in all the three cases.

Mean operating time for diagnostic laparoscopy alone is 30 minutes but it combined with therapeutic procedures it was 70 + 30 minutes

Conclusion

Appendicular pathology was the common cause of diagnostic laparoscopy in our local general populationThe role of diagnostic laparoscopy in chronic abdominal pain is tremendous which increases our knowledge about various underlying abdominal disorders[1].Diagnostic laparoscopy can identify abnormal findings and improve the outcome in patients with chronic abdominal pain. However, it should be considered only after a complete diagnostic evaluation has been carried out. It allows effective surgical treatment of many conditions encountered at the time of diagnostic laparoscopy hence intervension can be done simultaneously. It is a safe and effective tool to establish the etiology of chronic abdominal pain and allows for appropriate interventions.

A Study on Age and Sex Demogrpahics in Unstable Pelvic Fractures

Arshad A.R[1], M.R. Rajashekar[2], Srinivasan[2]

[1]Final Year M.S Orthopaedics, [2]Professor Dept of Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Breaks and wounds of the pelvic ring, which could conceivably be related with serious injury, are inconsistent and represent just 2 to 8% of all cracks experienced in orthopedic injury. Be that as it may, in the poly-damaged patients with other framework wounds, the event of pelvic ring damage is a lot higher, being seen in as much of the time as 20 to 25% of cases .

Breaks of the pelvic ring in the youthful people frequently happen as an outcome of high-vitality injury, for example, vehicle or cruiser mishap and from tumbles from extraordinary statures. In the older, they are typically brought about by a low-vitality injury, and are most ordinarily because of a tumble from standing stature, containing fundamentally because of bone porosity.

In all the youthful patients with pelvic ring breaks or wounds because of the high-vitality injury, they ought to be at first evaluated by a multi-disciplinary group, since they regularly have different organ wounds and are liable to major inner dying. Seeping in this kind of damage is progressively extreme when related with flimsy pelvic breaks. Thusly, older patients with cracks because of minor injury for the most part don't build up these numerous deadly entanglements.

Keywords*: pelvic ring, cracks, high-vitality*

Introduction

Generally, an extensive number of concentrates identified with the consideration and prompt or late inconveniences of this kind of wounds have been distributed. These inexorably illuminate and direct the experts engaged with convention the executives of such care, portraying the significance and seriousness of the damage, particularly in the poly-damaged.[3]

Understanding the life structures of the pelvic ring is fundamental for exact determination and treatment. A foundational approach considering the component of damage, physical assessment and radiographic appraisal is terrifically essential to rapidly distinguish shaky pelvic disturbances and their related wounds .The pelvis is a ring like structure, confined pubic rami break on plain radiographs are strange and should warrant cautious assessment for back pelvic interruption with 3D CT imaging.[7] Computed tomographic checking is hence a compelling technique for inspecting the pelvis. Hemorrhagic stun can happen in about 10% of pelvic ring wounds. Prompt acknowledgment and treatment of this dangerous condition is basic in crisis the board. Notwithstanding liquid revival and blood transfusion, circumferential wrapping, angiographic embolization, laprotomy with pelvic pressing, and outer obsession are each of the a piece of a significant life sparing subordinates in the setting of such hemo-dynamic shakiness [2].

Soundness is accomplished by the capacity of the osseo-ligamentous structures of the pelvis to withstand physiologic worries without anomalous twisting. The supporting pelvic tendons, including the back and

Corresponding Author:
Dr. Arshad A.R ,
Final year M.S Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

foremost sacroiliac, ilio-lumbar, sacro-spinous, and sacro-tuberous tendons, assume a significant job in pelvic adjustment. One should be comfortable with the ligamentous life systems and the bio-mechanics significant to understanding pelvic ring interruptions. The Young and Burgess order framework is a precise methodology for deciphering pelvic ring interruptions and surveying security based on basic power vectors that make unsurprising examples. This framework likewise accommodates an algorithmic way to deal with deciphering pictures and sorts wounds as anterio-back pressure, parallel pressure (steady and flimsy variation), vertical shear or any such joined. Opening and shutting of the pelvis from rotational powers result in antero-back and horizontal pressure wounds. In the vertical shear wounds, there is a cephalad uprooting of the hemipelvis. Learning of these damage examples prompts brief distinguishing proof and analysis of other inconspicuous wounds and their related entanglements by suitable imaging, so the orthopedic specialist can apply restorative powers for brief pelvic adjustment. [4]

Patients who support these wounds fall into two classes, viz; survivors and non-survivors. In non-survivors, mortality is of a bimodal appropriation. Early passing is normally a result of discharge or related mind damage. Late demise is normally a direct result of overpowering sepsis and additionally multi-organ disappointment. Survivors regularly experience long haul medicinal and financial ramifications of breaks of the pelvis. These incorporate emotional well-being issues, incessant torment, pelvic obliquity, leg length or rotational inconsistency, variations from the norm of the stride, urological and sexual brokenness and long haul joblessness. [5]

Among patients with various wounds, in light of gruff injury, upto 5 to 16% support wounds to the pelvic ring, bringing about a death rate as high as 11 to 54% that is basically because of hemorrhagic stun. Hence, it is essential to control the related discharge while dealing with these complex pelvic cracks. In most injury units, the underlying administration of a pelvic crack depends on the rules of Advanced Trauma Life Support (ATLS) framework created by the American College of Surgeons (ACS) Committee on Trauma. These rules don't contain information or an agreement on a conclusive pelvic adjustment methodology.[14] In principle, the decrease and adjustment of the pelvic ring can diminish seeping from the crack site as a decrease of pelvic volume has been appeared to lessen the degree of drain from such wounds by their tamponade impact. The sooner that the draining is managed, the more prominent are the opportunity of staying away from the "deadly group of three" of hypothermia, coagulopathy and acidosis optional to the hypotension or hypoperfusion of tissues. Early pelvic adjustment by outside mechanical pressure (EMC) with various gadgets, for example, C-braces, outer fixators, and sheets, can lessen pelvic volume and control discharge. In any case, the utilization of C-braces and outside fixators are intrusive, requires orthopeadic mastery and brief accessibility, however this limits access to the midriff for investigation, consequent nursing care, quiet situating and skin insurance. Normal non-intrusive strategies for pelvic adjustment incorporate sheet wrapping and pelvic folios.[6]

The present transient examination will plan to dissect the clinical, radiological and practical results in patients with flimsy pelvic cracks (Tile characterization B and C), treated by careful adjustment. The outcomes will be abridged by assessing them by the Cole et al; pelvic result scale toward the finish of 7 months.

Aim and objectives of the study

The aim of this study is to analyze the age and sex of the patients with unstable pelvic fractures who are managed by surgical interventions.[4]

Material and Method

Ours is a prospective study involving 21 cases of unstable pelvic injuries (Tile type B and C) managed surgicallypatients who were hemo-dynamically stable were primarily take up for definitive procedures.

These patients presented in the Casuality of SREE BALAJI MEDICAL COLLEGE AND HOSPITAL, Chromepet,Chennai, during the period from March 2017 to Feb 2018 (duration 12 months) .

Inclusion Criteria:

i) Both male and female patients in the age group 21 to 35 years were included.

ii) Pelvic injuries only conforming to Tile Type B and C alone were included.

iii) Cases with other major associated closed injuries were included.

Exclusion Criteria:

i) Patients not conforming to the above age group were excluded.

ii) Patients with open abdominal and crush injuries of the pelvis were excluded.

iii) Patient failing anaesthetic fitness and those with life threatening head and chest injuries were excluded.[6]

iv) Tile type A fractures.

A detailed clinical examination and radiological assessment was done in all patients by means of which the injury pattern and stability of the injured pelvis was ascertained. A 3D CT reconstruction imaging for all cases conforming to tile B and C variants , prior to surgical intervention.

Findings

Age and sex demographics:

Age in years	Male 'n' (%age)	Female 'n' (%age)	Total 'n'	%age
21-25	4	1	5	23.80%
26-30	4	0	4	19.04%
31-35	4	2	6	28.50%
36-40	1	2	3	14.33%
41-45	2	1	3	14.33%
TOTAL	15 (71.43%)	6 (28.57%)	21	100%

The average age in our study was 28 years (range: 21 to 35 years). There was a male preponderance in our study with a male to female ratio of 4:1

Sex distribution :

Discussion

Conventional orthopaedic wisdom is that patients who survive disruption of the pelvic ring eventually had few late musculo-skeletal problems . But studies on the natural history of the pelvic ring injuries proved that the unstable types had high mortality in the acute stage and chronic morbidity in the long term. Despite aggressive resuscitation including application of external fixators, the mortality of 10-20% remain unchanged. This led to clinical trials on internal fixation and several studies have shown that early open reduction and stable internal fixation improves the chances of survival and more importantly, reduces the incidence of late musculo-skeletal morbidity.

Twenty one patients with unstable pelvic fractures were treated surgically and analyzed with minimum follow-up of 7 months (range 7-19 months). The following observations were made. 28.50% of our patients belonged to the age group of 31-35 followed by 21-25 years (23.80 %) and 26-30 years (19.04%).Nearly 50% of our patients were less than 30 years of age. The male to female patient ratio was 5:2.

Conclusion

The mean age of the patient in our study was 32.8 years (range: 21 to 45 years) which is in close comparison to the Sunny Brook Medical Centre series which had a mean age of 30.9 years. Cole et al; reported an average age of 32 years. Sunil et al; reported on 78 cases with an average age of 29.99 years (range 10-65). There was extreme male preponderance in our series with 71.43 % of male patients. The sunny Brook medical centre study reported only slight male dominance with 55%. Cole et al reported a male preponderance with 56.25%.

A Study on Dermatoglyphic Pattern in Palmar Lesions

Sruthy.SR[1], Jayakar Thomas[2]

[1]PG Student , [2]Professor and HOD, Dept. of DVL, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Aim: To study dermatoglyphic pattern in palmar lesions

Place of Study: Skin opd ,sreebalaji medical college and hospital Chennai.

Patients and Method: A total of 100 patients with different hand dermatitis pattern were included in the study.

All patients were subjected to

1.Complete history

2.Dermatological examination

3.Finger print pattern of all the patients

4.Informed consent

Key words: *dermatoglyphic pattern, Finger print pattern*

Introduction

History

Since 1823 researchers have found that fingerprints and inborn knowledge are connected. Through numerous restorative sorts of research it is discovered that fingerprints are shaped during the thirteenth to nineteenth pre-birth week. The neocortexis created during a similar period. Numerous examinations incorporate hereditary qualities, embryology, dermatoglyphics and neural sciences with different insight. In studies, fingerprints of mentally handicapped individuals are not quite the same as that of typical people .Scientific acknowledgment of dermatoglyphics was made some time before the principal composed record concerning them. Developed, in 1684 introduced before the Royal Society of London, a report of his perceptions on patterns of the fingers and palms2

Embryogenesis

Dermal edge separation happens right off the bat in fetal improvement. The subsequent edge setup isgenetically decided and affected by ecological powers. There is a lack of information concerningthedeveloping component that decides extreme epidermal edge designs.3

The embryogenesis of the papillary edges has been contemplated widely. Ongoing electron minute investigations have illuminated the formative instrument in charge of edge arrangement. Penrose and Ohara(1973) acquainted electron infinitesimal examination with explore the formative instruments in charge of edge arrangement.4

- Hypothenararea(Hyp)

A. PALMAR LANDMARKS

Fingertip Patternconfigurations

Galton in 1892, divided fingertip pattern into threegroups.

- Arches
- Loops
- Whorls

Findings

Fingerprints are the mirror to a person's uniqueness. The skin is made out of three anatomical layers of dermal tissue cells. These are epidermis, dermis and hypodermis. The edge surface or volar cells, as theyare essentially called, have morphology that suits their functionality.The edge examples have been extensively ordered into five kinds, specifically, curve, rose curve, whorl, ulnar and spiral circle . [6]

An individual can have any of the above in any of the fingers. In any case, larger part of fingerprints found in populace study demonstrates that 70 percent of the prints are circles, 20 – 25 percent being whorls while just 5 to 10 percent countasarch or rose curve designs.[7]

The fingerprints can be either a circle, a whorl or anarch.Aloop isdefined bya design where edges start from a side, ascent towards the centre and return back to the side where they began from.

Circles for the most part have one delta and can either open towards the thumb or the little finger. [1]

They are the most every now and again happening edge designs, happening in around 60 percent of fingerprints. A whorl is the following most as often as possible happening sort of edge design. A whorl is characterized by two deltas and one focal round center. The center may have various examples. It might be winding, concentric circles, vertically compressed circles or even of the state of eye of a peacock quill. [8]

The edges start from one end, rise and hover towards the centre and go down towards the opposite end. Each example characterizes a diverse sort of cortical overlap around the particular cerebrum flap the finger is related with. Consequently, the phenotypic cosmetics gets modified from man to man, finger to finger.[9]

Psoriasis is portrayed by very much outlined shiny white layered papules and plaques. It happens in 1%to 3% of the populace The disease is lifelong and portrayed by constant, intermittent intensifications, and reductions that are genuinely and physically incapacitating. Psoriasis of the palms and fingertips is portrayed by red plaques with thick dark colored scale and might be undefined from incessant skin inflammation or tinea.

The lamellar scales are more follower than those on different pieces of the body, and just their expulsion will uncover the rosy fiery base. There might break and agonizing gaps and dying. The malady is transmitted hereditarily, and ecological variables can likewise accelerate the disease. The outcomes demonstrated dermatoglyphic changes that included papillary examples escalated at the expense of circles and bends.

Other eminent discoveries of the study incorporate an expansion in the ATD point esteem, a–b check in boys, the nearness of extra triradii, unusual endings of the principle palm lines alongside a decreased C line, and nonappearance of C triradiusin patients with protected exogenous adiposity. Comparable discoveries were seen in the relatives of the main degree of kinship.

Conclusion

The present investigation was embraced to analyze the dermatoglyphic changes in various types of hand dermatitis. The accompanying ends were made toward the finish of the study.

1.It is closed from our examination that distinctions saw between psoriasis patients and in different conditions might be the consequence of a genetic abnormality or the impact of some intrauterine ecological variables.

2.It is recommended that an investigation of dermatoglyphic patterns in psoriasis patients and their families may be rewarding on the grounds that example

design can serve as an help to determination and may demonstrate an expanded propensity to create the disease.

3.Thepalmar example forces were expanded in both genders, while the computerized example powers were expanded in guys and diminished in females.

4.TFRCwas expanded in guys and diminished in female patients. In the two cases and controls, TFRC was morein guys than females.

5. A-b tally demonstrated a noteworthy decrease in both genders.

6. Greatest atdangle demonstrated no significant changes.

7.Abnormal flexion wrinkle was not experienced in our examination.

8.Weconclude that dermatoglyphic pattern can be utilized as an essential analytic apparatus to analyze, different dermatological conditions.

A Study on Functional Outcome of Surgical Mangement in Unstable Pelvic Fractures

Arshad A.R[1], M.R. Rajashekar[2], Srinivasan[2]

[1]Final year M.S Orthopaedics, [2]Professor, Dept of Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research,Chennai

Abstract

Cracks and wounds of the pelvic ring, which might be related with serious injury, are rare and represent just 2 to 8% of all breaks experienced in orthopedic injury. Be that as it may, in the poly-damaged patients with other framework wounds, the event of pelvic ring damage is a lot higher, being seen in as often as possible as 20 to 25% of cases .

Breaks of the pelvic ring in the youthful people frequently happen as a result of high-vitality injury, for example, vehicle or cruiser mishap and from tumbles from incredible statures. In the old, they are normally brought about by a low-vitality injury, and are most generally because of a tumble from standing tallness, containing for the most part because of bone porosity.

In all the youthful patients with pelvic ring breaks or wounds because of the high-vitality injury, they ought to be at first evaluated by a multi-disciplinary group, since they frequently have various organ wounds and are liable to major inside dying. Seeping in this sort of damage is increasingly extreme when related with unsteady pelvic breaks. Thus, older patients with cracks because of minor injury by and large don't build up these numerous deadly confusions.

Keywords: *poly-damaged patients, high-vitality injury, pelvic ring damage*

Introduction

Recently, a significant number of concentrates identified with the consideration and quick or late inconveniences of this sort of wounds have been distributed. These inexorably educate and direct the experts associated with convention the executives of such care, portraying the significance and seriousness of the damage, particularly in the poly-damaged.

Understanding the life systems of the pelvic ring is basic for precise analysis and treatment. A fundamental methodology considering the system of damage, physical assessment and radiographic appraisal is exceptionally imperative to rapidly distinguish temperamental pelvic interruptions and their related wounds .The pelvis is a ring like structure, separated pubic rami crack on plain radiographs are unordinary and should warrant cautious assessment for back pelvic disturbance with 3D CT imaging.[7] Computed tomographic checking is along these lines a powerful technique for looking at the pelvis. Hemorrhagic stun can happen in about 10% of pelvic ring wounds. Quick acknowledgment and treatment of this dangerous condition is basic in crisis the executives. Notwithstanding liquid revival and blood transfusion, circumferential wrapping, angiographic embolization, laprotomy with pelvic pressing, and outside obsession are every one of the a piece of a significant life sparing subordinates in the setting of such hemo-dynamic unsteadiness .

Soundness is accomplished by the capacity of the osseo-ligamentous structures of the pelvis to withstand physiologic worries without irregular misshapening. The

supporting pelvic tendons, including the back and front sacroiliac, ilio-lumbar, sacro-spinous, and sacro-tuberous tendons, assume a pivotal job in pelvic adjustment. One should be comfortable with the ligamentous life systems and the bio-mechanics applicable to understanding pelvic ring disturbances. The Young and Burgess order framework is a methodical methodology for translating pelvic ring interruptions and surveying strength based on central power vectors that make unsurprising examples. This framework additionally accommodates an algorithmic way to deal with translating pictures and classifies wounds as anterio-back pressure, horizontal pressure (steady and precarious variation), vertical shear or any such consolidated. Opening and shutting of the pelvis from rotational powers result in antero-back and horizontal pressure wounds. In the vertical shear wounds, there is a cephalad removal of the hemipelvis. Learning of these damage examples prompts brief recognizable proof and conclusion of other unpretentious wounds and their related complexities by suitable imaging, so the orthopedic specialist can apply restorative powers for brief pelvic adjustment.[1]

Patients who continue these wounds fall into two classifications, viz; survivors and non-survivors. In non-survivors, mortality is of a bimodal dispersion. Early demise is ordinarily a direct result of drain or related cerebrum damage. Late demise is normally a result of overpowering sepsis and additionally multi-organ disappointment. Survivors habitually experience long haul medicinal and financial ramifications of breaks of the pelvis. These incorporate emotional well-being issues, interminable agony, pelvic obliquity, leg length or rotational inconsistency, variations from the norm of the walk, urological and sexual brokenness and long haul joblessness. [2]

Among patients with various wounds, due to dull injury, upto 5 to 16% continue wounds to the pelvic ring, bringing about a death rate as high as 11 to 54% that is fundamentally because of hemorrhagic stun. In this manner, it is essential to control the related drain while dealing with these complex pelvic cracks. In most injury units, the underlying administration of a pelvic break depends on the rules of Advanced Trauma Life Support (ATLS) framework created by the American College of Surgeons (ACS) Committee on Trauma. These rules don't contain information or an accord on an authoritative pelvic adjustment methodology.[14] In principle, the decrease and adjustment of the pelvic ring can diminish seeping from the crack site as a decrease of pelvic volume has been appeared to lessen the degree of drain from such wounds by their tamponade impact. The sooner that the draining is managed, the more prominent are the opportunity of staying away from the "deadly ternion" of hypothermia, coagulopathy and acidosis auxiliary to the hypotension or hypoperfusion of tissues. Early pelvic adjustment by outer mechanical pressure (EMC) with various gadgets, for example, C-clips, outside fixators, and sheets, can lessen pelvic volume and control discharge. Be that as it may, the utilization of C-clasps and outer fixators are intrusive, requires orthopeadic aptitude and brief accessibility, yet this limits access to the mid-region for investigation, ensuing nursing care, persistent situating and skin security. Basic non-intrusive techniques for pelvic adjustment incorporate sheet wrapping and pelvic fasteners.

The present momentary examination will mean to break down the clinical, radiological and utilitarian results in patients with shaky pelvic cracks (Tile characterization B and C), treated by careful adjustment. The outcomes will be abridged by assessing them by the Cole et al; pelvic result scale toward the finish of 7 months.[3]

Aim and Objectives of the Study

The aim of this study is to analyze the results and functional outcome of the patients with unstable pelvic fractures who are managed by surgical interventions.

In this study, the mechanism of different types of unstable injuries are studied followed by the clinico-radiological assessment of patients and their management by primary definitive internal or primary external fixation followed by definitive open reduction and internal fixation. We will then, analyze the outcome of these injuries following surgical management by using Col et al; scoring system for pelvic injury at 7 months post surgery.[4]

Material and Method

Ours is a prospective study involving 21 cases of unstable pelvic injuries (Tile type B and C) managed surgicallypatients who were hemo-dynamically stable were primarily take up for definitive procedures.

These patients presented in the Casuality of SREE BALAJI MEDICAL COLLEGE AND HOSPITAL,

Chromepet,Chennai, during the period from March 2017 to Feb 2018 (duration 12 months) .[5]

Inclusion Criteria:

iv) Both male and female patients in the age group 21 to 35 years were included.

v) Pelvic injuries only conforming to Tile Type B and C alone were included.

vi) Cases with other major associated closed injuries were included.[6]

Exclusion Criteria:

i) Patients not conforming to the above age group were excluded.

ii) Patients with open abdominal and crush injuries of the pelvis were excluded.

iii) Patient failing anaesthetic fitness and those with life threatening head and chest injuries were excluded.

iv) Tile type A fractures.

Table 1: Cole Et Al; Pelvic Outcome Scale

Category	Description	Points
Functional pain	Pain secondary to physical activity	Max: 5 points
	None	5
	Pain only with strenuous activity	4
	Mild pain with stair climbing,lifting,moving, or other moderately strenuous activities.	3
	Moderate pain with start up of activities and intermittent radicular pain.	2
	Pain with sitting or standing longer than 1 hour, requires frequent position changes .	1
	Chronic severe pain regardless of activity.	0
Subjective pain	Average of resting and ambulation scores on a scale of 1 (no pain) to 10 (severe pain)	Max: 4 points
	1-2 points	4
	3-4 points	3
	5-6 points	2
	7-8 points	1
	9 - 10 points	0
Narcotic uses	Narcotic use > 12 weeks post-operatively	Max: 1 point.
	No	1
	Yes	0
Activity status	Ability to resume previous work, household or recreational activities	Max: 10 points
	Without limitations	10
	With some discomfort	8
	With limitations such as tires more easily or cannot lift as much as before injury	6
	With marked limitation requiring change in work status to part time, sedentary, or with restrictions; requires assistance with household activities or avoids strenuous recreational activities	4
	Unable to resume any previous work, household, or recreational activities; canot drive and requires assistance with stairs or with shopping	2
	Unable to resume any previous work household, or recreational activities; requires assistance with activities of daily living	0

Cont... **Table 1: Cole Et Al; Pelvic Outcome Scale**

Physical examinataion	GAIT	Max: 4 points
	Normal	4
	Antalgic gait	3
	Requires assistive device (cane) .	2
	Requires assistive device (walker, occasionally use wheelchair).	1
	Nonambulatory.	0
	Tredelenberg	Max: 1 point
	Negetive.	1
	Positive	0
	Tenderness	Max: 2 points
	No sacral or pubic tenderness .	2
	Mild Sacral or pubic tenderness .	1
	Moderate Sacral and pubic tenderness .	0
	Lower extremity muscle group strength , Flexion / Extension	Max: 1 point.
	Bilateral hip flexion and extension = 5/5	1
	Hip flexion or extension < 5/5	0
	Abduction / Adduction	Max: 1 point.
	Bilateral hip abduction and adduction = 5/5	1
	Hip abduction and adduction < 5/5	0
	Range of motion	Max: 1 point.
	Normal hip and trunk range of motion	1
	< 200 difference in hip internal or external rotation when compared with contralateral side	0
Pelvic radiograph (AP, pelvic inlet and outlet views)	Posterior (normal sacroiliac joint space = 4mm)	Max: 6 points.
	Displacement <0.5 cm without sacroiliac joint reactive changes	6
	Displacement <0.5 cm with sacroiliac joint reactive changes	5
	Displacement >0.5 cm and <1cm	4
	Displacement >1 cm	2
	Non-union	0
	anterior (normal pubic symphysis space = .5cm)	Max: 4 point.
	Displacement <0.5 cm without pain	4
	Displacement <0.5 cm with some pain	3
	Displacement >0.5 cm and <1cm	2
	Displacement >1.0 cm and <2.0cm	1
	Displacement >2.0 cm	0

Fig: 1

Discussion

In our series of 21 patients whose functional outcomes were evaluated at the end of 7 months post-operatively, 19.05% (*n* =4) had excellent , 57.14 (*n* = 12) had good, 19.05% (*n* = 4) had fair and 4.76% (*n* = 1) had poor outcome., as evaluated by the cole et al; scoring system.

Thus ,in our series the Tile B1 fractures, all had excellent to good outcome. Tornetta et al; reported on 29 patients operated with a single symphyseal plate. They

also had reported 96% excellent results and four cases of hardware failure. Webb et al; in his series of 14 cases treated with a two holed plate fixation encouraged early mobilization of his patients and concluded that single plating allows some normal motion to take place at the symphysis pubis. However McGowan et al; and Schied in their studies concluded that two plates at 90^0 would give excellent stability, especially to the unstable pelvis. Our outcomes did not support the view that dual plate is mandated.

Conclusion

Anatomic decrease and inner obsession of unsteady pelvic wounds gives amazing solidness, takes into account early portability with great practical result. Deferred interior obsession was not related with expanded peri-employable bleakness. These cases accomplish preferred decreases over those that are gotten with outer obsession alone. Deferring the obsession, nonetheless, expanded the trouble of getting anatomic decrease in specific cases. Indeed, even deferred inside obsession may yield similarly great useful result in patients where close to anatomic decrease could be gotten.

Intense administration of unsteady pelvic wounds is without a doubt a difficult assignment. Systems of safe inner obsession are requesting, yet useful results are fulfilling. Consistent devotion to progress is and should be the objective of the pelvic orthopedic specialists.

Alopecia Areata An Over View

Kovi Sneha[1], Jayakar Thomas[2]

[1]Student, [2]Professor and HOD, Dept. of DVL, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Absrtact

Introduction: Alopecia areata is a typical ceaseless immune system provocative ailment that includes hair follicles, portrayed by male pattern baldness on the scalp and additionally body without scarring. Clinically, the sickness exhibits as smooth, inconsistent balding with different examples - diffuse or reticulate alopecia, ophiasis, ophiasisinversus, alopecia totalis (loss of hair all the scalp), or alopecia universalis (loss of hair everywhere throughout the body). Clinical conclusion of AA is made dependent on common example of male pattern baldness and the nearness of trademark outcry mark hair in microscopy. Intrusive (punch biopsy) procedures are regularly required sometimes where the clinical finding isn't straight advance . Biopsy indicates peribulbar lymphocytic invades in a "swarm of honey bee design" which is normal for the intense phase of the illness.

Materials and Method : Study Design: Cross sectional study

Study Area: Skin Outpatient Department, Sree Balaji Medical College and Hospital

Study Population: All patients with hair loss, attending skin OPD, who are clinically diagnosed as Alopecia Areata

Study Method: Observational study

Sample Size: 30

Result: Clinically, the sickness shows as smooth, sketchy balding with different patterns.Dermoscopy is valuable for determination of AA clinically by the nearness of cadaverized hairs (dark dabs), circle hair, coudablity hair, shout mark hairs (decreasing hairs), broken hairs, yellow spots and grouped short vellus hairs in the male pattern baldness territories.

Key words: *Alopecia areata, OPD, Dermoscopy*

Introduction

Alopecia areata is a typical ceaseless immune system fiery and non-startling sickness which includes hair follicles. It is described by male pattern baldness on the scalp as well as any place the hair is available on the body.1 The possibility of happening is 2% in their lifetime of an individual.2The shot of happening is 40% higher in more youthful people matured underneath 30years.

Clinically, Alopecia areata is separated into inconsistent alopecia, diffuse alopecia, reticulate alopecia, ophiasis, ophiasis inverses(loss of hair in the state of wave) alopecia totalis or alopecia universalis (loss all things considered) and perinevoid.4 Most normally around 3% to 30% of patients shows nail changes(diffuse fine nail setting, longitudinal ridging, slight and weak finger and toenails, and trachyonychia).3

Since it is an immune system issue, unexpected hair regrowth may happen whenever inside the time of hair loss.1The invulnerable framework is a noteworthy player, with T cells and a breakdown of the physiological resistant benefit (IP) of the hair follicle (HF)5plays a basic job in the pathophysiology of alopecia areata.6-8 The HF speaks to a site of relative IP, on the grounds that characterized districts of its epithelium (swell, bulb) don't express MHC class I and class II atoms, and in light of the fact that various immunoinhibitory cytokines and neuropeptides make an immunoinhibitory milieu.5, 9 Even the few intraepithelial Langerhans cells found inside the HF epithelium beneath its undifferentiated cell locale, the lump, are immunologically disabled, as they neglect to express MHC class II.10 This breakdown of insusceptible benefit (IP) of the hair follicle is a reason for autoimmunity to happen, is a generally acknowledged theory.11 This IP breakdown, which can most viably be prompted by IFN-γ or substance P probably prompts changes in the quality and amount of the conveyed what needs be antigen collection, rendering HFs, which currently ectopically express MHC class I-displayed autoantigens, helpless against hostile to self-safe reactivity. [3]

Clinical finding of Alopecia areata depends on the regular example of balding, and the nearness of trademark shout mark hair in microscopy. Now and again, if clinical highlights are not the unmistakable obtrusive technique (punch biopsy) may should be utilized for conclusion. The dermoscopic strategy has been proposed as a choice to keep away from punch biopsy, particularly in immature young ladies and kids, in which agreeableness of punch biopsy might be low. Numerous ongoing investigations have investigated the utility of noninvasive finding dermoscopy in the determination of Alopecia Areata. Aside from these stream cytometry-based estimation of different incendiary markers like IFN-γ, IL-13, IL-9, IL-17, and IL-22 cytokines in CD4+and CD8+ T cells have been utilized to enhance or affirm the clinical conclusion. Inducible co-stimulator particle (ICOS) and HLA-DR, which are utilized to characterize mid- and long-term T-cell enactment are likewise proposed as potential analytic markers in Alopecia areata.[12]

Figure: 1 Pattern of hair loss in Alopecia Areata

Discussion

Alopecia Areata

Alopecia areata is a typical ceaseless immune system provocative and non-unnerving sickness which includes hair follicles, portrayed by male pattern baldness on the scalp as well as other bristly districts of the body.1 The detailed shot of event is 2% in their lifetime of an individual,2 with a lot higher likelihood in more youthful people matured beneath 30years.1-3Depending on the ethnic foundation and the overall provincial distinction, the predominance of alopecia areata (AA) changes from 0.1 to 0.2%, with a determined lifetime danger of 2%. Ongoing examinations on creature models have proposed breakdown of hair follicle safe benefit in relationship with improved MHC class I articulation and organ-explicit immune system responses against hair follicle autoantigens prompted by NKG2D+ cytotoxic CD8+ T cells as the plausible instrument for the advancement of Alopecia areata.

Materials & Method

Types Alopecia areata: There are many clinical types of alopecia areata.

- Patchy Alopecia
- Diffuse Alopecia
- Reticulate Alopecia
- Ophiasis
- OphiasisInversus (loss of hair in the shape of the wave)
- Alopecia totalis or alopecia universalis (loss of all hairs)
- Perinevoid

Common Symptoms:

Patients are mostly asymptomatic even though some symptoms are seen

- Pruritus
- Pain
- Burning sensation may precede hair loss
- Nail changes (diffuse fine nail pitting, longitudinal ridging, thin and brittle finger and toenails, and trachyonychia).3

Etiopathogenesis: It is essential to understand the physiology of hair growth, for understanding the pathophysiological mechanisms underlying alopecia areata. Hair growth and maintenance depends on 3 phases of the hair cycle,

- Anagen (active growth phase),
- Catagen (involution phase), and
- Telogen (resting phase).

Length of the hair for the most part relies upon the anagen stage. In solid people, hair sheds out after the resting stage when the new hair anagen development begins (exogen). In alopecia areata patients, hair shedding happens even before the anagen begins (kenogen). It is commonly a confusion of hair cycling, in this way it is viewed as a condition of kenogen.[7]

Pandemics of AA announced from shelters and schools pointed towards irresistible etiology. It was seen that AA happening in monozygotic twins and solid family ancestry for some ages in groups of AA people demonstrates that AA can be acquired. Stress is considered as one of the triggers, yet controlled investigations didn't affirm this.[14]

As of late the agreement is more for immune system etiology. AA is viewed as an immune system ailment, because of its relationship with other immune system illnesses like thyroid sickness, iron deficiency, diabetes mellitus, vitiligo, and psoriasis. Hair follicle-explicit antibodies are expanded in fringe blood of AA patients, particularly to keratin 16 and trichohyalin. It is accepted that hair follicle is an insusceptible special site. In solid hair follicle epithelium, real histocompatibility complex (MHC) class I and II particles are not communicated, and TGF-β, IGF-1, and α-MSH are increasingly communicated. This insusceptible benefit is fell in AA by the nearness of expanded MHC I and II buildings, diminished immunosuppressive atoms, and higher articulation of bond particles (ICAM-2 and ELAM-1) in the perivascular and peribulbar hair follicular epithelium, prompting perifollicular inflammation.[10]

Clinical findings

The most widely recognized clinical appearance

of alopecia areata is patches of balding. They might be single or different patches. Little fixes may spread and frame bigger patches. The scalp is the most widely recognized site (90%), however it might happen at any piece of the body.10 It can be arranged relying upon the degree and example of balding. 1

It tends to be sketchy AA, in which there are discrete patches of male pattern baldness may exhibit in shifting number in the influenced piece of the body. Alopecia totalis may influence the whole scalp and body hair, for example, eyebrows, eyelashes, whiskers, axillary hair and pubic hair. Alopecia universalis (AU) includes the absolute body hair. The example of balding can be reticular, ophiasis, and sisaipho. Ophiasis (snake-like) is a band-like AA along the back occipital and transient edges. Sisaipho, additionally called as ophiasisinversus, presents with alopecia including the frontal, fleeting, and parietal scalp yet saves hair along the scalp outskirts, mirroring androgenetic alopecia. Intense diffuse and all out alopecia, another variation, which is as of late depicted. Some surprising sorts of AA are, perinevoid alopecia, in which alopecia patches are available around the nevi.26 Sometimes it might happen in straight conveyance too.

The outside of AA patches is smooth and typical skin shading with no skin modifications, for example, scaling and follicular changes. Once in a while, it very well may be patchy.2

Trademark 'exclamatory imprint hairs' are seen either inside or at the fringe of the patches.21 White hairs are saved including just pigmented hair causing abrupt brightening of hair in beginning stages. In constant cases, the white hair is additionally lost. For the most part, AA patients are asymptomatic, and once in a while pruritus, torment andss consuming sensation may go before hair loss.21 The analysis is for the most part clinical and doesn't cause trouble commonly.

Age and Sex Distribution of Patients of Giddiness with Significant Findings on MRI

Amish Aggarwal[1], I. Venkatraman[2], M. Prabakaran[3]

[1]Resident, [2]Professor, [3]Professor and HOD, Sree Balaji Medical College, 7, Work' S Road, Chrompet, Chennai, Tamilnadu, India

Abstract

Energy is a vague side effect or feeling that incorporates sensations, for example, faintness, discombobulation, vertigo and unevenness. The reason for the examination was to assess the job of attractive reverberation imaging (MRI) in diagnosing the reason for energy in symptomatic patients with age and sex dispersion of patients of happiness with noteworthy discoveries on MRI. An imminent companion study was directed in 106 patients who gave happiness. X-ray outputs of these patients were investigated, and we presumed that MRI can effectively exhibit the huge discoveries which cause energy.

Keywords: *Brain, Giddiness, Magnetic Resonance Imaging*

Introduction

Happiness is experimentally named as "dazedness" which means impedance in spatial observation and steadiness as characterized in Dorland's Medical Dictionary. Energy is accounted for in around 20–30% of the populace eventually in the year 20091.[1] Various pieces of the body are required for keeping up equalization including the internal ear, eyes, muscles, skeleton and the sensory system, so any confusion or sickness in these frameworks can show as what is generally alluded to as giddiness[2]. Regular physiological reasons for energy incorporate deficient blood supply to the cerebrum because of an unexpected fall in circulatory strain or blood vessel blockage, misfortune or bending of vision or obvious signals, issue of the internal ear, twisting of mind/apprehensive capacity by meds, for example, anticonvulsants and sedatives[2]. Differential analyses of numerous conditions are related with happiness. The most widely recognized causes are as per the following: 40% fringe vestibular brokenness, 10% focal sensory system sore, 15% mental issue, 25% presyncope/ dysequilibrium, and 10% vague giddiness3. Conditions that frequently present as energy or have happiness as a side effect include: kind paroxysmal positional vertigo, Meniere's ailment, vestibular neuronitis, labyrinthitis, otitis media, mind tumor, acoustic neuroma, incessant movement infection, Ramsay Hunt disorder, headache, numerous sclerosis, pregnancy, low circulatory strain (hypotension), low blood oxygen content (hypoxemia), myocardial localized necrosis, iron insufficiency (paleness), low glucose (hypoglycemia), hormonal changes (e.g., thyroid ailment, feminine cycle, pregnancy), alarm issue, hyperventilation, tension, sadness, age-decreased visual, equalization and impression of spatial direction abilities[1-3] . Happiness is a typical introducing manifestation in drug and otorhinolaryngology outpatient offices. Most patients with happiness regularly experience issues portraying their side effects, along these lines deciding the reason can be testing. A proof based methodology utilizing learning of key history, physical assessment and radiologic discoveries for the reasons for energy can help set up an analysis and think about suitable medicines much of the time. At the point when the manifestation is hard-headed to meds, patients are constantly alluded for attractive reverberation imaging contemplates (MRI) of Brain. Attractive reverberation imaging (MRI) has been appeared to can possibly analyze or to decide out conditions that present as happiness. X-ray has better goals than different cross-sectional imaging methods

like figured tomography for representation of back fossa of cerebrum where most focal sensory system illness that causes happiness are available. The points of this examination were to record the discoveries in patients who experienced MRI cerebrum for happiness as the exhibiting side effect and to dissect the affectability and explicitness of MRI in diagnosing the reason for energy.[4]

Aims & Objectives of the Study

The objective of the study wasto evaluate the age and sex distribution of patients of giddiness with significant findings on MRI

Materials and Method

The study was conducted in 106 patients who presented with complaint of giddiness (dizziness, vertigo, light headedness, imbalance) and referred for MRI to the Department of Radio Diagnosis. Majority of the referred cases were those who complaint of giddiness with neurologic signs and symptoms, risk factors for cerebrovascular disease, or progressive unilateral hearing loss.

Inclusion Criteria

- Patients with complaint of giddiness.
- Patients willing to undergo this study.

Exclusion Criteria

- Patients not willing to undergo this study
- Pregnancy
- Claustrophobic patients

Clinical assessment was done including detailed history, physical examination and laboratory investigations for the causes of giddiness.[7]

Subsequent MRI was done. For contrast enhancement, imaging was performed following intravenous injection of 0.1 mmol/kg of gadolinium.

Results and Observation

Table 1: Age distribution of the patients

Age in years	Number	%
0-20	6	5.66%
21-40	34	32.08%
41-60	35	33.02%
61-80	28	26.42%
81-100	3	2.83%
Mean +/- SD	49.2 +/- 18.6	

In the study group, majority of the cases ie., 33 % belong to the age group 41-60 years, 32 % belong to the age group 21- 40 years, 5.6 % belong to the age group 0-20, 2.8 % belong to the age group 81-100 years.

Chart 1:Age distribution of the patients

Chart 2: SEX distribution of the patients

Among the total cases, 58 (45%) were males and 48(55%) were females out of which significant MRI findings were found in 50 males and 38 females.

Findings

MRI findings in patients complaining of giddiness

MRI scans of 106 patients were analyzed and total 171 findings were seen that are known to cause giddiness. Out of 106 cases the most common finding on MRI was cerebral small vessel ischemic changes found in 45(26.3%) scans. 27(15.7%) scans had cerebral atrophy, 25(14.6%) patients had PCA territory infarct, 8(4.6%) scans had semicircular canal dehiscence, 8(4.6%) patients had mastoiditis and 5(2.9%) scans had CP angle tumors.

Other findings that were found includes intracranial hemorrhage found in 6(3.5%) scans, SOL found in 5(2.9%) scans, venous sinus thrombosis in 5(2.9%) scans and benign intracranial hypertension in 2(1.1%) scans. Overlap of findings in same scan was noted in many cases.[5]

Discussion

Giddiness is a common symptom which affects about 30% of people over the age of 65.[4] Benign paroxysmal positional vertigo, acute vestibular neuronitis, and Meniere's disease cause most cases of

giddiness; however, physicians must consider other causes including cerebrovascular disease, semicircular canal dehiscence, migraine, psychological disease, perilymphatic fistulas, multiple sclerosis, and intracranial neoplasms. In these patients MRI scan is done to look for the cerebrum, cerebellum as well as for cerebello-pontine angle lesions and the internal auditory meatus.

A descriptive cohort study was conducted on patients who present with complaint of giddiness (vertigo, light headedness, presyncope, and disequilibrium). In the present study 106 patients who presented with giddiness underwent MRI brain. MRI showed high sensitivity to visualize findings that were clinically significant and consistent with giddiness. We found that approximately 83% of scans had positive findings and 17% scans were normal. Kalsotra et al studied the findings on magnetic resonance imaging in patients with giddiness by evaluating MRI scans of 62 patients and reported 54.84% MRI scans as normal[5].

In the present study, most common finding was small vessel ischemic changes in 26.3% of the scans. In 2010 Papanikolaou et al. studied findings on MRI scans of patients presenting with audiovestibular symptoms. Subcortical white matter hyperintensive foci has been reported in 44% cases by Papanikolaou et al[6].

In present study the second most common finding was cerebral atrophy in 15.7%. Papanikolaou et al reported atrophy in 5.5% cases[6] while Kalsotra et al reported it in 3.22%[5].

Another significant and prevalent finding was posterior cerebral territory infarct in 14.6% scans and non-posterior cerebral territory infarct in 7.6% scans. Zoya Irfan Khan et al conducted retrospective study and analyzed MRI brain scans of 500 patients who presented with giddiness and reported acute infarcts in 8.4% cases[7].

In the present study semicircular dehiscence was seen in 8 (4.6%) scans which significantly attributes to giddiness. P. Browaeys et al. found that MR imaging has a sensitivity of 100% to depict semicircular canal dehiscence (SCD).

Mastoiditis was seen in 4.6% scans compared to 3% cases reported by Papanikolaou et al in his study.

In the present study CP angle tumors were visualized on MRI in 5(2.9%) scans.

Other findings include intracranial hemorrhage in 6(3.5%) scans, SOL in 5(2.9%) scans, venous sinus thrombosis in 5(2.9%) scans, benign intracranial hypertension in 2(1.1%) scans, meningoencephalitis in 1 scan (0.58%), hypoxic ischemic encephalopathy in 1 scan (0.58%), vertebral artery stenosis/occlusion in 1 scan (0.58%), vertebral artery stenosis/occlusion in 1 scan (0.58%) and vertebrobasilar dolichoectasia compressing over the midbrain in 1 scan (0.58%).

In the present study 45% were males and 55% were females out of which significant MRI findings were found in 50 males and 38 females.

Study conducted by Zoya Irfan Khan et al included 57.6% females and 42.4% males with age ranging between 36 to 74 years were found[7].

Current study comprised of patients between 6-94 years of age with mean age of 49.2 years. Majority of the cases i.e. 65% were in the age group of 21-60 years.

Conclusion

MRI has high sensitivity and can successfully demonstrate the significant findings which cause giddiness. Out of 106 cases, 83 % (88) of the cases had significant MRI findings that are known to cause giddiness and 17 % (18) of the cases had normal MRI scan.

Most common finding was small vessel ischemic changes and cerebral atrophy in these patients. PCA and non-PCA territory infarcts were among the other predominant findings.

Spectrum of other findings included semicircular canal dehiscence, mastoiditis, CP angle tumors, intracranial hemorrhage, SOL, venous sinus thrombosis, benign intracranial hypertension, meningoencephalitis, hypoxic ischemic encephalopathy vertebral artery stenosis/occlusion, vertebral artery stenosis/occlusion and vertebrobasilar dolichoectasia compressing over the midbrain.

Male predominance was noted in the study group.

Majority of the cases ie., 33 % belong to the age group 41-60 years, 32 % belong to the age group 21- 40 years with the mean age of 49.2 years.

MRI is a costly investigation, so it should be used

judiciously in such patients after obtaining detailed history and physical examination who do not respond to routine medications.

Summary

Giddiness is a common presenting complaint of patients. MRI scan of these patients is done to look for possible treatable definitive cause.

Out of 106 MRI scans, 83 % of the cases had significant MRI findings that are known to cause giddiness and 17 % of the cases had normal MRI scan.

Most common finding was small vessel ischemic changes in 26.3% of the scans. Spectrum of other findings included cerebral atrophy, PCA & non-PCA territory infarcts.

MRI is a highly sensitive investigation to find out the cause of giddiness. Its benefit weighs more than its cost. So the patients with persistent giddiness must undergo MRI brain to find the cause and for further appropriate management.

Evaluation and Description of Colorectal Pathologies Using CT Colonoscopy

Beno Jefferson[1], I.Venkatraman[2], M.Prabakaran[3]

[1]Final Year Resident, [2]Professor, [3]Professor and HOD, Department of Radio Diagnosis, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

CT colonoscopy is a newer submodality of imaging in Computed tomography specifically being used for colorectal evaluation. The aim of work is to evaluate and describe the role of CT colonoscopy for various colorectal pathologies in patients with lower GI symptoms.

Subject and methods: Our study included 50 patients with lower GI sypmtoms; 16 had inflammatory bowel disease , 6 of them had colorectal malignancy, 7 had polyps, 8 had hemorrhoid. All patients were subjected to CT colonoscopy examination and results were compared to conventional colonoscopy and documented by histopathology in all cases to determine the efficacy of CT colonoscopy.

Results: The results in our study showed that CT colonoscopy is a considerably efficient modality in evaluation colonic pathologies. when compared to conventional colonoscopy and further helps in delineating the locoregional extent of the lesion-n.

Keywords: *CT colonoscopy, submodality, malignancy*

Introduction

In recent times, computed tomographic (CT) colonoscopy, a new cross-sectional technique for imaging of the colon, emerged. CT colonoscopy has potential advantages over colonoscopy and double-contrast barium enema examination: multiplanar capabilities, detection of enhancing lesions that make the distinction between fecal residue and true lesion possible, and ante- and retrograde virtual colonoscopy.[7]

CT colonoscopy generates a large number of source images, which have to be read carefully for filling defects and wall thickness and, if intravenous contrast material is used, enhancing lesions. An important post-processing technique is multiplanar reformatting , which allows the viewer to see potential lesions in an orientation other than that of the source images

Virtual colonoscopy is a new method of imaging the colon in which thin-section, helical computed tomography (CT) is used to generate high-resolution, two-dimensional axial images. Three-dimensional images of the colon, simulating those obtained with conventional colonoscopy, are then reconstructed off-line. Studies suggest that this technique may be an attractive alternative to existing screening tests for colorectal cancer, since it is relatively safe and minimally invasive.[3]

Materials and Method

Sample size : 50 cases

Inclusion criteria : All patients with lower GI symptoms were included (Age group > 20 years)

Exclusion criteria: Asymptomatic individuals ; Children and pregnant women.

Methods: All patients will be subjected to CT colonoscopy and followed up by conventional colonoscopy.

Imaging protocols and Procedure :

Patients of the inclusion criteria were referred from the department of gastroenterology and after overnight fasting on empty stomach CT colonoscopy is done using HITACHI ECLOS 8 SLICE SCANNER. Patient was placed in supine position and manual insufflations of colon was done4

Scanning parameters:

All patients were examined in cranio-caudal direction starting from the level of the diaphragmatic cupola down to the anus.

Slice thickness 2.5 mm, Pitch factor 2:1 Milli ampere 200 mAs,

Kilo volt 120 to 150 kv, matrix 512 · 512.

Range for scanning time 20 to 30 s,

Field of view Full Reconstruction interval 1.25 mm.

The colon was insufflated by gentle squeezing of the BP cuff using room air, until the patients stated they were full or ~15 to 20 manual compressions. The adequacy of air insufflations was evaluated with a CT scout view , with more air insufflated if required. Bowel distension with air till cecum was considered adequate. Now the patient is made to lie down prone and scout view taken to look for if additional air insufflations was necessary. When air insufflations is satisfactory then image acquisition in prone position is done.5

Data Analysis

All the data acquired from the examination including the scanograms supine and prone acquisitions were transferred to work station unit

Findings

Table 1 – Age vs. Sex

Age group	Male	Female	Total
21-30	02	01	03
31-40	13	02	15
41-50	09	05	14
51-60	15	03	18
Total	39	11	50

Table shows that the majority of the male patients were under the age group of 51-60 (38.46%), whereas female patients were more in age group 41-50 years (45.45%).

The virtual colonoscopy/ CT findings showed incidences of various conditions in the cases, where maximum findings were of Inflammatory Bowel disease (32%), followed by Hemorrhoids (16%). The incidence of Polyp findings were 14%,Colorectal malignancies were 12% and rest cases showed no significant findings.[7]

Table 2 – CT findings

CT findings	No. of cases	Percentage
Inflammatory Bowel Syndrome	16	32%
Hemorrhoids	08	16%
Polyp	07	14%
Malignancy	06	12%
Normal	13	26%
Total	50	100

The conventional colonoscopy findings showed incidences of various conditions in the cases, where maximum findings were of Inflammatory Bowel disease (32%), followed by Hemorrhoids (20%). The incidence of Polyp findings were 18%, Adenocarcinomas (malignancy) were 12% and rest cases showed no significant findings.[4]

Table 3 – Conventional Colonoscopy findings

Colonoscopy findings	No. of cases	Percentage
Inflammatory Bowel Syndrome	16	32%
Hemorrhoids	10	20%
Polyp	09	18%
Malignancy	06	12%
Normal	09	18%
Total	50	100%

Table 4– Distribution of Extra-colonic finding

Findings	No. of cases
Ascites	02
Hepatic metastasis	01
Renal calculi	05
Renal cortical cyst	02
Inguinal Hernia	03
Lumbar spondylosis	02
GB wall thickening	01
Cholelithiasis	01
Cirrhosis and Portal hypertension	01
Hiatal Hernia	01

Table 5 – Results for CT colonoscopy in detection of various incidences

Incidence	Sensitivity (%)	Specificity (%)	PPV (%)	NPV (%)
Inflammatory Bowel Disease	100	100	100	100
Hemorrhoids	80	100	100	95.24
Polyp	77.78	100	100	95.35
Carcinoma (malignancy)	100	100	100	100

Table 6 – Age wise distribution of IBD and malignancy for CT findings

Age group	IBD (n=16)	Carcinoma (n=6)
21-30	0 (0%)	2 (33.33%)
31-40	3 (18.75%)	2 (33.33%)
41-50	6 (37.5%)	1 (16.66%)
51-60	7 (43.75%)	1 (16.66%)
Total	16 (100%)	6 (100%)

Age wise distribution of malignancies shows 66.6% of the cases were less than 40 years of age. Inflammatory bowel disease showed predominance in age group more than 40 with 81.25% of cases more than 40 years of age.

Discussion

This study was conducted in 50 patients with lower GI symptoms who were referred to the department of radiodiagnosis.

Among the 50 patients in our study, 37 patients had pathologies on CT colonoscopy with the most common being inflammatory bowel disease found in 32 % of the patients included in the study

In a study by Ayman osama et al, more prevalent lesions were found in sigmoid colon accounting for 46.4% of lesions, while 10.7% were seen in the rectum, 3.5% in the descending colon, 3.5% in the splenic flexure, 10.7% in the transverse colon, 3.5% in the hepatic flexure, 10.7

% in the ascending colon and 10.7% in the cecum.

Similarly in our study lesions were more prevalent in the sigmoid colon accounting for 40.5% of the lesions, while 27.1 % of the lesions were seen in the rectum and colon, 16.2% lesions in descending colon, 10.8% in transverse colon, 2.7% each in ascending colon and cecum[1].

Riss S et al in his prospective study among 976 patients found out the incidence of hemorrhoids was 38.93%, which is higher compared to our study. Our study indicates 20% incidence of hemorrhoids.[2]

In another cross sectional study conducted by Najar F. A. et al among 1800 patients the incidence of hemorrhoids was 9.08 % which is lower compared to the 20% incidence in our study.

Most of the literature dictates that colorectal polyps are more common in males compared to females. This was confirmed in our study that a predominant male population was involved with 3.5:1 male to female ratio. This result matches with that of Van Gelder et al study[3]

All the cases of malignancies were further evaluated for the presence of pericolonic / perirectal fat stranding and peri rectal lymphnodes , in which all the 6 cases showed the involvement of the perirectal fat stranding and peri rectal lymph nodes. Further staging by evaluation of the fat plane between the rectum and the bladder, between the rectum and the prostate were also done. Hepatic metastases in a patient with colorectal malignancy was also detected

Extracolonic findings are the incidental findings found in the axial CT images during the evaluation of the colon. This is an advantage over the conventional colonoscopy in which there is no role for extracolonic evaluation.

Michel et al in his study of prospective comparision of thin low dose multi detector row CT colonography and conventional colonoscopy among 296 patients 13.2 % had extracolonic findings (13.2%), varying in nature including aneurysmal dilatation of the aorta, vertebral changes, hemangiomas in the liver and pancreatic pseudocysts, leiomyomas of the uterus, mature teratomas in female patients and, in one case, a urothelial cell carcinoma was detected[4]. In our study the 19 out of 50 patients had extracolonic findings (38%), which were hepatic metastases in 1 patient , ascites in 2 cases, renal calculi in 5 cases, renal cortical cysts in 2 cases, inguinal hernia and lumbar spondylosis each in 2 cases; Gall bladder wall thickening and cholelithaisis in 1 case each; hiatal hernia in 1 case and 1 case of cirrhosis with portal hypertension.

In a study among 35 patients , ayman et al has described that 76% of the cases with malignancy were above the age of 40 and 60 % were above 50 %[1]. Jarmillo et al. has described that the incidence of colorectal cancer rises sharply after the age of 40, and 90% of cases occur over the age of 50[5]. This has been correlated by Halligan et al[6].But in our study 66.66% of the cases with colorectal cancer were detected in age group less than 40 years of age which is indicating a shift in the incidence of colorectal malignancies.

White TJ1 et al in their for prospective trial of 150 patients concluded that virtual colonoscopy was an effective and safe method for evaluating the bowel and was the investigation of choice amongst patients surveyed[7]

In our study only four patients (8%) complained of abdominal discomfort. It was also found only verbal reassurance was sufficient in these patients and the study could be completed without any sedatives or analgesics. Ayman osama et al in his study has described ~ 20% (7 patients out of 35) felt discomfort and similar to our study no patient needed sedatives or analgesic.[1]

Conclusion

CT Colonoscopy is an excellent, minimally invasive method of investigation of lower GI pathologies. In addition to the detection of the lesion CT colonoscopy can evaluate the locoregional extent of the lesion and gives us the information about any extracolonic incidental findings which may help the clinicians to provide further management to the patients. The main advantage with CT colonoscopy is it is minimally invasive has better patient acceptability and less inconveniency. The main disadvantage of CT colonoscopy is the radiation exposure to the patient and the inability to detect he histopathological nature of the lesion for which conventional colonoscopy suits better.

Evaluation of Self-Medication Practices in Urban Area of Kancheepuram District, Tamil Nadu

V.Aljin[1], Savitha A K[1], S. Suthanthira Kannan[1]

[1]Assistant Professor, Dept. of Community Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Self medicine is wide spread in India, on account of demonstrating compassion towards their evil relatives or companions, human services administrations not effectively accessible extraordinarily in provincial territories, destitution, ignorance, doubts, too many medication commercials given by pharmaceutical companies3, and simple access to prescriptions from pharmacies on the grounds that full time drug specialist isn't accessible, drug store keep running without drug specialists and normal medications can be accomplished from kirana shops (other than drug store).

Keywords: *destitution, pharmacies, pharmaceutical companies*

Introduction

Self-medicine is for the most part called as 'non-solution' or 'over the counter'(OTC) meds and can be effectively acquired without a doctor remedy from the retail drug stores and some from non-drug store retail outlets. It is exceptionally normal in creating nations. The patients analyze their very own sickness and purchase a particular medication from therapeutic shops to treat it. Individual self sedate themselves by taking pretty much than the suggested portion/recurrence of medication organization and length of treatment of medications. It has been seen that individuals utilize either past solutions or non doctor prescribed medications for self medicine [1].

Self medicine is wide spread in India2, on account of demonstrating compassion towards their evil relatives or companions, human services administrations not effectively accessible extraordinarily in provincial territories, destitution, ignorance, doubts, too many medication commercials given by pharmaceutical companies[3], and simple access to prescriptions from pharmacies4 on the grounds that full time drug specialist isn't accessible, drug store keep running without drug specialists and normal medications can be accomplished from kirana shops (other than drug store). [2]

It is normal for a patient with milder ailment, for example, fever, cold/hack, looseness of the bowels, acid reflux or wound contamination and so on, to get guidance(like a social insurance proficient) from their own companions, relatives or some time from outsiders in regards to pharmaceuticals extraordinarily about booked prescriptions like anti-infection agents, NSAIDs1 and so on.. In India, Schedule H (physician endorsed medications) and Schedule H 1 (anti-toxins and other confined meds) can be sold by a legitimately qualified enrolled drug endless supply of substantial remedy according to Drug and Cosmetics Act of 1943.

A larger part of the populace when they become sick, don't counsel with the social insurance experts particularly in rustic or little urban communities In India. Be that as it may, they do counsel legitimately to the drug store or potentially retail medication store and can undoubtedly get prescriptions for themselves[5].

Serious issues identified with self−medication are5wastage of assets, Increased opposition of pathogens and Causes genuine wellbeing risks, for example, unfavorable response and delayed anguish.[3]

Antimicrobial opposition is a present issue world−wide especially in creating nations where anti-infection agents are accessible with no medicine. Subsequently, the administration should find a way to control dependable self−medication. This should be possible by making accessibility of safe medications alongside legitimate directions about its utilization and if in need counselling a physician. In India, it is extremely normal to see self−medication practice and which is developing test to social insurance providers[10]

In light of this foundation, the present investigation was done to assess Self medicine rehearses in Urban territory of Kancheepuram locale in TamilNadu.

Methodology:

Study Area:

The study was conducted in **Anakaputhur,** an Urban field practice area of Sree Balaji Medical College and Hospital in Kancheepuram district, Tamil Nadu.

Study design:

A Community based cross sectional descriptive study

Study Period:

The study was conducted between June 2017 to May 2018.

Study Participants:

According to the 2011 census, Anakaputhur urban field practice area had a total population of 48,050 of which 24,158 were males , 23,892 were females . Total number of houses in Anakaputhur is 12,146. The study was done among adolescent and adults 15 years and above residing in the study area permanently at the time of the study.

Inclusion criteria:

All participants who were 15 years and above[6] and willing to participate in the study were selected

Exclusion criteria:

Those who were not willing to participate in the study were excluded.

Psychiatric patients, pregnent mother, severly ill patients were excluded from the study.

Study area:

Kancheepuram locale is one among the 32 areas of Tamil Nadu. As per the evaluation of India 2011,Kancheepuram locale covers a zone of 4433sq. km with a populace of 39.98 lakhs involving 20.12 lakhs guys and 19.8 lakhs females. Kancheepuram, the sanctuary town is the base camp of the locale for regulatory reasons, the region has been isolated into 4 income divisions containing 11 taluks with 1137 income towns. [4]

Anakaputhur is a Municipality city in the area of Kancheepuram, Tamil Nadu. It is isolated into 18 wards for which races are held at regular intervals. The investigation was led in Anakaputhur which is the urban field practice region of Department of Community Medicine of Sree Balaji Medical College and Hospital (SBMCH), situated a ways off of 7 kilometers from the organization with a territory covering roughly 16 sq. Kilometers.[8]

Sample size:

Sample size was calculated based on the study done by " Pushpa R Wijesinghe" in the year 2013 in Sri lanka which recorded the prevalence of self medication practice of 34%.[7] Using this study prevalence as reference the sample size was calculated by using 4pq / [L] [8] formula

Adding 10% refusal rate the sample size obtained is 394 which is rounded up to 400. The sample collected during the study period was 424.[10]

Sampling method:

Anakaputhur had a total population of 48,050 as per 2011 census. As per the data available in the UHTC register There were total of eighteen wards in Anakaputhur. The number of households 12146. The sampling technique followed for this study was systematic random sampling technique.

K = sample size in our study

N = Total no of households = 12146

n = sample size = 424

K = N / n = 12146 / 424 = 28^{th}. Every 28^{th} house were selected.

The name and address of the person was noted and was visited for the data collection. If the person corresponding to the number did not give informed consent or absent ,the next number was chosen and the next person was selected and interviewed. Likewise, 424 participants who gave informed consent and willingly participated in the study were identified.

Study tools:

A pre-tested structured questionnaire was used as a study tool to interview the study participants. The questionnaire was prepared in English and Tamil. It was conducted by face to face interview by the investigator himself and the responses were recorded in the questionnaire.

The questionnaire consisted of 6 sections relating to the details like socio-demographic characteristics, personal history and self-medication details,

Ethical approval: The study was approved by Institutional Ethical Review Committee of Sree Balaji Medical college and hospital , Chennai .

Informed consent: The details and purpose of the study and the confidentiality of their identity were explained to each and every participant those who were willing to participate in the study were required to sign the informed consent, after which they were included in the study . the informed consent was in Tamil ,the local language of the study participants.

Statistical Analysis

Data entry was done and analysed using SPSS software version 22

Findings:

Table1: **Prevalence of self-medication among the study participants**

Sl.no	Variables	Frequency N=424	Percentage %
3	TREATMENT FOR ILLNESS		
	Home remedy	24	5.7
	Sought medical care	146	34.4
	Self-medication	254	59.9

Table 2:Variables Related to over the counter medication

Sl.no	Variables	Frequency N=254	Percentage %
1	MODEOF GETTING OVER THECOUNTER MEDICATION		
	By telling the complaints	224	88.2
	By telling the names of the drugs	30	11.8
2	NUMBER OFDAYS DOSES BOUGHT		
	One	192	75.4
	Two	60	23.8
	Three	02	0.8
3	CHECKING EXPIRY DATE		
	Yes	12	4.7
	No	246	95.3

About 88.2% (n=224) of the study population obtained over the counter medicine by telling their complains to the pharmacist. A minimal of 11.8% (n=30) of them obtained medicine by telling the drugs name.

Majority of the study population 75.4% (n=192) obtained a single dose for their illness and 23.8% (n=60) of the study population obtained a single dose and 0.8% (n=2) of them obtained three doses for their illness.

Only 4.7% (n=60) of the study population checked for the expiry date while 95.3% (n=246)majority of the study population were not on the habit of checking the expiry date.

Table 3 : Common illness for which self medication used

Sl.no	Variables	Freq-Uency	Percen-Tage %
1.	Head ache	100	39.4
2.	Minor injuries	02	0.8
3.	Abdominal pain	08	3.1
4.	Fever	46	18.1
5.	Allergy	10	3.9
6.	Body pain	42	16.5
7.	URI	22	8.7
8.	Acidity	18	7.1
9.	Throat pain	02	0.8
10.	Wheezing	02	0.8
11.	Knee pain	02	0.8

About 39.4% (n=100) of the study population used self medication for head ache. About 18.1% (n=46) of them used for fever,16.5% (n=42)of them used for body pain, 8.7% (n=22) used for URI , 7.1% (n=18) for acidity and 3.1% (n=08) for abdominal pain,0.8% (n=02) for throat pain, wheezing, knee pain and head ache.

Table 4:Variables related to self medication

Sl.no	Variables	Frequency N=254	Percen-tage %
1	NOTGONEFORSELF MEDICATION		
	Illness less than 1 week	208	81.9
	Gender	02	0.8
	Paediatric	40	15.7
	Chronic illnesses	04	1.6
2	FACED PROBLEM DUETOSELF MEDICATION		
	Yes	32	12.6
	No	222	87.4
3	Advice self medication to others		
	Yes	38	9.0
	No	386	91
4	Harmful effects of self medication		
	Drug reaction	06	1.4
	Delay in care seeking	96	22.6
	Delay in diagnosis	248	58.5
	No expert opinion	74	17.5

	Rules and regulations	12	2.8
	Ban	56	13.2
	Awareness	146	34.4
	Availability	210	49.5

Table 6 shows the side effects faced. About 12.6% (n=32) have faced the consequence of self medication, while 87% (n=222) have not faced any complication. Among the total study population (n=424) about 9% (n=38) revealed that they would advice self medication to others where as majority of them 91% (n=386) revealed that they would not advice self medication to others.

Harmful effects of self medication . 58.5% (n=248) revealed that Delay in diagnosis. 22.6% (n=96)Delay in care seeking. 17.5% (n=74)No expert opinion. (1.4% n=06) Drug reaction Steps to be taken to stop self medications 49.5% (n=210) Availability 34.4% (n=146) Awareness. 13.2%(n= 56)ban.2.8% (n=12) Rules and regulations

Discussion

The present study is a cross sectional study , carried out in an urban field practicing area (Anakaputhur) of Sree Balaji Medical college and hospital, Kanchepuram district Tamil Nadu to evaluate the self medication practices among people residing in an urban community. The study was conducted for a period of six months. Data were obtained by administering the questionnaire to the participant by interview method. The collected data were analysed using SPSS software version.

Over all the self-medication in the current study is59.9%. This prevalence is comparable with the studies conducted by Khan et al 2014 was 54.9% and Kalaivani Annadurai [9]et al in Puducherry 2014 was 53.43%. T Aqeel[1] et al in Pakistan 2014 was 61.2%. The Prevalence of self medication is 59.9% , in that 47.2% of them got drug from previous prescription , 26.8% got drugs from pharmacy by telling their complaints, 17.3% advise from friends ,relatives and neighbour and remaining 8.7% from advertisements, internet ect . This is similar to a study done by Balamurugan .E[10] et al 21.5% of them got drug from previous prescription, 21% got drugs from pharmacy by telling their complaints ,12.5% advice from friends and remaining 5.5% from advertisements, internet etc. in another study done by Yogendra Keche[11] et al 64.32% of them god drug from previous prescription, 23% got drug from pharmacy by telling their complaints, 5.63% advice from friends ,and remaining 7.04% from advertisement and internet and Dr Pragatika Dadhich[13] et al, 45.26% got drug from previous prescription, 33.68% got drug from pharmacy by telling their complaints, 14.73% advice from friends , and remaining 6.31% advertisement and internet.

About 39.4% of the study participant took self medication for head ache and 16.5% for body ache similar to a study done by Yogendra Keche[11] et al 33.3%, 40.5% Shyambsunder keshari[6] et al ,35% by Balamurugan [10]E et al.

Conclusion

Health professionals have to spend some extra time in educating patients regarding the same. Improved knowledge and understanding about self-medication may result in rationale use and thus limit emerging microbial resistance issues. The adverse consequences of such practices should always be emphasized to the community and steps to curb it. Rampant irrational use of antimicrobials without medical guidance may result in greater probability of inappropriate, incorrect, or undue therapy, missed diagnosis, delays in appropriate treatment, pathogen resistance and increased morbidity. This study focused on the self−medication of allopathic drugs, their uses, its safety and reason for using it. At a pharmacy shop level, prescription monitoring and sales volume comparison should become a routine part of inspection and audit by drug regulatory authorities. The potential benefits of this trend, with the increasing empowerment of patients, are many. Nevertheless, developments in self medication will need to be carefully managed if these benefits are to be maximised and the potential risks kept to a miminum. Greater collaboration between doctors and pharmacists will be critical and joint training on over the counter medicines will be very helpful [12]

A Study of Airtraq Optical Laryngoscope for Intubation in Adult Surgical Patients, A Prospective Randomized Controlled Study

Jayakar Thomas[1], K. Manoharan[2]

[1]Professor and HOD, [2]Professor, Dept. of DVL, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Objectives: To ponder the intubating conditions in grown-up careful patients utilizing airtraq optical laryngoscope without hardly lifting a finger of intubation, time taken for intubation, aviation route injury and hemodynamic reaction to laryngoscopy.

Place of Study: Aneasthesia Department, Sree Balaji Medical College and hospital, Chromepet, Chennai.

Period of Study: August 2016 to February 2018(18 months).

Study Design: Cross sectional analytical study.

Materials & Method: The investigation was a Single focus, forthcoming, randomized, open mark, interventional controlled study. After acquiring institutional moral advisory group endorsement. 30 patients (test size) are posted for elective medical procedure requiring general anesthesia (Recruitment) with fulfilling consideration criteria were airtraqwho were decided on general medical procedure intubated with airtraqoptical laryngoscope tried out the examination in the wake of acquiring educated assent from the patients and relatives[5]

Results : Our study proved that Airtraq intubation helps the patients with good glottis view and it has less duration and less airway trauma. The intubation time and intubation difficulty score is more stable.

Conclusion : Our study concludes that endotracheal intubation is easier with Airtraq as it provide good glottis view. In addition to that Airtraq have less intubation duration, less hemodynamic response for intubation and less Airway trauma. Airtraqlaryngoscope significantly improve the view of glottic opening and facilitates fast, easy and reliable intubation.Airtraq reduce the need of more sophisticated and complex airway instrument like flexible fibreoptic bronchoscope to a particular extent.

Keywords: *anesthesia, airtraqoptical laryngoscope*

Introduction

Tracheal intubation utilizing a laryngoscope is considered as a best quality level of aviation route the board during organization of general anesthesia and furthermore in basic consideration settings due to its few focal points including

- Isolation of respiratory tract from Gastro intestinal framework and subsequently negligible danger of desire.
- Allows conveyance of oxygen and soporific gases by means of positive weight ventilation without expansion of stomach.
- Access to tracheobronchial tree for pneumonic

lavage and medication administration(e.g. breathed in bronchodilators).

- Improved access to head and neck medical procedures.

Airway management is important for anaesthesia because adverse respiratory events are responsible for 75% of ASA closed claims. Of these failed ventilation is the main culprit(38%), followed by faulty placement of endotracheal tube in esophagus (17%) and difficult intubation(18%). Approximately 600 patients die each year in the developed world from complications due to airway management and also in the underdeveloped world is much grimmer.[1]

MATERIALS &METHODS :

This study was done in SreeBalaji Medical College & Hospital, Chennai at Department of Anaesthesiolgy and Critical Care from August 2016 to February 2018. It was a Single centre, prospective, randomized,open label, interventional controlled study. After obtaining institutional ethical committee approval.30 patients (sample size) are posted for elective surgery requiring general anaesthesia (Recruitment) with satisfying inclusion criteria were enrolled in the study after obtaining informed consent from the patients and relatives.[2]

Group A -30 Patients –airtraq optical laryngoscope

INCLUSION CRITERIA

- ASA 1 & 2 patients
- Age 18-65 years, both sexes
- Elective surgical cases requiring GA
- MPC 1,2,&3 patients

EXCLUSION CRITERIA

- Severe CVS,RS, hepatic, renal disease patients
- Any valvular, conduction abnormality, IHD, Hypertensive patients
- Patients on antihypertensive drugs or beta blockers
- Anticipated difficult airway patients
- BMI more than 40
- Patient refusal

MATERIAL

- Airtraq optical laryngoscope adult size

Findings :

Table 1: Comparision of IDS

Total Intubation Difficulty Score	GROUP A	
	No	%

Parameter assessed	Group	N	Mean	S.D
Intubation time	Airtraq	30	15.93	2.55

Mean duration of intubation with the Airtraq group was 15.93 secs

Discussion

Expert airway management is an essential skill for anesthesiologist. Difficult endotracheal intubation is mostly caused by difficult direct laryngoscopy with impaired view of vocal cords. Despite all the information currently available, no single factor reliably predict these difficulties. Unfortunately many difficult intubations are not be recognized until after induction of anaesthesia. Unexpected difficult intubation lead to critical situation, especially who are difficult to ventilate by mask, who are at risk for gastric regurgitation and patients with limited cardiopulmonary reserves.When a person in supine position and head in the neutral position, the laryngeal axis is almost horizontal.The pharyngeal axis is 30-45˚ from the horizontal axis and the oral axis almost perpendicular to the laryngeal axis. For a successful direct laryngoscopy for the exposure of the glottis opening, the oral, pharyngeal and laryngeal axes alignment is required. Elevation of the head about 10cm with pads below the occiput aligns the laryngaeal and pharyngeal axes. Conventional macintosh laryngoscopy fails to get desired laryngeal view in patients with difficult airway like short neck, anteriorly placed larynx, small jaw, MPC 3 & MPC 4 patients, cervical spine immobilization needed patients etc. But reports said that airtraq have shown improvement in laryngeal view and ease of intubation in normal and difficult airway patients.

The advantages of airtraq optical laryngoscope from the available literatures are(24)

1. Airtraq does not need alignment of the axes to improve intubating condition because the axis of airtraq is curved and the image is transmitted through lenses and mirrors.

2. Airtaq is useful in patients with altered airway and magill's position contraindicated patients.

3. The displayed anatomy is magnified in proximal viewfinder.

4. The anatomical structure and anomalies are easily viewed with help of airtraq.

5. Airtraqassociated with less hemodynamic changes due to less manipulation of the airway and only clockwise or anticlockwise movement and upwards ordownwards movement was required, not the lifting movement as in macintosh laryngoscope.

6. Airtraq significantly reduces the duration of intubation.

7. A clip on wireless video system is also available in airtraq which allows viewing on an external screen. It is also useful for teaching purposes.

8. Shortens the endotracheal intubation learning curve in novice personnel.

9. Channel loading type of video laryngoscope example Airtraq optimal laryngoscope provides perfect visualization of larynx yet may result in failure of endotracheal intubation(17).

10. When insufficient visualization occurs the airtraq may be used to open an airway path. Insert Fibreoptic bronchoscope with an endotracheal tube either in channel or ext to the device and direct it towards the epiglottis(17)

11. We too have employed this combined technique in both adult and paediatric patients in difficult airway(3,36,43,44).

12. Many compared the degree of cervical spine movement in laryngoscope performed using airtraq and conventional macintosh laryngoscope. Although

significant movement of cervical spine from baseline wasnoted during all procedure($p<0.05$),cervical spine extension with airtraq was 29% less than measured during macintosh laryngoscopy between occiput and c4 and 44% less at the c3/c4 motion segment. Anterior deviation of the vertebral bodies from baseline were 32%,35%,38% and 40% less at the atlass,c2,c3 and c4 vertebrae respectively during airtraq laryngoscopy($p<0.01$)(45).

13. Some study also demonstrated that laryngoscopy using the airtraq laryngoscope involves less movement of cervical spine compared to conventional procedure using macintosh laryngoscope(45).

14. Videolaryngoscope are new intubating device which provide an indirect view of the upper airway in difficult airway management, they improves Cormack-lehane grade and achieve the same or a higher intubation success rate in less time compared with direct laryngoscope(46).

It was generally easy to insert the airtraq in to the oral cavity, to obtain a full view of the laryngeal aperture and to intubate the endotracheal tube into the trachea without majorcomplication. In airtraq the endotracheal tube can be attached to the side of the blade and the tip of the ET tube is visible on the proximal viewfinder. Once laryngeal aperture was positioned in the centre of the proximal viewfinder, it was easy to introduce the ET tube into the trachea.[4]

Eventhough we have a good view of glottis there was difficulty in negotiating the ET tube into the trachea, that result in prolonged intubation. The back and up maneuver or clockwise or anticlockwise movement of airtraq was needed to introduce the ET tube into the trachea.

The above findings suggest that the airtraq laryngoscopy produce less stimulation of heart rate and blood pressure during endotracheal intubation comparison with the macintosh laryngoscopy. These results show that airtraq provides good glottic view, without the need of alignment of pharyngeal, laryngeal and tracheal axes and less force required to lift during laryngoscopy. These results are similar to christen H Maharaj's study (14).

My study results show that airtraq have less intubation difficulty score, less Cormack and Lehane score, less intubation duration, less Airway trauma and less hemodynamic response for intubation. These results are similar to Christen H Maharaj's study

Summary

In our study Airtraq laryngoscopy had less intubation difficulty score Airtraq had less Cormack and Lehane grading, less intubation duration, less airway trauma and less hemodynamic response for intubation.[8]

Conclusion

Our study concludes that endotracheal intubation is easier with Airtraq as it provide good glottis view. In addition to that Airtraq have less intubation duration, less hemodynamic response for intubation and less Airway trauma.

Airtraqlaryngoscope significantly improve the view of glottic opening and facilitates fast, easy and reliable intubation.Airtraq reduce the need of more sophisticated and complex airway instrument like flexible fibreoptic bronchoscope to a particular extent.It can also be useful in routine anaesthesia management, in critical care, anticipated, unanticipated airway situations.Due to less hemodynamic response for laryngoscopy for airtraq may have advantage in clinical situation like coronary artery disease or cardiac arrhythmias and neuro surgery patients.

A Study of Injection 0.75% Ropivacaine for its Duration of Anaesthesia / Analgesia in Transversus Abdominis Plane Block for Unilateral Inguinal Hernia Repair Under Ultrasound Guidance

Dunnuthala Sreenivasulu Reddy[1], P. John Solomon[2]

[1]PG Student, [2]Professor, Dept. of Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Objectives: The point of the examination is to assess transversus abdominis plane square for postoperative absence of pain in patients experiencing inguinal hernia fix medical procedure with the dose of 0.75 % Ropivacaine& to quantify the hour of first solicitation for salvage absence of pain.

Place of Study: Aneasthesia Department, SreeBalajiMedical College and hospital, Chromepet, Chennai.

Period of Study: August 2016 to February 2018(18 months).

Study Design: Cross sectional analytical study.

Materials and Method: All patients who underwent unilateral inguinal hernioplasty surgery who were given 0.75% ropivacaine injection are included in the study, after explaining the nature of the study and obtaining informed consent for participating in the study. They are classified into different age group categories. P value < 0.05 was considered as statistically significant**.**

Results : The attempt to explore the efficacy of 0.75% ropivacaine in ultrasound guided - transversus abdominis plane block in patients undergoing unilateral inguinal hernioplasty under spinal anaesthesia found that th duration of analgesia was reasonable with the dosage of 0.75% ropivacaine. The vital parameters were well maintained among the patients throughout the study period. There were no complications like local anaesthetic toxicity noted among the patients and the drug was proved to be effective.

Conclusion : About 15 ml of 0.75 % ropivacaine for transverse abdominis plane block produces satisfactory and comparable sensory block, related to duration, analgesia and VAS score . The haemodynamics were stable in both the groups. The lower CNS and cardio toxicity of ropivacaine may help in reducing the risk to the patients. The clinical correlation in duration, dose of analgesia and VAS score among the patients, when injected in required volume for TAP block under ultrasound guidance. Ropivacaine has a potentially improved safety profile when compared to any other similar drug. Hence it may offer an advantage .

Introduction

The stomach divider frames a noteworthy wellspring of agony following stomach medical procedure.[5] Indeed, even a little medical procedure like inguinal herniorrhaphy might be trailed by danger of ceaseless torment in around 5-10% patients with critical impact

on every day exercises if postoperative absense of pain isn't dealt with. The standard pattern is to endorse a narcotic or a NSAID for postoperative absense of pain. The narcotics have number of symptoms like respiratory gloom, emesis, decrease in gut motility, sedation and so on. NSAIDS hav e certain reactions like hemostasis modification, renal brokenness, gastrointestinal discharge, and so forth. Nonetheless, in local pain relieving method, drugs have fringe site of activity and subsequently negligible fundamental symptoms. Consequently local soporific strategy has increased wide spread significance in postoperative absense of pain routine. [1]

Transversus Abdominis Plane (TAP) square is one of such provincial squares. It gives absense of pain after lower stomach medical procedure especially where parietal divider torment structures real part of agony. It is doctor's obligation to safeguard the patients from careful agony by the most conceivable mean. Presently postoperative torment control is commonly best overseen by anaesthesiologists, since they offer territorial soporific systems just as pharmacological ability in analgesics. [6]

Inguinal hernia fix medical procedure is one of the most widely recognized medical procedure performed when all is said in done populace. Postoperative absense of pain is fundamental to give solace and rebuilding of capacities like breathing, hack, development and co mmunication adequately. Utilization of narcotics and NSAIDS can bring about huge unfavorable impacts.

Different systems like rectus abdominis sheath square, paravertebral square, ilioinguinal/ilio - hypogastric square, neighborhood analgesic penetration and so forth are likewise tes ted. However, these have hindrances as they are difficult to perform, don't give satisfactory absense of pain, don't create long enough pain relieving length and so forth. The most recent pattern is the act of at least two pain relieving approach at the same time called multimodal absense of pain. It can create better agony control, lessen the individual portion of the specialist and in this manner brings down cost, low reaction and increasingly remedial security. Over late years, Transversus Abdominis Plane (TAP) square turned into a piece of multimodal absense of pain. [8]

TAP is a neuro fascial plane between the Internal Oblique (IO) and Transversus Abdominis (TA) muscle of the stomach divider through which every single tangible nerve supply the parietal peritoneum, skin and muscles of foremost stomach divider. Along these lines, it is a novel way to deal with square these tangible nerves by infusing nearby sedative inside the Transversus Abdominis Plane (TAP), named as TAP square .1 Because the tactile afferent nerves keep running between the muscular strength, these nerves can be blocked and postoperative torment can be overseen. This has been seen as a viable strategy in colon medical procedure, cesarean segment with midline entry point and prostatectomy and it is additionally compelling in overseeing torment following inguinal hernia medical procedures. TAP square was first depicted by Rafi et al in 2001 and was additionally created and tried by McDonnell et al in 2004.1[0]

Materials & Method

The purpose of our study was to evaluate effectiveness of TAP block to provide effective postoperative analgesia in patients undergoing inguinal hernia repair surgery with 0.75 % ropivacaine injection.

Patients receiving USG -TAP block at the end of surgery with 20 ml Inj. Ropivacaine 0.75% -20 patients.

Pre-anaesthetic check -up was done.

Inclusion & exclusion criteria were as follows;

Inclusion criteria

i. Male & Female patients giving written and info rmed consent for the study

ii . ASA grade I & II.

iii . All patients of age group 20 to 65 years of age.

iv **.** Patients undergoing unilateral inguinal hernia surgeryunder spinal anaesthesia .

Exclusion criteria

1. Patient refusal

2. Bleeding disorders

3. Allergy to local anaesthetics

4 . Mental disorders

5. Morbid obesity

6. Abnormal liver function tests

7. Infection at local site of block

8. Hemodynamic instability

9. Contraindications for spinal anaesthesia

10. Any anatomical deformity at site of block

11. ASA III & above

Patient details including Age, Sex, Weight, ASA grading were noted.

Thorough History taken and Clinical Examination done.

Materials Required

1. Ultrasound machine with a linear transducer (7 -13 MHz)

2. Sterile gloves

3. Ultrasound probe cover

4. Antiseptic solution for skin disinfection

5. ultrasound gel

6. 23-gauge spinal needle

7. 20ml syringe with injection tubing

Consent

Those patients who qualify as per the selection criteria were explained regarding surgical procedure, anaesthesia procedure & drugs to be used in their vernacular language[7]

A written informed consent was obtained in each case in their vernacular language. All patients were explained the concept of V.A.S score and their V.A.S scores were assessed accordingly.

Methodology

After Ethical Committee approval, we investigated forty patients undergoing unilateral inguinal hernioplasty. The patients were randomized and allotted to two groups by computer generated tables to undergo TAP block with ropivacaine(n =20) [GROUP B] versus ropivacaine (n = 20) [GROUP R].[8-10]

Written informed consent was taken on previous day and all the patients were explained visual analogue scale Patient preparation for spinal anaesthesia and TAP block was done so as to maintain all aseptic conditions.

On the Day of Surgery

Consent and fasting status were confirmed. In the operation theatre, standard monitoring including ECG, non -invasive BP, pulse oximeter were attached. Peripheral line w as taken with 18G IV cannula.[11-12]

As per the institutional protocol, patients were premedicated with intravenous ranitidine and intravenous ondansetron. All patients received standardized spinal anaesthesia with 0.75% ropivacaine 3.5 ml in sitting position. Level of analgesia achieved noted. Block assessed by pin prick method. Patients monitored intraoperatively. Hypotension was taken as fall in systolic blood pressure>20% 0f base line and treated with incremental doses of mepheneteramine 6mg and bolus of 200 ml ringer lactate. Bradycardia was taken as heart rate <50 bpm & treated accordingly with intravenous atropine 0.6mg. No analgesic or sedation was given to patient intraoperatively.

Intra operative monitoring:

- Vitals were monitored at 5,10,15,30,45,60,75, 90,120… mints till the end of surgery.
- Pulse, Blood Pressure, SPO 2 monitored and recorded.
- Any complications like bradycardia, hypotension were observed.
- At the end of surgery, Petits triangle was identified on the side of surgery and USG guided TAP block performed .

Total dose of diclofenac consumption in group R it was 75.14 ± 0.68 mg

Findings

Elective inguinal hernia repair is one of the most common surgical procedures performed. A good postoperative analgesic regimen is critically important to improve postoperative outcome. Adequate postoperative analgesia facilitates earlier patient mobilization and earlier fulfilment of discharge criteria from postoperative wards. Pain after inguinal hernia repair is more pronounced in the first two postoperative days. The pain is aggravated during mobilisation or coughing. Patients undergoing inguinal hernia repair commonly receive intravenous opioids for postoperative analgesia. With the advent of truncal nerve blocks there seem to be an alternative to epidural analgesia to provide postoperative pain relief. However, failure rate is high in truncal nerve blocks in anatomic landmark based approaches. Our study population had immediate pain relief by TAP block in the post-operative period with several implications in recovery of these patients, such as VAS score, reduced side effects of opioids and analgesics and better quality of analgesia. The VAS Score of our study group at various time intervals was stable. The time for rescue analgesia in our study for whom USG -guided TAP block was given, the time interval for requirement of first dose of rescue analgesia was prolonged in the case of 0.5 % ropivacaine group [mean analgesic duration – 308.87 ± 12.2 min. This correlates with studies of PATEL et al., who found that there was a 34% reduction in oral narcotic dosing in patients who received a TAP block. They also observed decreased opioid usage and hence the decreased side effects of it like pruritus, vomiting and nausea. This block also facilitates early ambulation, no urinary retention, and a more active state of the patient. The vital parameters such as heart rate, systolic

and diastolic blood pressures and the oxygen saturation were stable and there was no complications noted.

Results

A prospective, randomized study was designed to explore the efficacy of 0.75% ropivacaine in ultrasound guided - transversus abdominis plane block in patients undergoing unilateral inguinal hernioplasty under spinal anaesthesia. Based on the analysis the results are given below:

Ø There was no statistically significant difference in demographic profiles when ropivacaine is injected.

Ø The duration of analgesia was statistically insignificant with the dosage of 0.75% ropivacaine.

Ø The vital parameters were well maintained among the patients throughout the study period.

Ø There was no failure of TAP block among all patients who had a post -operative pain relief for 6 -10 hours.

Ø Patient satisfaction was good.

Ø There was no adverse reactions or side effects among the patients.

Ø There were no complications like local anaesthetic toxicity noted among the patients.

Ethical Clearance- No ethical clearance was necessary for this research work

Ki-67 Proliferative Marker in Thyroid Lesions

Prabhu K[1], Archana Rajasundharam[1], Jayakumari.S[1], Durga Devi.G[1]

[1]*Associate Professor, Department of Anatomy, Sree Balaji Medical College and Hospital, Chrompet, Chennai*

Abstract

Introduction: Approximately 5 percent of thyroid cancers happen in all thyroid nodules, regardless of their size. PTC is the most prevalent type of thyroid cancer in all thyroid cancers. Although it is hard to distinguish PTC from benign papillary hyperplasia of the thyroid gland on the basis of its morphology, it is essential to distinguish benign ones from malignant ones for early therapy and better patient management. Although the diagnostic and prognostic values of Ki-67/MIB-1 in thyroid cancer stay uncertain, it has been noted that Ki-67/MIB-1 has an impact.

Materials and Method: 60 gross samples have been taken for research. These biopsy samples were regularly fixed in 10% formalin and processed in paraffin wax. Five micron dense parts were sliced and drawn for research and hematoxylin and eosin staining of the parts was performed. Histopathological examination of these segments has been carried out. The immunohistochemistry survey using Ki-67 monoclonal antibody as a proliferation marker was conducted in 60 cases. The current survey was conducted to determine the function of ki-67 in distinct kinds of neoplastic and non-neoplastic thyroid lesions.[1]

Results : Mean Ki67 LI values in our research were 14.12±2.29,61.42±3.77 and 34.90±3.49 and 18.60±1.96 for PTC, FTC, FTA and NG, respectively. In this research, numerous group comparisons were made using the Bonferroni post-hoc test, and Ki-67 values were discovered to be statistically important among all thyroid lesions.[2]

Conclusion: Although the Ki-67 marker is costly, it was discovered to be very simple to conduct and to get better outcomes. It is therefore found that the Ki-67 marker is suggested to be used in instances of dubious capsular and/or vascular invasion and follicular lesions with questionable nuclear characteristics.

Key Words: *Ki-67, FTC,PTC,FA,NG,Ki-67 LI*

Introduction

Thyroid carcinoma, which accounts for about 1% of all cancers, is the most prevalent malignancy among all endocrine organs.(1) Approximately 5% of all endocrine diseases happen as thyroid tumors among all thyroid nodules, regardless of their size.(2) Of all thyroid cancers, PTC is discovered to be the most prevalent type of thyroid cancer. Although it is discovered that it is hard to distinguish PTC from benign papillary hyperplasia of the thyroid gland on the basis of their morphology, it is essential to distinguish benign from malignant for early and better therapy.Patient management. Histomorphologic examination of slides that are regularly stained by Haematoxylin and Eosin (H&E) is presently used as a normal diagnosis. [6]This has been recorded in literature that inter-observer or intra-observer disagreements in the diagnosis of follicular and papillary thyroid lesions.(3) A big amount of molecular changes in thyroid cancer have been documented in latest years in the distinction between malignant and benign thyroid lesions. Among these markers, Ki67 and cytokeratin-19 (CK-19), galectin-3 and TG have been most frequently used in thyroid pathology. Although the diagnosis and prognosis of Ki-67/MIB-1 in thyroid cancer remains uncertain, it has been noted that Ki-67/MIB-1 has an

impact on clinical development and prognosis in cancers with increasing proof. (6)Ki-67, which is deemed to be a nuclear antigen, is expressed in all cell nucleus, except in the G0 phase. MIB-1 acts as a monoclonal antibody and rises against Ki-67.(6) Ki-67 has been studied in many cancers in latest years, including cervical cancer, pulmonary cancer, breast cancer and thyroid cancer.(7) It has been revealed that Ki-67 has also been identified as an significant and autonomous prognostic factor in patients with thyroid cancer in many studies.[1]

Materials and Method

This research was conducted at the Department of Pathology, SreeBalaji Medical College & Hospital, Bharath University. during my study period of 17 months that is between February 2017 to July 2018. Out of the 78 thyroid specimens which were received for histopathological examination following initial cytological evaluation by fine needle aspiration cytology, 60 gross specimens were taken for study. These biopsy samples were regularly fixed in 10% formalin and processed in paraffin wax. Sections of 5 microns dense were cut and taken for the study and hematoxylin and eosin staining of sections was done. Histopathologicalexamination of these sections were done. Immunohistochemical study using Ki-67 monoclonal antibody as a proliferation marker was done in 60 cases.[9-10]

Results

The current research comprises of 60 thyroid mass instances. which were removed surgically and were sent for the Histopathological Examination to our department (Department of Pathology, SBMCH). All these specimens were received from the Department of Surgery, SBMCH. These 60 cases include 22(36.67%) Non-neoplastic lesions of Thyroid which include Nodular Goitre, MNG, Nodular Goitre with papillary hyperplasia,10(16.67%) benign neoplasms of Thyroid which include 8 cases of follicular adenoma and 2 cases of hurthle cell adenoma and 28 malignant thyroid lesions, including 25 (41.67 per cent) instances of thyroid papillary carcinoma and 3 (5 per cent) cases of thyroid follicular carcinoma.[10]

Ki 67 Labelling Index

Ki-67 immunohistochemistry staining was performed in all instances of Nodular colloid goitre, follicular adenoma, follicular carcinoma and papillary carcinoma. An region was chosen to assess the labeling index (LI).LI was expressed as a proportion by estimating brown nuclear reactivity (as shown in fig:1-4) (strongly stained cells) per 100 follicular epithelial cells. The mean values of Ki-67 in separate thyroid lesions are shown in Table-1 and Chart-1.[5] In this research, we discovered that with the mean values, follicular adenoma with follicular carcinoma and papillary carcinoma can also be differentiated. All of the lesions of thyroid, non-neoplastic, benign and malignant lesions can be differentiated.The highest Ki-67 LI was seen in Follicular thyroid carcinoma (52.67%) followed by Follicular Adenoma (21.60%). Surprisingly in this study, Papillary thyroid carcinoma has shown lower Ki-67 LI (12.48%) when compared to FTC and FA. Least Ki-67 LI was seen in nodular colloid goitre.[4]

Table -1

DIAGNOSIS	KI 67 LI %(MEAN ± SD)
NODULAR COLLOID GOITRE	5.18 ± 1.99
FOLLICULAR/HURTHLE CELL ADENOMA	21.60 ± 6.17
FOLLICULAR CARCINOMA	52.67 ± 9.86
PAPILLARY CARCINOMA	12.48 ± 3.75

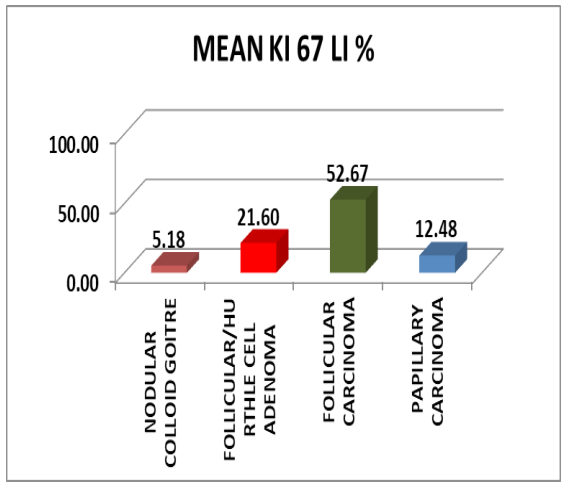

Chart-1

Table 2 Multiple comparison was done for KI-67 LI among Thyroid lesions

Dependent Variable			Mean Difference (I-J)	Std. Error	Sig.
Ki 67 Li %	Nodular Colloid Goitre	Follicular/Hurthle Cell Adenoma	-16.41818*	1.57792	.000
		Follicular Carcinoma	-47.48485*	2.54635	.000
		Papillary Carcinoma	-7.29818*	1.20945	.000
	Follicular/Hurthle Cell Adenoma	Nodular Colloid Goitre	16.41818*	1.57792	.000
		Follicular Carcinoma	-31.06667*	2.72352	.000
		Papillary Carcinoma	9.12000*	1.54805	.000
	Follicular Carcinoma	Nodular Colloid Goitre	47.48485*	2.54635	.000
		Follicular/Hurthle Cell Adenoma	31.06667*	2.72352	.000
		Papillary Carcinoma	40.18667*	2.52795	.000
	Papillary Carcinoma	Nodular Colloid Goitre	7.29818*	1.20945	.000
		Follicular/Hurthle Cell Adenoma	-9.12000*	1.54805	.000
		Follicular Carcinoma	-40.18667*	2.52795	.000

*p<0.05 is taken as significant.

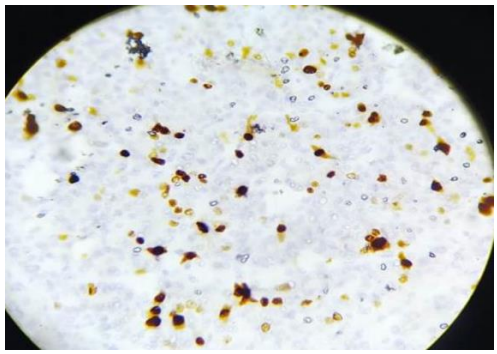

Fig: 1: FTC, showing highest nuclear positivity with highly significant brownish staining than FA, PTC, under

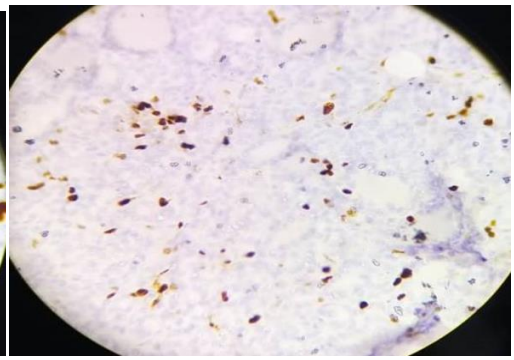

Fig:2: FA, showing moderate and significant nuclear positivity with higher brownish staining than PTC, under 40x.

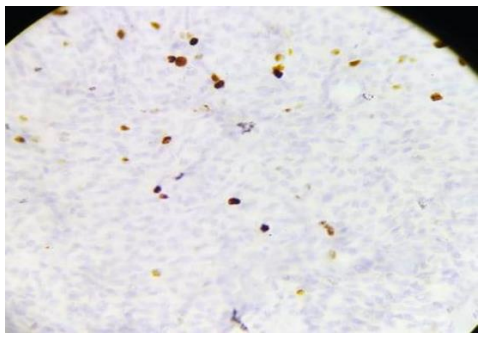

Fig:3: PTC, showing mild significant nuclear positivity with brownish staining more than

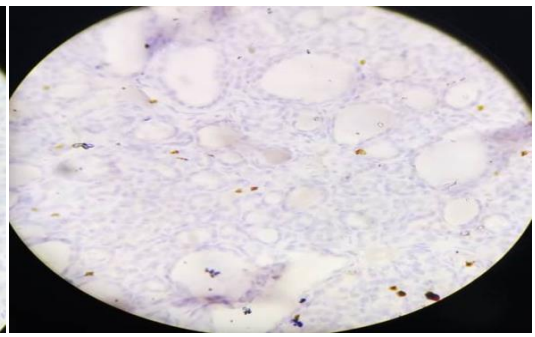

Fig:4: NG, showing least nuclear positivity with brown staining here and

As shown in the table-2, intergroup comparison for Ki-67 LI was done among different lesions of thyroid for statistical analysis, which were divided by using post hoc Bonferroni test. The value was found to be statistically significant among all the thyroid lesions. ($p<0.05$).[7]

Findings

More and more efforts have been made over the last century to discover extra requirements for precise diagnosis of thyroid nodules. Simple and low-cost antibody tests may be used in most laboratories if they have been shown to be effective in routine thyroid nodule assessments.[8] There is an urgent need for accurate and repeatable IHC markers to differentiate between benign thyroid nodules and malignant lesions. A number of research have been attempted to classify different biomarkers for thyroid carcinoma on the grounds of their gene expression profiles to date. The present research identified the use of Ki-67 in differentiating benign and malignant thyroid lesions. Ki-67 Labeling Index: Ki-67 as a marker for cell proliferation is correlated with biological and prognostic aggressiveness in separate tumors. As Ki-67 LI expression is usually found to be small in thyroid carcinoma, with the exception of anaplastic and badly distinguished carcinoma, restricted use of Ki67 was seen in the differential diagnosis of thyroid nodules. Mean Ki67 LI values in our study were 14.12± 2.29, 61.42±3.77 and 34.90±3.49 and 18.60±1.96 for PTC, FTC, FTA and NG respectively. (as shown in Table-1, Chart-1).Our results were shown in accordance with Mar et al., (2006)(9) and indicated in his research that mean Ki67index was 2.07±1.65 for FTC and 1.78±0.92 for FTA. Similarly, Sofiadis et al. Sofiadis et al., (2009)(10) also revealed that the mean Ki67 index was 2.9 for PTC, 3.5 for FTC and 1.6 for FTA in his study. Pujani M et al. (2010)(11) [8]also reported in his research that the mean Ki-67 Labelling Index rose progressively from multinodular goitre to follicular adenoma, papillary carcinoma, and was the highest in undifferentiated carcinoma. Erickson et al. 11(1998)(12) The largest values were noted for the Ki-67 Labelling Index in anaplastic carcinoma followed by follicular and

papillary carcinoma. Although anaplastic and poorly distinguished carcinomas were not included in this research, high Ki67 LI was found compared to those found in the literature for benign and malignant tumors. However, in contrast to our research, Saiz et al (2002) (13) was researched.It was found in his study that the highest expression by all these markers including Ki-67 was found in malignant tumours particularly in papillary carcinoma whereas in our study least expression of Ki-67 was seen in PTC when compared to FTC and FA.

In the present study, multiple groups comparison was done by post hoc Bonferroni test, Ki-67 values were found to be statistically significant among all the thyroid lesions. ($p<0.01$) as shown in table-2 .

The outcome was consistent with H.A. Aiad et al.,2012(14) indicated in his research that Ki-67 showed a substantial statistical distinction between FTC and FTA ($p<0.0001$). However, he did not discover a statistically significant distinction between PTC and Nodular colloid goitre.

Conclusion

Many studies had proved that higher expression of Ki-67 showed poor prognosis with poor survival or high mortality in patients of thyroid cancer.In current study,[8] Ki67 labelling index is It was discovered to be helpful in the differentiation between FTC and FTA and between FTC and PTC. Ki67 LI, too, was found significantly useful in differentiating PTC from FTA. Although Ki-67 marker is expensive but was found very easy to perform and get better results. Therefore, Ki-67 marker is suggested to use In instances of dubious capsular and/or vascular invasion and follicular lesions with questionable nuclear characteristics. However, with only restricted instances of 60 thyroid lesions, a further bigger research is required to verify this. associationof thismarker in thyroid lesions in the routine pathological practice.

To Compare the Side Effect Profile of Azithromycin Pulse Therapy with Doxycycline in Acne Vulgaris Treatment: An Open Labelled, Randomised , Parallel Group, Hospital based Study

P. Mohan Kumar[1], Savitha A K[1], S. Suthanthira Kannan[1]

[1]Assistant Professor, Dept. of Community Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Background: Skin break out vulgaris is a typical dermatological issue with multifactorial etiology . There exists both topical and fundamental treatment for skin break out This examination was led to look at the reaction profile of oral azithromycin beat treatment with oral doxycycline in the treatment of skin break out vulgaris . Techniques: This randomized controlled preliminary was led in the Dermatology division of Sree balaji therapeutic school and emergency clinic from March 2016 to March 2017. Patients of age (15–40 years) having any evaluation of skin inflammation vulgaris were incorporated into the study.200 patients were haphazardly isolated into two gatherings. Patients in first gathering were given azithromycin 500 mg day by day before feast for 3 sequential days in seven days for 3 months while patients in second gathering were given doxycycline 100 mg day by day after dinners for 2 months. Patients were followed up in the wake of taking treatment for 2 months to see the reactions of each medication. Symptoms were thought about Results: Gastrointestinal and dermatological reactions were progressively regular with doxycycline when contrasted with azithromycin. Conclusion:Aziyhromycin is a superior choice for treatment of skin break out vulgaris when contrasted with doxycycline regarding symptoms.

Keywords: *Acne vulgaris, acne therapy**,** Doxycycline, Azithromycin,.*

Introduction

Skin break out vulgaris is characterized as an incessant , incendiary illness of pilosebaceous unit , showing by and large in teenagers with pleomorphic injuries like comedones, papules, knobs and sores and these may prompt scaring[1]. It is a multifactorial infection influenzed by hormonal, hereditary, microbiological and immunological elements. However, it is profoundly predominant among pre-adult age gathering, it can influence all age bunches [2].

Material & Method

This is an open label , prospective, single centred , randomized, comparative study conducted to evaluate the side effect profile of oral Azithromycin Pulse Therapy -5oo mg once daily for three consecutive days in a week with oral doxycycline 100mg once daily for 8 weeks in patients with acne vulgaris. This study enrolled 200 patients. Patients who visited the Department of Dermatology, at Sree Balaji Medical College and Hospital, Chennai Tamil Nadu, with the complaints of pimples (acne), were the source of samples in the present study. The study duration was for 2 months and study period was from March 2016 to March 2017. The study protocol was reviewed and approved by the Institutional Ethics Committee and all trial participants have been informed about the study procedures and written informed consent was obtained.

Subjects :

Inclusion criteria :

- Both male and female patients
- Age between 15 to 40 years
- Patient with all grades of acne (Grade I to IV according to Indian author acne classification)

Methodology

All 200 study subjects , who fulfilled the study criteria were selected from 248 patients . They were then randomized into two groups in 1:1 ratio with the help of a statistical software SPSS version 23 . Each study group consists of 100 participants.

Initial assessment of acne vulgaris was carried out based on the simple grading system followed by Indian dermatologists in their routine clinical practice[1]

Laboratory Investigations :

The following laboratory investigations were done during screening i.e. baseline visit ('0'weeks), at 4th week and at 8th week. Blood Biochemistry :Complete blood count ,Random blood sugar,Renal function test,Liver function test.

Adverse Event Reporting :

All the adverse events observed / complained by the study participants were reported in the case report form along with the other information in relation to the study medication. Any drastic change in the laboratory parameters from the initial screening values were also considered as adverse event and documented in the case report form.

Study End Points :

Primary outcome measure :

To compare the safety and side effect profile of oral azithromycin and oral doxycycline by marking the adverse effects during the treatment phase.

Statistical Analysis : Data analysis was done using Statistical Package for the Social Sciences (SPSS) version 23 .

- All continuous variables were compared using t-test.
- Qualitative variables were compared using chi-2 test.

Observation and Results

A total of 248 patients were screened for this study , out of which 48 patients were excluded . Among the 48 patients , 10 patients refused to participate and 38 patients didn't meet the inclusion criteria of our study. The selected 200 patients were randomised into two groups and the treatment was started as and when they reported to the hospital. All of them continued the study , and there was no discontinuation or withdrawl due to adverse events. All statistical analysis was done in SPSS version 23 and intent to treat principle is employed for analysis . Results were distributed in age, sex, treatment comparison and adverse event profile. The overall results of this study is shown below :p value (Probability that the result is true) of < 0.05 was considered as statistically significant after assuming all the rules of statistical tests.Regarding demographic characteristics there is no significant difference between the two treatment groups.

Adverse Event Profile

Gastrointestinal and dermatological side effects are the common side effects noted among the study subjects.

Gastrointestinal side effects

Table - 1 : Frequency of gastro-intestinal side effects in study

	No side effects	GIT side effects	p value
Azithromycin (100 patients)	80	20 (20%)	< 0.001*
Doxycycline (100 patients)	54	46 (46%)	

p value - significant

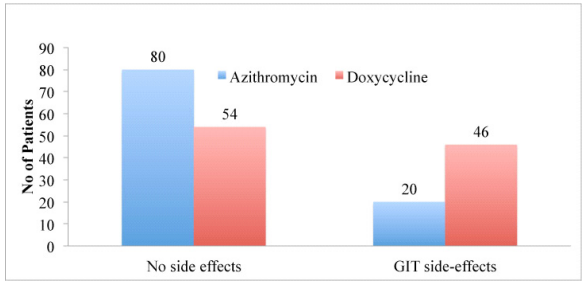

Figure -1: Gastro-intestinal side effects in Azithromycin and Doxycycline treatment groups

Vomiting, nausea, gastritis and diarrhoea are the common gastro intestinal side effects observed during the trial period. The side effects were mild and manageable in both the groups . Overall gastrointestinal side effects in azithromycin and doxycycline groupare 20% and 46% respectively. Comparison of gastrointestinal side effects between azithromycin and doxycycline treatment groups showed that the doxycycline caused more gastrointestinal side effects compared to the azithromycin treatment (p value = 0.001).

Dermatological side effects

Table -2: Frequency of dermatologic side effects in study

	No side effects	Dermatological side effects	p value
Azithromycin (100 patients)	100	0 (0%)	< 0.001*
Doxycycline (100 patients)	76	24(46%)	

p value - significant

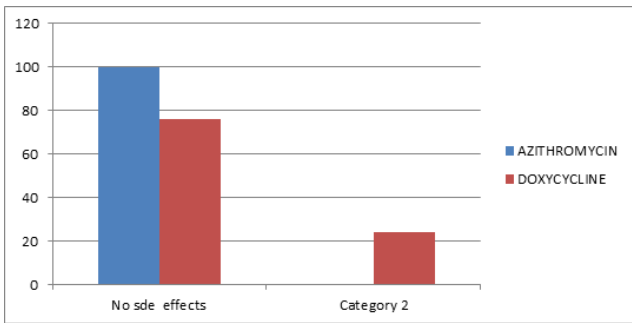

Figure -2: Dermatologic side effects in Azithromycin and Doxycycline treatment groups

Photosensitivity, pigmentation and rashes are the commondermatological side effects that found in response to the treatment during trial period. The side effects were mild and manageable. Overall dermatological side effects in azithromycin and doxycycline groups are 0% and 24% respectively. This indicates that the azithromycin treatment group did not show any dermatological side effects and only doxycycline group showed the side effects.

Effect of treatments on vitals

Table -3: The frequency of normal and abnormal liver function tests in Azithromycin and Doxycycline treatment groups

	Normal LFT	Abnormal LFT	p-value
Azithromycin (100 patients)	100	0 (0%)	0.007
Doxycycline (100 patients)	93	7(7%)	
Over all (200 patients)	193	7(3.5 %)	

p- value not significant

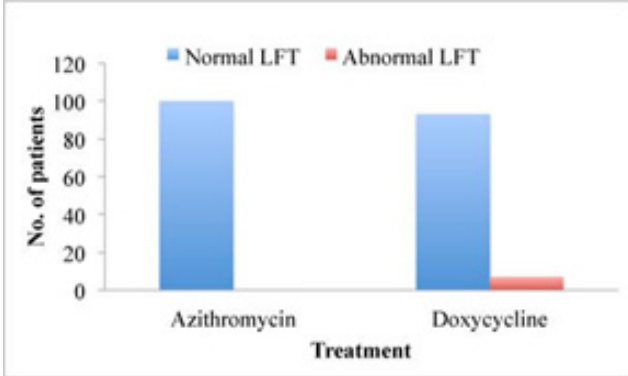

Figure 3: Distribution of normal and abnormal liver function tests in Azithromycin and Doxycycline treatment group

Analysis of complete blood count (CBC) at baseline and the end of first month and second month revealed that there are no major changes in the CBC of the patients. However in the doxycycline group about 7% of the patients show abnormal liver function . The azithromycin treatment group has not shown any abnormality in the liver function

Findings

Acne vulgaris is a common dermatological problem. The choice of proper treatment is determined by the severity and extent of acne . Systemic antibiotics have been the mainstay of treatment for moderate to severe acne vulgaris. The anti propionibacterium property found in antibiotics are able to inhibit the bacterial colonisation of pilosebaceous glands and prevent further inflammation. The efficacy and possible side effects of various oral

antibiotics has been the subject of numerous studies for atleast the last twenty years in an effort to understand, which products are likely to produce better efficacy with least possible side effects. The new emerging problem is antibiotics resistance to propionibacterium . There has been a constant increase in search of safe medications to overcome the side effects and resistance of existing formulations for the treatment of acne vulgaris. The tetracycline class of antibiotics should be considered first-line therapy in moderate to severe acne, except when contraindicated due to side effects[10]. Macrolides like azithromycin are effective alternatives for the treatment of acne. Its extensive distribution in the tissues allows pulse – dose regimen recommendation for increased compliance [11]..Therefore, this study was being conducted to assess the side effect profile of oral azithromycin pulse therapy with doxycycline therapy in the treatment of acne vulgaris.In the current study which included 200 patients, the minimum age of the study population was 15 and the maximum age was 40. The maximum numbers of patients were in the adolescent age group 26 -30 yrs which included 54 patients. The mean age of the study subjects was 26.7 ± 6.2 yrs. In our study , 44% were males and 56% were females which shows increased incidence of the disease among females

The results of our study are based on the acne patients whose demographic characteristics and grading at baseline are not statistically significant between the two groups , therefore comparison of the results between the two groups was more precises. At the follow up visits the acne grades were significantly reduced in both the groups compared to the baseline indicates that both drugs are effective in treating acne vulgaris. Doxycycline group showed (46%) gastrointestinal and (24%) dermatological side effects while azithromycin regime showed (20%) gastrointestinal and (0%) dermatological side . Hence compared to azithromycin , doxycycline showed more side effects and the values were also statistically significant . Further abnormal liver function was noted in about 7% of patients in doxycycline treated group.

Several studies have evaluated the efficacy and side effects of azithromycin and doxycycline for the treatment of acne. In Croatian patients with acne vulgaris when treated with azithromycin and minocycline showed satisfactory clinical response [15]. These drugs did not show significant differences in their clinical efficacy and tolerability [15]. Oral doses of 250 mg of azithromycin per day for 3 days in a week for 4 weeks showed good response in reducing the acne lesions compared to other antibiotics such as doxycycline , tetracycline and minocycline [7]. Pakistani acne patients treated with azithromycin 500 mg thrice weekly for 12 weeks, showed remarkable improvement in 82.9% patients. However, heartburn and nausea, were reported in 11.4% of patients[16].

Comparison of three dosage regimens (A- total dose 4.5g of azithromycin in 7 weeks; B- total dose 6.0 g in 10 weeks; and C- total dose 7.5 g in 13 weeks) for assessing the efficacy and safety of azithromycin treatment revealed that 6.0 g of Azithromycin in 10 weeks seems to be a promising agent with few side effects and good patient compliance in Crotians [17]. An open-label, non-comparative study in Italian acne patients azithromycin, 500mg thrice weekly for 8 weeks, appears to be a safe and effective for adolescents, with excellent patient compliance [9]. Another study in Italian showed that the Azithromycin, 500 mg thrice weekly for 12 weeks, is a safe and effective treatment for moderate acne vulgaris with excellent patient compliance [12]. Diarrhoea and abdominal pain are the few side effects observed in this study [12].An open, multicentric, non-comparative study in Brazilian acne patients, three monthly pulses of azithromycin 500mg for 3 consecutive days is safe, well tolerated, effective and promotes increased patient adhesion to the treatment [10]. In the present study gastrointestinal and dermatological side effects were found in doxycycline group, but in azithromycin group only gastrointestinal side effects were noted.Turkish acne patients treated with the azithromycin and doxycycline antibiotics revealed that there is no significant difference in the efficacy between these treatment groups. However, both treatment groups showed some side effects. The side effects of Azithromycin and doxycycline are diarrhoea and photosensitivity respectively[18].

Several lines of evidence revealed that the doxycycline is associated with an array of side effects. Pruritic dermatitis comprised of pink polygonal papules with some confluence into plaques that developed on the dorsal aspect of the hands and forearms in a sun-exposed pattern has been reported in acne vulgaris patient treated with doxycycline for the last 7 months[19]. Conventional acne treatment with doxycycline has triggered the development of characteristic lesions of AF represents a subtype called “pseudo – AF” [86]. Doxycycline -

induced acute pancreatitis (DIAP) was reported in an Indian adult female acne vulgaris patient who received the usual therapeutic dose for a week [21]. Similarly azithromycin in combination with other drugs showed superior efficacy in treating the acne vulgaris. Further, combination of azithromycin and levamisole is effective than azithromycin alone in decreasing of inflammatory lesions especially in nodulocystic form of acne with fewer side effects [14].

Though doxycycline was found to be better than azithromycin pulse therapy in reducing acne severity , gastrointestinal, dermatological and other side effects were higher with doxycycline and the results were also statistically significant . Our study also had some limitations . First, there was no blindness for the drugs that used in the study, which may present the possibility of interpretative bias in the study outcome. Second, study was conducted in a single geographic location, which may influence the generalizability of the study finding

Conclusion

Our study shows that both azithromycin and doxycycline are efficient in reducing acne vulgaris . However in terms of side effect profile comparison , azithromycin pulse therapy is better than doxycycline.

Role of MRV in Cerebral Venous Sinus Thrombosis

Revathy Pradeep[1], W.M.S.Johnson[2], Vathsala Venkatasan[3], Kavimani [4]

[1]PG Student, [2]Professor & HOD, [3]Professor, [4]Professor Department of Anatomy,
Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Cerebral sinus thrombosis (CVST) is a correspondingly phenomenal neurological issue with a sweeping extent of signs that makes early assurance and estimate hard. Imaging expect a key activity in the finding of CVST. Quick and sensible helpful treatment is fundamental as cerebrum parenchymal changes and venous thrombus advancement are maybe reversible. The purpose of this paper is to assert that MRV in mix with MRI can adequately break down CVST.

Keywords: *Cerebral sinus thrombosis, parenchymal changes*

Introduction

Cerebral venous sinus thrombosis happens when blood bunches structure in the brains of venous sinuses. This keeps blood from spilling out of the brain. Therefore, platelets may separate and gap blood into mind tissues, molding a channel. This chain of occasions is portion of a stroke that may happen in adults and children. It oftentimes impacts energetic to–modestly matured patients and even more commonly females, especially between the ages of 20 and 35, on account of pregnancy, puerperium and oral deterrent use. Although it has been acknowledged for more than 100 years, it is only in latest years that an ante-mortem has frequently been diagnosed. This is due in part to increased knowledge among physicians and neurologists, and in part to impr. improved non – invasive imaging techniques such as MRI and MRV.[2]

CVST is a problematic sickness as a result of its variability in clinical signs and indications. It is much of the time unrecognized at the primary talk. All age social events may be influenced. Tremendous sinuses, for instance, the upper sagittal sinus, are practically from time to time secured. Expansive protection course inside the cerebral venous structure enables for a liberal level of compensation in the early times of thrombus improvement.

The broad use of neuroimaging now allows early investigation and has completely changed our understanding into this sickness. CVST is more common than as of late associated shows with a wide range with clinical presentations, unlimited causes, and regularly a productive outcome with a low demise rate.

Aeitology

Numerous circumstances may trigger or predispose to CVST, and more than one cause is often discovered in the individual patient. The main difference can be created between infective and non-infective causes. Infectious causes have decreased and have been liable for only 8 percent of instances in latest series. Systemic circumstances such as connective tissue diseases, other granulomatous or inflammatory disorders and malignancies are most prevalent among non-infective causes.

The most prevalent causes and risk factors connected with CVST may be categorized or grouped as genetic causes, including antithrombin deficiency, protein C and protein S deficiency, factor V Leiden, antiphospholipid antibody, and acquired causes..

Acquired circumstances include nephritis syndrome, pregnancy and pueperium. Infections such as otitis, mastoiditis, sinusitis and meningitis also increase the

Bharath Institute of Higher Education and Research,
Chennai - 73

risk factor for CVST. Other causes include vascular collagen disease, such as systemic lupus erythematosus, sarcoidosis, and behcet syndrome. Hematological conditions such as polycythemia, leukemia and sickle cell disease, paroxysomal nocturnal hemoglobinuria, TTP. Use of drugs like oral contraceptives and tamoxifen. And other mechanical causes include trauma and neurosurgery. Other causes: dehydration and cancer. Apart from the above, there may be other causes such as local penetrating septic head injury, intracranial disease (abscess, emphyem, meningitis), systemic causes such as septicemia, endocarditis, typhoid, tuberculosis. Non-infective cause including local head injury, neurosurgery, stroke and hemorrhage, space-saving idiopathic intracranial hypertension. [5]

Materials and Method

A prospective study of 100 instances was conducted at our Radio Diagnostic Department. Patients with recognized CVST were treated with MRI using a 1.5 T MRI (Hitachi Aperto) medical system. The age group of the patient varies from 11 to 70 years. The average age of the patient was 32.3 years. Patients with recognized instances of CVST and clinically suspected cases of intracranial vascular lesions linked to MRI brain with MR Venography.

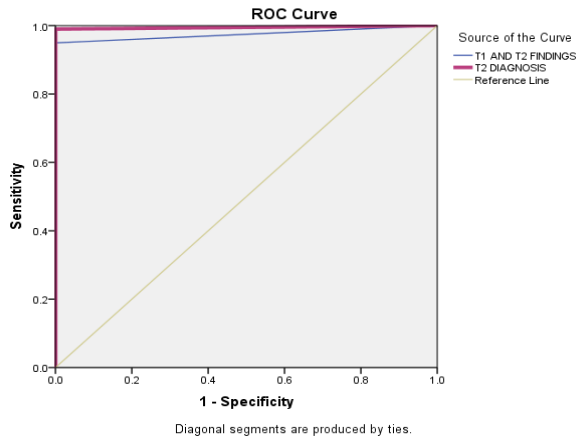
Multi-sequential studies have been conducted in coronal, sagittal and axial segments. The patient underwent MRV, which included the use of the 2D TOF method / sequence. The intracranial venous system was researched after a standarized reconstruction using a peak projection intensity.

In our examination, the cut thickness for the 2DTOF procedure was 3 mm with a remote factor of 33 percent, while the 2D TOF framework was improved by picking a sagittal cut course stamped barely towards coronal and center headings. The test time for 2DTOF in our assessment was 7 minutes and 20 seconds. Usually, it is alluring to set the thickness of the cut as meager as could be normal considering the present situation, customarily in the solicitation for 1.0 to 1.5 mm, in order to vanquish the control of the 2DTOF methodology, anyway this would have diminished the thickness of the cut. Checking time to 10 mm and was thusly not grasped in this assessment. The nearness of unquestionable intracranial venous structures was evaluated against the establishment of their sign power, consistency and size of the conspicuous structures in three specific MRV frameworks. In this manner, the characteristics were assigned to all of them in obvious strategies.[7]

Findings

The research involves 100 patients with CVST with a broad range of symptoms. The information has been assimilated for more than one year. Of the 100 patients, 64 per cent were female and the remaining 36% were male. Although CVST is extremely variable, we found 62 percent of instances with superior sagittal sinus thrombosis in our research. Right transverse sinus thrombosis was 54% followed by left transverse sinus thrombosis at 42%. Cortical venous thrombosis was discovered to be more prevalent in 38% of cases. Hypoplastic left transverse sinus (LTS) was discovered to be more prevalent in 72% of cases (Table 9) among other brain sinuses. Followed by Superior Sagittal Sinuses (SSS) 36% and Right Transverse Sinuses (RTS) 34%.

Table 1: Distribution of patients with CVST depending on sinuses involved



Sinuses Involved	No.of Patients	Percen-Tage
Superior sagittal sinus	62	62.0%
Right transverse sinus	54	54.0%
Right sigmoid sinus	51	51.0%
Left transverse sinus	42	42.0%
Left sigmoid sinus	39	39.0%
Straight sinus	46	46.0%
Internal cerebral vein	26	26.0%
Cortical vein	38	38.0%

Table 2: Displays the detection of MRV, T2 * and T1 & T2 thrombus cases. It can be noted that MRV detected 100% of the instances and is therefore considered to be the gold standard in the CVST inquiry.

Method	Number of cases
Detected by MRV	100
Detected by T1, T2	94
Detected by T2*	98

Table 2: shows the area under the curve signifying that MRV with T2* can accurately diagnose CVST.

Method	Using ROC curve
	Area under the curve
Detection by MRV and T1 & T2	0.975
Detection by MRV and T2*	0.995

Discussion

Although CVST can happen at any era (from neonates to elderly people), it is most frequently seen in young people. Almost 80 percent of patients are younger than 50 years of age. The most prevalent and early clinical presentation in this research was headache followed by convulsion, troubled consciousness, weakness of one limb, blurred vision, and papilladema.

In our research, 100 patients with cerebral venous sinus thrombosis were analyzed with the assistance of MRI and MRV. It was usually noted that the age group of 21-40 was relatively more susceptible to CVST. And, it was also noted that the incidence was higher in the case of females compared to males. This is due to the reality that females are subjected to predisposing factors such as pregnancy, oral contraceptives and puerperium. Studies in the female population during pregnancy and puerperium have shown that CVST may happen at any time, but the danger appears to be greatest during the first 2 weeks of puerperium.

More than 90% of instances involved dural venous sinus. Of these, 62% of reported instances predominate in superior sagittal sinus. Cortical venous system thrombosis has been seen in 38% of instances, inner cerebral venous thrombosis has been seen in 26% of instances. Two distinct parenchymal modifications have been observed–hemorrhagic infarction and non-hemorrhagic infarction. Parenchymal modifications may be secondary to cytotoxic oedema, vasogenic oedema, or intracranial hemorrhage. Vasogenic and cytotoxic oedema models may coexist.

MRI characteristics in our in our investigation have been noted as parenchymal changes and unpredictable banner in thrombosed veins and sinuses in both T1 and T2. In association with blooming in SWI, these progressions are found as hemorrhagic dead tissue, non-hemorrhagic limited putrefaction and edema. Substitution of sign opening of sinuses or bizarre sign power was the most generally perceived MRI results. It exhibited three specific examples, first hypertension in T1 and isotension in T2 (early subacute stage), second hypertension in both T1 and T2 (late subacute stage). Third was hypotense in both T1 and T2 at a consistent point. Finally, MRV was resolved to have an improper sign in both T1 and T2.

The primary MRV findings in our research were non-visualizationof occluded veins or sinuses due to lack of signal and defect in flow. Diffusion weighted imaging (DWI) can detect changes in water diffusion connected with cell dysfunction and can be used to identify ischemic brain lesions within the first few hours of stroke onset. The use of DWI in the diagnosis of acute arterial stroke is well founded. It indicates an early reduction and a late boost or normalization of the obvious coefficient of diffusion. DWI can be used to discriminate between distinct kinds of edema, to evaluate tissue viability, to detect subclinical defects, to provide early diagnosis time-saving data and to facilitate diagnosis.

CT scan with or without contrast injection is generally the first inquiry conducted. It is highly helpful to rule out many circumstances that may mimic CVT.

Direct signs of CVST-Delta sign: non-contrast CT scan a thick triangle seen inside the sinus. This sign is recorded in 20% of patients and will take approximately 1-2 weeks to vanish. Empty (inverse) delta sign: appears after contrast injection and reflects the opacification of the collateral vein in the SSS. However, it is not present when CT is conducted within the first five days of initiation of symptoms or more than two months later. 25 per cent-75 per cent of instances in the literature show an empty delta sign. Cord sign: visible on the CT plain.

Indirect signs of CVT-Represents thrombosed cortical veins. Genuine separation improvement of falx and tentorium: is accessible in 20% of events. It indicates venous equalization or hyperemia of the duramater. It may be connected with extended transcerebral medullar veins.

CT Venography-Bolus mixture of separation material offers a shocking anatomical detail of the huge and shallow intracranial venous system. Reported 95% affectability with Multiplanar Reformatted (MPR) pictures stood out from Digital Subtraction Angiography (DSA) as the reference standard. The declared favorable circumstances of CT venography stood out from MR imaging advancement are the snappy verifying of picture (lessening of moti). The aim of this study was to introduce the radiological features of venous sinus thrombosis and cerebral venous thrombosis, as well as to identify the most delicate imaging techniques. Several techniques are accessible for MRI picture veins, including contrast-enhanced andnon-contrast-enhanced pulse sequences.

MRV can be part into amazing blood and diminish blood techniques on the grounds of non-separate use. Splendid blood is an inexorably normal and strong strategy. Breathtaking blood NCE MRV heartbeat groupings are period of-flight (TOF) progressions, mastermind separate (PC) groupings, and enduring state free precession (SSFP) groupings.

Parenchymal varieties from the standard Parenchymal wounds are better addressed and more consistently perceived in MR imaging than in CT. Parenchymal changes may be assistant to cytotoxic edema, vasogenic edema, or intracranial channel. Vasogenic and cytotoxic oedema models may exist together. In context on the variable thought of the parenchymal varieties from the standard that may occur in cerebral venous thrombosis, the use of the term venous confined rot in association with these bruises should be dampened, as this term proposes irreversibility. As opposed to vein ischemic states, an extensive parcel of the parenchymal varieties from the standard assistant to venous obstruction are reversible. Regardless of the way that parenchymal changes may occur in cerebrum districts,

Instead of standard MR pictures, Diffusion Weighted Imaging (DWI) MR pictures can perceive vasogenic and cytotoxic edema. Cytotoxic edema is portrayed by a by and large diminished scattering. Vasogenic edema, with improved interstitial water, demonstrates overhauled scattering.

Withdrawn cortical venous thrombosis-Isolated CVT is a comparably remarkable substance; under 20 models have been recorded in imaging composing. Regular parenchymal results are locale of focal cortical edema or release that may be dubious. The finding of a flanking thrombosic venous structure may be the most express sign of this contamination. In CT pictures, this finding was suggested as the “line sign;” in MR pictures, it was insinuated as the “hyperintense vein sign.” Blooming old rarities in thrombosed veins can be a very pleasing development to GRE pictures.

False-negative instances of MRI-False-negative events of MRI are the aftereffect of a propagation of basic sign power (standard cerebrum tissue or standard circulatory system) by thrombosed dural sinuses. Exactly when gadolinium-containing contrast masters are directed, thrombus is predicted to realize a filling insufficiency inside the venous sinus. In any case, occasionally, the distinction overhauled T1-weighted pictures of DST in endless stages may in like manner show homogeneous multifaceted nature improvement of the thrombosed dural sinus in light of the nearness of thin coordinates in the thrombus, making it hard to isolate from the authorized dural sinus.

False-positive MRI cases-False-positive MRI events are found thusly resonation MR progressions when the sign intensity of the dural sinus reproduces that of the thrombus. The essential driver are moderate stream, in-plane stream, and in-cut ponders that reason the ordinary loss of stream void inside the dural sinus.

False-positive cases on MR Venography-It is associated with 9% of false positive rate. Anatomical causes of false-positive results may lead from differences in the size of dural sinuses, hypoplastic / aplastic dural sinuses, and anatomical structures that generate filling defects, i.e. arachnoid granulations. Flow-related artifacts and those particular to multiple MR venography techniques can also cause signal loss that simulate thrombus.

False-negative cases for MR Venography-This is gotten together with 24 percent of the counterfeit negative rate. Sign created by hyperintense thrombus on unenhanced T1-weighted pictures may duplicate the movement of TOF MR angiography inside the dural sinus and trigger a false-negative finding.

Subarachnoid channel (SAH) related with cerebral venous thrombosis has rarely been recorded as a hard copy. The accurate purpose behind SAH related with CVST isn't known. Venous hemorrhagic dead tissue may be committed for discretionary break in subarachnoid spaces and may trigger SAH. Dural sinus thrombosis with discretionary venous hypertension may incite SAH in subarachnoid space inferable from break of a fragile, thin walled cortical vein.

With spine-echo sequences, flowing blood typically generates a signal void; stationary blood on the thrombus has been found to generate greater signal intensity. This phenomenon is not completely accurate, however, as a range of flow-related artefacts may occasionally give rise to an enhanced intraluminal flow signal that may mimic the thrombus. Spin-echo MR pictures for CVST identification yield variable outcomes, demonstrating some degree of reliance on the era of the thrombus.

Conclusion

CVST is a possibly deadly disorder which, if properly acknowledged and handled, has outstanding prognosis. MRI and MRV are the finest diagnostic modalities for CVST. CVST is diagnosed with a mixture of hypertensive T1 and T2 signals from the sinus connected with a deficiency seen on the MR venogram in the suitable clinical environment. MRV in combination with MRI (T2*) is both delicate and specific enough to provide the finest non-invasive technique for the diagnosis of cerebral venous thrombosis.

Serum Hepcidin as a Marker of Anemia in Chronic Kidney Disease

Jyothi Elizabeth Roy[1], B. Shanthi[2], V.S. Kalaiselvi[3]

[1]Post Graduate, [2]Professor and HOD, [3]Professor, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: In CKD, there is a dynamic and tenacious loss of renal capacity which at last leads on to end organize renal malady (ESRD). Sickliness is a typical confusion of CKD and creates before ESRD. Hepcidin is known to be the focal controller of iron homeostasis in the body. It is up-controlled by aggravation and downregulated by iron deficiency. Past work has demonstrated that serum hepcidin levels were expanded in patients with CKD. Comprehension of hepcidin hormone and its job in iron digestion could prompt new treatments for CKD-related frailty. It is conceivable that expanded hepcidin fixations may cause iron-confined erythropoiesis additionally in CKD-related pallor.

Aim and Objectives: The aim of the study is to estimate the levels of hepcidin in CKD patients and to check the correlation of hepcidin to anemia in chronic kidney disease.

Method: This cross-sectional investigation was led at the Department of Biochemistry, Central Laboratory, Sree Balaji Medical College and Hospital, Chromepet, Chennai during January 2017 - June 2018 among 50 patients of incessant kidney sickness in the age gathering of 18-60 years. The blood tests were gathered utilizing vacutainer framework. Tests for serum hepcidin, urea and creatinine were gathered in red bested plain vacuum tube. The examples were centrifuged at 3000 rpm for 15 minutes. The examples were then prepared, and qualities were gotten. The information were examined utilizing SPSS bundle.

Results: The mean values of s. Hepcidin and s. ferritin were found to be increased in the study population. The mean values of s. Iron, s. TIBC, s. Transferrin levels and hemoglobin were lower in the study population.

Conclusion: Hepcidin levels are elevated in CKD and hepcidin is a predictor of iron stores since it correlated well with the markers of iron status, serum iron and ferritin levels.

Keywords: *Chronic Kidney Disease (CKD), Hepcidin*

Introduction

Incessant kidney infection (CKD) alludes to an irreversible dynamic weakening in renal capacity. CKD has turned into an around the world, constant, non-transmittable infection pestilence with antagonistic results of renal disappointment, cardiovascular sickness and unexpected passing. [1-3]

Hepcidin, a little cysteine rich liver-determined peptide hormone, is a key controller of fundamental iron homeostasis. Hepcidin has advanced as a plausible middle person of iron deficiency of interminable infection and irritation.

Past examinations have demonstrated that serum hepcidin levels were expanded in patients with incessant kidney infection. Expanded serum hepcidin levels may add to the improvement and seriousness of iron deficiency and the protection from erythropoiesis-animating agents1. The digestion of hepcidin is significantly changed in interminable kidney illness (CKD). What little information are accessible around there are

uncertain. Henceforth in the present investigation, the serum level of hepcidin was assessed in patients with CKD and the connection between serum hepcidin and iron deficiency were broke down.[6,7,8]

Aim:

The aim of the present study was to estimate the levels of serum hepcidin in patients with chronic kidney disease and to check the correlation of hepcidin to anemia in chronic kidney disease.

The objectives of the present study were to:

- Estimate serum hepcidin levels in patients with chronic kidney disease.

- Determine whether hepcidin levels correlated to markers of anemia in chronic kidney disease.

Materials and Method

This cross-sectional study was conducted in the Department of Biochemistry, Sree Balaji Medical College and Hospital, Chromepet, Chennai during the period of January 2017 – June 2018 among 50 patients of chronic kidney disease visiting the Nephrology outpatient services in the age group of 18-60 years. Age, gender, duration of chronic kidney disease, general history and medications and blood pressure were recorded. The study was explained to the participants and informed consent was obtained from them before taking the blood sample. After obtaining informed consent, 5 ml of blood was collected from each participant, from a peripheral vein under aseptic precautions in specific vacutainers. Plain tube for hepcidin, iron, ferritinand TIBC and EDTA tube for hemoglobin were used. Transferrin saturation value was obtained by calculation.Blood collected in the plain tube was allowed to clot, then each tube was centrifuged for 10 minutes at 3500 rpm within 2 hours of blood collection to separate serum. Serum sample was used for the estimation of all parameters. Hepcidin was estimated by competitive ELISA kit (Enzyme Linked Immuno Sorbent Assay). Estimation of serum ferritin was done by chemiluminescence assay in Siemens, ADVIA Centaur CP Immunoassay system.Serum iron and TIBC were measured by colorimetry in Biosystems semi-automatic analyser BTS-350. Hemoglobin was estimated by colorimetry in automated hematology analyser, Mindray BC 5380. Transferrin saturation was estimated as the percentage of serum iron to TIBC ratio, as shown below: [10-12]

Transferrin saturation = (Serum iron/ TIBC) *100

Data was categorised based on demographics (Age and Gender). All the results obtained were statistically analyzed using SPSS software version 16.0. Shapiro-Wilk test was used to test for normality of the data. Mean and standard deviation were used to represent normally distributed data. Median and interquartile ranges were used to represent data which were not normally distributed. Bivariate correlation analyses were done using Pearson correlation to correlate hepcidin with other parameters. The results of statistical analysis were arranged in tabular form and were plotted in graphs.

- **Inclusion Criteria:**

- Known cases of chronic kidney disease on conservative management in the age group 18-60 years

- **Exclusion Criteria:**

– Age group less than 18 years and greater than 60 years

– Pregnancy

– Any malignancy

– Pre-existing liver disease

– Active inflammatory disease

Findings

Table 1: Descriptive statistics of the study group

Parameters	N	Mean	Std. Deviation	Mean Rank
S.Hepcidin (ng/ml)	50	149.484400	47.5399263	75.50
S.Iron (mg/ml)	50	67.371200	23.9093768	28.90

Cont... **Table 1: Descriptive statistics of the study group**

TIBC (mg/ml)	50	236.964600	41.0666226	29.24
Transferrin Saturation (%)	50	28.454000	8.0481764	42.66
S.Ferritin (mg/dl)	50	187.757400	93.1905705	75.22
Hemoglobin (g/dl)	50	7.324	1.213	25.74

Kruskal-Wallis Test was used to test the statistical significance of hepcidin and other parameters among the study group. The mean values of s. Hepcidin and s. ferritin were found to be increased in the study population.The mean values of s. Iron, s. TIBC, s. Transferrin levels and hemoglobin were lower in the study population.

Table 2: Pearson's correlation between hepcidin and other parameters among CKD cases

Variables		**S. Hepcidin**
S. Ferritin	R Value	0.907
	P Value	0.000
S. Iron	R Value	-.490
	P Value	0.000
S. Tibc	R Value	-.627
	P Value	0.000
S. Transferrin	R Value	-0.491
	P Value	0.070
S. Hemoglobin	R Value	-0.724
	P Value	0.000

**. Correlation is significant at the 0.01 level (2-tailed).

The mean value of s. hepcidin had strong positive correlation with the mean values of s. ferritinwith r-value> 0.7.

The mean value of s. hepcidin had moderate negative correlation with s. iron, s. TIBC and transferrin saturation with r-value between 0.4 and 0.7.

Discussion

Sickliness is a noteworthy co-horribleness in patients with CKD. Iron insufficiency and frailty of irritation are the most widely recognized reasons for weakness in CKD. In any case, in spite of the announced high and disturbing commonness of pallor in CKD bringing about critical co-horribleness, paleness is regularly untreated or treated inappropriately in clinical practice. The explanation behind this is mostly in the trouble associated with deciding the etiology of iron deficiency in this condition which is essential in giving the correct treatment. Hepcidin is the ace controller of fundamental iron homeostasis1 and assumes a key job in paleness related with irritation. Physiologically, hepcidin hindrance happens in instances of sickliness, iron lack or hypoxia. In fiery conditions, levels of genius provocative cytokines are increased2. It is conceivable that expanded hepcidin fixations may cause iron-limited erythropoiesis in CKD-related weakness. [13]

In the present investigation, an aggregate of 50 CKD subjects were contemplated. Hepcidin levels were fundamentally higher in patients with CKD. Serum ferritin was seen as raised in CKD cases. Serum iron, TIBC, transferrin immersion and hemoglobin were diminished among the investigation populace.

In the present examination, serum hepcidin focuses were seen as altogether expanded in patients with CKD [Mean esteem: 149.484 ± 47.539 ng/mL]. Serum hepcidin levels were seen as expanding with the movement of CKD. These discoveries are as per the investigation of Tarek et al3, which detailed an expansion in serum hepcidin levels in all phases of CKD among 54 CKD patients under traditionalist administration and 40 CKD patients under hemodialysis. [15]

Hepcidin is cleared from the body by the kidneys. The expansion in hepcidin seen in CKD is because of its decreased renal freedom related with the crumbling renal capacity. Contingent upon the harm of kidney, the end of hepcidin is constrained and prompts the expansion in its serum level. Another explanation could be the ceaseless fiery province of CKD which invigorates hepcidin generation. Uremia is a condition of increased provocative enactment. Hepcidin blend is initiated in the liver as a reaction to IL-6 incitement and it communicates its action by diminishing the assimilation of dietary iron and keeps iron discharge from macrophages. Raised serum hepcidin levels intervene iron-limited erythropoiesis and add to initiating pallor in CKD patients. Momentary increments in serum hepcidin levels debilitate the arrival of capacity iron, and long haul increments in serum hepcidin levels bring about iron inadequacy. High serum hepcidin levels cause iron bar and pallor in constant sickness. Ceaseless kidney malady patients with pallor have been found to have raised serum hepcidin levels, and the high hepcidin levels are probably going to add to sickliness in CKD and to ESA hypo-responsiveness. [17]

S. Iron, TIBC and transferrin immersion were seen as diminished in CKD gathering contrasted with controls. Among the CKD cases, the mean estimation of S. Iron was seen to be 67.371 ± 23.909 mg/dl. Hepcidin and iron had a moderate negative connection with r-esteem being - 0.490 and p esteem < 0.001 in this examination. These discoveries were like that of Gupta et al4 who watched a negative connection among's iron and hepcidin among his investigation populace of 107

CKD patients. Diagnosing iron inadequacy in CKD is rendered troublesome within the sight of uraemia and irritation which are both seen in CKD. [16]

In the present examination, the mean estimation of S. TIBC was 236.964 ± 41.066 µg/dl in CKD patients. TIBC had a moderate negative connection with hepcidin, with r worth being - 0.627 and p esteem < 0.001 which are reliable with the discoveries of Esin Avci et al5. He watched a moderate negative relationship among's hepcidin and TIBC among hemodialysis patients. Nonetheless, he watched no relationship among's hepcidin and TIBC among non-dialysis CKD patients which stands out from this investigation. The mean an incentive for transferrin immersion in this investigation was 28.454 ± 8.048 % in CKD patients. No association of hepcidin and transferrin immersion was discovered (r esteem = - 0.491 and p esteem =0.070), yet there was an immediate relationship among's transferrin and hepcidin in the investigation done by Marijha et al6 among 104 CKD patients.

Iron and ferritin are considered as markers of iron status. Despite the fact that ferritin is a marker of body iron stores, it additionally increments in intense irritation and thusly turns out to be less significant as a pointer of iron status during aggravation seen in CKD. In this examination, hepcidin and ferritin were altogether higher in constant kidney illness patients contrasted with control subjects. The mean estimation of ferritin was 69.762± 24.182 mg/dl in control gathering while for the CKD bunch it was 187.757 ± 93.19 mg/dl. Likewise, Malyszko et al7 found that in his examination on patients with ceaseless renal disappointment and hemodialyzed patients, that serum ferritin and hepcidin were altogether higher than in the sound volunteers. There was a solid positive connection among's ferritin and hepcidin among the CKD cases (r = 0.907, p< 0.001) which is as per the investigation of Mercadal et al8. He watched a positive relationship among's hepcidin and ferritin in his examination among 199 non-dialysed non-transplanted patients with CKD stages [1-5].

The incessant fiery province of CKD is because of the interminable lopsidedness among prooxidant and cell reinforcement factors. Oxidative pressure prompts insulin obstruction by diminishing disguise of insulin9 and expanded ferritin blend. Utilitarian iron insufficiency is available in certain patients with constant renal disappointment, on traditionalist treatment and on dialysis, which is described by the nearness of sufficient iron stores with serum ferritin level either typical or raised. Moreover, provocative iron square happens among these patients generally because of a hidden fiery state. The fiery square alongside utilitarian iron insufficiency cause raised ferritin level6. Hepcidin level of the two examination bunches in the present investigation was identified with ferritin that concurs with the aftereffects of Peters et al10, who uncovered that serum ferritin fixation was a noteworthy indicator of hepcidin-25 levels in CKD by methods for various relapse investigation. Comparative connection among's ferritin and hepcidin was accounted for by Dallalio et al11, in sickly patients experiencing indicative bone marrow assessment. Notwithstanding, Malyszko et al5 couldn't locate a critical relationship among's hepcidin and ferritin in his investigation populace of patients with constant renal disappointment on traditionalist treatment and on hemodialysis. Diminished degrees of serum ferritin or transferrin immersion (TSAT) are available in many patients with CKD.

The mean estimation of hemoglobin in CKD was 7.324 ± 1.213 gm/dl. Indeed, even hemoglobin had solid negative connection with hepcidin with r esteem as - 0.724 and p= <0.001. These discoveries are steady with those of Karthik et al10 and furthermore with the discoveries of Uehata et al12. Karthik et al13 watched a solid negative connection among's hepcidin and hemoglobin among 52 end organize renal illness patients while Uehata et al12 watched comparable a moderate negative relationship among's hemoglobin and hepcidin among 505 non-dialysis CKD patients not getting parenteral iron treatment. This discovering appears differently in relation to that of Kuragano et al14 who watched a solid positive connection among's hemoglobin and hepcidin in non-dialysis CKD patients and among support hemodialysis patients.

Frailty among the present investigation populace could be either because of iron inadequacy or weakness of interminable infection. Iron insufficiency sickliness could create in CKD because of diminished iron ingestion as a piece of uremic disorder, loss of RBCs and iron as a piece of uremic disorder, or because of dialysis related blood and iron misfortune. With the information accessible, it is hard to separate between iron inadequacy pallor and weakness of interminable illness. Estimating solvent transferrin receptor-log ferritin proportion (sTfR/ log ferritin proportion) would be valuable to separate

between the two conditions. Despite the fact that solvent transferrin receptor articulation is demonstrated to be adversely influenced by aggravation, the sTfR/log ferritin proportion is considered as a precise pointer of body iron stores within the sight of inflammation15.

Conclusion

The present study suggests that hepcidin levels are elevated in CKD and hepcidin is a predictor of iron stores since it correlated well with the markers of iron status, serum iron and ferritin levels. This increase in hepcidin levels reflects both the renal impairment leading to reduced renal clearance of hepcidin. These findings highlight the close relationship between hepcidin and anemia in CKD.

Serum Hepcidin Levels in Chronic Kidney Disease

Jyothi Elizabeth Roy[1], B. Shanthi[2], V.S. Kalaiselvi[3]

[1]Post Graduate, [2]Professor and HOD, [3]Professor, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: In CKD, the dynamic and tenacious loss of renal capacity which eventually leads on to end arrange renal malady (ESRD). Iron deficiency is a typical entanglement of CKD and creates before ESRD. Hepcidinis considered as the headliner of iron homeostasis in the body. It is up-managed by aggravation and downregulated by pallor. Past work has demonstrated that serum hepcidin levels were expanded in patients with CKD. This was astounding as these patients had a constant incendiary state and concurrent iron deficiency. It is conceivable that expanded hepcidin focuses may cause iron-confined erythropoiesis likewise in CKD-related weakness.

Aim and Objectives: The aim of the study is to estimate the levels of serum hepcidin in patients with chronic kidney disease.

Methods: This cross-sectional examination was directed at the Department of Biochemistry, Central Laboratory, Sree Balaji Medical College and Hospital, Chromepet, Chennai during January 2017 - June 2018 among 50 patients of incessant kidney illness in the age gathering of 18-60 years. The blood tests were gathered utilizing vacutainer framework. Tests for serum hepcidin, urea and creatinine were gathered in red bested plain vacuum tube. The examples were centrifuged at 3000 rpm for 15 minutes. The examples were then processed,and qualities were gotten. The information were investigated utilizing SPSS bundle.

Results: In CKD patients, serum hepcidin levels are found to be elevated and found to be positively correlating with serum urea and creatinine values.

Conclusion: Serum hepcidin levels are elevated in CKD patients which could be responsible for the iron restricted erythropoiesis and resistance to erythropoietin stimulating agents in CKD.

Keywords: *Chronic Kidney Disease (CKD), Hepcidin*

Introduction

CKD has turned into an around the world, ceaseless, non-transmittable sickness pestilence with unfriendly results of renal disappointment, cardiovascular malady and unexpected passing. In created nations, it influences 10-15% of grown-up all inclusive community.

The disclosure of hepcidin and its capacities has prompted a superior comprehension of iron digestion issue in CKD. Hepcidin, a little cysteine rich liver-inferred peptide hormone, is a key controller of foundational iron homeostasis. Hepcidin has advanced as a likely middle person of iron deficiency of incessant malady and aggravation.

Past work has demonstrated that serum hepcidin levels were expanded in patients with interminable kidney malady. The digestion of hepcidin is significantly modified in incessant kidney illness (CKD). What little information are accessible here are uncertain. Thus in the present examination, the serum level of hepcidin was assessed in patients with CKD and the connection between serum hepcidin and CKD wasanalysed.

Aim

The aim of the study was to estimate serum hepcidin levels in patients with chronic kidney disease.

Materials and Methods

This cross-sectional study was conducted in the Department of Biochemistry, Sree Balaji Medical College and Hospital, Chromepet, Chennai during the period of January 2017 – June 2018 among 50 patients of chronic kidney disease visiting the Nephrology outpatient services in the age group of 18-60 years. Age, gender, duration of chronic kidney disease, general history and medications and blood pressure were recorded. The study was explained to the participants and informed consent was obtained from them before taking the blood sample. After obtaining informed consent, 5 ml of blood was collected from each participant, from a peripheral vein under aseptic precautions in specific vacutainers. Plain tubes for hepcidin, urea and creatinine were used. Blood samples collected were used for the estimation of serum levels of hepcidin, urea and creatinine. Blood collected in the plain tube was allowed to clot, then each tube was centrifuged for 10 minutes at 3500 rpm within 2 hours of blood collection to separate serum. Serum sample was used for the estimation of all parameters. Serum urea was analysed by Urease GLDH-UV method and creatinine by modified Jaffe's kinetic method by Mindray BS390fully automated analyser. Hepcidin was estimated by competitive ELISA kit (Enzyme Linked Immuno Sorbent Assay).Data was categorised based on demographics (Age and Gender).

All the results obtained were statistically analyzed using SPSS software version 16.0. Shapiro-Wilk test was used to test for normality of the data. Mean and standard deviation were used to represent normally distributed data. Median and interquartile ranges were used to represent data which were not normally distributed. Bivariate correlation analyses were done using Pearson correlation to correlate hepcidin with other parameters. The results of statistical analysis were arranged in tabular form and were plotted in graphs.

- **Inclusion Criteria:**

-Known cases of chronic kidney disease on conservative management in the age group 18-60 years

FINDINGS:

TABLE 1: DESCRIPTIVE STATISTICS OF THE STUDY GROUP

Parameters	N	Mean	Std. Deviation	Mean Rank
S.Hepcidin (ng/ml)	50	149.484400	47.5399263	75.50
S.Urea (mg/dl)	50	93.9800	32.87670	75.50
S.Creatinine (mg/dl)	50	8.578000	3.8869373	75.50

Kruskal-Wallis Test was used to test the statistical significance of hepcidin and other parameters among the study group. The mean values of s. Hepcidin, s. Urea and s. Creatinine levels were found to be increased in the study population.

Table 2: Pearson's correlation between hepcidin and other parameters among ckd cases

Variables		S. Hepcidin
S. Urea	r value	0.403
	p value	0.000
S. Creatinine	r value	0.843
	p value	0.000

**. Correlation is significant at the 0.01 level (2-tailed).

The mean value of s. hepcidin was found to have strong positive correlation with the mean values of s. creatinine with r-value> 0.7 and a moderate positive correlation with s. urea with r- value between 0.4 and 0.7.

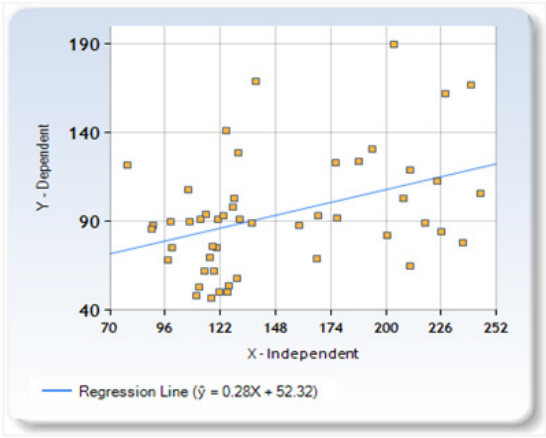

Figure 1 : Scatter plot with linear regression of hepcidin vs creatinine

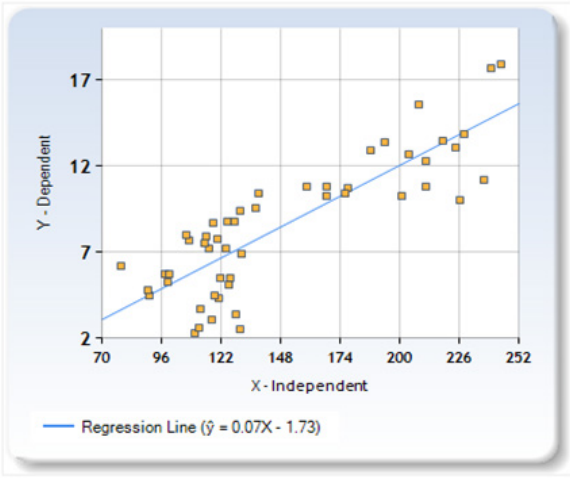

Figure 2 : Scatter Plot With Linear Regression Of Hepcidin Vs Urea

Discussion

Anemia is a significant co-morbidity in patients with CKD. Iron deficiency and anemia of inflammation are the most common causes of anemia in CKD. However, despite the reported high and alarming prevalence of anemia in CKD resulting in significant co-morbidity, anemia is often untreated or treated improperly in clinical practice. The reason for this is mainly in the difficulty involved in determining the etiology of anemia in this condition which is vital in providing the right treatment. Hepcidin is the master regulator of systemic iron homeostasis[1] and plays a key role in anemia associated with inflammation. Physiologically, hepcidin inhibition occurs in cases of anemia, iron deficiency or hypoxia. In inflammatory conditions, levels of pro-inflammatory cytokines are increased[2]. It is plausible that increased hepcidin concentrations may cause iron-restricted erythropoiesis in CKD-associated anemia[3].

In the present study, a total of 50 subjects who were diagnosed to have chronic kidney were studied. Hepcidin levels were significantly higher in patients with CKD patients. Serum urea and creatinine were found to be elevated in CKD cases.

S. urea and S. creatinine were found to be elevated in the CKD patients. The mean value of S. urea and S. creatinine were 93.98 ± 32.876 mg/dl and 8.578 ± 3.88 mg/dl respectively. Both parameters were found to have significant positive correlation with hepcidin with $p<0.001$. These parameters are known to increase with the progression of CKD[4].

In the present study, serum hepcidin concentrations were found to be significantly increased in patients with CKD [Mean value: 149.484 ± 47.539 ng/mL]. Serum hepcidin levels were found to be increasing with the progression of CKD. This finding is supported further by the highly significant positive correlation observed between serum hepcidin and creatinine in CKD cases ($r= 0.8437$, $p<0.001$). These findings are in accordance with the study of Tarek et al[5], which reported an increase in serum hepcidin levels in all stages of CKD among 54 CKD patients under conservative management and 40 CKD patients under hemodialysis.

Hepcidin is cleared from the body by the kidneys. The increase in hepcidin seen in CKD is due to its reduced renal clearance associated with the deteriorating renal function. Depending on the damage of kidney, the elimination of hepcidin is limited and leads to the increase in its serum level[6]. Another reason could be the chronic inflammatory state of CKD which stimulates hepcidin production. Uremia is a state of heightened inflammatory activation. Hepcidin synthesis is induced in the liver as a response to IL-6 stimulation and it expresses its activity by decreasing the absorption of dietary iron and prevents iron release from macrophages. Elevated serum hepcidin levels mediate iron-restricted erythropoiesis and contribute to inducing anemia in CKD patients[7,8,9]. Short-term increases in serum hepcidin levels impair the release of storage iron, and long-term increases in serum hepcidin levels result in iron deficiency. High serum hepcidin levels cause iron blockade and anemia in chronic disease[10]. Chronic kidney disease patients with anemia have been found to have elevated serum hepcidin levels, and the

high hepcidin levels are likely to contribute to anemia in CKD and to ESA hypo-responsiveness[11,12].

Conclusion

Hepcidin is a positive acute phase reactant synthesised in liver. Its levels are found to be increased in inflammation and decreased in iron deficiency anemia. CKD is characterised by both anemia and inflammation. Hepcidin plays a key role in the pathogenesis of anemia of inflammation associated with CKD.It was observed that serum hepcidin levels are increased in CKD. Hence, it appears that hepcidin could be a prognostic marker in the clinical outcome of CKD especially in the progression of CKD.

Serum Zinc Level in Children with Febrile Convulsion in Comparison with Normal Children

Dunnuthala Sreenivasulu Reddy[1], P. John Solomon[2]

[1]PG Student, [2]Professor, Dept. of Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Objective: Febrile seizure is the most well-known issue in youth with great visualization. There are various speculations about synapses and follow component, (for example, zinc) changes in the serum, which can have a job in pathogenesis of febrile seizure.

Aim: The point of the present imminent investigative case-control study was to decide if there was any adjustments in serum zinc level in kids with febrile spasm during seizure.

Methods: One Hundred youngsters matured a half year to 5 years were separated into two gatherings: bunch A, 50 kids with febrile seizure, and gathering B, 50 ordinary kids.

Serum zinc levels for the two gatherings were evaluated by nuclear assimilation spectrophotometry(AAS). The information were broke down to look at zinc level among the two gatherings utilizing suitable measurable instruments utilizing SPSS 13

Findings: Serum zinc levels of groups A, and B had a mean value of 62.93mg/l, 91.88 mg/l respectively. Serum zinc level of group A was lower than the other group ($P<0.0001$).

Conclusion: The serum zinc levels are diminished in youngsters with febrile seizure spasms, therefore demonstrating that zinc hardship assumes a noteworthy job in pathogenesis of febrile seizures.

***Key words**: Zinc, Febrile convulsion, Normal children*

Introduction

Febrile spasm is one of the most well-known reasons for hospitalization of youngsters in pediatric ward that happens in kids between 5 months and 6 years old. The pathogenesis of this condition is as yet obscure. The vast majority of the seizures in kids are incited by physical issue starting outside the mind, for example, high fever, disease, syncope, head injury, hypoxia, or poisons. Short of what 33% of seizures happening at an interim more prominent than 24 hours apart.[(1)]

Very nearly three decades back, Livingston saw that Children with febrile seizures fared superior to youngsters with epileptic spasms not activated by fever, the guess was progressively ideal and they were bound to be neurologically normal(3). In any case, a few hypotheses, for example, hereditary premise, decrease of serum just as cerebrospinal liquid (CSF) zinc and magnesium level and low Gamma amino butyric corrosive (GABA) have been proposed[2,3].

Zinc is known to assume a control job in the invulnerable framework, and zinc- inadequate people experience expanded vulnerability to an assortment of pathogens. Zinc additionally works as a cancer prevention agent and can balance out films. Zinc regulates the fondness of synapses, for example, glutamate to their receptors and encourages the inhibitory impact of calcium on N- methyl-D-aspartate receptors and

along these lines counteracts the excitatory neuronal discharge[4].

Subjects and Method

This spellbinding investigation was led during April 2017 to walk 2018. The material utilized in this examination were corrosive propylene washed test tube , IV cannula, scalp vein set, test cylinder stand, axis, serum gathering test cylinders and cooler.

The examination included 100 youngsters between a half year to 5 years old of both genders (50 with febrile seizure and 50 typical people). Febrile kids were taken as control.

All patients in febrile seizure gathering (first episode of single summed up febrile seizure enduring for < 15 minutes and fever gathering were experiencing viral contamination

Kids who had mental impediment, atypical spasm, central seizure, incessant sicknesses, unhealthiness, focal sensory system contamination, pneumonia, urinary tract disease, and other bacterial diseases, looseness of the bowels, hemolysis or nearby contamination were avoided from study.

One milliliter of fringe blood was gathered in an acid-propylene tube inside 12 hours after admission to emergency clinic. All examples were centrifuged and serum was protected in -80°C.

Serum zinc was evaluated by Atomic Absorption Spectrophotometry in Cellular, Molecular Research Center associated to the Faculty of Basic Sciences.

The task was affirmed by the logical warning and moral board of trustees. Composed educated assent structures were marked by the guardians before incorporating the youngsters in the investigation

Table1: Demographic data and serum zinc level in febrile seizure children in comparison with normal groups

Groups	Mean(Sd) Age(Year)	Mean (Sd) Serum Zinc Level (Mcg/Dl)
FEBRILE CONVULSIONS	1.8	62.93
Normal GROUP	3.2	91.88

Findings

Demographic data is shown in table 1.

The mean age of serum zinc level in febrile convulsion was 1.8 years.

The mean age of serum zinc level in normal children was 3.2 years

The mean serum zinc level in children with febrile convulsion was 42.9 mcg/dl.

The mean serum zinc level in children with normal child was 91.88 mcg/dl.

Discussion

The serum zinc level was altogether lower in patients who experienced straightforward febrile seizure .contrasted and typical kids.

The mean period of febrile seizure was 20 months in this investigation . Lynette et al detailed a mean age of year and a half and every single other investigation revealed mean period of beginning somewhere in the range of 20 and 25 months.

The mean serum zinc levels were 62.93 mcg/dl, 91.88 mcg/dl in youngsters with febrile spasm and typical kids. Kids with febrile seizure have factually critical low serum zinc levels when contrasted and ordinary kids.

In one examination by Papierkowski et al in Poland that was performed on 33 patients matured 8 months to 5 years of age incorporating 18 patients for the situation bunch with febrile seizure and 15 solid people in the control gathering, serum and CSF zinc and magnesium levels were assessed. It was seen that cases had fundamentally lower levels of serum and CSF zinc and magnesium contrasted with controls [5]. As per Burhanoglu et al from Turkey, low degrees of serum and CSF zinc levels were found in patients with febrile spasm [6]

Another Amiri et al from Ghazvin medical clinic that was performed on 60 patients which 30 patients with febrile seizure for the situation gathering and others in the control gathering. Serum zinc, selenium and copper levels were assessed. It was uncovered that serum zinc and selenium levels were altogether lower in kids with febrile spasm [7]

Zinc, as a noteworthy component of certain compounds, has a significant job in certain tissues like focal sensory system and can influence some inhibitory instruments of CNS [8].

Conclusion

- Lower serum zinc levels can predispose children aged 6 months to 6 years to simple febrile seizure.

- It is suggested that zinc supplementation be considered in patients who are at risk of febrile seizure.

Serum Zinc Level in Children with Febrile Convulsions in Comparison with Febrile Children without Convulsions

Dunnuthala Sreenivasulu Reddy[1], P. John Solomon[1]

[1]PG Student, [1]Professor, Dept. of Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Objective: Febrile seizures are the most widely recognized kind of seizures saw in

the pediatric age bunch There are various theories about synapses and follow component, (for example, zinc) changes in serum, which can have a job in pathogenesis of febrile spasm.

Aim: The point of the present forthcoming , case-control study was to decide if there was any adjustments in serum zinc level in youngsters with febrile spasm during seizure and febrile patients without seizures.

Methods: Kids matured a half year to 5 years were isolated into two gatherings: bunch A, 100 youngsters with febrile spasm, and gathering B, 100 febrile kids without seizures.

Serum zinc levels for the two gatherings were assessed by nuclear retention spectrophotometry(AAS). The information were examined to analyze zinc level among the two gatherings utilizing proper factual instruments utilizing SPSS 13

Findings: Serum zinc levels of groups A, and B had a mean value of 64.92mg/l, 81.03 mg/l respectively. Serum zinc level of group A was lower than the other group ($P<0.0001$).

Conclusion: The serum zinc levels are diminished in kids with febrile seizure spasms, in this way demonstrating zinc hardship assumes a noteworthy job in pathogenesis of febrile spasms.

***Key words**: Serum Zinc, Febrile seizure, Febrile children*

Introduction

A seizure is a paroxysmal time constrained change in engine movement as well as conduct that outcomes from anomalous electrical action in the cerebrum (1). Seizures are basic in pediatric age gathering and happen in roughly 10% of youngsters (1).Febrile seizure are the most well-known type of seizures and are twice as regular in young men as in young ladies .The component basic febrile seizure have multi factorial etiology, Febrile seizure happens with fever (temperature>380C) and without side effects of CNS contaminations. Most seizures in kids are incited by physical disarranges starting outside the mind, for example, high fever , contamination, syncope, head injury, hypoxia, or poisons. Short of what 33% of seizures in youngsters are brought about by epilepsy, a condition characterized as at least two ridiculous seizures happening at an interim more noteworthy than 24hrs apart.(2) is one of the most widely recognized sort of seizure happening in youngsters between 5 months and 6 years old, representing 30% of all seizures in children.(3,4) Febrile seizure can be isolated into two classes, one is straightforward febrile seizure and second one is intricate febrile seizure. Straightforward febrile seizure is separated , brief and

Mob.No: 9444610092

summed up (5).Complex febrile seizure is unified with central beginning, one that happens more than once during a febrile disease, or one that last more than 10 to 15 minutes(6). Formative postponement and more youthful age are related with delayed febrile seizure.(7) As opposed to straightforward febrile seizure, complex febrile seizures are delayed (>15 minutes), central and happen more than once in 24 hours.[8]

Materials & Method

This distinct examination was directed during April 2017 to walk 2018. The material utilized in this investigation were corrosive propylene washed test tube , IV cannula, scalp vein set, test cylinder stand, axis, serum gathering test cylinders and cooler.

The examination included 200 kids between a half year to 5 years old of both genders (100 with febrile seizure and 100 febrile patients without seizure). Febrile youngsters were taken as control.

All patients in febrile seizure gathering (first episode of single summed up febrile seizure continuing for < 15 minutes and fever gathering were experiencing viral disease

Kids who had mental impediment, atypical spasm, central seizure, incessant ailments, lack of healthy sustenance, focal sensory system disease, pneumonia, urinary tract contamination, and other bacterial diseases, looseness of the bowels, hemolysis or nearby disease were barred from study. one milliliter of fringe blood was gathered in an acid-propylene tube inside 12 hours after admission to medical clinic. All examples were centrifuged and serum was saved in -80°c. serum zinc was evaluated by nuclear retention spectrophotometry in cell, atomic research focus partnered to the workforce of fundamental sciences. the task was endorsed by the logical warning and moral board of trustees . Composed educated assent structures were marked by the guardians before incorporating the kids in the examination.

Table: Demographic data and serum zinc level in febrile seizure children in comparison with fever and seizure groups

GROUPS	MEAN(SD) AGE(YEAR)	MEAN (SD) SERUM ZINC LEVEL (Mcg/dl)
FEBRILE CONVULSIONS	2.1	64.92
Fever GROUP	2.6	81.03

Findings

Demographic data is shown in table 1.

The mean age of serum zinc level in febrile convulsion was 2.1 years.

The mean age of serum zinc level in febrile children was 2.6 years

The mean serum zinc level in children with febrile convulsion was 64.92 mcg/dl.

The mean serum zinc level in children with febrile children was 81.03 mcg/dl.

Discussion

The serum zinc level was essentially lower in patients who experienced straightforward febrile seizure .contrasted with patients who had typical youngsters.

The mean time of febrile seizure was 25 months in this investigation . Lynette et al revealed a mean age of year and a half and every other investigation detailed mean time of beginning somewhere in the range of 20 and 25 months.

The mean serum zinc levels were 64.92 mcg/dl, 81.03 mcg/dl in kids with febrile seizure and febrile youngsters. Youngsters with febrile seizure have measurably noteworthy low serum zinc levels when contrasted and febrile kids.

In one investigation by Papierkowski et al in Poland that was performed on 33 patients matured 8 months to 5 years of age incorporating 18 patients for the situation bunch with febrile seizure and 15 solid people in the control gathering, serum and CSF zinc and magnesium levels were assessed. It was seen that cases had altogether lower levels of serum and CSF zinc and magnesium contrasted with controls [5]. As per Burhanoglu et al from Turkey, low degrees of serum and CSF zinc levels were

found in patients with febrile seizure ([6])

Another Amiri et al from Ghazvin clinic that was performed on 60 patients which 30 patients with febrile seizure for the situation gathering and others in the control gathering. Serum zinc, selenium and copper levels were assessed. It was uncovered that serum zinc and selenium levels were altogether lower in youngsters with febrile seizure [(7)]

Zinc, as a noteworthy component of certain proteins, has a significant job in certain tissues like focal sensory system and can influence some inhibitory instruments of CNS [(8).]

Conclusion

Lower serum zinc levels can predispose children aged 6 months to 6 years to simple febrile seizure. It is suggested that zinc supplementation be considered in patients who are at risk of febrile seizure.

This study shows decreased serum zinc level is a significant predisposing factor for febrile convulsions.

Sex Distribution of Padindiabetic Patients

Rudach Mitul[1], V.Padma[2]

[1]Junior Resident, [2]Professor, Dept. of General Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Atherosclerosis, notwithstanding being an illness of lipid gathering, likewise speaks to an incessant provocative procedure [(1).] Specialists have guessed that incendiary markers, for example, high-affectability C-responsive protein (hsCRP) may give an adjunctive strategy to worldwide appraisal of cardiovascular hazard [(2-4).] On the side of this theory, a few huge scale point of view epidemiological investigations have demonstrated that plasma levels of has CRP are a solid autonomous indicator of danger of future fringe blood vessel sickness, Myocardial localized necrosis, stroke and vascular passing among people without known cardiovascular ailment [(4-14).]Based partially on these information, high-affectability examines for CRP have befome accessible in standard clinical research centers. Notwithstanding, clinical utilization of hsCRP testing will depend on showing of autonomous prescient worth, yet in addition on exhibit that expansion of hsCRP testing to customary screening techniques improves vascular malady chance expectation. Moreover, utilization of hsCRP as an instrument to aid worldwide hazard appraisal requires information of populace conveyance of hsCRP, clinical attributes of hsCRP assessment, and size of danger of future Peripheral vascular illness that can be normal at each degree of hsCRP. There is a positive relationship between hsCRP levels and T2DM among grown-up rural occupants of South India. This affiliation was free of age, sex, BMI, WC, and WHR, recommending that raised hazard for T2DM probably won't be constrained to stoutness alone in this populace. Comparable perceptions have been made in past investigations [(15, 16).] Raised hsCRP levels much of the time group with entrenched hazard components of T2DM, for example, weight and insulin resistance[(17).] Higher HbA1c levels were seen in all the South Indian subjects with an expansion in hsCRP levels. Likewise, as observed by numerous relapse examination, HbA2c was the significant determinant of hsCRP level in controls. Prior examinations have additionally demonstrated the relationship of raised hsCRP levels with obesity[(18)] and insulin resistance[(19)] in North Indian young people and South Indian grown-ups, separately. Relationship of expanding hsCRP levels with expanding fasting insulin, C-peptide, and HOMA-IR features concurrence of subclinical irritation and insulin opposition. There is likewise adequate proof to recommend that hsCRP might be related with an expanding danger of future cardiovascular occasions in generally solid individuals[(20).] The aftereffects of the investigation feature the relationship of irritation, as estimated by hsCRP, with T2DM in the rural South Indian populace, free of weight. Corpulence and glycemic controls were distinguished as the real corresponds of hsCRP levels, proposing that the two may have an autonomous impact of foundational aggravation in this populace.

Key Words: *T2DM, PAD, hsCRP, subclinical irritation, insulin opposition*

Introduction

Aim of the Study: The aim of the study was to determine the sex ratio for peripheral arterial disease among patients with type 2 diabetes at Sree Balaji Medical College and Hospital.

Corresponding Author:
Dr. V. Padma
Dept. of General Medicine,
Sree Balaji Medical College and Hospital,
Chennai, India, Email: padmaramesh86@yahoo.com
Mob.No: 9840166947

Results

A total of 100 diabetic patients (cases) and 100 non-diabetic controls participated in the study. All the 100 cases had more than five year type 2 diabetes history. Clinical history of fringe vasculopathy was inspired utilizing Edinburgh claudication poll and Ankle Brachial

Index was measured for all .

The difference between diabetic and non-diabetic women in the prevalence of PAD was measurably significant (p=0.0478), where as the same in men was not statistically significant(p=0.2939). Also, PAD was more common in women both diabetic and non diabetic. This is an important observation when the fact was that a number of these women were passive smokers as their spouses where smoking.

Table 1: Sex distribution of PAD in Diabetic and NonDiabetic

	Diabetic	**NonDM**	**Total**	**P**
	N=100	N=100	N=200	
	(ABI<0.9)	(ABI<0.9)	(ABI<0.9)	
Women	78(13)	64(3)	142(16)	0.0478 (S)
Men	22(3)	36(1)	58(4)	0.2939 (NS)

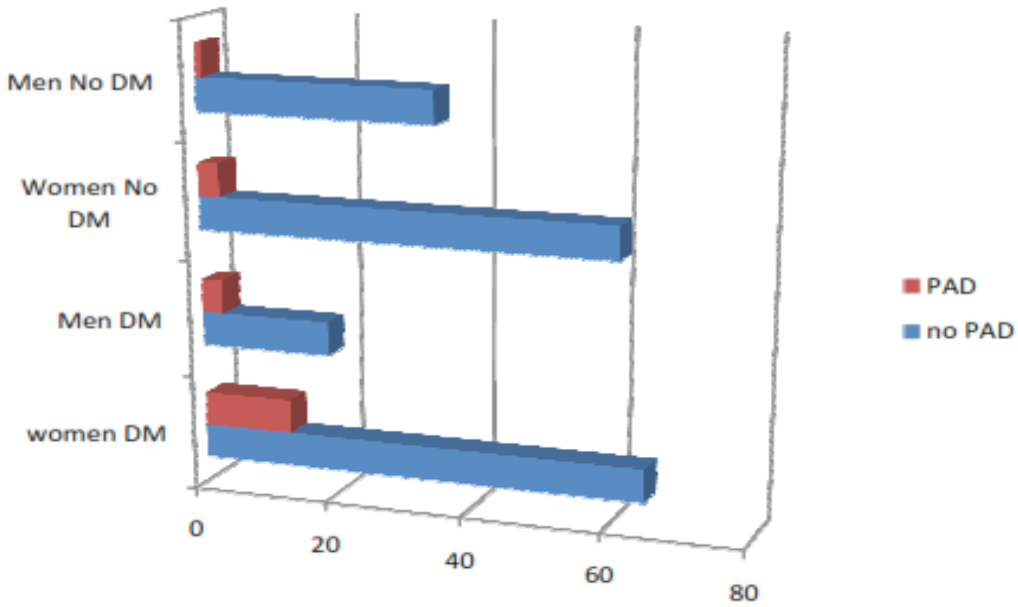

Chart 1:Sex distribution of PAD in Diabetic and Non Diabetic

Table Relationship of passive smoking with PAD in women

Women	**PAD NoDM**	**PAD DM**	**NoPAD DM**	**NoPAD No DM**	**Total**
Passive Smoking	2	9	27	28	66
No smoking	1	4	38	33	76
Total	3	13	65	61	142

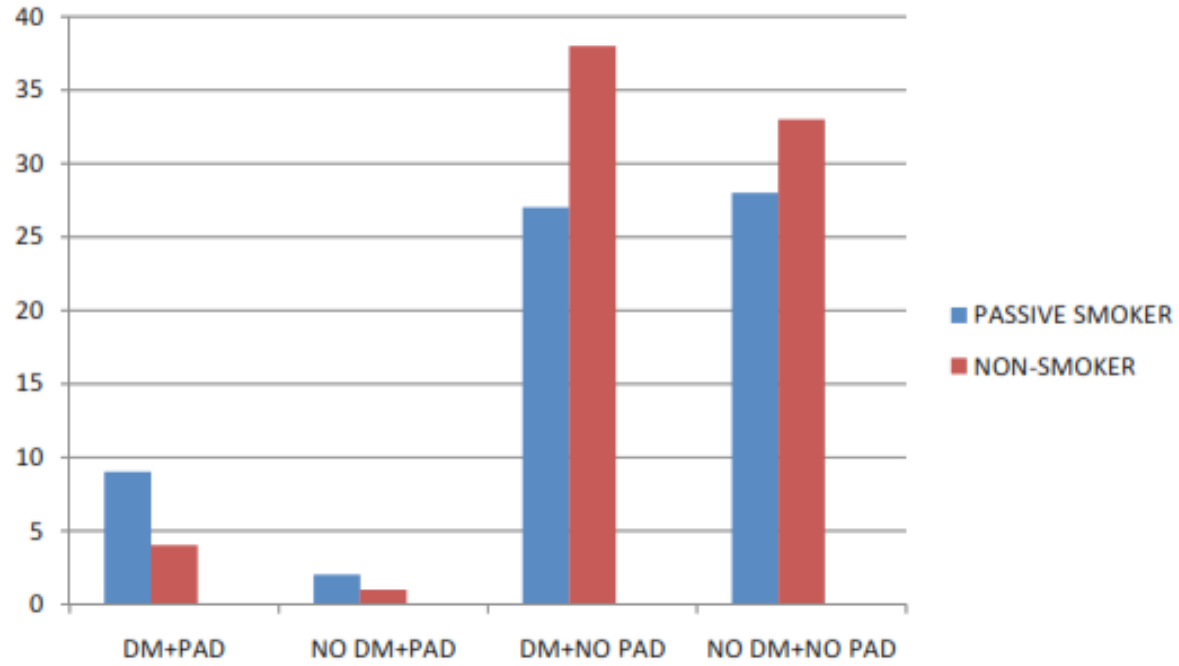

Chart 2: Relationship of passive smoking with PAD in women

Discussion

In our study all patients with evidence of any significant vascular illness were barred.

Yet another study of peripheral artery disease in diabetes reported 12.6% incidence of asymptomatic PAD. An examination in South Indian ladies with type2 diabetes[9], asymptomatic PAD was reported in 19% of diabetic women when compared non-diabetic ladies of comparative age gathering. In our study also there were more women included and the incidence of peripheral arterial disease was significantly more in females.

REGICOR investigators demonstrated a 4.5% prevalence of peripheral arterial disease in general population adults.

As per a study by Elizabeth Selvin and Thomas P Erlinger, peripheral arterial disease prevalence in adults more than 40 years in the USA was 4.3% (95% CI 3.1% to 5.5%),which translates to ≈ 5million persons (95%CI4to7million). Theprevalencewas14.5% (95%CI

10.8% to 18.2%) in older, over 70 years. Dark race/ethnicity(OR2.83,95% CI1.48to5.42) active smoking(OR4.46,

95% CI 2.25 to 8.84), diabetes (OR 2.71, 95% CI 1.03 to 7.12), hypertension (OR1.75,95%CI0.97to3.13),hypercholesterolemia(OR

1.68,95%CI1.09 to 2.57),and low kidney function (OR2.00,95%CI1.08to3.70) were positively associated with prevalent PAD in age and sex adjusted multivariate examination.

Sex difference was variable in published literature. In view by HigginsandHiggins,41 in women 45 to 93 years of age had a 3% to 29% (over this range of 5 decades) commonness of fringe blood vessel disease. But, it was evident that peripheral arterial disease was common in diabetic women. Most of these studies were done with cohort including smokers also. More men than women were smokers and hence, naturally men had higher occurrence of peripheral arterial disease. We excluded all smokers, both men and women and found that women had higher frequency of peripheral arterial disease in both diabetic and non diabetic populations, which was probably related to passive smoking as shown by the analysis.

Allison et al, showed that the prevalence of peripheral arterial disease increased with age for both men and women. More than just definitions, any atherosclerotic ailment had higher event, i.e., increase in the population "burden" of these diseases (defined as the total number of individuals who have the disease).

Age, the most traditional risk factor for peripheral arterial illness was seen to increase incidence. However in our study, diabetic population was more youthful than control population ($p<0.001$)

Assessment of Socio-Demographic Characteristics and Immunization Status of Under-Five Children in An Urban Area of Kancheepuram District

Arshad A.R[1], M.R. Rajashekar[2], Srinivasan[3]

[1]Final Year M.S Orthopaedics, [2] Professor Dept of Orthopaedics, [3]Assistant Prof; Dept of Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

The nutritional status of the children of a country has a direct bearing on its development. Giving a child a solid nutritional start has a positive impact on his/her physical, mental and social development . A child's nutritional future begins before its conception itself .It begins with the mother's nutritional status prior to pregnancy. A chronically-undernourished mother is likely to give birth to an underweight baby, who may be stunted as a child and in turn give birth to a malnourished baby. The sampling method applied to choose the required study population was Systematic Random Sampling. There were 4565 children under 5 years of age in the study area as per the records of UHTC. The list of under five children in this locality which is the sampling frame was obtained from UHTC on the basis of geographical order

***Keywords**: UHTC, Systematic Random Sampling*

Introduction

Pandit Jawaharlal Nehru, the First Prime Minister of India once said, "The children of today will make the India of tomorrow. The way we bring them up will determine the future of the country"..[1] Therefore it is important to concentrate on the nutritional status of the mother in order to break this vicious cycle of malnutrition. Eliminating malnutrition in mothers can reduce disabilities in their infants by almost one third.[1] Immunizing the child against vaccine preventable diseases improves their immune status and thereby reduces Infant morbidity and mortality. There is a need to assess the socio-demographic characteristics and immunization coverage of under five children in Tamil Nadu along with their feeding practices so that data regarding various factors that determine malnutrition could be obtained. Based on the results obtained from this study various measures could be formulated for preventing malnutrition in children as well as improving their health status.

Aim: The main aim of the present study is to assess the socio-demographic characteristics and immunization coverage of under-five children in an urban area of kancheepuram district in Tamil Nadu.

Objectives:

1. To assess the socio-demographic characteristics of under-five children .

2. To assess the immunization coverage of under-five children .

Materials and Method

Study design:

The present study is a community based cross-sectional , descriptive study conducted in an urban area of Kancheepuram district, Tamilnadu.

Study area and study population:

Kancheepuram district is one among the 32 districts of Tamilnadu. According to the Census of India 2011,

Corresponding Author :
Dr.Arshad A.R ,
Final year M.S Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Kancheepuram district covers an area of 4433 Sq.km. The population of Kancheepuram district is 39.98 lakhs comprising of 20.12 lakh males and 19.8 lakh females.[2] The study area identified for the present study is the field practice area of the Urban Health Training Centre located in Anakaputhur, which is attached to Sree Balaji Medical College and Hospital.

Anakaputhur is a Municipality city in the district of Kancheepuram, Tamilnadu. According to the 2011 Census, the total population of Anakaputhur is 48,050 of which 24,158 were males and 23,892 were females.[2] The study population identified were children below 5 years of age, residing in the Anakaputhur area, permanently at the time of the study. There were 4565 children under 5 years of age listed by the UHTC in the study area. They form the sampling frame for the study.

Study period:

The study was carried out from August 2017 to March 2018.

Sample size:

The sample size was calculated based on a previous study conducted by S.K.Senthilkumar in Coimbatore district in the year 2014.[3] The prevalence of underweight among children under 5 years of age was found to be 41.3%.[3] This prevalence of 41.3% was taken as the reference value for the sample size calculation for this study.

The sample size was calculated using the formula:

$N = Z_{1-\alpha/2}^2 pq / [L]\ 2$

Where, p = Prevalence of disease/ event (referred value)

q = 100 – p

Confidence level = 95%

Significance level (**α**) = 100- Confidence level = 100- 95 = 5%

Reliability Coefficient at that level ($Z_{1-\alpha/2}$) = 1.96

L =Relative precision, which is assigned as 10% of p (10% of 41.3 = 4.13) for this study

Substituting it in the formula,

[$Z_{1-\alpha/2}$ = 1.96, p= 41.3% , q = 58.7%, L = 4.13]

$$N = \frac{1.96 \times 1.96 \times 41.3 \times 58.7}{4.13 \times 4.13} = 546$$

Adding 10% non-response rate to the above obtained sample size , the final sample size was calculated to be 600.

Sampling method:

The sampling method applied to choose the required study population was Systematic Random Sampling. There were 4565 children under 5 years of age in the study area as per the records of UHTC. The list of under five children in this locality which is the sampling frame was obtained from UHTC on the basis of geographical order. Since the sample size calculated was 600, the sample interval (K) was calculated as given below.

K = N/n

Where N= total size of population

n = sample size

K = 4565/600 = 7.6

Every 8th child was selected from the list of children in the sampling frame. If a child or mother from the list was not able to be contacted for more than 2 visits they were excluded and the study was carried out till the required sample size was reached.

Inclusion criteria:

Children belonging to the age group below 5 years of age residing permanently with their families in Anakaputhur area whose mother consented for the study were included.

Exclusion criteria:

Children whose mother was not willing to participate in the study; children who were not able to be contacted even after 2 visits and children with severe illnesses were excluded from the study.

Study tool:

Data was collected through a pre tested semi-

structured questionnaire. The questionnaire consisted of the following sections:

Section I: Socio-demographic characteristics of the study population which included age, sex, religion, family type , family size, mother's educational status, mother's occupation and socio-economic status of the family based on modified Kuppuswamy classification[33].

Section II: Anthropometric measurements of the children which included height, weight and mid arm circumference of the child.

Section III: Information regarding feeding practices of the children which included adoption of exclusive breastfeeding, duration of breastfeeding, time of initiation of breastfeeding, type of breastfeeding, reason for not giving exclusive breastfeeding, practice of giving prelacteal feeds and time of initiation of weaning foods.

Section IV: Information regarding immunization status, gestational age, type of delivery, availment of Anganwadi services , antenatal services, history of acute respiratory tract infection and acute diarrhoeal disease in the child ; presence of anaemia and dental caries in the child and dietary pattern in the child .

Anthropometric measurements were recorded which included height of the child, weight of the child and mid arm circumference of the child. The interview was conducted by the investigator himself and their responses were recorded in the questionnaire. The physical instruments used in the study included a weighing scale, infantometer and a non-stretchable inch tape.

Length/Height: Length was measured in children less than 2 years old using an infantometer, with the child placed straight and supine on the horizontal board and the Frankfurt plane of the head kept perpendicular to the horizontal with the help of an assistant; length was recorded between the headpiece and the footpiece. A non-stretchable tape was used to measure the height of the children above 2 years of age , where the children were made to stand erect, with the heels, buttocks, shoulders and the head touching the wall, and the value was recorded to the nearest cm

Mid-arm circumference: A non-stretchable tape was used for measuring mid-arm circumference. The measurement was taken at the midpoint of the upper left arm, between the acromion process and the tip of the olecranon. After locating the midpoint, the left arm was extended so that it was placed loosely by the side, with the palm facing inwards. The tape was wrapped gently but firmly around the arm at the midpoint. Measurements were taken to the nearest millimetre.

Weight: Children who were able to stand independently were weighed using a weighing scale with a bare minimum of clothes and without shoes, with the weighing scale kept on a firm even surface and zero checked before each weighing. Weight was recorded to the nearest 0.1 kg. In children who were not able to stand independently, mother was weighed with and without the child and the difference was used as the child's weight.

Ethical approval:

The study was approved by Institutional Ethical Committee of Sree Balaji Medical College and Hospital , Ref. No.002/SBMC/IHEC/2017/964 .

Informed consent:

The details and the purpose of the study were explained to the mothers of the study participants. The informed consent was in Tamil language and consent was obtained before starting the interview .

Operational definitions:

- **Socio-economic status**: Socio-economic status was classified based on modified Kuppuswamy socio-economic status scale 2017 into five classes namely-upper class, upper middle class, lower middle class, upper lower class and lower class.[4]

- **A fully immunised child**: According to WHO , a child is fully immunised with all basic vaccinations if the child by one year of age, has received Bacillus Calmette-Guerin (BCG) vaccine at birth; three doses each of polio and pentavalent vaccines at 6,10 and 14 weeks of age ; and a vaccination against measles at 9 months of age.[5] If the child, by the age of one year, had missed even a single dose of the above said vaccines, the child will be termed as partially immunised and if the child had not received any vaccine, then the child will be termed unvaccinated.

- **Preterm**: According to WHO, preterm is defined as babies born alive before 37 completed weeks of gestation.[6]

- **Term**: Babies born alive from 37 completed

weeks to less than 42 completed weeks of gestation.[6]

- **Post term**: Babies born alive at 42 completed weeks or anytime thereafter of gestation.[6]

- **Low birth weight (LBW):** Low birth weight (LBW) is defined by the World Health Organization (WHO) as weight at birth less than 2500g irrespective of the gestational age.[6]

- **Underweight**: weight for age < –2 standard deviations (SD) of the WHO Child Growth Standards median[7]

- **Stunting**: height for age < –2 SD of the WHO Child Growth Standards median[7]

- **Wasting**: weight for height < –2 SD of the WHO Child Growth Standards median[7]

- **Overweight**: weight for height > +2 SD of the WHO Child Growth Standards median[7]

- **Mid arm circumference**: In children between the age group 1 and 5 years of age, mid arm circumference of more than 13.5 cm denotes normal nutritional status, mid arm circumference between 12.5 and 13.5 cm denotes mild to moderate malnutrition and mid arm circumference below 12.5 cm denotes severe malnutrition.[8]

Statistical Analysis

Data entry was done in Microsoft Office Excel 2007. Data analysis was done using Statistical Package for Social Sciences (SPSS), version 22. Results were presented using descriptive and analytical statistics. The descriptive statistics were presented as frequency distribution and percentage. The analytical statistics used were Chi-square test and Odds ratio. P value < 0.05 was considered as statistically significant value.

Findings

The present cross-sectional study was carried out in the field practice area of Urban Health Training Centre (UHTC) of Sree Balaji Medical College and Hospital, located in Anakaputhur area of Kancheepuram district. The results of the study are shown below using tables and figures.

Table no.1: Background information of mother and children.

S. no.	Socio-demographic variable	Frequency (N=600)	Percentage (%)
1.	Age of the child		
	0 – 6 months	140	23.3
	7 – 12 months	85	14.2
	13 – 60 months	375	62.5
2.	Gender		
	Male	324	54
	Female	276	46
3.	Religion		
	Hindu	558	93
	Muslim	26	4.3
	Christian	16	2.7
4.	Educational status of mother		
	Equal to or below higher secondary school	389	64.8

Cont... **Table no.1: Background information of mother and children.**

	Above higher secondary school	211	35.2
5.	Occupation of mother		
	Home-maker	516	86
	Working woman	84	14
6.	Socio-economic status according to modified Kuppuswamy socio-economic status scale 2017		
	Upper class	66	11
	Upper middle class	55	9.2
	Lower middle class	82	13.7
	Upper lower class	397	66.2
	Lower class	0	0
7.	Type of family		
	Nuclear family	330	55
	Joint family	270	45
8.	Size of family		
	Less than or equal to four	284	47.3
	Above four	316	52.7

As per table no.1, total number of children who participated in this cross-sectional study was 600 out of which 23.3% of children belonged to the age group 0 to 6 months , 14.2% of children belonged to the age group 7 to 12 months and 62.5% of children belonged to age group 13 to 60 months.Among the children who participated in this study , 54% of them were males and 46% of them were females. In this study, majority of children (93%) belonged to Hindu religion, followed by Muslims (4.3%) and Christians (2.7%).Majority of mothers (64.8%) have an educational qualification of equal to or below higher secondary school and the remaining 35.2% of mothers have an educational qualification of above higher secondary school. Majority of women (86%) were Home-makers while the remaining 14% were working women. Majority of the study population (66.2%) belonged to upper lower class followed by 22.8% of the study population belonging to middle class and 11% of the study population belonged to upper class(according to modified Kuppuswamy socio-economic status scale 2017).More than half of the study participants (55%) belonged to nuclear family while 45% of study participants belonged to joint family. Nearly half of the children (47.3%) belonged to a family size of equal to or less than four members while 52.7% of children belonged to a family size of more than four members.

Table no.2: Frequency distribution of immunization status of the study population

S.no.	Immunization status	Frequency (N=600)	Percentage (%)
1.	Fully immunised	566	94.3
2.	Partially immunised	34	5.7
	Total	600	100

Table no.2 shows, majority of children (94.3%) were fully immunised while only 5.7% were partially

immunised.

Discussion

The results obtained from the current cross-sectional study are compared with other similar studies done in India and abroad and the resultant findings are discussed below.

Socio-demographic characteristics of the study population:

The **maternal illiteracy rate** in the present study was only 1.3% which is significantly lower than the other studies that were done in India , which included the following: the study done by Venkateshiva B. Reddy et al in the Sugali tribe of Chittoor district in Andhra Pradesh, which showed a maternal illiteracy rate of 47%[9] ; the study done by Pujitha Sriram Padmanabhan in tribal children of Yercaud region in Tamil Nadu , which showed a maternal illiteracy rate of 25.5%[10] ; the study done by S.K.Senthilkumar in the tribal community of Coimbatore district in Tamil Nadu , which showed a maternal illiteracy rate of 42.2% [11] and the study done by Dinesh .P.V in rural preschool children of Sullia taluk of Karnataka, which showed a maternal illiteracy rate of 22.43%.[12]

The reason for lower maternal illiteracy rate in the present study when compared to the other studies done in India could be due to the difference in study settings: the present study was conducted in an urban area whereas the studies done by Venkateshiva B.Reddy[9], Pujitha Sriram Padmanabhan[10] and S.K.Senthilkumar[11] were conducted in tribal areas and the study done by Dinesh.P.V[12] was conducted in a rural area.

The maternal illiteracy rate in the present study was significantly lower than the study done by Sachin Singh Yadav et al titled, " An Epidemiological study of malnutrition among under five children of rural and urban Haryana", in the year 2012, which showed a maternal illiteracy rate of 16%.[13] The lower maternal illiteracy rate in the present study when compared to the study done by Sachin Singh Yadav et al[13] could be due to the following reasons: time period during which the study was undertaken- the study done by Sachin Singh Yadav et al was conducted five years back in 2012 when compared to the present study and another reason for lower maternal illiteracy rate in the present study could be due to the increased thrust given by Government of Tamil Nadu for improving the female literacy rate in the State.

Similarly the proportion of mothers who had an educational qualification of above higher secondary school level in the present study was higher (35.2%) when compared to the studies done by Venkateshiva B.Reddy et al[9] , Pujitha Sriram Padmanabhan[10], Dinesh P.V.[12] and Sachin Singh Yadav et al[13] , in which the proportion of mothers who had an educational qualification of above higher secondary school level was 5.2%, 9.1%, 18.5% and 12.9% respectively.

These factors highlight a better maternal literacy rate in the present study when compared to other studies done in India.

In the present study , majority of participants, that is, 66.2% of participants belonged to a **lower socio-economic status** which is comparable to the findings of the study done by Sachin Singh Yadav et al , in which the proportion of the study participants who belonged to lower socio-economic status was 65.5%.[13] The proportion of the study population belonging to lower socio-economic status was lower (66.2%) in the present study when compared to the findings of the study done by S.K.Senthilkumar in a tribal community of Coimbatore district, which showed the proportion of study population belonging to lower socio-economic status to be 83%.[11] This finding could be due to difference in the study settings – the present study was done in an urban area whereas the study done by S.K.Senthilkumar was conducted in a tribal area.[11]

Immunization rate:

In the present study , majority of children , that is, 94.3% of children were fully immunised which is comparable to the findings of the following studies: in the study done by Priyanka.R. the prevalence of children who were fully immunised was found to be 91.1%[14] and in the study done by S.K.Senthilkumar the prevalence of children who were fully immunised was found to be 90.8%.[11] The prevalence of children who were fully immunised in the present study was higher (90.8%) when compared to the NFHS-4 National data , which showed the prevalence of children who were fully immunised to be 63.9% in urban areas.[3]

This could be due to better availability of health care services and better maternal literacy status in the present study.

Conclusion

The present cross-sectional study assessed the nutritional status and feeding practices of under-five children along with its influencing factors in Anakaputhur area of Kancheepuram district, Tamil Nadu.

The findings in the present study were encouraging. Most of the mothers were literates (98.7%).Even though the maternal literacy rate in the present study was higher (98.7%) than other studies done in India, it is interesting to note that only 35.2% of mothers had an educational qualification of above higher secondary level and the remaining 64.8% of mothers in the present study had an educational qualification of equal to or below higher secondary level .

In the present study, more than two third of the study participants (66.2%) belonged to a lower socio-economic status. Majority of children (94.3%) were fully immunized.

Recommendations

From observing the findings of the current study, following recommendations are made:

1. In spite of Tamil Nadu Government's effort to increase the educational level of females, only 35.2% of mothers in the present study had an educational qualification of above higher secondary level and the remaining 64.8% of mothers in the present study had an educational qualification of equal to or below higher secondary level . Therefore all the agencies, both public and private, that are concerned with the improvement of educational status of women , should work in a coordinated way and undertake effective measures that would encourage all the girls to study up to at least higher secondary level and furthermore increase their enrolment in undergraduate programmes.

2. To improve the socio-economic status of the mothers, Tamil Nadu Government should undertake various steps to increase the female employment rate ; to make workplace environment (both in private and public institutions) conducive for breastfeeding by allocating separate rooms for nursing mothers to breastfeed their child with privacy; provision of maternity leave at all private institutions; increase the wages/salary of the working women and provide social security measures like medical insurance schemes.

Sonological Evaluation of the Clinically Negative Axilla in Women with Breast Cancer

Shreya Rajkumar[1], P.Darwin[1], C.T.Karthikeyan[1]

[1]PG Student, Dept. of General Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

The prognosis of breast carcinoma is dramatically altered by the presence of axillary lymph nodes. Hence, great importance is now given to axillary staging, One of the baseline investigations done for the axilla is sonology , to identify suspicious nodes.It is also part of the triad of triple assessment.This study aims to identify the common suspicious features of axillary nodes.40 patients with breast cancer and with clinically node negative axilla were taken up for the study ,and ultrasound of the axilla was done for them. On correlation of specific sonological characteristics with US-FNAC, the feature most predictive of malignancy was the absence of fatty hilum (34 cases) Hypoechoic cortex was the second best predictor(32 cases),followed by L/D ratio(31 cases). The ability of ultra sonogram to detect more suspicious lymph nodes increased with increasing tumour size.

With Westernization, and development of previously backward countries, one of the drawbacks is the rise of breast cancer, due to the life style,and unhealthy diet.Studies show that 1 in 8 women develop breast cancer during their life time.Of these, early detection and aggressive treatment can help cure them completely.A factor which dramatically changes the prognosis of the patient is the presence or absence of ipsilateral axillary nodal metastasis[1].This can be evaluated radiologically by sonology.

Keywords*: sonology , US-FNAC, nodal metastasis*

Introduction

Aim: This study aims to identify the commonest features of malignancy detected radiologically in axillary lymph nodes in patients with breast cancer.

Materials and Method: 40 patients who attended the OPD or IPD of the department of General Surgery, with biopsy proven breast cancer but clinically negative axilla were taken up for the study. A sonological study of the axilla was done for all of them, and the common features of malignancy noted were listed out in order of frequency.

Corresponding Author:
Shreya Rajkumar
Dept. of General Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Lymph nodes were evaluated for specific sonological characteristics like L/D ratio, presence or absence of fatty hilum and for echogenicity and for any morphological changes in cortex (notching, distortion)[10]

Results

On correlation of specific sonological characteristics with US-FNAC, the feature most predictive of malignancy was the absence of fatty hilum (34 cases) Hypoechoic cortex was the second best predictor(32 cases),followed by L/D ratio(31 cases). [1]

The ability of ultra sonogram to detect more suspicious lymph nodes increased with increasing tumour size.

Occurrence of absent fatty hilum seen in 34/40 patients (85%)

Occurrence of hypoechoic cortex seen in 32/40 patients (80%)

Hypoechoic cortex was seen in 32/40 patients (80%)

Alteration in L/D ratio (longitudinal axis/diameter ratio) was seen in 31 cases (77.5%)

Findings

A thorough knowledge of complete anatomy of breast and adjacent structures makes surgery easy to perform and gives patient the best management.Mammary glands are modified sweat glands seen only in mammals, and theydevelop along the milk line[2]. Awareness of this is essential to identify extramammarybreast lesions. This line extends from the axillary region to inguinal region. The mature breast extends between 2nd to 6th ribs in vertical plane, and from the side of sternum to anterior or mid axillary line horizontally. The tail of Spence extends into axillary pad of fat. The central nipple and areola have an important role intumor pathology. They can be involved in central lesions of major ducts, incancerization of ducts, and can extend upwards, leading to Paget's disease. Carcinoma involving the breast, being a major disease of the ducts, involvement of nipple, nipple retraction, and eczematous lesions are all clinical manifestations ofthe disease[2].

Mammary glands have a distinctive architecture consisting of parenchymal andstromal elements. It is considered a modified sweat gland and is made up of parenchyma which consists of the ducts and lobules. Tumors arising from these have a characteristic histological pattern and clinical progress[3]. However, knowledge of continuity of both these structures makes one understand how both these lesions can occur together. Numerous continual cyclic changes take place in them under the influence of endogenous hormones. Various types of involutionary changes are also taking place, with additional changes occurring during pregnancy and lactation. All these factors increase the susceptibility of the epithelium to abnormal proliferative changes increasing with age since any unrest epithelium is associated with tendency to malignant transformation. "Unrest soil is the seat for malignancy". Breast is thus common site for malignancy and is more common inolder age groups.[4]

The supportive stroma of breast contains the blood vessels, lymphatics and is having a major role in tumor biology. Blood vessels affect the growth of tumor byway of supplying blood and supporting angiogenesis. On the other hand insufficient blood supply leads to infarcts. Lymphatics cause secondary spread. Desmoplastic reaction acts as local barriers[4]. Inflammatory have major role in immunological response, thus govern the growth of tumors.[3]

The arterial supply is from lateral thoracic artery (arising from second part of subclavian artery), and lateral branches of 2nd, 3rd and 4th intercostals arteries,which are to be remembered during surgery. Venous drainage on the other hand is more significant in relation to spread of tumors. The axillary vein must be skeletonized during axillary dissection.2nd to 6th intercostals nerves supply the breast and are divided during surgery. However preservation of long thoracic nerve, thoracodorsal nerve and intercostobrachial nerves are important during surgery[5].

Knowledge of the lymphatic drainage of the breast is only too important sincelike all carcinomas, breast carcinoma first spreads by lymphatics.

There are 5 sets of axillary nodes draining the breast:

1. Anterior group (Pectoral group): these are situated along the lateral thoracicvein under the anterior axillary fold mainly in the 3rd rib. From here thelymph drains primarily into the central group.

2. Posterior group (Subscapular group): these lie along the posterior axillaryfold in relation to the subscapular vessels. Lymph drains from here mainlyinto central and supraclavicular nodes.

3. Lateral group (Axillary vein group): they lie along the upper part ofhumerous in relation to axillary vein.

4. Central group: These are situated in the fat of the upper part of the axilla.Lymph drains from here into the supraclavicular nodes. This nodal group isoften palpable in metastatic disease.

5. Apical group (Subclavicular group): They are constant in position boundedbelow by 1st intercostal space, behind by the axillary vein and in front by thecostocorocoid membrane[6.]

In evaluation of the axilla,the following are suspicious features seen on ultrasound:Suspicious :

A.	Size of more than about 10mm;
B.	The absence of a fatty hilum;
C.	Hypoechoic echoes internally;
D.	Rounded shape;
E.	sharply demarcated borders when compared to the surrounding fatty tissue;
F.	Aymmetric cortical thickening or eccentric lobulations of hypoechoic cortical rim7.

Benign:

If the lymph node showed Longitudinal axis/Diameter (L/D) ratio >1.5, with fatty hilum present and hyperechoic cortex

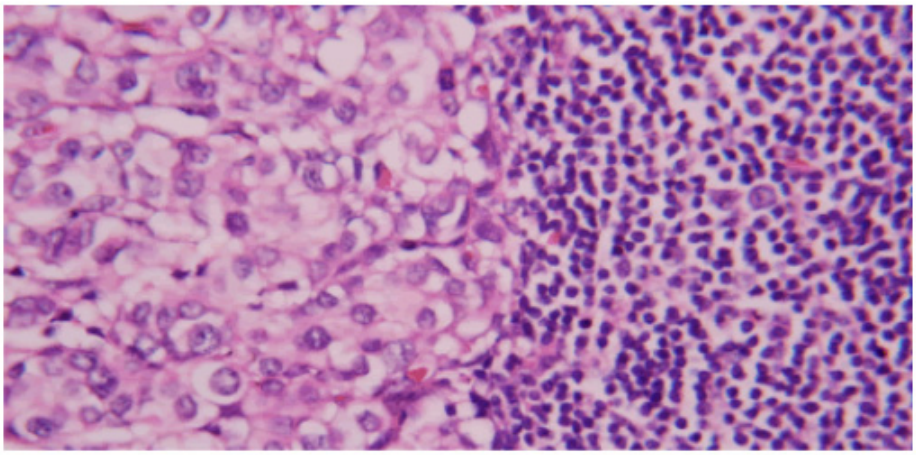

Fig 1.HISTOLOGY - METASTATIC NESTS IN AXILLARY LYMPH NODE

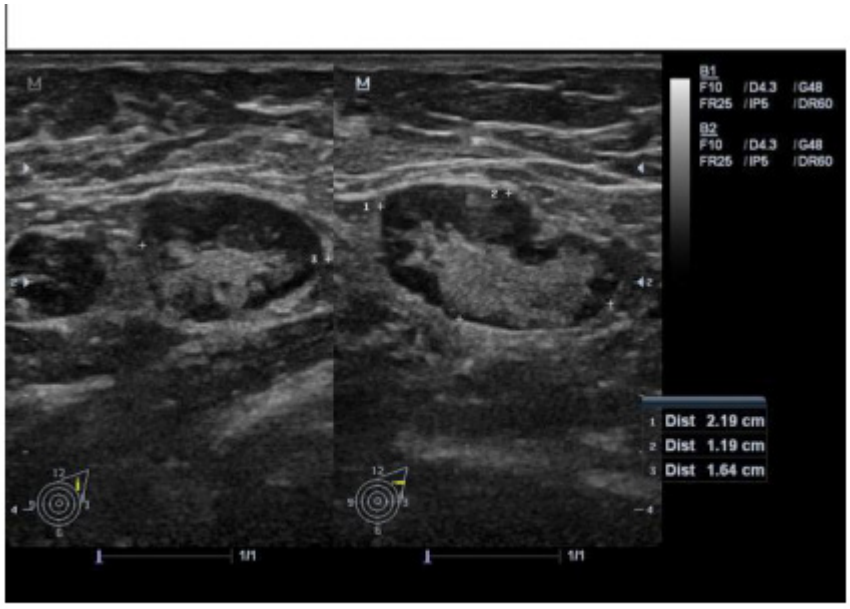

Fig 2.SONOGRAM OF AXILLA SHOWING A SUSPICIOUS NODE

Conclusion

On correlation of specific sonological characteristics with US-FNAC, the feature most predictive of malignancy was the absence of fatty hilum (34 cases) Hypoechoic cortex was the second best predictor(32 cases),followed by L/D ratio(31 cases).

The ability of ultrasonogram to detect more suspicious lymph nodes increased with increasing tumour size.

In conclusion, only those patients who showed benign or indeterminate features of lymph nodes on ultrasound and on patholoical evaluation of suspicious lymph node will require SLNB as the staging procedure[8].

Rest of the patients who show definite features of lymph node involvement on ultrasound may undergo ALND directly as a part of primary breast surgery, thus saving time and expense and also avoiding the morbidities associated with SLNB.

Specificity and Sensitivity of Ultrasound and Mri in the Diagnosis of Unicornuate Uterus

D. Prabu[1], T.Ramachandra Prasad[2], M.Prabakaran[2]

[1]PG Student, [2]Professor, Dept. of Radiogenesis, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

On MR pictures, the unicornuate uterus is effectively analyzed. X-ray has a high delicate tissue differentiate which gives magnificent picture quality for dependable location and portrayal of pathology in the female pelvis. The symptomatic yield of all the pelvic MRI assessments significantly depends on the cautious arranging of imaging planes utilized. The standard convention for pelvic imaging contains unenhanced Tl - and T2-weighted arrangements. Pelvic life systems is all around pictured on T2 weighted picture (T2WI) .MRI pictures should be gotten in at any rate two opposite planes for satisfactory assessment of the objective organs.

Keywords: *female pelvis, symptomatic yield*

Introduction

A **unicornuate uterus** is a less common type of congenital uterine anomaly, and it carries a mild risk of infertility and miscarriage.

Epidemiology

It is viewed as the less regular sort contrasted with different kinds of uterine irregularities(10 % of every single uterine oddity). It is named a class II Mullerian channel abnormality, as per the American Fertility Society.

Unicornuate uterus is the less basic kind of uterine inconsistency related with conceptive disappointment (12.5 %).

Pathology

Unicornuate uterus is considered because of disappointment of one Müllerian conduit to prolong while the different grows regularly. The embryologic transcendence of the unicornuate uterus tbe on the privilege has not been clarified. It could possibly have a simple horn.

Email: drm.prabakaran@gmail.com

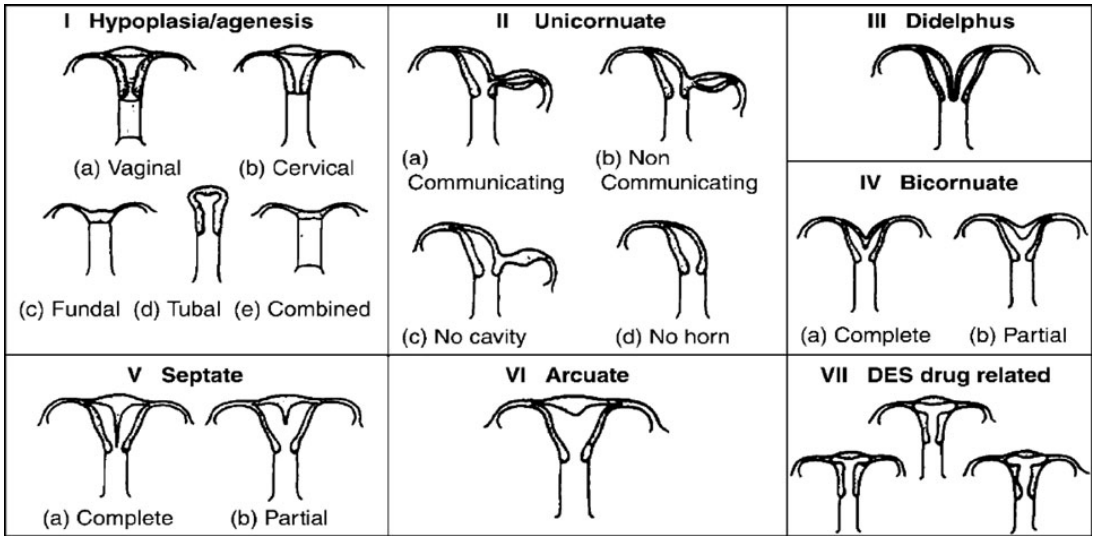
Radiographic features

General

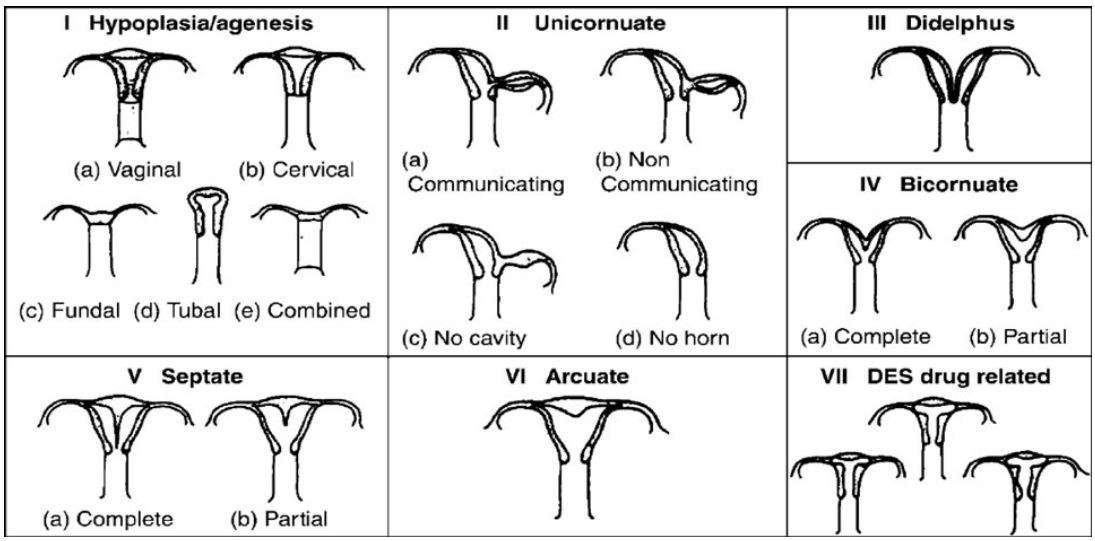
- the external uterine fundal contour may be smooth and deviated to one side.
- In less number of patients a rudimentary horn is noted.

Findings

Hysterosalpingogram



1. The endometrial pit ordinarily accept a fusiform (banana type) shape (aside from sort a where there may a little cavitation filling imperfection), decreasing at the summit and depleting into a solitary Fallopian tube. The uterus is for the most part moved off the midline.



2. Ultrasound

It is very difficult to detect a unicornuate uterus on ultrasound. The uterus may be seen tapering to one side.

MRI

- The uterus may appear curved and elongated :

banana-shaped external uterine contour

- The uterus may show a reduced volume
- The uterus may show asymmetric configuration
- A normal myometrial zonal anatomy is seen

MRI is considered the current imaging modality of choice.

On MR pictures, the unicornuate uterus is effectively analyzed. X-ray has a high delicate tissue differentiate which gives magnificent picture quality for dependable location and portrayal of pathology in the female pelvis. The symptomatic yield of all the pelvic MRI assessments significantly depends on the cautious arranging of imaging planes utilized. The standard convention for pelvic imaging contains unenhanced Tl - and T2-weighted arrangements. Pelvic life systems is all around pictured on T2 weighted picture (T2WI) .MRI pictures should be gotten in at any rate two opposite planes for satisfactory assessment of the objective organs.

Treatment and prognosis

Of the Müllerian duct anomalies, a unicornuate uterus is considered to have the second worst obstetric outcome (worst with a septate uterus).

Spontaneous abortion rates are reported to range from 41-62%. Reported premature birth rates range from 10-20%. Fetal survival rate is ~40% (range 38-57%).

Differential diagnosis

- Bicornuate bicollis
  - two cervical canals
  - cannulation of only one of these canals may

mimic unicornuate uterus on a hysterosalpingogram

Discussion

Morphology, thickness and vascularity of the endometrium, just as the state of the uterine cavity influence the implantation pace of the developing lives. The danger of unconstrained premature delivery at the primary trimester in patient with unicornuate uterus is 28-45% [(1).] High commonness of uterine irregularities among ladies with repetitive premature birth had been recorded by a few specialists [(2, 3).]

Precise finding in patient with repetitive premature birth is so significant in light of the fact that the sorts of oddities decide the treatment. Sometimes, careful treatment may diminish drastically the danger of repetitive premature birth [(4).] Hysteroscopy is a method that can't be supplanted due to remedial reason. Moreover, it could assess the intrauterine depression which can't be acquired from ultrasounds. Then again, hysteroscopy is the highest quality level demonstrative procedure for endometrial pit variations from the norm, uncovering an uneven fallopian tube which isn't perceived in HSG or ultrasound assessment [(5).] As indicated by the consequence of 2DUS in the Moini et al study in 2013, clearly determination of different septate uterus isn't pointedly separate [(6).] Subsequently MRI is done in all instances of suspected septate uterus to affirm the analysis.

In our examination, after ultrasound, ladies with septate uterus were submitted to MRI, which is viewed as the most significant technique to identify uterine septum.

Conclusion

Though Ultrasound is the primary investigation which is easily available , cheap and non- radiation to screen and detect uterine anomalies with expert hands, Magnetic Resonance Imaging is more specific and sensitive for detection of Unicornuate Uterus than Ultrasound

Spectrum of MRI Findings in Patients of Giddiness

Amish Aggarwal[1], I. Venkatraman[2], M. Prabakaran[3]

Resident[1], Professor[2], Professor and HOD[3], Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Energy is a vague side effect or feeling that incorporates sensations, for example, faintness, wooziness, vertigo and unevenness. The reason for the examination was to assess the job of attractive reverberation imaging (MRI) in diagnosing the reason for happiness in symptomatic patients. A planned companion study was directed in 106 patients who gave happiness. X-ray sweeps of these patients were dissected, and we reasoned that MRI can effectively exhibit the noteworthy discoveries which cause happiness.

Keywords: *Brain, giddiness, Magnetic resonance imaging*

Introduction

Happiness is logically named as "discombobulation" which means disability in spatial recognition and soundness as characterized in Dorland's Medical Dictionary. Happiness is accounted for in around 20–30% of the populace sooner or later in the year 20091. Different pieces of the body are required for keeping up equalization including the inward ear, eyes, muscles, skeleton and the sensory system, so any turmoil or malady in these frameworks can show as what is generally alluded to as giddiness2. Regular physiological reasons for energy incorporate insufficient blood supply to the cerebrum because of an abrupt fall in circulatory strain or blood vessel blockage, misfortune or mutilation of vision or viewable signs, issue of the inward ear, bending of mind/apprehensive capacity by drugs, for example, anticonvulsants and sedatives2. Differential judgments of numerous conditions are related with happiness. The most widely recognized causes are as per the following: 40% fringe vestibular brokenness, 10% focal sensory system sore, 15% mental issue, 25% presyncope/dysequilibrium, and 10% vague giddiness3. Conditions that regularly present as happiness or have energy as a side effect include: considerate paroxysmal positional vertigo, Meniere's ailment, vestibular neuronitis, labyrinthitis, otitis media, mind tumor, acoustic neuroma, incessant movement ailment, Ramsay Hunt disorder, headache, different sclerosis, pregnancy, low pulse (hypotension), low blood oxygen content (hypoxemia), myocardial localized necrosis, iron inadequacy (frailty), low glucose (hypoglycemia), hormonal changes (e.g., thyroid malady, monthly cycle, pregnancy), alarm issue, hyperventilation, nervousness, gloom, age-reduced visual, parity and view of spatial direction abilities1-3 . Energy is a typical displaying manifestation in prescription and otorhinolaryngology outpatient offices. Most patients with happiness frequently experience issues portraying their side effects, subsequently deciding the reason can be testing. A proof based methodology utilizing learning of key history, physical assessment and radiologic discoveries for the reasons for energy can help build up a determination and think about fitting medications much of the time. At the point when the manifestation is headstrong to prescriptions, patients are constantly alluded for attractive reverberation imaging considers (MRI) of Brain. Attractive reverberation imaging (MRI) has been appeared to can possibly analyze or to decide out conditions that present as happiness. X-ray has better goals than different cross-sectional imaging procedures like figured tomography for perception of back fossa of mind where most focal sensory system ailment that causes happiness are available. The points of this examination were to record the discoveries in

patients who experienced MRI mind for happiness as the exhibiting manifestation and to break down the affectability and particularity of MRI in diagnosing the reason for energy.[2]

Aims & Objectives of the Study

The objective of the study wasto evaluate the role of magnetic resonance imaging and spectrum of findings seen on MRI inpatients complaining of giddiness.

Materials and Method

The study was conducted in 106 patients who presented with complaint of giddiness (dizziness, vertigo, light headedness, imbalance) and referred for MRI to the Department of Radio Diagnosis. Majority of the referred cases were those who complaint of giddiness with neurologic signs and symptoms, risk factors for cerebrovascular disease, or progressive unilateral hearing loss. [4]

Inclusion Criteria

- Patients with complaint of giddiness.
- Patients willing to undergo this study.

Exclusion Criteria

- Patients not willing to undergo this study
- Pregnancy
- Claustrophobic patients

Clinical assessment was done including detailed history, physical examination and laboratory investigations for the causes of giddiness.

Subsequent MRI was done. For contrast enhancement, imaging was performed following intravenous injection of 0.1 mmol/kg of gadolinium.

Results and Observation

Table 1: Distribution of MRI findings in patients complaining of giddiness

S. No.	MRI Findings	No. of Cases	Percentage
1.	Semi-circular canal dehiscence	8	4.68%
2.	CP angle tumors	5	2.92%
3.	Mastoiditis	8	4.68%
4.	Posterior cerebral territory infarct	25	14.62%
5.	Cerebral atrophy	27	15.79%
6.	Small vessel ischemic changes	45	26.32%
7.	Venous sinus thrombosis	5	2.92%
8.	Vertebral artery stenosis/occlusion	1	0.58%
9.	Vertebrobasilar dolichoectasia	1	0.58%
10.	Benign intracranial hypertension	2	1.17%
11.	SOL (Space occupying lesion)	5	2.92%
12.	Intracranial hemorrhage	6	3.51%
13.	Non PCA territory infarct	13	7.60%
14.	Meningoencephalitis	1	0.58%
15.	Hypoxic ischemic encephalopathy	1	0.58%
16.	Normal	18	10.53%
	Total	106	100

MRI scans of 106 patients were analyzed and total 171 findings were seen that are known to cause giddiness. Out of 106 cases the most common finding on MRI was cerebral small vessel ischemic changes found in 45(26.3%) scans. 27(15.7%) scans had cerebral atrophy, 25(14.6%) patients had PCA territory infarct, 8(4.6%) scans had semicircular canal dehiscence, 8(4.6%) patients had mastoiditis and 5(2.9%) scans had CP angle tumors.

Other findings that were found includes intracranial haemorrhage found in 6(3.5%) scans, SOL found in 5(2.9%) scans, venous sinus thrombosis in 5(2.9%) scans and benign intracranial hypertension in 2(1.1%) scans. Overlap of findings in same scan was noted in many cases.[6]

Chart1: Distribution of MRI findings in patients complaining of giddiness

Chart 2: Number of patients with significant MRI findings VS Normal scan

Among the study group, 83 % (88) of the cases had significant MRI findings that are known to cause giddiness and 17 % (18) of the cases had normal MRI scan.

Out of 18 normal scans, 11 patients were clinically diagnosed as BPPV, cause of giddiness in 3 patients was psychological, 2 patients had orthostatic hypotension and after taking detailed history 2 patients were diagnosed with drug induced vertigo[10].

Findings

Giddiness is a common symptom which affects about 30% of people over the age of 65.[4] Benign paroxysmal positional vertigo, acute vestibular neuronitis, and Meniere's disease cause most cases of giddiness; however, physicians must consider other causes including cerebrovascular disease, semicircular canal dehiscence, migraine, psychological disease, perilymphatic fistulas, multiple sclerosis, and intracranial neoplasms. In these patients MRI scan is done to look for the cerebrum, cerebellum as well as for cerebello-pontine angle lesions and the internal auditory meatus.[6]

A descriptive cohort study was conducted on patients who present with complaint of giddiness (vertigo, light headedness, presyncope, and disequilibrium). In the present study 106 patients who presented with giddiness underwent MRI brain. MRI showed high sensitivity to visualize findings that were clinically significant and consistent with giddiness. We found that approximately 83% of scans had positive findings and 17% scans were normal. Kalsotra et al studied the findings on magnetic resonance imaging in patients with giddiness by evaluating MRI scans of 62 patients and reported 54.84% MRI scans as normal[5].

In the present study, most common finding was small vessel ischemic changes in 26.3% of the scans. In 2010 Papanikolaou et al. studied findings on MRI scans of patients presenting with audiovestibular symptoms. Subcortical white matter hyperintensive foci has been reported in 44% cases by Papanikolaou et al[6].

In present study the second most common finding was cerebral atrophy in 15.7%. Papanikolaou et al reported atrophy in 5.5% cases[6] while Kalsotra et al reported it in 3.22%[5].

Another significant and prevalent finding was posterior cerebral territory infarct in 14.6% scans and non-posterior cerebral territory infarct in 7.6% scans. Zoya Irfan Khan et al conducted retrospective study and analyzed MRI brain scans of 500 patients who presented with giddiness and reported acute infarcts in 8.4% cases[7].

In the present study semicircular dehiscence was seen in 8 (4.6%) scans which significantly attributes to giddiness. P. Browaeys et al. found that MR imaging has a sensitivity of 100% to depict semicircular canal dehiscence (SCD).

Mastoiditis was seen in 4.6% scans compared to 3% cases reported by Papanikolaou et al in his study.

In the present study CP angle tumors were visualized on MRI in 5(2.9%) scans.

Other findings include intracranial hemorrhage in 6(3.5%) scans, SOL in 5(2.9%) scans, venous sinus thrombosis in 5(2.9%) scans, benign intracranial hypertension in 2(1.1%) scans, meningoencephalitis in 1 scan (0.58%), hypoxic ischemic encephalopathy in 1 scan (0.58%), vertebral artery stenosis/occlusion in 1 scan (0.58%), vertebral artery stenosis/occlusion in 1 scan (0.58%) and vertebrobasilar dolichoectasia compressing over the midbrain in 1 scan (0.58%).

In the present study 45% were males and 55% were females out of which significant MRI findings were found in 50 males and 38 females.

Study conducted by Zoya Irfan Khan et al included 57.6% females and 42.4% males with age ranging between 36 to 74 years were found[7].

Current study comprised of patients between 6-94 years of age with mean age of 49.2 years. Majority of the cases i.e. 65% were in the age group of 21-60 years.

White matter hyperintensities and its progression, present in the MRIs of older people have been associated with hypertension and evidence suggests that WMHs occur because of arteriosclerosis within the wall of the arteriole.[8-11] Large arterial and small vessel disease of the cerebral circulation share risk factors, (e.g., hypertension, diabetes) and may coexist in individuals. People with uncontrolled and untreated hypertension had significantly greater white matter lesion progression than people with uncontrolled but treated hypertension.

In the present study 40 (37.7%) patients were known hypertensive. Out of 45 scans with small vessel ischemic changes (white matter hyperintensities) on MRI, 27 patients were hypertensive i.e. 60% of the cases with WMH were hypertensive. Out of 25 scans with PCA territory infarct on MRI, 15 patients were hypertensive i.e. 60% of the cases with PCA territory infarct were hypertensive. Out of 13 scans with non-PCA territory infarct on MRI, 10 patients were hypertensive i.e. ~ 77 % of the non-PCA territory infarct cases were hypertensive.

Conclusion

MRI has high sensitivity and can successfully demonstrate the significant findings which cause giddiness. Out of 106 cases, 83 % (88) of the cases had significant MRI findings that are known to cause giddiness and 17 % (18) of the cases had normal MRI scan.

Most common finding was small vessel ischemic changes and cerebral atrophy in these patients. PCA and non-PCA territory infarcts were among the other predominant findings.

Spectrum of other findings included semicircular canal dehiscence, mastoiditis, CP angle tumors, intracranial hemorrhage, SOL, venous sinus thrombosis, benign intracranial hypertension, meningoencephalitis, hypoxic ischemic encephalopathy vertebral artery stenosis/occlusion, vertebral artery stenosis/occlusion and vertebrobasilar dolichoectasia compressing over the midbrain.

Summary

Giddiness is a common presenting complaint of patients. MRI scan of these patients is done to look for possible treatable definitive cause. Out of 106 MRI scans, 83 % of the cases had significant MRI findings that are known to cause giddiness and 17 % of the cases had normal MRI scan. Most common finding was small vessel ischemic changes in 26.3% of the scans. Spectrum of other findings included cerebral atrophy, PCA & non-PCA territory infarcts.

MRI is a highly sensitive investigation to find out the cause of giddiness. Its benefit weighs more than its cost. So the patients with persistent giddiness must undergo MRI brain to find the cause and for further appropriate management.

Prevalence of Self-Medication Practices in Urban Area of Kancheepuram District, Tamil Nadu

D. Prabu[1], T.Ramachandra Prasad[2], M.Prabakaran[2]

[1]PG Student, [2]Professor, Department of Radio Diagnosis,Sree Balaji Medical College and Hospital, Chennai, India,

Abstract

Self-medication a worldwide problem[3] is common in developing countries like India and is an age old practice[2]. WHO has promoted practice of self-medication for effective and quick relief of symptoms without medical consultation, to reduce burden on health care services, which are often understaffed and inaccessible in rural and remote areas[2] In developed countries, the medicines which are available only on prescription of a medical practitioner are easily available over the counter in developing countries. Hence Self medication has become an important health issues in developing countries like India[4-7].

Keywords: *Medication, WHO, Self care*

Introduction

Self-medication or non-prescription of drug is an individual's medical behaviour towards self care that can do potential wellness and also be harmful[1] "Self-care practices in the form of self medication is nearly universal among every individual.About 75 percent or more of health care is undertaken without professional intervention. How ever without self-care, any system of health care would be swamped .The most crucial limitations in self-care functioning starts from the motivation, knowledge, custom and competence of the individual[2].

Self-medication a worldwide problem[3] is common in developing countries like India and is an age old practice[2]. WHO has promoted practice of self-medication for effective and quick relief of symptoms without medical consultation, to reduce burden on health care services, which are often understaffed and inaccessible in rural and remote areas[2] In developed countries, the medicines which are available only on prescription of a medical practitioner are easily available over the counter in developing countries. Hence Self medication has become an important health issues in developing countries like India[4-7].

Improper practice of self-medication due to **deficiency in knowledge** can lead to side effects especially in physiological conditions like lactation and pregnancy, and in extreme vulnerable ages, such as children and old age people[1].

Based on this background, the present study was carried out to find out the prevalence of Self medication in Urban area of Kancheepuram district in TamilNadu.

Materials & Method

Study Area:

The study was conducted in **Anakaputhur,** anUrban field practice area of Sree Balaji Medical College and Hospital in Kancheepuram district, Tamil Nadu.

Study design:

A Community based cross sectional descriptive study

Study Period:

The study was conducted between June 2017 to May 2018.

Corresponding Author:
Dr. M. Prabakaran
Department of Radio Diagnosis,
Sree Balaji Medical College and Hospital,
Chennai, India, Email: drm.prabakaran@gmail.com
Mob.No: 9444051419

Study Participants:

According to the 2011 census, Anakaputhur urban field practice area had a total population of 48,050 of which 24,158 were males , 23,892 were females . Total number of houses in Anakaputhur is 12,146. The study was done among adolescent and adults 15 years and above residing in the study area permanently at the time of the study.

Inclusion criteria:

All participants who were 15 years and above[8] and willing to participate in the study were selected

Exclusion criteria:

Those who were not willing to participate in the study were excluded.

Psychiatric patients,pregnent mother,severly ill patients were excluded from the study.

Study area:

Kancheepuram district is one among the 32 districts of Tamil Nadu. According to the census of India 2011,Kancheepuram district covers an area of 4433sq. km with a population of 39.98 lakhs comprising of 20.12 lakhs males and 19.8 lakhs females. Kancheepuram, the temple town is the headquarters of the district for administrative reasons, the district has been divided into 4 revenue divisions comprising of 11 taluks with 1137 revenue villages.

Anakaputhur is a Municipality city in the district of Kancheepuram, Tamil Nadu. It is divided into 18 wards for which elections are held every 5 years. The study was conducted in Anakaputhur which is the urban field practise area of Department of Community Medicine of Sree Balaji Medical College and Hospital (SBMCH), located at a distance of 7 kilometers from the institution with an area covering approximately 16 sq. Kilometers.

Sample size:

Sample size was calculated based on the study done by " Pushpa R Wijesinghe" in the year 2013 in Sri lanka which recorded the prevalence of self medication practice of 34%. Using this study prevalence as reference the sample size was calculated by using $4pq / [L]^2$formula

Adding 10% refusal rate the sample size obtained is 394 which is rounded up to 400. The sample collected during the study period was 424.

Sampling method:

Anakaputhur had a total population of 48,050 as per 2011 census. As per the data available in the UHTC register There were total of eighteen wards in Anakaputhur. The number of households 12146. The sampling technique followed for this study was systematic random sampling technique.

K = sample size in our study

N = Total no of households = 12146

n = sample size = 424

$K = N / n = 12146 / 424 = 28^{th}$. Every 28^{th} house were selected.

The name and address of the person was noted and was visited for the data collection. If the person corresponding to the number did not give informed consent or absent ,the next number was chosen and the next person was selected and interviewed. Likewise, 424 participants who gave informed consent and willingly participated in the study were identified.

Study tools:

A pre-tested structured questionnaire was used as a study tool to interview the study participants. The questionnaire was prepared in English and Tamil. It was conducted by face to face interview by the investigator himself and the responses were recorded in the questionnaire.

The questionnaire consisted of 6 sections relating to the details like socio-demographic characteristics, personal history and self-medication details,

Ethical approval:

The study was approved by Institutional Ethical Review Committee of Sree Balaji Medical college and hospital , Chennai .

Informed consent:

The details and purpose of the study and the confidentiality of their identity were explained to each and every participant those who were willing to participate in the study were required to sign the informed consent, after which they were included in the study . the informed consent was in Tamil ,the local

language of the study participants.

Statistical Analysis:

Data entry was done and analysed using SPSS software version 22

Findings

Table 1: Back ground characteristics of study participants.

Sl.no	Variables	Frequency N=424	Percentage %
1	AGE GROUPS		
	< 20 years	10	2.4
	21-30 years	70	16.5
	31-40 years	92	21.7
	41-50 years	66	15.6
	51-60 years	84	19.8
	61-70 years	82	19.3
	>70 years	20	4.7
2	SEX		
	Male	144	34
	Female	280	66
3	EDUCATION		
	Illiterate	170	33
	Primary school	192	45.3
	Secondary school	36	8.5
	Higher secondary school	56	13.2
4	OCCUPATION		
	Professional	18	4.2
	Skilled	38	9
	Semi skilled	142	33.5
	Unskilled	26	6.1
	Housewife	170	40.1
	Unemployed	30	7.1
5	PER CAPITA INCOME		
	Upper class	16	3.8
	Upper middle class	126	29.7
	Middle class	194	45.8
	Lower middle class	82	19.3
	Lower class	6	1.4
6	MARITAL STATUS		
	Married	408	96.2
	Unmarried	16	3.8
7	NO. OF FAMILY MEMBERS		
	≤ 4 members	336	79.2
	> 4 members	88	20.8
8	RELIGION		
	Hindu	368	86.8
	Christian	32	7.5
	Muslim	24	5.7

Age distribution:

The current study involves 424 study populations. In this study majority of the participant were female 66% (n=280) and 34% (n=144) of them were male. The study population belong to the age group of 20 to 70 years. About 21.7% (n=92) of them were between 31-40 years, 19.8 % (n=84)of them 51-60 years and 19.3% (n=82) of them belonged to 61-70 years. A minimum of 2.4% (n=10) of the population below 20 years and 4.7%(n=20) of them were above70 years of age.

Majority66% (n=280) of the study population were female and 34% (n=144) of them were male .Majority 45.3%(n=192) of them have completed primary school education , 33% (n= 170) of them were illiterate, 13.2% (n=56) have completed higher secondary education and 8.5% (n=36) have completed secondary school education. Majority of the study population 40.1% (n=170) was a home maker. 33.5%(n=142) of them was semiskilled worker. 9% (n=38) was skilled worker, 7.1% (n=30) was unemployed. A minimum of 4.2% (n=18) was professional by occupation.

Majority of the study population 45.8% (n=194) belonged to middle class. About 29.7% (n=126) Of them were upper middle class. About 19.3% (n=82) of them belonged to lower middle class. A minimal study population 1.4% (n=6) belonged to lower middle class.

About 96.2% (n=408) of the study population were married and a remaining of 3.8% (n=16) were unmarried. Majority 79.2% (n=336)of the study population the family had 4 members and below. About 20.8% (n=88) of them had more than 4 members in the family. Majority 86.8% (n=368) of the study population belonged to Hindu religion. About 7.5% (n=32) of them belonged to Christian and remaining 5.7% (n=24) of them belonged to Muslim religion.

Table2: **Prevalence of self-medication among the study participants**

Sl.no	Variables	Frequency N=424	Percen-Tage %
3	Treatment For Illness		
	Home remedy	24	5.7
	Sought medical care	146	34.4
	Self-medication	254	59.9

Among the study population majority 59.9% (n=254) of the study population followed over the counter medication for their treatment remedy.

Discussion

The present study is a cross sectional study , carried out in an urban field practicing area (Anakaputhur) of Sree Balaji Medical college and hospital, Kanchepuram district Tamil Nadu to determine the prevalence of self medication among people residing in an urban community

In the current study the age distributions of the study participant were between19 to 85 years with the mean age 47. Similar studies conducted by Kalaivani Annadurai et al. Nellikuppam Village, Kancheepuram District, Tamil Nadu (2017) which recorded mean age is 36.43years. In another study done by Saba HI et al. in Bengaluru, the age of the participants ranges from 15 to 60 years and above and the mean age is 37.8years. Ahmad et al. in his study done in Uttar Pradesh 18 to 60 and above. A study done by M. HYPERLINK "https://www.ncbi.nlm.nih.gov/pubmed/?term=Afridi%20MI%5BAuthor%5D&cauthor=true& cauthor_uid=26649022"IqbalHYPERLINK "https://www.ncbi.nlm.nih.gov/pubmed/?term=Afridi%20MI%5BAuthor%5D & cauthor= true& cauthor_uid=26649022"HYPERLINK "https://www.ncbi.nlm.nih.gov/pubmed/?term=Afridi%20MI%5BAuthor%5D&cauthor= true&cauthor_uid=26649022"Afridi, in Pakistan the study participants were 18 years and above[12]and the mean age is 33.49 years

The current study shows a maximum participant were female 66% and remaining 34% were male. This is similar to a study done by Kalaivani Annadurai et al. Nellikuppam Village, Kancheepuram District, Tamil Nadu (2017) where 73.13% of the participants where female . Saba HI et al.[11] Bengaluru, Karnataka,2016 67.64% .

Majority of the study population in the present study belongs to (86.8%) Hindu religion which is similar to study done by Kalaivani Annadurai et al in Nellikuppam Village, Kancheepuram District, Tamil Nadu (2017) where 92% of participants were Hindus. In a study done by Saba HI et al[11] in Barabanki 97.0%belonged to hindu religion.

In the presence study , 33% were illiterate, which is similar to the study done by Shyam sunder keshari et in Barabanki 2014, In which 38.7% of the study participants were illetrate

Over all the prevalence of selfmedication in the current study is59.9%. This prevalence is comparable with the studies conducted by Khan et al 2014 was 54.9% and Kalaivani Annadurai [7]et al in Puducherry 2014 was 53.43%. T Aqeel[1] et al in Pakistan 2014 was 61.2%.

Conclusion

In today's sophisticated medical world, self-medication is a double edged sword it is an alarming concept and its usage is increasing day by day[9]. Its usage would be safe, till the consumer who are using it, have sufficient knowledge[10] about its dose, time of intake, side effect on over dose Self-medication thus is a global phenomenon and a potential contributor to human pathogen resistance to antibiotics. Self-medication thus is a global phenomenon and a potential contributor to human pathogen resistance to antibiotics.

A Study on Socio Demographic Profile of the Prisoners Lodged in Central Prison, Chennai

Dunnuthala Sreenivasulu Reddy[1], P. John Solomon[2]

[1]PG Student, [2]Professor, Dept. of Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Wrongdoing is a man-made idea. Wrongdoing and its connection to different socio-statistic variables has been subject of discussion since days of yore. Wrongdoing is wide spread, different in nature and expanding in recurrence. The pace of wrongdoing is relentlessly expanding step by step everywhere throughout the world, India being no exemption. [1] Crime and its connection to different socio statistic and financial elements decide the idea of wrongdoing. It is a subject of changing frames of mind after some time inside a given society, and worldwide and national contrasts between the social orders. For instance, murder might be generally unlawful, aside from now and again of war, yet will-completely finishing the life of an in critical condition individual might be lawfully allowed in certain nations, yet is a wrongdoing of homicide in others. In the foreword to the 2002 World Report on Violence and Health, Nelson Mandela expresses, "The twentieth century will be recognized as a century set apart by viciousness, envy, vengeance, strength, and sexuality (for example assault) which are the all inclusive human behaviors.2

Keywords: *Crime, Nelson Mandela expresses*

Introduction

Social essentialness of both work and wrongdoing change significantly over the existence course. The connection among work and criminal conduct at various life-course stages influences the idea of wrongdoing. Joblessness is one of the social elements engaged with production of wrongdoing and conviction. Likewise when an individual is perpetrating a wrongdoing and getting detained he loses the employment and gaining, which influences the family's financial condition.[3]

There have been different research studies looking at the connection between financial status and captures and disciplines. At any rate financial status is freely viewed as a hazard factor. There are different research studies setting up the causal connection between financial status and capture. Elizabeth Brown and Mike Males, creators of "Ages or Poverty Level Best Predict Criminal Arrest and Homicide Rates?" found that "neediness level is an essentially bigger indicator of capture and manslaughter hazard than age. They explicitly took a gander at the information interfacing age to capture and afterward contrasted that with accessible information related with financial status.[4]

Wrongdoing is a result specifically compelling. A significant part of the wrongdoing in the nation can be credited to the issues and issues hurled by the ramifications of advancement hardships of the advantages and products of improvement interests by and large prompted variations bringing about the culpability and unrest.[5]

Indian culture has been going through intense and central changes in the wake of industrialization, westernization and urbanization, both in the structures, financial and social circles which not just delivered a changed physical condition and another type of monetary association yet in addition influenced the social request, solidarity, human direct and thought. Wrongdoing, which

is one social wickedness, which majors consequences for human relations, happens because of the absence of social solace and the general state. Handling wrongdoing can be accomplished uniquely from a multidisciplinary point of view, to feature every one of its highlights. One can stress the aversion arrangements to battle against debasement at the social level, the building up of blame, the correct positioning of the offense or, much more intricately, think about the types of fear based oppression appearance. Challenges in conceptualizing wrongdoing get from its different indications, both for foundations and people, with significant impacts and results on the financial, social and lawful sense. The etiological and causal view of wrongdoing requires the mastery of criminal disposition determination.[6]

Understanding the decent variety of the interior causes, by considering singular human instinct and outer causes pointed towards social, monetary, legitimate or political elements, is fundamental to catch the causal determinism of wrongdoing. Thus, the consideration is centered around the monetary benchmarks, instruction or populace thickness appropriation in urban and rustic areas.[6]

It is hard to land at a fair appraisal of the wrongdoing issue an evaluation that assesses the numerous different expenses and advantages of the significant social changes that have additionally made wrongdoing a conspicuous national issue. For arranging any counteractive action and control techniques, in regards to wrongdoing and to lessen viciousness and different types of wrongdoing, the information of socio-statistic variables and crimes ought to be understood.[6]

The Living conditions in each jail and united foundation implied for the care, care, treatment and recovery of guilty parties will be good with human poise in all angles, for example, settlement, cleanliness, sanitation, nourishment, garments, and restorative offices.

Congestion exacerbates condition for detainees. According to information of 2015 by National Criminal Records Bureau (NCRB), detainment facilities of India having an absolute limit of 3,66,781 while genuine number of detainees living in penitentiaries was 4,19,623.7

Consequently we have chosen to do an examination on jail populace to investigate the components and determinants of wrongdoing and the wellbeing status of the detainees which were not investigated much in Tamil Nadu prior.

Aim and Objectives

To study the socio demographic profile of the life convicts lodged in the central prison Puzhal, Chennai.

Materials & Method

A study conducted by Vinod kumar and UshaDatria among prisoners in central prison kota, Rajasthan in 2013 has found that the prevalence of psychiatric morbidities among them to be about 33%.[8]This prevalence was taken as the reference value for calculating the sample size for this study. The sample size was calculated using the formulaN = 4 PQ/ [L] 2

The sample size calculated was 353.76, by adding 10% for non-response rate (353.76+35.3) and the final sample size derived was 388 which was finally rounded off to 400. [N = 400]

Stratified random sampling (proportional stratified random sampling) technique was used to identify the study subjects. A pretested structured questionnaire was used as study stool for data collection. The questionnaire was prepared in English and translated to Tamil.

The data analysis was done using descriptive and analytical statistics. Data was entered in Microsoft excel and data analysis were done using the SPSS software, version 22. The descriptive statistics analysed were presented as frequency distribution and percentage.

The descriptive data were presented in the forms of tables (frequency and percentage) and figures.

Results and Discussion

Table 1: Socio demographic profile of the study participants.

S/No	Characteristics	Frequency (N=400)	Percentage
1	Age Group		
	Less than 30	44	11.0
	31-40	131	32.8
	41-50	138	34.5
	51-60	64	16.0
	More than 61	23	5.8
2	Place of Residence		
	Urban	230	57.5
	Rural	170	42.5

Cont... **Table 1: Socio demographic profile of the study participants.**

3	Type of Family		
	Nuclear	224	56.0
	Three generation	140	35.0
	Joint	36	9.0
4	Religion		
	Hindu	317	79.3
	Christian	32	8.0
	Muslim	43	10.8
	Others	8	2.0
6	Marital status		
	Single	113	28.3
	Married	211	52.8
	Divorcee	20	5.0
	Separated	56	14.0
7	Education		
	Professional	1	0.3
	Graduate	19	4.8
	Diploma	18	4.5
	High school	60	15.0
	Middle school	212	53.0
	Primary school	59	14.8
	Illiterate	31	7.8
8	Occupation		
	Profession	3	8.0
	Semi-profession	7	1.8
	Clerical	6	1.5
	Skilled	45	11.3
	Semiskilled	169	42.3
	Unskilled	165	41.3
	Unemployed	5	1.3
9	Socio-economic status (B.G.Prasad Classification)		
	Upper class	66	16.5
	Upper middle class	76	19.0
	Middle class	117	29.3
	Lower middle class	85	21.3
	Lower class	56	14.0

Table 1 demonstrates the sociodemographic profile of the examination members, which incorporates age, spot of habitation, sort of family, religion, conjugal status, training and occupation. About 67.3% (269) of the investigation members have a place with the age gathering of 31-50 years, the old populace i.e over 60 years is around 5.8%.

The greater part (57.5%) of the members were dwelling in urban regions. Around 56% (224) of them were from atomic kind of family and just 9% (36) were from joint family. Dominant part (79.3%) of the examination populace has a place with Hindu religion. Almost 28.3% (113) of the examination members were as yet unmarried as a result of their more drawn out span of detainment, 5% (20) were divorced people and 14% (56) were isolated.

About 90% of the examination members were from the school level (not exactly the higher auxiliary level); also, 89% of them were from the incompetent class of occupation. As indicated by B.G Prasad Socioeconomic status grouping almost 29.3% (117) of the members have a place with white collar class, 21.3% (85) and 14% (56) of the investigation populace has a place with lower center and lower class separately and about 16.5% (66) of them has a place with upper financial status.

Comparative outcomes were found in an investigation done by Fotedar S et al at Kanda model prison, Shimla which additionally demonstrated the mean age of the populace were 40.8 years and 56.5% of the examination populace has a place with the middle age gathering of 36-50 years of age.9

The investigations done by Kumar V, Daria U and Shrestha G et al demonstrated that around 43% in every examination the investigation members were from urban foundation.

Comparative outcomes were found in the examination done by Shrestha G et al in Regional jail in Nepal, demonstrated that 21.5% of the members were ignorant, and in the investigation done by Reddy S et al, demonstrated that 86% of the investigation members were instructed not exactly secondary school level.10,11

Conclusion

Though the diseases were reported alarmingly high among the prisoners, when compared to general population shows that, health of the prisoners still continues to be a neglected health care. This may be due to undetected, under-detected and under-treated of the illness in the prisoners since they are a neglected group.

Crouzon Syndrome – A Case Report

Shanthi Ramesh[1], Sundari S[2]

[1]Associate Professor, [2]Professor & HOD, Department of Pediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Crouzon disorder was first detailed by a French neurosurgeon in the year 1912. Crouzon disorder is an uncommon hereditary issue. It is acquired as an autosomal predominant attribute. The sutures in the human skull meld after the total development of the cerebrum, however on the off chance that any of these sutures close rashly, it might then meddle with the development of the mind. Crouzon disorder is described by craniosynostosis, with related dentofacial oddities. This report depicts the different clinical and radiological highlights in a multi year old male kid, with specific reference to the trademark discoveries of this disorder.

Keywords: *Crouzon syndrome, craniosynostosis, brachycephaly.*

Introduction

Crouzon disorder has a frequency of around 1 out of 25,000 births all around [1]. It is a type of craniosynostosis and establishes 4.8% of all instances of craniosynostoses [2]. Crouzon disorder is because of untimely combination of the coronal sutures and this outcomes in brachycephaly. The sickness is related with dentofacial irregularities [3]. The differential determination of Crouzon disorder incorporates Apert disorder, Chotzen and Carpenter disorder. Crouzon disorder is recognizable from the different craniosynostosis disorders by the absence of irregularities in the hand and foot [4].

Case Report

A multi year old male kid gave history of irregular shape the head and facial appearance. There was history intermittent migraine. On assessment the kid had brachycephaly, frontal bossing, unmistakable eyeballs and hypoplasia of the maxilla. X-beam skull sidelong view demonstrated beaten silver appearance showing raised intracranial weight brought about by melded sutures. X-ray cerebrum demonstrated diminishing of the cerebral cortex with combination of the privilege and left coronal sutures with a shallow orbital fossa. Crouzon disorder was analyzed dependent on clinical and radiological discoveries. Since the youngster had indications of raised intracranial weight, she was alluded to the neurosurgery group. Craniectomy was done to discharge the coronal sutures. This would give satisfactory cranial volume to permit ordinary cerebrum development. On follow up the youngster was without manifestation with no cerebral pain and improvement in the facial appearance.

Findings

With the approach of sub-atomic hereditary examinations, the quality for Crouzon disorder is restricted to the fibroblast development factor receptor II quality (FGFR 2) at the chromosomal locus 10q 25.3-q26 [5,6]. Early pre-birth conclusion testing for (FGFR 2) quality in the fetal DNA alongside pre-birth ultrasonogram may help in giving hereditary advising [7]. A late conclusion of Crouzon disorder may bring about different intricacies like flawed mental health, mental hindrance and facial deformations [8].

Conclusion

An understanding of these abnormalities and the associated problems is necessary to diagnose and treat this syndrome at an early age to prevent complications.

Acute Phenytoin Intoxication In A 4-Year Old Mimicking Viral Meningo-Encephalitis

Shachi Bhanuda[1], Ravanagomagan[2], Jagadeeswari[3], Sundari S[4]

[1]Post-graduate ,[2]Assistant Professor, [3]Professor, [4]Head of the Department, Departmentof Pediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

We report here the instance of a 4-year-old female preschooler who introduced to the division of Pediatrics, SreeBalaji Medical College and Hospital, Chennai with summed up tonic-clonic seizures and history of spewing, fractiousness and dysarthria of brief span. On assessment she was seen as responsive just to difficult upgrade, had terminal neck solidness and reciprocal extensor plantars. In perspective on her clinical introduction, an underlying determination of viral meningo-encephalitis was made in the crisis room and the youngster treated appropriately. On consequent exchange to the emergency unit), (the guardians uncovered extra history of a senior kin taking phenytoin for seizures. In this way, a doubt of intense phenytoin lethality was made and phenytoin levels sent for affirmation. Her serum phenytoin level was 80 µgm/mL (typical: 10–20). The kid was overseen moderately and released following 5 days of hospitalization. We announced this case to feature the unordinary introduction of this uncommon inebriation.

Keywords: *phenytoin, unordinary introduction, spewing*

Introduction

Phenytoin is a usually recommended anticonvulsant used to treat most sorts of seizure issue and status epilepticus, except for nonattendance seizures. Phenytoin digestion is portion subordinate. End pursues first-request energy at low medication fixations, and zero-request energy at higher medication focuses which conveys an extraordinary danger of portion related poisonous quality that is a significant issue in crisis medicine.1 Its wide pharmacokinetic changeability and restricted remedial range regularly prompts harmfulness which may have fluctuated indications. The highlights of intense harming are not quite the same as that of chronic.1 We report the one of a kind instance of a youngster who gave highlights of intense phenytoin harmfulness mirroring meningo-encephalitis.[1]

Case Presentation

A 4-year-old female youngster exhibited to the Department of Pediatrics in our emergency clinic, with objections of two scenes of summed up tonic-clonic seizures related with up-moving of eye balls and foaming going on for 10 min pursued by a postictal loss of awareness of 20 min. The guardians additionally gave history of retching, quick eye developments, hypotonia, fractiousness, dysarthria and dysphagia of 4-days span. The manifestations were noted by the mother after the kid woke up from rest. There was no history of fever, looseness of the bowels, hack, cold, injury, hound nibble, poison presentation or medication consumption imminent at affirmation. Previous history was non-contributory. The youngster wasborn out of a non-consanguineous marriage, and was fourth in the birth request. Her advancement was proper for her age. Her hemodynamics were steady with a pulse of 98/min, respiratory pace of 26/min and circulatory strain of 96/60 mm Hg.[2] Neurologic assessment uncovered a Glasgow Coma Scale score of 9, fractiousness, terminal neck firmness, flat nystagmus, diminished engine control, ordinary knee and misrepresented lower leg yanks respectively. Rest of the fundamental assessment was typical. In perspective on the above clinical range, at first, a temporary finding of viral meningo-encephalitis was made in the crisis room. Be that as it may, on ensuing exchange to the ICU (after 5 h) the guardians educated us that the senior kin (a 6-year-old kid) was

Corresponding Author:
Dr. Shachi Bhanuda
Post-graduate, Departmentof Pediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai - 73

taking phenytoin syrup at 5 mg/kg/day. Along these lines, a doubt of phenytoin inebriation was made and serum phenytoin levels sent likewise for affirmation.

Investigations:

Her initial investigations revealed normal blood glucose levels (random blood sugar −108 mg/dL), normal complete blood count, normal blood bio-chemistry (serum electrolytes, liver function tests, kidney function tests), normal arterial blood gases, electrocardiogram and chest x-ray. Her cerebrospinal fluid was acellular, with protein of 96 mg/dL and sugar of 88 mg/dL. The serum phenytoin levels sent on suspicion of acute phenytoin toxicity was 80 μg/mL (normal 10–20 μg/mL).[3]

Treatment:

The child was managed conservatively and closely monitored for side effects of the drug, especially cardiovascular and neurological. For her seizures, she was given midazolam, and loading and maintenance doses of valproate, as in our unit we often start valproate as first-line agent for generalizedtonic-clonic convulsions.[4] No antibiotics were used. The child started showing signs of improvement from day 2 of admission, vomiting and hypotonia resolved, motor power and consciousness improved by day 3. She was able to walk by day 4 of stay although ataxia, tremors and nystagmus persisted with diminished severity. Her repeat serum levels prior to discharge had dropped to 24 μg/mL.

Outcome And Follow-Up:

The child was discharged after 5 days of ICU stay after she made complete recovery. At discharge, only mild dysarthria persisted. Repeat phenytoin levels after 1 week of discharge showed no traces of the drug. A MRI of the brain has been planned forthe child after a gap of 6 months, as cerebellar atrophy may be a late complication in such cases.[5]

Findings

Phenytoin is hydroxylated and changed over to the para isomer of 5-hydroxy-phenyl-5-phenylhydantoin (p-HPPH) in the liver and is discharged as the glucuronide conjugate of p-HPPH in the pee. This is a saturable procedure. The time when immersion happens is erratic and shifts among people. When soaked, the serum phenytoin fixation ascends in a curvilinear way. This is the reason little additions in portion can cause an enormous increment in the serum phenytoin level in numerous patients. The limited helpful file, the wide between individual changeability in the pace of phenytoin digestion and leeway, and the immersion (zero-request) pharmacokinetics of phenytoin are in charge of the watched portion related toxicity.[6]

This case was irregular as there was no history of phenytoin consumption imminent at affirmation. The case could have effectively been missed as meningo-encephalitis, and the kid could have been begun on phenytoin for seizures which could have prompted further harm. This viably focuses at the significance of history taking, with expanded level of doubt towards phenytoin poisonous quality, given the wide range of clinical introductions of phenytoin lethality. Phenytoin poisonous quality happens much of the time with the standard focal sensory system introduction of nystagmus, ataxia, slurred discourse, diminished coordination and seizures. Cardiovascular poisonous quality has been related with the intravenous type of phenytoin, however has not been seen with the oral form.[2] This could likely be the purpose behind nonappearance of highlights of cardiovascular danger found in our patient. As phenytoin is a known hepatic compound inducer, it might influence the digestion and serum convergences of thyroid hormones and cause highlights of hypothyroidism.3–5 Gastrointestinal variations from the norm related with phenytoin harmfulness have not been recorded in the writing. Be that as it may, gastrointestinal irregularities have been related with hypothyroidism[6 7] which may happen optionally in these cases.[7]

Intense phenytoin danger is known to show with such an assorted cluster of neurological signs and side effects that, a high list of clinical doubt, combined with estimation of serum phenytoin levels are basic to clarify its range. The most successive neurological discoveries detailed incorporate nystagmus (95%), ataxia (88%), torpidity (22%) and seizures (19%), which were all found in the kid. Less normally, development issue, ophthalmoplegia, opsoclonus, cerebellar decay, reversible central neurological deficiencies present as difficulties of intense phenytoin inebriation from time to time.8 In grown-ups, the soonest indication of inebriation is nystagmus (level >20 μg/mL) trailed by dysarthria and ataxia (level >30 μg/mL). On the off chance that the level transcends 40 μg/mL lethargy may occur.9 Seizures have been accounted for at levels >30 μg/mL.10 It is vital in kids that the standard dangerous reactions, for example, nystagmus, happen at elevated

levels just, while ataxia may go before the former.9 Chronic phenytoin poisonous quality may copy different neurological issue, as cerebellar and brainstem sores, or subarachnoid haemorrhage,11 however there have been cases announced of cerebellar decay following intense overdose of phenytoin, in the light of which such a probability must be remembered in patients of intense phenytoin toxicity.[12]

The backbone of treatment for a patient with phenytoin inebriation is strong consideration. Treatment incorporates looking after vital functions, the executives of queasiness and heaving, and anticipation of wounds because of perplexity and ataxia. There is no antitoxin, and there is no proof that any strategy for gastrointestinal purification or upgraded end improves result. Actuated charcoal ought to be considered if the patient introduces early; notwithstanding, the job of different portion initiated charcoal is disputable. Exploratory investigations have demonstrated expanded leeway rates, however this impact has not been converted into clinical advantage. There is no proof that any intrusive technique for upgraded end, (for example, plasmapheresis, hemodialysis, or hemoperfusion) gives any benefit.[13] Seizures because of phenytoin inebriation are overseen by phenytoin withdrawal,[14] benzodiazepines can be utilized for controlling continuous seizures.[13]

Conclusion

Acute phenytoin intoxication may mimic acute viral meningo-encephalitis in children.

- There is no antidote.
- Seizures are best managed by drug withdrawal, benzodiazepines.
- Patient should be kept under follow-up to look for neurological complications like cerebellar atrophy.
- Parents should be educated time and again about the importance of prevention of such injuries as these are best prevented.

Evaluation of Anemia in Pregnant Mothers in Correlation with Anthropometry Measures in Tertiary Care Hospital

K. Saraswathi[1], Ritu Bawa[2], Nirupa.S.[2]

[1]Head and Professor, [2]Associate Professor, Department of OBG, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Introduction: In creating nations, maternal paleness during pregnancy has been accounted for to build the danger of the ominous fetal result. As indicated by the standard set somewhere around WHO, paleness in pregnancy is available when the hemoglobin fixation in the fringe blood is 11gm/100ml or less. Measure of iron moved to the baby is unaffected regardless of whether the mother experiences iron inadequacy pallor, yet the occurrence of low birth weight babies and pre 6 develop births are normal.

Aim of the Study: To correlate anthropometry measures with anemia in pregnant mothers.

Materials and Method: The examination was directed in the Department of Pediatrics and Department of Obstetrics and Gynecology at Sree Balaji Medical College and Hospital, Chennai from April 2017 to March 2018.100 term singleton neonates and their moms satisfying the consideration and prohibition criteria. A careful physical assessment of the neonate including anthropometry (Weight, Length, Head Circumference, and Chest Circumference) was finished.

Results: By using the Pearson correlation there is no relationship between the mother's Hb value and Baby's Head circumference where r value was -0.033 which was not statistically significant $p>0.05$. This shows that the baby's Head circumference values were not correlated with mother's Hb value. There is no relationship between the mother's Hb value and Baby's Length's. p value was 0.06 which was not statistically significant $p>0.05$. This shows that the baby's Length was not correlated with mother's Hb value.The baby's chest circumference was also not correlated with mother's Hb value.

Conclusion: The birth weight, head perimeter, chest outline, mid-arm circumference, and crown-heel length were fundamentally low in babies destined to ladies with moderate and extreme pallor in contrast with newborn children destined to non-pallid ladies. The development hindering impact of maternal iron deficiency was more on fetal birth weight and mid-arm outline than on other anthropometric lists.

Keywords**:** *Birth Weight, Anemic Mothers, Hemoglobin Level, Cord Blood Sample.*

Introduction

In the creating nations, sickliness is one of the significant general medical issues in all the age gatherings. Of these, the most helpless gathering is pregnant ladies. There are different reasons for pallor in pregnant women1. Among the different causes, wholesome frailty is the commonest one, especially in creating nations like India. In South-East-Asia locale, over 70% of pregnant ladies experience the ill effects of nourishing pallor.2Iron-inadequacy weakness is the commonest nourishing paleness influencing pregnant ladies. It might predate origination, frequently bothered by pregnancy and conveyance. 3One of the essential points of antenatal consideration is to anticipate and treat frailty during pregnancy since the wellbeing of work and

the puerperal state, and the conveyance of a sound infant and Neuro-Developmental result relies on the condition of the patient's hematological reserve.4Even however normal iron supplementation is routinely suggested by the medicinal services frameworks in our nation, this guidance is frequently disregarded making the pregnant ladies lacking in iron stores. The exchange of iron from the pregnant ladies to the hatchling **happens** over the placenta against a fixation gradient.5Iron from the mother is the main hotspot for the baby; it is extremely clear that the iron status of the mother will influence the iron status of the neonate. Different examinations have been directed till now, to explore the connection between the mother and the neonate as to the iron status6

Materials and Method

The study was conducted in the Department of Pediatrics and Department of Obstetrics and Gynecology at Sree Balaji Medical College and Hospital, Chennai from April 2017 to March 2018.100 term singleton neonates and their mothers fulfilling the inclusion and exclusion criteria. A thorough physical examination of the neonate including anthropometry (Weight, Length, Head Circumference, and Chest Circumference) was done**.**

Results

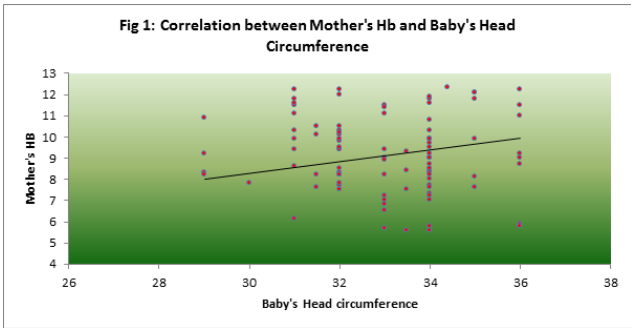

Fig 1 Correlation of Mother's Hb with Anthropometry of the Baby

By using the Pearson correlation there is no relationship between the mother's Hb value and Baby's Head circumference where r value was -0.033 which was not statistically significant p>0.05. This shows that the baby's Head circumference values were not correlated with mother's Hb value.

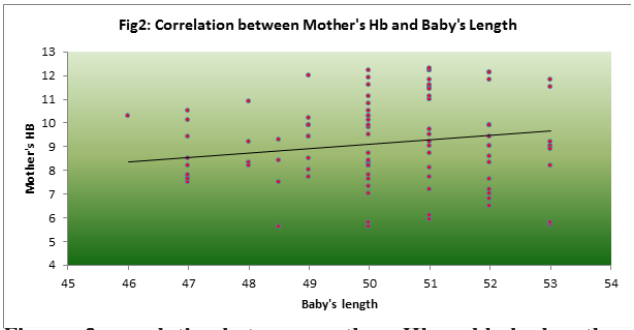

Figure: 2 correlation between mothers Hb and baby length

By using the Pearson correlation there is no relationship between the mother's Hb value and Baby's Length. The value was 0.06 which was not statistically significant p>0.05. This shows that the baby's Length was not correlated with mother's Hb value.

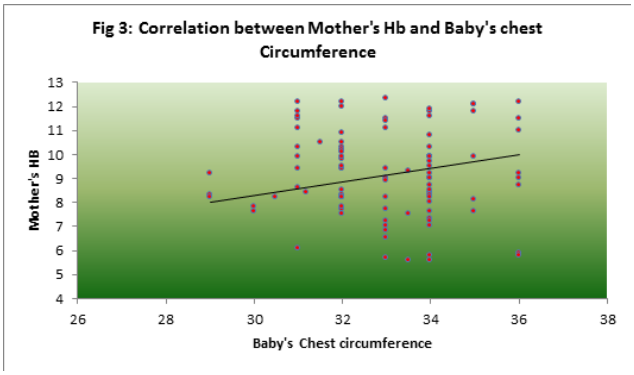

Figure: 3 Correlation Between Mothers Hb and Babys Chest Circumference

By using the Pearson correlation there is no relationship between the mother's Hb value and Baby's chest circumference r value was -0.05 which was not statistically significant p>0.05. This shows that the baby's chest circumference was not correlated with mother's Hb value.

Findings

Iron is effectively moved from the pregnant ladies to the embryo. In ladies with iron-lack, there is up regulation of certain proteins moving iron in the placenta. This guarantees a sufficient inventory of iron to the developing fetus7. This clarifies higher iron and ferritin esteems in the line blood, contrasted with the maternal blood, even in moms with extreme iron-lack. In any case, the straight connections of iron and ferritin levels of the string blood with the maternal hemoglobin, iron and ferritin levels demonstrate that the embryo collects iron in direct extent to the levels accessible in the mother. In this way it appears to be placental iron vehicle instruments are not intact, and in cases with serious paleness these systems may fall flat, prompting a lacking

iron stockpile to the baby.8Among 100 moms 9(9%) moms were in serious iron deficiency, 61(61%) were in gentle paleness, (10 %) were in moderate weakness and 20(20%) moms were typical. This information demonstrates that 80% of the pregnant moms were pale. Pregnant ladies with hemoglobin levels more noteworthy than 11 g/dl, which is viewed as typical, brought forth neonates with ordinary weight, while pregnant ladies with lower hemoglobin levels (< 9 g/dl), who were viewed as weak brought forth low birth weight babies. [9] Risk factors for LBW are numerous and differed. Statistic hazard elements incorporate youthful maternal age, primiparity, and low training. Maternal healthful status both previously and during pregnancy is a well-perceived determinant of birth results. Just two markers, specifically maternal pre-pregnancy weight list and weight gain during pregnancy have indicated predictable positive relationship with newborn child birth weight. 10Reports from created and creating nations demonstrate that maternal anthropometric estimations are related with birth outcome. This was as per Mavalankar et al who demonstrated that moms with iron lack paleness had a 3 times more serious danger of bringing forth babies with low birth weight. 11Another study has announced that the birth weight, head periphery, chest outline, mid-arm boundary, and crown-heel length were essentially lower in newborn children destined to frail mothers.12For assessing the impact of maternal iron lack on neonates, some neonatal parameters like birth weight, length, head circuit, and chest perimeter were considered as development indices. 13,14Pregnant ladies who got iron enhancements have been accounted for to have heavier infants by Neggers Yet al. The present examination showsa factually critical relationship between's maternal hemoglobin the neonatal birth weight. there was no factually huge relationship of head perimeter, length and chest boundary with the maternal hemoglobin levels.15In the investigation by Osrin D, et al. they have detailed a noteworthy relationship between's the neonatal head outline and the maternal frailty. Be that as it may, they didn't report any relationship between's the birth weight and maternal anemia16

Conclusion

The birth weight, head boundary, chest circuit, mid-arm circumference, and crown-heel length were altogether low in babies destined to ladies with moderate and extreme iron deficiency in contrast with newborn children destined to non-pale ladies. The development hindering impact of maternal iron deficiency was more on fetal birth weight and mid-arm perimeter than on other anthropometric records.

A Various Etiologies of Intestinal Obstruction – A Case Series

V.Naveen Kumar[1], S.Karthikeyan[1], K.S.Ravishankar[2]

[1]Post Graduate, [2]Head and Professor, Department of General Surgery, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: Gut hindrance stays one of the most well-known intra-stomach issues looked by general specialists in their training whether brought about by hernia, neoplasm, bonds or identified with biochemical unsettling influences intestinal impediment of either the little or huge gut keeps on being a noteworthy reason for horribleness and mortality. To distinguish and break down the different etiologies of patients with intense intestinal obstacle.

Objective: To analyse the various etiologies of intestinal obstruction.

Materials and Method : The investigation was led in Sree Balaji Medical College and Hospital, Chennai over a time of 19 months in all patients conceded with intestinal deterrent independent of age gathering.

Results: The examination gathering comprised of 50 instances of intense intestinal block in all the age group. The commonest reason for intestinal hindrance in the grown-ups in this investigation arrangement was deterred Hernia (42%) trailed by post operative adhesions(30%).

Conclusion: The investigation gathering comprised of 50 instances of intense intestinal impediment in all the age group. The commonest reason for intestinal block in the grown-ups in this examination arrangement was discouraged Hernia (42%) trailed by post operativeadhesions(30%).

Key words: *intestinal obstruction, hernia, postoperative adhesions.*

Introduction

Entrail hindrance stays one of the most widely recognized intra-stomach issues looked by general specialists in their training whether brought about by hernia, neoplasm, grips or identified with biochemical unsettling influences intestinal impediment of either the little or huge gut keeps on being a noteworthy cause of bleakness and mortality[1]. They represent 12% to 16% of careful affirmations for intense stomach objections. Indications of intense intestinal check can run from a genuinely decent appearance with just slight stomach inconvenience and distension to a condition of hypovolemic or septic stun (or both) requiring a crisis activity. The demise because of intense intestinal impediment is diminishing with better comprehension of pathophysiology, improvement in analytic strategies, liquid and electrolyte amendment, much powerful enemy of microbials and learning of concentrated consideration[2]. The majority of the mortalities happen in older people who look for late treatment and related prior maladies like, diabetes mellitus, cardiovascular sicknesses or respiratory disease. Early analysis of obstacle, legitimate system during medical procedure and escalated postoperative treatment convey a thankful outcome.

Dr. K.S. Ravishankar
Head and Professor, Department of General Surgery, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai-73.E Mail - kalravi1954@gmail.com, M - No - 9444066190

Materials and Method

The examination was led in Sree Balaji Medical College and Hospital, Chennai over a time of 19monthsin all patients conceded with intestinal

hindrance independent of age gathering[3]. Study structure - Prospective observational study. Patients who were having sub acute intestinal obstacle treated moderately were prohibited from the examination, and just those instances of intense intestinal hindrance which were overseen precisely were concentrated to set up the pathology of intestinal deterrent with a mean to know the method of introduction, physical discoveries, radiological and hematological discoveries, usable discoveries and result of intense intestinal obstruction. After the affirmation of the patient, clinical information were recorded according to Proforma[4]. The determination essentially dependent on clinical assessment and regularly bolstered by hematological and radiological assessments.

Findings

Table 1: Causes of intestinal obstruction in adults

Clinical condition	Number of cases	Percentage
Obstructed hernia	21	42
Postoperative Adhesions	15	30
Volvulus	2	4
TB abdomen	2	4
Malignancy	7	14
Intussusception	2	4
Mesenteric ischaemia	1	2
Total	50	100

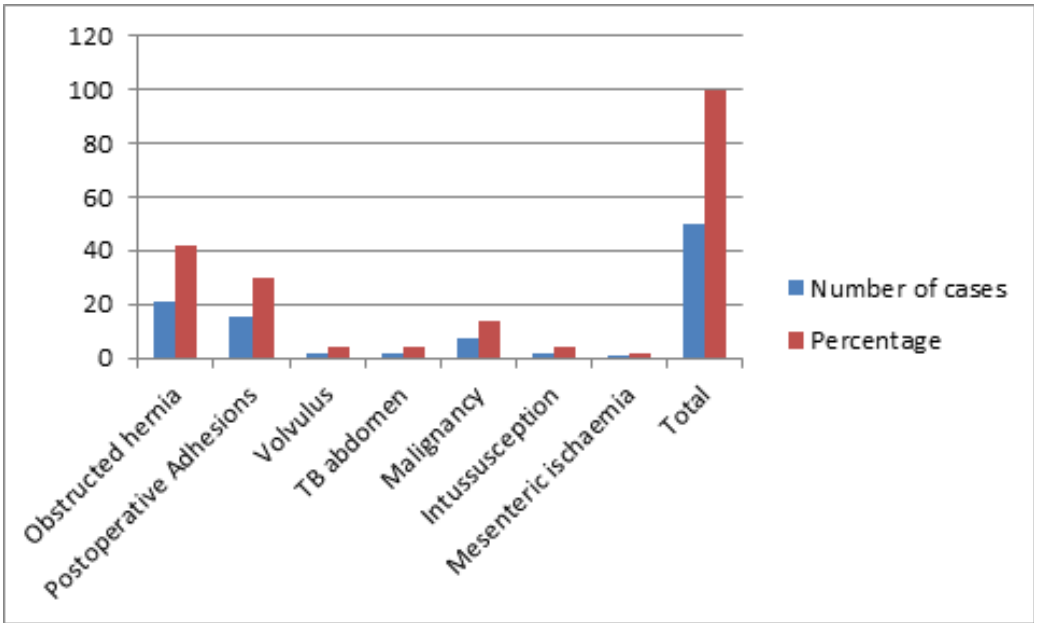

Figure 1: Causes of intestinal obstruction in adults

The most widely recognized reason for intestinal deterrent in our examination was Obstructed hernia. The following normal was Postoperative Adhesions. Different conditions incorporate harm, tuberculosis, intussusception, volvulus, mesenteric ischaemia in dropping recurrence[5].

Discussion

In our clinical examination occurrence of intense intestinal obstacle is 0.95% of complete careful cases[6]. In SouvikAdhikari et al. arrangement occurrence was 9.87% of absolute careful cases. In Bhargava Anderson's

arrangement rate was 3% of all out careful cases. The commonest cause was seen as blocked/strangulated hernia, trailed by post usable attachments, threat, intussusception, volvulus, tuberculosis and mesenteric ischaemia[7]. In creating nations like India, the commonest cause used to be hindered/strangulated hernia.

Table 2: Comparison of etiology with other studies

Cause	Souvik Adhikari	Jahangir	Arshad M. Malik	Cole GJ	Brooks And 48 Buttler	Playforth49 1970	Present Study
Hernia	36%	34%	19%	35%	25%	23%	42%
Adhesions	16%	49%	41%	10%	23%	54%	30%
Volvulus	6%	5%	4%	3%	1%	3%	4%
Tuberculosis	14%	1%	24%	3%	-	-	4%
Malignancy	17%	3%	2%	9%	5%	9%	14%
Intussusception	2%	6%	-	12%	18%	5%	4%
Mes.Ischaemia / Miscellaneous	9%	2%	10%	-	-	6%	2%

In the present examination, hindered/strangulated hernia is the commonest reason for intestinal check, which is equivalent with the other investigation bunches Souvik Adhikari et al[9]. Rate of impeded/strangulated hernia is more in the creating nations. It might be on the grounds that the ignorance of open, the inaccessibility of careful offices in the outskirts for the hernia fix, the hernias are not treated early[8].

Conclusion

Etiology – P esteem 0.001(<0.05), thus the level of individuals with deterred hernia, post operation grips, volvulus, TB stomach area and intussusception have higher fix rates when determined early , when contrasted with have harm and mesenteric ischemia which has lower fix rates and the thing that matters is measurably noteworthy[10].

Evaluation of Non Immune Mediated Thrombocytopenia in Children at Tertiary Health Care Center, Chennai

Tirumala Kanakadurga Sripati[1], Govindarajan[2], Hemalatha ganapathy[3]

[1]Professor, [2]Professor, [3] Head and Professor, Department of pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Thrombocytopenia is characterized as platelet check < 1.5 lakhs/cumm. It might result from either diminished generation or expanded sequestration/devastation of platelets. Pulverization of platelets can be either resistant or non invulnerable interceded.

DITP is the improvement of medication subordinate Abs against new epitopes of platelet glycol proteins created by their cooperation with the medication. TTP/HUS is moderately a remarkable perilous state of Thrombocytopenia11.In this planned examination, Dengue cases were seen as the most widely recognized reasons for thrombocytopenia among other non safe purposes of thrombocytopenia.

Aims and Objectives: To assess non insusceptible reasons for thrombocytopenia in kids with investigation of clinical profile and research center parameters in kids with thrombocytopenia.

Keywords – *Platelets, Glyco protiens, TTP/HUS, epitopes*

Introduction

Thrombocytopenia is characterized as platelet tally < 1.5 lakhs/cumm.

It is the commonest platelet variation from the norm saw in clinical practice with various clinical articulation[1]. It might result from either diminished generation or expanded sequestration/demolition of platelets1. Pulverization of platelets can be either resistant or non safe intervened.

Various components may contribute being developed of thrombocytopenia as found in essential invulnerable thrombocytopenia and hepatitis C infection contamination. Cautious assessment of the fringe blood smear is the best implies for narrowing the differential conclusion.

Corresponding Author:
Dr. Govindarajan,
Professor, Department of pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai-73. E Mail - drgovindarajan@gmail.com, M No - 9841744255

The present investigation centers around the assessment of non invulnerable reasons for thrombocytopenia in youngsters between 0-14 years who were affirmed with thrombocytopenia in tertiary medicinal services focus, Chennai[2].

Taking a careful medicinal history and Physical assessment can give significant data and extraordinarily encourage determination.

In the event that the etiology of the thrombocytopenia is hazy, a BM suction or biopsy ought to be performed to discount an essential BM disorder2.

Non Immune reasons for thrombocytopenia can be following:

Contaminations like Malaria, dengue, septicemia, subacute bacterial endocarditis.

Heart valves, Thrombotic microangiopathies (TTP, HUS), DIC, Kasabach Merrit Syndrome, HIV, Post transfusion purpura.

Materials and Method

This planned examination was led in the Sree Balaji

medicinal school and medical clinic from April 2018 to October 2018. This examination included 70 subjects (kids) who exhibited to the hematology office and medicinal OP branches of Sree Balaji Medical College and emergency clinic[3].

This investigation included kids showing to the hematology division and medicinal OP offices who were found to have thrombocytopenia[4], with platelet tally under 150 x 109/L in whom complete clinical and lab parameters were accessible.

Fringe venous blood was gathered for lab examinations like CBC, ESR, PT, aPTT, fibrinogen estimation, and for D-dimer levels .

Fringe blood smears were recolored by Leishman's stain. For hemoparasite representation, Giemsa stain was utilized.

For malaria: slender film was produced using EDTA blood and recolored with Leishman's stain at pH 7.2. (Giemsa stain can likewise be utilized). Direct representation: 0.02 ml EDTA blood was weakened with 2 ml of weakening liquid pursued by accusing the Neubaur's assembly of the liquid and number of platelet was checked[5].

Bone marrow study

Bone marrow suction was taken from posteriosuperior iliac peak . Smears were recolored with Leishman's stain[6]. Bone marrow trephine biopsy was performed in pertinent cases and H and E recolored paraffin areas were inspected.

Findings

Table 1: Diagnosis associated with thrombocytopenia

S.no	Diagnosis	No. of cases %
1	Dengue	39 (55.71%)
2	Malaria	15 (21.42%)
3	Septicemia	7 (10%)
4	HIV infection	4 (5.71%)
5	Drug induced	3 (4.28%)
6	DIC	2 (2.85%)
	Total	70 (100%)

Dengue cases were found to be the most common causes of thrombocytopenia in our study.

Discussion

Non immune causes of platelet destruction

Malaria:

The conjectured components are coagulation aggravations, sequestration in spleen, immune response intervened platelet demolition and oxidative pressure[3,4,5]

Dengue: DENV could directly or indirectly affect bone marrow progenitor cells by inhibiting the proliferative capacity of hematopoietic cells and the peripheral destruction of platelets[6].

Sepsis: This is usually multifactorial in etiology; related to associated DIC, nonspecific immune destruction of platelets, excessive consumption, marrow suppression, and drugs[7].

Thrombocytopenia is common in patients who are admitted to the ICU with severe sepsis and septic shock[8].

HIV: Chronic thrombocytopenia is a common hematological disorder in HIV patients. Pathophysiology includes accelerated peripheral platelet destruction and decreased (ineffective) production of platelets from the infected megakaryocytes[7].

DIC: Thrombocytopenia is almost common in patients with DIC due to activation of the clotting mechanism[9]. DIC is a systemic process caused by generation of thrombin.Etiological factors may include amniotic fluid embolism, abruptio placentae, trauma, snake bite, leukemias especially AML-M3.

Drug induced thrombocytopenia (DITP): The pathophysiologic mechanism of DITP is the development of drug-dependent Abs against new epitopes of platelet glycoproteins generated by their interaction with the drug. Patients with DITP usually present with moderate to severe thrombocytopenia and the thrombocytopenia usually resolves in around one week after drug withdrawal[10].

TTP / HUS is relatively an uncommon life threatening condition of Thrombocytopenia[11].

Out of 70 cases of non immune causes of thrombocytopenia in children , 39 cases were positive for Dengue IgG and IgM.

Bone marrow showed few megakaryocytic bare nuclei and haemophagocytosis.

we had 15 cases of malaria, in that 11 cases of P. vivax (Fig. 1) and 4 cases of P. falciparum infestation presented with thrombocytopenia, the pathogenesis of thrombocytopenia probably due to

a) splenic sequestration with increased macrophage activity.

b) activation of platelets by fragmented red cells resulting in DIC.

c) Chloroquine and Quinine also sometimes can cause thrombocytopenia.

In this study, 7 septicemia cases, 4 HIV patients were included. 3 cases of drug induced thrombocytopenia cases with typical history of drug intake were included in our study. We had 2 cases of DIC in our study.

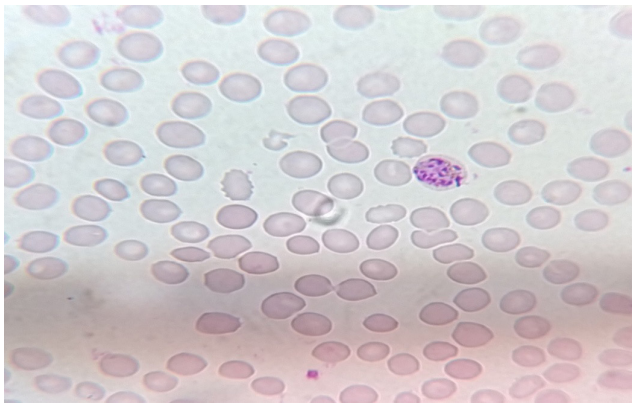

Figure. 1 Photomicrograph of peripheral blood smear showing Schizont phase of plasmodium vivax in a patient with malaria, background shows decreased number of platelets. (*Leishman 100x***)**

Conclusion

In the wake of assessing all non resistant intervened thrombocytopenia cases in youngsters, it is presumed that Dengue cases were seen as the most widely recognized reasons for thrombocytopenia in our examination.

At whatever point thrombocytopenia is identified, further examinations must be accomplished for explicit conclusion in the majority of the cases with the goal that suitable treatment can be given.

Assessment of the Functional Outcome of Proximal Femoral Nailing in Unstable Trochanteric Fractures

Mohammed Irshad Basha.A[1], Venkatachalam K[2]

[1] Post Graduate, [2] Professor, Department of Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Objectives: The aim of the present study is to assess the functional outcome of proximal femoral nailing in patients who have sustained unstable trochanteric fracture.

Place of Study: Department of Orthopaedics, Sree Balaji Medical College and Hospital, Chromepet, Chennai.

Period of Study: The study began in March 2017 and went on till February 2018 (a total recruitment period of 12 months).

Study Design: Prospective study.

Materials and Method: Both male and female patients, in the age social occasion of 46 to 65 years, who had proceeded with a shaky trochanteric break (AO-OTA 2.2, 2.3, 3.1, 3.2 and 3.3) were joined into the assessment. Patients with removed trochanteric split, open and masochist breaks were rejected. The patients were followed up for a base time of 7 months (mean 12.6; region 7 to 19 months). The cases were considered dependent on arrangement of harm, plan and treatment with Proximal femoral nail and assessed for their valuable outcome using HArris Hip Score.

Results: In our assessment which included 42 patients, the general valuable outcome assessed by the Harris Hip Score around the completion of seven months was extraordinary in 38.09% (n=16) of the patients, incredible in 33.33% (n=14), sensible in 21.42% (n=9) and poor results were seen in 7.16% (n=3) of the patients.

Conclusion: We therefore reason that, osteosynthesis utilizing a PFN, utilized in precarious trochanteric breaks, gives incredible adjustment, less mechanical complexities and good practical outcomes. It is along these lines a perfect embed for precisely overseeing unsteady between trochanteric cracks.

Keywords: *trochanteric split, osteosynthesis*

Introduction

The socioeconomics of total populace are evolving. A greater amount of the older individuals are living in the creating nations. By and by around three-fifths of the hip break happen in Asia which, it is anticipated that will turn out to be very nearly one-half continuously 2050. Between trochanteric cracks are one of the most widely recognized breaks of the hip happening both in the youthful grown-ups, because of high vitality injury and in the older, because of low vitality injury due to osteoporosis1. Issues of these cracks are: (a) they are related with significant horribleness and mortality, (b) mal-association is normal, (c) embed disappointment like cut-out of head and entrance into hip is a confusion,

(d) it is an incredible money related weight to the family and, (e) it is most usually connected with medicinal co-morbidities like diabetes and hypertension.

Non-employable preservationist the board which was done before had brought about an expanded horribleness, just as inconveniences like mal-association with varus and outer pivot disfigurement bringing about a short appendage stride, non-association and a high pace of mortality because of confusion of long prostration and immobilization which brought about intricacies like decubitus ulcers, profound vein thrombosis, urinary tract diseases, contracture of the joint, orthostatic pneumonia and renal calculi2. The objective of the treatment in between trochanteric cracks is the rebuilding of the patient to their pre-damage practical and mobile status at the soonest. Different obsession gadgets have been advanced to treat these cracks by inner obsession, in this way expanding patient solace, encourage nursing care, decline medical clinic remain and thus to anticipate inconveniences of delayed supineness. It is a widespread decree to treat between trochanteric breaks with stable inward obsession as right on time as could reasonably be expected. [2]

Materials and Method

The present study has been a prospective study, involving patients who had sustained unstable inter-trochanteric fractures. The study began in March 2017 and went on till February 2018 (a total recruitment period of 12 months). The study concluded in September 2018, so that there was a minimum follow-up of 7 months (mean 12.6; range 7 to 19 months).

Inclusion Criteria:

- Only unstable trochanteric fractures were included (AO-OTA 2.2, 2.3, 3.1, 3.2 and 3.3).
- Only fractures seen within 15 days of injury were included.
- Both male and female patients, in the age group of 46 to 65 years were included in the study.

Exclusion Criteria:

- Patients with displaced trochanteric fracture not conforming to the above parameters were excluded.
- Open and pathological fractures were excluded.
- Inability to walk independently, prior to fracture due to pre-existing stroke or CVA were excluded.

Follow Up Period:

Minimum period of 7 months (mean 12.6; range 7 to 19 months).

The cases were studied on the basis of mechanism of injury, classification and treatment with Proximal femoral nail along with their functional outcomes with their residual complications, if any.

Positioning:

The patient is positioned supine on the traction table. The ipsi-lateral arm was placed in an arm sling. The trunk was angled 15 degrees towards the unaffected side. The unaffected limb was flexed, abducted and externally rotated for providing enough space for positioning of the image intensifier. The affected lower limb was held in traction and adduction in the foot piece. Reduction was achieved by traction (dis-engaging the fracture fragments) and internally rotating the limb while maintaining traction and confirming with the image-intensifier view.

Entry Point:

Reduction of the fracture was essential before making the entry point. After confirming the anatomical reduction, entry point is made with a bone awl over the tip of greater trochanter

Guide Wire Insertion And Reaming

A 3.2mm guide wire was inserted and driven into the distal fragment. Proximal reaming was done with a 15 mm cannulated awl upto 7 cm distally in order to accommodate the proximal portion of the nail. Distal reaming was done with an increment of 1 mm more than the predicted diameter of the nail planned to be used[6].

Distal Targeting:

Distal targeting was done with distal targeting guide and drill sleeves using 4.0mm drill bit. In case of using a long nail, the distal locking was done through a free hand technique, under C-arm guidance.

Follow-Up:

- Patients were evaluated clinically and

radiologically bi-weekly for the first 2 months and then, once monthly there-after until signs of radiological and clinical union appear.

- Clinical union was assessed as being absence of pain and tenderness upon full weight-bearing.

Clinical Assessment Included the Folowing Parameters:

1. Gait, 2. Pain,3. Deformity, 4. Shortening, 5. Range of movements,6. Ability to sit cross-legged, 7. Ability to squat, 8.Be able to return to pre-injury occupational status.

Table 1: Clinical assessment included the folowing parameters

S.no.	CATEGORY	SCORE ACHIEVED
1.	Excellent	100-90
2.	Good	89-80
3.	Fair	79-70
4.	Poor	<70

Findings

Table 2: Sex Distribution:

SEX	No. of Patients 'n'	%age
Male	16	38.10
Female	26	61.90
TOTAL	42	100

Table 3: Time elapsed between injury and surgery:

Time Interval (In Days)	No. of Patients 'N'	% Age
0 – 2	6	14.28
3 – 5	7	16.66
6 – 8	5	11.90
9 – 12	12	28.58
13 – 15	12	28.58
TOTAL	42	100

Table 4: Fracture pattern distrbution:

AO CLASSIFICATION	No. of Patients 'n'	% age
Type A2.2	7	16.66
Type A2.3	14	33.33
Type A3.1	16	38.01
Type A3.2	-	-
Type A3.3	5	12.00
TOTAL	42	100

Table 5: Harris Hip Score[9]:

FUNCTIONAL OUTCOME	At the end of 6 months	
	No. of Patients 'n'	%age
Excellent	16	38.09
Good	14	33.33
Fair	9	21.42
Poor	3	7.16
TOTAL	42	100

As per our inclusion criteria, 42 patients were recruited for surgical fixation of unstable trochanteric fractures. Of these 42 patients, approximately 28% of the patients were of the age group of 46 to 50 years, 26% of the patients were between 51 to 55 years, 26% were between 56 to 60 years and 19% were between the age of 61 to 65 years. We had a total of 38.10% (n=16) male and 61.90% (n=26) female patients, with a male to female ratio of 2 : 3.2, thus indicating a female preponderance.

Discussion

The successful treatment of inter-trochanteric fractures depends on many factors[10]; the age of the patient, the patient's general health, the time elapsed from trauma to treatment, concurrent medical treatment

and the stability of fixation[11]. The appropriate method and the ideal implant used for these fractures are still debated with proponents of the various approaches and each claiming their advantages over others. Many internal fixation devices have been recommended for the treatment of these fractures, including extra-medullary and intra-medullary implants.

In the present study, the male to female ratio was 2 : 3.2, hence indicating a female preponderance in our study. This is in tandem with those reported by Pajarinen J et al;[25,26] and Dousa P et al;[27]. The mean duration between the injury and procedure was 8.7 days (range 0-15 days).

All of our patients could partially weight bear by the end of 2 weeks. None of the patients used any walking aid beyond 3 weeks. Pajarinen et al.[25] reiterated the ability to early weight bear with PFN.

The average time for fracture union in our study was 16.4 weeks (range: 12–20 weeks). In a meta-analysis, Kaplan et al;[28] presented a mean time taken to achieve consolidation of four months, independent of the device used. On the other hand, Bridle et al; reported that consolidation occurred after an average of six months. According to Crawford et al the consolidation rate found among patients treated with a cephalo-medullary nail was 89%. In the present study, consolidation was observed in all the patients after 5 months. Patients were followed up for an average period of 8.58 months and the results were analyzed by using the Harris hip scoring system at the end of 6 months post-surgery. Among these patients, union occurred in all patients with no case of non-union. Malunion occurs in one case with implant failure. The mean Harris hip score was 88.75 at 6 months. The score was excellent in 16 patients, good in 14 patients, fair in 9 patients and poor in 3 patients. The results are comparable to other international studies done in the same method.

Schipper et al; found a mean score of 66.80 (standard deviation = 17.94) with a proximal femoral nail of PFN type after one year. According to Pajarinen et al patients who underwent osteosynthesis with a cephalo-medullary nail, in unstable trochanteric fractures, presented a significantly faster return to their previous level of walking.

Herrera et al;[32] reported on a study involving 250 patients treated with the PFN and Gamma nail cephalo-medullary nails, in which around 50% of the patients had recovered their previous walking capacity, one year after the surgery. In the present study, we assessed the recovery of walking ability over the course of time. The greatest evolution in the quality of walking occurred over the first three months after the operation, such that all of our patients were walking without the help of any walking aid.

Conclusion

With the demographics of the world population changing, more and more elderly persons are sustaining osteoporotic fractures. Among them, displaced and unstable trochanteric fractures are in significant numbers. The development of implant designs to address these unstable fractures of the proximal femur, have got refined. This has significantly improved the surgical outcomes in managing these problematic fractures. The proximal femoral nail, which was the implant used in this study, has established its distinct superiority in the instances of surgically managing displaced and unstable trochanteric fractures. Its unique advantages are that it is amenable to closed reduction which preserves the fracture hematoma. There is less surgical insult. It enables early rehabilitation and early return to pre-injury activity status. We hereby conclude that, osteosynthesis using a PFN, used in unstable trochanteric fractures gives excellent stabilization, fewer mechanical complications and satisfactory functional results. It is thus an ideal implant for surgically managing unstable inter-trochanteric fractures.

Hearing Assessment in Myringoplasty

M.K. Rajasekar[1], Sumitha.R[2]

[1] Head and Professor, [2]Associate Professor, Department of ENT, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Myringoplasty is the surgery to reestablish the conference misfortune and destroy the center ear pathology in incessant suppurative otitis media. It is of two kind's tubotympanic and atticoantral type. An imminent report was done among 50 patients of CSOM. Patients chose on criteria of tubotympanic type, unadulterated conductive hearing misfortune, great cochlear save and great Eustachian cylinder capacity were considered for this examination

Keywords *– Myringoplasty, hearing misfortune*

Introduction

Incessant otitis media (COM) is characterized as interminable aggravation of mucoperiosteal covering of part or entire of the center ear split. It is ordered into two sorts, mucosal and squamous, of which mucosal sort is described by discontinuous mucoid or mucopurulent release through a punctured tympanic membrane. It is the significant general medical issue in youngsters and adults1.Tympanic film holes can prompt repetitive ear contaminations and hearing misfortune, in India there is a general absence of consciousness of the ailment and furthermore with respect to the difficulties of the illness[1].

From seventeenth to nineteenth century a few endeavors at shutting tympanic film punctures were made utilizing prosthetic materials like paper fix and closing up agents.Surgical fix of tympanic layer was first endeavored by Banzer (1640) with pig'sbladder1. In1878 Berthold conceived the term myringoplasty 2, 3 . In 1952, Wullstein officially reported 3, 4 a procedure of shutting puncturing. That time he utilized split thickness skin unite 3, 4.After Wullstein 5 and Zollner 6introduced tympanoplasty in mid 1950s, overlay join was being utilized in all medical procedures. The article "tympanoplasty as an activity to improve hearing in interminable otitis media and its outcomes" by Wullstein had arranged the field for the activity to be performed with an objective to improve hearing and shield the center ear from the outside condition 5. Spilt thickness and full thickness skin unite were being utilized at that timeframe, however join dermatitis, desquamation, with poor long haul results made specialists scan for exchange uniting materials. Channel skin pedicle unions had been utilized by Sooy in 1956 6. House and Sheehy 7, 8 and Plester 9 started utilizing trench skin as free overlay join autonomously of one another in 1958[2].

There are a few factor referenced in writing that may influence careful outcomes, including age, aperture size and site, the status of inverse ear, the sort of join , latent status and procedure utilized overlay or underlay.

Myringoplasty is a surgery to keep repetitive release from the center ear and to reestablish hearing system in patients with otitis media, by shutting the tympanic film puncturing utilizing distinctive kind of join. The temporalis belt or conchal ligament unite structures a platform for the developing epithelium to close the puncturing[3].

This examination concentrated on myringoplasty and investigations of audiometric example of hearing misfortune in CSOM patients experiencing pre usable hearing appraisal and post employable hearing improvement among the examination populace. Achievement is evaluated by hearing improvement via Air-Bone hole to inside 20db and join take-up.

Materials and Methodology

Just 50 patients were taken in this present examination. 50 patients incorporated into this examination are Tubotympanic illness. Criteria for determination of patients of both protected and dangerous sort of incessant suppurative otitis media with great cochlear save and great Eustachian cylinder capacity were chosen Patients were rejected from the investigation. Rejection criteria included as any complexities of CSOM Patients, hypertension, diabetes mellitus, great cochlear save, threat, hearing loss of sensorineural sort or blended sort.

All patients chose are who introduced in ENT opd with signs and side effects proposing CSOM. Itemized history and complete assessment were taken. Patient experienced pre employable audiogram and assessment under magnifying lens improved imagine the tympanic film aperture i.e., puncturing size, area of the aperture, Tympanosclerosis, plausibility of envisioning all the puncturing fringes and nearness or nonappearance of incendiary mucosa in the center ear. Routine examinations were sent for pre sedative wellness. Radiological evaluation were finished by doing by X-beam Mastoids and C.T. Output to know the nearness and degree of Cholesteatoma. DNE (indicative nasal endoscopy) to check the nasal condition and evaluate the correct working of the Eustachian tube.

Unadulterated tone Audiogram is done in all investigation populace, the accompanying frequencies including: 250, 500, 1000, 2000 Hz in all the examination populace had taken for surgery, which gave an appraisal of the level of hearing misfortune and its sort preoperatively. Midpoints of hearing misfortune were determined (air conduction edge) among three frequencies were: 500, 1000 and 2000 Hz. These frequencies were chosen since they speak to discourse recurrence range and rise of edge in these frequencies will be clinically noteworthy. Unadulterated tone audiometry had been utilized for appraisal of hearing level in this investigation[4]. Just unadulterated conductive kind of hearing misfortune patients are taken into study. Maico mama 52 clinical analytic two channel audiometer furnished with sound confirmation space for audiological evaluation utilized in this investigation. Air conduction earphone utilized as standard with concealing done if the Interaural bone hole was in excess of 40 dB. Patient was clarified about the system and satisfactory time was taken for testing.

The medical procedure is performed under general anesthesia utilizing a magnifying instrument. Endoscopic underlay method was utilized for all aperture. Temporalis sash unite was utilized in all cases. Post usable period is uneventful. Mastoid dressing has been finished. IV anti-microbials, analgesics, acid neutralizers were given. On seventh day unite suture has been finished. Postoperative audiogram was done following 12 weeks to evaluate the improvement of hearing and the accomplishment of the medical procedure[5].

As per the Japan Clinical Otology Committee for count of the meeting improvement (Tai, 1998) 2. Every one of the outcomes are classified and dissected and contrasted and other standard investigations.

Observation

The study population was 50 patients were followed for 24 months with detailed history of age, sex, size of perforation, pre op and post op air bone gap and improvement were noted.

Age:

Most of the patients selected were among 20-50 years,majority of the cases were among 20-30 years, the mean age was 24.3 years. With females 24 (48%) and males 26 (52%) in the study population. Of the 50 patients, 21 patients had left ear disease (46.2%) and 29 patients had right ear disease (63.8%).

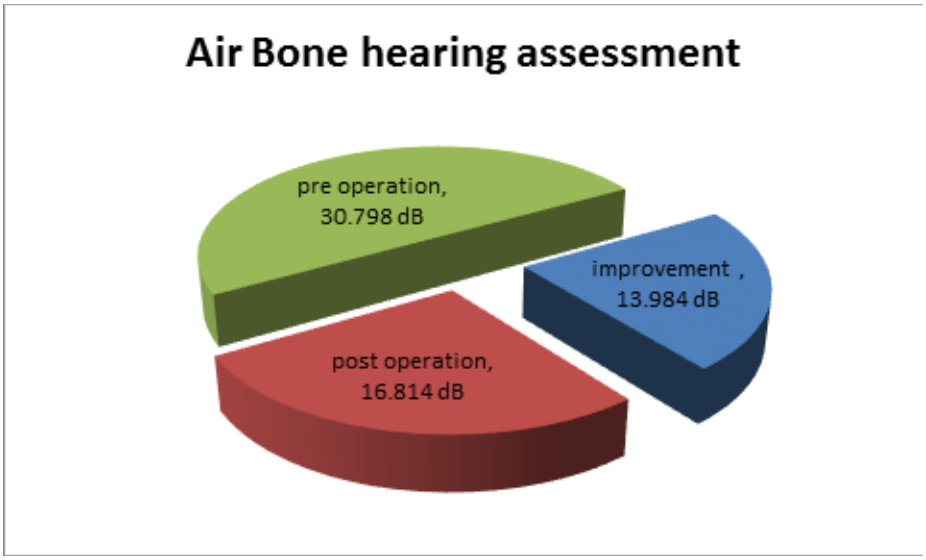
Table 1: Age Distribution (50 Patients)

S.no	Age group	No. of cases	Percentage
I	0-20	0	0
II	20-30	30	66
III	30-40	15	33
IV	40-50	5	11

Size of the perforation and audiological benefits

In our study out of 50 patients who underwent myringoplasty,4(8 %)patients had small perforation and 22(44%) patient had medium and rest 26(52%) patient had subtotal perforation. patients with subtotal perforation has shown hearing improvement with best outcome in term of graft success followed by medium. Overall we had a p value of 0.001[6].

Table 2: Number and size of perforation and audiology benifits



Size	Number of Patients	Mean Preop Ac Threshold	Mean Postop Ac Threshold	Percent	Valid Precent	Cumulative Percent
SMALL	4	34.15	23.45	44.0	44.0	44.0
MEDIUM	22	36.99	22.77	8.0	8.0	52.0
SUBTOTAL	26	37.53	23.17	48.0	48.0	100.0

Air- Bone gap improvement:

In our study, mean preoperative air bone gap was 30.798dB and mean postoperative air bone gap was 16.814dB. Hearing improvement was around 13.984 with p value 0.001 which is statistically significant.

Table 3: pre op and post operative air bone hearing assessment

AB GAP	MEAN	U CRIT	STD DEV	Z - SCORE	P – VALUE
PRE OP POST OP IMPROVEMENT	30.798dB 16.814dB 13.984dB	1013.8 968.69	143.272	8.4524	0.001

Findings

The present study showed that there is Sno sex predilection for the CSOM. Out of 50 cases, 20–30 years age group people were high (80%) indicating the fact that CSOM is mainly the middle ear infection which tends to occur more in early decades of life and resolves to leave permanent perforations with conductive hearing loss in many cases. The mean age was 24.3 years.

In the present study of 50 cases were of tubotympanic type. The findings were correlating with other studies [3, 4].

In our study more hearing loss found in subtotal perforation, Yung [5] found similar central perforation had greatest loss compared to other sites of perforation. He found 43 dB HL in the series of big central and posterior central perforation as well. An antero-inferior perforation have less hearing loss than antero-inferior perforation[7].

Ramani and Ahmad [6] had also found similar findings in their study that "It is seen that the difference in hearing losses between antero and postero-inferior perforations, is appreciable only at the lower frequencies".

In our study, mean preoperative air bone gap was 30.798dB and mean postoperative air bone gap was 16.814dB. Hearing improvement was around 13.984 with p value 0.001 which is statistically significant. Many studies on Tympanoplasty have found place in the literature with varying success rates [7-12]. Rizer's showed the same results. Myringoplasty shows successful results in hearing improvement.

Conclusion

Myringoplasty is most successful procedure for hearing improvement and eradication of middle ear pathology in CSOM. Success of the surgery depends upon size of the perforation. Smaller the perforation more the success rate.

Histomorphological Study of Lesions of Upper Respiratory Tract

K.Anbukkarasi[1], Hemalatha Ganapathy[2]

*[1]Assistant Professor**, [2]Professor and HOD, Department of pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai.*

Abstract

The nasal cavity and paranasal sinuses are collectively called as sinonasal tract. The sinonasal tract and nasopharynx form a functional unit and affected by a wide range of non -neoplastic and neoplastic lesions . Mechanical trauma, exposure to chemical agents, allergens and infectious agents results in formation of various tumour like conditions and neoplastic lesions .Histopathological diagnosis is mandatory for treatment and prognosis of sinonasal and nasopharyngeal lesions

Keywords: *paranasal sinuses, neoplastic lesions*

Introduction

The nasal cavity, paranasal sinuses, pharynx and larynx though in continuity form a complex system of upper respiratory tract, this region is endowed with a variety of elements such as epithelial, glandular, lymphoid, cartilage,and bone and is also exposed to a variety of infections,tumour like and true neoplastic conditions.

The nasal cavity and paranasal sinuses are collectively called as sinonasal tract. The sinonasal tract and nasopharynx form a functional unit and affected by a wide range of non -neoplastic and neoplastic lesions [1] . Mechanical trauma,exposure to chemical agents, allergens and infectious agentsresults in formation of various tumour like conditions and neoplastic lesions. The lesions present as mucosal thickenings or polypoidal masses with epistaxis or obstruction, making it difficult to differentiate non neoplastic lesions from neoplastic masses on clinical examination. Histopathological diagnosis is mandatory for treatment and prognosis of sinonasal and nasopharyngeal lesions.

Aims and Objectives

1. To study the Histomorphological lesions of upper respiratory tract in SBMCH from the period October 2016 - September 2018.

2. To study age, sex and site wise distribution of lesions of upper respiratory tract.

Materials and Method

This study is a prospective study on Histomorphological lesions of upper respiratory tract, conducted in the Department of Pathology, Sree BalajiMedical College Hospital and Research Centre, Chennaiduring the period, October 2016 to September 2018. A total of 5233 cases were submitted to the Department of Pathology, SBMCH between the period of October 2016and September 2018 for histopathological examination.

Detailed history regarding age, sex, sit e, type of procedure done were obtained for all the upper respiratory tract cases reported during the period of study from surgicalpathology records. Haematoxylin and Eosin stained 5 µm thick sections of the paraffin tissue blocks of al l the specimens were reviewed. The following clinical and pathological parameters were evaluated: Age, gender, siteand type of lesion. And for malignant neoplastic lesions age, sex, site, tumour type and grade were assessed.

**author designation updated in 2024

Findings

In the study period of 24 months from October 2016 to September 2018, a total of 5233 specimens were received in the department of Pathology, Sree Balaji Medical College and Hospital for histopathological examination. Totalnumber of URT specimens received were 186 cases (3.6%)(Table1).

Total number of upper respiratory tract specimens received were 186 cases of which malignant lesions accounted for 38 cases with a percentage of 20.4%. Of the remaining, 14 were benign cases (7.5%) and non-neoplastic cases were 129 (69.4%) (Table-2, Chart 1).

Non neoplastic lesions were the most commonly occurring lesion(69.4%) in URT followed by malignant lesions accounting for 20.4% of cases (Table 2)

Upper respiratory tract lesion were more common in the age group of 20 -40 years which accounted for about 55 % of cases. Benign lesions were common in 2nd and 3rd decade whereas malignant lesions were common in 6th decade (Table 3)

Table 1. Site Wise Distribution of Lesions of Upper Respiratory Tract

Site	Frequency	Percentage [%]
Nasal cavity & PNS	105	56.5
Pharynx	48	25.8
Larynx	33	17.7
Total	186	100

Upper respiratory tract lesions occurred more commonly in nasal cavity and paranasal sinuses(56.5%) followed by pharynx(25.8%) and larynx(17.7%) (Table 5)

Table 2: Histological Diagnosis of Non-Neoplastic Lesions

Histological diagnosis	Frequency	Percentage [%]
Non allergic polyp	29	22.4
Allergic polyp	46	35.6
Antrochoanal polyp	15	11.6
Rhinosporidiosis	08	6.1
Fungal infections	06	4.6
RLH	01	0.7
ATH	15	11.6
AMP	01	0.7
BVCP	06	4.6
FVLP	02	1.4
Tuberculosis	01	0.7
Total	129	100

Of the non neoplastic lesions polyp (Fig1)(69.6%) was the most common lesion occurring in this region followed by adenotonsillar hypertrophy (11.6%, rhinosporidiosis (Fig 2 (6.1%)and fungal infections (4.6%) (Table 6)

Table 3: Histological Diagnosis of Benign Lesions

Histological diagnosis	Frequency	Percentage [%]
Inverted papilloma	07	50
Capillary Hemangioma	05	35.8
Benign Osteoma	01	7.1
Neurofibroma	01	7.1
Total	14	100

Inverted papilloma was the most common lesion accounting for 50% of cases followed by capillary hemangioma (Fig 4) (35.8%) (Table7)

Table 4: Histological Diagnosis of Malignant Lesions

Histological Diagnosis	Frequency	Percentage [%]
SCC	31	81.7
Nasopharyngeal Undifferentiated Carcinoma	03	7.9
Lymphoepithelial Carcinoma	01	2.6
Mucoepidermoid Carcinoma	01	2.6
Epithelial Myoepithelial Carcinoma	01	2.6
Hodgkin's Lymphoma	01	2.6
Total	38	100

Of the malignant lesions SCC (Fig5) the most common malignancy accounting for about 81.7% of cases followed by undifferentiated carcinoma of nasopharynx accounting for 7.9% (Table8)

Discussion

The histopathological spectrum of lesions of URT is complex and display a wide range of neoplastic and non neoplastic types. Clinical features with advanced imaging technique correlation gives a probable diagnosis, however histopathological examination for categorisation of these lesions is essential for proper management. Non neoplastic lesions comprise majority of URT lesions followed by malignancy. Neoplasms constitute approximately 3% of head and neck tumours [6]

In head and neck tumors, squamous cell carcinoma remains the most common malignancy which has a great impact not only on patient survival, but also on the speech, swallowing and better well being of the patient.

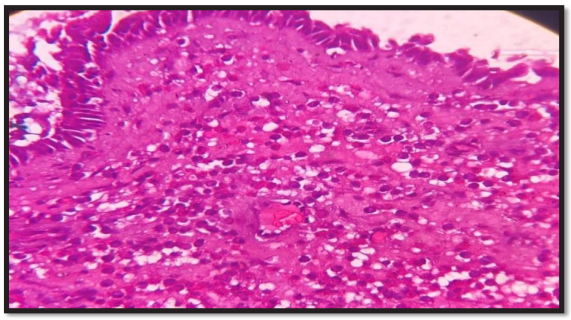

Fig 1: H&E Picture of Allergic Polyp -40x magnification

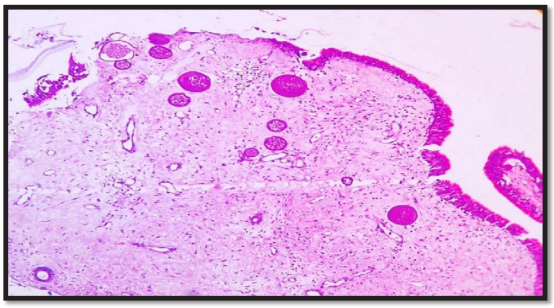

Fig 2 : H&E Picture of Rhinosporidiosis – 10x magnification

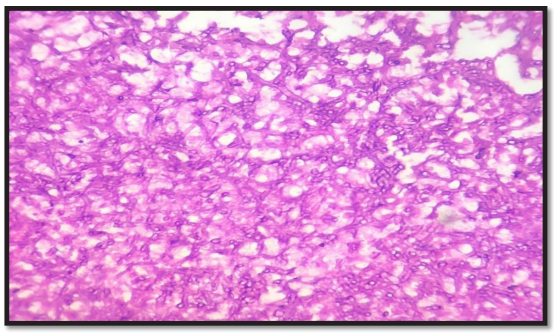

Fig 3: H&E Picture of Aspergillosis – 10x magnification

In the current study histomorphological study of lesions of upper respiratory tract was done.

The total number of specimens received in SBMCH from October 2016- September 2018 was 5233, out of which 186 (3.6%) specimens were from upper respiratory tract and out of which 129(69.4%) were non neoplastic, 14(7.5%) were benign,5(2.7%) were premalignant and 38 (20.4%) cases were malignant.

The non neoplastic lesions were more common in URT (69.4%), this was in concordance with Shaila N shah et al[7] who also observed that non neoplastic lesions were the most common in this region (70%). The non neoplastic lesions were common in 2nd and 3rd decade which is in concordance with studies by Khan N et al [5], Shaila N shah et al [7]. Nasal polyps (69.8%) and nasal cavity (69.9%) are the commonest type and site of lesion in this study and this also goes by the observation in studies by Khan N et al (82%,74%), Shaila et all (70%,69%) respectively.

Of the benign neoplastic lesions inverted papilloma (50%) was the most common lesion followed by capillary lobular hemangioma (35.8%) in this study, which is slightly higher than the results observed by Bhattacharya J et al[8], where the incidence was 29.4% for both inverted papilloma and capillary hemagioma . Both non neoplastic and benign lesions showed male predominance with a ratio of 1.1:1 and 2.4:1 respectively. This was in concordance with the studies conducted by Khan et al, Bhattacharya J et al.

Of the malignant lesions SCC was the most common tumour accounting for 81.7% of malignant cases followed by undifferentiated nasopharyngeal carcinoma. Men were commonly affected than women. The most common age group affected by malignancy is 6th and 7th decade.

Conclusion

This study shows that in Sree Balaji Medical College and Hospital the non-neoplastic lesions are the most commonly occurring lesions of upper respiratory tract followed by malignancy. And the most common malignant lesion observed is SCC. The malignant lesions occur in the age group of 60-70 years and men were more commonly affected. Therefore definite diagnosis of the benign and malignant lesions should be made on histopathological examination along with clinical history and imaging findings which will help the surgeons in providing appropriate surgical intervention for the patient.

Consequence of Early Versus Late Cord Clamping on Neonatal Outcome

Vimalshika R[1], Yuvarani R[2]

[1]Post Graduate Student, [2] Professor, Department of OBG, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

To examine the consequence of early versus delayed cord clamping on maternal and neonatal outcome. As part of the effective leadership of the third phase of labor in the advanced globe, ECC has become daily exercise without academic evaluation of its prospective effect on the health and growth of a newborn. In addition, ECC is thought to considerably reduce the danger of PPH as part of the active management of the third level of labor.

Because many effective leadership procedures include ECC, some suggest that DCC may boost the danger of PPH. On the contrary, in order to induce numerous neonatal benefits, the recent protocol proposed by WHO to manage the third stage of labor replaced the ECC by DCC.

Despite these extensive evidence, though, there are variations in the view and exercise of late cord clamping. This is not far-fetched as there are still concerns of postpartum haemorrhage maternal danger and neonatal jaundice risk

Objective: 1. Compare early cell clamping on neonatal results to determine the impacts of postponed cell clamping.

2. Primary results were intrapartum maternal blood loss evaluation, 72 hours after conception, neonatal packed cell volume and serum bilirubin.

Study Design: This was a potential, consent was obtained under the category of inclusion criteria.

Study population: Women who delivered a term infant (≥ 37 completed weeks of gestation) by normal vaginal delivery at Sree Balaji Medical college and hospital.

Keywords*: maternal, neonatal, PPH, labor, cord clamping*

Introduction

• Umbilical cable clamping and slicing is one of the most distinctive components of the birth process; however, its ideal timing is contentious yet to be obviously defined with the benefits and disadvantages of the distinct timing methods.

• Clamping and slicing of the umbilical line is essential because it prevents the loss of maternal oxygen and allows the baby to be removed for resuscitation from the family.

• The newborn child may obtain significant blood transfusion from the placenta within the first few minutes of birth. A word born 10 cm below the uterus stage raises its blood volume by an average of 32 percent during the first three minutes of existence.[1-7]

The 2015 ILCOR systematic study and several systematic studies revealed that improved placental transfusion by delayed cord clamping is correlated with lower prevalence of anemia, hypotension, respiratory distress syndrome, enterocolitis necrotizing, premature retinopathy and any grade of intraventricular hemorrhage.

Methodology

- Data collection technique adopted in the study was structured questionnaire .
- Maternal data such as gravida, parity , labour details , post partum blood loss and neonatal data such as gestational age, birth weight, Apgar scores, serum Hb and bilurubin were recorded.[10-19]
- Clearance for study was obtained from Institutional Human Ethical Committee (IHEC/795/2016)
- An informed consent was obtained from patients.
- Maternal blood sample (ante- partum – Hb & PCV and post-partum Hb & PCV) was collected through aseptic technique and was analysed. [20-27]

Findings

Table 1. Baseline description of neonates

Characteristics	ECC (n=100)	DCC (n=100)
Sex		
Male	47	46
Female	53	54
Estimated Fetal Weight (gm):		
Mean ± SD	2847.9 ± 280.32	2852.28 ± 259.04
Birth weight(gm):		
<2500 gm	07	04
2500 – 3000gm	55	61
3000 – 3999 gm	38	35

The mean birth weight in ECC babies was 2847.9 ± 28 grams and DCC babies was 2852.28 ± 25 grams. [28-34]

Table 2 Baseline characteristics of neonates

Characteristic	ECC(n=100)	DCC(n=100)
Gestational age (completed weeks): Mean ± SD	38.47 ± 0.87	38.61 ± 0.7
37 weeks	17	05
38 weeks	27	36
39 weeks	48	52
40 weeks	08	07
APGAR score at 1 min		
Median (IQ 75th – 25th)	9(9,8)	9(9,8)
APGAR score at 5 min		
Median (IQ 75th – 25th)	9(9,8)	9(9,8)

The mean gestational age in ECC group was 38.47 ± 0.87 weeks and DCC group was 38.61 ± 0.7 weeks.

75% babies were in the group between 38-39 weeks in ECC arm and 88% babies were in the group between 38-39 weeks in DCC arm.

The APGAR score at one minute and 5th minute were similar in both study arms.[35-39]

Table 3. Hematological parameters on day 3 among two study groups

Laboratory parameter	ECC (n=100)	DCC (n=100)	p value
Maternal Hemoglobin (gm/dl) Mean ± SD	10.61± 0.93	10.52 ± 0.79	0.465
Maternal PCV (%) Mean ± SD	31.01 ± 2.74	32.96 ± 2.37	0.496

There was a tendency towards greater original hematocrit in the DCC cluster compared to the ECC group in the current research, but there was no statistically significant distinction between the two populations.

Other comparable studies[12,13] showed that the original average hematocrit in the DCC category was greater than the statistically significant ECC group-[40-47]

Table 4: Relationship between DCC and ECC Groups Regarding the Neonatal Investigations(Day 3)

Laboratory parameter	ECC (n=100)	DCC (n=100)	p value
Neonatal Hb (g/dL) 14-18 >18 Mean ± S.D	 40 60 17.53 ± 1.85	 44 56 18.27 ± 1.72	 0.043*
HCT (%) < 50 51-60 > 60 Mean ± S.D	 32 50 18 52.59 ± 6.83	 18 55 27 54.84 ± 5.16	 0.001*

Looking at the main result measurements of neonatal packed cell quantity, proof indicates a significant rise in packed cell size among DCC organizations compared to ECC cluster. This research verified the same with average PCV of 54.43 ± 6.83 and 59.84 ± 5.16 for the research weapons A and B respectively, and this was statistically important (P<0.001).[48-54]

The bar diagram above, depicts the split in neonatal hematocrit among ECC and DCC group with PCV < 50 – (32 vs 18) , 50-60 – (5- vs 55) and > 60 (18 vs 27).

Table 5: Neonatal Hyperbilirubinemia in the study population

	ECC (n=100)	DCC (n=100)	p value
Neonates requiring phototherapy in the first week of life	60	70	0.04*
Normal Low risk below 40th percentile (≤13 mg/dl)	39	33	
Low intermediate risk from 40th and < 75th percentile (13.1-15.2 mg/dl)	38	42	0.001*
High intermediate risk 75th - < 95th percentile (15.3- 17.2 mg/dl)	19	17	
High risk above 95th percentile (17.3and more mg/dl)	04	08	
Serum Bilirubin on Day 3 mg/dl (Mean ± SD)	13.01 ± 60	13.96 ± 56	0.032*
Treatment			
Observation	40	30	
SSPT	33	35	0.097
DSPT	27	35	

The incidence of hyperbilirubinemia between two groups was significant (as evidenced : by p value of 0.032).

The highest bilirubin observed was 17 mg/dl in the ECC group and 19.3 mg/dl in the DCC group.

The mean bilirubin values observed in ECC vs DCC was 13.01 vs 13.96 mg/dl.

Table 6. Polycythemia in the study population

Laboratory parameter	ECC (n=100)	DCC (n=100)	p value
Polycythemia			
Yes	02	04	0.657
No	98	96	

In our study, 2 neonates had hematocrit greater than 65% in the ECC group.

There were 4 neonates with polycythemia in the DCC group, none of the neonates required exchange transfusion in either of the groups.

Discussion

Umbilical cord clamping is one of the most distinctive processes during childbirth, but the ideal timing is quite contentious and still needs to be obviously defined[1,2]. There is evidence of neonatal advantages and prospective minimal risk if postponed to allow placenta transfusion without damage to the mother.[1-7] This research obviously indicated that late clamping of the umbilical cord is useful rather than detrimental without enhanced parental or neonatal danger.

Several writers, including WHO, RCOG and ACOG, have suggested late cable clamping for all newborns with easily accessible phototherapy facilities, as it offers higher advantages for the child than the low danger of neonates. [1, 6, 7, 12].

In our study, among the DCC group, 46 (46%) were male babies and 54 (54%) were female babies. In ECC group, 47 (47%) were boy babies and 53 (53%) were girl babies. The difference in the proportion of neonate's gender between study group was statistically not significant (P value 0.887).

The mean birth weight of DCC group was 2852.28 ± 0.7 gram and ECC group was 2847,9 ± 0.87 gram, and the mean difference between two groups was statistically not significant (P value 0.210). Among the DCC group, 4 (4%) babies had <2500gm, 61 (61%) babies had 2500-2999 gm and 35 (35%) babies had 3000-3999 gm. Among the ECC group, 7 (7%) babies had <2500gm, 55 (55%) babies had 2500-2999 gm and 38 (38%) babies had 3000-3999 gm. The difference in the proportion of neonate's birth weight between study group was statistically not significant (P value 0.909).

Conclusion

This research demonstrates that DCC increases children ' filled cell size at 72 hours of birth, which stayed greater in the DCC category relative to the ECC group, with no important parental danger of postpartum hemorrhage and neonatal hyperbilirubinaemia. Furthermore, it can be stated, based on the results of this research, that DCC did not boost the likelihood of third-stage labor or the need for manual labor. It also revealed that neonatal hemoglobin, hematocrit, and RBCs have increased significantly. Additionally, although the average total bilirubin concentration in the DCC cluster was considerably greater, but still at a small medium danger (below 75th percentile) that did not involve huge action, late cable clamping could considerably enhance neonates ' intra-natal care without damaging impacts on the mom.

Histopathological Study of Lesions of Nasal Cavity and Paranasal Sinus

K.Anbukkarasi[1], Hemalatha Ganapathy[2]

*[1]Assistant Professor**, [2]Professor and HOD, Department of pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai*

Abstract

Sores including the nasal hole and paranasal sinuses are intricate and the most regularly happening in the upper respiratory tract. Nasal indications are one of the most widely recognized explanations behind which the patients look for restorative exhortation. Upper aviation routes are associated with an assortment of non neoplastic and neoplastic ailments. It is hard to recognize clinically and thus it is fundamental that all masses expelled from nose and paranasal sinuses ought to be submitted for histopathological assessment. In the present study an attempt is made to find out the incidence of various lesions of nasal cavity and paranasal sinuses .The polyps comprise the majority of lesions followed by malignant lesions.

Key words: *Nasal cavity, PNS*

Introduction

The nasal cavity and paranasal sinuses form functional unit of nose1 and is principally involved in filtering, humidifying and adjusting the temperature of inspired air [1].As the nose occupies a prominent anatomical position on the face, early diagnosis and treatment of any scarring or ulcerative lesion is important[2]

The nose and paranasal sinuses are exposed to a variety of infective and other factors[3].Tumors of nose are usually uncommon. Malignant tumors account for 0.2% to 0.8% of total malignancies and only 3% of all malignant tumors of upper aerodigestive tract[4]

Aims and Objectives

The study was undertaken with the following aims and

Objectives

• To study the incidence of various lesions of nasal cavity, and paranasal sinuses.

• To study age, sex and site wise distribution of lesions of nasal cavity and paranasl sinus.

• To compare the results with the available data.

Material and Method

The present study is done on the lesions of nasal cavity and paranasal sinuses examined in outdoor patient department or admitted to Otorhinolaryngology department and sent for histopathological examination to department of pathology in SreeBalaji Medical college and Hospital, Chennai

The clinical history was obtained from the department of otorhinolaryngology and after grossing all the sections were studied by routine paraffin sectioning and Haematoxylin and eosin stain.

Findings

Majority of lesions of nasal cavity and paranasal sinuses occured in the 3rd decade (30%) followed by 2nd decade(25%).The non neoplastic lesions were the most commonly occurring lesions of nasal cavity and paranasal

**author designation updated in 2024

sinuses accounting for 85% of cases. Benign neoplasms comprise 11% of cases and malignant neoplasms comprise 3 % of cases. Men were more commonly affected by non neoplastic lesions than women. The most common non neoplastic region encountered in this region was nasal polyp accounting for 69%.

Type of lesion	**No. of cases**	**Percen-tage(%)**
Non neoplastic	90	85.7
Benign	12	11.4
Malignant	03	2.9
Total	105	100

Most of the benign neoplasms occurred in the 3rd and 4th decade ,while most of the malignant neoplasms occurred in 6th decade of life. Inverted papilloma was the most common benign neoplastic lesion accounting for 50 % of cases followed by lobular capillary hemangioma. Menwere more commonly affected than women. Of the malignant lesion undifferentiated carcinoma of nasal cavity was the most common maliganant lesion followed by a lymphoepithelial carcinoma.

Majority of lesions occurred in nasal cavity(83%) followed by paranasal sinuses(17%) .Majority of polyps occured in nasal cavity (78%) followed by paranasal sinuses(22%).Of the non neoplastic lesion inflammatory allergic polyp was the most common followed by rhinosporidiosis and fungal infections like mucormycosis and aspergillosis

Discussion

Sinonasal masses were more typical in male than female with a proportion of 1.6:1 in our examination which was in concordance with Zafar et al.showing male prevalence of 1.7:1 .The second and fourth many years of life are the most defenseless period for improvement of sinonasal masses. Bakari et al5 had detailed a pinnacle rate of 33 years, while for Zafar et al [6] the mean period of introduction was 22.5 years. What's more, in our examination it was 25.6 years.

Malignancies have been accounted for commonly after the fourth decade of life.Non-neoplastic sores shaped 85.7 % of the absolute instances of nasal depression and paranasal sinus in our investigation.

Zafar U et al6 which had non-neoplastic sores of 89 %. Nasal polyps are the most widely recognized sores of the nasal cavity. The rate of nasal polyp was 69% which

was in concordance with concentrates by Tondon et al7 (64%) and Anjali et al 3(62.5%)

Reversed papillomas are relatively uncommon, yet this morphological variation is the most generally experienced sore of all sinonasalneoplasms.Inverted papilloma (Fig.5) shaped half of all kindhearted neoplastic masses in our examination, which was higher than the investigation done by Humayun et al1 who detailed 33.33% and higher from the discoveries of Bakari et al7who announced as 14.5% among all the sinonasal masses.

Malignancies of nasal cavity are uncommon in our examination we got two instances of undifferentiated nasal depression tumor and an instance of lymphoepithelialcarcinoma .

Conclusion

Threat ought to be separated from non-dangerous sores .With the assistance of exhibiting highlights, symptomatology a hypothetical conclusion might be made however histopathology and immune histo chemistry is required for the authoritative finding which would help in fitting treatment for the patient.

Evaluation of Incidence of Postapartum Urinary Retention in Vaginal Delivery

I.Indu[1], K.Saraswathi[2]

[1]Post Graduate Student, [2]Professor and HOD, Department of OBG, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Postnatal nervousness urinary help (PUR) is a customary consequence of bladder brokenness after vaginal development. Partitioned bladder discharging may slant to bladder brokenness at a later time of life. The motivation behind this appraisal is to assess the repeat of PPUR . The PVRBV of ladies who passed on vaginally was evaluated after the key unconstrained micturition with a versatile bladder-filtering gadget. A PVRVB>150ml were depicted as cases and PVRBV<150ml were portrayed as controls. The occasion of postnatal tension pee support in ladies with vaginal vehicle in this assessment is 9.1% Results Of 220 included ladies, 200 were controls and 20 were cases. Episiotomy,instrumental delivery,prolonged term of second time of work are peril elements of PPUR, while age and value were not seen as fundamental by precise assessment. Early confirmation of postnatal tension urinary help instantly may reduce the danger of bladder hurt. Thusly, no patients ought to be left over 6 hours without voiding after vaginal development.

Keywords: *PVRBV, Episiotomy, micturition*

Introduction

Urinary upkeep is the shortcoming to immovably void pee. Unprecedented urinary upkeep is the abrupt and reliably anguishing powerlessness to void paying little notice to having a full bladder. Patients with urinary help can give total nonattendance of voiding, lacking bladder discharging, or flood incontinence. Ensnarements combine contamination, unending voiding troubles and renal disappointment. Postnatal uneasiness urinary upkeep (PUR) is a typical and bewildering disorder in ladies during the short postnatal misery time period. It has been dynamically depicted as part or a large portion of the going with: frightening beginning of excruciating or straightforward shortcoming to void the bladder more than 12 h, requiring catheterization with launch of a volume practically identical to, or more noteworthy than beyond what many would consider possible. Remarkable postnatal misery urinary help, as depicted out in the Calgary Health Region's Policy and Procedures, was portrayed as the essential for at any rate one catheterization inside the hidden 24 h postnatal sadness, for in any occasion one of the going with reasons: (I) quiet has not voided inside 6 h postnatal tension; (ii) tolerant voids every now and then in unassuming sums; (iii) tireless needs to void at any rate can't void; or (iv) if, under any conditions, the patient was coordinated for an extent of 500 ml yield inside the fundamental 24 h postnatal nervousness. PUR has been planned into covert and clear structures. The in camouflage structure can be seen by raised post-void holding up estimations, either with ultrasound checking or with catheterization. Ladies with post-void additional volumes of 150 mL or more and no indications of urinary help are in this portrayal. Clinically clear postnatal discouragement urinary upkeep implies the failure to void after vehicle. Evaluated frequencies ranges from 0.05%-37.0%

Materials &Method

This is a best in class report done in Sree Balaji Medical College and Hospitals combines 220 ladies who had vaginal development . Following the basic

micturition after vaginal vehicle a transabdominal ultrasound was done to survey postvoid additional bladder volume. The transducer was orchestrated in the midline on the most critical reason for the symphysis pubis to get the longitudinal and transverse compass of the bladder. The most extricated up extensiveness in the transverse compass in cm (D1), the anteroposterior partition across over in longitudinal yield in cm (D2) and the cephalocaudal estimation in the longitudinal broadness in cm (D3) were recorded. Assessed PVRBV was constrained by utilizing the condition D1×D2×D3×0.7. Ladies with postvoidal remaining bladder volume more than 150ml were taken as cases and under 150ml were taken as controls.

For the majority of the patients age, decency, length of second time of work, episiotmy and instrumental development were gathered and after that a quantifiable assessment was performed with the above components to isolate the danger factors for Postpartum pee upkeep. Quantitative segments are managed by chi-square and relentless factors with free 'T' test. These two tests are utilized to discover the 'P' respect.

Results

Table 1

	No of patients	**Percentage**
Cases	20(with PPUR)	9.1%
Controls	200(without PPUR)	90.9%
Total	220	100%

Table 2.Characteristics of patients with or without postpartum urinary retention

	PPUR(+)	**PPUR(-)**	**P value**
AGE	26.60±3.21	26.03±3.09	0.7
PARITY Primi Multi	 9.8% 8.2%	 90.2% 91.8%	0.81
INSTRUMENTAL DELIVERY - +	 3.5% 28%	 96.5% 72%	0.001
EPISIOTOMY Given Not given	 16.1% 1%	 83.9% 99%	0.001
DURATION OF 2ND STAGE OF LABOR	111.4±43.01	67.56±33.36	<0.01

Of a total of 220, 20(9.1%) patients had postpartum urinary retention and remaining 200(90.9%) patients were controls.

In table 2 Chi-square test showed two factors(episiotomy and instrumental delivery)were significant, whereas parity is not found to be significant. P value of other two factors(age and duration of 2nd stage of labour) were calculated by independent T test, showed duration of 2nd stage of labour was found to be significant whereas age factor is not that much significant[9].

Discussion

The pace of postnatal uneasiness urinary upkeep in this appraisal is seen as 9.1%. In the assessments including ladies post vaginal birth (checking instrumental birth), the revealed pace of unquestionable (symptomatic) PUR continued running from 0% (Hée et al, 1992) to 11.4% (Ramsa[1] and Torbet, 1993). The evaluation by Hée et al (1992) had somewhat model size of 51 and, in this way, didn't experience any ladies incapable to void. Two observational appraisals proclaimed 0.7% as the pace of symptomatic PUR post vaginal birth (Pramanick

et al, 2014; Andolf et a[2], 1994), regardless, the bladder was assessed at six hours by catheter and unquestionably the beginning stage if requiring a catheter, freely. Six observational assessments announced an occasion between 0.3% (Kekre et al[11], 2011) and 1.9% (Ajenifuja et al, 2013). All evaluations used somewhat shifting ramifications of PUR. Three study examines with enormous model sizes went from 0.2% (Teo et al[5], 2007) to 0.8% (Pifarotti et al[4], 2014), in like way with moving definitions. Musselwhite et al[6](2007) in their review study proclaimed an occasion of 4.7%. Ching-Chung et al{9} (2002), Yip et al[3](1997) and Burkhart et al (1965) in their observational evaluations revealed an occasion some spot in the extent of 4% and 4.9% of PUR post vaginal birth[11].

Conclusion

At whatever point regulated quickly and fittingly, the vast majority of patients with PPUR as a rule come back to commonplace bladder work at the hour of discharge from restorative facility. Regardless, frustration in finding and the officials of PPUR can without quite a bit of a stretch result in whole deal bladder brokenness requiring deferred catheterization. Thusly, wary perception of postnatal depression patients and usage of direct bladder care standards can confine the threat of enduring bladder harm, particularly in those with a high-danger intrapartum course.

Postpartum Voiding Dysfunction in Vaginal Delivery: Identifying the Risk Factors

I.Indu[1], K.Saraswathi[2]

[1]Post Graduate Student, [2]Professor and HOD, Department of OBG, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Objective: To assess the risk factors for postpartum urinary retention after vaginal delivery.

Material and Method: Of 220 ladies with a vaginal conveyance, 20 (9.1%) ladies who had baby blues urinary maintenance were cases, and 200 (91.1%) ladies who didn't were controls. Baby blues urinary maintenance was characterized as the nearness of postvoid leftover bladder volume ≥150 mL or the powerlessness to void inside 6 hours after vaginal conveyance. Strategic relapse investigation distinguished hazard factors for urinary maintenance.

Results: Drawn out span of the second phase of work , nearness of episiotomy, perineal tear, instrumental conveyance and birth weight of >3.8 kg for the infant were found as hazard factors for baby blues urinary maintenance after vaginal conveyance.

Conclusion: Baby blues urinary maintenance after vaginal conveyance is a generally regular condition. Attention to hazard components may enable us to avoid potential risk against this difficulty.

Keywords: *Bladder, vaginal delivery, risk factors, urinary retention*

Introduction

Baby blues urinary maintenance (PUR) is a troubling occasion, the frequency of which extents from 1.7% to 17.9%. Physiologic changes during pregnancy, utilization of provincial absense of pain, instrumental conveyance, perineal injury, nulliparity, and delayed work have been hypothesized as the reasons for PUR. Based on basic side effects, PUR has been characterized as a "nonappearance of unconstrained micturition following 6 hours of vaginal conveyance" or "no unconstrained micturition after evacuation of inhabiting catheter after lower fragment cesarean segment". Baby blues urinary maintenance has been characterized into secret and obvious maintenance. Ladies with a postvoid remaining bladder volume (PVRBV) of in excess of 150 mL, recognized by ultrasound screening or by catheterization, without side effects of urinary maintenance are delegated having secret urinary maintenance. Plain urinary maintenance alludes to the powerlessness to void within the sight of signs and side effects of urinary maintenance. In most obstetric units, estimation of the PVRBV by ultrasound output is utilized as a noninvasive technique to recognize urinary maintenance. [1]

Materials and Method

The present investigation was completed in the Department of Obstetrics and Gynecology, Sree Balaji Medical College and Hospitals among the baby blues ladies who deliverd vaginally. [2]

Women who were not capable void inside 6 hours after vaginal transport were appointed having evident PUR. Covert support was portrayed as a PVBRV of more than 150 mL without urinary symptoms. Part

data—including age, uniformity, length of second period of work, birth weight>3.8kg,episiotomy,perineal tear and instrumental transport were bankrupt down and taken a gander at between those women who had PUR and the people who didn't. Authentic assessment was performed. Connection between the categoric variables was reviewed by methods for chi square test. Steady factors were poor somewhere near self-governing T test. A univariate assessment was performed and factors that were basically associated with PUR were destitute down through bivariate determined backslide. P=0.05 was seen as quantifiably important[3]

Findings

TABLE 1: Obstetric risk factors

	OR	**CI**	**P**
INSTRUMENTAL DELIVERY	**5.542**	**1.9-16.2**	**<0.02**
PERINEAL TEAR	**2.142**	**0.705-6.507**	**.17**
EPISIOTOMY	**0.109**	**0.013-0.898**	**<0.01**

Of a sum of 220 ladies with vaginal delivery,20(9.1%) patients had baby blues urinary retention:18(90%) had undercover retention(aymptomatic) and 2 (10%)had plain maintenance. Staying 200(90.9%) patients were controls.[4]

Quantitative factors caluculated utilizing chi square test: instrumental conveyance, episiotomy and perineal tear were seen as huge with P esteem 0.001,whereas equality isn't measurably critical in the present examination. Anyway the constant factors was determined utilizing free T test: the mean birth weight of infant for cases was fundamentally heavier than the controls and the mean length of the second phase of work was essentially longer in cases when contrasted with controls .The mean period of ladies with and without baby blues pee maintenance was not seen as factually huge[5].

No distinctions were found between these gatherings as far as age and equality.

In table 2 Logistic relapse investigation was carried on to recognize free hazard factors. Utilizing the three noteworthy elements distinguished by univariate examination, we found that solitary instrumental conveyance and episiotomy were altogether free hazard elements of baby blues urinary maintenance. Though perineal tear was not seen as noteworthy.

Discussion

In our investigation, PPUR after vaginal conveyance was found as a moderately regular event, with a rate of 9.1% (20/200). In the writing, the occurrence of PPUR differs broadly .

In the writing, a wide range of obstetrical hazard components have been considered for the pathogenesis of PPUR. The frequency of PPUR has been seen as higher in primigravidae than in multigravidae in the investigation led via Carley et al[1]. In the present investigation, in any case, equality was not a hazard factor for PPUR. A high frequency of PPUR was accounted for in patients with territorial anesthesia (Liang CC et al)[3] and instrument-helped vaginal conveyance (Yip SK et al[2]). Be that as it may, in our investigation, there were no ladies who had territorial absense of pain. Instrumental conveyance is related with a higher occurrence of PUR, particularly unmistakable retention.In the present examination, ladies who had an instrumental conveyance were increasingly inclined to create PUR (28%), which causes neurologic impingement, bringing about baby blues pee maintenance. In a review examination of 11,108 vaginal conveyances by Pifarotti et al[4], PPUR was distinguished in 105 ladies, and fundal weight during the second phase of work was a significant hazard factor for the improvement of PPUR. In our present investigation, none of the patients were given fundal weight, though all different elements that are huge in the present examination were discovered huge to study led by Pifarotti et al[4]

We recognized that a drawn out second phase of work and conveyance of macrosomic infant were the hazard variables related with the event of PPUR. So also, Kekre et al [5] revealed that the lengths of the first and second phases of work were straightforwardly identified with baby blues pee leftover volume, and work span ≥700 min was likewise connected with a more prominent rate of PPUR. It is conceivable that mechanical quality applied to the pelvic muscle floor during delayed second phase of work, notwithstanding the ascent in stomach weight with a macrosomic child, may add to pelvic and pudendal nerve harm, bringing about neurologic disability of micturition and, along these lines, urinary maintenance. In our examination prolonged second phase of work was seen as factually huge, while other 2 phases of work were not incorporated into the present investigation.

Conclusion

All in all, PPUR is a moderately basic condition that can make irreversible harm bladder work. Longer second phase of work, conveyance of a macrosomic infant, the nearness of perineal gashes, episiotomy and instrumental conveyance are huge hazard factors for the improvement of PPUR. Attention to hazard elements may enable the obstetrician to avoid this complexity.

Evaluation of Incidence and Risk Factors of Postpartum Urinary Retention in Women with Vaginal Delivery

I.Indu[1], K.Saraswathi[2]

[1]Post Graduate Student, [2]Professor and HOD, Department of OBG, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Objective : To assess the frequency and to survey the hazard factors for baby blues urinary maintenance in ladies with vaginal conveyance.

Material and Method: Of 220 ladies with a vaginal conveyance, 20 (9.1%) ladies who had baby blues urinary maintenance were cases, and 200 (91.1%) ladies who didn't were controls. Baby blues urinary maintenance was characterized as the nearness of postvoid lingering bladder volume ≥150 mL (clandestine or clear maintenance) or the powerlessness to void inside 6 hours after vaginal conveyance. Measurable investigation recognized hazard factors for urinary maintenance.

Results : The frequency of baby blues urinary maintenance in vaginal conveyance among 220 ladies is 9.1%.Prolonged term of the second phase of work , nearness of episiotomy, perineal tear, instrumental conveyance and birth weight of >3.8 kg for the infant were found as hazard factors for baby blues urinary maintenance after vaginal conveyance.

Conclusion : Baby blues urinary maintenance after vaginal conveyance is a moderately regular condition. Cautious observation of baby blues patients and implementation of basic bladder care rules can limit the danger of changeless bladder brokenness from happening. Consequently, attention to the hazard elements and inconveniences of baby blues urinary maintenance is required.

Keywords: *clandestine, bladder brokenness, episiotomy*

Introduction

Baby blues urinary maintenance is the failure to void after conveyance with a painful(usually) palpable or percussable bladder and the requirement for catheterisation to acquire alleviation.

Evaluated rates go from 0.05%-37.0%

There are two types of urinary retention that can affect women in the postpartum period:

M No - 9444357957

Overt Retention refers to the inability to void spontaneously within 6 hours of vaginal birth or removal of indwelling catheter.

Covert Retention Alludes to expanded post void remaining volumes of >150ml and no manifestations of urinary maintenance.

"Lager" first depicted voiding trouble, repetitive diseases and sphincteric in coordination in 1915.

The present term "useless voiding" (DV) was first utilized by Allen in 1977. This term has therefore been received by a few institutionalization archives.

The International Continence Society (ICS) expresses that: 'Typical voiding is accomplished by a deliberately started consistent detrusor withdrawal that prompts total bladder discharging inside an ordinary time range and without check'.

Urinary maintenance is probably going to be multifactorial, including physiological, neurological and mechanical procedures in the baby blues period. This can prompt durable voiding troubles, intermittent urinary tract diseases and seldom debilitated renal capacity.

As it is practically imposssible to foresee which patient will create baby blues urinary maintenance, all patients on the baby blues ward ought to be viewed as at high hazard.

The point of the present examination was to identify the rate of baby blues urinary maintenance in ladies who had ordinary vaginal conveyance and to decide the components adding to baby blues urinary maintenance.

Materials & Method

220 patients who conveyed vaginally going to SreeBalaji Medical College and Hospital are incorporated into the investigation. Ladies who were not able micturate inside 6 hours after vaginal conveyance were incorporated and known as obvious cases.All members gave educated assent for the examination. For the rest of the patients, following the principal micturition in the baby blues period a transabdominal ultrasound was done to assess postvoid lingering bladder volume. The transducer was situated in the midline on the highest point of the symphysis pubis to get the longitudinal and transverse sweep of the bladder. The most stretched out distance across in the transverse output in cm (D1), the anteroposterior measurement in longitudinal sweep in cm (D2) and the cephalocaudal width in the longitudinal sweep in cm (D3) were recorded. Assessed PVRBV was determined by utilizing the recipe D1×D2×D3×0.7

Ladies in whom the postvoid leftover bladder volume is more than 150ml yet are asymptomatic were characterized as clandestine cases and ladies who were not able void inside 6 hours following vaginal conveyance with a bladder volume more than 500ml were characterized as plain cases. Ladies who had an expected postvoid remaining bladder volume under 150 ml were characterized as controls.

For all members, maternal and neonatal statistic qualities, for example, age, equality, birth weight of infant, length of the second phase of labor(duration >120 mins inprimigravida and term >60mins in multigravida were taken as a drawn out period),perineal cut, episiotomy, and instrumental conveyances were gathered and afterward a factual investigation was performed with the above factors to break down the hazard factors for Postpartum pee maintenance.

Quantitative factors are given as number(percentage) and a factual correlation was completed by chi-square. Consistent factors with typical conveyance are introduced as mean±standard deviation and autonomous 'T' test is utilized to discover the 'P' esteem. A univariate investigation was performed and factors that were essentially connected with baby blues urinary maintenance were broke down by means of multivariate strategic relapse. The chances proportion was evaluated at 95% certainty interims. P<0.05 was considered factually huge.

Findings

	No of patients	**Percentage**
Cases	20(with PPUR)	9.1%
Controls	200(without PPUR)	90.9%
Total	220	100%

Table 1. Characteristics of patients with or without postpartum urinary retention

Table 2.Factors affecting the development of postpartum urinary retention (bivariate logistic regression)

	OR	**CI**	**P**
Instrumental Delivery	**5.542**	**1.9-16.2**	**<0.02**
Perineal Tear	**2.142**	**0.705-6.507**	**.17**
Episiotomy	**0.109**	**0.013-0.898**	**<0.01**

Of a sum of 220 ladies enrolled in the present study,20(9.1%) patients had baby blues urinary retention:18(90%) had secret retention(aymptomatic) and 2 (10%)had unmistakable maintenance. Staying 200(90.9%) patients were controls.[5]

Information in regards to conveyance attributes for ladies with and without baby blues urinary maintenance are appeared in table 1.Chi-square test demonstrated three factors(parity, instrumental conveyance, perineal tear and episiotomy) of which instrumental conveyance perineal tear and episiotomy were factually noteworthy with "p" estimation of 0.001.

Anyway the mean birth weight of infant for cases was fundamentally heavier than the controls(3.42±0.5 kilograms versus 2.94±0.48 kilograms,p=0.01) and the mean length of the second phase of work was essentially longer in cases when contrasted with controls (111.4±43.01 in minutes versus 67.56±33.36 in minutes,p<0.01).The mean period of ladies with and without baby blues pee maintenance was not seen as factually significant(26.60±3.21 vs26.03±3.09,p=0.7). Hence these 3 persistent variables(Age,Birth weight of infant and Duration of second phase of work) are determined utilizing INDEPENDENT "T" test.

No distinctions were found between these gatherings as far as age and equality.

In table 2 Logistic relapse investigation was carried on to recognize autonomous hazard factors.Using the three huge factors(instrumental delivery,perineal tear and episiotomy) distinguished by univariate examinations, we found that solitary instrumental conveyance and episiotomy were fundamentally free hazard variables of baby blues urinary retention(OR 5.542,95% CI 1.9-16.2, p<0.02 as well as 0.109,95% CI 0.013-0.898, p<0.01 separately). While perinealtear(OR 2.142 95% CI 0.705-6.507,p=0.17)was not saw as noteworthy[3].

Discussion

In our investigation, baby blues pee maintenance after vaginal conveyance was found as a

generally regular event, with a rate of 9.1%(20/220). In the writing, the rate of baby blues pee maintenance shifts broadly. Be that as it may, the evaluated rate is probably going to be more, since most cases regularly stay unanticipated. In the investigations including ladies post vaginal birth (counting instrumental birth), the announced occurrence of plain (symptomatic) PUR extended from 0% (Hée et al, 1992) to 11.4% (Ramsay[1] and Torbet, 1993). Six observational investigations announced a frequency between 0.3% (Kekre et al{10}, 2011) and 1.9% (Ajenifuja et al, 2013). All investigations utilized somewhat changing meanings of PUR. Three review thinks about with huge example sizes went from 0.2% (Teo et al, 2007) to 0.8% (Pifarotti et al, 2014), additionally with changing definitions. Musselwhite et al (2007) in their review study detailed a rate of 4.7%. Ching-Chung et al [7] (2002), Yip et al{3} (1997) and Burkhart et al (1965) in their observational investigations announced a rate somewhere in the range of 4% and 4.9% of PUR post vaginal birth. They all had slight varieties in the meaning of PUR. Lee et al. detailed a rate of 14.1% in an examination did at the Tsan Yuk Hospital from 1 to 30 April 1996, which included 256 patients who had conveyed vaginally. They utilized remaining pee volume surpassing 200 mL as meaning of PUR on post-conveyance day 2. The rate of 9.1% distinguished in this investigation is not as much as that of Lee et al. furthermore, this may have been because of variety in definition utilized. We utilized a volume of 150 mL, while they utilized 200 mL. It could likewise be because of racial contrasts and in 1999 Lee et al in their observational investigation detailed a higher rate of 5.8% post vaginal birth additionally utilizing varying meanings of PUR. . Plain maintenance is effectively distinguished by the signs and indications; be that as it may, secret maintenance is perceived uniquely by ultrasound or by catheterization on the grounds that influenced ladies are aymptomatic. [4]

In the present investigation themean time of ladies with PUR was like that of the controls. Similar to the case in different investigations, there was no huge relationship among age and Post partum pee maintenance .

For a situation control study, Carley et al[5] reported that PUR was more typical in primigravida than in multigravida (P<0.001) and that primigravida had a higher pace of instrumental conveyance than the controls (47.1% versus 12.4%; P<0.001). Primigravida were likewise bound to get episiotomy (P=0.001). Nulliparity has been accounted for to be a significant hazard factor for PUR. For instance, Liang et al.found that 78.1% of ladies with PUR were primigravida, contrasted and just 45% of ladies with no maintenance. In the present investigation, nonetheless, there was no relationship among equality and PUR (P=0.81).

Instrumental conveyance is related with a higher frequency of PUR, particularly unmistakable retention. In the present investigation, ladies who had an instrumental conveyance were increasingly inclined to create PUR (28%), which causes neurologic impingement, bringing about baby blues pee maintenance. Instrumental conveyance can bring about harm to the fringe nerves, pelvic musculature, and sphincter urethrae, and can likewise cause debilitated micturition reflex. In spite of the fact that episiotomy has seen as related with increasedincidence of PUR, the equivalent was seen as huge in the present study(p=0.001). The agony brought about by episiotomy can cause reflex urethral fit, which may result in PUR[2].

Birth trench wounds and serious perineal gash increment thechances of urinary maintenance. Liang et al.reported a significantlyhigher frequency of PUR in ladies with birth trench wounds: 41.2%,compared with 7.1% in controls (P<0.001).Glavind and Bjørk distinguished baby blues voiding brokenness in 12/1649 ladies (0.7%). Instrumental conveyance was performed in 33% of the maintenance gathering, contrasted and 8% of the all out populace. Butt-centric sphincter damage and huge perineal tears were available in 33% and 42% of the maintenance bunch individually, contrasted and 1% and 4% of the all out gathering. Thus in Ramsay andTorbett's investigation, unusual voiding parameters were found in 74% of ladies after forceps conveyance. Irregular parameters were additionally recognized in 35% of ladies who had perineal tears sutured, contrasted and 16% of ladies with an unblemished perineum. In the present examination, perineal tear was seen as critical utilizing chi-square formula(p=0.001) while, information investigation by strategic relapse perineal tear was not seen as significant(OR 2.142 95% CI 0.705-6.507,p=0.17).

In an investigation of 691 parturients, Yip et al.found that, on baby blues day 1, the frequency of plain maintenance was 4.9% and thatof secret maintenance was 9.7%, giving a general rate of 14.6%. Themean span of the second phase of work was longer in the maintenance gathering (P<0.001). Instrumental conveyance was related witha higher occurrence of obvious or

undercover urinary maintenance (P<0.001). Thesame was valid for multiparity (P<0.05),and episiotomy (P<0.05). Undercover urinary maintenance was self-limitingand didn't require intercession. However, in our present examination equality isn't seen as that critical though other threefactors(duration of second phase of labour,episiotomy and instrumental conveyance) were measurably huge.[1]

In a review examination of 11,108 vaginal conveyances by Pifarotti et al, PPUR was identified in 105 ladies, and primi parity(p<0.001), delayed second phase of labor(p<0.03),instrumental delivery(p<0.001) and episiotmy(medio horizontal p<0.001,midline episiotomy-p<0.03) were noteworthy and with strategic relapse he found instrumental conveyance was a free hazard factor for baby blues pee maintenance among every one of the variables. On contrasting and our examination every other factor with the exception of equality was huge. Thus in our examination the mean span of work among ladies with PUR was essentially longer than among ladies without PUR: (111.4±43.01 in minutes versus 67.56±33.36 in minutes,p<0.01), instrumental conveyance and episiotomy are the 2 autonomous hazard factors which was seen as noteworthy by calculated relapse investigation.

So also, Kekre et al. detailed that the more drawn out span of labour(379 minutes in patients with baby blues pee maintenance) was related with a more noteworthy frequency of PPUR. It is conceivable that mechanical quality applied to the pelvic muscle floor during delayed second phase of work, notwithstanding the ascent in stomach weight with a macrosomic child, may add to pelvic and pudendal nerve harm, bringing about neurologic debilitation of micturition and, hence, urinary maintenance.

In the present investigation, the mean length of work among ladies with PUR was altogether longer than among ladies without PUR: (111.4±43.01 in minutes versus 67.56±33.36 in minutes,p<0.01).

Consequences of the present investigation are likewise in concurrence with the examination done by SabriCavkaytar{15}, expressed that drawn out length of second phase of labour,presence of episiotomy,presence of perineal tear,birth weight >4000gms in infant were found as a free hazard factors that contribute baby blues urinary maintenance. Same elements were critical in our present investigation. In extra instrumental conveyance was likewise seen as an autonomous factor in the present investigation.

Conclusion

The frequency of baby blues pee maintenance in ladies with vaginal conveyance in this examination is 9.1%. Clear maintenance can without much of a stretch be identified with the signs and manifestations. While, secretive maintenance can be identified uniquely by transabdominal ultrasonogram as the patients are asymptomatic. Age and equality were not fundamentally identified with baby blues urinary maintenance. Ladies who had an instrumental conveyance and episiotomy were progressively inclined to create baby blues pee maintenance. Drawn out length of second phase of work and birth weight of infant more than 3.8kg were huge among ladies with PUR than among ladies without PUR. None of the ladies in the examination picked epidural analgesia(an significant factor which assumes a noteworthy job in baby blues urinary maintenance more in primiparity), accordingly the impact of such factor couldn't be investigated. Bladder filtering is required and advantageous in prompt baby blues period to analyze baby blues pee maintenance by estimating the postvoid leftover bladder volume. Early analysis of baby blues urinary maintenance immediately may decrease the danger of bladder harm. Henceforth, no patients ought to be left over 6 hours without voiding after vaginal conveyance.

Isolation and Identification of Klebsiella Species from Various Clinical Samples at a Tertiary Care Hospital, South India

Sathyavathy.K[1], Kiran Madhusudhan.B[2]

[1]Post Graduate, [2]Professor, Department of Microbiology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Different Klebsiella species may be responsible for different type of infections, and may also differ with the site of infections. K. pneumoniae subspecies pneumoniae is the most common hospital acquired pathogens causing urinary tract infection, wound infections, meningitis, abscesses, lung infections and stated to cause sepsis and death of newborn in the intensive care unit. They account for about 75% to 80% of all Klebsiella species. Much more rarely encountered species are K. pneumoniae subspecies ozaenae and K. pneumoniae subspecies rhinoscleromatis, which have been retained as separate species because of their association with specific diseases. Taxonomically, these two species are regarded as subspecies of K. Pneumoniae based on DNA-DNA hybridization data. Klebsiella oxytoca is another well- established species, accounting for 13% to 25% of isolates. K. oxytoca is normally isolated from environmental sources.

Keywords – *Pneumonia, DNA, Lung Infections*

Introduction

Enterobacteriaceae are a large, assorted group of gram negative bacilli commonly colonizing gastrointestinal tract and most notably associated with human infections. Few genera are recognized as environmental habitats or colonizer of animals. The term "Enterobacteriaceae" was first put forward by Rahn in 1937, which comprises of organisms that share subsequent properties. The Enterobacteriaceae Family embraces seven tribes, of which Klebsiella fits into fifth tribe. The genus Klebsiella is the second most common organism among Enterobacteriaceae family next to E. coli, which is a gram negative, lactose fermenting, non-motile, rod shaped, facultative anaerobic bacilli. They are the common causative agents of both nosocomial and community acquired infections. Klebsiella is the second commonest cause of nosocomial bacteremia and lethal sepsis in pediatric wards especially in premature infants and intensive care units (ICU), and often causes neonatal sepsis. Klebsiella spp. cause 3 – 8 % of all nosocomial infections and are widely recognized as important pathogens in urinary tract infections, pneumonia, wound, soft tissue and blood stream infections (BSI) (1). The genus Klebsiella are the bacterial pathogens most often found associated with infections in healthcare settings and infections may be endogenous or acquired through direct contact with an infected host. The Enterobacteriaceae Family embraces seven tribes, of which Klebsiella fits into fifth tribe. The genus Klebsiella is the second most common organism among Enterobacteriaceae family next to E. coli, which is a gram negative, lactose fermenting, non-motile, rod shaped, facultative anaerobic bacilli. They are the common causative agents of both nosocomial and community acquired infections[1].

Different Klebsiella species may be responsible for different type of infections, and may also differ with the site of infections. They account for about 75% to 80% of all Klebsiella species. Much more rarely encountered species are K. pneumoniae subspecies ozaenae and K. pneumoniae subspecies rhinoscleromatis, which have been retained as separate species because of their association with specific diseases. Taxonomically, these two species are regarded as subspecies of K. Pneumoniae based on DNA-DNA hybridization data.Klebsiella oxytoca is another well- established species, accounting for 13% to 25% of isolates. K. oxytoca is normally isolated from environmental sources.

Clinical manifestations by Klebsiella species may range from colonization of the skin and mucous membrane to serious infection leading to substantial morbidity and mortality. The ability of this organism to spread rapidly often leads to nosocomial outbreaks. Since 1982, strains that produce ESBL have been evolving.Epidemic and endemic nosocomial infection caused by Klebsiella species are a leading cause of high morbidity and mortality[2].

Materials and Method

The study was conducted in central diagnostic laboratory, Department of Microbiology for a period of one year (Jan 2017 to Dec 2017) at Sree Balaji Medical College and Hospital. Overall 980 non repetitive clinical samples (wound/pus, urine, sputum and blood) received and processed from General surgical wards. Out of which, 189 were isolated and identified as klebsiella by Gram staining, culture morphology on to MacConkey Agar, Blood agar and Nutrient agar plates and biochemical tests[4].

Microscopic appearance:

The isolated colonies from MacConkey agar and Blood agar was picked up for gram staining and motility.

Gram staining reveals short, thick rods of 0.3 to 1.5 by 0.5 to 5.0 µ, gram negative bacilli arranged in singles and pairs (Fig 4)

Colony morphology on agar medium:

On Nutrient agar colonies are circular, 2-3mm in diameter, dome shaped, mucoid (due to capsular polysaccharides), Greyish-white, translucent-opaque.

On MacConkey agar colonies are circular, 2-3 mm diameter, convex, mucoid, pink color due to (lactose fermentation), opaque.

On blood agar the colonies are similar to nutrient agar with no haemolysis.

Biochemical tests:

Tube catalase test

Indole production test (Kovac's reagent)

Methyl red test

Voges proskaeur test

Citrate utilization test on simmon's citrate utilization media

Urease production test on christensen's media

Sugar fermentation test (glucose, lactose, sucrose, mannitol, mannose)

Triple sugar iron media

Decarboxylation of arginine, lysine (Moller's method)

Table 1:Preliminary tests for Enterobacteriaceae groups:

S.No	Name of the test	Results for Klebsiella
1	Catalase	Positive
2	Oxidase	Negative
3	Nitrate reduction	Positive
4	Hanging drop	Non motile

Results

Table 3: Samplewise distribution of Klebsiella isolates:

S.no	Sample Type	Total Number	Klebsiella Isolates
1.	Urine	398	51(27%)
2.	Wound/Pus	502	94(50%)
3.	Sputum	48	26(14%)
4.	Blood	32	18(9%)
	Total	980	189(100%)

From a total of 980 various clinical samples, 189 isolates were Klebsiella, of which maximum isolates were from wound (50%), followed by urine (27%), sputum (14%) and blood (9%).

Table 4: Percentage of Klebsiella species isolated

Total Klebsiella Isolates	Klebsiella Pneumoniae	Klebsiella Oxytoca
189(100%)	155(82%)	34(18%)

Out of 189 Klebsiella isolates, 82% were Klebsiella pneumoniae followed by Klebsiella oxytoca which constituted 18%.

Table 5: Genderwise distribution of Klebsiella:

Total Klebsiella Isolates	Male Patients	Female Patients
189	123(65%)	66(35%)

Out of 189 Klebsiella isolates,123 were males (65%) and 66were female patients(35%).

Table 6:Agewise distribution of Klebsiella infection:

S.no	Age In Years	Number of Samples	Klebsiella Isolates
1.	15-30	113	32(17%)
2.	31-45	265	44(23%)
3.	46-60	230	47(25%)
4.	>60	372	66(35%)
Total		980	189(100%)

Out of 189 Klebsiella isolates, maximum isolates were obtained from the age group of >60 years (35%) followed by 46-60 years (25%), 31-45 years (23%) and15-30 years (17%).

Findings

Total number of samples taken in this study during the one-year period (Jan-Dec2017) is 980. The samples consisted of urine, wound/pus, sputum and blood from inpatients of General surgical wards at Sree Balaji medical college and hospital, Chrompet, Chennai, south India.

In this study, under proper aseptic conditions samples were collected, sent and processed in the microbiology section of central diagnostic laboratory. Organisms were identified based on culture characteristics, gram staining, motility test, and biochemical reactions. Out of the 980 samples, 189(19.8%) Klebsiella species were isolated. In a previous study by Saurav chakraborthy et al., 24% of Klebsiella were isolated from various clinical samples[7]. Jesmin Akter et al., in their study done at south eastern part of Bangladesh reported isolation of 19.72% of Klebsiella species, which was similar to our study[8].

This study shows that, out of 189 Klebsiella isolates from various clinical samples, maximum isolates were from wound/pus samples 94(50%), followed by urine 51(27%), sputum 26(14%) and blood 18(9%). Sunil Kumar biradar et al., at Karnataka isolated 50% of Klebsiella from wound, followed by 21% from urine, 18% from sputum and 7% from blood (9). A study by Asha et al., isolated 48% and 28% of Klebsiella species from wound and urine samples respectively [10] which was similar to the present study.

In this study, highest prevalence of Klebsiella isolates were obtained from the age group of >60 years (35%) followed by 46-60 years (25%), 31-45 years (23%) and the least from 15-30 years (17%). A similar study done by Namratha et al., isolated highest number of Klebsiella species in patient aged above 60 years (30%) followed by 45-60 years (25%), 31-45 years (22%) and 16% in patients aged 16-30 years. Various risk factors like diabetic mellitus, hypertension, steroid therapy, smoking and alcoholism were associated with Klebsiella infections in their study.

In this study, Klebsiella was isolated from 65% of males and 35% of females of ratio 1.8:1. A similar study done by Sunil kumar et al., isolated 62% from male and 38% from female with male and female ratio of 1.7:1[9]. Frequency of male is more than female which could be due to exposure to outside working environment.

Out of 189 Klebsiella isolates, 155(82%) were Klebsiella pneumoniae and 34(18%) were Klebsiella oxytoca. Thosar et al., at Amaravati isolated 86% of Klebsiella pneumoniae and 13% of Klebsiella oxytoca. A similar study done by Namratha et al.,found 79% being Klebsiella pneumoniae and 21% Klebsiella oxytoca.

Conclusion

In our present study, klebsiella species were most commonly encountered from wound samples of both gender among which maximum isolates were klebsiella pneumoniae than klebsiella oxytoca. This increase in klebsiella isolates in wound samples would be due to risk factors like diabetic mellitus, immunocompromised patients etc. Appropriate antibiotic policy should be followed in reference to CLSI guidelines for empirical therapy.

Study on Carcinomas of Breast with Special Reference to Expressions of Vascular Endothelial Growth Factor (VEGF)

C. Ramakrishnan[1], G. Jagan[1], R. Vedamanickam[2]

[1] Professor, [2]Associate Professor, Department of General Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Introduction: Bosom carcinoma is the most widely recognized malignant growth analyzed in ladies on the planet. The frequency of bosom carcinoma is additionally in an expansion in India and is presently the second most regularly analyzed carcinoma in ladies after cervical cancer. Albeit intrusive carcinoma of bosom was clinically viewed as a solitary substance before, histological and atomic investigation have shown that it is a heterogeneous ailment, made out of morphologically and hereditarily particular elements with various sub-atomic profiles, conduct and reaction to therapy(2).

A relationship between HER-2/neu over expression and VEGF articulation could fortify the theory dependent on preclinical proof that expanded VEGF articulation might be an after effect of HER-2/neu over expression and may add to the forceful phenotype of HER-2/neu over expressing bosom disease cells. This would give a method of reasoning to consolidated remedial methodologies focusing on both VEGF and HER-2/neu. The essential point of the present investigation was to decide potential relationship between articulations of HER-2/neu and VEGF in bosom carcinoma

Materials and Method

The present examination was done in the Department of Pathology, SBMCH, with endorsement from institutional morals panel. It included 30 instances of essential carcinoma bosom, affirmed by biopsy3.

Cont... **Table-1: Distribution of cases in relation to clinicopathological parameters**

Tumor size	T1 (<2cm)	1	3.3
	T2 (2-5cm)	21	70
	T3 (>5cm)	8	26.7
Histological type	Invasive carcinoma of no special type	24	80
	Invasive lobular carcinoma	2	6.7
	Mucinous carcinoma	2	6.7
	Metaplastic carcinoma of no special type	1	3.3
	Invasive papillary carcinoma	1	3.3
Histological grade	I	4	13.3
	II	14	46.7
	III	12	40
AJCC staging	I	0	0
	II	18	60
	III	12	40
	IV	0	0
Lymph node metastasis	Present	19	63.3
	Absent	11	36.7
HER2 neu	Positive	15	50
	Negative	15	50
VEGF	Positive	21	70
	Negative	9	30

Table 2 : Association between HER-2/neu and VEGF expressions :

HER2/neu	**No. of cases**	**VEGF**	
		Positive (%)	**Negative (%)**
Positive	15	15 (100%)	0 (0%)
Negative	15	6 (40%)	9 (60%)

HER2/neu positivity completely matches with VEGF positivity. Chi square test of independence also reveals a significant association between the two factors[1] ($p = 0.014$). Out of 15 negative cases of HER2/neu, 9 are in agreement with VEGF expression (60%), whereas 6 are in disagreement (40%). This observation leads to a firm indication that HER2/neu positivity has a strong association with VEGF positivity and also majority of HER2/neu negative cases are in agreement with VEGF expression[5].

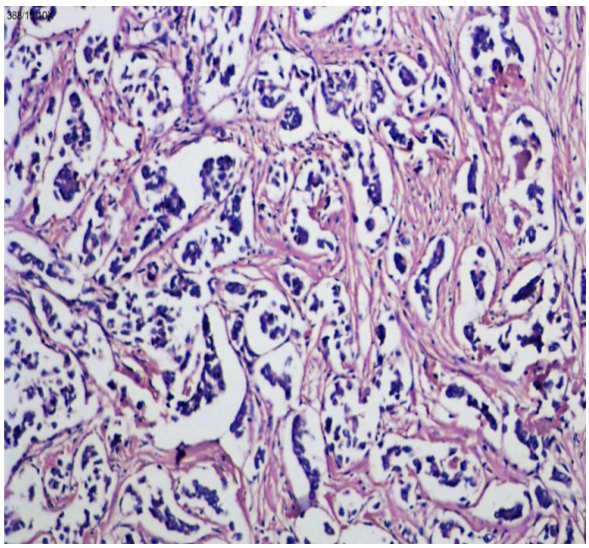

Fig 1 - Invasive Breast Carcinoma of No Special Type (H & E, 10X)

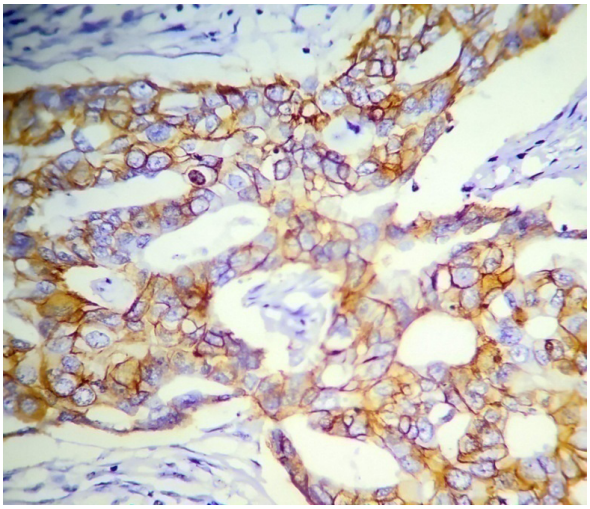

Fig 2 - Invasive Breast Carcinoma of No Special Type, showing positivity for HER2/neu (HER2/neu, 40X)

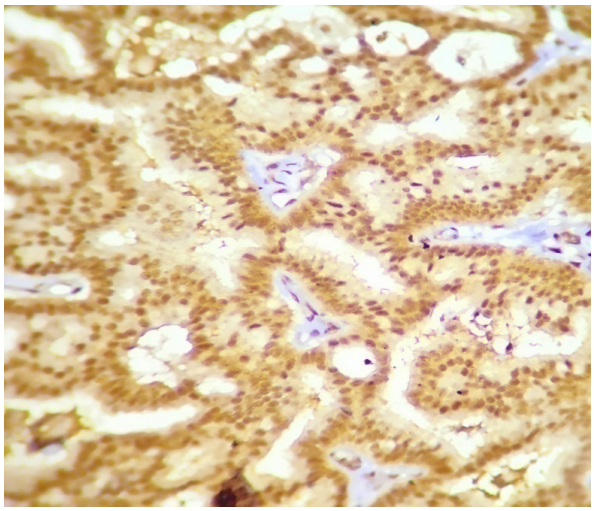

Fig 3 - Invasive Breast Carcinoma of No Special Type, showing positivity for VEGF (VEGF, 40X)

Discussion

Most of the clinical information relating to the association between HER-2/neu over-expression and VEGF expression in breast cancer, demonstrate a positive association between the 2 factors among massive series of primary breast cancer patients(3,4,5,6,7). Kimberly et al(8) during a study of 425 patients with pathologic process breast cancer incontestible a major direct correlation between HER-2/neu over-expression and mean microvessel density (MVD). However, in distinction to most of the studies, they found important lower levels of VEGF expression in HER-2/neu amplified tumours. The authors attributed this finding to the actual fact that higher quantity of growth in HER-2/neu amplified tumorus could result in less growth drive and successively decrease the assembly of VEGF. They additionally urged that this finding could also be explained by the quality of VEGF regulation. this study in primary breast cancer patients, however, supports the observation that HER-2/neu over-expression is related to VEGF expression[8].

Conclusion

The current study provides clinical proof that HER-2/neu over-expression is related to expression of VEGF in breast malignant neoplastic disease, suggesting that VEGF could partially mediate the aggressive composition of breast malignant neoplastic disease that over-expresses HER-2/neu[1]. These knowledge in addition support the employment of combination therapies directed against each HER-2/neu and VEGF for treatment of breast malignant neoplastic disease patients United Nations agency exhibit HER-2/neu over-expression. However, this study enclosed little variety of cases, therefore any studies with larger sample size square measure required during this space to conclude associate association between HER-2/neu and VEGF in breast malignant neoplastic disease[9].

Clinicopathological Spectrum of Breast Carcinoma Cases in Sree Balaji Medical College and Hospital

V.S. Kalaiselvi[1], K. Sumathi[2]

[1] Professor, [2] Associate Professor, Department of Bio Chemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Carcinoma is a major health issue worldwide. Approximately 10 million people are diagnosed with carcinoma and more than 6 million people die of the disease every year.(1) Breast cancer is by far the most common of all cancers diagnosed in women in the world. The incidence of breast cancer has risen in India (22.9%). The age-standardized mortality rate for breast cancer in India is found to be 11.1/100,000 whereas globally it is 12.5/100,000, according to International Agency for Research on Cancer report in 2008.(2) Breast cancer cases in India are expected to increase by 26% by 2020.(3) Among the Indian women, cancer cervix and breast carcinoma account for 60% of the total cases, of which the incidence of breast carcinoma is 10.4%. A study conducted by WHO (1999) (4) revealed that Chennai accounts for the highest incidence among all the leading centres in India i.e around 26/1, 00,000 women. The mean age of occurrence is approximately 42 years.(1,5)

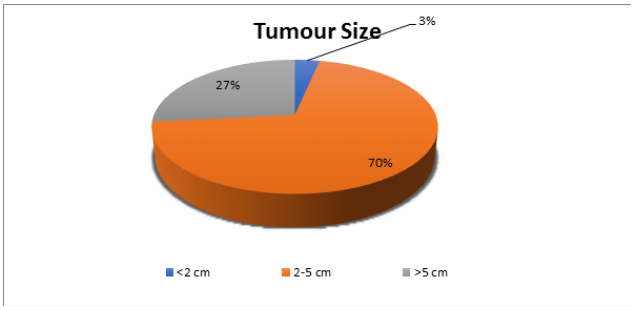
Materials and Method

The present study was done in the Department of Pathology, SBMCH, with approval from institutional ethics committee. It included 30 cases of primary carcinoma breast, confirmed by biopsy.



Findings

Clinicopathologic profile of the cases :

The **T2 lesions** (ranging between the size of 2-5cm) accounted for 70% of cases, while **T3** (>5cm in size) **and T1 lesions** (<2 cm in size) accounted for 26.7% and 3.3% of cases, respectively. (Table 2 & Graph 2)

Table1 : Size Wise Distribution of the Tumours

Tumour Size	Percentage	Frequency
T1 (<2 cm)	3.3%	1
T2 (2-5 cm)	70.0%	21
T3 (>5 cm)	26.7%	8
Total	100.0%	30

Graph 1 : Size Wise Distribution of the Tumours

Out of the total 30 studied cases, Invasive carcinoma of no special type (Fig-1), was the commonest **histologic type** accounting for 80% (24/30) cases[2]. There were two cases each of Invasive lobular carcinoma (Fig-2) and mucinous carcinoma (Fig-3) and one case each of metaplastic carcinoma of no special type (Fig-4) and invasive papillary carcinoma (Fig-5). (Table 3 and Graph 3)

Table 2 : Distribution of cases according to histological diagnosis

Histological Diagnosis	Percentage	Frequency
Invasive carcinoma of no special type	80.0%	24
Invasive Lobular Carcinoma	6.7%	2
Mucinous Carcinoma	6.7%	2
Metaplastic Carcinoma of No Special Type	3.3%	1
Invasive Papillary Carcinoma	3.3%	1
Total	100.0%	30

Regarding the **histologic grades** of the tumours, in this study 13.3% were grade I, 40% belonged to grade II and 46.7% were grade III tumours. (Table 4) Since grade I tumours were very few in numbers, grade I and grade II tumours could also be clubbed together as low grade tumours and grade III were treated as high grade tumours[3]. Hence, low grade tumours made up 53.3% (16 out of 30) whereas high grade tumours made up 46.7% (14 out of 30) of the 30 cases, which were included in this study.60% of the cases included in this study showed **AJCC stage II** tumours and 40% of the cases showed **AJCC stage III** tumours. None of the tumours belonged to stage I and stage IV.

Lymph node metastasis was seen in 63.3% cases while 36.7% cases were negative for it.

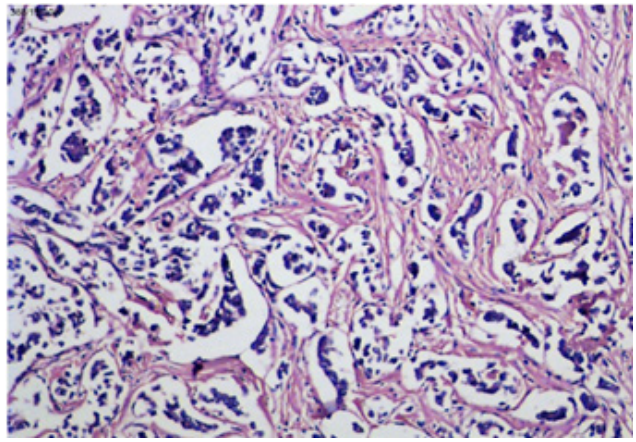


Fig 1 - Invasive Breast Carcinoma of No Special Type (H & E, 10X)

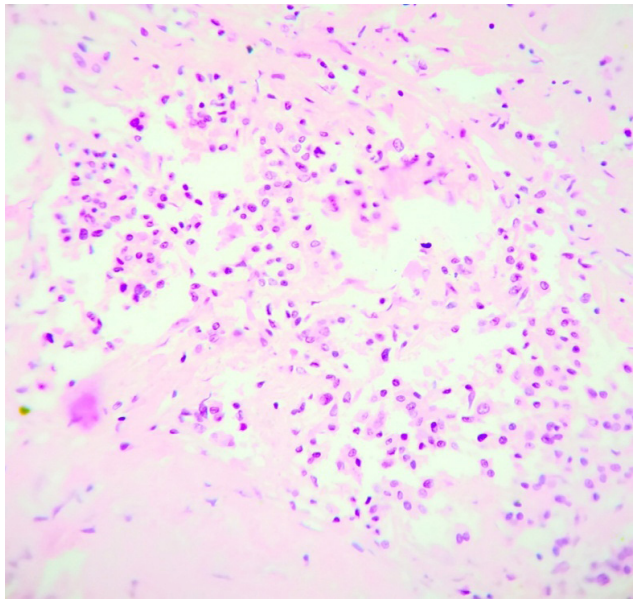

Fig 2 – Invasive Lobular carcinoma (H & E, 10X)

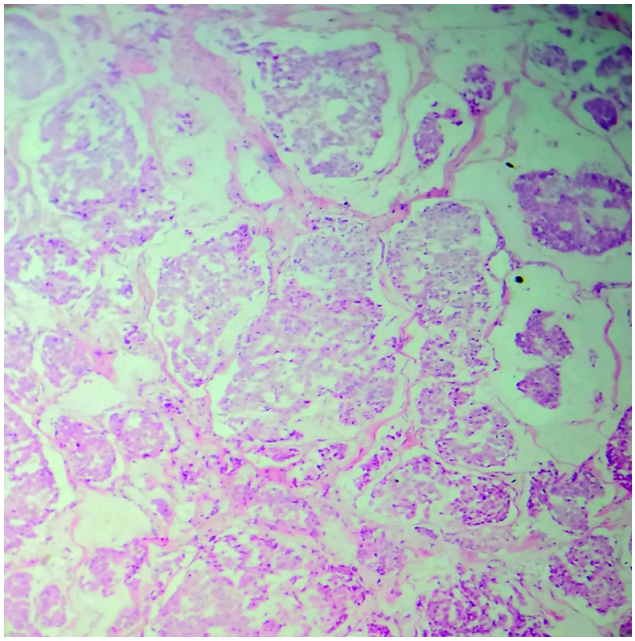

Fig 3 – Mucinous carcinoma (H & E, 10X)

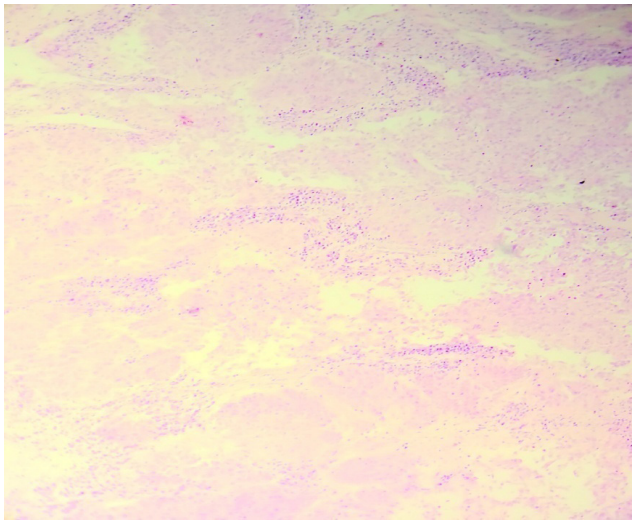

Fig 4 – Metaplastic carcinoma of no special type (H & E, 10X)

Discussion

The mean age of patients in our study group was observed to be 47.5 years which was comparable to the mean age of patients in the studies conducted by Xiaowei Ye et al (49.86 years), En-Qi Qiao et al (51 years) and Wentao Yang et al (51.9 years). The mean age in the study conducted by Konecny et al (58years) was however significantly higher than that in the present study. 63.3% of patients in our study were <=50 years while 36.7% of patients were >50 years compared to 49% (<50 years) and 51 % (>50 years) and 51 %(< 50 years) and 49 % (>50 years) of patients in the study conducted by En-Qi Qiao et al and Xiaowei Ye et al [4] respectively.

Table 3: Comparative analysis of Age Distribution in Breast carcinoma cases

Study	<=50 years	>50 years	Mean Age
Xiaowei et al (2010)	51%	49%	49.86 years
En – Qi Qiao et al (2013)	49%	51%	51 years
Wentao Yang et al (2002)	-	-	51.8 years
Konecny et al (2004)	-	-	58 years
Present Study	63.3%	36.7%	47.5 years

As far as the tumour size is concerned, T2 lesions (2-5 cm in size) were the most common (70%) in our study. This finding was in agreement with the studies conducted by Wentao Yang et al (62.6% of T2 lesions) and Konecny et al (51% of T2 lesions). However, T1 lesions were found to be the majority in the works of En-Qi Qiao et al (56%), Xiaowei Ye et al (42%) and Linderholm et al (57%).

Table 4 : Comparative analysis of Tumour Size Distribution in Breast carcinoma cases

Study	Most predominant tumour size	Percentage (%)
Xiaowei et al (2010)	T1	42
Linderholm et al (2004)	T1	57
Konecny et al (2004)	T2	51
En – Qi Qiao et al (2013)	T1	56
Wentao Yang et al (2002)	T2	62.6
Present Study	T2	70

Out of the total 30 cases studied, Invasive carcinoma of no special type was the commonest histological type accounting for 80% (24/30) cases. It was also the most common histological type in the studies conducted by Xiaowei Ye et al and Linderholm et al[5], where it accounted for 73.5% and 87.5% of cases respectively.

Table 5 : Comparative analysis of Distribution of Histological types in Breast carcinoma cases

Study	Commonest histological type	Percentage (%)
Xiaowei et al (2010)	Invasive carcinoma of no special type	73.5
Linderholm et al (2004)	Invasive carcinoma of no special type	87.5
Present Study	Invasive carcinoma of no special type	80

Regarding the histologic grade of the tumours, our study showed that 13.3% were in grade I, 40% were in grade II and 46.7% were in grade III. Due to few numbers of grade I cases, grade I and grade II tumours were clubbed together into low grade tumours (53.3%) and grade III tumours (46.7%) were taken as high grade tumours. The distribution of tumours among low grade and high grade was comparable to the findings of Xiaowei Ye et al (60% and 40%), Linderholm et al (60% and 40%) and Konecny et al (60.4% and 39.6%). En-Qi Qiao et al also had reported more cases in the low grade category (72%).

Table 6 : Comparative analysis of Distribution of Breast carcinoma cases according to histological grades

Study	Most predominant histological grade	Percentage (%)
Xiaowei et al (2010)	Low Grade	60
Linderholm et al (2004)	Low Grade	60
Konecny et al (2004)	Low Grade	60.4
En – Qi Qiao et al (2013)	Low Grade	72
Present Study	Low Grade	53.3

In our study, 63.3% cases were node positive which is comparable to the findings of Wentao Yang et al (61.7% node positive cases). The studies belonging to Xiaowei Ye et al, Linderholm et al, Konecny et al and En-Qi Qiao et al had 34%, 42%, 51.7% and 82% of node positive cases, respectively.

Table 7 : Comparative analysis of Lymph node metastasis status in Breast carcinoma cases

Study	Percentage of Lymph Node positive cases
Xiaowei et al (2010)	34
Linderholm et al (2004)	42
Konecny et al (2004)	51.7
En – Qi Qiao et al (2013)	82
Wentao Yang et al (2002)	61.7
Present Study	63.3

Conclusion

In the present study, 40% of the breast carcinoma cases belonged each to the age groups of 35-45 years and 45-55 years. The mean age of patients was found to be 47.5 years. The largest dimension in 70% of the breast tumours was between the range of 2-5cm (T2). Among the various histological variants in breast carcinoma, Invasive carcinoma of no special type, constituted 80% of the cases. The predominant grade among the breast carcinoma cases was Grade III, which accounted for 46.7% of the cases. As far as the AJCC staging of the breast carcinoma cases in concerned, majority belonged to AJCC stage II (60% cases). Among the 30 cases, lymph nodal metastasis was found in 63.3% cases.

Expression of Ki – 67 AND Bcl – 2 in Endometrial Hyperplasia

P. Shalini[1], Natrajan Suresh[2], Hemalatha Ganapathy[3]

[1]Post Graduate, [2]Associate Professor, [3]Professor and Head, Department of Pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Prolonged oestrogen exposure can induce exaggerated endometrial proliferation (hyperplasia), which is an important precursor of endometrial carcinoma[1]. This investigation uncovered that both HER2/neu cynicism and energy were similarly pervasive in both the wide age gatherings (<=50 years and >50 years). It demonstrated that HER2/neu energy was similarly circulated between T1, T2 and T3 sores of bosom carcinoma. Dominant part of the instances of obtrusive ductal carcinoma of no extraordinary kind were sure for Her 2/neu. None of the other histological sorts indicated HER2/neu inspiration. Thinking about the little quantities of instances of obtrusive lobular carcinoma, mucinous carcinoma, metaplastic carcinoma of no unique kind and intrusive papillary carcinoma, the nearness or nonappearance of relationship of HER2/neu articulation with the histologic sort can't be finished up. The present examination showed higher indication of HER2/neu energy in evaluation II, trailed by evaluation I and grade III cases. It likewise indicated more instances of AJCC arrange II tumors being sure for HER2/neu than AJCC organize III tumors. The present examination had no tumors of AJCC stages I and IV. HER2/neu inspiration has additionally been seen as related with positive lymph hub metastatsis status than negative lymph hub metastasis status.

Keywords: *mucinous carcinoma, metaplastic carcinoma*

Introduction

The significance of unopposed estrogen incitement for the advancement of endometrial hyperplasia and therefore adenocarcinoma is all around recorded. Be that as it may, the histogenetic components for the advancement of various endometrial injuries, for example, hyperplasia, polyps, and adenocarcinoma have not been completely described to date.

This investigation is pointed in deciding the degree of expansion and apoptosis in the endometrial tissue since the awkwardness between them frames the premise of carcinogenesis. The proliferative action in the endometrium is broke down utilizing the immunohistochemical marker – Ki – 67 and the apoptotic action is resolved utilizing the immunohistochemical marker – Bcl – 2.

Material and Method

This forthcoming, cross-sectional investigation, was done in the Department of Pathology, Sree Balaji Medical College and Hospital, Chromepet, Chennai, from March 2017 toJune 2018.The examination material included 50 endometrial biopsysamples and endometrium from the TAH and BSO specimens received by the Department of Pathology. Of the 50 examples, 30 examples were endometrial hyperplasia, and 20 examples were ordinary endometrial tissue.

Immuno histo chemistry was performed on every one of the examples utilizing Bcl-2 as an essential antigen, Ki – 67 and poly HRP as an optional unit. Antigen recovery was finished by utilizing microwave in Tris-EDTA cushion at pH 9. Re coloring was performed with DAB as chromogen.

Bcl2 inspiration will be demonstrated by cytoplasmic positivity in glandular and stromal cells. Yet, in my study, only the positive cells in the glandular epithelium

were considered. A segment from tonsil demonstrates higher grade positivity and was utilized as a control for dissecting the intensity.

The quantity of cells positive for Bcl - 2 werecounted in 100 epithelial cells and rehashed in 10 HPFs, andthen communicated as a rate. The power of the stainingin the positive epithelial cells is evaluated as:

Evaluation 1 - Mild

Evaluation 2 - Moderate

Evaluation 3 - Strong

Evaluation 4 - Very solid

The positive articulation of Ki-67 was characterized as nearness of darker yellow granules in cell cores or in both cell cores and cytomembrane. An area from tonsil was utilized as control for Ki – 67 articulation.

Since the force was seen as uniform in every one of the cells, just inspiration is determined. The positive cores were included in 100 epithelial cells and rehashed in 10 HPFs, and the all out number of positive cells was communicated as a level of 1000. At that point they are reviewed as pursues dependent on their energy:

1 - 25 % - Grade 1

26 - 50 % - Grade 2

51 - 75 % - Grade 3

76 - 100 % - Grade 4.

Findings

Bcl-2 scoring in this investigation was limited to the epithelialcompartment. The recoloring was for the most part uneven,with transcendence at the fringe edge of the epithelialcell cytoplasm. Periodically the stainingwas perinuclear and granular.

Proliferative endometrium indicated energy for Bcl - 2with fluctuating forces yet all cases were certain, where as only 50 % of cases demonstrated inspiration for Bcl-2 in the secretory endometrium. Indeed, even the mean rate of positive cells in secretory endometrium was low accounting only 11 %. The mean level of positive cells in the glandular epithelium of proliferative endometrium wasmore - 64.2 %.

Table 1: Mean Percentage of Positivie Cells for Bcl- 2 Andki- 67 in Various Histologic Groups

S. No.	Histologic group	Sample size	Bcl – 2	Ki – 67
1	Proliferative Endometrium	10	64.2	29.80
2	Secretory Endometrium	10	11	3.6
3	Hyperplasia without atypia	15	48.4	25.53
4	Atypical Hyperplasia	15	29.6	32.4

The expression of Bcl – 2 and Ki – 67 in various endometrial samples were graded according to the method described above and their distribution is summarized in the tables 2 and 3

Table 2: Expression of Ki – 67 and Bcl – 2 in Normal Cyclical Endometrium

Grade	Proliferative Endometrium (n = 10)		Secretory Endometrium (n = 10)	
	Bcl – 2	Ki -67	Bcl - 2	Ki -67
1	4	1	4	10
2	2	9	1	-
3	3	-	-	-
4	1	-	-	-

Table 3: Expression of Ki – 67 and Bcl – 2 in Normal Cyclical Endometrium

Grade	Hyperplasia without atypia (n = 15)		Atypical Hyperplasia (n = 15)	
	Bcl – 2	Ki -67	Bcl – 2	Ki -67
1	5	8	6	6
2	4	6	6	7
3	5	1	1	2
4	1	-	-	-

Discussion

The scoring for Bcl-2 was limited to the positive cells in the epithelial compartment. The cells recolored uneven, generally in the fringe edge of the epithelial cell cytoplasm. A few cells indicated perinuclear and granular recoloring in the cytoplasm.

Proliferative endometrium demonstrated inspiration for bcl-2 with fluctuating powers however all cases were sure, though just 50 % of cases indicated energy for Bcl-2 in the secretory endometrium. Indeed, even the mean level of positive cells in secretory endometrium was low bookkeeping just 11 %. The mean level of positive cells in the glandular epithelium of proliferative endometrium was more - 64.2 %.

With the beginning of secretory movement, bcl-2 epithelial energy was confined to the basal bits of the endometrium, vanishing in the late piece of this stage. The evaluation went from 0 to 2. Cells indicating secretory vacuoles were negative, while cells as yet demonstrating proliferative action were bcl-2 positive. The example of recoloring inside the phones was granular or in clusters. As pre-decidualization changes happened, discontinuous stromal inspiration (lymphocytes) was seen around the organs.

At the point when broke down with the articles which concentrated the Bcl-2 articulation in ordinary endometrium, for example, Gompel et al2, X J Tao et al[3], Mertens H J MM et al[4], Morsi et al[5] and T. E. Vaskivuo et al6, my outcomes were reliable with these investigations.

The proliferative movement was high in proliferative endometrium with a normal of 29.80% and most reduced in secretory endometrium with a mean level of 3.6 %. This example was likewise seen in the investigations by G. T. Gurda[7] et al, Morsi[5] et al, Mertens4 et al, Risberg8 et al and Vaskivou[6] et al.

In my examination, Bcl – 2 was discovered positive in each of the 15 instances of HWA, the mean level of positive cells communicating Bcl – 2 was 48.4 % in different evaluations of force. (Evaluation 1 to review 4). While in the 15 instances of atypical hyperplasia, 2 cases were negative for Bcl – 2 and the mean level of positive cells was 29.6 % in evaluation 0 to review 3. At the point when contrasted and the statement of Bcl – 2 in proliferative endometrium (64.2 %), it is seen that the declaration of Bcl - 2 exhibits diminished Bcl-2 articulation with a pattern from ordinary endometrium (most noteworthy articulation), through hyperplasia without atypia to atypical hyperplasia (least articulation).

Comparative pattern of Bcl-2 in the hyperplastic endometrium was seen in studies directed by Vaskivuo6 et al, Risberg [8] et al and Mitselou [9]et al where Bcl-2 articulation was most elevated in ordinary endometrium than the hyperplasias. Concentrates by Morsi5 et al, Kokawa[10] et al and Nunobiki11 et al noted Bcl-2 articulation to be higher in non-atypical hyperplasias contrasted and atypical hyperplasias.

Ki – 67 was discovered positive in all the 30 instances of hyperplasia with a 25.53 % and 32.4 % as mean level of inspiration in hyperplasia without atypia and atypical hyperplasia separately. The energy changed from 7 % to 54 % in non-atypical hyperplasia gathering and 18 % to 64 % in atypical hyperplasia gathering.

The outflow of the Ki – 67 is the most elevated in atypical hyperplasia (32.4 %), trailed by, proliferative endometrium (29.80 %), hyperplasia without atypia (25.53%) and is least in secretory endometrium (3.6 %).

Morsi5 et al, Gurda7 et al and Nunobiki11 et al in their investigations additionally watched a stepwise expanded articulation of Ki – 67 from ordinary, basic or complex hyperplasia with or without atypia to endometrial adenocarcinoma.

Conclusion

The finding of diminished bcl-2 articulation in atypical hyperplasia recommends a conceivable job for bcl-2 in advancing the threatening change of hyperplastic cells. When atomic atypia was watched, bcl-2 articulation was hard to recognize. What's more, it has been appeared in different examinations that Bcl-2 overexpression assumes a significant job in epithelial tumor advancement.

Bcl – 2 articulation is diminishing from hyperplasia without atypia to atypical hyperplasia, and Ki - 67 articulation is expanding from hyperplasia without atypia to atypical hyperplasia. This infers there is diminished apoptosis and expanded proliferative movement when the hyperplasia advances towards atypia.Hence Bcl – 2 and Ki - 67 may have some utility as a marker of EH movement and subsequently to endometrial carcinoma.

Ki – 67 Expression in Endometrial Hyperplasia

P. Shalini[1], Natrajan Suresh[2], Hemalatha Ganapathy[3]

[1]Post Graduate, [2]Associate Professor, [3]Professor and Head, Department of Pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstarct

An excess of estrogen relative to progestin, if sufficiently prolonged or marked, can induce exaggerated endometrial proliferation (hyperplasia), which is an important precursor of endometrial carcinoma.[1] The importance of unopposed estrogen stimulation for the development of endometrial hyperplasia and subsequently adenocarcinoma is well documented. However, the histogenetic mechanisms for the development of different endometrial lesions such as hyperplasia, polyps, and adenocarcinoma have not been fully characterized to date. This study is aimed at determining the expression of the proliferation marker – Ki-67 in endometrial hyperplasia.

Keywords: *endometrial carcinoma, proliferation marker – Ki-67*

Introduction

The proliferative activity of a cell is determined by Ki-67 antigen. This monoclonal antibody was derived by immunizing mice with Hodgkins lymphoma cells. This is named after the city of origin, Kiel which is located in Germany. Ki-67 is predominantly present in the nuclear matrix and is expressed in all active phases of the cell cycle such as G1, S, G2 and M phase. It is absent in the G0 phase of the cell cycle, which are in the resting phase, and undetectable during the DNA repair process. It is particularly detected in the nucleus during the interphase stage of the cell division. Ki67 is involved in the regulation and maintenance of cell division. Expression of this nuclear antigen by a cell denotes that particular cell is the active phase of the cell cycle.

Ki-67 is observed in proliferative endometrium, postmenopausal endometrium and in complex hyperplasia. Secretory endometrium showed decreased expression of both the markers. It is also very helpful in distinguishing endometroid endometrial carcinoma from primary clear cell or serous carcinomas. MIB-1 is the antibody against different epitope of the similar proliferating antigen.

Materials and Method

This prospective, cross-sectional study, was done in the Department of Pathology, Sree Balaji Medical College and Hospital, Chromepet, Chennai, from March 2017 to June 2018. The study material included 50 endometrial biopsy samples and endometrium from the TAH & BSO specimens received by the Department of Pathology. Of the 50 samples, 30 samples were endometrial hyperplasia, and 20 samples were normal endometrial tissue.

Immunohistochemistry was performed on all the samples using Ki - 67 as a primary antigen (Dako Laboratories) and poly HRP as a secondary kit. Antigen retrieval was done by using microwave in Tris-EDTA buffer at pH 9. Staining was performed with DAB as chromogen.

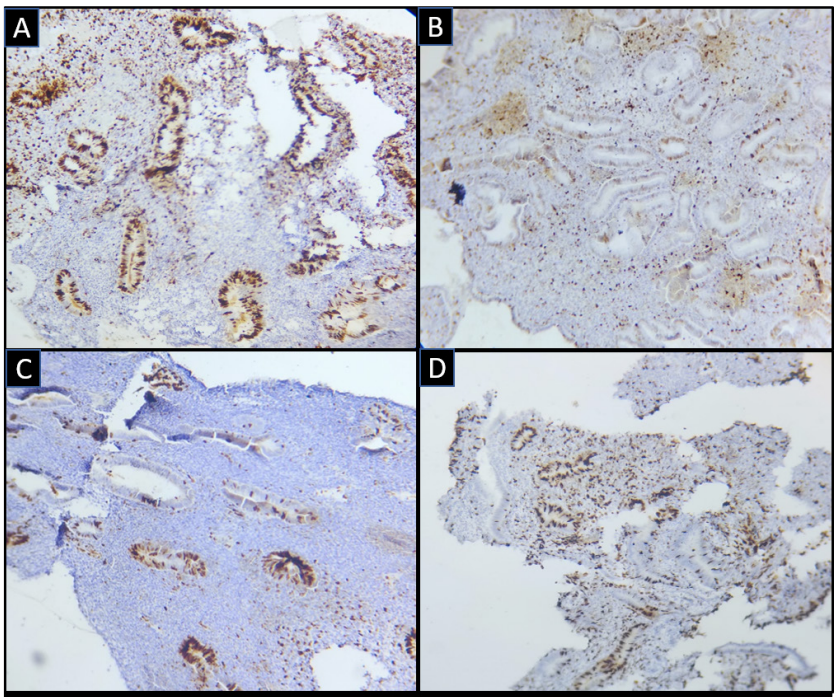
The positive expression of Ki-67 was defined as presence of brown-yellow granules in cell nuclei or in both cell nuclei and cytomembrane. A section from tonsil was used as control for Ki – 67 expression.

Since the intensity was found to be uniform in all the cells, only positivity is calculated. The positive nuclei were counted in 100 epithelial cells and repeated

in 10 HPFs, and the total number of positive cells was expressed as a percentage of 1000. Then they are graded as follows based on their positivity:

1 - 25 % - Grade 1

26 - 50 % - Grade 2



51 - 75 % - Grade 3

76 to 100 % - Grade 4.

Findings

S. No.	Histologic Group	n*	Ki – 67 Positivity Grade				Negative	Mean %**
			Grade 1	Grade 2	Grade 3	Grade 4		
1	Proliferative Endometrium	10	1	9	-	-	-	29.80
2	Secretory Endometrium	10	10	-	-	-	-	3.6
3	Hyperplasia without atypia	15	8	6	1	-	-	25.53
4	Atypical Hyperplasia	15	6	7	2	-	-	32.4

The mean percentage of Ki – 67 positive cells was the highest in the atypical hyperplasia with 32.4 %, followed by the proliferative endometrium group – 29.80 %, 25.53 % in hyperplasia without atypia group and a minimal 3.6 % in the secretory endometrial samples.

(A) PROLIFERATIVE ENDOMETRIUM (Ki - 67, 100 X MAGNIFICATION) GLANDS SHOWING HIGHER GRADE OF NUCLEAR POSITIVITY IN THIS FIELD (B) SECRETORY ENDOMETRIUM (Ki – 67, 100X MAGNIFICATION) ONLY FEW CELLS IN THE GLANDS ARE NUCLER POSITIVE FOR Ki – 67 (C) HYPERPLASIA WITHOUT ATYPIA (Ki - 67 400X MAGNIFICATION), MORE THAN 50 % OF GLANDULAR EPITHELIUM SHOWS NUCLEAR POSITIVITY FOR Ki - 67 IN THIS FIELD (D) ATYPICAL HYPERPLASIA (Ki – 67, 100X AGNIFICATION), ENDOMETRIAL GLANDS SHOWING < 50 % NUCLEAR POSITIVITY FOR Ki – 67 IN THIS FIELD

Discussion

The proliferative activity was high in proliferative endometrium with an average of 29.80% and lowest in secretory endometrium with a mean percentage of 3.6 %.

G. T. Gurda[2] et al analysed 11 cases of proliferative endometrium and 19 cases of secretory endometrium for Ki – 67 expression and in their study, 56 % ± 22 % for PE and 2.6 % ± 3.8 % for SE.

In the study by Morsi[3] et al, the Ki – 67 expression in PE was 29.7 % and in SE, it was 2.5 %. Morsi et al included 18 cases of proliferative endometrium and 19 cases of secretory endometrium in his study.

A study by Helena Mertens[4] et al in 2002 analysing expression of both Bcl - 2 and Ki – 67 in 30 cyclical endometrial samples also showed a similar pattern of increased Ki – 67 expression in PE and decreased in SE.

Similar pattern of Ki – 67 expression in the glandular epithelium was observed in the studies by Risberg[5] et al and Vaskivou[6] et al.

Ki – 67 was found positive in all the 30 cases of hyperplasia with a 25.53 % and 32.4 % as mean percentage of positivity in hyperplasia without atypia and atypical hyperplasia respectively. The positivity varied from 7 % to 54 % in non-atypical hyperplasia group and 18 % to 64 % in atypical hyperplasia group.

The expression of the Ki – 67 is the highest in atypical hyperplasia (32.4 %), followed by, proliferative endometrium (29.80 %), hyperplasia without atypia (25.53%) and is lowest in secretory endometrium (3.6 %).

Morsi[3] et al and Nunobiki[7] et al in their studies observed stepwise increased expression of Ki – 67 from normal, simple or complex hyperplasia with or without atypia to endometrial adenocarcinoma.

Morsi[3] et al studied 107 cases which included 18 cases of proliferative endometrium, 19 secretory endometrium, 15 postmenopausal endometrium, 6 cases of disordered proliferative endometrium, 12 cases of simple hyperplasia, 8 complex hyperplasia, and 29 endometrial adenocarcinomas for expression of Bcl – 2, Ki -67 and M 30. In his study, strong reactivity was seen in cases of simple hyperplasia (with a mean percentage of 21.8%), in cases of complex hyperplasia (with a mean percentage of 19.8%), and in cases of disordered proliferative endometria (mean percentage of 19.5%).

Gurda[2] et al analysed 104 cases of endometrial lesions for Ki – 67 and in his study and the mean percentage of Ki – 67 positivity was 0.8% in SEM, 11% in nonatypical hyperplasia, 33% in atypical hyperplasia, and 73% in carcinoma.

Thus, my study values corelates with the above studies.

Conclusion

Ki - 67 being a proliferative marker is expressed more in proliferative phase than in the secretory phase. Ki - 67 expression is increasing from hyperplasia without atypia to atypical hyperplasia. This implies that there is increased proliferative activity when the hyperplasia progresses towards atypia. It is also proved to further increase in transformation towardsendometroid carcinoma. Hence Ki - 67 can be used as a marker to determine the progression of endometrial hyperplasia to carcinoma.

KI-67 Expression in Scc of Upper Respiratory Tract

K.Anbukkarasi[1], Hemalatha Ganapathy[2]

*[1]Assistant Professor** , [2] Professor and Head, Department of Pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai*

Abstract

The nasal cavity, paranasal sinuses, pharynx and larynx though in continuity form a complex system of upper respiratory tract, this region is endowed with a variety of elements such as epithelial, glandular, lymphoid, cartilage,

and bone and is also exposed to a variety of infections, tumour like and true neoplastic conditions. Squamous cell carcinoma (SCC) of the upper respiratory tract ranks as the sixth leading cause of cancer worldwide (1). This represents about 4% of all cancers.In this study ki-67 expression in various histological grades of SCC of upper respiratory tract was done which showed ki 67 index was increasing with decreasing differentiation of the tuour.

Key words: *SCC, Ki-67,Upper respiratory tract*

Introduction

The nasal cavity, paranasal sinuses, pharynx and larynx though in continuity form a complex system of upperrespiratory tract, this region is endowed with a variety ofelements such as epithelial, glandular, lymphoid, cartilage,

and bone and is also exposed to a variety of infections,tumour like and true neoplastic conditions. Squamous cell carcinoma (SCC) of the upper respiratory tract ranks as the sixth leading cause of cancer worldwide(1). This represents about 4% of all cancers(2).This includes a heterogenous group of neoplasms arisingfrom regions like oral cavity, nasopharynx, oropharynx,hypopharynx and larynx, excluding the neoplasms arising from salivary glands(3) . Among the oral and upper respiratory tract malignancies, squamous cell carcinoma comprises more than 90%.

**author designation updated in 2024

Aims and Objectives

1.To stuyage,sex and site wise distribution of lesions of upper respiratory tract

2.To study ki 67 expression in various histological grades of SCC of upper respiratory tract

Materials and Method

This study is a prospective study on ki 67 expression in SCC of the upper respiratory tract, conducted in the Department of Pathology, SreeBalajiMedical College Hospital and Research Centre, Chennai during the period, October 2016 to September 2018. Squamous cell carcinomas reported in this

region irrespective of the age, sex and the procedure done were included for the study.

Observation and Results

Among the 31 cases of upper respiratory tract squamous cell carcinoma, the commonest occurrence of SCC was seen in age group above 60 years (Table 1)

Table 1: Site Wise Distribution of SCC

Site	Frequency	Percentage (%)
Nasal Cavity	0	0
Nasopharynx	05	16.1
Hypopharynx	15	48.4
Larynx	11	35.5
Total	31	100

Table 2: Histological Grading of Upper Respiratory Tract SCC

Grade	Frequency	Percentage (%)
Well Differentiated	07	22.6
Moderately Differentiated	20	64.5
Poorly Differentiated	04	12.9
Total	31	100

Among 31 cases of upper respiratory tract SCC, 20 cases (64.5%) were reported as moderately differentiated, 07cases (22.6) were well differentiated and 04 cases (12.9) were poorly differentiated grade SCC (Table 3, Chart 2).

Results of Ki 67 expression

All the cases of SCC of upper respiratory tract that included 07 cases of well differentiated grade, 20 cases of moderately differentiated grade and 04 cases of poorly differentiated grade were subjected to Ki 67 proliferative index study.

Positive Ki67 staining was observed as brown granular nuclear staining. Cytoplasmic staining is considered negative. To get the Ki67 index, most positive area of tumour was selected avoiding foci of inflammation. The number of positive nuclei was counted in 1000 tumour cells in a high power magnification (x400 magnification). The histological grade of the tumour was compared with the Ki 67 proliferative index of the tumour.

Table 3: Ki 67 Expression in Different Grades of SCC

Grade	No. Of Cases	Ki 67 Expression In Percentage (RANGE)
Well Differentiated	07	10-30%
Moderately Differentiated	20	31-50%
Poorly Differentiated	04	>51%

Well differentiated carcinomas showed Ki 67 expression in the range of 10 -30%, the lowest percentage expressed by a well differentiated carcinoma was 12% by SCC of pyriform fossa. Predominant group was moderately differentiated which showed a range of 31- 50%. Poorly differentiated carcinoma showed Ki 67 % above 51%.The highest value expressed was 65% by poorly differentiated SCC of tonsil.

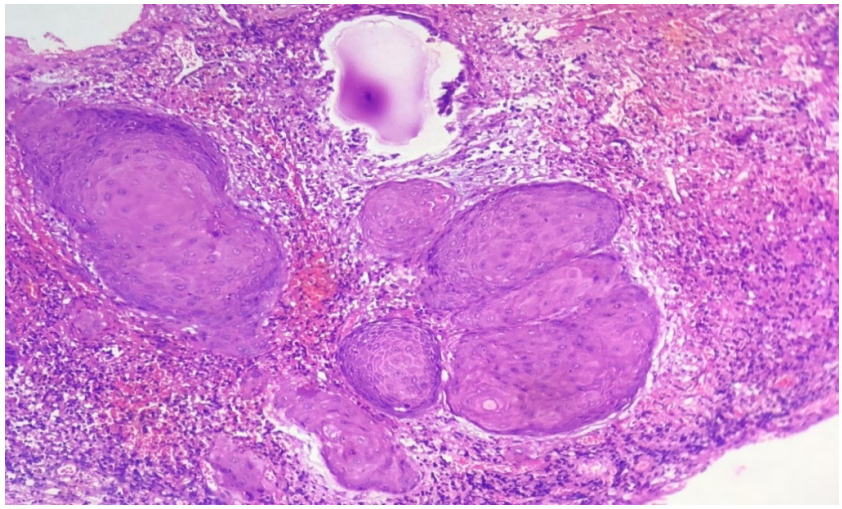

Fig1:H&E Picture of Well Differentiated SCC 10x Magnification

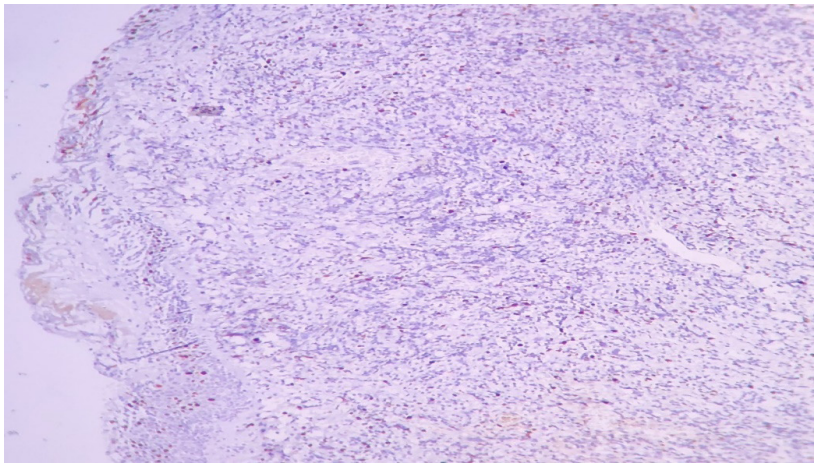

Fig2: Ki 67 expression of Well Differentiated SCC 10x magnification

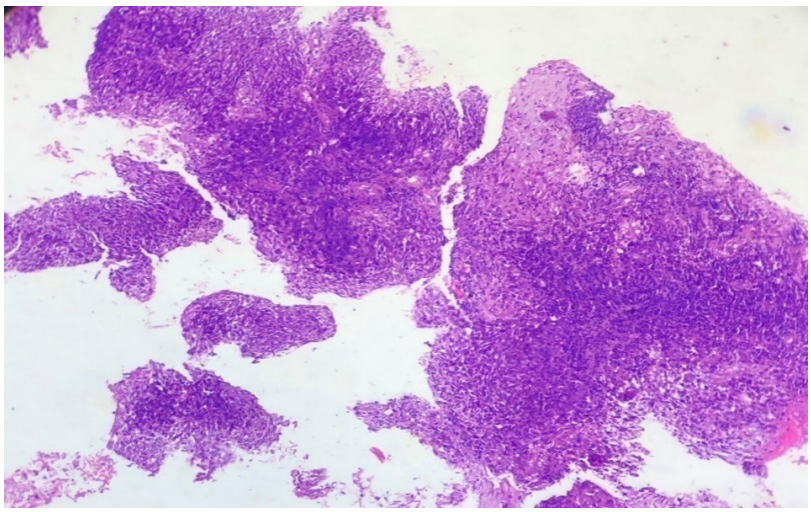

Fig 3: H&E Picture of Moderately Differentiated SCC 10x magnification

Discussion

Of the malignant lesions SCC was the most common tumour accounting for 81.7% of malignant lesions in the study period. In this study, the age group of upper respiratory tract SCC ranged from fourth decade to eighth decade. The highest incidence of SCC was observed between sixth and seventh decade in 18 cases (58.06%). This was followed by seventh and eighth decade in 07 cases (22.6%). This value was in concordance with the study by **Kajanti M et al (4)**who showed the mean age of 60 years.In this study, out of 31 cases, the maximum occurrence of tumour was noted in males, 26 cases (83.9%). In females, 05 cases (16.1%) were reported. This was in concordance with the study conducted by **American Cancer Society** which also showed male predominance in upper respiratory tract SCC.

In this study, it was observed that the site of distribution was maximum in hypopharynx. A total of 15 cases (48.4%) were reported in hypopharynx, followed by 11cases (35.5%) in larynx and nasopharynx 05 cases (16.1%).

This distribution was compared with the study conducted by **Silver C E et al (5)**In their study, the distribution was noted as glottis 26%, hypopharynx 10%, supraglottis 35% and nasopharynx 2% of cases.

On observing the data analysed in the study period, it was also found that the incidence of pyriform sinus SCC was more common in males compared to females. Totally 15 cases of SCC were noted from pyriform sinus region and it

was common in males compared to females. A similar male predominance was observed with pyriform sinus SCC in the study conducted by **Driscoll W G et al(6)**

In the current study, out of 31 cases maximum cases were found to be moderately differentiated grade amounting to 64.5%, followed by well differentiated grade (22.6%) and poorly differentiated grade (12.9%). This varied when compared to a study conducted by**HulyaSimsek et al**[7]where maximum upper respiratory tract malignancy was reported as poorly differentiated SCC (35.9%) followed by moderately differentiated SCC (33.7%) (Table-20).

Immunohistochemical Study of SCC Of URT:

Ki 67 study of SCC showed that proliferative index increases with decreasing differentiation of tumour ie well differentiated SCC showed Ki 67 index of < 30 % and poorly differentiated showed Ki 67 index > 50 %.This was in concordance with the study conducted by **Liu et al**[8]. **Masafumioya et al**[9] studied Ki 67 proliferative index in metastasising intramucosal gastric carcinomas which showed mean value of > 50 % in poorly differentiated carcinoma with lymph node invasion and < 20 % in well differentiated carcinoma**. Liu et al**[8] suggested that Ki67 expression was significantly higher in tumors with lymph node metastases and correlatedwith pathological stage.

Conclusion

In this study, the Ki 67 proliferative index was high in poorly differentiated SCC, which shows that Ki 67 percentage increases by the decreasing differentiation of the tumour and hence it could be used to assess the accurate histological grade of the tumour in conjunction with the routine H & E slides. It could also be used as a prognostic factor as like in breast, prostate etc. Ki 67 proliferative index study of the tumour helps in better understanding of the tumour behaviour so as to provide appropriate treatment and thereby increasing the survival rate of the patient.

Prosepective Study of Conchal Cartilage and Temporalis Graft in Myringoplasty

M.K. Rajasekar[1], Sridharanarayanan. D[2]

[1]Head and Professor, [2]Professor, Department of ENT, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstarct

To compare, access and analyze the results of graft uptake using Conchal and Temporalis graft in patients undergoing myringoplasty. In our study there are 50 patients in which 25 patients underwent myringoplasty using Conchal cartilage as Group A and 25 patients underwent surgery using temporalis fascia as Group B. The success of this study is assessed by graft uptake between 12-24 weeks.

Keywords *– Myringoplasty, Cartilage*

Introduction

Chronic suppurative otitis media is the most common otorhinolaryngology problems and one of the major health problems around the world. Chronic otitis media (COM) is defined as chronic inflammation of mucoperiosteal lining of part or whole of the middle ear cleft. It has been recognized since prehistoric times. It is classified into two types, mucosal and squamous, of which mucosal type is characterized by intermittent mucoid or mucopurulent discharge through a perforated tympanic membrane. It is the major public health problem in children and adults1. Incidence of Chronic Otitis Media is higher in developing countries because of poor socioeconomic standards, poor nutrition. Prevalence of chronic suppurative otitis media in developing countries is around 72 cases per 1000 inhabitants and in the world is over 20 million. In India, prevalence of chronic suppurative otitis media is approximately 2%.1 From seventeenth to nineteenth century several attempts at closing tympanic membrane perforations were made using prosthetic materials like paper patch and cauterizing agents. Surgical repair of tympanic membrane was first attempted by Banzer (1640) with pig'sbladder1. In1878 Berthold devised the term myringoplasty 2, 3 . In 1952, Wullstein formally announced 3, 4 a technique of closing perforation. That time he used split thickness skin graft 3, 4.After Wullstein 5 and Zollner 6introduced tympanoplasty in early 1950s, overlay graft was being used in all surgeries. In our study surgery done under endoscope using underlay technique. Grafts used are temporalis graft and Conchal cartilage. Temporalis fascia shows certain complication like retraction, cholesteatoma formation and graft lateralization. Cartilage shows better results than fascia with advantage of higher mechical stability.

Method

The entire study group underwent myringoplasty by endoscopic method. The technique used is underlay by using either temporalis graft as Group A or Conchal graft as Group B. patients selected were among age group of 20-40 years without any complication. Detailed history and clinical examination were taken for all patients. Routine investigations were done for pre anaesthetic fitness. Informed consent was taken for the study. Under aseptic precaution, preanaesthetic medication was given. In Group A Temporalis fascia is obtained from incision over temporal region graft obtained and suturing done. In Group B Conchal cartilage is obtained by incision on the Conchal region of about 12mm and suturing done with 3-0 ethilon. Graft harvested was tucked under the remnant tympanic membrane as an underlay technique and complete hemostasis is achieved. Gelfoam soaked

with ciprofloxacin is placed in the External auditory canal. Mastoid dressing is done. Post operative period is uneventful. IV antibiotics, analagesic, anatacids were given. Skin suture is removed after 7th Post operative day. Patient is followed for the period of 3-6 months. Graft uptake status is evaluated. Residual perforation or graft lateralization is taken as failure.

Findings

Age:

Age in Years	No of Patients	Percentage
20-30	28/30	93%
31-40	11/15	73.33%
41-50	3/5	60%

Graft uptake in relation to age group in which most of the age group is between 20-30 years and with success rate of 93% and failure rate of about 7%. The mean age is 24.87%.

Preoperative Hearing Loss:

Preoperative A-B gap	Temporalis fascia	Conchal cartilage	Total	%
20-30	2	3	5	10
31-40	18	20	38	76
41-50	5	2	7	14

Majority of patients shows mild to moderate hearing loss. 10% of them had air-bone gap upto 20db.76% of them had air- bone gap 31-40db.14% of them had air-bone gap 41-50db.

Postoperative Hearing Loss:

Postoperative A-B Gap	Temporalis Fascia	Conchal Cartilage	Total	%
<20	19	14	33	66
21-30	5	9	14	28
31-40	1	2	3	6

In the postoperative hearing analysis,66% of the patients showed air-bone gap upto 20Db.20% of the patients showed air-bone gap in range of 21-30db..6% of the patients showed air-bone gap in range of 31-40db..19 patients operated with temporalis fascia showed air-bone gap <20 db.14 patients operated with Conchal cartilage showed air-bone gap <20 db.

Hearing Improvement:

Hearing at 3 months, 35 out of 40 patients showed improvement in hearing (77.5%). Out of these patients, 24 out of 25 patients were operated using temporalis fascia showed improvement in hearing i.e. (96%) and 22 out of 25 patients were operated using Conchal cartilage showed improvement in hearing i.e. (88%).

Mean Change In Hearing Levels In Db	Temporalis Fascia Group A	Conchal Cartilage Group B	Total	Percentage
No Change Or Worsen	3	5	8	16%
1-15	18	17	35	70%
16-30	4	3	7	14%
>30	3	5	8	16%

Graft Success Rate:

Type of Graft	Total No of Cases	Uptake	Failure	%
Temporalis Graft	25	24	1	96
Conchal Cartilage	25	22	3	88

Out of 50 patients 25 underwent temporalis fascia shows success rate of about 96%. Meanwhile 25 patients underwent Conchal cartilage shows 88% success rate.

Disscusion

Prospective study of about 50 patients between then age group 20-50 years, who admitted in ENT opd. This entire group of patients suffered from Chronic suppurative otitis media tubotympanic type. Most of the cases belong to small to moderate hearing loss. All patients underwent myringoplasty 25 patients used temporalis fascia and 25 patients used Conchal cartilage. Postoperatively cases were followed for 3 months.

There are materials for closure of TM perforation like skin, perichondrium, vein, temporalis cartilage, Conchal cartilage, dura. Advantage of temporalis fascia:

1. Easily available.
2. Adequate amount of graft is obtained.
3. Thickness similar to tympanic membrane.
4. Basal metabolic rate is low.

Disadvantage of temporalis fascia:

1. Then oxygen and the metabolic requirement increases and the graft may fail, if it is not denuded properly of the muscles,
2. Adequate graft maybe difficult to obtain in revision cases.
3. Graft retraction.
4. Graft medialization.

Cartilage graft is characterized by its resistance to resorption, retraction and negative pressure in middle ear.[9,10].

Advantages of tragal cartilage perichondrium

(1) Easily available in operative field.

(2) Easy to shaped.

(3) No extra cost.

(4) Large graft can be harvested from tragus and concha.

(5) It has its own blood supply.

Graft uptake in relation to age group in which most of the age group is between 20-30 years and with success rate of 93% and failure rate of about 7%. The mean age is 24.87%.Hearing improvement in different type of graft used temporalis fascia shows 96% improvement and Conchal cartilage shows 88% improvement after 3 months post operatively. Palva et al (1987) in their study of 165 cases of myringoplasty, showed 96% improvement. Gibb AG, Chang SK(1982) in their study showed 91.4% for dry temporalis fascia and 87.9% for Conchal cartilage. Majority of patients shows mild to moderate hearing loss. 10% of them had air-bone gap upto 20db.76% of them had air- bone gap 31-40db.14% of them had air-bone gap 41-50db. In the postoperative

hearing analysis,66% of the patients showed air-bone gap upto 20db.20% of the patients showed air-bone gap in range of 21-30db.6% of the patients showed air-bone gap in range of 31-40db.19 patients operated with temporalis fascia showed air-bone gap <20 db.14 patients operated with Conchal cartilage showed air-bone gap <20 db. Same results given by rakesh who shows the about 80% cases operated with temporalis fascia showed hearing improvement, while similar percentage (75%) of cases that were operated using Conchal cartilage.

Jyoti P. Dabhalkar (2007)[6]reported hearing result in total 50 patients, temporalis fascia group improved in76% while tragal perichondrium group achieved 75% hearing gain. This study also compares well with Sunita Chhapola, Inita Matta (2011)[8] whose postoperative hearing assessed after 6 months of surgery, with temporalis fascia graft showed air bone gap of less than 10dB in 82% of patients and more than 10dB in 18% patients, air bone gap closure with tragal perichondrium was less than 10 dB in 78% patients and more than 10dB in 22% of patients. The patient population attending our hospital was also from low socioeconomic status, many had poor personal hygiene and poor nutritional status[7]. These were probably some of the factors which contribute to graft rejection.

Conclusion

Myringoplasty is the most effective method for control of Chronic suppurative disease and hearing improvement. Both Conchal cartilage and temporalis fascia are excellent graft materials for closure of perforation for graft uptake and hearing uptake. But graft uptake is slightly better in temporalis graft placement. Temporalis graft shows better hearing improvement. Conchal cartilage appears to be a better alternative to temporalis fascia as a graft. Temporalis fascia is the ideal graft material.

To Estimate and Compare Serumlipoprotein (a)Value in Hypothyroid Patients and Healthy Control

Leishangthem Rina[1], B. Shanthi[2], V.S. Kalaiselvi[3]

[1]Post Graduate, [2]Professor and Head, [3]Professor, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

This investigation is taken up to gauge and look at the degree of serumLp(a) in hypothyroid patients and in solid controls.A aggregate of 50hypothyroid patients inside matured gathering 20-60 years and aggregate of 50 sound controls inside 20-60 years were joined up with the examination subsequent to taking composed assent. Thyroid profile andLp(a) were estimated by CLIA and resistant turbidemetric technique individually. Information gathered was dissected utilizing Stata variant 14.1 programming. Result demonstrates an expanded degree of Lp(a) among hypothyroid patients when contrasted with solid controls.

Key Words: *Hypothyroid, Lipoprotein (a), healthy controls*

Introduction

Lipoprotein (an) is LDL like molecule shaped by the relationship of exceptionally polymorphic glycosylated apolipoprotein (a) through a disulphide bond with apolipoprotein B100[1] the exemplary protein moiety of LDL. [2]It was found by Kare Berg in 1963 [3]Genetic variety of the Lp(a) qualities is the principle determinant of Lp(a) serum levels yet non hereditary elements could likewise influence its focus. A few examinations have demonstrated the impact of eating routine, medications and hormones on Lp(a) levels. A few creators think about Lp (an) as a free hazard factor for coronary and cerebrum corridor atherosclerosis in Caucasian, Chinese, African and Indian populace. Lp(a) focuses (announced as ≥300 mg/L or ≥30 mg/dL) and the danger of enduring coronary occasions, fringe vein sickness, cerebrovascular malady, and the early advancement of atherosclerosis in kids and adolescents [4,5] .In a nutshell it is said that the atherogenic impact of Lp(a) is because of the cholesterol conveyance to the site of damage or to the endothelial cells, obstructing of plasmin age, endothelial cell tweak, smooth muscle cell expansion and angiogenesis[6].

Hypothyroidism is related with different metabolic variations from the norm, because of the impacts of thyroid hormones on about all major metabolic pathways. It causes unhinging of wide scope of parameters in lipid profile, hemodynamic changes, endothelial brokenness, coagulation unsettling influences, hormonal and metabolic changes, prompting different quantitative and additionally subjective changes of triglycerides, phospholipids, cholesterol, and lipoproteins including LDL-Cholesterol, HDL-Cholesterol, lipoprotein (an), apolipoprotein A1, and apolipoprotein B. The present investigation was intended to decide the Lp(a) levels among the hypothyroid patient and sound control and to look at the equivalent.

Materials and Method

The example size of this examination incorporates 100 subjects including 50 hypothyroid patients and 50 solid controlreporting to Medicine OPD, Sree Balaji Medical College and Hospital, Chromepet, were joined up with the investigation.

Subsequent to acquiring educated assent from patient, a detail history was taken trailed by research center examination as under:

Lp(a)							
	Test	23.120	1.714	12.118	19.720	26.520	10.24**
	Control	4.780	0.522	3.691	3.744	5.816	

Table 2: Lp (a) levels in test samples:

Lp(a) level category	Freq.	Percent
<=15	18	36
15 - 30	19	38
30 - 45	11	22
45 - 60	2	4
Total	50	100

Table 3: Lp(a) levels in control samples:

Lp(a) level category	Freq.	Percent
<=15	50	100
Total	50	100

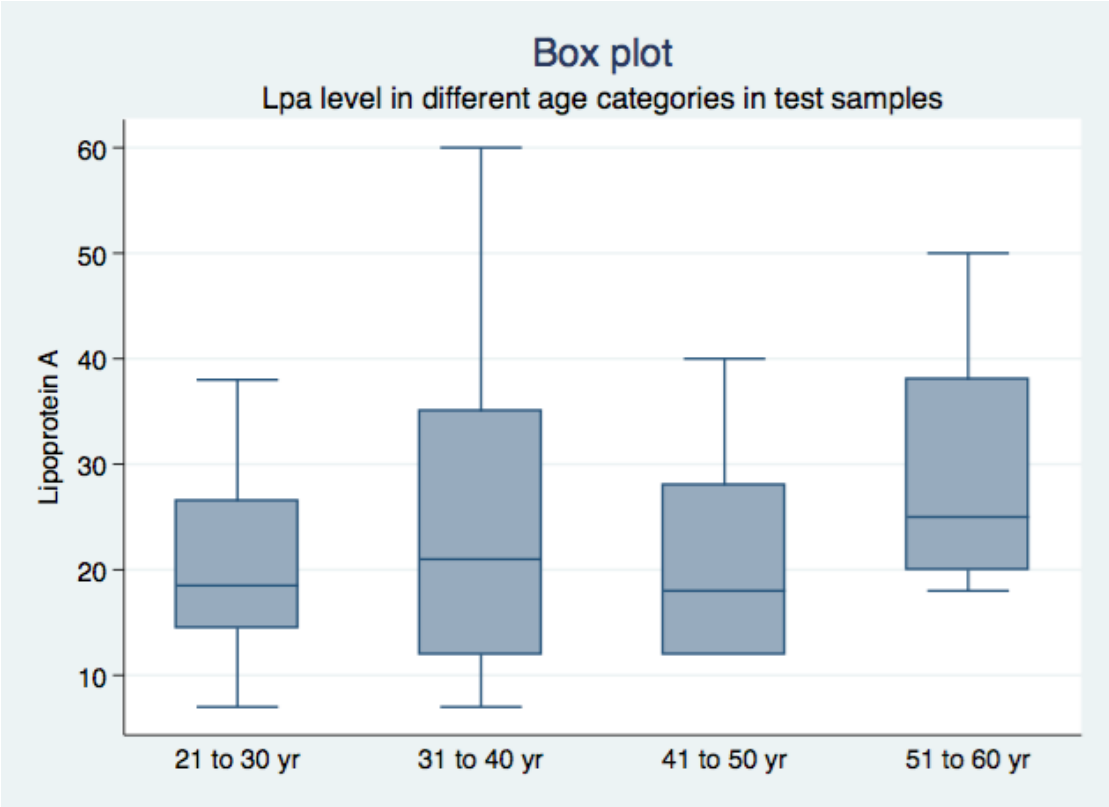

Figure 1: Box plot showing median, quartiles, and whiskers of Lp (a) levels in different age groups in test samples.

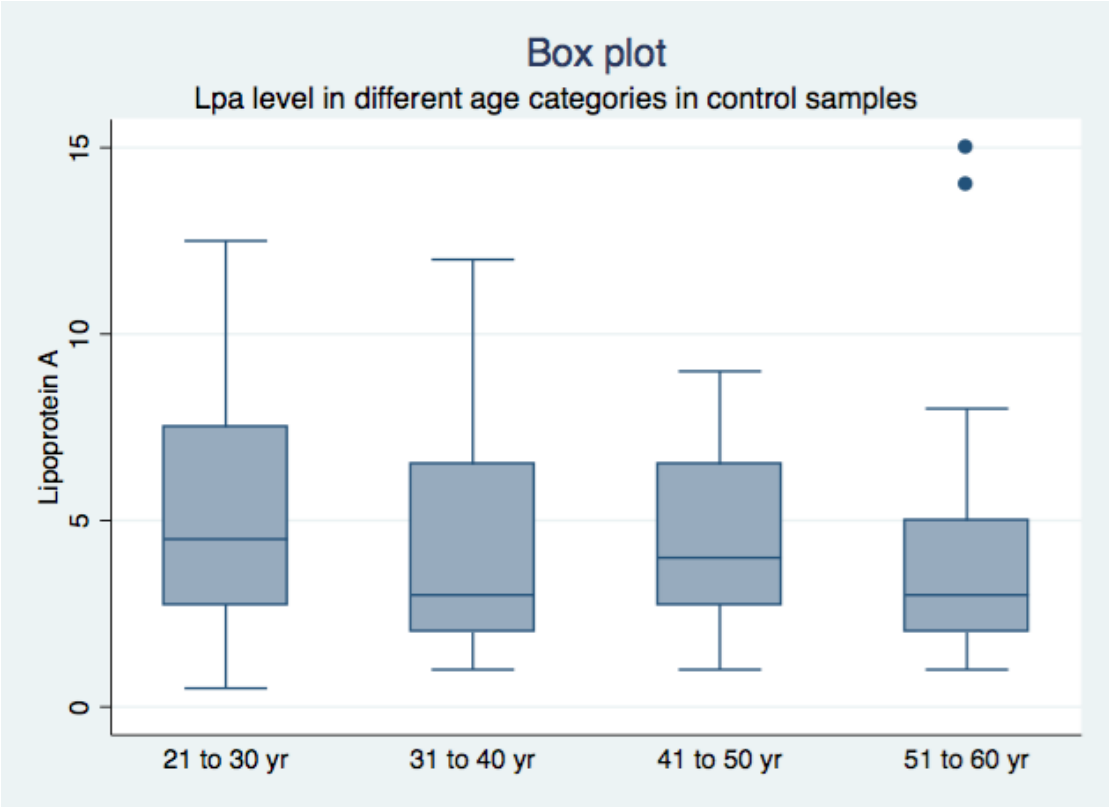

Figure 2: Box plot showing median, quartiles, and whiskers of Lp (a) levels in different age groups in control samples.

Discussion

This investigation was done on known instances of hypothyroidism, andhealthy people taken as controls. Between the investigation gathering, serum Lp(a) were fundamentally expanded in hypothyroid patients when contrasted with controls. Serum Lp(a) levels among hypothyroid patients (23.120±12.118) were altogether higher than control subjects (4.780±3.691) with t-esteem = 10.2375 ($p < 0.001$). It was additionally seen that serum Lp(a) levels were altogether expanded in all age gatherings and in the two sexual orientations of hypothyroid patients when contrasted with control, which recommended the impact of thyroid hormones on Lp(a) metabolism.The potential relationship among Lp(a) and thyroid capacity status in the overall public may be viewed as a significant perspective for cardiovascular hazard expectation and counteractive action. This theory was bolstered by De Bruin et al [7] who showed a practically ideal relationship between's free thyroxine file and Lp(a).

Cristina Hernandez et.al have expressed that serum Lp(a) level is reliant more on the pace of blend than on its catabolic rate[8]

In hypothyroid state, there is an expansion of LDL-C and apo B levels, which might be utilized in the Lp(a) synthesis[9] and furthermore there is diminished pace of catabolism of LDL. Since Lp(a) is comprised by apo(a) and LDL, decline in the catabolism of LDL will be normally considered the degree of Lp(a). Additionally, it has been investigated that Lp(a) is catabolized by a similar receptor by which LDL is catabolized. Henceforth Lp(a) having a similar receptor as LDL for its catabolism will be normally expanded in light of the fact that it has been found by Cristina Hernandez et al.,[8] that LDL has a higher fondness for the receptor than Lp(a). Henceforth when LDL level is expanded in Hypothyroidism it even more will contend with Lp(a) for the receptor.

Conclusion

The consequences of this investigation give abundant proof that the degrees of Serum Lp(a) are expanded in hypothyroid patients when contrasted with solid controls. As a result of this examination, a prescribed screening can be encouraged to hypothyroid patients to gauge Lp(a) level which may aid early treatment and keep them from creating cardiovascular maladies.

To Evaluate the Role of MRV in Normal Variants of Cerebral Venous Sinuses

Revathy Pradeep[1], M. Prabakaran[2], I. Venkataraman[3]

[1]Post Graduate Student, [2]Professor and Head, [3] Professor, Department of Radio Diagnosis, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

MR Venography is a generally utilized non obtrusive imaging procedure to analyze cerebral dural sinus thrombosis and other intracranial venous normalities. There are numerous ordinary variations and antiques that happen during MRV study reenacting filling surrenders that impersonates CVST causing analytic traps. Anatomical variations incorporate hypoplastic sinuses, atretic sinuses, deviated venous sinuses and atypical veins. The point of the examination is to describe the ordinary variations of cerebral dural venous sinuses on MR Venogram.

Keywords – *MRV, Hypoplastic Sinuses.*

Introduction

The variations and antiques on MRV happen regularly, hence a steady imaging example ought to be pursued[1]. There areas now and again correspond with locales where CVST is likewise normal and may cause indicative troubles. Transverse sinus stream holes are a typical event in MRV and discovered all the more much of the time on non-prevailing exchange sinus. These variations and curios can be potential traps in the MRV analysis of CVST particularly where there is no supporting imaging highlights, for example, mind infarcts. It is significant for the radiologists to know f pertinent MRI attributes to maintain a strategic distance from distortion of these variations and antiquities as CVST[2]. Source picture ought to be painstakingly considered alongside the MRV so as to precisely assess the variations of cerebral dural sinus and this will diminish the potential analytic mistakes.

The two procedures used to picture the venous life systems in MR Venography are time-off – light (TOF) and stage differentiate (PC) methods. TOF relies upon the excitation of blood in one cut of the body and identifying it in another. It separates moving blood from the stationary tissues. The entrance of the energized blood into an imaged cut relies upon the T1, speed and bearing of the stream. Stage differentiation relies upon the stage change of moving protons in the blood. The information from moving protons is upgraded by subtracting information gained twice utilizing positive and negative angles.

Materials and Method

An imminent investigation of 100 cases was performed at our division of radio conclusion. Patients with known CVST were exposed to MRI by utilizing 1.5 T MRI (Hitachi Aperto) therapeutic framework[3]. The age gathering of the patient ranges between 11 – 70 years. Mean age of the patient was taken as 32.3 years. Patients with known instances of CVST and clinically associated cases with intracranial vascular injuries, who were alluded for MRI mind with MR Venography.

Multi-successive examination in coronal, sagittal and hub areas were taken. Patient experienced MRV which included utilization of technique/grouping 2D TOF. Intracranial venous framework were considered after standared remaking were readied utilizing most extreme force projection.

In our examination the cut thickness for 2DTOF strategy was 3mm with far off factor 33%, 2D TOF

procedure was advanced by picking a sagittal cut direction titled somewhat towards coronal and hub bearings. Assessment time for 2DTOF in our examination was 7 minutes 20 seconds. As a rule, it is alluring to set the cut thickness as little as would be prudent, regularly on request of 1.0 to 1.5mm to defeat restriction of 2DTOF strategy yet that would have expanded the hour of sweep to 10mm and in this manner was not embraced in this examination[5]. The presence of different intracranial venous structure was surveyed in setting of their sign power, consistency and degree of measurement of the structures unmistakable on three distinctive MRV strategies. In like manner, values were relegated to every one of them in various strategies.

Findings

In our study, 72% of our patients had hypoplastic left transverse sinuses involved followed by superior sagittal sinuses (36%). Right transverse sinus were involved in 34%.

Table 1: Distribution of patient with normal cerebral venous sinus variants

Sinuses Involved	No.of Cases With Hypoplastic Venous Sinus	Percentage
Sss	36	36.0%
Lts	72	72.0%
Rts	34	34.0%
Lss	28	28.0%
Rss	15	15.0%

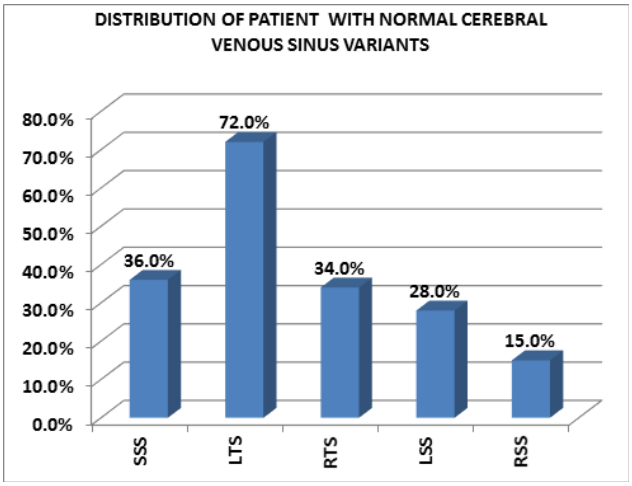

Chart 1: Bar diagram showing distribution of patients with normal cerebral venous sinus variants

Arachnoid granulations most much of the time happen in parasagittal area with unrivaled sagittal sinus and transverse sinus being the most well-known area[6]. Granulation regularly happens beside the passage of shallow depleting cortical vein into a sinus. So it imitates a thrombus in the cerebral venous framework which is misdiagnosed as thrombus. In our examination we discovered 12 cases having arachnoid granulation impersonating thrombus.

Table 2: Detection of arachnoid granulation mimicking venous sinus thrombosis (n=100)

	Detection on MRV
Arachnoid Granulation Mimicking Thrombosis	12
Occlusion of Venous Sinus by Thrombosis	62

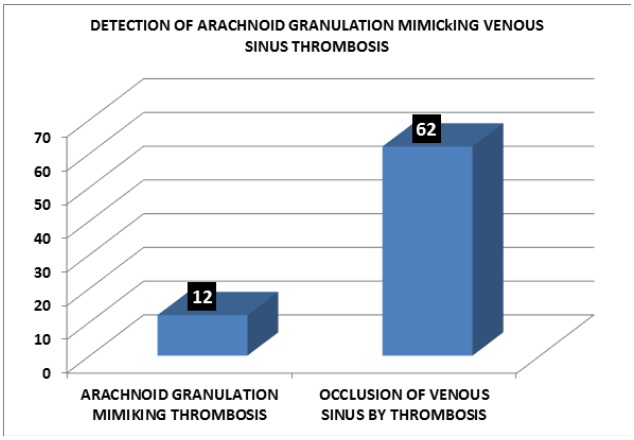

Chart 2: In 12% of cases arachnoid granulation was mimicking the thrombosis. In 62% of cases venous sinuses were occluded by thrombosis

Discussion

Cerebral venous framework is made out of shallow and profound channels. The shallow framework comprises of prevalent and sub-par sagittal sinuses alongside the shallow cortical veins. The profound framework comprises of profound cerebral veins, vein of galen, the straight sinus, the transverse and sigmoid sinuses. The course of action of cortical vein is exceptionally factor.

They can be partitioned into three gatherings, the front sinus, the lateroventral gathering depleting into the

parallel sinus, and mediodorsal gathering depleting into prevalent sagittal sinus[7]. There are numerous anastamotic channels which are similarly factor. The more steady pieces of anastamotic system are the vein of Labbe, which interface the center cerebral vein to horizontal sinus and incredible vein of Trolard, associating the center cerebral veins into the prevalent sagittal sinus.

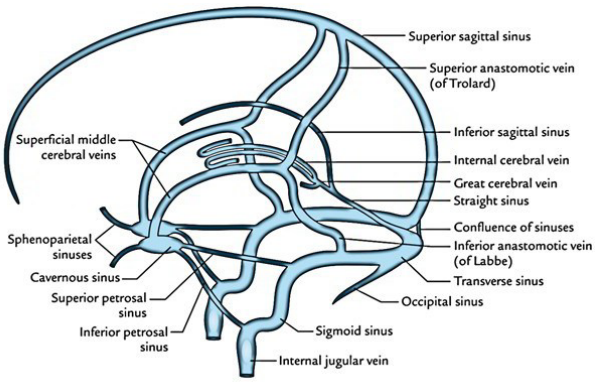

Diagram 1: Shows superficial and deep venous sinuses

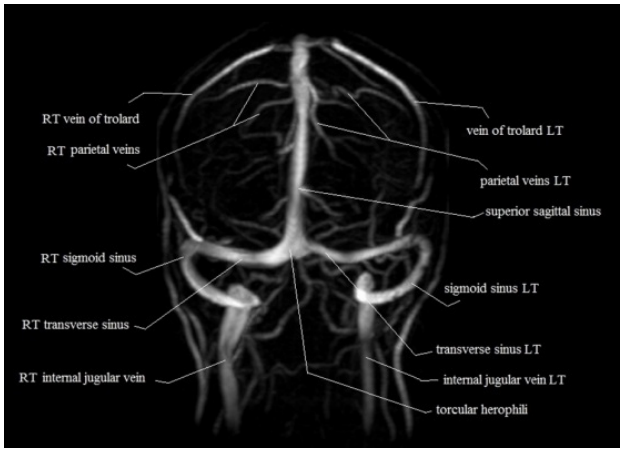

Diagram 2: Radiological anatomy of cerebral venous sinuses

The unrivaled sagittal sinus (SSS) starts at foramen cecum anteriorly and keeps running along the inward surface of calvarium in the mid sagittal plain to the inside occipital projection .The front part is tight and might be totally missing. The SSS channel the shallow surface of

cerebral side of the equator by means of the cortical veins. At the interior occipital bulge, the SSS joins the straight sinus and partitions into the two transverse sinuses running along the side[4]. The conjunction of sinuses at the inward occipital projection is known as the trocula of herophili. The spans of parallel sinuses are frequently hilter kilter with the left transverse sinus being littler (or even missing) than the correct one .The transverse sinuses keep running forward to turn into the sigmoid sinuses which into the inward juglar veins.

There are various anatomic varieties that might be confused as sinus impediment. The profound cerebral veins are a higher priority than shallow veins from the angiographic perspective. Three veins join simply behind the entomb ventricular foramen of monro to frame inner cerebral vein including the choroid vein, septal vein and thalamostriate vein. The choroid vein keeps running from the choroid plexus of the parallel ventricle[7]. The septal vein keeps running from the locale of septum pellucidum in the front horn of parallel ventricle and thalamostriate vein runs anteriorly in the floor of sidelong ventricle in the thalamostriate groove between the thalamus and lentiform core. The purpose of association of these veins is called venous point.

The inner cerebral vein of each side runs posteriorly in the top of the third ventricle and join underneath the splenium of corpus callosum to shape more prominent cerebral vein. The inward cerebral veins, which exist in 2mm in the midline, are the most significant profound veins since they can be utilized to analyze midline move. The cerebral vein of Galen is a short thick vein that passes postero - superiorly behind the splenium of corpus callosum in quadrigeminal storage. It gets the basal veins and back fossa veins and depletes to the foremost finish of straight sinus where it joins with the second rate sagittal sinus.

The Basal Vein of Rosenthal (BVR) starts at the foremost punctured substance by association of front cerebral vein, center cerebral vein and striate vein .The basal vein on each side goes around the midbrain to join incredible cerebral vein. Blood from profound white matter of the cerebral side of the equator and from basal ganglia, is depleted by inner cerebral vein. What's more, the basal vein of Rosenthal, which join to shape the extraordinary vein of Galen that channels into straight sinus. Except for wide variety of basal vein, the profound venous framework is fairly steady when contrasted with shallow venous framework. Consequently their thrombus is anything but difficult to perceive.

Conclusion

Hypoplastic left transverse sinus is the most widely recognized anatomical variety in our examination. Also, MRV is considered as the best methodology in diagnosing anatomical variations. So it is fundamental for the radiologist to be comfortable with their MRV qualities and life structures so they are not misconstrued as Cerebral Venous Sinus Thrombosis.

Ultrasound Mediated Brachial Plexus Block (Supraclavicular)

A.Shanmuga Priya[1], Parri Madhusudhana Rao[2]

[1]Post Graduate, [2]Professor, Department of Anaesthesiology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: Upper limb processes are frequently performed alone or in conjunction with general anesthesia under brachial plexus block. Either method–mistaken; heart stimulator (NS)-guided or mri (US)-guided method can perform the brachial plexus block. But since the last century, the advent of ultrasound has dramatically revolutionized the puncture methods. Direct visualization for distribution regions of medicines is suggested for effective and secure blocking rather than targeting the nerves straight. The purpose of this paper is to evaluate the various ultrasound-guided solutions to the brachial plexus block.

Method: This study was done on 20 patients who fit under inclusion criteria . Written informed consent to be taken from all patients.

Results: Ultrasound guided block had shorter execution time (p = < 0.002), faster onset of sensory block in minutes (p= <0.032), faster onset of motor block (p =< 0.000), lesser number of needle attempts (p = < 0.000).

Conclusions: USG guided brachial plexus block had lesser needle attempts , faster execution time , and faster onset of motor and sensory block and lesser or no complication

Key words: *Brachial plexus block; Ultrasound, heart stimulator, anesthesia*

Introduction

Traditionally, regional blocks were carried out using anatomical sights, stimulation of the nerves. Blind blocks generally producing severe complications that depend exclusively on anatomical landmarks[1-3]. The nerve stimulation method has been recognized as the gold standard for identifying nerves in national blocks over the previous centuries, but it does not guarantee an appropriate nerve block amount. By immediate puncture, it poses a danger of damage to nerve systems.

Ultrasound visualization of anatomical constructions guarantees block security by ideal needle placement of superior performance. The use of ultrasound for nerve blocks was first recorded in 1978 by La Grange and peers who used a Doppler ultrasound fluid stream sensor to perform supraclavicular brachial plexus blocks[4]. The first documented use of immediate sonographic visualization for regional anesthesia was released by Stephan Kapral et al in 1994. However, drastic advancement has been produced in the last ten years.

Materials and Method

This analysis was performed in the orthopaedic surgery theatre, SreeBalaji Medical College and Hospital, Chennai after obtaining institutional ethical committee approval.

Inclusion Criteria

The following criteria were taken for including the patients in this study.

- Elective surgical patients posted for surgery from middle one third of arm, forearm and hand

Corresponding Author
Dr. Parri Madhusudhana Rao,
Professor, Department of Anaesthesiology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai-73.

surgeries.

- ASA Status I , II and III
- Age between 18 and 60 years
- Weight >50 kg

Exclusion Criteria

- Patient refusal
- Coagulopathies
- Local infections / Sepsis
- Pregnancy/lactating women
- Peripheral neuropathy
- Allergy to local anaesthetics

Materials

1. Sterile tray for regional blocks
2. Drugs for the block

- 0.5% bupivacaine
- 2 % plain lignocaine

3. 23G Quinke spinal needle

4. The ultrasound machine which we used for our study was GE LOGIQ e machine

5.Equipments and drugs for resuscitation

Pre Operative Preparation

Patients were evaluated pre-operatively and the patient was described the operation. Informed approval has been acquired in writing. They have been evaluated with special regard to any contraindications[5].

Medication Pre: Tab. 150 mg ranitidine 2 hours prior to surgery with water sips.

Conduct of Anaesthesia: Monitors such as pulse oximeter, non-invasive blood pressure and ECG were linked and basis scores collected at the patient's arrival in the working room. In the opposite side, an intravenous entry was acquired.

Supraclavicular Brachial Plexus Block by the Subclavian Perivascular Technique[3]

Patients were placed with the face bent away from the body to be shielded and adduced by the ipsilateral force. The neck was prepared with povidone iodine solution and draped with sterile towels.

Landmarks:

The essential landmarks to be identified are

- Cricoid cartilage
- Interscalene groove
- Clavicle midpoint
- Subclavian artery

Supraclavicular blocks in the USG group were performed similarly using a 7.5 - 10MHZ ultrasonic scanning head . After sterile draping and local skin infiltration the probe is placed lateral to the larynx visualising the carotid artery and internal jugular vein. Sterile gel is used between the probe and the skin surface. The nerve buildings in the interscalene tube become noticeable as the sample is shifted sideways. The tool is then shifted to a supraclavicular location from the interscalene location. The subclavic artery is visualized and Doppler color is verified. Then the full brachial plexus is visualized close the artery[6].

The 23G Quinke needle is entered by an IN plane approach. The local anaesthetic solution is then injected after careful aspiration and is seen encircling the trunks. If the local anaesthetic does not spread in the right direction the needle can be redirected accordingly.

Evaluation of The Block:

- The following comments were produced:• Monitoring of vital indications; heart rate, non-invasive blood pressure, saturation of nitrogen and sedation rating was assessed every minute for the first 5 minutes and every 5 minutes thereafter until the end of the operation. They were recorded at 0, 1, 2, 5, 10, 15, 30 minutes and every 30 minutes later for statistical reasons.

- The block implementation period was described as the period between the introduction of the first button at the start of the block and its withdrawal.

• Patients were assessed for the initiation of sensory and engine blockade every minute immediately after medication administration.

• Sensory block assessed in the skin dermatomesC4-T2 by heat feeling using alcohol soaked cotton.

• Loss of forearm flexion expansion, thumb and second digit pinch and ear and third digit pinch were evaluated for the onset of engine blockade.

• The block drop was done as a block drop even after 20 minutes.

• Analgesic failure was managed with General anaesthesia as appropriate .

• Patient received supplemental O2 and intravenous fluids throughout the procedure[7,8]

• Local poisonous anesthetic responses were noted, including subjective and objective manifestations such as circumoral numbness, tinnitus, twitching, seizures, etc.

• Technical complications such as intravascular injection, intrathecal or epidural injection and pneumothorax[9] have been noted.

All the information were analyzed statistically. Block execution time, starting time for engine and sensory blockade and analyzing the achievement level and estimating the statistical significance. Statistically important was regarded a "P" value less than or equivalent to 0.05.

Findings and Discussion

Groups	Block execution time in minutes	Onset of sensory block in minutes	Onset of motor block in minutes	No of needle attempts
A	5.1	3.6	6.1	1.2

Ultrasound guided block had shorter execution time (p = < 0.002), faster onset of sensory block in minutes (p= <0.032), faster onset of motor block (p =< 0.000), lesser number of needle attempts (p = < 0.000).

Conclusion

During the supraclavicular brachial plexus blockade it was found that

• The block execution time for ultrasound guided block was much shorter .

• The number of needle attempts to localise the nerve was minimal with ultrasound.

• The time taken for the onset of motor and sensory blockade was faster in the Ultrasound group.

• The success rate was higher with the use of ultrasound guided blockade.

• No complications were seen in the two groups.

It is therefore concluded that the use of ultrasound in the supraclavicular brachial plexus block is clinically helpful for precise nerve location and to minimize the amount of needle tries, as well as statistical and clinical evidence.

Examination of Displaced Acetabular Fractures in Adults Treated qith Open Reduction and Internal Fixation

Venkata Kiran Pillella[1], V. Vijaynarasimman Reddy[2]

[1]III rd Year M.S (Ortho PG), [2] Professor and Head, Department of Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: The occurrence of acetabular fractures is growing at a fast pace globally owing to increased crashes in train and highway traffic and high-speed injuries. The incidence of acetabular fractures is growing at a fast pace globally owing to increased crashes in train and highway traffic and high-speed injuries.

Method: Included in the research were 30 individuals between 18 and 60 years of age with locked displaced acetabular bones. Depending on the type of fracture, a single surgical approach such as the Kocher-Langenbeck, the ilio-inguinal, and the extended ilio-femoral approach was selected, with the expectation that fracture reduction and fixation could be fully accomplished by the one approach.

Results: Of the 30 individuals, 12 were between the ages of 21-30 and 10 were between the ages of 31-40 and most were men engaged in road traffic accidents. The right-hand predominance was seen in 22 (73.33 percent) and left-sided injuries in 8 (26.66 percent). Fractures of the posterior wall were observed in 5 instances, while in 4 instances the transverse was observed. In 8 patients, combinations of both were observed. In more than 56 percent of studies, the results were outstanding and satisfactory in more than 30 percent of them.

Conclusions: For a stronger knowledge of long-term outcomes, the current research requires further follow-up.

Keywords: *Acetabular fractures, Open reduction, Internal fixation, Kocher-Langenbeck approach.*

Introduction

The incidence of acetabular fractures is growing at a fast pace globally owing to increased crashes in train and highway traffic and high-speed injuries. Other kinds of wounds such as height loss, mine crashes also lead to these injuries ‘ increased incidence. Often these fractures are linked to other life-threatening wounds.

While some fracture models may not take surgery to be adequate, those with hip dysfunction, hip incongruity, or fracture displacement in the acetabulum’s superior weight-bearing region should generally be controlled with open decrease and internal fixation. Acetabular fractures are often linked to life-threatening various traumatic injuries that can often be missed3. Extremity fractures, head injuries, neck, abdomen and wounds to the pelvic membrane are often correlated with acetabular fractures4. In the leadership of acetabular fractures, computed tomography has demonstrated invaluable. 3D reconstruction enables to further define the model of fracture, particularly for inexperienced surgeons5. The results of open decrease and internal fixation of acetabular fractures had been highlighted in the past by a variety of research. Our current research aims to report the results of surgically resolved acetabular fractures in the brief and long term.

Materials and Method

The Department of Orthopedics at Sree Balaji Medical College and Hospital, Chromepet, Chennai, performed this prospective study during the span from August 2016 to July 2018. 30 Judet-and Letournel-specific individuals aged between 18 and 60 years with locked displaced acetabular fractures were included in the research[11,12].

The research excluded patients with compound defects, skeletally immature patients, patients with pathological injuries and patients with surgical contraindications. Together with the cultural context, demographic patient information were observed on entry. Also observed were clinical assessments such as the complexity of the fracture, other comorbid conditions connected with wounds and structural accidents. For all patients after entry, antero-posterior and 450 oblique view (Judet opinions) of the pelvis were acquired[1,2].

Before planning for fixation of acetabular fracture, a proper preoperative planning is very much essential[3]. Timing of surgery is very crucial for good outcome. Before 3 weeks of injury, acetabular fixation is probable to result in excellent anatomical decrease and clinical results[13,14]. For fixing all kinds of fractures, no single strategy is optimal. A single surgical approach is generally selected with the expectation that the fracture reduction and fixation can be completely performed through the one approach. The Kocher-Langenbeck, the ilioinguinal[4], and the expanded iliofemoral method are the most frequently used surgical methods to the acetabulum.

Findings

Of the 30 clients, 12 were between the ages of 21-30 and 10 were between the ages of 31-40, claiming that this sort of accident was linked to the age group at danger for road traffic accidents[5]. The incidence average age was 32.5 years. The era was 18 years for the oldest clients and 60 years for the oldest person (Figure 1).

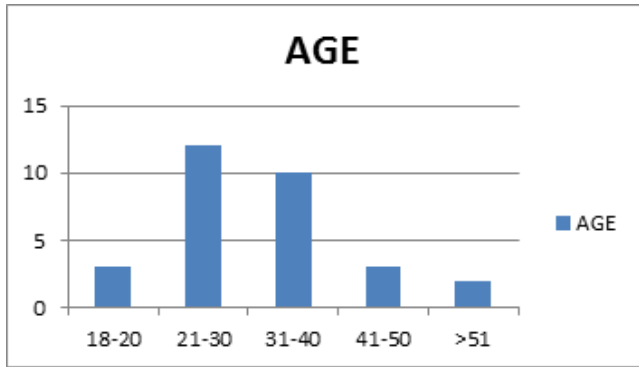

Figure 1: Age wise distribution of patients.

Table 1: Type of fracture

Type of fracture	No of cases
Posterior wall	5
Posterior column	2
Transverse	4
T Shaped	2
Transverse + Posterior wall	8
Posterior column + Posterior wall	7
Both column	2
Total	**30**

Males were more prevalent among those impacted (90 percent), likely not females (10 percent) owing to their job style. With 25 (83.33%) instances and 5 (16.66%) owing to falling height, RTA was the most prevalent source of injuries.

The right-hand predominance was seen in 22 (73, 33 percent) and left-handed defects in 8 (26.66 percent). Fractures of the posterior wall were observed in 5 instances, while in 4 instances transverse was observed. In 8 patients, a mixture of both was seen (Table 1). Of the 19 clients with dislocation[6], 14 were decreased within 12 hours while 5 patients reported decrease within 12 hours of the 11 clients without dislocation. (Figure 2-4).

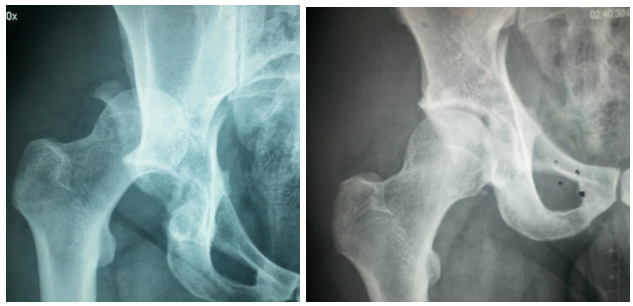

Figure 2 a: Before surgery, 2 b: After reduction

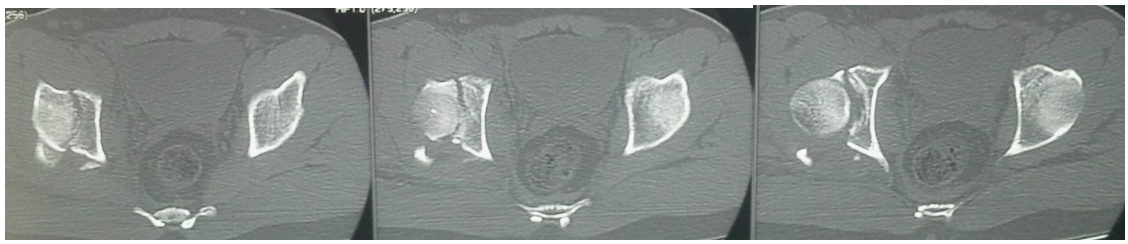

Figure 3: CT scan.

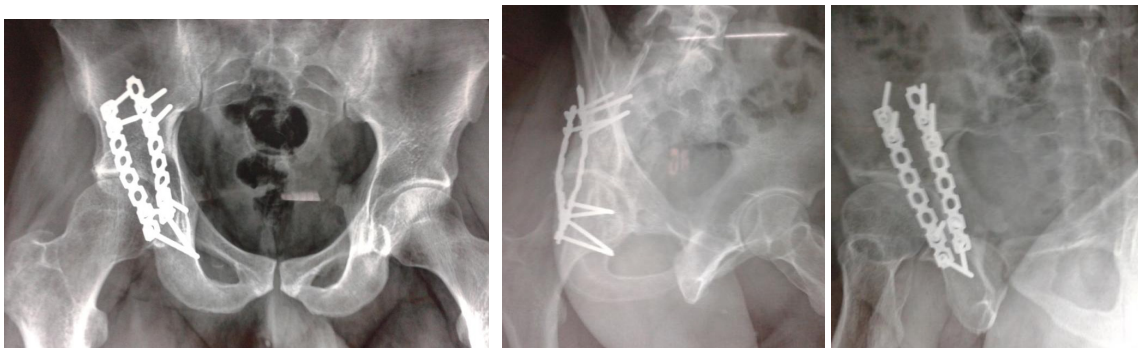

Figure 4: At 1 year of follow-up.

Figure 5: Mobility after surgery.

22 (73.33%) patients suffered related wounds with 14 (63.63%) instances of ipsi-lateral extremity injury (Figure 2-5). Post op, there were hardly any complications, except for one patient who acquired an infection and received treatment[7].

Eighteen patients had reduced fracture anatomically (0-1 mm) according to the Matta requirements. 17 of them had great results under the altered Merle D'Aubigne and Postel Clinical Grading systems, 9 of which had good results, as was the case with the Matta Radiological Score (Table 2).

Table 2: Outcomes of surgery by different criteria.

outcome	No of patients	percentage
Matta's Criteria – reduction of fracture		
Anatomic (0-1mm)	18	60%
Imperfect (2-3mm)	10	33.33%
Poor (0.3mm)	2	6.67%
Modified Merle D' Aubigne and Postel Clinical Grading system		
Excellent	17	56.67%
Good	9	30%
Fair	2	6.67%
Poor	2	6.67%
Matta Radiological Scoring system		
Excellent	17	56.67%
Good	9	30%
Fair	2	6.67%
Poor	2	6.67%

Discussion

Acetabular fractures are serious wounds and can be a complicated surgical issue. Judet and Letournel6 provided the biggest input to a stronger knowledge of acetabular fractures, their classification, fracture structure, and surgical therapy[10].

Yet, regardless of the therapy technique, they have the capacity for a bad results. The contributing variables may include incomplete decrease, acetabulum or femur osteochondral abnormalities at the moment of injury, osteoarthritis, femoral head AVN, heterotropic osification, sciatic tract disease, and infection7. It is recognized that the model of fracture, marginal impact and residual displacement of > 2 mm are correlated with arthritis growth. Non-operational therapy has become a rare occurrence for acetabular fractures. Open decrease and inner fixation is now a popular option procedure as it allows the patient to be mobilized soon.

Road traffic crash is the primary source of an acetabular fracture. RTA accounted for 83.3% of instances in our research, with the remainder falling from height. This was comparable to a retrospective research conducted by Almeida et al in which 60 out of 76 instances were due to RTA and a meta-analysis conducted by Giannoudis et al in which RTA was found in more than 80% of cases[8,9].

Conclusion

There is an growing incidence of acetabular fractures due to the enhanced frequency of road traffic accidents and high-speed injuries with the most impacted older men. With excellent surgical technique, the incidence of heterotopic ossification may be decreased; after surgery, indomethacin and irradiation may not be needed. There is a connection in most instances between fracture decrease and clinical and radiological results. In order to better understand the long-term outcomes, our research requires further follow-up.

Functional Outcome Analysis of Open Reduction and Internal Fixation of Complex Acetabular Fractures

Venkata kiran Pillella[1], V. Vijaynarasimman Reddy[2]

[1] III rd yr M.S (Ortho PG), [2] Professor and Head, Department of Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstarct

Over the last 20 years, Improvements in automobile safety, prehospital care, resuscitation, and transport as well as standardized protocols for treatment have all contributed to improved survival after severe pelvic injuries. Only 10% of the pelvic disruptions involve acetabulum. Posterior wall fractures are most common, comprising 24% of acetabular fractures. The primary cause in younger individuals is high-energy trauma. Acetabular fractures generally occur in conjunction with other fractures. The treatment of acetabular fractures is an enigmatic area of orthopaedics that is being continually refined. It involves a definite learning curve [1].

Keywords – *Conjunction, Acetabular Fractures*

Introduction

Acetabular fractures are generally associated with other injuries of the pelvis and lower limbs which may influence treatment options, surgical approach and clinical outcomes. Patient age, fracture stability, the presence of comorbidities and osteoporosis, combined with surgeon experience also influence treatment options.

The goals of the treatment should be anatomic reconstruction of articular surface and early mobilisation. This goal can be achieved only when acetabulum is adequately exposed and rigid internal fixation is done. Displaced fractures of the pelvis that involve the acetabulum are difficult to treat. With closed methods, it is difficult, if not impossible, to restore the articular surfaces completely and obtain sufficient stability for early motion of the hip.

The treatment of simple fractures of acetabulum is well known and studied. Treatment of complex Acetabular fracture is difficult as it involves both the column of the acetabulum, For reduction and fixation, both columns have to manipulated and fixed.

The purpose of this study is to analyse the results and functional outcome of open reduction and internal fixation of fracture involving both acetabular columns (Complex Acetabular Fractures) with the use of Kocher Langenbeck , ilioinguinal or both approaches .

Materials and Method

This is a prospective study done to assess the functional and outcome of complex acetabular fractures treated by open reduction and internal fixation in 20 patients over a period of two and half years from July 2016 - December 2018 at Our Institute, Sree Balaji medical college and hospital, Chromepet, Chennai.

Inclusion criteria:

1. Age greater than or equal to 18 years ,

2. Closed fractures,

3. Complex acetabular fractures including Transverse fractures, Transverse with posterior wall fracture, T Type fracture, Anterior column or wall with posterior hemitransverse fracture, Both column fractures.

M No : 9962256344

Exclusion criteria:

1. Open injuries,

2. simple fractures,

3. fracture greater than 3 weeks old ,

4. patient operated within last six months.

Patients were put on skeletal traction.

In our study , on receiving the patients in emergency room, general assessment and resuscitation was done . After stabilization of vital parameters, complete skeletal survey and associated injuries especially vascular and nerve injuries was assessed. Radiological assessment was done with anteroposterior, judet views of acetabulum and computed tomography with 3-d reconstruction of acetabulum if needed.

Closed reduction was done in dislocated patients under i.v sedation and skeletal traction was applied in all patients. Patients were operated between 5 to 10 days based on Damage Control Orthopaedics.

After completing clinical and radiological examination pre operative planning regarding approach and implant to be used was made on basis of fracture type, displacement and associated injuries.

Surgical exposure was decided preoperatively based on fracture displacement. Kocher Langen-beck approach was used for posterior fractures and anterior ilio-inguinal approach was used for anterior fractures . After reducing and fixing one column the reduction of other column was assessed by image intensifier and need for exposing the other column was made.

After exposure reduction poses the challenge. Reduction cant be achieved easily as in any long bones and maneuvers are not the same . In posterior approach, schanz pins was placed in trochanter, ischial tuberosity and iliac crest for simultaneous manipulation . Various reduction clamps are available to facilitate reduction and holding. In anterior approach a farabeuf clamp or a schanz pin was placed in iliac crest to manipulate and reduce. Matta‘s Quadrangular clamp of various sizes and with offsets and Picador ball spike pusher are very important instruments in Acetabular surgery. Reduction was fixed with lag screws whenever possible. Lagging was done with 4mm cancellous screws or 3.5 mm cortical screw with washer. 3.5mm Reconstruction plates are used as neutralisation plate .

All patients were given pre operative antibiotics and post operatively for 5 days. Drain removal done on 2nd post operative day . Suture removal was done on post operative day 12 to 14. Indomethecin[2] 25mg TDS was prescribed orally for 6 weeks from next day after surgery. Low molecular weight heparin was given for 7 days when anterior approach is used as DVT prophylaxis.

Passive mobilization was started on post operative day 2. Active movements started gradually in accordance with pain. Weight bearing was allowed as the fracture consolidates mostly on the 3rd or 4th month.

Radiological and functional examination was done on monthly review for first 6 months and third monthly there- after.

Patients in our study were analysed by the Matta‘s radiographic assessment post operatively and modified Merle d‘ Aubigné and postel Hip Score at each follow up.

Functional Outcome :

Modified Merle‘d Aubigné And Postel Grading System :

Pain :

None - 6

Slight or intermittent -5

After walking but resolves -4

Moderately severe but patient is able to walk -3

Severe, prevents walking -2

Walking

Normal -6

No cane but slight limp -5

Long distance with cane or crutch -4

Limited even with support -3

Very limited -2

Unable to walk -1

Range of motion*

95-100% -6

80-94% -5

70-79% -4

60-69% -3

50-59% -2

<50% -1

Clinical score

Excellent -18

Good -17,16,15

Fair 13 or 14

Poor <13

*The range of motion is expressed as the percentage value for the normal hip. This is calculated by obtaining a total of the ranges, in degrees, of flexion-extension, abduction, adduction, external rotation, and internal rotation for the injured hip and dividing it by the total for the normal hip.

Post operative Radiological assessment :

Matta's criteria:

Anatomic reduction <1mm;

Imperfect 1–3mm;

Poor >3mm.

Results

Table1 :Fracture Distribution

Fracture type (Judet and Letournal)	No. of Patients	Percentage
Transverse	7	35%
Transverse with posterior wall	4	20%
Anterior column with posterior hemi-transverse	2	10%
T type	4	20%
Both column	3	15%

Procedure	No.of Patients
Kocher Langenbeck Approach	14
Ilioinguinal Approach	3
Ilioinguinal approach Followed by Kocher langenbeck Approach	1
Kocher Langenbeck Approach followed by ilioinguinal approach	2

Radiologic assessment was done post operatively by Matta's criteria and Functional status of the patient was assessed by Modified Merle'd Aubinge and Postel score .

Twenty patients with complex acetabular fractures were treated surgically and analysed with average follow up of 10.5 months ranging from 6 months to 2 ½ years .

75% belong to less than 40 years. 35% patients belong to 4th decade followed by 3rd decade (25%). Males dominated our study group with a ratio of 9: 1. Road traffic accidents contributed to the injury in 80% of our patients and rest sustained by fall from height. Transverse fracture was the most common type in our study (7 cases). Anterior column with posterior hemitransverse was least common type (2 cases).

Eight patients had associated skeletal injuries. One patient had sciatic nerve injury and one patient had urethral injury. Most of the patient were operated by Kocher langen-beck approach (17 Patients). Three patients was operated by ilioinguinal approach. Three patients was operated by combined approach. In contrast to pelvic injuries, all patients were hemo-dynamically stable at the time of admission.

Figure1 : Before surgery

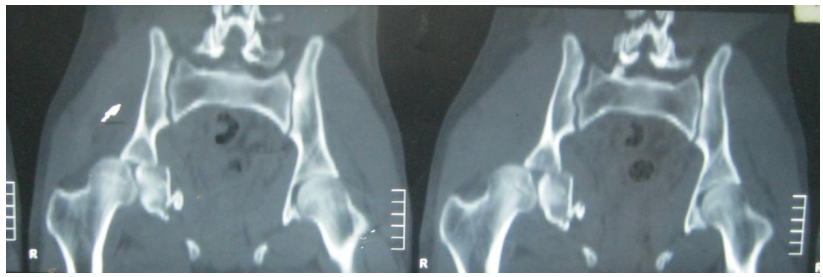

Figure 2 : CT scan.

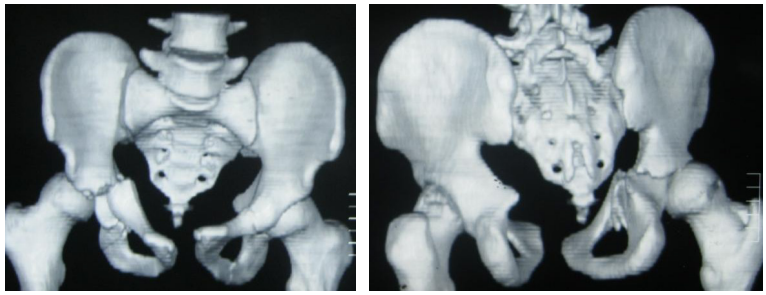

Figure 3: 3D - CT scan

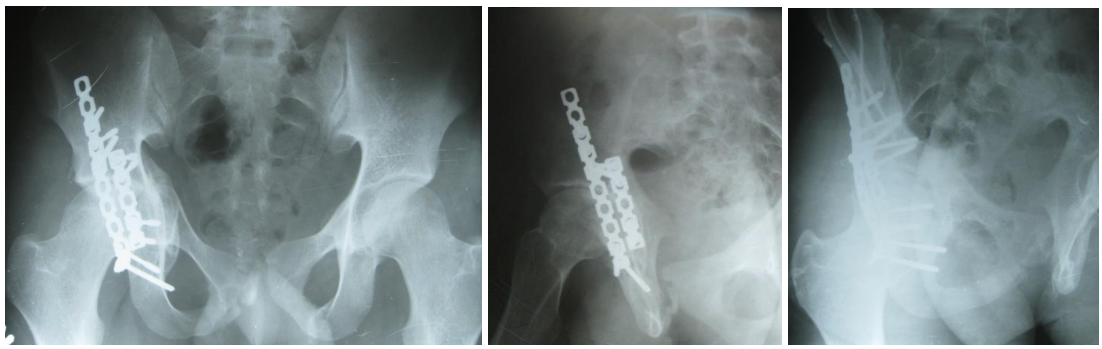

Figure 4: At 1 year of follow-up.

Figure 5: Mobility after surgery & Scar.

In our study the average surgical time delay was 6 days ranging from 5 to 11 days. The average surgical time was 127 minutes ranging from 60 minutes to 4 hours.

Four patients have encountered operative complications. One patient operated by ilioinguinal approach had superficial infection which settled with antibiotics. One patient had a deep circumflex vein tear managed by ligation following which he developed DVT that resolved with heparin. One patient was found have intra-articular screw after being operated via anterior approach. One patient operated by posterior Kocher langenbeck approach developed sciatic nerve palsy.

No patient had sacroiliac disruption or pubic diastasis. No patient died during treatment or follow up.

According to Matta's criteria, 6 patients had anatomic reduction, 7 patients had satisfactory reduction and 7 patients had poor reduction (>3mm gap). The mean score in anatomically reduced fractures was 15.1 , in imperfect reduction is 15.8 and in poorly reduced fracture is 14.5. Out of 18 patients, four patients had excellent , eight patient had good , five patient had fair and 1 patient had a poor results. 60% patient are having near normal life and 94% patient are having satisfactory result in our study. Function outcome score for the patients ranged from 10 to 18 (Maximum Score- 18).

The poor result (Score-10) in one patient was due to Avascular necrosis of femoral head . Patient had transverse with posterior wall fracture operated by posterior Kocher Langenbeck approach. Total hip replacement was done for this patient at 8 months after surgery.

There are seven patients with transverse fracture . one was lost to follow up. All patients with transverse fracture had excellent or good result except one patient who had fair result due to associated multiple skeletal injuries in lower limb .

Two patients with both column fracture was operated by anterior Ilioinguinal approach and one patient had excellent and other had good result. Associated posterior wall fracture had reduced the outcome score.

T type fracture , Anterior column with posterior hemitransverse and Transverse with posterior wall fracture had reduced outcome score than other two types.

Findings and Discussion

The treatment of simple acetabular fractures has been studied in detail and there has not been much of change over time. The options for treatment of complex acetabular fractures are wide and are continuously refined over time. The treatment of complex acetabular fracture is difficult because it involves both the columns and reduction of the both by single or double approach is must.

The mean age group in our study was 35.4 years which is comparable with Swiontkowski et al[3] on complex acetabular fracture. Males predominated as in other studies[3] . Road traffic accident forms the major mode of injury .

The highlight of open reduction and internal fixation is anatomic reduction, rigid fixation and early mobilization which will keep the joint functional as described by Matta[4] . Pennal et al[5] reported that the quality of the clinical result depends directly on the quality of the reduction that was achieved when open reduction and internal fixation were performed . In our study , there is decreased mean functional score (14.5) in the fracture group with poor reduction compared to rest (Anatomical Reduction 15.1 and Imperfect reduction -15.8).

Management of displaced acetabular fracture requires adequate exposure with minimal morbidity. An ideal approach would allow visualisation of both columns and the joint surface with minimal complications. We used only two non extensile approaches - Posterior Kocher Langenbeck approach and anterior Ilioinguinal approach.

We used single approach in most of the patients except in 3 patients . With this single approach we are able to get 65% of satisfactory reduction and 94% of favorable result in short term. According to Tile , even with best hands depending on the type and complexity of fracture , anatomic reduction can be obtained in 70% cases of acetabular fractures . In our study we included only complex fractures and we were able to get satisfactory reduction in 65% patients.

H. J. Kreder et al listed factors influencing the outcome[6]- degree of initial displacement, damage to the superior weight bearing dome or femoral head, degree of hip joint instability caused by posterior wall fracture, adequacy of open or closed reduction and late complications like AVN, heterotrophic ossification, chondrolysis or nerve injuries are assessed. In our study associated posterior wall fracture has reduced the functional outcome .

Giannoudis et al[7] in his meta-analysis reported 5.6 % of AVN in posterior approaches . In our study , We had a case of avascular necrosis of femoral head leading to poor outcome (5%) . Patient came with AVN at 8 month follow up for whom total hip replacement was done .

Extensile approaches around the hip joint have reported a high rate of complications. Alonso et al. reported 53% incidence of heterotopic ossification with Triradiate approach and 86% incidence with the use of Extended iliofemoral approach. No case of heterotopic ossification has been encountered till date in our study . Heterotopic ossification was reported as high as 20% in non extensile approaches used for complex fractures accoording to Jiong Jiong Guo, et al .We used Indomethacin for patients for 6 weeks as prophylaxis for heterotopic ossification.

Giannoudis et al[7] reported 8% of iatrogenic sciatic nerve palsy in posterior approaches. In Our Study ,We report one case of sciatic nerve palsy in posterior approach (5.8%) . Swiontkowski et al[3] also showed 8.3 % iatrogenic sciatic nerve palsy in his study. one case of DVT in anterior ilioinguinal approach .We had a case of intra articular screw penetration in anterior approach, but the patient was asymptomatic and had excellent functional outcome.

The complication rate is very low when compared to Matta[8] and Swiontkowski studies[3].

The non-extensile approaches which we advocated have operating time and average blood loss which are similar to those reported by others (Matta et al 1986;Goulet and Bray 1988 ; Reinert et al 1988 ; Routt and Swiontkowski 1990 ; Helfet et al 1992).

The mean functionl outcome score is 15.4 ranging from 10 to 18 (Maximum—18). The least score is seen in a patient with transverse with posterior hemitransverse fracture operated by Kocher langenbeck approach and developed Avacular necrosis of femoral head .

According to Marwin M Tile, Transverse has the best and T Type and anterior column and posterior hemi transverse fracture has worst prognosis. In our study Transverse fractures and both column fractures showed better results. T Type and anterior column with posterior hemi transverse had reduced outcome.

Even though our study comprised of small group of 20 patients with good pre operative planning , use of non extensile approaches and early rehabilitation , we have been able to produce 94 % good to satisfactory result according to modified Merle d Aubigne and Postel scoring systems. However, further follow up is needed to comment on long term outcome.

Conclusion

From our study , We conclude that Complex acetabular fractures treated by open reduction and internal fixation have a satisfactory functional outcome .

Use of non extensile approaches itself is sufficient to produce adequate fracture reduction with reduced complications.

Every chance of reducing the fragments anatomically, fixing rigidly and mobilizing early must be done for better function which is not possible by conservative means.

Treatment of acetabular fractures is a challenging task for any orthopaedic surgeon. With definite learning curve , proper pre operative planning , non extensile exposure , accurate reduction , rigid fixation and early rehabilitation , it is possible to produce a improved outcome.

Analysing the p16INK4a Stained Uterine Cervical Biopsy Specimen Histopathological Findings

Amish Aggarwal[1], I. Venkatraman[2], M. Prabakaran[3]

[1]Post Graduate Student, [2]Professor, [3]Professor and HOD, Department of Radio Diagnosis, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Human papilloma virus(HPV) is an epitheliotropic virus and usually a cause for Carcinoma cervix. Human papilloma virus being one of the most common cancer causing rganismin women worldwide.An immune histochemical analysis with pI6NK4a was performed in formalin- fixed, paraffin embedded samples of 50 cases.The aim of the study was to analyse the p16ink4a stained uterine cervical biopsy specimen histopathological findings. The p16INK4a immune expression was evaluated in all the cases and correlated with the histopathological findings.

Keywords: *Human papilloma virus, epitheliotropic, pI6NK4a*

Introduction

Cervical cancer is one of the most common carcinoma prevalent.by 13% of all the women affected cancers.(1)Cervical Intraepithelial neoplasia (CIN), which is described by abnormal growth/dysplasia of squamous cells in the surface epithelium of cervix is a premalignant condition.(2) Human papilloma virus is the most important causative organism in the development of cervical cancer[5]. They are transmitting sexually especially the high risk HPV types – 16,18,33; 16 and 18 mainly and then chronic infection causing CIN.(3,4) HPV 16 and 18 are the main sub types of papilloma virus causing cervical cancer and the other types are 45, 31,33,45,51,52,58 and 35.There are also other around 200 various subtypes. And if in cases which are left untreated, few cases develop cervical cancerbut only after a long standing period usually within 5 to 10 years which persistent infection may be causing it. HPV being detected in all cases of cervical dysplasia and neoplasia cases, is a crucial factor.(5)

Materials and Method

A cross sectional hospital basedstudy of 50 cases was followed in the Department of Pathology in collaboration with the Department of Obstretics and Gynaecology, SreeBalaji Medical College and Hospital (SBMCH), Chromepet.

The study was constructed for a period of two years starting from November 2016 to October 2018[6].

Study Population And Inclusion Criteria

- Both cone and punch biopsy are included.
- All the cervical biopsy specimens received in the department of Pathology within 2 years of the study period were included in the study.
- Patient irrespective of any age group undergoing cervical biopsy were included in the study.
- Patient who have consented for the study.

Exclusion Criteria

- Patient already treated
- Patients not consenting for the study(7)

Working Definition

- More than 10% nuclear stained epithelial cells

by p16INK 4a – p16 positive

- Less than 10% nuclear stained epithelial cells by p16INK 4a – p16 negative

Brief clinical information with regards to age, sex, etc.of the patient and clinical findings and diagnosis and any other relevant information received from the case file of the patient was recorded in the proforma for the study.

Slides prepared after formalin fixation were sent for immunohistochemistry and then for light microscopy examination .(8)

Findings

The p16INK4a immunoexpression was evaluated in all the cases and correlated with the histopathological findings[3]. The p16INK4a immunoexpression was evaluated in all the cases and correlated with the histopathological findings. Out of the premalignant conditions, 4 cases of CIN I was encountered in our study which was considered to be negative as it showed focal weak staining of less than 10% of the epithelial cells.

Discussion

This study is to find out the correlation of p16INK4a immunohistochemical expression on various histological lesions received in our department. It has been observed that most of the cases received were those of inflammatory lesions mainly chronic cervicitis with or without papillary hyperplasia and/or squamous metaplasia. These lesions had inflammatory cell infiltration with few having Nabothian cyst. Some of the lesions had papillary hyperplasia of the endocervix and few had squamous metaplasia.It was expected that few premalignant lesions may take up the stains but it also showed negative IHC results. Hence, they were considered to be p16INK4a negative.

Sano et al (6) conducted a study on the expression status of the p16INK4a protein associated with HPV oncogenic potential in cervical and genital lesions. To clarify the relationship between p16 overexpression and HPV infection incervical carcinogenesis, immune histochemical analysis of p16INK4a and detection of HPV by in situ hybridization and polymerase chain reaction were doneon 139 formalin fixed and paraffin embedded samples of cervical and genital condylomatous and neoplastic lesions. Marked overexpression of p16INK4a protein, i.e. diffuse and strong immunostaining was observed in all cervical cancers and preneoplastic lesions with infection by high and intermediate risk HPVs i.e. subtypes 16,18,31,33,52 and 58.Here in our case also only the carcinoma cases took up the stain[7] .Volgareva G et al(7) in their study "Protein p16INK4a as a marker of dysplastic and neoplastic alterations in cervical epithelial cells" found that in control samples which consisted of vaginal smears of healthy women and biopsy samples of cervical ectopia were negative for p16 INK4a. Overexpression of p16INK4a was detected in samples of cervical dysplasia (CINs) and carcinomas, which is similar to our study only for the carcinoma cases.

Conclusions

Many studies have shown that human papilloma virus (HPV) infection plays an important role in cervical carcinogenesis. HPV infection has been detected in almost all preneoplastic and neoplastic lesions of the cervix and is a significant factor in nearly all cases of cervical cancer. Early detection and treatment are the key to reduction in morbidity and mortality due to cancer. This study of p16INK4a expression on cervical biopsy specimen showed that those with inflammatory cervical histology, benign lesions of the cervix along with premalignant lesions of the cervix are negative for p16INK4a. And all of the malignant lesions were p16INK4a positive.Hence, the p16INK4a immunoreactivity may be used for the diagnosis of neoplastic lesions of the cervix[8].

Evaluation of the Clinical History with It's Features with the Histological Findings with P16ink4a Stained Cervical Biopsy

Jyothi Elizabeth Roy[1], B. Shanthi[2], V.S. Kalaiselvi[3]

[1]Post Graduate, [2]Professor and HOD, [3]Professor, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Dysplasia or neoplasis of the cervix is caused by human papillomavirus (HPV) infection of low or high oncogenic risk type. This cross sectional study on our college SREE BALAJI MEDICAL COLLEGE & HOSPITAL is to evaluate the clinical history with it's features with the histological findings with P16INK4a stained cervical biopsy. This is a study done on 50 sample size with a brief clinical information with regards to age, sex, etc.of the patient and clinical findings and diagnosis and any other relevant information received from the case file of the patient was recorded in the proforma for the study.

Keywords: *Dysplasia, HPV, Oncogenic*

Introduction

Human papilloma virus is an important role covering cervical carcinogenesis and one of the most common forms of cancer. Immunostaining of p16 INK 4a overexpression allowed specific and accurate negligible cases of CIN or cervical dysplasia in biopsy which allow improvement of diagnosis of cervical cancer.(11)P16INK inhibits the cyclin dependent kinase by preventing the phosphorylation of RB (hypophosphorylated form); pRB binds to transcription factors, it loses the G1/S check – point controller. RB gene in cervical dysplasia is inactivated as a HPV E7 proteinexpression.(11).E6-E6 inhibits the function of p53 indicated DNA damage and apoptosis pathway. E6 retarget E6- AP to induce ubiquitination and rapidproteosomal degradation of p53 which is a protein controlling the response to cellular stress including DNA damage and viral infection. HPV E6 can also activate telomerase n TERT transcription also. .(7,8)

E7- E7 inhibits the function of tumour suppress pRB mediated cell cycle regulation pathway and inactivation of the pRB and p53 tumour suppressor pathways and expression of the catalytic telomerase subunit hTERT constitute the process causing overexpression of the CDK inhibitor. P16INK 4a process through negative feedback control to check the cell proliferation through regulation of CDK4 and 6. Hence P16INK 4a is overexpressed in HPV mediated cervical cancer.(7,8,9)

Aim

Evaluation Of The Clinical History With It's Features With The Histological Findings With P16ink4a Stained Cervical Biopsy

Materials & Method

A hospital based cross sectional studydesign was followed. The study was carried out in the Department of Pathology in collaboration with the Department of Obstretics and Gynaecology, SreeBalaji Medical College and Hospital (SBMCH), Chromepet. The study was constructed for a period of two years starting from November 2016 to October 2018.

Study Population and Inclusion Criteria

•Both cone and punch biopsy are included.

•All the cervical biopsy specimens received in the department of Pathology within 2 years of the study period were included in the study.

•Patient irrespective of any age group undergoing

cervical biopsy were included in the study.

•Patient who have consented for the study.

Exclusion Criteria

•Patient already treated

•Patients not consenting for the study

Study Variables

•Age, religion, p16INK 4a expression

Working Definition

•More than 10% nuclear stained epithelial cells by p16INK 4a – p16 positive

•Less than 10% nuclear stained epithelial cells by p16INK 4a – p16 negative

WORKING TOOLS- Pretest proforma, light microscope, microtome, H&E stain and p16(G175-405) mouse monoclonal antibody kit

Brief clinical information with regards to age, sex, etc.of the patient and clinical findings and diagnosis and any other relevant information received from the case file of the patient was recorded in the proforma for the study.

Findings

The present study on the histomorphology of cervical specimens and their relationship with the immune histochemical expression of p16INK4a was conducted in the department of Pathology in collaboration with Obstretics and Gynaecology department, Sree Balaji Medical College and Hospital, Chennai, Tamil Nadu. A total of 50 cases were studied and the diagnosis are shown in Table. Out of the 50 cases, maximum are inflammatory conditions i.e. 26(52%), mainly chronic cervicitis which comprises 15(30%) cases and malignancies/carcinoma accounted for 2(4%) cases. Premalignant conditions consisting Low grade Squamous Intraepithelial Lesion and Cervical Intraepithelial Neoplasia accounted for 18(36%) cases. Benign conditions accounted for 4(8%).

The age of the patients in the study as shown in the Table 8 ranged from 21 years to 61 years and above. The malignant lesions seen were in the age group of 41 to 60 years. Premalignant conditions were seen highest in the age group of 41 to 50 years. Benign conditions were evenly distributed in women with age more 30 years. Inflammatory conditions occurred more in the age group of 31 to 50 years.

Out of the 50 cases, there were 2(4%) malignant cases in the study and both are infiltrating non keratinizing squamous cell carcinoma.

Table 1: Distribution of cases and their percentages.

Sl no.	Diagnosis	Number of cases	Percentage
A)CARCINOMA/MALIGNANT CONDITIONS:			
1.	Infiltrating non keratinized squamous cell carcinoma	2	4%
B)PREMALIGNANT CONDITIONS:			
1.	Low grade squamous cell carcinoma	14	24%
2.	Cervical intraepithelial neoplasia	4	8%
C)BENIGN CONDITIONS:			
1.	Dysplastic squamous epithelial cells	2	4%
2.	Endometrial hyperplasia with Nabothian cyst	2	4%
D)INFLAMMATORY CONDITIONS:			
1.	Chronic endocervicitis with Non Specific Reactive Changes in squamous epithelium	1	2%
2.	Chronic non specific cervicitis	2	4%
3.	Chronic cervicitis	15	30%
4.	Chronic papillary cervicitis	3	6%
5.	Chronic papillary endocervicitis with LSIL	3	6%
6.	Non specificendocervicitis	1	2%
7.	Chronic papillary cervicitis with non reactive cervicitis	1	2%
Total		**50**	**100%**

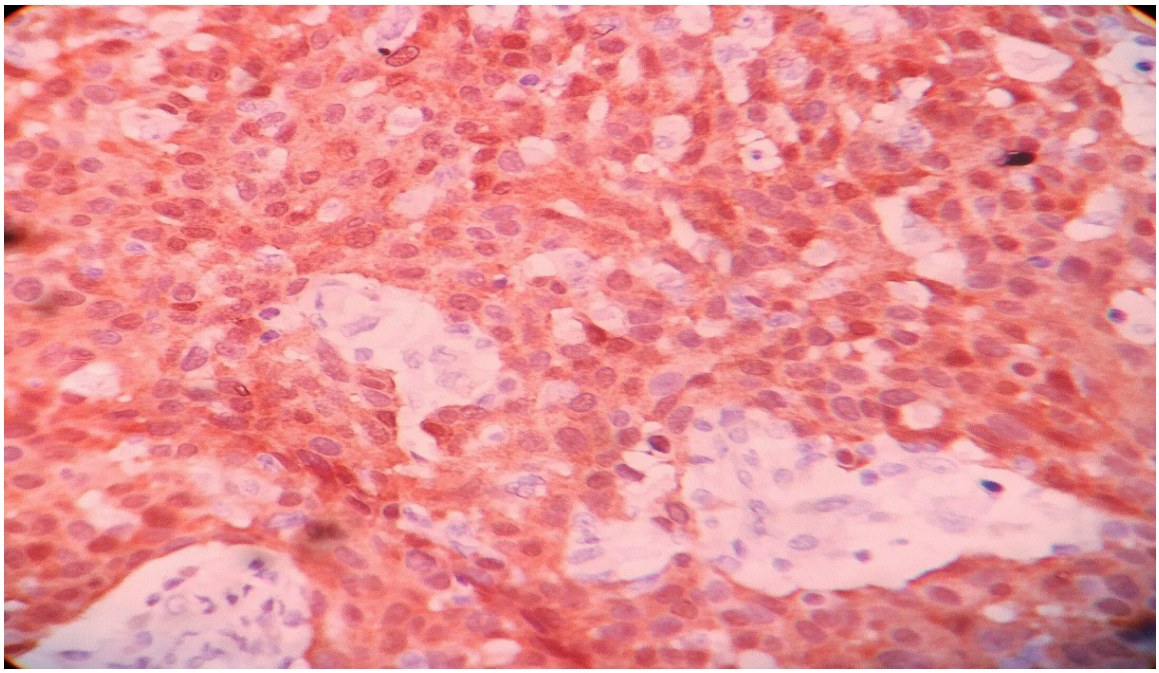

Figure 1: P16INK4a Positive in high power 40x magnification

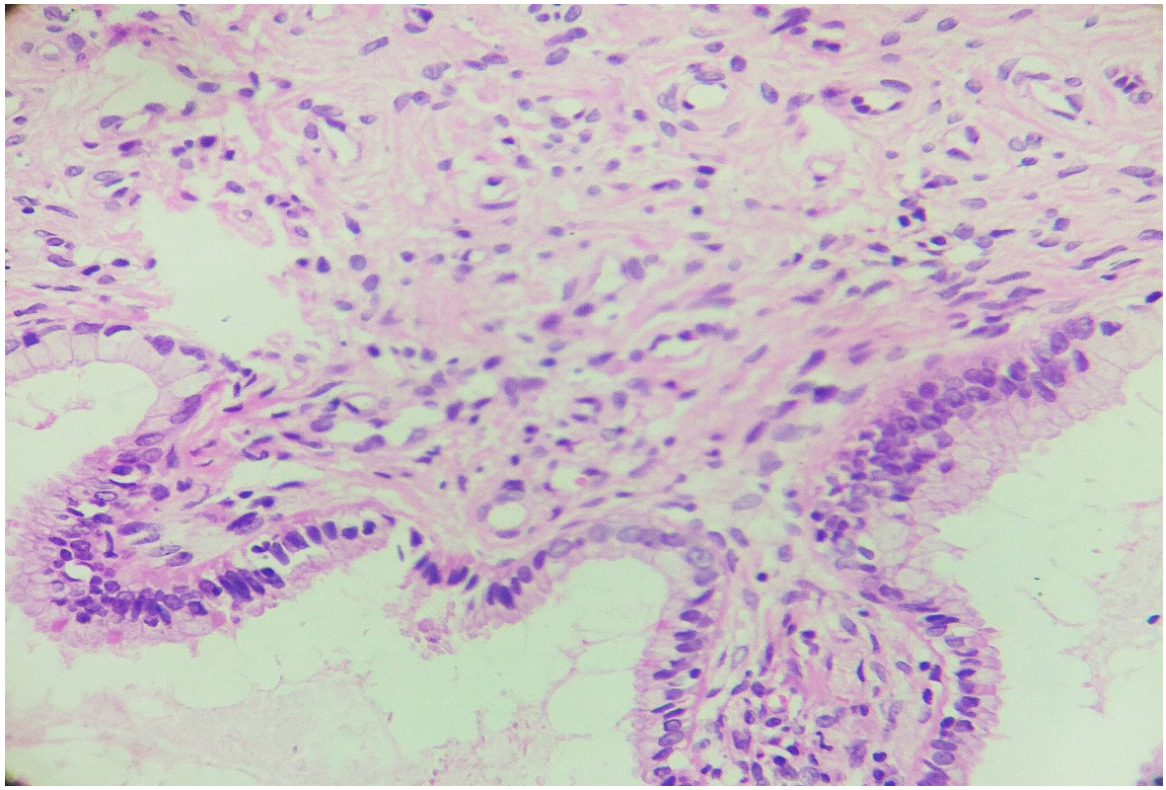

Figure 2: Chronic papillary endocervicitis H&E 40x magnification

Table 2: AGE wise distribution of the cases.

Age	Carcinoma/malignant conditions	Premalignant conditions	Benign conditions	Inflammatory conditions	TOTAL
21-30	.	2		1	3(6%)
31-40		4	1	10	15(30%)
41-50	1	7	1	10	19(38%)
51-60	1	4	1	4	10(20%)
>61		1	1	1	3(6%)
TOTAL	2(4%)	18(38%)	4(8%)	26(52%)	50(100%)

Table 3: Expression of p16ink4a in cervical tissue with different histolopathological diagnosis.

Sl no.	Diagnosis	No of cases	p16INK4a reactivity
1.	Carcinoma	2	2/2(100%)
2.	Premalignant conditions	18	0/18(0%)
3.	Benign conditions	4	0/4(0%)
4.	Inflammatory conditions	26	0/26(0%)

The p16INK4a immune expression was evaluated in all the cases and correlated with the histopathological findings. The result for the p16INK4a scoring was done using a semi quantitative scoring method as shown in the table 13. All premalignant conditions benign and inflammatory showed no expression of p16INK4a staining. The dysplastic and neoplastic cells show moderate to strong diffuse to strong cytoplasmic as well as nuclear staining. In the malignant condition considered to be p16INK4a positive, there was diffuse and strong nuclear as well cytoplasmic staining in more than 10% of the epithelial cells but the nuclear staining was considered to be significant in account of the positivity.

Out of the premalignant conditions, 4 cases of CIN I was encountered in our study which was considered to be negative as it showed focal weak staining of less than 10% of the epithelial cells. While correlating with different histopathological lesions with p16INK4a expressions in malignant lesions as shown in the table 15.

Statistical analysis using Chi-square test, it was seen that high statistical significance (p=0.0008) was found between p16INK4a and the different categories of the lesions.[8]

Statistical analysis using Chi-square test, it was seen that high statistical significance (p=0.0008) was found between p16INK4a and the different categories of the lesions.

Table4: Association of P16INK4a reactivity with different types of sample (n=50) using chi-square test

Samples	P16INK4a reactivity		p-value
	Positive	Negative	
Others	0(0%)	48(100%)	0.0008
Malignant	2(100%)	0(0%)	

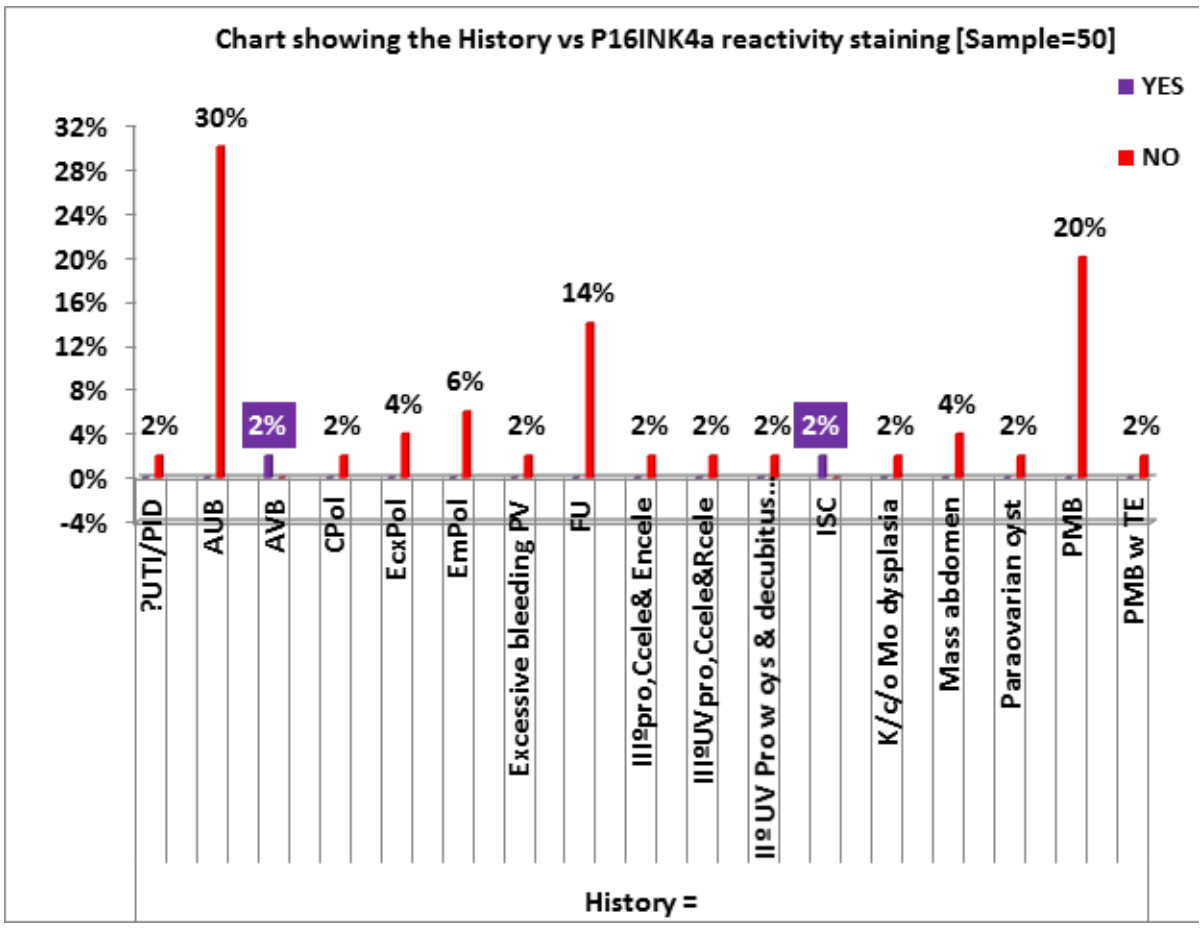

Fig 3: showing the history vs P16INK4a reactivity staining.

Discussion

This study attempts to find out the correlation of p16INK4a immunohistochemical expression on various histological lesions received in our department.(7)

Munoz et al(4) finds out of 26 inflammatory conditions (mainly chronic cervicitis and its variants).In this study done, non specific chronic cervicitis showed no expression of p16INK4a.

Wang et al (64) conducted a study on p16INK4a and p14ARF expression pattern by immunohistochemistry in human papilloma virus related cervical neoplasia. Serially andconsecutive biopsies representing normal cervical epithelium to cervical intraepithelial neoplasia and/or invasive cervical cancer were stained. The positive rates of these markers were significantly highest in cervical intraepithelial neoplasia and in squamous cell carcinomabut in my study only 2 cases i.e both in filtrating non keratinizing Squamous Cell Carcinoma were P16INK4a positive.

Klaes et al (25) study of p16INK4a in cervical biopsy specimens, showed no significant p16INK4a immunoreactivity in inflammatory lesions which is similar to my study.

Conclusion

Hypoplastic left transverse sinus is the most widely recognized anatomical variety in our examination. Also, MRV is considered as the best methodology in diagnosing anatomical variations. So it is fundamental for the radiologist to be comfortable with their MRV qualities and life structures so they are not misconstrued as Cerebral Venous Sinus Thrombosis.

Steroids for Nasal Polyposis and its Impact on Quality of Life

Dunnuthala Sreenivasulu Reddy[1], P. John Solomon[2]

[1]PG Student, [2]Professor, Dept. of Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Nasal polyposis is an incessant incendiary infection including the nasal and paranasal sinuses mucosa . Nasal polyposis has been related with various foundational and respiratory ailments, for example, cystic fibrosis, ciliary motility issue , rhinitis, and asthma

The management of nasal polyposis has been a topic of debate for many decades. Most authors agree on the fact that management of nasal polyposis should primarily be based on a

medical therapy and has to resort to surgery only in refractory cases . Treatment with oral or topical steroids has been shown to relieve symptoms, reduce polyp size, and reduce recurrence rates after surgery.

Keywords*: Nasal polyposis, ciliary motility issue, rhinitis*

Introduction

Nasal polyposis is by all accounts a minor infection because of simple determination by endoscopy .But patient will encounter nasal polyposis to be a disagreeable sickness in view of its the effect on patients' consistently action, work profitability, and generally Quality of Life (QoL), To precisely evaluate the weight of malady, different ailment explicit QoL surveys were planned over the previous years. These polls center around symptomatology and how they influence patients' general QoL[1].

Visual simple scale (VAS) is a psychometric estimation instrument generally utilized in the Rhinology field and measure seriousness of side effects. It speaks to a flat line of 10 cm with word grapples at each end speaking to the extraordinary emotions. Patients are told to demonstrate the point on hold that best relates to their status for the specific trademark being assessed. Notwithstanding its high affectability, unwavering quality and reproducibility, VAS is easy to use by patients and it doesn't require preparing, making VAS an exceptionally important device for ordinary clinical practice, yet in addition for genuine investigations .(1-2)

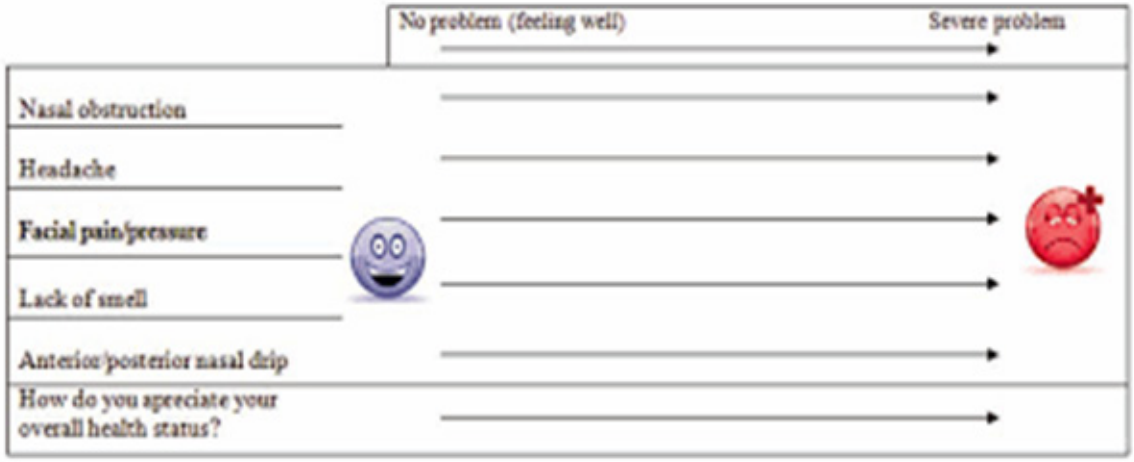
Aim



To evaluate the Quality of Life (QoL) outcome after steroid therapy using Visual Analogue Scale

Materials and Method

The present prospective study to assess the impact of nasal polyposis on Quality of Life(QoL) was conducted in the department of Otorhinolaryngology of Sree Balaji Medical College and Hospital , Chennai.The study period was from February 2017 to September 2018 .(4-6)

The study population was the 50 patients who presented to outpatient room of department of otorhinolaryngology with complaints of nasal obstruction , nasal discharge , headache , anosmia , allergic symptoms. Study group included patients aged between 18-60 . To avoid the influence on therapeutic effectiveness, the patients with bronchial asthma and aspirin sensitivity were excluded. All the patients were evaluated and diagnosis confirmed by Diagnostic Nasal Endoscopy and Computed Tomography(7,8)

All the patients under study population were given oral corticosteroid (deflacortisone) at a daily dosage of 18mg (6 mg tds) for 3 weeks and intranasal steroid spray (fluticasone propionate) at a daily dosage of 160 mcg(80 mcg bd) in each nasal cavity for 8 weeks . All patients were assessed and symptomatology was documented according to Visual Analogue Scale (VAS) before and after steroid therapy.[10,11]

Data were documented using IBM SPSS version 22 was used for statistical analysis. P value < 0.05 was considered statistically significant.[4-7]

Findings

In the present study 50 patients were evaluated and data documented. Protocol for medical management were followed for all patients. Diagnostic Nasal Endoscopic findings were documented before and after medical therapy

Post treatment was considered as essential result variable. Pre treatment was considered as essential illustrative variable.[6,7]

Downright results were thought about between study gatherings utilizing Mcnemar Chi square. P esteem < 0.05 was considered measurably huge. IBM SPSS adaptation 22 was utilized for factual analysis.IBM SPSS rendition 22 was utilized for measurable examination.

- Pre-treatment observations

Table 1: Descriptive analysis of pre-treatment symptoms in study population (N=50)

Parameter	Mean ± SD	Median	Min	Max	95% C.I	
					Lower	Upper
Nasal obstruction	6.72 ± 0.83	7.00	5.00	8.00	6.48	6.96
Hyposmia	5.86 ± 0.99	5.50	5.00	8.00	5.58	6.14
Nasal discharge	6.22 ± 0.86	6.00	5.00	8.00	5.97	6.47
Sneezing	6.06 ± 0.84	6.00	5.00	8.00	5.82	6.30
Facial pain or headache	5.54 ± 0.81	5.00	5.00	8.00	5.31	5.77
Total VAS	30.4 ± 2.84	30.50	25.00	39.00	29.59	31.21

The mean nasal observation was 6.72 ± 0.83 in the study population. Range between was 5 to 8 (95% CI 6.48 to 6.96). The mean hyposmia was 5.86 ± 0.99 in the study population. Range between was 5 to 8 (95% CI 5.58 to 6.14). The mean nasal discharge was 6.22 ± 0.86 in the study population. Range between was 5 to 8 (95% CI 5.97 to 6.47). The mean sneezing was 6.06 ± 0.84 in the study population. Range between was 5 to 8 (95% CI 5.82 to 6.30). The mean facial pain or headache was 5.54 ± 0.81 in the study population. Range between was 5 to 8 (95% CI 5.31 to 5.77). The mean total VAS was 30.4 ± 2.84 in the study population. Range between was 25 to 39 (95% CI 29.59 to 31.21). [14,15]

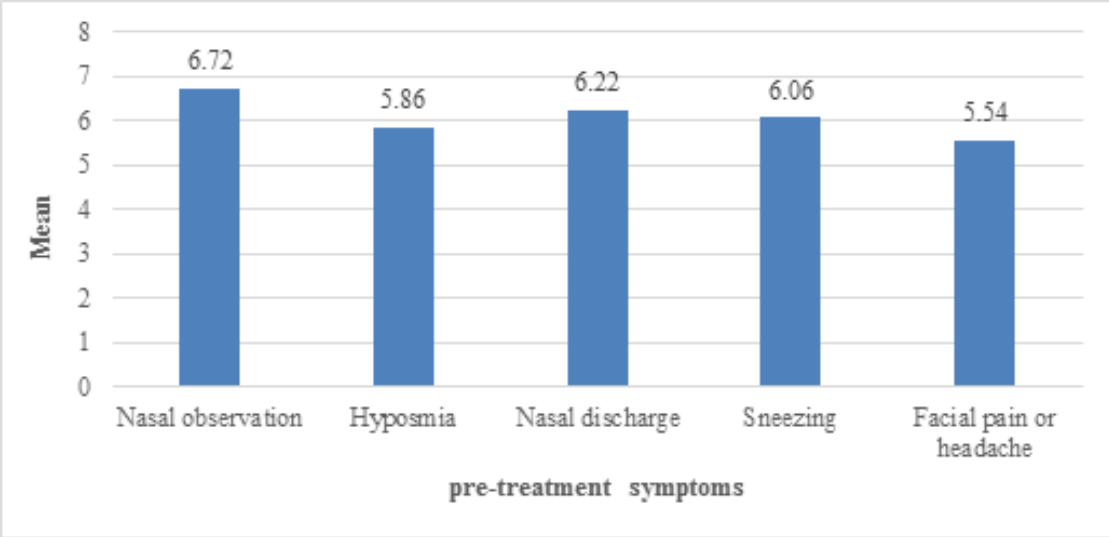


Chart 1: Bar chart of descriptive analysis of pre-treatment symptoms in study population (N=50)

- Post – treatment obervations

Table 2: Descriptive analysis of post treatment symptoms in study population (N=50)

Post treatment symptoms	Mean ± SD	Median	Min	Max	95% C.I	
					Lower	Upper
Nasal obstruction	1.82 ± 1.17	2.00	0.00	4.00	1.49	2.15
Hyposmia	1.42 ± 0.73	1.00	0.00	3.00	1.21	1.63
Nasal discharge	1.24 ± 0.63	1.00	0.00	3.00	1.06	1.42
Sneezing	2.1 ± 0.54	2.00	1.00	3.00	1.95	2.25
Facial or headache	1.1 ± 0.3	1.00	1.00	2.00	1.01	1.19
Total VAS	7.68 ± 2.62	7.50	2.00	14.00	6.93	8.43

The mean nasal observation was 1.82 ± 1.17in the study population. Range between was 0 to 4 (95% CI 1.49 to 2.15). The mean hyposmia was 1.42 ± 0.73in the study population. Range between was 0 to 3 (95% CI 1.21 to 1.63). The mean nasal discharge was 1.24 ± 0.63in the study population. Range between was 0 to 3 (95% CI 1.06 to 1.42). The mean sneezing was 2.1 ± 0.54in the study population. Range between was 1 to 3 (95% CI 1.95 to 2.25). The mean facial pain or headache was 1.1 ± 0.3in the study population. Range between was 1 to 2 (95% CI 1.01 to 1.19). The mean total VAS was 7.68 ± 2.62in the study population. Range between was 2 to 14 (95% CI 6.93 to 8.43).

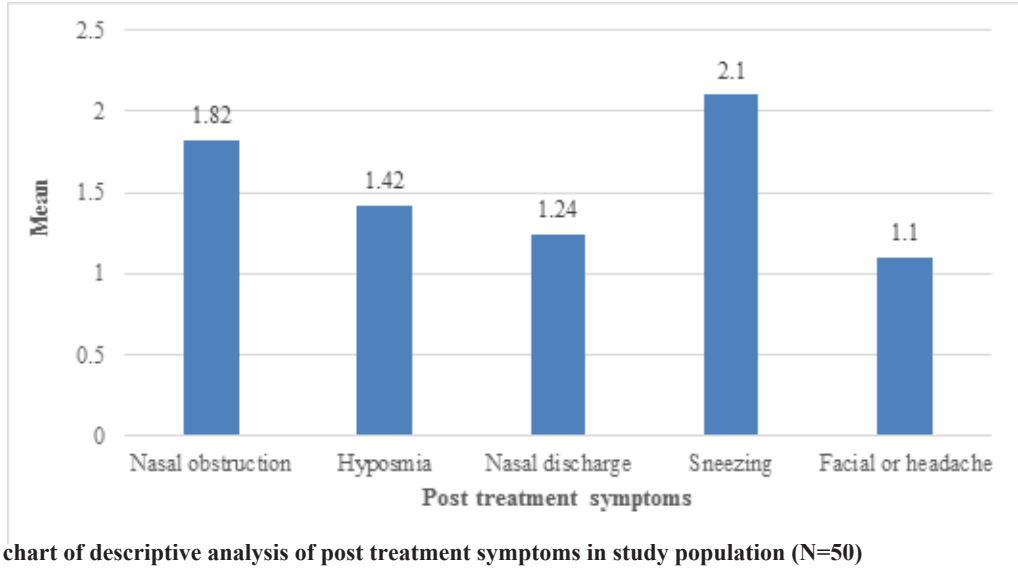

Chart 2: Bar chart of descriptive analysis of post treatment symptoms in study population (N=50)

- Comparison of results

Table 3: Comparison of pre and post treatment symptoms (N=50)

Symptoms	Pre treatment	Post treatment	Wilcoxon signed test P value
Nasal obstruction (Median (IQR))	7(6 to 7)	2 (1 to 3)	<0.001
Hyposmia (Median (IQR))	5 (5.50 to 7)	1 (1 to 2)	<0.001
Nasal discharge(Median (IQR))	6 (6 to 7)	1 (1 to 2)	<0.001
Sneezing (Median (IQR))	6 (5to 7)	2 (2 to 2)	<0.001
Facial pain (Median (IQR))	5 (5to 6)	1 (1 to 1)	<0.001
Total score VAS (Median (IQR))	30.50(28 to 32)	7.50 (6 to 10)	<0.001

Among the study population, the median nasal obstruction was 7(IQR 6 to 7) of pre-treatment and 2 (IQR 1 to 3)of post treatment. The difference in between pre and post treatment nasal obstruction was statistically significant (p value<0.001).Among the study population, the median hyposmia was 5 (IQR 5.50 to 7) of pre-treatment and 1 (IQR 1 to 2)of post treatment. The difference in between pre and post treatment hyposmia was statistically significant (p value<0.001).Among the study population, the median nasal discharge was 6 (IQR 6 to 7) of pre-treatment and 1 (IQR 1 to 2) ofpost treatment. The difference in betweenpre and post treatment nasal discharge was statistically significant (p value<0.001).Among the study population, the median sneezing was 6 (IQR 5to 7) of pre-treatment and 2 (IQR 2 to 2)of post treatment. The difference in between pre and post treatment sneezing was statistically significant (p value<0.001).Among the study population, the median facial pain was 5 (IQR 5to 6) of pre-treatment and 1 (IQR 1 to 1)of post treatment. The difference in between pre and post treatment facial pain was statistically significant (p value<0.001).Among the study population, the median total score was 30.50 (IQR 28 to 32) of pre-treatment and 7.50 (IQR 6 to 10)ofpost treatment. The difference in between pre and post treatment total score was statistically significant (p value<0.001).

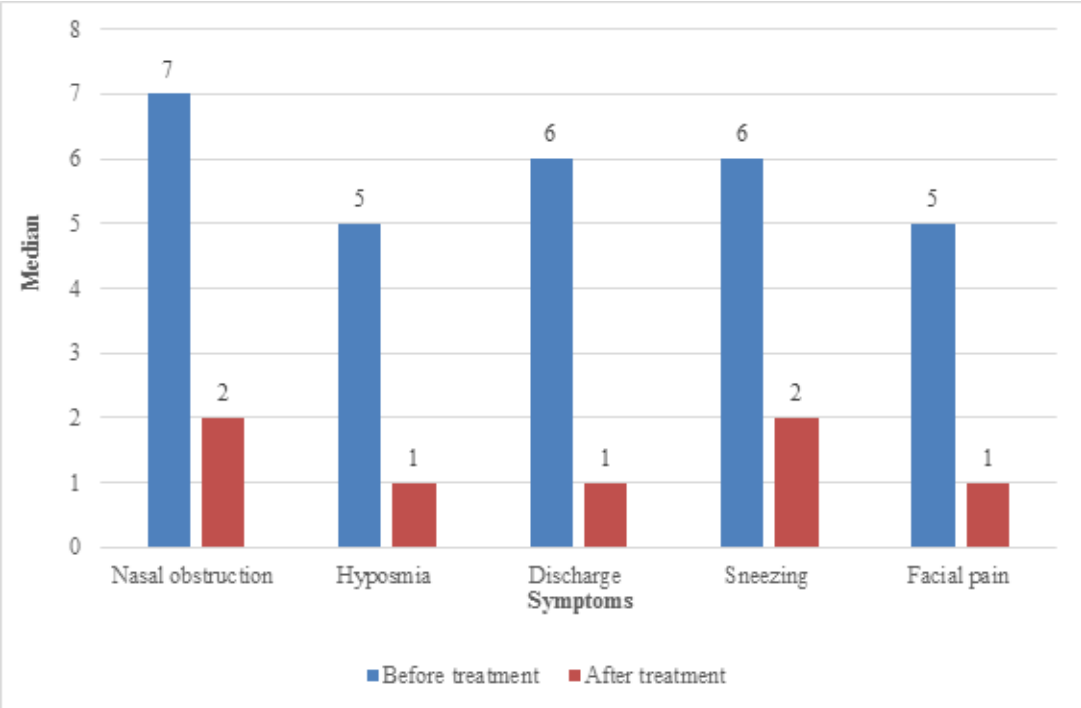

Chart 3: Bar chart of comparison of pre and post treatment symptoms (N=50)

Discussion

The evaluation of nasal polyposis is presently a lack of valid specific instruments to measure QOL. This study has been developed to highlight the effects of treatment of NP on QOL. Our study includes 50 patients aged between 18-60 years .All patients with nasal polyposis grade 1 or 2 according to the Lund and Kennedy grading were treated with the same regime for 8 weeks .

Radenne et al. exhibited that intranasal steroids improved the indications and the QoL in patients with NP especially in body torment, general prosperity, hugeness, social working, and mental health spaces. Van Camp and Clement showed an unquestionable improvement in nasal symptoms especially for nasal hindrance and loss of the sentiment of smell. In the latest decade, intranasal steroids have gotten affirmation as an elective treatment of restorative method for NP. Holmberg et al. shown that intranasal fluticasone or beclomethasone are persuading in lessening nasal signs when wandered from fake treatment. Joined oral and intranasal steroids seem, by all accounts, to be incredible to treat NP by improving the sentiment of smell, nasal obstacle, and other nasal symptoms .Jankowski and Bodino showed that nasal square was an important protesting of NP patients and the suffering cure of olfactory brokenness can be practiced through the blend of nasalization and low part of nasal steroids

Conclusion

The supportive practicality was overviewed dependent on the modification of the most constantly experienced clinical symptoms in nasal polyposis .In the present assessment results relied upon visual straightforward scale and three reactions of nasal polyposis rise above over all the others; the nasal snag , nasal discharge , sneezing records were separately recorded as 7.00 , 6.00 , 6.00 repectively. The other clinical issue (i.e., front and back rhinorrhea, and facial anguish) were generously less nonstop or possibly less discomforting. With steroid treatment nasal block , nasal discharge , wheezing records were diminished to .00 , 1.00, 2.00 separately. The total VAS score lessened from 30.5 to 7.50 which makes the p regard under .001. This quantifiable data examination shows the improvement in Quality of Life of patients with nasal polyposis on steroid treatment.

All things considered, these results suggest that NP significantly influences QoL, the treatment with a short-course of oral steroids exceptionally improve the QoL of patients with nasal

Post treatment was considered as essential result variable. Pre treatment was considered as essential illustrative variable.

All out results were thought about between study gatherings utilizing Mcnemar Chi square. P esteem < 0.05 was considered measurably noteworthy. IBM SPSS rendition 22 was utilized for factual analysis.

The Role of Computed Tomography in Evaluation of Nasal Polyposis

P. Mohan Kumar[1], Savitha A K[1], S. Suthanthira Kannan[1]

[1]Assistant Professor, Dept. of Community Medicine, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Plain film radiography was once the imaging modality of choice for assessment of sinonasal cavity. But they are of no value in the diagnosis of nasal polyps although they may confirm opacification of the sinuses. However, these standard views provide only limited display of Plain radiographs have now been replaced by CT (Computed Tomography) for the evaluation of sinonasal pathology. CT provides excellent bone detail and accurate soft tissue details. CT is used routinely to evaluate thee extent of the inflammatory disease and to assess important anatomical landmarks like anterior ethmoid cells, middle turbinate, osteomeatal complex, upper two thirds of nasal cavity and frontal recess area which plays key roles in the pathogenesis of sinonasal polyps. CT is universally accepted as the gold standard investigation for anatomical evaluation of paranasal sinus disease.

Keywords: *ethmoid cells, osteomeatal complex, opacification*

Introduction

The nose and paranasal sinuses are vital structures which are affected by a number of inflammatory as well as benign or malignant neoplastic conditions[7]. Millions of people suffer from inflammatory disease of paranasal sinus in India and all over the world. Sinonasal polyps are lesions that arise from the mucosa of the nasal cavity or the paranasal sinuses. The prevalence of Nasal Polypois(NP) in general population is measured to be around 4 % with a preponderance among males and patients older than 20. [4-5]

Etiology of NP is indefinite. Most theories consider polyps as an outcome of chronic inflammation and therefore conditions leading to chronic inflammation in the sinonasal mucosa can lead to nasal polyps.[8] Anatomical factors also plays a vital role in the etiology of NP as nasal polyps are mainly situated in the middle meatus and they arise from the mucous membrane at the outlets from the paranasal sinuses. Due to unknown etiology, treatment options vary and no one treatment has been found to be universally acceptable. Common medical conditions associated with polyps are non-allergic asthma, aspirin intolerance and cystic fibrosis, ciliary motility disorders.[1-3]

Their main presenting symptom is nasal obstruction, watery rhinorrhea, mucopurulent postnasal drip,. Hyposmia and anosmia, head ache or facial pain. Diagnosis of NP is made by rhinoscopy: anterior and posterior. The diagnosis is often simpler if a probe is used for gentle palpation as polyps are insensitive [Probe test]. [6-8]

Radiologic evaluation has been relied upon in the diagnosis of paranasal sinus pathology for many years. Plain radiographs of the paranasal sinuses.

Aim

This study aimed to show the importance of CT scan in evaluation of extent of disease in patients with sinonasal polyposis and its changes with medical management.

Materials and Method

The present prospective study was conducted in the department of Otorhinolaryngology of Sree Balaji Medical College and Hospital , Chennai.The study period was from February 2017 to September 2018 .

The study population was the 50 patients who presented to outpatient room of department of otorhinolaryngology with complaints of nasal obstruction , nasal discharge , headache , anosmia , allergic symptoms. Study group included patients aged between 18-60 . To avoid the influence on therapeutic effectiveness, the patients with bronchial asthma and aspirin sensitivity were excluded. All the patients were evaluated and diagnosis confirmed by Diagnostic Nasal Endoscopy and Computed Tomography. All scans were done using 3 mm thickness coronal planes. An assessment was then carried out to evaluate the anatomical variations and extent of disease in the CT scan of paranasal sinuses. CT scans were evaluated according to Lund–Mackay scoring system[13].

All the patients under study population were given oral corticosteroid (deflacortisone) at a daily dosage of 18mg (6 mg tds) for 3 weeks and intranasal steroid spray (fluticasone propionate) at a daily dosage of 160 mcg(80 mcg bd) in each nasal cavity for 8 weeks.[12]

Computed Tomography of paranasal sinuses were repeated at the completion of medical treatment. Again all scans were done using 3 mm coronal sections and were evaluated using Lund and Mackay scoring system [10] .

Data were documented using IBM SPSS version 22 was used for statistical analysis. P value < 0.05 was considered statistically significant.[10]

Findings

In the present study 50 patients were evaluated and data documented. Protocol for medical management were followed for all patients. CT paranasal sinus were taken for all patients before and after medical therapy and evaluated according to Lund and Macka scoring system and data were documented.

Post treatment was considered as primary outcome variable. Pre treatment was considered as primary explanatory variable.

Categorical outcomes were compared between study groups using Mcnemar Chi square. P value < 0.05 was considered statistically significant. IBM SPSS version 22 was used for statistical analysis.IBM SPSS version 22 was used for statistical analysis.

Table1: Pre-treatment Status of CT scan finding according to Lund MacKay staging

Sinus	Grade 0	Grade 1	Grade 2
Anterior ethmoid	0 (0%)	6 (12%)	44 (88%)
Posterior ethmoid	3 (6%)	20 (40%)	27 (54%)
Maxillary	9 (18%)	25 (50%)	16 (32%)
Sphenoid	20 (40%)	24 (48%)	6 (12%)

Among the people with anterior ethmoid sinus, 6 (12%) participants had grade 1 and 44 (88%) participants had grade 2. Among the people with posterior ethmoid sinus, 3 (6%) participants had grade 0, 20 (40%) participants had grade 1 and 27 (54%) participants had grade 2. Among the people with maxillary sinus, 9 (18%) participants had grade 0, 25 (50%) participants had grade 1 and 16 (32%) participants had grade 2. Among the people with sphenoid sinus, 20 (40%) participants had grade 0, 25 (50%) participants had grade 1 and 6 (12%) participants had grade 2.[4,6]

Table 2 : Post-treatment Status of CT scan finding according to Lund MacKay staging

Sinus	Grade 0	Grade 1	Grade 2
Anterior ethmoid	9 (18%)	26 (52%)	15 (30%)
Posterior ethmoid	12 (24%)	25 (50%)	13 (26%)
Maxillary	23 (46%)	17 (34%)	10 (20%)
Sphenoid	33 (66%)	13 (26%)	4 (8%)

Among the people with anterior ethmoid sinus, 9 (18%) participants had grade 1, 26 (52%) participants had grade 1 and 15 (30%) participants had grade 2. Among the people with posterior ethmoid sinus, 12 (24%) participants had grade 0, 25 (50%) participants had grade 1 and 13 (26%) participants had grade 2. Among the people with maxillary sinus, 23 (46%) participants

had grade 0, 17 (34%) participants had grade 1 and 10 (20%) participants had grade 2. Among the people with sphenoid sinus, 33 (66%) participants had grade 0, 13 (60%) participants hade grade 1 and 4 (8%) participants had grade 2.[4-6]

Table 3 : Comparison of CT scan status of anterior ethmoid grade pre and post treatment(N=50)[2,5]

Pre-treatmentanterior ethmoid grade	Post treatment ANT ethmoid grade		
	Grade0	Grade1	Grade
Grade1(6)	6 (100%)	0 (0%)	0 (0%)
Grade2(44)	3 (6.8%)	26 (59.1%)	15 (34.1%)

**No statistical test was applied- due to 0 subjects in the cells.*

Out of 6 patients with Grade 1 polyp , all 6 patients became grade 0 with treatment. While out of 44 patients with grade 2 polyp , 26 and 3 patients became grade 1 and grade 0 respectively and 5 patients remained grade 2.[1,3]

Table 4: Comparison of CT scan status of posterior ethmoid grade pre and post treatment(N=50)

Pre-treatment-posterior ethmoid grade	Post treatment Post ethmoid grade			McNemar P-value
	Grade 0	Grade 1	Grade 2	
Grade0(3)	3 (100%)	0 (0%)	0 (0%)	<0.001
Grade1(20)	9 (45%)	11 (55%)	0 (0%)	
Grade2(27)	0 (0%)	14 (51.9%)	13 (48.1%)	

**No statistical test was applied- due to 0 subjects in the cells.*

All 3 patients with grade 0 remained the same.Out of 20 patients with Grade 1 polyp , 9 patients became grade 0 and 11 patients remained as grade 1 with treatment. While out of 27 patients with grade 2 polyp , 14 patients became grade 1 and 13 patients remained grade 2

Table 5: Comparison of CT scan status of OMC pre and post treatment(N=50)

Pre-treatment OMC grade	Post treatment OMC grade		McNemar P-value
	Grade 0	Grade 2	
Grade0(16)	16 (100%)	0 (0%)	0.001
Grade2(34)	12 (35.3%)	22 (64.7%)	

**No statistical test was applied- due to 0 subjects in the cells.*

All 16 patients with grade 0 remained the same. While out of 34 patients with grade 2 polyp , 12 patients became grade 0 and 22 patients remained grade 2

Table 6: Comparison of CT scan status of maxillary sinus pre and post treatment(N=50)

Pre-treatment-maxillary grade	Post treatment maxillary grade			McNemar P-value
	Grade 0	Grade 1	Grade 2	
Grade0(9)	9 (100%)	0 (0%)	0 (0%)	<0.001
Grade1(25)	14 (56%)	11 (44%)	0 (0%)	
Grade2(16)	0 (0%)	6 (37.5%)	10 (62.5%)	

**No statistical test was applied- due to 0 subjects in the cells.*

All 9 patients with grade 0 remained the same.Out of 25 patients with Grade 1 polyp , 14 patients became grade 0 and 11 patients remained as grade 1 with treatment. While out of 16 patients with grade 2 polyp , 6 patients became grade 1 and 10 patients remained grade 2

*No statistical test was applied- due to 0 subjects in the cells.

All 20 patients with grade 0 remained the same. Out of 24 patients with Grade 1 polyp , 14 patients

became grade 0 and 10 patients remained as grade 1 with treatment. While out of 6 patients with grade 2 polyp , 2 patients became grade 1 and 4 patients remained grade 2

Discussion

Nasal polyps has a notable impact on the quality of life. Nasal polyps typically present in adults with slight male preponderance and more common among fourth decade age group.

The normal functioning of the nasal and sinus mucosa depend primarily on the ventilation and drainage. Anatomical factors plays a vital role in initiation of this inflammatory cascade of the sinonasal pathway and thus ultimately resulting in obstruction of the sinonasal pathway

According to Mackay and Lund, the ostiomeatal complex acts a drainage pathway for maxillary, anterior ethmoids and frontal sinuses. Any obstruction thus increases the propensity of impairment of mucociliary clearance. Secretions may then be retained at the site, creating the potential for infection even without ostial closure.

Most common sinus involved was anterior ethmoid followed by, maxillary sinus , posterior ethmoid, frontal and sphenoid sinuses. Present study correlates well with studies done by Suthar et al., \ Chaitanya CS et al., Kushwah APS et al., In all the studies sphenoid was least involved, which is also observed in the present study.. Among the study population most commonly involved sinus was anterior ethmoid (88%) followed by posterior ethmoid (54%)

With respect to anterior ethmoid sinus ,out of 6 patients with Grade 1 polyp , all 6 patients became grade 0 with treatment. While out of 44 patients with grade 2 polyp , 26 and 3 patients became grade 1 and grade 0 respectively and 5 patients remained grade 2. These observations were purely based on assessment of extent of disease in computed tomography.A value less than 0.001 shows the significant improvement of disease with medical management.

With respect to posterior ethmoid sinus ,All 3 patients with grade 0 remained the same.Out of 20 patients with Grade 1 polyp , 9 patients became grade 0 and 11 patients remained as grade 1 with treatment. While out of 27 patients with grade 2 polyp , 14 patients became grade 1 and 13 patients remained grade 2. These observations were purely based on assessment of extent of disease in computed tomography.A value less than 0.001 shows the significant improvement of disease with medical management.

With respect to osteomeatal complex ,All 16 patients with grade 0 remained the same. While out of 34 patients with grade 2 polyp , 12 patients became grade 0 and 22 patients remained grade 2. These observations were purely based on assessment of extent of disease in computed tomography. A value less than 0.001 shows the significant improvement of disease with medical management.

With respect to maxillary sinus, All 9 patients with grade 0 remained the same. Out of 25 patients with Grade 1 polyp , 14 patients became grade 0 and 11 patients remained as grade 1 with treatment. While out of 16 patients with grade 2 polyp , 6 patients became grade 1 and 10 patients remained grade 2. These observations were purely based on assessment of extent of disease in computed tomography. A value less than 0.001 shows the significant improvement of disease with medical management.

With respect to sphenoid sinus, all 20 patients with grade 0 remained the same.Out of 24 patients with Grade 1 polyp , 14 patients became grade 0 and 10 patients remained as grade 1 with treatment. While out of 6 patients with grade 2 polyp , 2 patients became grade 1 and 4 patients remained grade 2. These observations were purely based on assessment of extent of disease in computed tomography. A value less than 0.001 shows the significant improvement of disease with medical management.

So to conclude Computed Tomography not only helps in diagnosis , but also aids to assess the progress of disease during treatment. From our study it was concluded that anterior ethmoid sinus were the most common paranasal sinus involved followed by posterior ethmoid and maxillary sinuses. Sphenoid sinus were the least involved sinus. Anterior ethmoids and posterior ethmoids showed better response with medical management comparing to the results observed at OMC , maxillary sinus , sphenoid sinus in post treatment CT PNS. Thus computed Tomography helps to assess the treatment response also.[11-13]

Conclusion

To conclude CT of the nose and paranasal sinuses

is still the ideal imaging method to investigate nasal and paranasal sinus diseases with a high sensitivity signifying the importance of radiological assessment in all cases of nasal polyposis. It not only helps in diagnosis , but also to assess the progress of disease during treatment. From our study it was concluded that anterior ethmoid sinus were the most common paranasal sinus involved followed by posterior ethmoid and maxillary sinuses. Sphenoid sinus were the least involved sinus. Anterior ethmoids and posterior ethmoids showed better response with medical management comparing to the results observed at OMC , maxillary sinus , sphenoid sinus in post treatment CT PNS. Thus computed Tomography helps to assess the treatment response also. Radiology proves to be indispensable in cases of nasal polyps as it provide a road map to the endoscopic surgeon and warns one of any existing or impending complications.

Abstract

Epstein Barr Virus (EBV or Human herpesvirus 4) belongs to the genus Lymphocryptoviridae, the gamma 1 subtype of the Subfamily Gamma herpes viridae and is one of the most common viruses in humans. It is present in all populations, infecting more than 95% of all individuals within the first four decades of life.In developing countries,infections occur very early in life with no specific characteristics other than the general symptoms of acute viremia. In developed countries however, the infection is usually delayed until adolescence or early childhood years where it causes infectious mononucleosis, a benign self-limiting lymphoproliferative disorder [1].Though the infection with EBV is benign in the acute stages and latent in the chronic phase in the vast majority of people,the virus has been demonstrated to be involved in the development of many malignancies with the list of such malignancies progressively increasing. The first association was with the endemic Burkitt's lymphoma[1]. Subsequently, other lymphomas(subtypes of Hodgkin's and non-hodgkin's lymphomas)are also known to be associated with EBV infection. Epithelial malignancies such as lymphoepitheliomas of nasopharynx and stomach are included in the list of EBV associated tumors. Tumors arise as a result of genetic and epigenetic alterations produced by the virus, which transforms the normal cell into an immortalized proliferating cell [2].Since Burke et al first detected EBV in undifferentiated lymphoepithelioma like gastric cancer in 1990,many researches are undertaken to prove the same [3].EBV expresses latent membrane protein which can be detected immune histochemically. Our study is aimed at detecting the EBV expression in gastric carcinoma cells.

Keywords: *lymphoepitheliomas, EBV, Lymphocryptoviridae, acute viremia*

Introduction

Epstein Barr virus(EBV),also called Human Herpes Virus 4 (HHV-4), is a member of the Herpesviridae family.It is ubiquitous in nature and infects more than 90% of adult population worldwide.Primary infection normally occurs in childhood or early adulthood through salivary contact.Majority of children are asymptomatic,but some adolescents and young adults can develop infectious mononucleosis with harmless clinical manifestations[4]. EBV is composed of a linear double-stranded DNA genome surrounded by an icosahedral nucleocapsid which encodes about 85 genes.

EBV is divided into 2 major types,EBV-1/EBV-A and EBV-2/EBV-B.Worldwide EBV-1/EBV-A is the most frequent type while EBV-2/EBV-B is more characteristic in Africa .

Gastric Carcinoma:

Epidemiology:

Gastric cancer (GC) is the sixth most common malignancy in both sexes worldwide with nearly one million new cases estimated in 2012 (952.000 cases). The incidence rates are twice higher in males than in females. Nevertheless, age standardized rates (ASR) show that carcinoma of stomach is the fourth most frequent in men and the sixth in women. Despite a significant reduction of incidence and mortality rates

Corresponding Author :
Dr.Arshad A.R , Final year M.S Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

over the past few decades, GC still remains the third leading cause of death by cancer. Approximately, 8% of cancer-related mortality in world is attributed to tumors of stomach[2]. It is a major health problem with a distinct distribution according to geographical areas, socio-economic conditions and ethnic diversity. More than 70% of total cases occur in developing regions being the Eastern Asia (half cases in China), Eastern Europe and Latin America the areas with the highest age-standardized incidence rates. In contrast, the lowest incidence rates are observed in United States, Australia and some North European countries

Classification:

Gastric tumors are classified anatomically and histologically. Anatomically, GC is divided into proximal and distal tumors depending on their localization of stomach. Proximal tumors are found in cardia region whereas distal carcinomas are often located in the antrum/ pyloric region. Histologically, tumors of stomach show high heterogeneity at both architectural and cytological level that makes it difficult for the establishment of well-defined classification system. Some classifications have been established to classify the histologic pattern of gastric adenocarcinomas: Ming, Carneiro and Goseki, but the most commonly used are those of World Health Organization (WHO) and Lauren [5].

Lauren's classification is an essential system in gastric cancer history that over time have contributed to describe an association with several environmental factors, incidence trends and etiology. According to this classification, the two major histologic subtypes are intestinal and diffuse adenocarcinomas. The other types are classified to indeterminate type, when carcinoma is too undifferentiated and co-exist histological features, or uncommon variants . The relative frequencies are approximately 54% for intestinal type, 32% for the diffuse type and 15% for the indeterminate type.

Lymphoepithelioma-like carcinomas or medullary carcinomas are described by WHO as an uncommon subtype but are not represented in the Lauren's classification. This specific tumor, which is characterized by uniform proliferation of cancer cells throughout the lymphoid stroma, represents about 4% of all gastric carcinomas and more than approximately 80% of cases have EBV-infected cells .

Material and Method

Source of Data:

This prospective study was carried out inthe Department of Pathology, Sree Balaji Medical College and Hospital, with the help of Department of Medical Gastroenterology, Sree Balaji Medical College and Hospital, duringOctober 2016 to September 2018. A total of 43 cases suspected with gastric malignancy were taken for the study. Out of which, only 30 were proven to be malignant.So, only these 30 cases were included in the study.

Inclusion Criteria:

All cases of gastric malignancy detected by histopathology irrespective of age were included for study.

Exclusion Criteria:

Those with poor clinical data were excluded from thestudy. Proven cases of gastric malignancy due to the non-availability of the blocks(blocks that were taken for treatment purpose and and second opinion)were excluded from the study.

Method of Data Collection:

Out of the 43 cases, 32 cases were proven to be malignant,out of which 30 cases had adequate clinical data were included in the study.Those materials were processed and sections were cut at 5 microns. Hematoxylin and eosin staining of sections wasdone. Histopathological examination of these sections weredone.

LMP-1 immunohistochemical marker was used to demonstrate EBV in tissue sections.

IHC Markers Used

Latent membrane protein-1 (CS1-4 antibody) was used in all the gastric carcinoma cases. Section of nasopharyngeal carcinoma was taken as control for LMP-1. Immunostaining was scored on the basis of positive tumor cells and the relative immunostaining intensity. Five consecutive microscopic fields were analyzed.

Findings

This study was conducted in Sree Balaji medical college, Chennai, India. A total of 30 gastric carcinoma

diagnosed over a period from 2016-2018 was selected. Out of which, 19 patients were male (63%), and 11 patients were female (37%) with a sex ratio of 2:1. The mean age of patients was 58 years (range 29 years to 80 years).

Common Symptoms

Table-1 : Common Symptoms

Common Symptoms	Percentage
Upper abdominal pain (Epigastric pain)	59%
Loss of weight	31%
Nausea and vomiting	5%
Loss of appetite (cachexia)	3%
GI Bleeding (Malena)	2%

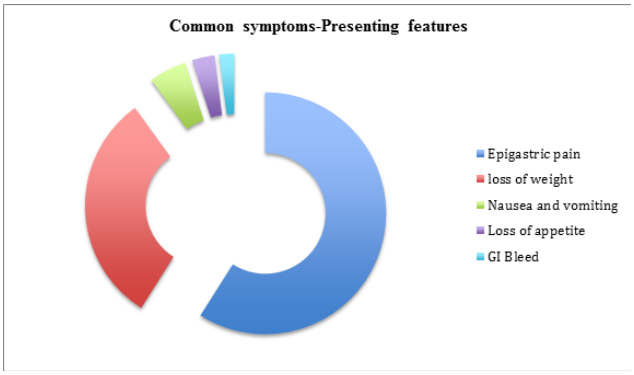

Chart 1: Common Symptoms

Pathological Features Tumour Location

In 18 (60%) cases, the tumor was located in antrum/ pylorus. In 4 (13%) cases the tumor was found in body of the stomach, and in 8 (27%) cases in the fundus/cardia of the stomach.

Table – 2: Tumor Location

Location	No. of cases
Antrum/pylorus	18
Body of the stomach	4
Fundus/cardia of the stomach	8
Total	30

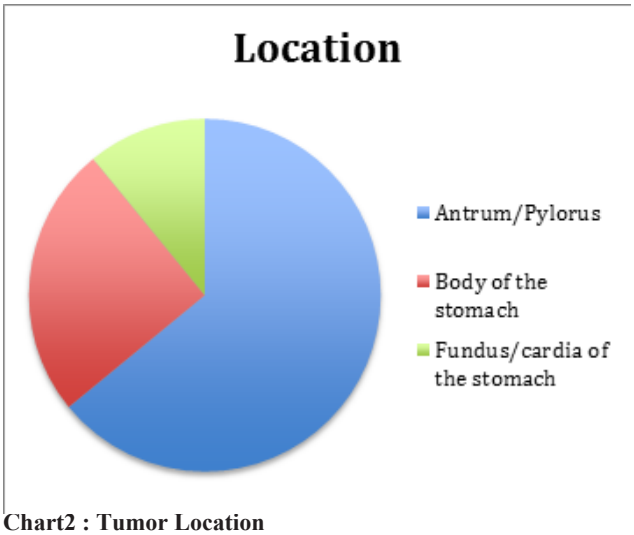

Chart2 : Tumor Location

Tumour Type Who 2012 Classification

According to the WHO classification, of the 30 cases of gastric carcinomas, 17 were classified as tubular adenocarcinoma, 8 cases as poorly cohesive carcinoma, 5 were mixed adenocarcinoma and 1 case was diagnosed to be carcinoma with lymphoid stroma.

Table- 3 : Tumor Type According to who 2010 Classification

Types	No. of cases
Tubular adenocarcinoma	17
Poorly cohesive carcinomas	08
Mixed adenocarcinomas	04
Carcinoma with lymphoid stroma	01
Total	30

According to Lauren Classification

Based on Lauren classification of gastric carcinoma, 23 were intestinal type carcinomas, 4 were diffuse type carcinomas, 2 were indeterminate type and 1 was lymphoepithelioma like carcinoma.

EBV Immunohistochemistry Results

Table 4: EBV Expression In Different Histological

TYPES (Based on WHO 2010 Classification)

HISTOLOGICAL TYPES	EBV EXPRESSION
Tubular adenocarcinoma type	0
Poorly cohesive adenocarcinoma type	**01**
Mixed adenocarcinoma type	0
Carcinoma with lymphoid stroma	**01**
TOTAL	**02**

TABLE-5 : Based on Lauren classification

HISTOLOGICAL TYPE	EBV EXPRESSION
Intestinal type adenocarcinoma	01
Diffuse type adenocarcinoma	0
Indeterminate type adenocarcinoma	0
Lymphoepithelioma like carcinoma	01
TOTAL	02

Out of 30 gastric carcinoma cases, 02 showed EBV expression. Both these patients were male and aged above 65 years.

Latent membrane protein -1 expression in tumor cells , studied using anti LMP-1 antibody immunohistochemistry was assessed using a scoring system based on the percentage of positive cells and the intensity of staining (commonly used in nasopharyngeal carcinomas).

Scoring Method

- 0 - none seen in the section
- 1 - presence of rare positive cells but not exceeding 25%
- 2 -26 to 50% positive cells
- 3 -51 to 75% positive cells
- 4 -76 to 100% positive cells

IMMUNOSTAINING INTENSITY

- 0 -none
- 1 -weak
- 2 -moderate
- 3 -intense

TABLE-6: Details of LMP1 Positive Cases

S.NO.	AGE/SEX	HPE (WHO)	HPE (LAUREN)	SITE	EBV (LMP-1)
1.	80/M	Carcinoma with lymphoid stroma	Lymphoepithelioma like carcinoma	Fundus/Cardia	Positive
2.	77/M	Poorly cohesive adenocarcinoma	Intestinal type carcinoma	Fundus/ Cardia	Positive

TABLE-7 : LMP-1 Immunohistochemistry Scoring

AGE/SEX	TUMOR GRADE	STAINING INTENSITY (A)	PERCENTAGE OF LMP-1 POSITIVE CELLS (B)	TOTAL SCORE (A + B)
80/M	Undifferentiated carcinoma	WEAK TO MODERATE (2)	Positive cells not exceeding 25% (1)	2 + 1 (3)
77/M	Poorly differentiated carcinoma	MODERATE (2)	Positive cells not exceeding 25% (1)	2 + 1 (3)

Both the LMP-1 positive cases in our study were observed to have a score of 3.

Discussion

Gastric carcinoma is a serious public health problem worldwide with high rates of mortality. GLOBOCON 2012 statistical data revealed about 951,600 newly diagnosed gastric cancer cases.In 2012 deaths due to gastric carcinoma worldwide was around 720,000 [7].

The symptoms and sign of the stomach cancer are often reported late when the disease is already in advanced stages and 5-year survival is less than 30% in developed countries and around 20% in developing countries.This indicates the need for an early diagnosis and treatment strategies to

improve the survival. The present study assess the age distribution, sex distribution, relationship between EBV and sporadic Indian GC and the role of latent membrane protein -1 in GC detection.

In general, our study showed male predominance accounting 64 % of all GC cases and the mean age was of 58 years old suggesting that gastric cancer appear more often in older individuals. These finding are in agreement with literature which also has described the occurrence of gastric carcinomas in male and older patients .

Most of the patients in this study,presented with upper abdominal pain (62.5%) and loss of weight(30%). Others (7.5%) presented with nausea,vomiting and upper GI bleed.Out of 30 cases, 17 were tubular adenocarcinoma, 8 were poorly differentiated carcinoma, 5 were mixed carcinoma and 1 was carcinoma with lymphoid stroma (according to WHO classification).23 were intestinal type carcinoma, 04 were diffuse type carcinoma, 02 were indeterminate type carcinoma and 1 was lymphoepithelioma like carcinoma (according to Lauren's classification).

Over past the 30 years, there have been described a new subset of gastric cancer, EBVaGC. In fact, about 10% of all GC have been associated with EBV infection however, the role of EBV in gastric carcinogenesis remains unclear . Recently, two studies suggested a new classification based on molecular features of gastric tumors and in these classifications arise a new four subtypes of gastric cancers: tumors positive for Epstein–Barr Virus, microsatellite unstable tumours, genomically stable tumors and tumors with chromosomal instability . To confirm, the association of EBV in a given tumor, the virus must be detected with in the tumor cells.

As per literature LMP-1 potentiates a variety of signaling pathways including the nuclear factor kb, Mitogen activated protein kinase,and phosphotidylinositol 3 –Kinase Alt pathways and involved is angiogenesis which is a key step in tumor growth, invasion and metastasis So the presence of EBV in gastric carcinoma cells can be confirmed by the presence of LMP-1 staining.

Immunohistochemistry was done with latent membrane protein- 1 and it was found that LMP-1 was positive in 2 out of 30 gastric carcinoma cases.This study showed that the prevalence of EBV in gastric tumors is of 6.6%. These findings are in agreement with previous studies. Studies have demonstrated that high EBV-positive rate has been found in low-incidence area and low EBV-positive rate has been found in a high gastric-cancer incidence area. Sousa, et al. (2008) in a systematic review demonstrated that North of America (region with low prevalence in GC) has shown an association between EBV and GC of 12.9%; conversely, in regions with a high risk for GC (Asia), it was demonstrated that EBVaGCs accounted only 7.99% of all gastric cancers.

The same relationship is verified in our study since we observed a low prevalence of EBVaGC (6.6%), a considered country with high incidence of GC. Considering other risk factors for GC development, we found that male predominance is also a strong characteristic of EBVaGC.

Regarding age distribution of patients with EBVaGC, it is yet little understood. In present study EBV-positive cases were observed in patients over than 65 years.Regarding the tumor location, we observed that in our study there was a high predominance of gastric tumors in the distal region (60%). Curiously, this is the anatomic location with lower prevalence of EBV. As previously reported, the presence of EBV has been mostly associated to body, and cardia region of stomach. Hence, our results which also showed a higher prevalence of EBVaGc in proximal regions, may explain the lower prevalence of EBVaGC in our study.

Histology-specific analysis of EBVaGC using Lauren's classification has shown controversial data. Chang et. al. (2001) and Corvalan et. al. (2001) demonstrated a strong EBV association with diffuse types, however Yoshiwara et. al. (2005) described an equal proportion between intestinal and diffuse types. In our study, EBVaGC was only found in intestinal-types

and lymphoepithelioma like carcinoma types without any case reported to diffuse-type.

Regarding the lymphoepithelioma-like carcinomas (LLCs) it was observed that all samples showed positivity for EBV. These findings are in agreement with literature which has described that more than 80% of LLCs are associated with EBV infection. Despite the low frequency of LLCs (about 4% of all gastric carcinomas), the pathologists should distinguish this subset of gastric cancer because it has been demonstrated that patients have a better prognosis when compared with other types of gastric cancer [8].

Available literature on EBV positive gastric carcinomas have not used the scoring system, generally employed in nasopharyngeal carcinomas. However, we attempted to use the scoring system and it was observed, that the scores were low, which is in consistent with the literature studies on nasopharyngeal carcinomas, which have also shown low scores in older age group and high scores in younger age group.

Abdel Majiid Khabir et al observed in his study that no biopsy is completely devoid of LMP-1 positive cells and he also suggested the use of S12 antibody which is more sensitive in staining tissue section than CS1-4 antibody. In this present study we used CS1-4 antibody for detecting the presence of EBV in tissue sections.

Despite the limitations of LMP-1, its simplicity, applicability to paraffin sections and its use as an indicator of progressiveness of the tumor has made it an attractive ancillary method for early diagnosis of EBV associated gastric carcinoma .

Conclusion

Hence our study justifies the role of EBV in the oncogenesis of gastric carcinoma. More elaborate and extensive studies are warranted to further emphasize this theory. Days would not be far off for a targeted therapy and an effective vaccine for EBV that would prevent primary infection or modulate its course leading to the reduction in the incidence of EBV associated gastric carcinoma, similar to the reduction of cervical cancer and hepatoma after HPV vaccine and hepatitis vaccine.

Proximal Femoral Nailing in Unstable Trochanteric Fractures -Demographic Study (Age, Sex and Mode of Injury)

P. Shalini[1], Natrajan Suresh[2], Hemalatha Ganapathy[3]

[1]Post Graduate, [2] Associate Professor, [3]Professor and Head, Department of Pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Objectives: The aim of this study is proximal femoral nailing in unstable trochanteric fractures – Demographic study (Age, Sex and mode of injury)

Place of Study: Sree Balaji medical college and hospital, Chrompet, Chennai.

Period of Study: The study began in March 2017 and went on till February 2018 (a total recruitment period of 12 months).

Study Design: Prospective study.

Materials and Method: The present study has been a prospective study, involving patients who had sustained unstable inter-trochanteric fractures. The study began in March 2017 and went on till February 2018 (a total recruitment period of 12 months). The study concluded in September 2018, so that there was a minimum follow-up of 7 months (mean 12.6; range 7 to 19 months).

Inclusion Criteria:

- Only unstable trochanteric fractures were included (AO-OTA 2.2, 2.3, 3.1, 3.2 and 3.3).
- Only fractures seen within 15 days of injury were included.
- Both male and female patients, in the age group of 46 to 65 years were included in the study.

Exclusion Criteria:

- Patients with displaced trochanteric fracture not conforming to the above parameters were excluded.
- Open and pathological fractures were excluded.
- Inability to walk independently, prior to fracture due to pre-existing stroke or CVA were excluded.

Follow Up Period: Minimum period of 7 months (mean 12.6; range 7 to 19 months).

Results and Conclusion: As per our study of 42 patients, approximately 28% of the patients were of the age group of 46 to 50 years, 26% of the patients were between 51 to 55 years, 26% were between 56 to 60 years and 19% were between the age of 61 to 65 years. We had a total of 38.10% (n=16) male and 61.90% (n=26) female patients, with a male to female ratio of 2 : 3.2, thus indicating a female preponderance.

Approximately, 88.10 % of the patients had sustained injury by accidental fall from standing height while, 11.90 % were injured by high energy road traffic accidents.

Keywords: *proximal femoral, trochanteric fractures, female preponderance*

Introduction

The demographics of world population are changing. More of the elderly people are living in the developing countries. Presently about three-fifths of the hip fracture occur in Asia which, it is predicted that will become almost one-half by the year 2050. Inter-trochanteric fractures are one of the most common fractures of the

hip occurring both in the young adults, as a result of high energy trauma and in the elderly, as a result of low energy trauma due to osteoporosis[1]. Problems of these fractures are: (a) they are associated with substantial morbidity and mortality, (b) mal-union is common, (c) implant failure like cut-out of head and penetration into hip is a complication, (d) it is a great financial burden to the family and, (e) it is most commonly associated with medical co-morbidities like diabetes and hypertension.[1-3]

These fractures are 3 to 4 times more common in the elderly women who are osteoporotic, in whom trivial trauma is by far the most common mode of injury[2,3]. These patients become confined to home and become dependent for their activities of daily living on others. One-half of these fractures that occur in the aged around the hip joint are of the trochanteric type and one-half of these are of the unstable variant.

Non-operative conservative management which was done earlier had resulted in an increased morbidity, as well as complications like mal-union with varus and external rotation deformity resulting in a short limb gait, non-union and a high rate of mortality due to complication of long recumbency and immobilisation which resulted in complications like decubitus ulcers, deep vein thrombosis, urinary tract infections, contracture of the joint, orthostatic pneumonia and renal calculi[2]. The goal of the treatment in inter-trochanteric fractures is the restoration of the patient to his or her pre-injury functional and ambulatory status at the earliest. Various fixation devices have been evolved to treat these fractures by internal fixation, thereby increasing patient comfort, facilitate nursing care, decrease hospital stay and hence to prevent complications of prolonged recumbency. It is a universal dictum to treat inter-trochanteric fractures with stable internal fixation as early as possible.[4-9]

Materials And Method

The present study has been a prospective study, involving patients who had sustained unstable inter-trochanteric fractures. The study began in March 2017 and went on till February 2018 (a total recruitment period of 12 months). The study concluded in September 2018, so that there was a minimum follow-up of 7 months (mean 12.6; range 7 to 19 months). [10-14]

Inclusion Criteria

- Only unstable trochanteric fractures were included (AO-OTA 2.2, 2.3, 3.1, 3.2 and 3.3).
- Only fractures seen within 15 days of injury were included.
- Both male and female patients, in the age group of 46 to 65 years were included in the study.

Exclusion Criteria:

- Patients with displaced trochanteric fracture not conforming to the above parameters were excluded.
- Open and pathological fractures were excluded.
- Inability to walk independently, prior to fracture due to pre-existing stroke or CVA were excluded.[15-19]

Follow Up Period:

Minimum period of 7 months (mean 12.6; range 7 to 19 months).

Findings

Table 1: Time elapsed between injury and surgery:

Time Interval (In Days)	No. of Patients 'N'	% Age
0 – 2	6	14.28
3 – 5	7	16.66
6 – 8	5	11.90
9 – 12	12	28.58
13 – 15	12	28.58
Total	**42**	**100**

Table 2: Fracture Pattern Distrbution:

AO CLASSIFICATION	No. of Patients 'n'	%age
Type A2.2	7	16.66
Type A2.3	14	33.33
Type A3.1	16	38.01
Type A3.2	-	-
Type A3.3	5	12.00
TOTAL	42	100

Table 3: Types of PFN Used:

PROXIMAL FEMORAL NAIL CHARACTERISTICS	**No. of patients 'n'**	**% age**
Long PFN 135 degree	9	21.42
Short PFN 135 degree	24	57.16
Short PFN 130 degree	9	21.42
TOTAL	**42**	**100**

Table 4: Intra-Operating Time: (Incision to Closure).

Operating Time (In Min)	**No. of Patients 'N'**	**%Age**
< 45	16	33.33
45 – 60	7	16.66
61 – 75	9	21.42
76 – 90	10	23.80
Total	42	100

As per our inclusion criteria, 42 patients were recruited for surgical fixation of unstable trochanteric fractures. Of these 42 patients, approximately 28% of the patients were of the age group of 46 to 50 years, 26% of the patients were between 51 to 55 years, 26% were between 56 to 60 years and 19% were between the age of 61 to 65 years. We had a total of 38.10% (n=16) male and 61.90% (n=26) female patients, with a male to female ratio of 2 : 3.2, thus indicating a female preponderance. [18]

Approximately, 88.10 % of the patients had sustained injury by accidental fall from standing height while, 11.90 % were injured by high energy road traffic accidents. The average time interval between the injury and surgery was 8.7 days (range of 0-15days). Among the 42 cases treated surgically, 49.99 % were of A2 type and 50.01 % were of the A3 type. Thus in our series, the fracture pattern distribution was found to be equal. The average operating time was 58 minutes (range 45 to 90 minutes). The type of implant used was a short PFN 135 degree in 57.16% (n=24). In 21.42% (n=9) the long PFN and the short PFN 130 degree was used).

Discussion

The fruitful treatment of between trochanteric cracks relies upon numerous variables ; the age of the patient, the patient's general wellbeing, the time passed from injury to treatment, simultaneous medicinal treatment and the security of obsession. The proper technique and the perfect embed utilized for these breaks are still bantered with defenders of the different methodologies and each asserting their points of interest over others. Numerous interior obsession gadgets have been suggested for the treatment of these cracks, including extra-medullary and intra-medullary inserts. [16]

The dynamic hip screw has remained the embed of decision for more than four decades due to its good outcomes and a moderately low pace of non-association and disappointment. It accommodates controlled pressure at the crack site. The utilization of DHS had been upheld by their profile mechanical properties which had been ventured to improve the mending of breaks. Notwithstanding, the DHS requires a moderately bigger introduction, more tissue dealing with and close to anatomical decrease, all of which builds the horribleness, the likelihood of a disease and a noteworthy blood misfortune. The probability of varus breakdown and the failure of the embed to get by until crack association were its fundamental disadvantages. The side-plate and screws weaken the bone mechanically. The common causes of this fixation failure were unstable trochanteric fractures, osteoporosis, a lack of anatomical reduction, failure of the fixation device and incorrect placement of the lag screw in the femoral head.

The PFN system, developed by AO/ASIF, has some major bio-mechanical innovations to overcome the previously mentioned limitations of the Gamma nail.

Addition of the 6.5 mm anti-rotation hip screw has helped to reduce the incidence of implant cut-out and the rotation of the cervico- cephalic fragment. In this respect, it should be borne in mind that the lag screw must be adjusted to the calcar, taking into account the need to place the de-rotational hip screw. The smaller diameter and the fluting of the tip of the nail, is especially designed in-order to reduce stress forces below the implant and thereby reducing the incidence of low-energy fracture at the tip. The PFN nail has been shown to prevent the fractures of the femoral shaft by having a smaller distal shaft diameter which reduces stress concentration at the tip. Intramedullary implants for internal fixation of the proximal femur withstands a higher static and a several-fold higher cyclical loading than does a DHS type of implant. The implant temporarily compensates for the function of the medial column.

In A1 and A2 breaks hub stacking prompts crack impaction, while in A3 cracks such impaction doesn't happen, and average removal of the distal section of the break will undoubtedly happen because of the precariousness factor. Because of its position near the weight-bearing hub the anxieties that are created on the intra-medullary inserts are irrelevant. The PFN embed likewise goes about as a brace in counteracting the medialization of the pole. Bio-mechanically, compared to a laterally fixed side plate, the Intra-medullary nail decreases the bending force on the hip joint by 25 to 30%. This has the advantage in the elderly age group in-order to make them weight bear earlier. The entry portal of the PFN through the trochanter limits the surgical insult to the tendinous hip abductor musculature only, unlike those nails which require entry through the pyriformis fossa. Compared to Gamma nail, the additional anti-rotation screw placed in the femoral neck avoids rotation of the cervico-cephalic fragments during weight bearing. The stabilizing and the compression screws of the PFN adequately compress the fracture, leaving between them a bone block for further revision should the need arise.

In our study of 42 patients with unstable intertrochanteric fracture, the average age incidence was 56.72 years. This is in contrast to higher age group as reported in the western literatures. Our study results are comparable with those of R. C. Gupta et al; Mohanty SP et al; and of that reported by G.S. Kulkarni et al;. Majority of cases occurred in older individuals as the average life expectancy of an Indian is 10 years less than western standards and malnutrition and osteoporosis go hand in hand.

In the present study, the male to female ratio was 2 : 3.2, hence indicating a female preponderance in our study. This is in tandem with those reported by Pajarinen J et al; and Dousa P et al;. The system of damage was incidental fall in 88.10% patients and 11.90% street car crash in 5 patients. None of the patient had any related wounds. The mean length between the damage and strategy was 8.7 days (go 0-15 days). The normal working time was evaluated as 54 minutes (range 40 to 85 minutes), which is in close concordance with the study by Dousa P. et al[98]; and Parker MJ et al ;. The average X-ray exposure including the time necessary for reduction of fracture was 3.4 minutes (range 1 to 8 minutes).

Conclusion

With the demographics of the world population changing, more and more elderly persons are sustaining osteoporotic fractures. Among them, displaced and unstable trochanteric fractures are in significant numbers. The development of implant designs to address these unstable fractures of the proximal femur, have got refined. This has significantly improved the surgical outcomes in managing these problematic fractures. The proximal femoral nail, which was the implant used in this study, has established its distinct superiority in the instances of surgically managing displaced and unstable trochanteric fractures. Its unique advantages are that it is amenable to closed reduction which preserves the fracture hematoma. There is less surgical insult. It enables early rehabilitation and early return to pre-injury activity status. We therefore infer that, osteosynthesis utilizing a PFN, utilized in shaky trochanteric cracks, brings about a low pace of clinical entanglements, gives phenomenal adjustment, less mechanical inconveniences and good useful outcomes. It is along these lines a perfect embed for precisely overseeing shaky between trochanteric breaks.

To Study Dermoscopic Findings in Alopecia Areata

Arshad A.R[1], Jayakar Thomas[2]

[1]Post Graduate Student, [2]Professor and Head, Department of DVL, Department of Biomedical Engineering SreeBalaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Introduction: Alopecia areata is a common chronic autoimmune inflammatory disease that involves hair follicles, characterized by hair loss on the scalp and/or body without scarring. Clinically, the disease presents as smooth, patchy hair loss with various patterns - diffuse or reticulate alopecia, ophiasis, ophiasisinversus, alopecia totalis (loss of hair all the scalp), or alopecia universalis (loss of hair all over the body). Clinical diagnosis of AA is made based on typical pattern of hair loss and the presence of characteristic exclamation mark hair in microscopy. Invasive (punch biopsy) techniques are often required in some cases where the clinical diagnosis is not straight forward .Biopsy shows peribulbar lymphocytic infiltrates in a "swarm of bee pattern" which is characteristic of the acute stage of the disease.

Dermoscopy is an imaging instrument that immensely magnifies surface features of skin lesions. It works on the principle of illumination and transillumination of skin with different light sources and studying it with a high magnification lens. Dry dermoscopy was done with heine delta 20 dermoscope which was followed by wet dermoscopy. Liquid paraffin was used as the immersion media. It is a noninvasive, repeatable, recordable bedside investigation.

Materials and Method

Study Design: Cross sectional study

Study Area: Skin Outpatient Despartment

SreeBalaji Medical College and Hospital

Study Population: All patients with hair loss, attending skin OPD, who are clinically diagnosed as Alopecia Areata

Study Method: Observational study

Sample Size: 30

Result: Clinically, the disease presents as smooth, patchy hair loss with various patterns**.**Dermoscopy is useful for diagnosis of AA clinically by the presence of cadaverized hairs (black dots), circle hair, coudablity hair, exclamation mark hairs (tapering hairs), broken hairs, yellow dots and clustered short vellus hairs in the hair loss areas. The results wear tabulated.

Keywords: *dermoscope, Alopecia areata, Liquid paraffin, , exclamation mark hairs*

Introduction

Alopecia areata is a common chronic autoimmune inflammatory and non-scary disease which involves hair follicles. It is characterized by hair loss on the scalp and/or wherever the hair is present on the body.[1] The chance

of occurring is 2% in their lifetime of an individual.[2] The chance of occurring is 40% higher in younger individuals aged below 30years.[1-3]

Clinically, Alopecia areata is differentiated into patchy alopecia, diffuse alopecia, reticulate alopecia, ophiasis, ophiasis inverses(loss of hair in the shape of wave) alopecia totalis or alopecia universalis (loss of all hairs) and perinevoid.[4] Most commonly around 3% to 30% of patients shows nail changes(diffuse fine nail pitting, longitudinal ridging, thin and brittle finger and toenails, and trachyonychia).[3] Since it is an autoimmune disorder, sudden hair regrowth may occur at any time within the year of hair loss.[1] The immune system is a major player, with T cells and a collapse of the physiological immune privilege (IP) of the hair follicle (HF) [5]plays a critical role in the pathophysiology of alopecia areata.[6-8] The HF represents a site of relative IP, because defined regions of its epithelium (bulge, bulb) do not express MHC class I and class II molecules, and because a number of immunoinhibitory cytokines and neuropeptides create an immunoinhibitory milieu.[5, 9] Even the few intraepithelial Langerhans cells found within the HF epithelium below its stem cell region, the bulge, are immunologically impaired, as they fail to express MHC class II.[10] This collapse of immune privilege (IP) of the hair follicle is a cause for autoimmunity to occur, is a widely accepted theory.[11] This IP collapse, which can most effectively be induced by IFN-γ or substance P presumably leads to changes in the quality and quantity of the expressed self-antigen repertoire, rendering HFs, which now ectopically express MHC class I-presented autoantigens, vulnerable to anti-self-immune reactivity.

Clinical diagnosis of Alopecia areata is based on the typical pattern of hair loss, and the presence of characteristic exclamation mark hair in microscopy. In some cases, if clinical features are not the clear invasive method (punch biopsy) may need to be used for diagnosis. The dermoscopic method has been proposed as an alternative to avoid punch biopsy, especially in adolescent girls and children, in which acceptability of punch biopsy may be very low. Many recent studies have explored the utility of noninvasive diagnosis dermoscopy in the diagnosis of Alopecia Areata. Apart from these flow cytometry-based measurement of various inflammatory markers like IFN-γ, IL-13, IL-9, IL-17, and IL-22 cytokines in $CD4^+$and $CD8^+$ T cells have been used to supplement or confirm the clinical diagnosis. Inducible co-stimulator molecule (ICOS) and HLA-DR, which are used to define mid- and long-term T-cell activation are also proposed as potential diagnostic markers in Alopecia areata.[15]

Dermoscopy

Dermoscopy is a non-invasive imaging technique which shows the magnified lesions on the surface of the skin. Skin surface microscopy for pigmented lesions was initially described in the first half of the 20th century based on earlier work done on colposcopy for visualisation of the cervical region. A couple of decades later, the use of oil-immersion fluid as an interface to improve skin surface visualisation and the use of the same for the diagnosis of pigmented lesions was described. Large dedicated dermoscopic devices were first used in the late 1980s, and hand-held devices started to be developed for the same in the early 1990s.

Dermoscopy is usually performed with Heine Delta 20 dermoscope, which usually have a magnification of around ×10 to ×20. The same can be used to take photographs by connecting them to a wide variety of cameras. Dermoscopyworked with the principle of illumination and transillumination of skin with different light sources and observed under the high magnifying lens. Most of the light is scattered due to the reflective property of the stratum cornium. In order to overcome this problem, fluid (liquid paraffin) medium is used as an interface, and a transparent glass contact plate is used for clear vision. Use of cross-polarized light is another method for this purpose. Both the methods allow looking at the clear image of a deeper section of the skin. Advanced dermoscopes are also increasingly available with polarised light allowing contact and non-contact dermoscopy.

The usual findings in dermoscopy assessment of patchy Alopecia areata include exclamation mark hairs and proximal tapering hairs.[17] Even though there are studies assessing the utility of dermoscopy in Alopecia areata, the correlation of dermoscopic features with the severity of disease has not been looked into by many previous studies on AA. Elucidation of dermoscopic features that are highly correlated with severe disease could help in developing dermoscopic predictors of severe disease or poor prognosis.[3] The scarcity of studies on the subject is even more conspicuous on the Indian population. Hence there is a strong need to conduct studies evaluating the correlation between dermoscopy and clinical findings. This may enhance the quality of available evidence on the subject and

may aid in evidence-based clinical practice. This is even more essential in resource-poor settings like India, where facilities for advanced and invasive interventions may not be accessible to a large section of the affected patients. Hence the present study was conducted to fill this knowledge gap.

Findings and Discussions

Our study results show that the mean age was 25.1 ± 11.75 in the study population, the minimum age was 3 and the maximum age was 46 in the study population (95% CI 20.63 to 29.57). Senior, S.C, at al said that the mean age was 26.2 years which is close to our results A similar results are seen in case-control study, conducted by Park, J., et al and Shim, WH., et al. among alopecia patients and reported ,the mean age was 34.0±18.2 and 30 years respectively which is higher than our results.

Our study results shown that, 5 (16.7%) participants were aged up to 9 years, 2 (6.4%) participants were aged 10 to 19 years, 10 (33.30%) participants were aged 20 to 29 years, 10 (33.30%) participants were 30 to 39 years and 3 (10%) participants were 40 and above among our results it is seen that 90% of the study people belong to age below 40 years only 10% belongs to above 40years similar results were shown in Sharma, V K., et al in his prospective, hospital-based study among 808 patients and concluded that 88% of the study population belonged to below 40years of age which is similar to our results

Our study results showed that 18 (60%) participantsweremale remaining 12 (40%) participants were female participants. Similar results were seen in Sharma, V K. et al. [23]in his prospective, hospital-based study and noticed that chance of development of alopecia areata in males having a risk of 2 folds more than females whereas Shim, WH., et al. noticed that development of alopecia areata is more often to females than males

Whereas 14 (46.70%) participants had single patch, 9 (30%) participants had multiple patches, totally 76.70% were reported with patches, which is less than 50 per cent in the study conducted by Park, J., et al[37], 33%, in the same study reported 2.8% of the study population were reported with ophiasis which is similar to our results with 3 (10%) participants ,similarly alopecia universalis (7%), diffuse which is double than our results with (3.30%), 3 (10%) of participants Senila, S.C, at al reported that 68.8% of the study population were reported with patches and similarly 8 patients (25%) had alopecia universalis.

Our results concluded that 24 (80%) participantshad no nail involvement and 6 (20%) participants had Some nail involvement. Similar results were noticed in Sharma, V K., et al in his perspective, the hospital-based study reveals that 20% of the study population developed in nails .Among the study population, 10 (33.30%) participantshad yellow dots which is one of the symptoms and are reported as a specific finding of Alopecia areta. Similar results are seen in a study conducted by Park, J et al. among 327 patients and reported 34.6% of the study population which is close to our results whereas Shim, WH. et al. [14] in his study concluded that 60% of his study population had yellow dots which is double than our report and reported 80% in a prospective study to evaluate various dermoscopic patterns by Guttikonda, A et al.[50]

Black dots are believed to be remnants of hair shafts arising from tapering hairs Among the study population, 11 (36.70%) participantshad black dots whereas Park, J., et al reported as 50.5% which is higher that1.5times than our results whereas Shim, WH., et al. reported 42% of the study population have black dots, and 58% were reported by Guttikonda, A et al. with their team contribution. Broken hair is one of the symptoms for alopecia areata, and Our study results show that 15 (50%) participantshad broken hair where a Park, J., et al and Guttikonda, A et al. also concluded that 44.4% and 56% of the study population were reported with broken hair respectively. Shim, WH., et al. reported only 2% of patients to have broken hair which is very less than compared to others.

Among the study population, 11 (36.70%) participantshad short vellus hair whereas Park, J., et al and Shim WH et al. reported 59.8% and 48% respectively which is slightly higher than ours, whereas Guttikonda, A et al.[50] reported 66% that seems to be double than our reports. Among the study population, 7 (23.30%) participants had exclamation mark hairs', could be observed with the naked eye; however, their characteristic feature of the hair shaft towards the hair follicle is more readily perceived with dermoscopy. Under the dermoscopy which is one of the major findings for the diagnosis of alopecia areata a similar study was conducted by a Park, J., et al and revealed that 41% of his study population was reported with Exclamatory mark hair.

Conclusion

In the current study, the average age of the study population was 25.1 ± 11.75, which was ranging between 3 to 46 years. But the majority of the study participants were in their second decade and third decade of life. There was a slight male preponderance, as 60% of the participants were male.

Among the study population, 14 (46.70%) participantshad a single patch, 9(30%) participants had multiple patches, 3 (10%) participants had diffuse, 3 (10%) participants had ophiasis, and 1 (3.30%) participant had alopecia universalist

- Among the study popuslation, 21 (70%) participantshad S0, no hair loss, 7 (23.30%) participants had S1, <25% hair loss, 1 (3.30%) participant had S3, 51-75% hair loss and 1 (3.30%) participant had S5, 100% hair loss.

- The proportion of subjects showing B1 (Somebody hair loss) was 6.70%, and 20% had some nail involvement.

- The mean duration of disease was 4.45 ± 11.75 months in the study population, the minimum two months, and the maximum 12 months in the study population.

- Among the study population, 12 (40%) participantshad scalp occipital present. And 18 (60%) participants who never had scalp occipital.

• Among the study population, 16 (53.30%) participantshad parietal, and 14 (46.70%) participants who never had parietal.

• Among the study population, 10 (33.30%) participantshad vertex, 50% of the participantshad temporal, 8 (26.70%) participantshad a frontal distribution of the disease.

• Among the study population, 10 (33.30%) participantshad yellow dots and 20 (66.70%) participants who never had yellow dots.

• Among the study population, 11 (36.70%) participantshad black dots and 19 (63.30%) participants who never had black dots.

• Among the study population, 50% of the participantshad broken hair.

• Among the study population, 11 (36.70%) participantshad short vellus hairs, and 19 (63.30%) participants had no short vellus hairs.

• Among the study population, 7 (23.30%) participantshad exclamatory mark hair.

• Among the study population, 16 (53.30%) participantshad a good response, 9 (30%) participantshad a minimal response and 5 (16.70%) participants had a poor response to treatment.

• In people with yellow dots group, 5 (23.8%) participants never had S0, 3 (42.9%) participants had S1, 1 (100%) participant had S3, and 1 (100%) participant had S5 (100% hair loss).

• Among the block dots group, 7 (33.3%) participants never had S0, no hair loss, 3 (42.9%) participants had S1, <25% hair loss and 1 (100%) participant had S5, 100% hair loss.

• Among the broken hairs group, 9 (42.9%) participants never had S0, no hair loss, 5 (71.4%) participants had S1, <25% hair loss and 1 (100%) participant had S3, 51-75% hair loss.

• Among the short vellushairs group, 6 (28.6%) participants never had S0 (no hair loss), and 5 (71.4%) participants had S1 (<25% hair loss), Among the exclamatory markhairs group, 5 (23.8%) participants never had S0 (no hair loss) and 2 (28.6%) participants had S1 (<25% hair loss).

A Study on Ocular Problems among Automobile Workers in Chennai

Amish Aggarwal[1], I. Venkatraman[2], M. Prabakaran[3]

[1]Post Graduate Student, [2]Professor, [3]Professor and HOD, Department of Radio Diagnosis, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

The report, entitled 'The Prevention of Occupational Diseases', gave for the World Day for Safety and Health at Work, the International Labor Organization said that in spite of the way that word related ailments kill 6 fold the number of people, mishaps draw in more prominent consideration. Of the evaluated 2.34 million yearly business related passings, most by far – around 2.02 million – are because of business related infections. This speaks to an every day normal of 5,500 passings. The ILO likewise assesses that 160 million instances of non-lethal business related diseases and 317 million non-deadly word related mishaps happen yearly. This implies, at regular intervals, 1 out of 151 specialists kicks the bucket with a business related accident.

Keywords – *Labor Organization, Occupational Diseases*

Introduction

Engine vehicles have turned out to be fundamental piece of the present life. Vehicles assembling, fix and upkeep need has prompted the development of an enormous areas, supposed car businesses. These are formal large size enterprises where as there are small and medium size enterprise, which includes workshops and service stations. Automobile industries are labor-intensive sector, and its size of enterprise, number of workers and job characterization vary considerably.(1-3)

The automobile sector is providing occupation to number of peoples. Occupation is the main source of income for many families to meet the needs and to lead a happy life. And occupational health is essentially a preventive medicine. Occupational health should aim at the promotion and maintenance of highest degree of physical, mental and social well being of workers in all occupation.(5,6)

Utilizes of any age are working routinely in the car parts. From wellbeing and security perspective, this is one of the intense divisions to tract and directs. Hundreds and thousands of dangers and risks go unnoticed. Basic word related dangers, for example, physical, ergonomic, natural and substance are found in engine vehicle assembling and fix laborers exercises, because of overwhelming hardware, oil fills/oils, high utilization of solvents, smoke, particulate issue and different toxins. These dangers become increasingly basic when there is an absence of mindfulness, controls measures and execution of wellbeing and security rules and regulations.1 And these perils additionally can cause antagonistic fundamental wellbeing impacts like respiratory sicknesses, intense wounds, eyes wounds, hearing misfortune, spinal pain, and musculoskeletal disorders.

The worldwide car fix and upkeep administrations enterprises worth is nearly $306 billion.4 The Indian car secondary selling is presently evaluated at Rs33000 cr. contributing 2.3% of India's GDP.5 The extra parts and post-deal administration including makers, merchants retailers, specialist co-ops like carports are everywhere scale developing business sector for Indian economy. (9,10) The portion of car administrations showcase in India is evaluated $10 billion.6 The car ventures area as of now having representatives an expected labor

of 78,77702 and expanding at the pace of 12% per annum. The size of car industry showcase in India, It is evaluated at 8-10billion USD. It is evaluated that half of this segment is unorganized.7 This industry division is increasingly common in rustic zones with less office and absence of information about wellbeing measures as contrast with urban regions.

The report, entitled 'The Prevention of Occupational Diseases', gave for the World Day for Safety and Health at Work, the International Labor Organization said that in spite of the way that word related ailments kill 6 fold the number of peo¬ple, mishaps draw in more prominent consideration. Of the evaluated 2.34 million yearly business related passings, most by far – around 2.02 million – are because of business related infections. This speaks to an every day normal of 5,500 passings. The ILO likewise assesses that 160 million instances of non-lethal business related dis¬eases and 317 million non-deadly word related mishaps happen yearly. This implies, at regular intervals, 1 out of 151 specialists kicks the bucket with a business related accident.(4)

Aim and Objective

- To assess the ocular problems among the automobile workers in the study area.
- To study the association between occupational hazards and ocular problems among the automobile workers.

Materials and Method

Study area

This study was conducted in a automobile industry in Chennai.

Study population

The automobile mechanics were the study population.

Study period

The study was carried out from June 1st2017 – March 31st2018

Sample size

N=310

Sample size was calculated based on a previous study conducted by **Selvi thangaraj.**

Inclusion criteria

The inclusion criteria for the study were the workers who had automobile mechanic work experience for more than 10 years and those who were willing to participate in the study.

Exclusion criteria

The automobile workers those who didn't give consent to participate in the study, were excluded from the study.

Sampling method

Stratified random sampling (proportional stratified random sampling) technique was used to identify the study subjects.

Study tool

A pretested structured questionnaire was used as study stool for data collection, by interviewing the study participants. The questionnaire was prepared in English and orally translated to local language (Tamil) while conducting the interview. The interview was conducted by the investigator himself and their responses were recorded in the questionnaire.

Data collection period

Data was collected from the study participants for a period of 3 months from 2ndNovember 2017 to 31st January 2018.

Statistical Analysis

Data was entered in Microsoft excel and analysed using the software SPSS, version 22 software.

Findings

Socio-statistic attributes of the examination members

Table 1 shows the socio-demographic details of the study participants. Among the study participants, nearly 167 (53.9%) of them belonged to the age group of 51-60 years followed by 129 (41.6%) of them belonged to age group of 41-50 years and only 14 (4.5%) them belonged to the age group of 31-40 years. Around 275 (88.7%) of the participants were hindus, 26 (8.4%) were Christians and 9 (2.9%) were muslims. Majority of the participants

were from urban 219 (70.6%) and 91(29.4%) were from rural. Among the study participants 151 (48.7%) had an education up to high school, 85 (27.4%) of them were graduates and 6 (1.9%) had an education only up to primary school. As per Modified BG Prasad Socio Economic Status Classification, 214 (69%) of the study participants belong to upper class, 48 (15.5%) of them belonged to upper middle class, and only 6 (1.9%) of them belonged to lower middle class.

Table 1: Socio-demographic characteristics of the study participants

S.No	Social Demographic Characteristics		Frequency (N=310)	Percentage (%)
1	Age	31-40 Years	14	4.5
		41-50 Years	129	41.6
		51-60 Years	167	53.9
2	Religion	Hindu	275	88.7
		Muslim	9	2.9
		Christian	26	8.4
3	Residence	Urban	219	70.6
		Rural	91	29.4
4	Education	Primary school	6	1.9
		Middle School	7	2.3
		High School	151	48.7
		Diploma	61	19.7
		Graduate/Postgraduate	85	27.4
5	Socio Economic Status	Upper Class	214	69.0
		Upper Middle Class	48	15.5
		Middle Class	42	13.5
		Lower Middle Class	6	1.9

Occupational hazard of the study participants

Table 2 shows the occupational hazard of the study participants. Among the study participants 12 (3.9%) were exposed to chemicals, 298 (96.1%) were not exposed to chemicals. Majority of the study participants 269 (86.8%) were working with machinery tools, 41(13.2%) were not working with machinery tools. Among the study participants 205 (66.1%) were working in both day and night shift and 105 (33.9%)

were working only in day shift.

Table 2: Occupational hazard of the study participants

S.No	Occupational hazard		Frequency (N=310)	Percentage (%)
1	Exposure to chemicals	Yes	12	3.9
		No	298	96.1
2	Working with machinery tools	Yes	269	86.8
		No	41	13.2
3	Working shift	Day And Night	205	66.1
		Day	105	33.9

Ocular disorders

Table 3 shows the prevalence of ocular problems among the workers. Among the workers participated in the study 130 (41.9%) did not have any ocular problem, 131 (42.3%) had defective vision, 26 (8.4%) had headache and 23 (7.4%) had watering of eyes.

Table 3: Ocular disorders

Ocular	Frequency (N=310)	Percentage (%)
Normal	130	41.9
Defective Vision	131	42.3
Headache	26	8.4
Watering Of Eyes	23	7.4

Association between occupational hazards and ocular problem

Table 4 shows the association between occupational hazard and ocular problem. There was no statistical significance between occupational hazard and ocular problem (P > 0.05).

Table 4: Association between occupational hazards and ocular problem

S.No	Occupational Hazard	N=310	Ocular problem		Odds ratio	95% CI	Chi square	P Value
			n=180	%				
1	Exposure to chemicals							
	Yes	12	6	50	0.713	0.22-2.26	0.333	0.564
	N0	298	174	58.4				
2	Working with machinery tools							
	Yes	269	157	58.4	1.097	0.56-2.12	0.075	0.784
	No	41	23	56.1				
3	Not using personal protection equipment							
	Yes	92	50	54.3	0.806	0.493-1.31	0.742	0.389
	No	218	130	59.6				
4	Working Shift							
	Day and night	205	121	59.1	1.123	0.69-1.807	0.229	0.632
	Day	105	59	56.1				

Discussion

Age

In this study majority of the study participants i.e. 53.9% belonged to 51-58 years of age, 41.6% belonged to 41-50 years of age and 4.5% belonged to 31-40 years of age. In a study by Selvi thangaraj et al only 18% of the workers were more than 40 years of age.[9] And in a study by Johnson OE et al also only 20.5% of the workers were more than 40 years of age.[10] This age difference may be due do in our study we have taken only the workers who had work experience more than 10 years.

Religion

In this study most of the study participants 88.7% were hindus, 8.4% were Christians and 9 (2.9%) were muslims. In a study by Selvi thangaraj et al most of the workers 88% were Muslims and only 12% were Hindus.[9]

Resident

In this study majority of the study participants were from urban 70.6%, this is because the truck manufacturing company is situated in urban Chennai and most of the workers were also residing in the urban Chennai.

Education

In this study 48.7% study participants had an education up to high school, 27.4% of the were graduates, 1.9% had an education only up to primary school and no illiterates. In a study by Kamble MS et al 1.9 % had primary school education which is similar to our study.[11] In a study by Selvi thangaraj 19.3% of the workers were illiterate which is in contrary to our study this is due to our study area.[9] In our study area (truck manufacturing company) only the workers who had at least primary education, were given the appointment to work in the company.

Socio economic status

In this study As per Modified BG Prasad Socio Economic Status Classification, 69% of the study participants belonged to upper class, 15.5% of them belonged to upper middle class, and only 1.9% of them belonged to lower middle class. In a study by kamble MS et al 12.8%, 36%, 45.5%, 5% and 0.7% of the workers

belonged to upper class, upper middle class, middle class, lower middle class and lower class respectively. In this study most of the study participants belonged to upper class, this due to that all the workers are getting a monthly income of 55000 which is high when to other automobile units.

Ocular

In this study most of the workers were elder (more than 40 years of age) which causes age related ocular problem and refractive error. The prevalence of ocular disorder is 58.1% in the present study. In the study done by Kamble MS et al in Pune among workers in automobile industry, they reported 45.7% had ocular disorder.[10] Were as in a study done by Vyas H et al 16% had ocular disorder. In a study done by Selvi thangaraj et al 14% had eye problems.

Conclusion

Among the study participants 3.9% were exposed to chemicals, 86.8% were working with machinery tools, 66.1% are working in both day and night shift, 70.3% were using any one PPE. Among the study participants 58.1% had ocular problem and none of the occupational hazards is associated with ocular problem. From the findings of the study, it can be concluded that the prevalence of ocularar problem and occupational hazards are high in the study area. These ocular problems among the automobile workers will reduce only if all the gaps are identified and intensive interventions are done.

Oral cavity disorders

Table 3 shows the prevalence oral cavity problems among the workers. Among the workers participated in the study 210 (67.7%) did not have any oral cavity problem, 51 (16.5%) had toothache, 49 (15.8%) had mouth ulcer.

Table 3: Oral cavity disorders

Oral Cavity	Frequency (N=310)	Percentage (%)
Normal	210	67.7
Mouth Ulcer	49	15.8
Toothache	51	16.5

Association between occupational hazards and oral cavity problem

Table 4 shows the association between occupational hazard and oral cavity problem. There was no statistical significance between occupational hazard and oral cavity problem (P > 0.05).

Table 4: Association between occupational hazards and oral cavity problem

Discussion

Age

In this study majority of the study participants i.e. 53.9% belonged to 51-58 years of age, 41.6% belonged to 41-50 years of age and 4.5% belonged to 31-40 years of age. In a study by Selvi thangaraj et al only 18% of the workers were more than 40 years of age.[9] And in a study by Johnson OE et al also only 20.5% of the workers were more than 40 years of age.[10] This age difference may be due do in our study we have taken only the workers who had work experience more than 10 years.

Religion

In this study most of the study participants 88.7% were hindus, 8.4% were Christians and 9 (2.9%) were muslims. In a study by Selvi thangaraj et al most of the workers 88% were Muslims and only 12% were Hindus.[9]

Resident

In this study majority of the study participants were from urban 70.6%, this is because the truck manufacturing company is situated in urban Chennai and most of the workers were also residing in the urban Chennai.

Education

In this study 48.7% study participants had an education up to high school, 27.4% of the were graduates, 1.9% had an education only up to primary school and no illiterates. In a study by Kamble MS et al 1.9 % had primary school education which is similar to our study.[11] In a study by Selvi thangaraj 19.3% of the workers were illiterate which is in contrary to our study this is due to our study area.[9] In our study area (truck manufacturing company) only the workers who had at least primary education, were given the appointment to work in the company.

Socio economic status

In this study As per Modified BG Prasad Socio Economic Status Classification, 69% of the study participants belonged to upper class, 15.5% of them belonged to upper middle class, and only 1.9% of them belonged to lower middle class. In a study by kamble MS et al 12.8%, 36%, 45.5%, 5% and 0.7% of the workers belonged to upper class, upper middle class, middle class, lower middle class and lower class respectively.[11] In this study most of the study participants belonged to upper class, this due to that all the workers are getting a monthly income of 55000 which is high when to other automobile units.

Oral Cavity

In this study workers were having habit of tobacco chewing which leads to oral cavity problems. The prevalence of oral cavity problems is 32.3% in the present study which was high to the finding in the study done by Kamble MS et al in Pune among workers in automobile industry; they reported 17.9 % had oral cavity problems.[11]

Conclusion

Among the study participants 3.9% were exposed to chemicals, 86.8% were working with machinery tools, 66.1% are working in both day and night shift, 70.3% were using any one PPE. Among the study participants 32.3% had ocular problem and none of the occupational hazards is associated with ocular problem. From the findings of the study, it can be concluded that the prevalence of oral cavity problem and occupational hazards are high in the study area. This oral cavity problem among the automobile workers will reduce only if all the gaps are identified and intensive interventions are done.

A Study on Genito Urinary Problems among Automobile Workers in Chennai

Vimalshika.R[1], Yuvarani.R[2]

[1]Post Graduate Student, [2]Professor, Department of OBG, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

The automobile sector is providing occupation to number of peoples. Occupation is the main source of income for many families to meet the needs and to lead a happy life. And occupational health is essentially a preventive medicine. Occupational health should aim at the promotion and maintenance of highest degree of physical, mental and social well being of workers in all occupation.

Keywords: *Occupational health, automobile sector*

Introduction

Engine vehicles have turned out to be fundamental piece of the present life. Vehicles assembling, fix and support need has prompted the rise of a huge segments, supposed car ventures. These are formal enormous size ventures where as there are little and medium size undertaking, which incorporates workshops and administration stations. Vehicle ventures are work concentrated segment, and its size of big business, number of laborers and occupation portrayal change impressively. Utilizes of any age are working routinely in the car areas. From wellbeing and security perspective, this is one of the intense divisions to tract and oversees. Hundreds and thousands of dangers and perils go unnoticed. Basic word related perils, for example, physical, ergonomic, natural and compound are found in engine vehicle assembling and fix laborers exercises, because of overwhelming hardware, oil powers/oils, high utilization of solvents, smoke, particulate issue and different toxins. These perils become increasingly basic when there is an absence of mindfulness, controls measures and usage of wellbeing and security rules and regulations.2 And these dangers likewise can cause unfavorable foundational wellbeing impacts like respiratory illnesses, intense wounds, eyes wounds, hearing misfortune, spinal pain, and musculoskeletal disorders.(3)

The worldwide car fix and upkeep administrations businesses worth is nearly $306 billion.4 The Indian car post-retail is at present assessed at Rs33000 cr. contributing 2.3% of India's GDP.5 The extra parts and post-deal administration including producers, wholesalers retailers, specialist co-ops like carports are everywhere scale developing business sector for Indian economy. The portion of car administrations showcase in India is assessed $10 billion.6 The car businesses area at present having workers an expected labor of 78,77702 and expanding at the pace of 12% per annum. The size of car industry showcase in India, It is evaluated at 8-10billion USD. It is evaluated that half of this part is unorganized.7 This industry segment is progressively common in rustic territories with less office and absence of information about security measures as contrast with urban regions.

The report, entitled 'The Prevention of Occupational Diseases', gave for the World Day for Safety and Health at Work, the International Labor Organization said that regardless of the way that word related ailments kill 6 fold the number of people, mishaps pull in more noteworthy consideration. Of the evaluated 2.34 million yearly business related passings, most by far – around 2.02 million – are because of business related illnesses.

This speaks to a day by day normal of 5,500 passings. The ILO additionally assesses that 160 million instances of non-lethal business related diseases and 317 million non-deadly word related mishaps happen every year. This implies, at regular intervals, 1 out of 151 specialists bites the dust with a business related accident.(8)

Aim and Objective

- To assess the genito urinary problems among the automobile workers in the study area.
- To study the association between occupational hazards and genitor urinary problems among the automobile workers.

Materials and Method

Study area:

This study was conducted in a automobile industry in Chennai.

Study population:

The automobile mechanics were the study population.

Study period:

The study was carried out from June 1st2017 – March 31st2018

Sample size:

N=310

Sample size was calculated based on a previous study conducted by **Selvi thangaraj.**

Inclusion criteria:

The inclusion criteria for the study were the workers who had automobile mechanic work experience for more than 10 years and those who were willing to participate in the study.

Exclusion criteria:

The automobile workers those who didn't give consent to participate in the study, were excluded from the study.

Sampling method:

Stratified random sampling (proportional stratified random sampling) technique was used to identify the study subjects.

Study tool:

A pretested structured questionnaire was used as study stool for data collection, by interviewing the study participants. The questionnaire was prepared in English and orally translated to local language (Tamil) while conducting the interview. The interview was conducted by the investigator himself and their responses were recorded in the questionnaire.

Data collection period:

Data was collected from the study participants for a period of 3 months from 2ndNovember 2017 to 31st January 2018

Statistical analysis:

Data was entered in Microsoft excel and analysed using the software SPSS, version 22 software.

FINDINGS

Socio-demographic characteristics of the study participants

Table 1 shows the socio-demographic details of the study participants. Among the study participants, nearly 167 (53.9%) of them belonged to the age group of 51-60 years followed by 129 (41.6%) of them belonged to age group of 41-50 years and only 14 (4.5%) them belonged to the age group of 31-40 years. Around 275 (88.7%) of the participants were hindus, 26 (8.4%) were Christians and 9 (2.9%) were muslims. Majority of the participants were from urban 219 (70.6%) and 91(29.4%) were from rural. Among the study participants 151 (48.7%) had an education up to high school, 85 (27.4%) of them were graduates and 6 (1.9%) had an education only up to primary school. As per Modified BG Prasad Socio Economic Status Classification, 214 (69%) of the study participants belong to upper class, 48 (15.5%) of them belonged to upper middle class, and only 6 (1.9%) of them belonged to lower middle class. (1,2)

Table 1: Socio-demographic characteristics of the study participants

S.No	Social Demographic Characteristics		Frequency (N=310)	Percentage (%)
1	Age	31-40 Years	14	4.5
		41-50 Years	129	41.6
		51-60 Years	167	53.9
2	Religion	Hindu	275	88.7
		Muslim	9	2.9
		Christian	26	8.4
3	Residence	Urban	219	70.6
		Rural	91	29.4
4	Education	Primary school	6	1.9
		Middle School	7	2.3
		High School	151	48.7
		Diploma	61	19.7
		Graduate/Postgraduate	85	27.4
5	Socio Economic Status	Upper Class	214	69.0
		Upper Middle Class	48	15.5
		Middle Class	42	13.5
		Lower Middle Class	6	1.9

Occupational hazard of the study participants

Table 2 shows the occupational hazard of the study participants. Among the study participants 12 (3.9%) were exposed to chemicals, 298 (96.1%) were not exposed to chemicals. Majority of the study participants 269 (86.8%) were working with machinery tools, 41(13.2%) were not working with machinery tools. Among the study participants 205 (66.1%) were working in both day and night shift and 105 (33.9%) were working only in day shift.[8]

Table 2: Occupational hazard of the study participants

S.No	Occupational hazard		Frequency (N=310)	Percentage (%)
1	Exposure to chemicals	Yes	12	3.9
		No	298	96.1
2	Working with machinery tools	Yes	269	86.8
		No	41	13.2
3	Working shift	Day And Night	205	66.1
		Day	105	33.9

Genito urinary disorders

Table 3 shows the prevalence genitor-urinary problems among the workers. Among the workers participated in the study 267 (86.1%) did not have any genito-urinary problems, 35 (11.3%) had burning micturation, 5 (1.6%) had benign prostate hyperplasia and 3 (1%) had calculus.

Table 3: Genito-urinary system disorders

Genito Urinary System	Frequency (N=310)	Percentage (%)
Normal	267	86.1
Burning micturation	35	11.3
Benign prostate hyperplasia	5	1.6
Calculus	3	1

Association between occupational hazards and genito urinary problem

Table 4 shows the association between occupational hazard and genito urinary problem. There was no statistical significance between occupational hazard and genito urinary problem ($P > 0.05$).

Table 4: Association between occupational hazards and genitor urinary problem

S.No	Occupational Hazard	N=310	Genito urinary Problem		Odds ratio	95% CI	Chi square	P Value
			n=43	%				
1	Exposure to chemicals							
	Yes	12	2	16.6	1.25	0.26-5.92	0.082	0.775
	No	298	41	13.8				
2	Working with machinery tools							
	Yes	269	37	13.7	0.930	0.36-2.36	0.023	0.879
	No	41	6	14.6				
3	Not using personal protection equipment							
	Yes	92	8	8.7	0.498	0.22-1.12	2.933	0.087
	No	218	35	16.1				
4	Working Shift							
	Day and night	205	29	14.1	1.071	0.53-2.127	0.038	0.845
	Day	105	14	13.3				

Discussion

Age

In this study majority of the study participants i.e. 53.9% belonged to 51-58 years of age, 41.6% belonged to 41-50 years of age and 4.5% belonged to 31-40 years of age. In a study by Selvi thangaraj et al only 18% of the workers were more than 40 years of age.9 And in a study by Johnson OE et al also only 20.5% of the workers were more than 40 years of age.10 This age difference may be due do in our study we have taken only the workers who had work experience more than 10 years.

Religion

In this study most of the study participants 88.7% were hindus, 8.4% were Christians and 9 (2.9%) were muslims. In a study by Selvi thangaraj et al most of the workers 88% were Muslims and only 12% were Hindus.[9]

Resident

In this study majority of the study participants were from urban 70.6%, this is because the truck manufacturing company is situated in urban Chennai and most of the workers were also residing in the urban Chennai.

Education

In this study 48.7% study participants had an education up to high school, 27.4% of the were graduates, 1.9% had an education only up to primary school and no illiterates. In a study by Kamble MS et al 1.9 % had primary school education which is similar to our study.[11] In a study by Selvi thangaraj 19.3% of the workers were illiterate which is in contrary to our study

this is due to our study area.[9] In our study area (truck manufacturing company) only the workers who had at least primary education, were given the appointment to work in the company.

Socio economic status

In this study As per Modified BG Prasad Socio Economic Status Classification, 69% of the study participants belonged to upper class, 15.5% of them belonged to upper middle class, and only 1.9% of them belonged to lower middle class. In a study by kamble MS et al 12.8%, 36%, 45.5%, 5% and 0.7% of the workers belonged to upper class, upper middle class, middle class, lower middle class and lower class respectively.[11] In this study most of the study participants belonged to upper class, this due to that all the workers are getting a monthly income of 55000 which is high when to other automobile units.

Genito urinary system

In the present study the prevalence of genito urinary problem among the study participants is 13.9% which is due to socio demographic risks factors such age, diet, and personal habits. A 10 years follow up study among automobile repair workers in The Netherlands, to assess cause specific mortality done by Eva S Hansen showed an increased mortality due to urinary tract cancer.[12]

Conclusion

Among the study participants 3.9% were exposed to chemicals, 86.8% were working with machinery tools, 66.1% are working in both day and night shift, 70.3% were using any one PPE. Among the study participants 13.9% had genitor urinary problem and none of the occupational hazards is associated with genito urinary problem. From the findings of the study, it can be concluded that the prevalence of genito urinary problem and occupational hazards are high in the study area. This genito urinary problems among the automobile workers will reduce only if all the gaps are identified and intensive interventions are done.
