Zinc insufficiency is one of the most well-known micronutrient inadequacies in creating nations. Maternal zinc lack is related with fetal development hindrance and other antagonistic fetal results. The examination expected to decide string blood zinc level between the term SGA and AGA babies. Strategies: This is an imminent cross-sectional investigation led in 50 terms SGA infants and their moms and 50 term AGA children and their moms. Maternal and line blood tests were taken at conveyance and zinc was assessed by endpoint nitro PAPS color restricting colorimetric technique. Results: It was discovered that line blood zinc levels were low in term SGA babies when contrasted with term AGA babies. There was likewise low maternal zinc levels in the term SGA babies when contrasted with moms of term AGA babies. In AGA 0.431 with the P VALUE of 0.002 demonstrates a noteworthy connection between's maternal zinc and string blood zinc levels.in SGA 0.472 with the P VALUE of 0.001 demonstrates a huge relationship between's maternal zinc and line blood zinc levels.Conclusion: Our investigation reasoned that Maternal and Cord blood zinc level lack can likewise one of the reasons for low birth weight babies.significantcorrelationof maternal zinc and line blood zinc levels are seen in AGA

Introduction

Over 20% of people are zinc inadequate worldwide, especially in creating nations. Zinc is needed for the development of the oocyte and the embryo. Acrodermatitis enteropathica is an acquired insufficiency of the zinc transporter protein ZIP4 bringing about insufficient zinc absorption.[1] Zinc manages the outflow of metallothionein, which has different capacities, for example, intracellular compartmentalization and cell reinforcement work. In this manner zinc inadequacy brings about debilitated development and advancement, and disturbance of regenerative and insusceptible capacity. Severe zinc deficiency can result in neural tube defects and other congenital malformations.[2]Low birth weight babies are at a higher risk from zinc deficiency and its impacts. Amending zinc insufficiency by satisfactory zinc supplementation will improve weight increase, straight development, cerebrum function, and development.[3]Zinc assumes a significant job in early advancement, both pre-birth and postnatal. Accordingly its fundamental organic chemistry, physiology and its digestion inthe maternal-placental unit and in the neonate must be talked about to investigate its impacts on the neonate.By dynamic vehicle, zinc is retained from the duodenum. Zinc homeostasis is kept up by both take-up and endogenous discharge by the ZIP family (1-5) and ZnT family transporters6. ZIP-4 is a transporter that is communicated at the luminal side of enterocytes through the little and internal organs. Zinc is sent out from enterocytes into the entryway blood by zinc transporters 1&2.More than 20% of people are zinc insufficient around the world, particularly in creating nations. Zinc is required for the advancement of the oocyte and the fetus. Acrodermatitis enteropathica is

an acquired insufficiency of the zinc transporter protein ZIP4 bringing about deficient zinc absorption[4]

Materials and Method

The investigation included 50 term-little for gestational age neonates and their moms and 50 term-suitable for gestational age neonates and their moms who fulfill the consideration and prohibition criteria. Point by point maternal history was takenand exhaustive physical assessment of the neonate was finished. Birth weight was plotted against gestational age in Lubchenco development graphs to evaluate on the off chance that they are little for gestational age or fitting for gestational age. Subsequent to acquiring educated assent from the guardians, string blood test for serum zinc was gathered from term-SGA and term-AGA children and 2ml of blood from the fringe vein of their moms following conveyance was gathered individually for serum zinc level estimation and sent to our focal research center.

STASTICAL ANALYSIS: The information was entered in exceed expectations sheet and investigated utilizing SPSS (Version 16). Graphic measurements with mean, standard deviation and extent (%) was determined for quantitative factors. To test the speculation ANOVA, Z test and Chi-Square test was utilized. ap-value<0.05 was considered as factually critical.

Findings

Table– 1 Correlation of maternal zinc and cord blood zinc levels in aga

		MATERNAL ZINC	CORD ZINC
MATERNAL ZINC	Pearson Correlation	1	.431**
	Sig. (2-tailed)		**.002**
	N	50	50
CORD BLOOD ZINC	Pearson Correlation	.431**	1
	Sig. (2-tailed)	**.002**	
	N	50	50

**Correlation is significant at the 0.01 level

Correlation coefficient - "value" – 0.431 with the P VALUE of 0.002 shows a significant correlation between maternal zinc and cord blood zinc levels.

Table-2 Correlation of maternal zinc and cord blood zinc levels in sga

		MATERNAL ZINC	CORD ZINC
MATERNAL ZINC	Pearson Correlation	1	.472**
	Sig. (2-tailed)		**.001**

	Sig. (2-tailed)	**.001**	
	N	50	50

**.Correlation is significant at the 0.01 level.Correlation coefficient - "value" – 0.472 with the P VALUE of 0.001 shows a significant correlation between maternal zinc and cord blood zinc levels.

Discussion

Newborn child death pace of India is 41 for every 1000 live births as per NFHS 4 (2015-2016) which is for the most part contributed by the high neonatal death pace of 32 for each 1000 live births. India contributes around 25% of the world's neonatal passings. One-fourth of the world's all out death happens in India.Low birth weight including preterm represents around 60-80% of the complete neonatal demise. The occurrence of low birth weight babies in India is 28%. One of the most significant reasons for low birth weight in India is maternal malnutrition. Children with low birth weight are at extensive danger of morbidity.[5] Long term impacts of birth weight influence the perinatal period as well as youth and adulthood. Hence our examination is interestingly with their study Keen CL, F et al contemplated the correlation of term SGA and term AGA with rope blood zinc levels (p-esteem 0.021) and maternal zinc levels (p-esteem - <0.017) indicates importance and this finding is in concurrence with our investigation. [6]Our study results are in accordance with those of numerous examinations led in various pieces of the world demonstrating a positive relationship between maternal zinc status and birth weight. Roungsipragarnet al perceived that the pace of zinc insufficiency was essentially higher in LBW infants and their moms when contrasted with term NBW neonates and their mothers. [7] Sandstead HH et al. discovered a noteworthy positive relationship between serum zinc level and birth weight. [8]In our examination both the term AGA and term SGA gatherings were tantamount in the subjective information like maternal age (p>0.05), equality of mother (p>0.05), method of conveyance (p>0.05), and sex of the child (p>0.05) and was not measurably critical while in an investigation of Sarkar B. et al indicated higher the equality of mother the lower their serum zinc levels which is negating our study.[9,10]

Conclusion: Our study concluded that Maternal and Cord blood zinc level deficiency can also one of the causes of low birth weight babies. significant correlation of maternal zinc and cord blood zinc levels are observed in AGA

A Study on Maternal Blood Zinc Level – Aga Vs Sga in Tertiary Care Hospital in Chennai

I.Indu[1], K.Saraswathi[2]

[1]Post Graduate Student, [2]Professor and HOD, Department of OBG, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Introduction: Zinc deficiency is one of the most common micronutrient deficiencies in developing countries. Maternal zinc deficiency is associated with fetal growth retardation and other adverse fetal outcomes. The study aimed to determine cord blood zinc level between the term SGA and AGA babies. **Methods:** This is a prospective cross-sectional study conducted in 50 terms SGA babies and their mothers and 50 term AGA babies and their mothers.Maternal and cord blood samples were taken at delivery and zinc was estimated by endpoint nitro PAPS dye binding colorimetric method.

Results: It was found that cord blood zinc levels were low in term SGA babies when compared to term AGA babies. There was also low maternal zinc levels in the term SGA babies when compared to mothers of term AGA babies.

Conclusion: Our study concluded that Maternal and Cord blood zinc level deficiency can also one of the causes of low birth weight babies.

Keywords: *Zinc,maternal blood, appropriate gestation age,[AGA] small gestation age [SGA]*

Introduction

A trace element is an element that constitutes less than 0.01%of the total body weight. They play a vital role in metabolic processes as they are components of many enzymesystems. Trace element deficiencies are being reported in humans and they have deleterious effects on the health, growth, and development.In trace elements, zinc stands second in order of importance next to iron. It also stands second next to iron in order of abundance in the human body[1]. Zinc plays an important role in early development, both prenatal and postnatal. Thus its basic biochemistry, physiology and its metabolism inthe maternal-placental unit and in the neonate have to be discussed to analyze its effects on the neonate.By active transport, zinc is absorbed from the duodenum.Zinc homeostasis is maintained by both uptake and endogenous secretion by the ZIP family [1-5] and ZnT family transporters6. ZIP-4 is a transporter that is expressed at the luminal side of enterocytes through the small and large intestines.[2] Zinc is exported from enterocytes into the portal blood by zinc transporters 1&2.More than 20% of individuals are zinc deficient worldwide,especially in developing countries. Zinc is needed for the development of the oocyte and the embryo. Acrodermatitisenteropathica is an inherited deficiency of the zinc carrier protein ZIP4 resulting in inadequate zinc absorption. Zinc regulates the expression of metallothionein, which has multiple functions such as intracellular compartmentalization and antioxidant function. Thus zinc deficiency results in impaired growth and development, and disruption of reproductive and immune function. Severe zinc deficiency can result in neural tube defects and other congenital malformations[3]

Materials and Method

The study included 50 term-small for gestational age neonates and their mothers and 50 term- appropriate for gestational age neonates and their mothers who satisfy the inclusion and exclusion criteria. Detailed maternal history was takenand thorough physical examination of the neonate was done. Birth weight was plotted against gestational age in Lubchenco growth charts to assess if they are small for gestational age or appropriate for gestational age. After obtaining informed consent from the parents, cord blood sample for serum zinc was collected from term-SGA and term-AGA babies and 2ml of blood from the peripheral vein of their mothers immediately after delivery was collected respectively for serum zinc level estimation and sent to our central laboratory.(1,2)

Stastical Analysis

The data was entered in excel sheet and analyzed using SPSS (Version 16). Descriptive statistics with mean, standard deviation and proportion (%) was calculated for quantitative variables. To test the hypothesis ANOVA, Z test and Chi-Square test was used. ap-value<0.05 was considered as statistically significant(7)

Findings

Table- 1 Maternal Age – AGA Vs SGA

	AGA	SGA
Mean	24.22	23.88
SD	4.258	3.858
Minimum	17	17
Maximum	34	35

The mean maternal age in AGA was 24.22 and in SGA was 23.88.The above tabular column shows that there is no statistical significance in the maternal age between AGA and SGA groups. P VALUE= 0.677

The primiparous mother was 46% and 58% in AGA and SGA respectively,whereas in multiparous it was 54% and 42% in AGA and SGA respectively.The above results show that there is no statistical significance in the parity of mother between AGA and SGA groups. P-VALUE = 0.229

Table- 2 Parity – AGA Vs SGA Table- 2 Parity – AGA Vs SGA

	AGA	SGA	Total
Primi	23 (46%)	29 (58%)	52
Multi	27 (54%)	21 (42%)	48
Total	50 (100%)	50 (100%)	100

Graph : 1 Maternal Blood Zinc Level – AGA Vs SGA

The mean maternal zinc level in AGA and SGA were 101.1 and 92.47 respectively.The results show that there is a statistical significance in the maternal zinc between AGA and SGA groups.In Figure 1, The minimum and maximum levels of maternal zinc among AGA group were 68.9 and 138.1 whereas the values of minimum and maximum levels in the SGA group was 56 and 136. (3)

Discussion

Birthweight isthevital factor of perinatal and neonatal outcome. Anew born baby weighingless than 2.5 kg at birth irrespective of the gestationalageistermedasa low birth weight baby. Low birth weight babie scan beterm SGA orpretermbabies. While a lot of importance is being given to protein and energy deficits, micronutrients other than iron are often forgotten. It has been argued that micronutrient deficiency during pregnancy can lead to LBW. [4]In particular zinc deficiency is associated with abnormal conditions during pregnancy including congenital malformation (anencephaly) and abortion. Though zinc is needed only in small quantity, they have several vital functions in our human body. As their requirements are small, their adequacy have to be checked carefully and moreover many of the trace elements have interactions with each other.[5] Thus their needs have to be adequately met with a concern

over their interactions and toxicity. Among several micronutrients, iron stands first whose importance have been extensively studied andpracticed. Next lies zinc whose importance is slowly brought in to light by several research trials and studies.Hence this study of serum zinc levels in the cord blood of term SGA babies & their mothers and term AGA babies & their mothers was done.In our study, The mean maternal age in AGA was 24.22 and in SGA was 23.88 Which shows that there is no statistical significance in the maternal age between AGA and SGA groups.[6] In a study the maternal age of the control and cases were comparable.The average age of controls was 27.54 and that of cases was 27.5. Thus the two groups were well matched in this study.Thus the mean maternal age in the two groups were comparable similar to the study conducted by BenjaminWet al. [7] In our study The primiparous mother was 46% and 58% in AGA and SGA respectively,whereas in multiparous it was 54% and 42% in AGA and SGA respectively which shows that there is no statistical significance in the parity of mother between AGA and SGA groups which was similar to the study done by Christine A et al. [8]In our study, The LSCS were 42% and NVD was 58% in our study which was not similar to a study conducted by RonaldEet alwere the LSCS were 54% and NVD was 46%.[9,10]

Conclusion

It was found that cord blood zinc levels were low in term SGA babies when compared to term AGA babies. There was also low maternal zinc levels in the term SGA babies when compared to mothers of term AGA babies.

Distribution of Hypertensive Patients Associated with Development of Open Angle Glaucoma

A.muzamil Ahmed[1], Chinni Vikram[1], R.G.Santhaseelan[2]

[1]PG Student, [2]Professor, Dept. of General Surgery, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Glaucoma is a condition influencing in excess of 60 million individuals overall prompting irreversible vision misfortune. Glaucoma is a dynamic multifactorial optic neuropathy described by optic nerve harm, visual field misfortune and intra visual weight (IOP) which is a modifiable hazard factor. The Mechanical impact of raised IOP on optic nerve head (ONH) is viewed as the most inferable reason for this condition [1]. Nonetheless, a few vascular factors, for example, fundamental hypertension, atherosclerosis, vasospasm and so on., have additionally been ensnared as potential hazard factors that are fit for expanding the danger of open-edge glaucoma (OAG) [2].

Key Words – *Glaucoma, Optic Nerve Head, Open Edge glaucoma*

Introduction

American Heart Association depicts Systemic hypertension as Systolic blood weights ≥140 mm Hg and Diastolic blood weights ≥90 mm Hg. Long haul hypertension can prompt different conditions, for example, coronary supply route infection, stroke, cardiovascular breakdown, fringe vascular illness and constant kidney ailment alongside glaucoma and vision misfortune.

Past examinations done at Baltimore [3], Bolzano [4], Southern Arizona [5], and Rotterdam [6] and an as of late distributed planned investigations in Barbados [7] have demonstrated that lower diastolic perfusion weight (DPP), characterized as diastolic circulatory strain (DBP) less IOP, is an autonomous hazard factor for creating open-point glaucoma (OAG).

The vascular speculation of OAG states that a low pulse (BP) in respect to IOP can prompt low mean visual perfusion weight (MOPP), subsequently impeding perfusion of the ONH with resultant glaucomatous measuring and visual field misfortune. Appraisal of the diurnal vacillations in IOP and MOPP is, along these lines, clinically applicable in glaucoma patients.

Glaucoma is viewed as an optic neuropathy that outcomes in vision misfortune, and it will in general stay asymptomatic until cutting edge stages have been come to. It is assessed that more than 76 million individuals will have glaucoma in 2020 expanding to 111.8 million of every 2040. Essential open-point glaucoma (POAG) is the most well-known type of glaucoma and speaks to roughly 60%–70% of all cases [8]. The most widely recognized hazard factor known is a raised intraocular weight.

Foundational hypertension has been identified with expanded intraocular weight (IOP) and a higher danger of POAG [9]. Despite the fact that the physiopathology of glaucoma is as yet not totally comprehended, IOP remains the principle modifiable hazard factor which is credited towards its direct mechanical impact on the optic nerve head (ONH). Other than the mechanical changes because of the ascent of intraocular weight (IOP) and a few other vascular factors, for example, fundamental hypertension, atherosclerosis and vasospasm have additionally been involved as hazard factors in open point glaucoma (OAG). All things considered, proof

recommends that harm to the optic nerve axons happens due to microvascular damage and low perfusion [10]. Among vascular variables related with glaucoma, circulatory strain (BP) is the most contemplated, on the grounds that it is identified with microvascular blood stream and IOP, the two principle components that decide the visual perfusion weight (OPP). Visual blood stream is determined by mean visual perfusion weight (MOPP), expectedly characterized as the contrast between mean blood vessel pulse (MAP) and IOP. Concerning the set up job of vascular dysregulation in the pathogenesis of glaucoma, the connection among MOPP and the advancement and movement of glaucoma is fundamental alongside the heap factors that impact OPP, IOP, and MAP. [10].

Materials and Method

Patient in the age group of 40-60 years with essential hypertension presenting to the Ophthalmology outpatient department of Sree Balaji medical college, Chennai – 600 044.

Study Design: Cross-sectional study

Study Period: March 2017 to October 2018.

Study Place: Ophthalmology outpatient department of Sree Balaji medical college, Chromepet, Chennai – 600 044.

Sample Size:100 patients

Information Collection Method:

Educated assent was gotten from all investigation members. A total clinical and visual assessment was done to every single qualified member.

Clinical Procedures and Operational Definitions

In the wake of getting the educated assent, the members experienced a total ophthalmic assessment. One estimation of IOP were acquired by Goldmann applanation tonometry.

Furthermore, a questioner controlled poll was utilized to get statistic, visual, and medicinal chronicles. Members were solicited whether they had a history from glaucoma.

Measurement of Blood Pressure (BP)

BP was estimated by irregular zero sphygmomanometer with the member in the sitting position. Two continuous estimations of systolic and diastolic BP were gotten, and the normal was utilized in the examination. Hypertension was characterized as systolic BP ≥140 mm Hg and additionally diastolic BP (DBP) ≥90 mm Hg as well as present antihypertension treatment. Marginal hypertension was characterized as SBP somewhere in the range of 120 and 140 and additionally DBP somewhere in the range of 80 and 90. Hypotension was characterized as SBP ≤90 and additionally DBP ≤60. Mean blood vessel BP (MABP) was characterized as ⅓SBP + ⅔DBP. Systolic, diastolic, and mean PPs were characterized as systolic, or diastolic or mean blood vessel circulatory strain less IOP, separately.

Findings

Total of 100 individuals who met the selection criteria among the 250 screened, of which, the mean age of the participants was 52 years, minimum and maximum age is 40 and 60 years.

Table-1: Distribution of Glaucoma

Glaucoma Status	Frequency	Percent
Present	54	53.5
Absent	46	46.5
Total	100	100.0

Among the total population 54% had glaucoma.

Table-2: Distribution of POAG

POAG Status		Frequency	Percent
	Present	53	53.5
	Absent	47	46.5
	Total	100	100.0

Distribution of POAG was also 53% among these study population

Table-3: Distribution of BP*OPP*IOP

Descriptive Statistics					
	N	**Minimum**	**Maximum**	**Mean**	**Std. Deviation**
SBP	99	15	160	134.76	17.510
DBP	99	70	95	82.43	4.710
OPP	99	38	60	49.29	5.648
IOP	100	12	20	15.70	1.224

The above table shows the mean value of the SBP,DBO,OPP and IOP of the study participants.

Discussion

Glaucoma is a multifactorial infection. The pathogenesis of optic nerve harm in glaucoma is credited to a mix of components. Other than the mechanical changes because of the ascent of intraocular weight (IOP), a few vascular factors, for example, fundamental hypertension, atherosclerosis and vasospasm have likewise been embroiled as hazard factors in open edge glaucoma (OAG). A fall in perfusion weight at the optic circle might be brought about by hypotension, vasospasm or intense blood misfortune.

Direct estimation of visual blood stream could bring about various results. Besides, there are inescapable estimation mistakes during evaluation of BP and IOP and furthermore the sizes of estimation contrast (IOP esteems are in the scope of 10-30 mm Hg while BP qualities surmised 100 mm Hg).

Over the last few decades, a variety of OAG risk factors have been identified, including structural properties of the eye such as cupping of the optic disc, myopia, and central corneal thickness; ocular blood flow properties such as ocular perfusion pressure, vascular dysregulation and hemorrhages in the optic disc; and systemic conditions such as systemic blood pressure and diabetes. The mechanisms by which these factors may contribute to OAG pathophysiology are still largely unknown, and this hinders the development of more successful therapeutic approaches for OAG. In particular, it remains unclear which of these factors are causes or consequences of the disease and whether combinations of different factors yield similar risk for OAG.

Conclusion

Along these lines, we need to reevaluate the general effect of this analytic parameter just as its connection to intraocular weight.

The creators not just affirmed the job of visual perfusion weight as a significant hazard factor for the advancement and movement of glaucoma yet besides brought up that this parameter consummately consolidates the vascular and mechanical parts of glaucoma. In perspective on the way that both IOP and BP decide the OPP, the physiological reaction to diminished BP was relied upon to cause impacts on visual BF like those brought about by expanded IOP [11].

Appropriation of Ocular Perfusion Pressureand its Relationship in Development of Open-Angle Glaucoma

Arshad A.R[1], M.R. Rajashekar[2], Srinivasan[2]

[1]Final year M.S Orthopaedics, [2] Professor ,Dept of Orthopaedics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

A few clinical investigations have additionally demonstrated that non-physiologic nighttime BP and more extensive circadian vacillation in mean visual perfusion weight (MOPP) are altogether connected with the advancement and movement of OAG [2]. Nonetheless, in Asian populace, the connection between perfusion weight and glaucoma has not been all around recorded [3]. It is known through numerous investigations that BP and IOP change impressively in whites, blacks, and Asians [4], and consequently it is hypothesized that the conveyance and determinants of perfusion weight and its association with glaucoma would be diverse among the Asian population[5].

Keywords: *glaucoma, visual perfusion weight*

Introduction

Glaucoma is a dynamic multifactorial optic neuropathy described by optic nerve harm, visual field misfortune and intra visual weight (IOP) which is a modifiable hazard factor. The Mechanical impact of raised IOP on optic nerve head (ONH) is viewed as the most inferable reason for this condition [1].

Mean visual perfusion weight (MOPP), which can be characterized as the distinction between mean blood vessel circulatory strain (MAP) and IOP is utilized to assess the visual blood stream. In the ongoing occasions, the job of vascular dysregulation has increased tremendous noticeable quality in the pathogenesis of glaucoma, and thus the connection among MOPP and the advancement and movement of glaucoma has turned out to be basic, alongside the bunch factors that impact OPP, IOP, and MAP. The vascular speculation of POAG states that a low pulse (BP) in respect to IOP can prompt low mean visual perfusion weight (MOPP), in this manner debilitating vascular autoregulation of the ONH with resultant glaucomatous measuring and visual field misfortune and thus evaluation of the diurnal varieties in IOP and MOPP is, in this way, clinically important in glaucoma patients.

Visual perfusion weight (OPP) can be characterized as the contrast between mean blood vessel weight (MAP) in the ophthalmic corridor and IOP. Tissue perfusion is basic to keeping up retinal capacity as it doesn't store glucose and furthermore the changing IOP in the eyes depends upon vascular auto guideline to remunerate this. Albeit high intraocular weight was viewed as the most significant hazard factor being developed of well glaucoma, anyway even without high IOP, numerous patients still show movement of glaucoma. This illuminates the way that in certain patients, visual perfusion weight (circulatory strain – intraocular weight) might be a sole significant factor as intraocular weight alone. Along these lines, fundamental hypertension is viewed as being defensive against glaucoma. Epidemiological examinations done in the past have uncertain outcomes about the previously mentioned reality. An elective hypothesis expresses that hypertension may not secure against raised intraocular weight, disregarding expanding visual perfusion weight is that morphological changes to the vasculature and autoregulatory disappointment optional to delayed

hypertension prompts poor retinal and optic nerve head blood supply [6].

OPP is characterized as the distinction between blood vessel weight and venous weight, which is equivalent to or somewhat more noteworthy than IOP [7]. Robotically, diminished visual blood stream might be auxiliary to raised IOP or potentially decreased BP, or it could be the outcome of an essential affront to the visual vasculature, for example, vasospasm and additionally flawed vascular auto-guideline [7]. Moreover, the Barbados Eye Study demonstrated that people with the most reduced 20% of DPP were 3.3-times bound to create glaucoma [8]. In a subgroup of patients from the Barbados Eye Study pursued for a long time, lower OPPs and lower systolic BPs were again distinguished as hazard factors [9]. In an alternate report, low mean visual perfusion weight (<42 mmHg), systolic perfusion weight (<101 mmHg) and DPP (<55 mmHg) were altogether demonstrated to be hazard factors for the advancement of glaucoma, with relative dangers of 3.1, 2.6 and 3.2, individually [10]. The Egna-Neumarkt Study announced a 4.5% expansion in glaucoma commonness in patients with DPPs <50 mmHg contrasted and patients with DPPs ≥66 mmHg [11]. Regardless of the way that these examinations are from differing populaces, they all found that diminished DPP is a significant hazard factor for the improvement of glaucoma. A few examinations explored the vascular hazard factors in the pathogenesis of glaucoma, with BP and OPP being the most considered. The vascular theory depends on the presumption that irregular perfusion and the consequent ischemia of the ONH assume a noteworthy job in the loss of RGCs.

Visual perfusion weight can be thought of as the weight at which blood enters the eye. Scientifically, OPP is characterized as the blood vessel BP short IOP. Both of these determinants are dynamic natural parameters. Intraocular weight changes for the duration of the day and from everyday. Pulse is considerably increasingly factor, with noteworthy changes all through each heart cycle. During every heartbeat, foundational BP ascends to a pinnacle, the systolic BP, and after that drops to a trough, the diastolic BP. In this manner, OPP is additionally a unique parameter, fluctuating as both BP and IOP shift.

Glaucoma is viewed as an optic neuropathy that outcomes in vision misfortune, and it will in general stay asymptomatic until cutting edge stages have been come to. It is assessed that more than 76 million individuals will have glaucoma in 2020 expanding to 111.8 million out of 2040. Essential open-point glaucoma (POAG) is the most widely recognized type of glaucoma and speaks to around 60%–70% of all cases [14]. The most well-known hazard factor known is a raised intraocular weight.

Glaucoma is one of the main sources of visual impairment all inclusive. Expanding proof demonstrates that the sickness is optional to optic nerve head hypo perfusion and autonomic brokenness. Visual perfusion weight, speaking to visual blood stream, is a key factor that ought to be assessed in the administration of glaucoma. Visual perfusion weight is liable to impact by a bunch of components, and its figuring has been ordinarily improved as the distinction between mean blood vessel circulatory strain and intraocular weight. Regardless, the immediate impact of different factors on circulatory strain and intraocular weight ought not be ignored. Remembering the provincial commonness of ordinary strain glaucoma, we survey the writing and condense the patho physiology of glaucoma, meaning of visual perfusion weight, connection between visual perfusion weight and glaucoma improvement and movement, and key factors that impact visual perfusion weight. A fall in perfusion weight at the optic plate might be brought about by hypotension, vasospasm or intense blood misfortune. Visual perfusion weight is a gauge for the neighborhood intraocular blood stream, determined as contrast between the target esteems for the diastolic or systolic foundational pulse (BP) and IOP.

Mean OPP (MPP) = 2/3 [diastolic BP + 1/3 (systolic BP – diastolic BP)] – IOP

Systolic OPP (SPP) = Systolic BP – IOP

Diastolic OPP (DPP) = Diastolic BP – IOP

A low mean ocular perfusion pressure (MOPP) can impair perfusion of optic nerve head leading to glaucomatous cupping and visual field loss. As MOPP engulfs both systemic BP and IOP, it could be used to evaluate the presence and evolution of OAG better. Previous research showed that a possible connection between ocular perfusion pressure and open-angle glaucoma (OAG) has been hypothesized. The etiology of primary open-angle glaucoma (OAG) remains in doubt, despite extensive research.

Materials and Method

Patient in the age group of 40-60 years presenting to the Ophthalmology outpatient department of Sree Balaji medical college, Chennai – 600 044.

Study Design: Cross-sectional study

Study Period: March 2017 to October 2018.

Study Place: Ophthalmology outpatient department of Sree Balaji medical college, Chromepet, Chennai – 600 044.

Sample Size:100 patients

Data Collection Method

Informed consent was obtained from all study participants. A complete clinical and ocular examination was done to all eligible participants.

Mean Ocular Perfusion Pressure (MOPP) was calculated using standardized formula.

1. MOPP = 2/3 (MAP) - IOP

2. Mean arterial pressure (MAP) = DBP+1/3 (SBP-DBP).

Optic Disc Evaluation was done using +90D lens.

Field charting was done when there is abnormal optic disc changes or when C:D ratio is raised.

Correlation of ocular perfusion pressure with vision, cup disc changes and field changes was studied.

Eye pressure is measured in millimeters of mercury (mmHg). Normal eye pressure ranges from 12-22 mmHg, and eye pressure of greater than 22 mmHg is considered higher than normal. When the IOP is higher than normal but the person does not show signs of glaucoma, this is referred to as ocular hypertension.

Findings

Total of 100 individuals who met the selection criteria among the 250 screened, of which, the mean age of the participants was 52 years, minimum and maximum age is 40 and 60 years.

Table-1: OPP * POAG

Age Present	POAG		Total	
	Absent			
40-45	17	9	26	**Spearman Correlation 0.510**
46-50	14	18	32	
51-55	13	7	20	
56-60	9	12	21	
Total	54	46	100	

While comparing the OPP with OAG, there was significant correlation observed.

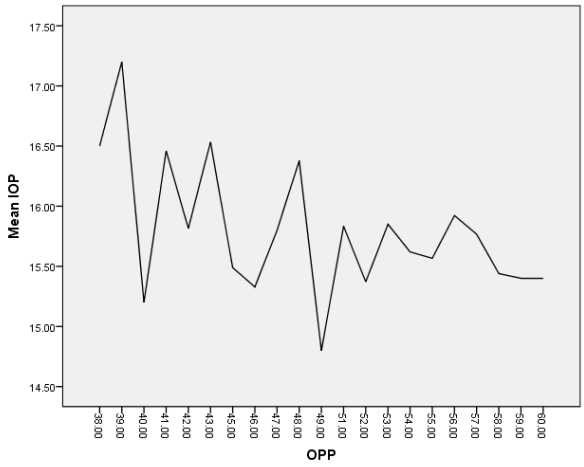

Table-2: OPP * Glaucoma

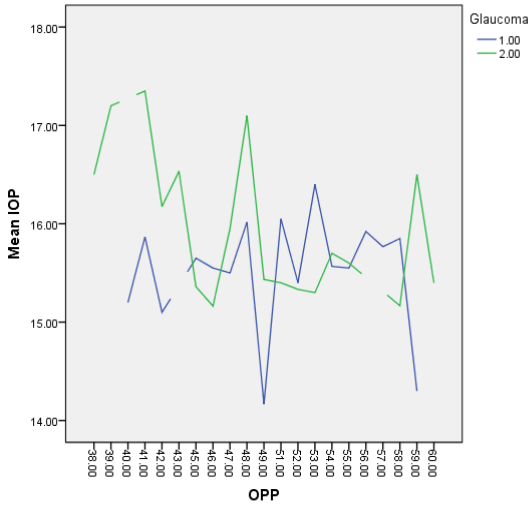
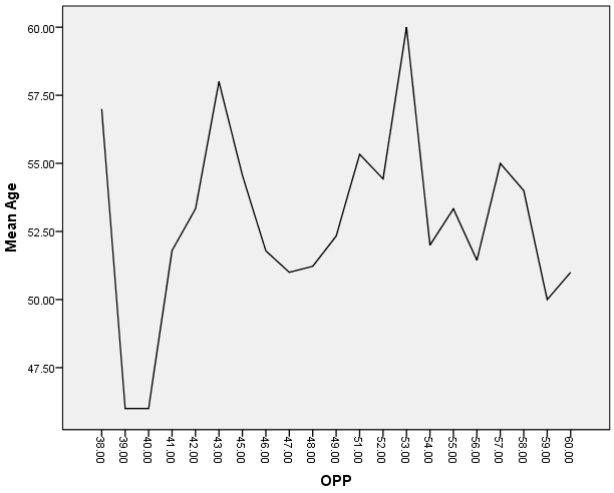


Age Present	Glaucoma		Total		
	Absent				
40-45	10	16	26	**Spearman Correlation 0.040**	**p-value 0.035**
46-50	16	16	32		
51-55	12	8	20		
56-60	15	6	21		
Total	53	46	99		

Though the OPP and Glaucoma was highly statistically significant, it was negatively correlated with Glaucoma.

Table-3: OPP * IOP

Age >15	IOP			Total		
	15-18	<18				
40-45	4	19	3	26	Spearman Correlation -0.068	p-value 0.134
46-50	10	20	2	32		
51-55	5	14	1	20		
56-60	7	13	1	21		
Total	26	66	7	99		



The above graph shows that there is no association with glaucoma status and Mean IOP and OPP.

Table-4: Distribution of BP*OPP*IOP

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
SBP	99	15	160	134.76	17.510
DBP	99	70	95	82.43	4.710
OPP	99	38	60	49.29	5.648
IOP	100	12	20	15.70	1.224

The above table shows the mean value of the SBP,DBO,OPP and IOP of the study participants.

Age Vs OPP

The above graph shows that the OPP was increased if the age increased.

Discussion

Low DOPP has been unequivocally connected with expanded pervasiveness of glaucoma. In the Barbados eye study [15], low DOPP (< 55 mm Hg) was a hazard factor for improvement of glaucoma, with a general danger of 3.2. Following 9 years of further development, it was demonstrated that people with the most minimal 20% of DOPP were 2.2 occasions bound to create glaucoma, despite the fact that pattern BP didn't anticipate OAG chance. In another Caucasian-based examination, the Baltimore Eye Survey found a 6-overlay expanded OAG predominance in subjects with low diastolic perfusion weight (< 30 mm Hg) [16]. Essentially, the Egna-Neumarkt Study [11] revealed a 4.5% expansion in glaucoma pervasiveness in patients with DOPP of < 50 mm Hg contrasted and those with DOPP of ≥ 66 mm Hg. In Proyecto VER, Quigley et al [17] additionally affirmed a 4-overlay increment in OAG pervasiveness at DOPP of < 50 mm Hg. In this way, a low DOPP has been unequivocally connected with OAG commonness in different populace based epidemiological investigations. Actually, the connection among SOPP and pervasiveness of OAG is less predictable. In the wake of modifying for OAG hazard factors, the Blue Mountains Eye Study [18] found an expanded commonness of 10% with every 10 mmHg increment in SOPP. However, in the Barbados Eye Study [8], patients with lower SOPP (< 101.3 mmHg) had 2.6 occasions expanded relative danger of creating OAG. The questionable proof partner SOPP with glaucoma pervasiveness prompts the hypothesis that low DOPP might be increasingly significant in the improvement of glaucoma and is as per the idea that most tissue perfusion happens during diastole. Further information are expected to assess whether the atherosclerotic hazard in high SBP genuinely adds to vascular deficiency of the ONH.

Conclusion

Visual perfusion weight and glaucoma movement Age is a key factor in glaucoma movement. As revealed in the Early Manifest Glaucoma Trial [19], after populace based follow-up for a long time, more seasoned patients had an expanded and quicker movement than more youthful patients. In the Collaborative Initial Glaucoma Treatment Study [20], the relative hazard expanded by 35% for consistently, while in the Advanced Glaucoma Intervention Study [21]. It is hypothesized that with maturing, vessels experience atherosclerosis, bringing about expanded sheer pressure, and bargain of narrow stream and supplement trade [22]. Since OPP is gotten from IOP and BP, their particular association with glaucoma movement is essential. As to, relationship between higher IOP with glaucoma movement have been reliably appeared in major clinical preliminaries in the previous decades. Patients with higher mean IOP during follow-up were bound to advance [23], while IOP decrease was altogether viable in postponing glaucoma movement., The Advanced Glaucoma Intervention Study (AGIS): The Canadian Glaucoma Study found up to a 19% expansion in movement per mm Hg increment in IOP, while the Advanced Glaucoma Intervention Study [24] (The Advanced Glaucoma Intervention Study (AGIS): found a lower pattern IOP (< 18 mm Hg) to be related with diminished visual field movement. The Early Manifest Glaucoma [25] showed a 12% to 13% expanded hazard per mm Hg increment in IOP, and demonstrated the centrality of an underlying decrease in IOP for forecast in glaucoma movement, where every mm Hg decline in IOP from pattern was related with a 8% decline in dangers proportion. As to, its circadian musicality must be considered. On the off chance that low perfusion weight and visual blood stream are embroiled in glaucoma harm, these conditions could likewise influence the movement of built up OAG. Despite the fact that not all investigations are steady, vascular components have been ensnared in the clinical course of glaucoma patients. Besides, circadian change of the mean visual perfusion weight was reliably identified

with infection seriousness in ordinary pressure OAG.

Long haul movement information (as long as 11 years) were given as of late by the Early Manifest Glaucoma Trial, a randomized clinical preliminary assessing the job of quick treatment, when contrasted with no underlying treatment, on glaucoma movement. The new outcomes demonstrate that patients with low systolic perfusion weight at pattern advanced quicker than their partners. The examination additionally assessed elements for movement independently for patients with higher versus, lower IOP at benchmark, as characterized by a middle split. A huge HR of 1.55 for low visual perfusion weight was seen in patients with higher benchmark IOP. This discovering parallels the aftereffects of some pervasiveness thinks about, where the affiliation was watched distinctly in patients with 'high pressure' glaucoma.

A Study on Life Style Habits of the Life Convicts Lodged in Central Prison, Chennai

A.muzamil Ahmed[1], Chinni Vikram[1], R.G. Santhaseelan[2]

[1]PG Student, [2]Professor, Dept. of General Surgery, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

Wrongdoing is a man-made idea. Wrongdoing and its connection to different socio-statistic elements has been subject of discussion since days of yore. Wrongdoing is wide spread, assorted in nature and expanding in recurrence. The pace of wrongdoing is consistently expanding step by step everywhere throughout the world, India being no exemption. 1 Crime and its connection to different socio statistic and financial elements decide the idea of wrongdoing

Keywords - *Crime , Wrongdoing*

Introduction

It is a subject of changing mentalities after some time inside a given society, and universal and national contrasts between the social orders. For instance, murder might be generally unlawful, aside from now and again of war, however will-completely finishing the life of a critically ill individual might be legitimately allowed in certain nations, yet is a wrongdoing of homicide in others. In the foreword to the 2002 World Report on Violence and Health, Nelson Mandela expresses, "The twentieth century will be recognized as a century set apart by viciousness, envy, vengeance, predominance, and sexuality (for example assault) which are the all inclusive human behaviors.[2]

Social significance of both work and crime change dramatically over the life course. The relationship between employment and criminal behavior at different life-course stages affects the nature of crime. Unemployment is one of the social factors involved in creation of crime and conviction. Also when a person is committing a crime and getting imprisoned he loses the job and earning, which affects the family's economic condition.[3]

There have been multiple research studies examining the relationship between socioeconomic status and arrests and punishments. Anyways socioeconomic status is independently considered a risk factor. There are multiple research studies establishing the causal link between socioeconomic status and arrest. Elizabeth Brown and Mike Males, authors of "Does Age or Poverty Level Best Predict Criminal Arrest and Homicide Rates?" found that "poverty level is a significantly larger predictor of arrest and homicide risk than age. They specifically looked at the data connecting age to arrest and then compared that to available data associated with socioeconomic status.[4]

Crime is an outcome of particular interest. Much of the crime in the country can be attributed to the issues and problems thrown up by the implications of development deprivations of the benefits and fruits of development pursuits generally led to disparities resulting in the criminality and unrest.[5]

Indian society has been passing through drastic and fundamental changes in the wake of industrialization, westernization and urbanization, both in the structures, socio-economic and cultural spheres which not only produced a changed physical environment and a new form of economic organization but also affected the social order, solidarity, human conduct and thought.

Crime, which is one social evil, which does major effects on human relations, occurs due to the lack of social comfort and the general state. Tackling crime can be achieved only from a multidisciplinary perspective, to highlight all its features. One can emphasize the prevention policies to fight against corruption at the social level, the establishing of guilt, the proper ranking of the offence or, even more elaborately, consider the forms of terrorism manifestation. Difficulties in conceptualizing crime derive from its various manifestations, both for institutions and individuals, with profound effects and consequences on the economic, social and legal sense. The etiological and causal perception of crime requires the expertise of criminal attitude determination.[6]

Understanding the decent variety of the inner causes, by considering singular human instinct and outside causes pointed towards social, monetary, legitimate or political variables, is fundamental to catch the causal determinism of wrongdoing. Thus, the consideration is centered around the financial models, training or populace thickness dissemination in urban and provincial areas.

It is hard to land at a decent evaluation of the wrongdoing issue an appraisal that assesses the numerous different expenses and advantages of the significant social changes that have additionally made wrongdoing a noticeable national issue. For arranging any counteractive action and control techniques, with respect to wrongdoing and to diminish brutality and different types of wrongdoing, the information of socio-statistic elements and crimes ought to be understood.

The Living conditions in each jail and partnered foundation implied for the authority, care, treatment and restoration of wrongdoers will be perfect with human respect in all angles, for example, settlement, cleanliness, sanitation, nourishment, dress, and medicinal offices.

Congestion aggravates condition for detainees. According to information of 2015 by National Criminal Records Bureau (NCRB), penitentiaries of India having a complete limit of 3,66,781 while real number of detainees living in jails was 4,19,623.7

Hence we have decided to do a study on prison population to explore the factors and determinants of crime and the health status of the prisoners which were not explored much in Tamil Nadu earlier.

AIM AND OBJECTIVES

To study the life style habits of the prisoners lodged in the central prison Puzhal, Chennai.

Materials and Method

A study conducted by Vinod kumar and UshaDatria among prisoners in central prison kota, Rajasthan in 2013 has found that the prevalence of psychiatric morbidities among them to be about 33%.[8]This prevalence was taken as the reference value for calculating the sample size for this study. The sample size was calculated using the formulaN = 4 PQ/ [L] 2

The sample size calculated was 353.76, by adding 10% for non-response rate (353.76+35.3) and the final sample size derived was 388 which was finally rounded off to 400. [N = 400]

Stratified random sampling (proportional stratified random sampling) technique was used to identify the study subjects. A pretested structured questionnaire was used as study stool for data collection. The questionnaire was prepared in English and translated to Tamil.

The data analysis was done using descriptive and analytical statistics. Data was entered in Microsoft excel and data analysis were done using the SPSS software, version 22. The descriptive statistics analysed were presented as frequency distribution and percentage. The descriptive data were presented in the forms of tables (frequency and percentage) and figures.

FINDINGS AND DISCUSSION

Table 1 : Life style habits of the study population

Sl.no	Characteristics	Frequency (N=400)	Percentage
1	**Diet**		
	Vegetarian	20	5.0
	Non-vegetarian	380	95.0
2	**Smoking status**		
	Smoker	279	69.7
	Non smoker	121	30.3
3	**Alcohol status**		
	Consume Alcohol	285	71.2
	Does not Consume alcohol	115	28.8
4	**Chewable tobacco**		
	Tobacco chewer	251	62.7
	Non chewer	149	37.3
5	**Brushing Behaviour**		
	Twice daily	68	17.0
	Once in a day	252	63.0
	Once in two days	80	20.0

Table 4 shows the personal lifestyle habits of the study participants, 95% of the participants were non-vegetarians. Nearly 69.7% (279) were known smokers,71.2% (285) were known alcoholic and 62.7% (251) were tobacco chewers. About 20% (80) of the participants were brushing once in 2 days and 17% (68) were brushing twice in a day.

Nearly 69.7% of the study population were known smokers and 62.7% were chewing tobacco in this study, similar results shown in the studies done by Reddy S et al in a central prison, Bangalore which showed that 87.5% of the inmates were smokers.[9] Similarly, the study done by Torwane et al in Central prison, Bhopal showed that 66.4% of the study population had the habit of tobacco consumption.[10] The study done by Abdu Z et al in Jimma town prison, South West Ethiopia showed that 46% of the study population were smokers.[12] This study shows 71% of the study population were consumed alcohol, while a study done by Abdu Z et al showed that only 21% of the inmates were alcoholic.[11]

From the above findings it is evident that the prevalence of alcohol consumption and smoking were increasing steadily and this may be due the adoption of abusive life style habits among the young and middle age group.

This study shows that 80% of the study population were brushing regularly once or twice in a day and 20% were brushing once in two days. Similar results were shown in a study done by Naghibi Sistani et al with 18% of the inmate were brushing once in two days.[12] This is a reflection of the oral hygiene practices among the prison inmates.

Conclusion

Though the diseases were reported alarmingly

high among the prisoners, when compared to general population shows that, health of the prisoners still continues to be a neglected health care. This may be due to undetected, under-detected and under-treated of the illness in the prisoners since they are a neglected group.

[1]PG Student, [2]Professor & Head, [3]Professor, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: Metabolic syndrome is a cluster of risk factors that increases the probability for developing cardiovascular disease, diabetes mellitus and chronic kidney disease. Non-alcoholic fatty liver disease is emerging as a major heath burden and is considered as the most common liver disease affecting large number of people and its prevalence is rising. It occurs in significant proportion of people who do not take alcohol.

Aim: It aims in studying the prevalence of non-alcoholic fatty liver disease in already diagnosed metabolic syndrome patients.

Method: A total of 100 metabolic syndrome patients were selected for study over a period of 1year. The patients were selected based on the metabolic syndrome criteria as given by National Cholesterol Education Program (NCEP) adult Treatment Panel III (ATP III). General demographic data were taken and biochemical parameters were estimated by standard guideline.When the criteria for Met syndrome has been fulfilled USG abdomen were taken for these patients.

Results: Out of 100 cases, 34 patients had USG evidence of fatty liver and out of them 18 had grade 1, 14 had grade 2 and 2 had grade 3 fatty liver. Age of the participants ranged from 20-60 yearswhere average age of the patients was 41.36 with standard deviation 7.170. BMI, waist circumference, triglyceride, fasting insulin, HOMAIR are found to be significant while HDL is not significant.

Conclusion: Non-alcoholic fatty liver disease is related with metabolic syndrome which is both the cause and also the consequences in the study population. Increased prevalence of all the metabolic factors and changes are seen in biochemical markers in Non-alcoholic fatty liver cases. Early diagnosis and treatment will help in preventing the complications.

Key words: *Metabolic syndrome, cardiovascular disease, Non-alcoholic fatty liver disease*

Introduction

Non-alcoholic fatty liver disease is considered as the most common liver diseasewhichranges from asymptomatic to simple steatosis, steatohepatitis, advanced fibrosis, cirrhosis and even hepatocellular cancer. Because of the increasing prevalence of obesity & aging, it has become a serious health issue [1-3]. NAFLD is strongly related with the metabolic syndrome risk factors and is seen in those individuals who meet the criteria of metabolic syndrome. On the other hand, metabolic syndrome is a group of risk factors that adversely affect the health. The chance of developing diabetes mellitus, cardiovascular disease, non-alcoholic fatty liver disease, non-alcoholic

steatohepatitis, cirrhosis, cerebrovascular disease and chronic kidney disease are high in this particular group of people.According to National Cholesterol Education Program (NCEP) Adult Treatment Panel III (ATP III), JAMA 2001, it introduced clinical criteria in which the metabolic syndrome is identified by the presence of three or more of the five abnormalities [4]:

Abdominal obesity (waist circumference >35 inches in women, >40 inches in men), Triglycerides ≥150 mg/dl, High-density lipoprotein cholesterol (<50 mg/dl in women or <40 mg/dl in men), Blood pressure ≥130/≥85 mmHg, Fasting blood glucose ≥ 110mg/dl

In 2005, the International Diabetes Federation (IDF) proposed a definition which represents the modifications of ATP III and WHO guidelines showing visceral obesity as the main factor of the syndrome [5]. IDF definition of the metabolic syndrome: Central obesity (waist circumference) in Caucasian >94 cm in men, >80 cm in women plus at least 2 of the following: Triglycerides >150.5mg/dl or specific treatment for lipid abnormality, HDL-cholesterol <34.8mg/dl in men, <42.5mg/dl in women or specific treatment for lipid abnormality, RR >130 systolic or >85 mm Hg diastolic or treatment of previously diagnosed hypertension, Fasting glucose >100.8 mg/dl or previously diagnosed type 2 diabetes or IGT. Studies have found out the age dependence of metabolic syndrome; it increases with increase in age [6, 7].One of the risk factors is Non-alcoholic fatty liver disease which usually goes undetected or the other co morbid factors takes precedence over this because they are more life threatening hence importance of NAFLD is to be discussed below.

Epidemiology

Globally, NAFLD is estimated as 6.3%-33% of the general population. Ludwig introduced the term Non Alcoholic Fatty Liver Disease (NAFLD) and Non Alcoholic Steato Hepatitis (NASH). It is influenced by age, sex affecting all racial and ethnic groups in the world. As age progresses, its prevalence also increases and is seen more commonly in 40-49 years. Non-alcoholic fatty liver disease contributes 10 to 24 percent of the general population in different countries. The prevalence rises to 57.5% [8] to 74% [9,10] in obese persons.Asmentioned, NAFLD has different stages. Roughly about 10% of NAFLD patients progresses to more severe form, NASH. It is much higher in diabetic and obese individuals as NAFLD in 60%-75% and NASH in 20%-25%.Fatty Liver is a condition of hepatic steatosis detected by abdominal ultrasound scan which is caused by many risk factors and the spectrum of disease may progress from mild to liver fibrosis and cirrhosis [13]. Lipids especially triacylglycerol accumulate excessively in the liver which results in fatty liver. It is considered as the most common liver abnormality among asymptomatic subjects associated with deranged liver function tests .

The risk factors for the development of NAFLD are age, Central obesity, Type 2 Diabetes Mellitus, hyperlipidaemia, Hypertension, Wide Waist circumference, Hypertriglyceridemia, Hypercholesterolemia, hyperuricemia, Low levels of high density lipoprotein (HDL) cholesterol, Family history of steatohepatitis, Cardiovascular disease, High fat diet, Sedentary lifestyle. Pathogenesis is the progression from simple steatosis to steatohepatitis and to advanced fibrosis results from two distinct factors. First is the insulin resistance which leads to the accumulation of fat within hepatocytes and second is the mitochondrial reactive oxygen species which causes peroxidation of lipids, Fas ligand and cytokine induction.

Method And Materials

The study explained to the participants and before taking the blood sample, informed consent were taken from them.Sample size as 100 metabolic syndrome patients.

Inclusion criteria: Age group of 20-50 years who are willing to participate, both genders equally (50- F, 50-M), Non alcoholics, No critical illness.

Exclusion criteria: Alcoholics, Chronic hepatitis, Cirrhosis, Steroid use, Pregnancy. With the help of ROC analysis, the patients are grouped as very high risk, high risk and moderate risk groups. Grading of Fatty liver was done based on the criteria accepted by American Gastroenterological Association.

- Grade I: Increased liver echogenicity with obvious periportal and diaphragmatic echogenicity.
- Grade II: Increased liverechogenicity with periportal echogenicity, without obscuration of the stomach.
- Grade III: Increased liver echogenicity with periportal echogenicity and obscuration of the stomach.

Findings

In this cross-sectional observational study, 100 individuals were selected based on the criteria for metabolic syndrome and their history, general anthropometric measurements, biochemical parameters and USG findings were all studied and is enumerated below.

Distribution of Fatty Liver

Table 1:-Frequency distribution of Fatty Liver

Fatty Liver	Frequency	Percent
Grade 1	18	52.9%
Grade 2	14	41.2%
Grade 3	2	5.9%

Out of 34 fatty liver cases totally identified among 100 patients, almost 52.9% of the cases have grade 1 fatty liver and 41.2% of the cases have grade 2 fatty liver. Only two cases (5.9%) with grade 3 fatty liver were also noted.

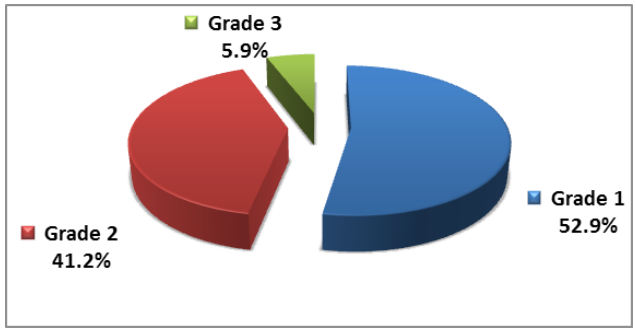

Fig 1:- Distribution of Fatty Liver

By ROC analysis, the patients are demarked into 3 groups as very high risk, high risk and moderate risk groups.

Comparison of BMI between Groups

Table 2:- Comparison of BMI

Group	Mean	SE	Range	p - value
Very High Risk	33.90	0.990	23.0 - 45.2	0.000
High Risk	27.51	0.695	23.0 - 33.5	
Moderate Risk	23.72	0.125	22.0 - 24.9	

Here the p-value is <0.05 so, the difference in BMI between groups is significant different. The table reveals that BMI is significantly higher in very high risk (33.90 ± 0.990) and significantly lower in moderate risk (23.72 ± 0.125) compared to high risk (27.51 ± 0.695).

Comparison of Waist Circumference between Groups

Table 3:- Comparison of Waist Circumference between Groups

Group	Mean	SE	Range	p – value
Very High Risk	100.6	1.591	83.5 - 117.2	0.000
High Risk	96.12	1.841	85.0 - 112.5	
Moderate Risk	83.96	0.153	82.0 - 85.0	

Here the p-value <0.05; the difference in waist circumference between groups is significant. The table reveals that waist circumference is significantly higher in very high risk (100.6 ± 1.591) and significantly lower in moderate risk (83.96 ± 0.153) compared to high risk (96.12 ± 1.841).

Comparison of TGL between Groups

Table 4:- Comparison of TGL between Groups

Group	Mean	SE	Range	p – value
Very High Risk	263.9	13.70	152 - 500	0.000
High Risk	202.1	6.531	158 - 333	
Moderate Risk	183.7	7.650	152 - 332	

Here the p-value <0.05; the difference in TGL between groups is significant. The table reveals that TGL is significantly higher in very high risk (263.9 ± 13.70) compared to high risk (202.1 ± 6.531) and moderate risk (183.7 ± 7.650).

Comparison of HDL between Groups

Table 5:- Comparison of HDL between Groups

Group	Mean	SE	Range	p – value
Very High Risk	43.09	1.533	30 - 60	0.267
High Risk	40.44	0.996	30 - 52	
Moderate Risk	42.53	1.088	30 - 52	

Here the p-value >0.05; the difference in HDL between groups is not significant. The table reveals that HDL is almost same in very high risk (43.09 ± 1.533), high risk (40.44 ± 0.996) and moderate risk (42.53 ± 1.088).

Comparison of Fasting Insulin between Groups

Table 6:- Comparison of Fasting Insulin between Groups

Group	Mean	SE	Range	p - value
Very High Risk	11.69	0.485	7.0 - 17.0	0.000
High Risk	9.656	0.246	5.8 - 12.9	
Moderate Risk	7.020	0.241	3.8 - 10.0	

Here the p-value <0.05; the difference in fasting insulin between groups is significant. The table reveals that fasting insulin is significantly higher in very high risk (11.69 ± 0.485) and significantly lower in moderate risk (7.020 ± 0.241) compared to high risk (9.656 ± 0.246).

Comparison of HOMAIR between Groups

Table 7:- Comparison of HOMAIR between Groups

Group	Mean	SE	Range	p – value
Very High Risk	4.009	0.165	2.5 - 6.0	0.000
High Risk	2.897	0.050	2.2 - 3.5	
Moderate Risk	2.080	0.043	1.8 - 2.7	

Here the p-value <0.05; the difference in HOMAIR between groups is significant. The table reveals that HOMAIR is significantly higher in very high risk (4.009 ± 0.165) and significantly lower in moderate risk (2.080 ± 0.043) compared to high risk (2.897 ± 0.050).

Discussion

The metabolic syndrome has become one of the more prevalent diseases in Asian countries and with increased incidence of obesity and insulin resistance especially among Indian population we have found a rise in NAFLD due to metabolic syndrome excluding other causes. NAFLD has been recognized as the common liver disease causing morbidity and mortality. It progresses from simple steatosis to steatohepatitis to cirrhosis and hepatic failure. The main pathophysiology being insulin resistance producing steatosis and mitochondrial reactive oxygen species increasing lipid peroxidation leading to increased hepatic damage [16] which have increased undetected liver disease in these patients.In our study with 100 patients diagnosed with metabolic syndrome we found that 34 patients had USG evidence of fatty liver and out of them 18 had grade 1, 14 had grade 2 and 2 had grade 3 fatty liver.Obesity, one of the most important risk factor is associated with fatty liver [17] is commonly observed in developed countries. Diabetes mellitus along with obesity, hyperlipidaemia and hypertension are the main manifestations of metabolic syndrome associated with insulin resistance [18].Metabolic syndrome is a group of metabolic abnormalities which have high chance of having diabetes mellitus, cardiovascular disease, NAFLD, NASH, cirrhosis and cerebrovascular disease. Different examinations have researched that advancement of NAFLD and MS go deliver hand. Others studies managing comparable cases like in 2018, Pardhe et al set up a relationship between's metabolic disorder and biochemical changes among non-alcoholic greasy liver malady patients in a tertiary consideration emergency clinic of Nepal. An aggregate of 429 (219 NAFLD and 210 control) subjects were chosen and was presumed that there is an expanded predominance of metabolic disorder parts and noteworthy changes seen in biochemical markers in NAFLD patients

In 2006, Peter Latimar L Andrada et al projected a similar study to determine the prevalence of MS among patients with non-alcoholic fatty liver disease. It is a case series of patients with NAFLD diagnosed by ultrasonography .

RoliAgrawal et al in 2009analysed a group of 129 patients of cross sectional study to find out the association between non-alcoholic fatty liver disorder and obesity, which is the important risk factor for metabolic syndrome. It was concluded that there is a positive correlation with obesity

A review article on hypertension and the metabolic syndrome by Lea Duvnjak et al [(1)] in 2008 elaborated that Insulin resistance and central obesity are considered the main factors involved in the pathogenesis of the metabolic syndrome. Hypertension is associated with the metabolic syndrome.

Most of the cases of NAFLD are asymptomatic. Hepatomegaly,being the commonest physical finding. The underlying pathogenesis is the insulin resistance which leads to the triglyceride accumulation within hepatocytes and the mitochondrial reactive oxygen species which cause lipid peroxidation and cytokine induction.

Limitations ofthe Study:

- In this study as the sample size is limited therefore for a better understanding a large population can be included.

- Liver biopsy is the gold standard for predicting Non Alcoholic Fatty Liver disease which was not done in this study as it is a major invasive procedure.

Conclusion

Non-alcoholic greasy liver infection is connected with metabolic disorder which is both the reason and furthermore the results in the examination population. There is an expanded pervasiveness of the considerable number of variables of metabolic disorder and changes are seen in biochemical markers in Non-alcoholic greasy liver cases.Ultrasound greasy liver record is a modest, straightforward and exact locator of danger of metabolic disorder. Most instances of NAFLD are asymptomatic. So, frequent checking, timely diagnosis and treatment helps in delaying the complications and prevents cardiac disease as its relation with MS is frequent.

Study of Lipid Profile in Metabolic Syndrome Patients

Pinky Karam[1], B. Shanthi[2], Kalai Selvi[2]

[1]PG Student, [2]Professor & Head, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: Metabolic syndrome is a group of metabolic abnormalities in which the chance of developing cardiovascular disease, diabetes mellitus, chronic kidney disease are high.

Aim: It aims at studying the lipid abnormalities in metabolic syndrome patients.

Method: Total of 100 metabolic syndrome patients were selected for study over a period of 1year. These patients were selected based on the criteria for metabolic syndrome as established by National Cholesterol Education Program (NCEP) adult Treatment Panel III (ATP III). Demographic data were taken and biochemical parameters were estimated by standard guideline.

Results: Total cholesterol is significantly higher in very high risk (272.1 ± 8.591) compared to high risk (241.2 ± 3.901) and moderate risk (231.5 ± 4.498).TGL is significantly higher in very high risk (263.9 ± 13.70) compared to high risk (202.1 ± 6.531) and moderate risk (183.7 ± 7.650).HDL is almost same in very high risk (43.09 ± 1.533), high risk (40.44 ± 0.996) and moderate risk (42.53 ± 1.088). LDL is significantly higher in very high risk (177.9 ± 4.255) and high risk (169.4 ± 3.190) compared to moderate risk (155.7 ± 3.098). VLDL is significantly higher in very high risk (52.78 ± 2.739) compared to high risk (40.43 ± 1.306) and moderate risk (36.73 ± 1.530).CHO: HDL is significantly higher in very high risk (6.648 ± 0.366) compared to moderate risk (5.560 ± 0.207). High risk (6.060 ± 0.156) is not significantly different from very high risk and moderate risk.Thus, TC, TGL, LDL, VLDL, and CHO:HDL is significant as p value < 0.05 while HDL did not have any significance as p value > 0.05

Conclusion: In this study, high prevalence of dyslipidaemia is seen. So, timely diagnosis and treatment will help in detecting dyslipidaemia patients in future.

Key words: *Dyslipidaemia, Lipid profile, NCEP, Metabolic syndrome.*

Introduction

The term metabolic syndrome (MS) also known as "syndrome X", "insulin resistance syndrome" was only coined in the 1950s and commonly used in the late 1970s. It is a group of risk factors that adversely affect the health. The chance of developing diabetes mellitus, cardiovascular disease, non-alcoholic fatty liver disease, non-alcoholic steatohepatitis, cirrhosis, cerebrovascular disease and chronic kidney disease are high in these particular groups of people. The prevalence of metabolic syndrome is approximated as 17%-25% in general population [1, 2] and 59% to 61% in people with diabetes mellitus [1,3]. Researchers have shown a higher incidence of the metabolic syndrome in men [4, 5] than in women, while in some other studies, it shows the reverse of it [6]. Studies have found out the age dependence of metabolic syndrome; it increases with increase in age [4, 7].

According to National Cholesterol Education Program (NCEP) Adult Treatment Panel III (ATP III), JAMA 2001, it introduced clinical criteria in which the metabolic syndrome is identified by the presence of three or more of the five abnormalities [8]:

Corresponding Author:
Dr. Kalai Selvi,
Professor & HOD, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai-73.

Abdominal obesity (waist circumference >35 inches in women, >40 inches in men), Triglycerides ≥150 mg/dl, High-density lipoprotein cholesterol (<50 mg/dl in women or<40 mg/dl in men), Blood pressure ≥130/≥85 mmHg, Fasting blood glucose ≥ 110mg/dl

In 2005, the International Diabetes Federation (IDF) proposed a definition which represents the modifications of ATP III and WHO guidelines showing visceral obesity as the main factor of the syndrome [7].

Metabolic risk factors contributing are abdominal obesity, dyslipidemia, hypertension, elevated plasma glucose, pro-thrombotic state and pro-inflammatory state Dyslipidaemia characterized by increase TGL and decrease HDL leads to cardiovascular complications. It is seen in 20-80% of NAFLD patients [14] and the leading cause of deaths. Several studies were done, Matteoni et al found mortality rate of 36% among 132 patients and was due to cardiac complications

Aim: Study of lipid profile in metabolic syndrome patients.

Method and Materials

This study was conducted in the Department of Biochemistry, Sree Balaji Medical College and Hospital, Chromepet, Chennai during the period of December 2016 – December 2017 among 100 patients with metabolic syndrome attaining outpatient and inpatient services of the Department of General Medicine. The study explained to the participants and before taking the blood sample, informed consent were taken from them. These patients were selected based on the criteria for metabolic syndrome as established by National Cholesterol Education Program (NCEP) Adult Treatment Panel III (ATP III).

Inclusion criteria:

- Patients between age group of 20-50 years who are willing to participate.
- 100 patients with metabolic syndrome
- Both genders equally (50- F,50- M)

Exclusion criteria: Chronic hepatitis, Cirrhosis, Steroid use, Pregnancy, Malignancy

General history, medical and family history were also noted. In these patients general demographic data like history, age, gender, waist circumference and blood pressure were recorded.The laboratory investigations done: blood sugar (fasting and post prandial), total cholesterol, triglyceride, HDL, LDL, VLDL. All the Biochemical Investigations were done using BS390 fully automated analyser.

Findings and Discussion

ROC Analysis

On performing receiver operative characteristics analysis with the above set criteria we noticed the patients getting demarked into 3 risk categories: Moderate Risk, High Riskand Very High Risk

The frequency of distribution was 30 moderate risk cases, 36 high risk cases and 34 very high risk cases.

Here the p-value <0.05; the difference in waist circumference between groups is significant. The table reveals that waist circumference is significantly higher in very high risk (100.6 ± 1.591) and significantly lower in moderate risk (83.96 ± 0.153) compared to high risk (96.12 ± 1.841).

Here the p-value <0.05; the difference in systolic blood pressure between groups is significant. The table reveals that systolic blood pressure is significantly higher in very high risk (147.2 ± 1.241) compared to high risk (140.4 ± 0.851) and moderate risk (141.5 ± 1.178).

Table 1:- Comparison of FBS between Groups

Group	Mean	SE	Range	p - value
Very High Risk	141.6	5.159	100 - 244	0.001
High Risk	123.2	2.658	100 - 180	
Moderate Risk	123.6	3.764	100 - 200	

Here the p-value <0.05; the difference in FBS between groups is significant. The table reveals that FBS is significantly higher in very high risk (141.6 ± 5.159) compared to high risk (123.2 ± 2.658) and moderate risk (123.6 ± 3.764).

Table 2:- Comparison of PPBS between Groups

Group	Mean	SE	Range	p – value
Very High Risk	196.9	9.137	130 - 309	0.272
High Risk	197.8	9.163	103 - 308	
Moderate Risk	178.0	10.20	103 - 304	

Here the p-value >0.05; the difference in PPBS between groups is not significant. The table reveals that PPBS is almost same in very high risk (196.9 ± 9.137), high risk (197.8 ± 9.163) and moderate risk (178.0 ± 10.20).

Table 3:- Comparison of Total Cholesterol between Groups

Group	Mean	SE	Range	p – value
Very High Risk	272.1	8.591	200 - 420	0.000
High Risk	241.2	3.901	201 - 300	
Moderate Risk	231.5	4.498	200 - 300	

Here the p-value <0.05; the difference in total cholesterol between groups is significant. The table reveals that total cholesterol is significantly higher in very high risk (272.1 ± 8.591) compared to high risk (241.2 ± 3.901) and moderate risk (231.5 ± 4.498).

Table 4:- Comparison of TGL between Groups

Group	Mean	SE	Range	p – value
Very High Risk	263.9	13.70	152 - 500	0.000
High Risk	202.1	6.531	158 - 333	
Moderate Risk	183.7	7.650	152 - 332	

Here the p-value <0.05; the difference in TGL between groups is significant. The table reveals that TGL is significantly higher in very high risk (263.9 ± 13.70) compared to high risk (202.1 ± 6.531) and moderate risk (183.7 ± 7.650).

Table 5:- Comparison of HDL between Groups

Group	Mean	SE	Range	p – value
Very High Risk	43.09	1.533	30 - 60	0.267
High Risk	40.44	0.996	30 - 52	
Moderate Risk	42.53	1.088	30 - 52	

Here the p-value >0.05; the difference in HDL between groups is not significant. The table reveals that HDL is almost same in very high risk (43.09 ± 1.533), high risk (40.44 ± 0.996) and moderate risk (42.53 ± 1.088).

Table 6:- Comparison of LDL between Groups

Group	Mean	SE	Range	p – value
Very High Risk	177.9	4.255	120 - 220	0.000
High Risk	169.4	3.190	134 - 200	
Moderate Risk	155.7	3.098	132 - 200	

Here the p-value <0.05; the difference in LDL between groups is significant. The table reveals that LDL is significantly higher in very high risk (177.9 ± 4.255) and high risk (169.4 ± 3.190) compared to moderate risk (155.7 ± 3.098).

Here the p-value is less than the significance level 0.05; the difference in VLDL between groups is significant. That is, there is a significant difference in VLDL between groups. The table reveals that VLDL is significantly higher in very high risk (52.78 ± 2.739) compared to high risk (40.43 ± 1.306) and moderate risk (36.73 ± 1.530).

Here the p-value < 0.05; the difference in CHO:HDL between groups is significant. The table reveals that CHO:HDL is significantly higher in very high risk (6.648 ± 0.366) compared to moderate risk (5.560 ± 0.207). High risk (6.060 ± 0.156) is not significantly different from very high risk and moderate risk.

Discussion

The metabolic syndrome has become one of the more prevalent diseases in Asian countries.In our study with 100 patients diagnosed with metabolic syndrome, WC is significantly higher in very high risk (100.6 ± 1.591) and significantly lower in moderate risk (83.96 ± 0.153) compared to high risk (96.12 ± 1.841). The total cholesterol is significantly higher in very high risk (272.1 ± 8.591) compared to high risk (241.2 ± 3.901) and moderate risk (231.5 ± 4.498). TGL is also significantly higher in very high risk (263.9 ± 13.70) compared to high risk (202.1 ± 6.531) and moderate risk (183.7 ± 7.650). HDL between groups is not significant. It is almost same in very high risk (43.09 ± 1.533), high risk (40.44 ± 0.996) and moderate risk (42.53 ± 1.088). On the other hand, LDL is significantly higher in very high risk group (177.9 ± 4.255) and high risk (169.4 ± 3.190) compared to moderate risk (155.7 ± 3.098). VLDL is significantly higher in very high risk (52.78 ± 2.739) compared to high risk (40.43 ± 1.306) and moderate risk (36.73 ± 1.530). CHO:HDL is significantly higher in very high risk (6.648 ± 0.366) compared to moderate risk (5.560 ± 0.207). High risk (6.060 ± 0.156) is not significantly different from very high risk and moderate risk.

Thus, TC, TGL, LDL, VLDLand CHO:HDL is significant while HDL did not have any significance.A study done by Dhumal Uttareshvar Mahaling et al [5] to detect and do a comparison of serum lipid abnormalities in patients with different grades of non-alcoholic fatty liver diagnosed by ultrasonography. A total of 70 NAFLD cases (30 males and 40 females) taken and their lipid profile compared. It was found that, out of 70 cases, grade I NAFLD as 47.15%, grade II of 42.85% and grade III of 10%. Serum TG, TC, LDL and VLDL levels were raised and low serum HDL levels were seen in 62.85%.

An original article by AbhijitSen et al [6] in 2013, conducted a cross sectional study to assess the BMI and lipid profile of NAFLD patients. A total of 385 NAFLD subjects included where the demographic and lipid profile as total cholesterol, triglycerides, HDL, LDL, VLDL recorded. TC and TG were found to be higher in grade III and similarly for HDL and VLDL. But LDL was similar in all grades of NAFLD patients.

A similar study by Khem Raj Bhusal et al was conducted on studying the lipid abnormalities in different grades by ultrasound. A total of 100 NAFLD patients (67 males and 37 females) were included in the study where mild NAFLD was found in 83%, moderate in 17% n severe none. Similarly, TC, TG, LDL were raised and HDL decreased. It was concluded that prevalence of dyslipidemia was high in NAFLD patients. So, early detection with ultrasonography is useful in these patients.

Bashu Dev Pardhe et al [19] shows the bidirectional and mutual linkage of high density lipoprotein when compared to controls, which was significantly less as compared to the controls. Likewise another study was carried out by Agarwal et al. and Uttareshvar et al who reported that there was an increase in TC, TGL, LDL-C,

VLDL-C but decrease in HDL-C levels indicating the possible atherogenic dyslipidaemia

The uptake of fatty acids in the liver causes accumulation of fat especially triglyceride, liver toxicity and the inflammatory cytokines, tumour necrosis factor causes non-alcoholic fatty liver disease and also fatty liver with mild to moderate elevation of liver enzymes[7].

Conclusion

The study showed patients with dyslipidaemia. There is positive correlation of obesity, waist circumference, systolic blood pressure, fasting plasma glucose, total cholesterol, triglyceride, LDL, VLDL and negative correlation with HDL-C.Dyslipidaemia is a common condition associated with non-alcoholic fatty liver disease. So, early detection, frequent checking, identifying and treating dyslipidaemia is important to prevent any cardiovascular and cerebrovascular disease.

Study of Prevalence of Thyroid Lesions of Patients Coming to Department of Pathology, SBMCH

P. Shalini[1], Natrajan Suresh[2], Hemalatha Ganapathy[3]

[1]Post Graduate, [2]Associate Professor, [3]Professor and Head, Department of Pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Introduction: Thyroid cancer is the most common endocrine neoplasm. It is well documented that the incidence of thyroid cancer is higher in women than in men and its incidence is growing at a global level. As the pathology of thyroid is complex, which comprises a benign element (that can coexist with other pathologies), and also a malignant element which has a devastating impact on the patient.Reports have shown that the patients' age when being diagnosed, sex, tumour size, lymph node, distant metastases and pathologic differentiation of the cancer are the risk factors of prognosis in thyroid cancer.

Materials & Method: The present study consists of 60 cases of thyroid masses which were removed surgically and were sent for the Histopathological Examination to our department (Department of Pathology, SBMCH). All these specimens were received from the Department of Surgery, SBMCH.The present study highlighted the prevalence of thyroid lesions among patients coming to our department of pathology, SBMCH.

Results: The prevalence of thyroid specimens coming to our department from all the departments is 2.70%, out of the specimens from the surgery department, the prevalence of thyroid specimens is 6.68%.The ratio between M:F is 1 : 4.5.The mean age group in which thyroid lesions are seen most commonly is 40-49 years followed by 30-39 years and the mean age is 43.08 years.

Conclusion: Among the distribution of thyroid lesions, the prevalence of papillary carcinoma cases were reported as more common which were of 41.67% in this study followed by nodular colloid goitre of 36.67%. Follicular Adenoma cases were reported as 16.67%. Follicular carcinoma cases were reported as least prevalence of 5 %.

Key Words: *Prevalence, Thyroid cancer, Age & Sex Incidence.*

Introduction

The thyroid is a significant endocrine organ, which assumes a noteworthy job in the elements of practically all typical metabolic procedures. As the pathology of thyroid is unpredictable, which contains a favorable component (that can coincide with different pathologies), and furthermore a dangerous component which devastatingly affects the patient.(1) Stress is seen as activating element for the immune system thyroid pathology. Thyroid nodules which are more commonly encountered during routine medical care and their prevalence increases with age, with the average of 4−7% in adult population.(2)It has been documented that 90 people were diagnosed with thyroid cancer out of 1,00,000 people and among these patients, 6.8 people were died in china. It has also been reported that 1,980 people died of the disease in 2016 and it has been estimated that there will be 64,300 new patients of thyroid cancer in USA.(3)Reports have shown that the patients' age when being diagnosed, sex, tumour size, lymph node, distant metastases and

pathologic differentiation of the cancer are the risk factors of prognosis in thyroid cancer.Thyroid cancer is the most common endocrine neoplasm. It is all around recorded that the rate of thyroid malignant growth is higher in ladies than in men and its rate is developing at a worldwide level.(4)However, men by and large go to the doctor in a further developed phase of infection, exhibiting extra-thyroidal augmentation, subsequently prompting an increasingly held guess on both endurance and repeat pace of the disease.The fundamental driver for increment in number of new thyroid malignant growth cases in the most recent decade are: radiation (ionizing radiation), natural components, hereditary elements, better access of the populace to wellbeing administrations with expanded addressability, and the improvement of restorative imaging with early discovery of any adjustments in the thyroid organ.

Materials & Method

The present study consists of 60 cases of thyroid masses which were removed surgically and were sent for the Histopathological Examination to our department (Department of Pathology, SBMCH). All these specimens were received from the Department of Surgery, SBMCH. These 60 cases include 22(36.67%) Non-neoplastic lesions of Thyroid which include Nodular Goitre, MNG, Nodular Goitre with papillary hyperplasia,10(16.67%) benign neoplasms of Thyroid which include 8 cases of Follicular Adenoma and 2 cases of Hurthle cell adenoma and 28 Malignant lesions of Thyroid which include 25(41.67%) cases of Papillary carcinoma of Thyroid and 3 (5%) cases of Follicular carcinoma of Thyroid.The present study highlighted the prevalence of thyroid lesions among patients coming to our department of pathology,SBMCH.[4-6]

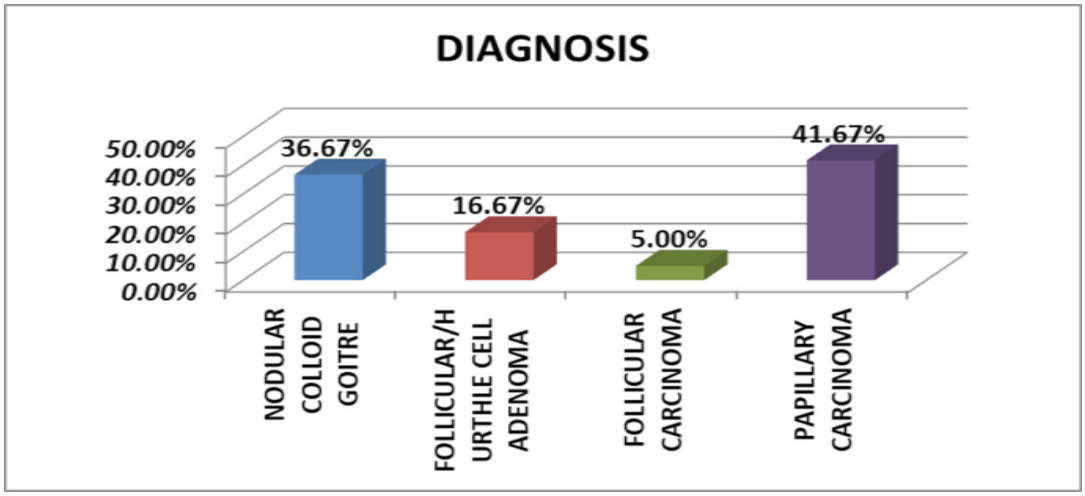
Findings

During 17 months study period, total of 2893 biopsy specimens were received in our department for histopathological examination. Among these cases, a total of 1172 cases were received from surgery department, out of which 78 cases were thyroid specimens. The prevalence of thyroid specimens coming to our department from all the departments is 2.70%, out of the specimens from the surgery department, the prevalence of thyroid specimens is 6.68%.

Prevalence of Thyroid Lesions

Table-1: Year-Wise Distribution of Thyroid Lesions

Year	Total no. of Biopsy specimens received	Total no. of specimens received from surgery department	Total no. of Thyroid specimens received	% of Thyroid Cases among total biopsy specimens	% of Thyroid cases among cases received from surgery dept.
01-03-2017 to 31-12-2017	1705	676	48	2.82 %	7.1%
01-01-2018 To 31-07-2018	1188	496	30	2.52%	6.05%
Total (17 months)	2893	1172	78	2.70%	6.65%



Histopathological Evaluation of Thyroid Lesions

The histopathological diagnosis was done for all the 78 thyroid cases, out of them 60 cases were taken for study by excluding few Non-neoplastic lesions like inflammatory lesions as mentioned earlier and their distribution in the current study was shown in Table:2 and chart:1.

Table 2: Distribution of Thyroid Lesions among 60 Cases

Diagnosis			No. of Cases	% of Cases
Non-Neoplastic		Nodular Colloid Goitre	22	36.67%
Benign Hurthle Cell Adenoma (2)		Follicular Adenoma (8)	10	16.67%
Malignant	Follicular Carcinoma	Oncocytic (1)	3	5.00%
	Papillary Carcinoma	Follicular (10)	25	41.67%
		Classic (6)		
		Oncocytic (4)		
		Solid (2)		
		Micropapillary (3)		
Total			60	100.00%

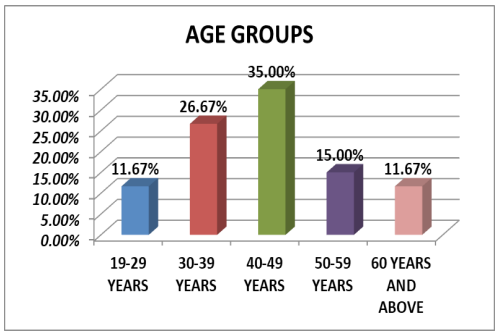
Among the distribution of thyroid lesions, the prevalence of papillary carcinoma of thyroid cases were reported as more common which were of 41.67% in this study followed by nodular colloid goitre of 36.67%. Follicular carcinoma was of least prevalence of 5%. No medullary carcinoma and anaplastic carcinoma cases were received during this study period.[1-3]

SEX INCIDENCE:

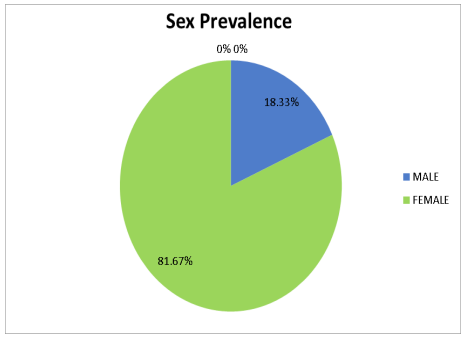
The sex incidence of thyroid lesions were shown in table-3 and chart-2:

TABLE -3

Sex	Cases	
	No.	**%**
Male	11	18.33%
Female	49	81.67%
Total	60	100%



The sex prevalence is seen as Female preponderance in this study. Out of 60 cases studied, 11(18.33%) were Male and 49 (81.67%) were Female as shown in table-3 & chart-2. The ratio between M:F is 1 : 4.5.



Age Incidence:

Table :4

AGE GROUPS	NO. OF CASES	PERCENTAGE
19-29 YEARS	7	11.67%
30-39 YEARS	16	26.67%
40-49 YEARS	21	35.00%
50-59 YEARS	9	15.00%
60 YEARS AND ABOVE	7	11.67%
Total	60	100.00%
Mean Age	43.08 Years	

The mean age group in which thyroid lesions are seen most commonly is 40-49 years followed by 30-39 years and the mean age is 43.08 years.

Discussion

The prevalence of thyroid nodules mostly depends on the method that is used for detecting the nodules.

An average worldwide prevalence of thyroid nodules, by palpation is estimated as 4−7% in iodine-sufficient regions, by USG imaging is up to 35−70%, and at autopsy from 50% to over 80%.[5]With current diagnostic methods of clinically evident thyroid nodules, the risk of malignancy in all nodules is between 5% and 15%, whereas 15−20% are estimated to be benign adenomas and the rest are adenomatous nodules.[5]Current practice considers as goitre to be a benign disease with no need for routine follow-up. Worldwide, thyroid cancer is the 18th most common cancer type among both genders, 9thin women and 21st in men, but it is the most common endocrine cancer.In a review, Nixon and Simo[6] estimated the incidence of MNG to be approximately 10% in the population when screened by USG. The risk of occult cancer was estimated to be up to 10−35% in these occult MNGs. On the other hand, in a large meta-analysis study, it was stated that the risk of thyroid cancer was less frequent in MNG than in a single nodule, in which the prevalence of thyroid cancer was estimated as 5%.The National Cancer Institute Surveillance Epidemiology and End Results (SEER) programme has reported increased incidence rates of thyroid cancer in both genders, since 1980 in the United States. Similar findings, especially increased incidence of papillary subtypes in women, had been reported in almost all continents: Europe, the Americas, Asia and Oceania. [7]The WHO changed their histological classification of PTC according to nuclear features in 1988, which led to a shift of many carcinomas from FTC to FVPTC and to reduced FTC cases. FVPTC is predominantly comprised of a follicular architecture, with the majority of cells containing nuclei of pseudo inclusions and grooves.[8]Increased incidence of thyroid cancer, especially PTC, may be due to the supplementation of iodine in food products, which is linked to autoimmune thyroiditis and again to PTC. Additionally, increased use of bioaccumulating polybrominated diphenyl ethers (PBDEs), which are used as fire retardant coating matter in textiles and furniture, had altered thyroid hormone homeostasis and caused thyroid dysfunction and tumorigenesis.[8]Increased exposure to external radiation, either therapeutic or accidental radiation, can also cause thyroid cancer especially PTC and females are known to be more susceptible to it.[9]

Risk Factors: The improvement of the various subgroups of thyroid malignant growths is impacted for the most part by natural, hereditary and hormonal elements and sometimes by the cooperation among them. Among the natural elements, ionizing radiation is the best-settled reason for thyroid carcinoma. Ron et al (10), found in a pooled-examination with 58000 uncovered people, 61000 unexposed, 700 thyroid carcinoma, and 3 million man years, a critical portion hazard for presentation during youth, in view of five companions and two case-control studies.In ladies, the hazard for thyroid carcinoma is roughly 3-crease more when contrasted with men. This could be a direct result of an impact of estrogen and/or different variables related with pregnancy, as the frequency of thyroid disease is nearly the equivalent for the two sexual orientations before adolescence and after the female menopause. [7]

Occurrence of thyroid lesions:60 net examples were taken for the present studystudy which were gotten for histopathological assessment after beginning cytological assessment by FNAC (fine needle yearning cytology) in our division of pathology, SreeBalaji Medical College, Chennai. In present examination Non-neoplastic sores represents 22 cases and neoplastic injuries represents 38cases. The proportion between non-neoplastic and neoplastic thyroid sores in this investigation is 1:1.72.

Incidence of Non-neoplastic and Neoplastic thyroid lesions in this study and correlation with other studies is tabulated in table number -5.

TABLE-5: Comparative study of Incidence with other studies

SL.No.	Series	Non-Neoplastic	Neoplastic	Ratio
1.	Slowinska-Klencka et al. (11)	22	78	1: 3.54
2.	H.A.Aiad et al(12)	27	53	1: 1.97
3.	Solymosi et al (13)	17	34	1: 2
4.	Pujani et al (14)	50	50	1: 1
5.	Present study	22	38	1: 1.72

In present study and also correlation studies showed incidence of malignant lesions higher than benign lesions.

Age Incidence

In the present study the mean age of presentation is 43.08 years which correlates with the literature of various authors and tabulated in table number – 6.

SL.No.	Studies	Mean Age
1.	H.A.Aiad et al[12]	44.17 years
2.	Hossain M I et al [15]	38.21 years
3.	Martin et al [16]	39.5 years
4.	Prakash HM et al [17]	35.67 years
5.	Present study	43.08 years

Table-6: Comparative study of mean age with other studies

Sex Incidence: In this study, majority of them were females. Female to male ratio of 4.5:1 and correlates with observation of other studies as indicated in table number-7.

Conclusion

In present study Non-neoplastic lesions accounts for 22 cases and neoplastic lesions accounts for 38 cases. The ratio between non-neoplastic and neoplastic thyroid lesions in this study is 1:1.72.The prevalence of thyroid specimens coming to our department from all the departments is 2.70%, out of the specimens from the surgery department, the prevalence of thyroid specimens is 6.68%.Among the distribution of thyroid lesions, the prevalence of papillary carcinoma cases were reported as more common which were of 41.67% in this study followed by nodular colloid goitre of 36.67%. Follicular Adenoma cases were reported as 16.67%. Follicular carcinoma cases were reported as least prevalence of 5 %.A total of 60 patients belonging to the age group of 19-70 years with the mean age of 43.08 years, were subjected to histopathological study of thyroid lesions. Female patients were of 81.67% and male patients were of 18.33% and with female to male ratio was of 4.5 :1.

Study of Role of Agnor in Thyroid Lesions

Sathyavathy K[1], Kiran Madhusudhan B[2]

[1]Post Graduate, [2]Professor, Department of Microbiology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Introduction: Thyroid cancer is the most common endocrine neoplasm. Different proliferation markers such as Ki67, proliferating cell nuclear antigen (PCNA) and argyrophilicnucleolar organizer regions (AgNORs) have been examined and observed their importance in thyroid tumours. It has also been reported that like other markers, AgNORs are also related to the rate of cell proliferative activity. As it is also found useful in distinction, it can also be used in distinguishing different lesions.

Materials & Method: 60 gross specimens were taken for study. These biopsy specimens were routinely fixed in 10% formalin and processed in paraffin wax. 5 microns thick Sections were cut and taken for the study and hematoxylin and eosin staining of sections was done. Histopathologicalexamination of these sections were done. Special stain (AgNOR Stain) procedure was also done in 60 cases.

Results: The present study showed that mean mAgNOR in case of nodular goitre was 1.59 (SD ± 0.13) with a range of 1.4–1.75, in benign lesions i.e.; Follicular Adenoma/Hurthle cell Adenoma was 3.63(SD ±0.41) with a range of 2.9 – 4.05, in malignant lesions i.e.; in papillary carcinoma was 2.77 (SD ± 0.56) with a range of 1.5 – 4.05 and in follicular carcinoma was 4.92 (SD± 0.27) with a range of 4.68 – 5.21.

Conclusion: Our study concluded that mAgNOR count and pAgNOR values can differentiate follicular adenoma and papillary carcinoma and also can differentiate non-neoplastic, benign and malignant lesions of thyroid.

***Key Words**: mAgNOR, pAgNOR, PTC, FTC,FA,NG, H&E*

Introduction

Thyroid cancer is the most common endocrine neoplasm. It is well documented that the incidence of thyroid cancer is higher in women than in men and its incidence is growing at a global level.[(1)]Based on histopathology, thyroid carcinomas are classified into follicular thyroid cancer (FTC), papillary thyroid cancer (PTC), medullary thyroid cancer (MTC), anaplastic thyroid cancer and poorly differentiated thyroid cancer. [(2)]So far, there is no developed global screening program to detect thyroid cancer. Although there is increased incidence, the mortality caused by this cancer is seen low. [(1)]The diagnosis of thyroid cancer is often based on magnetic resonance imaging, ultrasound, computed tomography, fine needle aspiration and radionuclide imaging. Although various methods are well applied in clinics, patients often have poor outcome.Different proliferation markers such as Ki67, proliferating cell nuclear antigen (PCNA)and argyrophilicnucleolar organizer regions (AgNORs) have been examined and observed their importance in thyroid tumours. The nucleolar organizer regions (NORs) which are DNA segments, that encode ribosomal RNA.[(3)] NORs are associated with some nucleolar proteins which are usually called as AgNOR proteins or AgNORs, that are stained black with silver methods.[(4)]It has also been reported that likeother markers, AgNORs are also related to the rate of cell proliferative activity[(5)]. As it is also found useful in distinction, it can also be used in distinguishing different lesions.[(6)]In a study by Pich et

al. 1995[7], explained that this AgNORs can be easily detected by a very simple silver staining technique which is called as AgNOR method,

Materials & Method

A total of 60 cases were included in this study and according to WHO guidelines,[8] all these cases were diagnosed. The cases included were: 25 PTC (in which 12 were of classic variant, 7 were of follicular variant, 2 were of solid variant, 4 were of oncocytic variant), 3 FTC (in which 2 were of oncocytic variant), 10 benign neoplasms (in which 8 were follicular micro and macroadenoma, 2 were hurthle cell adenoma), 22 nodular goitres (NG).Out of the 78 thyroid specimens which were received for histopathological examination following initial cytological evaluation by fine needle aspiration cytology, 60 gross specimens were taken for study. These biopsy specimens were routinely fixed in 10% formalin and processed in paraffin wax. 5 microns thick Sections were cut and taken for the study and hematoxylin and eosin staining of sections was done. Histopathological examination of these sections were done. Special stain (AgNOR Stain) procedure was also done in 60 cases.

AgNOR staining :[9]AgNOR staining was performed by adopting both previous and also modified procedures. In previous methods counter stain (Neutral red) was used. But in this study, neutral red counter stain was not used.

Preparation of solutions:

Solution A: This solution was prepared by dissolving 500 mg gelatin powder in 25 ml deionized water at 37 degrees C and then 250 micro L formic acid was added. Continuous shaking for about 10 min at 37 degrees C was sufficient to dissolve the gelatin and a clear solution was obtained.

Solution B: It was prepared with silver nitrate and deionized water.

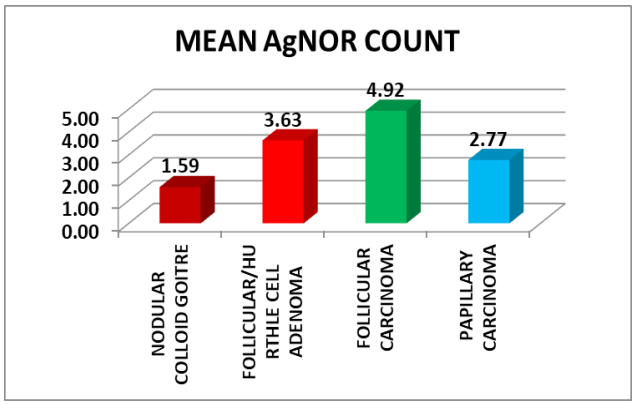
Working solution:This was prepared by mixing one part by volume of solution A with two parts by volume of solution B and it was filtered through filter paper into plastic bottle. As it degrades immediately, it was used immediately.

AgNOR staining procedure: TheAgNOR strategy was adjusted from the examination as referenced before and furthermore from the investigation which was depicted by Crocker and Nar.(10)4 microns thick areas were taken for each case.Deparaffinized in xylene. Hydrated through diminishing evaluations of ethanol to twofold refined deionized water. The segments were then responded with newly arranged silver colloidal arrangement (that contains one section by volume of 2% gelatin in 1% formic corrosive and two sections by volume of half watery silver nitrate arrangement) in a shut Coplin container for 35 min at room temperature, guaranteeing a dull domain all through the response time. The silver colloidal arrangement was washed with twofold refined deionized water. The segments were then treated with 10% sodium thiosulphate for 5 mins.And washed in twofold refined deionized water. Dehydrated through expanding evaluations of ethanol. Cleared in xylene, and mounted..

AgNORs Quantitative Analysis:From the selected areas, an average of 5–10 microscopic fields, were analysed from each case, at magnification 100x(Under oil immersion) (Fig.1-4). 100 nuclei were analysed in each case, whole nuclei were taken as actual lesion. Each overlapped and fragmented nuclei were counted and taken as 1.

Findings

AgNORCOUNT:



TheAgNOR staining and enumeration was done on 60 cases. The AgNORs appeared as black dots in a pale-yellow stained nucleus (as shown in the fig:1 -4) and mAgNOR (mean AgNOR count) and pAgNOR (percentage of cells with at least five distinct AgNORs within one nuclei) values were counted in different thyroid lesions which are shown in Table-1 and Chart -1.

Table-1

Diagnosis	mAgNOR (MEAN±SD)	PAgNOR (%)
Nodular Colloid Goitre	1.59 ± 0.13	2
Follicular/Hurthle Cell Adenoma	3.63 ± 0.41	14
Follicular Carcinoma	4.92 ± 0.27	22
Papillary Carcinoma	2.77 ± 0.56	9

In present study, it was observed that AgNOR dots were large, regular and very less in the nuclei of nodular colloid goitre, whereas AgNOR dots were numerous in no. Which were irregular and in bizarre clusters are seen in Follicular carcinoma when compared to Follicular Adenoma in which AgNOR dots were slightly irregular, very few in clusters and slightly lesser in number. Whereas papillary carcinoma showed no clusters but slightly irregular and more lesser in number when compared to Follicular Adenoma but higher than nodular colloid goitre.The highest mean AgNOR was noted in Follicular Thyroid Carcinoma as 4.92 ±0.27 followed by Follicular Adenoma as 3.63±0.41. The pAgNOR also showed higher values in FTC (22%) as compared to FA (14%) as shown in Table-1 and Chart-1.

Chart-1

Discussion

The technique for examination of AgNOR is utilized for routine appraisals of velocity of cell multiplication (Ofner et al., 1992;(11)Trere, 2000;(12)Canet et al., 2001(5). The consequences of estimations of AgNOR are essentially affected by a few components, for example, the recoloring technique that incorporates brooding time &temperature and the strategy for assessment that is by manual checking versus picture investigation (Trere, 2000).(12)The silver-recoloring procedure has been applied by utilizing different states of recoloring in the previous years. The quantitative investigation has been constrained to make it simple for surveying the highlights and to assess without picture examination, predominantly to those that depict the quantity of AgNOR dabs in the core. Limited application of AgNOR counting in the diagnosis of thyroid follicular lesions mainly because of their overlapping of score which were observed and reported in adenomas and carcinomas by some investigators like Nairn et al., 1988,[13]Zaczek et al., 1996[14]. It was also considered that this method is to be used only as one of some additional techniques, that facilitates the final diagnosis by some other investigators such as Solymosi et al.,1996,[15],Cor et al.,1999,[16],Mehrotra et al.,1998, 2002;[17],Lewy-Trenda et al and Bienkiewicz et al, 1999[18]. To evaluate the importance of AgNORs in differentiating Non-neoplastic, benign and malignant lesions of the thyroid, the present study was conducted. For the routine evaluation of cell kinetics for prognostic purposes,the use of interphase AgNOR quantification appears to be very interesting and promising method.It is the only method which permits the information to be obtained on the rapidity of cell proliferation in routinely processed samples. The method that can be more frequently used and involves in the evaluation of the sample directly under the light microscope by counting the number of interphase AgNORs per cell. The sections at very high magnification (100 x oil immersion level) should be focussed and AgNOR dots can be seen and are visible as black dots inside the nucleus. It was found that in follicular carcinoma, numerous AgNOR dots can be seen followed by follicular adenoma and least no. of dots can be seen in Nodular colloid goitre. The present study showed that mean mAgNOR in case of nodular goitre was 1.59 (SD ± 0.13) with a range of 1.4–1.75, in benign lesions i.e.; Follicular Adenoma/Hurthle cell Adenoma was 3.63(SD ±0.41) with a range of 2.9 – 4.05, in malignant lesions i.e.; in papillary carcinoma was 2.77 (SD ± 0.56) with a range of 1.5 – 4.05 and in follicular carcinoma was 4.92 (SD± 0.27) with a range of 4.68 – 5.21. (as shown in table-1, chart-1). Although overlapping in range values were seen in both follicular adenoma and Papillary carcinoma, with the mean mAgNORvalues we can suggest that mAgNOR count can differentiate follicular adenoma and papillary carcinoma. It also can differentiate Non-neoplastic, benign and malignant lesions of thyroid. Here we considered <8% for nodular colloid goiter, 8-14% for kindhearted and >14% for threatening sores. Be that as it may, Papillary carcinoma indicated less pAgNOR as 9%. (as appeared in table-1, outline 1)This outcome is in concordance with Mourad et al[21,22] who expressed in his examination that pAgNOR that is > 8% demonstrates high proliferative movement and the dangerous injuries indicated high proliferative action with a middle of 11%.Both Mean mAgNOR and pAgNOR qualities have indicated noteworthy contrasts in our stud. Malignant lesions usually show high proliferative activity. The present study showed that mean pAgNOR in case of

nodular goitre was 2% with a range of 0-5%, in benign lesions i.e.; Follicular Adenoma/Hurthle cell Adenoma was 14% with a range of 8-18%, in malignant lesions i.e.; in papillary carcinoma was 9% with a range of 4-15% and in follicular carcinoma was 22% with a range of 20-25%. Here we considered <8% for nodular colloid goiter, 8-14% for kindhearted and >14% for threatening sores. Be that as it may, Papillary carcinoma indicated less pAgNOR as 9%. (as appeared in table-1, outline 1) This outcome is in concordance with Mourad et al.(21,22) who expressed in his examination that pAgNOR that is > 8% demonstrates high proliferative movement and the dangerous injuries indicated high proliferative action with a middle of 11%.Both Mean mAgNOR and pAgNOR qualities have indicated noteworthy contrasts in our study. It is also found that especially pAgNOR values are revealed less overlapping between histologically proven benign and malignant thyroid lesions and these are in concordant with other studies which are done by Ansari et al.(23) and Hossain M I et al.(24)Our results regarding pAgNOR were concordant with Ruschoff et al. (1996). In an investigation which was done uniquely by Ruschoff et al. (1993)(25) who has expressed that the assurance of AgNOR score that incorporates the level of cells with at any rate five AgNORs inside one nucleolus can be utilized for the separation of amiable and threatening follicular injuries. Slowinska-Klencka et al.,(26) Bukhari et al.(27).In present study, morphology was described as numerous, irregular bizarre clusters of AgNOR dots in nuclei were seen in follicular carcinoma followed by follicular adenoma and papillary carcinoma. Least no. of dots, regular and large dots in nuclei were seen in Nodular colloid goitre. (as shown in fig: 1-4).

Conclusion

Although overlapping in range values were seen in both follicular adenoma and Papillary carcinoma, with the mean mAgNOR values and pAgNOR values, still it can be suggested that mAgNOR count and pAgNOR values can differentiate follicular adenoma and papillary carcinoma and also can differentiate non-neoplastic, benign and malignant lesions of thyroid.

Study of Thrombocytopenia in Adults Due to Decreased Production

Tirumala Kanakadurga Sripati[1], Govindarajan[2], Hemalatha Ganapathy[3]

[1]Post Graduate Student, [2]Professor, Department of Pathology, [3]Professor and Head of the Department, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Thrombocytopenia is defined as platelet count < 1.5 lakhs/cumm. It may result from either decreased production or increased sequestration/destruction of platelets. In the present study maximum number of patients were in the age group 20-39 years, and males were more commonly affected than females. Leukemia cases were found to be the most common causes of decreased production of platelets leading to thrombocytopenia in our study. Inherited Platelet Disorders caused by a variety of genetic defects affecting platelet production, function or both.

Aims and Objectives: To study thrombocytopenia due to decreased production of platelets in adults with study of clinical profile and laboratory parameters in adults with thrombocytopenia.

Keywords - *Disorders, Platelet Disorders*

Introduction

Thrombocytopenia is defined as platelet count < 1.5 lakhs/cumm.

It may result from either decreased production or increased sequestration/destruction of platelets[1]. Destruction of platelets can be either immune or non immune mediated. Despite the number and diversity of disorders that may be associated aetiologically, thrombocytopenia mainly results from four processes – artifactual thrombocytopenia, deficient platelet production, accelerated destruction and abnormal distribution or pooling of platelets within the body.

Thorough medical history taken , physical examination done in all patients who were included in our study.Numerous mechanisms may contribute in development of thrombocytopenia as seen in primary immune thrombocytopenia & hepatitis C virus infection. Careful examination of the peripheral blood smear is the best means for narrowing the differential diagnosis.

The present study focuses on the study of thrombocytopenia due to decreased production of platelets in adults between 18- 70 years who were confirmed with thrombocytopenia.

Taking a thorough medical history and Physical examination can provide valuable information and greatly facilitate diagnosis.

If the etiology of the thrombocytopenia is unclear, a BM aspirate or biopsy should be performed to rule out a primary BM disorder[2].

Materials and Method

This prospective study was conducted in the Sree Balaji medical college and hospital from May 2018 to October 2018. This study included 50 subjects who presented to the hematology department and medical OP departments of Sree Balaji Medical College and hospital.

This study included adults presenting to the hematology department and medical OP departments who were found to have thrombocytopenia, with platelet

count less than 150 x 10^9 /L in whom complete clinical and laboratory parameters were available[2].

Peripheral venous blood was collected for laboratory investigations like CBC, ESR, PT, aPTT, fibrinogen estimation, and for D-dimer levels .Peripheral blood smears were stained by Leishman's stain. For hemoparasite visualization, Giemsa stain was used.

Findings

Table 1: Age distribution of cases of thrombocytopenia.

Age (years)	No. of cases	Percentage
20 - 39	26	52%
40 – 59	18	36%
60 – 79	6	12%
Total	50	100%

In the present study maximum number of patients were in the age group 20-39 years (26 cases, ie.,52 %). (Table.1)

Table .2 Sex distribution of cases of thrombocytopenia.

Sex	No. of cases	percentage
Male	34	68%
Female	16	32%
Total	50	100%

In our study maximum number of patients presenting with thrombocytopenia were males (68%). (Table .2)

Table 3: Diagnosis associated with thrombocytopenia

S.no	Diagnosis	No. of cases %
1	Megaloblastic anemia	12 (24%)
2	Leukemia	15 (30%)
3	HIV infection	9 (18%)
4	Aplastic anemia	8 (16%)
5	MDS	6 (12%)
	Total	50 (100%)

Leukemia cases were found to be the most common causes of decreased production of platelets leading to thrombocytopenia in our study. (Table.3)

Discussion

I. Decreased production of platelets in bone marrow can be due to

1) Marrow infiltrative disorders like **Hematological malignancies** (Leukemias, Lymphoma, Myeloma), **Metastatic carcinomas** (carcinomas of the breast, lung, and prostate. Bone Marrow trephine biopsy is preferred to detect these tumours).

Thrombocytopenia in hematological malignancies are clonal proliferations of the malignant hematopoietic stem cells characterized by the accumulation of blasts principally in the marrow at the cost of impaired production of normal blood cells[3,4].

Non neoplastic conditions causing secondary myelofibrosis with consequent cytopenias including thrombocytopenia are autoimmune disorders like SLE, Rheumatoid arthritis and Sjogrens syndrome[5], granulomatous disorders of marrow including viral, bacterial, fungal, rickettsial and toxoplasmosis[6] and storage disorders including Gaucher's disease and Niemann Pick disease.Common viral infections include HIV infection,[7] and CMV infection causing lymphohistiocytic infiltration of the marrow.

Ineffective haematopoiesis : Marrow hyperplasia with ineffective haematopoesis include myelodysplastic syndromes and vitamin B12 deficiency anaemias. Myelodysplastic syndromes are clonal stem cell disorders characterized by cytopenias in combination with a hypercellular marrow that frequently exhibits dysplastic changes in any of the three haematopoietic cell lineages[8].

Thrombocytopenia is seen in approximately 50% of patients and occurs in combination with other cytopenias[9]. In megaloblastic anaemia thrombocytopenia is due to ineffective megakaryopoiesis and there is a moderate reduction in platelet count rarely < 40 X 10^9 / L. Dysplastic morphologic features observed in megakaryocytic series of MDS in Peripheral blood: Large, vacuolated, or hypogranular platelets.

In Bone marrow: Small mononuclear forms (micromegakaryocytes).

Large forms with multiple small, rounded nuclei.

Forms with hypolobated nuclei.

Forms with hyperchromic nuclei and scant cytoplasm[10].

Hypoplastic anaemia: Hypoplastic disorders affecting marrow mainly include aplastic Anaemia which is characterized by diminished or absent hematopoietic precursors in the marrow, most often due to injury to the hematopoietic stem cells[10,11]. Bone marrow biopsy of Non severe (moderate) AA usually has a cellularity less than age-appropriate cellularity, often <50% in children and <30% in adults, while severe and very severe AA have a cellularity <25%. typical bone marrow biopsy shows profound hypocellularity with decreased trilineage hematopoiesis.

Megakaryocytes in AA are within normal limits morphologically, but because of the low number of megakaryocytes, the evaluation of megakaryocytic dysplasia may be difficult[10].

In paroxysmal nocturnal hemoglobinuria, platelets activated by complement proteins followed by thrombus formation and consumption of platelets.

Heriditary thrombocytopenia:

Inherited Platelet Disorders caused by a variety of genetic defects affecting platelet production, function or both. Also may present as isolated thrombocytopenia or as part of a syndrome. Patients typically present with mucocutaneous bleeding or menorrhagia. Careful clinical history intake, including family history of bleeding tendency, and detailed physical examination to assess for any associated physical anomalies are essential in establishing a suspicion of an inherited platelet disorder and distinguishing these from acquired causes of thrombocytopenia. Flow cytometric evaluation can be used to evaluate platelet surface glycoprotein expression[10].Bernard Soulier syndrome associated with deficiency of platelet GP Ib α / 1bβ /1X / V receptor.

15 cases of leukemia were found in our study (fig .1,AML-M4), (fig.2, CLL), 8 cases of Aplastic anemia (fig.3),12 cases of megaloblastic anemia, 9 cases of HIV and 6 cases of myelodysplastic syndrome were found in our study.

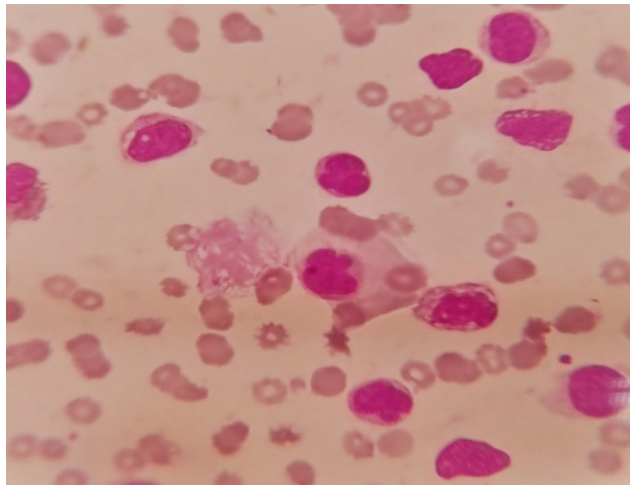

Figure 1. Photomicrograph of peripheral blood smear showing monoblasts with abundant vacuolated cytoplasm and prominent nucleoli background showing reduced number of platelets in a case of AML-M4 (*Leishman 100x*)

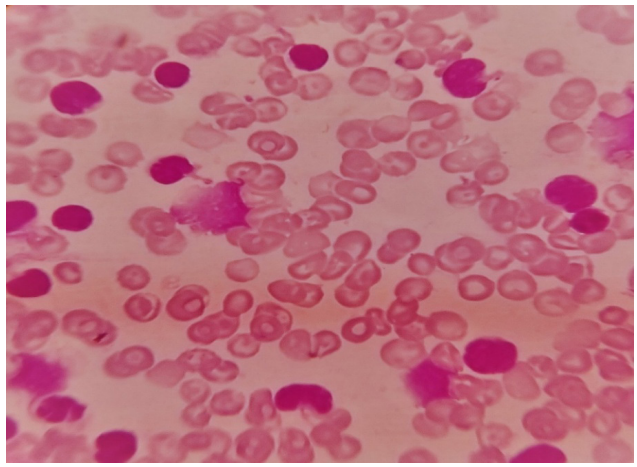

Figure 2. Photomicrograph of peripheral blood smear showing increased number of mature lymphocytes and smudge cells background showing reduced number of platelets in a case of CLL (*Leishman 100x*)

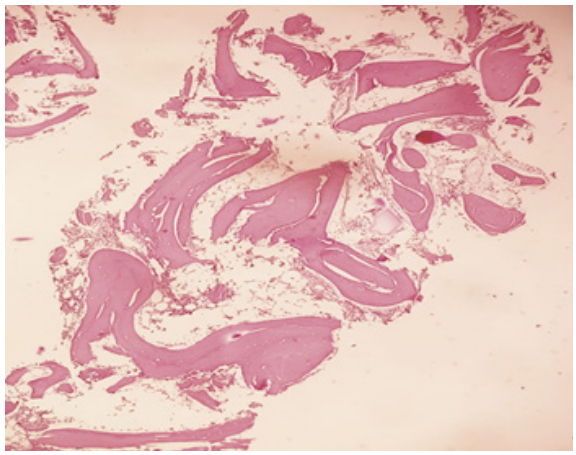

Figure.3 Photomicrograph of hypocellular bone marrow biopsy showing 15% cellularity in same case of Aplastic anemia (H & E 10x)

Conclusion

Age group between 20-39 years were most commonly affected with thrombocytopenia than other age groups. Males were more commonly affected with thrombocytopenia than females in our study. After evaluating all cases of thrombocytopenia with decreased production of platelets, it is concluded that leukemia was the most common cause of thrombocytopenia in our study. Whenever thrombocytopenia is detected, further investigations has to be done for specific diagnosis in the most of the cases so that appropriate treatment can be given.

Study to Determine the Potential Risk Categories and Risk Factors for Developing Steatohepatitis in NAFLD Cases with Metabolic Syndrome

Sathyavathy.K[1], Kiran Madhusudhan.B[2]

[1]Post Graduate, [2]Professor, Department of Microbiology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background:NAFLD is considered as the most common liver disease affecting large number of people. Metabolic syndrome is a group of metabolic abnormalities in which the chance of developing cardiovascular disease, diabetes mellitus, chronic kidney disease are high.

Aim: It aims to determine the potential risk categories and risk factors for developing steatohepatitis in NAFLD cases with metabolic syndrome.

Method: Total of 100 metabolic syndrome patients were selected for study over a period of 1year. These patients were selected based on the criteria for metabolic syndrome as established by National Cholesterol Education Program (NCEP) adult Treatment Panel III (ATP III). Demographic data were taken and biochemical parameters were estimated by standard guideline.

Results: BMI, waist circumference, systolic blood pressure, PPBS, fasting insulin, HOMAIR, total cholesterol, TGL, HDL, LDL, VLDL and CHO:HDL are $p<0.05$; and affecting steatohepatitis.HDL is significantly lower in steatohepatitis cases compared to non-steatohepatitis cases. Diastolic blood pressure, FBS and HbA1c are not affecting steatohepatitis as the corresponding p-values are greater than the significance level.

Conclusion: There is positive correlation of obesity, waist circumference, blood pressure, insulin resistance, triglyceride, fasting glucose, LDL, VLDL and negative correlation with HDL-C.

Key words: *Dyslipidaemia, Lipid profile, NCEP, Metabolic syndrome.*

Introduction

Metabolic syndrome also known as "syndrome X", "insulin resistance syndrome" is a group of risk factors that adversely affect the health where the chance of developing diabetes mellitus, cardiovascular disease, non-alcoholic fatty liver disease, non-alcoholic steatohepatitis, cirrhosis, cerebrovascular disease and chronic kidney disease are high in these particular group of people.According to National Cholesterol Education Program (NCEP) Adult Treatment Panel III (ATP III), JAMA 2001, it introduced clinical criteria in which the metabolic syndrome is identified by the presence of three or more of the five abnormalities [1]:

- Abdominal obesity (waist circumference >35 inches in women, >40inches in men)
- fasting serum triglycerides (>150 mg/dl)
- fasting serum high density lipoprotein cholesterol HDL-C (<50 mg/ dl in women or<40 mg/dl

M No - 9841434966

in men,)

- Blood pressure greater than or equal to 130/85mmHg

- Fasting serum glucose greater than or equal to 110mg/dl.

Non-alcoholic fatty liver disease ranges from asymptomatic to simple steatosis, steatohepatitis, advanced fibrosis, cirrhosis and even hepatocellular cancer. Obesity, Type 2 diabetes and hyperlipidaemia are associated for the development of non-alcoholic fatty liver disease [2-10] and the increased trend has also been seen in Asian countries.Most subjects with NAFLD are usually asymptomatic, but fatigue and abdominal discomfort may be reported in right upper quadrant [11].

Aim: Study to determine the potential risk categories and risk factors for developing Steatohepatitis in nafld cases with Metabolic Syndrome.

Materials and Method

This study was conducted in the Department of Biochemistry, Sree Balaji Medical College and Hospital, Chromepet, Chennai during the period of December 2016 – July 2018 among 100 patients with metabolic syndrome attaining outpatient and inpatient services of the Department of General Medicine.The study explained to the participants and before taking the blood sample, informed consent were taken from them.

Inclusion criteria: Age group of 20-50 years who are willing to participate,100 patients with Metabolic syndrome, Both genders equally (50- F, 50- M), non-alcoholics, no critical illness

Exclusion criteria: Alcoholics, Chronic hepatitis, Cirrhosis, Steroid use, Pregnancy, Malignancy

General history, medical and family history, demographic data like age, gender, waist circumference and blood pressure were recorded. The laboratory investigations like Fasting and post prandial blood sugar, HbA1c, fasting insulin, HOMAIR, total cholesterol, triglyceride, HDL, LDL, VLDL. All the Biochemical Investigations were done using BS390 fully automated analyser.

Findings

Table 1 :- Factors affecting Steatohepatitis

Factors affecting Steatohepatitis

Parameters	Non-steatohepatitis	Steatohepatitis	p - value
BMI	32.24 ± 0.823	43.50 ± 0.643	0.000
Waist Circumference	98.23 ± 1.444	114.5 ± 0.988	0.000
Systolic BP	145.1 ± 1.000	159.6 ± 0.980	0.000
Diastolic BP	88.69 ± 0.764	90.40 ± 1.327	0.383
FBS	138.9 ± 5.593	157.0 ± 12.39	0.219
PPBS	187.7 ± 8.982	250.4 ± 23.85	0.013
HbA1c	7.420 ± 0.231	8.404 ± 0.614	0.117
Fasting Insulin	11.13 ± 0.477	14.96 ± 0.911	0.003

TGL	243.3 ± 9.437	383.6 ± 52.05	0.000
HDL	44.79 ± 1.585	33.20 ± 1.068	0.005
LDL	173.8 ± 4.479	201.6 ± 6.046	0.018
VLDL	48.66 ± 1.887	76.72 ± 10.41	0.000
CHO:HDL	6.023 ± 0.269	10.27 ± 0.842	0.000

Here the p-value corresponding to BMI, waist circumference, systolic blood pressure, PPBS, fasting insulin, HOMAIR, total cholesterol, TGL, HDL, LDL, VLDL and CHO:HDL are $p<0.05$; and affecting steatohepatitis. These factors are significantly higher in steatohepatitis cases compared to non-steatohepatitis cases. HDL is significantly lower in steatohepatitis cases compared to non-steatohepatitis cases. Diastolic blood pressure, FBS and HbA1c are not affecting steatohepatitis as the corresponding p-values are greater than the significance level. Diastolic blood pressure, FBS and HbA1c are almost same in both steatohepatitis and non-steatohepatitis cases.

ROC Analysis:

On performing receiver operative characteristics analysis with the above set criteria we noticed the patients getting demarked into 3 risk categories:

- Moderate Risk
- High Risk
- Very High Risk

The frequency of distribution was 30 moderate risk cases, 36 high risk cases and 34 very high risk cases

HbA1c	0.77 (0.59 - 0.95)	0.058	7.210	3 (60.0%)	24 (82.8%)	27 (79.4%)

Cont ... **Table 4:- Risk factors cut off value, significance, sensitivity, specificity and accuracy for very high risk**

Fasting Insulin	0.87 (0.72 - 1.00)	0.010	15.10	3 (60.0%)	26 (89.7%)	29 (85.3%)
HOMAIR	1.00 (1.00 - 1.00)	0.000	5.000	5 (100.0%)	29 (100.0%)	34 (100.0%)
Total Cholesterol	0.84 (0.65 - 1.00)	0.016	337.5	3 (60.0%)	29 (100.0%)	32 (94.1%)
TGL	0.80 (0.57 - 1.00)	0.032	354.5	3 (60.0%)	29 (100.0%)	32 (94.1%)
HDL	0.88 (0.76 - 1.00)	0.007	37.00	5 (100.0%)	22 (75.9%)	27 (79.4%)
LDL	0.87 (0.73 - 1.00)	0.009	199.0	3 (60.0%)	26 (89.7%)	29 (85.3%)
VLDL	0.80 (0.57 - 1.00)	0.032	70.90	3 (60.0%)	29 (100.0%)	32 (94.1%)
CHO:HDL	0.99 (0.95 - 1.00)	0.001	8.520	5 (100.0%)	28 (96.6%)	33 (97.1%)

From the above ROC analysis we can understand that there are certain factors which have more significant relation with predicting the risk for steatohepatitis in NAFLD and other factors are less significant and some no acceptable significance.

- The factors which are highly significant with p<0.01 CI 99% are BMI,WC, Systolic BP, Fasting Insulin, HOMAIR, HDL, LDL, CHO:HDL ratio
- The factors which are significant with p<0.05 CI 95% are PPBS,TC, TGL,VLDL
- For all 3 categories, these 3 ROC analyses again shows that diastolic blood pressure, FBS and HbA1c are not affecting steatohepatitis as the corresponding p-values are greater than the significance level.

Based on these findings we have deduced 3 levels of risk categories with significant sensitivity, specificity and accuracy factors. The potential risk factors identified were those study parameters which showed 100% sensitivity and/or 100% specificity and /or 100% accuracy.

- Systolic BP – 100% sensitivity, 100% specificity, 100% accuracy in all 3 categories. The other factors showed significant differences among the different categories.

Very High Risk

Sensitivity, specificity and accuracy relation with group

- BMI, WC, HOMA IR 100% sensitive, 100% specific, 100% accuracy
- TC, TGL, VLDL 100% specificity
- CHO:HDL, HDL 100% sensitivity

Statistical significance:

- BMI, WC, Systolic BP, HOMAIR, HDL, LDL, CHO:HDL with p < 0.01, CI 99%
- PPBS, TC, TGL, VLDL with p < 0.05, CI 95%

High Risk

Sensitivity, specificity and accuracy relation with group

- BMI, WC, HOMAIR, CHO:HDL 100% sensitive
- No factor is 100% specific to detect high risk

Statistical significance:

- BMI, WC, Systolic BP, Fasting Insulin, HOMAIR, HDL, LDL, CHO:HDL with p < 0.01, CI 99%
- PPBS, TC, TGL, VLDL with p < 0.05, CI 95%

MODERATE RISK

Sensitivity, specificity and accuracy relation with group

BMI, WC, PPBS, HbA1C, Fasting Insulin, HOMAIR,TC, LDLand CHO: HDLare 100% sensitive

- No factors are specific in detecting moderate risk

Statistical significance:

- Highly significant – BMI, WC, Systolic BP, Fasting Insulin, HOMAIR, HDL, LDL, CHO:HDL with $p < 0.01$, CI 99%
- PPBS, TC, TGL, VLDL with $p < 0.05$, CI 95%

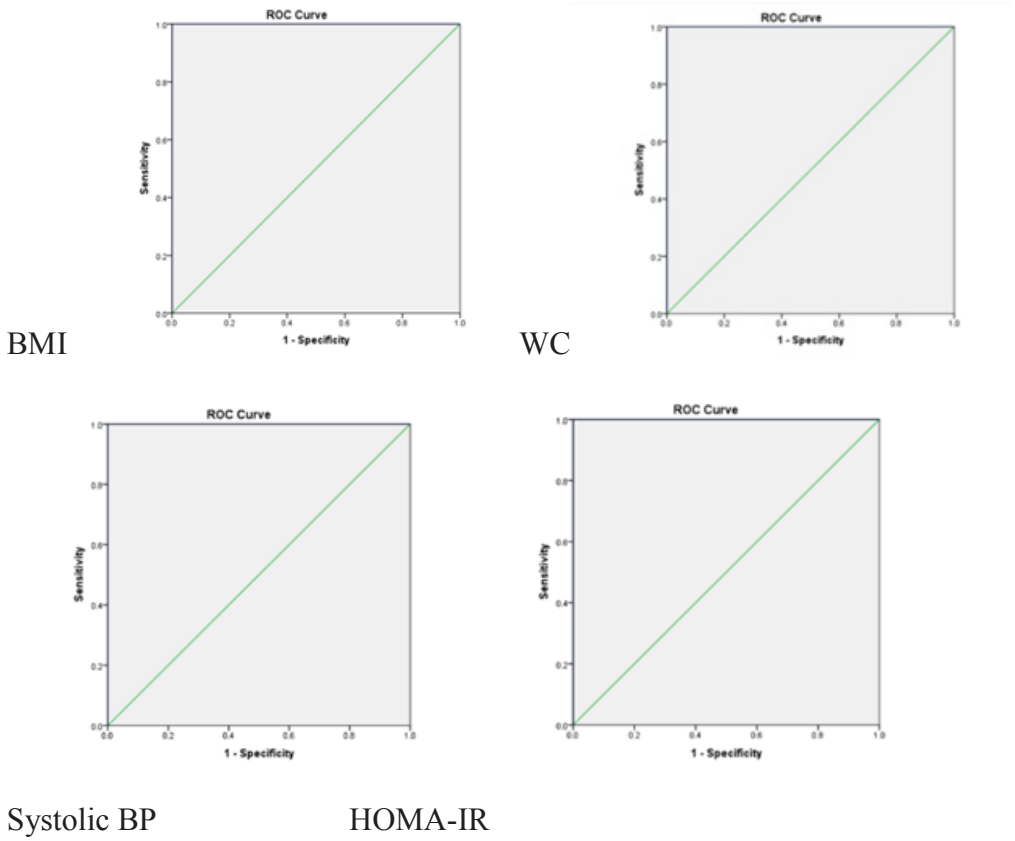

Figure 2:ROC graph for BMI,WC,Systolic BP and HOMAIR

Discussion

Obesity, one of the most important risk factor is associated with fatty liver [12] is commonly observed in developed countries. Diabetes mellitus along with obesity, hyperlipidaemia and hypertension are the main manifestations of metabolic syndrome associated with insulin resistance [13]. In our study, BMI is significantly higher in very high risk (33.90 ± 0.990) and significantly lower in moderate risk (23.72 ± 0.125) compared to high risk (27.51 ± 0.695) proving the increase of obesity among our population also which may be due to causes like westernisation of diet, sedentary lifestyle etc.

Waist circumference and BMI are two important parameters of obesity. Distribution of body fat is more important than total body fat in obesity-related diseases. Visceral fat shows a better predictor of steatosis than subcutaneous fat which is also associated with severity of NAFLD [14]. Waist circumference is considered as a marker of visceral fat tightly related with triglyceride content, hepatic inflammation and fibrosis. In our study, WC is significantly higher in very high risk (100.6 ± 1.591) and significantly lower in moderate risk (83.96 ± 0.153) compared to high risk (96.12 ± 1.841). Shou-Wu Lee et al[15] in a study, show the positive correlation between the obese parameters and NAFLD. Higher BMI and higher waist circumference has additional risk factor for NAFLD with BMI showing increase positive correlation. Another study having 250 NAFLD and 240 non NAFLD shows waist circumference as effective factor for non-alcoholic fatty liver disease [16]

Hypertension or prehypertension is associated with NAFLD which is the main cause of chronic liver diseases and abnormal liver function. In our study, systolic blood pressure is significantly higher in very high risk (147.2 ± 1.241) compared to high risk (140.4 ± 0.851) and moderate risk (141.5 ± 1.178). Systolic BP is 100% sensitivity, 100% specificity, 100% accuracy in all 3 categories while there is no significant difference in diastolic blood pressure between groups. Ong JP et al in their study relate that NAFLD patients are at increased risk of having elevated BP with liver related and overall mortality [17]. Another study from Finland reported that high ambulatory BP are associated with higher risk of prevalent NAFLD in middle aged adults. Hepatic fat accumulation and high blood pressure together increase the risk for cardiovascular diseases [18].

Insulin resistance is the hallmark of MS and was the laboratory finding associated with the presence of non-alcoholic fatty liver disease irrespective of fat distribution, BMI and glucose tolerance as shown by Marchesini et al [19]. In our study HOMAIR was significantly higher in very high risk (4.009 ± 0.165) and significantly lower in moderate risk (2.080 ± 0.043) compared to high risk (2.897 ± 0.050). Kaushal Madan et al [100] found in his study mean HOMA – IR of 2.6 ± 1.3 and IR in 80% of study population with reference to liver function test profile of patients, increased SGOT (≥40 IU/Lt) and SGPT (≥42 Kg/Lt) and observed in majority of patients (98.4 with mean 76.05 ± 41.74 and 97.6% with mean 100.31 ± 43.74 respectively).

In 2017, Zhi-Chao Yao et al [20]published an original article about the association of Non-alcoholic fatty liver disease and increased risk of hypertension and prehypertension. The study demonstrates NAFLD as a risk factor for hypertension and prehypertension, so careful monitoring of blood pressure of patients with NAFLD is recommended.

In 2011, a study done by Mona A. Hegazya et al [20] to show the correlation between different grades of NAFLD by liver ultrasound scan and homeostasis model assessment insulin resistance (HOMA-IR) and in predicting its severity. 57 obese, non-diabetic aged around 18-57 years taken. The study shows HOMAIR having positive correlation with the severity of fatty liver and also NAFLD have positive association with insulin resistance expressed by HOMAIR.

Conclusion

High range in anthropometric parameters like BMI, BP, WC, Insulin resistance are associated with greater risk of developing NAFLD. There is positive correlation of obesity, waist circumference, blood pressure, insulin resistance, triglyceride, fasting glucose, LDL, VLDL and negative correlation with HDL-C.Therefore knowledge about the potential risk factors and new preventive, diagnostic and management protocols for NAFLD should be among the priorities for the treatment of metabolic syndrome patients.

A Study on Risk Factors of Nocturnal Enuresis in Children

R. Sushmitha[1], Shanthi Ramesh[2], Sundari[3]

[1]Post Graduate Student, [2]Assistant Professor, Dept of Peadiatrics, [3]Prof & HOD Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research,Chennai

Abstract

Objectives: The aim of the study is to assess the risk factors of children presenting with nocturnal enuresis.

Place of Study: Paediatric OPD Sree Balaji Medical College and Hospital.

Period of Study: July 2017 to June 2018 (12 months).

Materials and Method: Detailed history of each child who presented to the OPD with complaints of nocturnal enuresis were included in the study. A detailed history was taken and complete physical examination was done.

A printed Proforma was handed over to the patient attender and clearly explained. Followed by that the patient filled the Proforma and returned it. Later on the urine was collected in aseptical conditions and sent for various urine analysis.(1,2)

The data collection technique adopted in this study is a structured questionnaire on the evaluation of nocturnal enuresis in children from 5 years of age 12 years of age who presented to the Pediatric OPD for 1 year at Sree Medical College and Hospital. Detailed history obtained from the parents.(4)

Results: Enuresis was found to be common among younger children and its frequency decreases with increasing age. The prevalence of Enuresis among 5 – 12 year olds is reported as between 1.4 to 28% in most studies.

Primary enuresis formed 84% of cases while secondary 16%. Since the present study is a Hospital based study, the age at presentation does not reflect the true prevalence. In the present study we see more children in the older age group than community based studies. This could be because of the fact that, this is a hospital based study and parents in general don't view enuresis a problem in younger children and seek medical attention only if it persists for long.(3)

Conclusion: In the study found that enuresis is a common childhood illness which at time presence as a single symptom but presentation might be multifactorial having a psychological burden. Primary and Secondary enuresis so many similarities while the few differences presence.(5)

Keywords: *nocturnal enuresis, Primary enuresis, common childhood illness*

Introduction

DSM IV meaning of enuresis was utilized for characterizing an instance of enuresis for example

- Repeated automatic or deliberate voiding during the day or night in garments or in bed.

• At least 2 such occasions for each week for in any event 3 back to back months or the nearness of clinically critical trouble in social, scholarly or other significant regions of working[1].

• Chronological period of in any event 5 years or more.

Materials and Method

This descriptive observational study was conducted in the Institute of Social Paediatrics, Govt. Stanley Hospital, Chennai. All children between the ages of 5 to 12 who presented to the OPD with the complaint (As a primary one or one of the many) of bedwetting constituted the study material[2].

Detailed history of each child fulfilling above mentioned criteria was recorded in a preformed proforma and complete neurological examination was done.

Findings

An aggregate of 51 patients with enuresis introduced during the investigation time frame. No parent or youngster wouldn't take part in the examination[3]. There were 30 males (58%) and 21 females (42%). Of the 51 children who were enuretic, 48 had only nocturnal enuresis (94%).No strict daytime enuresis was recorded. Combined daytime and nocturnal enuresis accounted for only 3 cases (6%). 84% of cases were primary (n=43) while only 16 % were secondary (n=8).

The mean age at presentation was 8.75 years for all cases, for Males being 9.27 years and for females 8 yrs.

There were 30 males and 21 females. Though males were higher in proportion among primary enuresis it was not statistically significant.

Family history was present in 21 cases (41.18%). Majority of these children had history of enuresis in one parent (35 %) and 1 child had a sibling who was enuretic and 2 other children had both parents who were enuretic.

Children were assessed for arousability by Sleep arousal score (SAS). A score of 1 to 8 was assigned. Children who had a score of 1-3 were classified as easy to arouse, 4-5 as moderate and 6- 8 as difficult to arouse[4].

More than half (52 %) were found to have difficulty in arousability.

Discussion

The risk factors of nocturnal enuresis is constituted by various factors such as family history, age group, socio economic status and difficult sleep arousability. A detailed history of the patients along with the parents and physical examination usually prevents further investigations. Appropriate diagnosis for the reason precipitating nocturnal enuresis is essential in order to provide the right treatment option.

Nocturnal enuresis which is usually caused by social factors should always be treated along with family support[5].

Conclusion

Nocturnal enuresis is a common condition that can affect a child's self-esteem. Reassurance and minimizing the number of investigations are critical to address parent's concerns.

A Study on Clinical Profile and Risk Factors of Nocturnal Enuresis in Children

R. Sushmitha[1], Shanthi Ramesh[2], Sundari[3]

[1]Post Graduate Student, [2]Associate Professor, [3]Professor and HOD, Department of Paediatrics Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Objectives: The aim of the study is to assess the clinical profile and risk factors of children presenting with nocturnal enuresis.

Place of Study Paediatric OPD Sree Balaji Medical College and Hospital.

Period of Study: July 2017 to June 2018 (12 months).

Materials and Method: This descriptive observational study was conducted in the Institute of Social Paediatrics, Govt. Stanley Hospital, Chennai. All children between the ages of 5 to 12 who presented to the OPD with the complaint (As a primary one or one of the many) of bedwetting constituted the study material.

Detailed history of each child who presented to the OPD with complaints of nocturnal enuresis were included in the study. A detailed history was taken and complete physical examination was done. Later on the urine was collected in a septical conditions and sent for various urine analysis.

The data collection technique adopted in this study is a structured questionnaire on the evaluation of nocturnal enuresis in children from 5 years of age 12 years of age who presented to the Pediatric OPD for 1 year at Sree Medical College and Hospital. Detailed history obtained from the parents.

Results: There was close closeness in the clinical Introductions of the 2 gatherings. The normal nearness of daytime voiding side effects in patients with both PNE and SNE recommends that daytime voiding propensities may impact the accomplishment of evening time self-restraint. The similarities in Primary and Secondary enuresis are also reflected in the study by Robson et al19 who concluded that they likely share a common pathogenesis.

Conclusion: The major significant differences between the patients whom we report with Primary Enuresis and those with Secondary Enuresis are storage symptoms, cystitis symptoms and sleep disordered breathing which were more common in secondary enuresis ($P < 0.05$) and Low income which was more significantly associated with primary enuresis ($P < 0.05$).

Keywords: *bedwetting, nocturnal enuresis, structured questionnaire, primary enuresis, secondary enuresis*

Introduction

Nighttime enuresis can be principally named essential and optional enuresis. Essential and auxiliary enuresis have for the most part been viewed as discrete elements with an alternate pathogenesis. For Most patients with essential enuresis the pathogenesis is

viewed as identified with the issue with excitement, overproduction of pee around evening time, a little nighttime bladder limit, or a blend of these components. The basic revealed reasons for SNE incorporate UTI, stoppage, ask disorder/broken voiding, mental pressure, diabetes, and obstructive rest apnea. An aggregate of 43 (84.3 %) of the patients whom we surveyed had PNE. This extent is like that seen in different examinations.

Materials and Method

A prospective study was plan on children with complaints the various risk factors of enuresis were assessed using different modalities. The risk factors which were assessed are sleep disordered breathing, documented UTI and other associated symptoms like day time symptoms, storage symptoms, bladder over activity and low bladder capacity.

Functional Bladder capacity was assessed using Frequency – volume charts as per ICCS guidelines. Maximal voided volume was noted and if it was within 65 % to 130 % of expected bladder capacity, the child was designated as having Normal Bladder capacity.(1)

- Expected Bladder capacity was calculated using the formula
- Estimated Bladder capacity = (Age in Years x 30) + 30 in ml
- Comparison of Primary Enuretics with Secondary Enuretics:

Findings

The mean age at presentation was 8.75 years for all cases, for Males being 9.27 years and for females 8 yrs.

There were 30 males and 21 females. Though males were higher in proportion among primary enuresis it was not statistically significant.

Family history was present in 21 cases (41.18%). Majority of these children had history of enuresis in one parent (35 %) and 1 child had a sibling who was enuretic and 2 other children had both parents who were enuretic.

Children were assessed for arousability by Sleep arousal score (SAS). A score of 1 to 8 was assigned. Children who had a score of 1-3 were classified as easy to arouse, 4-5 as moderate and 6- 8 as difficult to arouse. (2)

More than half (52 %) were found to have difficulty in arousability.

Functional Bladder capacity was assessed using Frequency – volume charts as per ICCS guidelines. Maximal voided volume was noted and if it was within 65 % to 130 % of expected bladder capacity, the child was designated as having Normal Bladder capacity.

- Expected Bladder capacity was calculated using the formula
- Estimated Bladder capacity = (Age in Years x 30) + 30 in ml

Storage symptoms like increased day time frequency, daytime incontinence and nocturia were significantly more associated with secondary enuresis than primary (P = 0.0224)

Symptoms of bladder over activity like urgency and urge incontinence were the commonest daytime symptoms in enuresis (51 %, n= 21), there was not any significant difference between Primary and secondary enuresis. (P =0.4759)(3)

Symptoms of cystitis like dysuria, Lower abdominal pain, Hematuria were present in 5 cases though documented UTI was present only in 2 cases and cystitis symptoms were more in Secondary Enuresis which was also statistically significant. (P= 0.0132)

Arousability was assessed using a sleep arousal score and children were classified into easily/Moderate/ Difficult to arouse. Difficult to arouse were 52.9 % of study population.

Discussion

When compared both primary and secondary enuresis were similar in presentation except in storage symptoms, Cystitis symptoms and symptoms of sleep disordered breathing which were significantly higher in Secondary enuresis and low income which was more significant in primary enuresis.(4)

Conclusion

Nocturnal enuresis in children as well as adults can be detrimental for their overall development and well-being. Although the pathophysiology is unclear, NE is associated with a high arousal threshold and fragmented sleep, often associated with PLMD. Appropriate

diagnosis for the reason precipitating NE is essential in order to provide the right treatment option.[5]

A Study on Clinical Profile of Nocturnal Enuresis in Children

R. Sushmitha[1], Shanthi Ramesh[2], Sundari[3]

[1]Post Graduate Student, [2]Associate Professor, [3]Professor and HOD, Department of Paediatrics, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Objectives: The aim of the study is to assess the clinical profile of children presenting with nocturnal enuresis.

Place of Study: Paediatric OPD Sree Balaji Medical College and Hospital.

Period of Study: July 2017 to June 2018 (12 months).

Materials and Method: Detailed history of each child who presented to the OPD with complaints of nocturnal enuresis were included in the study. A detailed history was taken and complete physical examination was done. Later on the urine was collected in aseptical conditions and sent for various urine analysis.

The data collection technique adopted in this study is a structured questionnaire on the evaluation of nocturnal enuresis in children from 5 years of age 12 years of age who presented to the Pediatric OPD for 1 year at Sree Medical College and Hospital. Detailed history obtained from the parents.

Results: Enuresis was found to be common among younger children and its frequency decreases with increasing age. The prevalence of Enuresis among 5 – 12 year olds is reported as between 1.4 to 28% in most studies. Primary enuresis formed 84% of cases while secondary 16%. Since the present study is a Hospital based study, the age at presentation does not reflect the true prevalence.

In the present study we see more children in the older age group than community based studies. This could be because of the fact that, this is a hospital based study and parents in general don't view enuresis a problem in younger children and seek medical attention only if it persists for long.

Conclusion: In the study found that enuresis is a common childhood illness which at time presence as a single symptom but presentation might be multifactorial having a psychological burden. Primary and Secondary enuresis so many similarities while the few differences presence.

Keywords: *childhood illness, nocturnal enuresis, urine analysis, psychological burden*

Introduction

Enuresis alludes to the tirelessness of wrong voiding of pee past the time of foreseen bladder control. The improvement of bladder control is a multidimensional procedure that requires tactile attention to bladder completion by the youngster, limit with respect to capacity of pee, deliberate control of the bladder sphincter, mental want for control, and a positive preparing knowledge. Diurnal enuresis is automatic spilling of pee during waking hours. Nighttime enuresis. Alludes to automatic section of pee during rest and is delegated essential or auxiliary(1).

Materials and Method

A prospective study was plan on children with complaints of bedwetting at night. Children between 5 years to 12 years of age who satisfy the below criteria

are to be selected for the study.[2]

Inclusion Criteria

The cases which were included in the study are the Children satisfying the following category. DSM IV meaning of enuresis was utilized for characterizing an instance of enuresis for example [3]

- Repeated automatic or purposeful voiding during the day or night in garments or in bed.
- At least 2 such occasions for every week for at any rate 3 continuous months or the nearness of clinically huge trouble in social, scholarly or other significant territories of working.
- Chronological period of at any rate 5 years or more.[4]

Exclusion Criteria

- Children less than 5 years of age.
- Children more than 12 years of age.
- Children with developmental delay.
- Children with cerebral palsy
- Children manifesting any neurological disorder.
- When parents did not give consent for the study.

Findings

A total of 51 children with nocturnal enuresis were included in the study. . There were 30 males (58%) and 21 females (42%). Eighty four % of cases were primary (n=43) while only 16 % were secondary (n=8).[5]

Storage symptoms like increased day time frequency, daytime incontinence and nocturia were significantly more associated with secondary enuresis than primary (P = 0.0224).

Symptoms of bladder over activity like urgency and urge incontinence were the commonest daytime symptoms in enuresis (51 %, n= 21), there was not any significant difference between Primary and secondary enuresis. (P =0.4759).

Symptoms of cystitis like dysuria, Lower abdominal pain, Hematuria were present in 5 cases though documented UTI was present only in 2 cases and cystitis symptoms were more in Secondary Enuresis which was also statistically significant. (P= 0.0132).

Discussion

Enuresis is common among younger children and its frequency decreases with increasing age. The prevalence of Enuresis among 5 – 12 year olds is reported as between 1.4 to 28% in most studies.

Primary enuresis formed 84 % of cases while secondary 16%.

Conclusion

The present study assessed and evaluated clinical profile of nocturnal enuresis in children from 5 to 12 years visiting Pediatric out patient department Sree Balaji Medical College & Hospital we have observed that the clinical profile of nocturnal enuresis is usually multifactorial and as many associated symptoms like increased day time frequency, urgency and lower abdominal pain.

Role of 3Dct in Fractures Around the Knee Joint

A.muzamil Ahmed[1], Chinni Vikram[1], R.G. Santhaseelan[2]

[1]PG Student, [2]Professor, Dept. of General Surgery, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai, India

Abstract

The knee joint is complex joint and is the commonly injured joint now a days because of increased traffic accident, and sports related injuries. As it is a superficial joint it is more exposed to external forces, hence this joint easily gets injured. Knee joint fracture involves one or multiple fractures, which involves patella, tibia and femur Fractures around the knee are often complex injuries that present to the surgeon with numerous potential complications importance of an affirmative diagnosis lies in the fact that it helps to opt for most effective treatment a negative radiograph is not reliable to rule out fracture MDCT is a fast and accurate is a fast and accurate examination to evaluate fracture adequately. 3D CT is an excellent modality for evaluation of the knee joint as it helps in better demonstration of fracture fragments and extent of fracture in complex anatomical location.Fracture of the tibial plateau is seen frequently in knee trauma units and poses major threats to the structure and function of the knee joint. Tibial plateau fractures are complex injuries to treat due to their articular involvement and associated disruption of ligamentous structures in the knee. Spiral CT 3D reconstructions give a better and more accurate demonstration of the tibial plateau fracture and allows a more precise pre-operative surgical plan.(1)

***Keyword**: 3DCT, knee joint injuries , Tibial plateau fracture*

Introduction

Cracks of the tibial level are among the most provoking breaks in orthopedics to treat. To forestall posttraumatic osteoarthritis and to re establish ideal joint capacity, the congruency of the articular surface, the dependability, and the right burden appropriation should be restored(2).

To accomplish this objective, an exact preoperative arranging is basic. Notwithstanding the customary plain radiographs, the CT output is progressively utilized. In any case, constrained investigations are accessible that report extra estimation of a CT scan(3-5). Thinking about the extra heap of radiation to the patient and costs, a CT output should possibly be utilized when legitimized by the clinical benefits(6).

With this intra-and interobserver study, the estimation of the CT filter notwithstanding plain radiographs for the grouping of tibial level cracks as per Schatzker and the preoperative treatment plan was examined. Late advances in modernized tomography have decreased information securing and recreation times so three-dimensional CT pictures of knee wounds might be financially and immediately produced. 3DCT was made a decision about better than multiplanar two-dimensional CT in showing the spatial connections of crack sections in mind boggling and mid knee injury. 3D CT empowers an unmistakable view of degree of real break line and coming about removal of parts. So this new methodology licenses preoperative investigation and careful arranging when contrasted with other regular radiography for treatment of knee cracks(4)

Materials and Method

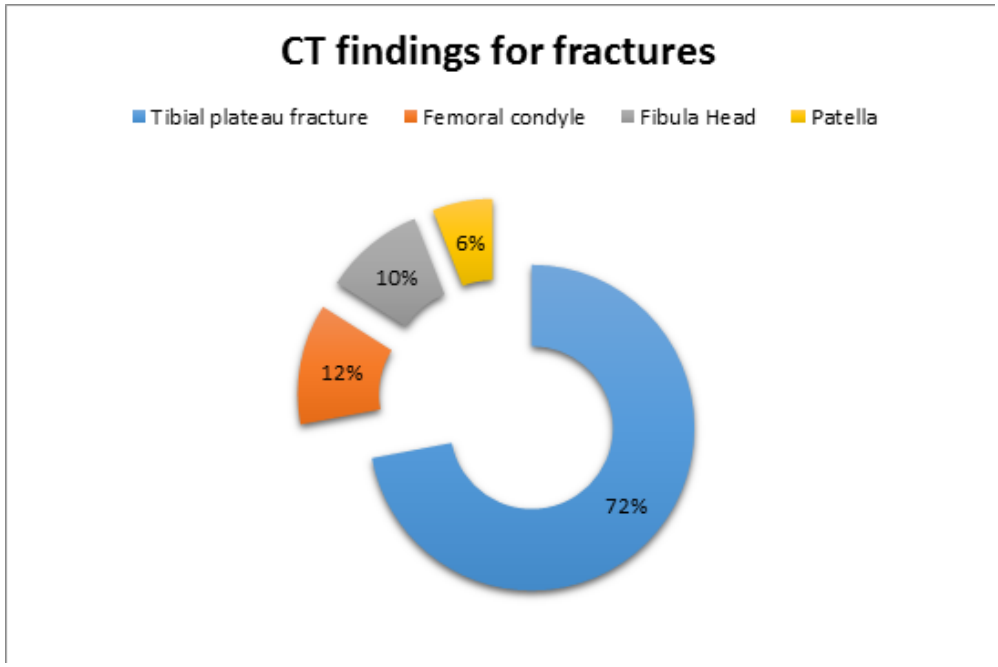
Source of data: all patients referred from orthopaedics and casualty department of sreebalaji medical college.

Duration of study:- Aug 2016 to Oct 2018

Sample size:- 50.

Inclusion criteria:- (i) All the patients presenting with knee fracture following trauma having positive plain radiograph findings. (ii) Patients suspected of fractures clinically with subtle or negative plain radiograph.

Exclusion criteria:- (i) Pregnant females, pediatric age group, patients with prosthesis and patients with unstable vital parameters especially in trauma settings. (ii) Patients presenting with acute bleed, seizure and shock.



Method

All patients will be subjected to CT imaging of knee joint with 3D reconstruction. The CT were images were obtained with Hitachi Eclos 8 Slice Scanner. Images were processed on a PC , using commercially available software. The processed images included sagittal and coronal 3D reformatted images. The evaluation began with 2D transverse CT images, followed by a 3D reconstruction view. The patients were placed in supine position with the feet forward. The maximum course range of the table is sufficient to allow an examination starting from the top of the pelvis to the foot on the side to be operated. Knees series include the entire knee joint (10 cm above and below the joint) (7)

Findings and Discussion

The results obtained by for the knee joint fractures undertaken by 3D reconstruction in CT for the different bones were identified maximum 72% for Tibial plateau fracture in about 36 cases. Whereas, identification of injury for other bones viz., Femoral condyle, Fibula Head and Patella were 12%, 10% and 6%, respectively.

CT findings for fracture	No. of cases	%
Tibial plateau fracture	36	72%
Femoral condyle	06	12%
Fibula Head	05	10%
Patella	03	6%
Total	50	100%

Discussion

Mustonen et al [7] in his study series of 409 patients found that 356 patients had knee fracture A total of 451 fractures were found in all anatomic regions: distal femur (n=49), proximal tibia (n-307), patella (n=23), and proximal fibula (n=72). In our study tibial plateau fracture were found to be most common fracture around knee joint seen in 36 patients (72%), to be followed by femoral condyle in 6 patients (12%) and fibula and patella fracture seen in 5 and 3 patients respectively

Amani Mohamed in his study of with fractures of tibial plateau [8] concluded that MDCT is advised for the accurate classification of tibial plateau fractures and so the management decision as concurred in our study.

Conclusion

Incidence of tibial plateau fracture is highest among knee joint fractures. Most cases of musculo skeletal trauma require MPR or 3D Imaging. As there is no additional scanning or radiation involved in the reconstruction of images, 3D VR images and MPR is a valuable tool for the radiologist interpreting knee plateaufractures. MPR and 3D VR pictures help better assessment of breaks distinguished on hub pictures. 3D recreation is helpful to survey hard engineering in huge comminuted, dislodged, and complex breaks including numerous planes For the situation of complex cracks, and permit a sufficient representation and simple understanding of the crack sections and, their relationship to each other. This is extremely useful when settling on the most appropriate preoperative making arrangements for every patient.[8]

Efficacy of Metformin Monotherapy 1Gm in Newly Diagnosed Type 2 Diabetes Mellitus- A Prospective Open Label Study

Hemalatha Ganapathy[1], Rajalakshmi.V[2]

[1]Professor, Department of Pathology, [2]Professor, Department of Pathology, SreeBalaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Aim and Objectives: Diabetes mellitus is a chronic crippling cellular disorder that causes serious disruption and malfunction of biological enzymes causing to chronic hyperglycemia, resulting to micro and macro arterial abnormalities.The occurrence of diabetes is rising rapidly, leads to an increase in death and mortality in India. The main objective of treatment for type 2 diabetes mellitus (T2DM) is to attain and preserve excellent glycemic control and to decrease the mortality and threat of microvascular and macrovascular problems..Metformin is the first-line and most usually prescribed anti-hyperglycaemic drug in patients with type 2 diabetes. It may be used as monotherapy or in conjunction with many other oral anti-hyperglycaemic drugs or insulin.

Materials and Method: In this study a total of 50 patients who fulfilled the eligibility criteria were enrolled. And they were subjected to trial medication tablet metformin 500mg twice daily and patients baseline line investigations fasting blood glucose and postprandial blood glucose were collected and they advised to followup for 3months and 6 months and any adverse events during the study period were reported and it was recorded and managed appropriately**. Results: B**aseline FBS and PPBS baseline values expressed as Mean±SD were 138.06±17.12 mg/dl and 223.12±30.63 mg/dl respectively. After 6 months of metformin therapy, FBS and PPBS were 91.64±10.55 mg/dl and 133.88±7.99 mg/dl respectively.

Conclusion: The current study summates that metformin 1gm monotherapy in newly diagonosed type 2 diabetes mellitus showed effective gylcemic control for period of six months and this proves that metformin is a effective and gold standard antidiabetic agent and thereby reducing macro and micro complications at the initial stage of disease.

Key words: *diabetes mellitus, micro & macrovascular complications, glycemic control.*

Introduction

Diabetes mellitus of this sort recently incorporated non-insulin-subordinate diabetes, or grown-up beginning diabetes[6]. It is a term utilized for people who have relative (instead of outright) insulin insufficiency. Individuals with this kind of diabetes habitually are impervious to the activity of insulin[1 2 3]. At least at first, and regularly all through their lifetime, these people needn't bother with insulin treatment to endure. This type of diabetes is every now and again undiscovered for a long time on the grounds that the hyperglycaemia is regularly not serious enough to incite recognizable side effects of diabetes. By the by, such patients are at expanded danger of creating full scale vascular and smaller scale vascular confusions[4-8.]While patients with this type of diabetes may have insulin levels that seem typical or raised, the high blood glucose levels in these diabetic patients would be relied upon to result in considerably higher insulin esteems had their beta-cell capacity been ordinary . Hence, insulin emission is flawed and lacking to make up for the insulin obstruction[4].

Corresponding author:
Hemalatha Ganapathy,
Professor, Department of Pathology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai - 73.
Mail ID- hemalathagnpthy@yahoo.com

Then again, a few people have basically typical insulin activity however uniquely debilitated insulin discharge. Insulin affectability might be expanded by weight decrease, expanded physical action, as well as pharmacological treatment of hyperglycaemia yet isn't reestablished to typical Metformin has turned out to be one of the most generally utilized medications in the treatment of sort 2 diabetes mellitus[5]. Metformin, other than hypoglycemic movement, has been taken with eating routine and exercise changes to avoid diabetes in individuals who are at high hazard for getting to be diabetic.Metformin (a biguanide subordinate), by monitoring blood glucose level reductions these entanglements. Metformin works by reestablishing the body's reaction to insulin. It diminishes hepatic glsucose creation (HGP) and intestinal glucose retention.[9]

Materials and Method

'Efficacy Of Metformin Monotherapy 1gm In Newly Diagnosed Type 2 Diabetes Mellitus- A Prospective Open Label Study"

This study was conducted in SreeBalaji Medical College and Hospital, Chennai during the period from November 2017 to April 2018 in accordance with declaration of Helsinki and ICH GCP guidelines3. The study protocol was reviewed and approved by the Institutional Ethics Committee and all trial participants have been informed about the study procedures and written informed consent was obtained.

Inclusion criteria

a. Newly diagnosed Type-2 DM

b. Patients started on metformin monotherapy.

Exclusion criteria

a. Patients on statin and aspirin therapy

b. Patients on insulin/other oral hypoglycemic agents

c. Any infective, inflammatory, allergic disorders, cardiovascular disorders, malignancy

d. Patients with trauma due to surgery, burns, fractures

e. History of alcohol and/or smoking

f. Pregnant/lactating women

Withdrawal criteria

- Adverse event which warrants withdrawal of subject.
- Non-compliance with procedures.
- Withdrawal of consent for participation in the study by the subject.
- Failure of the study drug to produce the desired effect.

Study Procedure

The study "Efficacy Of Metformin Monotherapy 1gm In Newly Diagnosed Type 2 Diabetes Mellitus- A Prospective Open Label Study" was started after obtaining approval from the Institutional Ethics Committee of SreeBalaji Medical College and Hospital[7]. Voluntary written informed consent was taken from all the study participants after explaining the clinical study protocol in detail about the risk and benefit. They were given adequate time to decide for their participation. Confidentiality was maintained and patient's identity was not revealed in the source document[2]. The informed consent was available in English as well as local language (Tamil).All the 50 patients who fulfilled the Eligibility criteria was advised to take the study drug Tablet Metformin 500mg twice daily one in the morning and one in night. The study Drug was given free of cost to the patients and they were given assurance that any withdrawal from the study would not affect their future treatment in the same hospital. Baseline laboratory investigations were done before study and repeated after 3 months and 6 months of treatment.The baseline features like demographic data, general, systemic and local examination were carefully noted in the case report form. Contact numbers of the investigators and emergency physician were provided to all the study participants for any queries during the study period and for reporting of any adverse events.There were three scheduled visits during the study- baseline visit, 3rd month and 6th month (end of the study visit)

Study population

A total of 50 patients with newly diagnosed type 2 DM were included in the study. Both sexes were included in study . Study data was documented and patients were assessed periodically.

Drug dosage

Tablet Metformin 500 mg twice daily, one in the morning and one in the night were advised to the study participants.

Adverse Event Reporting

.All the unfavorable occasions watched/whined by the examination members were accounted for the situation report structure alongside the other data about the seriousness, for example, gentle, moderate or extreme and any connection to the investigation drug[1].

Laboratory Investigations

A baseline investigation protocol was followed before starting the study, the following investigations were performed at the begining of the study and were repeated at 3months and 6 months[8].

Blood Biochemistry

- fasting blood sugar (FBS)
- post prandial blood sugar (PPBS)

End points

Primary endpoints

Efficacy Of Metformin Monotherapy 1gm In Newly Diagnosed Type 2 Diabetes Mellitus- A Prospective Open Label Study"

Secondary endpoints

To evaluate the tolerability of metformin in type 2 diabetes mellitus

Findings and Suggestions

FBS and PPBS baseline values expressed as Mean±SD were 138.06±17.12 mg/dl and 223.12±30.63 mg/dl respectively. After 3 months of metformin therapy, FBS and PPBS were 104.24±16.63 mg/dl and 184.84±26.9 mg/dl respectively. After 6 months of metformin therapy, FBS and PPBS were 91.64±10.55 mg/dl and 133.88±7.99 mg/dl respectively. Treatment with Metformin showed effective reduction in FBS and PPBS values comparatively between FBS and PPBS baseline values and FBS and PPBS values at sixth month were statistically significant (P<0.05). [Table 1 and Figure 1 and 2]

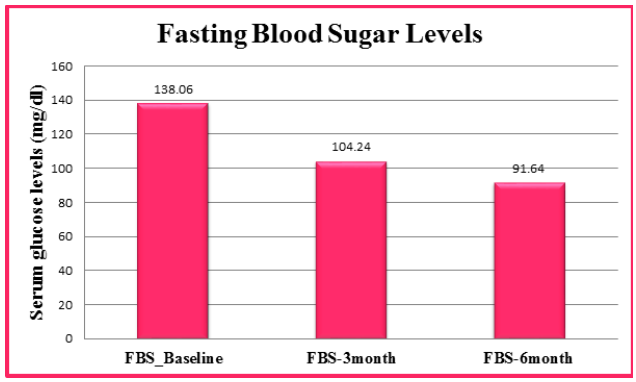

Figure 1: Comparison of FBS between Baseline and Post-treatment (6month).

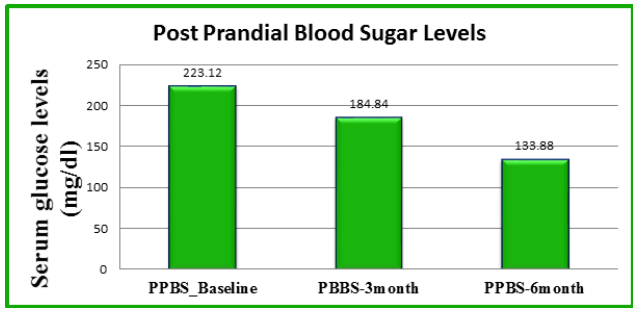

Figure 2: Comparison of PPBS between Baseline and Post-treatment (6month).

Table 1: Comparison of lab parameters between baseline and after treatment

S.No	Para-meter	N	Metformin (n=50)	
			Baseline (1month)	End of The Study (6month)
1	FBS	50	138.06 ± 17.12	91.64 ± 10.55 *
2	PPBS	50	223.12 ± 30.63	133.88 ± 7.99 *

ALUES EXPRESSED IN MEAN ± STD. DEVIATION, * REPRESENTS P<0.05.

Conclusion

The present study shows that metformin monotherapy in newly diagnosed diabetes patients showed effective glycemic control and this shows the efficacy of metformin as sole antidiabetic agent and thereby effective glycemic control will ultimately reduce

the disease complications.

Neurostimulation Guided Brachial Plexus Block (Supraclavicular)

A.Shanmuga Priya[1], Parri Madhusudhana Rao[2]

[1]Student, [2]Professor, Department of Anaesthesiology,Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: Upper limb processes are frequently performed under brachial plexus block alone or in conjunction with local anesthesia. Brachial plexus block can be conducted by any of the methods–blind; directed nerve stimulator (NS) or ultrasound (US)-guided. Over the last centuries, the evoked potentials method has been recognized as the gold standard for nerve detection in the area.

Method: This study was done on 20 patients who fit under inclusion criteria . Written informed consent to be taken from all patients.

Results: Neurostimulation block had shorter execution time, faster on sent of motor and sensory blockade with lesser needle attempts

Conclusions: Neurostimulation guided brachial plexus block had lesser needle attempts , faster execution time , and faster onset of motor and sensory block and lesser complication

Key words: *Brachial plexus block, neurostimulation, sensory blockade, local anesthesia, Upper limb processes*

Introduction

Traditionally, regional blocks have been conducted use anatomical landmarks, nerve stimulation. Blind blocks that depend exclusively on anatomical landmarks generally cause severe side effects[1].Over the previous centuries; the neural stimulation method has been recognized as the gold standard for nerve detection in regional blocks[2-4]. However, it does not guarantee an appropriate amount of nerve blocks. It holds the danger of damage to nerve systems by specific puncture.

Materials and Method

This study was established out in the orthopaedic surgery theatre, SreeBalaji Medical College and Hospital, Chennai after obtaining institutional ethical committee approval.

Inclusion Criteria:

The following criteria were taken for including the patients

in this study.[5]

- Elective surgical patients posted for surgery from middle one third of arm, forearm and hand surgeries.
- ASA Status I , II and III
- Age between 18 and 60 years
- Weight >50 kg

Exclusion Criteria[6]:

- Patient refusal
- Coagulopathies
- Local infections / Sepsis

Corresponding Author
A.Shanmuga Priya
Student, Department of Anaesthesiology,SreeBalaji Medical College,Bharath Institute of Higher Education and Research, Agharam Road, Selaiyur, Chennai-73.

- H/o significant neurological, psychiatric, neuromuscular, cardiovascular, pulmonary, renal or hepatic disease
- Pregnancy/lactating women
- Peripheral neuropathy
- Allergy to local anaesthetics

MATERIALS:

1. Sterile tray for regional blocks
2. Drugs for the block
- 0.5% bupivacaine
- 2 % plain lignocaine

3. 23G Quinke spinal needle

4. The ultrasound machine which we used for our study was GE LOGIQ e machine

5.Equipment and drugs for medical intervention

6. Equipment and drugs for transformation to general anaesthesia in case of block failure[7]

Pre Operative Preparation:

Patients were pre-operatively evaluated and the procedure was explained to the patient. Written informed consent was obtained. They were assessed with particular attention to any contraindications.[8]

Pre Medication:

Tab. ranitidine 150mg 2 hours before medical procedure with tastes of water**.**

Lead of Anesthesia:

On appearance of the patient in the working room, screens like heartbeat oximeter, non intrusive circulatory strain and ECG were associated and standard qualities were recorded. An intravenous access was acquired in the contrary arm

Supraclavicular Brachial Plexus Block by the Subclavian Perivascular Technique[3]

Patients were positioned supine with the head turned away from the side to be blocked and the ipsilateral arm adducted. The neck was prepared with povidone iodine solution and draped with sterile towels.

Landmarks:

The essential landmarks to be identified are

- Cricoid cartilage
- Interscalene groove
- Clavicle midpoint
- Subclavian artery

Under strict aseptic precautions standing by the side of the patient, the interscalene groove was palpated with the index finger, reversing the hands for the opposite side. Patient placed supine with head turned away from the side to be blocked and ipsilateral arm adducted, the interscalene groove and the midpoint of clavicle identified. After local infiltrations of 1 ml of 2% lignocaine intradermally in the interscalene groove 1 to 1.5 cm above the clavicle, a 22G, 5cm short bevelled unipolar insulated needle connected to a nerve locator is directed caudally towards the ipsilateral nipple and posteriorly. End point in a nerve stimulator is a motor response with an output lower than 0.6mA. To avoid intra vascular injection aspiration was done every 3-5 ml of study drug injected

Assessment of the Block:

The accompanying perceptions were made:

Vital signs observing; pulse, non intrusive circulatory strain, oxygen immersion and sedation score were estimated each moment for the main 5minutes and at regular intervals from that point until the finish of medical procedure. For measurable purposes, they were recorded at 0, 1, 2, 5, 10, 15, 30 minutes and at regular intervals from that point**.**Block execution time was defined as the interval between the first needle insertion and its removal at the end of the block.

• Immediately following the administration of the medicine, patients were assessed every second for the start of sensory and engine blockade.

Sensory square assessed by temperature sensation utilizing ether absorbed cotton the skin dermatomes C4-T2.

• Onset of engine barricade was surveyed by misfortune offorearm flexion expansion, thumb and second digit squeeze and thumb and fifth digit squeeze.

•Failure of the square to be set up even after 20

minutes was taken as square disappointment.

- Analgesic failure was managed with General anaesthesia as appropriate .

- After confirmation that the block has taken up, surgery was started.

- Patient received supplemental O2 and intravenous fluids throughout the procedure

Local soporific poisonous responses including abstract and target signs like circumoral deadness, tinnitus, jerking, spasms, and so on., were watched[9].

- Entanglements related with the framework like intravascular imbuement, intrathecal or epidural mixture and pneumothorax were viewed.

Every one of the information were exposed to measurable investigation. Square execution time, beginning time for engine and tactile barricade, and the achievement rate were broke down and the measurable hugeness assessed. A "P" esteem not exactly or equivalent to 0.05 was considered factually critical.

Findings and Suggestions

Groups	Block execution time in minutes	Onset of sensory block in minutes	Onset of motor block in minutes	No of Needle Attempts
B	9	6.1	8.7	2.2

Conclusion

During the supraclavicular brachial plexus blockade it was found that

- The block execution time for neurostimulation guided block was much shorter .

- The number of needle attempts to localise the nerve was minimal with neurostimulation..

- The time taken for the onset of motor and sensory blockade was faster in the neurostimulation group.

- The success rate was higher with the use of neurostimulation guided blockade.

- No complications were seen in the two groups.

Therefore, it is inferred that neurostimulation use Clinically, supraclavicular brachial plexus block is helpful for precise nerve localization and minimizes the amount of needle attempts.

Occurrence of Euthyroid Sick Syndrome in Acute Myocardial Infarction and their Prognostic Significance

Nithesh Kumar A[1], Noorul Ameen[2]

[1]Post Graduate Student, [2]Associate Professor, Department of General Medicine, Sree Balaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background : Depression of the thyroid hormone system may happen in otherwise euthyroid patients in serious acute illness of any cause. In this situation, called Euthyroid Disease Syndrome, the standard feed-back regulation of the metabolism of the thyroid is changed.[11-13]**Aims :** 1. To find out the occurrence of EUTHYROID SICK SYNDROME in ACUTE MYOCARDIAL INFARCTION patients admitted to intensive care unit in SREE BALAJI HOSPITAL , CHENNAI and its prognostic significance. **Material and Method:** This study was conducted in the Intensive care unit,SREE BALAJI MEDICAL COLLEGE AND HOSPITAL , Chennai in collaboration with Dept of internal medicine, Dept of Cardiology and Dept of biochemistry. It was a prospective study done during the period from April 2017 to March 2018 . 100 patients with history, clinical features suggestive of myocardial infarction were selected irrespective of age and sex . **Results :** In our study 42 of MI patients had Euthyroid sick syndrome. So occurrence of Euthyroid sick syndrome in our patients was 42% , p value was 0.258. So occurrence of Euthyroid sick positivity rate was not statistically significant. This implies that occurrence of Euthyroid sick positivity rate may vary In which the occurrence of Euthyroid sick syndrome among death patients was 100%. **Conclusions** : The presence of Euthyroid sick syndrome in Acute myocardial infarction patients may contribute to the elaboration of an AMI severity index.

Key words*: Myocardial infarction , Euthyroid sick syndrome*

Introduction

Euthyroid disease syndrome can be defined as abnormal results from thyroid function tests that happen in non-thyroid disease settings (NTI) without pre-existing hypothalamic-pituitary or thyroid dysfunction.11-13 Decreased serum complete triiodothyronine (T3) is the most prevalent thyroid function ailment in patients with acute illness14 This can be detected within 2 hours of the beginning of severe physical stress.15 As the severity of the disease progresses, there is a gradual growth of complicated syndrome connected with low concentrations of T3 and thyroxine (T4).16,17The concentrations of thyroid stimulating hormone (TSH) remain unchanged or mildly decreased.. Conversion of pro-hormone (Thyroxine, T4) to active form is reduced owing to reduced peripheral activity of 5'-deiodinase and enhanced manufacturing of inverse T3 (rT3) metabolites. These modifications in thyroid hormones may be partially mediated by cytokines or other inflammatory mediators., Acting at the hypothalamus and pituitary levels, the thyroid gland, and the hepatic deiodinase system, as well as at the linking of thyroxine to thyroid globulin (TBG). It remains uncertain how much the hormone reaction in Euthyroid Disease Syndrome is component of an adaptive response that reduces the energy demands of tissues in the face of systemic disease. Or a maladaptive reaction that induces harmful tissue hypothyroidism. As a result, the use of thyroid hormone treatment in Euthyroid disease syndrome is contentious. Recovery from inherent acute illness is associated with the demise of thyroid defects. Altered levels of thyroid hormones have also been revealed in starvation,10 acute

and chronic medical conditions,29-31 acute myocardial infarction4 , bone marrow transplantation,8 surgery,9 trauma,22 and, in reality, these modifications can be seen in any serious systemic disease.18,19.

Euthyroid disease syndrome has also been established in acute myocardial infarction and has been postulated as a connection between the severity of cardiac harm and the degree of increase in thyroid hormones..4 The objective of this research is to identify the incidence of Euthyroid disease syndrome in patients with Acute myocardial infarction and to assess whether the existence of Euthyroid disease syndrome in these patients has any prognostic importance in assessing the seriousness of AMI.

Material & Method

This study was conducted in the Intensive care unit,SREE BALAJI MEDICAL COLLEGE AND HOSPITAL , Chennai in collaboration with Dept of internal medicine, Dept of Cardiology and Dept of biochemistry. It was a prospective study done during the period from April 2017 to March 2018 . 100 patients with history, clinical features suggestive of myocardial infarction were selected irrespective of age and sex .

Inclusion Criteria

1. Myocardial infarction patients admitted to the Intensive care unit.

Exclusion Criteria

1. Patients with past or present history of thyroid dysfunction.

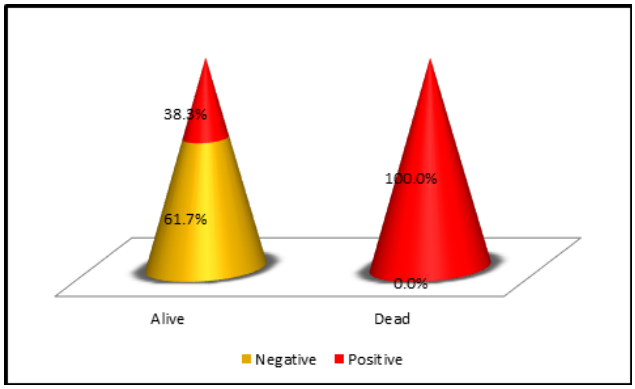
2. Patients taking drugs that will affect thyroid function.

3. Patients with chronic renal failure.

4. Patients with decompensated liver disease.

5. Patients with thyroid function test suggestive of primary Hypothyroidism or Hyperthyroidism.

Study Population



A total of 124 patients were enrolled for the study from the patients admitted to Intensive care unit in Sree Balaji Hospital from the period April 2017 to march 2018. 24 patients were excluded as per exclusion criteria. The remaining 100 patients, who satisfied all the inclusion criteria were selected for the study and followed for one week. Written consent was obtained from all patients participating in the study. All patients were subjected to a detailed clinical history and thorough physical examination as per proforma. The complicated cases identified by KILLIP classification criteria and ejection fraction. The serum of patients was analysed for thyroid function tests at day 1 (T3,T4,TSH) and in euthyroid sick positive patients repeat thyroid function tests was done at day 7 to confirm the reversal of hormone status. Day 1samples were obtained before reperfusion therapy. Echocardiography was done during hospital stay. All patients underwent CBC, Blood sugar, Serum Na, Urea, Creatinine, LFT, Fasting lipid profile, Thyroid function tests, ECG,Troponin I, ECHO.

Laboratory Tests

All patients underwent CBC, Blood sugar, Serum Na, Urea, Creatinine, LFT, Fasting lipid profile, Thyroid function tests, ECG, Trop I and ECHO. The serum of patients was analysed for thyroid function tests at day 1 (totalT3, total T4, TSH) and in sick euthyroid positive patients repeat thyroid function tests done at day 7 to confirm the reversal of hormone status. The thyroid function test was done by ELISA method. All samples were obtained before reperfusion therapy. Echocardiography was done during hospital stay.

Results

Our study shows that of 42% acute myocardial infarction patients had Euthyroid sick syndrome positivity. The commonest abnormalities is found to be a low level of total T3 as demonstrated in our study where 71% of the patients had low level total T3. The next most common abnormalities is found to be both low level of total T3 &total T4(24%) As the severity of the illness increases Euthyroid sick syndrome positivity rate was increased. In our study patients who presented with (KILLIP 1 the Euthyroid sick syndrome occurrence was 28.6%, in KILLIP 2 was 55.9%, in KILLIP 3 was 50% and KILLIP 4 was 100%). Patients presented with LVEF<50 the positivity of Euthyroid sick syndrome was 56.9% and patients presented with LVEF>50 was 26.5%) .

			ESS		Total
			Negative	Positive	
Status	Alive	Count	58	36	94
		%	61.7%	38.3%	100.0%
	Dead	Count	0	6	6
		%	0.0%	100.0%	100.0%
Total		Count	58	42	100
		%	58.0%	42.0%	100.0%

Discussion

In our study 42 of MI patients had Euthyroid sick syndrome. So occurrence of Euthyroid sick syndrome in our patients was 42% , p value was 0.258. So occurrence of Euthyroid sick positivity rate was not statistically significant. This implies that occurrence of Euthyroid sick positivity rate may vary. In our study patients who presented with LVEF<50 the occurrence of Euthyroid sick syndrome was 56.9% and patients who presented with LVEF>50 was 26.5%. In our study 56.9% of Euthyroid sick positive patients are in LVEF<50 But 43.1% of Euthyroid sick negative patients only in this group. This observation was statistically significant with p value of 0.002** . In Hallstrom A et al[7] . J Am Coll Cardiol. 1995 May;25(6):1250-7.study concluded that low left ventricular ejection fraction are strongly associated with morbidity and mortality after acute myocardial infarction .Euthyroid sick positive patients are high likelihood to have LVEF<50. So the Euthyroid sick syndrome positivity predicts the high mortality and morbidity than negative individuals in acute myocardial infarction.In our study the decrease of MeanT3level, Mean T4 level between the two groups of patients who presented with LVEF <50 and LVEF>50 was observed. P values of which were 0.001, 0.0005 respectively which was statistically significant. In Medha Rajappa and S.K. Sen et al Biomedical Research 2005; 16 (1): 15-18 study observed that extent of decrease of Mean T3 level ,Mean T4 level, Mean TSH level It was more important in patients in Group I (LVEF < 50%) with a diagnosis than that in Group II.So analysing from various studies our study also observed that when the severity increased as evidenced by low LVEF more suppression of thyroid hormone level occurs.

Conclusion

From the above observations it is inferred that Decrease in T3 is inverse to the intensity of cardiac harm and may have a probable diagnostic value.. These changes in the thyroid hormone status return to normal once the patient recovers from the critical illness. Though these patients have abnormalities in the thyroid hormone status they are clinically euthyroid. The thyroid hormone system is quickly controlled in acute myocardial infarction. This can be useful during acute ischemia. The Euthyroid sick syndrome positivity rate is comparative to the sternness of cardiac damage (as evidenced by KILLIP class and Ejection fraction) and may have a possible prognostic value. Thus Euthyroid sick syndrome positivity may underwrite to the embellishment of an AMI cruelty index. The role of thyroid hormone replacement as a method for treatment of Euthyroid sick syndrome is still controversial and there are no proper studies to recommend , further studies are required for recommendation . Treatment of underlying condition is the treatment of choice.

Total		Count	58	42	100
		%	58.0%	42.0%	100.0%

Discussion

In our study 42 of MI patients had Euthyroid sick syndrome. So occurrence of Euthyroid sick syndrome in our patients was 42% , p value was 0.258. So occurrence of Euthyroid sick positivity rate was not statistically significant. This implies that occurrence of Euthyroid sick positivity rate may vary. In our study in Euthyroid sick positive patients mean ICU stay duration was 4.39 days compare to Euthyroid sick syndrome negative patients in whom mean ICU stay duration was 3.45 days with p value of 0.005** so this observation was statistically significant. This implies that Euthyroid sick positive patients have high morbidity.

Conclusion

From the above observations it is inferred that Decrease in T3 is inverse to the intensity of cardiac harm and may have a probable diagnostic value.. These changes in the thyroid hormone status return to normal once the patient recovers from the critical illness. Though these patients have abnormalities in the thyroid hormone status they are clinically euthyroid. The thyroid hormone system is quickly controlled in acute myocardial infarction. This can be useful during acute ischemia. The Euthyroid sick syndrome positivity rate is comparative to the sternness of cardiac damage (as evidenced by KILLIP class and Ejection fraction) and may have a possible prognostic value. Thus Euthyroid sick syndrome positivity may underwrite to the embellishment of an AMI cruelty index. The role of thyroid hormone replacement as a method for treatment of Euthyroid sick syndrome is still controversial and there are no proper studies to recommend , further studies are required for recommendation . Treatment of underlying condition is the treatment of choice.

Occurrence of Euthyroid Sick Syndrome in Acute Myocardial Infarction and Their Relation to Type of Myocardial Infarction

Durga Devi G[1], Rahe R[2]

[1]Associate Professor, [2]Assistant Professor, Department of Anatomy, SreeBalaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Depression of the thyroid hormone system may happen in otherwise euthyroid patients in serious acute illness of any cause. In this condition, called Euthyroid Disease Syndrome, the standard feed-back control of the homeostasis of the thyroid is changed.[11-13] To find out the occurrence of EUTHYROID SICK SYNDROME in ACUTE MYOCARDIAL INFARCTION patients admitted to intensive care unit in SREE BALAJI HOSPITAL , CHENNAI and its prognostic significance. This study was conducted in the Intensive care unit,SREE BALAJI MEDICAL COLLEGE AND HOSPITAL , Chennai in collaboration with Dept of internal medicine, Dept of Cardiology and Dept of biochemistry. It was a prospective study done during the period from April 2017 to March 2018 . 100 patients with history, clinical features suggestive of myocardial infarction were selected irrespective of age and sex . In our study STEMI were 52 patients and NSTEMI were 52 patients, among which the occurrence of Euthyroid sick syndrome among STEMI was 46.2% and NSTEMI was 37.5%. p value was 0.381 which is statistically insignificant. To our knowledge no study compared between STEMI and NSTEMI.In our study AWMI were 56 patients , IWMI were 38 patients and Other MI were 6 patients among which occurrence of Euthyroid sick syndrome in AWMI patients was 32.1%, in IWMI patients was 47.4% and in OTHERS it was 100% .p value was 0.004 that was statistically significant. Previous studies also showed similar results.The presence of Euthyroid sick syndrome in Acute myocardial infarction patients may contribute to the elaboration of an AMI severity index.

***Key words**: Myocardial infarction ,Euthyroid sick syndrome*

Introduction

Euthyroid disease syndrome can be defined as abnormal results from thyroid function tests that happen in non-thyroid disease settings (NTI) without pre-existing hypothalamic-pituitary or thyroid dysfunction.11-13 Decreased serum complete triiodothyronine (T3) is the most prevalent thyroid function ailment in patients with acute illness[14] This can be detected within 2 hours of the beginning of severe physical stress.[15] As the severity of the disease progresses, there is a gradual growth of complicated syndrome connected with low concentrations of T3 and thyroxine (T4).[16,17]The concentrations of thyroid stimulating hormone (TSH) remain unchanged or mildly decreased.. Conversion of pro-hormone (Thyroxine, T4) to active form is reduced owing to reduced peripheral activity of 5'-deiodinase and enhanced manufacturing of inverse T3 (rT3) metabolites. These modifications in thyroid hormones may be partially mediated by cytokines or other inflammatory mediators., Acting at the hypothalamus and pituitary levels, the thyroid gland, and the hepatic deiodinase system, as well as at the linking of thyroxine to thyroid globulin (TBG). It remains uncertain how much the hormone reaction in Euthyroid Disease Syndrome is component of an adaptive response that reduces the energy demands of tissues in the face of systemic disease.

Or a maladaptive reaction that induces harmful tissue hypothyroidism. As a result, the use of thyroid hormone treatment in Euthyroid disease syndrome is contentious. Recovery from inherent acute illness is associated with the demise of thyroid defects. Altered levels of thyroid hormones have also been revealed in starvation,[10] acute and chronic medical conditions,[29-31] acute myocardial infarction[4], bone marrow transplantation,[8] surgery,[9] trauma,[22] and, in reality, these modifications can be seen in any serious systemic disease.[18,19.]

Euthyroid disease syndrome has also been established in acute myocardial infarction and has been postulated as a connection between the severity of cardiac harm and the degree of increase in thyroid hormones..[4] The objective of this research is to identify the incidence of Euthyroid disease syndrome in patients with Acute myocardial infarction and to assess whether the existence of Euthyroid disease syndrome in these patients has any prognostic importance in assessing the seriousness of AMI.

Material & Method

This study was conducted in the Intensive care unit,SREE BALAJI MEDICAL COLLEGE AND HOSPITAL , Chennai in collaboration with Dept of internal medicine, Dept of Cardiology and Dept of biochemistry. It was a prospective study done during the period from April 2017 to March 2018 . 100 patients with history, clinical features suggestive of myocardial infarction were selected irrespective of age and sex .

Inclusion Criteria

1. Myocardial infarction patients admitted to the Intensive care unit.

Exclusion Criteria

11. Patients with past or present history of thyroid dysfunction.

12. Patients taking drugs that will affect thyroid function.

13. Patients with chronic renal failure.

14. Patients with decompensated liver disease.

15. Patients with thyroid function test suggestive of primary Hypothyroidism or Hyperthyroidism.

Study Population

A total of 124 patients were enrolled for the study from the patients admitted to Intensive care unit in SreeBalaji Hospital from the period April 2017 to march 2018.

24 patients were excluded as per exclusion criteria. The remaining 100 patients, who satisfied all the inclusion criteria were selected for the study and followed for one week. Written consent was obtained from all patients participating in the study.

All patients were subjected to a detailed clinical history and thorough physical examination as per proforma. The complicated cases identified by KILLIP classification criteria and ejection fraction.

The serum of patients was analysed for thyroid function tests at day 1 (T3,T4,TSH) and in euthyroid sick positive patients repeat thyroid function tests was done at day 7 to confirm the reversal of hormone status. Day 1samples were obtained before reperfusion therapy. Echocardiography was done during hospital stay.

All patients underwent CBC, Blood sugar, Serum Na, Urea, Creatinine, LFT, Fasting lipid profile, Thyroid function tests, ECG,Troponin I, ECHO.

Laboratory Tests

All patients underwent CBC, Blood sugar, Serum Na, Urea, Creatinine, LFT, Fasting lipid profile, Thyroid function tests, ECG, Trop I and ECHO. The serum of patients was analysed for thyroid function tests at day 1 (totalT3, total T4, TSH) and in sick euthyroid positive patients repeat thyroid function tests done at day 7 to confirm the reversal of hormone status. The thyroid function test was done by ELISA method. All samples were obtained before reperfusion therapy. Echocardiography was done during hospital stay.

Findings

Our study shows that of 42% acute myocardial infarction patients had Euthyroid sick syndrome positivity. In our study STEMI were 52 patients and NSTEMI were 52 patients, among which the occurrence of Euthyroid sick syndrome among STEMI was 46.2% and NSTEMI was 37.5%. p value was 0.381 which is statistically insignificant. To our knowledge no study compared between STEMI and NSTEMI.

In our study AWMI were 56 patients , IWMI were 38 patients and Other MI were 6 patients among which occurrence of Euthyroid sick syndrome in AWMI patients was 32.1%, in IWMI patients was 47.4% and in OTHERS it was 100% .p value was 0.004 that was statistically significant. Previous studies also showed similar results.

			ESS		Total
			Negative	Positive	
Diagnosis	AWMI	Count	38	18	56
		%	67.9%	32.1%	100.0%
	IWMI	Count	20	18	38
		%	52.6%	47.4%	100.0%
	Others	Count	0	6	6
		%	0.0%	100.0%	100.0%
Total		Count	58	42	100
		%	58.0%	42.0%	100.0%

Discussion

In our study 42 of MI patients had Euthyroid sick syndrome. So occurrence of Euthyroid sick syndrome in our patients was 42% , p value was 0.258. So occurrence of Euthyroid sick positivity rate was not statistically significant. This implies that occurrence of Euthyroid sick positivity rate may vary. Our study shows that of 42% acute myocardial infarction patients had Euthyroid sick syndrome positivity. In our study STEMI were 52 patients and NSTEMI were 52 patients, among which the occurrence of Euthyroid sick syndrome among STEMI was 46.2% and NSTEMI was 37.5%. p value was 0.381 which is statistically insignificant. To our knowledge no study compared between STEMI and NSTEMI.In our study AWMI were 56 patients , IWMI were 38 patients and Other MI were 6 patients among which occurrence of Euthyroid sick syndrome in AWMI patients was 32.1%, in IWMI patients was 47.4% and in OTHERS it was 100% .p value was 0.004 that was statistically significant. Previous studies also showed similar results.In our study patients who presented with LVEF<50 the occurrence of Euthyroid sick syndrome was 56.9% and patients who presented with LVEF>50 was 26.5%. In our study 56.9% of Euthyroid sick positive patients are in LVEF<50 But 43.1% of Euthyroid sick negative patients only in this group. This observation was statistically significant with p value of 0.002** . In Hallstrom A et al[7] . J Am CollCardiol. 1995 May;25(6):1250-7.study concluded that low left ventricular ejection fraction are strongly associated with morbidity and mortality after acute myocardial infarction .Euthyroid sick positive patients are high likelihood to have LVEF<50. So the Euthyroid sick syndrome positivity predicts the high mortality and morbidity than negative individuals in acute myocardial infarction.In our study the decrease of MeanT3level, Mean T4 level between the two groups of patients who presented with LVEF <50 and LVEF>50 was observed. P values of which were 0.001, 0.0005 respectively which was statistically significant. In Medha Rajappa and S.K. Sen et al Biomedical Research 2005; 16 (1): 15-18 study observed that extent of decrease of Mean T3 level ,Mean T4 level, Mean TSH level was more significant in patients in group I (with LVEF < 50%), who have a worse prognosis than those in group II. So analysing from various studies our study also observed that when the severity increased as evidenced by low LVEF more suppression of thyroid hormone level occurs.

Conclusion

From the above observations it is inferred that Decrease in T3 is inverse to the intensity of cardiac harm and may have a probable diagnostic value.. These changes in the thyroid hormone status return to normal once the patient recovers from the critical illness. Though these patients have abnormalities in the thyroid hormone status they are clinically euthyroid. The thyroid hormone system is quickly controlled in acute myocardial infarction. This can be useful during acute ischemia. The Euthyroid sick syndrome positivity rate is comparative to the sternness of cardiac damage (as evidenced by KILLIP class and Ejection fraction) and may have a possible prognostic value. Thus Euthyroid sick syndrome positivity may underwrite to the embellishment of an AMI cruelty index. The role of thyroid hormone replacement as a method for treatment of Euthyroid sick syndrome is still controversial and there are no proper studies to recommend , further studies are required for recommendation . Treatment of underlying condition is the treatment of choice.

A Various Outcomes of A Patients with Acute Intestinal Obstruction – A Case Series

V.Naveen Kumar[1], Bharathi Raja[1], K.S.Ravishankar[2]

[1]Post graduate, [2]Professor, Department of G.Surgery,SreeBalaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: Bowel distortion continues the most common intra-abdominal problems experienced by primary care doctors in their career, whether caused by hernia, neoplasm, conductance or associated with physiological disorders, continues a important cause of disease risk due to small or big intestinal invasion... To identify and analyse the various outcomesin a patients with acute intestinal obstruction. **Objective**: To analyse the various outcomes in a patients with acute intestinal obstruction. **Materials and methods** : The study was conducted in SreeBalaji Medical College and Hospital, Chennai over a period of 19months in all patients admitted with intestinal obstruction irrespective of age group. **Results**: Bowel distortion persists one of utmost important prevalent intra-abdominal issues encountered by general surgeons in their profession, either provoked by hernia, neoplasm, conductivity or linked to biochemical disorders, tiny or large intestine intrusion tends to be significant cause of morbidity and mortality.**Conclusion:**Achievement in the therapy of acute intestinal obstruction relies mainly on early diagnosis, careful monitoring and treatment of the pathological consequences of infection, even more than the cause itself..There is no statistically significant difference between cure rates and death rates due to various surgeries, probably because our sample size was too small. P value 2.0(>0.05).

Key words: *intestinal obstruction, peritonitis,septicemia.*

Introduction

Bowel intrusion continues some of the most predominant intra-stomach issues experienced by general specialists in their calling, regardless of whether prompted by hernia, neoplasm, bond or connected to biochemical unsettling influences[1], intestinal obstacle of the small or digestive organ stays to be a noteworthy reason for dismalness and mortality[3]. They apply for 12 to 16 percent of careful confirmations for extreme stomach issues[2]. Qualities of intense intestinal deterrent can differ from a moderately fair look with just slight stomach agony and distension to a condition of hypovolemic or septic stun[4] (or both) requesting crisis medical procedure[9]. Passing inferable from intense intestinal block diminishes with better learning of pathophysiology[5], improved symptomatic strategies, liquid and electrolyte.,A lot of powerful anti-microbials and understanding of intensive care[6-8]. Most deaths happen in elderly people who seek late therapy and related pre-existing illnesses such as diabetes mellitus, heart illness or respiratory disease[10]. Early diagnosis of obstruction, adequate technique during surgery and intensive postoperative therapy are very welcome[11].

Materials and Method

The study was conducted in SreeBalaji Medical College and Hospital, Chennai over a period of 19months in all patients admitted with intestinal obstruction irrespective of age group. Study design - Prospective observational studyPatients who had prudently processed subacute intestinal obstruction were removed from the examination and just those cases of intense intestinal

check that had been carefully controlled were inquired about to decide the pathology of intestinal deterrent so as to comprehend the kind of execution, physical outcomes, radiological and hematological outcomes., Operational outcomes and consequence of intense intestinal block. Clinical information were registered as per Proforma after admission of the patient. Disorder is primarily based on clinical investigation and is sometimes endorsed by haematological and radiological tests.

Finding

Table 1: Postoperative complications

Postoperative complications	Number of cases
WI	2
RTI	2
Wound dehiscence	-
Faecal fistula	-
Septicaemia	5

Mortality

Table 2: Mortality

Mortality	Number of cases	Percentage
Cured	43	86
Dead	7	14

In the current research of 50 instances, approximately 7 patients died as a proportion of 14 per cent. Most of fatalities because of inconveniences, for example, septicemia, peritonitis, respiratory disease. In the present study 7 persons died during postoperative period. The analysis of cause of death is shown below.

Table 3: Death Causes

Age and sex	Symptoms prior to admission	Operative Findings	Operative procedure	Cause of Death
55/F	3 days	Carcinoma sigmoid colon	Resection and anastamosis	Septicaemic Shock
72/M	8 days	Carcinoma Rectum	Hartman's Procedure	RTI
65/M	5 days	Mesenteric Ischaemic	Resection anastamosis	Septicaemic Shock
45/M	3 days	Carcinoma Caecum	Resection and anastamosis	RTI
58/F	5 days	Carcinoma ovary with sigmoid colon Infiltration	Transverse loop colostomy	Septicaemic Shock
63/M	3 days	Carcinoma Rectum	Hartman's Procedure	Septicaemia
55/M	4 days	Carcinoma Colon	Resection and anastamosis	Septicaemia

Table 4: Follow-up status

Follow-up	Follow-up status		
complications	**One month**	**3rd Month**	**6th Month**
A. Wound infection	1	Nil	Nil
B. Septicemia	Nil	Nil	Nil
C. Enterocutaneous Fistula	Nil	Nil	Nil
D. Prolonged ileus	Nil	Nil	Nil
E. Fever	2	3	Nil
F. Respiratory infection	2	1	Nil
G. Death	Nil	Nil	Nil
H. Recurrent obstruction	Nil	Nil	Nil

Discussion

In our clinical research, the prevalence of acute intestinal obstruction is 0.95% of complete surgical instances. The recurrence of SouvikAdhikari et al. in arrangement was 9.87 percent of complete careful occurrences. The occurrence of Bhargava Anderson arrangement was 3% of complete careful occasions. In the present investigation gathering of 50 examples, variations from the norm, for example, septicemia 5 cases, pneumonic tract disease 2 cases, twisted damage in two cases. Septicemia was increasingly confused in occasions of danger and one instance of mesenteric ischaemia where sepsis was available right now of affirmation, and for these occurrences, intestinal medical procedures were performed which were not well arranged. In two examples, one with blocked inguinal hernia and one with carcinoma rectum, the patients had past comorbid COPD conditions because of respiratory tract contamination.

The death rate in our examination is 14 percent, for example 7 out of 50 examples. Of these 6 occurrences, one was because of harm and one was because of mesenteric ischaemia. that have occurred during various studies have been tabulated as follows.

Table5: Morality rate in various studies

Studies	Year	No. of cases Studied	Mortality
Present study	2014	50	14%
Souvik Adhikari44	2005	367	7.35%
Safian Matsu Moto50	1975	171	19%
Jahangir-Sarwar Khan45	2001	100	7%
Ramachandran CS51	1982	417	12.7%

The death level in this research is much like the Ramachandran CS et al. inquire about, however is higher contrasted with the SouvikAdhikari et al., Jahangir et al. contemplates.

Out of 7 examples, 6 were because of danger. Since the danger was higher in the more established gathering and the ill-equipped intestinal medical procedure performed on the patient brought about septicemia. furthermore, brought about death. Two patients were ceaseless smoker who endured respiratory tract contamination and died. As an outcome, most fatalities were because of danger, which had a significant impact in the consequences of the ailment. Mortality in intestinal impediment is higher in patients who advance suffocation and intestinal gangrene, including the individuals who arrive at the emergency clinic following 3 days.. With these, the age of the patient, the general ailment of the patient, the length of the infections. Operational processes have a strong role to play in both advancement and mortality.

Conclusion

Success in the treatment Acute intestinal obstacle depends fundamentally on early finding, cautious administration and treatment of the neurotic results of deterrent, as much as the hazard individually.There is no statistically significant difference between cure rates and death rates due to various surgeries, probably because our sample size was too small. P value 2.0(>0.05).

Ethical Clearance- No ethical clearance was necessary for this research work

Comparision of Pre-Operative & Post-Operative Pain Grading after Diagnostic Laparoscopy in Patients Presenting with Chronic Abdominal Pain at SBMCH

A.Muzamil Ahmed[1], Chinni Vikram[1], R.G.Santhaseelan[2]

[1] Post graduate, [2]Professor, Department of G. Surgery, Sree Balaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

To evaluate the diagnostic and therapeutic value of laparoscopy in chronic abdominal pain. Tofindthe various unrevealed aetiology for chronic abdominal pain.To assess the extent of the diseaseTo analyse the accuracy and efficacy of diagnostic laparoscopy in chronic abdominal pain.

Keywords: *Pre-operative & Post-operative, chronic abdominal pain.*

Introduction

Chronic abdominal pain is a common complaint which is difficult to manage by both physician and surgeon. It is the 4th frequent cause of chronic pain syndrome in general population worldwide. Although patients with chronic abdomen pain undergo numerous clinical & radiological diagnostic work up, definite diagnosis still remains a challenge to the surgeon. This affects the patients both physically and psychologically[1]

With the introduction of the diagnostic laparoscopy new tools has been added to our knowledge. Laparoscopy can identify abnormal findings and improve outcome in majority of the patients with chronic abdominal painDiagnostic laparoscopy also helps the surgeon to decide whether any surgical management is mandatory and also to elicit the signs of inoperability in case of disseminated diseases such as advanced malignancy,tuberculosis[2] etc in which the prodromal symptoms may be chronic abdominal pain[3]. This study is mainly designed to highlight the significance of laparoscopy in diagnosing the etiology of chronic abdominal pain , impact on the treatment and on post-operative painrelief[4 5]

Materials & Method

This study was conducted in patients presented with abdominal pain more than 3 months whose diagnosis was doubtful or could not be made by our routing physical, laboratory and imagingmodalities.Between MARCH 2017 and OCTOBER 2018, a total number of 105 consecutive patients with chronic abdominal pain were enrolled in this prospective descriptive cross-sectional study.They were recruited from the outpatient clinic of General Surgery Department in Sree Balaji Medical College & Hospital, Chennai in the above said study period.

Inclusion criteria

- Age between 15 and65
- Both males andfemale
- Abdominal pain more than 3months

Exclusion criteria

- Known abdominal malignancypatient
- Known psychiatricpatient

Findings

Table – 1 Findings

Findings	Percentage
Thickened appendix	44 (42%)
Adhesions	22 (21%)
Enlarge mesentric nodes	14 (13%)
Ovarian cyst	9(8%)
Koch's abdomen	3(3%)
Neoplasia	3 (3%)
Hernia	3 (3%)
Others	3(3%)
No abnoramality	4 (4%)

PRE OP PAIN GRADING

Table – 2 Pre Op Grading

Grading	Percentage
Mild	14(13%)
Moderate	78 (74 %)
Severe	12 (12%)
Very severe	1(1%)

Most of the patient had moderate pain which accounts for 74% (n=78)

POST OP PAIN RELIEF

Table – 3 Post OP Pain Relief

Duration	Positive out come	Negative out come
After 1 month	80 %	20%
After 3 month	90 %	10%

Discussion

All patients were observed in the immediate post operative period for pain perception and amount of analgesic were needed to treat. All of them had the follow up in 1st month and 3 rd months. Verbal Rating Scale for pain perception were analysed. At the end of 1st month 80% patients got complete pain relief and at 3rd month 90% got complete pain relief. In the remaining 10% patient there were no changes in pain grading, it may be because of the diseasenature.

Conclusion

The role of diagnostic laparoscopy in chronic abdominal pain is tremendous which increases our knowledge about various underlying abdominal disorders.Diagnostic laparoscopy can identify abnormal findings and improve the outcome in patients with chronic abdominal pain. However, it should be considered only after a complete diagnostic evaluation has been carried out.It allows effective surgical treatment of many conditions encountered at the time of diagnostic laparoscopy hence intervension can be done simultaneously. It is a safe and effective tool to establish the etiology of chronic abdominal pain and allows for appropriate interventions.

Comparison of Fine Needle Aspiration Cytology with Histopathology in Thyroid Swellings & its Diagnostic Accuracy

Mary Lilly.S[1] Ramamoorthy.V[2]

[1]Professor, [2]Professor, Department of Pathology, SreeBalaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

To observe the correlation of FNAC and histopathology in various thyroid swellings.Solitary nodular goitre, Multi nodular goitre Suspected malignancy of thyroid, Malignancy of thyroid and to study its diagnostics accuracy.

Key words: *Cytology, Histopathology*

Introduction

Thyroid gland is unique among endocrine organs. It is the largest endocrine gland in the body and the first to develop in fetal life. A thyroid nodule is either palpable clinically or ultrasound detected[1-8]. A multitude of diagnostic tests like ultrasound, thyroid nuclear scan, fine needle aspiration cytology (FNAC) and many more are available to evaluate a thyroid swelling[9-14]. Final diagnosis requires morphological examination of lesions for which requires FNAC and histopathological examination (HPE) becomes mandatory tests.

Materials and Method

This study includes the patients who were operated for solitary and multinodular thyroid disease, suspicious malignant disease and malignant disease. All cases were studied in detail with detailed clinical examination and investigations. Cases with hard thyroid swelling, male sex, fixity to surrounding structures, nerve involvement and cold nodules are studied in detail to rule out malignancy. Cases with cystic swellings are not aspirated they were subjected to surgery to rule out papillary carcinoma.It is a prospective study done between April 2017 to September 2018 done in Department of General Surgery, Sree Balaji Medial college & hospital Department of Pathology, SreeBalaji Medical College& hospital.

Equipment's for FNAC: -

- FNA gun or 10cc syringe
- 22 to 24 gauze needle
- Syringe holder
- Glass slides
- Alcohol
- Fixative
- Gauze pad
- Adhesive bandage

Procedure: -

Initial examination should be with patient in upright position but FNAC done in supine position. Place a pillow under the neck. Ask the patient to keep still and to refrain from swallowing. Perform 2 to 4 aspiration in same session. Depending on the size of the thyroid swelling use different angles and change in point of entry. Cells are placed and prelabelled in dry glass slides. Some are immediately placed in 70% alcohol while others are air dried. The stain used is papanicolaou or wrights stain. Skilled pathologist can accurately diagnose thyroid lesions.

Group I -Benign

All patients whose clinical examination showed features of solitary or multinodaluar thyroid disease with preoperative FANC as nodule, colloid, adenomatous goitre.

Group II- Suspicious Malignancy

Solitary nodular or multinodulargoitre with pre-operative FNAC showing suspicious of malignancy/ suspicious of follicular neoplasm

Group Iii – Maliganancy

- Hard swelling
- Pre-operative FNAC showing malignancy
- H/o recent voice change
- H/o difficulty in breathing or swallowing
- Fixity to surrounding structures.
- Lymph node enlargement (secondary from thyroid nodule).

All 60 patients underwent surgery. Final histopathology report obtained for all patients.

Findings

During the study period we had 60 patients who presented with thyroid swelling who underwent FNAC followed by surgery and final histopathology y] report was obtained for all. The comparison between FNAC report and histopathology report were present which was studied in detail. Based on the FNAC the 60 patients were divided into three groups. GROUP-1 benign, GROUP-2 suspicious of malignancy & GROUP-3 proven malignancy. There was less discordance in group-1 when compared to group-2 which had more discordance. the group-3 had no discordance. The incidence of different types of diagnosis for thyroid swelling is reported in Table 1 and figure 1. The incidence of different types of thyroid diagnosis as per HPE is reported in table 2 & figure 2. The comparison table of FNAC and HPE is reported in table 3. The correlation & discordance between FNAC and histopathology has been reported infigure 3 & 4.

Table-1: Incidence as Per FNAC

Diagonsis – Cytological	No. of Cases
Nodular Colloid Goitre	50
Papillary Carcinoma	3
Suspicious of Follicular Carcinoma	6
Medullary Carcinoma	1

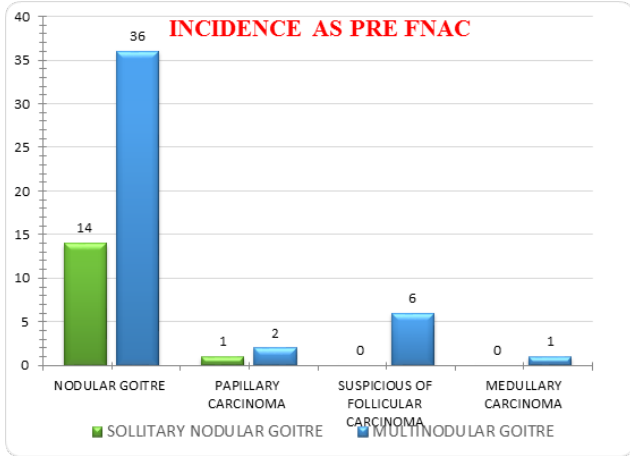

Figure-1 Incidence as Per FNAC

Table- 2: Incidence as per histopathology report

Diagonsis- Histopathological	No. of Cases	Precentage
Nodular Colloid Goitre	42	70%
Papillary Carcinoma	7	11.6%
Follicular Carcinoma	2	3.3%
Medullary Carcinoma	1	1.6%
Follicular Adenoma	7	11.6%
Hashimotos Thyroiditis	1	1.6%

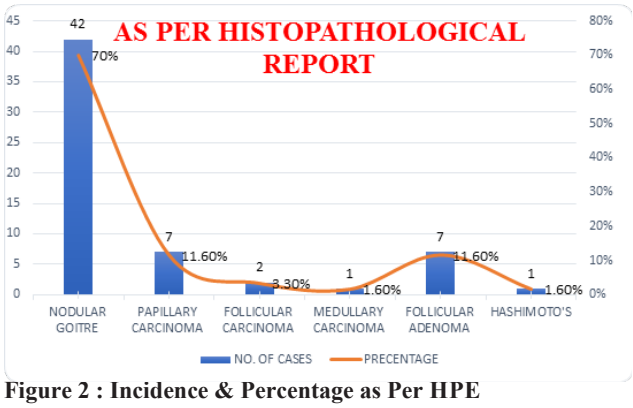

Figure 2 : Incidence & Percentage as Per HPE

TABLE- 3: Diagnosis of thyroid swelling in FNAC & Histopathology

Diagnosis	Fnac	Histopathology
Nodular Colloid Goitre	50	42
Papillary Carcinoma	3	7
Suspicious of Maliganancy	6	-
Follicular Carcinoma	-	2
Medullary Carcinoma	1	1
Follicular Adenoma	-	7
Hashimotos Thyroiditis	-	1

Group I - Benign

Number of benign disorder diagnosed by pre-operative FNAC = 50

Correlated with HPE = 42

Percentage of correlation = 84%

Discordance in biopsy =8

Percentage of Discordance = 16%

Group II – Suspicious of Malignancy

Number of Pre-operative FNAC diagnosed as suspicious of malignancy = 6

Correlated with Biopsy -3

Percentage of correlation - 50%

Discordance in Biopsy = 3

Percentage of discordance - 50%

Group III – Maliganant

Number of Pre-operative FNAC diagnosed as malignant = 4

Correlated with Biopsy = 4 cases

Percentage of correlation – 100%

Percentage of discordance – 0%

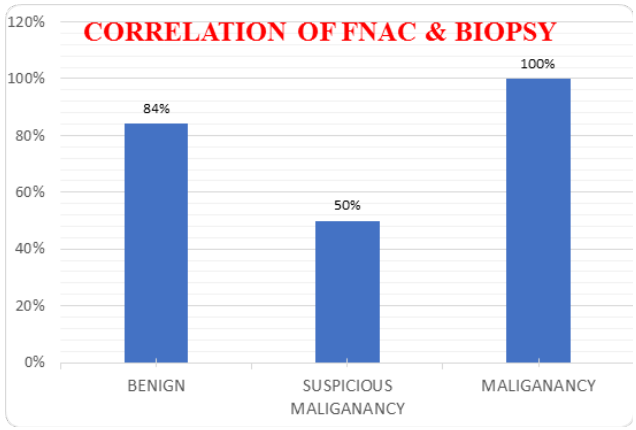

Figure – 3: Correlation FNAC & Biopsy

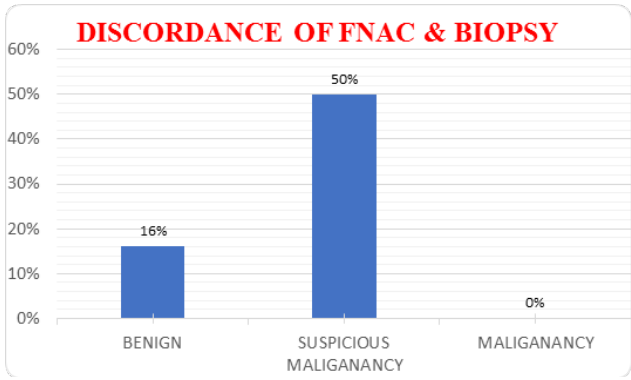

Figure – 4: Discordance of FNAC & Biopsy

Discussion

FNAC is simple to conduct and secure with a minimal infection rate. Care must be taken to achieve an appropriate specimen-most writers suggest between 3 and 6 expectations. A suitable sample includes at least 6 groups of 10 to 15 excellently-preserved cellsThey are classified as benign, indeterminate or suspicious and malignant. The treatment of papillary thyroid carcinoma by FNAC on the basis of distinctive nuclear alterations is reliable and accurate, with tolerance and accuracy reaching 100%.In our study among 60 cases, 3 cases are reported as papillary carcinoma in FNAC. But after HPE report 7 cases are diagnosed as papillary carcinoma. So the discrepancy of 4 cases, the FNAC diagnosis of 4 cases were one as suspected follicular carcinoma and 3 cases were nodular colloid goitre

type. In case of follicular neoplasm, the sensitivity of FNAC is about 90% and specificity less than 50% this limits the usefulness of FNAC. Tpoimmuno chemistry with monoclonal antibody (MO Ab 47) improves the accuracy of FNAC for follicular lesions. It increases sensitivity to 100%specificity to 70%B.Mundasad, P.C. pyper 2006 *et al*[15] conducted a study on Accuracy of FNAC in diagnosis of thyroid swellings. In their study among 144 patients - FNAC revealed 94% benign, 6% malignant 4% suspicions. 13% inadequate, 4% indeterminate. But histopathology showed 82% benign, 18% malignancy. In their research, the survey rate was 13 per cent insufficient. The most significant variables include the understanding of the vacuum cleaner and the requirements used to identify a suitable sample.Published dates suggest inadequate sample ranges between 9 to 31% in their study false negative rate is 23% i.e. FNAC negative for cancer but histology positive for cancer. According to AACE/AME team on thyroid knobs Endocrpract 2006:124 63-102 the normal false negative rate is 5% their rules to limit false negative outcomes are. (9) Aspirate different knob destinations, Aspirate numerous knob locales in MNG, follow up cytologically kind knobs, Submit pimple liquid for assessment, Review contemplates with experienced cytopathologist

Conculsion

In conclusion, FNAC is simple, safe, and cost effective but HPE remains final diagnostic tool. Because FNAC cannot differentiate between adenoma and carcinoma in follicular and hurthle cell lesions. The suspicious results in FNAC prove to be an area of uncertainty often resolved by diagnostic surgical resection. In case of Multinodular goitre even if the preoperative FNAC is negative it does not exclude with certainty the possibility of a carcinoma because the error in sampling the right area is greater. Such evaluation may lead to non-radical operation and the need of a second surgery or radio therapy.

Efficacy of Autologous Platelet Rich Plasma Injection in Lateral Epicondylitis and Plantar Fasciitis

Vivek K[1], Padma V[2]

[1]Student, [2]Professor, Department of General Medicine,SreeBalaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

The aim of the study is to find out the efficacy of autologous platelet rich plasma injection in lateral epicondylitis and plantar fasciitis. The treatment and complete cure from chronic enthasopathies like tennis elbow, plantar fasciitis, has always been ranked among the most difficult and frustrating problem for both patients and treating doctors. Tennis elbow or lateral epicondylitis has been described as a degenerative tendonopathy of extensor carpi radialis brevis muscle. The most common pathogenesis is repetitive micro trauma of muscle from overuse resulting in tendinosis of ECRB with or without involvement of extensor digitorum communis muscle. Various forms of conservative treatments are available for tennis elbow and the outcome of these treatments varies in patient to patient. Plantar fasciitis is also known as heel tennis, because the plantar fascia is constantly stretched at the attachment over calcaneal tuberosity. Repeated micro trauma makes this disease difficult for conservative treatment. Surgical options like plantar fascia release were practiced but devastating complications will occur since plantar fascia is a supporting structure for maintain the longitudinal arch of the foot.

Key words: *Platelet rich plasma, lateral epicondylitis, and plantar fasciitis.*

Introduction

Platelet rich plasma (PRP)injections are widely studied for treating various musculoskeletal disorders due to its increased healing properties.[1]The contains growth factors such as Platelet-Derived Growth Factor, Insulin-Like Growth Factor, Transforming Growth Factor, Epidermal Growth Factor (EGF), Vascular Endothelial Growth Factor (VEGF), Fibroblast growth factor. Interaction of this growth with differentiation factors, and the adhesive protein factors such as fibronectin and vitronectin are responsible for the healing response promoting the regenerative process of chemotaxis, self proliferation, tissues debries, angiogenesis, extra cellular matrix formation, osteoid production and collagen synthesis, which enhance the healing rate in chronic tendinopathies.[2]This methodology of treating chronic tendinopathies has general importance as this form a connecting approach between conservative management as well as surgical management.[3]

The incidence of lateral epicondylitis is 4-7 per 1000 per year in general population,and35-54 years age group are commonly involved.[4] Lateral epicondylitis occurs due to overuse of the wrist extensors or supinator muscle with may be incriminating. In lateral epicondylitis the muscle involved is Extensor carpi radialis brevis.[5]Various methods have been advocated for the treatment of lateral epicondylitis rest, physiotherapy, activity modification, bracing, nonsteroidal anti-inflammatory drugs, and injections.[6] Surgery is also an option for patients who have persistent symptoms despite continued efforts at conservative treatment.[7]Thecommon cause of heel pain is plantar fasciitis which affect 10% of the general population.The age group of 40 -70years most commonly occurs.[8] It tends to occur more often in women, middle aged, military recruits, athletes and the obese persons.[9]The inflammation is due to repeated trauma from overuse or injury. The degeneration occurs

Vivek,
Department of General medicine, SreeBalaji Medical College & Hospital,Bharath Institute of Higher Education and Research, AgharamRoad,Selaiyur, Chennai-73.

at origin of the plantar fascia at the medial tuberosity of the calcaneum.[10]Various methods have been advocated for treating this condition like rest, non-steroidal anti inflammatory drugs, night splints, keeping appropriate wedge on shoe, soft heel pad, plantar stretching exercises, ultrasound massage to heel, extracorporeal shock wave therapy (ESWT), local corticosteroid injections, and operative treatments.[11]Platelet rich plasma helps in healing both lateral epicondylitis and plantar fasciitis following which recurrence rate was found to be low.

Materials and Method

The present sample size of 80 patients were analysed prospectively by injecting platelet rich plasma for conditions such as lateral epicondylitis and plantar fasciitis. The study was conducted in sreebalaji medical college and hospital from March 2017 to March 2018with afollow up period of 3 months duration.

Inclusion criteria:

1. Plantar fasciitis diagnosed patients.
2. Lateral epicondylitis diagnosed patient.
3. Patients should have minimum three months duration of symptoms.
4. Patients should undergo conservative treatment for a minimum period of three months.
5. Pain score more than seven at the time of injection.
6. Local steroid injection in the last 2 months.
7. Both male and female
8. Age group above 20 years.

Exclusion criteria:

1. Lateral epicondylitis and plantar fasciitis of less than three months duration.
2. Pain scores less than seven.
3. Patients without any trial of conservative treatment.
4. Recent local steroid injection.
5. Patients suffering from other causes like rheumatoid arthritis, Sero negative spondylo arthritis .
6. Infection or ulcer at the injection site.
7. Patients less than 20 years.
8. Cancer.
9. Women in lactation and pregnancy

Pain assessment:

Visual Analogue Scale (VAS):

No pain ***Worst Possible Pain***

Method of preparation of platelet rich plasma:

Initially a venous puncture is done and specific volume of autologous bloodis collected from the patient (10ml of venous blood sample) into a tube containing an anticoagulant (sterile sodium citrated tubes) At 1800 rotations/minute (rpm) for 15 mins centrifugation takes place separating plasma from packed red blood cells. The top layer consists of plasma and bottom layer consists of red blood cell. The plasma is shifted to a sterile tube following which the packed cell layer is discarded. The second centrifugation takes place at 3500 rpm for 10 min which yields concentrated platelet layer after extraction of platelet poor plasma.

Injection technique:

Patient in supine position and palpate most tenderness point and marked using skin marker. The area was prepared and draped for injection. Initially,a local blockof lignocaine is infiltrated subcutaneously. Under proper aseptic precaution a 21-g needle is used to inject, 1ml platelet rich plasma is injected over the maximum tenderness while the remaining platelet rich plasma is injected into the surrounding tissue. (figure 1 and 2)

Follow Up:

Patients were followed up for 3 months. Follow ups was done at 1st, 2ndand 3rdmonth. Patients were assessed subjectively using the visual analogue score.

Findings

SPS software system was used to do statistical analysis by comparing the results.

Patients were analysed for pain relief subjectively at 1st 2nd and 3rdmonth post injection therapy and there pain is tabulated using visual analogue score (VAS) (pain score).

Table 1: Comparison of VAS with age groups in lateral epicondylitis:

VAS Score	Age Group				Total
	20-29	30-39	40-49	50-59	
Excellent	7 (100)	10 (66.6)	7 (70)	2 (25)	26 (65)
Good	0	5 (33.34)	3 (30)	6 (75)	14 (35)
Fair	0	0	0	0	0
Total	7 (100)	15 (100)	10 (100)	8 (100)	40 (100)
Chi sq	9.524		P value	0.023*	

Table 2: Comparison of VAS score with age in Plantar Fascitis:

VAS Score	Age Group				Total
	20-29	30-39	40-49	50-59	
Excellent	2 (100)	8 (100)	11 (55)	10 (100)	31 (77.5)
Good	0	0	9 (45)	0	9 (22.5)
Fair	0	0	0	0	0
Total	2 (100)	8 (100)	20 (100)	10 (100)	40 (100)
Chi sq	11.613		P value	0.009*	

*-Significant ($p<0.05$)

Mean Pain Score:

Pain score was assessed at the time of injection. The mean pain score of all the patients was 8.5. The mean pain score at 1,2,3 months was 4.825%, 3.3125%, and 1.935% respectively. When individually analyzed mean pain score for lateral epicondylitis at 0, 1,2,3 months was 8.55%, 4.725%, 3.25%, 1.9% respectively. Similarlymean pain score for plantar fasciitis at 0,1,2,3 months was 8.45%,4.925%,3.375%,1.925% respectively.

Table 3: Mean pain score:

Patient	Mean pain score at the time of injection	Mean pain score at 1stmonth	Mean pain score at 2ndmonth	Mean pain score at 3rdmonth
Total (80)	8.5%	4.825%	3.3125%	1.935%
Lateral epicondylitis(40)	8.55%	4.725%	3.25%	1.9%
Plantar fasciitis(40)	8.45%	4.925%	3.375%	1.925%

Result

The mean difference between in VAS scoring system at the time of presentation was 8.5%, and there was gradual and significant improvement in VAS scoring system of both lateral epicondylitis and plantar fasciitis. Which showed as 4.825% at 1st month, 3.3125% at 2nd month, and 1.935% at 3rd month respectively.

Discussion

The growing trend in using platelet rich plasma injection for condition like plantar fasciitis and lateral epicondylitis had significantly improved in last decade. The steep rise in use of platelet rich plasma is because of good functional outcome of this modality.

We have taken up this study to evaluate the efficacy of platelet rich plasma in lateral epicondylitis and plantar fasciitis. We selected a sample size of 80 patients who were suffering from lateral epicondylitis and plantar fasciitis. The number of patients were divided into 40(100%) for plantar fasciitis and 40(100%)for Lateral epicondylitis. Out of which the sex distribution which was attributed to lateral epicondylitis was 22 males (55%) and 18 females (45%) and plantar fasciitis was 15 males (37.5%) and 25 females(62.5%).

Comparison of VAS score at each age group for lateral epicondylitis had a significant difference in their functional outcome at the end of mean follow up period of 3 months. The p value was 0.023.Which was found to be significant.

Similarly comparison of VAS score at each group for plantar fasciitis had a significant difference at the end of mean follow up period of 3 months. The P value was 0.009.Which was found to be significant.

The comparison of these groups for lateral epicondylitis and plantar fasciitis at different age groups had shown significant difference in their outcome at the end of 3 months. Therefore usage of platelet rich plasma injection for lateral epicondylitis and plantar fasciitis has show significant outcome due to its healing properties.

The mean VAS score system shows significant difference in pain varying from time of injections till the end of 3rd month. Initial VAS score was (8.5%),at the end of one month(4.825%), two months(3.312%) and three months were (1.935%)respectively. This shows significant outcome of improvement in lateral epicondylitis and plantar fasciitis

In our study,there were certain limitations such as multiple scoring technique, volume of patient, and long term followup study needs to be done for knowing the better outcome of platelet rich plasma injection.

Conclusion

In conclusion, we consider that platelet rich plasma injection for lateral epicondylitis and plantar fasciitis hasserved as an effective tool in management of these conditions.The significant difference in P value in different age groups had shown a proportionate improvement due to platelet rich plasma injection in varying age groups. Hence this type of management decreases the progressiveness for surgical management of lateral epicondylitis and plantar fasciitis.

Abstract

Dislocations of the humerus shaft account for roughly 1% of all lacerations handled. The method of interconnecting nails reflects a newer strategy to the therapy of glenoid broken bones.The aim is to prospectively study the "functional outcome of antegrade intramedullary interlocking nailing in fracture shaft of humerus" at the Department Of Orthopaedics in Sree Balaji Medical College and Hospital chrompet Chennai. The recruitment period of this study shall be from March 2017 to February 2018 (12 months). The follow-up period shall be for a minimum period of 7 months (range: 7 to 19 months).Radiological union, practical outcome and problems have been evaluated. By the end of 6 months, the Union rate was 97.14 per cent. According to Rodriguez-Merchan EC, of the 35 patients evaluated, 17 had an outstanding functional rating, 14 had a good rating, 3 had a reasonable rating and 1 had a bad rating. There was 1 instance of non-union,1 case of superficial infection,1case of post-operative radial nerve palsy and 1 case of stiffness of shoulder. Unreamed glenoid interlocking nails are an efficient means of fixing severe humeral fractures.

Keywords- *Glenoid, orthopaedics, Dislocations, fractures, Glenoid broken bones.*

Introduction

Fractures of the humerus shaft account for approximately 1% of all fractures handled [1]. Previously, injuries in the humeral shaft were classified as fracture location, fragment pattern, associated soft tissue injury and bone quality. This fracture was addressed by a fixed reduction & casting with / without casting strengthening and by an open reduction & internal fixing using dynamics. Compression Many authors recorded the basic good outcome regarding the obsession of the compression plate [2,3,4], which is still regarded to be the gold standard for the informant therapy of acute humeral shaft fractures. Although plate fixation occurred in a high level of bonding, it includes comprehensive soft tissue extraction, significant injury to the radial nerve, and bad infatuation to the nerve.The bone of the osteoporotic. Many kinds of later flexible nails have been used [5,6]. The advantages of intramedullary nailing are restricted surgical visibility, stronger biomechanical obsession, restricted soft tissue disturbance, and early mobilization of neighboring joints..

The procedure of interlocking nailing speaks to the more up to date approach of the treatment of humeral breaks. Interlocking nailing additionally maintains a strategic distance from intricacies like absence of rotational control, movement of nail and prerequisite of strengthening bracing[7,8]. The Seidel nail was the main nail to be tried clinically. In the end a few nail frameworks advanced [3,7,9,10,11].The investigations distributed by Cox MA[7] and Crates J[10] association rates were 87.9% and 94.5% individually in antegrade interlocking nailing. Antegrade interlocking nailing has a higher pace of shoulder stiffness[7]. The undreamed intramedullary nail has its own particular hypothetical points of interest like taking out the odds of iatrogenic cracks, saving of cortical blood supply and disposing of the harm to rotator sleeve.The point of this examination was to assess the utilitarian result after antegrade undreamed interlocking nailing in break shaft of humerus, the association rate

and the reasons for poor result.

Materials and Method

The aim is to prospectively study the "functional outcome of antegrade intramedullary interlocking nailing in fracture shaft of humerus" at the Department Of Orthopaedics in Sree Balaji Medical College and Hospital chrompet Chennai. The recruitment period of this study shall be from March 2017 to February 2018 (12 months). The follow-up period shall be for a minimum period of 7 months (range: 7 to 19 months). Radiological union, functional outcome and complications were assessed.Every one of the nails were embedded antegrade through a passage indicate simply average more noteworthy tuberosity. Reaming was not done to stay away from harm to spiral nerve and to diminish harm to the rotator sleeve. Every one of these breaks were fixed utilizing a widespread humeral nail of 6.7 mm width and of proper length determined intraoperatively. Distal locking was done anteroposteriorly by freehand procedure utilizing picture increase. Proximal locking was finished utilizing the dance. Rotator sleeve was fixed in all cases.In 35 patients the worked appendage was immobilized for 2 days and dynamic helped shoulder assembly was begun from third postoperative day.We followed up 35 patients for least of year and a half postoperatively.Radiological association was characterized as the nearness of spanning callus of there cortices in two symmetrical views(7). Deferred association was characterized as disappointment of crack association to happen by 4 months. Non association was characterized as disappointment of crack association by a half year or proof of obsession failure(3).The useful result was surveyed utilizing Rodriguez-Merchan EC criteria(10). The scope of developments was estimated by a solitary spectator utilizing a goniometer.

Grading	**Elbow Rom**	**Shoulder Rom**	**Pain**	**Disability**
Excellent	Extention 5 Flexion 130	Full Rom	None	None
Good	Extention 15 Flexion 120	<10% Loss Of Total Rom	Occasional	Minimum
Fair	Extension 30 Flexion 110	10-30% Loss	With Activity	Moderate
Poor	Extension 40 Flexion 90	>30% Loss	Variable	Severe

The stiffness of the shoulder was described in accordance with the requirements of Benjamin Shaffer(12) and Douglas(13).

History of damage or dull injury or medical procedure with beginning of firmness that practically confines the utilization of furthest point.

2) An assessment with constrained with restricted shoulder movement a particular way, multidirectional or all around.

3) Radiograph with ordinary cartilaginous joint space.

4) Range of movement of shoulder that was under 90% of the range when unaffected contralateral shoulder.

Findings and Discussions

Findings of our study (2017-2018) can be summarized as follows:

(a) Our male to female ratio, in the sampled age group of 31 to 55 years, was 5:2. Hence there was a clear male dominance in the sampled total of n=35 patients. On critical analysis of this, while the male preponderance dropped when we move up the age scale, many female recruits had joined the study beyond age 46 to 55 years. Thus this bimodal model is as distinctly reflected in our

study too.

(b) Right sided injuries predominated at 77.14% (n=27) in our study.

(c) In the younger age group of 31 to 45 RTA was the predominant mode of injury. As we move up the age scale from 46 to 55 years, trivial fall constituted the majority of recruits, who also happened to be females.

(d) As per the 2018 AO-OTA adult diaphyseal classification system adopted in our study, type 12 B 3 constituted 40% (n=14) cases, followed closely by type 12 B 2 at 31.42 % (n=11).

(e) Our average injury to surgery time lapse was at 5.9 days (range : 0 to 11 days). From surgery to discharge our time of hospitalization was at 14.7 days (range : 8 to 19 days)

(f) 34.29 % (n=12) cases in our series of 35 cases, had an associated skeletal injury.

(g) Our average time for bone union in 97.14% (n=34) cases was 16.8 weeks (range : 12 to 21 weeks). We encountered 2.86% (n = 1) cases of non-union in a 55 year old female, who had hysterectomy done at age of 38 years for DUB at 6 months and was appropriately subjected to LCP with bone grafting which united in 5.3 months. This particular case type 12 B 3 AO-OTA grade at index fixation.

(h) Of the total complications that we encountered, 8.58 % (n=3) were minor complications like; superficial wound infection, shoulder impingement and radial nerve palsy. All resolved without affecting the final clinical or functional outcome. We did encounter a 2.86% (n = 1) of major complications of non-union, as described earlier and resolved with resurgery.

(i) Our functional and clinical outcomes by the rodriguez-merchan criteria was at 88.56 % (n=31) good to excellent, 8.56% (n = 3) of fair and 2.86 % (n=1) of poor result.

(j) The poor outcome (n = 1) as already detailed underwent plate osteo-synthesis with bone grafting and achieved union at 5.3 months post re-surgery and had a fair outcome as per rodriguez-merchan criteria.

Conclusions

Unreamed humeral interlocking nails are an efficient means of fixing severe humeral fractures.

To Study Clinical Manifestaion of Hyperandrogenism in Adult Male with Acne

Paavai S[1], Thomas Jayakar[2]

[1]Student, [2]Professor, Department of DVL, SreeBalaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

To study clinical manifestation of hyper and rogenism in adult male with acne.30 patients were included in the study. Informed consent was obtained from all patients. we were looking for clinical manifestation of hyperandrogenism in male above 18 years of age. Among 30 patients 21 patients had acanthosis nigricans, 20 had alopecia, 22 had seborrhea. To conclude, male patients above 18 years of age with acne were presented with clinical manifestation of hyperandrogenism.

Keywords- *Clinical Manifestation, Seborrhea*

Introduction

Acne is more a disease of late childhood and adolescence, despite the reality that it may continue, recur or start in adulthood[1-5]. Although acne has been recorded in some of the more healthy kids as young as 8 years of age and even sooner in those with unusual virilization or precocious puberty, most instances happen between 14 and 19 years of age.Four central point assume a significant job in the pathogenesis of skin break out vulgaris[6-8]: (1). Hyperplasia of sebaceous organs, (2). Expanded sebum generation, (3). Hyperkeratinization of pilosebaceous conduits and (4). Propionibacterium acnes colonization and periglandular dermal aggravation[9-12].

Androgens animate the creation of sebum, the development of the sebaceous organs and hyperkeratinization. Clinical manifestations of hyperandrogenism are acanthosis nigricans, alopecia, seborrhea.

Materials and Method

Study Design: Cross sectional study.

Study Area: Skin Outpatient Department, Sree BalajiMedical College and Hospital

Study Population: All male patients ageabove 18 attending skin OPD, who are clinically diagnosed with acne vulgaris.

Study Method: Investigational study.

sample size : 30

Inclusion criteria:

1. Males aged above 18 years with acne 2. Consenting for thestudy.

3. 3. Good health in particular 4. No usual consumption of drugs (except for acne treatment)

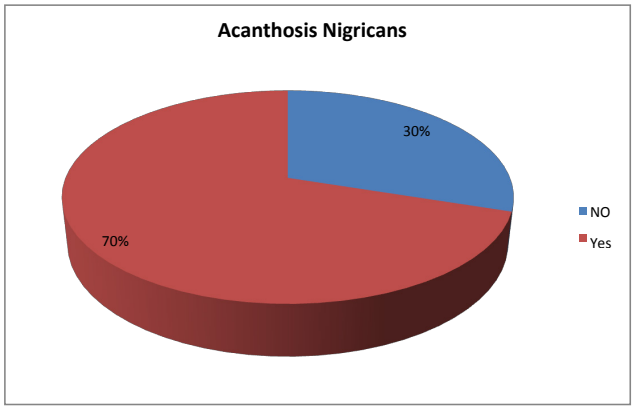
4. 5. consenting forinvestigation

Exclusion criteria:

1. Known case of Diabetes Mellitus Type 1 or Type2

2. Patients impacted by other dermatological illnesses or therapy of other endocrine diseases

3. Not consenting for thestudy

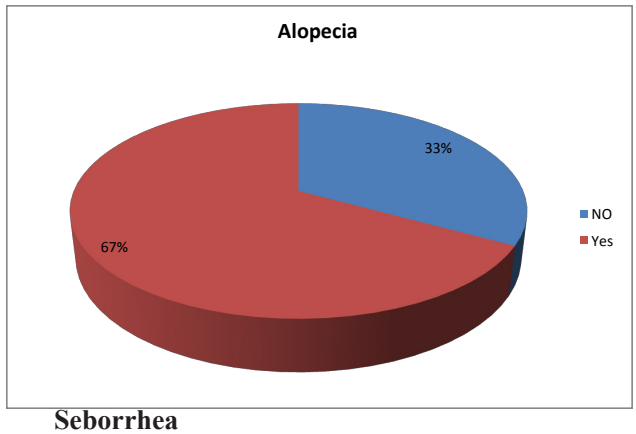


4. Patient not willing for the investigations 5. Patients receiving psychotropicdrugs

Findings

ACANTHOSIS NIGRICANS (N=30)

Acanthosis nigricansis Described by dark, velvety discoloration of body folds and creases. The impacted skin may become thicker.Thesewere observed in 21 patients which are around 70%, absent in 9 patients which were30%.



Acanthosis_Nigricans	Frequency	Percentage
NO	9	30.0%
Yes	21	70.0%
Total	30	100.0%

Alopecia

Alopecia It can be located at the front and the top of the head as in the prevalent masculine pattern of baldness. It might be patchy, as in a disease called alopecia aerata..In ourstudy 66.7%, and 33.3% Patients had noalopecia.

Alopecia	Frequency	Percentage
NO	10	33.3%
Yes	20	66.7%
Total	30	100.0%

Seborrhea

Chronic autoimmune disease of the skin, defined by aggregation of scales (fatty). Itchy yellow crusted plaques may be present. Seborrhea has a prevalent effect on the scalp. Other locations include the face, ears, eyebrows and eyelids, umbilical, and genitalia..In our 22 patients (73.3%) had seborrhea and 8 patients (26.7) seborrhea isabsent.

Seborrhea	Frequency	Percentage
NO	8	26.7%
Yes	22	73.3%
Total	30	100.0%

Discussion

It is observed that hyperandrogenism occurs in men. The manifestations are usually in the form of patterned alopecia, Acanthosis nigricans, and acne. The name APAAN (acne, patterned alopecia, acanthosis nigricans) syndrome is suggested for this presentation in men

The pathogenetic procedure of skin inflammation seems to start with androgenic hormonal incitement of pilosebaceous units, the thickness of pilosebaceous units is most noteworthy on the face and scalp (400 – 800 organs/cm2) and least on the furthest points (50 organs/cm2). Before the degrees of flowing androgens increments, pilosebaceous units comprise of delicate, fine, unpigmented vellus hair and little sebaceous organs. Circulating androgens bind to androgen receptors that are localizedto thebasallayeroftheouterroot–sheathkeratinocytesofthehair follicle and to sebaceous glands.“In sexualareas, such as the axilla, pilosebaceous units begin to differentiate into large terminal hair follicles. In sebaceous areas, such as the face, pilosebaceous units become sebaceous follicles while the hair remains vellus

. Without circulating androgens, the sebaceous glands remain small. The gonads and adrenals produce the majority of circulating androgens. During the period of prepubertal, adrenal androgens appear to be the major determinant of sebaceous gland activity." In the two young men and young ladies, plasma groupings of the adrenal androgens dihydroepiandrosterone (DHEA) and dihydroepiandrosterone sulfate (DHEAS)'' regularly start to increment at adrenarche, or adrenal adolescence, which commonly happens at about age 8 years, and keep on ascending through pubescence. Conditions like adrenal hyperplasia or polycystic ovary malady are related with hyperandrogenism.

Conclusion

Among 30 patients 21 patients had acanthosis nigricans, 20 had alopecia, 22 had seborrhea. To conclude, male patients above 18 years of age with acne were presented with clinical manifestation of hyperandrogenism.

Malignancy in Solitary Thyroid Nodules: A Study on Incidence & Evaluation of Risk

Padma V[1] Ramakrishnan C[1]

[1]Professor, Department of General Medicine, SreeBalaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Thyroid swellings or nodule can present as both mutlinodular and solitary nodular goitre. A discrete swelling in an otherwise impalpable gland is termed as solitary nodule of thyroid.Prevalence ranges from 4% to 10% in general adult and 0.2 to 1.5% in children.The study was done SreeBalaji Medical College & Hospital from June 2017 to October 2018 in the department of Generalsurgery.incidence of carcinoma in solitary nodular goitre (6.66%) is more than multinodular goitre (20%).the peak age incidence of solitary nodular goitre is 30-40 years.It is found from this sequence that 6.66 per cent of the solitary thyroid nodules are benign with females.

***Key words**: Thyroid Nodules, Evaluation, Risk.*

Introduction

Thyroid nodule is a palpable clinically orradiologicallyover the gland. There is a elevated risk of STN malignancy compared to various nodules. So, for this, the solitary thyroid nodules must be handled with elevated suspicion.[1-3] Solitary thyroid nodules (STNs) happen in 4-7% of the population with thyroid swelling. They are more prevalent in women (6.4%) than men.(1.5%).Preoperative treatment of thyroid nodules to distinguish benign from malignant nodules is essential to prevent unnecessary surgery and associated issues.[4-7]

Material and Method

A survey was conducted on 60 patients admitted and operated for the SreeBalaji Medical College solitary thyroid nodule during the period from June 2017 to October 2018 in the Department of General Operations.. All the patients underwent both FNAC & post-operative Histopathology for the final diagnosis. It is prospective study.[3-5]

Corresponding Author:
Padma V
Professor, Department of General medicine, SreeBalaji Medical College & Hospital,Bharath Institute of Higher Education and Research, AgharamRoad,Selaiyur, Chennai-73. E-mail.padmaramesh86@yahoo.com

Findings

In our research of 60 patients, 7 were male and 53 were female. Solitary thyroid Nodule noted in 15 instances (Male 1-Female 14) Multinodular goitre in 45 instances (Male-6, Female-39).The incidence of SNG & MNG in malr& female have been shown in table-1. The age incidence of SNG & MNG has been shown in table 2. [11-12] incidence of malignancy in SNG in shown in table 3

Table-1: Sex Incidence

Sex	Solitary Nodular Goiter	Multinodular Goitre
Female	14	39
Male	1	6

Table-2: Age Incidence

Age Limit	Solitary Nodular Goitre	Multinodular Goitre
21-30	0	2
31-40	6	14
41-50	4	15
51-60	4	25
61-70	1	4

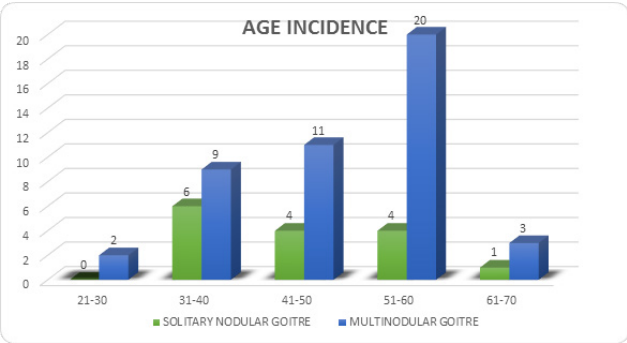

Fig 2: Age Incidence

Table- 3: Incidence of Malignancy in SNG

Type of Maliganancy	Solitary Nodular Goitre
Papillary Carcinoma	1
Follicular Carcinoma	0
Medullary Carcinoma	0

Table-4: Percentage of Maliganancy in SNG & MNG

	Solitary Nodular Goitre	Multinodular Goitre
Percentage of Maliganancy	6.66%	20%

Discussion

FNAC is anything but difficult to perform and safe with least confusion rate. Care must be taken to get a sufficient example most creators prescribe between 3 to 6 goals is required. Good example contains at any rate 6 gatherings of 10 to 15 very much protected cells. They are sorted by their appearance to generous, vague or suspicious and harmful. The conclusion of papillary thyroid carcinoma by FNAC based on trademark atomic changes is solid and precise with affectability and particularity both moving toward 100%.

Oliver H beechar*set al* stated that goitres were frequently seen in women however, the incidence of carcinoma in man is greater than in women. In our study among 60 cases, the incidence of carcinoma in Male (1.6%) is greater than in female (15%). This is in accordance with various published reports. Fenn A.S *et al*1976 found that there was no great sex predominance in the incidence of malignancy. [20]According to Dr. C. Suryaprakash Rao et al, – Andhra Pradhesh – Adenoma thyroid was the most prevalent benign lesion, and papillary carcinoma was the most prevalent malevolent lesion.Prof. R.L Gupta Delhi analyses 370 cases of solitary nodule. In his study, about 38.7%. OF HPE report was different from FNAC. His study showed the fact that FNAC is not full proof and surgery with HPE report remain the only method of confirmation.

As Per Hossein gharib and papini et al. [8] nodule size does not predict pathology. The following characteristics have been noted to be correlated with an enhanced danger of disease in the thyroid nodule.

H/o of childhood head and neck radiation

Family H/o of PTC, MTC, or MEN 2 (multiple endocrine neoplasia)

Age 20 or >70 yrs

Male sex

Abnormal cervical adenopathy

Fixed nodule

Vocal cord paralysis.

They concluded that risk of cancer is not significantly higher for solitary nodular than for glands with multiple nodules. But in our study the incidence of carcinoma in solitary nodular goitre (6.66%) is more than multinodular goitre (20%).

According to koh and cole WH *et al,* the incidence of carcinoma in MNG Varies from 7% to 17% [11]. In our study the incidence of carcinoma in MNG is 20%.

Conclusion

Results have been contrasted and available writing has been disclosed beforehand. Singular thyroid knobs have been seen in highly minor cases of cautious confirmations with the age frequency of the third century. There are no instances under 10 years of age. Papillary carcinoma is the most common malignancies observed, accounting for 80% of all malignancies. Further reviews are anticipated to explore the rationale for this suitable cause and prevention for papillary carcinoma

Antimicrobial Activity and Surface Characterization of a Denture Relining Material Coated with *Reynoutria Elliptica* Extract

Song-Yi Yang[1], Min-Kyung Kang[2]

[1]Department and Research Institute of Dental Biomaterials and Bioengineering, Yonsei University College of Dentistry, 50-1 Yonsei-ro, Seodaemun-gu, Seoul, 03722, Republic of Korea, [2]Department of Dental Hygiene, Hanseo University, 46 Hanseo 1-ro, Haemi-myun, Seosan-si, Chungcheongnam-do, 31963, Republic of Korea

Abstract

Background/Objectives: The purpose of this study was to evaluate the antimicrobial effect and surface characterization of a denture relining material coated with *Reynoutria elliptica* extract.

Methods/Statistical Analysis: A denture relining disk was coated with coating resin containing *Reynoutria elliptica* extract. Extracts of coated specimens were analyzed to determine polyphenol content, and also incubated with *S. mutans* and *C. albicans* for 48 h. The coated surfaces were evaluated for microhardness, contact angle, and color characteristics. Cell viability was confirmed by performing MTT assay according to ISO 10993-5. All data were checked with one-way ANOVA followed by the Tukey's multiple comparison test (p=0.05).

Findings: The antimicrobial activity of experimental groups was significantly higher than control group on both *S. mutans* and *C. albicans*. Extracts analysis revealed that the level of polyphenol released from the experimental groups increased with increasing proportion of added *Reynoutria elliptica* extract. The surface microhardness, $\triangle E^*$ values, and cell viability were not significantly different between experimental groups and control group. The contact angle test revealed that the experimental groups exhibited more hydrophilic surface than the control group.

Improvements/Applications: Coating materials containing *Reynoutria elliptica* extract can be used as antimicrobial dental materials, with no deterioration of surface characteristics and biocompatibility.

Keywords:*Antimicrobial activity, Reynoutria elliptica extract, Coating resin, Microhardness, Contact angle, Cell viability*

Introduction

The adherence of pathogenic microorganisms on removable denture is associated to diseases like denture stomatitis and aspiration pneumonia[1]. Especially, microorganisms like *Candida albicans* and *Streptococcus mutans*, which easily adhere and form biofilms on liner material such as poly(methyl methacrylate) (PMMA) acrylic resin and poly (ethyl methacrylate) (PEMA)[2].

Cleaning of dentures and oral health care are effective methods for assuring oral hygiene and healthful living, and are especially effective in inhibiting denture stomatitis and aspiration pneumonia[3]. Furthermore, mechanical washing of denture surfaces is effective in defensing infections[4]. However, from the perspective of denture wears, mechanical cleaning can present a physical handicap for keeping dentures clean without roughening the surface[5-6].

Applying the polymer coating to the denture material have proved beneficial for stain resistance, mechanical

and chemical properties[7]. Previous studies has been focused on the invention of antimicrobial coating materials or the synthesis of chemicals with antimicrobial activity[8-9]. Modification of denture materials to enhance their antimicrobial activity could reduce colonization by pathogenic oral microorganisms[10-11].

*Reynoutria elliptica*extract has high antimicrobial activity. It has shown potent inhibition of *Streptococcus mutans*, equivalent to that of *Helicobacter pylori*[12-13]. In addition, *Reynoutria elliptica* extract have been used in combination with numerous products for antimicrobial applications. *Streptococcus mutans* plays asignificant role as a colonizer in denture plaque formation and is actively attached to the acrylic resin surface. *Candida albicans* is also found in denture plaque[3, 14].

Modification of denture materials or surface is effective in preventing oral diseases, including denture stomatitis. In some case, denture base resin combined with antimicrobial agents like chlorhexidine was used. However, the release of these agents has cytotoxic effects on human gingival fibroblast[15].

In this study, we have tried to develop denture coating materials containing *Reynoutria elliptica* extract as a natural material for preventing stomatitis from oral pathogenic microorganisms. The aim of this study was to evaluate its antimicrobial effect against two types of oral microorganisms and characterize the surface of denture relining material coated with *Reynoutria elliptica* extract. The null hypotheses were that the application of a coating material containing *Reynoutria elliptica* extract would not produce significant differences in the antimicrobial activity and surface characterizations compared to the application of a coating resin without *Reynoutria elliptica* extract.

Method

A mold, 1.0 ± 0.1 mm in thickness and 10.0 ± 0.1 mm in diameter, was filled with the denture relining material (Tokuyama Rebase II, TOKUYAMA, Japan). The denture relining material in the mold was cured as per the manufacturer's recommendation. Then, the cured denture relining disk was carefully separated from the mold.

Reynoutria elliptica was obtained from an herbal shop in Korea. 500 g of *Reynoutria elliptica* was pulverized, added to 5 L of 70% methanol solution, and extracted at25 °C for 48 h. This extract was collected through filter paper #2 (Whatman, UK). The filtered extract was evaporated and concentrated on a vacuum evaporator (ETELA, Japan), and was prepared in powder form using a freeze dryer device (Ilshin Lab, Korea).

To make the experimental coating resins, a coating solution (Plaquit, Dreve, Germany) containing *Reynoutria elliptica* extract powder was prepared as the following groups (weight of *Reynoutria elliptica* extract powder/volume of coating resins): 200 μg/mL (RE 200), 400 μg /mL (RE 400), 600 μg /mL (RE 600), and control group (RE 0).

10 μL of experimental coating resins were spread on the cured denture relining disk and polymerized for 10 min using the Visio Beta Vario unit (3M ESPE, USA).

To confirm the antimicrobial activity against two types of oral microorganisms, the *Streptococcus mutans* (ATCC 25175) and *Candida albicans* (ATCC 10231) were selected as antimicrobial strains. According to the ISO 10993-12[16], the coated experimental specimen was extracted using PBS (Gibco, Life Technologies, Roskilde, Denmark) for 24 h at 37 ℃. After extraction, the extracts were mixed with the bacterial culture fluid at 1:1 ratio and incubating at 37 °C for 48 h. Antimicrobial activity was estimated based on the OD values in each well using an ELISA reader (Epoch, BioTeck, Winooski, VT, USA) at 600 nm.

To confirm the polyphenol contents of extracts, the test samples were extracted using distilled water (DW) for 7 days at 37 ℃ according to ISO 10993-12[16]. 50 μL of the extracts solution and 50 μL of Folin Denis reagent were added to 650 μL of DW, and allowed to react at 25 °C for 3 min. 100 μL of 10% Na_2CO_3 solution and 150 μL of DW were added to the reacted solution to make the final volume to 1 mL. These pretreated extracts were kept for 1 h at 37 °C in dark environment. The absorbance was subsequently analyzed by using a UV/VIS Spectrometer (X-ma 1200 Spectrophotometer, Human, Korea) at 725 nm.

A microhardness tester (DMH-2, Matsuzawa Seiki Co., Tokyo, Japan) was used to measure the Vickers Hardness Number (VHN) of the coated surface. Indentations were made by using a diamond indenter with 0.09 MPa load for 20 s of dwell time.

Contact angle was determinedwith a contact angle measuring device (Phoenix 300, SEO, Korea). A micro syringe was used to place a 5 μL droplet of DW on

the materials' surfaces, and the contact angles were examined after 3 s.

The color of the coated experimental specimens was evaluated using a spectrophotometer (Lamba20, Perkin Elmer, Orwalk, CT, USA). The color difference (ΔE) was calculated by following equation $\Delta E^* = \sqrt{(\Delta L^*)^2 + (\Delta a^*)^2 + (\Delta b^*)^2}$ to compare the values before and after the coating treatment.

To confirm the cell viability, test samples were extracted in cell culture medium with serum for 24 h at 37 ℃. MTT assay was performed according to ISO 10993-5[17]. The L929 cells (1×10^5 cells/mL) were seeded into a 96-well plate (SPL, Pochen-Si, Gyeonggi-Do, Korea) and incubated in a humidified incubator at 37 ℃ in 5% CO_2 for 26 h. 100 μL sample extracts were dispensed on to the cell, and incubated for one day. The extracts solution was removed and refilled with 50 μL of MTT solution. After incubation of the cell with MTT solution for 3 h, the MTT solution was removed and each well was filled with 100 μL isopropanol. The absorbance was detectedwith an ELISA reader (Epoch, BioTek, Winooski, VT, USA) at 570 nm. Cell viability was estimated using the following equation: Cell viability (%) = ($OD_{\text{treated cell}}/OD_{\text{negative cell}}$) × 100

All test results were checked using one-way ANOVA (IBM SPSS statistics 23, IBM Co., USA) followed by Tukey's multiple comparison test. All the significant levels were fixed at 0.05.

Result and Discussion

As shown in [Table 1], the antimicrobial activity of the experimental groups showed a significant effect on both *Streptococcus mutans* and *Candida albicans* compared to the control group ($p<0.05$). The level of polyphenol released from the experimental coating materials increased as the proportion of added *Reynoutria elliptica* extract increased ($p<0.05$).

The surface microhardness and color characteristics between the experimental groups and the control group were not significantly different ($p>0.05$). The contact angles were not significantly different between RE 200, RE 400, and RE 600 ($p>0.05$). However, these experimental groups exhibited a more hydrophilic surface than that of the control group ($p<0.05$). The results of the cell viability test showed that there was no significant difference between the experimental groups and the control group ($p>0.05$).

Table 1. Microhardness, contact angle, color characteristics, polyphenol content, antimicrobial activity, and cell viability for each group (mean ± S.D.)

Group		RE 0	RE 200	RE 400	RE 600
Microhardness(VHN)		25.5 ± 1.3a	22.3 ± 3.1a	25.6 ± 4.4a	25.6 ± 2.1a
Contact angle(°)		73.5 ± 5.4a	65.2 ± 7.1b	67.0 ± 7.1b	64.0 ± 3.2b
Color (△E*)		0.6 ± 0.3a	0.5 ± 0.2a	0.6 ±0.3a	0.6 ± 0.2a
Polyphenol content (μg/mL)		–	6.7 ± 2.8a	42.1 ± 3.9b	195.0 ± 7.2c
Antimicrobial activity (OD)	S. mutans	0.8 ± 0.2a	0.5 ± 0.1b	0.5 ± 0.1b	0.4 ± 0.1b
	C. albicans	0.9 ± 0.0a	0.7 ± 0.2b	0.8 ± 0.2b	0.7 ± 0.3b
Cell viability (%)		107.0 ± 4.2a	109.2 ± 7.6a	108.7 ± 2.8a	116.6 ± 1.4a

*The same lowercase letter implies no difference in values between groups ($p>0.05$).

Discussion

In our study, the effects of a denture relining material coated with a coating resin containing *Reynoutria elliptica* extract on the microbial activity, and mechanical and physicochemical properties were evaluated. Most plant extracts have been used for various purposes because of their proven safety. Additionally, it is currently being used as an ingredient in oral hygiene materials[13].

The inhibition of microbial activity indicates a reduction in reproduction and pathogenesis. Herein, *Streptococcus mutans* and *Candida albicans*, which are the known colonizers of denture plaque and strongly adhere to denture base materials, are evaluated[3, 14]. In this study, the experimental groups show significant antimicrobial effects on both *Streptococcus mutans* and *Candida albicans* compared to the control group ($p<0.05$), as listed in [Table 1]. These results indicate that a denture relining material coated with coating resins containing *Reynoutria elliptica* extract inhibits the activity of oral pathogenic microorganisms. Antimicrobial activity results show an increasing tendency with an increasing mass fraction of the *Reynoutria elliptica* extract, which results from the antimicrobial activity of the *Reynoutria elliptica* extract that increases with an increase in the polyphenol content. Phenolic metabolites are widely distributed in plants and exhibit various biological activities such as antimicrobial effects. Antimicrobial agents are also generally known to be related to phenolic compounds[18]. Therefore, the released *Reynoutria elliptica* extract from the coating material containing phenolic compounds may contribute to the inhibition of microbial activity.

Surface hardness is related to wear resistance and is the most common mechanical property indicator for prosthetic materials[19]. Our results imply that *Reynoutria elliptica* extract components do not have any effect on the surface hardness of the coating resin.

A major factor in the retention of a denture is the force associated with the wetting of the denture and oral mucosal. It has been recommended that enhancements in denture retention can be obtained by making the surface more wettable[20]. Thus, wetting measurements of a surface can provide an implication of the degree of denture retention. The contact angles for RE 200, RE 400, and RE 600 are not significantly different. However, the experimental groups exhibit more hydrophilic surfaces than the control group ($p<0.05$). It is possible that the components of *Reynoutria elliptica* extract improve the wettability of the coating resin.

The spectrophotometer used in our study can speedily measure the intensity of transmitted light reflected by the specimens as well as chrominance, with high accuracy and reproducibility[7]. The surface color characteristics between the experimental and control groups are not significantly different ($p>0.05$). Therefore, it was confirmed that the *Reynoutria elliptica* extract components do not exhibit any effects on the color of the coating resin surface.

Large areas of the oral mucosa can be exposed to toxic or irritating ingredients while wearing dentures[21]. Cell viability tests are studied to estimate the biological response of mammalian cells using *in vitro* biological parameters[17]. The results of the cell viability test show no significant difference between the experimental and control groups ($p>0.05$). This implies that the *Reynoutria elliptica* extract components do not have any side effect on the cell viability.

Based on the above results, we partially reject the null hypothesis stating that the application of the coating material containing *Reynoutria elliptica* extract does not result in significant differences in the antimicrobial activity and surface characterizations compared to the group without *Reynoutria elliptica* extract.

In this study, the antimicrobial effect of the coating resin containing *Reynoutria elliptica* on the surface of denture relining material against *Streptococcus mutans* and *Candida albicans* lasts for few days. However, it is necessary to investigate the long-term antimicrobial action, as well as the mechanical and physiochemical properties of this new material. Nevertheless, based on the above results, coating resins containing *Reynoutria elliptica* extract can be used as new dental materials with antimicrobial effects by employing natural extracts.

Conclusion

Denture relining material coated with coating resin containing *Reynoutria elliptica* extract showed antimicrobial effect against two types of oral microorganisms, namely, *Streptococcus mutans* and *Candida albicans*, with no deterioration of surface microhardness, color characteristics, and biocompatibility. Wettability was improved by introducing *Reynoutria elliptica* extract. Finally, the addition of *Reynoutria elliptica* extract, used in small

amount of 200 μg have minor influence on polyphenol release profiles of coating resin containing *Reynoutria elliptica* extract, but still sufficient to conduce the antimicrobial dental material with no negative side effects on biocompatibility.

The Effect of Simulation-based SBAR Education Programs of Nursing Students

Min-Jeong Chae

Assistant Professor, Chosun Nursing College, 309-2, Pilmun-daero, Dong-gu, Gwangju, Korea

Abstract

Background: The aim of this study was to analyze the effects of an education that uses simulation-based SBAR on nursing students' communication clarity, self-leadership, patient safety attitudes and safety care performance.

Method:The research was based on a pre-post design with a nonequivalent control group. Sixty students attending the clinical nursing practice course at S Nursing College in South Korea participated in the study. The experimental group consisting of 30 participants (n=30) underwent a simulation-based SBAR education program, which included a 60-minute lecture and a 120-minute SBAR practice. To analyze the program's effects, paired sample t-test and t-test analyses were performed.

Findings: As a result, after the program, the intervention group showed a significant increase in communications clarity scores (t=-2.49, p=0.020), self-leadership scores (t=11.75, p=0.001), patient safety attitude scores (t=5.12, p=.027), and safety care performance scores (t=7.85, p=0.007) compared with the control group. Therefore, it can be concluded that the application of the SBAR program education can reduce various conflicts caused by communication errors and contribute to reducing patient safety problems.

Applications: In addition, the findings suggest that training nurses in standardized communication skills and developing and using structured checklists are required to ensure patient safety.

Introduction

Recently, the quality of medical care for patients has increased because of developments in the medical field. The World Health Organization (WHO) has shared the outcomes of the Patient Safety 2030 report, highlighting the importance of patient safety and the need for international cooperation, with particular emphasis on improving health care to improve patient safety and quality of care[1]. According to the Joint Commission International (JCI), "…effective communication between health care providers, patients and their families is essential for patient safety and quality care[2]." Errors in medical orders and test results include problems caused by incorrect letters, telephone calls, mispronounced words or phrases, hospital noise, unfamiliar drug names, and medical terminology unfamiliar to patients and fellow caregivers[3]. In particular, improper communication can lead to erroneous operations, delays in treatment, patient falls, and drug accidents. According to a 2016 study, in the several preceding years, communication failures at US medical institutions resulted in many deaths and severe financial costs[4].

To reduce communication problems, the JCI recommends that health service providers use standardized tools. Today, many medical institutions use SBAR. In SBAR, S, or situation, reports the name, department, patient's name, and current problem faced by the person reporting the situation. B, or background, describes the patient's background, such as their diagnosis, date of their admission to the hospital, and medical history. A, or assessment, presents an

Email: minjung0960@hanmail.net

assessment of the patient's symptoms, vital signs, medications, and status of their oxygen therapy. Finally, R, or recommendation, provides a way for healthcare providers to follow up on patient problems[5]. SBAR ensures that patient information is fully exchanged between healthcare providers, which are essential for ensuring that quality of medical care is kept up by maintaining patient safety and continuity of medical treatment[6]. According to the survey standard proposed by the Korean Institute for Healthcare Accreditation, medical institutions must be provided with regulations for accurate communication between medical personnel, and it is reported that they are increasingly interested[7].

According to a recent study in South Korea, Nursing students often have difficulty in reporting patient conditions because they found it difficult to apply theoretical knowledge in practice and communication. Despite having enough clinical data, the students lacked the capacity to transmit the information effectively, leading to the communication issues[8-9]. SBAR techniques provide an efficient way of communicating, as they make minimal patient information concise and easy to communicate[10]. Therefore, it is very important that nursing students have effective communication skills, and they need to undergo practical training courses to develop such abilities [9].In South Korea, research on nurses' methods, efficiency, conversation contents, and tool development were conducted[11]. However, South Korea is still early in the process of introducing SBAR communications, and there are not enough studies to confirm the effectiveness of the method.

Nursing students often experience stress because they are unable to express their opinions early in their careers after graduation. Their stress can also be attributed to poor communication skills, which negatively affect their performance and create problems at work [12]. To solve this problem, nurses need to communicate in a standardized way and be able to assert themselves, or express their opinions appropriately. Their lack of self-assertion makes effective communication and cooperation difficult for both the nurses and medical service providers[13]. These problems may affect patient safety, so it is necessary to develop their communication by including relevant skills in the curriculum [14]. Simulation training has been reported to be more effective for improving student participation and nursing interventions than observation-based practices that were developed from clinical backgrounds. Trainings related to communication education include role play, simulation training using SBAR techniques, debriefing, and nursing record writing[15]. Accordingly, it is necessary to apply SBAR techniques in trainings at nursing colleges, so that medical professionals can improve their communications skills and become experienced in problem-solving processes.

Method

The participants were 60 senior nursing students enrolled in S nursing college from G city. Survey was conducted with subject group of 60 nursing student living along in Southern cities S and from June 1 to 30, 2018.

The communication clarity measurement tool, which was originally developed by[16] and modified by [8], was used to measure communication clarity. To measure self-leadership, we used a version of the self-leadership scale developed by Manz[17] and modified and supplemented by Kyung-Hee Cho [18]. attitude toward patient safety and safety care performance tools were developed by Madigosky et al. [19]. Jung Hye Park and MyungHwaPark[20] modified and supplemented the tools.

To develop the scenario, the clinical scenarios used by the Laerdal Medical Corporation and the National League for Nursing were revised, and SBAR components such as patient's symptoms, clinical results, and doctor's prescriptions were included. The experiment group was provided with SBAR theory education, practice, and simulation process steps. The SBAR theory education was based on the contents included in the Institute for Healthcare Improvement's (IHI) SBAR Toolkit and SBAR Training Scenarios tools [21]. To help students understand SBAR, we watched videos and acted out roleplaying scenarios to confirm the importance of communication. The control group was given handouts that contained the basic communication contents required for patient safety, and they then autonomously learned it and performed the requirements as a simulation process step. The process of application by the experimental and control groups is as follows.

The experimental group also underwent SBAR lectures for 60 minutes and practice for 120 minutes. The control group was provided with self-learning modules that would take about 60 minutes to complete. Later, they were given a basic information book on patient safety, and they would also undergo a group discussion and presentation module for 120 minutes.

The collected data used SPSS/win 20.0 Program. To test the hypotheses, the differences in variables before and after the intervention in each group was analyzed using paired t-test and differences of dependent variables between two groups after the intervention were analyzed with a t-test .

Result and Discussion

1. Homogeneity of General Characteristics, Dependent Variables

A total of 60 participants, 30 in intervention group and 30 in control group and the results are shown in [Table 1, Table 2].

Table1. Homogeneity Test of General Characteristics between Two Group

Variables N (%)		**Int. (n=30)**	**Cont. (n=30)**	**χ^2**	**p**
		N (%)			
Gender	Male	6 (20.0%)	8 (26.7%)	.22	.728
	Female	24 (80.0%)	22 (73.3%)		
Age	22 years old	4 (13.4%)	3 (10.0%)	3.74	.152
	23 years old	10 (33.3%)	8 (26.7%)		
	>24 years old	16 (53.3%)	19 (63.3%)		
Religion	Yes	23 (76.7%)	21 (70.0%)	.35	.761
	No	7 (23.3%)	9 (30.0%)		
Nursing Satisfaction	Satisfied	22 (73.3%)	18 (60.0%)	.29	.733
	Usual	8 (26.7%)	12 (40.0%)		

The experimental group participating in the simulation based SBAR training program compared to control group in communication clarity(=-2.49, p=.020), self-leadership(t=11.75, p=.001), attitude of patient safety(t=5.12, p=.027), safety care performance (t=7.85, p=.007) were significantly higher.

Table 2. Differences of the Outcome Variables between the Two Group

Discussion

The aim of this study was to examine the effects of SBAR the communication skills, self-leadership, patient safety attitudes, and safety nursing performance of 4th grade nursing students experiencing clinical practice.

First, the clarity of communication increased in both the intervention and control groups, and it was significantly higher in the experimental group (t=-2.49, p=0.020).

We observed that the clarity of communications was significantly higher among students who had received training through SBAR techniques and team-based training. This includes training with the example of the patient with dyspnea, premature nursing[22], basic nursing, and acute renal failure[15], and the findings are consistent with the results of the study. The hypotheses of this study are supported by our findings, which show increased awareness of effective communication and cooperation among students after education in SBAR techniques[23]. This suggests that the use of standardized tools has a positive effect on improving the quality of communication. In this study, it is thought that SBAR-related theoretical lectures and videos before simulation training, provision of the learning goal with the example of patient with dyspnea, and debriefing after the simulation training contributed to the clarity of the students' communication. In addition, we found that the use of SBAR in clinical practice requires extensive training, so it is necessary to develop and apply various scenarios during the students' education.

Second, self-leadership was significantly higher in the intervention group than in the control group (t=11.75, p=0.001). Although different from the study's design, nurses are targeted[24] for the training. Self-leadership after SBAR theoretical training, SBAR practice (through watching videos and practice in reporting cases such as hypoglycemia difficulties and chest pain), the effectiveness of SBAR application significantly improved from 3.17 to 3.43, which consistent with our hypothesis. Previous studies related to the application of SBAR are insufficient and difficult to compare with the team training modules for doctors and nurses[25]. In the study of the relationship between communication and self-leadership[26], communication ability was found to have a significant influence on self-leadership. Further, training in communication and debriefing for problem solving among team members in theoretical education and simulation training for SBAR had a positive effect on self-leadership. This shows that communication and self-leadership interact with each other. Therefore, various education programs should use SBAR techniques to improve self-leadership.

Third, attitudes toward patient safety increased in the intervention group after education but decreased in the control group. There was a significant increase in the experimental group's measurements (t=5.12, p=0.027). Although the study design and the tools are different, after attending lectures for 30 minutes, video training for 12 minutes, scenario writing for 30 minutes, and role play for 20 minutes, the attitude of nurses and doctors toward patient safety was significantly elevated after the training, which supports the hypotheses of this study. Indeed, nursing students' attitude scores toward patient safety were higher with higher satisfaction with majors [27], and attitude scores were improved overall in students who were educated about patient safety within the curriculum[28]. In this study, the experimental group showed significantly higher attitude scores for patient safety than the control group because the experience in simulation exercises positively influenced communications with the patient and the importance of patient safety. Further, to develop nurses with attitudes of patient safety as a top priority, a variety of practical training should be included in curriculum design and operation.

Fourth, the safety nursing ability of the intervention group increased beyond that of the pre-education group. However, the control group's scores decreased, and the increase was more significant in the experimental group (t=7.85, p=0.007). Although it is difficult to compare, in the study of safety nursing performance of nursing college students[28], the score was lower than the average of 4.32 however, students demonstrated high competence in performance, patient identification, correct hand hygiene, infection control, and fall prevention. In this study, accurate patient identification, diagnosis, history confirmation, and current status were reported to the physician during the simulation based on the asthma patient scenario. Particularly, by practicing the nursing interventions that are difficult to deal with in the field, such as discussing the necessary nursing interventions, we observed that they have helped solving patient problems by improving self-confidence.

Conclusion

Through this study, we confirmed that applying simulation training using SBAR techniques to nursing

students is effective in improving communication clarity, self-leadership, attitude toward patient safety, and safety nursing performance. In particular, nurses who play a central role in communication should be able to accurately report health problems for patient safety and express their opinions clearly and confidently. Therefore, it is necessary to continuously apply SBAR techniques in the simulation exercise. Further studies to verify the impacts of SBAR techniques are needed

Study of Change of Character of Nursing Students through Team-Based Learning (TBL) Humanities Class

Ok Hee Koo

Dept. of Nursing, Baekseok University, Cheon-an, 31065, Republic of Korea

Abstract

Background/Objectives: The object of the research is to find the change of character of nursing students who have taken the team-based learning humanities class.

Methods/Statistical analysis: Character scale of Lee at al. was measured against 97 sophomore students from one nursing school, and the total hours of class were 30 hours.Paired t-test was used to compare the level of character before and after TBL.

Findings:The score of character increased from 4.58 to 4.71 ($p<0.1$). If you take a look at differences of the three subareas of character, the area of knowing factor increased from 4.65 to 4.77 ($p<.03$), the area of feeling factor increased from 4.75 to 4.87 ($p<.0.7$), and the area of behaving factor increased from 4.06 to 4.25 ($p<.00$).

Improvements/Applications: We suggest a development of convergent educational program that helps supporting behavioral character and recurring research of internal and external reasons that effect character and effect of application of character enhancement program.

Keywords:*TBL, Humanities class, Character, Change, Nursing Students, Convergence*

Introduction

Korea has become a popular country that gives great taste and impression to everywhere in the world through K-pop and K-food. However, Korea ranked the 1stin the suicide rate ranking among OECD countries. In happiness ranking UN presented in 2016, Korea ranked 58th which is a lower rank. From the ranking provided by Reputation Institute in 2017, Korea ranked 35th out of 50 countries[1]. People who suffer from social maladjustment and depression are continuously increasing in society. To solve the societal problems, comprehensive understanding and discussion on elements of character such as not only personality, temperament, motivation but also knowledge, value, attitude, and behavior are required. And the completion of character is required through learning from a willful decision. As a result, Character Education Promotion Act was passed in the country as character education is essential to develop potential and value of students. Character education has become mandatory and has been exercised since July 2015[2].

Humans are required to show his or her talent with responsibilityand consciousness, and character education is a much more important curriculum than acquiring major related knowledge and skills. On the other hand, college students in these days prefer eating and drinking by themselves and have become more self-oriented. In addition, due to stress of getting job and competition, they have become lack in consideration, empathy, and responsibility to others[3]. Especially, nursing students do not have much opportunity to learn or train character development education because of their heavy school works and clinical training. Therefore, The Korean Nurses Association suggests to implement character related educational curriculum to help nursing students to reach essential capabilities. It is considered that school curriculum that enhances character education is extremely required to make nursing students to become

Corresponding Author :

professional nurses[4].

Character lets human knows and what is right and loves what is right. Moreover, it makes human to behave what is right. In addition, attitude toward others such as consideration, diligence, respect others are desirable minds for nurses who will have to nurse and encounter diverse patients[5]. Character education is not a teaching what is right and what is not. It is a life-long learning process to become a right human[1]. Lickona[6], a famous scholar of theory of character education, defined characteras a complicated concept that encompasses moral conception, feeling, and behavior and demonstrated that these elements do not function separately but they influence each other in various ways and they can be cultivated through acquired learning.

Research on character of nursing students has started from the research that suggested need of character education in 2012 to the developmentof classical reading program, the research looked for application possibility, and the research looked for factors related to character and relationship[4, 7-11]. Since there has been no research that nursing professor actually processed classes related to humanities, this research intends to find out change of character of nursing students through team discussion activities by TBL.

Method

The research was conducted against 97 nursing students in the secondary grade of one school who were taking humanities classes and had agreed to the survey and the research. The participants were calculated using G*power 3.1 program with a setting of effect size of 0.5, power function of 0.95, and significance level of 0.05. Since the minimum sample number was 45, it is considered that the sample number of this study was satisfied.

Character was measured by Barom character scale for college students developed by Lee et al[12]. There are total 60 questionnaires and three sub-areas: knowing factor, feeling factor, and behaving factor. Knowing factor has 23 questionnaires: 4 for moral awareness, 7 for knowing moral value, 3 for moral reasoning, 3 for reflectivedecision making, 3 for self-understanding, and 3 for awareness of self-initiated life. Feeling factor is composed of 25 questionnaires: 5 for conscience, 4 for self-respect, 5 for empathy, 4 for loving the god, 2 for self-control, and 5 for community spirit. Behaving factor has 12 questionnaires including 7 for will and competence and 5 for habit. Each questionnaire is 6 points Likert scale, and higher score means higher in level of character. At the time of tool development, Cronbach's α was .96. The pre-survey Cronbach's α was .95, and the post-survey Cronbach's α was .97.

The research was conducted against students who took "Encountering humanities" through 15 weeks of 2 hours per week, which is total 30 hours of classes. 16 teams were composed of 6 to 7 students. The class was consist of a lecture of topics by professor and presentation and Q&A on TBL activity and discussion on each week topic. Classes were conducted on 10 sub chapters by choosing 「Pathos of distance」[1] as a text. TBL activity was conducted by choosing topics that are related to class. By alternating classic reading classes conducted by liberal arts course, students are guided to connect understanding and feeling of the work to their own experiences and to find themselves and newly compose the meaning of life by self-reflecting and meeting with others. In addition, students are guided to imagine from birth to death and had time to reflect on own aspects on nurse as a job, good nurse, and good nursing.

The collected data were analyzed using SPSS Statistics 18.0[13] and the significance level was set at .05. The descriptive statistics such as mean and standard deviation were used for continuous variables. Paired t-test was used to compare the level of character before and after TBL.

For ethical consideration, the purpose of the study, anonymity of data, and confidentiality were explained, and students were asked to participate the survey voluntarily. Moreover, the explanation that any student could withdraw from the study at his own will anytime and the collected data would be only used for the study was explained.

Result

The research target was divided by gender and admission background. Female students were 89 (91.8%), and male students were 8 (8.2%). Admission students were 52 (53.6%), and transfer students were 45 (46.4%). Before the beginning of the class, students scored 4.52 (maximum 6) for character, 4.57 for knowing factor (maximum 6), 4.68 for feeling factor, and 3.98 for behaving factor. After the termination of the class, students scored 4.74 (maximum 6) for character, 4.78 for knowing factor, 4.89 for feeling factor, 4.34 for behaving factor. There were statistically significant

difference in every areas(table 1).

Table 1. The comparison of character of nursing students (N=97)

Categories		**M**	**SD**	**t**	**p**
Knowing factor	Before	4.57	.50	5.041	.000
	After	4.78	.56		
Feeling factor	Before	4.68	.49	4.768	.000
	After	4.89	.55		
Behaving factor	Before	3.98	.61	6.175	.000
	After	4.34	.77		
Character	Before	4.52	.48	5.282	.000
	After	4.74	.56		

The result of character level of subareas of knowing, feeling, and behaving is as follows (table 2). In knowing factor, the average of moral awareness increased from 4.78 (maximum 6) to 4.98, and it was statistically significant (p=.001). The average of knowing moral value increased from 4.55 (maximum 6) to 4.70, and it was statistically significant (p=.007). The average of moral reasoning increased from 4.79 (maximum 6) to 5.05, and it was statistically significant (p=.001). The average of reflective decision making increased from 4.79 (max 6) to 4.96, and it was statistically significant (p=.02). The average of self-understanding increased from 4.46 (max 6) to 4.66, and it was statistically significant (p=.008). The average of awarenessof self-initiated life increased from 4.15 (max 6) to 4.39, and it was statistically significant (p=.011). In feeling factor, the average of conscience increased from 4.92 (maximum 6) to 5.09, and it was statistically significant (p=.011). The average of self-respect increased from 4.25 (maximum 6) to 4.51, and it was statistically significant (p=.000). The average of empathyincreased from 4.81 (maximum 6) to 5.02, and it was statistically significant (p=.001). The average of loving the god increased from 5.09 (maximum 6) to 5.28, and it was statistically significant (p=.001). The average of self-control increased from 4.26 (maximum 6) to 4.48, and it was statistically significant (p=.004). The average of community spirit increased from 4.52 (maximum 6) to 4.73, and it was statisticallysignificant (p=.000). In behaving factor, the average of will and competence increased from 4.17 (max 6) to 4.45, and it was statistically significant (p=.000). The average of habit increased from 3.71 (maximum 6) to 4.18, and it was statistically significant (p=.000).

Table 2. The comparison of knowing, feeling and behaving factor

Admission background	admission from high school	52	4.75	.55	0.033	.86
	transfer to another college and transfer after graduation of college	45	4.73	.59		

Discussion

The research was conducted to find out change on character of nursing students through TBL based humanities class. The level of character of students was 4.52 (maximum 6) before the class and 4.74 (maximum 6) after the class and it was statistically significant(p=.000). In comparison with research that used similar tool, the average of character from the research of Koo &Ryu[4] against third and fourth year students was 4.71 (maximum 6) and it was similar to post average. The research of Sim&Bang[9] against first year students was 4.42, and it was lower than the pre average of the research. The research of Lee &Kwak[14] against all students had average of 4.32, which was far lower. Although the research was conducted against only second year nursing students in one school, it is

considered that the research somewhat represents the level of whole second year nursing students. The averages of each factor demonstrate that the feeling factor was the highest and the behaving factor was the lowest in the pre-survey, and the order was the same in the post-survey. This is the same result as previous studies[4, 9, 14], and we can know that students still lack in skills taking action rather than just thinking. Therefore, participation of volunteering and medical volunteering for vulnerable people are absolutely required. The character education of nursing students should include behavioral access to improve vulnerable moral behavior and habits as well as cognitive access that encompasses self, others and decision making by implicating external social environment and relationship with others. The goal of character education is becoming the real, righteous person, which is a life-time process[1]. Aristoteles[15] emphasized that "development and learning in teenager are not sufficient, and one should continuously behave after he or she becomes adult. In addition, it should be a habit." Erikson[1] also noted that character is not completed in teenage age but it is continuously developed and changed through adult and old age. The character education of ours should not only be education during students but also be education of life time. The research of Lee &Nam[16] stated that there is a difference of character between genders and the character of male is higher than that of female. However, the character of female was higher for this research, and there was not statistically significant difference. The character of the male students was a bit higher for the research of Sim&Bang[9], but there was not statistically significant difference. Since the differences between genders were found in other results, it is considered that the gender variance should be examined in later researches. It was predicted that the character of transfer students would be higher than the character of regular admission students, but there was no difference in the averages. Because there was no difference between grades in the research of Lee &Kwak[14], it is regarded that the research on a larger population is required.

Conclusion

The research was conducted against the secondary grade of nursing students to find out change in character of students through the humanities class based on TBL. As a result of the research, the level of character was increased from the average of 4.52±.48 (maximum 6) to 4.74±.56 ($p<.000$). For the differences in 3 factors of character, knowing factor changed from 4.57±.50 (max 6) to 4.78±.56($p<.000$), feeling factor changed from 4.68±.49 to 4.89±.55($p<.000$), and behaving factor changed from 3.97±.61 to 4.34±.77($p<.000$). They all increased by significant amount statistically.

It is suggested that comprehensive education program that helps improving deficient behavioral character should be developed by helping nursing students build right behavior and constructive habit including feeling, knowing, and behavioral character. In addition, recurring research on variance check and effect of application of character improvement program through recurring research on internal and external factors that affect character of nursing students is proposed

A Longitudinal Analysis on Ethical Values of Nursing Students

Myung Sook Kim[1], Ok Hee Koo[2]

[1]Assist Professor, Dept. of Nursing, Yeoju Institute of Technology, 12652, Korea,
[2]Assist professor, Dept. of Nursing, Baekseok University, 31065, Korea

Abstract

Background/Objectives: The object of the research is to navigate how ethical value and ethical sensitivity of nursing students have changed over the course of 4 years of education.

Methods/Statistical analysis: The first data was collected from 200 nursing students of two schools that were marked for convenience before the regular nursing ethics course began. The additional data were collected on the end of May of 2016, 2017 and 2018. Average and standard deviation of the collected data were calculated, and repeated ANOVA was used for finding change of difference by school year.

Findings: The result of the research demonstrates that there is a significant difference of change of ethical value by school year ($F=184.30$, $p<.000$). There is also a significant difference of change of ethical sensitivity by school year ($F=2.704$, $p<.045$). We expected ethical value and ethical sensitivity would change positively as the school year went up, but there was reluctance on the changes by school year.

Improvements/Applications: : I suggest the ethical courses to develop various teaching procedures and education contents such as AI, VR, AR, and others in order to positively change ethical value and ethical sensitivity of students.

Keywords: *Longitudinal Analysis, Ethical Value, Ethical Sensitivity, Nursing Students, Convergence.*

Introduction

Due to the scientific development, life have become an objection of selection by artificial control and possibility of genetic manipulation. People treat other things more important than the meaning of life in some situations[1]. These changes have brought changes in belief of human and value of life so that there is a limit to apply the existing ethical standard and rule. Therefore, new morality and ethical remedy are in need[2]. In order to deal with many ethical problems brought by AI (Artificial Intelligence), Big Data, genetic technology, and AR (Artificial Reality) of the 4th industrial revolution, an ethical education that cultivates understanding, autonomy, and value judgment about human should be early learned[3]. Especially, the development of medical technology have brought ethical problems such as human life extension, genetic therapy, artificial intercession, and life-saving treatment, and it demands right ethical decision making skill to nurses. As a nurse is required to provide nursing to meet each patient's demand, nursing itself is a study based on morality[4]. Since the ethical value of nursing students becomes a basis to solve ethical problems that are directly related to nursing, building right ethical value is extremely important to nursing students[5]. As a result, nursing school tries to help nursing students to solve ethical dilemma they face and establish their value as well as define broad meaning of morality so that they can become professionals of life science[6]. Ethical value recognition skill and ethical sensitivity that help nurses making ethical decision make them to choose ethical value primarily and take ethical action. Rest[7] defines ethical sensitivity as a skill that allows people to recognize ethical problems in given situations and understand how the result of behavior effects welfare of others. In addition, it is a first factor that helps an individual to make a decision. He also states that a person who is morally sensitive considers ethical recognition, value, and principle that impose

Corresponding Author :
Ok Hee Koo,
koh0528@bu.ac.kr

ethical meaning on specific situations, as important. Han[8] demonstrated that the level of ethical judgment of nurse are usually developed in school, especially during college. They make decisions based on value they have built in school. Therefore, nursing of future professional nurses are decided by ethical value of nursing students. As nursing have significant impact on development of professional nurses and health of people, ethical establishment of nursing students is extremely important. As the fact that ethical value are varied by grades in the prior researches[9,10,11] on changes in ethical value of nursing students was found, longitudinal study or time-series research that finds how their value changes during school is suggested. In addition, nursing students are able to experience diverse ethical problems that they can face in practice through diverse ethical education program and clinical training such as discussion, role play, and watching related video[9]. Because it was considered that nursing students would not only learn professional knowledge and skill but also change in ethical value and ethical sensitivity through 4 years of education, the research was conducted to 1st year student who had not taken nursing ethical education and to see how their ethical value and sensitivity would change as they take 3 years of education.

Method

The research was conducted against 200 students from two schools in Gyeonggi-do and Chungcheong-do who had entered school in 2015. The first data was collected before regular program began and the total of 4 data were collected every time when the school ends in late May from 2016 to 2018 to measure ethical value and ethical sensitivity. Using G*power Win 3.1.9.2 program, the adequacy of the sample size was at least 81 after calculation of required participants from significance level of .05, power function of 1-β=.80, effect size of (f)=.15, and 4 repetitive measurement analysis of a single group.

Tool of Lee et al.[12]was used for ethical value. It was composed of 8 questionnaires of human-life area, 7 questionnaires of nurse-client relationship area, 7 questionnaires of nurse-nursing task relationship area, and 4 questionnaires of nurse-colleague relationship area. Regarding that absolute utilitarianism is 1 and absolute obligatory is 5, the higher score means that ethical value and value recognition are stubborn and positive.

In the study of Lee et al, the Cronbach's α was .71. Tool of Han et al.[13]was used for ethical sensitivity. It was composed of 5 questionnaires of patient-oriented care, 7 questionnaires of professional responsibility, 5 questionnaires of conflict, 6 questionnaires of moral meaning, and 4 questionnaires of benevolence. Total of 27 questionnaires are measured at 7 points. Higher score means higher ethical sensitivity a person has. In the study of Han et al., the Cronbach's α was .76. The reliability of the research is as follows in the table 1.

Table 1: Cronbach's alpha in instrument

Year	Ethical value Cronbach's alpha	Ethical sensitivity Cronbach's alpha
2015	.685	.790
2016	.675	.708
2017	.741	.855
2018	.658	.859

The collected data were analyzedusing SPSS Statistics version 18.0 program[14], and the significance level was set at .05. The general characteristic of the participants was calculated by frequency and percentage. To check ethical value and ethical sensitivity, statistical analysis like average and standard deviation were used. Change in different school year is analyzed by repeated ANOVA. In order to satisfy the basic assumption of repeated ANOVA, Mauchly's test of sphericity was first conducted. If the assumption was satisfied, an univariate analysis was conducted. If not, an univariate or multivariate test using Greenhouse-Geisser was conducted. Afterward, the difference in each time was analyzed through in-object effect test.

The research is certified by Baekseok University Institutional Review Board (BUIRB-201704-HR-005). The participants of the research were fully explained on purpose and procedure of the research. The survey was distributed to ones who had signed the agreement

Result

The general characteristic of the participants is as follows in the table 2. As the research was conducted against the same group for 4 years, there was a huge change in numbers of participants. In 2015, 192 out of 200 participated. However, the number of participants dropped to 163 (16% dropout rate) in 2016, 126 (23%

in dropout rate) in 2017, and 112 (12% in dropout rate) in 2018. Even though a small gift was given to a participantfor years, the dropout rate was high due to voluntary participation method, military of male students, leave of absence, and exclusion of insufficient data. In the data of final 4thyear students, the percentage of under 23 years old was 89.3%, female was 96.4%, no religion was 55.4%, first of sibling was 46.4%, second of sibling was 45.5%, and third of sibling was 8%. 49.1% were living in big city, 43.8% were living in medium-sized city, and 92.9% were living in city. 87.5% voluntarily chose nursing as major, and 75.9% were satisfied in the major.

The ethical value and ethical sensitivityby grades are as follows in the table 3. The change in ethical value was 3.51-2.71-3.37-3.31 (maximum 5), and there was statistically significantdifference (F=184.303, p<.000). All of the subareas had statistically significant differences: human-life area (F=74.515, p<.000), nurse-client relationship area (F=237.868, p<.000), nurse-nursing task relationship area (F=57.969, p<.000), and nurse-colleague relationship area (F=136.932, p<.000).The overall change in ethical sensitivity was 4.95-5.10-5.08-5.06 (maximum 7), and there was statistically significant difference (F=2.704, p<.045). For subareas, patient-oriented care (F=3.745, p=.011), professional responsibility (F=21.303, p<.000), moral meaning (F=7.896, p<.000) had statistically significant difference. However, there were no statistically significant differences in conflict (F=.082, p=.970) and benevolence (F=1.905, p=.128).

Discussion

The development of human ethics begins when people born in family and develops as they build relationship with friends in school years. Consequently, it helps college students to become important members of society as adults by helping them make right decisions and righteous behavior[15]. Especially, high quality of ethics and morality are required for nursing students who will deal with human life[16, 17]. According to the result that stated that college curriculum and experience of college life have a great impact on the development of ethics[18], the research was conducted to find out how ethical value and ethical sensitivity of nursing students change through 4 years of college curriculum.

As a result of the research, ethical value showed obligatory tendency for all 4 years, but there were many changes by school year. Comparing the average of 3.44 of Koo[10] and the average of 3.38 of Kwon[19] that examined ethical value of freshman, the results are similar. However, thinking of the reason why freshman who have not taken the regular course has the highest level of ethics, the first year is the period when nursing students are aware of the ideal role and duty of nurses as they enter school. Nevertheless, freshman students had gone through many chaos on ethical value as they experience diverse nursing theory and clinical training. In particular, the result that the score of human life area and nurse-patient relationship area dropped by large amount is similar to the preceding study [9, 10, 11, 20] in which the score of human life area was changed to utilitarianism. It is considered that social atmosphere, in which enforces life-expectancy law and demands legalization of pregnancy termination, and change in recognition of nursing students who demand professional relationship rather than sacrificing relationship between nurses and patients are factors that impact students. For the average of ethical sensitivity, the first year was the lowest and the second year was the highest. After their second year, it had a tendency to decrease. The average of the preceding research[10,18,21] was 5.0 − 5.10 (maximum 7) which is similar to the research. As the complicated ethical situation had given hard time making decisions to students, it is considered that various lecturing methods such as movie, book, and role play would help students building ethical sensitivity. In addition, ethical education should begin early and should be sustained to build an ethical basis. Therefore, ethical education should not only be a course of college but also be an opportunity to build characteristic and ethical reasoning skill by starting from elementary school. Moreover, educational

and political efforts are necessary so that people can build their ethical basis and provide specific life ethical education that fits to their social roles[6].

Conclusion

The study is a longitudinal study that aims to find out how ethical value and ethical sensitivity of nursing students change throughout the 4 years of education. As a result of the study, there were statistically significant difference in ethical value by different school years (F=184.30, p<.000). Also, there were statistically significant change in ethical sensitivity by different school years (F=2.704, p<.045). Because the study was conducted against only two nursing schools, there is a limit to generalize the result to all nursing students. As it was found that ethical value and ethical sensitivity change by school years from the study, it is suggested that diverse ethical education contents should be developed for more positive effects. In addition, as ethical education should begin early and needs to be sustained to build an ethical basis, it should not only be a college course of life ethical education but also be an opportunity to build the ethical basis, character, and reasoning skill on life ethics before college. An educational policy that helps people solidify ethical basis through sustainable education is necessary.

Factors Influencing Depression in Postmenopausal Women by Subjective Health Awareness

Myoungjin Kwon[1], **Sun Ae Kim**[2]

[1]*Assistant Professor, Nursing Department, Daejeon University, Republic of Korea,*
[2]*Assistant Professor, Nursing Department, Korea National University of Transportation, Republic of Korea*

Abstract

Background/Objectives: The purpose of this study was to identify factors affecting the depression of menopause women due to subjective health awareness.

Methods/Statistical Analysis: This study was a descriptive research study that analyzed the data of the National Health and Nutrition Survey for 2014-2017. Weights were assigned through the IBM SPSS 25.0 program to generate a composite sample plan file and analyzed.

Findings: There was a significant difference between groups in all general characteristics ($p < .05$). In postmenopausal women, age, exercise, and psychological factors were found to be major factors affecting depression.

Improvements/Applications: It is necessary to identify the extent to which depression is associated by dividing women into groups after menopause by age group instead of dividing them into one group.

Keywords: *Menopause, Middle age, Women, Depression, Subjective body Awareness*

Introduction

Menopause is a phenomenon that all women experience as a natural transition process,butMenopause is a physical change that permanently affects a woman's life[1].

These irreversible changes can alter women's lives and cause psychological and emotional problems. The prevalence of depression in men is 6.6%, compared with 13.7% in middle-aged women, more than twice that in men[2].

Depression also lowers the quality of life[3-4]. Women in menopausal transition stage have a four-fold increased risk of depression compared to premenopausal[5]. The depression of middle-aged women is a serious status, the problems are neglected and enlarged, finally missed opportunities for prevention and early treatment[6]. Previous studies have shown that subjective health status affects the elderly life expectancy of middle aged women[7]. Health behavior is very important when considering that a healthy life is a necessary factor for successful aging. Depression, which negatively affects health behaviors, ultimately affects successful, healthy aging.

Among the general characteristics of the previous studies, age, education level, religion, income, and marriage duration were reported as factors affecting depression in middle[1] - aged women. In addition, there was a statistically significant correlation between the intimacy of the couple and the symptoms of menopausal symptoms[8].

Health status perception and family economic status were found to be significant predictors of depression in middle-aged women[9]. In another study, the depression of middle-aged women was significantly lower with better health status, lower alcohol dependency, no experience of violence from spouse, higher life satisfaction and higher self-esteem[10].

However, most studies were focused on individual factor analysis. In the elderly, the lower the subjective perception of health, the higher the depression[11]. In addition, subjective perception of health affects suicidal thought and it is reported that elderly people with the low subjective perception of health are more likely to commit suicide[12].

A study conducted on the elderly in relation to individuals' subjective health awareness and depression was reported. Older people placed more emphasis on the subjective aspect of recognizing the degree of difficulty they suffered from the disease than on the presence or absence of a real disease. Therefore, subjective health awareness was reported to be more closely related to depression[13].

There were a few studies of women's health awareness and depression after menopause. In the case of perimenopause women and in postmenopause, both groups were more depressed than normal, but there was no difference in depression. But there were differences in factors affecting it[14].

This study attempts to analyze the data of the reliable data, the National Health and Nutrition Survey, for the total number of menopause women and to understand the health problems of postmenopausal women.

Method

This is a descriptive research study that analyzes the data of the National Health and Nutrition Survey for 2014-2017.

This study was conducted on 5,615 postmenopausal women who clearly answered that they were natural menopause among the total of 31,207 subjects.

The National Health and Nutrition Survey was conducted after obtaining approval from the National Statistical Office and the Research Ethics Review Board (IRB) in the CDC.

The general characteristics are age, economic status, education level, number of family members, weight change and weight control for one year, marital status, health screening.

Influencing factors include age(yr), education level, number of family members, weight change, weight control, marital status, health screenings, activity limits, dietary level, hypertension, drinking status, sitting (hr/day), body mass index(kg/m^2), walking exercise (day/week), strength exercise(day/week), suicidal ideation, stress, subjective body awareness.

Logistic regression was used to determine the factors that influence to depression.

Result

1. General characteristics of the subjects

There was a significant difference between groups in all general characteristics ($p < .05$).

Subjects who perceived subjective health badly were older, had lower economic levels, had lower education levels, and had fewer families.

In addition, who answered that food was lacking, decreased weight, tried to gain weight, did not take a health check perceived subjective health bad.

2.Factors influencing depression

A significant factorsinfluencing depression were age, activity limits, dietary level, walking exercise, suicidal ideation, stress, and subjective body awareness in those who perceived subjective health as good (p <.05).

A significant factorsinfluencing depression were age, weight control, marital status and activity limits, dietary level, BMI, walking exercise, strength exercise, suicidal ideation and subjective body awareness in those who perceived subjective health as medium(p<.05).

A significant factorsinfluencing depression were age, education level, number of family members, weight change, health screenings, dietary level, hypertension, drinking status, sitting , BMI, suicidalideation, stress, subjective body awareness in those who perceived subjective health as bad (p <.05). <Table 2>

Discussion

Weight is considered to have influenced subjective perception of health. In addition, depression was also higher in the group who perceived themselves as thin.

Nutrition related diseases or nutritional problems can be inferred that they can cause a person to perceive their health status as poor.

Among the general characteristics, those who said they lacked food in their diet are perceived to be worse at subjective health awareness. Unintentional weight loss in older people may be a response of disease or hidden illness[15-17]. Even if there is no disease, it could be weight loss due to muscle loss[18].

On the other hand, older people with stable weight have the advantage of not having to protect themselves from muscle loss[19]. Another reason is the risk of losing

weight due to dehydration by the elderly[20].

In fact, according to the Meta-analysis of weight loss and mortality among people aged 60 and older, male adults were not able to find any relation to weight loss and mortality, but in the case of female adults, weight loss was reported to increase mortality. However, intentional weight loss has reduced mortality[21]. Unintentional weight loss can be attributed to malnutrition caused by poor appetite[22].

The days of walking and the days of muscle exercise all belonged to a large category of exercise and showed different results.Exercise and physical activity are encouraged as interventions to lower depression[23]. In addition, in a study of middle-aged women, more respondents said they exercise in those who perceive subjective health conditions as good than those who did not exercise[24]. However, there have been similar results from previous studies.

In a study of factors related to depression experience in menopause women, there was no difference in the experience of depression between those who walk and those who do not[25]. These existing studies are partly consistent with the results of this study. On the other hand, light exercise and physical activity relieve depression, but strenuous physical activity increases depression rather than depression[26].

This study found that subjects who did not drink were more likely to be aware of subjective health as bad. Previous studies have reported that there were no differences in drinking due to subjective health conditions[24].

There have been many studies that confirmed the relevance of eating habits to menopause women, but none have been found to be related to drinking directly. It is also influenced by cultural attitudes toward alcohol consumption[27-28].

Young women's perceptions of drinking have changed a lot, women's drinking is not considered positive. Therefore, there may not be many clear studies of drinking.

In this study, it was found that depressive symptom experience according to the age of postmenopausal women was more depressed as the age was younger regardless of subjective health perception. Previous studies have shown that menopausal women have higher rates of depressive symptoms than women who have not had menopause and that depressive symptom experience increases with age. In another study, menopause women were reported to have a lower risk of experiencing depression as age increases[25]. And In the case of males, the number of reports of depression increases with age, but in females over 70 years of age, it is lower than that of females in their 60s[29].

Conclusion

The purpose of this study is to identify the influencing factors of depression according to how women perceive their health status. Repetitive studies are required using the post-menopausal duration as a mediator.

Research is needed because special programs for menopause women, who are about to be implemented into old age, need to be developed.

The Influence of Nursing Students' Self-Esteem on Depression: Mediation Effect of Rejection Sensitivity

Yun Ju Lee[1], **Sung-Yun Ahn**[2]

[1]*JEI University, Dept. of Nursing, South Korea,* [2]*Pai Chai University, Dept. of Nursing, South Korea*

Abstract

Background/Objectives: The purpose of this study was to verify the mediating effects of rejection sensitivity on the relationship between self-esteem and depression of nursing students.

Methods/Statistical analysis: From May 30 to July 11, 2018, data of 381 nursing students at two universities were collected by convenience sampling and the results analyzed with SPSS 21.0. The degree to which the rejection sensitivity of nursing students is mediated by self-respect and depression was determined following the guidelines of Baron and Kenny, and the Sobel test was used to verify the statistical significance of the mediated effects.

Findings: A negative correlation was found between self-esteem and depression in nursing students, and rejection sensitivity and depression showed a positive correlation. Also, self-esteem and rejection sensitivity showed an amulet correlation. The results of a three-step regression to check whether rejection sensitivity mediated the relationship between perceived self-esteem and depression were statistically significant ($Z = -4.817$, $p < .001$).

Improvements/Applications: Depression in nursing students is an important emotion that can be transmitted to the patient. The results will be the basis for developing depression prevention programs for nursing students.

Keywords:*Nursing student, Self-esteem, Depression, Rejection sensitivity, Mediation effect.*

Introduction

Nursing departments conduct education courses to impart basic knowledge and skills for nurses to properly fulfill their mission as professional caregivers for sick patients. Nursingstudents complain of considerable academic stress due to the pressure in theoretical subjects of applying a relative evaluation method, and the tension or anxiety causedby practice at a strange clinical site[1-2].This has caused more than 40 percent of nursing students to show more than mild levels of depression and contemplate suicide[2-3].Depression is a significant impediment to nursing students' adaptation to school life[4], so it is necessary to consider from various angles how to provide adequate early assistance.Positive psychological tendencies such as the self-efficiency, optimism, hope, and resilience of nursing students serve to reduce depression[1]. Self-esteem, even among positive psychological tendencies, is an evaluative concept that respects and values itself[5] and is reported in studies as a personal preference that has a significant impact on depression[6-7].

University students who have been in the nuclear family for a long time before entering the examination-oriented education field have shown difficulties in adapting to the formation and continuity of the new relationship[8].

According to this study, which identified personality types as intermediaries affecting the self-respect and mental health of nursing students, extroverted tendencies were correlated with self-esteem, and introversion was highly related to mental health.Thus, individual

personality traits are important for nursing students to pursue a healthy university life.Difficulties in school life including relationships with professors and interpersonal relationships with friends underlie differences in adapting to university life. Therefore, it is necessary to pay attention to the trends of our relationships with others so that we can maintain them positively[4-5, 10].

Rejection sensitivity is a cognitive and emotional process that can cause excessive reactions as it is proactive, anxious, and awake to rejection in various situations[11]. There is a tendency for it to play an important role in maintaining a close relationship with others. Since 2009 in Korea, research has focused on the rejection sensitivity of university students with regard to such issues as solving interpersonal problems and developing basic data or programs that can improve the quality of relationships[12-13]. According to earlier study results, the higher the level of performance instability among university students with a higher level of rejection sensitivity[12], the more auniversity student who tends to reject relationships with others may be unable to adequately display his abilities and potential and be highly prone to depression, frustration, and self-reliance[2,6]. In particular, as female college students' rejection sensitivity and performance anxiety were higher than those of male students[12].High rejection sensitivities can enhance depression by enhancing negative interpretations and memory biases concerning stressful situations[13]. In light of these facts, rejection sensitivity can be considered to have a considerable relationship with depression.Nurses should cooperate with patients or guardians and various professionals to provide proper treatment and care. Therefore, it is necessary to identify rejection sensitivity among nursing students so that proper interpersonal communication can be made in various situations before entering practice. However, there are few studies related to rejection sensitivity of nursing students.

Few studies have examined the relationship between self-esteem, rejection sensitivity, and depression among nursing students. In this study, the effect of self-esteem and rejection sensitivity of nursing students on depression is investigated and the role of rejection sensitivity is identified. The purpose of this study is to present basic data that can help reduce the level of depression among nursing students.

Method

This study applied a descriptive survey to identify the relationship between self-esteem, rejection sensitivity, and depression of nursing students.

This research involved 381 university students attending nursing departments in I and D. The G*Power 3.1.9.2 program was used to determine the necessary number of participants with a significance level of .05, an effect size of 0.15, and a power of 0.80, resulting in a minimum of 343 participants. The survey was distributed to 388 people in consideration of likely numbers of excluded participants, and 381 copies were used for the final analysis.

The research variables were measured by the following research tools.The Self Esteem Scale, created by Rosenberg[5] and developed by Jeon[14]. Cronbach's alpha was .88 in Rosenberg's version[5], and .870in this study.

The degree of rejection sensitivity was measured using a tool developed by Park and Yang[15].It comprises a total of 16 questions comprising four sub-factors, anticipated rage, anticipated anxiety, overreaction, and rejection perception. Cronbach's alpha was .91 in the original study and .917 in this study.

The CES-D (Center for Epidemiologic Studies Depression Scale), a measure of depression developed by Chon etc.[16]. Cronbach's alpha was .91 in the original study and .924 in this study.

Data were collected from May 30 to July 9, 2018. The participants were explained the purpose and method of the study and told that all the data were coded and anonymous.Participants were informed that they could stop the survey at any time and that there was no harm in agreeing to the survey. The surveys were distributed after those with a full understanding of this information signed written consent forms. When the survey was completed, a small number of products were provided to the participants.

The collected data were analyzed using the SPSS 22.0 statistics program. The general characteristics of the study participants, self-esteem, rejection sensitivity, and depression were determined by descriptive statistical methods.

The relationship between self-esteem, rejection sensitivity, and depression of the subject was analyzed using Pearson's correlation coefficients. Hierarchical regression was performed to determine the influence of

the self-respect and rejection sensitivity of nursing students on depression.

Finally, the degree to which the rejection sensitivity of nursing students is mediated by self-respect and depression was determined following the guidelines of Baron and Kenny[17]and the Sobel test was used to verify the statistical significance of the mediated effects.

Result and Discussion

1. General characteristics of the subjects

The demographic characteristics of the participants are shown in Table 1.

Table 1. General characteristics of participants

Characteristics	Categories	N(%) or Mean(SD)
Gender	Female	325(85.3)
	Male	56(14.7)
Age (years)	-	22.4(3.37)
Year of study	First	129(33.9)
	Second	102(26.8)
	Third	59(15.5)
	Fourth	91(23.9)
Religion	Yes	249(65.4)
	No	132(34.6)
Money per month	≤ 100,000	15(3.9)
	100,000−200,000	46(12.1)
	200,001−300,000	105(27.6)
	>300,000	215(56.4)
Short-term job	Yes	275(72.2)
	No	103(27.0)
	Missing	3(0.8)
Subjective healthy status	Severely unhealthy	3(0.8)
	Unhealthy	60(15.7)
	Moderate	144(37.8)
	Healthy	139(36.5)
	More healthy	35(9.2)

2.Level of self-Esteem, rejection sensitivity, and depression

The participants' average self-esteem score was 28.8 points, while the mean rejection sensitivity score was 42.2 points, which are normal. The participants' level of depression averaged 18.5 points as shown in Table 2.

Table 2.Levels of self-esteem, rejection sensitivity, and depression

Variables	Min.	Max.	Mean	SD	Item	
					Mean	SD
Self-esteem	10	40	28.8	5.0	2.9	.05
Rejection sensitivity	16	100	42.2	11.8	2.6	0.2
Depression	0	60	18.5	10.7	0.9	0.5

3. Correlation of self-esteem, rejection sensitivity, and depression

The results of correlation among self-esteem, rejection sensitivity, and depression are shown in Table 3.

Table 3. Correlations among self-esteem, rejection sensitivity, and depression

	1	2	3	4	5	6	7
1. Self-esteem	1						
2.Anticipated rage	−.026	1					
3.Anticipated anxiety	−.377**	.063	1				
4. Overreaction	−.387**	.082	.551**	1			
5.Rejection perception	−.307**	.071	.436**	.590**	1		
6.Rejection sensitivity	−.390**	.125*	.787**	.823**	.758**	1	
7. Depression	−.609**	−.067	.390**	.447**	.344**	.449**	1

**: p<0.01

4. Mediating effect of rejection sensitivity

The validity of the mediating effect was analyzed as follows.Self-esteem reduces rejection sensitivity (Hypothesis 1).Self-esteem reduces the level of depression (Hypothesis 2).Self-esteem reduces depression level by lowering the level of rejection sensitivity (Hypothesis 3).The results of the three-step hypothesis test are shown in Table 4.

In the first step, self-esteem was significantly predictive of rejection sensitivity. The results showed that self-esteem had a significant effect on rejection sensitivity (β = −. 390, p< .001).After verifying whether self-esteem significantly predicts depression in Step 2, self-esteem was shown to have a significant effect on depression (β = −.609, p< .001).

In the third step, the effects of self-esteem and rejection sensitivity on depression were examined, showing that both self-esteem and rejection sensitivity had significant effects on depression. The effect of self-esteem on depression was less than at the second stage (Stage 2: β = −.609, Stage 3: β = −.512). This suggests that rejection sensitivity has a partial mediating effect between self-esteem and depression.

Finally, the Sobel test was used to test the significance of the indirect effects of self-esteem on depression through rejection sensitivity (Sobel's t: Z

= −4.817, p< .001). Therefore, rejection sensitivity is partially mediated by the effect of self-esteem on depression, and the associated partial parametric model is shown in Table 5.

Table 5. Sobel test of the mediating effect of rejection sensitivity

Path	a(SEa)	b(SEb)	Z (p)
Self-esteem → Rejection sensitivity	−.92	.407	−6.265
→ Depression	−.112	−.042	(< .001)

Discussion

This study found that the mean score for self-esteem was 2.9 out of 4 points, which was lower than the 3.03 points found in a study by Lee[6] using the same measurement tool for nursing students, but higher than the 2.89 points found in a study by Jung and Shin[18], indicating that the difference in the mean scores between these studies was not large, but rather they had generally similar results.

In this study, the mean score for rejection sensitivity was found to be 2.6 out of 5 points. Since related studies using the same instrument are rare, this finding was compared with the results of a study of junior college students using the same instrument[19]in which the mean score for rejection sensitivity was 2.5 points. The difference in the mean scores for rejection sensitivity between the studies was not large. In addition, the score found this study was equivalent to 52% of the instrument's maximum total score, which was estimated to converge to a normal distribution. The mean score for depression was found to be 0.9 out of 3 points, equivalent to 30% of the instrument's maximum total score, and higher than the 0.61 points (20.3%) found in a study by Yoo[20] using the CES-D for nursing students, but lower than the 1.84 points (61.3%) in a study by Lim etc.[21]. The reasons for such a large difference in depression score between studies involving similar subjects can be inferred as follows. All three studies used the CES-D tool, but this study used the Integrated Korean adaptation of the CES-D[16], whereas the other studies used a different version of CES-D translated and modified by different researchers. Therefore, even if the questions are similar in context, the possibility cannot be ruled out of differences in mean scores in different adaptations. Therefore, further studies are needed to examine the agreement between various versions of the CES-D.

Table 4. Mediating effect of rejection sensitivity

Step	Independent variable	Dependent variable	Unstandardized		Standardized	t	p
			B	SE	β		
Step 1 (route A)	**Self-esteem**	**Rejection sensitivity**	**−.92**	**.112**	**−.39**	**−8.235**	**< .001**
	R2 = .150, F = 67.812						
Step 2 (route B)	Self-esteem	Depression	−1.303	.087	−.609	−14.958	< .001
	R2 = .370, F = 223.736						
Step 3 (Independent variable)	Self-esteem	Depression	−1.095	.091	−.512	−12.08	< .001
Step 3 (Parameter)	Rejection sensitivity		.226	.038	.25	5.893	< .001
	R2 = .421, F = 139.186						

The results of this study found that there were significant negative correlations among self-esteem, rejection sensitivity, and depression. Previous study[6] involving nursing college students have shown negative correlations between self-esteem and depression, supporting the results of this study.

Rejection sensitivity among college students is a concept that has recently emerged as an issue, and no related previous studies of similar participants could be found. However, one study of female college students[22] reported a positive correlation between rejection sensitivity and depression, supporting the results of this study.

This study investigated the mediating effect of rejection sensitivity on the relationship between self-esteem and depression among nursing students. The results showed that rejection sensitivity played a partial mediating role in the relationship between self-esteem and depression, and that self-esteem had a direct effect on depression. The results of this study are in line with previous studies showing that there was a significant positive correlation between self-esteem and interpersonal relations[6], that rejection sensitivity increased interpersonal anxiety[23], and that there was a significant negative correlation between interpersonal relations and depression[6]. The partial mediating role of rejection sensitivity found in this study not only confirmed the importance of addressing rejection sensitivity in depression as a way to improve depression among nursing students, but also suggested that self-esteem is still important. This study found that increasing self-esteem and lowering rejection sensitivity in nursing college students is a way to reduce depression more effectively. Therefore, cooperative efforts between nursing educators and nursing leaders are needed to change nursing students' depression more positively.

Conclusion

Depression of nursing students is an important variable for emotional management that can affect not only academic work but also transfer to patients as prospective nurses. This study found the mediating effect of rejection sensitivity in the relationship between self-esteem and depression among nursing college students. The results of this study are expected to be used as the basis for developing specific intervention programs designed to reduce the depression level of nursing students.

Comparison of knowledge and Performance after Cardiopulmonary Resuscitation Training at 3, 6, 9 Months

Tai-Hwan Uhm[1], Jee-Hee Kim[2], Sang-Kyu Park[3], Eun-Jwoo Kwag[4], Young-Lim Ham[5]

[1]Department of Emergency Medical Services, Eulji University, Rep. of Korea, [2]Department of Emergency Medical Services, Kangwon National University, Rep. of Korea, [3]Department of Emergency Medical Technology, Gachon University, Rep. of Korea, [4]Department of Emergency Medical Technology, Daewon University College, Rep. of Korea, [5]Department of Nursing, Daewon University College, Rep. of Korea

Abstract

Purpose: Assuming that attitude education for basic cardiopulmonary resuscitation contributes to delaying the declining period, the purpose of this study was to determine retention of knowledge and performance after cardiopulmonary resuscitation (CPR) training.

Method: Total 90-minute training consisting of a 30-minute lecture, a 30-minute practice by non-feedback mannequin (Actar 911 Squadron™; Vital Signs, New Jersey, USA), and a 30-minute attitude education (such as prevention of brain damage progression; confidence in ability to perform correct compression; understanding of damage caused by compression; ability to overcome the patient's appearance of distress; awareness of exemption from liability; confidence in the subject's physical capacity; low probability of infection) was conducted with 256 undergraduate students at Eulji University in accordance with 2015 AHA guidelines for layperson adult CPR. A self-assessing Likert scale (1, not at all; 2, not really; 3, undecided; 4, somewhat; 5, very much) was used before and after basic CPR training in three-month intervals (total of five times: March, May and September 2015, and December 2015, February and June 2016) to assess knowledge (how much you know about CPR) and performance (how much you can do CPR). Repeated measures ANOVA were used at α=.05 (2-side) of type I error rate to determine change in knowledge and performance scores over time.

Findings: Statistically significant difference in knowledge (epsilon, .891) was found (p<.001), in which the Bonferroni method was applied as post hoc analysis. There was a difference in knowledge score between before-training and months three, six, and nine. However, no difference in knowledge scores between months three, six, and nine, implying that knowledge had been retained at least for nine months. Statistically significant difference in performance (epsilon, .831) was found (p<.001), in which the Bonferroni method was applied as post hoc analysis. There was difference in performance score between before-training and months three, six, and nine. However, no difference in performance score was found between months three, six, and nine, implying that performance had been retained at least for nine months.

Applications: It was determined that knowledge and performance have been retained at least for nine month after basic CPR training combined with attitude education. Knowledge and performance scores that have improved compared to that before training were consistently maintained after training. Results of this study show lengthier retention than other studies, suggesting that attitude education added to basic CPR training delays decline of knowledge and performance.

Introduction

Re-certification of CPR is generally conducted in two-year intervals. However, knowledge and

performance start rapidly declining three to 12 months after training [1-3]. Retraining was conducted six-nine months after certification for retention of performance, resulting in improvement of chest compression and reduction in defibrillation time [4-8]. There is no clear instruction for retraining method and time for basic CPR re-certification. However, it is recommended for high potential group to provide basic CPR to provide opportunities of self-learning or training as frequent training improves performance and confidence of trainees.

The best mechanism for retention of basic CPR performance is unknown while being supplemented as needed. The best time and method of supplementation have not been determined. Thus, there is an unmet need to determine training methods, retraining intervals and retraining methods for prevention of decline. Repeated training via video materials facilitates improvement of knowledge, performance, and attitude of trainees. Attitude training has a positive effect on willing trainees [9-11]. Attitude training to encourage the will of trainees to provide basic CPR is expected to delay decline as is improving the training effect.The purpose of this study was to determine retention of knowledge and performance when attitude education was added to basic CPR training.[2]

Method

Total 90-minute training consisting of a 30-minute lecture, 30-minute practice by non-feedback mannequin (Actar 911 Squadron™; Vital Signs, New Jersey, USA), and 30-minute attitude education (such as prevention of brain damage progression; confidence in ability to perform correct compression; understanding of the damage caused by compression; ability to overcome the patient's appearance of distress; awareness of exemption from liability; confidence in the subject's physical capacity; low probability of infection) was conducted five times with 256 undergraduate students from five departments at Eulji University in accordance with 2015 AHA guidelines for layperson adult CPR. A self-assessing Likert scale (1, not at all; 2, not really; 3, undecided; 4, somewhat; 5, very much) was used before and after basic CPR training in three-month intervals (total of five times: March, May, and September 2015, and December 2015, February and June 2016) to assess knowledge (How much you know about CPR) and performance (How much you can do CPR). Participating students were provided sufficient time to think and provide consent for the investigation. They were allowed to withdraw their consent at any time, even after the investigation, with no penalty. There was no participant who withdrew consent, while there were 14, 42, and 40 non-respondents at months three, six, and nine, respectively.

Status of data collected was presented as frequency (%) for non-continuous variables as well as mean and standard deviation for continuous variables, by using SPSS 21.0 for Windows (IBM Inc, New York, USA). Repeated measures ANOVA were used at α=.05 (2-side) of type I error rate to determine change in knowledge, performance and attitude scores over time as seen in the table. [table 1].

Table 1. Number of Respondents over Time Intervals N=256

Major	Time intervals				
	Before class	After class	3 months later	6 months later	9 months later

Discussion

It was determined that knowledge and performance had been retained at least for nine months after basic CPR training combined with attitude education. Knowledge and performance scores that had improved compared to that before training were consistently

maintained after training. Knowledge and performance scores decreased over time but was maintained to some degree by month nine; thus, may have been maintained by month 12. Provided that knowledge and performance after training are known to decline since months 3-12 [12-14], such retention is considered quite lengthy among other relevant studies. Added attitude education seemed to delay decline of knowledge and performance.

In other studies, some barrier variables have been determined [15-16] and an effort to reduce them was made by attitude education to enhance willingness variables [17]. However, in this study, 30 minutes of attitude education added was expected to extend training by retaining knowledge and performance for a considerable period, as well as positively influence willingness to engage in basic CPR training. Thus, attitude education to enhance willingness should be included in basic CPR training. As observed in studies that retained knowledge and performance by continuous training conducted with medical practitioners [18], training effect can be increased by training adjusted to the extended training cycle.

Considering increased willingness among study groups-formed by university students-[19]on attitude education, it is estimated that attitude education influences the retention period. However, 90 minutes of training lengthier than[20-21] and different from short frequent retaining sessions of recent trend may influence the retention period, must be well organized. Additionally, there is a possibility that the retention period increased as this study was conducted among health-related major students with a high level of learning ability compared to typical people.

Although this study used 30:2 conventional CPR in training, compression-only CPR training [22] that is simplified for convenience must be studied relative to if it extends the retention period of knowledge and performance.

Conclusions

In conclusions, there is a need to investigate the retention period using knowledge scores with theoretical test and performance scores as practical tests in future studies. Also, the effect of attitude education must be determined by randomized controlled trials, as this study was not a comparison with a control group in which attitude education was not provided.

Factors Related to Early Childhood Caries Using Infant Examination

Youn-Soo Shim[1], So-Young Park[2], Jong-Bin Kim[3], Ji-Sun Shin[3], So-Youn An[4]

[1]Department of Dental Hygiene, Sunmoon University, Korea, [2]Department of Dental Hygiene, Wonkwang Health Science University, Korea, [3]Department of Pediatric Department, School of Dentistry, Dankook University, Korea, [4]Department of Pediatric Dentistry, College of Dentistry, Wonkwang University, Korea

Abstract

Background/Objectives: The results of this study showed that dental caries increased with age. The target audience is the infants who visited the dental clinic of some university dental clinics in Korea. **Methods/ Statistical analysis**: The results of the analysis of the surveyed data are expressed as frequencies and percentages. Chi-square tests were used to examine the distribution trends and ECC correlations for each study group and questionnaire item. A total of 324 records of oral examinations of infants and children were analyzed.

Findings: Early childhood caries were 19.6% in 2 years old, 64.4% in 4 years old and 70.1% in 5 years old. As age increased, dental caries tended to increase.Differences in oral health perception among early childhood caries were significantly correlated with early childhood caries, experience of tooth pain in infants and young children, and caries perception of dental caries. Differences in oral health perception among early childhood caries were significantly correlated with early childhood caries, experience of tooth pain in infants and young children, and caries perception of dental caries. Early childhood caries 61.7% Early childhood caries was as high as 83.9% in the past month when a child has complained about toothache. For questions regarding the number of times children consume sugar and sticky snacks during the day, 49.6%, 47.1%, and 27.6% of the subjects at the first, second, and third examinations, respectively, consumed sugary snacks 2 - 3 times or more a day, and the difference was statistically significant.

Improvements/Applications: It is necessary to actively promote oral health checkups for infants and activate oral health services.Development of a program on oral health should be active for infants.

Keywords**:** *Dental caries, Dental visit, Early childhood caries, Infants, Toothache*

Introduction

Early childhood caries (ECC) refers to the presence of one or more caries in infant and toddler infants, a missing tooth in caries or a filled tooth[1]. Dental caries in infants and infants have problems such as toothache, difficulty in chewing, loose nipples, and infection.Early childhood caries can cause malocclusion and dental development of permanent teeth after growth, and can interfere with healthy growth by affecting growth[2]. Therefore, systematic oral health preventive care from infant to permanent tooth is very necessary.

During infant oral health screening, consultations regarding oral health awareness, oral health-related habits, and oral symptoms are conducted based on a questionnaire answered by the parents[3]. Then, tooth evaluations, oral hygiene screening and other examinations are performed. According to the results of the examination, parents are given instructions regarding necessary oral health education as well as follow-up recommendations and counseling[4-7].Parents' knowledge, awareness and attitude towards child oral health are closely related to the maintenance and

Corresponding Author :
So-Youn An,
9543sue@hanmail.net

promotion of oral health in children[8-9]. A number of previous studies have examined parents' perceptions of oral health, children's habits, and their association with dental caries[10-12]. However, no studies have been conducted using infant oral health examination screening.

The purpose of this study was to investigate the oral health awareness of the parents and the oral health habits of the children and to evaluate the association of these factors with ECC using infant oral examination questionnaires. Dental caries is a chronic infectious disease that involves a combination of time, fluoride, saliva, lifestyle, and socioeconomic factors.In order to establish an appropriate preventive strategy, evaluating individual caries risk factors and determining caries risks must be preceded, and in order for the caries risk assessment to be effective, risk factors including biological predisposition, prevention factors, and clinical screening elements must be included[13-15].

Therefore, it is necessary to make an effort for more accurate prediction of caries risk by establishing a relationship with caries occurrence by reflecting the biological factors causing dental caries. Recently, methods to identify S. mutans in saliva without bacterial culture process as well as the characteristics of saliva have been developed to help clinicians determine caries risk and apply it to medical care. According to the American Academy of Pediatric Caries for Early Childhood Caries5, early childhood caries is a unique pattern of caries associated with frequent or long consumption of liquids containing carbohydrates that can ferment, which is inadequate to reduce the risk of early caries. It was suggested that feeding practices should be suppressed. The American Academy of Pediatric Caries Policy on Early Childhood Caries: Don't go to sleep with a bottle, don't feed breast milk at night, drink it with a cup when you're close to 1 year old, weaning at 12-14 months Avoid repeated drinking of fermented carbohydrate-containing liquids into a bottle or no-spill training cup, oral hygiene if the first teeth erupt. Provide oral health counseling within 6 months and 12 months after eruption, and attempt to investigate and lower mutans streptococci levels in mothers or caregivers. However, 75.5% of the infants in this study had not visited the dentist since birth. In an analysis of the health screening program for infants and young children conducted in 2009[16], 76% of the infants aged 18 - 24 months had not visited the dentist since birth, which is similar to the results of this study. As age increased, the proportion of dental visits significantly increased.

In Korea, infant health checkups are conducted to systematically manage the physical growth and development of infants and young children according to the age of infants and to provide a health care program desirable to their caregivers.The purpose of this study was to investigate the oral health awareness of infants and toddlers by using the results of oral examinations and to investigate the relationship between infant and childhood caries.

Method

This study was approved by the Institutional Review Board (IRB) of OO University Dental Hospital (W1718/001-001). The target audience is the infants who visited the dental clinic of some university dental clinics in Korea. A total of 324 records of oral examinations of infants and children were analyzed. The subjects of the study were 143 first, 104 second, 77 third, and 324 oral examinations records of infants and toddlers were analyzed. For the consistency of the analysis results, three trained researchers conducted the analysis. The questionnaire for infants and toddlers was set as dental history, oral health perception items, and oral health habits. To ensure the consistency of the analysis results, one researcher conducted the entire analysis. The infant oral health examination questionnaire consists of questions related to dental history, oral health awareness, and oral health habits.Questions related to oral health habits are divided into sugar intake, oral hygiene, and fluorine use. The results were analyzed for each question and the results were analyzed. The correlation between the results of questionnaire preparation and dental caries was evaluated by checking the presence of caries.

Statistical analysis was performed using SPSS 24.0 (SPSS Inc. Chicago, IL, USA). The results of the analysis of the surveyed data are expressed as frequencies and percentages. Chi-square tests were used to examine the distribution trends and ECC correlations for each study group and questionnaire item. The significance level was set at a 0.05 probability level.

Result and Discussion

1. Early childhood caries differences according to age of infants

Early childhood caries were 19.6% in 2 years old, 64.4% in 4 years old and 70.1% in 5 years old. As age

increased, dental caries tended to increase. This was statistically significant [Table 1].

Table 1. Early childhood caries differences according to age of infants

	Years				
	2years	**4years**	**5years**	**X2**	**P**
ECC					
Yes	28(19.6)	67(64.4)	54(70.1)	72.455	0.000***
No	115(80.4)	37(35.6)	23(29.9)		

2.Differences in oral health perception among early childhood caries subjects

Differences in oral health perception among early childhood caries were significantly correlated with early childhood caries (p = 0.000), experience of tooth pain in infants and young children, and caries perception of dental caries (p = 0.000). In other words, early childhood caries (61.7% Early childhood caries was as high as 83.9% in the past month when a child has complained about toothache. Table 2 shows that early childhood caries (46.3%) were significantly higher when the caregiver recognized dental caries symptoms [Table 2].

Table 2. Differences in oral health perception among early childhood caries subjects

	Early Childhood Caries (ECC)			
	Yes	**No**	**X^2**	***P***
Dental visit				
Yes	92(61.7)	55(31.4)	29.842	0.000***
No	57(38.3)	120(68.6)		
Toothache				
Yes	125(83.9)	10(5.7)	9.255	0.002**
No	24(16.1)	165(94.3)		
Dental caries				
Yes	69(46.3)	13(7.4)	64.618	0.000***
No	48(32.2)	103(58.9)		
Not know	32(21.5)	59(33.7)		
Tooth-brushing frequency				
Favorable	126(84.6)	123(70.3)	9.222	0.102
Poor	23(15.4)	52(29.7)		

3.Questions related to sugar intake

For questions regarding the number of times children consume sugar and sticky snacks during the day, 49.6%, 47.1%, and 27.6% of the subjects at the first, second, and third examinations, respectively, consumed sugary snacks 2 - 3 times or more a day, and the difference was statistically significant (p = 0.005). On the question regarding the daily intake of carbonated beverages and

soft drinks, 18.3%, 7.7% and 6.5% of the respondents at the first, second and third answered that their children consumed more than 2 per day. The difference was statistically significant (p = 0.009) [Table 3].

Table 3.Questions related to sugar intake

	Years				
	2years	4years	5years	X2	P
Sticky snack					
0-1	71(50.4)	55(52.9)	55(72.4)	10.498	0.005*
2-3	70(49.6)	49(47.1)	21(27.6)		
Carbonated or soft drink					
0-1	116(81.7)	96(92.3)	72(93.5)	9.341	0.009*
2-3	26(18.3)	8(7.7)	5(6.5)		

4.Questions related to oral hygiene

For the question asking whether the parents or the child had learned to brush their teeth at a dental office or public health center, 80.4%, 68.3% and 45.5% of the first, second and third respondents answered no, respectively. Overall, uneducated rates were higher, but as age increased, educational experience increased. This difference was statistically significant (p = 0.000). For the question asking if the child's teeth were cleaned regularly, 83.9%, 88.5%, and 92.2% answered yes in the first, second, and third examinations. However, there was no statistical significance in the difference among the periods (p = 0.193). For the question regarding the number of brushings, fewer than two was considered inappropriate; inappropriate responses were given by 37.8%, 15.4%, and 6.5% parents in the first, second and third examinations, respectively. As age increased, the number of brushings tended to increase, and the difference was statistically significant (p = 0.000) [Table 4].

Table 4.Questions related to oral hygiene

2years		Years			X^2	p value
		4years	5years			
Tooth brushing instruction	Yes	28 (19.6)	33 (31.7)	42 (54.5)	28.219	0.000
	No	115 (80.4)	71 (68.3)	35 (45.5)		
Regular brushing	Yes	120 (83.9)	92 (88.5)	71 (92.2)	3.286	0.193
	No	23 (16.1)	12 (11.5)	6 (7.8)		
Tooth brushing Frequency	Favorable	89 (62.2)	88 (84.6)	72 (93.5)	32.697	0.000
	Poor	54 (37.8)	16 (15.4)	5 (6.5)		

5.Questions related to fluoride use

On the question asking whether the toothpaste the child uses included fluoride, inappropriate answers were yes for children younger than 2 years and no or don't know for children older than 2 years. A total of 45.5% of the respondents at the first examination, 35.6% at the second, and 20.8% at the third answered inappropriately. As the child's age increased, the appropriate use of

fluoride toothpaste was more appropriately, and the difference was statistically significant (p = 0.001). The percentages of patients who did not use the recommended amount of toothpaste were 61.5%, 39.4% and 33.8% at the first, second and third examinations, respectively. As the child's age increased, toothpaste usage became more appropriate; the difference among the groups was statistically significant (p = 0.000) [Table 5].

Table 5.Questions related to fluoride use

1st		Period			X^2	P value
		2nd	3rd			
Fluoride toothpaste	Favorable	78 (54.5)	67 (64.4)	61 (79.2)	13.207	0.001
	Poor	65 (45.5)	37 (35.6)	16 (20.8)		
Amount of toothpaste	Favorable	55 (38.5)	63 (60.6)	51 (66.2)	19.818	0.000
	Poor	88 (61.5)	41 (39.4)	26 (33.8)		

Conclusion

This study analyzed the questionnaires of the oral health screening program for infants and young children conducted in Korea as part of public oral health policy. The results of this study showed that the awareness of oral health of infants and children and the oral health habits of children were identified and the main factors affecting the occurrence of ECC were identified.

Previous research on general health checkups for infants and toddlers has been relatively widely published, but research on oral health checkups is insufficient. In this study, the research subjects are restricted to children and caries in some parts of Korea and there is a limit to generalization to other areas. This study has limitations in that the subjects were limited to children in the OO area and the number of subjects was low. However, this is the first study to analyze the responses to the infant oral health screening questionnaire used in the health screening project, which is included in the national policy. Through our analysis, we were able to understand parent's perceptions of their children's oral health and the child's oral habits and determine the factors related to the occurrence of ECC. More detailed investigations related to each question will be needed in the future. Although oral health screening for infants and children has been conducted since 2007, there is little data on the effectiveness of the system, and there is no national study. While there are many studies of infant health screening in pediatrics, there was no study of the use of infant health screening in pediatric dentistry. Therefore, it is necessary to actively promote oral health checkups for infants and young children and activate oral health services. In addition, the development of programs on oral health care education and methods should be activated by age and care for infants and caregivers.

Effects of a Mixed Herbal Extract on the Corpus Cavernosum of Male Rabbits

Sun Young Park

Professor, Dept. of Physiology, College of Korean Medicine, Semyung University, Korea

Abstract

Background/Objectives: We aimed to estimate the effects of a mixed herbal extract(MT) of three natural products (FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus) on erectile dysfunction.

Methods/Statistical analysis: Male sexual function was investigated through experiments on the corpus cavernosum of male rabbits. Isolated corpus cavernosum strips were treated with the aqueous extract of MT (0.01–3.0 mg/mL) and with 1 mM calcium chloride (Ca2+) after pretreatment with MT in a Ca2+-free Krebs-Ringer solution. Strips were contracted by treatment with Nω-nitro-L-arginine (L-NNA), indomethacin (IM), and tetraethylammonium (TEA) before MT treatment.

Findings: MT resulted in a significant relaxation of the cavernous body strips to which the maximum contraction was applied by incubation with 3 mg/mL phenylephrine (PE). The relaxation effect of the extract on the cavernous body was not affected by pretreatment with IM or TEA, but was significantly inhibited by pretreatment with L-NNA. The extract significantly inhibited contraction changes increased by extracellular Ca2+ influx.

Improvements/Applications: From the above results, we determined MT exerted a relaxation effect on the corpus cavernosum through an increase in NO production via eNOS and by blocking extracellular Ca2+ influx.

Introduction

Very extensive physical and mental changes may arise from aging; one of the most noticeable physical changes results from the decrease in sex hormone levels. For women, as there is the clear definition for menopause, appropriate prevention and treatment have been investigated socially and medically. In contrast, for men, appropriate prevention and treatment have not been investigated as symptoms from decreased male hormone levels are not clear; in addition, it is not recognized by society as a disease. In 2005, the typical symptoms that men experience as they age and other symptoms accompanying decreased male hormone levels were collectively defined as the male menopause, heralding its recognition as a medical condition [1].

The symptoms of the male menopause arising from a decrease in male hormone levels affect mental, sexual, reproductive, and musculoskeletal function[2]. Sexual function symptoms, the most notable, can be divided further into reduced sex drive, erectile dysfunction, premature ejaculation, and other symptoms related to an individual's sex life. In particular, erectile dysfunction, the most common disease among middle-aged men

Erectile dysfunction refers to the inability to have or maintain an erection. In the 1970s, endothelium-derived relaxation factors were identified as the substances involved in penile erection; and in the late 1980s, these relaxation factors were identified as nitric oxide(NO), prostacyclin, and endothelium-derived hyperpolarizing factors (EDHF) [3-4].

Corresponding Author :
Sun Young Park,
blbee@semyung.ac.kr

Prostacyclin is a substance with relaxing effects that is synthesized and released by cyclooxygenase and prostacyclin synthase from arachidonic acids in the endothelium[5]. The EDHFs activate the K+ pathway, cause hyperpolarization of the cell membrane, deactivate the voltage-sensitive Ca2+ pathway, reduce the Ca2+ concentration within the smooth muscle, and induce relaxation[6]. NO is synthesized and released by NO synthases from L-arginine in nonadrenergic and noncholinergic neurons and the endothelium in the corpus cavernosum. The released NO directly diffuses into smooth muscle cells, adheres to and revitalizes guanylatecyclase, and converts GTP into cGMP. The producedcGMP then activates protein kinase G (PKG). Moreover, the activated cGMP blocks the calcium pathway in the cell membrane, phosphorylates a particular protein that removes intracellular ionized calcium, reduces the overall intracellular calcium concentration, and relaxes the corpus cavernosum smooth muscles and the cavernosal artery[7]. As mentioned earlier, these three factors are derived from the endothelium and are involved in relaxing smooth muscles and blood vessels in the corpus cavernosum. Of these factors, NO was shown to be the most important as NO-cGMP action ultimately relaxes the corpus cavernosum and the cavernosal artery, fills the corpus cavernosum with blood, resulting in an erection.

FructusAmomi Amari has been reported to have relaxation effects in the corpus cavernosum and to improve osteoporosis and muscle atrophy caused by aging [8-9]. Eucommiae Cortex has also been reported to improving reproductive function and male osteoporosis caused by aging[10-11]. BombyxBatryticatus has been reported to have relaxation effects in the corpus cavernosum and to ameliorate depression caused by aging[12-13]. In addition, as a potential formlation to ameliorate the symptoms of the male menopause symptoms overall, Park et al. used an extract that mixed FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus in a particular ratio. By histochemical and immunohistochemical analyses, the authors reported that the extract exerted beneficial effects against depression, reduced reproductive function, decreased sexual function, and bone and muscle problems[2].

Therefore, we believe that the mixed herbal extract of FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus resulting in improved sexual function. Therefore, we conducted an organ bath study in male rabbits.

Method

The present study used New Zealand white male rabbits (Samtako, Korea) with a body weight of approximately 2.5 kg. The animals were acclimatized to the laboratory environment for 1 week with no restrictions on food or water prior to the start of any experiments.

The animal experiments were accomplished in accordance with the approval obtained from the Institutional Animal Care and Use Committee of Semyung University (smecac 18-12-04).

FructusAmomi Amari, BombyxBatryticatus, and Eucommiae Cortex were mixed in a 2:1:1 ratio. The mixture (MT, 400 g) was obtained 40.8 g of powder finally.

Each rabbit was anesthetized with urethane (0.6 g/kg; intravenous injection) and the penis was harvested. The harvested penis tissue was placed in a pH 7.4 modified Krebs-Ringer bicarbonate solution (KCl 4.9 mM, NaHCO3 15.8 mM, MgSO4 1.2 mM, CaCl2 2.8 mM, NaCl 125.4 mM, glucose 12.2 mM, KH2PO4 1.2 mM) and maintained at 4°C. The tunica albuginea and remaining fat around the penis was removed, and cut into 2×2×6 mm strips.

Mixed gas (95% O2 and 5% CO2) was provided from a peristaltic pump, and the modified Krebs-Ringer bicarbonate solution maintained at 37°C was injected into the organ bath (1.5 mL capacity) at a rate of 3 mL/min. One end of the penis strip was connected to the organ bath, and the other end was connected to the force transducer. Subsequently, by using a physiograph (PowerLab, Australia), the changes in tension were recorded.

Before experiments, the penis strips were stabilized for 1 hour in the above conditions, and the micromanipulator (Narishige N2, Japan) was used to apply the passive tension of 1.5 g. After they were stabilized again for 1 hour, the experiments were conducted. When the experiments were conducted successively, the strips were again stabilized for 1 hour before any other treatments were performed.

Phenylephrine (PE; 1 μM) was administered into the penis strips to cause contraction. The alteration in size was recorded after the administration of the mixed herbal extract of FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus at different concentrations

(0.01, 0.03, 0.1, 0.3, 1, and 3 mg/mL).

The penis strips were treated for 15 minutes each in 10 μM indomethacin (IM), tetraethylammonium (TEA), and Nω-nitro-L-arginine (L-NNA). PE (1 μM) was administered to induce contraction, and then the mixed herbal extract of FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus (0.1, 0.3, 1, and 3 mg/mL) was administered to compare the change in size when the IM, TEA, L-NNA, and MB pretreatments were not applied.

To test the effect of extracellular Ca2+ influx on the mechanism of action for the corpus cavernosum relaxation effect, the mixed herbal extract (3.0 mg/mL) was pretreated for 10 minutes in Ca2+-free solution. Then, 1 μM PE was administered to induce contraction; 1 mM Ca2+ was administered to compare the change in size in the absence of the mixed herbal extract pretreatment.

Result

1. The relaxation effect on the MT on of the corpus cavernosum

The penis strips were relaxed significantly by application of the MT extract at 3 mg/mL (Table 1, Fig. 1).

Table 1. The relaxation effect of the extract on the corpus cavernosum

Treatment	Contraction (g)	Relaxation (%)
PE	1.70±0.41	0

Discussion

Sexual function can be measured mainly by erection. Erection is a phenomenon in which the smooth muscles and blood vessels in the corpus cavernosum are relaxed by a particular stimulus, and it is caused by the activity of endothelium-derived relaxing factors. The relaxation factors include endothelium-derived hyperpolarizing factors (EDHF), prostacyclin (PGI2), and nitric oxides (NOx). The problem with producing these factors increases the tension in smooth muscles and blood vessels in the corpus cavernosum or causes a disorder in the endogenous relaxation mechanism, which may lead to erectile dysfunction. Hence, if we understand the effect and mechanism of a particular drug on smooth muscles and blood vessels in the corpus cavernosum, this may help the development of an effective treatment for erectile dysfunction.

Hence, this author thought that the herbal extract that mixed FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus at a particular ratio, which has already been proven effective to protect the body, would be effective in the amelioration of erectile dysfunction caused by decreased male hormones. Therefore, we studied the effect and mechanism of the extract on the relaxation of the corpus cavernosum in male rabbits.

First, PE was administered to the penis strips to induce maximum contraction. The mixed herbal extract of FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus was administered at different concentrations. The results showed that the penis strips were relaxed significantly by 3 mg/mL extract, which confirmed the relaxation.

Next, an experiment was conducted to determine the mechanism through which the extract relaxed the corpus cavernosum.

In the presence and absence of IM, TEA of pretreatment, 3 mg/mL extract significantly relaxed the penis strips. The comparison revealed no significant difference in the relaxation effects of the extract on the corpus cavernosum.

IM is a substance that prevents prostacyclin production [5]. TEA is a KCa-channel blocker, which activates the K+ pathway and blocks the action of EDHFs that causes hyperpolarization of the cell membrane [6]. Therefore, the absence of no significant difference in the relaxaion effect on the corpus induced by IM and TEA treatment demonstrates that the extract is not involved in prostacyclin and EDHFs, which are the factors relaxing the corpus cavernosum.

In both non-pretreatment and pretreatment of L-NNA, 3 ㎎/㎖ of the mixed herbal extract significantly relaxed the penis strips. However, the comparison of non-pretreatment of L-NNA and pretreatment of L-NNA showed that pretreatment of L-NNA significantly inhibited the corpus cavernosum relaxation effect.

L-NNA is a substance that inhibits eNOS, an enzyme that converts L-arginine into NO through NO synthases in the corpus cavernosum endothelium [14]. As pretreatment with L-NNA significantly inhibited the relaxation effect, it was shown that since it occurred as NO production through eNOS was inhibited, the mixed herbal extract showed its relaxation effect as the extract was involved in NO production through eNOS.

Finally, in the Ca2+-free Krebs-Ringer solution, the mixed herbal extract significantly inhibited the increase of contraction due to the extracellular Ca2+ influx. This finding demonstrates the fact that the mixed herbal extract is involved in the mechanism that blocked

the extracellular Ca2+ influx and relaxed the corpus cavernosum.

According to the experiments that have been conducted so far, the mixed herbal extract increases NO production through eNOS, blocks the extracellular Ca2+ influx, and shows a relaxation effect on the corpus cavernosum.

Conclusion

The following are the conclusions:

1. The mixed herbal extract of FructusAmomi Amari, Eucommiae Cortex, and BombyxBatryticatus significantly relaxed the penis stripsat the concentration of 3 mg/mL.

2. The relaxation effect of the mixed herbal extract on the corpus cavernosum was not affected by pretreatment with IM, TEA, but was significantly inhibited by pretreatment with L-NNA.

3. The mixed herbal extract significantly inhibited contraction changes increased by the extracellular Ca2+ influx.

A Study on the Effects of Eucommiae Cortex on Male Osteoporosis

Ho Hyun Kim[1], Sun Young Park[1], Ki Bong Kim[2], Sang Hyun Ahn[3]

[1]Professor, Dept. of Physiology, College of Korean Medicine, Semyung University, Korea, [2]Professor, Dept. of Korean Pediatrics, Hospital of Korean Medicine, Pusan National University, Korea, [3]Professor, Dept. of Anatomy, College of Korean Medicine, Semyung University, Korea

Abstract

Background/Objectives: To investigate the effects of Eucommiae Cortex on osteoporosis in males, we performed experiments using histochemical methods and dual energy X-ray absorptiometry (DEXA) in aged male mice.

Methods/Statistical analysis: Male ICR mice aged 8 weeks and 50 weeks were used. The extracts of Eucommiae Cortex (EC) were obtained 37.9g. 8-week-old ICR mice were used as controls. The aging group and Eucommiae Cortex group (EC group) included ICR mice aged 50 weeks. EC extract (0.51 g/kg) was dissolved in DW and administered once a day for 6 months.

Findings: EC treatment increased bone mineral density, decreased bone loss on X-ray examination, and increased the distribution of glycosaminoglycan in the bone matrix in dense femoral bone. In addition, EC increased osteopontin (OPN) and osteocalcin (OCN) positivity in osteoblasts, decreased 8-OHdG positivity related to oxidative stress as well as RANKL and MMP-3 positivity, and increased osteoprotegerin (OPG) positivity.

Improvements/Applications: EC reduces aging-induced bone loss and weakening of the bone matrix; inhibits osteoclast action and promotes osteoblast function; reduces degradation of osteoid tissue and oxidative stress in bone.

Keywords:*Eucommiae Cortex (EC), osteoporosis, osteocalcin (OCN), osteopontin (OPN), osteoprotegerin (OPG), Reaction of activation of nuclear factor kappa B ligand (RANKL)*

Introduction

Generally, males have more bone mass and larger skeletal size than females. In addition, men have less age-related bone loss than women because of more periosteal compensation and less endosteal uptake in men [1]. Most osteoporosis treatments and studies that have been carried out so far have focused on postmenopausal women since the age of osteoporosis onset and the rapid increase in the risk of fracture occur later in men than in women. However, the total fracture relaxation rate from the 40s to the 60s is higher in males [2], Approximately 60% of male osteoporosis is secondary osteoporosis with a risk factor that prevents the gaining of peak bone mass or causes abnormal bone loss. Especially, the incidence of osteoporosis is increasing, as the population ages. Therefore, it is necessary to identify the cause of osteoporosis in men and appropriately prevent and control it.

The strength of bone is established by the amount and the quality of bone. Factors affecting bone quality include bone structure, turnover rate, mineralization, and micro-damage. However, since there is no satisfactory index to assess bone quality as a whole, osteoporosis is diagnosed using bone mineral density(BMD) scan, which tests the amount of bone. Usually, BMD is tested using Dual-energy X-ray absorptiometry (DEXA).

DEXA is a standard test for assessing BMD and can be applied to the WHO criteria for osteoporosis diagnosis based on T-score [3-4].

Eucommiae Cortex (EC) is a deciduous tree belonging to the EC family, the dried bark of Eucommia ulmoides Oliver. The cork layer is cut off from spring to summer and the tree bark is dried in the sun [5]. Various studies show that EC affects bone metabolism, but there are no studies on the effects on osteoporosis in men, nor on the mechanism of osteoporosis in men.

The object of this study was to investigate the effect of EC on male osteoporosis using histochemical methods and DEXA to measure bone mineral density in aged male mice.

Method

EC extract was dried using a lyophilizer to measure the weight of the powder (37.9 g).

The experimental group was classified into three groups. The control group used 8-week-old ICR mice without any treatment, and the Aging group and Eucommiae Cortex group (EC group) used 50-week-old ICR mice. In the aging group, 0.5 ml of DW was administered once a day for six months without any treatment, EC extract (0.51 g/kg) was dissolved in DW and administered once a day for six months in the EC group.This animal experiment was conducted under the approval of the Semyung University Animal Experiment Ethics Committee (SMECAE 18-12-04).

Bone loss was analyzed by x-ray absorptiometry (Inalyzer, Medikors, Seoul, Korea) after anesthesia with sodium pentobarbital.

The mice were sacrificed with ether, then fat and muscle were removed from around the femur and fixed with 10% neutral buffered formalin for 24 hours at 37°C. The fixed femurs were treated with decalcification solution (BBC, UK) for 12 hours after washing and embedding in paraffin using standard procedures to make 5-mm thick sections.

Safranin-O-fast green (S/F) staining was performed, followed by optical microscopy (BX51, Olympus, Japan).

Immunohistochemical staining using mouse anti-osteocalcin (OCN) and mouse anti-osteopontin (OPN) was performed to study the distribution of OCN and OPN produced in osteoblasts. First, the bone tissue sections were subjected to proteolysis in proteinase K (20 mg/mL) for five minutes and then were blocked for two hours in 10% normal goat serum. The cells were cultured in a moistened chamber at 4°C for 72 hours with mouse anti-OCN (Santa Cruz Biotech, 1:50) and mouse anti-OPN (abcam, 1:50). Then, the cells were incubated with a secondary antibody, biotinylated goat anti-mouse IgG1 (DAKO, 1: 100) at 37°C for 24 hours and then were responded with an avidin biotin complex kit (Vector Lab) at 37°C for 1 hour. After colorizing in tris-HCl buffer solution(0.05 M) containing HCl (0.01%, pH 7.4) and 3,3'-diaminobenzidine(0.05%), counterstaining was performed with hematoxylin.

Immunohistochemical staining was performed to observe changes in Reaction of activation of nuclear factor kappa B ligand (RANKL, Santa Cruz Biotech, 1:50) and osteoprotegerin (OPG, Santa Cruz Biotech, 1:50) which are involved in osteoporosis pathogenesis, and matrix metalloproteinase-3 (MMP-3, Santa Cruz Biotech, 1:50) involved in osteoid tissue degradation.

Immunohistochemical staining was performed to determine changes in 8-OHdG (1: 100, Santa Cruz Biotech, USA), which is involved in gene damage due to oxidative stress.

Result

1. Effect of EC on Bone Loss in the Femur

Bone loss was increased in the femurs of animals in the Aging group compared to that in the control group, but compared to that in aging group, decreased in the EC group (Figure 1). In addition, BMD, in the Aging group decreased compared to that in the control group, but compared to that in the Aging group increased by 40% in the EC group (Table 1).

Figure 1. Effect of EC on Bone Loss in the Femur. A, Control group; B, Aging group; C, Eucommiae Cortex group

Discussion

EC is an herbal medicine used to strengthen muscles and bones, and to stabilize fetuses [5]. Studies have already been accomplished on the effects of EC in bone. However, these studies have only been conducted in females, and the effect of EC on BMD on osteoporosis were reported, but there is no research on the mechanism.

In this study, we studied the effect and the mechanism of EC on male osteoporosis by using histochemical methods and DEXA, which is used as a representative bone mineral density assessment, in the femurs of aged male mice.

Bones are generally formed of dense bone of an outer layer and spongy bone of an inner layer. The dense bones are hard, thick, and placed where support is needed, such as the long bones or muscles of the legs. Bone continues to form and break down by the action of osteoblasts and osteoclasts, which make bones by forming osteoids, a mixture of collagen and other proteins to which enzymes and hydroxyapatite bind. Recent studies show that osteocalcin and osteonectin assist in the accumulation of calcified substrates. Osteoclasts are multinucleated cells that break down bones, releasing hydrogen ions from calcified substrates to dissolve crystals and secreting enzymes to break down bones [6-7]. At this time, a chemical called RANKL acts. RANKL is a factor that promotes the action of osteoclasts. It binds to RANK, a protein receptor on the surface of macrophage membranes, which induces macrophages to differentiate into osteoclasts and promotes bone resorption by inhibiting apoptosis. Thus, if only RANKL is present in the body, bone mass will continue to decrease as bone degradation and resorption are increased. However, bone mineral density, a measure of bone mass, remains constant in humans until an individual reaches their 50s. This is due to a factor that prevents osteoclasts from promoting bone resorption activity, called OPG. OPG binds to RANK first to prevent RANKL from binding to RANK receptors, thereby interfering with the action of RANKL. As such, osteoclasts break old bones down, and osteoblasts form new bones at the sites where they are degraded, and these events are controlled by OPG and RANKL [8-10].

First, as a result of DEXA test using X-ray absorptiometry, bone mineral density decreased by aging was increased by EC treatment, and decreased bone loss was also confirmed by X-ray test. In addition, the distribution of GAG, a polysaccharide contained in all connective tissues in the dense bone matrix of the femur, was increased by EC.

GAG restores cartilage damage by overcoming the load of articular cartilage, and has the effect of reducing pain and improving exercise capacity in patients with osteoarthritis [11]. Therefore, the results of the previous DEXA test and the present test results offer that EC improves male osteoporosis by reducing bone loss by aging and bone weakness.

Earlier, osteocalcin was mentioned as a substance that helps to accumulate calcified matrix in osteoblasts. OCN is known to be the most sensitive and specific marker for osteoblast activity. In other words, when osteoblast activity increases during bone remodeling, OCN levels in serum increase, which can be used as an indicator of bone formation, and OPN is known to enhance the adhesion and migration of cells involved in bone metabolism with bone tissue [12-13]. These positive

reactions of OPN and OCN were increased by EC, respectively. This means that EC improves osteoporosis in males by increasing osteoblast activity.

The results of this study showed that RANKL and MMP-3 positivity was decreased by EC treatment, and OPG positivity was increased. MMPs are important proteolytic enzymes involved in tissue destruction and tissue reorganization in various diseases such as chronic inflammatory disease, rheumatoid arthritis, skin disease, and cancer, among which MMP-3 regulates the activity of MMP-1 and degrades extracellular matrix [14-17]. In other words, it is thought that EC improves osteoporosis in males by suppressing osteoclast action, promoting osteoblast function, and reducing osteoclastic tissue degradation.

Finally, we examined the effect of EC on oxidative stress in bone. As one of the major products of DNA oxidation, 8-OHdG positivity [18], which is a measure of oxidative stress, was reduced upon administration of EC, suggesting that EC reduces oxidative stress in bone, thereby improving male osteoporosis.

These results suggest that EC reduces osteoclast-induced bone loss and weakening of bone matrix, inhibits osteoclast function, and promotes osteoblast function by increasing the production of OCN and OPN by osteoblasts, increasing OPG levels, decreasing RANKL and MMP-3 levels, and decreasing the degradation of bone tissue and oxidative stress in bone, thereby improving osteoporosis in males.

Conclusion

To study the effects of EC on osteoporosis in males, we extracted the femurs of aging male mice and conducted experiments using histochemical methods and DEXA, which is used as a representative bone mineral density test

EC reduces osteoclast-induced bone loss and weakening of bone matrix, inhibits osteoclast function, and promotes osteoblast function by increasing OCN and OPN production by osteoblasts, increasing OPG, and decreasing RANKL and MMP-3, and decreases the degradation of bone tissue and the oxidative stress in bone, thereby improving osteoporosis in males.

Association between Homeboundness and Depression in the Elderly Population According to Gender

Eun hi Choi[1], Hye-sun Jung[2]

[1]Professor, Department of Nursing, Eulji University, Republic of Korea, [2]Professor, Department of Preventive Medicine, College of Medicine, The Catholic University of Korea, Dept, Republic of Korea

Abstract

Background/Objectives: According to the Korean National Statistics in 2017, suicide was ranked the 5th most common cause of death, and more than half of those who had committed suicide were 60 years of age or older. In this study we investigated the association of homeboundness and depression in the elderly population.

Methods/Statistical analysis: This study was conducted at the Korea National Institute of Health, using questionnaire data from personalized home-visit healthcare services to investigate the association of homeboundness and depression in the elderly according to gender. Data from 56,562 seniors 65 years of age or older who fully provided their answers regarding general characteristics, homeboundness, depression and regular exercise were ultimately selected for analysis in our study. SPSS ver. 18.0 program was used for all data analyses.

Findings: 1. Among subjects in the study, 13.3% were male and 16.2% were female homebound seniors. 2. In elderly males, mild depression was 1.882 times greater and severe depression was 2.919 times greater in homebound seniors compared to those who were not. In elderly females, mild depression was 1.556 times greater and severe depression was 2.540 times greater in homebound seniors compared to those who were not.

Improvements/Applications: Our study revealed a strong positive correlation between homeboundness and depression. Therefore, taking measures to prevent depression in homebound seniors is important, especially by promoting their social activities. Differences in gender with respect to homeboundness and depression should be taken into consideration when managing depression in these individuals.

Keywords: *elderly, homeboundness, depression, gender, Economic status*

Introduction

[3]According to the Korean National Statistics in 2017, suicide was ranked the 5th most common cause of death, and more than half of those who had committed suicide were 60 years of age or older [1]. Depression is known to be one of the leading causes of suicide [2]. In 2005, the Ministry of Health and Welfare reported that 80% of suicides in the elderly were due to depression [3].

Depressive disorders in the elderly can be treated in 60% of the cases, but they are often overlooked due to the lack of attention from seniors themselves as well as others around them[4]. Reportedly, depression is significantly less recognized than other chronic illnesses in the elderly 65 years of age or older [5]. This suggests that both public and individual awareness of depression is low, despite the fact that depression in the elderly increases the risk of suicide and ultimately the death rate.

Homeboundness is a typical example of social isolation. Homeboundness is a state in which the boundaries of one's daily activities are confined to one's home, going outdoors less than once a week [6-7]. According to a study by Lee Su-ae and Lee Gyeong-mi [8], 23.6% of the elderly rarely went outdoors, and many of those homebound individuals suffered from depression [7-8]. A cohort study in Israel that followed-up homebound seniors for 5 years revealed a close association between homeboundness and depression, which can affect the death rate [9].

Homeboundness is an important issue when considering implementing future health policies, since homebound seniors are more susceptible to mental illnesses such as depression [10]. Studies from many countries classified different types of seclusion and analyzed factors affecting homeboundness[6,9-10], particularly the elderly population in Japan [11-14]. In Korea, however, although several studies have investigated the frequency of outdoor activities among the elderly in rural areas [8] and factors related to homeboundness among elderly women in local communities [7], studies that directly focus on the association between homeboundness and depression are lacking.

Since depression occurs in 4.3% of males and 9.1% of females (according to statistics in 2011) [6], gender differences need to be considered when investigating the association between homeboundness and depression.

In this study we investigated the association between homeboundness and depression in the elderly population according to gender using questionnaire data from personalized home-visit healthcare services in 2009, which was provided by the Korea Health Promotion Foundation (affiliated with the Ministry of Health and Welfare) and conducted by health centers across the country

Method

This study used questionnaire data from Gyeonggi-do's personalized home-visit healthcare services, which was conducted in order to provide healthcare service to residents in local communities. A total of 249,724 residents were provided with home-visit healthcare services from Gyeonggi-do health centers in 2009, of whom 108,203 were 65 years or older. Finally, data from 56,562 elderly people 65 years of age or older who fully provided answers regarding general characteristics, homeboundness, depression and regular exercise were selected for analysis in our study.

Any personal information included in the original data was removed, and the remaining information was provided by the Korea Health and Welfare Information Service (affiliated with the Ministry of Health and Welfare) and sanctioned by the Catholic University of Korea Institutional Review Board (MC12QIS10041).

General characteristics included gender, age, economic status, family type, smoking, drinking, regular exercise and subjective health. Regarding economic status, subjects in the near poverty group and recipients of government aid were classified as low-income.

Shinkai[13] defined "homeboundness" as answering "no" to the question "do you go outdoors at least once a week?" Since there is a question "do you go outdoors at least once a week?" among the 20 questions in the elderly assessment chart of personalized home-visit healthcare, individuals who answered "no" to this question were classified as "homebound" in accordance with Shinkai's definition.

To measure depression, we used the short form of the Geriatric Depression Scale, a 15-question scale that was simplified from the KGDS developed and standardized by GiBaek-seok[15]. On a scale from 0 to 15, a score of 0-4 was classified as normal, 5-9 as mild depression, and 10-15 as severe depression.

Result and Discussion

1. Characteristics of the subjects according to gender

Among 56,562 subjects 65 years of age or older, 15,389 (27.2%) were male and 41,173 (72.8%) were female.Homebound seniors consisted of 13.3% males and 16.2% females and the difference was statistically significant between the two genders ($p < .001$).

Among males, 33.8% had mild depression and 9.4% had severe depression; among females, 36.6% had mild depression and 10.9% had severe depression, differences that were statistically significant ($p < .001$) [Table 1].

2. Multiple regression analysis of risk factors for depression

In males, there was a significant association between mild depression and the following factors: economic status, family type, smoking, exercising, subjective

health and homeboundness. Mild depression was 1.882 times greater and severe depression was 2.919 times greater in homebound seniors (p< .001).

In females, there was a significant association between mild depression and the following factors: age, economic status, family type, smoking, drinking, exercising, subjective health and homeboundness. Mild depression was 1.566 times greater and severe depression was 2.540 times greater in homebound seniors (p< .001) [Table 3].

Discussion

This study used questionnaire data from personalized home-visit healthcare services to investigate the association between homeboundness and depression according to gender.

Depression was greater in homebound seniors. This correlates with Lee Jong-cheon's finding that living in seclusion without going outdoors has a significant effect on depression [16]. Shinkai et al. [12] also found that less outdoor activity leads to depression, and a study by Cohen-Mansfield et al. [9] revealed that homebound seniors are more susceptible to depression, and ultimately a higher death rate.

The effect of homeboundness on depression was found to be more significant in males than females, which is likely attributable to more socio-psychological factors that cause depression in females than in males. Additionally, since seniors who exercised at least once per week had less depression than those who did not, we think that promoting outdoor activity or exercising to homebound seniors at least once per week is important.

In this study, in males, 33.8% had mild depression and 9.4% had severe depression, while in females. Overall, the depression scores were higher in females than in males. In a study, which investigated depression in the elderly using meta-analysis [8], a study whose subjects were both low and middle income seniors [17], and a study which observed seniors living in local communities, depression in females was always found to be greater than in males [16]. Likewise, a study whose subjects included seniors from rural areas [8], and a study who analyzed low-income seniors in local communities also revealed the same trend, elderly females displayed more cases of mild and severe depression than elderly males [18].

Additionally, the percentage of homebound seniors was 13.3% in males and 16.2% in females. In several studies, the percentage of homebound seniors was found to be higher in females than in males. In an American study, the percentages of homebound senior males and females were 3.9% and 14.7%, respectively [19], while a Japanese study reported 21.4% and 44.3%, respectively [11]. An Israeli study revealed the same trend [20]. Reportedly, old age, a low level of education and low income are associated with a higher rate of homeboundness[9], which could explain why there are more homebound female seniors than male seniors in Korea. Additionally, according to a study, encouraging any senior who can walk at least 5 meters by him/herself to participate in some type of activity is important [10]. This is a noteworthy point from a sociopsychological perspective, considering approximately 20% of such physically capable seniors are homebound. Therefore, we believe promoting social activity in seniors who are capable of walking at least 5 meters by themselves is important.

Other than homeboundness, factors such as old age, low income, living alone, smoking, drinking, exercising less than once a week and poor subjective health were shown to affect both mild and severe depression. In particular, severe depression was 13.226 times greater

in males with poor subjective health, and 10.241 times greater in females with poor subjective health, indicating a need for measures to promote subjective health in such individuals. Since many homebound seniors suffer from depression, we think emotional support is necessary to improve subjective health in the elderly who are physically incapable of outdoor activities.

The effect of homeboundness on mental health is an important consideration when implementing future health policies, since homebound seniors are more susceptible to mental illnesses such as depression [9,12,16]; an extensive study regarding this issue has yet to be conducted.

Based on the results of this study, we advise the following: First, since there is a significant association between homeboundness and depression, promoting social activity in homebound seniors by encouraging them to go outdoors at least once per week is important. Second, since homeboundness and depression were more prevalent in elderly females than in elderly males, such differences in gender should be taken into consideration while managing depression in these individuals. Third, preventative measures should be implemented for seniors who are at high risk of depression (e.g. living alone, low-income, or homebound).

Conclusion

The influence of homebound is very important, because homebound and mental problem showed a positive correlation. Our study showed a significant association between homeboundness and depression in the elderly 65 years of age or older. Preventing depression in homebound seniors is also important, specifically by promoting their social activities. Additionally, gender differences concerning homeboundness and depression should be considered when managing depression in these individuals.

The Study for Reform of the Korean Care Helpers National Licensing Examination

Sung-HeeBaik[1], Jae-Kwan Koo[2], Hyun-Gyung Kim[3], Tae- Sik Lee[3]

[1]Division of Health Science, Baekseok University, Korea, [2]Department of Social Welfare, Yeonsung University, Korea, [3]Department of Nursing, Baekseok Culture University, Korea, [4]Department of Physical Therapy, Dong-eui Institute of Technology, Korea

Abstract

Background/Objectives: This study aims to propose subject reforms to the NLE for care helpers by including 'Support for Cognitively Stimulating Activities' for long-term care dementia beneficiaries as added work detail.

Methods/Statistical analysis: This study was carried out from August 1, 2016 to August 31, 2017. Study methods first deduced the operational status and problems of the current National Licensing Exam for caregivers. Second, focus group interviews and work detail analyses were conducted on a group of caregivers regarding the newly added service. Third, reforms regarding the subjects of the NLE were developed through public hearings and expert consultations.

Findings: : In July 2016, a system for long-term care institutions exclusively caring for dementia was introduced and the standard services of long-term care included 'Cognitively Stimulating Activities (CTA)' for home visited care among the standard services of long-term care. In doing so, 'Support for Cognitively Stimulating Activities (SCTA)' was added as a work detail for long-term care beneficiaries. Considering this, standard textbooks must be amended accordingly and additional content regarding the newly announced work detail of 'CTA' must be included in the curriculum.

Second, the results of analyzing the work detail regarding 'SCTA' upon surveying 245 caregivers uncovered implementation frequency, importance and acceptance-levels to be on average 3.22/5 points, 3.64/5 points and 2.32/3 points respectively. This reflects a positive level of 'importance' and 'acceptance' on the part of caregivers regarding the 'SCTA' work detail even under limiting circumstances whereby services are only being provided by caregivers who have completed professional training on dementia. In light of these findings, content on 'SCTA' must be included in the licensing examination for caregivers.

Improvements/Applications: First, the standard curriculum for care helpers must be revised. Second, the common standard textbook should be amended. Third, the Welfare of Older Persons Act should be amended.

Keywords: *Health Personnel, Certification, Aged, Long-Term Care, Care*

Introduction

The NLE for Care helpers was first implemented in August 2010 and studies on the work details of care helpers began to be undertaken to determine the basis by which the evaluation criteria of qualifications for the examination would be established [1]. As a result of this, the work detail of a care helper was categorized into 6 missions, 18 domains and work categories, and 64 work elements. Based on this, efforts were made to develop exam questions that consider these specifications regarding the work detail of a care helper.

[4]In addition, in 2013, studies were undertaken to review whether the subjects and questions found within the NLE for care helpers could be considered an

Corresponding Author :
Hyun-Gyung Kim
E-mai: hgkim@bscu.ac.kr

acceptable means of measuring the necessary skills to implement work detail associated tasks on a practical level [2,3]. In light of this, the standards and bases for the NLE for care helpers were identified to secure appropriate levels of feasibility and thus the examination was administered a total of 22 times by July 2017[4].

The elderly population subject to receive long-term care was 6,995,652 in December 2016 out of a total population of 51,696,216, which constitutes 13.53% of the total population [5]. The prevalence of dementia among the elderly population was 9.8% of the total or 648 thousand individuals in 2015. This proportion is expected to rise to 10.4% or 840 thousand individuals by 2020 and 15.1% or 2.71 million individuals by 2050 [6]. According to a Regulatory Impact Analysis Report regarding the pre-announced legislation of a Partial Amendment (proposed) of the Enforcement Rule of the Welfare of Older Persons Act by the Ministry of Health and Welfare [7], approximately 50% of all long-term care beneficiaries as classified by the Long-Term Care Insurance System present symptoms of dementia and approximately 65.8% of elderly users of day-care facilities and 76.5% of day and nighttime care facilities present symptoms of dementia [8].

As part of a National Political Task in response to this rapid climb in dementia patients, a Fifth Long-Term Care Grade (special grade for dementia) was established for dementia patients [9].

The success of this system that entailed dementia exclusive treatment facilities beginning in July 2016, depends on the establishment of programs that train specialized personnel and provide appropriate services designed to lower the rate of cognitive decline [10].The training of specialized personnel capable of providing care for dementia patients is one of the most important factors that determine the quality of provided services [11].

However, despite 8 years having past since the implementation of the Long-Term Care Insurance System, there still is an extreme lack of specialized personnel capable of providing care for dementia patients and this has raised a need to establish short and long term solutions to address this issue.

In order for the NLE for care helpers to include appropriate subjects and questions that are capable of measuring the ability of a care helper to provide care on a practical level, there is a need to reinvestigate the work details of care helpers as they are actually being applied in practice. In light of this, amidst a rapidly changing environment, changes to the work details of care helpers must be analyzed and the NLE for care helpers must also be reviewed as to whether the work details of a care helper are adequately being evaluated within the examination. This in turn should lead to the proposal regarding the means of implementing amendments to the subjects found within the NLE as adequately reflecting the work details of a care helper.

Method

To identify the operational status and problems associated with the NLE and training curriculums for care helpers, this study undertook a literature review in addition to receiving expert consultations.

From the perspective of each phase, first, the necessity of reforms regarding the current NLE for care helpers was investigated. Second, the operational status and problems associated with the NLE for care helpers were identified through literature reviews and expert consultations. Third, a work detail analysis was run in regards to the changes made to the work details of care helpers. Fourth, reforms (proposed) of the licensing examination subjects that reflected the amended care helper work details were developed. Fifth, opinions were collected and organized through public hearings and consultative meetings with experts. Sixth, the means of implementing the finalized NLE for care helpers was developed.

To analyze the work details of long-term care beneficiaries support services for care helpers, the number of long-term care facilities, daytime care facilities and home care services available by each region - Seoul/Gyeonggi-do, Daejeon/Chungcheong-do and Gyeongsang-do - were taken into account to collect proportionate samples in which 100 samples each were collected from each of the three regional groups. Excluding inappropriate responses from 55 respondents, the study included a total of 245 survey results.

The research tools used in this study consisted of general features of the subjects and the work details of care helpers. Survey questions on general features included questions on gender, age, level of education and place of work. Survey questions on care helper work details included the 5 Cognitive Stimulation Activity related work details including preparations for the cognitive stimulation program, implementation of the cognitive

stimulation program, organization of items, evaluations and recording in which implementation frequency (5points), importance (5 points), and acceptance levels (3 points) were surveyed. The Cronbach's α of the survey results was calculated as being .946.

Data collection was undertaken between March 20 and April 28 in 2017. The purpose and subject of research and the method of research were delivered through an official notice to the concerned institutions and those institutions that expressed the intent to cooperate were selected. Upon doing so, a survey study agent handling each region who had been trained regarding the survey guidelines and items of caution visited the institution and distributed the surveys, which were then directly filled out by the participants themselves.

The collected data was statistically processed using SPSS 20.0 and was analyzed using descriptive statistics. More specifically, the general features of the subjects were analyzed with respect to frequency and percentages while the implementation frequency, importance and acceptance levels of the Cognitive Stimulation Activity of the care helpers were analyzed via averages and standard deviations.

Result and Discussion

First, the necessity of reforms regarding the current National Licensing Examination for care helpers was investigated. Considering that the work detail regarding SCSA was added following the work detail analysis of care helpers in 2010 there exist a need to add content regarding the Cognitive Stimulation Activity that was added as a work detail in the training curriculum prior to amending the standard textbook. There should also be questions regarding this work detail as a subject in the NLE. Second, a work detail analysis of the 'SCSA' was undertaken using care helpers as the subjects.

[Table 1] presents the results of the surveys. The survey results of the general characteristics indicated that women accounted for 98.8% of the respondents and that the age group between 50 and 59 was the largest at 48.1%. The largest group in terms offinal education was found to be middle school graduates or lower at 39.0%. The second largest group was found to be high school graduates at 38.6% and those with a vocational degree or higher were found to constitute 22.4%. In terms of the types of institutions, the percentage of subjects handling home care services working from a visited care center was 62.0%. The next highest percentage of subjects were those working in long term care facilities at 27.8% and daytime care facilities at 10.2%.

Table 1.General Features of the Subjects

(N=245, excluded empty responses)

Variables	Categories	N(%)
Gender	Female	242(98.8)
	Male	3(1.2)
Age (years)	≤ 70	7(3.0)
	60~69	68(28.9)
	50~59	113(48.1)
	40~49	38(16.2)
	≥ 39	9(3.8)
Final education	Vocational School or Higher	53(22.4)
	High school	91(38.6)
	Middle school or lower	92(39.0)
Institution Type	Long-term Care Facility	68(27.8)
	Visited Care Services	152(62.0)
	Daytime Care Services	25(10.2)

[Table 2] presents the results of the surveys. The implementation frequency of the Cognitive Stimulation Activity work detail for long-term care beneficiaries surveyed on a five-point scale presented an average of 3.22 points, which indicated, such activities to have been implemented at a 'more than average' level. The importance of the work detail analyzed on a five point scale presented an average of 3.64 points, which indicated, the work detail to be considered as being 'important.' The results of analyzing work detail acceptance levels on a 3 point scale presented an average of 2.32, which indicated a 'positive level of acceptance'. The care helper survey results indicated a high level of importance and acceptance of the services to support Cognitive Stimulation Activity. Considering this, it is recommended that content regarding such services become included in the licensing examination for care helpers.

Table 2. Long-Term Care Beneficiary Cognitive Stimulation Activity Support Work Detail

Implementation Frequency, Importance and Acceptance Level

Work	Element(s)	Implementation Frequency		Importance		Level of Acceptance	
		Mean	SD	Mean	SD	Mean	SD
Preparation of Cognitive Stimulation Program	Planning of Cognitive Stimulation Program	2.93	1.37	3.62	1.26	2.16	0.69
	Preparation of Textbook and Tool	2.91	1.37	3.58	1.24	2.17	0.72
Implementation of Cognitive Stimulation Program	Cognitive Training Workbook Activities	3.07	1.43	3.66	1.23	2.33	0.70
	Art Activities	3.07	1.41	3.67	1.25	2.32	0.70
	Recollection Activities	3.33	1.34	3.71	1.18	2.40	0.73
	Hand Exercises	3.48	1.29	3.74	1.89	2.45	0.70
	Cerebral Stimulation Activities Using Cognition Cards	3.07	1.44	3.61	1.23	2.32	0.76
	Diary Writing	2.58	1.40	3.11	1.33	2.09	0.76
	Sound Recognition Training	3.00	1.44	3.42	1.23	2.33	0.75
	Physical Activities	3.69	1.26	3.85	1.12	2.50	0.67
	Music Activities	3.24	1.49	3.60	1.29	2.32	0.74
	Daily Inspection Activities	3.49	1.47	3.74	1.23	2.44	0.69
Item Organization	Organization of Stationaries	3.58	1.37	3.76	1.21	2.38	0.71
Evaluation	Evaluation of Cognition Training Tool Application Effects	3.00	1.38	3.52	1.24	2.19	0.74
Record Keeping	Record of Provision of Long-Term Care Benefits	3.80	1.36	3.93	1.20	2.46	0.67
Total		3.22	1.39	3.64	1.28	2.32	0.72

Lastly, a means of implementing reforms on subjects included within the NLE for care helpers was developed. First, a standard by which examination questions can be centered on the work detail of a care helper was established. Through the analysis of work details and review activities undertaken above, the 'Cognitive Stimulation Activity Program' was found to be lacking in terms of its level of implementation during the activities of care helpers that provide care services to elderly individuals suffering from dementia. There were no content that dealt with such a work detail within the training curriculum for care helpers or the criteria through which the National examination questions were developed. This indicated a need for the training curriculum of care helpers to be amended and that the standard by which the NLE questions were developed also needed to be amended.

Discussion

When examining the development standards regarding the development of questions for the practical skills test subjects of the current NLE for Care helpers, the examination includes sections on specialized care safety techniques, a specific domain on 'cognitive stimulation' in the dementia care domain and a question on 'cognitive stimulation activity.' Despite this, this question has never actually been used in an actual test. Based on the results of this study, a question on 'Cognitive Stimulation Activity' must be developed and applied to verify the work detail skills of care helpers.

The questions should be developed especially with respect to the 10 cognitive stimulation programs currently under development by the Ministry of Health and Welfare and provided to long-term care beneficiaries through the National Health Insurance Corporation, which include cognitive training workbook activities, art activities, recollection activities, hand exercises, diary writing, sound recognition training, physical activities, musical activities, daily routine scheduling activities.

Conclusion

When examining the development standards regarding the development of questions for the practical skills test subjects of the current NLE for Care helpers, the examination includes sections on specialized care safety techniques, a specific domain on 'cognitive stimulation' in the dementia care domain and a question on 'cognitive stimulation activity.' Despite this, this question has never actually been used in an actual test. Based on the results of this study, a question on 'Cognitive Stimulation Activity' must be developed and applied to verify the work detail skills of care helpers.

The questions should be developed especially with respect to the 10 cognitive stimulation programs currently under development by the Ministry of Health and Welfare and provided to long-term care beneficiaries through the National Health Insurance Corporation, which include cognitive training workbook activities, art activities, recollection activities, hand exercises, diary writing, sound recognition training, physical activities, musical activities, daily routine scheduling activities.

The Effect of Health Behavior, Depression and Stress on Metabolic Syndrome in Korean Adults

Kyung-Shin Paek

Department of Nursing, Semyung University, 65 Semyung-ro Jecheon-si Chungcheonbuk-do, 27136 Korea

Abstract

Background/Objectives:The prevalence of the metabolic syndrome is growing. The risk of developing cardio-cerebrovascular diseases is accelerated by metabolic syndrome. This research was to identify the determinants of the metabolic syndrome of Korean adults.

Methods/Statistical analysis: Data from the 7th Korean National Health Examination Survey (VII-1, 2016) was used to analyze 3,377 adults aged 19 to 64 years. The data were analyzed using complex sample analysis that considered stratification, clustering of variables and sampling weights using SPSS/WIN 22.0.

Findings: 32.0% of male and 18.5% of female were affected by metabolic syndrome. The factors related to the metabolic syndrome of both sexes were smoking status, frequency of having breakfast per week, age, body mass index (BMI). The frequency of binge drinking was related to the metabolic syndrome in male and psychological health such as stress and depression were not connected with the metabolic syndrome of Korean adults of both sexes.

Improvements/Applications:It needs to strengthen their right lifestyle to reduce the developing metabolic syndrome in Korean adults. It is required to identify gender differences between psychological health and metabolic syndrome.

Keywords: *Korean adult, Health behavior, Psychological health, Metabolic syndrome, KNHANES*

Introduction

Metabolic syndrome(MS) is closely related to the risk of cardiovascular disease. It raises 2 times of developing cardiovascular disease and 1.5 times of mortality[1]. Prevalence of MS was 20.3% of adults aged 19 and older, 27% of aged 30 and over, 37.7% of the elder over 65 in Korea [2]. Prevalence of MS corresponding to the increasing population of the elderly is steadily going to rise and early detection and management are of vital importance for the treatment of MS [3].

The cause of MS was not to identifyclearly but it was reported that genetic factors such as insulin resistance, socioeconomic and environmental factors interact with each other [4]. Lifestyle such as smoking, drinking, and exercise was one of the important factors related to MS. Smoking raises the levels of triglyceride and LDL cholesterol and it can increase the risk of cardiovascular disease [5]. Excessive drinking causes abdominal obese and elevation of blood pressure,[6] regular exercise reduces the risk factors of MS [7].

Recently, it was reported that psychological factors such as stress and depression are related to MS,[3,7]they lead to increasing the risk of MS, which get the worse a lifestyle of patients with the MS. Stress can increase the levels of blood pressure, blood sugar and triglyceride like components of MS and generate abdominal obese and insulin resistance [8]. Depression causes a rise in stress hormones and weight gain by lower physical activity and it is bound up with abdominal obese [7]. The prevalence of MS was high in person with symptoms and history of depression [3].

Until now, a lot of studies have been conducted about MS, most of the researches were related to the lifestyle of adults. While there are still many insufficient

Corresponding Author:
Kyung-Shin Paek,
Semyung University, kspaek@semyung.ac.kr

studies about the influence of psychological health on MS. Thus, the purpose of this research is to investigate the effects of lifestyle, depression, and stress on MS of Korean adults of both sexes,and to provide basic data for preventing metabolic syndrome of Korean adults.[5]

Method

Participants consisted of 3,377 Korean adults, 39.9%(n=1,348) in males and 60.1%(n=2,029) in females aged between 19-64 years old. Data from the 7th Korean National Health Examination Survey (VII-1, 2016)[9] were used.

Health behavior was assessed using smoking status, frequency of drinking and binge drinking, moderate exercise, frequency of breakfast per week, BMI, menopausal status.

Psychological health was measured as depression and stress. The Patient Health Questionnaire-9,[10] which consists of 9 items with a 4-point measure was used to evaluate depression. Stress was evaluated as 4 points scale of one item, "How much do you usually have feeling stress in daily life?"

Metabolic syndrome has used the standards recommended by abdominal obesity in Korea [11] and National Cholesterol Education Program-Adult Treatment Panel III (NCEP-ATP III) [12]. Metabolic syndrome was classified if it was more than 3 of the 5 components, including pharmacologic treatment

To analyze the data, complex sample analysis that considered stratification, clustering of variables and sampling weights was conducted using SPSS/WIN 22.0. The factors related to MS according to gender was conducted by Multiple logistic regression analysis.

Result

1. General characteristics of non-MS group and MS group

in male, age (x^2=132.18, p<.001), educational level (x^2=20.66, p<.001) marital status (x^2=44.56, p<.001), economic activity (x^2=9.19, p<.05), were significant differences in MS. In female, age (x^2=214.68, p<.001), economic status (x^2=17.06, p<.01), educational level (x^2=121.94, p<.001), marital status (x^2= 96.27, p<.001), menopausal status (x^2=148.22, p<.001), were significant differences in MS.

2. Health behaviors and psychological health of non-MS group and MS group

BMI (t=-3.45, p<.001), smoking status (x^2=8.84, p<.05), drinking frequency (x^2=22.18, p<.001), the frequency of binge drinking (x^2=31.10, p<.001)were significant differences in MS of male. In female, BMI (t=-4.57, p<.001), smoking status (x^2=11.01, p<.01), drinking frequency (x^2=14.14, p<.01), frequency of breakfast per week (x^2=16.12, p<.01) and menopause (x^2=148.22, p<.001)were significant differences in MS.

There was no significant difference between depression, stress and MS of both sexes.

3. Factors associated with MS

As described in table 1, smoking status (OR: 1.640, male/ OR: 2.591, female) frequency of breakfast per week (OR: .471, male/ OR: .542, female), age (OR: 1.114, male/ OR: 1.065, female), BMI (OR: 1.471, male/ OR: 1.466, female) were significant factors related to the MS. The frequency of binge drinking (OR: .442-.466) was related to the MS of male. MS of Korean adults was not connected with stress and depression.

Table 1. Multiple logistic regression analysis of factors associated with Metabolic Syndrome

Discussion

In this study, 32.0%(n=453) of male and 18.5% (n=409) of female had a MS. Study of Kim [13] on Korean workers aged between 30 and 64 used the same data (KNHANES VII-1, 2016) and the same classification criterion of MS reported that 37.3% of male and 21.0% of female. Compared with this study, the prevalence of MS was a bit lower in the present study. When considering the participants aged 20 and over, regardless of their work in the present research, the prevalence of MS for Korean adults showed a similar result. The prevalence of MS is reported in various ways according to classification criteria of MS and statistical analysis, it needs to unify a classification criterion of MS and apply the correct statistical analysis to get precise results of prevalence of MS.

The present study demonstrated that compared to the former smokers and non-smokers, current smokers were 1.64 times of male, 2.59 times of female more likely to develop MS. It coincided with the results of Bermudez et al. [14] which reported that current smokers were higher the chances of developing MS both males and females than non-smokersand current male smokers were much higher development of MS than former male smokers[15] and former smokers were not at high risk of MS compared to non-smokers [14]. Smoking is a global health issue and it is emerging as the main causes of various diseases and death. It requires to promote stop smoking to prevent the development of the MS.

The frequency of breakfast was identified as a significant factor related to MS in this study. The probability of getting MS is 2.3 times higher in men who do not eat breakfast than men who eat breakfast of 5-7 days per week, and 1.84 times in women than having breakfast of 1-4 days per week. This finding is in line with Odegaard et al. [16] that young adults, who eat breakfast daily and 4-5 days per week are less likely to have abdominal obesity, MS, and type 2 diabetes compared to

those who eat breakfast 0-3 days per week. The earlier studies [16-17] showed that the number of breakfast and habitually not eating breakfast were associated with sugar control problem, obesity and MS. Recently, daily breakfast consumption reduced gradually due to the busy life of today. It needs to emphasize the importance of having breakfast.

In this study, the more BMI increases, the more dangerous both sexes develop into MS.It is consistent with the studies that overweight or obese adult men and women were more vulnerable to MS than underweight or normal weight[18] and BMI is a predictor of MS of all ages, and those with BMI above 25 were more likely to have MS than those with BMI below 25[19]. Westernized eating habits are increasing the obesity population and obesity affects components of MS. It has been confirmed that maintaining the proper weight is important to prevent MS.

This study has shown age was a significant risk factor related to MS. This is in line with report [18] that both male and female were more likely to develop MS as their age increase. But, Lim et al. [20] indicated that MS increases dramatically after menopause in their 50s for women, while it increases consistently with age, and decreases slightly after 60s for men. One in three elderly people aged 65 or older contracts the MS,[2] and taking the growing elderly population into account, the likelihood of developing MS is expected to increase. Therefore, it is necessary to develop a strategy of long-term aspect for preventing MS and to reassess the possibility of MS by gender according to age.

This study found that men who had a daily binge drinking or 1 time per month were more likely to have MS than men who did not binge. Lee [21] reported that the MS of men was associated with frequency of excessive drinking. However, Santos et al [22] found that the prevalence of MS of male and female was not linked to alcohol consumption, or a proper amount of alcohol consumption may reduce the progression of MS of both sexes[23]. This discrepancy may be attributed to drinking pattern, drinking behavior among both sexes and drinking culture between countries.

The stress of this study was not a meaningful variable related to MS in both genders. It is not corresponding to an earlier study [24] which reported that psychological social stress of men and women affects the likelihood of progressing MS. In the present study, stress was measured with one question as the degree of stress in daily life. It is required to evaluate the development of MS related to a specific kind of stresses

The current study found that depression was not a significant factor for MS in adult men and women. But Akbaraly et al [25] suggested the symptoms of depression in both sexes were predicted by MS. The higher the score of depression symptoms in women, the higher the severity of the MS [26] and MS among urban Japanese men was linked with depression [27]. The relationship between depression and MS by gender was not consistent.

Conclusion

This study demonstrates that smoking, skipping breakfast, overweight and heavy drinking were risk factors for metabolic syndrome among Korean adults. Therefore, more attention should be paid to promote a lifestyle to prevent metabolic syndrome for adults. Also, it needs to continually identify gender differences between psychological health including stress and depression, and metabolic syndrome.

A Prediction Model of Suicidal Ideation among Male Elderly Living Alone in Korea

Sun Kyung Kim

Assistant Professor, Department of Nursing, Mokpo National University, 1666 Yeongsan-ro, Cheonggye-myeon, Muan-gun, Jeollanam-do

Abstract

Background: The rate of suicide has been of great concern in Korean society and is more problematic among elders living alone. Knowing the gender difference, the present study investigated factors influencing suicidal ideation among male elders living alone.

Method: A cross-sectional study was conducted using data on 2,295 male elders living alone from the Community Health Survey in 2013. Pearson's correlation analysis and path analysis were conducted using SPSS 25.0 and Amos 25.0.

Findings: Most variables showed statistically significant but week correlation with suicidal ideation. In the path model, examined factors explained 43.1% of suicidal ideation, 48.3% of psychological distress, and 53.2% of physical health. Psychological distress was the only factor with a statistically significant influence on suicidal ideation.

Conclusion: The present study revealed the importance of socioeconomic status among male elders and psychological distress had the biggest impact on suicidal ideation. Well-designed interventions to reduce psychological distress with effort to incorporate gender-specific factors may alleviate the risk of suicidal ideation among male elders living alone.

Introduction

Suicide is a serious concern in South Korea with the highest suicide rate among Organisation for Economic Co-operation and Development (OECD) countries. The problem is growing in that suicide was ranked the eighth leading cause of death in 2001, fourth in 2013, and fifth in 2015[1].Recently, Koreans have made efforts to reduce suicide rates. Since 2004, suicide prevention efforts have aligned with one of the seven mental health policies of the National Mental Health Plan in Korea[2]. In addition, in 2011, The Korean government adopted the Act for the Prevention of Suicide and the Creation of Culture of Respect for Life[2].

skkim@mokpo.ac.kr

Despites efforts, suicide has been become a serious issue, especially in the elderly population. Advancements in medicine have extended the life expectancy of human; however, this longevity has generated problems in other parts of society, including higher levels of depression, social isolation, and solitary death among older adults[3]. The aging population is viewed as a major contributor to this increased prevalence of suicide, which was a rather unique phenomenon in Korea compared with countries belonging to the OECD[4].

In addition to an extended lifetime, changing household types caused several problems including a rapid increase in the number of elders who live alone. In Korean culture in the past, siblings, mostly the first son, had responsibility to care for parents' later life[5]. The culture has now shifted and support from the family has gradually weakened; however, social benefits provided by the governments are insufficient to meet the needs of

elders. According to the interpersonal theory of suicide, suicidal ideation stems from thwarted belongingness, which can be explained as the perceived lack of social support and isolation due to the absence of a social network[6].

Gender differences exist in that female elders are more likely to self-report having suicidal ideation than male elders[7]. Moreover, female elders have a greater likelihood of participating in suicide-prevention programs, benefit from being a member of a social group, counseling, and health services[8]. In contrast, male elders are less likely to express their ideation of suicide and seek help and also pose a greater risk of actually attempting suicide[9]. These gender differences suggest the need for the investigation of factors affecting male elders' risk of suicide, especially among those live alone. Thus, tailored and distinctive interventions are needed for male elders living alone who live in poor surroundings with tenuous and fragile social networks, in contrast to those who live with their family[10].

Seeking ways to control the incidence of suicide is critical in Korea, as one of the world's fastest aging countries. It is essential to address suicide with male-specific factors. Comprehensive understanding of mechanisms leading to a high risk of suicide would help in identifying individuals or groups, attenuating the risk in this important phase of life and developing a safe environment in this aging society.

Method

Participants

This study is a secondary data analysis of data derived from the Korean Community Health Survey (KCHS). KCHS is a nationwide survey conducted by the Korean Center for Disease Control and Prevention. The survey has been conducted annually using computer-assisted personal interviewing methods with trained research assistants. In this study, data were obtained from the 2013 KCHS, including a total of 228,781 individuals aged ≥ 19; in the present analysis, I used data from 2,076 male elders living alone.

Variables

The dependent variable for risk of suicide was suicidal ideation. Suicidal ideation (yes, no) was defined as events when individuals had thoughts of committing suicide in the past year. Socioeconomic-status variables were education (uneducated, elementary school or more, middle school or more, high school or more, college or more), receipt of basic social security (non-, past, and present receiver), and private insurance (yes, no). Social environment variables were social environmental satisfaction (satisfied with seven factors including neighbors, neighborhood, surrounding nature, living environment, public transportation system, and medical services; not satisfied with any factor, 0 points ~ satisfied with all factors, 7 points) and social contact (frequency of social contact during the last 1 week). Physical and oral health (very healthy, 5 points ~ very unhealthy; 1 point) were defined as perceived level of physical and oral health. Psychological distress was level of stress (very high level of stress, 4 points ~ very low level of stress, 1 point) and depression (yes, no).

Statistical data-analysis

The Statistical Package for Social Science (SPSS, version 25) and Amos (version 24) were used for statistical data analysis. To examine differences between elders with and without suicidal ideation, I used t-tests and chi-square tests. There were two phases of data analysis in this study. In the first stage, to test the relationship among the variables, Pearson's correlation coefficient analysis was calculated for all variables. The structure of the model was confirmed through adoption of structural equation modeling and the model's goodness of fit was evaluated using fit indices including chi-square statistics, the good fitness index (GFI), the comparative fit index (CFI) and the root mean square error of approximation (RMSEA). A model was considered to have good fit at the level of 0.9 and above for CFI and GFI, and below .08 for RMSEA in this study.

Result

1. General characteristics of study participants

The general characteristics of male elders living alone who participated in this study appears in [Table 1]. The majority were undereducated with 11.7% uneducated; their mean age was 74.2 years old. Approximately 21.0% had suicidal ideation and 9.6% had depressive symptoms. Using a 5-point Likert-type scale, the mean scores of perceived level of stress and physical health were 2.7 and 1.9 respectively.

Table 1. General characteristics of study participants

Variables	Categories/ Range	N	%	M±SD
Education	Uneducated	268	11.7	
	Elementary school	879	38.3	
	Middle school	395	17.2	
	High school	483	21.0	
	College and above	270	11.8	
Receiving basicliving security	Yes	313	13.6	
	In the past	48	2.0	
	No	1934	84.3	
Private insurance	No	1834	80.0	
	Yes	461	20.1	
Suicidal Ideation	No	1812	79.0	
	Yes	483	21.0	
Depression	No	2074	90.3	
	Yes	221	9.6	
Age				74.2± 6.5
Social Contact	1-18			11.0± 4.0
Environmental Satisfaction	0-7			5.3 ± 1.7
Oral Health	1-5			2.2 ± 1.0
Physical health	1-5			2.7 ± 1.0
Stress	1-4			1.9 ± 0.8

2. Correlation matrix

The relationships among study variables were examined using Pearson's correlation analysis [Table 2]. All examined variables showed statistically significant correlations with suicidal ideation ($p < .01$).

3. Path analysis model

A path model was developed to test a hypothetical association with suicidal ideation. The fit indices of the path model [Figure 1] were GFI = .897 CFI = .999, AGFI = .959, NFI = .886 and RMSEA = .057. The fitness of the model was examined using fit indices with values shown in [Table 3]. The path model accounted for 48.3% of psychological distress, 53.2% of physical health, and 43.1% of suicidal ideation. In the path analysis, psychological health mediated the effect of social support and socioeconomic status on suicidal ideation. For physical health, socioeconomic status showed a statistically significant effect (direct effect = .707, total effect =.707). Social environment (direct effect = -246, total effect =-.302) and physical health (direct effect =

-.836, total effect =-.836) had a statistically significant affect for psychological distress. Only psychological health had statistically significant effects on suicidal ideation (direct effect = .754, total effect =.754).

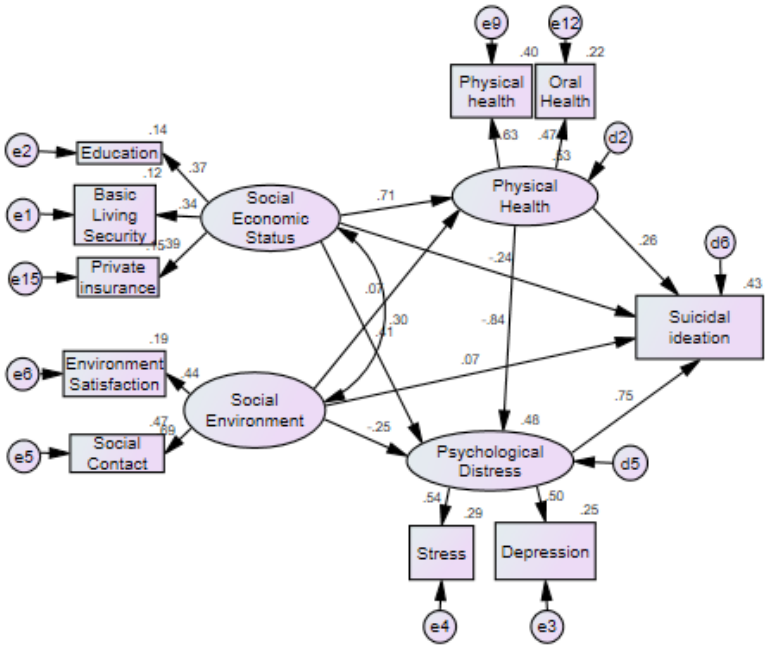

Figure1. Path diagram demonstrating the impact of socioeconomicstatus,socialenvironment,physical health, andpsychologicaldistress on the suicidalideation.

Discussion

The present study was conducted to reveal factors affecting suicidal ideation among male elders aged 65 and over who live alone. Using big data from a nationwide survey of the KCHS, I identified the multivariate relationships between variables and suicidal ideation. Factors considered included socioeconomic status, social support, physical health, and psychological health and their relationship to lead suicidal ideation.

Study findings indicated that psychological distress was the only factor showing a statistically significant affect on suicidal ideation, mediating all the other factors examined. A similar result was found in a previous study assessing factors on older adults' suicidal attempts; in that study, depression was the most salient factor[11]. These psychological-distress factors are more threatening for elders living alone as they lack the social resources to alleviate stress or depressive symptoms[12]. Knowing that male elders are far less likely to report their negative feelings or seek help[8], it is quite necessary to develop strategies to identify those with high potential to engage in risky behavior. We recommend implementing information and communication-technology interventions that provide various and easy ways to engage in social interaction without requiring active participation and involvement[13]. Assisting male elders to find the most suitable methods, aligned with their individual preferences, could effectively alleviate their social isolation.

Although physical health factors did not show a statistically significant affect, it had a stronger indirect affect on suicidal ideation than other factors by mediating psychological distress. In addition, socioeconomic status was an important predictor of physical health in the population of the current study. Living in a community may require some degree of higher socioeconomic status among male elders for health-related behaviors that determine physical health[14]. Especially elders without familial support need self-motivation for those behaviors because physical illness not only reduces motivation but also causes psychological distress.

Interestingly, when comparing with social-support factors, socioeconomic-status factors showed a much stronger affect on suicidal ideation directly and indirectly. This is in line with a previous study that showed the combination of living alone and poverty are strong predictors of suicidal ideation[15]. In addition previous research found gender differences between male and female older adults[8]. Similarly in Japan, although higher community involvement and individual relationship lowered the risk of psychological distress among female elders, this was not the case for male elders[16]. Studies emphasized that inactive engagement of male elders in preventative interventions suggests the

need for distinctive efforts for male elders. Considering the current study's findings, such efforts could associate older men with their particular interests to mitigate their low dependency on social support. Clearly, efforts are needed to reduce the incidences of suicide, primarily targeting elders living alone who live in poverty; thus, strategies should aim to improve security in their socioeconomic status.

Several limitations need to be considered in this present study. One is the cross-sectional design used. To clarify the causal relationship, longitudinal study designs like cohort study designs are more appropriate. Hence, I suggest future studies use a longitudinal study design to show a clear causal relationship between variables and suicidal ideation. In addition, using secondary data caused limitations in selecting variables to be included in this study. In this study, I examined present depressive symptom and suicidal ideation rather than intention to engage in risky behaviors such as self-harm. Additional study is needed on the relationships among variables that include individuals' intention to engage in risky behaviors.

Conclusion

Using big data with a nationally representative sample, the present study was able to suggest improvements for the future, based on intentions to prevent suicidal incidences for male elders living alone. Explanatory power was 43.1% for suicidal ideation, 53.2% for physical health, and 48.3% for psychological distress. Psychological distress was the most salient single mediating factor that led male elders living alone to consider suicidal ideation. Interventions to improve psychological distress with the incorporation of gender-specific factors can have a positive impact, reducing suicidal ideation in male elders living alone.

The Effect of an Oral Self-Care Intervention Program on the Oral Care of Diabetic Elderly

Yeo-Ju Kim[1], Jung-EunPark[2], Kyung-Sook Jo[3], Keun-YooLee[4], Jong-HwaJang[5]

[1]MS.student, [2]Assistant Professor, [3]Researcher, Dept. of Dental Hygiene, Dankook University, 31116, Re. of Korea, [4]Researcher, Public Health Center, Asan-si, 31521, Rep. of Korea, [5]Associate Professor, Dept. of Dental Hygiene, Dankook University, 31116, Rep. of Korea

Abstract

Background/Objectives: The purpose of the present study was to investigate the effect of a personalized oral self-care intervention program in diabetic elderly.

Methods/Statistical analysis:The study employed a non-equivalent quasi-experimental design with 10 participants in the intervention and control groups, respectively. An oral self-care intervention program was performed once per week for eight weeks from September 10 to December 19, 2018, and the effect of the program was measured by changes in subjective xerostomia, knowledge, self-efficacy, and oral self-care behavior.

Findings: After the program, the intervention group showed a significantly higher increase in knowledge ($P = 0.015$) and instances of brushing per day ($P = 0.005$) than the control group. There were no statistically significant differences in xerostomia and the use of oral care products ($P > 0.05$).

Improvements/Applications: The oral self-care intervention program for diabetic elderly was found to be useful in improving oral care, and the development of furtherstrategies for the improvement of the health of the elderly is necessary.

Keywords: *Diabetic elderly, Oral self-care intervention program, Subjective xerostomia, Knowledge, Oral self-care behavior*

Introduction

Due to the rapid aging of the South Korean population, elderly people aged over 65 years were 14.3% of the total population in 2018 and is expected to be 41.0% in 2060[1]. Consequently, promoting the health of the elderly is increasingly emphasized[2]. In addition, the prevalence of chronic diseases is continually increasing among the elderly[3]. In particular, diabetes was found to be the leading chronic disease, as three out of ten (29.8%) of the elderly aged 65 years or older were found to be diabetic[4].

Diabetes is considered to be a serious chronic disease and has been consistently ranked 5th–6thleading cause of deathsince 2007[5]. Diabetes is a metabolic disease characterized by hyperglycemia due to deficiencies in insulin secretion, insulin action, or the combination of both. It typicallycauses complications in the function of the eyes, kidneys, nerves, heart, and blood vessels through decreased infection resistance and delayed healing processes[6,7].

Many previous studies have reported that diabetes is associated with oral diseases, including periodontal disease, in patients. A previous study reported the existence of mutual influences between diabetes and periodontal disease, which repeat a vicious cycle in which diabetes exacerbates periodontal disease and then periodontal disease makes it difficult to control blood glucose[8]. Another study reported a higher prevalence of various oral complications in diabetic patients, including periodontitis, xerostomia, dental caries, oral Candida infection, oral cancer, and dysgeusia, through

Corresponding author:
Jong-Hwa Jang,
jhj@dankook.ac.kr

a systematic literature review[6]. Regarding American elderly aged 65 years or older, another study reported a higher incidence of permanent tooth loss and periodontal disease due to cavities in diabetic patients compared to the general elderly population[9].

Oral self-care is part of overall health self-care, which ranges from self-diagnosis, self-treatment, and self-prevention to seeking general and professional health management[10], and it is particularly important for diabetic patients. In diabetic patients 65 years or older, a relationship has been reported between oral care behavior and periodontal disease, as the risk of periodontal disease increases significantly in people with poor oral health awareness and infrequent brushing and who do not use interdental brushes [11]. That is, while diabetic patients are more prone to exposure to oral diseases than non-diabetic people, their recognition of the importance and proper performance of oral care may be lacking [12–14].

Some previous studies have identified factors influencing quality of life related to oral health among the general South Korean elderly population [2,15], and some studies have been conducted to improve oral function [16–18]; however, research on oral self-care interventions among diabetic patients is lacking.

Accordingly, the present study sought to investigate the effect of an oral self-care intervention program on knowledge and behavior related to oral self-care to provide basic data for the development of a personalized health-management program for diabetic elderly.

Method

1. Study design

As shown in [Table 1], this study used a nonequivalent control group pretest-posttest design to compare the performances of diabetic elderly in the experimental group who were treated with a personalized oral self-care intervention program to that of diabetic elderly in the control group who were not treated.

Table 1: Study design

Group	Pre-test	Intervention	Post-test
Intervention group	O1	X	O2
Control group	O1	-	O2

X=treatment; O=Measurement

2. Study Subjects

The population targeted by the present study was people with a history of diabetes living in Asan-si. The 10 experimental group participants were selected from participants in a metabolic syndrome prevention program offered by the healthy living center of the community health center of city A. These individuals understood the study's goals and agreed to participate. Ten elderly visitors to the senior citizen center of city A with diabetes were selected for the control group. The number of subjects calculated using the G*power 3.17 program for an effect size of 0.20 and power of 0.80 for both groups was 20, of which 10 were assigned to the experimental group and 10 to the control group. To ensure the ethical treatment of subjects, the study was reviewed and approved by the National Bioethics Committee of South Korea appointed by the Ministry of Health and Welfare.(IRB No. P01-201709-11-003)

3. Experimental treatments and data collection

For the intervention group,oral health practice and oral health education were conducted via a 40-minute oral care intervention program once a week for eight weeks from September 10 to December 19, 2018. The program consisted of oral health practice along with instruction in tooth brushing, using an interdental brush, using dental floss, and tongue brushing for self-care oral hygiene, and the participants were instructed to practice these activities every day. Participants in the control group would receive this training after the termination of the program. Factors related to oral health were measured through a survey and interviews before the oral care intervention program was conducted and after the eight weeks of experimental treatment. The same measurements were performed for the control group, which did not receive the experimental treatment

4. Measurement instruments

The instrument used in the present study consisted of four items concerning subjective mouth dryness, 15 items concerning oral self-care knowledge (OSCK), 15 items based on a self-efficacy scale for self-care (SESS), and five items assessing oral self-care behavior. Subjective mouth dryness[19] was measured using four items scored on a 3-point Likert scale (range = 4–12 points), with higher scores indicating higher oral discomfort. The reliability of the instrument measured via Cronbach's α was 0.77. The OSCK[20] consisted of items asking diabetic patients about periodontal disease,

mouth dryness, and oral care. Participants were asked to answer "Yes," "No," or "Do not know," and correct answers were given one point while incorrect and "Do not know" answers were given zero points. The reliability of this scale measured with Cronbach's α was 0.86. The SESS[21] assessed individuals' ability, with sufficient information and motivation, to effectively perform behavioral changes, and it was measured using an instrument developed by Kakudate et al. The instrument features three categories: dental examination, dental hygiene, and dietary habits and is scored on a 5-point Likert scale, with scores ranging from 1 point for "unconfident" to 5 points for "confident." Higher scores indicate higher self-efficacy. Cronbach's α at the time of development was 0.85, and Cronbach's α in the present study was 0.95. Oral self-care behavior[20] consisted of items related to improved oral health, including dietary habits, dental hygiene, and oral care, and Cronbach's α was 0.70.

5.Statistical analysis

The homogeneity of the dependent variables among the intervention and control groups was assessed via the Mann-Whitney Test using the SPSS program (IBM SPSS Statistics 23.0 for Windows, SPSS Inc., Chicago, USA). Both groups were determined to be homogeneous regarding the OSCK items as analyzed using a repeated measures ANOVA, while a significant difference was found regarding participants' SESS scores, as analyzed using ANCOVA with the initial value as a covariate. In addition, the Wilcoxon test was performed to identify changes in the oral health practices of the intervention group.

Results and Discussion

1. Analysis of homogeneity among participant groups

The homogeneity levels of dependent variables between the intervention and control groups are presented in [Table 2], which presents the homogeneity levels of oral self-care knowledge (Z = −.994, P = 0.320), subjective mouth dryness

(Z = −.781, P = 0.435), and oral self-care behavior (Z = −1.178, P = 0.247).

The difference in SESS (Z = −3.180, P = 0.001) between the intervention and control groups, however, was statistically significant, which indicates non-homogeneity between the two groups.

Table 2: Homogeneity of independent variables between intervention and control group

Variables	Intervention group (n=10)	Control group (n=10)	Z	P*
	M±SD	M±SD		
OSCK	10.30±2.79	8.50±3.78	-0.994	0.320
SESS	3.01±0.42	4.00±0.67	-3.180	0.001
Perceived dry mouth	5.10±1.10	6.20±2.53	-0.781	0.435
Oral Health Practice	2.87±0.33	3.33±0.91	-1.178	0.247
Three meals a day	3.90±0.32	4.20±1.32	-1.662	0.123
Water intake	3.20±0.79	3.70±1.57	-1.087	0.315
TBF / per day	2.70±0.67	3.80±0.79	-2.730	0.009
Oral care supplies	1.70±0.48	1.40±0.52	-1.314	0.280
OCSF / per week	1.57±1.27	2.40±3.31	-0.509	0.669

OSCK=oral self-care knowledge; SESS=self-efficacy scale for self-care; TBF=tooth brushing frequency; OCSF=oral care supplies frequency; * by Mann-Whitney Test

2. Comparison of changes in oral self-care behavior after attending the oral self-care program

[Table 3] presents the change in oral self-care behavior before and after the oral self-care intervention program. After the intervention, the increase in water intake (Z = −2.236, P = 0.025) and the instances of brushing per day (Z = −2810, P = 0.005) were statistically significant.

No statistically significant difference (P> 0.05) was found pre- and post-intervention regarding whether participants consumed three meals per day, the number of oral care products used by participants, and participants' weekly frequency of oral care product use.

Table 3: Comparison of changes in oral self-care

behavior after attending the oral self-care program (n = 10)

Variables	Pre	Post	Z	P*
	M±SD	M±SD		
Three meals a day	3.90±0.32	3.80±0.63	-0.577	0.564
Water intake	3.20±0.79	3.70±0.95	-2.236	0.025
Tooth brushing frequency / per day	2.70±0.67	3.78±0.67	-2.810	0.005
Oral care supplies	1.70±0.48	1.90±0.32	-1.414	0.157
Oral care supplies frequency / per week	1.57±1.27	3.00±2.52	-1.367	0.172

* by Wilcoxon Signed Ranks Test

3. The effect of the oral self-care intervention program on oral self-care knowledge

[Table 4] shows the results of the univariate analysis performed, as the sphericity assumption was met, and this analysis indicated a statistically significant difference (F = 5.86, P = 0.028) between the two groups regarding oral self-care knowledge. Though no significant difference existed between two points in time (F = 0.26, P = 0.620), a significant interaction effect was found between group and time (F = 7.38, P = 0.015), indicating that the oral self-care intervention program significantly affected changes in oral self-care knowledge over time.

This finding is consistent with that of Kim[20], who found significantly higher oral self-care knowledge and self-efficacy in an intervention group than in a comparison group after an oral self-care intervention program.

Table 4: Comparison of oral self-care knowledge

Variable M±SD		Pre	Post	Source	F	P*
		M±SD				
OSCK	Intervention group (n = 10)	10.30±1.05	12.10±1.10	Group	5.86	0.028
				Time	0.26	0.620
	Control group(n =10)	8.50±1.05	8.50±1.10	Group*Time	7.38	0.015

OSCK=oral self-care knowledge

* by two-way repeated measured ANOVA

4. The effect of oral self-care intervention program on the number of brushing

The results of an analysis of SESS and the instances of brushing per day showed significant differences in the homogeneity test as covariates, and these results are presented in [Table 5].

The effect of SESS on the instances of brushing per day post-intervention was nonsignificant (P = 0.859), but the effect of the instances of brushing per day pre-intervention on the instances of brushing per day post-intervention was significant (P < 0.001).

The effectiveness of the oral self-care intervention program in increasing the instances of brushing per day was confirmed because the estimation, in which the instances of brushing per day pre-intervention were controlled, of the intervention group (EM = 4.40) was significantly higher (F = 69.95, P < 0.001) than that of the control group (EM = 3.20).

This finding differs from that of Kim [20], who found a nonsignificant difference between a control and

intervention group regarding behavioral changes after an oral self-care intervention program, and the difference may be attributable to the direct education on oral hygiene management offered in the present study.

Table 5. Comparison of oral self-care knowledge between the intervention and control group

Variable EM±SE		Post	MD	Source	F	P*
TBF	Intervention group (n =10)	4.40±0.16	-1.23	Group	21.10	<0.001
				SESS_pre	0.032	0.859
	Control group (n =10)	3.20±0.15		TBF_pre	69.95	<0.001

SESS=self-efficacy scale for self-care; TBF=tooth brushing frequency

* by ANCOVA

Conclusion

The oral self-care intervention program was verified to be effective in increasing the oral self-care knowledge and the daily instances of brushing in diabetic elderly.

This study's results showed that the use of oral hygiene products somewhat increased post-intervention, but the difference between the two groups was not statistically significant. Since the use of interdental brushes and dental floss should be actively encouraged, as dental plaque cannot be sufficiently managed through brushing alone, methods that will promote the adoption of this behavior through further emphasizing the importance of interdental care must be developed to supplement the program.

The program examined in the present study was found to be valuable for the oral care of diabetic elderly, but further experimental research on factors influencing the effect of oral self-care programs on actual oral health is suggested.

The Effects of Positive Thinking and Stress on the Ability for Interpersonal Relationship in Nursing Students

Young-Sook Kwon

Department of Nursing, Joongbu University, Geumsan-gun, Chungnam, 32713, Korea

Abstract

Background/Objectives: Interpersonal relationship ability is an important competency for nursing students. Therefore, there is need to explore and identify factors related to interpersonal relationship ability. This study was conducted to identify the influences of positive thinking and perceived stress on the ability for interpersonal relationship in nursing students.

Methods/Statistical analysis: Subjects consisted of 258 nursing students. The ability for interpersonal relationship was measured using the Relationship Change Scale (RCS). Positive thinking was evaluated with a tool consisting of 18 items. Stress was measured with the perceived stress scale (PSS).

Findings: The results of multiple regression analysis showed that positive thinking, perceived stress, and relationship with friends significantly predicted the ability for interpersonal relationships in nursing students, explaining 42.5% of variance.

Improvements/Applications: Interpersonal relationship programs to facilitate positive thinking and reduce stress are recommended to improve the ability for interpersonal relationship among nursing students.

Keywords: *Interpersonalrelationship, Positive thinking, Stress, Nursing students, Friends*

Introduction

College students experience various relationships as they encounter new university environments. During this period, students should develop the ability to form intimacy with others and build the foundations for mature interpersonal relations. Thus, the ability to establish accessible interpersonal relationships is important.

Due to the rigorous curriculum, excessive training, and stress of clinical practice, the stress level of nursing students is reported to be higher than that of general college students[1-2]. Stress may have a negative impact on the nursing students' success in forming interpersonal relationships[3]. However, interpersonal relations or role conflicts are rarely addressed in nursing education. Thus, the Introduction of a variety of interpersonal skill training programs is advised[4]. A lack of initiative to research and improve interpersonal relationship ability has been engendered by viewing interpersonal relationships as an individual tendency[5]. Although nurse-patient relationships and therapeutic communication are taught in the nursing curriculum, it is likely that more time will be required before improvements in interpersonal relations are manifested on the wards[6]. In some studies[7-8], interpersonal abilities of nursing college students have been deemed unsatisfactory for establishing and maintaining effective and therapeutic relationships with patients in the clinical practice setting. Therefore, it is necessary to identify the factors affecting interpersonal relationships of nursing students and address them in the context of educational training programs[8].

Although a study has reported[9] that stress of nursing college students is due to interpersonal relations, it is difficult to find in the literature, studies which examine the effects of stress on interpersonal relations. Positive thinking is known to reduce negative emotions such as anxiety, stress, and depression; thereby, it is also thought

Corresponding Author:
Young-Sook Kwon,
E-mail: yskwon@joongbu.ac.kr

to affect interpersonal relationships directly or indirectly. According to [10], who researched life satisfaction of lifelong education participants, positive thinking was found to be significantly correlated with interpersonal skills; however, there are few studies analysing whether positive thinking influences interpersonal ability. The importance of interpersonal ability, in addition to nursing knowledge and nursing skills, has been emphasized within the field, thus research which could confirm the factors that influence interpersonal relationship would be of much significance. Therefore, this study was carried out to identify the level of interpersonal relationship ability of nursing students and to measure the effect of stress and positive thinking on the ability for interpersonal relationships.

Method

The subjects of this study were students who attended the nursing department of a university in G-gun. The survey was conducted from March 25, 2019 to April 5, 2019. The questionnaires were distributed to 270 peoples, and the data of 258 persons, excluding 12 missing cases, were analysed.

The level of ability for interpersonal relationship for participants was evaluated by the Relationship Change Scale (RCS). The RCS was developed by [11] and was subsequently translated to the Korean language by [12]. There are 25 questions with a 1 to 5 scale (1, very dissatisfactory; 5, very satisfactory) with the total score ranging from 25 to 125, the higher the score indicating higher satisfaction of one's interpersonal relationships. Positive thinking was measured by a tool developed by [13]. It is a 5-point scale consisting of 18 items. It is comprised of 2 sub-factors and 13 items – the 'subjective satisfaction' factor reflects the positive interpretation and overall satisfaction of life, and the 'goal seeking' factor reflects the effort to pursue and realize one's goal. Two negative questions were scored reversely; the higher the score, indicating higher positive thinking. Stress was measured by using the perceived stress scale (PSS) developed by [14] and translated by [15]. It is composed of 10 items with a 5-point Likert scale, and the possible scores range from 10 to 50. A higher total score indicates higher perceived stress.

Result

1. Ability for interpersonal relationship according to general characteristics

The relationship between general characteristics and ability for interpersonal relationship of subjects are summarized in [Table 1]. The ability for interpersonal relationship was significantly associated with selection motivation to study nursing, major satisfaction, economic status, health status, relationship with family members, relationship with friends, relationship with professors, and satisfaction with one's appearance.

Table 1. Ability of interpersonal relationship according to general characteristics (N=258)

Variables	Categories	n(%)	M±SD	t/F	*p*	Scheffe

2.Level of ability for interpersonal relationship, positive thinking, and stress

As shown in [Table 2], the mean for ability for interpersonal relationship was 93.48, means for positive thinking and stress were 65.41 and 27.26; respectively.

Table 2. Means of ability for interpersonal relationship, positive thinking, and stress (N=258)

	M±SD	**Min.**	**Max.**
Ability of interpersonal relationship	93.48±10.98	65	122
Positive thinking	65.41±9.65	36	90
Stress	27.26±5.65	10	41

3.Correlations between variables

As shown in [Table 3], theability for interpersonal relationship was significantly and positively correlated with positive thinking (r=.537, p<.001) and negatively correlated with perceived stress (r=-.391, p<.001).

Table 3. Correlations of ability for interpersonal relationship, positive thinking, and stress (N=258)

	Ability of interpersonal relationship	**Positive thinking**	**Stress**
	r *(p)*	r *(p)*	r *(p)*
Ability of interpersonal relationship	1		
Positive thinking	.573 (<.001)	1	
Stress	-.391 (<.001)	.440 (<.001)	1

4.Predictors of ability for interpersonal relationship

[Table 4] presents the results of regression analysis of variables at two hierarchical steps. Eight variables were introduced in Model 1 and accounted for 25.4% of the variance in interpersonal relationship ability. In Model 2, positive thinking and perceived stress were included. These accounted for 42.5% of variance in interpersonal relationship ability.

Discussion

In the present study, the mean score of interpersonal abilities of subjects was 93.48, which was slightly higher than the means of 89.65 and 89.22 in studies by [16], and [8]; respectively. The mean found in this study was similar to 92.10 reported by [6]. The average (93.48) of subjects was 74.8% of the 125 score maximum, which was higher than mid-level, yet was not satisfactory. Therefore, the development of effective educational interventions to help nursing students improve interpersonal skills is a necessary addition to nursing education[8].

In the univariate analysis, there was a difference in interpersonal ability according to selection motivation to study nursing, major satisfaction, economic status, health status, relationship with family members, relationship with friends, relationship with professors, and satisfaction with appearance. [17] states that correction of distorted thoughts related to appearance and an increase in satisfaction of appearance would have a positive effect on interpersonal relationships in adolescents. A study[18] has shown that major satisfaction affected competence in interpersonal communication. The improvement of interpersonal communication is thought to improve interpersonal relationship ability. The mediating effect of communication competence on the relationship between degree of major satisfaction and interpersonal relationship ability are worth analysing in the future. Although subject population differed from that of this study, another report on dental hygiene students' satisfaction with clinical practice showed that admission motivation, major satisfaction, health status, and economic level were significantly related to interpersonal ability[19]. Therefore, identifying methods to further increase major satisfaction among nursing students after entering university may improve interpersonal relationship ability. The results of [6] showed that degree of interpersonal relationship differed according to age and grade. In this study, however, we found that age and grade were not related to the ability for interpersonal relationship. Unlike the findings of our study, [6] reported that economic status was not of significant influence. Repeat studies may help explain what factors led to the differing outcomes. Regression analysis showed that good friendships or relationships with professors influenced high interpersonal abilities. Particularly, good relationship with friends had a positive influence on interpersonal relationship ability even in Model 2 which added positive thinking and stress. [20] showed that the most influential factor for interpersonal relationships was social support. In this regard, friendship can be regarded as a form of social support. Thus, one could expect that better relationships with friends would engender higher levels of interpersonal ability, as social support increases. Therefore, students should be encouraged and facilitated in seeking active exchange with their peers and seniors through club activities and meetings.In the present study, hierarchical regression analysis was used to confirm that positive thinking and stress influenced the ability for interpersonal relationship. As the two variables were added, explanatory power of the variance in interpersonal relationship ability increased by 17.1%. [21] examined the relationship between diverse interpersonal conflict and self-rated health.

Table 4. Factors affecting ability for interpersonal relationship of nursing students (N=258)

Variables	Model 1			Model 2		
	β	t	*p*	β	t	*p*
Selection motivation to study nursing	.053	.974	.331	.012	.292	.770
Major satisfaction	.104	1.831	.068	-.041	-.924	.357

They considered that positive psychology factors such as positive thoughts, gratitude, and transcendence could reduce interpersonal conflict. The increase in tendency of positive thoughts and/or transcendence, saw decrease in the likelihood of conflict between friend or neighbour. These positive psychological factors can be fostered by personal and social interventions such aspsychological training programs. Research concerning the relationship between positive thinking and interpersonal abilities is very limited. [22] had developed a positive thinking training program which enables positive cognitive restructuring. She conducted the program eight times for 10 daughters-in-law and showed that it was effective in improving the relationship between daughter-in-law and mother-in-law. This effect is due to the positive cognitive training which helps subjects recognize the position of counterparts, to discuss and reduce problems, or to search out good aspects of the opposite party. This suggests that positive thinking may alleviate interpersonal conflict and improve interpersonal relationships. Those with high positive emotions are relatively more receptive to stressful situations[23]. Therefore, training which increases positive thinking may be an effective strategy to reduce stress and improve interpersonal relationship ability. Perceived stress was identified as a crucial factor in our study. In a study[24] analysing the effects of stress coping and interpersonal abilities on gambling in college students, there was a significant correlation between stress coping and interpersonal abilities. However, there has been no study showing that stress itself directly affects interpersonal relationships, thus direct comparisons were unable to be made with the results of this study. Depression due to stress may passively influence interpersonal activities. In cases of high stress, interpersonal problems act as a stress source leading to increased stress perception, and, in turn, diminishment of interpersonal relationships. Therefore, it would be beneficial for students who have difficulty with interpersonal relationships to practice relaxation and coping techniques. Also, students who are in stressful situations should be counseled to relieve stress and learn flexibility in social situations. In order to improve the ability for interpersonal relationship among nursing college students, it is necessary to explore variables that mediate negative effects of stress on interpersonal relationships. The results of this study provide the groundwork of basic data for the development of intervention plans to improve the interpersonal ability of nursing students who are in the preliminary stages of nursing education.

This study finds that positive thinking and perceived stress are the most important factors affecting interpersonal relationship ability, among variables tested. Therefore, the development and application of curricular or extra-curricular programs to enhance positive thinking for nursing students is highly recommended. In addition, we hope further research will proceed to evaluate the effects of such developed programs on nursing students.

Conclusion

We found that the main determinants of interpersonal relationship ability in nursing students were positive thinking and perceived stress. Therefore, interpersonal relationship programs that improve positive thinking are needed to decrease stress among students undergoing nursing education.

Effects of the Child -Woman Health Nursing Convergence-based Simulation Practice Program on the Critical thinking, Communication Competency, Learning Flow, Clinical Judgment for Nursing Students

Heejeong Kim[1], **Misun Yoon**[1], **SoyounYim**[1]

[1]*Professor, Baekseok University, , Department of Nursing Science, 76 Munam-ro, Cheonan, 31065,Republic ofKorea*

Abstract

Background/Objectives: This study was undertaken to determine effects of the child–woman health nursing convergence-based simulation practice program on the nursing student's the critical thinking, communication competency, learning flow, clinical judgment.

Methods/Statistical analysis: The data, self-reported questionnaires were given to 78 senior nursing students located in Cheonan city in Korea which were gathered during Mar. 2 to Aug. 31, 2018. The data were analyzed using paired *t*-test and correlation.

Findings: After the Child–Woman Health Nursing convergence-based simulation, it showed a significant difference in learning flow (t=-2.806, p<.05) and clinical judgment (t=-2.878, p<.05). A learning flow showed a positive correlation with communication competency and clinical judgment.

Improvements/Applications: The findings from this study are expected to provide a valuable baseline data to develop the curriculum in the convergence-based simulation practice program and strengthen the nursing clinical practices.

Keywords: *Nursing students, Convergence-based simulation practice program, Critical thinking, Communication competency, Learning flow, Clinical judgment*

Introduction

According to the rapid changes of knowledge and technology in medical environment, it is required diverse professional nursing skills. And, nursing student needs professional practice training, it is important to know the cognitive situations step by step, as a process of logical reasoning and contextual considerations with judgment to be an expert nurses, leads by a critical thinking in clinical setting. And, it requires nurse to solve problems and make crucial decisions in clinical situation related to health and illness, in other words clinical judgment[1].Nurses must develop clinical thinking, clinical judgment to evaluate salient information and respond in a concerned and involved manner in patient care situations[2]. A patient-centered care is based on therapeutic communications, nursing students must demonstrate[6]effective communication knowledge and skills prior to be graduated[3]. We focus on face-to-face with patient interacting for a comfortable rapport.

Simulation has become a major part of nursing department, because of evidence based of simulation helping students learn clinical situation. Faculties who teach in a caring-base nursing practice program has a clinical career that they use to integrate caring in high fidelity simulation[4], express interest in simulation are providing supervision for simulation to ensure quality experiences for students.

In current nursing education research on simulation, focus is improvements in clinical judgment after simulation education[5]. Computer-based simulation in speech-language pathology clinical education provides a framework for integration. Faculty can also plan a roadmap for communication scenario, it is necessary to identify convergence-based simulation education effects.

Specially, it becomes a challenge to resolve faced by pediatric nursing to assisting all of family clinical nursing skill, including of childbearing, delivery, newborn-baby cares. In other words, It is difficult to participate in practical nursing experience of the birth process - newborn care because of decreasing the birth rate gradually in Korea. If the capability of pregnancy is lower, unpredictable progress of emergency labor and newborn's low APGAR score situation happened frequently[6].Computer-based simulation which used part-task training device can provide a diverse degree of real-world application, focusing on specific skills and human anatomy in nursing part, high-fidelity patient simulators can provide real physical inputs and interactivity[7]. A high-fidelitymanikin represents a patient withcorrect anatomy, patho-physiological andpharmacologicalresponses, and Justification about the value of use comparing high-fidelity simulation and traditional teaching strategies isnecessary[8].

Simulation-based learning is an educational curriculum to give nursing students a chance to simulate real clinical situations[9], and the simulation provides a unique learning method and setting a risk-free environment in which nursing students can integrate knowledge and practice without the fear of harming patient[10], which is beneficial when dealing with the emotional support of patient. Simulators comes true equipped of a variety features that support a experiences case by case situation, such features support educators abilities to create learning environments that address a variety of specific clinical situation[11].

The simulation practice program is a new education strategy designed to modify a diverse real-life situations, to provide the opportunity to perform a critical thinking, communication with patient, clinical judgment. Modern medical technology advances such as simulation are being widely used within nursing curricula, it is possible to provide students with patients who present with all of the diagnoses taught in the classroom[12].

Therefore, aims of this study determine effects of the child–womanhealth nursing convergence-based integrated simulation practice on the nursing student's the critical thinking, communication competency, learning flow and clinical judgment which enables to provide a valuable data strengthening the nursing clinical practices.

Method

The In this study, the child-woman health nursing convergence based simulation practice program was conducted by major subject's professors and reviewedby the clinical practice nurses. The program consists of two scenarios in which each of the situation a labor and newborn's care including ofAPGAR score assessing. As the tool to measure this study total 90 items were consisted: 35 of the critical thinking by Kwon[13], 15 of the communication competency by Hur[14], 29 of the learning flow by Kim[15], 11 of the clinical judgment by Ha[16]. Pre and Post simulation education program, participants received sufficient explanation for the study and carried out the self reported questionnaire after agreeing to it. Before data collection began, faculty participated in briefing-time incorporated into the curriculum and specifically simulation program.

The data was collected during the period of Mar.2 to Aug. 31 2018, with 78 Seniornursing students located inCheonan city in Korea.

Result and Discussion

1. General characteristics of the subjects

As shown in[Table 1]was that the general characteristics among 78 subjects in this study. Variables divided of gender, academic years, religion, character, experience of simulation class status, experience of other active learning class status. Mainly, simulation education program as the main subject in nursing curriculums needs experience of clinical practice. All of participants were senior nursing students.

Table 1. General Characteristics

(N=78)

Characteristics	Categories	N(%)
Gender	Female	66(84.8)
	Male	12(15.4)
Academic years	Senior	78(100)
Religion	None	36(46.2)
	Protestant	32(41.0)
	Catholic	10(12.8)
Character	Introversive	15(19.2)
	Extroversive	23(29.5)
	Moderate	40(51.3)
Experience of simulation class	Yes	7(9.0)
	No	71(91.0)
Experience of other active learning class	Yes	56(71.8)
	No	22(28.2)

2.Differences among Critical thinking, Communication competency, Learning flow, and Clinical judgment after Convergence-basedsimulation class

As shown in[Table 2]showed a significant difference in learning flow (t=-2.806, p<.05) and clinical judgment (t=-2.878, p<.05) after the convergence-based simulation practice, but communication competency and learning flow not showed a significant. Understanding subjects curricular priorities is fundamental to the design of clinical judgment[17], the Clinical Judgment Model was incorporated into the learning flow for students to patient care. The results clearly showed that concise definitions to guide a teaching strategies. If simulation educator acts to guide students to motivate a learning flow, clinical judgment developed synergic effects.

Table 2. Differences among Critical thinking, Communication competency, Learning flow,andClinical judgment after Convergence-basedsimulationpractice program (N=78)

Variables	Pre M±SD	Post M±SD	t(p)
Critical thinking	96.05 ±13.84	94.58 ±14.07	.729 (.468)
Communication competency	3.36 ±0.41	3.42 ±.041	-.979 (.331)
Learning flow	2.67 ±0.48	2.90 ±0.51	-2.806 (.005)
Clinical judgment	32.61 ±6.48	35.12 ±5.70	-2.878 (.005)

3.Correlation among Critical thinking, Communication competency, Learning flow, and Clinical judgment after Convergence-basedsimulation class.

As shown in [Table 3] indicated thatthe level of learning flow showed a positive correlation with communication competency and clinical judgment(r=.412, p<.001: r=.492, p<.001), but not shown else. As a result, Implementing communication competencies requires one's logical clinical judgment.

Table 3. Correlation among Critical thinking, Communication competency, Learning flow,and Clinical judgment after Convergence-based simulation practice program

C.T.: Critical Thinking

C.C.: Communication Competency

L.F.: Learning Flow

C.J.: Clinical Judgment

Conclusion

Child–Woman Health Nursing Convergence-basedSimulation showed positive effects on thecritical thinking, communication competency, learning flow, clinical judgment for nursing. More specially, first, after the convergence-based simulation practice, it shows a significant difference in learning flow and clinical judgment. Second, the level of learning flow showed a positive correlation with communication competency and clinical judgment.

Additionally, these results reported that nursing student's clinical basic skills improved that the simulators have pulses chest rise, heart sounds, lung sound, coughing, crying as well as hiccup including Sim-baby and Sim-Ped. According to simulators monitors changing by educator's scenario makes nursing student immediate responses nursing process, it makes to be prepared an empowerment skillful nurse by simulated-based education.

It is point out that the discussion that clinical practicum score of child and maternity is replaced with simulation curriculum. One of the reasons, it appears that the lower the Korea's birth rates, the fewer practical opportunities nursing experience. Above all, the developed variety of scenario is necessary in simulation-based education, child-woman nursing area. Though costs of simulators will vary widely depending on purchasing costs, advanced technology will be provided educators with cooperation simulation research institute.

The challenge is to create an effective output according to simulation education. Successful simulation education output requires more proper simulation design and research for changing nursing curriculum. Teaching as part of simulation requires faculty to design current clinical-based scenario that set a learning educational environment in which students feel safe from uncomfortable and afraid with a new relationship, patient.

There were limitations of this study results that proceed theChild–Woman Health Nursing Convergence-basedSimulationPracticeProgram, except adult, management, senior of nursing. And students were limited in senior nursing students. The subjects will be expanded to the next study.

In this study, it is confirmed to provide a valuable baseline data to develop the curriculum in Convergence-basedsimulation practice program and strengthen the nursing clinical practices. We would also recommend.

Development of Career Counseling Program for Nursing University Students according to Adler's Theory

Hwa jin Lee

Professor, Nursing Department, Kyung Dong University Kangwondo Wonju City Munmak, 26495 Korea

Abstract

Background/Objectives: The aim of this study was to present counseling techniques and counseling step-by-step contents of career counseling to help nursing students decide their career based on Adler's theory

Methods/Statistical analysis: This study is a study on the development of a nursing student's career counseling program developed by Jeong EG(2009) based on Adler(1927) theory, which was reconstructed and verified by a researcher in accordance with the actual conditions of nursing students.

Findings: As a result of this study, which was analyzed according to Adler's theory, career counseling for nursing university students consisted of five stages. In detail, the entire consultation consists of a relationship formation period, lifestyle exploration period, self-reflection period, career exploration period and a decision making period. The career counseling programs presented in this study span eight semesters, from the first semester of the first year to the second semester of the fourth year. Therefore, counseling is conducted with two sessions in every semester, and a total of 16 sessions in four years.

The total is five stages and consists of 16 sessions.Adler emphasizes first understanding himself and then making career decisions. Therefore, by the 10th session is searched for lifestyle, self-reflection, and the 11-14th session are handled sequentially with a career investigation, and then the decision of course is dealt with in the 15-16th session to reach career decision making through psychological and practical preparation.

Improvements/Applications: This study will eventually have a positive impact on the career of nursing students.In the future, research is proposed to verify the effectiveness by applying career counseling programs.

Keywords:*Counseling, Program, Nursing, University, Student*

Introduction

University students need to develop their skills and expertise through their majors, while at the same time making preparations for efficient career choice and career decisions. Nursing university students also need sufficient career preparation for successful employment and post-employment adaptation [1]. Nursing students can be regarded as a career setting person who are guaranteed employment at the same time as they enter the university, but, in contrast to this perception, they fail to adapt to the clinical nursing after graduation, resulting in a high rate of early turnover [2].This is because there are many students majoring in nursing who have chosen their majors according to vague expectations of a high employment rate or recommendations from around them[3]. Although relevant research is gradually being carried out as a means of nursing students as they fail to adapt to clinical nursing after graduation and the rate of early turnover increases [4]. Research on career counseling for nursing students has not been conducted actively and it is difficult to effectively consult students due to lack of professional knowledge on counseling[5]. To solve these problems, it is necessary to develop and strengthen career counseling programs to clearly establish their career direction after university admission. Park IS and Han YJ said, the nursing student's career status has

Corresponding author:
Hwa jin Lee
E-mail: nursewhite@kduniv.ac.kr1

been shown to differ depending on gender, grades, and satisfaction with practice, and added, systematic career guidance and counseling are needed considering these factors. Systematic guidance requires a consultation stage based on theory and step-by-step guidance. There are several theories, such as psychoanalysis therapy for counseling, personal therapy, existential therapy, human-centered therapy, form therapy, real-life therapy, and family system therapy, but the different subjects, purposes, and methods of applying the theory to counseling and developing the program accordingly [6]. The issue of career, which is life itself and should be addressed in career counseling, should be explored in depth about oneself and helped establish and determine the meaning and goals of life, rather than focusing on aspects of interest or aptitude[7].In this regard, Adler's theory is suitable for career counseling as it explains how people make decisions on career paths by paying attention to life goals and lifestyles. Adler said that human life is determined by its own goals as it pioneered its own future[8]. Contrary to the component of general career counseling program is the type and search of jobs, the value of work and the search for human relationships, the consultation technique presented by Adler is staged step by step. These are the sequence of the trust-building relationship period, lifestyle and dynamic explore period including early memory and family structure, self-understanding period that positively accommodates oneself, and a re-establishment period that redefining the transition to a new direction. It also involves encouraging students emotionally and encouraging them to open themselves up during each consultation session.

Jeong EG created career development topics and components according to the concept of Adler's theory, and developed career counseling programs for male high school freshmen. Unlike previous career counseling programs, his research is highly meaningful in that it specifically suggests the course of career counseling based on Adler's theory. However, since Jeong EG has organized career counseling programs suitable for the development stage for male high school freshmen, it is limited to apply them to university students. Students majoring in nursing also undergo clinical practice and interview to get a job in the fourth grade. Therefore, nursing students get a job before graduation, so it is necessary to develop career counseling programs suitable for nursing students.

Thus, in this study, to help establish a clear career path for nursing students, it was reconstructed by the researcher based on a study that developed an Adler career counseling program for high school students.The results of this study will provide a step-by-step manual for career counseling for nursing students, which will eventually have a positive impact on the career of nursing students.The purpose of this study is to present counseling techniques and counseling step-by-step contents of career counseling to help nursing students decide their career based on Adler's theory.

Method

The design, period and procedure of this study are as follows. In order to secure the ethics of the research, the purpose and method of the research were fully explained to the students and the consent of the research was obtained during an on-site survey(method of interview, observation).

This study is a study on the development of a nursing student's career counseling program developed by Jeong EG based on Adler theory, which was reconstructed and verified by a researcher in accordance with the actual conditions of nursing students.The study was conducted for a total of seven months from January to August 2018.

First, a literature review (an analysis of relevant prior research), an on-site survey(method of interview, observation)was carried out to investigate the program's demands.

Second, the Adler career counseling program developed by Jeong EG was reorganized by the researcher in accordance with the actual conditions of the nursing university student.

Third, it was modified after expert review (consultation) and the program was identified.

Result and Discussion

In this study, the counseling technique and consultation step details of the nursing university students were presented in five stages in accordance with the actual conditions of the nursing university students, developed by Jeong EG divided the career counseling program into seven stages and organized 12 sessions a year for freshmen in high school. The difference between study of Jeong EG and this study is the duration, the subject, and the stages of the consultation. In this study, counseling was designed to be conducted for the entire four years from 1st to 4th grade, taking into account the actual conditions of nursing university

students, and is largely divided into five stages. Unlike a study by Jeong EG(2008), that needs to complete a high school counseling within a year, this study set the nursing university student counseling to begin with a relationship formation period without setting a life goal for the first counseling because it lasts for four years.

It has proven the effectiveness of counseling in applying Adler's theory. A study on the effect of Adler's career counseling on the maturity of career behavior in elementary school students showed that students who experienced career counseling programs based on Adler's theory have significantly increased career attitude. The study proved that elementary school juniors can improve their career identity by conducting career counseling through childhood memory and family composition[9]. In addition, a study on the effect of group counseling on the maturity of career behavior in elementary school students using Adler's theory also demonstrated that the planning, independence, and self-determination of life has all improved[10].

Therefore, in this study, the researcher attempted to study counseling using Adler's theory. As a result of this studycareer counseling for nursing university students consisted of five stages. The career counseling programs presented in this study span eight semesters, from the first semester of the first year to the second semester of the fourth year. Therefore, counseling is conducted with two sessions in every semester, and a total of 16 sessions in four years. At the beginning of every step, open-heart counseling techniques are used, and at the end of the stage, a counseling technique of encouragement is used. (Table 1).

Table 1. The stage and contents of career counseling for nursing students

Grade, Semester	Session	Stage	Contents

4, 2	15, 16	Decision making period	Opening mind Modifing and establishing the goals of life Planning Social contribution Encouragement

1. Relationship formation period

As the first step in the conversation, Adler found the relationship building is important. In this study, therelationship formation period was set as the first stage of the consultation. And the contents of this stage include anIntroduction to the consultation program, the general and demographic characteristics of the students. To identify the general and demographic characteristics of a student, question about the origin of high school, age, residence, family structure, birth rank, family occupation, health condition, economic level, method of funding for tuition, and so on.

Above all, it is important to establish a mutual trust relationship at this stage. Relationship formation period is the first stage of the consultation, not the first step in understanding the problem of the students, but the first step in understanding and showing interest in their post-graduation goals and helping them open themselves up. It comforts students by starting to talk about weather, health conditions, and class schedules that are not relevant to the problem.

2. Lifestyle exploration period

Once the relationship is formed for career counseling, the second stage of the consultation is to explore the lifestyle so that the students can understand their beliefs, emotions, and to find out how the lifestyle is affecting the individual. Personal lifestyles are greatly influenced by the atmosphere of parents' values, and parenting attitudes when students were young. To do this, the professor can ask them about what kind of children they were and about their first memories of childhood. The professor inspires students to identify who the primary caregiver was, and the caregiver's attitude. Consistent or inconsistent parenting and nurturing attitudes are important clues for awareness of the main emotion among fear, anxiety, disappointment, longing, joy, happiness and so on.

If you ask what student's parents and brothers are like and what are their merits and demerits, you can find out what they think of their family members as usual, whether their relationship with their family members was compliant or rebellious. More directly, asking who is best in the family, who is the closest sibling, and who is most influenced by, will give you some insight into their relationship with family members and their emotional bond with them.

3. Self-reflection period

It is a step that allows students to reflect on their personality, inferiority complex and current state of mind in order to look inside more deeply after exploring lifestyle. It is also important to figure out the cause and extent of a student's inferiority complex during this period.

Adler saw the inferiority complex itself as a cause of improvement, not an anomaly. It is necessary to overcome the inferiority complex and to explore and

become more intrinsically self-aware. The professor encourages students to recognize that the student has the key to change and to focus on what they have.

Meanwhile, before entering the career exploration period, the professor asks the student who he or she likes and respects as a role model. This allows students to reflect on themselves what they admire and what aspects they are similar to and which are different from them. Ask students what books they like, what parts of the book and what phrases have affected their lives. People are attracted to books that show how to experience life problems similar to their problems because books usually contain life difficulties and ways to deal with. It encourages and emulates person's coping strategy.

4. Career exploration period

To explore the career path, professor has been encouraged to explore the student's lifestyle and to reflect on students. To explore the course in earnest, ask what childhood dreams and visions were based on student's own aptitude, lifestyle, personality, motto and how they have changed so far. In the career exploration period, professors can ask about the hospitals and wards that fit them during clinical practice.

It is very important to prioritize when making decisions to choose a job. Priority in selecting students' jobs can vary depending on salary, distance from home, atmosphere of work, parents' expectations, honor, power, promotion opportunities, comfort, service and dedication. It is important to have a deep understanding of themselves to set priorities. To this end, it is helpful to have job portfolios and job files written and kept. The documents included in the employment file include report cards, certificates, service and practical experience, self-Introduction letters, information for preparing for interviews, and various job information. And the professor identifies how prepared and independent the student is to make the decision. Students with clear goals set through career counseling programs will become aware of the meaning of campus life and have a strong motivation to achieve it and have an adaptive campus life.

5. Decision making period

Finally, it is time for students to make their own decisions about career paths. It is counseling to make them realize that the interpretation of life is in their own hands and that the true meaning of life can be found by contributing to society[11]. This stage involves modifying and establishing a student's life goals so far. Also, students need to consider the impact of their success on society and plan in detail how it will contribute. Human behavior is goal-oriented, so goals should be set well, with professors revealing why students are committed to their studies and letting them know that goals can be revised. Humans should be interested in each other, working together, and contributing. Because society and human beings can live happily and peacefully only when they are united. Therefore, professors encourage the student to ponder the impact of students' own success, purpose of life, meaning on others, communities, communities and countries.

Conclusion

This study was tried to develop career counseling program for nursing student's clear career choice. According to the study, Adler career counseling program developed by Jeong EG was presented in five stages in accordance with the actual conditions of the nursing student. The full consultation consisted of five stages: relationship formation period to form a trust relationship, lifestyle exploration period to investigate lifestyle, self-reflection period to have in-depth insight into themselves, career exploration period and decision-making period. The result of this study will be that by presenting the stage and step-by-step content of the consultation, it will eventually contribute to the nursing student's career satisfaction and the maintenance of a high employment rate. In the future, research is proposed to compare and verify the effectiveness of nursing university students by applying career

Factors Affecting the Positive Perception of Marriage of Unmarried Men and Women in South Korea

Hye-gyeong Cha

Dept. of Nursing, Namseoul University, 91 Daehakro, Seonghwan-eup, Seobuk-gu, Cheonan-si, Chungcheongnam-do, 331-707, Korea

Abstract

Background/Objectives: This study is a descriptive survey to identify the factors affecting the positive perception of marriage of unmarried men and women in South Korea.

Methods/Statistical analysis: Data survey was collected from 254 unmarried men and women in Korea and research tools used structured questionnaire that consisted of 7 general characteristics, 24 questions of types of love, 18 questions of sexual assertiveness, 24 questions of ambivalent sexism and 11 questions of the positive perception of marriage. Data were analyzed by descriptive statistics, t-test, ANOVA, Pearson's correlation and multiple stepwise regression analysis using SPSS 22.0 program.

Findings: The results showed that the variables affecting the marriage of Korean single men and women were complementary gender differentiation (B=.424), Eros (B=.152), Agape (B=.193), heterosexual hostility (B= -.173), and then the explanatory power of the three variables was 34.2%.

Improvements/Applications: Through this study, we intend to provide basic data for the national policies for the increase of marriage and fertility rate in South Korea by exploring the mindset and value system related to marriage of single men and women in South Korea.

Keywords: *Positive perception of marriage, complementary gender differentiation, type of love, hostile heterosexual hostility, fertility rate.*

Introduction

Marriage has a very important meaning not only for individuals or families, but also for society and the country. Marriage,in particular, plays a major role in inheriting culture, customs, language and values between generations through the birth and upbringing of children, as well as the combination of the two couples. However, as people's worldview and values change in modern society, the consciousness that marriage must be made is declining[1] and that unmarried men and women avoid marriage and childbirth[2]. In Korea, especially in the process of rapid socioeconomic development, as individualism and happinessism are accepted as important meaning of life, the marriage of unmarried men and women has changed into a negative trend, increasing the choice of non-marriage and later marriage[3].

The low fertility rates, coupled with a shrinking population, has led to a decrease in the economically active population, and has become a more dangerous national problem, linked to the social problem of an aging society. The reasons for the continuation of low fertility rate are a variety of factors, including socio-cultural factors, economic factors, and policy factors[4]. However, in previous research, the view of marriage has been shown to have a strong influence on the willingness to give birth, and the higher the positive marriage view, the higher the willingness to give birth[5,6]7. In order to unmarried men and women to form healthy families through marriage and to improve their willingness to give birth, it is necessary to examine the factors influencing their positive perception of marriage.

Corresponding Author:
Hye-gyeong Cha,
Dept. of Nursing,
E-mail: hgcha@nsu.ac.kr

Factors affecting single men and women's marriage so far have been identified such as demographic factors, family cohesion, parenting attitudes, adult attachment, and attitude toward having a child. This study focuses on the changing values of individuals and examines the love type, sexual assertiveness, and ambivalent sexism of single men and women to determine which of these factors affect the positive perception of marriage. The purpose of this study is to provide basic data on the establishment of a positive view of marriage for unmarried men and women and the policy for raising the will of childbirth.

Method

This study is a descriptive research study to identify the factors that influence the view of marriage of unmarried men and women. Data was collected from 254 unmarried men and women in Korea from May 1 to May 30, 2018, and research tools used structured questionnaire that consisted of 7 general characteristics, 24 questions of types of love, 18 questions of sexual self-assertion, 24 questions of ambivalent sexism and 11 questions of positive perception of marriage.

Based on [7]'s six types of love, the latest version of [8]'s scale, which was translated and used by [9], with a total of 24 questions including 4 questions per each type of love and with a Likert 5 points scale. The highest score was your type and in this study, the tool reliability Cronbach's α was found to be .86.

The sexual assertiveness scale used in this study was used with a tool developed by [10]. The scale consists of a total of 18 questions and 3 subfactors, with six questionsrejecting unwanted sexual contact, six questions preventing pregnancy and sexually transmitted diseases in sexual experience with a given partner, and six questions claiming desired sexual contact. The scale was graded on a Likert5-point scale.In this study, the tool reliability Cronbach 's α was found to be .84.

Based on the ambivalent sexism scale of [11],the Korean Multiple Sexism Inventory, which [12] was shortened and supplemented the K-ASI produced by [13], was used. The K-MI consists of 12 items that measure hostile sexism and 12 items that measure benevolent sexism. K-MSI consisted of 12 questions measuring hostile sexism, 12 questions measuring benevolent sexism and 24 questions in total. It consists of a Likert scale, higher scores mean higher sexism, and lower scores mean higher gender equality awareness.In this study, the tool reliability Cronbach 's α was found to be .94.

The measure of value on marriage used by [14] was modified and supplemented to the subject of the study, and 23 questions were analyzed for factor analysis, and 11 questions were selected for the positive perception of marriage and used as a scale of positive perception of marriage. It consists of a 5-point Likert scale, and the higher the score, the more positive perception of marriage is. In this study, the reliability of this was measured at Cronbach's α = .90.

Data were assessed by the average and standard deviation, t-test, ANOVA, Pearson correlation coefficients, and multiple regression using SPSS 22.0 program.

Result and Discussion

1. General characteristics of the subjects

The general characteristics of this study are shown in [Table 1]. This gender was 195 people (76.8 percent) and 59 people (23.2 percent), and their average age was 20.84±1.82. 112 respondents (44.1 percent) said they had a religion, 221 (including the present and past) had experience of Heterosexual relationship, and 131 (51.6 percent) had Intercourse experience. Sex-related knowledge acquisition channels accounted for 80 sex education programs (31.5%), mass media 78 people (30.7%), and friends (seniors) 77 people (30.3%). Most respondents answered 'Middle' at 183 (72%).

Table 1.General Characteristics

Variable	Categories	n	%
Gender	Male	59	23.2
	Female	195	76.8
Age		20.84(±1.82)	
Religious stats	Yes	112	44.1
	No	142	55.9

Cont... **Table 1.General Characteristics**

Heterosexual relationship experience	Yes, now	98	38.6
	Yes, past	123	48.4
	No	33	13.0
Intercourse experience	Yes	131	51.6
	No	123	48.4
Acquisition channel of Sex-related knowledge	Family	9	3.5
	Friends (Seniors)	77	30.3
	Sex education program	80	31.5
	Mass media	78	30.7
	Others	10	3.9
The economic level	High	39	15.4
	Middle	183	72.0
	Low	32	12.6

2. Descriptive Statistics for variables

The types of love, sexual assertiveness, ambivalent sexism, and positive perception of marriage of the subjects in this study are shown in [Table 2]. Types of love were followed by Eros (2.91±0.68), Pragma (2.78±0.79), Mania (2.75±074), Storge (2.60±0.83), Agape (2.50±0.81), and Ludus (2.33±0.60).

For sexual assertiveness, the average score of 18 items in 3 areas was 3.75 ± 0.55. In the subfactor of sexual assertiveness, the average of Reject to unwanted sexual behaviors was 3.94 points, Reject to unwanted sexual behaviors' average was 4.11 points, and Attempt to sexual behavior's average was 3.18 points.

Table 2. Descriptive Statistics for Variables

Variable		**Range**	**M±SD**	**Min**	**Max**
Type of Love Ludus Storge Mania Pragma Agape	Eros	1~5	2.91±0.68	1.00	5.00
	1~5	2.33±0.60	1.00	5.00	
	1~5	2.60±0.83	1.00	5.00	
	1~5	2.75±074	1.00	5.00	
	1~5	2.78±0.79	1.00	5.00

	1~5	3.18±0.49	1.17	4.78	
	Mean	1~5	3.75±0.55	1.28	4.78

Cont... **Table 2. Descriptive Statistics for Variables**

Ambivalent sexism	HS: Hostile sexism	Dominant paternalism (HP)	1~5	1.83±0.73	1.00	4.00
		Competitive gender differentiation (HD)	1~5	1.83±0.79	1.00	4.75
		Heterosexual hostility (HH)	1~5	1.86±0.84	1.00	4.50
		HS mean	1~5	1.84	1.00	4.25
	BS: Benevolent sexism	Protective paternalism (BP)	1~5	2.01±0.80	1.00	4.75
		Complementary gender differentiation (BD)	1~5	2.51±0.89	1.00	5.00
		Heterosexual intimacy (BH)	1~5	2.24±0.92	1.00	4.50
		BS mean	1~5	2.25	1.00	4.50
Positive perception of marriage		Positive perception of marriage	1~5	3.15±0.74	1.00	5.00

At the level of ambivalent sexism, the mean of hostile sexism was 1.84 points and the mean of benevolent sexism was 2.25, both lower than average. Complementary gender differentiation of BS (2.51) were the highest, followed by Heterosexual intimacy of BS (2.24) and Protective paternalism (2.01) of BS. Next, Heterosexual hostility of HS (1.86), and dominant paternalism of HS (1.83) and competitive gender differentiation of HS (1.83). The positive perception of marriage was 3.15 ± 0.74.

3. Positive perception of marriage according to the general characteristics.

As a result of analyzing whether there is a difference in positive perception of marriage according to the general characteristics of the study subjects, there was a statistically significant difference according to the acquisition channels of knowledge related to gender and gender as seen in [Table 3]. First, the gender ($t = 3.958$, $p < 0.001$) showed higher positive perception of marriage than the female (3.05), but no statistically significant depending on religion, Heterosexual relationship experience, Intercourse experience, and economic level. Sex-related knowledge acquisition channels ($t = 3.021$, $p = .019$) showed higher positive perception of marriage than mass media (2.98 points) in the case of friends or seniors (3.35 points).

4. Correlation among Main Variables

[Table 4] shows the result of analyzing the correlations among the main variables of this study. Positive perception of marriage of Korean unmarried women was positively correlated with all types of love (Eros: $r = .342$, Ludus: $r = .150$, Storge: $r = .255$, Mania: $r = .241$, Pragma; $r = .286$, Agape: $r = .348$; $p < 0.001$), negative correlation with sexual assertiveness ($r = -.211$, $p < .001$), and all subfactors of ambivalent sexism are positive correlations.

5. Factors affecting marriage values in unmarried men and women

To identify the factors affecting positive perception of marriage, the dependent variables of this study, the result of a stepwise multiple regression analysis using six types of love, sexual assertiveness, and six subfactors of ambivalentsexism, which are the main variables of this study, are shown in [Table 5].

As a result of multiple regression analysis, variables affecting the positive perception of marriage of unmarried men and women were complementary gender differentiation (B = .148), Eros (B = .152), Agape (.193), and heterosexual hostility (-. 173), and the explanatory power of these four variables was 34.2%.

Discussion

The nation's current efforts to solve the serious low birthrate problem are being mainly aimed at married couples. However, in a situation where non-marriage and later marriage are increasing due to changes in individual values, it is necessary to identify the factors that affect the positive marriage attitude of single men and women, which is the biggest factor in the number of births, along with the existing solutions.The formation of primary values in adults can be said to be through interaction with parents at home. When you're in your 20s and experience social life and experience various sexual and sexist experiences, you're going through a change in values again. This study was conducted to confirm how the various gender-related values of single men and women of this time affected positive perception of marriage.

In a study on the relationship between quantitative gender discrimination and gender equality in Korean officialdom, hostile sexism (HS) has negative effects on gender equality, and benevolent sexism haspositive effects on gender equality. These results suggest that the subjects thought that men should protect women who were weak, that women complemented what men did not have, and that being intimately romantic with women would make gender equal[15].

Efforts are expected to be made as gender equality awareness, which can be seen as a reflection of the positive influence of complementary gender roles and the

negative influence of hostile heterosexuality and hasthe positive effect on the positive perception of marriage.

Conclusion

In this study, single men and women in South Korea have been shown to help create positive perception of marriage when awareness of complementary gender differentiation has been raised and heterosexual hostility has been reduced. Since the perception of gender equality, which reflects the positive influence on complementary gender differentiation and the negative influence on heterosexual hostility, may also be seen as having the positive influence on the positive perception of marriage, social measures and policies will be needed to take into account these values of single men and women. The purpose of this study is to provide basic data on policy preparation for improving fertility rate in Korea, which is becoming increasingly low by raising the positive perception of marriage for unmarried men and women. However, this study is based on convenience sampling of unmarried men and women in some parts of South Korea. Therefore, it is difficult to generalize the results of this study, and future repeated research and extension studies are needed.

Abstract

Background/Objectives The purpose of this study is to provide basic data for the development of sustainable service program for all nursing students by analyzing the relationship between service satisfaction, morality and psychological well - being.

Methods/Statistical analysis: This is a descriptive research study conducted from November to December 2018. Data collection was conducted among 216 college students who agreed to the research and completed the questionnaire. Data were analyzed using t-test, ANOVA and Scheffe post-test, and Pearson correlation coefficients were calculated using SPSS 24.0. The results of the study showed that the service satisfaction was positively correlated with morality and psychological well - being.

Findings: As a result of the study, psychological well - being showed a significant positive correlation with morality(r=.54 *p<.001*), and service satisfaction showed a significant positive correlation with morality(r=.55 *p<.001*) and psychological well - being(r=.40 *p<.001*). In the multiple regression analysis, four variables accounted for 35.5% of total service satisfaction (F = 29.06, p <.001). And among the four predictors, service participation period and service activity polarity are significant variables that explain service satisfaction. Groups with more than three years of service were found to have higher levels of service satisfaction than other groups.The level of service satisfaction was higher than those in which very active participation is actively participated, those in normal or passive participation, and those in very passive participation. And the groups actively participating in the service satisfaction level were higher than those that participated passively or very passively. In addition, the groups that participated very passively in the degree of service satisfaction were lower than those that participated very actively, actively participated and normally participated. The results of this study suggest that service satisfaction can have a positive impact on psychological well - being for personal growth and morality which can enhance social responsibility.

Improvements/Applications: Based on the results of this study, follow-up research is needed to develop various programs to improve service satisfaction and become a sustainable service at the entire lifetime level.

Keywords: *Nursing, college students, service satisfaction, morality, psychological well – being*

Introduction

The nation's rapid economic development has led to conflicts between classes and generations and the widening gap between the rich and the poor, posing a serious social problem. Volunteer activities of sharing and caring through voluntary participation of each member of society as well as pan-national efforts are desperately needed to solve these complex social problems. The move is seen as an important part of national policy and also as part of enhancing national competitiveness, recognizing its importance in social, economic, and educational settings in countries around the world, including the United States and Japan[1].

Soon Young Yun,
E-mail: syb3000@bu.ac.kr

In modern society, universities are highlighted by their service to society as well as their educational and research functions.The university recognized the importance of community service function to directly [8]or indirectly solve various problems in modern society as well as the education and research function of the university in terms of social awareness, and the government added community service to the evaluation items in 1995 in response to the demands of this era, thereby promoting community service practice and community service education[2].

The significance of volunteering is high in that students at universities that train talent can have opportunities for love, consideration and understanding of humans, and self-fulfillment through volunteering. In other words, volunteering is an activity that achieves the realization and self-realization of altruism by providing services based on the spirit of human respect and democracy through the prevention and resolution of social problems, voluntary participation in the public service of the nation and no pay[3]. The college-age period is an important time to link volunteer activitiesthat were reconstructed at universities based on the experience of elementary, middle and high schools to volunteer throughout their entire lives until adulthood[4].

Volunteer activities can be seen as a measure of the effectiveness of volunteer work and as an important factor in the participation and continuation of volunteer work[5].

Morality, meanwhile, is the ability to judge the right and wrong of human behavior, i.e. to determine which norms to decide on[6]. In a study on the relevance of university students' experience in volunteer activities and morality, there is a report that the level of morality is high in college students with experience in volunteer activities, and the longer the service period, and it has a positive effect on the development of morality[7,8]. However, there are not many studies that suggest that volunteer work has affected the morality of nursing students.

The ultimate goal is for all humans to live in pursuit of happiness. Quality life for this is a conscious, subjective and cognitive judgment, which defines as subjective life satisfaction or psychological well-being[9]. In the study of the relationship between sense of well-being and volunteerism, it is considered a measure of the condition of life as a result of human behavior. It has important implications as an indicator of how happy or satisfied a human life is[10].

A satisfaction study of overseas Taekwondo volunteers showed that satisfaction has a significant effect on the target consciousness, self-acceptance and environmental acceptance, all of which are subcomponents of psychological well-being[11]. In conclusion, volunteering provides not only a simple meaning of leisure activities, but also an opportunity to lead a fruitful life, thereby gaining the results of self-satisfaction and self-realization of the organization to which the volunteers belong, and has a positive effect on the psychological well-being of the volunteers[12].

This study aims to identify the relationship between service satisfaction and morality and psychological well-being among nursing college students and provide basic data on the development of sustainable service programs at the whole life level to help foster morality and enhance psychological well-being as prospective medical personnel.

Method

The study participants extracted nursing students from one university in C City from October 1 to October 30, 2018.The sample size of the study subjects was used using the G*Power 3.1 program, and the number of samples was calculated by entering a significant level of 0.05 for multiple regression analysis, a power of 0.8 and an effect size of 0.15. A total of 230 questionnaires were distributed and 216 questionnaires were finally used.

This study is a descriptive research study to investigate general characteristics, morality, service-related inadequacy and service-based status of nursing college students, and to identify factors that affect service-based status.

The data collected by the participants was explained to be used only for research purposes and may be withdrawn at any time if they do not wish to participate in the study, and was conducted after receiving written consent. Data collection took an average of 15 to 20 minutes.

The service satisfaction level is comprised of 18 questions using tools from Shin[13] and consists of a five-point scale from five points of 'very yes' to one point of 'not at all'. A higher score means a higher level of satisfaction with volunteer work, and Cronbach's alpha

in this study was .949.

Morality is a five-point scale from 'very yes' to 'not at all' using the tools of Seo[14] and consists of two sub-domain areas of altruism and social responsibility. Higher scores mean higher morality, and Cronbach's alpha in this study was .846.

The psychological well-being is made up of 31 questions using Kim[15] tools and consists of a five-point scale ranging from 'Very Yes' to 'Not at all'. The higher the score, the higher the psychological well-being. Cronbach's alpha in Kim's study was .923 and this study was .906.

The collected data was analyzed using the spss win 24.0 program. The demographic and social characteristics of the subjects and the characteristics of the service association used the error and percentage, mean and standard deviation. The difference in service satisfaction according to characteristics was analyzed by t-test and ANOVA, and the post-verification method was used by the Scheffe method. Volunteer satisfaction, morality and psychological well-being were obtained by means and standard deviation, and their correlation was verified using Pearson's correlation coefficiency. Factors affecting service satisfaction were analyzed by multiple return analysis.

Result and Discussion

1. General characteristics of the subjects

The age of the subjects was between 20-55 and 20.80 on average. Female students numbered 86.6 percent (187), and 53.7 percent (116) had religion. The service period was less than one month to one year (40.7 percent), and the service type was the highest (45.4 percent). 52.3% (113) were actively participating in volunteer activities, while 22.7% (49) were very *active (Table 1).*

Table 1: Characteristics of the subjects

Characteristics	**Categories**	**M±SD(Range) or n(%)**
Age(yrs)		20.80±3.70(19-55)

	very passive	3(1.4)

2. The morality, psychological well-being, and service satisfaction of the subject

The morality, psychological well-being and service satisfaction scores of the subjects were 57.91, 110.07 and 65.84, respectively (Table 2).

Table 2: Descriptive Statistics of Major Variables

Variable	M±SD	Range
morality	57.91± 6.93	34- 80
psychological well-being	110.07±13.47	78-153
service satisfaction	65.84±10.71	22- 90

3. Differences according to demographic and service-related characteristics of service satisfaction

As a result of grasping the status of service according to demographic and social characteristics, there were significant differences depending on duration of participation (F=7.00, *p<.001*), and activism (F=10.87, *p<.001*).As a result of grasping the status of service according to demographic and social characteristics, there were significant differences depending on duration of participation (F=7.00, *p<.001*), and activism (F=10.87,*p<.001*).

Groups with three years or more were found to be more satisfied with their service than those with less than one month of service or a group from more than one year to less than three years. The groups that actively participate in the event had higher levels of service satisfaction compared to those that actively participate, usually participate, passively participate, and very passive participation. And the groups that actively participate showed higher levels of service satisfaction than those that participated passively or very passively, while those that participated very passively showed lower levels of service satisfaction than those that participated very actively, actively, and usually(Table 3).

Table 3: Differences in Service Satisfaction by Personal Characteristics

Characteristics	Categories	Service Satisfaction	
		M±SD	t/F(p) Scheffe
Gender	Female	65.85± 9.76	0.02(.977)
	Male	65.79±15.75	
Grade	1st	64.30± 9.41	1.70(.167)
	2nd	67.24± 8.47	
	3rd	63.43±11.68

	passive(d)	59.09± 8.98	
	very passive(e)	42.66±17.92	

4. Correlation among observed variables

Psychological well-being showed the results of a significant quantitative correlation with morality(r=.54 *p<.001*) and service satisfaction showed a significant quantitative correlation with morality(r=.55 *p<.001*) and psychological well-being(r=.40 *p<.001*) (Table 4).

Table 4: Correlations Among Observed Variables

	morality r(p)	**psychological well-being r(p)**
psychological well-being	.54(<.001)	
service satisfaction	.55(<.001)	.40(<.001)

5. Factors Affecting Service Satisfaction

Regression analysis was performed to identify the factors affecting the service satisfaction of the nursing student. Among the general characteristics, the regression model included the period of service participation, moral and psychological well-being that showed significant differences in service satisfaction, which showed a significant correlation between service activity polarity and service satisfaction. The tolerances of the regression model designed for this study were calculated between .66 and .61, with a range of 1.03-1.50 variance expansion factors. These findings mean that this regression model does not have a multi-pronged problem. The Durbin-Watson value, which was conducted to verify the independence of the residuals, was also found to be 2.01 without autocorrelation.

The multiple regression analysis showed that the four variables explained 35.5% of the total service satisfaction variables, and that the duration of service participation and service activity polarity among the four predictors were significant variables that explained service satisfaction.

Groups with more than three years of service were found to have higher levels of service satisfaction than those with less than one month of service or less than three years from more than a year of service. In addition, the level of service satisfaction was higher than that of those who actively participate, usually participate, or participate passively or very passively.

In addition, the groups actively participating were more likely to have a higher level of service satisfaction compared to those that participated more passively and more passively, and those that participated were less likely to have a higher level of service satisfaction than those that participated more actively, actively, and generally (Table 5).

Table 5: Factors Affecting Service Satisfaction

Variable	**β**	**t**	**p**
Morality	.430	6.333	.001
Psychological well-being	.129	1.941	.054
Service participation period	-.156	-2.772	.006
The active nature of volunteer work	.096	1.602	.111
R2=.355		F=29.06	p<.001

Discussion

This study was conducted to check the difference between the service satisfaction level of nursing college students according to the demographic and service experience characteristics, and to check the correlation between morality and psychological well-being.

Research shows that psychological well-being has a significant quantitative correlation with morality, and service satisfaction has a significant quantitative correlation with morality and psychological well-being. Kang's study[16]shows that volunteer satisfaction and psychological well-being have a static correlation, and that the longer the service period and the higher the service activity, the higher the level of service satisfaction, supporting this study.

In Yoon's study[17], the more participating time, the more active the attitude, the more satisfied the attitude, the more affecting the development of morality, so the duration of participation and attitude service satisfaction are important factors. Therefore, it is required to develop a program in which volunteer activities of current universities can maximize motivation and participation satisfaction of university students.

Conclusion

This paper studied the relationship between the nursing college student's service satisfaction, morality and psychological well-being. The purpose of this study is to demonstrate to nursing college students that they can enhance the moral and psychological well-being they should have as a prospective health care person by positively influencing their morality and psychological well-being when service satisfaction is high. Psychological well-being showed significant quantitative correlation with morality and service satisfaction showed significant quantitative correlation with morality and psychological well-being. And it turns out that the duration of service participation and active service activity are significant variables that explain service satisfaction level. When service participation period is more than 3 years and service participation is very active, service satisfaction was high. Therefore, it is necessary to develop volunteer programs that are active and sustainable throughout their lives.

Factors Influencing the Preparation of Manuals for Emotional Labor and the Provision of Programs Depending on Type of Trade in South Korea

Hye-sun Jung[1], Eun hi Choi[2], Sewan Oh[3]

[1]Professor,Department of Preventive Medicine, College of Medicine, The Catholic University of Korea, Republic of Korea, [2]Professor, Department of Nursing, Eulji University, Dept, Republic of Korea, [3]Director, Department of Industrial Health, Ministry of Employment and Labor, Republic of Korea

Abstract

Background/Objectives: This study investigated the factors which influence on emotional labor among those engaged in the customer service industry and the Preparation of Manuals for Emotional Labor and the provision of programs to solve problems.

Methods/Statistical analysis: Field surveys of the actual management of emotional labor were conducted on 585 high-risk businesses from January 2015 through June 2016 in south Korea. A total of 581 were analyzed, excluding four with missing values. SPSS ver. 23.0 program was used for all data analyses. Differences by trade were analyzed through chi-square test and ANOVA. Multiple regression analysis by variable was performed to identify the factors influencing the preparation of manuals and the provision of programs.

Findings: Findings show that big box stores ranked first in terms of the preparation of manuals and the provision of programs. Significantly impacting factors were designated staff and committee, budget, level of understanding of business reality, and organizational culture. They varied slightly depending on the trade they belong to.

Improvements/Applications: For a wider and better implementation, businesses need to offer not only support to individuals and organizations but budget. In addition, they need to understand the state of emotional labor among workers and their request in order to shape corporate culture that supports business owners, managers, and customers.

Keywords:*Emotional labor, Manuals, Programs, Organizational culture, Human resources and organization, Understanding of business reality*

Introduction

[9]After Hochschild's Emotional Labor (1983), experts and those working at civic groups in Korea started to raise the need for the management of emotional labor since the middle of the 2000s. This drew a broad attention from Koreans particularly when 'nut rage' became a social issue (a case where a daughter of the CEO of Korean Airline Co., Ltd. yelled to cabin crew while onboard a plane moving from a slot to taxi of New York and forced the pilot to change direction backwards to JFK airport on December 5, 2014). Since then, difficulties of emotional laborers were brought to light and attracted due attention from the public.

The customer service industry mostly forces those working in its field not to express their emotion and to wear guided facial expressions and bodily movement. This is why they are called as emotional laborer [1]. The trade largely consists of service-oriented businesses, including big box stores, hotels, department stores, clinics and hospitals, and bus, taxi and other public transportations.

In 2000, Grandey suggested a model that explains emotional labor is not just a social phenomenon but an issue that affects individuals and organizations as a whole. The model insists that emotional labor decreases job satisfaction among individuals and causes damages to business performance and turnover [2].

The reason why emotional labor triggers such problems can be explained through emotional inconsistency. The emotional inconsistency is a state in which employees behave in different ways other than in what they really feel for various reasons, including sales growth pressures [3], improper conditions or customer's excessive request [4], and employee's characteristics [5]. These mismatches occur, going beyond the trade or occupation they are working in [6]. These emotional disparities frequently lead to individual's exhaustion [7] and emotional deviation [8]. In addition, they increase turnover rate [9] and encourage counter-productive behaviors [10], affecting organizations.

This study is to identify the current state of manuals prepared in workplaces and emotional labor programs delivered to those employees as well as the factors influencing them, in order to contribute for the protection of emotional laborers.

Method

This study used nationwide emotional labor management data provided by labor supervisors of the Ministry of Employment and Labor. The data is a result of survey done on high-risk workplaces of customer services from January 2015 to June 2016. Except the four with missing data, a total of 581workplaces were analyzed. Institutional Review Board (IRB: EU19-24) in South Korea.

Preparation of Manuals bears two survey questions: businesses have an internal manual that can control too excessive consumer's complaint, businesses provide a measure designed to cope with customer's violence or other violent behaviors (Perfect score is 2.).

Provision of Programs is made up with six questions: whether a comprehensive emotional labor management is drafted, a healing program for emotional laborer is provided, a health promotion program is offered to emotional laborers, a training course that helps emotional laborers control their work, emotional labor management project is evaluated, training program will continue (Perfect score is 6.).

Designated Staff and Committee carries three questions: businesses designated a person in charge or a department reserved for the protection of emotional laborers, businesses provided a person in charge of managing emotional laborer's health, emotional labor related issues are handled by occupational health and safety committee (Perfect score is 3.).

The budget required for emotional labor management consists of two questions: the budget for managing emotional laborers is allocated,participants in emotional labor training programs are incentivized (Perfect score is 2.).

The understanding of emotional labor in business reality consists of two questions: whether or not data about the level and frequency of excessive consumer complaint is recorded: the request of emotional labor management by employees is investigated (Perfect score is 2.).

The organizational culture consists of four questions: labor and management are collectively working on the management of emotional labor out of their own will, a business owner finds it necessary to manage emotional labor, managers have a plan to protect and support emotional laborers at a time of conflict between them and consumers, internal guideline for controlling excessive consumer complaint is prepared (Perfect score is 4.).

Result

1. Difference in variables by trade

With regard to the preparation of manuals, there were differences among trades. Big box stores scored 1.5 points out of 2, ranked first, and others marked 0.8 to 1. Regarding the provision of programs, the big box section scored 4.7 points out of 6, the highest, followed by hotels (3.1), medical institutions (2.7), others (2.5), andtransportation (2.2) [table 1].

2.Factors influencing manual preparation for emotional labor

The regression model for the preparation of manuals explained 49.7% in overall workplaces, exhibiting significant differences in designated staff and committee (β=0.113, p= 0.004), budget (β=0.202, p= <0.001), organizational culture (β = 0.438, p = <0.001), and understanding of business reality (β = 0.132, p = <0.001) [table 2].

3.Factors influencing on the activation of programs for emotional labor

The regression models for the provision of programs explained 70.4% in overall workplaces, displaying significant influence in designated staff and committee (β=0.266, p= <0.001), budget (β=0.294, p= <0.001), organizational culture (β = 0.264, p = <0.001), and understanding of business reality (β = 0.201, p = <0.001) [table 3].

Discussion

Previous studies suggested that an emotional labor manual should carry measures that can help emotional laborers handle excessive complaints and consumer's foul languages [9-10]. 87.2% of those working in the distribution sector experienced unpleasant languages, and 19.1% of them underwent sexual harassment from consumers [11]. In addition, 98.1% of nurses said they experienced violence (of verbal and physical as well as threat) from patients and their caregivers over the recent one year [12]. Considering this reality, the level of manual preparation in workplaces is low.

It is the time for the Korean government to come up with a comprehensive measure which all businesses should comply with [13]. In order to manage emotional labor in workplace, such a manual that can protect emotional laborers from black consumers should be prepared [14]. Several studies found that the provision of manuals, training, and healing program, all at a time, to those working at sales positions showed improvement in emotional labor intensity, depression, social approval, exhaustion, job satisfaction, and intention of turnover. Yet, the provision of training and healing program only ended in significantly lowered depression [15].

With regard to the preparation of manuals, there were differences among trades. These differences can be attributable to the phased adoption of the preparation. For instance, issues centered on emotional labor in the call center and the retail sector have been around in the Korean society longer than in other trades, including medical institutions – nurses - and transportation [16]. In the meantime, the hotel business is where emotional labor manuals were first discussed, and thus has reaped certain levels of achievement [17]. Regarding the provision of programs, transportation was the lowest because this sector was a small-scale one and frequently covered by one single laborer. The trade's features make it hard to provide such a program that aims at a group of people.

Designated staff and committee left significant influence on big box stores and hotels; budgeting impacted big box stores, hotels, transportation, and others, other than medical institutions. According to the theory of planning, arranging staff and committee is the first thing to do, and then comes budget allocation for the mission [18]. When working on the arrangement, it is desirable to designate a department or staff who will deal with customer complaints, and to secure budget for training and consultation, from the money needed for safety and health management [19].

Traditionally, the value of emotional labor has not been properly appreciated [20], so medical institutions in which skilled professionals, including doctors and nurses, work put focus on their expertise, instead of the labor[21]. Given that, the fact that understanding of business reality, particularly in the medical sector, leaves influence on the preparation of manuals can be construed as an important change that began to see nurse's care an emotional labor[22].

* β= Standardized regression weights

Korea's organizational culture, a merit system designed to collectively pursue ultimate goals, has been said to have a component that encourages employees to develop themselves under a rational and cooperative atmosphere, and this is believed to positively influence inner elements of emotional labor[23]. In addition, innovative culture and relation-based organization culture reduced emotional labor[24].

Conclusion

Based on the findings, this study suggests the followings: First, in order to support emotional laborers and improve their health, manuals that can protect emotional laborers from consumer's violence and control excessive complaints in the face-to-face workplaces should be prepared. Second, provision of programs, including training for such laborers, should be regularly planned and continuously performed in

workplaces. Third, designated staff and organization should be provided so that the preparation of manuals and the provision of programs are conducted. In addition, for that purpose, budget should be allocated, and current state of emotional labor should be studied. Fourth, since each workplace shows different conditions from another, the labor and the management should autonomously manage emotional labor. Furthermore, business owners and managers should support such management efforts and shape organization culture that communicates with customers about those activities.

Relationship Between Hyperglycemia and Periodontal Symptoms in Korean Type 2 Diabetes Mellitus Patients Aged ≥ 50 Years

Jun-Seon Choi

Department of Dental Hygiene, Gachon University, Republic of Korea

Abstract

Background/Objectives: Diabetes mellitus is a disease that reduces quality of life and has a variety of oral manifestations. This study analyzed the relationship between the hemoglobin A1c level, an index that reflects the average blood glucose level over the preceding 2 to 3 months, and self-reported periodontal symptoms in individuals with type 2 diabetes mellitus.

Methods/Statistical analysis: The participants in this cross-sectional study were 156 patients aged ≥ 50 years who had type 2 diabetes mellitus. A questionnaire was used to investigate their general characteristics, oral health behaviors, and self-reported periodontal symptoms. The hemoglobin A1c test was conducted to assess the blood glucose level of the participants. The outcome variable was the number of self-reported periodontal symptoms. Independent t-tests and logistic regression analysis were performed for statistical analysis.

Findings: Self-reported periodontal symptoms differed significantly according to sex, average monthly income, frequency of tooth-brushing, recent dental check-ups and hemoglobin A1c level ($p < 0.05$). In the regression model adjusted for general characteristics and oral health behaviors, a higher hemoglobin A1c level was associated with a higher risk of periodontal symptoms ($p < 0.01$). The results of this investigation indicate that chronic hyperglycemia is associated with the development of periodontal symptoms.

Improvements/Applications: In future studies, additional risk factors for periodontal inflammation should be considered and the number of participants should be increased.

Keywords: *Diabetes mellitus, Hemoglobin A1c, Hyperglycemia, Oral health, Periodontal symptoms*

Introduction

Diabetes mellitus is a chronic disease characterized by hyperglycemia, which causes abnormal changes in the metabolism of carbohydrates, proteins, and lipids[1]. Diabetes mellitus is a growing health problem worldwide. In Korea, one in eight adults aged ≥ 30 years is affected by diabetes[2], and it remains difficult to control risk factors for the disease[3]. As diabetes mellitus causes a variety of life-threatening complications and reduces patient quality of life[4], all health professionals must be aware of practices for effective management of the disease.

There have been various reports on the chronic complications of diabetes mellitus, which include cardiovascular and kidney diseases[5]. Compared with healthy individuals, patients with diabetes mellitus exhibit more severe periodontal tissue destruction and a higher prevalence of dental caries[6,7]. The prevalence rates of tooth mobility and gingival recession are also higher in patients with diabetes mellitus[8]. Despite increasing evidence of a relationship between diabetes mellitus and oral health status, both health professionals and patients with the disease continue to exhibit a lack awareness of the importance of dental care[9].

Previous studies of the oral manifestations of diabetes mellitus have generally used clinical *periodontal* parameters, such as pocket depth and periodontal attachment loss, to assess the participants' periodontal health status[10]. However, based on the definition of health of the World Health Organization, as well as from a quality of life perspective, patient-centered measures, such as self-reported health status, are particularly important. Moreover, the fasting plasma glucose test, which was primarily used to assess the blood glucose level of subjects in previous studies, can show large deviations depending on the timing of recent meals[11]. Recently, the American Diabetes Association (ADA) recommended the use of the hemoglobin A1c (HbA1c) test to screen for diabetes mellitus[1]. Therefore, there is a need to assess the HbA1c level, which can reflect long-term blood glucose management status and serves as a predictor of complications associated with diabetes mellitus[12].

Accordingly, the aim of this study was to investigate the relationship between HbA1c level and self-reported periodontal symptoms among patients with type 2 diabetes mellitus. The findings of the study can be used as reference data for improving the general health, oral health (including gingivalhealth), and h*ealth-related* quality of life of individuals with type 2 diabetes mellitus.

Method

Participants: This cross-sectional study was approved from the Ethics Committee of Gachon University (IRB NO. 1044396-201905-HR-080-01) and conducted in accordance with the World Medical Association Declaration of Helsinki. This study evaluated type 2 diabetes mellitus patients aged ≥ 50 years who visited one of two internal medicine clinics located in Gyeonggi Province; the clinics were selected using the convenience sampling method. An examiner visited the clinics and provided a detailed explanation of the study's purpose and process to the patients visiting the clinics. Among the patients who voluntarily agreed to participate in the study, the examiner obtained informed consent from those who did not meet any of the following exclusion criteria: 1) patients who had periodontal surgery within 6 months from the start date of the study; 2) patients with a body mass index of ≥ 25 kg/m^2; 3) patients who were diagnosed with degenerative diseases of their hands or shoulders; 4) patients who had cognitive disorders; 5) patients who were diagnosed with dementia; 6) patients who consumed more than one-half glass of alcohol per day; 7) patients who smoked ≥ 5 cigarettes each day; 8) patients who had xerostomia; 9) patients who had ≤ 20 remaining teeth.

Data were collected from 156 participants during the period from May 30, 2019 to June 15, 2019. G*Power software (ver. 3.1.9.2) was used to calculate the minimum sample size required for univariate analysis. When setting the significance level at 5%, power at 95%, and effect size at 0.30[13], the minimum sample size needed was 111 participants.

Measurements: We used a questionnaire to survey the general characteristics, oral health behaviors, and self-reported periodontal symptoms of the participants. A higher number of self-reported periodontal symptoms over the past 12 months was considered indicative of worse periodontal health status[14]. The HbA1c test was performed to assess the average blood glucose level over the preceding 2 to 3 months. Approximately 0.2 cc of blood was collected from the capillary vessel of the fifth *finger of the dominant hand;*the HbA1c level in the blood sample was immediately analyzed using the In2it™ analyzer (Bio-Rad Laboratories, CA, USA). Higher scores were considered indicative of worse blood glucose management. Participants with an HbA1c level of ≥ 7.0 were classified into the group with poorly controlled blood glucose. The average duration to complete the interview and the HbA1c test was 15 min.

Statistical analysis: The collected data were analyzed using SPSS for Windows software (ver. 25.0; IBM Corp., Armonk, NY, USA). Independent t-test were performed to analyze the differences in self-rated periodontal health status according to general characteristics, oral health behaviors, and HbA1c levels. In addition, multiple logistic regression analysis was performed to evaluate the influence of HbA1c level on self-reported periodontal symptoms;independent variables included all factors for which the P values were < 0.05 in the independent t-test. Values of $p < 0.05$ were considered statistically significant.

Result

1. Self-reported periodontal symptoms according to general characteristics

Analyses of differences in periodontal symptoms according to general characteristics revealed that men and participants with an average monthly income ≥ 1.51 million KRW had more self-rated periodontal symptoms

than their counterparts($p < 0.05$ for both)[Table 1].

Table 1. Self-reported Periodontal Symptoms According to General Patient Characteristics

Variables	N	Number of periodontal symptoms	
		Mean ± SD	t (P)
Sex			
Male	35	1.91 ± 1.68	2.390 (0.018)
Female	121	1.22 ± 1.45	
Age (years)			
≤ 64	67	1.54 ± 1.69	1.128 (0.261)
≥ 65	89	1.26 ± 1.39	
Average monthly income (million/ KRW)†			
≤ 1.50	88	0.93 ± 1.03	-3.224 (0.002)
≥ 1.51	54	1.80 ± 1.79	

†Divided by participants' median

2.Self-reported periodontal symptoms according to oral health behaviors and HbA1c level

Participants who brushed their teeth ≥ 3 times per day, and those who had undergone a periodical dental checkup within the past 2 years, had more self-rated periodontal symptoms than their counterparts ($p < 0.05$ for both). In addition, participants with poorly controlled blood glucose had more self-rated periodontal symptoms than participants with well-controlled blood glucose ($p < 0.05$)[Table 2].

Table 2. Self-reported Periodontal Symptoms According to Oral Health Behaviors and HbA1c Levels

Variables	N	Number of periodontal symptoms	
		Mean ± SD	t (P)
Frequency of tooth-brushing (per day)			
≤ 2	109	1.18 ± 1.30	-2.133 (0.037)
≥ 3	47	1.83 ± 1.89	
Tooth-brushing technique			
Non-rolling stroke	55	1.16 ± 1.22	-1.296 (0.197)
Rolling stroke	101	1.50 ± 1.66	
Recent dental check-ups (years)			
≤ 2	93	1.61 ± 1.68	-2.362 (0.019)
> 2	63	1.03 ± 1.19	
Use of interproximal cleaning devices			
No	137	1.35 ± 1.54	-0.609 (0.543)
Yes	19	1.58 ± 1.46	
Periodic dental scaling			
No	142	1.37 ± 1.54	-0.129 (0.898)
Yes	14	1.43 ± 1.39	
HbA1c level			
Good control (< 7.0)	91	1.16 ± 1.59	-2.083 (0.039)
Poor control (≥ 7.0)	65	1.68 ± 1.39	

3. Logistic regression model of the association between self-reported periodontal symptoms and HbA1c

The regression model, when adjusted for general characteristics, showed that higher HbA1c was associated with a higher risk of periodontal symptoms (p = 0.009). Self-rated periodontal health status differed according to sex (p = 0.006) and average monthly income (p = 0.051), showed a trend toward a significant association with history of recent dental check-ups (p = 0.071)[Table 3].

Table 3.The Association between Self-reported Periodontal Symptoms and HbA1c by Multiple Logistic Model

Variables	B	OR	CI	P*
Sex	-1.307	0.271	0.10-0.68	0.006
Average monthly income	0.990	2.691	0.99-7.28	0.051
Recent dental check-ups(yrs.)	0.791	2.205	0.93-5.20	0.071
Frequency of tooth-brushing	-0.396	0.673	0.25-1.76	0.420
Tooth-brushing technique	0.137	1.147	0.45-2.88	0.771
HbA1c	0.444	1.559	1.11-2.17	0.009

*By multiple logistic regression analysis adjusted for age.

Dependent variable (0 = with one or more periodontal symptoms, 1 = with two or more periodontal symptoms)

Sex (0 = male, 1 = female), average monthly income (0 = ≤1.50, 1 = ≥1.51), recent dental check-ups (years) (0 = > 2, 1 = ≤ 2), frequency of tooth-brushing (0 = ≤2, 1 = ≥3), tooth-brushing technique (0 = non-rolling stroke, 1 = rolling stroke), and HbA1c (continuous).

Discussion

There have been reports of an association of diabetes mellitus with abnormalities in several soft tissues, including the periodontium[15]. However, with regard to periodontal health, it is more meaningful to evaluate oral manifestations according to blood glucose level, rather than to consider only the prevalence of diabetes mellitus. Furthermore, patient-centered measures can provide important information that can be used to improve quality of life. Therefore, we hypothesized that a higher HbA1c level (an indicator of the average blood glucose level over the preceding 2 to 3 months) would be associated with a higher prevalence of self-perceived periodontal symptoms. The results of this study confirmed the presence of a positive correlation between HbA1c level and periodontal symptoms in patients with type 2 diabetes mellitus, even after adjustment for factors related to periodontal disease. This result is consistent with the findings of a prior study, in which patients with hyperglycemia had a higher prevalence of periodontal inflammation than non-diabetic individuals[16]. This study supports the result of another previous study, in which diabetes patients, despite having similar oral hygiene habits, had more dental biofilm and periodontal inflammation than healthy individuals[17]. In summary, the findings of the present study suggest that comprehensive monitoring of HbA1c can contribute to the prevention or early detection of periodontal symptoms. Hyperglycemia has previously been reported to be a critical risk factor for the development of vascular complications[9]. In particular, aggressive periodontitis has been identified as the sixth common complication in patients with type 2 diabetes mellitus[18], and several robust mechanisms have been proposed to explain the association between hyperglycemia and periodontal problems. High glucose conditions eventually accelerate periodontal tissue destruction by inducing a hyper-inflammatory response of the periodontal microbiota, as well as by inhibiting repair of damage due to inflammation[19,20]. Another study found that under high

glucose conditions, periodontal ligament fibroblasts did not respond adequately to mechanical deformation[21]. Therefore, patients with diabetes mellitus should be advised that failure to control blood glucose can lead to severe periodontal disease. Moreover, improving or eliminating periodontal inflammation can reduce fasting blood glucose[22]. Non-surgical periodontal therapy is reportedly effective for improving periodontal health and metabolic control, as reflected in HbA1c and triglyceride level[23]. Therefore, all health professionals should be aware that hyperglycemia is a valuable predictor of periodontal diseases; moreover, periodontal inflammation inhibits effective glycemic control. In addition, to promote optimal health status of patients with diabetes mellitus, an effective interdisciplinary communication system should be established promptly among all health professionals. Finally, based on the findings of the present study, we suggest that blood glucose level should be measured during assessments of the oral health status of patients with diabetes mellitus.

The study had several weaknesses. First, it used a cross-sectional design and thus could not identify causal relationships among variables. Second, when selecting the study participants, we only considered those with diabetes mellitus who had visited either of two clinics, and who were chosen using the convenience sampling method. Third, the primary aim of the study was to identify relationship between HbA1c and periodontal symptoms; thus, risk factors for periodontal disease were not explored comprehensively. In further studies using systematic designs and including more participants, various factors that affect periodontal disease should be considered. Despite these limitations, this study was significant in that the screening for HbA1c performed herein, as recently recommended by the ADA, showed that chronic hyperglycemia was associated with the development of periodontal symptoms that led to poor oral function and reduced quality of life.

Conclusion

In this study, we found that self-reported periodontal symptoms differed significantly according to sex, average monthly income, frequency of tooth-brushing, recent dental check-ups and hemoglobin A1c level. Furthermore, the study demonstrated a significant relationship between HbA1c level and self-reported periodontal symptoms,even after adjustment for general characteristics and oral health behaviors. These findings suggest that comprehensive monitoring of HbA1c can contribute to the prevention or early detection of periodontal symptoms. Therefore, medical personnel should strictly monitor blood glucose to delay the complications associated with diabetes mellitus and minimize the associated decline in quality of life. Moreover, dental professionals should regularly perform various interventions to improve oral hygiene status and prevent periodontal issuesin individuals with poorly controlled diabetes.

Affecting Factor of Nursing Professionalism among Nurses in Geriatric Hospitals

Jin-hee Kwon[1], Bong-sil Choi[1]

[1]Nambu University, Department of Nursing, Korea

Abstract

Background/Objectives: This study is a descriptive research that aims to identify the impacts of nursing competencies and role conflict of nurses in geriatric hospitals on nursing professionalism.

Methods/Statistical analysis: : Data was collected from 203 nurses working in geriatric hospitals and conducted descriptive statistical analysis, t-test, one -way ANOVA, Scheffe's test, correlation analysis, and regression analysis on the collected data using SPSS/WIN 23.0.

Findings: Nursing professionalism showed a statistically significant difference in age, education level, position, working pattern, and health status. While nursing professionalism and nursing competency showed a significantly positive correlation, nursing professionalism and role conflict did not have a significantly positive correlation. Nursing competency and education level were the most influential factors on nursing professionalism of the subject. The higher the nursing competency and education level were, the nursing professionalism increased as well.

Improvements/Applications It is necessary to continuously conduct research on nursing professionalism targeting at nurses in geriatric hospitals for identifying the influencing factors and develop positive nursing professionalism.

Keywords:*nurses in geriatric hospitals, nursing competency, role conflict, nursing professionalism*

Introduction

As the demand for long-term care services increases due to changes in disease patterns, such as the increasing prevalence of senile chronic diseases due to a rapidly aging society, the number of geriatric hospitals has increased rapidly, to 1,507 in 2017[1]. In addition, considering that most of the patients in geriatric hospitals are patients with complex, chronic illnesses who are highly dependent on the medical staff, the reality of the nursing staff in geriatric hospitals can have a significant impact on the quality of care provided to the patients[2]. Geriatric hospital nurses not only provide direct care for elderly patients but also provide daily care, observe emergency situations and safety accident risks, and provide general care that encompasses physical, mental, and spiritual aspects. In reality, practical nurses and care helpers assist in nursing and are also responsible for the work of doctors due to the lack of medical staff and the lack of education and supervision of nursing assistants[3] [4]. As such, geriatric hospital nurses are required to have a high level of nursing competency, such as more professional experience, extensive knowledge, skills, and values because of these newly added roles in addition to nursing and the delegation of ambiguous nursing actions[5].

Among the various difficulties experienced by geriatric hospital nurses, the problem of role conflict due to the difference in nursing service between geriatric hospitals and acute-care hospitals and the relationship with the health care providers is very serious. In particular, the practical nurses at geriatric hospitals often perform the same nursing service as the nurses, so

Corresponding Author :
Bong-sil Choi,
choibs@nambu.ac.kr

conflicts occur due to the unclear and disorganized work distribution according to one's position[6]. They also have to repeatedly persuade, listen to the needs of and manage the excessive interference of patients' guardians, and sometimes are even the target of guardians' anger. In addition, they perform the work of doctors that is beyond their expertise as nurses because of the lack of medical staff, resulting in unclear liabilities in the event of legal problems[7]. Due to the unclear division and delegation of duties, the role conflict of geriatric hospital nurses leads to identity confusion[4].

Nurses are required to form a higher level of nursing professionalism to develop their roles as professionals with positive work values, professional knowledge, and technical and administrative skills as professionals[7]. Positive nursing professionalism can contribute to increasing the competitiveness of hospitals by reducing the intention of nurses to change jobs while providing high-quality care by increasing job satisfaction and nursing service performance[8]. There have been many previous studies on nursing competency, role conflict, and nursing professionalism in Korea, but only a few studies about nurses in geriatric hospitals. Recently, as the role conflict experienced by geriatric hospital nurses has gained attention, the need for positive nursing professionalism and nursing competency has been emphasized. Therefore, this study intends to examine the impact of nursing competency and role conflict on nursing professionalism for nurses working at geriatric hospitals, and thereby enhance the nursing competency of geriatric hospital nurses and resolve role conflicts, to provide basic data that will support the development of positive nursing professionalism.

The purpose of this study is to examine the effect of nursing competency and role conflict on nursing professionalism for geriatric hospital nurses.

Method

This study is a descriptive study to examine the effect of nursing competency and role conflict on nursing professionalism for geriatric hospital nurses.

The subjects were nurses working in geriatric hospitals with more than 150 beds in G metropolitan city. Data was collected from 203 nurses working in geriatric hospitals and conducted descriptive statistical analysis. Data collection was performed from June 15 to 30, 2017, and was approved by the N University Bioethics Review Committee in advance (1041478-2017-HR-007). The researcher provided information on the purpose of the study and questionnaire to the nursing department of each hospital and received approval to collect data.

Nursing competencystudy used the nursing competency tool developed by Kim[5].The tool for role conflict was prepared by the researcher based on the study of role conflict experience of geriatric hospital nurses carried out by Park & Yeom[6]. Nursing professionalism study used the nursing professionalism tool developed by Yun et al·[7]. The degree of nursing competency, role conflict, and nursing professionalism was obtained as the average and standard deviation.The t-test and one-way ANOVA were used for nursing competency, role conflict, and nursing professionalism according to general characteristics, and the Scheffe's test was used for post-hoc analysis.The correlation between nursing competency, role conflict, and nursing professionalism was analyzed using Pearson's correlation coefficient. Multiple linear regression analysis and stepwise multiple regression analysis were used for factors influencing nursing professionalism.

Result and Discussion

1. General characteristics of the subjects

The differences in nursing competency, role conflict, and nursing professionalism according to general characteristics are shown. Nursing competency showed statistically significant differences depending on age, position, shift pattern, hospital type, and health status. Role conflict showed statistically significant differences with changes in the shift pattern, the number of beds, and health status.

Nursing professionalism showed statistically significant differences related to age, final education, position, shift pattern, and health status. .

2.Correlation between nursing competency, role conflict, and nursing professionalism

The correlation between nursing competency, role conflict, and nursing professionalism is shown in [Table 1], and there was a positive correlation found between nursing professionalism and nursing competency ($r=.60$, $p<.001$). However, there was no statistically significant correlation between nursing professionalism and role conflict ($r=.05$, $p=.524$), or between nursing competency and role conflict ($r=.04$, $p=.563$).

Table 1. Correlation of nursing competency, role conflict and nursing professionalism (*N*=203)

	Nursing competency		Role conflict	Nursing professionalism
Nursing competency	1			
Role conflict	.04(.563)		1	
Nursing professionalism	.60(<.001)		.05(.524)	1

3. Factors influencing nursing professionalism

The factors that influence nursing professionalism are shown in [Table 2] A multiple linear regression analysis was performed to examine the influence of the general characteristics and nursing competency of geriatric hospital nurses on nursing professionalism. In particular, the analysis included age, final education, position, shift pattern, and health status, which showed statistically significant differences in nursing professionalism among the general characteristics.

It was found that 3 variables of the general characteristics (age, final education, health status) and nursing competency were significant variables influencing the subjects' nursing professionalism, and the explanatory power was 41.8% (F=35.60, *p*<.001). In other words, when the age is 30～40 years old, it was (β=-.132); 4-year university graduate nurse (β=.123); normal health (β=-.130); and nursing competency (β=.533). In particular, the characteristics associated with a reduction in the nursing professionalism of the subjects are age (30～40 years old) and health status (normal health). The characteristics associated with an increase in the subjects' nursing professionalism are 4-year university graduates and nursing competency.

Table 2. Factors of nursing professionalism (*N*=203)

Discussion

This study is descriptive research that aimed to examine the effect of nursing competency and role conflict on nursing professionalism for geriatric hospital nurses. The study found that the nursing competency was 3.49, which was lower than the result of 3.80 in the study by Kim[9] and similar to the result of 3.47 in the study by Kim & Gu[10]. As was found in the previous study by Kim & Gu[10], more clinical practice experience leads to more clinical experience and knowledge, which results

in demonstrating professionalism and higher nursing competency, and the clinical practice experience of the subjects in this study was 9.73 years, compared to the average of 12.01 years in the study by Kim[9], which in turn influenced the results of this study. The degree of role conflict was 3.48 in this study, which was higher than the study by Sung[11], which compared the degree of role conflict between the nurses working in the intensive care unit (2.99) and general ward (2.88). This result is related to the emphasis on cooperative work with other professions such as practical nurses, care helpers, social workers, and physical therapists, the requirement for more responsibility and independence than general nurses in special circumstances, and the requirement of quick and accurate decisions in crisis situations[12]. In addition, the degree of nursing professionalism was 3.49, which is similar to the result of 3.48 in the study by Park & Kim[13] on the nursing professionalism of geriatric hospital nurses.

In this study, nursing competency and nursing professionalism showed a positive correlation. In the study of Han et al.[8], there was a significant positive correlation between nursing professionalism and nursing service performance, and nurses with more positive nursing professionalism were more satisfied with their job. The results were also high in performing nursing service to meet the needs of patients, which were similar to the results of this study. As there is a positive correlation between self-concept and nursing service performance in the process of performing nursing duties, positive values and attitudes are shown when confidently performing tasks with a professional self-concept. Currently, the geriatric hospitals in Korea do not have separate departments for specialized medical care, and as the number of patients with severe diseases increases, we can perceive the lack in competency and preparation to provide quality nursing care to those patients. Therefore, nurses who take care of elderly patients emphasize the need for nursing education considering the characteristics of the older adults, but about 73% of nurses report that they have not received nursing education for the elderly within the past year[14]. Unlike general hospitals, geriatric hospitals do not have a learning atmosphere within the nursing department, which requires self-reflection and efforts of nurses; to improve this situation, institutional support within the organization should be considered in various ways[6]. Meanwhile, there was no statistically significant correlation between role conflict and nursing professionalism found in this study, which is consistent with the findings of Yun et al.[7].

As nursing competency was the most influential factor in nursing professionalism, higher nursing competency led to higher nursing professionalism. In the study of Han et al.[8] about the factors influencing nursing professionalism, service performance ability, a similar concept to nursing competency, was reported as the first influencing factor of nursing professionalism, which supports the results of this study. In particular, the study considered that nursing professionalism was formed by performing nursing activities that demonstrate identity, professionalism, and autonomy among work performance abilities[8]. As nursing practice refers to all nursing activities that are intentionally performed to meet the demands of complex and diverse nursing subjects through a systematic approach in a medical situation, it is a professional practice that requires identity, professionalism, and autonomy. The study of Lee & Kim[4] reported that there was a perception that geriatric hospital nurses were incompetent and incapable, and that nurses went to geriatric hospitals because it was easy work. Geriatric hospital nurses serve an important role because they are not only directly responsible for nursing practice with professional nursing knowledge and skills[14], but also educate employees about infection control and manage nursing assistant staff[10]. However, out of 91 nursing actions at geriatric hospitals, nurses and nursing assistants work together within a wide range of nursing care, with the exception of the 3 actions of nursing diagnosis, setting goals for nursing, and preparing patient evaluation tables. In terms of direct nursing practice, nursing assistants perform as little as 40.2% to as much as 80.4%, so the elderly nursing performance status by nurses was very low[15]. Accordingly, the nursing competency level of geriatric hospital nurses was reported to be significantly lower than its perceived importance[10]. Therefore, in order to enhance the identity, professionalism, and autonomy of nursing, geriatric hospital nurses should actively participate in education and training for nursing level improvement and evidence-based practice to improve nursing competency, and with the support of policies and systems that can nurture the identity of nursing within the boundaries of the law, we can expect to form a positive nursing professionalism.

Conclusion

This study analyzed the effect of nursing

competency and role conflict on nursing professionalism for nurses working at geriatric hospitals. As a result, among nursing competency and general characteristics, age, final education, and health status were identified as significant factors influencing nursing professionalism. In a rapidly changing medical service environment, establishing a positive nursing professionalism for geriatric hospital nurses is very important in order to ensure effective nursing practice performance, provide high-quality nursing service, establish a position as a professional nurse, and ensure the stable operation of nursing staff in medical service organizations. To improve nursing professionalism, internal and external improvements are required to maximize nursing competency while conducting professional nursing practice. In addition, individual nurses should try to improve their professionalism in their nursing practice so that nurses can receive professional respect. Geriatric hospitals should also respect, consider, professionally recognize the field of nursing, and provide promotion opportunities and improve treatment. Management and attention are needed at the organizational level to strengthen professional education and consider the role and functions of nurses to encourage them to establish and improve a healthy and positive level of nursing professionalism for nurses working at geriatric hospitals. The results of this study indicate that nursing competency is the most influential factor in the nursing professionalism of geriatric hospital nurses. Therefore, continuous research is needed to develop programs and strategies to improve the nursing competency of geriatric hospital nurses and to establish interventions to understand the effects.

An Analysis of the Need For Aid Tools in Dementia Patients: Focusing on the Normal Elderly, Dementia Patients, and Caregivers of Dementia Patients

Hwan-Hee Kim

Department of Occupational Therapy, Semyung University, Rebulic of Korea

Abstract

Background/Objectives: The purpose of this study was analyze the subjects to understand dementia patients' level of need for aid tools that affect their daily activities, safety management, and cognitive function.

Methods/Statistical analysis: The current study recruited subjects through a community welfare center for the elderly. Fifty-seven normal elderly, thirteen dementia patients, and fifteen caregivers of dementia patients agreed to participate in the study. We were provided with explanations of each item and invited to ask questions. The questionnaires consisted of personal information, general health states, and supportive needs (daily life, safety management, cognitive function). The collected data underwent statistical processing using SPSS.

Findings: The first analysis was regarding the difference in preference for daily activity aids among the normal elderly, dementia patients, and caregivers of dementia patient groups. The normal elderly and dementia patients mostly preferred the automatic dispenser; however, the caregiver group displayed the highest preference for the medication calendar. In the area regarding tools for safety management, the night sensor was the most preferred in the three groups. In terms of aid tools for cognitive activities, the normal elderly mostly preferred the alarm clock, dementia patients selected the artificial intelligence speaker, and the caregivers chose the large-sized calendar and notebook.

Improvements/Applications: Instead of providing aids without conditions, they should be offered according to the level of need experienced by beneficiary. Also, systematic service of specialist will be required for the process.

Keywords: *Aid tool, Assistive device, Caregivers, Dementia patients, Elderly, Need*

Introduction

With the continuing global trend of population aging, the number of patients with dementia is increasing annually. There were forty-seven million people suffering from dementia in 2017, and the number is expected to increase to one hundred and thirty-one million by 2050[1]. Dementia, one of the most typical geriatric diseases, causes irreversible brain damage that restricts a person's cognitive, behavioral, and motor capacity[2]. Another feature of the disease is that it gradually deteriorates the patient's ability to independently carry out daily activities, which in turn adds to the psychological and economic burden of family members who care for the elderly with dementia[3].

In the end, this burden takes on the form of a socioeconomic problem. Statistics show that the nation-wide cost of treating dementia in Korea increased from 810 billion won in 2010 to 1 trillion and 448.3 billion won in 2015, exhibiting an increase of more than 600 billion won in just five years[4]. To cater to and fulfill the social and economic needs of patients with geriatric [1]diseases including dementia, the Korean government introduced the long-term care insurance program.

Corresponding Author :
Hwan-Hee Kim,
heeya6672@daum.net

All Korean citizens are required to sign up for the long-term care insurance: the program provides welfare benefits to the elderly aged sixty-five years or older or patients who are sixty-four years or younger with geriatric diseases, if they suffer from significant functional disorders and cannot independently carry out daily activities for six months or longer. Three types of welfare benefit services are provided through the long-term care insurance program: facility use benefits, in-home care benefits, and special cash benefits[5]. The welfare medical device salary service, which is one of the in-home services, is a service that lends or purchases equipment necessary for daily life or physical activity support to the elderly with long-term care insurance and who experience difficulty in daily life due to a decrease in mental and physical functions[6].

As the need for welfare equipment increases, concerns about the welfare service associated with these equipment are also emerging. Dementia patients and their caregivers are not aware of what tools to use and how to use them. Moreover, there is a lack of specialists and education on selection as well as proper use of welfare equipment[7]. Welfare equipment service professionals should evaluate the environment and capabilities of the target person, assist them in selecting the appropriate welfare tool, and train them on how to perform the intended task successfully, including training on how to manage and use the welfare tool[8].

Recently, research on the assistive devices for the elderly and handicapped have been carried out; however, there is insufficient research on the use of assistive devices for dementia patients and their caregivers. There was a review paper on assistive technology for the elderly with dementia in the community[9]. However, there was no questionnaire study to elaborate the needs of the subjects. Therefore, the purpose of this study is to investigate the need for assistive devices among dementia patients and their caregivers.

Method

1. *Subjects and Periods*

The current study was conducted on the normal elderly, dementia patients, and caregivers of dementia patients. The normal elderly who participated were aged sixty-five years or older and capable of independently executing daily activities without physical and mental difficulties. The dementia patients in this study were diagnosed as having mild dementia by psychiatric specialists according to the DSM-5 (Diagnostic and Statistical Manual of Mental Disorders, the 5th edition) standards, and were able to communicate with others. The welfare medical device was targeted toward patients with dementia and those living in the community. Excluding the responses which included unanswered questions or unreliable answers, a total of eighty-five responses (fifty-seven from the normal elderly, thirteen from dementia patients, and fifteen from caregivers of dementia patients) were used for the analysis.

This study was conducted from June to August 2018, and the subjects were recruited via a welfare center for the elderly in a local community. In consideration of ethical aspects of the study, all the subjects received an explanation about the objectives and methods of the current study, verbally and in writing, and signed an agreement to participate. The normal elderly and caregivers of dementia patients were organized into groups of four or five. To ensure they completely understood the items in the questionnaire, they were provided with explanations of each item and invited to ask questions. The questionnaire was explained individually to study participants with mild dementia, and the researcher confirmed whether the patients sufficiently understood the items in the questionnaire. This study was approved by the Institutional Review Board of the Semyung University (IRB No. SMU-2019-06-004-01).

2.*Outcome Measures*

The questionnaires consisted of personal information, general health states, and supportive needs (daily life, safety management, cognitive function). Subsidiary aid tools for each area were provided, and the respondents were asked to indicate their demand for each aid tool and its importance on a five-point scale. The same questions were provided to the normal elderly, dementia patients, and caregivers of dementia patients.

Daily life aids include aprons, bath chairs, electric tooth brushes, automatic dispensers, and medication calendars. Safety management aids include safety handles, anti-slip mats, night sensors, wandering detection mats, and GPS wandering detectors. The cognitive aids include large-sized calendars, desk calendars, notebooks, alarm clocks, devices for cognitive activity (e.g., puzzles), smart taps for cognitive function, and artificial intelligence speakers.

3. *Statistical Analysis*

The collected data underwent statistical processing using SPSS Version 21.0. Frequency analysis was executed to understand the general characteristics of the respondents. To find out the average preference in each group of the normal elderly, dementia patients, and caregivers of dementia patients, mean analysis and ANOVA were conducted. The differences between the groups were analyzed via Scheffe test, a post-hoc analysis method. The statistical significance level was set at 0.05.

Result and Discussion

For general characteristics of the subjects, information about their age, gender, marital status, residence type, and religion were collected for each group. Because there were significant differences in terms of these characteristics due to the nature of the current study, no homogeneity test was conducted. The average age was the highest in the group of dementia patents, and all groups had a higher proportion of women. Details about this information can be found in [Table 1].

Table 1. General Characteristics

variable		**normal elderly (n=57)**	**dementia patients (n=13)**	**caregivers (n=15)**
Age		74.29±11.60*	77.46±4.45	61.80±11.09
Sex	Male	22(38.6)#	6(46.2)	3(20)
	Female	35(61.4)	7(53.8)	12(80)

	No religion	19(33.3)	3(23.1)	9(60)

*Mean±SD, #N(%)

The first analysis was regarding the difference in preference for daily activity aids among the normal elderly, dementia patients, and caregivers of dementia patient groups. The normal elderly and dementia patients mostly preferred the automatic dispenser; however, the caregiver group displayed the highest preference for the medication calendar. Preferences for the electric toothbrush and automatic dispenser were significantly different among the groups (p=0.00), with statistically significant differences exhibited between the normal elderly and caregivers, and between the dementia patients and caregivers [Table 2].

Table 2. Comparison of the Need for Daily Activity Aids

	normal elderly	dementia patients	caregivers	F	p
apron	3.18±1.61	2.46±1.61	2.80±1.66	1.16	0.32

In terms of aid tools for cognitive activities, the normal elderly mostly preferred the alarm clock, dementia patients selected the artificial intelligence speaker, and the caregivers chose the large-sized calendar and notebook. The groups displayed differences in their preferences for the desk calendar, device for cognitive activity, smart tap, and artificial intelligence speaker. The normal elderly and caregivers displayed significantly different preferences for the desk calendar, device for

cognitive activity, and smart tap, and dementia patients and caregivers had statistically significant differences in their preference for the artificial intelligence speaker [Table 4].

Discussion

The list of assistive technology aids itemized in the questionnaire for the current study referenced data from the U.K. and Ireland. A report by the University of Manchester describes the objectives of applying assistive technology as "enabling and empowering," "health and well-being," and "safety and independence." This structure can be used to categorize assistive technology aids into each area[10]. The Alzheimer's Society published a promotional booklet on assistive technology for dementia patients, providing easy explanations for the public. It classifies areas that employ assistive technology as daily activities, removal of risky environment factors to ensure safety, transportation safety, and telecare for monitoring dementia patients[11]. In addition, to establishing assistive technology categories for dementia patients, the current study referred to "Implementing Assistive Technology in Dementia are Services: A Guide for Practitioners" published by the Work Research Center in Ireland, which takes a more detailed view on the topic based on the life and safety of dementia patients[12].

The results of the current study indicate that each subject group displayed different levels of preference for various aid tools. In terms of daily activities, subjects in all groups mostly preferred the aid tool that provides assistance in medication management. More specifically, the normal elderly and dementia patients preferred the automatic dispenser while caregivers answered that they prefer the medication calendar. Such results may have been produced because the elderly respondents sought out assistance from digital technology in the belief that they would not be able to manage their medications by themselves; however, the caregivers presumed that it would be difficult for the elderly to use digital tools at all.

In terms of safety management aids, all three groups displayed the most preference for the night sensor. The safety handle was the item with the most varying preferences by the three groups: The normal elderly and dementia patients answered that the safety handle is essential in preventing them from falling; however, caregivers were of the opinion that this tool is unnecessary since dementia does not entail physical difficulties. However, falling is a crucial element that impacts the mobility of dementia patients, and systematic preparations are required to prevent falls in such a population[13].

As for the cognitive activity aid tools, the three groups displayed the most varying preference levels for the desk calendar. The elderly subjects made an effort to remember by writing down their schedules in the desk calendar; however, the caregivers responded that the calendar is not necessary at all because dementia

patients cannot practically remember the recorded events. In most questionnaire items, the caregivers were found to underestimate the functional capacity of dementia patients, and the dementia patients answered that they need many aid tools as they receive help from caregivers. Many negative emotions are generated by dementia, and the elderly experience subtle emotional changes with regards to this condition[14].

The limitation of the current study is that the number and features of the subject groups were different. On the other hand, however, this was the objective of this study. At the core of this study is the comparison among the opinions of the normal elderly who may suffer from dementia in the future, dementia patients, and caregivers of dementia patients, in terms of the need for aid tools. Another shortcoming is that only a quantitative analysis on the need was conducted. In future research, a qualitative analysis should be performed to facilitate the understanding of aid tools and their necessity, with a goal of seeking alternatives.

Conclusion

Worldwide, where dementia is a social problem, it is essential to apply appropriateancillary equipment to patients with dementia so that they can perform their daily activities safely and stably. Based on the results of the current study, different types of assistive tools should be provided depending on the features of the beneficiary. Instead of providing aids without conditions, they should be offered according to the level of need experienced by each beneficiary. Also, systematic service of professional manpower will be required for the process.

The Effects of a Brain-Activating Dementia Prevention Program on the Elderly: Improving Cognitive Capacity, Depression, and Quality of Life

Hwan-Hee Kim

Department of Occupational Therapy, Semyung University, Rebulic of Korea

Abstract

Background/Objectives: The objective of study is to implement a meta-cognitive program based on brain-activating rehabilitation for elderly people to investigate its effect on the subjects' cognitive functions, depression, and quality of life.

Methods/Statistical analysis: This study was carried out from September 2018 to December 2018 at the J Social Welfare Center in the Republic of Korea. Subjects included 18 community-dwelling elderly people over 65 years old. A total of thirteen intervention program sessions were provided, with one session per week and ninety minutes per session. Three assessment tools (CERAD-K, GDS-SF, SF-36) were used in the study. The collected data underwent statistical processing using SPSS.

Findings: A cognitive evaluation using CERAD-K revealed statistically significant differences for all items except for Construction Praxis. Depression testing using the GDS-SF and quality of life evaluation using the SF-36 also revealed statistically significant differences between pre-intervention and post-intervention tests.

Improvements/Applications: By re-establishing these cognitive activities, more efficient interventions will be made possible. More systematic methods to prevent against dementia will need to be implemented on a local community level.

Keywords: *Brain-Activating Program, Cognition, Dementia, Depression, Prevention, Quality of Life*

Introduction

The prevention of chronic diseases in the geriatric population is a key goal of clinical and public health programs. With an aging global population, the number of people suffering from dementia is also on the rise, which makes dementia prevention a crucial policy agenda[1]. Cognitive functions deteriorate as aging progresses. Cognitive functions refer to the entire process in which the human brain receives and stores information, and later retrieves and uses it. These functions are a set of abilities that enable people to think, judge, remember, and act, and they include the capacity to retain and learn information, solve problems, execute linguistic and motor activities, and recognize time and space. A decline in cognitive functions can lead to the experience of minor memory failures, which is considered a risk indicator for dementia[2].

In the last World Alzheimer Report, the global economic impact of Alzheimer's Disease (AD) and dementia was estimated to be $818 billion USD, with 47 million people suffering from AD, about 0.5% ^{2}of the global population[3]. Dementia, characterized by widespread progressive decline in cognitive and functional abilities and a wide range of challenging behavioral symptoms[4], is one of the major causes of disability and dependency among older people[5-6]. In particular, elderly patients with late-stage dementia are necessarily dependent on others to carry out parts or the entirety of their daily activities, putting significant cost

Corresponding Author:
Hwan-Hee Kim,
heeya6672@daum.net

and other burdens on their families and caregivers. As such, recent statistics show that people are most afraid of contracting dementia, compared to past surveys that showed people were most afraid of contracting cancer[7].

The 2016 American Psychiatric Association (APA) Practice Guidelines provide recommendations for the treatment of agitation or psychosis in patients with dementia, suggesting a comprehensive, person-centered, non-pharmacological approach[8]. A non-pharmacological approach for dementia treatment plays a crucial role in delaying the progress of the disease, as well as functional deterioration. Furthermore, efficient interaction between the patient, therapist, and the patient's family members is considered an important element that can impact the effectiveness of treatment[9]. The therapist identifies the person's intrinsic capacity and current level of function, assesses the requirements of the task or activity outlined in the goal, and helps devise a plan to overcome these problems using evidence-based rehabilitative methods. In more recent years, there has been a growing awareness that non-pharmacological treatments must take precedence over pharmacological treatments[10]. Therefore, this study implemented a non-pharmacological rehabilitation method that stimulates brain activation.

This brain-activating rehabilitation method is composed of five principles: first is allowing the patient to engage in enjoyable and comfortable activities in an acceptable atmosphere, and the second is to encourage empathetic two-way communication between the therapist and the patient, as well as between patients. Third, the therapist uses compliments to motivate the patient, and fourth, the therapist tries to offer the patient tasks involving social roles that the patient is capable of at his or her functional level. Lastly, the rehabilitation method demands maintaining the patient's dignity to induce errorless learning[9]. Until now, most non-pharmacological treatments have sought to make patients participate in activities and maintain their functionality, which makes them different from this proposed brain-activating rehabilitation method.

While the principles of brain-activating rehabilitation are definite, its methodology is not regulated. As such, previous studies have approached this method from diverse angles. A Japanese study provided reminiscence therapy to dementia patients and normal elderly people to provide brain-activating rehabilitation. As a result, the subjects' cognitive function increased, and the burdens experienced by the caregivers were reduced[11]. In addition, an enjoyable walking program based on brain-activating rehabilitation was provided to elderly people who were seventy years or older, which resulted in enhanced cognitive and physical functions, in addition to the observation that the subjects maintained their enjoyable walking regimen six months after the study[12]. However, because there is a lack of previous research that directly implements brain-activating rehabilitation in cognitive training, the current study sought to apply a meta-cognitive program based on brain-activating rehabilitation. Meta-cognition has been mainly used to enhance students' learning ability[13-14], but there is a dearth of studies that examine its effects on elderly people. As such, the objective of the current study is to implement a meta-cognitive program based on brain-activating rehabilitation for normal elderly people to investigate its effect on the subjects' cognitive functions, depression, and quality of life.

Method

1. *Subjects and Periods*

This study was carried out from September 2018 to December 2018 at the J City Social Welfare Center in the Republic of Korea. Subjects included 18 community-dwelling elderly people over 65 years old. The selection criteria included the ability to walk independently, not diagnosed with dementia, no cardiovascular disease relating to blood pressure or heart rate, and the ability to communicate and understand the study content. All participants read and signed the informed consent to participate in the experiment in according to the ethical principles of the Declaration of Helsinki. Among all participants, there were 5 men (27.8%) and 13 women (72.2%). The average age was 72.23±5.41 years old and the average of length of education was 9.13±4.18 years.

2. *Procedures*

At the beginning, all participants attended a collective orientation session that explained the objectives, process, and schedule of the study. Participants who expressed a wish to participate in this study and pledged not to miss the sessions were admitted as subjects. A total of ten intervention program sessions were provided, with one session per week and ninety minutes per session [Table 1].

Table 1. Schedule of integration program

Week	Meta memory improvement program	program based brain-activating rehabilitation
1	Order pictures	Hand massage
2	Create new words by changing syllables only	Activity reminiscence therapy(wedding)
3	Remember the location of the picture and paint it	Straw mosaic
4	Writing related words for each category	Introduction to our town
5	Writing common differences in pictures	Play the rummikub
6	Find a common first syllable	Create a block model
7	Drawing reminiscent of a given word	Coffee pot making
8	Make sentences with suggested words	Contextual Role Play
9	Expressing the sounds of each object in simple language	Mental calculation
10	Fill in the blanks in the conversation	Activity reminiscence therapy(travel)

The intervention was based on the use of brain activating rehabilitation principles. Among various programs based on the brain activating rehabilitation, the meta-cognitive program is a memory-based training method developed to improve memory and prevent dementia. By executing and monitoring information processing, meta-cognition fosters the ability to voluntarily regulate this cognitive process. Conceptually, it is the ability to recognize knowledge about one's own cognitive process and regulate it, as well as one's own supervision and control of thinking and learning activities[15-16]. Previous literature explains that the meta-cognitive training method is the process of obtaining knowledge about oneself, awareness about the knowledge used for cognition, and when and why certain strategies are used. Many scholars wrote that cognitive regulation includes planning, monitoring or regulation, and evaluating activities[16-17]. The author of this study purchased a manual by Meta Memory Health Center, available commercially in Korea, to be used in this study. Details include meetings, leisure, diversity, challenges, acceptance, sharing, making memories, and new beginnings. Although the program was conducted in a group, it was customized according to the subjects' level of awareness.

3. Outcome Measures

Evaluation was carried out in the same way before and after the intervention. Three assessment tools were used in the study. The subject's cognitive function was primarily tested with the Consortium to Establish a Registry for Alzheimer'sDisease (CERAD-K) Neuropsychological Assessment Battery. CERAD-K is the standardized assessment for the early diagnosis of dementia. It is easy to implement and takes about 30~40minutes. The test results were obtained using a scoring rubric standardized in consideration of the educational level and age of the patients. The test-retest reliability was found to be 0.63-0.87[18].

The Korean version of the Geriatric Depression Scale-Short Form (GDS-SF) can easily measure elderly people's depression levels and reflects the thoughts, emotions, cognition, and physical and social aspects, through which the overall phenomenon of depression can be understood[19]. To measure quality of life, we used the Short-Form Health Survey (SF-36), a tool developed by Ware and Sherbourne in 1992. The SF-36 has been translated into Korean, and its reliability and validity has been verified[20].

4. *Statistical Analysis*

The collected data underwent statistical processing using SPSS Version 21.0. The general characteristics of the subjects were measured using descriptive statistics. Paired t-tests were conducted for all variables to calculate the mean, standard deviation, and significance probability before and after the intervention. The statistical significance level was set at 0.05.

Result and Discussion

A cognitive evaluation using CERAD-K revealed statistically significant differences for all items except for Construction Praxis. Although the score for Construction Praxis increased, it did not prove statistically significant. Details about this information can be found in [Table 2].

Table 2. Comparison of CERAD-K for cognitive function by area in pre- and post-test

Variable	Pre-test	Post-test
Verbal Fluency test	4.1±2.1	6.1±3.1**
Modified Boston Naming test	5.4±3.1	6.9±3.1**
MMSE-KC	18.0±5.3	19.8±3.6**
Word List memory	7.2±4.3	8.9±4.3**
Constructional Praxis	5.4±1.8	6.1±3.1
Word List Recall	2.1±1.7	3.1±1.8*
Word List Recognition	3.5±2.2	4.2±1.7*
Constructional Recall	2.0±2.5	2.8±2.6*

*p<0.05, **p<0.01, MMSE-KC: MMSE in the Korean version of the CERAD assessment packet

Depression testing using the GDS-SF and quality of life evaluation using the SF-36 also revealed statistically significant differences between pre-intervention and post-intervention tests. The GDS score decreased from 12.1±4.6 to 5.0±3.1, indicating that depression was alleviated (p<0.01). The SF score increases from 48.8±15.2 to 57.1±10.8, which means an improvement in quality of life (p<0.05) [Table 3].

Table 3. Comparison of depression, quality of life by area in pre- and post-test

Variable	Pre-test	Post-test
GDS-SF	12.1±4.6	5.0±3.1**
SF-36	48.8±15.2	57.1±10.8*

*p<0.05, **p<0.01, GDS-SF: the Geriatric Depression Scale-Short Form, SF-36: the Short-Form Health Survey

Discussion

The meta-memory enhancement program that can fortify cognitive functions, which was provided in this study, was found to have a significant effect on the subjects' cognitive functions. These results are similar to those of a study that evaluated the effect of a memory-training program that used a memory enhancement self-efficacy program and efficacy resources[21]. The alignment between the results of this study and previous studies indicates that the integrated cognitive program increases the use of memory techniques, strategies, and aids for enhancing memory performance in elderly people at high risk of contracting dementia. This also shows that the program taught the subjects that memory is important in certain situations, in addition to motivating them to think that a good memory is crucial for the self[22].

There is prior documentation that brain-activating rehabilitation is effective in improving cognitive functions, the behavioral and psychological symptoms of dementia, and daily activities[9]. Furthermore, there are many other studies on reminiscence therapy, a typical example of brain-activating rehabilitation. A meta-analysis study that investigated the effect of reminiscence therapy on the cognitive functions and depression symptoms of elderly people with dementia looked at twelve randomized controlled trials and reported that the therapy had positive effects on both cognitive functions and depression symptoms[23]. Therefore, the previous literature supports the results of this study.

The limitation of this study is that a control group was not established, and the sample size was not large enough. It is, however, thought to be impossible to satisfy the above conditions, considering the nature of the intervention used in this study, which includes one-on-one customized programs for each subject, and that the program encourages motivation by interacting with the subjects. Furthermore, the current study attempted to enhance its objectivity and validity by using a manual published by a memory research center, but failed because there is no formalization of brain-activating rehabilitation and meta-cognitive programs. As such, it would be difficult to implement the program described in this study in future research. If this research expands in the future, it would do well to develop an intervention manual tailored to the characteristics of its subjects.

Conclusion

The current study investigated an intervention program for preventing dementia in the elderly people of a local community. After implementing a meta-cognitive program based on brain-activating rehabilitation, this study discovered that the program significantly enhanced the cognitive and psycho-social functions of its subjects. The current dementia prevention program is composed of line drawing, coloring, origami, and crafting

activities. By re-establishing these cognitive activities based on the principles of brain-activating rehabilitation, more efficient interventions will be made possible. If it is impossible to cure dementia with modern medicine, more systematic methods to prevent against dementia will need to be implemented on a local community level.

The Effect of Participation of Clinical Dental Hygiene Care Program on the Level of Dental Fear in Some Adults

Jung-Eun Ha[1], Ki-Hun Ye[2]

[1]Department of Dental Hygiene, Baekseok University, Cheonan-si, 31065, South Korea,
[2]Department of Optometry, Baekseok University, Cheonan-si, 31065, South Korea

Abstract

Background/Objectives: The purpose of this study was to investigate the effect of dental fear on oral health and to check whether dental fear can be controlled by participating in dental hygiene program.

Methods/Statistical analysis: The dental fear index was measured by the Dental Anxiety Scale, which was composed of 4 items. The lowest point was 0 point (very comfortable) and the highest point was 20 point (very terrifying) at the Dental Anxiety Scale. The changes in dental fear index before and after participating in the dental hygiene care program was measured using the McNemar's test and the significance level was set at 0.05.

Findings: This study was conducted on 91 subjects who participated in the dental hygiene care program conducted by the Department of Dental Hygiene at B University in Cheonan, South Korea. The mean age of the subjects was 24.5 years. Among the subjects, male participants were 44 (48.4%) and female participants were 47 (51.6%). The effect of dental hygiene care program by the dental hygienist on the characteristics of the subjects did not show any difference in dental phobia with the gender before the program, but it was confirmed that the dental fear was lowered slightly after the participation of dental hygiene care program. The effect of dental fear reduction by the dental hygiene care program was greater for women than for men. And, the more oral health education program was conducted in recent years, the greater the effect of dental fear reduction by the dental hygiene care program. The dental fear index was 8.98 before participating in the dental hygiene care program, but it decreased to 5.60 after participating. In conclusion, dental hygiene care program was found to effectively reduce dental fear.

Improvements/Applications: Dental hygiene care program could be effectively reduced dental fear of the subjects. Thus, dental hygienists should try to control their fear by understanding these characteristics of the patients.

Introduction

Dental phobia refers to a patient's phobia for everything related to a dental practice or dentistry[1]. Patients with severe dental fear tend to avoid the situation or subject, which in turn results in avoidance of dental treatment [2,3]. For this reason, fear of dental hygiene may prevent early oral care by avoiding visits to dental clinics, which may cause deterioration of oral health so the dental medical personnel should make efforts to control patients' fear[3]. Therefore, dental health practitioner such as dental hygienists should train oral communication skills to prevent oral diseases of dental fear subjects, promote oral health, and perform oral health management that focuses on behavior control of the subjects[4].3

The main cause of dental phobia was pain in the process of dental treatment, and fear of dental treatment

Corresponding Author :
Jung-Eun Ha,
hajungeun@bu.ac.kr

has been reported to be related to the attitudes of dentists and hygienists as well as pains experienced by patients in the past[5,6]. In addition, negative and physical effects in the treatment process cause dental phobia[7,8]. When sitting in the dental unit chair at the dental clinic, the patient's behavior was controlled by the dentist and the dental hygienist. In other words, even if the pain or discomfort occurs, the idea of not being able to do what they want will approach the patient with fear, and this fear causes psychological disturbances and affects the dental treatment. In this situation, the dentist and dental hygienist must be able to control the patient's anxiety by trying to communicate with the patient sufficiently[9]. The purpose of this study was to investigate the effect of dental fear on oral health and to check whether dental fear can be controlled by participating in dental hygiene program.

Method

This study was conducted on 91 subjects who participated in the dental hygiene care program conducted by the Department of Dental Hygiene at B University in Cheonan, South Korea.The totals of 91 subjects were included in the study and the mean age of the subjects was 24.5 years (19 to 31 years old). Among the subjects, male participants were 44 (48.4%) and female participants were 47 (51.6%).

All items were entered by computer such as gender, age, smoking status, and drinking status were examined. The items related to oral health were investigated in terms of subjective oral health status, subjective oral health care performance, past dental visit time, oral health education experience period, and negative experience of dental treatment.

The dental hygiene care program is an integrated dental preventive care program based on the theoretical framework called dental hygiene process. The dental hygiene process requires decision making and assumes that dental hygienists are responsible for identifying and resolving client problems within the scope of dental hygiene practice. The dental hygiene process involves dental hygiene diagnosis, assessment, planning, implementation and evaluation.So, the dental hygiene care programincluding oral health education, preventive care for tooth decay and periodontal disease is an integrated preventive dental treatment process provided by dental hygienists to improve the oral health status based on the subject's health-related information.

The dental fear index was measured by the Dental Anxiety Scale (DAS)[10], which was composed of 4 items.The questionnaire was composed to as follows: (1) How would you feel if you had to go to the dentist tomorrow? (2) How would you feel when you waited for your turn to be treated at the dentist's clinic? (3) How would you feel if the dentist was preparing a power drill for tooth decay that produced water, soundswhile sitting in a patient's dental unit chair? (4) How would you feel if a dental hygienist approached you and prepared your calculus removal device while you were waiting in the patient's dental unit chair for scaling? The lowest point was 0 point (very comfortable) and the highest point was 20 point (very terrifying). According to the distribution, dental fear index was categorized into 0 to 6 points as 'low', 7 to 15 points as 'normal', and 16 to 20 points as 'high'.

Data were analyzed using SPSS (Windows version 19, SPSS INC) program. McNemar's test was used to analyze differences in dental fear levels before and after participating in the dental hygiene care program according to general characteristics of the subjects and oral health related characteristics. The changes in dental fear index before and after participating in the dental hygiene program was measured using the corresponding sample T-test and the significance level was set at 0.05.

Result

General characteristics of the study subjects are shown in [Table 1]. A total of 91 subjects were surveyed. The average age was 24.5 years, with 44 males (48.4%) and 47 females (51.6%), respectively. People (36.3%) and 58 non-smokers (63.7%). As a result of drinking, 62 (68.1%) were drinking alcohol, and 29 (31.9%) were drinking alcohol.

The results of analyzing oral health-related characteristics of the study subjects are shown in [Table 2]. 49.4% of the subjects answered that their subjective oral health status was healthy, and 50.5% of the respondents said that they were not healthy. 52.7% answered that they were good at performing subjective oral health behaviors, and 47.3% said they were not. In the past, the most frequent visit to the dentist within 6 months was 27.5% and followed by 23.1% between 1 year and 2 years, 6 months to 1 year, and more than 2 years. In the case of experience of oral health education, 68.1% showed the highest level of not to participation to oral health education, and within 6 months, more than 2

years, 6 months ~ 1 year, 1 year ~ 2 years. Subjecthas negative experience were 28.0% and 71.9% had no experience.

Table 1. General characteristics of subjects

General Characteristics		**N**	**%**
Total		91	100.0
Gender	Male	44	48.4
	Female	47	51.6
Smoking	Yes	33	36.3
	No	58	63.7
Drinking	Yes	62	68.1
	No	29	31.9

As shown in [Table 3], the effect of dental hygiene management by the dental hygienist care program on the characteristics of the subjects did not show any difference in dental phobia with the gender before the program, but it was confirmed that the dental fear was lowered slightly after the dental hygiene care program. The effect of dental fear reduction by the dental hygiene care program was greater for women than for men.

Table 2. Oral health-related characteristics of research subjects

Oral health-related characteristics	**N**	**%**
Total	91	100.0
Subjective oral health status		
Healthy	44	49.4
Not healthy	45	50.5
Oral health behaviors		
Well performing properly	48	52.7
Not performing properly	43	47.3
Past dental clinic visit		
Not to visit	7	7.7
Within 6 months	25	27.5
6 months ~ 1 year	20	22.0
1 year ~ 2 years	21	23.1
Over 2 years	18	19.8
Participate in oral health education		
Not to participate	62	68.1
Within 6 months	18	19.7
6 months ~ 1 year	3	3.2
1 year ~ 2 years	1	1.0
Over 2 years	7	7.6
Negative experience at dental clinic		
Yes	25	28.0
No	64	71.9

Cont... **Table 2. Oral health-related characteristics of research subjects**

According to the oral health-related characteristics of the subjects, the reduction of dental fear by the dental hygiene care program is shown in [Table 4]. Although it did not appear the significant difference between before (baseline) and after (end-point) dental hygiene care program, it was found to be slightly lower of dental fear after the dental hygiene care program than before.

The effect of the dental hygiene care program on dental phobia is shown in [Table 5]. The dental fear index was 8.98 before participating in the dental hygiene care program, but it decreased to 5.60 after participating. As a result, the dental hygiene care program was found to effectively reduce dental fear of the subjects.

Discussion

Maintaining oral health is an important factor not only in physical health (or general health status) but also in overall quality of life. Diseases of the teeth and periodontium can cause pain as well as difficulty eating and can lead to diseases of other parts of the body.

Table 3. Reduction of dental fear by dental hygiene care program according to gender

Therefore, regular dental care and dental hygiene care are needed to prevent oral disease and promote oral health. However, patients with high level of dental fears may postpone dental treatment or avoid dental visits due to dental fears, which may cause a vicious cycle in oral health and may adversely affect oral health care[11].Therefore, this study was carried out with the expectation that the oral health education included in the dental hygiene care program could be more familiar with the dental clinic environment, and as the awareness level of the oral health care (or behavior) increased, the fear of dental treatment could be reduced. The effects of dental fear on oral health were investigated, and the participation of dental hygiene care program in some adults was able to control dental fear.

The dental treatment using specific appliance produces certain sounds, smells, and has a sharp or sharp shape when used, so that a sense of dental fear can also be caused by hearing, smell and sight. So, playing soft music in the dental waiting room is known to be effective in reducing the dental fears of patients because it can mask some of the noises generated during dental treatments and stabilize the patients psychologically. In addition, the method of listening to music using headphones during dental treatment can effectively reduce the dental fear caused by sound.As described above visual stimuli may act as factors causing dental phobia[12]. When treating these patients, it is important to make sure that the dental instruments are not seen by the patients as much as possible.In order to reduce the odor generated from the materials used in dental treatment, it is a good idea to use a fragrance diffuser in the dental treatment room or to select a material that does not generate much odor.

In this study, subjects who had negative experiences in the past dental visits had higher dental fear than those who did not.It has been reported that dental fear is related to the treatment attitudes of dentists and hygienists as well as pains associated with treatments experienced by patients in the past.Negative experiences associated with dental clinics make dental fears worse and directly evade visits by dental clinic. This can interfere with the initial treatment of oral disease, which can deteriorate oral health, so dentists and dental hygienists should be concerned about the attitudes of their patients when providing dental treatment to their patients.In this study, 52% of the subjects who had negative dental experience had a high level of dental fear. However, after the dental hygiene care program ended, only 16.7% of the subjects had negative dental experience in the past had a high

level of dental fear. In addition, about 46% of them were found to have a low level of dental fear, which was significantly higher than the previous 12%. This suggests that the positive experience of dentistry influenced the level of dental fear caused by the past negative dental treatment experience, effectively controlling the level of dental fear.Therefore, dentists and dental hygienist should strive to experience positive dental care for their patients.

Conclusion

It was found that dental hygiene management program can effectively reduce dental fear of subjects. To reduce the dental fear, a more relaxed and stable atmosphere of dental care should be created in the dental clinic. Prevention care for dental disease should be actively carried out to reduce the dental treatment experience. Also, in oral health education, the importance of regular check-ups should be emphasized to reduce the fear of dental treatment. The dental hygiene care program was found to reduce fear of dental care and change perceptions so that the subjects could not be afraid of dental visits by recognizing the importance of oral health, prevention of oral disease and initial treatment. In the future, as dental medical personnel, dental hygienists should consider that dental fear patients are likely to fall into a vicious cycle in terms of oral health care, thus avoiding visits to dental clinics and thereby impeding the initial treatment or oral diseases. Thus, dental hygienists should try to control their fear by understanding these characteristics of the patients.

[2]Chunnam Techno University, Department of Nursing, Korea

Abstract

Background/Objectives: This study was conducted to analyze the effect of simulation-based education program on communication ability, problem-solving ability and critical thinking among nursing students.

Methods/Statistical analysis: This study was one-group pretest-posttest design. 117 nursing students in G city, j provincewererecruited.In order to evaluate the achievement of nursing students, Structured questionnaires were used.Paired t-test and pearson'sorrelation was used for analysis.

Findings: After simulation-based education program, the participants had showed much improvement in communicationability, problem-solving ability, critical thinking.

Improvements/Applications: Judging from these findings, it should be required to develop simulation-based education program for nursing students.

Keywords: *Nursing students, simulation-based education, communication ability, problem solving ability, critical thinking*

Introduction

Cases where new nurses complain of difficulties[4] in adapting to clinical settings are increasing, leading to the limitation in securing nursing manpower in hospitals [1-3]. Therefore, reducing the difficulties of nursing students experienced in the process of new nurses through which nursing students are turned into nurses is essential for securing nursing manpower and improving the qualitative level of medical service, and to this end, the willingness to improve against structural problems in the field, such as 'bullying prevention', 'ensuring welfare', and 'insurance fee improvement', is also essential [2]. In addition, as the basis for such structural improvement, long-term interest in and capacity building for nursing students and nurses working in the field structures should precede.

Communication ability is the ability to accuratelyconvey the feelings and thoughts of oneself and others through communication leading to mutual understanding[4] and is one of the core competencies for enhancing the effect of nursing intervention through effective relationship formation [4-5]. Critical thinking is a factor that affects communication as such so that it can be made rationally[4-5], which also importantly affects problem-solving ability [5]. Problem-solving ability is the ability to recognize problems and select the most appropriate one among potential alternatives to the problems, which can be said to be one of the core competencies required to accurately cope with unforeseen problem situations in the field [6]. Communication ability is an essential element required for effective exertion of the problem-solving ability as such [6]. That is, communication ability, problem-solving ability, and critical thinking can be said to be the influencing factors of each other.

Although the literature that studied the communication ability, problem-solving ability, and

critical thinking of nursing students together could be hardly found, studies on each of them have been conducted relatively steadily. In particular, as studies of the communication ability of nursing students, correlation studies related to communication ability [7-9], studies of influencing factors of communication ability [10-11], studies of communication types[12], studies of communication ability and critical thinking ability [4-6], experimental studies to see changes in communication ability according to teaching methods and educational contents[13-15], and studies to develop programs for the cultivation of communication ability could be identified[16-17].

Recently, simulation-based education programs, which are one of the major teaching and learning methods in nursing education, enable students to participate in the realistically reproduced field actively and critically with active and critical attitudes so that they can solve problems in nursing of subjects thereby enabling students to obtain diverseeducational effects such as professional accuracy and self-confidence in the process of being brought into their roles[14].Although previous studies that investigated the effects of the team-based learning (TBL) educational method on nursing students' communication ability, problem-solving ability, and critical thinking ability could be identified [6], studies that reported the effects of simulation-based education programs could not be identified. Therefore, this study aims to provide basic data for nursing students' capacity building by grasping the effects of simulation-based education programs on the communication ability, problem-solving ability, and critical thinking of nursing students.

Method

This study was one-group pretest-posttest design. The simulation practice education was applied to thesubject termed integrated simulation practice organized as a compulsory major subject in the second semester of the fourth grade (1 credit, 2 hours per week), and was operated for 2 hours per time over 15 weeks for 30 hours in total. 117 nursing studentswere recruited.Offer sufficient information about this study to them and select the students who agree to participation in this study. The data are collected from September to December, 2018. The researchers fully explained prior to participate on this study that in case of the students who feel the negative feelings while participating in the study, they could stop participation in immediately.

The communication ability was measured using the comprehensive interpersonal communication ability measurement tool (GICC-15) developed by Hur (2003) by modifying and supplementing the original tool [18]. The problem-solving ability was measured using a measurement tool modified and supplemented by Woo (2002) [19]. This questionnaire required the respondent to solve three unstructured questions and mark the answers on the questionnaire. Each problem-solving process consists of five steps: finding a problem, defining the problem, devising a problem solution, implementing the problem solution, and reviewing the problem solution. The critical thinking ability was measured using the critical thinking ability measuring tool developed by Yoon (2004) for nursing students [20]. The critical thinking ability measuring tool consists of comprising, intellectual passion/curiosity, prudence, self-confidence, system, intellectual fairness, sound skepticism and objectivity.

SPSS WIN 18.0 Version program is used for data analysis. General characteristic of the subject is used for frequency analysis and descriptive statistic, paired t-test and Pearson's correlationwas used for analysis.

Results and Discussion

1. Difference of Communication Ability after Intervention

After intervention with a simulation-based education program, the average score of communication ability increased by 3.5 points on average from 70.9 ± 9.6 before intervention to 74.4 ± 12.4 after intervention, and the difference was significant (t = -2.48, p = .015), indicating that the simulation-based education programs affected communication [Table 1].

Table 1.Difference of communication ability, after simulation-based education program(N=117)

Variables	Pre test M±SD	Post test M±SD	Paired Differences M±SD	t	p
CA	70.9 ±9.6	74.4 ±12.4	3.54 ±15.5	-2.48	.015**

CA: Communication ability

2. Difference of Problem-Solving Ability after Intervention

After the intervention with the simulation-based education program, the average score of problem-

solving ability increased by 2.7 points on average from 62.7 ± 6.47 before intervention to 69.8 ± 10.0 after intervention, and the difference was significant (t = -2.32, p = 0.02)). Among the subareas, significant differences appeared in finding problems (t = -.2.40, p = .018), defining the problems (t = -.2.24, p = .027), and implementing the solution (t = -.2.10 p = .038), while no significant difference appeared in devising problem solutions (t = -.1.06, p = .293) and reviewing problem solving (t = -.2.84, p = .403)[Table 2].

3. Difference of Critical Thinking after Intervention

After the intervention with the simulation-based education program, the mean score of critical thinking increased by 2.1 points from 59.2 ± 5.0 before intervention to 61.3 ± 5.4 after intervention, and the difference was significant (t = -3.01, p = .003) indicating that the simulation programs affected critical thinking. As for the subareas, significant differences appeared in objectivity (t = -2.89, p = .005), systematicity (t = -3.32, p = .001), and intellectual passion / curiosity (t = -2.87, p = .005) while no significant difference appeared in intellectualcompleteness (t = -1.81, p = .074), prudence (t = -1.75, p = .082), pursuit of truth (t = 1.17, p = .247), and reliability (t = -0.62, p = .537) [Table 3].

4. Correlation between Communication Ability, Problem-Solving and Critical Thinking

After the intervention with the simulation-based education program, the correlations between individual variables was examined and according to the results, communication ability and problem-solving ability (r = 692, p = .000), communication ability and critical thinking (r = .629, p = .000), and problem-solving ability and critical thinking (r = .679, p = .000) showed significant positive correlations[Table 4].

Table 4.Correlation between communication ability, problem solving ability, and critical thinking(N=117)

Discussion

In this study, the simulation-based education programs affected communication ability. This is consistent with the study finding of Joo et al., who measured the effect of standardized patient simulation practice education using the same tool [21], and similar to the findings of a study conducted by of Kim & Kim, in which communication ability scores increased after application of team base learning(TBL) and the study findings of Park & Choi, who studied the effect of the SBAR communication education programs [6,13].

In this study, the simulation-based education programs affected problem solving ability, and among the subareas, significant differences appeared in finding problems, defining the problems, and implementing the solution. These results are consistent with those previous studies that measured the effects of problem-based simulations using the same tool [22-[23], and are in the same context with the findings of the previous study in which problem-solving ability scores increased after applying team base learning (TBL) [6]. However, there is a difference in the significance of each subareas[6,22-23], These differences are considered attributable to differences in the contents of class operation on professors in charge of the subject.

In this study, the simulation-based education programs affected Critical Thinking, and among the subareas, significant differences appeared in objectivity, systematicity and intellectual passion / curiosity. These results are consistent with the study findings of Joo et al. and Kim & Yu, who measured the effects of simulation-based teaching methods using the same tool [21,23], and are similar to the study findings of Park & Choi, who studied the effects of the SBAR communication education program [13]. In particular, although the study conducted by Kim & Kim has similarities to this study in the composition of the class operation, subjects applied, and the same effect measurement tool, the results are somewhat different[22]. This is considered attributable to individual differences among professors in charge of the classes and students who participated in the classes. The critical thinking, which is emphasized in nursing education, is a thinking process that can make rational decisions based on reasonable criteria [6], and personal dispositions and habits [13].

After the intervention with the simulation-based education program, there is significant correlations that means the higher the communication ability, the higher the problem-solving ability and critical thinking, and the higher the problem-solving ability, the higher the critical thinking. The study findings of Kim & Yu, who studied the effects of simulation-based nursing education on problem-solving processes could be said to be in the same context with the results of this study [23]. In addition, Lee & Chung, who studied the correlations between nursing students' critical thinking tendency, self-esteem, and communication ability, and Kim & Kim, who studied the effects of simulation practice on problem-solving ability, critical thinking, and learning satisfaction of nursing students support some of the results of this study [6,24]. Communication ability helps problem solving ability to be maximally exerted, problem-solving ability

should be considered along with critical thinking, and critical thinking helps communication to be smooth. Although these three variables are closely related to each other as such, studies of them are insufficient now. Therefore, additional studies are necessary.

Conclusion

This study was conducted to understand the communication ability, problem-solving ability, and critical thinking that are foundational competencies required for nursing students and the effects of simulation-based education programs as a teaching-learning method suitable for the building of the competencies and provide basic data for nursing students' competency building.

This study is a quasi-experimental study with single-group pre-postal design conducted with 4th grade nursing students in the 2nd semesters. The effects should be verified through an experimental group and a control group. In addition, since the effects in this study were measured on a one-off basis in the second semester of 4th grade, the necessity of studies of systems for competency building considering the level differences among grades should be presented. In recent years, diverse teaching-learning methods and educational means have been presented for nursing education. Smart education using various electronic devices, programs, and applications is gaining strength, and the converged forms of simulation-based education programs that introduced diverse educational means are also appearing. Therefore, this researcher would like to suggest studies to develop nursing education methods suitable for building certain competencies.

The Factors Affecting Satisfaction with College Life among Nursing School Students

Joo-Young Lee[1], Do-Young Lee[2]

[1]Seoul Women's College of Nursing, Dept. of Nursing, Korea, [2]Changshin University, Dept. of Nursing, Korea

Abstract

Background/Objectives: To solve complex problems in clinical working place as professional nurses, nursing education is very important. This study is to analyze the factors affecting satisfaction with college life among nursing school students.

Methods/Statistical analysis: This research analyzed factors affecting satisfaction with college life using 112 nursing school students in S city as research objects. Specifically, this research examined self-resilience, communication capacity, and self-respect.

Findings: It was found that satisfaction with college life have significant relationship with self-resilience, communication capacity, and self-respect. Regression analysis showed that self-resilience and communication capacity significantly affect satisfaction with college life. Consequently, to raise satisfaction with college life, we should prepare ways to improve self-resilience and communication capacity.

Improvements/Applications: By examining factors affecting satisfaction with college life among nursing school students, it is hoped that the findings of this research will be the basis in leading to systematic policies in nursing school education.

Keywords: *Ego Resilience, Communication Skill, Self-esteem, College Life Satisfaction, Nursing Student*

Introduction[5]

To cultivate professional nurses who are equipped with sophisticated medical technology, and can efficiently solve complex problems of patients which occur frequently in clinical working places, it is very important to run educational programs to cultivate nurses who can solve such problems[1]. Given the same situation, beliefs of individuals and internal resources lead some nurses to overcome problems they are put in and perform their duties, and others to be in difficult situations caused by maladjustment in their college life[2]. In such nursing environment, as the ego resilience is the behavior, emotional and cognitive control skills that allow them to adapt to the environment and is the element that helps respond to the stress situation and the difficulties flexibly without being frustrated by the changing situation, it canplay the important role to adapt to the collage life[3]. If the ego resilience is high, Since the level that one is tense and endures in the environment depending on the situation, they can accept and respond to diverse demands flexibly in unfamiliar situation. Therefore, the person whose ego is resilient can adapt to new situation successfully by adjusting the level of tension and endurance by the new situation and reacting to the unfamiliar situation flexibly[4]. In addition, since the ego resilience provides the ultimate force to determine the area of activity by determining the motive, it can be considered as major factor to enhance the collage life satisfaction by inducing the active academic adjustment and by relieving the stress or get rid of withering[5] with the adaptability that is exerted when facing with unexpected event or un certainty. It is suggested as major variable for the problem solving process and clinical competence[6], and reported that it exerts the excellent problem solving ability in unexpected clinical situation[7].

In the rapidly changing medical environment, since the efficient communication skill of the nurses helps to established the therapeutic relationship with the patients from diverse classes and to form the cooperative relationship with healthcare specialists, it is the essential skill to become professional nurse[1]. Nurses should make cooperative relationship with the patients, medical personnel and guardians for the health and welfare of the patients and for that, should exert the communication skill according to the situation[8]. Therefore, as the competence to make relationships with diverse people and to provide the nursing, the communication skill can be considered as core competence that should be held by nurses[9], and in case of nursing student having insufficient communication skill can fell the difficulty in the clinical training[10]. In addition, the self-esteem means that respects, consider and recognize themself worthwhile[11].

Nursing students face the clinical training in the state that they have difficulties in adapting to the department and collage life, and will encounter the greater difficulties in adapting to the collage life. Therefore, it is important to verify the adaptation estate of the nursing students to the collage life and to provide appropriate mediation for the adaptation[12].

Consequently, existing researches have dealt with self-resilience, communication capacity, self-respect and satisfaction with college life separately. In particular, there are not enough researches on the effects of those variables on satisfaction with college life. Accordingly, this research examined general characteristics of respondents, self-resilience, communication capacity, and self-respect, and tried to prepare basic data to prepare policies to improve satisfaction with college life among nursing school students.

Method

This research is descriptive survey research to examine the effects of self-resilience, communication capacity, and self-respect on satisfaction with college life among nursing school students.

The objects of this research are 112 nursing school students located in S city. The number of research objects were determined by G* power program, which indicates that, under the criteria of significance level .05, effect size .15, and power .95 in multiple regression analysis, the minimum number of sample is 109. 113 copies of the questionnaire were distributed, and 112 were collected (99.1%), satisfying the criteria of analysis.

This study is the research tool. First, the ego resilience score refers to the score measured with the tool that[14] translated, corrected complemented the ego resilience scale developed by[13]. It composed of total 14 questions based on 5 point-scale and the higher the total score is, the more greater the ability to return to the level controlled by individual after experiencing the stress. In this study, Cronbach'sα was .848. Second, communication skill score refers to the score measured with global interpersonal communication competence developed by[15]. This tool was composed of total 15 questions on the self-disclosure, taking another person's perspective, social tension relaxation, assertive, concentration, interaction management, expressiveness, bearing capacity, immediacy, efficiency, social relevance, logic, target detection and reactive power including 2 question on the noise control[10, 11]. The questions were measured with 5-point Likert scale and the higher the score, the higher the communication skill. Cronbach's α at the time of development was .72 and in this study, it was .87.

Third, collage life satisfaction score refers to the score measured with the measure tool of National Customer Satisfaction Index (NCSI) correct and complemented by[16]. This tool was composed of total 17 questions divided into 3 sub-factors of overall collage life, quality of education and administration and welfare satisfaction and measured with 5-point Likert scale. The higher the score, the higher the satisfaction.Cronbach's α in the research by Lee was .83 and in this study, it was.88.

Forth, self-esteem score refers to the score measured with the tool developed by[17] and corrected, complemented and translated by[18]. This tool measures with 5-point Likert scale and composed of total 10 questions: 5 questions on the positive self-esteem and 5 questions on the negative self-esteem. 1 point was granted to "Not at all" to 5 points to "Absolutely" and the higher the score, the higher the level of self-esteem level. For the negative questions, the score is converted in reverse. The reliability Cronbachα in this study was .86.

Data were collected from May 03, 2017 to May 15, 2017 and the self answering method through structured questionnaire was used. The researcher met and explained the purpose of study to the students

personally, obtained the consent and explained the objectives and the method to the students. After asking the consent to participating in the study to the subjects who expressed the participation voluntarily and received the written consent from them. The questionnaire survey took 10 - 15 minuted per subject and the subject read and answered the questionnaire personally. To protect the subjects ethically, the consent form was attached to the questionnaire and contained the purpose and contents of the study, spontaneity of the participation and the contents that the anonymity will be guaranteed and the subject can stop the participation anytime during the survey, they will not have any disadvantage by the interruption of participation and the collected data will not be used other than the purpose of the study. Considering the ethical aspect of the subject, the researcher explained them to the subject personally.

The collected data were analyzed using SPSS 20.0. The general characteristics of the participants were analyzed in real numbers and percentages

Result and Discussion

1. General characteristics of study subjects

The general characteristics of study subjects are as seen in [Table 1].

Table 1: General characteristics of study subjects (N=112)

Characteristics	Categories	n(%)
Age(years)	19-25	97(86.6)
	26-30	11(9.8)
	31-40	4(3.6)
Religion	Christian	35(31.3)
	Catholic	15(13.4)
	Buddhist	8(7.1)
	none,	54(48.2)
Major satisdaction	Satisfied	61(54.5)
	Usally	9(43.8)
	Unsatisfied	2(1.8)
Academic grades	Good	16(14.3)
	Fair	76(67.9)
	Poor	20(17.9)
Motive to select the nursing department	Considering the high school grad	18(16.1)
	It fits to my aptitude and hobby	34(30.4)
	It gives me good opportunity to be employed	33(29.5)
	Recommended by parents and teacher	19(17.0)
	To have better opportunity to go to overseas	3(2.7)
	To have service job	6(5.4)
Health condition	Very healthy	23(20.5)
	Healthy	52(46.4)
	Nomal	31(27.7)
	Unhealthy	6(5.4)

In the age, the age between 19 and 25 was 97 students(86.6%) occupying the most and in the religion, none, Christian, Catholic and Buddhist were occupied the most in order. In the major satisfaction, the subjects answered 'satisfied' were 61students(54.5%) occupying the most. In the academic grades, the subject answered 'Fair' were 76students(67.9%) the most. As motive of choosing nursing as their major, the item 'It fits to my aptitude and hobby' got the largest proportion. The motive to select the nursing department was shown in order of 'It fits to my aptitude and hobby', 'It gives me good opportunity to be employed', 'Recommended by parents and teacher', 'Considering the high school grade', 'To have service job', and 'To have better opportunity to go to overseas'. In the health condition, the subjects answered 'Healthy' were 52students(46.4%) the most.

2.Degree of the Variable of the Subject

The degree of the ego resilience, communication, self-esteem and the collage life satisfaction in this study are as shown in [Table 2].

Table 2: Degree of the Variable of the Subject(N=112)

Variables	M±SD	Min.	Max.
Ego resilience	3.49±**0.53**	2.14	5.00
Communication	3.77±**0.44**	2.67	5.00
Self-esteem	3.67±**0.57**	2.20	4.80
Collage life satisfaction	3.10±**0.55**	2.06	4.76

The score of the ego resilience, communication, self-esteem and the collage life satisfaction of the subjects were 3.49±0.53 points, 3.77±0.44 points, 3.67±0.57 points and 3.10±0.55 points, respectively.

3.Relationships among the Study Variable

The correlations among the variables in this study are as shown in [Table 3].

Table 3: Relationships among the Study Variable (N=112)

Variables	ER	CC	SE	CS
	r(p)	r(p)	r(p)	r(p)
ER	1	0.64 (<.001)	0.58 (<.001)	0.50 (<.001)
CC		1	0.61 (<.001)	0.54 (<.001)
SE			1	0.49 (<.001)
CS				1

The ego resilience of the subject showed the significant positive correlation with communication (r=.64, p<.001), self-esteem (r=.58, p<.001) and collage life satisfaction (r=.50, p<.001). The communication showed the significant positive correlation with the self-esteem (r=.61, p<.001) and collage life satisfaction (r=.54, p<.001), and the self-esteem showed the significant positive correlation with the collage life satisfaction (r=.49, p<.001).

4.Factors Influencing on Collage Life Satisfaction

To identify the factor having influence on the collage life satisfaction of the subject, the residence type, which showed the significant different out of the ego resilience, communication, self-esteem was analyzed. Since the tolerance to diagnose the multicollinearity among the variables was shown as 0.1 or more and the variance inflation factor was shown as 10 or less, there is no problem in the multicollinearity and as Durbin-Watson was 1.764 satisfying the independency of residual, it was confirmed that the basic assumption of regression analysis was satisfied.

In the analysis results, the regression model was significant (F=6.828, p<.001), it was shown that the communication (ß=.358, p=.009) and the ego resilience (ß=.185, p=.088) have significant influence on the collage life satisfaction and the explanatory power was 67.0% [Table 4].

Table 4: Factors Influencing Collage Life Satisfaction (N=112)

Variables	B	SE	ß	t	p	TI	VIF
(Constnat)	.713	.582		1.224	.224		
Ego resilience	.185	.107	.180	1.726	.088	.508	1.969
Communication	.358	.135	.288	2.650	.009	.466	2.145
Self-esteem	.163	.109	.169	1.499	.137	.435	2.300

Adj. R2=.67, F=6.828, p<.001, Durbin-Watson=1.764

Discussion

If the ego resilience enhancement program is developed and applied to nursing curriculum, it will contribute to enhancing the interpersonal relationship and the emotional control ability of the nursing students to perform the clinical training with diverse patients and families, for which the relatively low outcome was shown [19]. If the ego resilience is high, to control the stress situation, one would cope with the stress actively, which will help the collage student adapt to the study, society and collage environment well [21].

During the clinical training, the nursing students need the ability to solve the problem in the relationship with the patient and fellow students in diverse nursing situations and the communication skill in such situation is important[22]. Therefore, considering the characteristics of the practice-oriented nursing, the communication skill of the nursing student need to be improved by introducing diverse teaching methods[1].

The clinical training stress of the nursing student showed the significant positive correlation with the communication skill[23], and to enhance the communication skill of nursing student, the education of communication considering the role play, etc focusing on the experiencing the actual situation not the instructor-led education should be considered by investigating the demand of the subject[24].

The self-esteem is that respects and recognize oneself as worthwhile and has a correlation with the self-efficacy that can be considered as the belief on one's own ability to achieve the goal and the self-esteem and the self-efficacy of the nursing student were the significant factor having influence on the ego resilience[25]. The person having high ego resilience are known to have high self-confidence and self-esteem, and is stabilized emotionally and adapts well in the stress situation. Therefore, to enhance the ego resilience of the nursing student, the self-esteem should be enhanced.

Conclusion

This research was performed to examine the effects of self-resilience, communication capacity, and self-respect on satisfaction with college life, and to search for ways to improve satisfaction with college life among nursing school students.

In this study, the ego resilience showed the significant positive correlation with the communication, self-esteem and the collage life satisfaction.

Though there are some limits of this research, this research wants to suggest the followings.

First, to identify factors affecting satisfaction with college life of nursing school students, it is necessary to do researches including various factors.

Second, it is necessary to apply programs and systematic educational policies for nursing school students, and it is necessary to do researches and continuous management.

Finally, this research used nursing school students of one college. Thus, to get generalized results, it is necessary to expand the sample, and do repetitive researches.

Effects of Occupational Therapy using CO-OP on Activities of Daily Living and Balance Ability of People with Intellectual Disability using Day care Center

Won-Jin Bae[1], Nam-hae Jung[2]

[1]Department of Health Science and Technology, Graduate School of Inje University, Republic of Korea,
[2]Department of Occupational Therapy, Dongseo University, Republic of Korea

Abstract

Background/Objectives: The purpose was to investigate the effects of occupational therapy using cognitive orientation to daily occupational performance (CO-OP) on activities of daily livings and balance for adults with intellectual disabilities using the daycarecenter.

Methods/Statistical analysis: From February to June in 2018, 10 people with intellectual disabilities who use the day care center in B city were enrolled. The occupational therapy was conducted for once a week for a total of 20 weeks. The Burg Balance Scale and Modified Barthel Index were assessed for physical balance and independence of activities of daily living before and after treatment.

Findings: occupational therapy using CO-OP showed significant improvement in total score of Modified Barthel Index and Berg Balance Scale for adults with intellectual disability.

Improvements/Applications: Occupational therapy based on CO-OP was effective in balancing the activities of daily living of adults with disabilities using day care center.

Keywords: *Activities of daily living, Balance, Cognitive orientation to daily occupational performance, Day care center, Intellectual disability, Occupational therapy*

Introduction

People with intellectual disabilities have deficits in cognitive functions such as problem solving, planning, judgment, learning, language, motor, and social abilities [1-4]. These deficiencies interfere with communication skills, social participation, academic or occupational functioning, and self-reliance in the home or community when engaging in daily activities and social activities. People with intellectual disabilities, unlike other people with disabilities, receive services from the facilities because they have considerable restriction on instrumental daily living and social life[5]. It is necessary for people with intellectual disability to provide activities that complement the deficiencies of cognitive, physical, and emotional development and enhance the ability of activities of daily living through various intervention[6].

Mild to moderate adults with intellectual disabilities can perform activities of daily living independently through continuous daily training, which requires continuous intervention and management. Despite the high demands for occupational therapy for people with intellectual disabilities, there is a lack of evidence on the effectiveness of occupational therapy. Level of the ID was found to be associated with ADL performance in people with ID [7]. physical fitness is also an aspect in the ability to perform ADL [8-11].

In Republic of Korea, major services for people with disability at the day care center include rehabilitation, field trips, hobbies, education, counseling, lunch and snack instruction. There are few daycare centers in the Republic of Korea that provide occupational therapy services.

Adults with intellectual disabilities need task-oriented training that can be used functionally in everyday life. Cognitive orientation to daily occupational performance (CO-OP) approach, which focuses on activities and participation, not disability and impairment, focuses on improving occupation in their environment by developing strategies to enable activities and participation. The client-centered approach motivates clients to identify and learn skills that have purpose and meaning. Increasing motivation can improve motor learning and performance [12]. CO-OP approach is a new intervention that successfully modifies the environment based on exercise/learning theories. And it based on evidence, and focuses on performance. Also, it fulfills client need successfully. It is important to use problem solving strategies by the clients themselves which requires three skills: language, cognitive function, and reaction to behavior. The goal of CO-OP is to acquire skills and generalize through the use of cognitive strategies [13].

The purpose of this study was to investigate the effects of occupational therapy using CO-OP approach on daily activities and balance in young people with mild intellectual disabilities using day care center.

Method

The subjects were recruited from 3 daycare centers in B city in Republic of Korea. The subjects were 10 persons with intellectual disability. The researcher explained the purpose and method of the study to the participants, and the participants agreed to participate. Average age of participants was 23.2. The participants were 8 male and 2 female. The criteria for selecting participants were as follows. First, adults over 18, second, persons with intellectual disabilities according to disability, third, persons using day care centersand those who can understand and follow the contents of the researcher's instructions.

Ten adults with intellectual disability suing day care centers were selected. The evaluator conducted a Canadian Occupational Performance Measure to select participant' 2 target activities. As an intervention for participants, a cognitive strategy for target activities based on CO-OP was applied. Intervention was 60 minutes per session for a total of 20 weeks. Before and after intervention, the activities of daily living was assessed using the Modified Barthel Index (MBI) and balance was assessed using the Berg Balance Scale (BBS). The assessment was conducted before and after the intervention.

MBI is a tool for assessing the level of activities of daily livings by observing or interview. The assessment items were 10 of personal hygiene, bathing, eating, toilet treatment, climbing stairs, dressing, stool control, urine control, walking, and chair/bed movement. The higher the score from the minimum score of 0 to the maximum score of 100, the higher the independence of activities of daily living. The total scores are divided into four stages: full independence, partial independence, and full dependence, depending on the patient's level of function. MBI has an internal validity of .90, test-retest reliability of .90 and inter-tester reliability of .95 [14]. BBS consists of 14 items including sitting, standing, posture change, and so on. Evaluate the balance ability by asking the patient to do the items themselves. The score ranges from a minimum of 0 to a maximum of 4 for each item, with a total score of 56 for the 14 items. This test has an intra- and inter-measured reliability of r=0.99 and r=0.98, respectively, with high confidence and internal validity for assessing balance [15].

Through the Canadian Occupational Performance Measure, two activities of high importance but low performance and satisfaction were selected as target activities. The target activities of each participant were trained based the CO-OP approach. CO-OP approach focuses on the subjects and uses a self-guidance strategy that solves the task performance problem and improves work ability. The process of this strategy set client centered goal and then developed detailed plan accordingly. After executing the plan, the participants themselves check if modifications were needed. This is called 'Goal-Plan-Do-Check.' The data was analyzed by SPSS Version 20.0. The general characteristics of the subjects was analyzed by descriptive statistics such as frequency and percentage. In order to examine the effect of occupational therapy, the daily life activity and balance ability were measured and compared using the Wilcoxon signed rank test. The statistical significance level was .05.

Result and Discussion

1. Change in ADL

As seen in Figure 1, MBI total score was 69.2±**20.07 in pre-intervention, and 72.1±19.44 in post-intervention. There was a statistically significant improvement.**

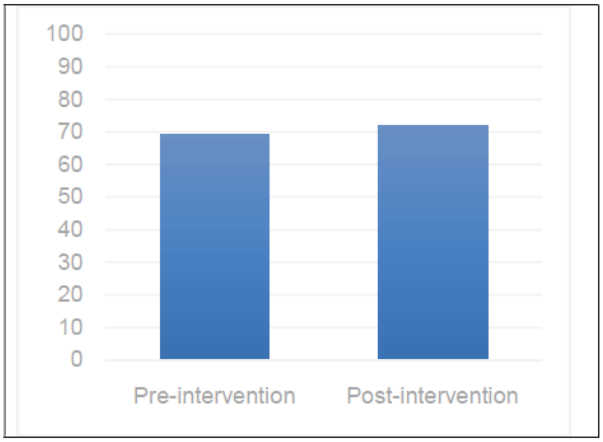

Figure 1. Modified Barthel Index

2.Change in balance

As seen in Figure 2, the result of BBS showed a statistically significant improvement from 43.7±13.17 to 47.7±12.84 (Table 1).

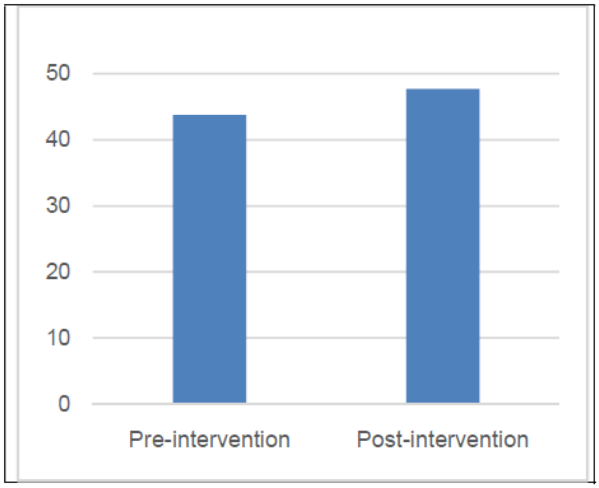

Figure 2. Berg Balance Scale

Discussion

For adults with intellectual disabilities, intellectual levels and physical abilities are important factors in determining ADL [16]. Not only does it increase the demand for care of caregiver [17], but also predicts the overall ADL degeneration. intellectual level and mobility level of the people with intellectual disability are the most important factors affecting the quality of life. A study of 480 adult with intellectual disabilities reported that 49.8% were completely independent, 8.1% were mildly dependent, 27.9% were moderately dependent, 11.9% were severely dependent, and 2.3% were completely dependent. To improve the quality of life for adults with intellectual disability in communities, we should provide appropriate services and intervention. As times change, evidence for community-based occupational therapy beyond medical institutions is required. Many adults with intellectual disability use day care centers and their rates are increasing. Adults with Mild to moderate intellectual disabilities can perform activities of daily living through continuous daily training, which requires continuous intervention and management. Especially, CO-OP approach, which focuses on activities and participation, focuses on improving occupation in their environment by developing strategies to enable activities and participation.Few studies have reported the effects of occupational therapy on adults with intellectual disabilities. As a result of previous studies, occupational therapy was found to be effective in improving daily activities. However, most of the previous studies were single subjects with 3 to 6 subjects. As a result of this study, occupational therapy using the CO-OP approach was found to be effective in the activities of daily living and balance of adults with intellectual disabilities. The CO-OP approach is applicable to subjects who are able to respond to cognition, language, and behavior. This was possible because the subjects were mild. It may be limited to apply to moderate and severe adult intellectual disabilities. In the early stages of intervention, CO-OP acquires motor skills for children with developmental coordination disorders. According to previous studies, CO-OP is not only effective for improving and maintaining motor performance skills of children with developmental coordination disorder and Asperger disorder, but also has recently been applied to children with cerebral palsy and brain injury[18] [19] [20] [21][22] [23] [24] [25] [26] [27]. In addition, since 2010, there have been increasing cases of applying CO-OP to adults, and it has been proved that it is effective in improving daily life functions mainly for stroke, brain injury, and the elderly [28] [29][30][31][32].This study is the first study to verify the effect of CO-OP in adult intellectual disabilities. In the future, it is necessary to verify the effectiveness in various aspects.

Relations on Communication Competence, Job Satisfaction and Nursing Performance of Clinical Nurse

Eun-Hong Kang[1], Sung-Ja Yoon[1]

[1]Kyungdong University, Dept. of Nursing, Korea

Abstract

Background/Objectives: The aim of this study was to identify the relationship among the Communication Competence, Job satisfaction and nursing performance of clinical nurses in Korea.

Methods/Statistical analysis: The 212 clinical nurses were participants who worked at general hospitals. The difference of job stress according to the general characteristics was performed by t-test, ANOVA test. Multiple regression analysis was executed to investigate factors that influence the job stress.

Findings: The result of this study, it was shown that communication skills 3.56 ± 0.44, job satisfaction 3.25 ± 0.60, and nursing job performance were 3.75 ± 0.53, total were 3.52 ± 0.43. According to general characteristics, the communication skills, job satisfaction, and nursing performance, all showed significant correlation for age, career, and didn't show the correlation for education.

Improvements/Applications: The nurses' communication skills enhancement will increase job satisfaction and job performance ability and have a positive effect on disease recovery and patient healing.

Keywords: *Communication Competence, Job satisfaction, Job Stress, Nursing Performance, Clinical Nurse, Korea.*

Introduction

Human beings form their relationships through communication from birth. In particular, communication regarding treatment plans and progress should be made in the medical institutions, establishing the relationship with medical staff and patients[1,2]. In this progress, good communication with each other based on precise decision making is very important.

The hospital organization consists of professionals in various fields who provide services with the common goals of the treatment of the disease and the recovery of the health for the subjects. Among them, nurses are a group which is more than 30% of the total hospital workforce and occupies a high proportion in the workforce structure[3,4]. Nurses play a central role in collaborative communication for work progress with caregivers, colleagues and other departments in addition to performing independent nursing services that supply direct medical service according to the request of the subject for 24 hours[5]. The communication executed by nurses in organic relationships with them reduces psychological anxiety and fear, providing emotional stability for the subjects, and this leads to decrease pain and drug use, it also affects symptomatic relief and physiological function enhancement[6]. On the other hand, as the result from poor communication is directly related to the subjects' health care and the problem of treatment and related to job performance, effective communication competence is one of the essential core abilities nurses should have[7].

Therefore, nurses need interpersonal skills for the subjects' emotional stability and recognition abilities of one's self and others to notice the subjects' psychological needs in the busy medical environment and also they need empathy abilities for communication skills improvement[8,9].

Nurses play an intermediate role with the hospital's medical staff, establish the most direct and lasting relationship with patients who are medical consumers, and nurses are in the crucial position that can influence the medical consumer's perception. Thus, nurses' communication competence is one of the factors needed to enhance the efficiency of the hospital organization. Therefore, the purpose of this study is to apprehend the relationship between communication, job satisfaction and job performance of nurses working in general hospitals and to investigate factors which have an impact on the job stress of nurses.

Method

For the study, after explaining the purpose of the study and requesting consent to a total of 300 nurses working at general hospitals with more than 300 beds located in S city from March 2 to March 9, 2018, the questionnaires were distributed to them and answered in a self-filled method. 294 out of 300 questionnaires were collected and 212 questionnaires except for unsatisfactory responses were analyzed. The measuring tool of the nurse's communication type was a total of 18 questions which consisted of 6 questions of informational type, 6 questions of friendly type, and 6 questions of authoritative type. Cronbach's α = .88. Job satisfaction was a total of 39 questions and 7 sub-areas which were composed of 6 questions of professional positions, 3 questions of nurse-doctor relations, 7 questions of administration, 5 questions of autonomy, 5 questions of job requirements, 8 questions of interactions, and 4 questions of pay. Cronbach's α = .86. Job stress is a total of 38 questions and the high score means the job stress is high. Cronbach's α = .92.The data collected in the study were analyzed using the SPSS/WIN 21.0 program as follows. The difference of job stress according to the general characteristics of the subjects was performed by t-test, ANOVA test. The relationship between subject communication type, critical thinking tendency, job satisfaction, and job stress was analyzed by Pearson correlation coefficient.Multiple regression analysis was executed to investigate factors that influence the job stress of the subjects. The statistical significance level was set to .05.

Result and Discussion

The general characteristics of respondents are shown in the following [Table 1]. The age was the highest in the 20s as 55.7%, followed by 25.5% in the 30s and 18.9% in the 40s and above. Among them, 67.5% were single. As for the educational background, it was shown that 53.3% was the bachelor's degree, 40.6% was the professional bachelor's degree. Concerning the career, it was investigated that 43.9% was less than 3 years, and 42.0% was more than 7 years. As for the type of residence, it was shown that 64.6% was a residence with family. Regarding the position, general nurses were the highest at 73.6%, temporary nurses were 16.0%. As for the working department, it was shown that wards were the highest at 31.1%, intensive care units were 25.0%.

As for the occupations that nurses feel difficulty in communication, as presented in [Table 2], it was shown that specialists were the highest at 36.8% in the 1st priority, senior (junior) nurses were 27.8%, medical practitioners were 21.7%, clinical pathologists were 4.2%, nurse colleagues were 3.3%, others were 3.3%, and radiologists were 2.8%. In the 2nd priority, medical practitioners were 38.7%, senior (junior) nurses were 26.4%, specialists were 17.9%, nurse colleagues were 7.1%, clinical pathologists were 5.7%, radiologists were 2.4%, and others were 1.9%. Also, in the 3rd priority, it was shown that senior (junior) nurses were 21.7%, nurse colleagues were 20.8%, medical practitioners were 12.3%, specialists were 10.8%, radiologists were 8.0%, clinical pathologists were 8.0%.

Table 5. Job satisfaction and job performance according to general characteristics

Variables	Communication skill		Job Satisfaction		Nursing performance	
	M±SD	p	M±SD	p	M±SD	p
Marital status						
Single	3.5±0.41	.000	3.1±0.49	.000	3.6±0.47	.000
Married	3.8±0.41		3.5±0.69		4.0±0.57	
Residence						
With family	3.6±0.43	.000	3.3±0.62	.014	3.8±0.57	.002
Single	3.4±0.43		3.1±0.53		3.6±0.43	
Department						
Ward	3.5±0.39	.000	3.2±0.53	.456	3.8±0.52	.039
ICU	3.4±0.36		3.2±0.42		3.7±0.44	
Recovery room	3.4±0.55		3.3±0.43		3.5±0.54	
ER	3.5±0.43		3.1±0.63		3.7±0.42	
Outpatient	3.8±0.49		3.5±0.64		3.9±0.58	
Other	3.8±0.46		3.2±0.81		3.9±0.60	

Job satisfaction and nursing performance according to general characteristics are the above [Table 5].

According to the marital status, when single, communication skill was 3.5 ± 0.41, job satisfaction was 3.1 ± 0.49, and nursing job performance was shown to be 3.6 ± 0.47, and when married, communication skill was 3.8 ± 0.41 job satisfaction was 3.5 ± 0.69, and nursing job performance was shown to be 4.0 ± 0.57. According to the residence type, when residence with family, communication skill was 3.6 ± 0.43, job satisfaction was 3.3 ± 0.62, and nursing job performance was shown to be 3.8 ± 0.57, and when single residence, communication skill was 3.4 ± 0.43, job satisfaction was 3.1 ± 0.53, and nursing job performance was shown to be 3.6 ± 0.43.

Discussion

As a hospital is an organization in which several professional occupations work together, cooperation between the various professions is an essential factor to provide effective, efficient, safe medical services[10-12]. As a result of the study, the 1st place occupation that nurses have difficulty in communication was a specialist who was shown to be the highest at 36.8%. It is believed that it is the same as the result of previous studies[2] in which the highest factor of job stress of clinical nurses was a conflict with a doctor.

The better the cooperative relationship between nurses and doctors, the higher the job satisfaction and the job holding intention of the nurses[13,14], and as it has an important impact on enhancing patient's results to increase consensus while interacting with each other in a stable cooperative relationship between nurses and doctors[15-18], Aninstitutional strategy for increasing plans of cooperation between doctors and nurses in the hospital should be arranged.

The result of the study that the next place occupation that nurses feel difficulty in communication was a senior(junior) nurse at 27.8% was shown to be similar to the result of the study that it was also high even to high position nurses from the nurses' perspective[19]. Although it is unavoidable that the clinical nurses experience conflict caused by communication while performing nursing work, the reality is to not be able to stop interacting with uncomfortable colleagues due to the nature of nursing work. This problem causes continuous stress and hinders job performance and ultimately leads to job dissatisfaction and job turnover. In the 3rd place, the medical practitioner was shown to be 21.7% and it is the expectable difficulty when considering that general hospitals are mostly doctor training hospitals. This is identical to the response result

that 75% of nurses had difficulty in communication with doctors in the result of the study which was investigated with 288 nurses and 118 doctors working in 4 general hospitals, regarding communication between nurses and medical practitioners[2,20].

As nurses are core personnel who plays a central role in nursing care in health care institutions, nurses' job performance should be enhanced in order to meet the subject's needs for good quality services. Excessive workloads cause job satisfaction to be lowered, which may result in less than the subject's expectations[21]. As the result of the study, the investigation result of the communication, job satisfaction, and job performance, it was shown that the communication skill was 3.56 ± 0.44 and job satisfaction was low at 3.25 ± 0.60. As excessive nursing workloads lead job satisfaction to be deteriorated and cause the subject's needs to be difficult to be met[22], the nursing workloads need to be presented with an appropriate level of work and should be standardized.

Communication skills showed a statistically significant positive correlation between job satisfaction and nursing job performance. This means that communication in the organization resolves interference between the members of the organization and reinforces work motivation and cohesiveness of the group.

Communication ability, job satisfaction, and nursing job performance, all showed a positive correlation with age and career. As nursing work is always dynamic with the most complex environments more than any occupation, this was similar to the study result that communication ability, job satisfaction, and nursing job performance have a positive correlation due to the accumulation of experience according to the increase of the age and career of nurses[23], and the study result that job independence owing to the accumulation of nurses' careers increase job satisfaction[24,25].

When analyzing the above results, the systematic communication program of hospital will lead a good communication in the hospital in the future, and it is regarded that the work efficiency between medical staff will be able to be increased by activating communication channels of nurses.

Conclusion

The nurses' communication skills enhancement will increase job satisfaction and job performance ability and have a positive effect on disease recovery and patient healing. Therefore, for this purpose, the programs related to communication are needed at the hospital and it is necessary to provide an environment in which the hospital's direction can be understood and contributed through positive discussion and directional presentation for organizational goal achievement of the nursing department. My proposal is that nursing department managers should actively accept suggestions from the entire nurse meetings and from the ward meetings for smooth communication between nurses, and the sessions of conversation, discussion meeting, etc. should be applied to communicate smoothly for the safety of the patients who are subjects through regular meetings with other occupations, in other words, doctors with whom nurses have difficulty in communication.

Associated Determinants of Successful Ageing among Older Koreans : from the 7th KNHANES

Hye-Sook Choi[1], **Moon-Hee Kwon**[2]

[1]*Kyungdong University, Dept. of Dental Hygiene, Korea,* [2]*Kyungdong University, Dept. of Nursing, Korea*

Abstract

Background/Objectives: Ageing problems are rapidly increasing globally. But rare studies on preparing strategies are existed despite of increasing risks. We aimed to identify associated major factors of successful ageing.

Methods/Statistical analysis: Our study analysed the 7thKNHANES (Korea National Health and Nutrition Examination Survey Data) to find out associated determinants of successful aging, by general characteristics, socio-economic, healthy life style, mental and oral health factors. We analysed on 1,252 subjects to identify the associated major determinants of successful ageing with multiple- logisticregression by complex-sampling method.

Findings: Through multiple-logistic -regression it was showed that stress(OR 2.921; 95% CI: 2.081-4.098), chewing (OR 2.102; 95% CI: 1.645-2.687), gender (OR 1.759; 95% CI: 1.341-2.309), economic activity (OR 1.660; 95% CI:1.273-2.165), physical activity (OR 1.346; 95% CI:1.004-1.804), and education level (OR 1.830; 95% CI:1.139-2.939) were statistically connected with successful ageing. While, other associated factors of successful ageing such as the factors of presence of spouse, income, areas of residence, alcohol drinking were presented with having no relationship of successful ageing after adjustment.

Improvements/Applications: Specified and concrete strategies of public health interventions should be prepared by considering psychological, physical aspects such as stress management and oral health care as well as thinking of socio-economic factors of the elderly for the successful ageing in the Korean community.

Keywords: *Chewing ability, Economical activity, Education level, Gender, Successful ageing, Stress*

Introduction

Rapidly increasing elderly population of Korea is the most rising issue. Successful ageing of the elderly was well known to be closely associated with physical activity[1-2], which was affecting cognition and brain[1] as well as preventing of anxiety and depression[3]. Through the recent study of China, it was reported that mental health was a strong factor of causing the need for long term care supports and services among both in female and in male elderly[4]. Also, a combined exercise and nutrition intervention of the elderly was reported to be as important one to maintain and improve physical function as well as improving quality of life in Dutch's study[5]. And the patterns of healthy diet were reported to be associated with quality of life and better self-perceived health by Australia's study[6].

But it was reported that the prevalence of successful ageing was low by the cohort study of older people of Colombia[7]. And social participation, which was well known as the factor of successful aging, was reported to have beneficial effect of functional health of the elderly by recent China's study[8]. Moreover, social supports and economic constraints were found to be the major factors for the effectiveness of physical activity behaviors by recent US study[9].

In addition to those things, the well-designed and continuous intervention programs for successful ageing were found to be very beneficial for older adult's health

Corresponding author:
Moon-Hee Kwon,
ellizzabeth@hanmail.net

as well as being delayed ageing[10]. And it was reported that healthy ageing nutrition index was modifiable factor of predicting longevity of older adults[11]. Especially, successful ageing and life satisfaction of older adults were reported to be having little attention of researchers[12]. And also, exercise was reported to be effective even to osteoarthritis patients[13] which was known to be very common disease in the older people.

Furthermore, the chronic diseases of the older people were reported to be caused of threatening their health which has complex relationship of repeat caring of informal care[14]. But the researches on the major determinants of successful ageing of older adults are very rare despite of getting great importance in the trend of entering into super-aged society.

Therefore, we investigated to examine on the associated major determinants of successful ageing among older people in Korea.Our data will provide the basic guidance on preparing evidence based and well-designed interventions for healthy and successful ageing.

Method

We used the representative national data of the 7th KNHANES (KOREA NATIONAL HEALTH and NUTRITION EXAMINATION SURVEY DATA) to find out associated determinants of successful aging, which was accounted for EQ-5D and satisfaction of life factors, by general characteristics data, socio-economic, healthy life style, mental health and oral health factors. The 7th KNHANES was performed from 2016 to 2018. Stratified sampling methods of two state were used. The data were surveyed and collected by the approval with Institutional Review Board of the Korea Centers for Disease Control and Prevention.

The gender, spouse, residence, education, economic activity, and income variables were used as demographic characteristics. Education level was divided as follows: under elementary, graduation of middle school, graduation of high school and over college. Smoking, alcohol drinking, breakfast, sleep time, and physical activity were as health related behaviors and life-style factors. The variable of psychological aspects was stress. The variable of oral health status was chewing difficult.

We analyzed 1252 participants aged ≥ 65 to identify the associated major determinants of successful ageing by complex sampling methods with multiple logistic regression using SPSS (ver. 21.0). The significance level of statistics was .05 ($p < .05$).

Result and Discussion

[Table 1] shows on the general demographic characteristics of the 1,252 study population. Under half of them were male (45.0%). About two thirds of them were under elementary educated participants (59.2%). A larger proportion of the participants were showed to be having spouse (66.2%) and resided in dong area (76.8%). Approximately one thirds of them were doing economic activity (31.8%). The proportion of income level was similar in 4 groups (low, middle-low, middle-high and high level). In the health behavior aspects, smoking (8.9%), drinking (35.4%), and doing physical activity (35.2%) were showed. In mental health behavior aspects, no stress group was reported to be 81.7% and abnormal sleep time group was over half of the participants (55.9%). And in oral health aspects, the participants with chewing difficulty (44.7%) was about under half of them.

Table 1. General characteristics of study subjects (N=1,252)

Variables	Division	N	%

Discussion

The major determinants of successful ageing were revealed as the factors of no stress, good chewing ability, gender(male), doing economic activity, doing physical activity, and higher education level in order through findings of our study analysis of the ongoing nationwide 7th Korea National Health and Nutrition Examination data.

Stress, the important psychological factor of mental health of the elderly, was found out to be as the major determinant factor of successful ageing in our study which have some consistent with other studies[3,4]. Chewing ability, the indicator of oral health, was the important determinant of successful ageing through our study and it was also considered as the indicator of getting nutrition contributing to mortality as well as disability of later life and survival prediction particularly in older adults[11] with reflecting general health status. Gender, which has known as the important variable, was also found out to be the determinant of successful ageing of our study and it was reported to have the distinct in doing physical activity related health behaviors by gender[9] and be the social determinant of cardiovascular cause of increasing mortality of the elderly by sex[15]. Doing economic activity, which was considered as social activities in light of broad concepts, was revealed as the determinant factor of successful ageing of our study and it was known of a key role of cognitive function[10] and lowering the risk of functional disability of the elderly[8]. Moreover, the association of social activities and the better cognitive function among the older people was identified as the key point role[16] and these findings were supporting our results in terms of active socio-economic activities despite of different study subjects. Physical activity which was well known as the key factor of general health, was also identified as the determinant factor of successful ageing and it was already suggested as the prevention of depression and anxiety[3] and also recommended as improving of health promotion in other studies[2,11-12]and contributing on quality of life[5]. And it was also reported that physical activity affects cognition and brain[1]. And the research on the association of exercise and osteoarthritis[13] was also supporting our findings even though the difference of study subjects and design.Education level, the higher education levelas the determinant factor of successful ageing, should be considered for both genders to delay the need for long term care supports and services[4]. In terms of acceptance and applying of important intervention information. Especially, in case of older people, it was reported that life-style recommendations were found to be remaining low state even though having much publicefforts[17] even though among the different subjects.

In terms of applying intervention aspects it was reported that encouraging exercise and physical activity for successful ageing was known to have much barriers according to another study[18] despite of being difference of subject age. And there were some important researches which were dealing with the effect of mindfulness based health education on health behaviors and the quality of life[19], and the research of the experimental ageing and the frailty as cohort research[20]for the successful ageing. And also, knowledge, attitudes and perceptions were found to be closely related with the cardiovascular risk[21]which was well known to be as the most prevalent disease worldwide leads to sudden death in older adults.

The strengths of our study have some points. First, we used the recent data of nationally representative one to have good reliability and validity through complex sampling methods. Second, we dealt with the most urgent and valuable problem, the major determinants of successful ageing in the context of rapidly going to the super-aged society. Third, to know about the determinant factors of successful ageing, we included the important variables such as mental health factor and oral health factor, which was well known for the predictor of general health. And the limitation of our study was that we did not more specified and classified the health risky behavior factors such as smoking and drinking.

But the findings of our study may be used to help to prepare the concrete strategies of public health and nursing professional fields in the view of remarkably super-ageing Korean elderly population.

Conclusion

Therefore, specified and concrete strategies of public health interventions should be urgently prepared by considering psychological, physical aspects such as stress management and oral health education as well as thinking of socio-economic factors of the elderly for the successful ageing in the Korean community.

A Study on Attitude of Menstruation, Menstrual Discomfort and Coping Method in Female College Students

Hyun-Jung, Jang

Professor, Department of Nursing, KKOTTONGNAE, University, South Korea

Abstract

Background/Objectives:To provide positive experience of menstruation, which has a great effect on women's life, and provide basic data in menstrual management education.

Methods/Statistical analysis: Subject includes women in their 20s that were selected through convenience sampling. Major variables include Korean Menstrual Attitude Questionnaire, Menstrual Distress Questionnaire and coping style questionnaire. Collected data was processed on SPSS 22.0 for frequency analysis, descriptive statistics and Pearson correlation coefficient, and personal coping method in case of menstrual discomfort and motive for considering an alternative type were verified and analyzed through open-ended questions.

Findings: Average age of first menstruation in subjects was 12.64, and 70.3% experienced regular menstrual cycle. 45.6% had a menstrual cycle of 26-30 days, 78.1% had a menstrual period of 4-6 days, and 68.7% had normal blood loss. 69.2% used painkiller during menstruation, and 54.2% experienced discomfort in daily life due to menstruation. The average score of subject's menstruation attitude was 4.09±.49, which is slightly higher than the midpoint. Degree of discomfort before, during and after menstruation was 1.42±1.03, 2.03±1.04, and .92±.97 respectively, the highest during menstruation period, followed by before and after menstruation. In terms of subject's coping method, aggressive coping method was .99±.55, and passive coping method was 1.12±.76. Discomfort during menstruation and coping method, although weak, show significant positive correlation, and subject's coping method was higher as the premenstrual discomfort was higher ($r=.224$, $p<.001$), menstrual discomfort was higher ($r=.227$, $p<.001$), and intermenstrual discomfort was higher ($r=.186$, $p<.05$). 16.5% of subject tried tampons or menstrual cups as an alternative to sanitary napkins due to the discomfort caused by them.

Improvements/Applications: Nurses need to provide customized education on different alternatives in consideration of women's individual characteristics, so they can practice preventive coping method and self-manage menstrual discomfort.

Keywords:*Menstruation, Menstruation Attitude, Menstrual Discomfort, Coping Method, Female College Students, Premenstrual Syndrome (PMS)*

Introduction

Menstruation is an inevitable phenomenon in all women, and is a requirement that enables pregnancy and delivery. In modern society, the age of first menstruation is gradually lowered, and the period of lactation and pregnancy are decreasing due to low birth rate, which increases number of menstruations until menopause. Accordingly, period of menstrual discomfort is increasing, causing more women to have negative attitude towards menstruation. Women that had negative experiences of menstruation complained of severe premenstrual discomfort and symptoms[1], so it is important to provide other alternatives to relieve discomfort, so they can have positive experience of menstruation, which has a significant effect on women's

life. Women in Korea tend to reduce the discomfort and pain by themselves that many cope with even severe premenstrual discomforts passively. As a result, the nursing intervention for subjects was very passive and limited.

Menstrual discomfort is accompanied by fatigue, headache and diarrhea, and is described as an intense squeezing pain in abdomen. Prevalence of such menstrual discomfort is the highest in university students (92%) [2], followed by high school students (76%) [3], and adult women (75%) [4], which shows that women in their 20s experienced menstrual discomfort the most. Menstrual discomfort is known to be caused by psychosocial factors, such as gender role, depression, menstrual attitude, stress and femininity, in addition to biomedical factors, such as hormone and neuroendocrine Imbalance. However, the correlation between safety of sanitary napkins, which are used for the convenience of women, and menstrual discomfort is being raised recently, it is difficult to find relevant studies that clarify the exact cause [5-6]. Sanitary napkin is a disposable female product that is used to absorb blood during menstruation, and is a daily essential that is used for a long period of time from the first menstruation to menopause. Examination of discomfort and aftereffect related to sanitary napkin has been handled very importantly and studied for the health of women. As sanitary napkin is in contact with the most sensitive and gentle part of women's body, the vulva, it should be produced in consideration of safety and health. However, in the survey of sanitary napkin usage and aftereffect, 66% experienced skin diseases and itchiness [7], and concerns are raised in terms of safety since 2005, as harmful substances such as dioxin and polyethylene were detected in the materials of sanitary napkin. Safety issue of female sanitary napkin recently became a social issue, and efforts are made to relieve fear pf sanitary napkins by releasing the result of harmful substance analysis for sanitary napkins manufactured in Korea, forming a sanitary pad assessment committee in August 2017, and opening the result of complete enumeration of sanitary napkin clearly. A complete result is not yet available for an interpretation, but most women are paying attention to other alternatives due to distrust and anxiety about reduced blood amount, worsened menstrual cramps and change of menstrual cycle. Based on the MFDS's survey on female sanitary product usage on 1028 fertile women between 10~60, result showed in the order of sanitary napkin, tampon, cotton pad and menstrual cup, and sanitary napkin was used the most for convenience. Usage rate of menstrual cup was low, but its awareness was 41.1%, showing that many women were interested in it. Women in 10~20s accounted for 61% of users, who evaluated it positively for 'economic benefit', 'environment protection' and 'prevention of skin allergy', and users in the 20s that complained about menstrual discomfort the most were gradually increasing. Unlike sanitary napkins, menstrual cup is not in direct contact with the vulva, so it prevents contact dermatitis, and wasn't detected of harmful substances that threaten women's health [8] that there is an increasing expectation as an alternative to sanitary napkin. This study aims to examine the menstrual attitude, perimenstrual discomfort and coping methods of women in their 20s, who make new attempts for their own safety, and verify the negative experience factors of menstruation. Also, by studying the motive and acquisition of alternative products other than sanitary napkin, it aims to provide basic data in menstrual management education that can contribute to menstrual discomfort management and menstrual product decision, as well as positive experiences of menstruation, which has a significant effect on women's life.

Method

This is a descriptive research conducted to determine the menstrual attitude, perimenstrual discomfort and coping method of women in the 20s, their motive of selecting alternatives other than sanitary napkin, and personal coping method for menstrual discomfort.

Subject includes women in the 20s, who are having menstruation, selected through convenience sampling. Selection criteria includes fertile women that are having menstruation, who experienced discomfort due to the use of sanitary napkin and consider other alternatives, or already are using alternatives. Number of subject was calculated as 120 using G*Power 3.1 program, with significance level=.05, statistical power=80% and effect size of .25. This study was conducted on 182 women.

Subject includes women in the 20s, who are having menstruation, selected through convenience sampling. Selection criteria includes fertile women that are having menstruation, who experienced discomfort due to the use of sanitary napkin and consider other alternatives, or already are using alternatives. Number of subject was calculated as 120 using G*Power 3.1 program, with significance level=.05, statistical power=80% and effect size of .25. This study was conducted on 182 women,

satisfying the criteria

To examine the structure of adult female's menstrual attitude, the Korean version of Menstrual Attitude Questionnaire [8] was used. This questionnaire consists of 33 questions in 5 factors, where factor 1 (1-12) was named 'menstruation that weakens daily activities', factor 2 (13-18) as 'menstruation that causes negative physiological and emotional changes, factor 3 (19-23) as 'menstruation as a natural phenomenon', factor 4 (24-28) as 'denial of effects of menstruation', and factor 5 as 'menstruation as a hassle'. This tool is a 7-point scale, from 'Highly disagree' at 1 point to 'Highly agree' at 7 points, and higher point signifies negative menstrual attitude. In terms of reliability of this tool, Cronbach's α was .95~.97 at the time of development, and the reliability of the tool in this study was Cronbach's α= .747.

In order to measure the symptoms periodically experienced in premenstrual, menstrual and intermenstrual periods, the Korean version of Menstrual Distress Questionnaire (MDQ) [9] was used. Premenstrual period refers to 7-day period prior to menstruation, menstrual period is from the first day of menstruation to the last day, and intermenstrual period refers to the remaining period excluding the previous two periods. MDQ consisted of 9 questions in behavioral change, 6 questions in negative emotion, 7 questions in lowered concentration, 6 questions in water retention, 5 questions in response of autonomic nervous system, 2 questions in awareness, 4 questions in control and 2 questions in other areas at the time of development, but after modification, it contained 37 questions in the Korean version. Each question is a 5-point scale from 'None' at 1 point to 'Very severe' at 5 points, and higher score signifies severe degree of menstrual discomfort. This tool can be used for premenstrual, menstrual and intermenstrual periods, and questions about premenstrual, menstrual and intermenstrual discomfort. In terms of the reliability of this tool, Cronbach's α was .96 at the time of adaptation, and in terms of the reliability of the tool in this study, Cronbach's α for premenstrual period was .967, menstrual period was .956 and intermenstrual period was .977.

In order to measure the process of coping to a specific stress, the Coping Style Scale, which was adapted into statements [10] was used. 39 questions were extracted in 5 factors, including problem-solving (15), emotional relief (6), seeking support (9), avoiding problem (4) and wishful thinking (5). Problem-solving and seeking support are considered aggressive coping style, and emotional coping, wishful coping and avoiding problem as passive coping style. Evaluation is on a 4-point scale (1 point for not using, 2 points for using, 3 points for using frequently, 4 points for using highly frequently), and higher point signifies more frequent use of specific coping method. The reliability of this tool in this study was Cronbach's α= .955.

Collected data was analyzed as follows using SPSS 22.0.

1)Descriptive statistics of Subject's general characteristics and research variables was analyzed through frequency analysis and descriptive analysis.

2)Correlation between menstrual discomfort due to menstrual attitude and coping method used Pearson correlation coefficient.

3)Personal coping method for menstrual discomfort, coping method for discomfort caused by use of sanitary napkin, and motive for considering alternatives were confirmed and analyzed through open-ended questions.

Result and Discussion

1. *Subject Characteristics*

Subject's general characteristics and menstrual characteristics are as follows. Age range of subjects that participated in the study is 18-29, and the average age is 19.86. 80.8% does not exercise, 62.6% had an average sleep time of 5-6 hours, 63.7% drank alcoholic beverage, 57.5% drank coffee, and 97.8% did not smoke. 34.6% had the family history of gynecological diseases.

Average age of first menstruation was 12.64, and 70.3% had a regular menstrual cycle. 45.6% had a menstrual cycle between 26-30 days, 78.1% had a menstrual period of 4-6 days, and 68.7% had normal blood loss. 69.2% used painkiller during menstruation, and 54.2% felt daily discomfort due to menstruation.

2.*Menstrual Attitude, Perimenstrual Discomfort, Coping Method*

Subject's average score of menstrual attitude was 4.09±.49, which is slightly higher than the midpoint. Degree of perimenstrual discomfort was 1.42±1.03 for premenstrual, 2.03±1.04 for menstrual, and .92±.97 intermenstrual period. Subject's coping method was

classified into 5 categories, which are problem-solving (.99±.55), seeking support (.84±.62), emotional coping (1.05±.75), avoiding problem (1.05±.73), and wishful thinking (1.25±.78). Aggressive coping style was .99±.55, and passive coping method was 1.12±.76 as shown in table 1.

Table 1. Attitude of Menstruation, Menstrual Discomfort, Coping Method of Subjects (n=182)

Variables		Item	Items M ±SD
Attitude of Menstruation		33	4.09±.49
	Menstruation as a Debilitating Event	12	4.52±.62
	Anticipation and Prediction of the Onset of Menstruation	6	4.04±.72
	Menstruation as a Natural Event	5	5.15±.91
	Denial of any Effect of Menstruation	5	2.49±1.13
	Menstruation as Bothersome Event	5	4.26±.72
Menstrual Discomfort		37	
	Premenstrual	37	1.42±1.03
	Menstrual	37	2.03±1.04
	Intermenstrual	37	0.92±.97
Coping Method		39	.98±.55
Coping Method Active	Problem-focused	15	.99±.55
	Social support seeking	6	.84±.62
Passive Coping Method	Emotional-focused	9	1.05±.75
	Avoidance coping	4	1.05±.73
	Wishful thinking	5	1.25±.78

3. *Personal Coping Method for Menstrual Discomfort*

When subjects were instructed to mark all coping methods that they use for menstrual discomfort, 69.2% (126) selected 'Take painkillers', 56.6% (103) selected 'Take a rest', and 40.7% (74) selected 'Warm the affected site'.

4.*Correlation of Menstrual Attitude, Menstrual Discomfort, and Coping Methods*

When subject's premenstrual discomfort was higher, menstrual discomfort was higher ($r=.695$, $p<.001$) and intermenstrual discomfort was higher as well ($r=.774$, $p<.001$), and when the menstrual discomfort was higher, intermenstrual discomfort was higher as well ($r=.583$, $p<.001$). Menstrual discomfort and coping method, although weak, show a significant positive correlation, and subject's coping method was higher when premenstrual discomfort was higher ($r=.224$, $p<.001$), menstrual discomfort was higher ($r=.227$, $p<.001$), and intermenstrual discomfort was higher ($r=.186$, $p<.05$) as shown in table 5.

5.*Motive for Considering Other Alternatives*

16.5% (n=30) of subjects have used tampons or menstrual cup as an alternative to sanitary napkin due to discomfort. The analysis of multiple responses on the motive to use alternatives to sanitary napkin included 'Use of sanitary napkin cause physical discomfort (itchiness, redness, swelling, rash, odor) by 28% (n=51), 'Harmful due to carcinogen' by 8% (n=14), and 'Makes noise when walking' by 1% (n=2).

Discussion

This study was conducted to provide positive menstrual experience and basic data for menstrual management education, which can contribute to menstrual discomfort management and decision of menstrual product by examining menstrual attitude, menstrual discomfort and coping methods of women in the 20s, verify the negative experience factors of menstrual, and study the motive and acquisition of alternatives to sanitary napkin.

Subject's menstrual attitude was 4.09±.49, which is slightly more negative than the average. Menstruation was a cumbersome phenomenon that affects daily life, and the factor that makes subject nervous because its start could not be predicted. Until now, menstruation was considered an inevitable phenomenon, but with increasing level of education in women and active social life, it was acknowledged as an inconvenient phenomenon. Therefore, individual's discomfort may

be examined to offer customized nursing intervention, so women can acknowledge menstruation positively, and if the problem arises from sanitary napkin, use of alternatives such as tampons or menstrual cup may be suggested as well.

54.2% of subjects experienced discomfort in daily life due to menstruation, 69.2% used painkillers due to menstruation, but premenstrual discomfort was 1.42±1.03, menstrual discomfort was 2.03±1.04, and intermenstrual discomfort was .92±.97, showing that the level of menstrual discomfort was not high. Also, in terms of coping method for menstrual discomfort, aggressive coping method was .99±.55, and passive coping method was 1.12±.76, which seems that subjects consider menstruation natural and the actual discomfort is not too severe that they take passive coping methods for menstrual discomfort. However, the attitude towards menstruation is negative, rather than the actual menstrual discomfort, that a transition education to convert the negative attitude positively is needed. Since negative attitude of menstruation may be reflected on menstrual symptoms, proper menstruation education and emotional support would be necessary.

In addition, whereas the number of students considering alternatives due to the discomfort caused by sanitary napkin was high, number of students actually using alternatives was low. Therefore, it is important to determine the actual reason why they do not use alternatives, and educate them on various alternatives, so they can manage menstrual discomfort.

In order to relieve menstrual discomfort, nurses need to understand the subject's characteristics and provide customized care. Also, rather than temporary methods, preventive coping methods must be provided in the education as well.

Conclusion

This research conducted to determine the menstrual attitude, perimenstrual discomfort and coping method of women in the 20s, their motive of selecting alternatives other than sanitary napkin, and personal coping method for menstrual discomfort.

Subjects' attitudes toward menstruation were negative, and they responded passive coping to menstrual discomfort. The most common way to deal with menstrual discomfort was to take painkillers. The higher the menstrual discomfort, the specific coping style was used.

Factors Affecting the Occurrence of Work-related Accidents during Night Shifts

Miyoung Lee[1], Eun-Hi Choi[2], Minkyoung Lee[3]

[1]Associate Professor, [2]Assistant Professor, [3]Ph.D. Student, College of Nursing, Eulji University, Republic of Korea

Abstract

Background/Objectives: To investigate the occurrence of work-related accidents during night shifts, the present study aimed to evaluate the status of night shifts and understand its impact on the occurrence of work-related accidents.

Methods/Statistical analysis: Data from the 5th Work Environment Survey conducted by the Institute of Occupational Safety and Health were used to analyze 4,424 night shift workers. The association between several variables and work-related accidents were analyzed using the chi-square test. Logistic regression analysis was used for all relevant variables to identify factors affecting the occurrence of work-related accidents.

Findings: The overall proportion of workers who experienced work-related accidents during their night shift was 2.2%. The factors affecting work-related accidents during the night shift were sleep disorder (OR = 2.221, $p = 0.001$), fatigue (OR = 4.932, $p < 0.001$), education (OR = 1.924, $p = 0.029$), exposure to emotional instability (OR = 1.898, $p = 0.021$), and noise (OR = 1.915, $p = 0.015$).

Improvements/Applications:It is necessary to consider various methods to reduce sleep disturbance and fatigue, in consideration of age and work environment, and improve education and awareness regarding work-related accidents during night shifts.

Keywords: *Night shift, Work-related accidents, Sleep disorder, Fatigue, Risk factors*

Introduction

In 2019, a worker in his 50's was discovered dead during his night shift in a manufacturing company[1]. It was difficult to identify the cause of his death because of his expertize, but the most viable hypothesis was that a primary accident resulted in a fall, which led to his death. This event triggered a debate on the safety of night workers.[6]

Night shifts cause changes in the natural human biorhythm and negatively affect human health. A prime example is sleep disturbance. As the night shift takes place during nighttime, at which time one should sleep, it induces fatigue, psychological fatigue, attention deficit, sensory defects, etc.[2,3]. Working despite health changes increases the likelihood of work-related errors, which may affect safety in the workplace[3,4]. This argument is in line with research findings on the higher risk of work-related accidents during night shifts. A series of recent work-related accidents in South Korea exemplify the increased frequency of accidents during night shifts.

In 2007, the International Agency for Research on Cancer classified night work in the "2A" causes ofcancer based on cohort studies[5]. Multiple studies asserted that night shifts affect not only physical conditions (e.g., cardiovascular diseases, digestive diseases, breast cancer) but also psychological conditions[6-8] because of an unstable biorhythm arising from insufficient sleep[9].

Unstable biorhythm caused by night work may deteriorate workers' health in terms of sleep and fatigue in hazardous working conditions, which entail extreme noise, machine handling, or height. The government

choieh@eulji.ac.kr

of South Korea has recognized this issue and has implemented special health checkups to detect and prevent health problems in night workers since 2014. Article 259 of the Enforcement Regulations of the Occupational Safety and Health Standard included night work for a preventative operation on health injuries caused by stress. Also, it has been reported that unstable working conditions increase the likelihood of accidents[10]. This study identifies the factors affecting work-related accidents in workers engaged in working at least one night in a month to provide baseline data for activities for night work in industrial sites. This study analyzes the fifth Working Environment Survey conducted by the Occupational Safety and Health Research Institute to survey the current status of night shifts and determine the impact of night shifts on work-related accidents in order to build safe working environments.

Method

Research subjects and data collection

With reference to the contents of the European Working Conditions Survey conducted every 4–5 years since 1991, the Working Environment Survey has been designed and conducted by the Occupational Safety and Health Research Institute since 2006 to investigate the working environments of all workers in the country to identify the levels of exposure to hazard by occupation, industry, and employment type. This study refers to the data of the fifth Working Environment Survey in 2017 and analyzed 4,424 respondents (96.5%) after eliminating 157 nonrespondents (3.4%) of 4,581 respondents who were engaged in at least 2 hours of night work (from 10 PM to 5 AM) per month.

Research tools

Night shifts

The respondents were asked to write down answers to the question "Do you work for at least 2 hours from 10 PM to 5 AM." Excluding the respondents who did not work at least one night shift in a month, the respondents who worked at least one night shift were classified into 1 day, 2–3 days, and 4 days or more.

General and occupational characteristics of the respondents

Age and sex of the respondents were counted as general characteristics, and occupational category, number of workers in the workplace, and professional training by the company were designated as occupational characteristics.

The four occupational categories were office jobs, sales and services, mechanics, and simple labor. The industries were classified into manufacturing, construction, and others. The number of workers was divided into three groups: up to 50 individuals, 50–300 individuals, and 300 individuals or more. Professional training by the company was indicated by "yes or no" to the question of whether the respondent received a training or education session provided by or at the expense of the company for skill improvement during the past 12 months.

Occupational hazards

The occupational hazards of the participants were noise, psychological insecurity, and exposure at three levels: none, ¼ of the working hours, and ½ of the working hours.

Health complications of subjects

The health complications of the subjects were sleep disturbance and systematic fatigue. Regarding sleep disturbance, questions were asked on difficulty in sleeping, repeated waking up during sleep, and extreme fatigue and exhaustion. "Daily" was given 5 points, whereas "none" was given 1 point. The total points of the three questions were 15. Any point of 8 or above meant "no" sleep disturbance, and points of 7 or below meant "yes" The respondents were asked to answer yes or no to the question about any presence of systematic fatigue during the last 12 months.

Accidents

The presence of past accidents was investigated. For the question "any presence of health problems such as injury (accident) in the last 12 months," the respondents were asked to answer either "yes" or "no."

Analytical methods

Data from the 5th Work Environment Survey conducted by the Institute of Occupational Safety and Health were used to analyze 4,424 night shift workers. The chi-square test was used to analyze the differences between several variables and work-related accidents. Logistic regression analysis was used for all relevant variables to identify factors affecting the occurrence

of work-related accidents. As a result of the Hosmer–Lemeshow logistic regression test, the probability of significance was set at p =0.482, and the model was considered appropriate.

Result and Discussion

[Table 1]summarizes the characteristics of the participants. Of the total evaluated population, male and female workers comprised 66.9% and 33.1%, respectively, and those under 39 years comprised 26.7%, those between 40–49 years, 23.1%, and those over 50 years, 50.2%.

It was found that 2.2% of night shift workers (99 individuals) experienced accidents during the night shift, which is higher compared with other workers who experienced accidents (1.6%). Night shifts increase the likelihood of accidents in all workers, including those working on weekends.

Work-related accidents were associated with age (χ^2 = 7.91, p = 0.019), noise exposure (χ^2 = 31.06, p<0.001), emotional instability exposure (χ^2 = 62.43, p<0.001), sleep disorders (χ^2= 34.14, p<0.001), fatigue (χ^2 = 70.27, p<0.001) and number of night shifts (χ^2 = 11.58, p = 0.003) in the [Table 2].

[Table 3] summarizes the factors affecting accidents during night shifts. Sleep disturbance and systematic fatigue were found to be significant factors. With sleep disturbance or systematic fatigue, the likelihood of accidents is 2.221 times (95% CI: 1.398–3.528) or 4.723 times (95% CI: 2.986–7.500) higher, respectively.

Discussion

If sleep disturbance occurs, the worker experiences mental and physical fatigue, attention deficit, and sensoryinsensitivity[2,3]. Continued sleep disturbance leads to increased fatigue, which results in systematic fatigue. Previous studies also reported that systematic fatigue reduces attention on the job and increases the likelihood of work-related errors to negatively affect safety in the workplace. Therefore, it is necessary to assign the workload and workers in a way to prevent continued fatigue in consideration of worker conditions (e.g., breaks).

With regard to accidents during working nights, 10% of the workers had an accident on the first day, 11.1% had an accident on the second day, and 78.8% of the workers experience an accident on the fourth day onward [Table2]. The longer the duration of the night shift, the more the sleep disturbance and fatigue increases. On the contrary, [Table 3] shows that the likelihood of accidents is 2.540-fold higher for 4 or more working nights in a month compared with that for 2–3 working nights in the same period. This result is noteworthy because all other variables are controlled. In other words, biorhythm is disrupted on the second working night, which increases sleep disturbance and systematic fatigue[11]. It is necessary to proactively manage sleep disturbance and systematic fatigue from the second working night onward.

The impact of the working environment is important in accidents during night shifts. [Table 3] shows that when exposure to noise continues for more than half of the total working hours, the likelihood of accidents increases 1.915-fold and when psychological insecurity continues for more than half of the total working hours,the likelihood increases 1.989-fold. These two figures are significant. If one continuously exposes to noise, discomfort and muscle tension increases, noise causes psychological insecurity as a major cause of accidents[12,13]. Psychological insecurity may be a result of hazardous working conditions, excessive workload, inappropriate intensity, or speed of the work. The likelihood of accidents increases if the worker is exposed to these conditions during the night shift.Various measures are needed to relieve psychological insecurity and reduce the likelihood of accident during night shifts, including reduction of hazards in the working environment, workload adjustment, and reduction in the work intensity.

Training has a significant impact on accidents during the night shift. Workers that did not receive any training had 1.974 times (95% CI: 1.070–3.459) higher likelihood of accidents compared with trained workers.

Table 2: Differences according to subject characteristics and work-related accidents occurring during the night shift

Variable		Category No	Work-related accidents Yes		χ^2	p
General characteristics	Sex	Male	2,890 (66.8)	68 (68.7)	0.15	.697

		Yes	1,032 (23.9)	19 (19.2)		

Cont... **Table 2: Differences according to subject characteristics and work-related accidents occurring during the night shift**

Risk factors	Noise	No	3343 (77.3)	59 (59.6)	31.06	<.001
		1/4	496 (11.5)	11 (11.1)		
		≥1/2	486 (11.2)	29 (29.3)		
	Exposure to emotional instability	No	3,374 (78.0)	60 (60.6)	62.43	<.001
		1/4	595 (13.8)	16 (16.2)		
		≥1/2	356 (8.2)	23 (23.2)		
Health problems	Sleep disorder	No	3,761 (87.0)	66 (66.7)	34.14	<.001
		Yes	564 (13.0)	33 (33.3)		
	Fatigue	No	2,918 (67.5)	27 (27.3)	70.27	<.001
		Yes	1,407 (32.5)	72 (72.7)		
Night shifts	Number of night shifts	1	156 (3.6)	10 (10.1)	11.58	.003
		2-3	441 (10.2)	11 (11.1)		
		≥4	3,728 (86.2)	78 (78.8)		

Productivity is high if the worker is familiar with the machine in a workplace handling unfamiliar machinery[14], and if training is conducted on any change in the working content, the workplace had fewer accidents[15]. Among the workers who experienced accidents, 80.0% of workers (80 individuals) did not receive any training on skill improvement within the organization, whereas 19.2% (19 individuals) received such training. Professional development training sessions are needed to further develop expertise and confidence and supplement inadequacy in order to prevent accidents.

Conclusion

This study was conducted to build a safe working environment by identifying the factors affecting accidents during night shifts. Age, technical training provided by the company, exposure to noise and psychological insecurity, sleep disturbance, systematic fatigue, and number of working nights were determined as factors affecting work-related accidents of night shift workers.

It is necessary to consider various methods to reduce sleep disturbance and fatigue, in consideration of age and work environment, and improve education and awareness regarding work-related accidents during night shifts.That is, when working at night, it is necessary to reduce the work intensity rather than the day work, and to reduce the work tension by focusing on simpler work. Sleeping during the night shift makes the worker more comfortable and reduces fatigue to prevent accidents. When working at night, and opportunities for training in safety, reduces inevitably reduced. Workers working at night require a number of measures to increase their educationalopportunities.

A Case Study on the Effects of Pelvic Exercise Using Virtual Reality on Balance and Gait of an Incomplete Spinal Cord Injury Patient

Je-Hyeok Lee[1], Beom-Cheol Jeong[1]

[1]Physical Therapist, Noble care Hospital, 858, Eonju-ro, Gangnam-gu, Seoul, Republic of Korea, 06017

Abstract

Background/Objectives: This study aimed to determine the effects of pelvic exercise using virtual reality on the balance and gait of an incomplete spinal cord injury patient.

Methods/Statistical analysis: A pelvic exercise program using virtual reality of three sessions a week, 30 minutes per session, for 12 weeks was run for a 62-year-old man diagnosed with incomplete spinal cord injury (ASIA D) caused by a fall. A balanced performance instrument (BT4) was used to evaluate balance and a wireless motion analyzer (iSEN) was used to evaluate gait; comparative analysis was made initially and 6 weeks and 12 weeks later.

Findings: Both the dynamic balance assessment and the static balance assessment showed positive changes for each time segment. The gait assessment found positive changes in each time segment.

Improvements/Applications: This study has confirmed that pelvic exercise using virtual reality is effective for improving balance and gait of an incomplete spinal cord injury patient.

Keywords: *Incomplete, SCI, Pelvic, Virtual reality, balance, gait*

Introduction

A person with spinal cord injury is defined as one whose trunk or extremities are completely or partly paralyzed because of spinal cord injury and whose sensorimotor functions have been lost or disabled [1]. The degree of functional loss depends on the location and degree of spinal cord injury. A universal type of complete spinal cord injury is to lose the sensorimotor functions completely under the injured spinal segment. An incomplete spinal cord injury refers to partial functional loss and is characterized by the existence of ascending and descending fiber for functional performance at other specific sites and of voluntary sensorimotor functions at Segment 3 or lower under the neurological level in relation to the lesion despite weakened sensorimotor functions [2,3]. Due to the difficulty with sensorimotor modulation, patients can suffer pain from nerve injury, urination and defecation function disorder and renal failure, difficulty in controlling paralyzed muscles and sensory loss under the injured site, and balance disorders[4].

For successful gait, spinal cord injury patients principally need to support the trunk with the lower extremities and have the ability to move the body in the intended direction, dynamic balance to control the body, and flexibility to move according to the environmental need and goal [5]. In addition, perfect timing, muscle strength, rhythm, and co-ordination learning are essential to gait, whose vital elements include movement of upper and lower extremities, position of feet, weight support, and pelvic movement [6]. The pelvis plays a crucial role in keeping the trunk upright and in restoring body balance in the case of instability [7].

With the recent development of computer game technology, there has been a tendency to make computer-using therapeutic task training programs and to facilitate

jbc0406@naver.com

therapy using such programs. Computer-using therapy allows people to fulfill specific tasks while enjoying the therapeutic process, be given somatosensory stimuli, and be more highly motivated to obtain treatment [8]. This may contribute to subsequent recovery from injury in the spinal cord through stimulation of the sensorimotor cortex along with intensive sensory pressure around the injured spinal cord. Also, it may serve as a good therapeutic tool by facilitating neuroplasticity of the injured spinal cord and reorganization the relevant neural circuit physiologically [9].

Therefore, this study aimed to determine the effects of pelvic exercise using virtual reality on balance and gait of an incomplete spinal cord injury patient.

Method

Table 1. Pelvic exercise with virtual reality

Order (time)	Detailed contents	Intensity
Warm-up(5min)	Upper and Lower limb, Trunk stretching

Cool-down(5min)	Upper and Lower limb, Trunk stretching	

The subject was a 62-year-old man with a height of 176 cm and a weight of 66 kg. He was diagnosed with incomplete spinal cord injury (ASIA D) because of compression fracture in the fifth and sixth cervical vertebrae as a result of a fall in December 2017. Muscle strength was graded as F+/F+ for the upper extremities and as F/F for the lower extremities, with no specific restrictions on the range of motion.

Intervention was provided in 3 sessions a week, 30 minutes per session, for a total of 12 weeks. He was given treatment as generally provided in hospital, including physical therapy and occupational therapy. In addition, he was provided with a pelvic exercise program using virtual reality. For the exercise program using virtual reality, a game of leaning the pelvis forward, backward, to the right, and to the left in a Valedo system was employed. The therapist assisted the progress of the game and his movements. If he felt uncomfortable, the training was discontinued. An identical test was performed by the same rater before and 6 weeks and 12 weeks after the 12-week intervention. The exercise program is presented in Table 1.

A balanced performance instrument (BT4; Hur Lab, Kkoarla, Finland), was used to assess the patient's balance. BT4 has a sampling rate of 100 Hz and has a strain gauge on each vertex of the square. To assist the patient with posture, the position of feet was marked on a rectangular platform, four sensors were used to decide on the center of pressure, and Smart-suit Balance software (ver.1.4) was used to measure and analyze balance in terms of postural sway with time. The test protocol of Romberg 30s was used to assess static balance with open and closed eyes alternatively. The position of feet was marked on the platform and each foot was placed on "V" 15 degrees outward. He kept standing upright while keeping his eyes to the front. C90 area refers to the area (mm2) of COP movement at the center of pressure, and trace length refers to the distance (mm) of COP movement; the better the static balance, the smaller the area and the shorter the distance of movement. The test protocol of Limits of Stability (LOS) was used to assess dynamic balance. It has the same position of feet as the static balance assessment. The subject was asked to stand upright with feet kept on the platform and then to lean forward, backward, to the right, and to the left for eight seconds in order to obtain the maximum range of motion. Principal measurements can be presented in the maximum degree; the better the dynamic balance, the larger the range of motion [10,11].

A wireless motion analyzer (iSEN, STT Systems, Spain, 2016) was used to measure gait competence. This analyzer is composed of a three-axis gyroscope working at the maximum sampling rate of 400 Hz and ±2000 deg/s, a three-axis low noise accelerometer working at the sampling rate of 400 Hz and ±16 g, a triaxial magnetometer with the range of motion of ±1300 μT, and an air pressure sensor with the range of 300-1100 hPa. The protocol for gait analysis was used to analyze his gait. A total of five sensors were used in this study and one sensor was attached to each of the pelvis (S1), the 1/2 area of right and left femur, and the 1/2 area of the tibia. The measurement items included gait time, gait speed, cadence, and step length.

To observe changes in balance and gait of an incomplete spinal cord injury patient, BT4 and iSEN were used initially and 6 weeks and 12 weeks later for comparative analysis.

Result and Discussion

1. Balance assessment

The changes in balance following pelvic exercise using virtual reality as found by BT4 are presented in Table 2. The exercise program improved both static and dynamic balance, which is consistent with findings that a four-week intervention with a virtual reality system in an imaging room improved functional static balance in 13 patients diagnosed with paraplegia caused by spinal cord injury at the thoracic level [12] and that a 12-session virtual reality game program significantly improved standing balance in 6 incomplete spinal cord injury patients [13]. Also, the results of this study are similar to those findings that Nintendo Wii game training was effective in controlling sitting balance of ASIA A thoracic cord injury patients [14]; that participating in virtual reality game training for about 30-40 minutes improved dynamic balance of thoracic cord injury patients in a sitting posture [15]; and that six-week visual bio-feedback simulation training significantly improved the stability index, postural control, and fall risk index in 7 ASIA C and D incomplete spinal cord injury patients [16]. This study is also consistent with those reports that game-based virtual reality treatment motivated patients and improved their postural dynamic balance [17] and that virtual reality training using visual feedback was effective in improving postural control through an improvement in weight shift [18]. Such consistency is probably because stimulation of the sensorimotor cortex along with intensive sensory input around the injured spinal cord through visual and auditory feedback of the patient with a virtual reality system is effective in improving balance by curing the injured spinal cord. Also application of such a program using virtual reality is useful for controlling posture and balance and improving motor skills, recovering from injured physical functions, enhancing the motions of daily living, and improving the quality of life through interaction in family or society [19,20].

Table 2. Comparison of changes in Balance

			0wk	6wk	12wk
LOS	Forward(˚)		3.49	4.75	6.18
	Rearward(˚)		3.68	3.94	5.02

		TL(mm)	742.1	528.59	492.41

LOS: Limit of stability, TL: Trace Length,
EO: Eye open, EC: Eye close

2. Gait assessment

The changes in gait following pelvic exercise using virtual reality as found by iSEN are presented in Table 3. This study found that gait time and speed, step length, and the gate rate were all improved. For incomplete spinal cord injury patients, there was a statistically significant increase in gait speed from 0.22 m/s before automatic gait training to 0.28 m/s after four-week training and to 0.31 m/s after eight-week training [6]. In a study on the effects of elastic resistance training on gait and balance of the elderly in an upper and lower extremity group and a lower extremity group [21], the training changed cadence and gait speed in both groups, with no inter-group difference. Several studies using elastic resistance exercise found that application of an exercise program significantly decreased TUG [22,23], which is consistent with the results of this study. There have been other reports also that are consistent with the results of this study. In one report, one-hour physical therapy using a weight supported treadmill with three incomplete spinal cord injury patients (thoracic, ASIA C and D) along with three-month treadmill gait training was effective in improving gait speed and gait endurance and in decreasing oxygen cost [24]. The treadmill gait training involved five sessions a week for 20 minutes a day (gradient 0%) and improved gait speed from 0.118 m/s to 0.318 m/s and gait endurance from 20.3 m/5min to 63.5 m/5min and decreased oxygen cost from 1.96 ml.kg-1'm-1 to 1.33 ml.kg-1'm-1. In another report, three-month treadmill gait training with three sessions a week for 1.5 hour a day (gradient 0%) along with 30% weight support and electric stimulation applied to muscles of the lower extremities to improve gait in nine chronic incomplete spinal cord injury patients improved over ground walking, increased gait speed and distance, and improved the lower extremity motor score from 15 to 18 [25]. As seen from the increased weight shift to the injured part in previous research [26], identical weight shift to both legs was enabled, contributing to movement of the legs.

Table 3. Comparison of changes in Gait

	0wk	6wk	12wk
Time(seconds)	24.150	22.850	21.920
Speed(m/s)	0.414	0.438	0.456
Step Length(m)	0.410	0.420	0.420
Cadence(step/min)	60.597	62.520	65.172

Conclusion

This study aimed to determine the effects of pelvic exercise using virtual reality on balance and gait of an incomplete spinal cord injury patient and suggest an efficient treatment method. The results of this study, the intervention improved both balance and gait of the patient, and it has been confirmed that pelvic exercise using virtual reality contributes to balance and gait of an incomplete spinal cord injury patient. Therefore, based on the results of this study, pelvic exercise using virtual reality could be suggested as an effective exercise method for improving balance and gait in patients with incomplete spinal cord injury. In future studies, comparative studies between subjects of various spinal cord injury levels and control groups should be secured.

Relationship between Water intake, Xerostomia, Halitosis, Stress and Salivary Cortisol in the Elderly

Hye-Young Joung[1], **Yeonim Choi**[2], **In-Hoo Jung**[3]

[1]Kyungdong University, Department of Nursing, Korea, [2]Songho University, Department of Biomedical Laboratory Sciences, Korea, [3]Kyungdong University, Department of Research & Business Foundation, Korea

Abstract

Background/Objectives: This study is a descriptive research conducted to identify the relationship between water intake, xerostomia, halitosis, stress and salivary cortisol in the elderly living in the community.

Methods/Statistical analysis: This study conducted on elderly people over 65 years old who live in the community. General characteristics were analyzed by frequency analysis and descriptive statistics. The data were analyzed using One-way ANOVA and t-test with the SPSS program. One-way ANOVA was used to determine the relationship between water intake, xerostomia, halitosis, stress and salivary cortisol. Independent t-test was used to determine the relationship between saliva cortisol and halitosis, stress.

Findings: The subjects were 21 males (42%) and 29 females (58%), the mean age was 75.3 years old. Among them, 13 (26%) were over 80 years old and 19 (38%) subjects have dentures.There were no statistically significant differences in water intake, xerostomia, halitosis, stress, and salivary cortisol. However, the relationship between salivary cortisol and halitosis and stress was found to be significant difference between salivary cortisol and halitosis.

Improvements/Applications: As a result of this study, we suggest to develop an intervention program to mitigates xerostomia in order to improve halitosis by stress factors in the elderly.

Keywords: *Elderly, Water Intake, Xerostomia, Halitosis, Salivary Cortisol*

Introduction

As life expectancy increases and the average life expectancy is extended due to the development of health technology and the improvement of the standard of living, the problem of the quality of life of old age is being emphasized. The life of elderly people in Korea is expressed as 'illness, 'economic difficulties' and 'solitude due to social isolation'. Korea's elderly population is over 14%, and overall attention and efforts are required for the elderly society[(1)]. Aging problems with aging arise from the physical, mental and psychosocial aspects.

Water is an indispensable material for life and health, an essential ingredient for maintaining blood volume, and plays an important role in nutrient supply and waste excretion in the body [(2)]. Healthy adults can control the body's water balance, but the elderly are difficult to control and are prone to dehydration. Elderly people are exposed to water deprivation more easily than other age groups due to aging of thirst, changes in body composition (increase in intracellular fluid ratio), and renal function[(2, 3).] Water accounts for about 55% of the elderly's weight, and hydration status is an important indicator of the health of the elderly[(4)]. Another cause of fluid intake is chronic disease, which is similar to the cause of decreased salivation.

Oral health, which is one of the important issues for the quality of life of the elderly, is directly related to whole-body health and is increasing interest. The most common oral problems in the elderly are decreased salivation, xerostomia and halitosis. The reduction of saliva secretion is the cause of oral problems in the

Corresponding Author:
Yeonim Choi,
yichoi@songho.ac.kr

elderly, and the saliva secretion of the elderly is about half of the adult daily saliva secretion, xerostomia and halitosis occurs. Chronic degenerative diseases of most elderly people take long-term medication and cause side effects such as decreased salivation and xerostomia. xerostomia is known as a major cause of halitosis[5, 6].

A previous study reported that there is a correlation between xerostomia and moisture knowledge and oral health quality of life[5]. In addition, about 70% of the elderly had less than 1,000mL of daily water intake, which was less than 1,800mL, which is the Korean standard of daily water intake.

In elderly, halitosis can negatively affect interpersonal relationship and social life, leading to stress[7, 8]. In particular oral tends to be neglected than other than other physical health care due to cost problems and discomfort in the dental process. Therefore, improving the oral health and improving the quality of life and relieving stress of the elderly are considered to be the tasks to be solved.

As described above, oral problems are linked to the quality of life for the elderly, and studies on saliva secretion, xerostomia and halitosis of the elderly are being conducted in Korea. Considering previous studies, salivary secretion in the elderly is associated with xerostomia and halitosis, but it is necessary to confirm the correlation between hydration status and xerostomia with physiological variables.It is also necessary to confirm the causal relationship between the willingness to drink water and knowledge about water in the elderly.

The purpose of this study is to identify the relationship between water intake, xerostomia, halitosis, and stress in the elderly, and to provide basic data on nursing interventions for the oral health of the elderly.

Method

This study is a cross-sectional narrative study conducted to identify common characteristics associated with water intake in elderly people living in the community and to determine the relationship between water intake and xerostomia, halitosis and stress and saliva cortisol.

This study was conducted on elderly people over 65 years old who live in the community. Subjects were selected who can communicate, understanding when reading or explaining questionnaires with no history of psychiatric diagnosis, and no doctor's diagnosis of water intake restrictions.The sample size of the study was 0.05 using the G * power program 3.1.6, and the effect size was 0.95 power of 0.95 power. The number of samples required was 45, but 56 were selected in consideration of the dropout rate.

The general characteristics consisted of information on the use of dentures to confirm gender, age and oral care.The question of water intake is, "How many glass of water you drink per day?" And what belongs to the water means bottled water, barley tea, corn tea, or cassia tora seed tea?The water intake standard was based on the liquid intake of sufficient water based on the Korean daily water intake standard suggested in 2015 Korean nutrient intake standard.The measurement of water intake was 1 glass = 200 mL, and both men and women used a sufficient daily intake of 1,000 mL[9]. The relationship with the variables was identified by dividing into three groups according to water intake. Group 1 consisted of 2 glasses or less, less than 50% of the daily intake criteria, group 2 consisted of 3-4 glasses, and group 3 consisted of 5 glasses or more, which satisfies daily intake.

For xerostomia, a tool was used, referring to questionnaires of Fox and Torres([10]).The instrument composition consists of 7 questions about xerostomia, 3 questions about xerostomia, and 10 questions. The higher the score, the higher the subjective xerostomia symptoms. In this study, Cronbach 's $\alpha = .75$.

For the measurement of stress, a tool which was developed, based on FILE(family Inventor of life and changes) was used[10]. The instrument composition consists of 22 items of stress measurement, 22 items of measure measures, and 44 items. The higher the score, the higher the subjective stress symptom.

To check the changes in stress hormones due to water intake, take a salivary sample in a sterilized tube at 8-10 am with fasting state for 8 hours. The collected sample was stored in -70 ℃ deep freezer, the supernatant was used after centrifugation for 15 minutes at 1,500g. Cortisol concentrations were measured using a salivary cortisol enzyme immunoassay kit (Salimetrics, MI, USA). Cortisol concentration in saliva was measured using a standard curve according to the manufacturer's instructions.

The data was collected after approval of the institutional bioethics committee of the researcher's university (approval number: 1041455-201806-HR-001-

01). The recruitment visited the local senior citizens' and health clinic, cooperated with the subjects, explained the purpose of the research and the progress of the research. The data collection period is from July 1 to August 15, 2018, and the subjects were visited and explained that they can withdraw the data at any time if they do not want, including data collection procedures, test items, inconveniences that may occur during blood collection. The questionnaire was asked to fill out the questionnaire on its own, and in case it was difficult to read or difficult to write, the researcher and the participating researchers assisted in reading and writing it for them. They were trained on how to use and precautions, and how to operate the equipment.

Collected data were analyzed using frequency analysis and descriptive statistics to determine the percentage, mean, and standard deviation of the general characteristics of subjects using SPSS / WIN 19.0 Program.The relationship between saliva cortisol, halitosis and stress was analyzed by independent t-test. To determine the relationship between halitosis, stress and salivary cortisol among three groups with different water intake, one-way ANOVA was used and sheffe test was performed by posttest. Reliability test of the tool was analyzed by Cronbach 's α.

Result and Discussion

1.General characteristics

[Table 1] shows the general characteristics of this study. The subjects were 21 males (42%) and 29 females (58%), the mean age was 75.3 years old. Among them, 13 (26%) were over 80 years old and 19 (38%) were dentures.

Table 1: General characteristics(N=50)

Variables	**Categories**	**n(%)**	**M(SD)**
Gender	Male	21(42.0)	-
	Female	29(58.0)	
Age	60~69	9(18.0)	75.3 (5.97)
	70~79	28(56.0)	
	≥ 80	13(26.0)	
Dentures	Y	19(38.0)	-
	N	31(62.0)	
Water intake (1 glass =200mL)	≤ 2 glasses	13(26.0)	3.6 (1.65)
	3~4 glasses	22(44.0)	
	5~6 glasses	12(24.0)	
	≥ 7 glasses	3(6.0)	

2. The level of xerostomia, halitosis

[Table 2] shows the results for xerostomia,average halitosis, peak and trough levels. Xerostomia was relatively low with an average of 3.1 (± 2.55) out of 10. Ten points of respondents who answered that they had all symptoms of xerostomia were 2%, and a score of 0 who answered that they had no symptoms of xerostomia was 16%.

Table 2. The level of xerostomia, halitosis (N=50)

Categories	Total score	M(SD)	Max(%)	Min(%)
Xerostomia	10	3.10(2.55)	10(2.0)	0(16)
Halitosis	-	55.82(17.60)	96(2)	14(2)

3. Difference in xerostomia, halitosis, stress and salivary cortisol between water intake of 3 groups

[Table 3] shows the results for xerostomia, halitosis, stress and salivary cortisol are shown in. The relationship between water intake, xerostomia, halitosis, stress and salivary cortisol was not statistically significant.

Table 3. Difference in xerostomia, halitosis, stress and salivary cortisol between water intake of 3 groups (N=50)

Categories	F	*p*
Xerostomia	1.61	.210
Halitosis	.320	.728
Stress	.176	.839
Salivary cortisol	2.30	.111

※ Group1: ≤3 glasses, Group2: ≥ 4 glasses, Group3: ≥ 5 glasses

4. Relationship between salivary cortisol and halitosis, stress

Cortisol hormone associated with stress is a glucocorticoid secreted by the adrenal cortex. [Table 4] shows the correlation between the cortisol hormone concentrations detected in saliva and halitosis and stress.There was a statistically significant difference between saliva cortisol hormone and halitosis (t = -2.06, p = .045), and there was no statistically significant difference between saliva cortisol hormone and stress (t = .15, p = .878). In other words, it was analyzed that the perception of stress and the physiological indicators of stress coincide, so that halitosis affects the stress of the elderly.

Table 4: Relationship between Salivary cortisol and Halitosis, Stress (N=50)

Categories	Halitosis		Stress	
	t	p	t	p
Salivary cortisol	-2.06	.045	.15	.878

Discussion

Water is a major component of more than 60% of the body and is recommended for all ages by setting a certain amount of water to be consumed per day. Maintaining the body's hydration status with proper water intake is essential for physiological function, and dehydration due to this lack of water has been reported to affect various cognitive impairments in the elderly[2].

The purpose of this study was to investigate the degree of water intake and to determine the relationship between halitosis, xerostomia, stress and stress hormones in the elderly living in the community. Seventy percent of the subject drink less than four glasses per day (800 mL), and 26% of them drink less than two glasses (400 mL). This is similar to the results of the research on the elderly of the community in previous studies, and it is not satisfied with the Korean nutrition intake standard. Therefore, measures to correct this should be prepared [11]. The average degree of halitosis was 55.82, which was slightly higher than the normal range, showing similar results to previous studies[5, 12].

The results showed that halitosis was not enough to identify the direct causal relationship between the effects of water intake on halitosis, xerostomia and stress.Preliminary findings suggest that a person with halitosis may have mental stress because he or she is concerned that the other person will be offended. It is also suggested that it should be considered as a social problem but not just a personal problem, because it can interfere with normal interpersonal relationships and

social life[5].

Conclusion

The aging of the population, one of the existing problems in our country, is a task to be solved together in the social aspect, not the efforts of individuals. As the life of the elderly grows longer, various systems are being prepared along with the interest in the quality of life of the elderly. Among various studies related to the healthy life of the elderly, there are also studies related to halitosis.

Halitosis symptoms are considered important because they can have a detrimental effect on the physical and mental health of an individual and can affect various personal and social problems including interpersonal relationships. Current studies have regarded variables such as stress as the cause of halitosis and only measured the relationship between halitosis and stress and xerostomia.

In this study, it was difficult to identify the significant relationship between water intake, halitosis, xerostomia, stress and salivary cortisol hormone in the elderly. However, salivary cortisol hormone, a physiological variable, was compared to confirm that halitosis is one of the stressors in the elderly. This study was the first to determine the correlation with halitosis by measuring the salivary cortisol hormone. As a result, it was confirmed that halitosis could cause an increase in stress hormone.

Based on these results, we suggest the development of an intervention program that can alleviate xerostomia, which is a cause of halitosis, in order to improve oral health affecting the quality of life of the elderly.

The Effects of Applying Havruta Learning Method in Nursing Classes

Eunae Burm[1], Ae-Sook Choi[1], Jeung-Ah Gu[1], Hyun-Gyung Kim[1], Eunju Lee[1], Oonhee Yee[1]

[1]Department of Nursing, Baekseok Culture University, Korea

Abstract

Background/Objectives: The purpose of this study was to investigate the changes in core competencies by applying the self - directed Havruta learning method to nursing students.

Methods/Statistical analysis: We applied the Havruta learning method in the major subjects of 275 students in nursing college.After examining the general characteristics of the subjects, the author surveyed their debating skills, immersion level into learning and self-directed learning skills in advance and after the research. Then, the author analyzed the collected data in terms of frequency, percentage, and paired T-test by using the R program.

Findings: Compared to the prior state to the Havruta learning, third graders after the Havruta learning have seen an increase in the average value of critical thinking ability in the discussion ability evaluation.(p = 0.024). In the assessment of learning immersion level, the average values of clear goals, concrete feedback, action-aware matching, task concentration, control, loss of self-consciousness, modified time sense, and self-purpose experience have all increased.(p<0.05). In self-directed ability assessment, the average values of target setting, resource identification for learning, and basic self-management skills have all increased. (p <0.05). This suggests that Havruta learning method can improve critical thinking skills and nursing knowledge, skills, clinical treatment skills and problem solving skills to solve the target nursing problem, thus influencing the enhancement of knowledge, skills and attitudes required at the nursing field site.

Improvements/Applications: We suggest that the future study will be based on this research that adopts the Havruta-style class model in a wider variety of subjects.

Keywords: *Havruta learning, nursing, critical thinking ability, discussion ability, Self-directed Learning Ability, problem solving skill*

Introduction

At the heart of a successful class would be the class with learners. To this end, it requires, among other things, active participation by learners in classes[1].But when you look at actual college classes in Korea, there is still a lack of participation and interaction amonglearners[2]. The reason why various teaching methods are needed along with teaching methods is that today's society emphasizes diversity, and thus needs teaching methods that can promote diverse needs and creativity rather than teaching methods, which are necessary for a student to become a leader, not a passive target in class and a teacher to act as a facilitator[3].

The goal of the recent nursing education is to train competent nurses in terms of knowledge, skills and attitudes demanded in the field of nursing practice[4].The Korean Accreditation Board of Nursing Educationoffers seven key competences for nursing students: integrated application of nursing knowledge and manual skills, cooperative communication with professional workers, critical thinking ability to solve nursing problems, and leadership ability[4]. However, working-level nursing staff assess the lack of nursing skills in the new caregiver's nursing knowledge, skills, clinical treatment skills and problem-solving skills[5]. The traditional teaching methods used mainly in nursing education

Corresponding author:
Ae-Sook Choi,
aschoi@bscu.ac.kr

impose limitationon training nurses with basic work skills required in nursing field practice[6].7

In order to deal with these nursing site problems and changes in the educational paradigm, a self-directed and proactive teaching learning strategy, differentiated from the traditional nursing education method, should be introduced and transformed[7].

As a result of systematic consideration of the self-directed learning effects applied to health care personnel, self-directed learning has been reported as an efficient teaching method from the aspects of improving attitudes as well as knowledge and skills compared to traditionalteaching methods[8].

Havruta learning is a student activity-centered education method that develops the power to variously think, question, and debate in pairs as a method of education[3].Havruta learning is a self-directed learning method in which techniques of collaborative learning are used in the field through training as a way to improve both personality and academic ability[3]. In that respect, Havrutahas emerged as one of the most efficient methods of personality-education-oriented cooperation classes[9]. Because of the countless mutual questions, positive interactions through questions can occur actively at school sites[9].The purpose of Havruta is to develop the power of thought, thinking skills to describe it briefly. Rather than memorizing and letting students know, Havruta aims to stimulate the student's brain to improve his/her ability to think and develop insight and critical thinking skills[7].

The implications derived from these articles are as follows:First, the Havruta class is applied to a variety of subjects and is used in particular as a learning method that causes interaction of students, such as discussion and debate activities. However, the method has not been applied to a nursing department, so a study of the Havruta learning method is needed to suit the characteristics of nursingteaching courses.

Second, in order to encourage students to ask questions and debate, the professor should prepare carefully in selecting content,findingexploration questions, and preparing materials. This is because the professor's preparation can determine the success or failure of the Havruta class. Third, through the process of communication, listening and persuasion, students should be encouraged to take self-directed learning. Since the process of discussing the created meanings of each other is important, the professorsshould make students' own learning occur.Fourth, in order to create a class environment in which questions are actively asked, the lecturers not only provide studentswith opportunities for practice to familiarize themselves with discussions and exchange of opinions, but also create an acceptable atmosphere.

This study aims to lay the foundation for the practice of'active and cooperative learningclass'for learners at the class site by utilizing the Havruta learning method. Specifically, the author intends to apply the Havruta learning method at the classroom site to the nursing class in order to examine the changes in the nursing student's core competency.

Method

This study adopted one group pretest-posttest design and a quasi-experimental study to identify the changes in core competences before and after the application of the Havruta learning method of nursing students.The participants were second and third graders of a four-year nursing college located in C city, Chungcheongnam-do, South Korea who agreed to participate in the research in writing. During the data collection process, we explained the purpose of the research to the research subjects ethically, promised anonymity and confidentiality, and notified themthat they would not be requested to participate in the research if they did not want to.

The appliedcourse of the second-grade students in the Havruta class was 'health assessment and practice', and thethird-grade courses were 'regional nursing', 'adult nursing', 'nursing management' and 'child nursing'. Among thevarious models of the Havruta class, we applied the 'friend teaching Havruta' class. At the end of the professor's lecture, the students conducted a discussion in pairs and prepared a study activity log to teach each other by organizingunclear questions, making questions, and explaining the contents, sharing group questions and finding answers.

Through the questionnaire, the author investigated the general characteristics of the subjects and looked into theirdebating skills, learning immersion level, and self-directed learning abilities before and after the research.

The discussion ability test tool developed by Park[10] was modified and complemented by Jung[11], consisting of four questions from the 'communication skills'

element, three questions from the 'critical thinking ability' element,two questions from the 'predictive ability' element, and two questions from the 'listening ability' element (a total of 11 questions). The higher the score on the 5-point Likert scale when measuring debating skills, the higher the debate ability.

A measurement tool developed by Kim et al[12] was used for learning immersion. The tool was comprised of a total of 29 questions in nine sub-sections: Challenges-technical balance, clear objectives, specific feedback,behavior-perception consistency, task concentration, control sensation, self-conscious loss, transformed time sensation, self-purpose experience, etc. As a five-point Likert scale, the higher the score, the higher the learning immersion ability.

Measurement tools that incorporate cognitive, affective and behavioral characteristics developed by Lee et al[13].was used. Measuring instruments were comprised of a total of 21 questions in seven sub-categories: learningcourse management, learning result assessment, learning motivation, self-concept, persistence of learning activities,learning resource management, and the creation of learning environment. As a five-point Likert scale, the higher the score, the higher the self-directed learning ability.

The author analyzed the general characteristics of age, sex, etc. of the study subjects, and compared and analyzed the differences in terms of the discussion ability of each school year that was measured by the Havruta learningmethod, in addition to learning immersion level and self-directed learning ability that were assessed by the Paired T-test. We analyzed the statistical analysis of the study by using R(R version 3.5.1), with a significant level of 0.05.

Result and Discussion

1. General characteristics of the subjects

The general characteristics of the subjects are as shown in Table 1. Those aged between 20 and 25 accounted for 83.6%, 9.1% for male students and 90.9% for female students. There were 137 second graders, 138 third graders participated, and 60.4% of the students felt that the cause of their stresswas related to school record.

Table1. General characteristics of subjects

Variables	Categories	N(%)
Age (years)	< 20	24(8.7)
	20~25	230(83.6)
	26~30	10(3.6)
	> 30	11(4.0)
Gender	Male	25(9.1)
	Female	250(90.9)
School grade	2	137(49.8)
	3	138(50.2)
Religion	No	142(51.6)
	Yes	133(48.4)
School hours/minute	<30	126(45.8)
	30-59	38(13.8)
	60-120	59(21.5)
	>120	51(18.6)
Allowance (10,000 KRW/month)	No	43(15.6)
	<10	15(5.5)
	10-20	34(12.4)
	21-30	74(26.9)
	> 30	109(39.6)
Causes of stress	School record	166(60.4)
	School class	62(22.6)
	Career or employment	32(11.6)
	Family	11(4.0)

Numbers do not always show the same total because of missing values.

2.Discussionability

Before and after the Havruta learning, we looked at communication skills, critical thinking skills, predictive ability, and listening skills, which are sub-factors of measuring discussion ability[Table 2] to assess each grader's discussion ability. The sophomore student was statistically insignificant, although the average value of critical thinking and listening skills increased after learning compared to prior to the Havruta learning, and

the third grader showedstatistically significant as the average value of critical thinking ability increased.

3.Learning immersion level

In order to evaluate the learning immersion levelamong each grader before and after learning Havruta, the author explored challenge-technology balance, clear goals,specific feedback, action-perception matching, task concentration, sense of control, loss of self-consciousness, transformed time sense, and self-purpose experience [Table 3]. Compared to prior to the Havruta learning, the third-grade studentsshowed statistically significant, with increased average values of clear goals, concrete feedback, behavioral-intelligence matching, task concentration, sense of control, loss of self-consciousness, changed time sense, and self-purpose experience.

4.Self-directed Learning Ability

In order to evaluate the self-directed learning ability of each grader before and after Havruta learning, we explored the sub-factors of self-directed learning measurement: learning drive diagnosis, goal setting, resource identification for learning, basic self-management ability, choice of learning strategy, persistence of learning execution, efforts on outcomes and self-reflection[Table 4]. Compared to the prior state to the Havruta learning, third-grader showed the increased average value of basic self-management skills, setting goals, and identifying resources for learning, and they were statistically significant.

Discussion

The purpose of this study is to establish the foundation for realizing the 'active and cooperative learning' of learners at the class site, when there is no previous study applied to major courses in nursing college. As a result, we confirmed that there has been a positive change in the communication skills and critical thinking of nursing students through cooperative learning activities.Through dialogue, the Havruta learning method, in which students participate directly in a class, can foster not only the above effects but also an active sense of community. With this learning method, we can expect to cultivate the talent needed for a new society as a necessary capacity for nursing personnel. The author hopes that through this study, the university's discipline will be changed a little bit. In the classroom, there should be a lot of passion for students to learn on their own while the teacher becomes an inspiring educator, not just providing knowledge, and we dream that students can discover their visions in the teachers' lectures. Based on this study, we hope that future research will continue to attempt the Havruta-style class model in more diverse subjects.

Conclusion

Suggestions for follow-up research are as follows:

First, the continuous development of the Havruta class model should be made in various subjects. AppropriateHavruta classes applied to Korean college students who have grown up in the absence of a voluntary and creative debate culture cannot be developed just for one or two class application. Researchers will need to develop a more advanced class model by modifying and supplementing it based on the class model that they have tried in this study.Second, the Havruta learning method requires learners' active attention and intervention, which will ask professors to strengthen their expertise through various training or learning community activities for the efficient classes.

Nurses' Perception of Nursing Malpractice Liability Insurance

Mi Joon Lee[1], **Mi Yeon Lee**[2], **Hye Won Min**[3]

[1]Innovation Healthcare Center, [2]Division of Biostatistics, [3]Division of Medical Information, Kangbuk Samsung Hospital, Seoul, Republic of Korea

Abstract

Background/Objectives: Hospital nurses' increased responsibility in exercising advanced nursing skills also brought about greater risk of error and liability. However, Korea still has no systems such as liability insurance to protect nurses from such risks. This study estimates nurses' perceptions of nursing care liability insurance and their willingness to pay (WTP) for nursing malpractice insurance.

Methods/Statistical analysis: This study estimates the WTP of 156 nurses from six hospitals in Seoul and the metropolitan area using the contingent valuation method with a regression model with the double-bounded dichotomous choice method.

Findings: The analysis results show that nurses' perceptions of the insurance ($p<0.037$) had a significant impact on their WTP the insurance premium. In other words, the higher the perceptions about the insurance (B=6,534.067) were, the higher the insurance premium to they were willing to pay. Participants who perceived that nursing malpractice insurance was necessary had a WTP of 22.12 USD as the insurance premium.

Improvements/Applications: The results pertaining to insurance premiums in this study can be utilized as baseline data to develop a nursing malpractice liability insurance system in Korea, and for the ultimate calculation of rational insurance premiums. This study provides basic data on the needs for nursing care liability insurance in Korea.

Keywords: *Insurance, negligence, malpractice,nurses,perception*

Introduction

Recently, the risk of malpractices in the nursing field in Korea has increased, setting precedents for assigning civil and criminal responsibilities. Nursing malpractice refers to damages caused to patients because of nurses not implementing the necessary due diligence practices in their daily work routines while providing patients with nursing care[1, 2]. Accidents due to nurses' negligence are very similar in nature to other medical accidents. Nurses' lack of knowledge and skills, carelessness, disregard for nursing ethics, and improper management cause such negligence. The Supreme Court of South Korea, too, applies a balanced standard theory in this regard[3]. The negligence is defined as a wrongdoing caused by irrational and careless attitudes, while a mistake is a special form of negligence, wherein a trained/educated expert violates the standards. To charge a nurse with the responsibility for an illegal act, the said nurse should have been in charge of implementing a nursing task or duty according to the nursing standards, damage should have occurred following the violation of that particular duty, and there should causality between the violation and damage[4]. An analysis of the precedents judged by the Supreme Court of Korea[5] and listed on the Comprehensive Legal Information Homepage shows that there were eight cases of nursing malpractice as per the Korea Nurse Practice Act for which casual relationships between negligence and damage were established.

Legally, nursing malpractice is a default on an obligation or an illegal act violating a treatment contract[6]. Therefore, nursing malpractice is filed as a damage claim suit against an illegal act or default on a

Corresponding Author :

roybrain2@naver.com

medical obligation. Damage caused by the negligence of medical personnel during a medical act is called a nursing malpractice liability. This responsibility is essentially a civil liability, entailing legal responsibility for damage to another person's body or property by intention or negligence, and the liabilities for economic losses/damage include pecuniary damage, non-pecuniary damage, and other expenses[7].

In the early 2000, South Korea established a physicians' professional liability insurance system after reviewing similar systems of countries like the United States[8]. Recently, nurses have been recognized as having a higher risk of committing medical accidents owing to the increase in the number of tasks allotted to them and the risks inherent in these tasks. However, Korea has not developed a system for nursing malpractice liability insurance as yet. Doctors and nurses perform mutually cooperative tasks and the operational system, though divided, tends to be generalized. Thus, it is necessary to develop a reasonable negligence insurance system that applies specifically to nurses and excludes doctors[9].

Insurance is a reasonable and realistic method to prevent disputes or legal suits resulting from mistakes committed by professionals in the medical field. The concept of Willingness to Pay (WTP) has long been adopted as an analytical tool to find the maximum monetary value an individual is willing to pay to attain a good or avoid an undesirable outcome[10]. The contingent valuation method helps researchers to present a hypothetical scenario for a specific service to research subjects. The results of the contingent valuation method are used to estimate the WTP for that service[11]. Thus, it is necessary to check Korean nurses' WTP for nursing malpractice liability insurance as part of an overall nursing malpractice risk management plan. We propose to do the same using the contingent valuation method.

In this study, nursing malpractice liability insurance is a system in which an insurance company guarantees liabilities for damages to be borne when a nurse's work causes harm to a patient's body and/or property[12]. Operationally, nursing malpractice liability insurance refers to a type of professional indemnity liability insurance in which an insurance company financially compensates patients for civil and criminal liabilities due to a nursing malpractice that occurred in the process of nursing services provided to patients[13].

Method

We designed a survey in line with the contingent valuation method to estimate WTP and the premium for the nursing malpractice liability insurance. In doing so, we provide baseline data useful toward developing such a system. The contingent valuation method involves quantitative research to assess WTP and associated cost/payment by setting up a hypothetical scenario.

While selecting the subjects, we referred to Cohen[14]. Using the two-tailed test, 132 subjects were drawn with the following characteristics: moderate effect size=0.5, power=0.8, and type 1 error=0.05. Considering an elimination rate of 20%, the final sample number comprised 158 persons.

Before conducting the study, the ethical review was completed by obtaining the approval of the Institutional Review Board (IRB) at Hanyang University (HY-14-07-12). All participants were informed of the fact that they could exercise their free will and withdraw from the study at any time. They were requested to sign a form confirming their voluntary participation in the research. One copy was kept by the research participant, and the other, by the researchers.

Trained interviewers conducted face-to-face surveys with 156 nurses working in Seoul and the metropolitan area. The purposive sampling method was used with non-probability sampling. The survey was conducted for 30 days from January 10 to February 10, 2015. This study included 78 nurses in 3 hospitals providing comprehensive nursing services (referred to as "total nursing care service" by Korea Nursing Association) and 78 nurses at 3 other hospitals not providing comprehensive nursing services (26 persons were interviewed at each medical institution).

Notably, checking participants' indirect and direct nursing malpractice experiences allowed this study to assess the impacts of these nursing malpractice experiences on WTP and the premium amount for the nursing malpractice liability insurance. Before asking their WTP for the nursing malpractice liability insurance,separate descriptions were added to help the nurses understand what constitutes nursing malpractice. One of the questions in the survey doubled the annual coverage of the nursing malpractice liability insurance and suggested the maximum amount the respondents could pay as the premium. The final credibility assessment of this tool for the nursing malpractice

liability insurance was determined using Cronbach's α (the value was 0.869).

The premium for nursing malpractice liability insurance depends on the malpractice experience. Thus, various factors affect WTP. Using SPSS 18, we conduct a regression analysis of WTP according to nurses' direct experience with malpractice[15]. We also conduct a logistic regression analysis using dummy variables.

Result

1. Subjects' sociodemographic characteristics

[Table 1] presents the general sociodemographic characteristics of the participants in this study. None of the nurses reported serious health issues (i.e., none of them selected "very unhealthy"). There was no significant difference in sociodemographic characteristics between comprehensive hospitals providing comprehensive nursing service and the non-comprehensive hospitals which do not provide comprehensive nursing service ($p>0.05$).

2.Logistic regression analysis of nurses' perception of nursing malpractice insurance

As [Table 2] shows, the demand for the necessity of a nursing malpractice liability insurance system was most affected by the position (1.303), with nurses at a higher position expressing a demand for such a system that is 3.7 times (exp B) higher than those at a lower position. The type of education level (-0.075), monthly income (0.021), and subjective health status (-0.055) did not affect nurses' demand for a nursing malpractice liability insurance system.

Table 2. The Factors affecting nurses' decision about the necessity of nursing malpractice liability insurance

Independent variable	**B**	**Standard error**	**p**	**Odds Ratio**	**95% Confidence interval**
Constant	0.375	1.217	0.739	1.455	
Implementation of comprehensive nursing service	1.139	0.364	0.002*	3.124	1.531-6.374

*$p<0.05$.

3. Contingent valuation and willingness to pay for nursing malpractice insurance

A positive answer ("Yes") means that the scheme is perceived to be more useful to respondents who want to subscribe to it by paying a certain prescribed amount compared to those who do not wish the same. In liability insurance, the premium to be paid is unilaterally determined by the insurance company, and the market price formed in a fully competitive market cannot be observed[16]. The nurses' willingness to pay premium toward the nursing malpractice liability insurance was checked as seen in [Figure 1]. First, the nurses were offered a sum of 20,000 won as a monthly premium. Those who responded that they were willing to pay were then asked if they would accept 40,000 won as the premium amount. Nurses who indicated their unwillingness to pay the hypothetical premium of 20,000 won were asked if they would agree to pay 10,000 won instead.

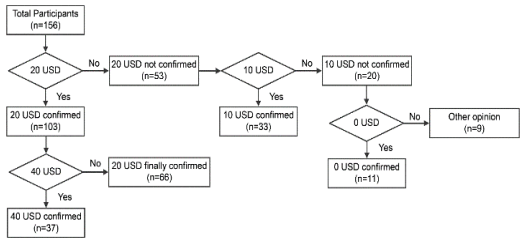

Figure 1. Interview scheme for the contingent valuation method

The amount offered the second time is twice that offered the first time if the response to the latter is "Yes," and half of the first offered amount if it is "No."

WTP was estimated with a regression model coupled with the double-bounded dichotomous choice method. The estimation was conducted after employing dummy variables. The results of the analysis of respondents' perceptions about nursing malpractice liability insurance [Table 3] show that nurses' perception about the insurance have a significant impact ($p<0.037$) on the premium payment; the more positive the perceptions about the system (B=6,534.067), the higher the liability insurance premium. Moreover, the explanation ability of the nursing malpractice liability insurance premium payment is 2%.

We consider the dummy regression model . Here, , is the estimated value of the insurance premium, while Xi refers to perceptions about the need for nursing malpractice liability insurance. The coefficient of regression is statistically significant at 0.05, and thus, the following formulae can be obtained by estimating the amount of nursing liability.

Perception about the nursing malpractice liability (necessary):

Perception about the nursing malpractice liability (unnecessary):

Therefore, the participants who perceived the necessity of insurance were willing to pay 22.12 USD as the premium, while those who perceived that it would be unnecessary reported a WTP of 15.59 USD.

Table 3. Estimation results of WTP using a regression model coupled with the double-bounded dichotomous choice method

Classification	*B*	Standard error	β	*t*	*p*
Constant	15,588.235	2,934.414		5.312	<0.001*
Perception about (need for) nursing malpractice liability insurance	6,534.067	3,108.682	0.167	2.102	0.037*

Adj. R^2=0.028, F=4.418 ($p<0.05$)
WTP: Willingness to pay.
*$p<0.05$.

Discussion

This study assessed nurses' perception and WTP with regard to nursing malpractices, which may occur in the process of caring for patients, through a nursing malpractice liability insurance system. Hanemann et al.[16] found that twice as many subjects indicated their willingness to subscribe to such a system compared to those who did not. This finding agrees with the result of this study; 89.1% of all nurses responded that a nursing malpractice liability insurance system is needed, and the necessity and intention to join were higher than the corresponding values estimated by the preceding studies[13, 16]. Our result of a logical regression analysis conducted to identify the factors affecting the perceptions regarding the need for the nursing malpractice insurance system indicate that the provision of comprehensive nursing services affects the need for such a system ($p<0.002$). Similarly, we believe that nurses' understanding about nursing malpractice liability insurance has increased, changing their perceptions. The results of this study with regard to reason for establishing a nursing malpractice liability insurance system, the coverage provided by such insurance, and the subjects who would bear the costs of the nursing malpractice liability insurance are similar to those of Kim et al.[13]. The results also point to changes in practice. Previously, the division of labour was vertical; doctors were primarily responsible for medical practices, whereas division of labour at hospitals has now become more horizontal, wherein nurses share certain medical responsibilities with the doctors. This increases their anxiety and can potentially lead to more disputes and malpractice cases. With the expansion of the comprehensive nursing service, nurses' moral responsibility and ethical awareness as professionals have increased. They look forward to the introduction of nursing malpractice liability insurance as a formal policy despite the fact that the scope of their duties and responsibilities are yet to be legally specified. Unfortunately, the issue of accountability remains unresolved as the demarcation of the roles of all team members is unclear.

Professional liability insurance covers attorneys' fees, settlement money, and compensation money, and there have been calls to extend this system to the nursing malpractice field[17]. Recently, infections are leading to frequent safety accidents in clinical practice. In this environment, the need for nursing care liability insurance, which can protect nurses from their mistakes, is increasing. However, there is no nursing liability

insurance to protect nurses in Korea. We believe that this study will help establish a strategy to protect both nurses and patients in the event of a mistake, and reduce nursing malpractice risk through its analysis of nurses' perceptions of nursing malpractice liability insurance.

Conclusion

This study was conducted to estimate hospital nurses' WTP toward nursing malpractice liability insurance. Data from focus group interviews and a survey questionnaire were used to estimate the nurses' WTP as well as the premium amount for the same. The findings also indicated that participants who responded that nursing malpractice liability insurance is necessary were willing to pay 22,122 won as insurance premium, while those who responded otherwise were willing to pay 15,588 won. Notably, the nurses were willing to subscribe to such an insurance policy should it become a reality. The abovementioned results lead us to propose the following.

Correlations of Mothers' Oral Health Knowledge and Verbal Oral Health Literacy with Children's Oral Health Behaviors in a Daycare Center

Jong-HwaYum[1], Hye-jin Kim[1]

[1]Department of Biomedical Health Science, Dongeui University, Gaya 1-dong, Busanjin-gu, Busan, Republic of Korea

Abstract

Background/Objectives: The aim of the study was to confirm the relation of subjective periodontal symptoms to objective periodontal index by comparing personal periodontal evaluation and actual oral health.

Methods/Statistical analysis:This study was conducted by receiving consents from parents with their children attending the childcare center attached to D. University in Busan. In this study, SPSS23was used to analyze data, and statistical significance was determined with the significance test at $P \leq 0.05$.

Findings: Mothers and children's brushing habits and tongue brushing had similar behavior patterns, but the quantity of toothpaste was slightly higher for mothers than for children. Of the mother's brushing behaviors, the more brushing per day, the higher score of oral health knowledge became, and as for brushing method, the score of oral health knowledge was a little higher when the rolling method and horizontal method were used than when the brushing method of mixing the vertical method with various methods was used, which was statistically significant. Children's brushing behaviors, brushing method, and tongue cleaning had a negative correlation, and children's brushing method and mother's oral health knowledge had a positive correlation.

Improvements/Applications: The mother's oral care behaviors have an impact on the formation of children's right habit and medium-to-long-term oral care, it is judged that it would be necessary to provide oral care education experience opportunity for mothers and make institutional preparation so that expert oral health activities can consistently be made for children in daycare centers and kindergartens.

Keywords: *Brushing behavior, Child, Mother, Oral health behavior, Oral health Literacy, Oral health knowledge.*

Introduction

In 5-6 years-old children age, good habits for oral care should be established to keep their teeth healthy during their lifetime, but they currently tend to escape from fosterers' care, along with changes in social phenomena related with rearing due to increasing the economic participation rate of women[1)]. Although the prevalence of 5 years old children's dental caries has been decreased in Korea, it is still higher than that of other OECD members[2)]. According to the preceding studies, the degree of the awareness about young children's oral health is the highest in mothers as compared to other guardians, and children's poor oral hygiene care leads to poor oral hygiene status in their growth[3,4)]. They play the most central role in the maintenance and promotion of family oral health, e.g. It was found that mother's knowledge and attitudes about oral health affects children's oral health[5)], mother's and children's oral health behaviors have a great correlation[6)] and the children of the mothers who experienced the use of dental institutions for the purpose of prevention had

Corresponding Author:
Hye-jin Kim
khj1126@deu.ac.kr*†

about seven times higher probability of brushing three or more times on average a day than mothers who did not experience that[7]. As proven in several preceding studies, it is considered an established theory that mother's oral health knowledge level or behavior affects children. The health literacy requires a minimal ability to enjoy abundant life, maintaining healthy body in the modern society, and it is applied to oral health[8,9]. The dental health literacy, one of many methods to enhance the oral health of mothers has a great effect on correct dental practices and behavior regarding oral health[10,11]. In many children of parents with low verbal oral health literacy, the first molar sealant is often absent[12]. Mothers' oral health knowledge, literacy, and behaviors can be important factors in the oral care of children[13,14]. Thus, this study would investigate the correlation in oral health behaviors between child and mother, investigating verbal oral health literacy according to mothers' oral health characteristics and several factors decisively affecting oral health management in preschoolers.

Materials and Method

Study Subjects

This study was conducted by receiving primary consents from parents with their children attending the childcare center attached to D university in Busan, after explaining the purpose of this study to teachers and secondary ones from children's legal representatives.

Research Method

Mother's oral health knowledge was composed of 30 questions in total, and for the percentage of correct answers, 1 point was given for a correct answer and 0 for a wrong answer. Verbal oral health literacy consisted To measure the verbal oral health literacy, the Rapid Estimate of Adult Literacy in Dentistry (REALD-99) was used after adaptation, revision[11] and Cronbach`α = .987.

Statistical Analysis Methods

In this study, SPSS (ver. 23.0 for windows, Chicago, IL. USA) was used to analyze data, and statistical significance was determined with the significance test at $P \leq 0.05$.Frequency analysis was conducted on the mother's general characteristics, oral health interest rate, the path of information collection, and oral health literacy, and independent samples t-test and one-way ANOVA were conducted on verbal oral health literacy and oral health knowledge according to the mother's general characteristics and brushing behaviors.

Result and Discussion

Distribution of responses of mother's verbal oral health literacy

In the degree of the mother's literacy on oral health-related terms in Table 1, the words with a high ratio of response, "I know" over 90% were toothpaste(98.6), toothbrush(98.6), and sugar(98.6), and the understanding of cavity(14.3), eruption(18.6), fistula(21.7), and imperfecta(24.3) was the lowest.

Table 1. Mother's verbal oral health literacy (Understanding of the oral health-related terms)

Mother's verbal oral health literacy and oral health knowledge according to their general characteristics

In Table 2, most many age were 36 to 39 years old(57.1%). By the level of education, those with a bachelor's degree were 78.6%. By income, most earned more than 5 million won a month(58.6%), and by occupation, most were professionals(54.3%).There was a significant difference in functional oral health literacy by the subjects' sociodemographic characteristics was drawn, different from the results of the preceding studies[15]. The higher incomes, the higher score of oral health knowledge were a statistically significant difference. It was similar to the result of Lee[16].

Mother's oral health interest rate and the path of information collection

In Table 3, most were "not interested"(57.1%).In the oral health knowledge learning route, got it from newspaper, TV, Internet were 45.7%. For oral health education experience, those with experience were 55.7%, while without experience were 44.3%.In the path of education, clinic and hospital reply was 41.9%. Mother's oral health interest was only 20.0%, and thosewith oral health education experience were only 44.3%. Thus, judging from the result of the preceding studies that guardian's oral health education experience degree is a factor affecting elementary school students'

oral health knowledge[17], it is noted that mother's oral health education experience degree affect children.

[a] Answer Only if having oral health education experience

Distribution of response in oral health behaviors between mother and children

In Table 4, as for the quantity of toothpaste, most of them used 1/2 of the toothbrush head(68.6%), and as for brushing time, most of them brushed their teeth for 1 minute and 31 seconds to 2 minutes and 30 seconds (41.4%). As for the quantity of toothpaste, most children used 1/3 of the toothbrush head(57.1%). As for brushing time, most of them brushed their teeth for 30seconds to 1minute and 30seconds; 34.3%. As for the appropriate quantity of toothpaste in tooth brushing, 1/3 of the toothbrush head or the shape of a kidney bean is appropriate. However, the mothers responded that they used a more quantity of toothpaste while the children used it suitably. Thus, there was a conflicting result. The rolling method is an appropriate method, but the rolling method is not necessarily efficient for the removal of dental plaque in the oral cavity. Various factors act, and it is necessary to beconcerned about the method of finding and controlling the cause, of oral health behaviors, individually, if appropriate for the removal of dental plaque, with other methods, not with the rolling method.

Mother's verbal oral health literacy and oral health knowledge according to their brushing behaviors

As a result of a survey of the mother's brushing behavior, there was no difference in verbal oral health literacy according to that. Judging from the result of a study that mother's oral health management behaviors and verbal oral health information understanding affect preschoolers' oral health characteristics[18]., it is noted that the aspect or change of mother's oral health behaviors would affect children's oral health behaviors. Of the mother's brushing behaviors, the more brushing per day, the higher score of oral health knowledge became, and as for brushing method, the score of oral health knowledge was a little higher when the rolling method and horizontal method were used than when the brushing method of mixing the vertical method with various methods was used, which was statistically significant($p<.05$). This was similar to the result of Kim[19].Oral health knowledge degree was significantly higher according to the number of times of brushing, brushing method, and brushing education experience.

Table 4. Distribution of response according to mother and children's brushing behaviourN (%)

Variable	Contents	Mother	Children

Correlations of mother's verbal oral health literacy and oral health knowledge with children's brushing behaviors

The results of an analysis of the correlations of mother's verbal oral health literacy and oral health knowledge with children's brushing method, quantity of toothpaste,brushing time, the number of times of brushing per day, and tongue cleaning are like Table 6. Of children's brushing behaviors, brushing method and tongue cleaning had a negative correlation ($p<.008$), and children's brushing method and mother's oral health knowledge had a positive correlation ($p<.037$). Thus, these were statistically significant.

Conclusion

This study would understand correlations by checking the degree of mother's oral health knowledge and verbal oral health literacy and comparing mother and children's brushing behaviors. Childhood is a time when the right oral care habit is very important, and repeated education and interest in oral health are necessary. Thus, the mother's oral care behaviors have an impact on the formation of children's right habit. It was found that the correlations of children's brushing method and tongue cleaning with the mother's oral health knowledge were significant. In conclusion, for children's medium-to-long-term oral care, it is judged that it would be necessary to provide oral care education experience opportunity for mothers and make institutional preparation so that expert oral health activities can consistently be made for children in daycare centers and kindergartens

Abstract

Background/Objectives: The purpose of this study was to investigate the activity of the spinal muscles according to the pelvic tilt angle and to identify the muscles affecting the posture.

Methods/Statistical analysis:Thirty healthy young adults participated in this study. The muscle activity and pelvic tilting of the erector spinea were measured using electromyography and inertial sensor. One-way repeated ANOVA was used to compare muscle activity of each muscle according to pelvic tilting angle.

Findings: The muscle activity of the three muscles of the spine showed a significant difference between posterior tilting and anterior tilting of the pelvic ($p<0.05$). In other words, it showed higher muscle activity in anterior tiling. Iliocostalis lumborum showed lower muscle activity in the sitting position, although the range of motion of the pelvic was larger in the sitting position than in the standing position.

Improvements/Applications: Appropriate muscle activity of the iliocostalis lumborum in the sitting position should be considered for weight-bearing reduction of the lumbar spine and prevention of musculoskeletal disorders of the spine.

Keywords: *Pelvic tilting, Erector spinae, Iliocostalis thoracis, Iliocostalis lumborum, Longissimus thoracis, Muscle activation*

Introduction

With the development of industry, the sedentary lifestyle increased in modern society. These changes may cause many musculoskeletal disorders[1]. The sitting position causes pelvic posterior tilting rather than standing position and reverses the normal curve of the lumbar, resulting in increased intervertebral disk pressure. In the sitting position, the intervertebral disk pressure is three times higher than the standing position and seven times higher than the lying position[2]. Because the spine and pelvis are anatomically composed of a spine-pelvic complex, the position and angle of the pelvic have an important influence on the spine[3]. This is explained by Tully's bottom-up mechanism, which suggests that the tilting of the pelvis gradually affects the shape of the spine. Pelvic anterior tilt observed in the sagittal plane causes spinal lordosis, and pelvic posterior tilt causes spinal kyphosis. Likewise, asymmetrical pelvic tilt caused by conditions such as putting the wallet in one back pocket leads to the asymmetrical posture of erector spinae and spinal imbalance[4].

To sit in an upright position, balanced movement of the trunk muscle and enough range of motion for hip joint flexion are required. The upright sitting position is a flat position in which the pelvis is tilted backward and the anterior displacement of lumbar vertebrae[2]. Lowering the head or bending the trunk in a sitting posture places the line of gravity in front and presses the lumbar vertebrae to induce low back pain[5]. On the other hand, the sitting position with back too upright affects erector spinae and iliopsoas to maintain lumbar vertebrae curve, putting pressure and anterior shear force on lumbar vertebrae and increasing the spinal load that leads to low back pain[2,6]. The sitting position with weight on one-side causes side bending in lumbar vertebrae, and if such side bending is limited to one or two segments of lumbar vertebrae, it can put a greater load on lumbar vertebrae,

Ji Heon Hong,
hgh1020@hanmail.net

causing low back pain. A weight-bearing on one side in a sitting position causes side bending of the lumbar vertebrae. When side bending is limited to one or two segments, the load on the lumbar vertebrae increases and causes pain. It also affects other segments and changes alignment[2,7,8].

Improper sitting posture increases the pressure of the lumbar vertebrae. As a result, decreased the strength and endurance of the muscles around the lumbar, decreased endurance, soft tissue damage, degenerative changes of the intervertebral disc and pain are caused[9]. Low back pain can be prevented by working in a proper sitting position[10]. One of the primary causes of low back pain is increased lumbar lordotic angle. Thus, pelvic tilt exercise is used for lumbar alignment of patients with chronic low back pain[11]. Pelvic anterior tilt position increases the lumbar lordotic angle, and pelvic posterior tilt position decreases lumbar lordotic angle[12-14].

In electromyography (EMG) studies of muscle activation according to pelvic tilting angle in standing position, erector spinae and multifidus activity was highest in a pelvic anterior tilt. Muscle activity of transverse abdominis was highest in a pelvic posterior tilt. These findings suggest that the muscles around the lumbar vertebrae are related to the pelvic tilt angle[15]. Because the lumbar vertebrae are structurally unstable, they require appropriate muscle contraction of the surrounding muscles[16]. Muscles that contribute to spine stability include multifidus, transverse abdominis, the bottom fiber of the internal oblique abdominal muscle, and the deep muscle of the erector spinae. Excessive activity of the muscle associated with the movement of the spine may cause spine instability and low back pain[17]. Previous studies have shown that transverse abdominis, multifidus, and erector spinae are involved in pelvic tilting. However, there are not many studies on deep muscles of erector spinae. Therefore, the purpose of this study was to investigate muscle activity of erector spinae (iliocostalis thoracis (IT), longissimus thoracis (LT), and iliocostalis lumborum (IL)) according to pelvic tilting angle in sitting and standing postures.

Method

Thirty healthy young adults were recruited to this study. The general characteristics of the subjects are shown in Table 1. Of the 30 subjects, 10 subjects with a pelvic tilting angle below the average were excluded from the study. Those with low back pain, history of surgery, inflammatory disease or degenerative arthritis were excluded from this study. Also, those who have difficulties in maintaining the sitting and standing position were excluded from the study. This study was approved by Sunmoon University Institutional Review Board (SM-201805-029-2).

Table 1. General characteristic of the subjects

Weight, kg	69.32 ± 10.59
Gender	male = 12, female = 8

Mean ± standard deviation

Micro-Electro-Mechanical Systems (MEMS) sensors (EBIMU24GV3, E2BOX, Seoul, Republic of Korea) were used to measure the pelvic tilting angle. The sensor consists of a three-axis accelerometer, a geomagnetic sensor, and a gyroscope. The sensor data was recorded at 40 Hz. The sensor was attached to the ASIS and joint angle values were calculated by setting three axes as a roll (Z-axis), yaw (Y-axis), and pitch (X-axis)[18]. A surface electromyogram (EMG) (Zero WIRE EMG, Italy, 2009) was used to measure erector spinae muscle activity during pelvic motion. Before attaching EMG electrodes, the area was disinfected with alcohol. EMG electrodes were attached to the three muscles. The electrode mounting positions are as follows; iliocostalis thoracis (exterior 3-4 cm of LT), iliocostalis lumborum (above the iliac crest in the horizontal of L4), and longissimus thoracis (between the spinous process of L1 and the vertical of PSIS) [Figure 1][19]. EMG analog signals collected from three channels were sent to MP150 system to be transformed into digital signals, and EMG software Myoresearch 1.06.44 software was used for signal analysis and data processing. The sampling rate was set at 2000Hz when measuring EMG, and frequency band-pass filter was set at 20~500Hz.

The subject was given a description of the pelvic neutral position, anterior tilting and posterior tilting in sitting and standing position. The maximum voluntary isometric contraction (MVIC) of the muscle was measured first in the prone position [Figure 2]. Muscle

activity of each muscle was measured in neutral, sitting, and standing positions after MVIC measurement. The measurement was performed for 3 seconds [Figure 3, Figure 4]. The muscle activity data was calculated as the root mean square (RMS) and the mean value for 3 seconds was used for data analysis. All data has been normalized as a percentage of MVIC. Of the 30 subjects, 10 subjects whose pelvic tilting angle was below average were excluded from the study, and the results of 20 subjects were used for data analysis.

Figure 1. Electrode attaching placement

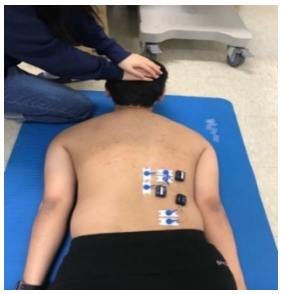

Figure 2. Maximum voluntary isometric contraction measurement

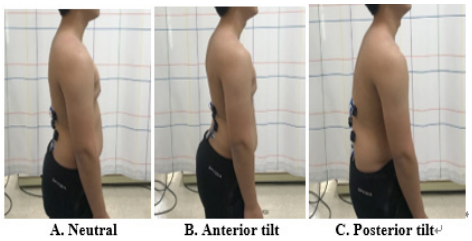

Figure 3. Pelvic motion in the standing position

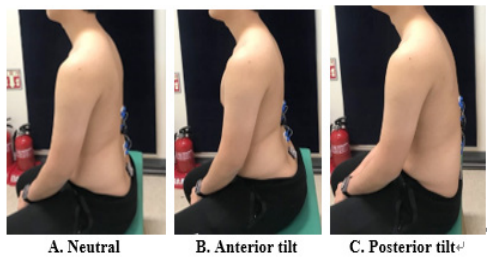

Figure 4. Pelvic motion in the sitting position

All data are expressed as mean and standard deviation. Shapiro-Wilk was used for normality test. One-way repeated ANOVA was used to compare muscle activation among IT, IL and LT. Bonferroni correction was used for post hoc comparison of the differences among each variable. Paired T-test was conducted to compare the differences pelvic tilting angle. The significance level was set at $p<0.05$. IBM SPSS/PC ver.20.0 for window program was used for statistical analysis.

Result

There was a significant difference in pelvic tilting angle between sitting and standing position ($p <0.05$) [Table 2]. In the standing and sitting positions, there was a significant difference in muscle activity of all three muscles of IT, LT and IL according to pelvic tilting angle ($p<0.05$) [Table 3, Figure 5]. All three muscles showed the highest muscle activity during pelvic anterior tilting in the standing position.

Table 2. The average pelvic tilting angle

	Anterior tilting	Posterior tilting

Discussion

This study was performed to compare the muscle activity of the erector spinae (IT, LT, and IL) according to the pelvic tilting angle in sitting and standing positions. Three muscles showed the highest muscle activity during pelvic anterior tilting. Muscle activity during pelvic posterior tilting was higher than neutral position, however, lower than pelvic anterior tilting. The range of motion of the pelvic tilt angle was larger than the standing position. Posterior tilting at the two positions had a greater range of motion than anterior tilting. Muscle activation of IT and LT was highest in sitting position, and that of IL was not clearly shown. From the name 'erector', it can be known that erector spinae are vital muscles in holding the spine upright. The Erector spinae is activated for pelvic tilting motion and is also activated to maintain standing and sitting positions[20-22]. Thus, this study showed that muscle activation was highest in anterior tilting, and muscle activation was greater in posterior tilt than in neutral positions. In previous studies, the center of mass changes according to the trunk tilting angle, so the relationship between the center of mass and trunk muscles activity according to the trunk tilting angle was compared[23]. As a result, as the trunk tilting angle increased, the muscle activity of the trunk muscle increased. In this study, as the pelvic tilting angle increased in the sitting position, IL activity decreased. Therefore, it may be assumed that other muscles are used excessively than the muscles around the lumbar.

Tilting of the pelvis occurs due to changes in the couple-force between the abdominal muscle and hip extensors, spine muscle and hip flexors[24]. That is, the tilting angle of the pelvic is controlled by the surface muscles in the direction crossing each other[25]. The activities of muscles such as erector spinae, iliopsoas, sartorius, and rectus femoris are involved in anterior tilting. On the other hand, muscles such as external abdominal oblique, rectus abdominis, gluteus maximus, and hamstring are involved in posterior tilting. In lower cross syndrome (LCS) patients, pelvic anterior tiling is more common in sitting position because of the activation of larger hip flexors. Similarly, the pelvic posterior tilting angle may have been greater because more hamstring was activated in LCS. Muscle activity was low, even as the pelvic tilting angle increased. This may be due to LCS where hip flexors are used more than spine muscles. The muscle activity of LT was highest among erector spinae during pelvic anterior tilting, and IL muscle activity was highest during pelvic posterior tilting. Muscle activity was highest during pelvic anterior tilting in standing position. This study supports the argument that when the IL is appropriately activated in the sitting position, the compression of the intervertebral disc is reduced.

Conclusion

According to the results of this study, LT was most active during pelvic anterior tilting and IL was most active during pelvic posterior tilting in sitting and standing position. In addition, when compared to standing and sitting positions, muscle activity was higher in a pelvic tilt. An important point to note from this result is that muscle activity decreases in sitting position, as IL at the lumbar level is barely active during pelvic tilting. Although muscle activity decreases more in sitting position than in standing position, pelvic tilting angle was greater due to LCS. In standing position, muscle activity increased as activation is added during pelvic tilting to the already existing muscle activity of erector spinae. However, because lumbar spine is maintained for a long time, the angle rather decreased, and it was greater for pelvic tilting in sitting position. If IL is activated in the sitting position, weight load on the lumbar may be assumed to decrease.

Abstract

Background/Objectives: The purpose of this study was to examine the changes of pennation angle based on gastrocnemius stretching and additional exercise and to identify the influence of exercise on stretching effects.

Methods/Statistical analysis: Thirty healthy adults (15 males and 15 females) participated in this study. Subjects performed stretching of the gastrocnemius and additional muscle exercises. The pennation angle of the muscle was measured before and after the intervention. A paired t-test was used to compare pre- and post-intervention and an independent t-test were used to compare between interventions.

Findings: As a result of gastrocnemius stretching, there was a significant difference between pre- and post-intervention ($p<0.05$). In addition, the results of stretching and additional muscle exercise showed significant differences in pre- and post-intervention ($p<0.05$). However, there was no significant difference between stretching intervention and stretching and additional exercise intervention ($p>0.05$).

Improvements/Applications: According to the results, the effect of stretching was not decreased even if stretching and exercise were applied together. Therefore, it is considered appropriate to perform stretching and exercise together.

Keywords: *Stretching, Muscle exercise, Gastrocnemius, Pennation angle, Flexibility*

Introduction

Calf muscles play an important role including human's basic movement control such as when standing up from a sitting position, lifting up the heel while walking, and maintaining balance while standing[1]. They assist plantar flexion of the ankle joint and the knee joint flexion. By lifting up the heel, it generates most of the momentum needed when walking or jumping. During walking, calf muscles work in the stance phase and help maintain balance. The activity of this muscle starts at the last 1/4 period of the swing phase[2]. In addition, the activation period of this muscle is greatly increased while jumping. Thus, this muscle is strong and thick in order to lift up the body and create momentum and acceleration during activities such as walking, jumping, running, leaping up, or trying to stand up with one's toes.

Stretching is an effective intervention method to increase the joint range of motion of shortened muscles[3]. It requires exercise that does not cause pain at least twice a week[4]. Stretching is often used clinically to increase the ankle joint range of motion and stimulate the somatic sense. Static stretching is the most common stretching technique that can be performed at home. Ballistic stretching, on the other hand, is a risk of tissue damage. Neurophysiologic stretching is safe and effective, however, difficult to perform on its own[5-7].

The muscle strength of lower limbs plays an important role in effective control over the center of the body, maintaining the balance, and enabling safe and efficient lower limb exercise[5]. Muscle strength refers to tension that is generated by muscle constriction

Corresponding Author :
Ji Heon Hong,
hgh1020@hanmail.net

and explained as the maximum strength that muscle can create against resistance[8]. Muscle-strengthening maintains and promotes work efficiency, endurance, and increases connective tissue tolerance of ligaments and muscles. In addition, it reduces the damage risk of joint loading, soft tissue during physical activity. In addition, it has the potential of healing the damaged soft tissue and promoting its recovering ability[9]. It has been reported that muscle-strengthening exercise makes the muscle strength by increasing the volume of muscle and that it has a lot of positive effects on metabolism, flexibility, and endurance due to the increase of blood flow rate [10].

Most of the muscles in our body are comprised with U-shaped muscles, and they are classified into semi U-shaped muscle, U-shaped muscle, and U-shaped muscle bundle based on the number of the fibers attached to the central tendon[2]. It has been observed that the U-shape angle increases as a result of training which is because this enables more fibers to be present on the cross-section, and this is related to the increase of the thickness and intensity of the muscle and the periosteum[11]. The process of estimating the U-shape angle includes estimating the direction of the bundle of fibers between aponeuroses[12]. Most people have the U-shape angle and the normal range is between 0° and 30°, which possibly reflects flexibility[13,14]. Flexibility refers to an ability of easy and smooth movement in single joint or multiple joints without any restriction or pain[15]. Along with joint integrity, the muscle length and the extensibility of soft tissue around the joint determine flexibility. Flexibility is related to the extensibility of each tendon that traverses the muscle and it is an ability that can be transformed and relaxed by extensibility. Not only the transforming ability of the connective tissue around the joint but also the arthrokinematics (the rolling and gliding ability over the facies articularis) influence the related range of motion and one's overall flexibility[9]. When the muscle is extended, there could be a change in the U-shape angle which can influence the muscle's ability to deliver the force. When the angle decreases, the length of the fiber bundle increases, and if the former increases, the latter decreases, which mean that the muscle length is increased during stretching[16,17].

Although gastrocnemius plays an important role in maintaining balance, the results of this muscle stretching study are not clear. Therefore, this study investigates the effect of exercise on stretching effect by measuring the change of the U-shape angle.

Method

Thirty healthy young adults (15 females and 15 males) participated in this study. The general characteristics of the subjects are shown in Table 1. Subjects were divided into stretching group (n=15) and stretching combined exercise group (n=15). Those with a history of knee and musculoskeletal disorders, history of surgery, or pain in the knee and ankle joints were excluded in this study. Subjects provided written consent before participating in the study. This study was conducted according to the protocol approved by the Institutional Review Board of Sun Moon University (SM-201804-027-1).

Table 1. General characteristic of the subjects

Sex	Male (n=15)	Female (n=15)
Age, year	21.53±2.35	21.33±1.82
Height, cm	176.62±4.42	161.29±5.12
Weight, kg	71.73±15.57	57.13±12.07

Real-time ultrasonography with a 7.5 MHz linear array transducer (ultrasonography, eZono 3000, Germany, 2011) was used to measure the U-shape angle and length of the gastrocnemius [Figure 1]. For measurement, the direction of the probe is set to the longitudinal axis direction [Figure 2]. The dominant leg of the subject was measured before and after the intervention. The dominant leg was defined as the preferred leg when kicking the ball.

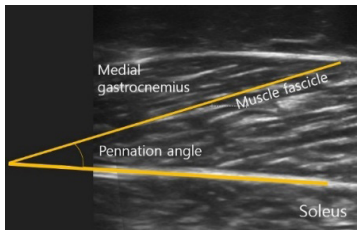

Figure 1. Pennation angle

Figure 2. Ultrasonography probe placement

For stretching the gastrocnemius (stretching group), the subjects were instructed to stand on the slant board with their feet spread out over the shoulder width. Subjects leaned back against the wall, straightened the back, looked straight ahead, and kept their feet aligned [Figure 3]. Stretching was performed on the slant board for 1 minute. Two repetitions were performed and a 30-second break between each performance stretch was provided. To perform a stretching combined exercise (stretching combined exercise group), subjects widened their feet to the shoulder width and lifted the heel by pressing the floor with their front feet [Figure 4]. It was repeated 10 times per set according to the metronome signal and 10 sets were performed. A 30-second break between each set was provided. After the strengthening exercise, subjects performed the same stretching as the stretching group. The subjects performed a stretching exercise and stretching combined exercise three times a week and performed for three weeks.

A paired t-test was used to compare before and after each intervention in the group. An independent t-test was also used for comparison between the two groups. SPSS version 20.0 program (IBM Corp, Armonk, NY) was used for statistical analysis. The statistical significance level was set at 0.05.

Figure 3. Stretching posture

Figure 4. Strengthening posture

Result

There was a significant difference in the stretching group pre- and post- the intervention. Similarly, the stretching combined exercise group showed significant differences in pre- and post the intervention [Table 2]. However, there was no significant difference between the two groups [Table 3].

Table 2. Difference between pre- and post- the intervention within the group

Intervention		Pennation angle (°)	p
Stretching	pre	18.64 ± 2.61	0.01
	post	15.84 ± 2.27	
Stretching combined exercise	pre	19.11 ± 1.81	0.01
	post	15.64 ± 1.68	

Table 3. Difference in pennation angle between two groups

Intervention	Mean	p
Stretching	2.81 ± 1.79	0.44
Stretching combined exercise	3.47 ± 1.29	

Discussion

The purpose of this study was to investigate the effect of muscle-strengthening on the stretching effect based on changes in U-shape angle when stretching and stretching with combined exercise. According to the results of this study, there was a significant difference in the U-shape angle within the stretching group and the stretching combined exercise group after intervention. However, there was no significant difference between groups.

The U-shape angle plays an important role in delivering force, and the lower the angle, the more the force is generated in each muscle. As the muscle is extended, there can be a change in the angle, and this delivers strength to the muscle, thereby influencing muscle activity. In case the tendon is transformed due to stretching, the accompanied U-shape angle can also increase[13]. Muscle tone refers to the resisting force against the muscle extension, that is, the stiffness of the muscle itself[18]. The increase in flexibility means a decrease in muscle tone. The decrease in the U-shape

angle means a decrease in muscle tone.

Stretching is an effective intervention method for increasing the joint range of motion and extension of the shortened muscles[3]. The effect of stretching can appear in various ways based on the application time and method, the effect of stretching can be varied depending on the application time and method. However, stretching more than 15 seconds is necessary for muscle relaxation and increased range of motion. Also, if the range of motion of the ankle joint is limited due to neurological damage, a longer period of the continuous static ankle stretching is required[6]. Based on the research that found out the length of the muscle increased significantly after maximum 2 minutes of stretching but there was no significant difference after more than 3 minutes of stretching[19], this study applied 2 minutes of stretching. Previous studies have shown that muscle length is significantly increased after 2 minutes of stretching. However, there was no difference between stretching for more than three minutes. Therefore, in this study, stretching was applied for 2 minutes. As a result, all the subjects had significantly reduced U-shape angle after the intervention.

Muscle-strengthening exercise and a warm-down program for 10 weeks (3 days/week) showed that muscle strength at the area of damage improved. However, it was found that there was no relationship between increased muscle strength and muscle tone[20]. The effects of muscle strength in groups with various ankylosis were investigated[21]. As a result, muscle training has been reported to increase muscle strength without an increase in ankylosis. In addition, it has been reported that there is no significant relationship between muscle strength and ankylosis in both agonist and antagonist muscles[18,22]. Muscle-strengthening exercise can increase or decrease the weight in various degrees during each body part exercise and also diversify the exercising areas, thereby strengthening the muscles of the damaged parts against gradual resistance, enhancing flexibility, and effectively contributing to the stabilization of the spine[23]. Muscle-strengthening exercises can be performed in a variety of ways, effectively contributing to increased muscle strength, improved flexibility, and stabilization of the spine[23]. This training program is considered to be able to contribute effectively to increasing muscle strength without an increase in ankylosis[9].

According to the results of this study, both the stretching group and the stretching combined exercise group showed a decrease in U-shape angle after the intervention (2.81, 3.46, respectively). This indicates an increase in the length of the muscle and degree of flexibility. This means that both interventions are effective in reducing the U-shape angle. Previous studies have shown that complex exercises are more effective for increasing aerobic capacity, endurance, flexibility, balance, and muscle strength than when performing one exercise[24,25]. In this study, performing additional muscle strength exercises during stretching may be considered to have no effect on the stretching effect. Therefore, additional strengthening is more effective than stretching alone to increase flexibility and muscle strength.

There are some limitations in this study. First, the intervention period of 3 weeks was relatively short. Second, because it was conducted for healthy young adults, it did not reflect the effects of various ages. Third, muscle strength was not measured. Fourth, there was difficulty in controlling each subject's individual life pattern. In further studies, it is necessary to find effective stretching 0s by applying interventions for a longer period of time. Further research is needed to find effective stretches at various ages. Also, a longer period of intervention should be performed.

Conclusion

In this study, the effect of stretching and stretching combined exercise on the change of U-shape angle of gastrocnemius was investigated. Both showed a significant increase in the U-shape angle, which means an increase in flexibility. However, there were no significant differences between the two interventions. In conclusion, additional muscle-strengthening did not affect the stretching effect of the gastrocnemius. Therefore, additional strengthening should be considered during stretching to increase muscle strength and flexibility.

Abstract

Background/Objectives: The purpose of the act was to verify the operability of the Korean Mistletoe extract as a functional material through antioxidant activity, cell toxicity in B16F10 melanoma cells, melanin production inhibiting function, and tyrosinase inhibiting effect.

Methods/Statistical analysis: After extracting the Korean mistletoe with 70% ethanol, the total polyphenol content, total flavonoid content, DPPH radical Scavenging Activity, cell toxicity in B16F10 melanoma cells, melanin production inhibitory and tyrosinase activity were measured.

Findings: The Korean Mistletoe extract was found to contain total polyphenols and total flavonoids, which are concentration-dependent. The excellent DPPH Radical Scavenging Activity effect was identified. the effect of tyrosinase in vitro was checked. No cell toxicity in B16F10 melanoma cells was present, and melanin production inhibits were identified.

Improvements/Applications: As the active antioxidant effect was confirmed through various methods of Korean mistletoe extract and whitening effect due to excellent antioxidant activity, it is believed that it may be a functional material.

Keywords: *Antioxidant, B16F10 Melanoma cell, DPPH, Korean Mistletoe, ROS, Tyrosinase*

Introduction

Reactive Oxygen Species (ROS) are formed continuously by several factors in the cell apoptosis process[1]. ROSs that are common in life include superoxide radical (O2-), hydroxyradical (OH-), hydrogenperoxide (H_2O_2), nitricoxide (NO). It is known to be deeply involved in the carcinogenesis process of forming cancer cells, as the protein lipid component of the cell is damaged by the increased formation in vivo, degraded by the damage to the intracellular constituent protein lipid content, and damaging the DNA in the cell[2]. In particular, it produces a rapid oxidation reaction with each component in the body, which degrades the function of the body, attacks normal cells, causes cancer, and causes organ necrosis[3]. It also promotes various diseases and aging by causing oxidative damage[4]. Several prior studies have shown that cell damage from the production of ROS is one of the most widely applied causes of aging[5]. Despite the antioxidant enzymes and vitamins C, E, and glutathione as a defense mechanism for free radicals, there are reports of aging due to increased in vivo attacks and decreased defense of free radicals, including age[6]. therefore, there is an increasing interest in natural antioxidants derived from vegetables, fruits, etc., which have the effect of increasing the in vivo antioxidant defense system or eliminating harmful free radicals[7]. Natural antioxidants are in the spotlight because they are known to have high stability and no side effects, but their antioxidant activity has been found to be lower than that of synthetic antioxidants. So the synthetic antioxidants, Butylated Hydroxy Anisole (BHA) and Butylated Hydroxy Toluene (BHT),

Corresponding Author :
Ji-Sun Moon,
wltjs55555@naver.com

were developed. However, problems with synthetic antioxidants are raised in safety issues, such as toxicity and carcinogen in the body, and reported results that cause mutation in biotic enzymes and fat and cause diseases in the body due to toxicity[8], which is strictly regulated by law. As a result, the interest in natural antioxidants with strong antioxidants while retaining the benefits of natural antioxidants is increasing, and research on natural antioxidants is actively conducted.

The Korean Mistletoe (*Viscum album Coloratum*) is a parasitic tree in Quercus, Celtis sinensis Persoon, Castanea crenata and Betula platyphylla trees. In Europe, anti-cancer activity was already recognized in the 1920s and is used as a raw material for medicines and functional foods such as tumor treatment, high blood pressure and hardening of arteries[9,10]. Research began late in Korea compared to Europe. However, with the recognition of its potential as a natural material, various studies are actively being conducted. the Korean Mistletoe contains alkaloid, which has a relatively high level of anti-cancer activity[11]. It contains selectin, the main ingredient of mistletoe, indicating strong anti-cancer activity and strong activity, and reports that it is effective in immunity enhancement, anti-cancer activity and cytotoxicity. In addition to the selectin, flavonoid, alkaloid, and viscotexin are known as the physiological active ingredients of the mistletoe[12].

Therefore, in this study, the effect of activating antioxidant by using Korean Mistletoe extract and the effect of inhibiting tyrosinase activity in test tubes was verified. the purpose of the Act was to provide basic data on basic physiological activity characteristics research by examining the possibility of Korean Mistletoe extract as a safe and effective functional material.

Materials and Method

1.Total Polyphenol Compound Content Measurement

Dissolve the final concentration of the specimen in distilled water to 1, 2.5, 5 and 10 mg/mL in each tube to dilute 400μL of the diluted specimen and 400μL of the Folin-Ciocalteu's phenol element to react 3 min. then, after mixing 400μL of 10% Na_2CO_3 and reacting 60 min in the darkroom, a supernatant of 200μL was taken on 96 well plate to measure absorbency at 760 nm. Caffeic acid was used as a standard substance (R^2=0.9818).

2.Total FlavonoidCompound Content Measurement

Korean Mistletoe extract 100μL, 10% alum nitrate 20μL, 1 M potassium acetate 20μL, ethanol 860μL, and 100μL of distilled water so that the final concentration is 1, 2.5, 5 and 10mg/mL. Leave at room temperature for 40 min, and then sink the suspended solids with a centrifuge for 200mL. Qercetin was used as areference material (R^2=0.988).

3.DPPH Radical Scavenging Activity

Radical degeneration of the Korean Mistletoe extract was measured using the Blois (1958) method[13]. After diluting the specimen with distilled water to the final concentration of 1, 2.5, 5 and 10 mg/mL, a mixture of 180μL of a 10 mM DPPH solution dissolved in 99% ethanol in 96 well plate and 20μL of a specimen solution was mixed to react 30 min at 37°C and then absorbency at 517 nm. Ascorbic acid was used as a reference material.

4.In vitro Tyrosinase Active Inhibitor Measurement

L-DOPA was used to check the tyrosinase active inhibitor effects of Korean Mistletoe extract. 25 mM L-DOPA dissolved in potassium phosphate buffer (0.5 M, pH 6.8) and 3000 units/mL of M-tyrosianse were prepared. After reacting 30 min at 37°C with diluted samples, tyrosinase, and L-DOPA, the absorbency was measured at 475 nm. A positive control used an extract of the Morus alba L.

5.Cell Survival rate Measurement

The cells 3×10^4 cells/well per well were attached to the 96 well plate to the incubator for 24 h. After 24 h, the specimen was treated by concentration and incubated at 37°C for 48 h. After 48 h, incubated for 3 h in 1% NR solution, and then processed 20 min of phosphate buffered saline (PBS) with 10% formaldehyde solution into each well. NR desorb solution was added to each well to extract NR in the cell and absorbance was measured at 540 nm using microplate reader (Synergy HT; BioTek Instruments, USA).

6.Melanin producing inhibitor Measurement

96 Attach 2×10^3 cells/well per well to the incubator for 24 h. After 24 h, it was replaced with α-MSH, which was treated at a concentration of 5% FBS and 100 nM and then the Korean Mistletoe extract was diluted for

each concentration to grow 72 h. the amount of melanin secreted in the well plate was measured at 405 nm using a microplate reader. 100 μg/mL of arbutin was used as a positive control.

7.Statistical Processing

Statistical processing was analyzed using the SPSS Window Version 17.0 (IBM, USA).

Result and Discussion

1.Total Polyphenol Content Results

Polyphenol-based substances are aromatic compounds with two or more phenolic hydroxyl (-OH) machines within a molecule that easily bind with proteins and giant molecules. the phenol compound, among other activities, has a function to suppress oxidation by giving hydrogen to alkylperoxy radical, alkyl radiated, and thus shows strong antioxidant activity[14,15].

In this study, the total polyphenol content was measured by diluting the Korean Mistletoe extract to a concentration of 1, 2.5, 5 and 10 mg/mL, and then using the caffeic acid as a standard curve. the results are shown in Figure 1. the test found that the total polyphenol content of the Korean Mistletoe extract was 22.77, 58.94, 99.39, 148.97 mg/g, which is high. the relationship between total polyphenol content and antioxidant activity is known to be largely correlated.

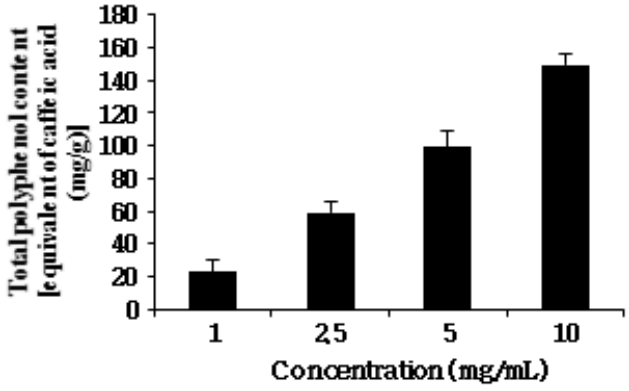

Figure 1. Total Polyphenol Contents of Korean Mistletoe Extract. It was confirmed that the total polyphenols content of the Korean mistletoe extract increased as the concentration increased.

2.Total Flavonoids Content Results

Flavonoids are phenolic compounds with the structure of C6-C3-C6 as the basic skeleton and benzø-pyrone. It collectively refers to about 4,000 compounds that make up the yellow of fruits or vegetables[16]. Flavonoids are mainly found in plant or plant-based foods and are a physiological active substance with various functionalities such as anti-oxidation, anti-cancer, anti-inflammatory, anti-bacterial, cholesterol-lowering, and breast cancer incidence[17]. In this study, the total flavonoid content was measured by diluting the Korean Mistletoe extract to a concentration of 1, 2.5, 5 and 10 mg/mL, and quercetin as a standard curve. the results are shown in Figure 2. the results showed that the total flavonoid content of the Korean Mistletoe extract was 8.3, 20.54, 38.96 and 76.48 mg/g. the total flavonoid content increased in concentration.

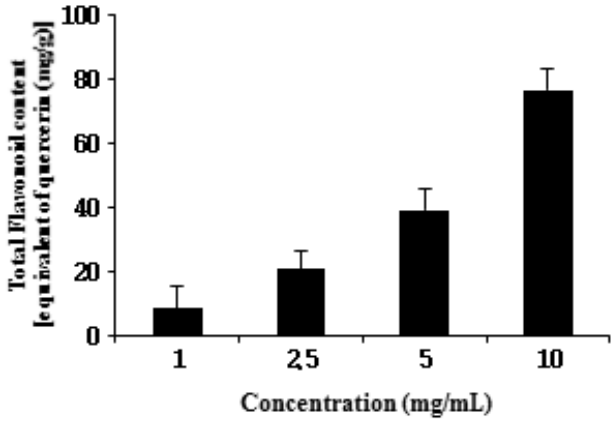

Figure 2. Total Flavonoid Contents of Korean Mistletoe Extract. It was confirmed that the total flavonoids content of the Korean mistletoe extract increased as the concentration increased.

3.DPPH Radical Scavenging Activity Results

In this study, the Korean Mistletoe extract was diluted to a concentration of 1, 2.5, 5 and 10 mg/mL to measure the DPPH radical scavenging. The results are shown in Figure 3. A DPPH radical scavenging of 95.9% was identified at a concentration of 1 mg/mL of the positive control Ascorbic acid. Korean Mistletoe extract were 49.93, 51.79, 59.78 and 70.73% confirming high DPPH radical scavenging. the previous study also reported the highest activity in 70% ethanol extract compared to 85.6% of L-ascorbic acid activity at a concentration of 1 mg/mL used as a positive control. It is also reported that an increase in the addition of mistletoe significantly increases the DPPH radical scavenging, which increases the antioxidant capacity[18].In addition, among the various antioxidants of mistletoe, the results were found to be relatively effective in the activity of radical erasing rather than lipid acid suppression. This study also confirmed that the mistletoe extract has a high antioxidant effect on ethanol extract. Several studies have identified the active effect of high DPPH radical

scavenging of Korean Mistletoe extract.

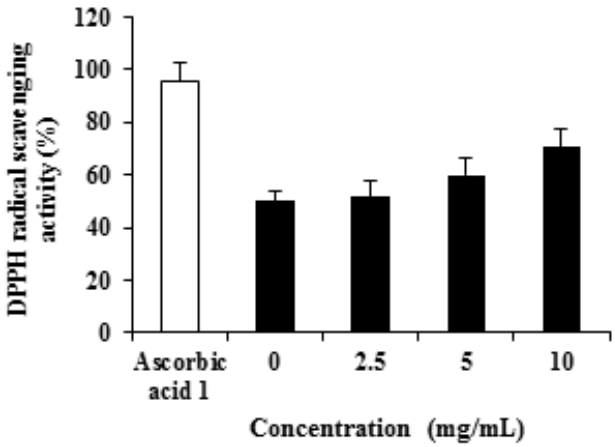

Figure 3. The DPPH radical Scavenging Activity of Korean Mistletoe Extract. Korean Mistletoe extracts showed more than 70% DPPH Radical Scavenging Activity at a concentration of 10 mg/mL.

4.In vitro Tyrosinase Active Inhibitor Measurement Results

Tyrosinase is an enzyme that plays an important role in melanin synthesis. Tyrosinase with tyrosine hyperxylate activity to switch to DOPA and DOPA osidase activity to oxidize DOPA into DOPA quinone is an enzyme involved in early reaction, a speed determination phase, in the melanin synthesis process[19].In this study, the effect of tyrosinase activity inhibition was measured using L-DOPA to dilute the Korean Mistletoe extract to a concentration of 1, 2.5, 5 and 10 mg/mL to determine if it affects tyrosinase activity in a test tube. the results are shown in Figure 4. the positive control was measured using a *Morue alba* L. extract known to be of good tyrosinase inhibitory activity. the results of the experiment showed that the effect of suppressing the activity of tyrosinase in vitro of Korean Mistletoe was 29.85, 28.13, 35.59, 41.04% of the Korean Mistletoe extract compared to Control 100%. In particular, significant tyrosinase-active inhibitory effects were identified at concentrations of 5 to 10 mg/mL ($p<.01$, $p<001$). the positive control, *Morue alba* L. extract, was identified as an active inhibitor effect of 29.85, 39.75, 49.93, and 54.09%, and the significant tyrosinase inhibitor effect was identified at concentrations of 2.5, 5 and 10 mg/mL. the *Morue alba* L. extract known to be excellent inhibition of tyrosinase activity and the Korean Mistletoe extract were found to have similar levels of active inhibitory effect. the Korean Mistletoe extract is believed to have an important adjustment step in the melanin synthesis process.

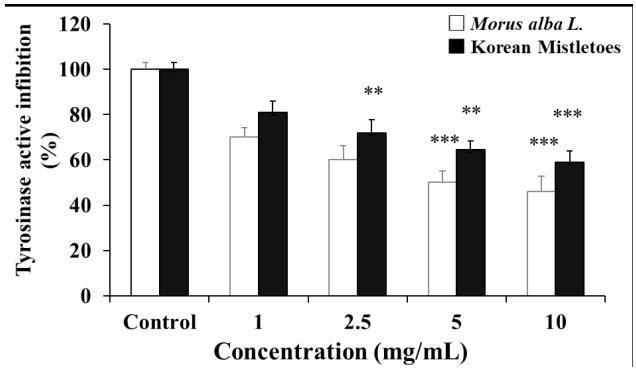

Figure 4. Effect of Korean Mistletoe Extract on Tyrosinase Inhibitor Activity. The Korean Mistletoe extract showed similar levels of tyrosinase inhibition to *Morue alba* L. extract, a positive control group.

5.Results of Survival rate in B16F10 Melanoma cell

The Korean Mistletoe extract was recognized for cell survival rate in the B16F10 melanoma cell, which produces melanin. the results are shown in Figure 5. Experiments have shown little cell toxicity to B16F10 melanoma cell.

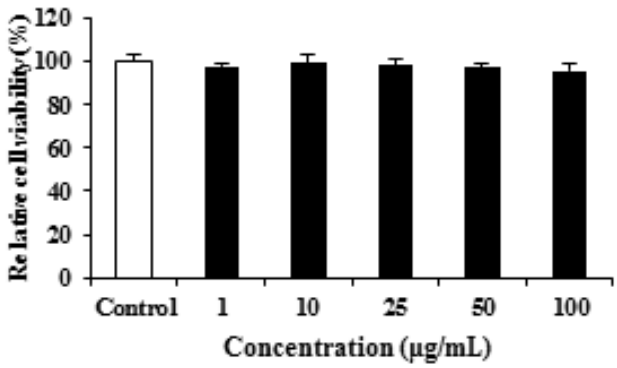

Figure 5. Cell Survival rate of Korean Mistletoe extract. The Korean Mistletoe extract has not been confirmed to be cell toxicity in B16F10 melanoma cells.

6.Melanin production inhibitor results

The results of a test of melanin biosynthesis in Korean Mistletoe extract were shown in Figure 6. It increased melanin production by processing a-MSH, which is known to promote melanin production compared to control. In the experiment, the positive control, albutin, decreased statistically significantly at 100 μg/mL concentrations ($p<0.001$). the concentration - dependent reduction effect of the Korean Mistletoe extract used in this experiment was identified. these results confirmed that the Korean Mistletoe extract used in this study directly affects the melanin biosynthesis process, and confirmed its potential for use as a substance that has little toxicity to cells and safely inhibits melanin

production.

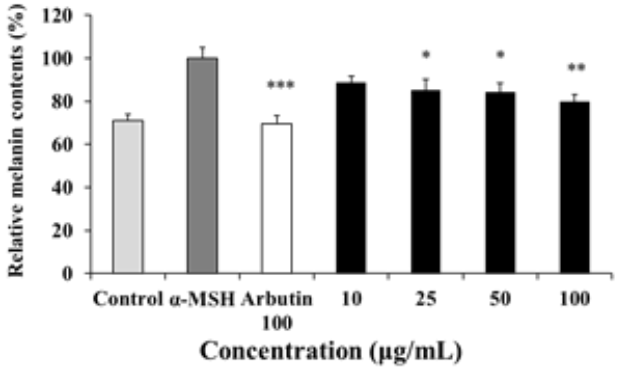

Figure 6. Effect of Melanin Production Inhibitor of Korean Mistletoe extract. The Korean Mistletoe extract showed the effect of controlling melanin production as concentration increased in B16F10 melanoma cells.

Conclusion

In this study, we tried to examine the effect of inhibiting tyrosinase activity, which indicates antioxidant activity, cytotoxicity, and whitening effect after extracting it with 70% ethanol using extracts from Korea. As a natural material, it was intended to provide basic data on basic physiological activation characteristics of Korean Mistletoe extract. In the experiment, the total polyphenol and total flavonoid content known to be an indicator of antioxidant activity were examined to confirm the concentration-dependent content. In particular, high content of 148.97 mg/g and 76.48 mg/g were identified at a concentration of 10 mg/mL of total polyphenols and total flavonoids. In the DPPH radical scavenging activity, the positive control ascorbic acid 95.9% and 49.93 were identified at a concentration of 1 mg/mL, and the concentration-dependent DPPH Radical Erasing activity was confirmed. these results confirmed that the total polyphenols and total flavonoids containing high extracts of Korean Mistletoe are active in decaying DPPH radical. To check whitening activity, the effect of suppressing the tyrosinase activity in the test tube was found to be 41.04% of the Korean Mistletoe extract and 54.09% of the epithelium extract compared to Control 100% at the concentration of 10 mg/mL. In summing up these results, the anti-oxidant activation effect of the Korean Mistletoe extract was verified through various experiments, and the excellent whitening activity effect was confirmed through the suppression of tyrosinase activity by inhibiting oxidation. Therefore, Korean Mistletoe extract is a natural material that can be used as a material with excellent antioxidant and whitening effects.

Abstract

Background/Objectives: 14 kinds of essential oils used for the analysis of heavy metals were selected from 3~5% pure grade aromatherapy essential oils.

Methods/Statistical analysis: As a selection criterion, the sample was divided into top note, middle note, and base note classified to be volatilized into the air. An amount of 0.2g of the selected analytical sample was taken and put into each sterile case to perform the experiment.

Findings: The results of the analysis of heavy metals (Antimony, Arsenic, Cadmium, Chromium, Copper, Iron, Lead, Magnesium, Nickel, Titanium, Zinc) on 14 kinds of essential oils were showed no Antimony, Arsenic, Cadmium, Zinc, Chromium, Copper, Nickel, Lead, Titanium and Barium in the top notes, middle notes and base notes. It is shown to be harmless to the human body.

Improvements/Applications: The purity of essential oils greatly affects the therapeutic value. Therefore, there is a need for regulations that identify the stages of purity, quality testing, manufacturing processes, sourcing, etc. of essential oils according to specified standards by international organizations.

Keywords: *Essential oil, Heavy metal, Aromatherapy, Top note, Middle note, Base note.*

Introduction

Numerous chemicals have been handled in the modern society due to the advancement of industrialization resulting in the spread of heavy metals in the soil, water, and air [1]. The spread of heavy metals in the modern society caused the increase of the plants detected with heavy metals in multiple areas in the world due to the limitation of their self-purification capacity which could absorb some extent of heavy metals [2]. Herbs among medicinally cultivated plants which affect the human health significantly can be polluted by heavy metals in a easiest way with polluted soil, water, air, and pesticides, herbicides, and so on that are used in the cultivation process [3]. If they are absorbed into the human body by intake of plants grown by this or administration, metal elements such as Aluminum, Lead, mercury, Cadmium, Arsenic, Chrome, and so on could affect the body negatively even with low concentration[3,4].

Corresponding author:
Yang- Yi Lim,
yan1496@ddu.ac.kr

In addition, unexcreted heavy metals with dangerous level remain in the body over years or decades to inhibit the normal function of the body as well as to affect the central nerve system, liver, lung, heart, kidney, and so on implicating fatal risk factors to cause chronic or acute diseases, therefore, consumers' distrust on the herbs and foods has been raised more and more [5]. Especially, aromatherapy which is an integrative medicine affects pulmonary system, digestive system, hormones, brain, and so on, upon application into the body such as lung, blood, and so on by diffusion, absorption, skin contact and so on using volatile high-concentrate essential oil extracted from the roots, stems, leaves, and fruits of natural plants [6]. Essential oil is eliminated completely by breathing, sweat, urine, and so on after passing liver or kidney in 3 to 9 hours from application, however, stability should be secured first since the treatment process of essential oil to be administered into the body for the application of aromatherapy [1,7].

Therapeutic properties of essential oil are determined by its active ingredients based on the conditions such as soil status of each plant, accurate altitude, and so on,

hence, clear international regulations are required on GC/MS, HPLC, sensory test, chirality, C-14, optical rotation and refractive index, certain gravity and microorganism test, and quality test [7,8].

However, 'therapeutic grades' are sometimes used for the marketing purposes that show the grades of oils certified from the institutions using standardized quality mediatory variances. International Organization for Standardization (ISO), which is an non-governmental organization founded in 1947, defined essential oil as the thing to be physically separated from water after mechanical processing of water, vapor, rind of tangerines or dry distillation of natural substances. Standardization of quality grades for essential oils were suggested by Fragrance Materials Association (FMA) and Association Française de Normalisation (AFNOR), while clear guideline on the heavy metal tests had not been established for the standards of quality differentiations [4,8,9]. For safe application of aromatherapy, it should be urgently prepared for the analysis of heavy metal contamination in the essential oils and supplementation of the systems on the clear standardization and grades to prevent from introduction of harmful chemicals in the processes of essential oil cultivation and its extraction.

Hence, this study aims to secure the scientific safety of essential oils which are used in aromatherapy by heavy metal analysis and to contribute the expansion of qualitative medical service with aromatherapy that can be safe pharmacologically and assist to save the medical cost upon providing data to the development of international standardization process for the quality grades of essential oils.

Method

In this study, 14 kinds of essential oils used for the analysis of heavy metals were selected from 3~5% pure grade aromatherapy essential oils. As a selection criterion, the sample was divided into top not(grapefruit-citrus paradise,eucalyptus-eucalyptus globulus,lemongrass-cymbopogon flexuosus, clove bud-eugenia caryophyllata, Petitgrain-citrus aurantium), middle note(lavender-lavandula angustifolia, ylang-ylang-cananga odorata, marjoram-thymus mastichina, geranium-petargonium graveolens, rosemary-rosmarinus officianlis), and base note(vetive-vetiveria zizanoides, sandalwood-santalum album) classified to be volatilized into the air. An amount of 0.2g of the selected analytical sample was taken and put into each sterile case to perform the experiment .

1. Experiment analysis equipment

ICP/wnd (Perkinelmer, Optima 5300 DV) was used in heavy metal analysis in this experiment.

-Type: ICP Optical Emission Spectrometer (ICP-OES)

- Brand: Perkin Elmer/ PE

- Model: Optima 5300 DV ICP-OES

- Usage: heavy metal analysis

2. Sample and reagent treatment method

In order to quantify the heavy metals contained in the essential oils, Antimony and Arsenic as the semimetal group elements, Cadmium and Zinc as the Zinc group elements, Chromium as the Chromium group element, Copper as the Monetary metal element, Iron and Nickel as the Iron group element, and Platinum group elements Twelve kinds of heavy metals such as Pb, Al, Titanium and Alkaline Earth elements, Barium and Magnesium, were detected twice and averaged[Table 1][Table 2][Table 3].

Table 1. Experimental process

Approximately 0.2 g of sample is placed in a survey 50 mL microwave digestion vessel.
HNO310mL
Start the microwave decomposition program. 1. Power : 1800W, ℃ : 180℃ Time: 20min heating. 2. Power : 1800W, ℃: 180℃ Time: 20minmaintain. 3. 20min cooling.
After cooling, place into 50mL volumetric flask and fill with purified water until mark.
No sample is added. Repeat the above procedure to prepare a blank test solution.
Measure with ICP-OES.

Table 2. Operational conditions of ICP-OES

Operational conditions of ICP-OES	
Parameter	Operational Conditions
Plasma gas flow	18L/min
Auxiliary gas flow	1.6L/min
Nebulizer gas flow	0.5L/min

Result

The results of the analysis of heavy metals (Antimony, Arsenic, Cadmium, Chromium, Copper, Iron, Lead, Magnesium, Nickel, Titanium, Zinc) on 14 kinds of essential oils were as follow

1. Top note of essential oil.

Lemons, Grapefruits and Lemongrass in the top notes essential oil showed Antimony, Arsenic, Cadmium, Copper, Nickel, Titanium, Zinc, Aluminum, Barium and Lead less than 10 (mg / kg), and Iron was Grapefruits 39 (mg / kg), Eucalyptus 66 (mg / kg), Lemongrass 41 (mg / kg), Clove 51.5 (mg / kg), Petitgrain 51.5 (mg / kg) and Magnesium are Grapefruits 41.75 (mg / kg)), Eucalyptus 70.5 (mg / kg), Lemongrass 38.5 (mg / kg), Clove 80.5 (mg / kg), and Petitgrain 71 (mg / kg), respectively [Table 4].

Discussion

Upon the results of heavy metal tests with essential oils, Antimony, Arsenic, Cadmium, Zinc, Chrome, Copper, Nickel, Lead, Titanium, and Barium were not detected in top, middle, and base notes, while Iron, Magnesium, and Aluminum were detected with small quantity which was the level of harmless to the human body. To be used as the therapeutic grades, essential oils should not contain any artificial ingredient, however, it is almost impossible practically not to be applied and accumulated with pesticides and chemicals in the processes of cultivation and harvest in the modern society [9]. World Health Organization reported the concentrations of cadmium and lead were 0.3ppm and 10ppm, respectively, in the dried plants which were used for raw materials of medicines, which reached the maximum allowable limits of toxic metals [10]. Despite minute quantity, toxic heavy metals may affect the functions of central nerve system, cardiovascular and digestive systems, lung, kidney, liver, endocrinological system and bones, negatively causing skin diseases, pediatric intellectual disability, adult dementia, insomnia, CNS disorders, neurological disorders, organ damages, renal diseases, liver diseases, brain damage, motor neuron disorder, atherosclerosis, cardiovascular diseases, and so on. In particular, toxic heavy metals such as mercury, lead, cadmium, arsenic, and so on may be harmful to the health in case of chronic exposure resulting in the increase of risks for multiple degenerative diseases and cancers [11,12]. Since essential oils are applied locally by respiration, diffusion, and skin, damaged or contaminated essential oils by synthetic chemicals may affect the physical and mental health badly [9,13]. Therefore, to enhance the quality value and sustain the purity of essential oils, strict international regulations are required to open not only for soil, climate, quality of seeds, distillation, harvesting and storage processes which can cause the changes of quality, but also the chemicals, cultivation and harvesting processes without pesticides, distillation process, and distribution process [14].

Conclusion

Upon the results of heavy metal tests with essential oils, Antimony, Arsenic, Cadmium, Zinc, Chrome, Copper, Nickel, Lead, Titanium, and Barium were not detected in top, middle, and base notes, whileIron, Magnesium, and Aluminum were detected with small quantity which was the level of harmless to the human body. When essential oils are applied to the human body, their absorptions are very fast to be distributed in the whole body, hence, the influences of minimum amount of heavy metals are very significant. Thus, strong international standard regulations are required to check the steps of essential oils including purity, quality tests, manufacturing processes, sourcing, and so on to apply aromatherapy safely which has been widely introduced globally.

Effects of Training of Activities of Daily Livings on Occupational Performance and Motivation in People with Intellectual Disability using Day Care Center

Nam-hae Jung

Department of Occupational Therapy, Dongseo University, Republic of Korea

Abstract

Background/Objectives: The purpose was to investigate the effects of training for activities of daily living on the performance and motivation in the people with intellectual disability using day care center.

Methods/Statistical analysis: This study is AB design in single subject study design. Three people with intellectual disabilities were given individual occupational therapy twice a week for 30 minutes, for a total of 6weeks. The occupational therapists conducted daily life activities training centered on the occupation that selected the caregiver through Canadian Occupational Performance Measure. The quality of the task performance was evaluated by Performance Quality Rating Scale (PQRS), and the level of effort and motivation during the activity was evaluated by the Pittsburgh Rehabilitation Participation Scale (PRPS).

Findings: Three adults with intellectual disability improved performance of activities of daily livings and motivation and effort level after ADL training.

Improvements/Applications: It should be evidence on effects of ADL training onoccupational performance and motivation level.

Keywords: *Activities of daily living, Day care center, Intellectual disability, Occupational therapy, Single subject design*

Introduction

Many adults with intellectual disability (ID) use day care centers and their rates are increasing [1]. Many studies have pointed out that people with ID do not receive professional services that meet their needs [2]. Adults with Mild to moderate ID can perform activities of daily living through continuous daily training, which requires continuous intervention and management. Research on occupational therapy has shown that lack of research on the effects of occupational therapy on independent activities of daily living (ADL) for adults with ID[3]. Previous study investigated the effects of occupational therapy interventions on ADL and perceptions of disability in six people with ID. Participants selected 2 daily life tasks for daily life training and developed intervention to solve problems [4]. Five of the six participants improved their quality of life activities after four weeks of intervention. Many studies have reported the effects of occupational therapy on children with ID, but the number of studies on adults with ID is insufficient. So, the purpose of this study was to investigate the effects of occupational therapy on ADL and level of motivation and effort for adults with ID.

Method

The participants of this study were 3 people with mild ID using day care center. Participant 1 (P1) was 23 years old man, participant 2 (P2) was 25 years old man, and participant 3 (P3) was 26 years old man. This study was conducted for about 2 months from October, 2018. At the preliminary stage, the researchers explained the purpose of the study to the caregivers and the subjects

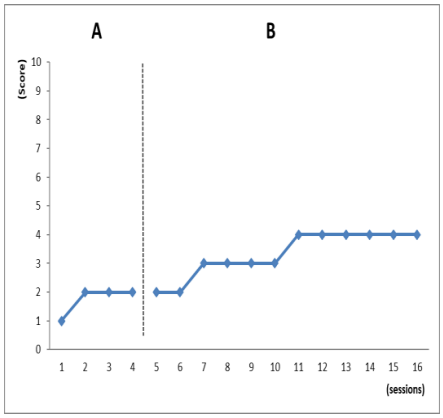
and agreed with them. The total number of assessments including baseline and intervention was 16 sessions. After the occupational therapist conducted the COPM with their caregivers, they set two activities with high importance but low performance and satisfaction as target activities. The target activities for P1 were to establish toilet training, to put on and take off the clothes for the toilet use, and the target activities for P2 were going alone to day care center from home and brushing the teeth himself. The target activities for P3 were buying some items in grocery store, and eating alone. This study is AB design in single subject study designs for 3 people with ID. The quality of performance of the two target activities was measured by PQRS and the evaluation of effort and motivation level was measured by PRPS. During the baseline period, a total of four times of assessment were performed until the data stabilized. The intervention period was a total of 12 sessions. Intervention was conducted for 30 minutes per session, twice a week for a total of 6 weeks, and PQRS and PRPS were conducted at every session.The intervention was based on the activities selected by conducting the COPM for the caregivers. Task adaptation, use of assistive devices (alarms, large ring on pants, etc.) and simplification of tasks (using credit cards instead of cash) and using environmental cue (using picture card, etc.) was conducted to improve performance of ADL. The main activity for P1 was to establish toilet training and to put on and take off the clothes for the toilet use. In order to use the independent toilet, which is the target activity of P1, we set the time for going tothe toilet during the day and kept it. Approximately the cycle was 2 hours. As soon as he arrived at the day care center, he was trained to go to the toilet at 10 pm, before 12 o'clock, and at 2 pm. The trousers were made to wear rubber banding pants so that they could easily put on and take off his pants. It continued in the order of holding and taking off the ring. The target activity for the participant 2 was going alone to day care center from home. The house and the center were 8 to 10 minutes on foot. It was familiar enough with the participants, but never without a caregiver. Participant was accompanied by a therapist fromthe center to the house, from home to the center, being instructed to go to the side the road to avoid the car. The therapist walked away from the participants slowly and continued until they did not feel anxiety. The other target activity for theparticipant 2 was brushing teeth independently. For P2 who refused to brush teeth, various mouth games were performed first. We first performed oral games such as blowing a balloon, blowing a pen, blowing a soap bubble, and reducing the sensitivity to contact with the mouth, and then introduced a weak powered toothbrush. Using a picture card, demonstration, and verbal instructions, the therapist instructed participants to brush their teeth in the order of the upper teeth molar, the upper teeth front teeth, the lower teeth molars, the lower front teeth, the palate, and the tongue. The target activity for the P3 was buying some items at supermarket, and eating alone. In order to achieve the first target activity, the therapist trained participant in order to create check a list of items to buy from the supermarket, to ask the clerk to look for items in the supermarket, to ask the clerk to look for items in the supermarket, and to pay by check card. After the intervention, he was able to purchase two or three items that were small and light. The target activity was to have dinner alone at home, but the activities were simplified for safety reasons, such as using a rice cooker or a gas range. They asked the caregiver to keep the rice and side dished for the participants in the lunch box. P3 took the lunch out of the fridge and ate it, then trained the empty lunch box to put it in the sink. COPM is a criterion-based measure of occupational performance and satisfaction. The score of COPM is from 1 to 10, and the higher the score, the higher the performance or satisfaction [5]. COPM is an evaluation tool that has high reliability and validity to measure performance and satisfaction on client centered occupation [6]. Quality of occupational performance was assessed by PQRS. PQRS is a simple tool to measure the quality of an individual's occupational performance through observations after the therapist has made operational definitions of the activities that the client has chosen. PQRS can be measured on a 10point scale from 1 point (cannot perform) to 10 points (can perform well). Test-retest reliability was 0.80 [7].Pittsburgh Rehabilitation Participation Scale (PRPS) was used to assess the level of effort and motivation during the activity. PRPS is an assessment tool for participation. The therapist is an assessment tool that monitors the subject's performance and gives a score on the level of effort and motivation during the activity. The score scale is a 5-point scale ranging from low (Poor: not participating in half of the session to a half or rejecting it) to excellent. Test-retest reliability was .91[8].

Result and Discussion

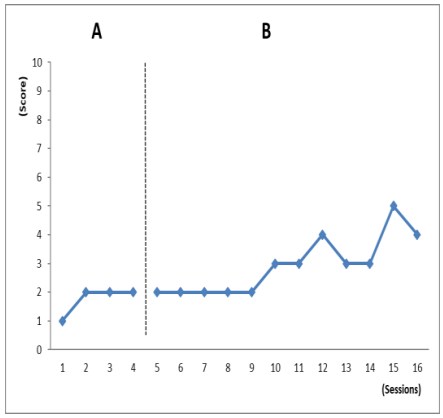
1. Change of Task Performance

The quality of performance of the target activities of



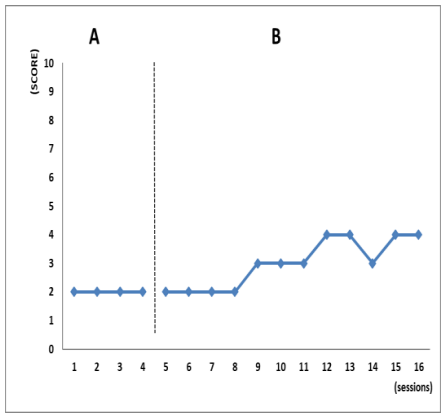
P1,2, and 3 was improved. PQRS of each subject is as follows. P1's baseline average score for Target activity 1was 2 points, and the average score was 3 points during the intervention period. The baseline average score for target activity 2 was 1, with an average score of 2.08 during the intervention period. The baseline average score for P2's target activity 1 was 1.75 and the average score during the intervention period was 3.33. The baseline average score for activity 1 was 1 point and the average score during the intervention period was 1.91. The baseline average score for target activity 1 of P3 was 1, and the mean score was 2.58 during the intervention period. The baseline average score for target activity 2 of P3 was 1.75 and the average score was 2.08 during the intervention period.

As shown Figure 1, the greatest improvement was going alone to day care center from home, which was the target activity of P2, and the buying of some items at the supermarket, which was the goal activity of P3. On the other hand, eating alone which was the goal activity of P3 showed the least improvement.



2.Change in level of effort and motivation

As shown Figure 2, during the intervention period, the level of effort and motivation of the participants' goal activities was improved than the baseline.



The PRPS scores for each participant were as follows. The baseline score for P1's target activity 1 was 3.25, improved to 4.08 during the intervention period, and the score for target activity 2 for P1 improved from an average of 1.75 points during the baseline to 2.58 during the intervention period. The baseline score for P2's target activity 1 was 1.75, improved to 2.91 during the intervention period, and the baseline score for P2's activity 2 increased from 2 points to 2.5 during the intervention period. The baseline score for target activity 1 of P3 was 1 point, the score during the intervention period was improved to 2.83, and the baseline score for target activity 2, which was 2 points, was improved to 3.75 during the intervention period. The activities that showed the greatest improvement were buying items at the supermarket which is the target activity of P3, and the activities which showed the least improvement were eating alone, which is the target activity of P2.

Discussion

People with ID must be provided with appropriate services for their life cycle. In particular, people with ID who have graduated from school and enter adulthood have a dramatically reduced chance for day services. A large number of adults with ID use day care, but they are more focused on getting care rather than providing personalized services. In study of day services for adults with ID in Ireland reported that the most noticeable change over the time from 2009 to 2014 is the increase in number of people attending care centers. The increase was largely accounted for by attendances who attends activation centers[9]. To achieve maximum independence through improved living skills, client centered occupation based occupational therapy is needed. So, the purpose of this study was to investigate the effects of client centered occupation based occupational therapy on task performance, motivation and effort level among three adults with ID using a day care center.

The target activities for P1 were to establish toilet training and to take off the pants for the toilet use, P2 were going alone to day care center and brushing the teeth himself. The activities for P3 were buying some items in grocery store, preparing and eating the dinner alone. Because the difficulty of each participant's target activity is different and individual characteristics, the effect was different. In particular, previous studies have reported that money management is a difficult skill for people with ID [10] [11], but in this study, the task performance, motivation and effort level of the purchase of goods related to money use were most improved.

In this study, P3 used a check card with a limited amount of money rather than paying directly with money. The goal of occupational therapy is to improve the performance of tasks that are meaningful and purposeful to the client [12]. To this end, environmental adjustment and compensation strategies are essential. Attaching loop on pants, using an electric toothbrushing, using alarm to remind time for toilet time, and using a lunch box were the same approaches.

Looking at the impact of client-centered occupational therapy on the performance, motivation, and level of effort of the three participants, going to the center which was target activity for P2, and purchasing items at supermarket which was target activity for P3 showed the highest improvements. The eating alone which was P3's target activity showed the lowest improvement. This was different from previous studies that personal care activities such as eating, dressing, and washing are generally easier to achieve than others [13]. This may be a result of reflecting the characteristics of the individual such as the will and motivation of the individual.

Even with ID, client-based occupational therapy is necessary because the level of ADL can vary according to various factors such as educational level, comorbid status, and environment[14]. One study reported that client-centered occupational therapy for three adults with ID improved treatment skills but did not improve motor skills and awareness of disability in all [3]. Another study[4] reported that the performance of ADL was improves by only five persons as a result of client-centered occupational therapy for six people with

intellectual disabilities.

In addition to the two previous studies, this study is also single-case design. Single case designs have been reported to be useful for examining clinical application. Although many studies have been conducted on children with ID, there is a lack of research on the effects of occupational therapy on adults with ID. It will be necessary to study the effect of occupational therapy on a large number of adults with ID.

CONCLUSION

Continuous intervention is needed to maximize the independence of ADL of people ID. Many people with ID at the day care center are not getting customized services. Three adults with intellectual disability received ADL training improved performance of activities of daily livings and motivation and effort level. ADL training was conducted with activities of high importance, low performance and satisfaction. This study will serve as a basis for providing training for ADL to people with ID using the day care center.

Evaluation of Accuracy of Stereotactic Body Radiotherapy Using 3D Moving Phantom

Gha-Jung Kim

Far East University, Department of Radiological Science, Republic of Korea

Abstract

Background/Objectives: The objective of the present study was to use original data on respiration and tumor location coordinates saved during treatment period of patients who underwent body Radiotherpay to operate a 3D phantom for backward verification of the accuracy of stereotactic body radiotherapy.

Methods/Statistical analysis: The present study acquired original treatment data of 20 patients who underwent CyberKnife radiotherapy. Radiation was irradiated on the 3D phantom after applying external respiratory coordinates and tumor movement coordinate, which were original data from actual patients. The irradiated radiochemical film was scanned 24 hour later and assessment was made by γ-index values based on comparison of 2D dose distribution and radiotherapy plan.

Findings: The mean correlation error of entire treatment process of 20 patients was 1.26±073 (range: 0.47-1.98). The mean respiratory cycle of the patients during the entire treatment period was 3.77 sec (range: 1.90-5.39 sec). As an indicator of regularity of patient respiratory cycle, standard deviation of respiration during the entire treatment period was measured, the results of which showed minimum of 0.35 and maximum of 1.65. When the respiration and internal tumor movement of entire process after completion of treatment in 20 patients were applied to the 3D phantom for comparative analysis against the treatment plan, the mean pass rate of gamma-index values was 95.20±4.35% (range: 81.87% - 99.92%). Since the mean pass rate was ≥ 95%, accuracy of radiotherapy was confirmed by backward verification

Improvements/Applications: The significance of the present study can be found in the fact that it performed backward dose verification by reproducing respiratory and tumor coordinate after radiotherapy, using the same condition as before radiotherapy.

Keywords:*Stereotactic body radiotherapy, 3D moving phantom, γ-index value, CyberKnife, Respiratory cycle*

Introduction

According to 2017 data from Statistics Korea, cancer-related mortality accounts for 27.6% of all mortalities while showing an ever increasing trend. Along with the increase in the number of cancer patients, the role of radiotherapy has increased as well and effective radiotherapy would need to maximize the local tumor control rate by irradiating high radiation dose to the tumor while delivering minimum dose to surrounding normal organs. Currently, effectiveness of radiotherapy is being enhanced through application of various treatment techniques based on Image Guided Radiotherapy (IGRT), such as 3D Conformal Radiation Therapy(3D-CRT), Intensity Modulated Radiation Therapy(IMRT), Volumetric Arc Therapy(VMAT), Stereotactic Radiosurgery(SRS), and Stereotactic Body Radiation Therapy(SBRT) [1-4].

However, radiotherapy for tumor in parts of the body with significant amount of motion faces difficulties [1]with determining the target volume or predicting the exact location of the tumor. According to the ICRU Report 62, it is recommended that Planning Target Volume (PTV) be divided into Internal Margin(IM) and Setup Margin(SM) to be within the irradiation field

Corresponding Author :
Gha-Jung Kim,
gjms1225@hanmail.net

with inclusion of all normal tissues within the range where movement of the organs is expected[5]. Moreover, American Association of Physicists in Medicine (AAPM) limits respiratory control or 4D-CT when tumor movement is ≥ 5 mm [6], while tumor control rate associated with radiotherapy is being improved by high-dose hypofractionated radiotherapy by 4D- radiotherapy, such as Respiratory Gated Radiotherapy(RGRT) and Cyberknife Synchrony that can compensate for moving organs due to respiration[7-9].

Calibration and pre-dose measurement of such complex and precise therapeutic techniques are very important processes, which are also essential processes for assuring accurate dose delivery, and International Commission of Radiological Units and Measurements(ICRU) recommends that the accuracy of radiation treatment dose should be within 5%. However, various variables, such as the condition of the patient, respiratory cycle, and treatment time, may cause the results in the actual treatment process to appear differently than the standardized pre-dose assessment results[10,11].

Accordingly, the objective of the present study was to use original data on respiration and tumor location coordinates saved during treatment period of patients who underwent body radiotherapy to operate a 3D phantom for backward verification of the accuracy of Stereotactic Body Radiotherapy(SBRT). The study also aimed to assess how variables, such as condition of the patient, respiratory cycle, and treatment time, are correlated with achieving accuracy of treatment[12].

Method

1. Subjects and acquisition of original data on tumor location coordinates

The present study acquired original treatment data of 20 patients who underwent CyberKnife radiotherapy (AccurayInc, Sunnyvale, CA).

Table 1. Information of patients who underwent SBRT

List		Pt (%)	Min	Max	Mean	SD
sex	M	9(45)				
	F	11(50)				
Site	Lung	10(50)				
	Liver	10(50)				
Age	30	2(10)				
	40	4(20)				
	50	7(35)				
	60	5(25)				
	70	2(10)				
			33	76	55.9	12.06
Tumor Volume(cc)			7.8	165.4	57.78	47.5
Total Dose(Gy)			36	60	48.05	7.85
Number of Beam			108	259	227	34.56
Treatment Time(min)			38	86	75.75	10.25
Total		20(100)				

[Table 1] shows the information about the patients who underwent SBRT, which included 10 patients with lung cancer and 10 patients with liver cancer. Their mean age was 55.9±12.06 years and there were 9 males and 11 females. The mean tumor volume (MTV) was 57.78±47.5 cc; mean prescribed dose (MPD) was 48.05±7.85 Gy; mean number of beams was 227±34.56; and mean treatment time was 75.75±10.25 sec.

The CyberKnife system employed in the present study uses an X-band linear accelerator to generate 6 MV X-ray with frequency of 9300 MHz. In addition, IGRT was performed using an orthogonal diagnostic X-ray generating device to calculate the tumor coordinates in real time by comparing to DRR images. The Synchrony respiratory tracking system is a system that delivers radiation to tumor in real time by 3D linear movement and prediction of tumor movement based on calculation of robot delay time by the movement tracking computer using modeling that simultaneously acquires external respiration (external marker) using LED and internal tumor movement (internal marker) using IGRT[13]. Among the original data of patients who completed SBRT, the present study saved and analyzed Markers. log files, representing external respiratory movement coordinates, and Modeler.log files, representing internal tumor movement. In addition, external respiratory coordinates and tumor coordinates were reproduced in the 3D phantom for irradiation applying the same conditions as the actual treatment for backward verification of 2D

dose assessment. Moreover, the deviation between the predicted spatial coordinates and actual internal tumor coordinates was assessed by correlation error, and as shown in Equation (1), it is calculated as square-root mean based on superior/inferior, left/right, and anterior/posterior deviations. Among the original data, MtsMain.log files were used to measure and analyze the correlation error for the entire treatment process.

$$\text{Correlation error} = \sqrt{(dev_{Sup-Inf})^2 + (dev_{Rt-Lt})^2 + (dev_{Ant-Post})^2} \quad \text{---- (1)}$$

2. Assessment of accuracy of SBRT using a 3D phantom

As shown in [Figure 1], the 3D phantom comprised 2 axes that independently reproduced movement coordinates of the external marker and movement coordinates of internal tumor. It was operated by transmitting log coordinates acquired every 0.1 s. For the assessment of dose accuracy, radiochemical film (Gafchromic EBT, Wayne NJ, USA) was inserted into a cube-shaped body sized 63.4 mm^3.

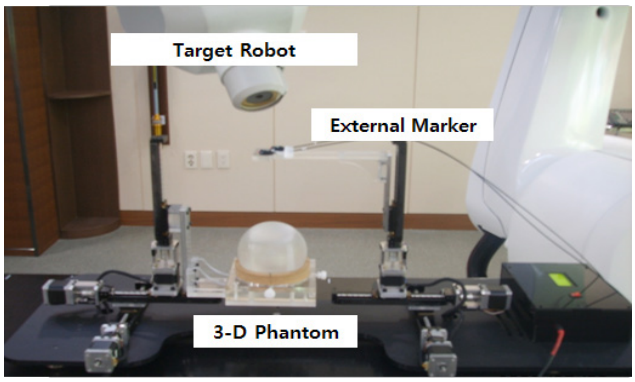

Figure 1. 3D phantom and CyberKnife treatment system used for backward verification of SBRT

To assess the accuracy of SBRT, CT scan was performed on the phantom to set a virtual target volume in the center and isocentric technique treatment plan was established by applying total bean number of 108, 5 Gy, and 20 mmφ cone. Radiation was irradiated on the 3D phantom after applying external respiratory coordinates (Markers.log) and tumor movement coordinate (Modeler.log), which were original data from actual patients.

[Figure 2] shows the process of delivering radiation according to the isocentric technique treatment plan designed by MultiPlan treatment planning system by applying original SBRT data to the 3D phantom.

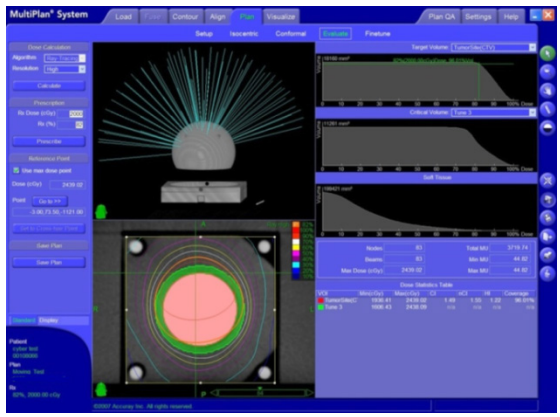

Figure 2.Dose distribution and isocentric technique treatment plan using radiotherapy planning system

The irradiated radiochemical film was scanned 24 h later and assessment was made by γ-index values based on comparison of 2D dose distribution and radiation treatment plan. Typically, γ-index value is based on a criterion of dose difference and DTA of 3% / 3 mm. where passing that criterion gives γ-index value of ≤ 1, whereas failing the criterion gives a value > 1. The γ-index values are calculated at all 2D points for calculation of the pass rate to make sure that it is within the allowable range[14,15].

[Figure 3] shows the dose distribution with calculation of γ-index values from scanning the Gafchromic EBT film after irradiating the 3D phantom that was operated after applying the respiratory and tumor coordinates of patients who underwent SBRT.

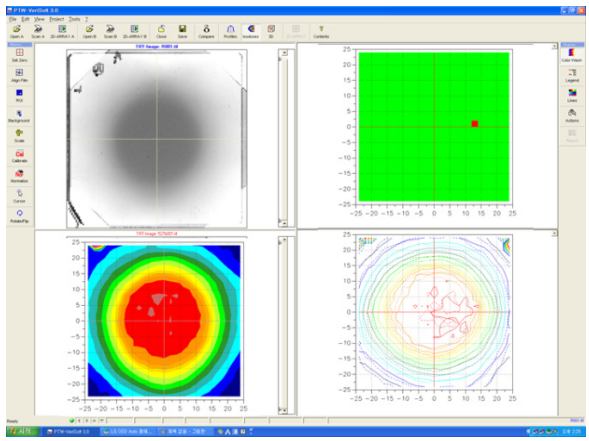

Figure 3. Measurement of γ-index values from scanning Gafchromic EBT film after irradiation applying the 3D phantom

Result and Discussion

[Table 2] shows the results of assessing correlation error and respiratory cycle based on analysis of original data of patients who underwent SBRT, along with γ-index values from using the 3D phantom.

The mean correlation error of entire treatment process of 20 patients was 1.26±073 (range: 0.47-1.98). The mean respiratory cycle of the patients during the entire treatment period was 3.77 s (range: 1.90-5.39 s). As an indicator of regularity of patient respiratory cycle, standard deviation of respiration during the entire treatment period was measured, the results of which showed minimum of 0.35 and maximum of 1.65. When the respiration and internal tumor movement of entire process after completion of treatment in 20 patients were applied to the 3D phantom for comparative analysis against the treatment plan, the mean pass rate of γ-index values was 95.20±4.35% (range: 81.87% - 99.92%). Since the mean pass rate was ≥ 95%, accuracy of radiotherapy was confirmed by backward verification.

Table 2. Correlation error, respiratory cycle, and γ-index value of 20 patients who underwent SBRT

Pt	Correlation error		Respiratory Cycle		Gamma-index(%)	
	Average (mm)	SD	Average (sec)	SD	passed	failed
1	1.29	0.71	3.18	0.47	97.72	2.28
2	0.47	0.57	1.90	0.35	99.92	0.08
3	0.75	0.32	3.91	0.83	98.97	1.03
4	1.04	0.62	3.81	0.76	96.98	3.02
5	0.82	0.44	3.37	1.62	95.67	4.33
6	1.74	0.87	4.53	1.65	88.17	11.83
7	1.90	0.71	2.67	0.99	93.29	6.71
8	1.98	0.88	3.29	0.46	95.65	4.35
9	1.54	1.22	5.39	1.45	92.33	7.67
10	1.57	1.18	3.52	0.53	96.46	3.54
11	1.13	0.77	3.11	1.42	95.25	4.75
12	1.41	0.80	4.06	1.10	95.55	4.45
13	1.51	1.18	5.20	1.40	81.87	18.13
14	0.97	0.54	4.23	0.90	98.64	1.36
15	0.95	0.56	4.46	0.78	99.13	0.87
16	1.12	0.75	4.45	1.33	96.47	3.53
17	1.18	0.76	2.98	0.61	97.39	2.61
18	0.94	0.34	3.17	0.38	98.15	1.85
19	1.49	0.78	4.43	1.28	88.67	11.33
20	1.47	0.68	3.73	0.80	97.73	2.27
Total	1.26	0.73	3.77	0.96	95.20	4.80

However, there were 5 patients with pass rate < 95% relative to dose difference and DTA of 3%/3 mm. [Table 3] shows the results of testing for significance after statistical processing for correlations between accuracy of SBRT and variables that could be checked during the treatment process, such as age of the patient, tumor volume size, treatment time, correlation error, respiratory error, and regularity of respiratory cycle. The results showed no correlation with age of the patient ($p<0.966$), tumor volume size ($p<0.756$), and treatment

time ($p<0.822$), while accuracy of treatment showed high correlation with correlation error analyzed using original data of treatment process ($p<0.011$) and regularity of respiration during the entire treatment period ($p<0.003$). In particular, it is believed that respiration and accuracy of treatment are considered to be the most important factors for assuring accuracy of SBRT. CyberKnife radiotherapy employs the method of real-time tracking of radiation beam based on prediction by the robot through modeling of respiration and tumor coordinates, and the present study confirmed that irregularity of respiration is an important variable that determines success or failure of treatment.

Table 3. Correlation analysis between γ-index value measured using the 3D phantom and various variables

Index	person correlation coefficient with gamma-index			
	mean	SD	r-value	p-value
Age	55.9 (years)	12.06	-0.01	**0.966**
Tumor Volume	57.78 (cc)	47.5	0.074	**0.756**
Treatment Time	75.75 (min)	10.25	0.054	**0.822**
Correlation error	1.26 (mm)	0.73	-0.558	**0.011***
Respiratory Cycle	3.77 (sec)	0.96	-0.636	**0.003***

Recently, SBRT for moving tumor is being used more often, and in addition, various studies are investigating calibration using a phantom. However, there are difficulties in reproducing the movement of tumor by linking it to the respiration of actual patients. The present study was meaningful in that it used CyberKnife respiration tracking system to acquire external and internal respiratory coordinates from the original data and conducted tests using a 3D phantom that can reproduce such coordinates, thereby conducting a dosimetric assessment on calibration after treatment. Moreover, the importance of regularity of respiration in treatment plan that compensates movement of organs was recognized.

Conclusion

The goal of radiotherapy to achieve local tumor controls by delivering accurate radiation dose to the tumor region, while also minimizing radiation hazard in normal tissues. Development of new equipment and techniques designed to increase such therapeutic ratio has allowed higher therapeutic effect by allowing accurate irradiation. Currently in the field of radiation treatment, there is high interest in SBRT, a therapeutic method that can deliver accurate dose to moving tumor with minimal damage to normal tissues. The significance of the present study can be found in the fact that it performed backward dose verification by reproducing respiratory and tumor coordinate after radiotherapy, using the same condition as before radiotherapy. The results showed mean pass rate of 95.2% relative to γ-index values. Moreover, correlation analysis on respiratory cycle, treatment time, and condition of the patient during SBRT showed that regularity of respiration was the biggest influencing factor. Based on these findings, treatment success or failure depending on respiration during SBRT should be made aware and more accurate treatment should be performed through practice. Since the present study used only CyberKnife that can identify respiratory and tumor coordinates, it is believed that the importance of regularity of respiration in patients could be made aware even for 4D- Radiotherapy or RGRT using Real-time Position Management™ (RPM) system.

A Study on Perception of Nursing School Students on Long-Term Care Hospital

Sunyoung Jang

Associate Professor, *Hanseo Univ., 46 Hanseo1 Ro, Haemi-myun, Seosan-si, Chungcheongnam-do, Dept. Nursing, South Korea*

Abstract

Background/Objectives: The aims of this research are to examine perceptions of nursing school students on long-term care hospitals, classify perceptions into different types, and describe characteristics of different types.

Methods/Statistical analysis: The applied methodology is Q method. 15 students in nursing department at A college were asked to evaluate 46 statements on long-term care hospitals. The collected data were analyzed using QUANL PC Program.

Findings: This research found out 3 factors in perceptions on long-term care hospital, which explained 42.28% of the total variation. It was found that explanatory power of the first factor was 20.71%, that of the second factor 14.19%, and that of the third factor 20.71%. Among the total respondents, 6 belonged to the first factor, 5 to the second factor, and 4 to the third factor. Those who belong to the same factor have similar perception on long-term care hospital. The perceptions of respondents were classified into 3 types: 'nurse consideration type', 'patient family-oriented type', and 'merits and demerits consideration type'.

Improvements/Applications: This study is intended to provide basic sources to understand perceptions of nursing school students on long-term care hospitals, and educating them.

Keywords:*Long-term care hospital, Nursing school students, Perception, Q methodology, Nurses.*

Introduction

The demand for public health and medical service for old patients has increased, and, with the change of family structure and growing number of women who have regular jobs, low birth rate and nuclear family phenomenon has become serious. Owing to the social changes such as increase of one-person household, the role and function of traditional family have been weakened. Family members who played important roles in caring old members of family can no longer play such roles because of the the change of family structure. And, the demand for long-term care hospitals has increased. Not only old patients with chronic diseases but those who need long-term recuperation and treatment for chronic diseases (dementia, paralysis, and terminal cancer, etc.) search for long-term care hospitals.

Accordingly, many long-term care hospitals are being built. According to the survey of the Health Insurance Review & Assessment Service, in 2004, the number of long-term care hospitals was only 109, but soared to 1,346 in 2015, over 10-fold increase in 10 years[1]. The number of patients in long-term care hospitals is about 140,000, 30% of all the patients hospitalized in all medical facilities. In the elderly medical system, convalescent hospital is located between acute care hospital and long-term care hospital[2], and is considered as the long-term living space place where old patients receive total care in the wide range from physical, mental, emotional, and even spiritual areas[3].

Nurses take the largest part in public health and medical care, and are core workers who have the closest contact with objects. In the rapidly changing public

Corresponding Author :
Sunyoung Jang,
sjang@hanseo.ac.kr

health and medical care environment, they should provide safe and high-quality care to objects within limited time[4]. Therefore, it is important to figure out perceptions of nurses and preliminary nurses.

Q method is what starts with the perspective of actor instead of the assumption of researcher, and it allows researcher to examine the characteristics of different types depending on the subjectivity structure of humans[5]. As perception of nursing school students on long-term care hospital is subjective experience of them, Q method is a proper method to identify types of perception of them on long-term care hospital.

Accordingly, this study aims to examine the subjective structures of perception of nursing school students on long-term care hospital, and provide basic data to develop educational programs differentiated to characteristics of various subjective types of nursing school students on long-term care hospital.

Method

1. Selection of Q Population and Q Sample

To extract comprehensive statement of nursing school students on effect of long-term care hospitals, this research examined domestic and foreign literature, open-ended questionnaire, and in-depth interview. Through such a process, this research produced Q population in 3 areas, and over 150 units. In addition, through examination of domestic and foreign literature, this research extracted over 80 Q population. Q samples were inspected and revised, and, finally, 46 samples were finally selected.

2. Q classification and data analysis method

Q classification method is to classify Q sample statements of respondents with forced normal distribution method, and, by this method, each individual makes voluntary definition on long-term care hospital[6]. This research collected data using Q card from 15 students of nursing department, 00 college. The time spent to complete Q classification by each respondent was 20-25 minutes. The distribution of Q samples was made by the method that each respondent was asked to respond to the statements chosen as Q samples. The range of responses is from strongly positive to strongly negative. The scale is 12-point one. Afterwards, the respondents who chose extreme points in the scale were interviewed.

Q factor analysis was done by Principle Component Factor Analysis (varimax). In choosing factors, the critical value was over Eigen value 1.0. The factors were selected based on Eigen value and total explained variation. Collected data were converted to scores on the 12-point scale on forced distributed card. Imposed converted scores were coded in the order of Q sample numbers, and they were processed with Principle Component Factor Analysis. Data were analyzed with the QUANL PC Program.

3. Ethical consideration on research objects

Research respondents agreed to participate in the survey by their own wills, and they were given explanation that they could stop answering the questions any time during the survey. To respect rights of respondents and protect their privacy, and individual information secret, all the data were treated without respondent names. They were encoded, and under Q sorting.

Result and Discussion

1. Characteristics of different types in perception on long-term care hospital

To classify perceptions of nursing school students on long-term care hospital into different types, this research described characteristics of different types focusing on statements belonging to the types [Table 1].

To analyze characteristics of each type of perception on long-term care hospital, the statements whose questions got z-scores over ±1.00 were given meanings. This research found that the number of those whose weights were over ±1.00 was 6 in Type Ⅰ, 5 in type Ⅱ, and 4 in type Ⅲ.

Table 1: Eigen Value, Variance, and Cumulative Percentage

	Type I	Type II	Type III
Eigen Value	4.1411	2.8373	1.4773
Variance(%)	.2071	.1419	.0739
Cumulative	.2071	.3489	.4228

2.Analysis of each type

- Nurse consideration type: The number of nurses belonging to Type □was 6. The statements to which

respondents answered very positively were 'Patient selects long-term care hospital with good environment' (Z=2.20); 'The number of nurses is not sufficient' (Z=1.48); 'It is possible to prevent dementia through efforts by long-term care hospital' (Z=1.44). The statements on which respondents were most negatively were as follows: 'We cannot trust long-term care hospital' (Z=-1.80); 'Long-term care hospital is more helpful to those who cannot lead daily life because of diseases' (Z=-1.69); 'In Long-term care hospital, role conflicts are increasing' (Z=-1.60).

The characteristics of respondents in Type Ⅰ can be summarized as follows: They perceive that long-term care hospital is inevitable in Korea which is characterized by low birth rate and the increase of the proportion of the elderly. They expect that, for nurses, the job opportunities in such hospitals will increase. They view that long-term care hospitals should provide patients with good environments and various programs, and that, nurses should improve their capacities. In their view, long-term care hospital plays more positive roles than its negative image the media give to people. In short, long-term care hospital has more merits than demerits. Accordingly, this research defines Type Ⅰ as nurse consideration type.

- Patient family-oriented type: 5 respondents belong to Type Ⅱ. The statements to which respondents who belong to Type Ⅱ were as follows: 'Patients choose long-term care hospital with good environment' (Z=2.06); 'It is necessary to develop various programs for old patients' (Z=2.01); 'Hospitalization of the elderly to long-term care hospital can satisfy demands of family members of them' (Z=1.41). Among the statements belonging to Type Ⅱ, what has the highest weight was statement 2 (0.8375). What made respondents agree most positively were statement 5 and statement 3. What made respondents respond most negatively were as follows: 'People trust long-term care hospital more than general hospital' (Z=-2.22); 'Long-term care hospital can help the elderly improve their quality of life' (Z=-2.07); 'Patients can get patient-oriented medical service in long-term care hospital' (Z=-1.53).

The characteristics of Type Ⅱ reveal the perceptions of respondents to long-term care hospitals on whether such hospitals treat patients as if they are family members. Respondents were asked to respond to statements from the position where they are caring old patients or have dementia patients. So, they focus on burdens family members should burden. Even if patients cannot receive treatment in long-term care hospitals as much as when they are cared by family members or in general hospital, they choose long-term care hospitals, because it can reduce burden of family members, and they consider some cautions when they choose a hospital. This research named Type □as 'Patient family-oriented type'.

- Merits and demerits consideration type: The number of respondents belonging to Type 3 is 4. The statements which got strong positive responses were as follows: 'Patients can get patient-oriented medical service in long-term care hospital' (Z=1.89); 'Such a hospital is more helpful to the elderly who cannot lead daily life because of diseases' (Z=1.74); 'Such a hospital is stronger in qualitative aspect than in quantitative aspect' (Z=1.58). What received the most negative responses from respondents were as follows: 'It is difficult to protect privacy in long-term care hospital' (Z=-1.72); 'Long-term care hospital can help patients receive long-term recuperating treatment' (Z=-1.69); ' Easy accessibility is important for patients to choose a long-term care hospital' (Z=-1.52).

Respondents belonging to Type Ⅲ perceive that long-term care hospital is inevitable today, and that we should think of the ways to improve such hospitals. They perceive that long-term care hospitals opened recently try to improve the public image of long-term care hospital, and revise the demerits of such hospitals, overcoming old management policies. With the increase of the number of long-term care hospitals, they perceive, old patients with chronic diseases can have good treatments. So, this research named Type Ⅲ as 'merits and demerits consideration type'.

Discussion

Type Ⅰ is 'nurse consideration type'. It is reported that patients with dementia in long-term care facilities have more desires which are not fulfilled than old patients in acute hospital or old people who visit primary care clinics[7-8]. Such a phenomenon seems to be caused by the fact that the treatments in long-term care facilities like the elderly-special hospital or nursing home are not given in response to the desires of patients, but by the seriousness of the disease or conveniences of nurse providers like nurses or assistant nurses. Such a problem is not the one which can be found only in Korea, but discovered also in foreign studies. Namely, it has been

pointed out that medical service in long-term care facilities are provided not based on individual desires of patients, but on physical and mental symptoms of patients, and management of disability[9]. Foreign studies reported that, due to shortages of personnel and economic resources, it is difficult for nursing providers in long-term care facilities to fulfill desires of patients, particularly, social and emotional desires of them[10]. According to a study[11], among the symptoms demential patients suffer, only 10% are from the disease, and the rest 90% are from quality of nursing they are provided with and the environment. Therefore, it is necessary to evaluate patient's desires, and reflect them in the care of patients, which can soothe the symptoms of patients or postpone aggravation of symptoms, and improve quality of life of them.

Type II is 'patient family-oriented type'. Accordingly, it is necessary for long-term care hospitals to prepare conditions where they can continue to communicate with patients and protectors of patients. Hardin[12], and Newbern & Lindsey[13] argued that it is important to maintain communications between the medical team and patients and with families of patients, and it is necessary to communicate with patients and with families of patients in deciding how to treat the patients. Recently, nursing philosophy is changing to patient-focused and patient's rights-respecting ways. In particular, family members of patients have more say in the treatment process. Thus, the medical team should try to understand emotion and complaints of patients and families of patients, and provide them with information and alternatives in the decision-making in treatment. Eustis et al [14] argued that, with the change of nursing philosophy, patients and families of patients will play the role of subjective decision-makers in medical and nursing places.

Type III is 'merits and demerits consideration type'. When the period of caring an old patient with dementia gets long, family members including the primary care-giver suffer physical fatigue, depression, powerlessness, tension, or anxiety, and reveal actions without self-control such as impatience and anger to patients[15-16].

The government intended to increase the number of credible long-term care hospitals by strengthening merits and revising flaws of them. Credibility is the most important factor for long-term care hospitals to respond to social and family demands in the age of aging population and spread of chronic diseases.

This kind of a study on perception can be used a basic sources for long-term care hospital supporting program which attracts attention recently. In addition, this study expects that, by suggesting the perceptual structure and characteristics of each type on the perception of nursing school students on long-term care hospital, the findings of this study will serve as basic data for educational programs.

Conclusion

This study is intended to provide basic data to adopt policies to activate programs to support long-term care hospitals by classifying perceptions of nursing school students on long-term care hospitals. It is expected that the classification of nursing school students into different types will help to develop educational programs considering characteristics of such types. This study suggests that there will be further studies on analysis of different types by choosing samples considering various factors, and qualitative studies to identify various factors affecting nursing cares of patients in long-term care hospitals.

Related Determinants of Eye Disease, Cataract, Glaucoma and Macular Degeneration Among Adults of Korea: from the 7thKnhanes

Hye-Sook Choi[1], **Moon-Hee Kwon**[2]

[1]Kyungdong University, Dept. of dental Hygiene, Korea, [2]Kyungdong University, Dept. of Nursing, Korea

Abstract

Background/Objectives: Eye disease problems are rapidly increasing worldwide. But few studies have been performed despite of its importance. Our study was aimed to find out the major determinants of cataract, glaucoma and macular degeneration.

Methods/Statistical analysis: The 7thKnhanes(KOREA NATIONAL HEALTH and NUTRITION EXAMINATION SURVEY) data was used to identify the association of the major determinants of eye disease including cataract, glaucoma and macular degeneration. We used the national representative data. 4041 participants were involved and analyzed to find out affecting major determinants of eye diseases with multiple- logistic-regressions by complex-sampling-methods.

Findings: The prevalence of eye disease was 15.6%. The most affecting related determinant was ageing. Through analyzing with multiple-logistic-regression, our study showed that ageing of over 65 aged group (OR 44.96; 95%CI; 13.07-154.72) and 35-64 aged group (OR 4.58; 95%CI; 1.35-15.53) compared to 19-34 aged group were showed as the strongest determinant of eye disease significantly. And the next determinants were revealed as in no presence of spouse (OR 1.63; 95%CI; 1.27-2.10) and lowering education level,especially in under elementary educated group (OR 1.64; 95%CI; 1.15-2.34), poor oral health (chewing difficulty)(OR 1.43; 95%CI; 1.02-2.10 and in more getting stress group(OR1.39; 95%CI; 1.07-1.80) in order.

Improvements/Applications: Therefore, well designed public health interventions such as health education of the community including improving chewing ability and managing stress should be accomplished in the community basis of primary health care for the successful ageing as well as preventing eye diseases of Koreans.

Keywords:*Cataract, Glaucoma, Macular degeneration, Ageing, Spouse, Education level, Chewing, Stress*

Introduction

The prevalence of eye diseases such as glaucoma was remarkably high among the elderly and risk factors were related with older age[1-3]. And dietary intake of vitamins showed a beneficial association with eye disease such as glaucoma[4-5] and certain components of diet was reported to be related with the progression and incidence of glaucoma[6]. Furthermore, people with glaucoma was reported to be exposed to get the risk of Alzheimer's disease[7] which was known for losing memory and cognitive function cause of fatal change of personality and behavior[8]. And also, it was reported that chronic disease like glaucoma patients need more personalized care to manage[9].

And social and economic burdens as well as vast medical cost of eye disease were rapidly increasing. Despite of its growing importance, there are rare studies on their major determinants of eye disease such as cataract, glaucoma and macular degeneration. Therefore, we tried to investigate the determinants of eye diseases among Korean adults in the trend of rapidly ageing

population.

Method

The 7thKnhanes data (KOREA NATIONAL HEALTH and NUTRITION EXAMINATION SURVEY) was used to identify the association of the major determinants of eye disease including cataract, glaucoma and macular degeneration with the data based on such as general characteristics (age, gender), socio-economic status(occupation, presence of spouse, income level, education level), health related behaviors(smoking, alcohol drinking, aerobic physical exercise, eating breakfast, sleep duration), dietary supplements and oral health factors (chewing problem) as well as psychological factor(stress level).

We used the national representative data with getting the approval of Institutional Review Board as well as collecting informed consents of all participants. 4041 participants were involved and analyzed to find out affecting major determinants of eye diseases with multiple- logistic-regressions by complex-sampling-methods using the package of SPSS (ver. 21.0).

Result and Discussion

[Table 1] reveals the general demographic and health-behavior characteristics of 4041 participants. The prevalence of eye disease like cataract, glaucoma and macular degeneration was 15.6%. 65 and over aged group was 28.9% and 35-64 aged group was 62.7%. Over half of the participants was female. The lowest education group (under elementary) was 24.5%. Having no spouse group was 16.1%. Drinking experience group was 87.0% and present smoking subjects were 38.0%. Approximately a quarter of the participants were not in good status of oral health with chewing difficulty and feeling much stress group. About half of them were showed as not having normal sleep time.

The odds of related determinants of eye disease according to variables are shown in [Table2]. The strongest determinant of eye disease was ageing, especially which the risk of eye disease was showed dramatically the highest in oldest aged group (65≤) and in 35-64 aged group compared to under 35 aged group. And the next major determinants of eye disease were investigated as lowering of education level, lowering of chewing ability, no presence of spouse, alcohol drinking, owner running business job compared to office job, no physical activity, gender(female) group and not having breakfast group in order.

Discussion

Through our study analysis after adjustment, we found the strong correlation among the ageing, education level (getting lowering trend), the presence of spouse (having no spouse), oral health (lowering level of chewing ability), getting more stress, and the risk of eye diseases significantly.

Ageing identified as the strongest major remarkable determinant of eye diseases in our findings was supported by other studies which resulted in focusing on age and intra-ocular pressure especially in glaucoma of some physiological aspects[10-11] and physiologically and clinically supporting by another study[2].Another recent study of Denmark which the strong association of chronic inflammation and aged related macular degeneration was identified[12] and these results are partially supporting ours even though having the difference of sample subjects and study methods. By another study of Iran, which was identified that older age and high intra-ocular pressure were the major risk factors of glaucoma among adults[1], it was also having in consistency with our findings. Moreover, that central corneal thickness and endothelial cell density as the important protective and optical layer for normal anatomical and physical function were also investigated to be decreasing with regards to age of Pakistan's study[3] was also supporting our results. Educational level, which was found to be thesecond major determinant of eye disease in our study, was also identified as the risk factor especially in glaucoma patient by another one[13] and these findings were supporting ours. And according to another Malaysia's study, which they found the major affecting factors as age, education level in visual fields of glaucoma patients[14], was also supporting our findings in some aspect despite of the different sample population and methods. The presence of spouse, which was found to be the major determinant of eye disease through our study analysis, might be broadly explained in some aspect by another recent population-based study of Spain, identifying the association between loneliness and physical multi-morbidity[15].Oral health (level of chewing ability), identified as the strong and important determinant of eye disease in our study analysis, was well supported in some view of functional aspects of oral health in nutritional balance by another study dealing with the relationship between the role of diet and eye disease such as glaucoma[5-6]. Psychological stress, which was known to be related with eye disease especially among workers and females of another recent Korean study[16], was also found to be major determinant of eye diseases through our study. According to another population-based study, they found physical multi-morbidity was identified to be associated with anxiety, stressful life-events and depression among 16-44 aged group[15]and these findings were also enhancing our results even though directly not related with eye disease. The association of anxiety, depression and eye disease like cataract or glaucoma was also found to be correlated[13].Moreover, by another Taiwan's 13-year nationwide cohort study, it was reported that the significant association of normal tension glaucoma and the Alzheimer's disease[7]was identified and these results suggest that we might to deal with the eye disease clinically and public health management as well as considering psychological aspects. Especially it was reported that more personalized health care might be helpful to manage the chronic disease like glaucoma according to interventional cohort study of US[9].

On the other hand, to prevent eye diseases, it was reported that social support and increasing the capacity of resilience were investigated to improve quality of life especially in glaucoma patients[17]and these outcomes were also partially supported our results which more psychological stress was related with eye disease. According to another Korean study, niacin as the modifiable nutrient was identified to be strongly related

with normal tension glaucoma[5]which was known to have more common in Asians and leaded to vision loss as the neuro-degenerative progressive disease. Furthermore, individual's diet such as maintaining weight with normal range, avoiding excessive consumption of coffee, and increasing the vegetables and fruits eating was reported and found to have an impacting on the progress of glaucoma as well as intra-ocular pressure[6].

It was reported that retinal stress and oxidative stress induced by metabolic disturbance were physiologically and clinically identified to be linked with the retinal degeneration including age-related macular degeneration[18]and these finding was supporting in some aspects of our findings.

In gender aspects, particularly, the risk of eye disease was increased in our study even though having no significance after adjustment and these results were also supported by another study despite of different sample subjects and study methods[16]. In view of dietary supplements, that one, another study of Netherlands which they found the beneficial association of vitamin A and C in glaucoma[4] was not consistent with our findings that dietary supplements were not related with eye disease and that is thought to be due to study design and methods. In term of clinical and physiological aspects, there were some reports of dealing with eye disease in genetic aspects[19] and in physiological aspects by prospective study[20].

Conclusion

The strong valuable point of our study is that we used the recent nationwide representative data of the 7th KNHANES as possible as it might be generalized. Second, we dealt with the important determinant factors of eye diseases in the state of dramatically increasing of older people in Korea as well as growing in the worldwide. Third, we included the important variable of oral health as the indicator of good health and nutritional balance. And the limitation of our study was that we did not specify on the remarkable health behavior such as smoking and drinking.

Therefore, well designed public health interventions such as health education of the community including improving chewing ability and managing stress should be accomplished in the community basis of primary health care for the successful ageing as well as preventing eye diseases of Koreans.

Change of Histological Shape and Gene Expression of Thymosin β_4, c-Myc, Erb-B_2 and TGF-$\beta_1$byAcute Hepatotoxicity

Jean-Soo Kim[1], Dong-Yeop Lee[2]

[1]Department. of Clinical Laboratory Science, Daejeon Health Institute of Technology, South Korea,
[2]Department. of Physical Therapy, SunMoon University, South Korea

Abstract

Background/Objectives: The aim of this study was to evaluate the expression of TGF-β_1, C-Myc, Erb-B_2 and Thymosin-β_4 in acute hepatotoxicity.

Methods/Statistical analysis:The test method produced an acute hepatic model by oral administration to 10-week-old BALB/c using CCl_4 and studied changes in the gene expression of TGF-β_1, C-Myc, Erb-B_2, and Thymosin-β_4 through real-time PCR.

Findings: The results showed that the histological changes and the expression of Thymosin β_4, C-Myc, and TGF-β_1 gene were higher in liver injury than normal tissues.

Improvements/Applications: In addition to serological and systematic examination in the prevention and determination of liver function-related diseases, genetic expression by molecular diagnostic techniques of TGF-β_1, C-Myc and Thymosin-β_4 could be used as an aid in liver disease determination.

Keywords: *C-Myc, Masson trichrome, Hematoxylin, Erb-B_2, Thymosin-β_4*

Introduction

The recent development of medical technology has been accompanied by expectations of increased life expectancy. However, prolonged life expectancy for people exposed to various diseases can reduce the quality of life. In particular, modern humans are exposed to various liver diseases such as cirrhosis and liver cancer that are affected by alcohol, tobacco, and various stresses and greatly reduces the quality of our lives. The purpose of this study was to determine the changes in the expression of liver tissue damage by selected Thymosin-β_4, C-Myc, Erb-B_2 and TGF-$\beta_1$gene related to cancer development and tissue damage from a molecular pathological viewpoint. Thymosin-β_4 is involved in the initial process of neovascularization[1] and is known to be expressed in embryonic cell-specific differentiation and in brain development[2,3], in the process of making hair follicles[4], in cancer cells more so than in normal cells[1], and in cancer metastasis[5,6]. C-Myc (c-Myelocytomatosis oncogene) is as a transcription factor that influences genes involved in telomerase expression and cell proliferation and is reported to be amplified in leukemia, gastric cancer, and lung cancer[7].Erb-B_2 (erythroblasticleuemia virtual oncogene homolog 2) has been shown to amplify in 25% of ovarian and breast cancers and is reported as having poor survival prognosis[7].

In addition, Transforming growth factor-β_1 (TGF-β_1) is a gene involved in the regulation of cell proliferation, cell growth, cell death, and differentiation, and is known to be associated with the expression of type 1 collagen due to chronic and acute hepatocellular injury. This can be inferred that TGF-β_1 increase marks the inception of fibrosis[8].

Therefore, this study aims to evaluate the expression level of TGF-β_1, C-Myc, Erb-B_2 and Thymosin-β_4 an

kan717@hanmail.net

early stage of acute liver injury, usually through fibrosis and the development of cancer.[1]

Method

1. Animals and Administration

With a purpose to induce acute hepatotoxicity, 10-week-old male BALB / c mice with an average body weight of 20-25 g were administered by oral gavage a mixture of CCl_4(Aldrich, USA) and olive oil (Extra Virgin, ITali)2 volumes: 1 volume, 2ml / kg, using the experimental model Lee Jung-Il method[9]. The experiment was divided into two groups, the group that was injected with CCl_4 alone (n = 5) and control group (n = 5). Anesthesia and sacrifice were performed after 24 hours, and various tests were performed.

2.Hematologocal examination

The laboratory animals were anesthetized with Ether and sacrificed, and then the blood of 700 μl or more was collected from the heart using a syringe and used for blood component analysis.

3.Electron Microscopic Observation

Some liver tissues were cut and fixed to Glutaraldehyde and dehydrated at high concentrations (70% to 100%) at low concentrations using alcohol. Electro-staining was performed. Block was made using EPON 812 and etched using Ultramicrotome, followed by electro-staining with uranyl acetate.

4.Tissue Section Staining

After some liver tissues were removed from laboratory animals, the tissues were fixed in 10% formalin for 24 hours. Paraffin blocks were made in stages of dehydration, infiltration, and transparent processes, and then cut into 4 ~ 6 μm with microtome. Using the generated tissue slides, Hematoxylin& Eosin, Masson's Trichrome and Gomori Reticulum were stained.

5.Genetic Testing

After some liver tissues were removed from laboratory animals and stored at -70℃ for freezing, the tissues were used for real-time PCR for gene mRNA expression testing. Genetic analysis was conducted using the Kenneth method[10]. RNA extraction was conducted using Homogenizer, followed by RNA Prep Kit manufactured by company B. Reverse transcription was conducted using 20 μl RNA for 60 minutes at 42°C and reversed cDNA was amplified using real-time PCR equipment using AccupowerGreenstarqPCRpreMix Kit. This was followed by a total amplification of 40 times at 20 seconds at 95°C and 45 seconds at 56°C of a total mixture of 50 μl, including cDNA, primers and qPCR premix.

Result and Discussion

In normal liver tissue, the structure of mitochondria was morphologically normal, and there were no specific findings that are of significance related to the distribution of glycogen and lysosomes. However, in the acute hepatotoxic tissue treated with carbon tetrachloride, lysosomes were distributed around the central vein, and the state of the mitochondrial had been damaged severely, including the ridge structure of the intimate private membrane protruding inwardly. Furthermore, the enlargement of cellular void spaces was caused by damage to organelles[Figure 1].

Hematological tests were performed in both the hepatotoxic group and the control group. The mean was 41, the SD was 6.12, the MIN was 33, and the Max was 50 in group ingested D.W of ALT. The mean was 100, the SD was 14.8, the MIN was 77, and the Max was 116 in group ingested $CCl_4$of ALT. Compared to the control group, ALT was 100.7 U / l higher in the hepatotoxic group. The mean was 166, the SD was 7.6, the MIN was 159, and the Max was 177 in group ingested D.W of AST. The mean was 812, the SD was 62, the MIN was 768, and the Max was 922 in group ingested $CCl_4$of AST. Compared to the control group, AST was 812.9 U / l in the hepatotoxic group. However, ALP was not significantly different compared to the control groupThe mean was 81, the SD was 7.7, the MIN was 70, and the Max was 91 in group ingested D.W of ALP. The mean was 81, the SD was 9.6, the MIN was 70, and the Max was 89 in group ingested CCl4of ALP.

Compared to the control group, the H&E staining result of hepatotoxic group incurred severe tissue necrosis around the central vein as well as the enlargement of the nucleus and accumulating of moisture in the cytoplasm following cell damage resulted in ballooning, which is referred to as ballooning degeneration (→) phenomenon[Figure 2]. Cell bulging (swelling) accompanying ballooning degeneration caused the cells to grow, compressing the surrounding vessels, i.e., oyster-shaped liver vessels, and narrowing of the

vessels were observed in the hepatotoxic group when compared to the control group. In addition, fat vesicles (↓) generally observable in toxic substances and hypoxia damage appeared and low staining was visible due to cellular degeneration of the cells around the central vein and the liver[Figure 2].

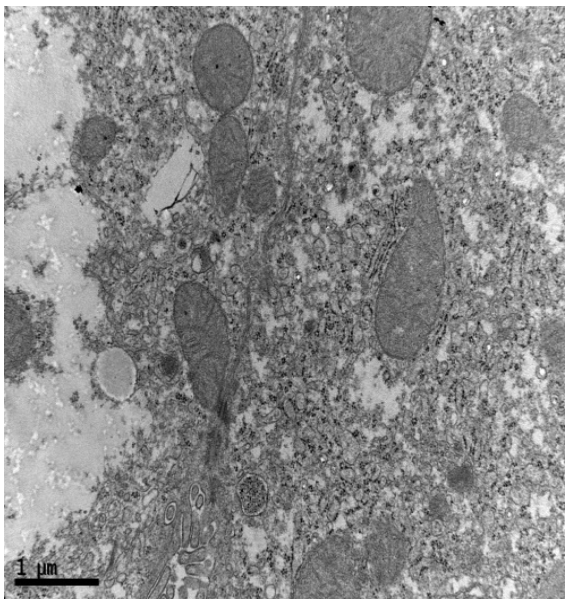

Figure 1. Shapes of acute liver toxic tissue in the group administered with CCl_4 in the Transmission Electron Microscope(x 10,000)

Compared to the control group, M.T(Masson's Trichrom) staining did not result in collagen fibers in the acute hepatotoxic group due to the short duration of administration of toxic substances when attempted to observe the deposition of collagen fibers around the central vein and liver lobules. However, the stainability due to cell damage around hepatic lobules was lower staining (↓) than that of normal tissues[Figure 3].

The reticulum staining of 10-week-old BALB/c mice did not show comparable retinal staining in the control and experimental groups. However, the cell staining caused by the toxic substances entering the portal vein resulted in the cell degeneration around the mesenchymal lobe, and when compared with surrounding tissues, the results were lower staining (↓) than surrounding tissues[Figure 4].

The β-actinCq value was 20.02, The Erb-B2Cq value was 32.77, The TGF-β1Cq value was 27.93, The c-MycCq value was 29.58, and The Thymosin-β_4Cq value was 23.39 in gene expression of control group. The β-actinCq value was 24.94, The Erb-B2Cq value was 36.74, The TGF-β1Cq value was 28.99, The c-MycCq value was 27.24, and The Thymosin-β_4Cq value was 24.97 in gene expression of CCl_4 group. The Cq values of the two groups were high in the Erb-B_2 gene Cq using β-actin value as the basis for comparison. When comparing the Cq values between two groups, the value of Erb-B_2 gene Cq was higher than the value of general gene Cq of 18-32, and the gene TGF-β_1 appeared to be lower in the control group. The gene C-Myc was higher in the control group as well as the gene Thymosin-β_4, which appeared to be lower in the control group. In comparing the gene expression between two groups, Erb-B_2 gene expression, which usually ranges between 18-32 CT in general expression studies, was out of this range and was thus shown that the expression was not very high[Table 1]. TGF-β_1 gene expression was higher in the acute hepatotoxic group than in the control group[Figure 5]. The C-Myc gene expression was also higher in the acute hepatotoxic group than in the control group[Figure 5]. The Thymosin-β_4 gene expression was higher in the acute hepatotoxic group than in the control group[Figure 5]. In comparing the expression of acute hepatotoxic genes in general, the expression of TGF-β_1, C-Myc and Thymosin-β_4 genes except Erb-B_2 gene was found to be higher in the acute hepatotoxic group than the control group.

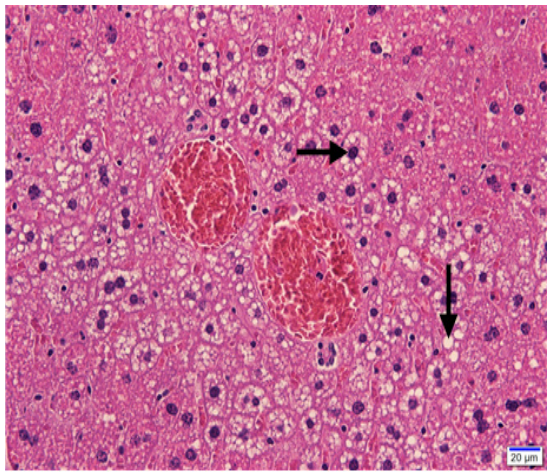

Figure 2. H&E stain of acute liver toxicity in the group administered with CCl_4

In summary, the above results show that hepatotoxic mechanism from carbon tetrachloride produced CCl_3, which is highly reactive by reductive dehalogenation reaction in P-450 enzyme system, and this radical combines with oxygen molecules to form Cl_3COO. Cl_3COO forms carbon-centered lipid radicals by removing hydrogen atoms from saturated fatty acids. These lipid radicals combine with oxygen molecules to form lipid peroxyl radicals to initiate

lipid peroxidation[11]. In this study, the weight loss of experimental animals was small when the hepatic injury was induced by carbon tetrachloride. However, when liver damage was induced by carbon tetrachloride in mice, the experimental results of lipid or water degeneration caused by an accumulation of lipid or water leading to liver hypertrophy[11] are similar to the results obtained in previous studies. In particular, TGF-β_1 is known to be a factor of hepatic fibrosis[11], and in this study, TGF-β_1 was found to increase during fibrosis. Furthermore, the serologically related enzymes of ALT, AST, and ALP increased during liver damage, and the elevated levels of serum ALT, AST, and ALP means damage to liver tissue and these results are consistent with the paper[12], which indicated this phenomenon to mean liver toxicity[12] and the study[13], which reported an increase in related enzymes. In other words, peroxidation of unsaturated fatty acids in the cell membrane destroys membrane structure and function and thereby inhibits liver protein synthesis and decreases the amount of glycogen in the liver and increases serum related enzyme efflux such as ALT and AST into the blood[13].

Figure 4. Reticular fiber stain of acute liver toxicity in the group administered with CCl_4

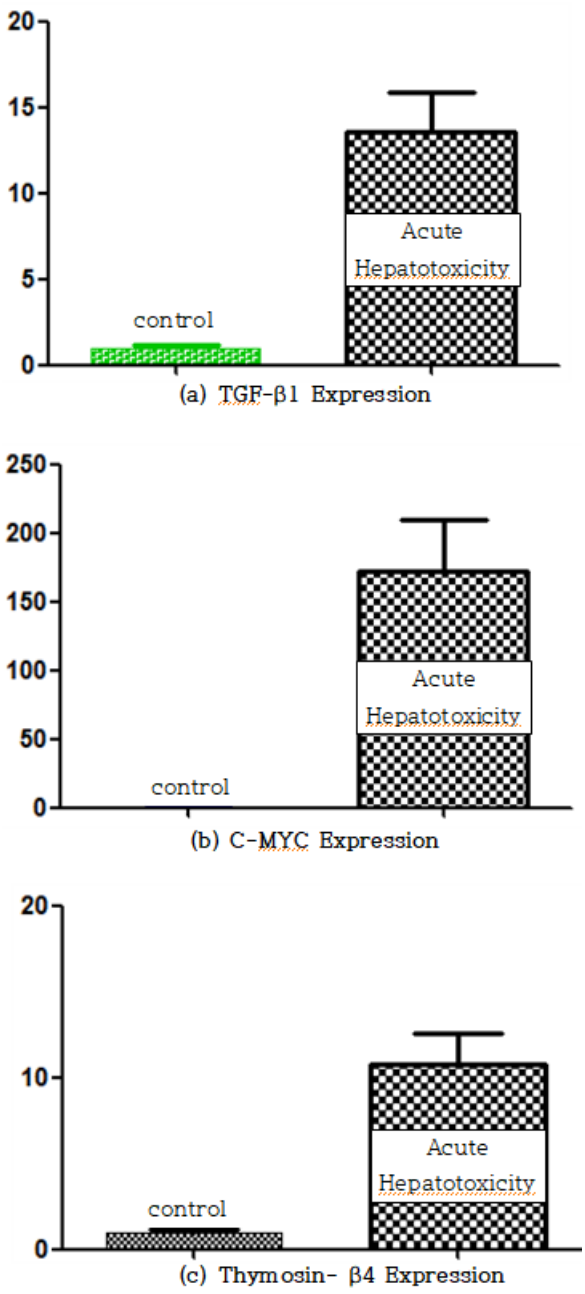

Figure 5. Gene expression in groups treated with CCl_4

Table 1.Relative expression of *β-actin, Erb-B*$_2$, TGF-β_1, C-Myc and Thymosin-β_4 gene

	β-actin	Erb-B2	ΔCt	ΔΔCt	Normalization (2-ΔΔCt)
Control	20.026	32.774	12.748	0	1
CCl4	24.948	36.748	11.8	-0.95	1.93
	β-actin	TGF-β1	ΔCt	ΔΔCt	Normalization (2-ΔΔCt)
Control	20.026	27.938	7.912	0	1
CCl4	24.948	28.992	4.044	-3.87	14.60
	β-actin	C-Myc	ΔCt	ΔΔCt	Normalization (2-ΔΔCt)
Control	20.026	29.588	9.562	0	1
CCl4	24.948	27.244	2.296	-7.27	153.92
	β-actin	Thymosin-β4	ΔCt	ΔΔCt	Normalization (2-ΔΔCt)
Control	20.026	23.394	3.368	0	1
CCl4	24.948	24.976	0.028	-3.34	10.13

Conclusion

The histological changes and gene expression Thymosin β_4, c-Myc and TGF-β_1 were observed to be higher in case of liver tissue injury than in normal tissues. Therefore, for use in disease prevention and determination of disease related to liver function, this study, together with serological and histological examinations, can be used as a supplementary data for determination of liver disease by examining the gene expression status of Thymosin β_4, C-Myc and TGF-β_1 using molecular diagnostic techniques.

Factors Associated with Psychological Well-being among Korean Nursing students

Hyunjin Lee[1], Kawoun Seo[2]

[1]Professor, College of Nursing, Eulgi University, Republic of Korea,
[2]Professor, Department of Nursing, Joongbu University, Republic of Korea

Abstract

Background/Objectives: This study was designed to investigate the effects of resilience and interpersonal competence on psychological well-being among nursing students in Korea.

Methods/Statistical Analysis: A cross-sectional descriptive study was conducted. The 282 participants were recruited from nursing students in C-do, D city. The data analysis included descriptive statistics, Pearson's correlation coefficients, and multivariate analysis using SPSS 22.0. The two models extracted through hierarchical regression analysis were tested to determine the predictors of psychological well-being in nursing students.

Findings: The findings showed positive associations among resilience, interpersonal competence, and psychological well-being. In the first model, personal factors such as religion (**β** = −.12, p = .018), interpersonal relationship (**β** = −.20, p < .001), academic satisfaction (**β** = −.30, p < .001), normal personality (**β** = −.18, p = .001), and negative personality (**β** = −.23, p < .001) were significant and accounted for 30.1% of the variance. Finally, when general characteristics, resilience, and interpersonal competence were entered into the final model, religion (**β** = −.09, p = .043), interpersonal relationship(**β** = −.14, p = .005), academic satisfaction (**β** = −.17, p = .006), personality (**β** = −.18, p = .001), resilience (**β** = .24, p < .001), and interpersonal competence (**β** = .22, p < .001) were significant. This final model, which included both personal factors and main variables, accounted for 42.5% of the variance.

Improvements/Applications: Resilience and interpersonal competence are important factors in the psychological well-being of nursing students. Therefore, strategies should be developed to increase the psychological well-being of nursing students by improving resilience and interpersonal competence.

Keywords:*Nursing students, Resilience, Interpersonal competence, Psychological well-being*

Introduction

University students suffer more from emotional difficulties than students in childhood or adolescence due to heavy academic burden and career and employment problems[1-2]. In particular, nursing students seem to have stable academic lives due to the clarity of their career and high employment rate after graduation, but their levels of stress are increased due to the difficulties in interpersonal relationships, excessive study requirements, and burdens related to clinical practice[2-3]. Because of these problems, nursing students have had considerable difficulties in adapting to university life and report low psychological well-being[4].

Psychological well-being is a concept that includes autonomy, self-acceptance, positive interpersonal relationships, and control over one's environment, as well as an emotional attitude that grows with the purpose of life[5]. In other words, psychological well-being concerns the degree of happiness and satisfaction felt while functioning well in society based on one's strength, efforts, and growth[6]. Therefore, it has a strong influence on nursing students' adaptation to university

Corresponding Author:
Kawoun Seo,
kwseo@joongbu.ac.kr

life[7]. It is also an important factor in the personality and emotions of nursing students who will provide holistic nursing in various clinical fields[8]. Therefore, the psychological well-being of nursing students is very important to enable them to grow into psychologically healthy professional nurses.

Recent research has focused on resilience, emotional regulation, cognitive flexibility, interpersonal relationships, active coping style, and stress coping strategies as positive factors related to psychological well-being[9-10]. Resilience plays a role in coping with difficulties, adapting flexibly to stress, and maintaining psychological balance[11]. This flexible psychological response affects psychological well-being while reducing negative emotions and stress[11]. Nursing students with high resilience have been reported to have low clinical stress and reduced anxiety[12-13].

Recently, interpersonal competence has been studied as an important variable in understanding psychological well-being. Interpersonal relationships are relationships involving a small number of people, with particular emphasis on the relationship between two people, in terms of the universal psychological orientation of the individual[14]. The ability that is important when attempting to establish such relationships is interpersonal competence. Interpersonal competence refers to the ability to effectively establish and maintain relationships with others, an important ability for maintaining a socially pleasurable life that directly relates to individual growth, development, and mental health[15]. The lack of interpersonal competence has been reported to be associated with a longer duration of depressive emotions, as well as lower adaptive capacity to university life and interpersonal skills[16-17]. However, in previous studies, the psychological well-being of nursing students was mainly studied with respect to the relationship with other emotional qualities, such as academic resilience, self-esteem, and emotional intelligence[18-19]. There is a lack of research on resilience and interpersonal competence that can help improve psychological well-being.

Therefore, it should be useful to investigate the relationship between the degrees of resilience, interpersonal competence, and psychological well-being of nursing students. The purpose of this study was to identify the factors such as resilience and interpersonal competence associated with the psychological well-being of Korean nursing students.

Method

This descriptive cross-sectional study examined the effect of resilience and interpersonal competence on psychological well-being. The participants in this study were recruited from nursing students of D city, who voluntarily agreed to participate. A total of 282 subjects responded to a self-report questionnaire.

Resilience was measured using a scale of resilience for nursing students developed by Yang et al.[20]. This tool comprises 24 items scored on a five-point Likert scale. The reliability of the original resilience scale was shown by a Cronbach's alpha score of .84. In this study, the score was 0.92.Interpersonal competence was measured using the Interpersonal Competence Questionnaire (ICQ), which was developed by Buhrmester et al.[21] and translated and revised by Han and Lee[22]. The ICQ consists of 31 items across the five subdomains. Responses to this tool are scored on a five-point Likert scale. The reliability of the original ICQ was shown by a Cronbach's alpha score of .83. In this study, Cronbach's alpha = .84.Psychological well-being was measured with the Psychological Well-Being Scale (PWBS) developed by Ryff[5] and revised by Cho[24]. This instrument comprises six subdomains with a total of 18 items scored on a four-point Likert scale. In Cho's study, Cronbach's alpha = .80, and in this study, it has a value of .92.

Descriptive statistics and Pearson's correlation coefficients*r* were calculated and multivariate analysis performed using the IBM SPSS Statistics 22.0 program. Hierarchical multiple regression was conducted to determine the predictors of psychological well-being. The statistical significance level was set atα= 0.05.

Result

1. Sample Characteristics

General characteristics of this study's sample are summarized in [Table 1]. The study subjects consisted of 36 men (12.8%) and 246 women (87.2%). Their average age was 22.29 (± 3.82) years. Sophomores accounted for 43.3% of the total, and 76.2% of the subjects reported themselves as being without religion:67 (23.8%) had religious beliefs, while 215 (76.2%) had none. About 36% of them supported the nursing department with aptitude, and 67.7% of them were living alone. Most subjects answered that their economic level was intermediate (79.8%) and their interpersonal relationships were good

(51.1%) or usual (45.0%). Half of all students answered that they usually felt academic satisfaction (45.4%), and that their personality was positive (51.1%).

The mean scores of resilience (3.50± 0.51), interpersonal competence (3.42 ± 0.50), and psychological well-being (2.89 ± 0.39) are presented in [Table 1].

Table 1. General Characteristics and independent variable of Participants

Variables		n (%)or Mean(±)SD
Gender	Male Female	36 (12.8) 246 (87.2)
Age (yrs)	≤ 19 20-25 ≥ 26	22.29±3.82 23 (8.2) 234 (83.0) 25 (8.8)
Grade	Freshman Sophomore Junior Senior	53 (18.8) 112 (43.2) 51 (18.1) 56 (199)
Religious	Yes No	67 (23.8) 215 (76.2)
Motivation for Nursing	In aptitude Realistic reason Other	103 (36.5) 128 (45.4) 51 (18.1)
Economic level	High Medium Low	18 (6.4) 225 (79.8) 39 (13.8)
Living alone	Yes No	191 (67.7) 91 (32.3)
Interpersonal relationship	Good Usually Poor	144 (51.1) 127 (45.0) 11 (3.9)
Academic satisfaction	Satisfied Usually Dissatisfaction	71 (25.2) 128 (45.4) 83 (29.4)
Personality	Positive Usually Negative	144 (51.0) 126 (44.7) 12 (4.3)
Resilience		3.50(± 0.51)
Interpersonal competence		3.42(± 0.50)
Psychological well-being		2.89(± 0.39)

2. Correlations Between Resilience, Interpersonal competence, and Psychological well-being

The correlations (*r*-values) between resilience, interpersonal competence, and psychological well-being are shown in [Table 3]. Resilience was positively correlated with interpersonal competence (r = .52, p< .001) and psychological well-being (r = .51, p< .001). Moreover, interpersonal competence and psychological well-being were positively correlated (r = .48, p< .001).

3. Factors Associated with Psychological well-being

The results of the hierarchical regression model of the psychological well-being of nursing students are presented in [Table 4].

Table 2. Correlation among Resilience, Interpersonal competence, and Psychological well-being

Variables	**1**	**2**	**3**
1. Resilience	1		
2. Interpersonal competence	.52 (p<.001)	1	
3. Psychological well-being	.51 (p<.001)	.480 (p<.001)	1

Personal factors, including demographic information, were entered into Model 1, and the regression equations were significant (F = 14.43, p< .001). The explanatory power for psychological well-being was 30.1%. Religion (**β** = −.12, p = .018), "usual" in interpersonal relationship (**β** = −.16, p < .001), "dissatisfaction" in academic satisfaction (**β** = −.30, p < .001), "usual" in personality (**β** = −.18, p = .001), and "negative" in personality (**β** = .23, p < .001) were significant predictors of psychological well-being in this model.

Finally, resilience and interpersonal competence were entered into Model 2; therefore, Model 2 was significantly altered (F = 19.87, p<.001). Religion (**β** = −.09, p = .043), "usual" in interpersonal relationship (**β** = −.14, p = .005), "dissatisfaction" in academic satisfaction (**β** = −.17, p = .006), and "negative" in personality (**β** = −.18, p = .001) were observed to be strong predictors of psychological well-being. Moreover, resilience(**β** = .24, p < .001) and interpersonal competence (**β** = .22,

$p < .001$) were significant predictors in the last model, accounting for 42.5% of the variance.

Discussion

The personal characteristics influencing the psychological well-being of nursing students were found to be religion, interpersonal relationships, academic satisfaction, and personality. First, there was a significant relationship between religion and psychological well-being. In one study of clinical nurses[24], psychological well-being was higher among religious subjects than those who did not have religion, and there were also differences by type of religion. However, Jin and Kim[18] found no difference in psychological well-being by the type of religion. Second, academic satisfaction is a significant factor in psychological well-being. In Park and Hong's[25] and Jin and Kim's studies[18], the higher the satisfaction with one's major, the higher one's psychological well- being was found to be. This is because satisfaction withone's majoris of high importance to one's university career. However, there is a lack of research on the effects of academic satisfaction or religion on the psychological well-being of nursing students.

Table 3. Hierarchical Regression Models Examining the Association of Psychological well-being

Variables			B	β	SE	t	p	F (p)	R2
1	Constant		3.39		.09	36.81	<.001	14.43 (<.001)	.301
	Religion (ref. yes)	No	-0.11	-.12	.04	-2.38	.018		
	Interpersonal relationship (ref. good)	Usually	-0.16	-.20	.04	-3.72	<.001		
	Academic satisfaction (ref. satisfaction)	Dissatisfaction	-0.26	-.30	.05	-4.66	<.001		
	Personality (ref. positive)	usually	-0.14	-.18	.04	-3.32	.001		
		Negative	-0.46	-.23	.11	-3.99	<.001		
2	Constant		1.98		.20	9.91	<.001	19.87 (<.001)	.425
	Religion (ref. yes)	No	-0.08	-.09	.043	-2.03	.043		
	Interpersonal relationship (ref. good)	Usually	-0.11	-.14	.04	-2.85	.005		
	Academic satisfaction (ref. satisfaction)	Dissatisfaction	-0.15	-.17	.054	-2.78	.006		
	Personality (ref. positive)	Negative	-0.36	-.18	.106	-3.46	.001		
	resilience		0.18	.24	.04	4.36	<.001		
	interpersonal competence		0.17	.22	.04	3.85	<.001		

Third, interpersonal relationships and interpersonal competence are other variables affecting psychological well-being. Lee[17] showed that social connectedness was a factor influencing subjective well-being, and that interpersonal problems lowered subjective well-being. In addition, while there is no such study of nursing students, this is consistent with Jeong'sfinding[26] that higher interpersonal competence indicates higher psychological well-being in general university students. The effect of social support on psychological well-being is lowered by the buffer effect of college students, even if they experience strong life stress[27]. Since such people are highly likely to receive social support, it can be assumed that their psychological well-being increases. However, it is necessary to investigate the moderating or mediating effects of social support on the psychological well-being of nursing students. Finally, resilience was positively correlated with and showed a strong influence on psychological well-being. These results are consistent with Choi and Kim's finding[28] that the higher the resilience, the higher the psychological well-being. It is also consistent with the significant correlation between ego-resilience and psychological well-being in Park's study[25]. On the other hand, Lee et al.[19] reported that psychological well-being affected resilience. Thus, resilience and psychological well-being can be considered to have an interactional relationship. Nursing students have many negative emotions in their academic and clinical practice. In this situation, resilience can be considered as a buffer such that psychological well-being increases. Therefore, to improve the psychological well-being of nursing students, an intervention plan should be developed to increase their resilience.

Conclusion

The purpose of this study was to investigate the effects of resilience and interpersonal competence on psychological well-being, which are found to be important factors for nursing students. The results showed that resilience and interpersonal competence had a significant effect on psychological well-being. Therefore, in order to improve the psychological well-being of nursing students, it was confirmed that a personalized and systematic education and training program should be established to improve resilience and interpersonal competence. Based on the results of this study, we would like to make the following suggestions. First, a further study is needed to identify factors that affect the psychological well-being of nursing students. Second, in order to improve the psychological well-being of nursing students, research is needed to develop and apply individualized and systematic programs.

Effects of Resilience and Authentic Leadership on Job Embeddedness of Clinical Nurses in Korea

Jeonghwa Cho[1], Junghee Yu[2], Kawoun Seo[3]

[1]Department of Nursing, Daejeon Institute of Science and Technology, Republic of Korea, [2]Department of Nursing, Taegu Science University, Republic of Korea, [3]Department of Nursing, JoongbuUniversity, Republic of Korea

Abstract

Background/Objectives: This study was designed to investigate the effects of resilience and authentic leadership on the job embeddedness of staff nurses in Korea.

Methods/Statistical analysis: A cross-sectional descriptive study was conducted. A total of 168 participants with more than 2 years of experience were recruited from staff nurses from a university hospital in D city, Korea. Data analysis included descriptive statistics, Pearson's correlation coefficients, and multivariate analysis using SPSS 22.0. Two models extracted during the hierarchical regression analysis were tested to determine the predictors of job embeddedness.

Findings: The results showed that job embeddedness had a significant positive correlation with resilience and authentic leadership of head nurses. There was also a significant positive correlation between resilience and head nurses' authentic leadership. In the first model, personal factors such as education level, days off as requested, nurse satisfaction, and salary satisfaction were found to be significant and accounted for 21.1% of the variance. In the second model, where personal factors, resilience, and authentic leadership were entered, nurse satisfaction, salary satisfaction, resilience, and authentic leadership were found to be significant. This final model, which included both personal factors and main variables, accounted for 30.2% of the variance.

Improvements/Applications: In order to increase the job embeddedness of staff nurses, hospitals should try to increase resilience on the personal level and improve the authentic leadership of head nurses.

Keywords: *Nurses, Resilience, Leadership, Job embeddedness, Regression*

Introduction

Skilled nurses are essential to meet the expectations of the recent increase inhealthcare services[1]. Moreover, the turnover rate of nurses at general hospitalsin Korea is very high at 25.6%[2]. High turnover rates can lead to the deterioration of the quality of medical care in hospitals and the economic loss entailed by the cost of training new nurses, in additionto the disruption of the careers of nurses through their personal experiences[3]. This results in a reduction in the quality of health services. Various studies have been conducted to addressthese problems[3-4].

Kawoun Seo,
kwseo@joongbu.ac.kr

Job embeddedness refers to the degree to which an organization is rooted in relation to its duties, and is used in the opposite sense of turnover[5].Whereas turnover intent simply indicates whether the nurse intends to leave the organization, job embeddedness helps us better understand why nurses remain in the organization[5]. Nurses with a high degree of job embeddedness show low turnover intention even if job stress is high[4]. Therefore, it is necessary to examine the factors affecting the degree of job embeddedness.

Resilience is the socio-psychological ability of individuals to return or cope successfully despite adverse situations[6]. It is known that nurses with high resilience maintain high psychological well-being by flexibly coping with job stress[7]. It also affects burnout and has been found to affect caring behavior[7-8].

Therefore, this ability is essential for nurses who have to cope with various situations arising from interpersonal relationships with various people. A low resilience is apt to lead to stress and burnout[7,9], as well as reduced organizational commitment and organizational socialization, which ultimately causes the nurse to leave the job[9-10]. Thus, the degree of a nurse's resilience can be expected to affect job embeddedness.

Another factor that is expected to influence the organizational adaptability of nurses is the authentic leadership of their head nurse. An Authentic leader is one who works with organizational members while achieving positive self-development. Authentic leadership involves high self-awareness and relational transparency, a balanced process of information, positive psychological capacity to encourage internalized morality, and ethics[11]. In a previous study, the authentic leadership of the head nurse as perceived by new nurses improved the latter's self-efficacy and clinical performance[12]. In addition, it appears that nurses' emotional labor, burnout, and job satisfaction are related to the head nurse's authentic leadership[1,13]. However, there have been few studies of nurses' job embeddedness, and in particular, there have been few studies of the authentic leadership ofhead nurses.

Therefore, it should be useful to investigate the relationship between the degree of resilience, authentic leadership, and job embeddedness of staff nurses. The purpose of the current study was to identify how factors such as resilience and authentic leadership of head nurses affect the job embeddednessof staff nurses in Korea.

Method

This descriptive cross-sectional study examined the effect of resilience and authentic leadership on job embeddedness. The participants of this study were recruited from staff nurses with more than 2 years of work experience at a university hospital in D city, Korea who voluntarily agreed to participate. A total of 180 subjects responded to a self-report questionnaire; the response rate was 89.0%. Of these, 18 questionnaires were excluded from the analysis because of insufficient data. Thus, 162 questionnaire responses were analyzed in total.

Resilience was measured using the Korean version of the Connor-Davidson Resilience Scale (CD-RISC) which was developed by Connor and Davidson [14] and translated and revised by Baek et al. [15]. This tool consists of five subscales: tenacity, patience, optimism, support, and spirituality, with a total of 25 items scored on a 5-point Likert scale. Higher CD-RISC scores indicate greater resilience. In Baek et al.'s study [15], the reliability of the instrument was shown by a Cronbach's alpha score of .91. In this study, the score was .94. Authentic leadership was measured using the Authentic Leadership Questionnaire (ALQ), which was developed by Walumbwa, Avolio, Gardner, Wernsing, and Peterson [11] and revised by Song [16]. The ALQ consists of 16 items across four subdomains: self-awareness, transparency, balanced processing, and morality. Items are scored on a 5-point Likert scale; higher scores indicate higher authentic leadership. The original instrument had a Cronbach's alpha score of .79 and in this study the score was .94. Job embeddedness was measured using the Job EmbeddednessScale which was developed by Mitchell et al. [17] and translated and revised by Kim [18]. This instrument comprises three subdomains: fitness, connection, and regeneration. Items are scored on a 5-point Likert scale; higher scores indicate higher job embeddedness. The reliability in Kim's study [18] was shown by a value ofCronbach's alpha of .87, and in this study the score was .90.

The collected data were analyzed using the IBM SPSS WIN 22.0 program.

1) The general characteristics were analyzed using frequency, percentage, mean, and standard deviation.

2) Resilience, authentic leadership, and job embeddedness were analyzed using mean and standard deviation.

3) The correlations between the resilience, authentic leadership, and job embeddednesswere analyzed using Pearson's correlation coefficient.

4) Hierarchical multiple regression was conducted to examine the predictors of job embeddedness. Model 1 included personal factors such as age, marital status, educational level, employment career, type of work shift, days off as requested, nurse satisfaction, salary satisfaction, and experience rotation. Resilience and authentic leadership were then entered into Model 2 as predictors of job embeddedness. The statistical significance level was set at $\alpha = 0.05$.

All study procedures were approved by the C university hospital's Institutional Review Board (IRB No.DIRB-신20170620-022). Before the survey was

conducted, the participants were given all details of the study's purpose, procedure, benefits, potential harm to the participants, confidentiality, and participants' rights, and their written consent was obtained.

Result

1. Sample Characteristics

The study subjects' general characteristics are summarized in Table 1. The study subjects were aged in their 20s (80.4%), 30s (18.5%), and 40s and above (1.1%). Their average age was 27.2 (± 3.40) years and their average work experience at the hospital was 47.39 (± 35.08) months. About 63% of them had graduated from university, and 150 participants (89.3%) were single. Moreover, 164 (97.6%) were shift workers and 133 of them were able to rest on the days they wanted. Of the total, 30.4% were satisfied with their task, but only 1.8% were satisfied with their salary.

Table 1. General Characteristics of Participants

Variables		n (%)	Mean ± SD
Age (yrs)	20-29 30-39 ≥ 40	135(80.4%) 31(18.5%) 2(1.1%)	27.2±3.40
Marital state	Single Married	150(89.3%) 18(10.7%)	
Education level	College University ≥ Graduate school	53(31.5%) 106(63.1%) 9(5.4%)	
Employment career (month)	12-36 37-60 ≥ 61	80(47.6%) 46(27.4%) 42(25.0%)	47.39±35.08
Type of work shift	Shift Fixed	164(97.6%) 4(2.4%)	
Days off as requested	Yes No	133(79.2%) 35(20.8%)	
Nurse satisfaction	Not satisfied Moderate Satisfied	46(27.4%) 71(42.2%) 51(30.4%)	
Salary satisfaction	Not satisfied Moderate Satisfied	135(80.3%) 30(17.9%) 3(1.8%)	
Experience of rotation	Yes No	20(11.9%) 148(88.1%)	

2. Descriptive Statistics Concerning Resilience, Authentic leadership, and Job embeddedness

The mean scores for Resilience (3.18 ± 0.47), Authentic Leadership (3.79 ± 0.53), and Job Embeddedness (2.80 ± 0.53) are presented in Table 2.

Table 2. Resilience, Authentic leadership, and Job embeddedness

Variables	Mean	± SD	Min	Max	Range
Resilience	3.18	± 0.47	1.96	4.36	1-5
Authentic leadership	3.79	± 0.53	2.44	5.00	1-5
Job embed-edness	2.80	± 0.53	1.00	4.71	1-5

3. Correlations Between Resilience, Authentic leadership, and Job embeddedness

The correlation (*r)*-values between resilience, authentic leadership, and job embeddedness are shown in Table 3. Resilience was positively correlated with authentic leadership (r = .29, p< .001) and job embeddedness (r = .39, p< .001). Moreover, authentic leadership and job embeddedness were positively correlated (r = .30, p< .001).

Table 3. Correlation among Resilience, Authentic leadership, and Job embeddedness

Variables	1	2	3
1. Resilience	1		
2. Authentic leadership	.29 (p<.001)	1	
3. Job embeddedness	.39 (p<.001)	.30 (p<.001)	1

4. Factors Associated with Job embeddedness

The results of the hierarchical regression model for the job embeddedness of staff nurses are presented in Table 4.

Personal factors, including demographic information, were entered into Model 1, and the

regression equations were found to be significant (F = 5.95, p< .001). The explanatory power for job embeddedness was 21.1%. Education level (**β** = −.15, p = .035), days off as requested(**β** = .14 p = .037), nurse satisfaction (**β** = .26, p < .001), and salary satisfaction (**β** = .28, p <.001) were significant predictors of job embeddedness in this model.

When resilience and authentic leadership were added in Model 2, the regression equations were still significant (F = 7.55, p< .001). Nurse satisfaction (**β** = .15, p = .041) and salary satisfaction (**β** = .29, p < .001) remained as predictors. Additionally, resilience (**β** = .25, p = .001) and authentic leadership (**β** = .17, p = .016) were significant variables in Model 2, accounting for 30.2% of the variance in the other variables.

Table 4. Hierarchical Regression Models Examining the Association of Job embeddedness

Model		B	β	SE	t	*p*	R^2	F(*p*)
1	(Constant)	2.41			8.54	.000	.211	5.95 (<.001)
	Education level	-.14	-.15	.07	-2.12	.035		
	Rest on the desire date	.19	.14	.09	2.10	.037		
	Nurse satisfaction	.18	.26	.05	3.64	.000		
	Salary satisfaction	.33	.28	.08	3.91	.000		
2	(Constant)	.85			2.01		.302	7.55 (<.001)
	Nurse satisfaction	.10	.15	.05	2.06	.041		
	Salary satisfaction	.34	.29	.08	4.25	.000		
	Resilience	.28	.25	.08	3.32	.001		
	Authentic Leadership	.17	.17	.07	2.42	.016		

Discussion

This study was designed to evaluate the impact of resilience and authentic leadership of head nurses on the job embeddedness of staff nurses. The present results demonstrated significant positive correlations among resilience, authentic leadership, and job embeddedness.

In this study, among general characteristics, education level, whether or not days off may be obtained as requested, and satisfaction with nursing and salary were found to affect job embeddedness. In particular, nurse satisfaction and salary satisfaction were strong influencing factors. A previous study[4] found that the higher the degree of job satisfaction of nurses, the higher their degree of job embeddedness. It can be considered that salary is determined not by the value of money but by the subjective satisfaction of the nurse. However, there have been few studies of the effect of salary on job embeddedness. There have also been few studies of nurse salary standards and nurse salary satisfaction. Therefore, it is necessary to investigate the degree of satisfaction of nurses with their salaries, and it is necessary to try to increase the job satisfaction of nurses including these.

Nurses' resilience was a strong factor influencing job embeddedness. Resilience means the power to withstand difficult situations. In previous studies, job embeddedness was found to be negatively correlated with burnout and job stress[4,7,10]. In other words, resilience may be considered a moderating or mediating factor in the relationship between negative psychological factors such as fatigue, emotional labor or burnout, and job embeddedness. However, the present study is insufficient in addressing this question. Therefore, in future studies, it will be necessary to investigate the moderating or mediating effect of resilience between the negative psychological factors of nurses and job embeddedness.

In addition, the authentic leadership of the head nurse affects the job embeddedness of staff nurses. In

a previous study by Choi and Ahn[19], it was suggested that the authentic leadership of the head nurse affects nurses' job satisfaction and organizational commitment. This can be attributed to reducing turnover intention by increasing the job satisfaction of nurses. In addition, it can be considered that the authentic leadership of head nurses has been found to increase the occupational coping self-efficacy of staff nurses[20]. The authentic leadership of the head nurse can be thought of as affecting not only the work domain but also the psychological aspects of nursing, thereby enhancing nurses' intention to continue work. Therefore, we need a systematic education program that can improve authentic leadership in head nurses.

Conclusion

This study was attempted to identify the effects of resilience and authentic leadership on job embeddednessof clinical nurses. The results showed that resilience and authentic leadership had a significant effect on the job embeddedness of clinical nurses. Therefore, in order to improve the job embeddedness of clinical nurses, individualized and systematic education and training programs should be prepared to improve their resilience. There is also a need for ways to improve authentic leadership of head nurses. Based on the results of this study, we would like to make the following suggestions. First, further studies are needed to identify the psychological factors affecting the job embeddedness of clinical nurses. Second, interventional research is needed to develop and apply individualized and systematic programs to improve the job embeddedness of clinical nurses.

The Factors Affecting Unmet Medical Needs of the Elderly Aged more than 65 Years

Ju-Youn Hong[1], **Yun-Hee Jeon**[2]

[1]Dept. of Division of Health Administration, Gwangju University, Hyodeok-Ro 277, Nam-Gu, Gwangju, Republic of Korea, [2]Dept. of Public Health administration, Chungcheong University, Wolgok-Gil 38, Gangnae-Myeon, Heungdeok-Gu 1, Cheongju, Chungbuk 28171, Republic of Korea

Abstract

Background/Objectives: This study identifies the unmet medical experiences in which the elderly older than 65 years old are not able to utilize appropriate medical service despite the medical need and analyze the factors that affect the unmet medical experiences.

Methods/Statistical analysis: The research used the Community Health Survey. We applied a weight so that this sample represents the Korean elderly older than 65. To test the relationship between the predisposing factors, enabling factors, and need factors of the subjects and their unmet medical experiences, we performed the chi-square test. In addition, we also performed a logistic regression analysis to identify the factors that affect unmet medical experiences. Collected data were analyzed using SAS 9.4 Version.

Findings: The results of this study show that a significant number of unmet medical experiences is occurring to an increasing number of elderly persons despite the improvement in the accessibility to medical services and the development of new medical technology. The factors affecting the elderly unmet medical experience are as follows. In the case of women, late-stage elderly, people in the low education level, those without spouses, those who perform financial activities, low-income persons, medical aid beneficiaries were more likely to have unmet medical experience. Also, if subjective health condition is perceived to be bad, those who currently smoke, those who drink, and those who are underweight were more likely to have unmet medical experience.

Improvements/Applications: We anticipate that the results of this study can be used to search for the direction of health and medical service policies for the elderly older than 65 years old in the future.

Keywords: *Elderly older than 65, Unmet medical experiences, Predisposing factors, Enabling factors, Need factors.*

Introduction

The proportion of the Korean population comprised of the elderly is increasing each year due to the improvement in the accessibility to medical service and the development of new medical technology. It is expected to increase from 13.1% in 2015 to 19.0% in 2024 and 40.0% in 2060[1]. This increase in the elderly population not only decreases the life expectancy and quality of life due to various geriatric diseases but also increase medical utilization and medical costs socioeconomically due to the high burden of the diseases[2].

Medical need is distinguished by the determining entity, and can be a medical need that a medical expert perceives as necessary to maintain one's health or medical need or desire perceived by oneself to maintain one's health[3]. The case of not suitably receiving medical care despite the need perceived by the subject is referred to as an unmet medical need[4], and all situations of experiencing an unmet medical [2]need are referred to

Corresponding Author :
Yun-Hee Jeon
jeonyh_daum@hanmail.net

as an unmet medical experience[5]. In other words, the phenomenon of the elderly not meeting their medical demands due to the increase in medical costs is referred to as unmet medical needs, and experiencing this is referred to as an unmet medical experience. The results of many studies showed that the proportion of the elderly experiencing unmet medical needs was high compared to other age groups. The rate of unmet medical needs of the Korean elderly was 16.7% (12.3% among males, 20.8% among females) in 2012, with a constant decrease in the last 5 years. This is two- to three-fold higher than the rate of unmet medical needs of the elderly in the 27 countries in the European Union(5.9% among males, 6.7% among females)[6-7].

The frequency of diseases in the elderly is higher than in other age groups due to the decline of physical functions and most elderly experience chronic diseases and geriatric diseases, thus resulting in high demand for medical care[7]. However, the anxiety toward medical utilization is increasing due to the decrease in income with the limitations of financial activities[8]. There are also obstacles to medical utilization due to the limited transportation methods, complex medical consultation process, and long wait-times[9]. Therefore, it is necessary to identify the unmet medical experiences of the elderly and the factors that are related to the search for methods to resolve them.

To date, variousstudies on unmet medical care of the elderly have been made.However, previous studies are a study which divided by income levels [10], a study on patients with chronic diseases [11], and a study which divided by regions [12].Previous studies had problems with representativeness because they focused their research on the unmet medical experiences of the elderly on a particular region or a limited and specific group of subjects. Additionally, research which used the Korean Health Panel and Survey of Living Conditions of Elderly Individuals had problems with representativeness due to the lack of the number of research subjects, despite allowing comprehensive analyses.Furthermore, they were conducted by defining the unmet medical experiences as limitations due to mostly financial reasons among unmet medical experiences. It is necessary to identify other related factors of unmet medical experiences by types other than financial reasons to put effort into improving them.

Therefore, in this study, we use a large-scale survey data from Community Health Survey to identify the unmet medical experiences in which the elderly older than 65 years old are not able to utilize appropriate medical service despite the medical need and analyze the factors that affect the unmet medical experiences.

Method

1. Research Subjects

For this research, we used the data from 5 years of Community Health Survey data from 2013 to 2017 that was conducted by the Centers for Disease Control and Prevention. Community Health Surveys have been conducted each year n adults older than 19 years old in 253 health clinics nationwide since 2008. To maintain the representativeness of the sample, the samples of 900 subjects, on average, from 253 regions are sampled and selected with the multistage probability sampling method for analyses. Data were collected through 1:1 interviews with a trained interviewer. 228,781 subjects were surveyed in 2013, 228,713 in 2014, 228,558 in 2015, 228,452 in 2016, and 228,381 in 2017. Among those, 60,592 were the elderly older than 65 years old in 2013, 60,602 in 2014, 63,929 in 2015, 64,223 in 2016, and 67,835 in 2017, for a total of 317,181 subjects selected as the subjects of this research.

2. Analysis Variables

Andersen modelwas applied.

2.1. Independent Variables

Predisposing factors are factors related to personal characteristics that exist before the onset of the disease. In this study, we selected sex, age, education level, household generation, spouse, and financial activities. Age was divided as early-stage elderly (65 to 74 years old) and late-stage elderly (75 years old or older) by 75 years old.

Enabling factors are factors related to the method that enables medical service utilization, such as income or the type of medical insurance. In this study, we selected the total monthly household income and whether subjects were medical aid beneficiaries.

Need factors refers to the level of disease that determines the use of medical services, and is the recognition of the existence of a disease or the possibility that a disease can exist. In this study, we used subjective health condition, current smoking, current alcohol consumption, the actual performance of moderate-level

physical activities, underweight (BMI<18.5), and obese (BMI≧25) as variables of analysis.

2.2. Dependent Variable

The dependent variable was unmet medical experiences. Subjects were asked "Did you have an experience of not being able to visit a medical center (excluding dental offices) when you wanted to in the last year?" Subjects who responded that they have even one experience to this item was defined as having had an unmet medical experience.

3. Data Collection and Analyses

We applied a weight so that this sample represents the Korean elderly older than 65. To test the relationship between the predisposing factors, enabling factors, and need factors of the subjects and their unmet medical experiences, we performed the chi-square test. In addition, we also performed a logistic regression analysis to identify the factors that affect unmet medical experiences. Collected data were analyzed using SAS 9.4 Version.

Result

1. Relationship between predisposing factors, enabling factors, and need factors and unmet medical experiences

The results of [Table1]showed that there were differences in the distribution of predisposing factors, enabling factors, and need factors between having had or not having had unmet medical experiences.

Table 1. Relationship between predisposing factors, enabling factors, and need factors and unmet medical experiences

Variable		Unmet(%)	Met (%)	χ^2	p-value

	Normal	7.26	92.74		
	Obesity (BMI≧25)	7.40	92.60		

2. Factors that affect unmet medical experiences

For [Table 2] we performed a logistic regression analysis to identify factors that affect medical care.

Among predisposing factors, unmet medical experiences were 1.051-fold higher for women compared to men. For age, unmet medical experiences were 1.105-fold higher for those who are older than 75 compared to those who are between 65 and 74 years old. Unmet medical experiences were higher for those without spouse compared to those with a spouse.

Among enabling factors, it was found that unmet medical experiences were higher with lower monthly household income. Those who are not medical aid beneficiaries experienced 0.701-fold fewer unmet medical experiences compared to those who are medical aid beneficiaries.

For need factors, it was found that the unmet medical experiences were 3.038-fold higher for individuals with "bad" subjective health condition compared to individuals with "very good" subjective health condition. Current smokers had 1.375-fold more unmet medical experiences compared to non-smokers.

Discussion

Among predisposing factors, the unmet medical experiences were higher for women compared to men, for older people, and for people without spouses. This is the same as the results of previous studies[13]. A study[14] found that unmet medical experiences were high when subjects had spouses. Since this study was conducted on the elderly in poverty, it appears that the unmet medical experiences were high because the spouses themselves are a part of the elderly in poverty who do not physical, emotional, or financial freedom even if subjects have spouses. The unmet medical experiences were found to be high with decreasing education level. Education level affects the solving of health problems[15], so previous studies have also found that unmet medical experiences were high with lower education levels[12].

For enabling factors, the unmet medical experiences were found to be higher when the total household income was low, in line with the results of previous studies[11]. Although policies are being enacted to increase accessibility to medical care, it appears that people in low income levels are still having trouble from the perspective of accessibility to medical care. Research on the use of medical care of aid beneficiaries are being consistently conducted, and previous studies[2,16] show the same results as the results of our study in that the unmet medical experiences were found to be high among aid beneficiaries.

For need factors, our results that there were unmet medical experiences with a worse subjective health condition were in line with previous studies[13]. Subjective health condition is a simple subjective evaluation on one's own health condition, but it is known as an important predictive variable for mortality rate[17]. Therefore, consistent health management and social interest in the group with low subjective health condition are needed. The unmet medical experiences were also found to be high for those with poor health habits, such as currently smoking or drinking alcohol, in line with the results of previous studies[2].

We anticipate that the results of this study can be used to search for the direction of health and medical service policies for the elderly older than 65 years old in the future.

Conclusion

This signifies that we must identify ways to reduce unmet medical experiences by sex, and a plan is needed for the health management, medical service, and accessibility for the female elderly. Additionally, in terms of the types of medical insurance, it was found that the unmet medical experiences increased for medical

aid beneficiaries; this shows that a financial barrier still exists in actuality, despite the efforts of the Korean health insurance policy to increase the coverage. Toincrease the accessibility of medical care, discussion about the expansion of low-income medical aid for the elderly, a decrease of items that are not covered, and decrease of out-of-pocket costs of the medical aid beneficiaries must be made and medical services need to be improved. It was found that unmet medical experiences increase when the elderly perceive that their subjective health condition is not good. The opportunity to provide medical service to the elderly must be expanded and policies related to medical institutions must be strengthened to establish plans to improve medical services, such as a medical care reservation system provided by the medical institution, shortening of wait-times, and assistance with the hours of medical care.

In other words, to resolve the unmet medical needs in the period of old age, not only the government and regional medical and health policies for the elderly, but also the variability, accuracy, and approachability of medical information provided by the public health care institutions and private medical institutions must be actualized simultaneously.

Novel Approach on the Introduction of Clinical System for the Prevention of Heart Arrhythmia

Seong-Ran Lee

Department of Medical Information, Kongju National University, Korea

Abstract

Background/Objectives: The number of people with arrhythmia is increasing. The research is to develop a novel approach on the introduction of clinical system for the prevention of heart arrhythmia.

Methods/Statistical analysis: The derived data were carried out through question investigationfrom October 27through December 21, 2018. It is classified as 56people of the experimental group and 56 people of the control group. Fundamental contents of the respondents were analyzed by Chi-square test. Arrhythmia symptoms following experimental attempts were used as t-test. The arrhythmia status according to model attempt was analyzed as t-test.

Findings: The results of this paper are as follows. 1) An introvert in personality turned out to be 69.6% significantly higher in the experimental group than 33.9% of the control group. 2)In character, extroverts turned out to be 30.4% lower than 66.1% in the patient population(X^2=1.62, p<.05). 3) ln regard to p**sychological difficulties. 62.5%** of patients felt significantly more mental difficulties than 33.9% of control group(X^2=5.94, p<.05). 4) The heart palpitating symptoms were significantly higher the average of 39.85 points at patient population for the control group at 25.73 points on average(t=2.96, p=.02). 5) Theanxiety symptoms had decreased significantly the average(25.62±2.18) after the application thanthe average(43.70±0.63) before the attempt of the clinical system (t=4.57, p=.00). 6)Garlic intake has increased since seven days before it was consumed after the model attempt.7) The efficiency of the system has been shown efficient since it was applied.

Improvements/Applications:When clinical system is introduced, it is expected to contribute to the availability and effectiveness of the arrhythmia. Webelieve that recovery of arrhythmia requires diet and exercise.

Keywords: *Heart, Arrhythmia, Clinical system, Garlic, Palpitation symptoms*

Introduction

In order for muscles to contract, electricity must be generated. Irregular heartbeat caused by changes in this system or malfunction is called arrhythmia.An arrhythmia may or may not be a sign of a serious heart condition. The patient may or may not be aware. The normal heart rate for adults at rest is 60 to 80 beats per minute, and 60 to 100 beats per minute is called normal pulse.An arrhythmia is an abnormality in the number of heart beats or an abnormality in the rhythm, which can occur anywhere in the atrium and ventricle. Pulse is an important indicator of whether your heart is beating properly.In particular, arrhythmia may be a secondary symptom of cardiovascular disease such as myocardial infarction or heart failure, so it shouldbe observed more carefully[1].

Arrhythmia is important for regular examinations related to cardiovascular disease as data has been released that the number of people with arrhythmia in Korea is increasing every year. The number of arrhythmia due to heartfailure has increased by 6.48% everyyear from

145,000 in 2012 to 199,000 in 2017. The arrhythmia is dangerous because of sudden death.**In** the heart, there is an electrical transmission system that generates

Corresponding Author :
Seong-Ran Lee,
lsr2626@naver.com

regular electricity and transmits electrical signals to the whole heart.The irregular heartbeat caused by changes in this system or by malfunctioning lights is called arrhythmia[1-2].

People should be careful when the temperature of the arrhythmia is higher than 10 degrees in the morning and evening. Recently, the number of people with arrhythmia is increasing rapidly in Korea.The risk of developing heart arrhythmia in smokers is twice as high as those who do not smoke. Cardiac arrhythmia is a significant decrease in quality of life, and serious health problems are at high risk of stroke.An irregular heartbeat is a common condition that occurs in one in four people over the age of 40[3-4] Therefore, the paper is to develop a new information system model to prevent cardiac arrhythmia.

Data Analysis

3. Arrhythmia status according to model attempt

[Figure 2] revealsthe arrhythmia status according to model attempt. It was decreased significantly in the experimental group from 6 days after the model attempt than the control group. But 12 days later, the number of experimental group had increased again.

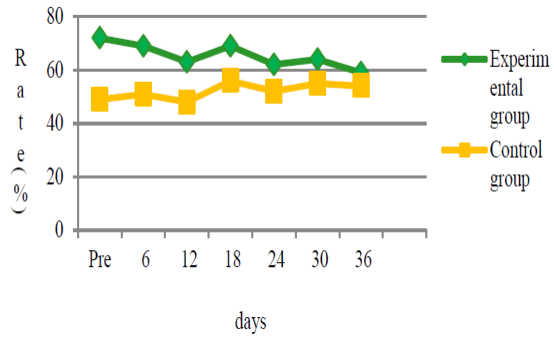

Figure 2. Arrhythmia status according to model attempt

4. Attempt methods for treating arrhythmia

[Figure 3] reveals the attempt method for treating arrhythmia. Garlic intake has increased since seven days before it was consumed after the model attempt. But twelve days later, the number had decreased again.

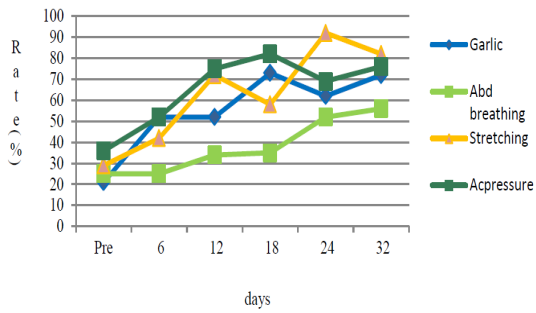

Figure 3. Attempt methods for treating arrhythmia

5. Advantages of results for system attempts

[Figure 4]indicated the advantages of the results for system attempts.**The efficiency of the system has been shownefficient since it was applied. But it has decreased temporarily since the 18th days and then increased againafter 24 days. Costs tended to increase after 8 days and then decrease after 13 days.**

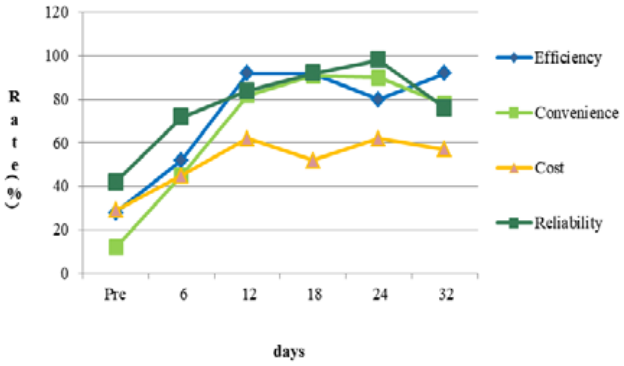

Figure 4. Advantages of results for system attempts

Discussion and Conclusion

This paper is to develop a new information system model to prevent heart arrthymia. As a result, an introvert in personality turned out to be significantly higher in the experimental group than the control group. This is similar to the results of the previous study of myocardial infarction[5-6]. According to a recent study, shy and introverted personality traits often develop heart disease or stroke. It acts as a source of stress on the new environment and the smooth flow of the heart. First of all, it is better to relax and treat yourself with foods that are good for arrhythmia.

Dizzinesswas significantly reduced after clinical attempt. This research is similar to the results of a positive study on angina pectoris[7-9]. The cause of dizziness cannot be prevented in a simple way because there are various causes.If dizziness occurs, the body sends a signal to notify other organs of abnormal condition. It is a good way to prevent dizziness by exercising steadily to keep your body healthy.Therefore, this study recommends that you take care of the accumulation of sodium in the body and manage the normal blood pressure.The system used in this study is expected to be helpful in treating dizziness symptoms.The state of the answer to the heart is less than the state of the application of the information system application.

The heart palpitating symptoms were significantly higherthe average of 39.85 points at experimental group for the control group at 25.73 points on average. This is consistent with the study of coronary heart disease derived from the preceding study[10-12]. Ifpatients find and correct the cause of the body, autonomic nerves will be adjusted, which will restore their control and improve your circulation. The parasympathetic nerve is delivered smoothly, and the pulse returns to normal in harmony with the sympathetic nerves. And then the heart is relaxed, breathing is cool, and their body is changing to a healthy. Thus, when clinical system is introduced, it is expected to contribute to the availability and effectiveness of the arrhythmia. Therefore, l believe that fast, perfectly safe recovery of arrhythmia requires diet and exercise.

Analysis of Experimental Data for Improving Bone Density in Osteoporosis Women Over the Age of 50

Seong-Ran Lee

Department of Medical Information, Kongju National University, Korea

Abstract

Background/Objectives: Osteoporosis is a skeletal disease that is fractured due to weakened bone strength. This paper is to analyze experimental data for improving bone density in osteoporosis women over the age of 50.Methods/Statistical analysis: The paper conducted by question investigation from March 20, to May 28, 2018. People who did not perform health practice. The demographic characteristics of the respondents were performed with X2-test. The condition of bone density before and after the act of living health was performed by t-test. The condition before and after the act of living health due to changes in lifestyle was carried out using t-test.

Findings: The data obtained are as next. 1) The number(63.5%) of patients with other diseases was significantly higher than that(42.3%) of the normal population(X^2=3.18, p<.05). 2) Respondents with regular exercise were significantly higher than non-exercise respondents(X^2=1.33, p<.05). 3) In case of jogging, bone density of osteoporosis is improved more after it than before the act of living health(t=-5.19, p<.001). 4)The condition of bone density is better after drinking milk than before drinking milk(t=-4.28, p<.01). 5) The test respondents after 16 days and then it increased again from 24 days. 6)The practice of living health has been shown to increase since one day in test respondents. However, the practice of living health has shown a tendency to decline since the 17 days. But the behavior of living health has increased again since the 25days. Living health activities have shown a continuing increase since 26 days..

Improvements/Applications: To prevent osteoporosis, it is effective to enjoy balanced food and exercise at the same time. The data will help improve the quality of medical care.

Keywords: *Bone, Density, Osteoporosis, Women, 50 years old*

Introduction

Osteoporosis is a skeletal disease that is fractured due to weakened bone strength. The bone density is highest in those in their 20s and 30s, and after that, the bone density is reduced a little. Particularly, the bone density decreases at a rapid rate for the first five years of menopause. Osteoporosis is a weakened condition and can be broken by small shocks. The biggest cause is hormone changes as age increases, and calcium and vitamin metabolism decreases and lack of exercise[1-3].

Osteoporosis fracture is not enough to treat the fracture itself. Osteoporosis is a risk of retraction, so continuous efforts should be accompanied by medication and prevention of falls. Bones begin to become weak in their 40s and older, and as age increases, osteoporosis increases. In Australia, people get bone fracture every three to four minutes because of old age. Recently, there is a high rate of bone reduction among middle-aged people in their 40s and 50sIn Korea, 1 in 3 women aged 65 and 2 out of 3 women aged 70 have osteoporosis[4-5]. Gender is shown in [Figure 1].

Osteoporosis is a skeletal disease that is fractured due to weakened bone strength. Most of the time, there are no symptoms, but fractures can cause pain and vary depending on the area where the fracture occurs. Fractures can occur in all areas, but fractures frequently

occur, especially in wrist bones, vertebrae and femur[6-7]. If a person with a risk factor of osteoporosis suddenly complains of pain in the back or decreases in height, it is a spinal fracture. In addition to pain from fractures, several complications can arise.

A femur fracture must require surgery, and the mortality rate increases due to complications occurring before and after the surgery. In the case of spinal fractures, the height may be reduced and the waist may be loose, and in the case of thoracic fractures the lung capacity may be reduced. Osteoporosis fracture is not enough to treat the fracture itself[8-10].

Osteoporosis is a risk of retraction, so continuous efforts should be accompanied by medication and prevention of falls. Therefore, the paper is to analyze experimental data for improving bone density in osteoporosis women over the age of 50.

Materials and Method

1. Conceptual framework

The following research had established a method for strengthening bone density in osteoporosis patients. 1) strategies for bone density 2) experimental attempt 3) methods for treating osteoporosis. The conceptual frame process for improving bone density is indicated in Figure 2. This study designs and collects data for strengthening bone density in osteoporosis patients. The attempt was made to the participants after investigating the reliability. After checking the data, we are analyzing the results [Table 1].

2. Materials

The paper conducted by question investigation from March 20, to May 28, 2018.The investigation consisted of 52 people who performed the act of living health and 52 people who did not perform health practice.

3. Methods

The demographic characteristics of the subjects were performed with X2-test. The condition of bone density before and after the act of living health was performed by t-test. T-test was performed for changes in the condition of osteoporosis depending on the health performance status. The condition before and after the act of living health due to changes in lifestyle was carried out using t-test

Result

1.Social demographic characteristics of subjects

[Table 2] reveals social demographic characteristics of respondents. The number (63.5%) of patients with other diseases was significantly higher than that (42.3%) of the normal population(X^2=3.18, p<.05). Respondents with regular exercise were significantly higher than non-exercise respondents (X^2=1.33, p<.05).The population of patients drinking showed a significantly higher distribution than those who did not drink(X2=4.26, p<.05).

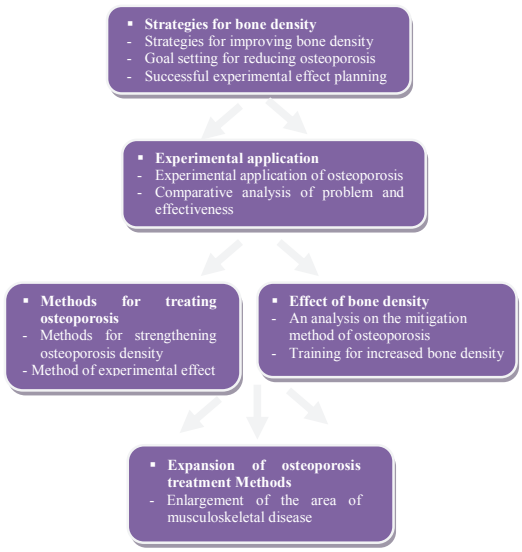

Figure 2. Construction of a method for strengthening bone density

Table 1.Training contents of osteoporosis

Division	Training contents
Causes of osteoporosis	■ Osteoporosis is a bone system condition in which bone strength is weakened and fractured easily. ■ Factors that determine the strength of a bone - bone quality, mineral quality of a bone -bone structure, micro-damage, amount of bone ■ As age increases, the amount of bone decreases gradually.
Outbreak of osteoporosis	■In women's cases, the decrease in female hormones caused by menopause leads to a sharp reduction in bone loss. ■When menopause occurs, the bones will be rapidly weakened within five to ten years. ■Men are much less likely to develop osteoporosis because they have no apparent menopause unlike women ■Men also develop osteoporosis because calcium intake decreases and bone generation decreases as they grow in age
Symptom mitigation method	■ Walking, climbing, gymnastics, and etc ■20 minutes of sunshine a day or more ■Taking vitamin D such as milk, tofu, eggs, etc. ■Reducing caffeine consumption and keeping food bland

3.Changing the condition of osteoporosis

[Figure 3] examined the changing the condition of osteoporosis. The test respondents had improved the condition of osteoporosis after the 8th days. But the condition of it decreased after 16 days and then it increased again from 24 days.

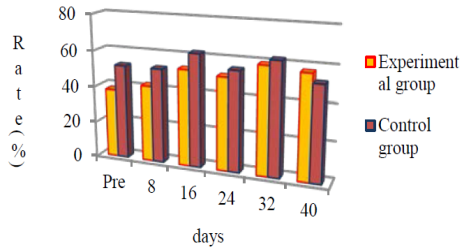

Figure 3. Changing the condition of osteoporosis

4. Condition of before and after the act of living health

[Figure 4]examined the condition of before and after the act of living health. The practice of living health has been shown to increase since one day in test respondents. However, the practice of living health has shown a tendency to decline since the 17thdays. But the behavior of living health has increased again since the 25th days. Living health activities have shown a continuing increase since 26thdays.

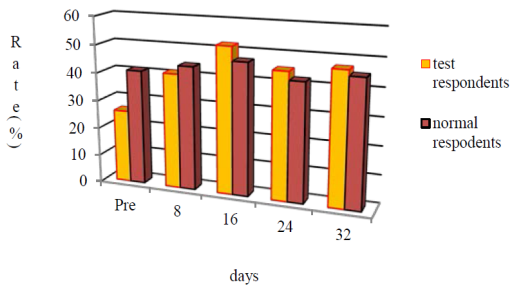

Figure 4.Conditionof before and after the act of living health

Discussion

The paper is to analyze new experimental effect for strengthening bone density in osteoporosis patients. As a result of this study, bone density in osteoporosis patients has been improved by knee-jerk reaction to regular act of living health every day after day. The finding was similar with the previous studies on the spinal stenosis[11-12]. In order to prevent osteoporosis, the types and amount of exercise that match the health status of the participants must be defined and followed. Climbing the stairs will be a useful tool for patients to strengthen bone density in osteoporosis patients. Therefore, the data will play important roles in the prevention and treatment of osteoporosis. Calcium and vitamin D are the most important nutrients for the health of bones

The condition of bone density is better after drinking milk than before drinking milk. This is similar to an arthritis thesis in a prior study[13-14].Bone density levels are diagnosed as osteoporosis from -2.5. Milk contains a lot of vitamin D, which prevents osteoporosis. Proper calcium and vitamin D are important to prevent osteoporosis. Osteoporosis fracture is not enough to treat the fracture itself. Osteoporosis fractures require continuous effort to prevent falls and to prevent eating habits because the risk of retraction increases. Thus, to prevent osteoporosis, it is effective to enjoy balanced food and exercise at the same time. We believe that the data produced will help improve the quality of medical care in the future.

Effect of Quality Management Initiative to Improve Patient Identification Behavior of Nurses

Young Mee Kim

Namseoul University,Dept. of Nursing,Korea

Abstract

Background/Objectives: Patient identification (ID) errors occurring during medication administration process can be fatal. Thus, the aim of this study was to identify the effectiveness of a quality improvement (QI) project to improve the patient ID behavior of nurses during the medication administration process.

Methods/Statistical analysis: This study adopted a quasi-experimental design. More than a thousand nurses participated in the QI project at a university hospital in Seoul Korea. Eighty- six nurses (from 70 nursing units) were chosen as "Patient Safety (PS) Keepers" to take the lead in fostering medication safety. Ten strategies to improve nurses' compliance for patient ID were conducted. The patient ID behavior of nurses was quantified using mean ± SD values, and differences between the pre- and post-test scores were analyzed using the t-test.

Findings: The scores for patient ID behavior were significantly increased from 4.41 ± 0.49 in the pre-test group to 4.55 ± 0.51 (out of 5) in the post-test group ($t = -6.548$, $p < 0.001$). The patient ID behavior of nurses was improved by the implementation of strategies. This finding has implications for nurse training and for the development of strategies leading to nurses' behavioral changes during medication administration.

Improvements/Applications: After this QI project, nurses' patient ID behavior was designated as an annual performance indicator in this hospital. The PS keeper initiative is quite applicable in nursing departments and can be a useful strategy to encourage nurses to actively participate in QI.

Keywords: *medication administration, patient identification, patient safety, nurse, behavior*

Introduction

The purpose of this study was to identify the effectiveness of a quality improvement (QI) project to improve the patient ID behavior of nurses during the medication administration process.

In hospitals, while errors may take place in each step of the medication-use process—procuring the drug, prescribing, dispensing, administering, and monitoring patients, most errors occur at the prescribing and administration stages [1]. On average, a hospitalized patient is subject to one administration error per day [2]. During the administration process, nurses provide the last opportunity to prevent medication errors, with one study reporting that nurses prevent the majority (85%) of potential medication errors [3]. Nevertheless, nurses may not always be prepared to identify potential medication errors. An experimental study demonstrated that 39% of the participating nurses misidentified the patient and administered the medication to the incorrect patient [4].

The most common causes of these errors are communication challenges between medical personnel and patients [5]. When nurses are well informed about a patient, they reportedly often omit patient ID procedures, such as audibly stating the patient's full name [6]. According to a 2007 report published in the UK on serious impairments due to blood transfusions, the main cause of serious complications was failures in patient ID procedures at bedside, and the administration of an incorrect blood type [7]. Therefore, it is essential for nurses to identify patients correctly before administering

Corresponding Author:
Young Mee Kim,
seoulymk@nsu.ac.kr

medications or transfusions, even if a bar-code system is used. Practical guidance and evaluation criteria for patient ID must be developed to improve the quality of nursing [8].

"Improve the accuracy of patient identification" is the goal 1 of Hospital National Patient Safety Goals by the Joint Commission every year. The intent for this goal is two-fold: first, to reliably identify the individual as the person for whom the service or treatment is intended; second, to match the service or treatment to that individual. Using at least two patient identifiers are recommended when administering medications, blood, or blood components[9].

Hospitalized patients, they might respond to another's name because of disorientation or impaired hearing. Healthcare providers must check the ID of patients, using a formal protocol for patient ID, before administering any medical treatment, such as medications, transfusions, examinations, or surgery.

Patient identification (ID) errors occurring during medication administration can be fatal. However, many nurses do not comply with the patient ID principle presented by the Korea Institute for Healthcare Accreditation, audibly stating the patient's name and hospital registration number (HRN) and checking if the medication card matches the patient ID band's HRN. The patient ID process includes the series of steps that nurses conduct to ensure that the medication is given to the correct patient.

Moreover, one nurse on duty is responsible for more than 10 patients in Korea. It is easy to get confused with a patient for a nurse on duty because of many patients. Nurses should follow the protocol for patient ID prior to administering medications or transfusions. At this hospital, only 41% of the nurses reported in a 2012 QI survey that they always audibly identified patients, before administering medication. To improve the patient ID behavior of nurses, it would be advantageous to utilize the PS keepers (of fellow nurses) initiative to encourage implementation of the protocol.

Method

This study adopted a quasi-experimental design that identified the effectiveness of the PS keeper initiative, as a QI project of the nursing department at a 1,670-bed tertiary teaching hospital.

The present study was approved by the Institutional Review Board of the university (IRB No. 2013-19) at which the researcher was affiliated. The purpose and methods of the study were explained to each subject before the survey was administered. The questionnaire was only issued if the subject had agreed to participate. To ensure correct patient ID by nurses administering medications and transfusions, our QI team developed a protocol. Instead of limiting the project to one-sided education, the QI project also selected PS keepers to monitor and provide feedback during the study.

The QI team developed a measurement tool that included eight items: three items related to medications, and five, related to blood transfusions. A standard procedure was used to ensure the accurate ID of the patient, such as checking the patient's ID bracelet and name, along with the HRN on the medication, and audibly stating the patient's name and HRN when administering medication. The tool was scored on the following 5-point Likert scale: 1 = never, 2 = seldom, 3 = sometimes, 4 = usually, and 5 = always. A value of 0.80 for Cronbach's alpha confirmed the reliability of the instrument [10].

Eighty- six nurses were chosen as "PS Keepers" to take the lead in fostering medication safety at 70 nursing units except operating rooms, and then participated in a workshop April, 2013.

The team shared the importance of patient safety and discussed the need for improved patient ID. They also proposed strategies to improve the patient ID behavior of nurses.

The PS keeper nurses were expected to play an exemplary role in nursing units, by identifying patients according to a protocol. For example, before medication was administered, the nurse was supposed to ask the patient's name and HRN, to confirm verbally that the stated name and HRN match those on the ID band. The nurse was then required to confirm that the name and HRN of the medication card match those on the patient's ID band.

A pre-test was conducted from March 5 to March 15, 2013. It involved the direct involvement of nurses in the administration of medications and transfusions to patients using a tool for patient ID behavior. To investigate the effects of the QI project, a post-test was conducted, from September 9 to September 15, 2013. The pre- and post-tests were not conducted on an entirely

identical group of participants, owing to the turnover and rotation of nurses during the project.

The collected data were coded, and the general characteristics of the subjects were analyzed using descriptive statistics. Patient ID behavior was analyzed using means and standard deviations, and the differences between the pre- and post-test scores were analyzed using the t-test.

The specific activities are as follows: 1) Every even month, the PS keepers observed the patient ID behavior of their fellow nurses incognito, and reported the results to the QI committee under the nurses' real names. The PS keepers also participated in educating new nurses and encouraged them to identify patients correctly, according to the protocol. 2) In monthly meetings, the PS keepers discussed the degree of improvement and problems with nurse managers of the QI committee. 3) Every Monday all nursing staff campaigned by wearing a label marked "The day of correct patients" on the chest. 4) The committee held a poster contest for the attention of the nursing staff, and four were selected as outstanding work for correct patient ID. 5) Both winners and participants were awarded prizes, money, and pearl bracelets. Bracelets are meaningful because they are similar to ID bands. 6) Award-winning works were used for computer screen savers. 7) The contents of patient ID methods were added to education video material on admission. 8) A pictogram representing patient ID was designed and attached to every patient's bed. 9) Warning statement, "correct patient" was marked on the blood type tags hanging in IV poles. 10) The PS keepers uploaded comments praising colleagues to promote role models of patient ID through intranet.

As a part of QI activity, the complete survey (incognito monitoring) was conducted every two months for 4 monitoring sessions: Primary and Pre-Initiative in February, 2nd in April, 3rd in June, and 4th in August. PS keepers secretly observed that their fellow nurses' patient ID behavior were consistent with the given protocol, and reported the results to the committee under the nurses' real names. The results are as follow: the compliance rate of patient ID behavior for blood transfusion improved from pre-initiative 95.5% to 99.7%. But the compliance rate of patient ID behavior for medication in pre-initiative session was 68.9%, and it has since improved as the initiative progressed: 70.3% in April, 82.5% in June, and 89.3% in August. Overall, the compliance rate of patient ID behavior in medication administration improved by 20.4% [Figure 1].

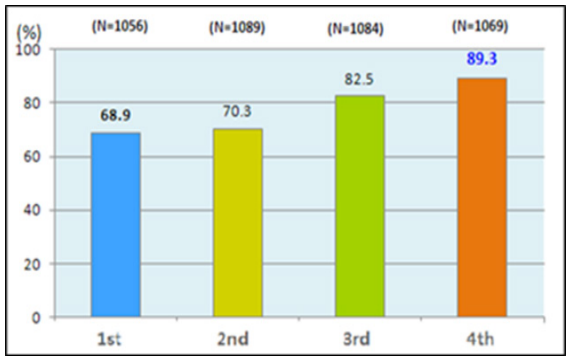

Figure 1. The compliance rate of patient ID behavior for medication over time period (70 nursing units, under incognito monitoring)

The compliance rates of patient ID behavior for medication were similar in adult wards, but relatively low in ER, Pediatric department, and ICU [Figure 2].

	Medical[1]	Surgical[2]	Ped[3]	Cancer[4]	ICU[5]	ER[6]	OPD[7]	PACU[8]	mean

Result

1. General characteristics of the subjects

Most participants were female (97.4% and 97.5% for the pre- and post-test, respectively). The mean ages of the participants were 28.68 and 28.95 years in the pre- and post-test groups, respectively. The mean total clinical employment duration was 62.67 and 67.17 months, and the mean present nursing unit employment duration was 28.19 and 30.75 months, in the pre- and post-test groups, respectively [Table 1].

Table 1. Characteristics of the study participants

		Pre-test group (N=1106)	Post-test group (N=1038)
Characteristics	Category	N (%) or mean±SD	N (%) or mean±SD
Gender	Female	1077 (97.4)	1012 (97.5)
	Male	29 (2.6)	25 (2.4)
	No answer	-	1 (0.1)
Age (years)		28.68±5.15	28.95±5.33
Education	College	303 (27.4)	279 (26.9)
	Bachelor	774 (70.0)	723 (69.7)
	Master's degree	26 (2.4)	24 (2.3)
	No answer	3 (0.2)	12 (1.2)
Total duration of clinical employment (months)		62.67±59.29	67.17±61.25
Duration of present nursing-unit employment (months)		28.19±26.72	30.75±27.17

2. Differences in patient ID behavior between the pre-test and post-test groups

The patient ID behavior of nurses was quantified using mean ± SD values, and differences between the pre-and post-test scores were analyzed using the t-test. The scores for patient ID behavior was significantly increased from 4.41 ± 0.49 in the pre-test group to 4.55 ± 0.51 (out of 5) in the post-test group ($t = –6.548$, $p < 0.001$) [Table 2].

Table 2.Differences in patient ID behavior between the pre-test and post-test groups

Group	Patient identification behavior	
	Mean ± SD	t (p)
Pretest (N =1106)	4.41±0.49	–6.548 (<.001)
Posttest (N =1038)	4.55±0.51	

Discussion

This study was designed to identify the effectiveness of a QI project to improve the patient ID behavior of nurses.

Westbrook and others[11] who observed nurses preparing and administering medication, reported the failure to confirm the patient's ID with the medication chart as the most frequent procedural failure, and in only 41.3% (n = 1762) of all the cases was the proper ID protocols followed. The 41.3% compliance with the patient ID protocol is almost consistent with 41% compliance found prior to the QI activity at this hospital.

Henneman and others[12] suggest that before performing a task, the simplest and most efficient way to verify the identity of a patient who is awake, is to ask the patient his or her name and date of birth, and confirm the stated information to the information on the patient's identity band and the task artifact. This procedure verifies the accuracy of the information on the identity band and matches the task artifact to the correct patient.

Based on these suggestions, this study conducted the PS keeper initiative QI project to enhance compliance with the protocol for patient ID. Thus, nurses were required to audibly state the patient name and HRN, compare the patient information with those on the ID band, and verify the ID band information against the name and record of medication. The effects of the QI project were investigated by evaluating the differences

in patient ID behavior, before and after the PS keeper initiative.

The results showed that the average score of patient ID behavior was significantly increased following the implementation of the PS keeper initiative. The findings by the self-reported questionnaire and by the incognito monitoring were in accordance. Therefore, this QI project was successful in improving and facilitating correct patient ID behavior in nurses.

Moreover, each PS keeper played an active role as a change agent, who led by example in practical, proper patient ID behavior, and monitored and encouraged fellow nurses to follow the protocol of patient ID for enhanced patient safety.

In an incognito survey of QI activities, the compliance rate of patient ID behavior was the lowest in the ER. This is similar to those reported by Henneman et al., [4] which shows that most emergency providers (92%) failed to verify patient identity, thus ordered medical tests on an incorrect patient when presented with an unexpected patient identity error. It is considered that the characteristics of each ward led to this result.

Leape et al.[3] found that, of identified 334 medication errors from 11 acute care wards, nurse medication administration errors (38%) were the second-largest category of medication errors following physician medication order errors (39%). A single patient can receive up to 18 doses of medication per day, and a nurse can administer as many as 50 medications per shift [13]. Therefore, emphasis on the importance of patient safety among all nurses, and guidance and encouragement in following the protocols for medication and transfusion services in practice are all necessary.

To improve patient safety and reduce the incidence of adverse events, efforts are needed to develop tools and change strategies that enable the redesign of care and support teams, and assist individual practitioners to identify and prevent adverse events [3]. In the present study, the development of the protocol for patient ID was equivalent to a redesign of the patient ID procedure, and PS keepers were considered change agents in the nursing units. Thus, the PS keeper initiative is quite applicable in nursing departments and can be a useful strategy to encourage nurses to actively participate in QI.

Conclusion

In conclusion, this study provides evidence that the nurse's patient ID behavior has become routine as a result of the QI project (PS keeper initiative, continuous incognito survey, and various organizational and cultural activities). It is very meaningful that the results by the self-reported questionnaire and by the incognito monitoring were in accordance.

Abstract

Background/Objectives: The purpose of this study is to assess changes to the medial elbow joint space(MEJS) depending on grip contraction, valgus force and the angle of the glenohumeral joint external rotation(GHER).

Methods/Statistical analysis: Ultrasonography was used to investigate the spatial variation of MEJS according to the angle of GHER, valgus force and grip contraction. In this condition, each variable was set to grip and non-grip; GHER 90 and maximum; valgus force 0 lb, 1 lb and 2 lb. One-way repeated ANOVA was used to see change with weight, and independent-samples T-test was used to see changes with the angle of the GHER and valgus force.

Findings: The MEJS was the narrowest at GHER 90° x grip contraction x 0lb and the MEJS was the largest at GHER maximum x non-grip contraction x 2lb. There was no significant difference between GHER 90° and the GHER maximum, and it was significant between the grip contraction and non-grip contraction. GHER 90° × grip contraction and GHER 90° × non-grip contraction showed significant difference between 0lb and 2lb according to the weight and there was no significant difference in the rest. In the GHER maximum x non-grip contraction, there was a significant difference between the 0lb and 2lb and the 1lb and 2lb and there was no significant difference in the rest. There was no significant difference in GHER maximum x grip contraction.

Improvements/Applications: According to the results of this study, the prevention of ulnar collateral ligament(UCL) damage and the guidelines for exercise during overthrowing can be applied.

Keywords: *Medial elbow joint space, Valgus force, External rotation, Forearm &Finger flexor, Ulnar collateral ligament, Ultrasonography*

Introduction

The UCL provides the primary stability to valgus stress. This is composed of anterior, posterior, and oblique bundle. The anterior bundle provides the main restraint to valgus stress between 30º to 120º of elbow motion[1,2].And the UCL provides about 54% stability to the valgus torque[3]. In previous studies, the elbows loaded with valgus force was 34N. However, the problem is that during the pitching motion, the baseball player's elbow is loaded by more than 90N. In a recent study, 25% of major league baseball pitchers reported having undergone UCL reconstruction[4]. The maximum load is applied to the medial elbow at the maximum GHER and 90°of the elbow joint in throwing motion[5]. Flexion of the elbow 90°, external torque on the forearm to perform GHER test. In elbow 90° flexion, the GHER and the valgus movement of the elbow are in the same plane, and GHER measured at 90° of elbow flexion is affected by valgus laxity. Insufficiency to the UCL is a common injury of the pitcher, resulting in increased elbow valgus laxity[6].

The valgus force is a major cause of damage to the UCL. In addition, this force damages the flexor carpi ulnaris(FCU), the flexor digitorum superficialis(FDS)

Corresponding Author:
Jae-Ho Yu,
naresa@sunmoon.ac.kr

and the pronator teres[7,8]. In baseball, a lot of valgus force is given in the cocking phase. Valgus force is increased from overextension stress, whereas in the deceleration phase, the cocking phase to the acceleration phase is increased[9,10]. Youth players experience 28Nm and professional pitchers experience 64Nm. When the valgus force is given, to reduce instability in the elbow, 54% of the UCL's varus torque is used[11]. Also, the varus torque restricts medial elbow joint gapping through forearm and finger flexor[4].

The MEJS is the distance between the midportion of the trochlea of the humerus and the edge of the coronoid process of the ulna. Previous studies have shown a much wider spacing of the MEJS in the cocking phase where valgus stress is loaded than during the wind-up phase[12,13].The ultrasonography(US) is a useful tool for assessing the pathological condition of the elbow, such as medial elbow joint instability and UCL injury[14]. This method is sufficient to show sensitive changes in the spacing of the MEJS[15,16].

Atanda et al.(2016) performed stress ultrasound on the elbow of 102 youth and youth baseball pitchers.The width of the MEJS at rest and at 150N valgus stress was measured in 12-18-year-old subjects. Measurements were performed on both dominant and non-dominant arms. The results of this study show that the width of joint space is increased when stress is applied compared with resting time. And there is no difference between the dominant elbow and the non-dominant elbow[17]. Such previous studies have shown that the MEJS increases when valgus force is given during pitching. The effects of the forearm and finger flexors on valgus angle and the MEJS been demonstrated in several studies, but studies on the effects of valgus force on the wrist loading and the effects of the angle of the GHER are insufficient yet. Therefore, the purpose of this study is to assess changes to the MEJS depending on grip contraction, valgus force and the angle of the GHER.

Materials and Method

1. Subject

This study was one group multiple intervention comparison design and a single blinded study, cross-sectional study. The subjects were recruited undergraduate 38 students in S University, located in Asan, Chungnam province. There were instructed enough about the purpose and method of the research prior to the experiment. The total sample size of 34 was selected using G*Power 3.1. A total of 34(17 male and 17 female) people was selected in order to apply the standard of inclusion and exclusion. This research was performed under the approval of Institutional Review Board (IRB) in Sunmoon University(SM-201804-019-2).

2. Procedures

The subjects were placed supine on the bed with the shoulder in 90º of abduction; the elbow in 90º of flexion, as measured by a goniometer(Digital Absolute+Axis, 12-1027, USA, 2012)[Figure 2-A]. The ultrasonography(eZono3000, Germany, 2011, 7.5MHz, 3cm) was used to assess the MEJS[Figure 2-B].

Images were taken under 3*2*2(valgus force* grip contraction*GHER) different conditions. The MEJS was measured in the dominant arm. The subjects are required movements according to the presence of the grip contraction, the angle of the GHER, and the valgus force. In each condition, the subjects were set in which they performed a non-grip or a maximal grip contraction; the forearm and finger flexor contraction. The weight on the wrist was set to 0lb, 1lb and 2lb. After measuring the MEJS to each condition, they took a rest for 7 seconds in neutral position and continued the rest of the experiment with the same method.

[A][B]

Figure 2. Instrumentation.
[A] : Goniometer [B] : Ultrasonography.

A line was drawn from the most distal portion of the trochlea to the most proximal portion of the coronoid

process. This distance was recorded as the MEJS [Figure 3]. Ten participants were included in a pilot study to assess intrasession test-retest reliability.

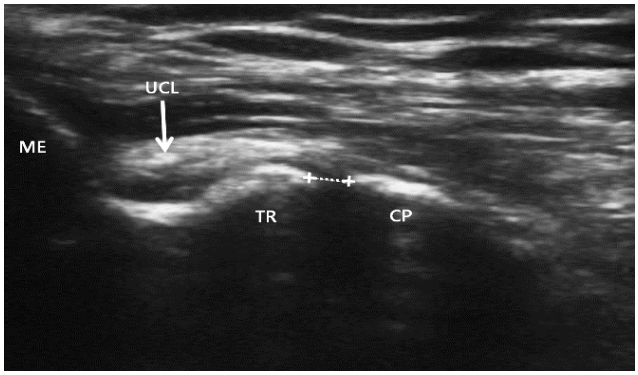

Figure 3. Ultrasonographic image of medial elbow.

Dotted line represents MEJS, ME, medial epicondyle; TR, trochlea; CP, coronoid process; UCL, ulnar collateral ligament.

Statistical Analyses

Statistical analysis of every measured value was calculated using SPSS/PC ver.18.0 for windows program. One-way repeated ANOVA was used to see change with weight, and independent-samples T-test was used to see changes with the angle of the GHER and valgus force. In addition, Scheffe method was used in post-hoc test in order to figure out the weight condition. The significance level was set to (p<.05) for statistical analysis.

Results

1.Comparison of changes in MEJS by weight

There was no significant difference between the 0lb and 1lb groups, 1lb and 2lb groups in the non-grip and GHER 90° group(p>.05). However, there was a significant difference between the 0lb and 2lb groups(p<.05). There was no significant difference between the 0lb and 1lb groups, 1lb and 2lb groups in the grip and GHER 90° group(p>.05). However, there was a significant difference between the 0lb and 2lb groups(p<.05).There was a significant difference between the 0lb and 2lb, 1lb and 2lb groups(p<.05).

2. Comparison of changes in MEJS by GHER

There was no significant difference between the grip types and 0lb, 1lb and 2lb group(p>.05).

Table 2. MEJSacross the 12 condition measured[a]

A	Maximal grip		t	Non-grip		t
GHER	90°	Max.		90°	Max.	
0	2.93±0.12	3.19±0.13	-1.45b	3.44±0.12	3.7±0.11	-1.61b

F	3.41*	1.94	.	4.753*	5.347*	.

[a] **Values expressed as millimeters (mean 6 SD).**

[b]Significant differences between groups; 90° and maximum of the GHER.

***Significant differences between groups; 0, 1lb and 2lb(p<.05).**

3. Comparison of changes according to presence or absence of grip

There was significant difference between 0, 1 and 2lb and GHER 90° group(p<.05).

4. The mean of each group

. In terms of the mean change in MEJS, when maximal grip x GHER 90° x 0lb, the smallest space was 2.93mm.It had the widest space of 4.23mm when it was non-grip x GHER maximal x 2lb.In addition, the mean space of the non-grip group was larger than the maximum grip group, the GHER maximum group was larger than the GHER 90° group, and the mean space of the 2 lb group was larger.

Discussion

The UCL is the primary inhibitor to valgus stress of an overhead athlete.The UCL injury is recorded as the cause of medial elbow pain among throwers. According to recent literatures, the factors that affect the elbow valgus force during throwing are largely divided into grip-contraction, GHER and weight on wrist. Because the motion of throwing is a complex cycle in which the kinetic chain–shoulder, elbow, wrist and hand[6,18,19].

But, as the quality of life in modern society improves, the increase of leisure time actively generated sports participation by citizens. Exercise is no longer just a unique area for athletes, and injuries resulting from it are also common for the general public. Because of this, our study was conducted on students.

Previous studies have demonstrated that a torque is generated at the UCLduring pitching that is higher than the torque that causes damage[20,21].MEJS significantly increases when a valgus load is applied to the elbow[4]. Wrist and finger flexors have demonstrated their ability to protect the MEJS and the UCL from damage in vitro, but these results are currently being studied in vivo[22]. In particular, TheFCU and the FDShave many influences on the MEJS[4]. In this study, the width of the MEJS was significantly different between the grip condition and the non-grip condition. Regardless of valgus force loading and angle of the GHER, wrist and finger flexors activity led to a decrease in MEJS in the grip conditions compared with non-grip conditions. Thus, hardening of the wrist flexor, particularly FCU, FDS, is considered important.

In this study, when looking at the valgus load by grip contraction and GHER conditions, there was a significant difference between 0lb and 2lb. This does not seem to affect the MEJS much if the weight does not differ by as much as 2lb. It is not resulting in a significant difference between 0lb and 1lb, 1lb and 2lb. Therefore, it is recommended that at least 2lb of difference be made if you want on see the change by the valgus force using weight. On the other hand, the comparison of weights with a GHER maximum angle and grip contraction does not appear to affect space and there is no significant different.

To our knowledge, when the shoulder is external rotated maximum, the valgus force applied to the elbow may anatomically exceed the normal range and lead to injury. Several studies suggest that have to do elbow flexion 90° in order for the GHER to affect elbow valgus force. The GHER and the valgus movement of the elbow are in the same plane, and the GHER measured at 90° of elbow flexion is affected by valgus laxity in elbow 90° flexion[4,7,9,11]. The mean value between the GHER 90° and maximum was different. The value of the GHER 90° was significantly lower than the maximum. However, the statistics showed no significant difference. The reason for this is that when the angle of the GHER is 90°, it is anatomically considered that the MEJS is already stretched enough. So, the elbow flexion 90° is only a device for viewing the maximum valgus force effect, but the relationship between the GHER 90° and maximum does not seem to affect it. Looking at this, if overhead exercise is performed, the magnitude of the impact on the MEJS at between the GHER 90° and maximum is not much different, so the player don't have to attention. However, if there is damage or instability at the UCL and the wrist flexor, so it is recommended to be carried out with caution.

Conclusion

The purpose of this study is to assess changes to the MEJS depending on grip contraction, valgus force and the angle of the GHER. The MEJS increases significantly when a valgus load of more than 2lb is applied to the elbow. The maximal contractions of the forearm and finger flexor muscles decrease the MEJS in healthy

participants. Activation of the forearm and fingers flexors is important to prevent injuries to the UCL and internal elbow joints. Furthermore, experiments with baseball players should be conducted to prevent injury. However, the GHER showed no significant difference between 90 and maximum. So, the GHER doesn't have to pay much attention to exercise.

Antimicrobial Effect and Physical Properties of *Paeonia Lactiflora* Coated on the Denture Base Resin

Yu-Ri Choi[1], Min-Kyung Kang[2]

[1]Department of Dental Hygiene, Hallym Polytechnic University, 48 Janghakgil, Dong-Myeon, Chuncheon-si, Gangwon-do, 24210, Republic of Korea, [2]Department of Dental Hygiene, Hanseo University, 46 Hanseo 1-ro, Haemi-myun, Seosan-si, Chungcheongnam-do, 31963, Republic of Korea

Abstract

Background/Objectives: The purpose of this study was to coat an antimicrobial material on denture base resin. The antimicrobial activity, physical properties, and cytotoxicity of specimens were evaluated coating on Paeonialactiflora

Methods/Statistical analysis: In order to evaluate the physical change, microhardness, color difference, and contact angle measurements were conducted. The OD (optical density) values of *Streptococcus mutans* and *Candida albicans* were obtained to confirm the antibacterial activity. In addition, the MTT method was used to evaluate the cytotoxicity of the coating extract.

Findings: The physical properties of the denture base resin coated with the extract changed. Compared with the uncoated specimens, the hardness improved and the contact angle reduced, indicating a hydrophilic surface. The color change could not be confirmed by the color difference measurement. The Paeonialactiflora extract showed antimicrobial activity 48 h after exposure to *Streptococcus mutans* and *Candida albicans*. The extract did not show cytotoxicity.

Improvements/Applications: The antimicrobial activity of the denture base resin coated with Paeonialactiflora extracts was confirmed. In the future, various antibacterial substances from natural extracts should be developed.

Keywords**:** *Paeonialactiflora, Antimicrobial activity, Natural extract, Streptococcus mutans, Candida albicans*

Introduction

Owing to the rapid increase in the population of the elderly, Korea is considered an aging society. Oral health management has become a very important issue for elderly individuals[1]. Most elderly individuals who experience tooth loss wear their dentures in the oral cavity; if the dentures are mismanaged, bacterial growth occurs. Older people with dentures have poor oral hygiene and a high rate of pathogenic microbial infections. Inappropriate denture management among the elderly leads to systemic diseases caused by aspiration pneumonia and affects the mortality rate of the elderly[2]. Keeping dentures clean is important not only for maintaining an esthetic, odor-free appliance, but also for maintaining oral health. It is not sufficient even if the elderly try to clean dentures themselves; food residues or calculus and pigments deposited on the dentures can cause oral bacterial growth such as denture stomatitis[3]. The control of many bacteria has been studied for denture care, because they affect not only the oral cavity[3], but may also lead to systemic diseases[4].

In previous studies, the use of a denture cleanser was studied as a denture management method[5]. Recently, research on alternative materials has been carried out to overcome the disadvantages of existing antibacterial products. Effective antimicrobials have been developed to reduce side effects by using extracts

Min-Kyung Kang,
kmk0709@hanseo.ac.kr

that are widespread in nature[6]. In this study, extracts of the natural compound Paeonialactiflora were used. Studies revealed that Paeonialactiflora extracts contain polyphenols and flavonoids; the antibacterial activity of Paeonialactiflora against *Streptococcus mutans, Porphyromonas gingivalis*, and *Candida albicans* was also reported[7]. The purpose of this study was to investigate the antimicrobial activity and physical changes induced by coating Paeonialactiflora extract onto denture base materials, and to examine its effectiveness against *S. mutans* and *C. albicans*, which cause oral disease. The materials used in this study were jet dentures coated with Paeonialactiflora extracts.

Method

Paeonialactiflora was added to a 70% methanol solution and extracted at room temperature for 48 h. Primary filtration was performed using a filter paper (Filter paper # 2, Whatman, U.K.). There after, the mixture was concentrated by evaporation using a vacuum evaporator (Vacuum Evaporator, ETELA, Japan). Additionally, the specimens were prepared in powder form using a freeze dryer (Freeze Dryer, Ilshin Lab, Korea).

The specimens were prepared with denture resin (Jet denture, Lang, U.S.A) and denture Tokuyama Rebase II (TOKUYAMA, Japan), and coated with plaquit (Dreve, Germany).To prepare the specimens, a polyethylene film was placed on a slide glass. In a Teflon mold, the resin was mixed as instructed by the manufacturer, following which it was coated by the polyethylene film again and cured. Paeonialactiflora extract powder was dissolved in plaquit solution at concentrations of 200 μg / mL, 400 μg / mL, and 600 μg / mL on the prepared specimens, and 10 μL of the mixed solution was spread on the resin specimen. For 10 min at a wavelength of 380 nm (Visio Beta vario, 3M).

Tests were conducted to evaluate the change in hardness in the uncoated group and plaquit-coated group. The hardness test was performed with a micro hardness tester (Dmh-2; Matuzawa Seiki, Tokyo, Japan). A load of 0.09 MPa with a die pyramid indenter was placed for 20 s at a face angle of 130°, and each specimen was tested thrice.The contact angle was measured to determine the difference (if any) in the contact angle of the specimen coated with the extract. It was measured immediately after dropping 5 μL of distilled water in the specimens, using a contact angle measuring device (Phoenix 300, SEO, Korea). This was repeated three times for each experimental group.To confirm the color change in the coated specimen, we examined the color difference between the control and experimental groups. To determine the color difference, a white plate was used as a standard; the L *, a *, and b * values were obtained; and the color difference was measured using a spectrophotometer (CM-3500d; Minolta, Kyoto, Japan). The E value was calculated. Three measurements were performed per specimen.The polyphenol content was measured by immersing the specimen in distilled water and eluting it in a constant-temperature water bath at 37 °C for 7 days, for which 50 μL of the test solution was added to 650 μL of distilled water. Then, 50 μL of Folin Denis reagent was added and reacted at room temperature for 3 min. (UV / VIS Spectrometer, X-ma 1200 Spectrophotometer, Human, Korea). The standard curve was obtained by adding 100 μL of a saturated solution of Na_2CO_3 and reacting it in a constant-temperature bath (dark room) at 37 °C for 1 h. Subsequently, standard amounts of garlic acid (Sigma Aldrich, USA) were used to calculate the content of polyphenols.*Streptococcus mutans* were cultured in brain heart infusion (Becton Dickinson and Co., Sparks, MD, USA), and *Candida albicans* was cultured in yeast mold (Becton Dickinson and Co., Franklin Lakes, NJ, USA). After 24 h, they were used in the experiment. To analyze the growth inhibition effect of the experimental group, the medium dilution method was used. Immersed in 600 μL PBS and eluted for 24 h. The absorbance was measured at 600 nm using an ELISA reader (Epoch, BioTeck, Winooski, VT, USA) at 37 °C for 24 h and 48 h after mixing the bacterial culture and eluate in a 1: 1 ratio.The MTT assay method was applied to determine the cytotoxicity of the extracts. According to ISO 10993-5, the number of cells per well was adjusted to 1×10^4 and cultured for 24 h. Cells were loaded with the experimental material and incubated for 24 h. After 24 h, the eluates were removed and washed with 100 μL of DPBS (Gibco BRL, Life Technologies, NY, USA). After washing, 50 μL of 1 mg / mL MTT (3- [4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide) (Sigma, UK) was added and incubated for 2 h. To dissolve the formed MTT formazan, 100 μL / well of isopropanol was added and the reaction was allowed to proceed for 20 min (Sigma, UK). The absorbance at 570 nm was measured with a spectrophotometer. The MTT reduction rate of the control group was normalized to 100%, and the result was obtained as a percentage.

Result And Discussion

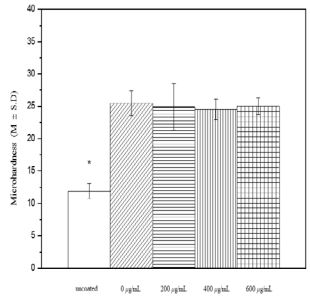

Figure1. Microhardness results

*The statistics significant difference by One-Way ANOVA ($p > 0.05$).

From the micro hardness test results [Figure 1], it can be concluded the hardness of the experimental group coated with the extract was significantly higher than that of the control group

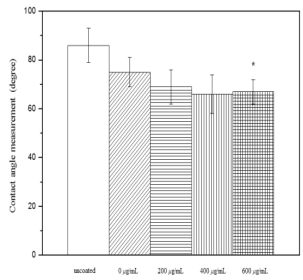

Figure 2. Contact angle measurement results

*The statistics significant difference by One-Way ANOVA ($p > 0.05$).

All experimental groups showed a decreased contact angle compared to that of the uncoated control group [Figure 2],it was evident that the coated surface was rendered hydrophilic. As the concentration increased, the contact angle decreased. In the experimental group, the 600μg/mL group in particular showed a statistically significant decrease.

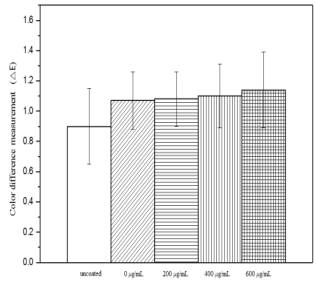

Figure 3. Color difference measurement results

In order to confirm the color change of the coated surface of the denture base resin, color difference measurements were performed, and the results were comparedwith those of the control group. There was no significant difference in the color of the experimental group compared to that of the uncoated control group [Figure 3].

Table 1. Contents of polyphenol in Paeonialactiflora

Group	Polyphenol (μg /mL)
200 μg/mL	5.64 ± 1.37^{a}
400 μg/mL	10.29 ± 1.84^{a}
600 μg/mL	11.00 ± 3.50^{b}

[ab]The difference letter indicates statistics significant difference by One-Way ANOVA($p > 0.05$).

Analysis of the polyphenol content of the Paeonialactiflora extract showed that it was present in the experimental group in concentrations of 200μg/mL, 400μg/mL, and 600μg/mL. The 600μg/mL group showed significantly higher polyphenol content than the other groups ($p < 0.05$)[Table 1].

Table 2. Antibacterial effect of *Streptococcus mutans*

Group	**OD (M ± S.D)**	
	24 h	**48 h**
0μg/mL	0.053 ± 0.003 a	0.612 ± 0.008 a
200μg/mL	0.049 ± 0.005 a	0.455 ± 0.071a,b
400μg/mL	0.047 ± 0.002 a	0.428 ± 0.021a,b
600μg/mL	0.047 ± 0.002 a	0.433 ± 0.050a,b

[ab]The difference letter indicates statistics significant

difference by One-Way ANOVA($p > 0.05$).

Table 3.Antibacterial effect of *Candida albicans*

Group	OD (M ± S.D)	
	24 h	48 h
0 μgmL	0.061 ± 0.001 a	0.884 ± 0.130 a
200 μg/mL	0.056 ± 0.003 a	0.818 ± 0.096 b
400 μg/mL	0.057 ± 0.004 a	0.837 ± 0.136 b
600 μg/mL	0.052 ± 0.003 a	0.825 ± 0.101 b

[ab]The difference letter indicates statistics significant difference by One-Way ANOVA($p > 0.05$).

The Paeonialactiflora extract was exposed to *S. mutans*[Table 2] and *C. albicans*[Table 3] to confirm its antimicrobial activity. There was no significant difference in the antimicrobial activity of the control and experimental groups, which were stored for 24 h after application of *S. mutans* and *C. albicans*. However, in the group to which the extract was applied for 48 h, the experimental group showed a significant decrease in bacteria compared to the control group.

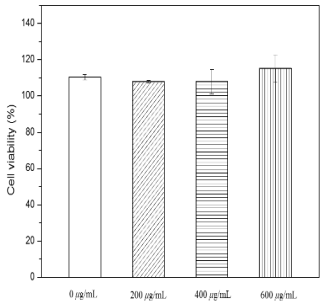

Figure 4. Cell viability ofPaeonialactiflora

The MTT assay was performed to confirm the cytotoxicity of the Paeonialactiflora extract [Figure 4].The extract showed a similar survival rate compared to the control, and it was confirmed that there is no cytotoxicity.

Discussion

There are two ways to keep dentures clean: physical and chemical. The physical method involves cleaning the denture surface using an ultrasonic cleaner, toothbrush, or toothpaste. The chemical method involves disinfecting the denture surface by immersing the denture in the chemical[8,9]. In the physical method, it is difficult for the elderly to remove bacteria from the denture surface with a toothbrush, as movements are difficult for them. On the other hand, the chemical method causes discoloration of the denture surface and corrosion of metal parts[10, 11].Therefore, this study aims to prevent the growth of bacteria through an antimicrobial coating on the denture surface. As a result of microhardness, the coated material affected the surface hardness of the denture base resins, and the physical properties were improved. Increasing the micro hardness of denture base resins may increase the using period of denture base resins. Previous studies have reported that the color change of a resin surface caused by the application of chemical disinfectants on denture base resins was a disadvantage[10]. Color difference was not observed in this study. Therefore, Paeonialactiflora was found to be suitable for use as a coating for denture base resins. For the polyphenol contents of specimens analysis, Previous studies have shown that Paeonialactiflora contains polyphenols and flavonoids. The polyphenol content was also high in this study. The extract product containing these polyphenols exhibited antioxidant activity. According to previous paper, substances with these antioxidant activities affect biological properties[12]. The reason the specimen exhibited antimicrobial activity is due to the surface being rendered hydrophilic, as well as the antioxidant content of the material. In a previous study, Paeonialactiflora was extracted from hexane extract, methanol, chloroform, and ethyl acetate to confirm the antimicrobial activity of *S. mutans, C. albicans*, and S *aureus*[9].

In this study, the antimicrobial activities of Paeonialactiflora extract against *S. mutans* and *C. albicans* were confirmed. The extract also showed antimicrobial activity against *S. epidermidis*[13]. Further research suggests that the Paeonialactiflora extract should be applied to various bacteria.

On the other hand, Previous studies also showed no cytotoxicity in a Paeonialactiflora extract, which is consistent with the results of this study. In another study, the extracts were effective in killing oral squamous cell carcinoma[13]. The application of Paeonialactiflora extract, which is toxic to cancer cells without showing cytotoxicity to normal cells, is expected in various fields.

Conclusion

The antibacterial activity of extracts of Paeonialactifloraagainst *S. mutans*and*C. albicans*was investigated. Compared with the control group, the

treatment groups showed lower absorbance, confirming the antibacterial activity.To confirm the physical changes in the surface of the denture base material caused by the antimicrobial coating, the contact angle was measured. The contact angle was lower in the treatment groups, and the surface of the specimen was more hydrophilic than in the control group. The microhardness of the experimental group was higher than that of the control group. The color difference test indicated that there was no difference in color between the control group and the experimental group. Moreover, the extract of Paeonialactiflora did not show cytotoxicity. The results of this study showed that the Paeonialactiflora extract had an antibacterial effect when used to coat the surface of dentures.

Integrative Literature Review on Resilience of Family with the Elderly Dementia

DooRee Kim[1], Jeoung A Kwon[2], Eun Kyoung Han[3]

[1]College of Nursing, Konyang University, 158, Gwanjeodong-ro, Seo-gu, Daejeon, 35365, Republic of Korea, [2]Graduate School of Public Health, Yonsei University, Seoul, 50 Yonsei-ro Seodaemun-gu, Seoul, 03722, Republic of Korea, [2]Institute of Health Services Research, Yonsei University College of Medicine, 50 Yonsei-ro Seodaemun-gu, Seoul, 03722, Republic of Korea, [3]College of Nursing, Eulji University, 553, Sanseong-daero, Sujeong-gu, Seongnan-si, Gyeonggi-do, 13135, Republic of Korea

Abstract

Background/Objectives: The dementia is rapidly growing. This study is to develop evidence of the intervention program for family with demented elderly patients and to suggest the direction of future research.

Methods/Statistical analysis: The integrative literature review was applied for 20 years since 2000. We evaluated the extracted data through literature search. 11 papers were confirmed. The concepts of 'quality of life' and 'satisfaction of life', which were not included in the main search term, were important as a positive concept. Three researchers analyzed the results after discussing the contents of the final analysis.

Findings: In qualitative studies, the center for dementia care provided positive change in family such as opening mind to dementia, help each other, changing pattern of life, and changing for better life. The process of family resilience with in-home patient was analyzed as four stages of confrontation, challenge, integration, and sublimation. The type of family resilience was analyzed as positive meaning seeking, rational mutual cooperation, passive reality accepting, and external resource dependent. The adapted family's the main caregivers were spouses, had good health condition, social resources, and religion. In quantitative studies, the factors affecting adjustment of family were family resilience and support burden, and life satisfaction of family were family resilience.

Improvements/Applications: This study provides the evidence of intervention program for family resilience with the demented elderly patients. Also, the result of this study suggests the future direction of the research.

Keywords: *Family resilience, Elderly dementia, Integrative literature review, Quality of life, adaptation*

Introduction

The number of patient with dementia which is called the most painful disease is rapidly growing ahead of its entry into the aging society. According to the Ministry of Health and Welfare, the number of dementia patients in Korea is over 700,000 as of 2017, and it is estimated to be 1 million by 2024[1]. The symptoms ofdementia are characterized by worsening as the disease progresses. In particular, family caregivers with dementia patients have a greater burden of care and nursing costs if they suffer from complicated symptoms such as cognitive dysfunction, psychiatric symptoms, and wandering symptoms[2].In order to meet these social needs, a long-term care insurance was introduced in 2008 and a day for overcoming with dementia was established. The centers for dementia care were established nationwide in 2018 in order to detect dementia early and overcome dementia[3], but 72% of the elderly patient with dementia cared by family[4]. In Korea, when a family member develops dementia, the family members have burden and pain by increasing stress, criticizing the behavior or the attitude between family members, and increasing conflict due to responsibility of the care[5],[6]. In addition, the severity

Corresponding Author:
Eun Kyoung Han,
haahaa21@hanmail.net

of cognitive impairment, behavioral symptoms, and impaired function of daily living in patients with dementia also decreases the quality of life of family members[7]. The results of previous studies on the family members of the elderly patients with dementia were mostly focused on negative physical, and mentioned the family function is decreased by providing care[5].However, in 2012, Kim et al[8] mentioned that previous studies did not investigated the characters of the family with the elderly dementia patients which have ability of coping crisis situation positively. Therefore, the positive factors that decreasing family stress, and improving family relationship under crisis situation should be considered in studies. The resilience of family is a family capacity that can be successfully adapted when faced with stress by reducing the burden of family with dementia patients, improving adjustment and quality of life[9]. Although the resilience of family of the elderly patients with dementia has begun to be investigated, systematic studies on the resilience are still rare[8,10]. It is the time that shifting a paradigm of the elderly patients with dementia to identify the negative factors experienced by family members, to mediate the strategy, and to identify the positive factors of the family members. Exploring positive factors such as the resilience of family may be useful for developing various interventions to help adjustment of family of the elderly patients. Therefore, it is necessary to integrate various research results related to the resilience of family and to systematically and objectively evaluate the results of research to clearly establish the basis of nursing intervention.

The purpose of this study is to develop the evidence of the intervention for the family with the elderly dementia and to suggest the direction of future research by analyzing the resilience of family of the elderly patients with dementia by the integrated literature review method.

Method

This study is an integrative literature review for integrating study results regarding the resilience of family of the elderly patients with dementia for 20 years since 2000.This study is to investigate the literature on the resilience of family with the elderly dementia by using of Whittemore & Knafl[11].

Result

1. General characteristics of the studies

In this study, the characteristics of domestic studies on family resilience of dementia were analyzed. 5(45.5%) studies out of 11 studies were year before 2010, and since 2011, there have been 6(54.5%) studies. In academic field, 7(63.7%) studies were the field of nursing. Out of 7 nursing studies, 1(9.1%) is in general nursing, 3(27.3%) were published in the Korean Journal of Psychiatric/Adult Nursing each. In addition, there were 3(27.3%) elderly welfare studies, 1(9.1%) social welfare administration study. In study design, there were 4 (36.4%) qualitative research, 7(63.6%) quantitative research.

2.Analysis of qualitative research on family resilience of dementia patients

In this study, four qualitative domestic researches on the family resilience of dementia were presented. One of the four qualitative studies was the experience of the family of demented elderly using the care support of the center for dementia care and the other two were the experience of family resilience of dementia patients or in-home demented patients. A case study was conducted to propose an improvement plan for improving the family resilience of dementia patients.

The subjects of the qualitative research analyzed in this study were the wife, daughter, daughter-in-law, husband, son and grandchild daughter-in-law of the elderly with dementia. The number of subjects was 8 to 30. Among the papers analyzed in this study, the experience of the family resilience of in-home dementia did not conduct the interviews with the subjects themselves. The analysis was based on 31 handwritten records of families with demented patients participated in the “Dementia resilience Experience Contest” in 2011-2012 who agreed participation in this study. The duration of providing family care to dementia ranged from a minimum of 1 year to a maximum of 10 years.

The qualitative research results analyzed in this study are as follows. First, as a result of the experience of the demented family using the care support of the center for dementia care, the use of the center for dementia care became the driving force of the understanding of the dementia and the demented elderly. The use of the center for dementia care for the elderly with dementia was an experience that would lead to another world. The center

for dementia care is helpful to family as well by proving free time. Second, the analysis of the experiences of familyof demented patients with in-home dementia were analyzed through 31 handwritings, and the process of resilience was analyzed as four stages of confrontation, challenge, integration, and sublimation. Third, as a Q methodology based on in-depth interviews of the demented elderly family, the type of dementia family was analyzed as positive meaning seeking type, rational mutual cooperation type, passive reality accepting type, and external resource dependent type. Fourth, a study on the improvement of social welfare services for the improvement of family resilience of demented elderly has compared and analyzed the cases of demented elderly caregiving adjustment family and maladjustment family. As a result, the adapted family showed that the majority of the main caregivers were spouses, had good health condition, used social resources (Day Care Center), and had religion .

3. Analysis of quantitative research on family resilience of dementia patients

In this study, the number domestic study regarding family resilience with dementia patients was 7. Two were intervention studies and the other five were survey researches.The first study among the intervention studies by Bang et al. in 2016 consisted of the family resilience enhancement program applied to the main caregiver of the elderly dementia. It consists of contents to increase family belief system, organization type, and strengthen communication to increase family resilience. The time was about 1 hourper session. The session was conducted once a week and total 8 session. The program consisted of 20 minutes of education, 40 minutes of group activities. As a result, the experimental group with the program showed improved family resilience, adjustment, perceived health status compared to the control group. The second study by Song et al. in 2014 was a group counseling program named "Happiness plus program" that combined art, music, horticulture, and cognitive-behavioral therapy to improve the stress coping ability of caregiving families and to better care for the demented elderly after education.The program consisted of a total of 8 sessions. Prior to the start of the program, two hours of pre-education sessions were held on topics such as 'Dementia and proper nursing and coping'. The results of this study showed that the subjects who participated in the program had lowered their depression after the program.

The study by Kim et al. in 2009 was conducted to investigate the factors affecting the life satisfaction of family with the demented elderly. Among them, 37.7% were the daughter-in-law and 21.9% were the daughters. Also, 54.1% of subject provided care for the elderly with dementia for 4 ~ 9 hours per day, and the average hour for caregiving was 9.34 hours per day. As a result of this study, the factors affecting life satisfaction of family with the demented elderly were family resilience, and the explanatory power was 30.4%. The study by Lee in 2008 is a study on the adjustment of family with demented elderly. This study suggests the direction of adjustment through the analysis of correlation with family maladjustment using the family resiliency model.

The subjects were 52% of the daughters-in-law and 18% of the daughters. As a result of this study, the influencing factors on maladjustment of family with the elderly dementiawere incendiary communication, confident of problem solving ability, power of challenge in sense of family control power, social support. Through this, I-Message communication method is used to improve the family adaptability with demented elderly patient. Also, improving problem solving ability using community resources, improving the family power of challenge and control, and providing emotionalsupport through relationships with friends were necessary. The study by Yoo in 2007 was also conducted to investigate the factors influencing the family adjustment with demented elderly patient. The average age of the subjects was 53.42 years, and the duration of caregiving was less than 2 years (41.7%). As a result of this study, the factors affecting family adjustment with demented elderly patient were family resilience and family support, and the explanatory power was 23.4%.

Discussion

This study investigated the study regarding resilience of family with demented elderly patients since 2000 and conducted a integrative literature review on 11 studies. Among the 11 studies analyzed in this study, 63.7% of the studies were written in the field of nursing, and 63.6% of the studies were quantitative rather than qualitative. As a study method, survey research methodology using the survey was the highest with 45.5%. The results of this study are discussed in the following two aspects.

First, in order to search for the resilience of family with demented elderly patient studies, the main search terms were selected and 35 studies were searched.

However, based on the title and abstract of the studies, the research team selected the best studies for the purpose of this study and 11 studies were selected finally. In the present study, the family with demented elderly patients were more likely to experience depression, burden, and stress which were negative[12-14].According to the analysis of newspaper articles on dementia families from 1920 to 2014, there were four types such as suicide of family with dementia patient, murder of the demented family, suicide after murder, and co-suicide. It can be seen that the negative concept is dominant in the media as well as in the research. In recent years, however, the concept of resilience of family with demented elderly patient has been emphasized as the adjustment patterns of psychosocial and healthy family members demonstrate the flexibility of the family using various resources around them rather than the burden of the family members and the maladjustment[15]. In addition, in Korea, the third comprehensive plan for dementia managementwas announced in December 2015. This is because, unlike the first and second plans, the focus of support for patients and their families is emphasized. The vision of the tertiary plan is 'Implementation of a society in which dementia patients and their families can live comfortably and safely in their communities'.

The areas for this are community-oriented prevention of dementia, providing diagnosis, treatment, and care of dementia patients under comfortable and safe environment, and reducing the burden of care for the family members with dementia patients. At the same time, there was effort to improve the resilience of family with demented patient. In the future, the research for the family with demented elderly patients should also be based on a positive concept.

Second, in analyzing the type of research in this study, qualitative research was 36.4% and quantitative research was 63.6%. Five out of seven quantitative researches were conducted as survey research. It is based on Dickoff and James' four theories which were factor-isolating theory, factor-relating theory, situation-relating theory, and situation-producing theory[16]. The studies related with family with demented elderly patients so far have focused on factor-isolating theory that conceptualizing phenomena and classifying facts and events. Also, the studies have focused on factor-separation theory that identifies the relationship between named factors and concepts, and the contingency theory that predicts the exact cause and effect relation. However, there have been few researches on the situation-producing theory for prescribing specific situation to control the situation based on the predicted theory and to bring the definite goal or specific result.

Conclusion

This study investigated the study regarding resilience of family with demented elderly patients. There is not enough research and standardized measurement tools on the family resilience with demented elderly patients. Therefore, developing standardized measurement tools to measure the positive concept of family with demented elderly patients is necessary to promote family resilience, to develop intervention programs, and to start intervention studies for investigating the effect of family resilience.

Physical, Biological and Antimicrobial Properties of Polymethyl Methacrylate Coated with *Cnidium Officinale* Extract

Myung-Jin Lee[1], Min-Kyung Kang[2]

[1]Department and Research Institute of Dental Biomaterials and Bioengineering, Yonsei University College of Dentistry, 50-1 Yonsei-ro, Seodaemun-gu, Seoul, 03722, Republic of Korea, [2]Department of Dental Hygiene, Hanseo University, 46 Hanseo 1-ro, Haemi-myun, Seosan-si, Chungcheongnam-do, 31963, Republic of Korea

Abstract

Background/Objectives: This study was aimed to investigate the influence of *Cnidium officinale* (CO) extract coating on the physical, biological, and antimicrobial properties of polymethyl methacrylate (PMMA) surface.

Methods/Statistical analysis: PMMA was coated with CO extract of different concentrations and tested for physical properties such as microhardness, water contact angle, and color change, and cytotoxicity measured through MTT assay. Antimicrobial and antifungal activity was measured against *Streptococcus mutans* and *Candida albicans*. Polyphenol content in the extract was analyzed using a UV-vis spectrometer. The results were analyzed by one-way ANOVA followed by Tukey's test.

Findings: There were no significant differences in microhardness, contact angle, color change, and cell viability ($p > 0.05$) between control and CO-coated PMMA samples. However, the CO-coated groups showed significant reduction in *Streptococcus mutans* and *Candida albicans* ($p < 0.05$). CO significantly improved the antimicrobial effect of the denture, consistent with its polyphenol content.

Improvements/Applications: Our results indicate that coating PMMA resin with CO extract would be effective for ensuring good antimicrobial activity, while maintaining the advantages of PMMA.

Keywords:*Antimicrobial property, Biological property, Cnidium officinale, Extract, Physical property, Polymethyl methacrylate*

Introduction

Recently, with the entry of an aging society, the oral health care of the elderly has emerged as an important problem in dentistry. The use of dentures is increasing steadily among elderly people who have severe tooth loss[1]. Although polymethyl methacrylate (PMMA) has been generally used as a biomaterial in the dental fields for denture due to its physical and biological properties, and simple fabrication[2], its poor antimicrobial property still remains a shortcoming[3]. Many studies have been reported on stomatitis and denture surface bacterial proliferation in denture patients[2-3]. A plaque could easily form in the environment of the mouth, leading to the acceleration of oral infection and unfavorable odor[4]. Thus, attempts have been made to reduce infections by adding antimicrobial agents to PMMA[2]. However, the addition of antimicrobial agent has a number of problems in terms of physical and biological properties, such as changing surface, affecting cytotoxicity[1-5]. Therefore, in order to develop an antimicrobial PMMA, it is important to select and add an antimicrobial agent that does not cause side effects and does not deteriorate the physical and biological properties.

Antimicrobial agents using chemically synthesized materials are inexpensive, uniform in composition and can be mass-produced, but toxicity, carcinogenesis

kmk0709@hanseo.ac.kr

and mutagenesis in the human body are potential risks associated with it[6]. Therefore, natural products have been researched as a way to find alternative substances with antimicrobial propertiesand less side effects[7-8]. Natural organic matters have limitations in terms of composition or manufacturing conditions, but have the advantage of low residual toxicity and side effects[9]. Recently, studies on antioxidants to inhibit free radicals, which are closely related to the health of modern people, have been carried out for natural products[10]. Moreover, there has been increasing interest in oriental medicine with several studies on their antioxidant activity and safety

Cnidium officinale (CO), a Korean medicinal herb, has been used in Asia as a traditional medicine for long periods of time, including as painkillers, anti-inflammatory drugs, and treatment for menstrual irregularity[12]. In addition, CO exhibits various effects such as antibacterial, antifungal, vascularization, sedation, and analgesics[13-14]. Although it is known that CO has antimicrobial activities against various microorganisms such as bacteria and fungi, there is a lack of studies on its application in dental materials[15].

Therefore, in this study, we aimed to produce PMMA with improved antibacterial properties by observing the effects of surface coating PMMA with different concentrations of CO extract. Our null hypothesis states that (1) surface coating of PMMA would result in significant differences in physical properties, (2) biological properties, and (3) antimicrobial properties compared with uncoated PMMA and control.

Method

Four groups were fabricated using a teflon mould of diameter of 10 mm and a thickness of 1 mm. Commercially available PMMA (Tokuyama Rebase II,TOKYUAMA, Japan) was chosen as samples. Surface coating solution (Plaquit, Dreve, Germany) was prepared by mixing various concentrations (0, 200, 400, 600 ug/mL) of CO extract. After mixing PMMA, 10 uL of coating solution was spread on a PMMA sample by microbrush and then coated with a light curing machine (Visic Beta vario, 3M) for 10 min. Measurements were performed twice for each sample (n = 5).

Microhardness

The samples were prepared in a hardness tester (micro hardness tester, Dmh-2; Matuzawa Seiki, Tokyo, Japan) and a 200 g weight was applied for 10 s at different points of the samples. The major axis length of the pressed mark was measured to determine surface hardness. Two sites were measured at random for each specimen, and the mean value and standard deviation were obtained and compared.

Wettability

The wettability of samples was carried out using a contact angle analyzer and contact angle measurement software. A 20-uL droplet of distilled water was dropped on the sample surface, and examined after 3 s of contact (Phoenix. 300, Gyunggido, Korea).

Color change

A spectrophotometer (Lamba20, Perkin Elmer, Orwalk, CT, USA) was used to measure the color changes of the samples. The CIE L*a*b* color system is a three-dimensional uniform color space with axes L*, a* and b*, indicating the difference in distance from origin to color change. The L* values indicate brightness and extend from 0 (black) to 100 (white). The Lab values and color change (ΔE) were determined according to the CIE color coordinate system.

Cell cytotoxicity

The cytotoxicity was evaluated using the MTT assay according to ISO 10993-5 standards. L929 cells were seeded into a 96-well plate (SPL, Pochen-Si, Gyeonggi-Do, Korea) with a density of 1×10^5 cells/mL and cultured for 24 h. After removing the culture medium from the wells, 100 uL of the CO extract was added to each well. After 24 h, the culture medium was removed and replaced with 50 uL of MTT solution in phosphate-buffered saline. The MTT solution was discarded and 100 uL isopropanol was added to each well. The absorbance was then evaluated using an ELISA reader (Epoch, BioTek, Winooski, VT, USA) at 570 nm.

Microbial analysis

For microbial analysis, the growth inhibitory effect of the extract was analyzed. The strains used in the experiment were *S. mutans* (ATCC 25175), and *C. albicans* (ATCC 10231). *S. mutans* was cultured in brain heart infusion (Becton Dickinson and Co., MD, USA), and *C. albicans* in yeast mold (Becton Dickinson and Co., Franklin Lakes, NJ, USA). The samples were then extracted in 600 uL of PBS and incubated for 24 h. Bacterial culture fluid was diluted so that the OD600

value was 0.4-0.6. After mixing the solution and bacterial culture with 1:1 ratio, the mixture was incubated at 37 °C for 24 h and 48 h. Inhibitory effect of the extract was measured based on the optical density (OD) values in each well using an ELISA reader (Epoch, BioTeck, Winooski, VT, USA) at 600 nm.

Polyphenol contents

The polyphenol content was measured by immersing the specimen in distilled water (same as MTT elution method). Then, 50 uL of the sample solution was added to 650 uL of distilled water. Next, 50 uL of Folin Denis reagent was added and reacted at room temperature for 3 min, after which 100 uL of 10% Na_2CO_3 saturated solution was added and 150 uL of distilled water was used to adjust the final volume to 1 mL. After mixing and incubating the reaction for 1 h in a water bath at 37 °C (dark room), the absorbance was evaluated at 725 nm using a UV/VIS Spectrometer (X-ma 1200 Spectrophotometer, Human, Korea). The standard curve was calculated using the standard material gallic acid, and the polyphenol content was calculated.

Statistical analysis

The results obtained for the control and experimental materials were analyzed by one-way analysis of variance (IBM SPSS statistics 23, IBM Co., USA), followed by Tukey's test ($p<0.05$).

Result and Discussion

No significant differences were observed between the samples in terms of microhardness, wettability, and color change, except for the uncoated resin. In terms of cytotoxicity, no significant differences were observed between the samples [Figure 1]. Microbial analysis showed that the OD of the experimental samples containing CO significantly decreased at 48 h for both *S. mutans* and *C. albicans*[Figure 2]. This confirmed the presence of 200, 400, 600 ug/mL polyphenol in the experimental samples [Table 1].

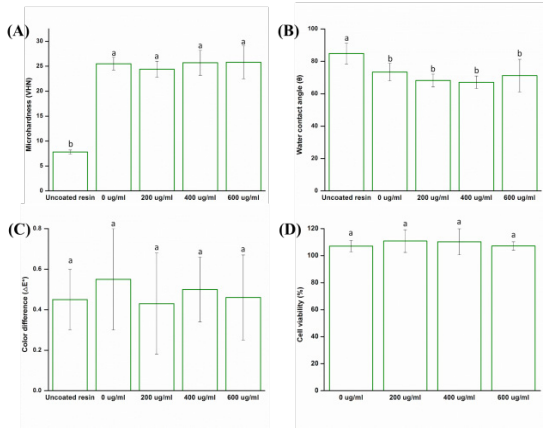

Figure 1. Comparison of (a) microhardness, (b) water contact angle, (c) color change and (d) cell cytotoxicity among different groups of samples.

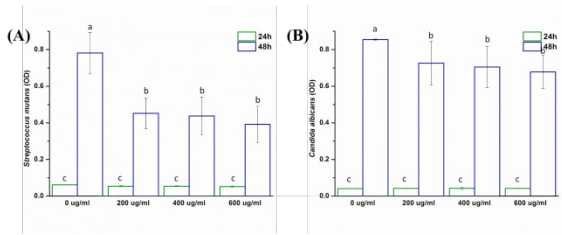

Figure 2. The results of the optical density (OD) of (a) *S. mutans* and (b) *C. albicans* among different groups of samples.

Table 1.Polyphenol contents of denture base resin containing *Cnidium officinale*

Group	Polyphenol (ug/mL)
200 ug/mL	22.71 ± 1.17
400 ug/mL	24.14 ± 1.17
600 ug/mL	24.14 ± 2.47

Discussion

PMMA is widely used in dentistry for positioning artificial teeth in the oral cavity and for correcting tooth position[2]. Bacteria or fungi on PMMA surface can cause various side effects, including oral thrush infections[4, 16]. Thus far, studies have tested PMMA coated with antibacterial agents, however, the release of these agents could have toxic effects or cause population shifts in normal oral flora[17]. Thus, in the current study, CO extract, which is a natural material, was used to coat the PMMA surface.

The physical properties of the coated PMMA were first evaluated. As shown in Figure 1A,only the uncoated resin group had a significantly lower surface hardness

than the other groups ($p< 0.05$), while the control, experimental groups did not show any significant difference in surface hardness ($p> 0.05$). Uncoated resin group had a significantly higher water contact angle [Figure 1B], while the control, experimental groups did not show a significant difference in wettability ($p< 0.05$). Furthermore, none of the groups showed significant difference in evaluation of color difference ($p> 0.05$) [Figure 1C]. Based on the above results, we rejected the first null hypothesis that surface coating of PMMA would result in significant differences in physical properties. Since denture coatings are in direct contact with oral mucosal tissues, cytotoxicity is very important. In terms of cell cytotoxicity [Figure 1D], all groups showed 100% cell viability, and there was no significant difference between the groups ($p > 0.05$). In accordance with ISO standard, over 70% cell viability is an indicator of cell cytotoxicity[18]. Thus, our second null hypothesis that surface coating of PMMA would result in significant differences in biological properties was also rejected.

Removable PMMA resin comes into contact with many microbial species in the oral cavity, causing unfavorable odors and accelerating oral bacterial and fungal infection[2]. In order for natural extract to be used as denture coating, it is necessary to verify the antibacterial and antifungal effects on the major bacteria found in the oral cavity and dentures. *S. mutans* is a representative caries-causing bacteria, and the acidic environment created by the organic acid formed during the process of glucose metabolism promotes the attachment of *C. albicans* to the oral mucosa and dentures[19-20]. In addition, the fact that most of the biofilms constituting the removable prostheses such as acrylic resin are composed of *S. mutans* and *C. albicans*, these two are the main pathogens in patients using denture. In microbial analysis [Figure 2], OD of both *S. mutans* and *C. albicans* was significantly decreased at 48 h in samples containing CO extract ($p< 0.05$). Therefore, our third null hypothesis stating that surface coating of PMMA would result in significant differences in antimicrobial properties compared with uncoated and control was accepted. The presence of the polyphenol contents within the experimental samples of 200, 400, 600 ug/ml was also confirmed [Table 1]. Phenolic compounds are one of metabolites widely distributed in plant systems, and they show antioxidant and antimicrobial activities. In general, antimicrobial agents are known to be related to phenolic compounds[21], and previous studies have reported that phenolic substances exhibit antimicrobial activity[22]. In this study, antimicrobial activity was also observed in the presence of phenolic substances. The result of this experiment is consistent with the high antimicrobial activity of phenolic substance-containing extract against bacteria and fungi, which are the most important microorganisms in the oral cavity[21].

Although our study indicates that surface coating with CO extract shows antimicrobial properties, without changing the desired physical and biological properties of PMMA, the mechanism of the antimicrobial properties remains unknown. In addition, our in vitro study has the limitation that the experimental period was too short; the long-term effects of the CO extract need to be evaluated. Further studies are also required to delineate the proportions of components and observe the effects over time.

Conclusion

Our study shows the surface coating of PMMA with COprovides antimicrobial effects, while maintaining the physical and biological properties of PMMA.

1. The microhardness, contact angle, and color change of the surface did not show significant differences between control and CO-coated PMMA samples ($p> 0.05$).

2. The cell viability did not show significant difference between control and CO-coated PMMA samples ($p> 0.05$).

3. The antimicrobial effect against *S. mutans* and *C. albicans* at 48 h showed significant difference between control and CO-coated PMMA samples ($p< 0.05$).

Thus, we conclude that CO has the potential to be used as a denture base resin. In addition, PMMA coated CO would be suitable for clinical practice.

Surface Characterization and Antimicrobial Efficacy of Denture Base Resin Coated with *Glycyrrhiza uralensis extract*

Yu-Ri Choi[1], Song-Yi Yang[2], Myung-Jin Le[2], Min-Kyung Kang[3]

[1]Department of Dental Hygiene, Hallym Polytechnic University, 48 Janghakgil, Dong-Myeon, Chuncheon-si, Gangwon-do, 24210, Republic of Korea, [2]Department and Research Institute of Dental Biomaterials and Bioengineering, Yonsei University College of Dentistry, 50-1 Yonsei-ro, Seodaemun-gu, Seoul, 03722, Republic of Korea, [3]Department of Dental Hygiene, Hanseo University, 46 Hanseo 1-ro, Haemi-myun, Seosan-si, Chungcheongnam-do, 31963, Republic of Korea

Abstract

Background/Objectives: *Glycyrrhizauralensis* is known for its antibacterial properties. The purpose of this study were to analyze surface characteristics of denture base resin coated with *G. uralensis* to evaluate antimicrobial activity and cell cytotoxicity.

Methods/Statistical analysis: The powdered *G. uralensis* extract was dissolved in Plaquit solution and then applied to a denture base resin and cured with light. Microhardness, water contact angle, and color change analyses were performed to analyze the surface characteristics. Specimens were obtained from the coated surfaces and analyzed to determine the amount of polyphenol. Antimicrobial activity was evaluated against *S. mutans*and *C. albicans* and cytotoxicity was investigated using the MTT assay.

Findings: The surface coated with the *G. uralensis* extract maintained or improved the mechanical and physical properties of the specimens. The polyphenol content increased with the amount of *G. uralensis* coating. The antimicrobial activity of the specimens from the experimental group showed a significant effect on both *C. albicans* and *S. mutans* compared to that from control group. In addition, denture base resins coated with the *G. uralensis* extract were noncytotoxic, demonstrating their biocompatibility.

Improvements/Applications: Denture base resins coated with *G. uralensis* extracts can be used to develop antimicrobial denture base resins to prevent oral stomatitis.

***Keywords*:** *Glycyrrhizauralensis*, Antibacterial activity, *Streptococcus mutans*, *Candida albicans*, Denture base resin

Introduction

Bacteria residing in the oral cavity are responsible for various oral diseases[1]. Microorganisms, mainly as different species of bacteria, can create an oral biofilm or dental plaque, resulting in periodontal disease and dental caries. The attached of bacteria to the saliva on the teeth surfaces showed to be the first step in a formation of dental plaque. The collection of bacteria on the teeth surface is important stage in the development of dental diseases[2].

Oral diseases are caused that the accumulation and colonization of oral microorganisms, and adhesion is the first stage in the bacteria colonization process. *Streptococcus mutans (S. mutans)* and *Candida albicans (C. albicans)* are representative organisms involved in a variety of oral diseases. *S. mutans* is a Gram-positive coccus and facultatively anaerobic properties. Usually, S. mutans was found in the oral cavity and the cause of dental caries. *S. mutans*indicated have agreater ability to form biofilms than isolates of other bacteria species that accumulation the human oral cavity[3].*C. albicans* is a pathogenic yeast that has been showed as a predominant feature organism in the oral candidiasis.

Corresponding Author :
Min-Kyung Kang,
kmk0709@hanseo.ac.kr

C. albicans usually showed in the oral, but *C. albicans is not* found to be a cause serious of oral disease[4-5].

A number of studies have been conducted on antibacterial efficacy against oral bacteria. Common antimicrobial agents have many side effects, leading to greater interest in the development of alternatives, such as using natural materials. Natural extracts have been used for hundreds of years in folk medicine. Many natural plant products have been successfullyutilized as antibacterial agents[6]. Many studies have been conducted to evaluate the antibaterial efficacy of various compounds, with much growing interest in natural extracts that do not produce resistant organisms.

Among natural extracts studied, *Glycyrrhizauralensis* is known to have antibacterial and anti-inflammatory properties. Previous studies have shown that *G. uralensis* exhibits antibacterial effect against Gram-positive bacteria (e.g., *P.acnes*and*B. subtilis)* and two Gram-negative bacteria (*E.coli* and *P.aeruginosa*)[7]. Additionally, it appears to be effective against *Helicobacter pylori*, the causative agent of gastric cancer[8], and to influence antibiotic resistance in organisms[9]. Various studies have reported the antimicrobial efficacy of *G. uralensis*; however, none of these have been conducted on the representative bacteria involved in oral diseases. Therefore, the purpose of our study is to evaluate the antimicrobial efficacy of a denture base resin coated with the powdered extract of *G. uralensis.*

Method

G. uralensis (500 g) was pulverized and extracted with a 70% methanol solution at room temperature for 48 h. The solution was filtered (filter paper #2, Whatman, U.K) and then concentrated by evaporation in a vacuum evaporator (ETELA, Japan). The concentrated extract was prepared in powder form with a freeze dryer (Freeze Dryer, Ilshin Lab, Korea).

Jet Denture (Lang, U.S.A) was used as the denture resin and Plaquit solution (Dreve, Germany) was used for coating with *G. uralensis* extract. Polyethylene film on a slide glass and then resin was mixed in a Teflon mold (10 × 10 × 0.1 mm) as instructed by the manufacturer. The extracted *G. uralensis* powder was mixed with 200 μg / mL, 400μg / mL, and 600 μg/ mL of Plaquit solution and stirred to dissolve. The mixture was spread on a resin specimen prepared with a micro brush, then the surface was coated and cured using a light curing machine (Visio Beta vario, 3M) for 10 min.A microhardness tester (Dmh-2; Matuzawa Seiki, Tokyo, Japan) was used to determine the hardness difference between the experimental and the control (uncoated and Plaquit-only coated) specimens. A 0.09 MPa load was applied to the surface of the specimen for 20 s using a pyramidal-shaped diamond indenter. To determine the contact angle of coated specimens, 5 μL of distilled water was dropped on the uncoated and Plaquit-only coated specimens, and the contact angle of these control specimens was measured using a contact angle measurement device (Phoenix 300, SEO, Korea). Chrominance measurements were conducted using with a spectrophotometer (CM-3500d; Minolta, Kyoto, Japan) to determine the color difference of the three groups of experimental and control (uncoated and Plaquit-only coated) groups. A white plate was set as the standard for color change; a*, b*and L* values of the specimens were obtained and ΔE * values were calculated. The polyphenol content was measured from a solution of the specimens immersed in distilled water and incubated for 7 d in a water bath at 37 °C. Next, 650 μL of distilled water was added to 50 μL of the specimen solution, followed by addition of 50 μL of Folin-Denis' reagent and reaction for 3 min. Afterward, 100 μL of 10% Na_2CO_3 saturated solution and then 150 μL of distilled water were added for a total volume of 1 mL. After incubation for 1 h, the absorbance was measured at 725 nm using a UV/vis spectrophotometer (X-ma 1200 Spectrophotometer, Human, Korea). The standard curve was calculated using a standard gallic acid solution (Sigma Aldrich, U.S.A). To analyse the growth inhibitory effect*, S. mutans*(ATCC 25175) were grown in a brain infusion medium (Becton Dickinson and Co., Sparks, MD, USA) and cultured for 24 h; *C. albicans*(ATCC 10231) were incubated in a yeast and mold medium and incubation for 24 h. The specimens were extracted in 600 μL of phosphate-buffered saline (PBS) for 24 h. The bacterial culture was diluted to an OD 600 of 0.4-0.6 and the absorbance was measured at 600 nm using an optical density reader (Epoch, BioTeck, Winooski, VT, USA) at 24 and 48 h after the eluate and bacterial culture were mixed in a 1:1 ratio. The MTT cytotoxicity test was conducted according to ISO 10993-5, in which the number of L929 cells per well was adjusted to a density of 1×10^4 cells/mL; 100 μL solution of cells were incubated with a dental base resin specimen for 24 h. The absorbance was measured on the UV-vis spectrophotometer and analysed at 570 nm.

Result and Discussion

1. Physical properties results

The microhardness of the coated, uncoated, and Plaquit-only coated specimens are listed in Table 1. Microhardness of the experimental group coated with the *G. uralensis* extract increased significantly from that of the uncoated group ($p < 0.05$). However, all coated specimens in the experimental group were not significantly different ($p > 0.05$). After establishing the microhardness of the specimens, contact angles were then investigated [Table 2]. The uncoated group had the largest contact angle (84.81° ± 6.52°), whereas the most concentrated 600 µg/m Lcoated group had a significantly lower contact angle (66.96° ± 4.68°) than that of any other experimental specimen ($p < 0.05$). These results demonstrate that the coated resin surface exhibits a hydrophilic character. The color change of the coated specimens was compared to that of the uncoated specimen [Table 3] whereby no significant difference between coated and uncoated specimens was observed ($p > 0.05$).

Table 1.Microhardness of denture base resins.

Group	Hardness (MPa)*
Uncoated resin	10.8 ± 1.2*
0 µg/mL	26.5 ± 1.7
200 µg/mL	27.1 ± 1.9
400 µg/mL	25.3 ± 1.9
600 µg/mL	25.1 ± 3.2

*Values are presented as mean ± standard deviation.

Table 2. Contact angles of denture base resins.

Group	Angle (Degrees)*
Uncoated resin	84.81 ± 6.52 [a]
0 µg/mL	73.45 ± 5.44 [a]
200 µg/mL	74.12 ± 4.78 [a]
400 µg/mL	71.45 ± 4.26[a]
600 µg/mL	66.96 ± 4.68[b]

*Values are presented as mean ± standard deviation.

[a,b]different superscript letters denote significant differences by one-way ANOVA.

Table 3.Color change of denture base resins.

Group	ΔE*
Uncoated resin	0.82 ± 0.37
0 µg/mL	1.05 ± 0.30
200 µg/mL	0.97 ± 0.40
400 µg/mL	0.94 ± 0.43
600 µg/mL	0.94 ± 0.46

*Values are presented as mean ± standard deviation.

2.Result of component analysis

The polyphenol content increases with increasing coating concentration [Table 4], however, there is no significant difference among the coated specimens in the experimental group ($p > 0.05$).

Table 4. Polyphenol content of denture base resins.

Group	Concentration (µg/mL)*
0 µg/mL	-
200 µg/mL	11.48 ± 2.97
400 µg/mL	12.43 ± 3.78
600 µg/mL	29.57 ± 26.94

*Values are presented as mean ± standard deviation.

3. Biological analysis effect results

Antimicrobial activity was evaluated by optical density (O.D), whereby a significant reduction of O.D was observed for specimens coated with the *G.uralensis* extract [Table 5] the 600µg/mL coated specimen exhibited the highest antimicrobial activity ($p < 0.05$) while the 0 µg/mLcoated specimen displayed the lowest antimicrobial activity against *S. mutans* and *C. albicans.* Figure 1 shows the cell viability results of the *in vitro* cytotoxicity test, indicating that there is no significant difference among the experimental group of *G. uralensis* coated denture base resins ($p > 0.05$).

Table 5. Optical density related to antimicrobial activity of denture base resins.

Group	Optical density (OD)*	
	S. mutans	***C. albicans***
0 µg/mL	0.612 ± 0.008 [a]	0.884 ± 0.130 [a]
200 µg/mL	0.410 ± 0.010 [a,b]	0.733 ± 0.121 [b]
400 µg/mL	0.412 ± 0.020 [a,b]	0.685 ± 0.248 [b]
600 µg/mL	0.389 ± 0.047 [b]	0.726 ± 0.088 [b]

*Values are presented as mean ± standard deviation.

[a,b]different superscript letters denote significant differences by one-way ANOVA.

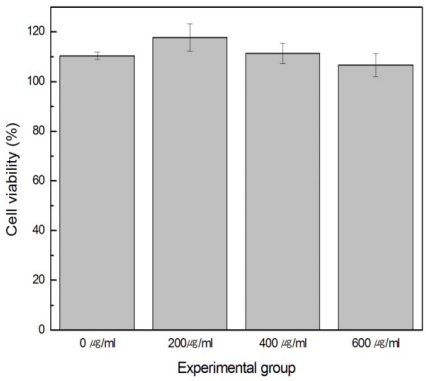

Figure 1. Cell viability of polymer base resins with *G. uralensis* extract powder coating

Discussion

These results demonstrate that microhardness of the surface increased upon coating with the extract. Hardness of the denture is an important factor because it affects abrasion resistance of the surface. Mechanical cleansing of dentures makes the surface rough and causes scratches, which can increase the attachment of microbial colonies while also being difficult to clean[10]. Thus, the denture base surface coated with the *G. uralensis* extract can likely improve the wear resistance. Hydrophobicity of the resin surface may interfere with denture retention and can promote adhesion of microorganisms, such as *C. albicans*, which is hydrophobic and adhereswell[11-12]. Coated surfaces were more hydrophilic than the uncoated surface and *C. albicans* could not adhere to the coated surface. The differences in the color change of denture base resins can be attributed to their composition. Thus, there should be no difference in the color of the specimens. The clinical remark of color difference has been quantified by the National Bureau of Standards (NBS) as NBS units expressed using the following formula: NBS unit = $\Delta E^* \times 0.92$ [13]. The color change of all denture resins was almost the clinically accepted range for color difference. The amount of polyphenol present in the specimens was determined because previous studies identified many phenolic compounds, such as liquiritin and isoliquiritin, which have shown inhibitory activity against bacterial growth[14-15]. *S. mutans* is the main pathogen that composes oral biofilms, while *C. albicans* is the most common microorganism to attach to the denture surface causing denture-related stomatitis, a disease characterized by inflammation and erythema of oral mucosa that is covered by the denture[16-17]. Therefore, many studies have been conducted to prevent both biofilm formation and attachment of *C. albicans*, as well asdevelopment of antimicrobial denture base resins[18-19].Recently, antimicrobial activity of natural extracts has been introduced for this purpose because increasing antimicrobial resistance has resulted in the need for alternative therapies using natural plant extracts. *G. uralensis* has been reported to exhibit antimicrobial activity against bacteria, including Gram-positive *S. mutans*, as well as antifungal activity toward *C. albicans*. Therefore, the *G. uralensis* extract may serve as an alternative antimicrobial therapy for oral dental caries, periodontal disease, and oral stomatitis[20-21].The cytotoxicity test provides insight into the biocompatibility of any dental or medical related materials. One concern in particular is the release of toxic substances from denture base resins, such as biocides, which may affect the oral mucosa[18]. Our results show that the *G. uralensis* extract does not exhibit a cytotoxic effect.

Conclusion

The denture base resin surface coated with the *G.uralensis* extract maintained or improved mechanical and physical properties of denture base resin. The *G. uralensis* extract coated resin also showed antimicrobial activity against *S. mutans* and *C. albicans*, while not exhibiting cytotoxic effects, as evidence of its biocompatibility. Therefore, denture base resins coated with powdered extracts of *G. uralensis* can be used for producing effective antimicrobial dentalmaterials.

Relationship between Critical Thinking Disposition, Self-efficacy, Self-esteem and Optimism of Nursing Students

Bo Ram Choi[1], JungIm Kim[2]

[1]Department of Nursing, Yong-In Songdam College, Yongin-si, Gyonggi-do, Republic of Korea,
[2]Department of Nursing, Kyungdong University, Wonju-siGangwon-do, Republic of Korea

Abstract

Background/Objectives: This study wasconducted to understand the relationship between critical thinking tendency, self - efficacy, self - esteem and optimism of a students in nursing.

Methods/Statistical analysis: Data collection was conducted from March10 to September 30, 2018 for 258students of the nursing college.Analysis was performed using the SPSS 23.0 version program and analyzed by t-test, ANOVA, Scheffe-test and Pearson's correlation coefficient.

Findings: The subjects' scores of critical thinking disposition(F=10.194,ρ=.000, F=7.011,ρ=.001), self-efficacy(F=4.020, ρ=.008, F=3.750, ρ=.006),self-esteem(F=4.701, ρ=.003)and optimism(F=6.407,ρ=.000, F=7.011, ρ=.000) were different according to their major satisfaction and motivation for selecting majors. There was a significant positive correlation(ρ<.001) between self-esteem, self-efficacy, self-esteem and optimism.

Improvements/Applications: It is necessary to seek educational programs that raise critical thinking disposition, self-efficacy, self-esteem and optimism in order to increase the satisfaction of major in nursing students.

Keywords: *Critical Thinking Disposition, Self-efficacy, Self-esteem, Optimism, Nursing Students*

Introduction

Clinical practice classes at the nursing college are guided by applying the nursing process, and various teaching methods including critical thinking are required to apply the nursing process and strengthen the ability to practice[1]. In nursing education in Korea, performance-based curriculum is proposed to provide students with core competencies and suggeststhat critical competencies include critical thinking[2].These critical thinking means the personal tendency to think and uses the thought that makes a decision for the purpose of problem solving and decision making[1].Self-efficacy means a belief that an individual can successfully achieve the action required to produce an outcome[3].Self-esteem means respecting and favoring oneself and recognizing that I am a worthy being[4].Critical thinking disposition and self-efficacy have positive effects on students' ability to perform nursing process[5]. Self-esteem was positively related to students' ability to practice and practice[6]. Also, life stress and satisfaction of nursing college was a positive correlation between optimism[7].

Therefore, this was conducted to analyze the relationship between critical thinking disposition, self-efficacy, self-esteem and optimism of students in nursing. The purpose of this study is to provide a basis for developing a systematic education program by summarizing the concepts necessary for the nursing process.4

Method

jikim@kduniv.ac.kr

self-efficacy, self-esteem and optimism of students in nursing. The subjects of the study were students who were second year students at a nursing college and who voluntarily agreed to participate in this study by listening to the explanation of the purpose of the study.Data collection was conducted from March10 to September 30, 2018 and a total of 258 surveys were collected and used in this study. The specific purpose of this study is as follows.

First, identify the general characteristics of the subjects.Second, the subjects' critical thinking disposition, self-efficacy, self-esteem and optimism. Third, the difference of critical thinking disposition, self-efficacy, self-esteem, and optimism according to the general characteristics of the subject.Fourth, analyze the relationship the critical thinking disposition, self-efficacy, self-esteem and optimism for the subjects.

2. Data Analysis Methods

All data were analysis using the statistics programfor SPSS version 23.0. The general characteristics of the subjects were analyzed by descriptive statistics. The t-test, ANOVA and Scheffe-test were used for the differences of critical thinking disposition, self-efficacy, self-esteem, and optimism according to general characteristics of subjectsPearson's correlation coefficient was used for the relationship the critical thinking disposition, self-efficacy, self-esteem, and optimism for the subjects.

3. Questionnaire

2.3.1.Critical Thinking Disposition

In order to measure the critical thinking disposition, the tool developed by Yoon[8] was used. A total of 27 items consist of seven areas of intellectual enthusiasm, curiosity, prudence, confidence, systematic, intellectual fairness, conferencing, and objectivity. The score is a Likert 5-point scale and the higher the score, the higher the critical thinking disposition. The reliability of the instrument were Cronbach's α = .84 in Yoon's study[8] and Cronbach's α = .87 in this study.

2.3.2.Self-efficacy

Self-efficacy was used to Lee, Schwarzer and Jerusalem[9] the development of a self-efficacy scale for the adaptation of tools Kim[10], which consists of a total of 10 questions. The score is a Likert 4-point scale and the higher the score, the higher the self-efficacy. The reliability of the instrument were Cronbach's α = .88 in Kim's study[10] and Cronbach's α = .89 in this study.

2.3.3.Self-esteem

Self-esteem was used as a measure of a Jeon[11] adapted for self-esteem of the tool Rogenberg[12].A total of 10 items were composed of 5 items of positive self-esteem and 5 items of negative self-esteem. The score is a Likert 4-point scale and the higher the score, the higher the self-esteem. The reliability of the instrument were Cronbach's α = .85 in Jeon'sstudy[11] and Cronbach's α = .82 in this study.

2.3.4.Optimism

For the optimality measure, we used Shin's[13] revised version of Revised Life Oriented Test (LOT-R) as modified byScheier, Carver and Bridges[14].This is a total of 10 questions, and the score is a Likert 5-point scale and the higher the score, the higher the optimism. The reliability of the instrument at the time of development was Cronbach's α = .78, Cronbach's α = .73 in the study of Shin[13] and Cronbach's α = .78 in this study.

Result and Discussion

1. General characteristics of the subjects

The general characteristics of the subjects were the same as[Table 1]. The subjects were a total of 258, whose average age was 21.1 years, of these, 94.6% (244 students) were female.Religion 'None' is 65.5% (169 students), Christian 23.6% (61 students) was followed. Satisfaction about the science of nursing's major was answered by students of 62.0% (160 students). Support motivation for the science of nursing's major was "self-selection" 60.9% (157 students), "others invitation"17.1% (44 students), "consider employment"15.5% (40students), "consider aptitude" 3.5% (9students), "consider grades"3.5% (8students).

Table 1.General Characteristics of the Subjects

Variables		**N(%)**
Average Age(year)		21.10±.65
Gender	Female	244(94.6)
	Male	14(5.4)
Religion	Christian	61(23.6)
	Buddhism	11(4.3)
	Catholic Christian	17(6.6)
	None	169(65.5)

Major Satisfaction	Very satisfied	38(14.7)
	Satisfied	122(47.3)
	Fairy satisfied	92(35.7)
	Very unsatisfied	6(2.3)
Selection of Major	Self-selection	157(60.9)
	Others invitation	44(17.1)
	Consider grades	8(3.1)
	Consider aptitude	9(3.5)
	Consider employment	40(15.5)
Total		258(100.0)

2.Degree of Critical Thinking Disposition, Self-efficacy, Self-esteem and Optimism

The subjects' critical thinking disposition, self-efficacy, self-esteem, and degree of optimism were the same as[Table 2]. The means of the critical thinking dispositionwas 96.88 (out of 135), the self-efficacy was 28.60 (out of 40), the self-esteem was 28.32 (out of 40) and optimism was 34.33 (out of 50)

Table 2. Degree of Critical Thinking Disposition, Self-efficacy, Self-esteem and Optimism

Variables	Min	Max	Mean±SD
Critical Thinking Disposition	78	122	96.88±9.18
Self-efficacy	18	61	28.60±4.21
Self-esteem	14	58	28.32±4.58
Optimism	20	58	34.33±4.67

3.Critical Thinking Disposition, Self-efficacy, Self-esteem and Optimism according to the General Characteristics of the Subject

Critical thinking disposition, self-efficacy, self-esteem and optimismaccording to the general characteristics of the subject are the same as [Table 3 and table 4].The critical thinking disposition was statistically significant according to the major satisfaction (F=10.194, ρ <.001) and motivation for selecting majors (F=7.011, ρ <.05).Students with high level of major satisfaction showed high scores on critical thinking disposition, and those who selected majors in consideration of aptitude showed high scores on critical thinking disposition.Self-efficacy was statistically significant according to the major satisfaction (F=4.020, ρ <.05) and motivation for selecting majors (F=3.750, ρ <.05). Students with high level of major satisfaction showed high self-efficacy and students who selected majors in consideration of aptitude showed high self-efficacy. Self-esteem was statistically significant according to the major satisfaction (F=4.701, ρ <.05). Self-esteem score was higher in students who had high level of major satisfaction.The optimism was statistically significant according to the major satisfaction (F=6.407, ρ <.001), motivation for selecting majors (F=7.011, ρ <.001).The students with high level of major satisfactionshowed high optimistic scores and those who selected majors considering their aptitudes showed high optimism.

4.Relationship between Critical Thinking Disposition, Self-efficacy, Self-esteem and Optimism

Relationship between critical thinking disposition, self-efficacy, self-esteem and optimism are the same as[Table 5].Critical thinking disposition, self-efficacy (r = .565, ρ <.001), self-esteem (r = .352, ρ <.001) and optimism (r = .375, ρ <.001) was statistically significant positive correlation. Self-efficacy, self-esteem(r=.501, ρ<.001) and optimism (r = .405, ρ <.001) was statistically significant positive correlation. Self-esteem and optimism (r = .574, ρ <.001) was statistically significant positive correlation.

Discussion

This study aims to identify the degree of critical thinking disposition, self-efficacy, self-esteem and optimism of students in nursing and try to understand the relationship between these concepts.The results of analysis of critical thinking disposition, self-efficacy, self-esteem and optimism according to general characteristics were as follows.

The general characteristics that showed significant difference from the critical thinking dispositionwere majors satisfaction and motivation for selecting majors. In other words, students with high level of major satisfaction and students who supported by considering their aptitude showed high critical thinking disposition, which is consistent with the results of previous studies[5,15,16].The general characteristics that showed significant difference in self-efficacy were students who applied with high major satisfaction and motivation for selecting majors to achieve major self-efficacywhich is consistent with the results of previous studies[5].

Also, the higher the self-efficacy, the higher thesatisfaction of the major. In other words, the choice of majors according to aptitude seems to increase self-efficacy and increase major satisfaction[17].The major characteristics of self-esteem were found to be general satisfaction, which showed that self-esteem was high for students with high majors.Features shown a significant difference in self-esteem is a major satisfaction was shown, it was a high-major satisfaction is higher self-esteem, which was consistent with the other results of studies about self-esteem[18].The factors that showed significant difference in optimism were major satisfaction and motivation for selecting majors. In other words, students with high major satisfaction and students who applied with majors according to aptitude showed high optimistic scores.In the previous study[19], optimism and major aptitude were found to have a significant effect on the feeling of happiness for nursing college students.In another study[20], it was found that those who are optimistic can better practice their efforts to be happy with optimistic expectations.As a result, this study shows that students who are highly satisfied with their majors and who have chosena major according to their aptitude are more optimistic.

Critical thinking disposition, self-efficacy, self-esteem and optimism was statistically significant positive correlation. Self-efficacy, self-esteem and optimism was statistically significant positive correlation. Also self-esteem and optimism was statistically significant positive correlation.

Conclusion

Based on the results of the above study, suggestions are as follows.

There was statistically significant difference between motivation for selecting majors and the major satisfaction of the nursing college students with the critical thinking disposition, self-esteem, self-efficacy and optimism.This suggests that there is a need to develop a curriculum or education programs that can enhance the critical thinking disposition, self-efficacy, self-esteem, and optimism in the curriculum of nursing college.here is also a need to continually study various concepts related to the nursing process in order to increase the satisfaction of the major

The Influence Factors on the Stages of Exercise Behavior Change of Female Nursing University Students in Transtheoretical Model

Hyea-Kyung Lee

Jungwon university, Department of Nursing,Republic of korea

Abstract

Background/Objectives: The purpose of this study was to analyze the effects of exercise motivation, perceived benefits and perceived barriers on stages of exercise behavior change in female nursing students.

Methods/Statistical analysis:The subjects were female nursing students two universities including J university in C province and M university in K province, and they were 144 female nursing students who understood the purpose of the study and agreed to participate in the study. The data were analyzed using frequency, percentage, mean, standard deviation, t-test, X^2 test, and multiple logistic regression.

Findings: The exercise motivation factors of female nursing students were found to have a significant effect on exercise motivation (β=2.239, p<.001). In other words, subjects with changes in exercise behavior were 9.3 times higher in exercise motivation than subjects without changes in exercise behavior.

Improvements/Applications: In order to promote regular exercise of female nursing students, the provision of information and exercise promotion programs at the school level to strengthen exercise motivation are suggested..

Keywords: *Exercise, Behavior, Motivation, Benefits, Barriers.*

Introduction

Exercise not only prevents various diseases by providing positive effects on physiological and biochemical changes in the body, but also helps recovery and rehabilitation from diseases, and provides psychological and social benefits as well as physical effects. Along with interest in health, there is a growing awareness that exercise promotes good health and improves quality of life[1]. Exercise is a lifestyle that works when a certain period of time is maintained regularly, and voluntary effort and practice are needed to promote health through exercise [2].

According to the data from the Statistical Office[3], the practice rate of health maintenance for women in their 20s was lower than that of other age groups. In case of regular exercise, 25.1% of women aged 20~29 and 60.7% of women in their 60s practiced regular exercise, showing that the regular exercise practice rate of women in their 20s is very low. In addition, 76% of women in their 50s and over practiced regular checkups, while only 22.3% of women in their 20s practiced it. These results suggest that the health maintenance practice rate of female nursing students, such as regular exercise and regular health checkup, is very low, given that most of the female nursing students are in their 20s.

Health is a central motivation for life for nursing students learning health-related disciplines. In addition, in the future, as they will be in charge of health education for health promotion of many subjects and should be a model of desirable health promotion behavior practice, nursing students being aware of the importance of health and practicing health promotion activities are meaningful in helping national health

Corresponding Author :
Hyea-Kyung Lee,
lee-hk1214@hanmail.net

promotion[4]. Nursing students can be expected to have a significant impact on the quality of health care as a key player in future healthcare delivery. In addition, nursing students, who will become nurses in the future, are prospective health care professionals who will work in the profession to achieve the ultimate goal of nursing to prevent diseases and maintain the health of subjects. Therefore, it is necessary to establish one's own healthy fitness level through exercise first[5]. Therefore, there is a need to find ways to promote the exercise of nursing students who require more active health maintenance, and the direction of intervention to promote systematic health maintenance and efficient health promotion[4].

Looking at the previous research on exercise continuation, attitudes and behaviors to participate in and sustain exercise can be influenced by an individual's internal choice, among which motivation is recognized as the most fundamental area that determines exercise participation[6]. Motivation factors play an important role in determining current and future exercise participation. This determines that the participant is the driving force that motivates them to play a role. People with high internal motivation in physical activity, exercise, and sports can continue to exercise even in the absence of compensation, and since they are able to fulfill their desires and tasks for their competence, they can lead to voluntary and active participation, which is why it is necessary to improve exercise motivation in university students.

Looking at recent research on stages of exercise behavior change [6-10] exercise motivation and social support [6,8,9], exercise self-efficacy [7,9], perceived health status [7-9], exercise gain and exercise loss [10] have been identified as major influencing factors of stages of exercise behavior.Therefore, by applying pan-theoretical model to nursing students, the study will analyze the convergent factors affecting each stage of change in exercise behavior and prepare the theoretical basis of nursing intervention for starting and continuing exercise.

Method

This study is a descriptive correlation study to investigate the factors affecting the stages of exercise behavior change of female nursing students.

The subjects of this study were female nursing students from two universities, J university in C province and M university in K province, and those who met the above criteria were sampled and the research purpose and objective were explained, and data collection was conducted on subjects who agreed to participate in the research.

Stages of exercise behavior change

The instrument used to measure stages of exercise behavior change in this study was a tool developed by Marcus et al.[11]that was adapted by Joe[12]. Based on these results, the precontemplation and contemplation stages that do not exercise were categorized into non-practice groups, and preparation stage, action stage, and maintenance stage are categorized into groups that practice exercise behavior.

Exercise motivation

An 18-item tool derived from the Intrinsic Motivation Questionnaires developed by McAuley et al.[13] edited by Choi [14] to use the three subfactors categorized into competence, effort, and pleasure was used. In the study by Choi[14], the reliability of the tool was Cronbach's α = .82 for competence, effort Cronbach's α = .69, pleasure was Cronbach's α = .85, and reliability in this study was Cronbach's α = .74.

Perceived barriers

8 of the 9 items developed by Lee[16] based on the tools of Sechrist et al.[2] and Steinhardt et al.[15] were used except for item 8 that was not related to the subject of this study. In the study by Lee[16], the reliability of the tool was Cronbach's α = .76 and in this study, Cronbach's α = .84.

Result

1. General characteristics of the subjects

The mean age of the subjects of this study was 21.83 years, and sophomore was the most common at 30.6%. 77.8% were non-religious subjects and 67.4% were normal BMI subjects. In the stages of exercise behavior change, 41.7% were in the contemplation stages, where they are not exercising but are motivated or willing[Table 1].

Table 1. General characteristics of subjects

Characteristics	Classification	n(%)	M±SD
Age			21.83±1.98
Grade	Freshman Sophomore Junior Senior	24(16.7) 44(30.6) 38(26.4) 38(26.4)	
Religion	Yes No	32(22.2) 112(77.8)	
Exercise stages	1 Stage(pre contemplation) 2 Stage(contemplation) 3 Stage(preparatory) 4 Stage(action) 5 Stage(maintenance)	27(18.8) 60(41.7) 39(27.1) 10(6.9) 8(5.6)	
BMI	Underweight Normal Overweight Moderate obesity Severe obesity	29(20.1) 97(67.4) 13(9.0) 5(3.5) 0(0)	

2.Exercise Motivation, Perceived Benefits and Perceived Barriers of Subjects

Exercise motivation showed average levels with 2.89 points, perceived benefits showed 2.97 points, and perceived barriers showed 2.39 points, showing above average levels [Table 2].

Table 2. Exercise Motivation, Perceived Benefits and Perceived Barrier of subjects

Variables	M±SD	Range
Exercise Motivation	2.89±.42	1~5
Perceived Benefits	2.97±.43	1~4
Perceived Barriers	2.39±.49	1~4

3. Differences in General Characteristics, Exercise Motivation, Perceived Benefits and Perceived Barriers According to Stages of Exercise Behavior Change

Looking at differences in general characteristics, exercise motivation was significantly different between exercise practice group and non-practice group (t=-5.33, p<.001), The exercise practice group scored higher on internal motivation than the non-practice group[Table 3].

Table 3. General characteristics, Exercise Motivation, Perceived Benefits and Perceived Barriers by Stages of Change of Exercise

Characteristics	Categories	Stages of exercise behavior change		X2 or t	p
		Group that did not exercise	Group that did exercise		
		n(%) or M±SD	n(%) or M±)SD		
Grade	Freshman Sophomore Junior Senior	15(17.2) 27(31.0) 28(32.2) 17(19.5)	9(15.8) 17(29.8) 1(17.5) 21(36.8)	6.76	.080
Religion	Yes No	18(20.7) 69(79.3)	14(24.6) 43(75.4)

Exercise Motivation		2.75±.38	3.10±.40	-5.33	<.001
Perceived Benefits		2.91±.45	3.06±.36	-2.04	.042
Perceived Barriers		2.46±.48	2.29±.49	2.00	.047

4. Influencing Factors on the Stages of Change of Exercise in Subjects

The exercise motivation factor of female nursing students was found to have a significant effect (p<.001) on stages of exercise behavior change. The explanatory power of the dependent variables of the regression model was 23.8%, and the classification accuracy of the stages of exercise behavior change of the regression model was 69.4%.

Among the independent variables introduced into the regression model, exercise motivation was statistically significant, and perceived benefits and perceived barriers were not statistically significant. Thus, there was a change in exercise behavior among female nursing students with high exercise motivation. Analysis of the exercise behavior change of nursing students through odds ratio showed that subjects with changes in exercise behavior were 9.3 times higher in internal motivation than subjects without changes in exercise behavior[Table 4].

Table 4. Influencing Factors on the Stages of Change of Exercise in Subjects

	B	SE	Wals	OR	95% C.I	p

Discussion

The purpose of this study was to investigate the general characteristics, internal motivation, perceived benefits, and perceived barriers according to stages of exercise behavior change of female nursing students and to determine the factors that influence stages of exercise behavior change.

Looking at the stages of exercise behavior change, the most frequent was contemplation stage with 41.7% and next, the preparatory stage, which refers to current irregular exercise, was 27.1%. The precontemplation stage was 18.8%, the maintenance stage where regular exercise is done was 6.9%, and the action stage where regular exercise has started was 5.6%. In conclusion, 34% of the subjects practiced exercise irregularly, and 60.5% did not exercise. In the study by Lee et al.[6] on low back pain patients also showed that 75.9% exercised and 24.1% did not. In a study of elderly, Kim [7] found that 60% were exercising irregularly, but 40% were not exercising. A study by Lee et al.[8] of middle-aged women showed 75.1% of irregular exercisers and 24.9% of non-exercises, showing a higher ratio of exercise than in this study. Compared to other college students, this may be due to the accumulation of fatigue and lack of exercise time due to heavy learning volume and clinical practice. Therefore, custom interventions by stage according to the exercise behaviors to maintain and promote the health of nursing students who will be the nurses responsible for the future national health is needed.

The exercise motivation score of female nursing students was 2.89 points, which was moderate, and subjects with changes in exercise behavior were 9.3 times higher in exercise motivation than subjects without changes in exercise behavior. As a result, exercise motivation was the biggest influencer among subjects with changes in exercise behavior. Internal motivation is particularly important in exercise and has a strong correlation with exercise continuation because it is highly self-determining and has a positive effect on behavioral commitment and mental aspects[17,18]. Study by Lee[19] on middle-aged adults who exercise regularly showed that exercise motivation was an important factor in explaining middle-aged exercise continuation, which had a direct impact on middle-aged exercise continuation. As such, in order for female nursing students to continue their exercise, it is very important to have exercise motivation to drive exercise continuation.

The average score of perceived benefits of female nursing students was 2.97 points, and perceived benefits did not differ significantly in stages of exercise behavior change among female nursing students. In the study by Lee[20], As a result of analyzing the difference of perceived benefits according to the stages of exercise behavior change, there was a statistically significant difference in the mean between stages of exercise behavior change, and the higher the perceived profit, the higher the performance of health promotion and the results were different from this study. In Hwang and Chung[21], exercise benefit was also found to have the biggest influence on exercise performance. These findings suggest that female nursing students pursue health promotion activities with relatively low exercise barriers in other ways besides exercise such as sleep, rest, and vitamins to promote health promotion in difficult curriculum that requires both academic and clinical practice. Therefore, in order to improve perceived benefits, interventions such as the development and application of easily accessible exercise programs are likely to improve perceived benefits.

The perceived barriers had a mean score of 2.39 points, which was above average, and the perceived barriers showed no significant difference in the stages of exercise behavior change of female nursing students. This is different from the results of the study by Hwang and Chung[21], in which the subjects who regularly exercise perceived higher than the subjects who did not exercise regularly. Therefore, it is determined that it is important to promote the benefits of exercise through specific exercise programs and to minimize the factors that interfere with exercise continuation. In particular, for female nursing students, self-management by exercise promotes appearance satisfaction, and mental health is improved, and there are various advantages of relieving stress and tension. But despite these advantages, it is very difficult to perform these exercises regularly. Therefore, it is important to develop strategies for practicing consistent and regular exercise, taking into account the identified exercise motivation, perceived benefits, and perceived barriers as factors influencing the stages of exercise behavior change of female nursing students.

Conclusion

The study was conducted with the aim to identify the factors that influence the stages of exercise behavior change of female nursing students and to obtain the

basic data necessary to find ways to improve the exercise behavior of female nursing students.

As a result, exercise motivation was investigated as a factor affecting the stages of exercise behavior change of female nursing students. Based on these findings, it is suggested to develop and apply exercise and educational programs to provide information to enhance exercise motivation, which greatly affects exercise continuation, to improve the stages of exercise behavior change in female nursing students.

Study on Subjectivity of Nursing Students toward Patient with Dementia

Sunyoung Jang

Associate Professor, Hanseo Univ., 46 Hanseo1 Ro, Haemi-myun, Seosan-si, Chungcheongnam-do, Dept. Nursing, South Korea

Abstract

Background/Objectives: The purpose of this study is to identify the subjectivity toward the patient with dementia perceived by nursing students.

Methods/Statistical analysis: To describe the characteristics by type and to classify the patient with dementia, and Q methodology was applied. 18 nursing students of A University were asked to classify 47 statements about patients with dementia. Collected data were analyzed using QUANL PC program.

FindingsIn the results of this study, the perception of the nursing students toward the patient with dementia was classified to 3 factors. 3 factors were identified and explain 50.94% of whole variables. Factor 1 was 34.94%, factor 2 was 10.48% and factor 3 was 5.52%. As the factor 1 has 34.94% of explanation power, it can be considered the factor explaining the subjectivity of the nursing students' perception on the patient with dementia the most. Out of 18 subjects, the subjects belonged to factor 1 was 3, factor 2 was 9 and factor 3 was 6 subjects. The subjectivity type toward the patient with dementia was 'Nurse-oriented', 'Family of patent with dementia-oriented' and 'Future improvement-oriented.

Improvements/Applications: This study identified the perception of nurses in clinical field toward the patient with dementia and provides the basic data for education.

Keywords: *Dementia patients, Nursing student, Subjectivity, Q methodology, Nurses*

Introduction[1]

As the principal agent providing direct nursing service to the elderly with dementia in the field of healthcare, the positive attitude of nurses toward the elderly with dementia has influence on the quality of nursing[1], and the negative attitude affects the diagnosis, support, decision making, etc. degrading the quality of diverse services provided to elderly with dementia[2]. As the social demand for the nursing of elderly with dementia is increased, the nursing collage which cultivates and produces the professional nurses who perform or should perform the direct nursing in the field of healthcare are responsible for cultivating professionally trained nurses. In addition, Since the positive perception and the attitude have influence on the quality improvement of nursingand the negative perception or attitude toward the aged patients are likely to increase the possibility to avoid the aged patients[3], the importance of verifying the attitude of nursing students who will become nurse is greatly emphasized.

However, the research on the patient with dementia with the nursing students is not sufficient. So, Q methodology is the methodology that allows us to understand the characteristics of each type according to the structure of human subjectivity and is the methodology started from the perspective of the actor not the presumption of researcher[4]. Since the perception of the nursing student toward the patient with dementia is the unique subjective experience of the nursing students, Q methodology, which is the research method considering subjectivity of the subject is the research method appropriate to verify the type of perception of

Corresponding Author:
Sunyoung Jang
sjang@hanseo.ac.kr

the nursing students toward the patient with dementia.

Therefore, this study was intended to provide the basic data in developing differentiated education program according to the characteristics by type of perception toward the patient with dementia as a student nurse before they go to nursing field that the nursing of patient with dementia is made successfully by identifying the subjectivity structure of the patient with dementia.

Method

1. Selection of Q Population and Q Sample

To draw the comprehensive statements for the effects on the patient with dementia from the students of nursing department, Q population was drawn through the related domestic and overseas literature review, open questionnaires, in-depth individual interviews, etc. Through such processes, 200 Q populations over 3 domains were drawn and in addition to them, total 100 Q populations were extracted by integrating the literatures collected through related domestic and overseas literature review. Final 48 samples having high power of discrimination were selected from the extracted Q samples through the review and correction procedure.

2. Q-sort and Data Analysis Method

Q-sort process is the process that the research subjects make voluntary definition of each individual toward the patient with dementia by classifying the statements of Q-sample with the forced normal distribution method[5]. The data were collected from 30 students of nursing department at OO University utilizing Q-card. The time taken to complete Q-sort by one research subject was mostly 30 ~ 45 minutes. For the distribution chart of Q-sample, the research subjects classified the statements selected as Q-sample from strong affirmation to strong negation according to their importance. Statement (Q1) about the patient with dementia was sorted on 12-Point scale. Then, the interview regarding the statements sorted at both ends was performed with the research subjects. For Q factor analysis, the principle component factor analysis (varimax) was used. The type was selected considering the results, total explanatory variable, etc. calculated by entering the number of factors based on Eigen value of 1.0 or more. Collected data were converted to score with the conversion score from 1 to 12 granted around the card distributed by force in Q-sample distribution chart. The conversion score granted was codified according to Q sample No. and treated with the principal component factor analysis by PC program. The data were analyzed using QUANL PC program.

3. Ethical consideration on research objects

Before starting the study, the subjects were explained that they could stop participating any time during the study after obtaining the voluntary consent. To respect the rights of the subject and to guarantee the privacy and personal information of the subject, all the information collected through this study were treated anonymously and codified and treated with Q sorting.

Result and Discussion

1. Characteristics by Type of Subjectivity toward Patient with Dementia

In the results of analyzing the subjectivity toward the patient with dementia, 3 factors were identified and explain 50.94% of whole variables. Factor 1 was 34.94%, factor 2 was 10.48% and factor 3 was 5.52%. As the factor 1 has 34.94% of explanation power, it can be considered the factor explaining the subjectivity of the nursing students' perception on the patient with dementia the most [Table 1]. Out of 30 subjects, the subjects belonged to factor 1 was 3, factor 2 was 9 and factor 3 was 6 subjects. The subjects belonged to each factor mean the group showing similar reaction toward the patient with dementia.

Table 1: Eigen Value, Variance, and Cumulative Percentage

	Type Ⅰ	Type Ⅱ	Type Ⅲ
Eigen Value	6.9884	2.0952	1.1050
Variance(%)	.3494	.1048	.0552
Cumulative	.3494	.4542	.5094

2.Analysis of each type

- Deliberation Type: The subject belonged to type 1 was 3 subjects. The statements that the subjects classified as type 1 showed strong affirmation were 'Since the patient with dementia is being increased continuously, the nurses having expertise and experience are needed (Z=2.08)', 'Supporting the patient with dementia increases the government expenditure (Z=1.64)' and 'More facilities related to dementia are needed (Z=1.46)'. The statements that the subjects of type 1 showed the

strong negation were 'It is the most desirable that the patient with dementia always lies down and stays alone (Z=-2.38)', 'The facilities for the patient with dementia are enough (Z=-1.94)', 'The acts like doubt, delusion, etc., of the patient with dementia should be corrected by pointing out that they are wrong (Z=-1.82).

The characteristic of type 1 is that they are thinking that in the Korean society where the low birth rate and aging are under progress rapidly, the chronic diseases of elderly would be increased, and particularly, the number of patient with dementia would be increased rapidly. They judged that accordingly, the demand for nurses and the nursing home would be increased. As the economic burden needed for taking care of patient with dementia would be increased, they thought that the expansion of nursing hospital that provides the proper treatment would be needed. In this context, they thought that the nurses would need to develop the ability to taking care of the patient with dementia. Therefore, type 1 was named as 'Nurse-oriented type.

- Family of Patient with Dementia Consideration Type: The subject belonged to type 2 were 9 subjects. The statements that the subjects of type 2 showed the strong affirmation were 'Caregiving of elderly with dementia by the increase of elderly with dementia is a serious social problem (Z=2.14)', 'There are lots of cases that the role of the caregiver of the patient with dementia is increased too much (Z=1.62)', 'The caregiving of patient with dementia within the family causes the conflict in the family relationship (Z=1.60)'. The statement that the subject of type 2 showed the strong negation was 'It is most desirable that the patient with dementia always lies down and stays alone (Z=-2.19)', 'The facilities for patient with dementia are enough (Z=-1.43)', 'Many patients with dementia are treated or protected in the hospital or facilities (Z=-1.42)'.

The characteristic of type 2 is that they thought about the patient with dementia assuming that the person who is close to them is or would be the patient with dementia. They worried that family having patient with dementia would have lots of economic burden, for which the conflict of family relation should be provoked. In this context, they thought that they should prepare for their golden life well and said that the program development for the pain suffered by family would be needed. In addition, they thought that the facilities to be able to accommodate the number of patients with dementia to be increase in future are required and the education and publicity about the patient with dementia are needed. Therefore the type was named as 'Family of patient with dementia consideration type'.

- Future Improvement Consideration Type: The subject belonged to type 2 were total 6 subjects. The statements that the subjects of type 3 showed the strong affirmation were "Caregivers of the patient with dementia need the caregiving education (Z=2.13)', 'Government should provide the protection service for the patient with dementia (Z=1.72)', 'Since the patient with dementia is being increased continuously, the nurses having expertise and experience are needed (Z=1.56)'. The statements that the subject of type 3 show the strong negation were 'It is the most desirable that the patient with dementia always lies down and stays alone (Z=-1.99)','Since the ability to think and to perceive of the patient with dementia is degrade, he(she) cannot do anything by him(her)self.(Z=-1.82)', 'Taking care of the patient with dementia, I cannot trust the caregiver. (Z=-1.53)'.

The subjects of type 3 thought that lots of social supports would be need in preparation of future that the patient with dementia will be increased. They thought that the education about caregiving of patient with dementia is needed and diverse program should be established under the support of government. In addition, they said that considering that the patients with dementia will be increased, the education on the patient with dementia for nurses, etc. will be needed. They though that leaving the patient with dementia alone without taking care of them is not desirable and as it is hard for the family to take the burden alone, the social support is needed. Therefore, type 3 was names as 'Future improvement consideration type'.

Discussion

The type 1 identified in this study was 'Nurse-oriented type'. As in the healthcare field, the main agent that provides the nursing service is the nurse, the positive attitude of the nurse toward the patient with dementia has influence on the quality of nursing[6], and the negative attitude has influence on the diagnosis, treatment, support, decision making, etc. degrading the quality of diverse services provided to the elderly with dementia[7]. The empirical study related to the knowledge and the attitude toward the elderly with dementia showed that the nurse's low job satisfaction and high burnout were because of negative attitude toward the patient with dementia and misunderstand of the problems related to

the behavior disorder of the patient with dementia[8]. Moreover, since the nursing students were reported to have more negative perception and attitude toward the elderly patient with dementia than those toward the general elderly patient[9], it is deemed that the nursing education to produce the profession manpower having expertise and positive attitude required for nursing service for elderly patient with dementia is needed.

Type 2 was 'Family of patient with dementia consideration type. As the patient with dementia is increased, the quality of life is degraded in the principal caregiver who are very close to patient with dementia by the stress by the caregiving together with the degradation of quality of life in the patient by diverse irreversible symptoms around cognitive and behavior disorder[10]. Actually, in case of family taking care of patient with dementia, the misunderstanding by the lack of information on the dementia degrades the quality of caregiving by affecting the caregiving burden of the family, it is necessary to provide the education program encompassing all of these elements[11].

Type 3 was 'Future improvement consideration type'. Considering that the patient with dementia will be increased rapidly for long-term, they think that the national and social supports are required. As it is judged that they have great economic burden in caregiving patient with dementia, they said that the establishment of policy to support the family of patient with dementia is important.

Our country has implemented the long-term care insurance service for aged from August, 2007 for the purpose of alleviating the burden on the family of the elderly having chronic diseases including dementia and of enhancing the quality of their life in the national level[12]. Since 22.5% of this service users used the facility protection service and about 52.5% used the in-home protection service, it was shown that the user of in-home protection service was more than double[13]. There is the aspect that the caregiving burden in the family of patient with dementia is alleviated by using in-house protection service but still the burden of family persists in the situation that the patient with dementia should be taken care for long time at home[13].

Such research on the subjectivity will be able to be used as the basic data for education of the subjects of patient with dementia, which recently become issue. In addition, it is expected to be utilized as basic data for differentiated education program development by suggesting the subjective structure on the perception of the nursing students as prospective healthcare provider toward the patient with dementia and the characteristics by type.

Conclusion

This study provides the basic data required to introduce or applying the policy to activate the future support system for patient with dementia by categorizing the subjectivity of the nursing students toward the patient with dementia. Since through this study, the perception type of the nursing students toward the patient with dementia was analyze and its characteristics were verified, it is expected that the education program would be developed considering the characteristics by each type. In addition, it is suggested that the additional research on the type analysis would be made by selecting the samples considering diverse factors and the qualitative research would be made to verify the diverse factors having influence on the nursing of patient with dementia.

The Effect of Resilience and Nursing Professionalism on the College Life Adaptation of Nursing Students

Miyoung Lee[1], Mi-Kyoung Lee[1], Youngshin Song[2]

[1]College of Nursing, Eulji University, Republic of Korea,
[2]College of Nursing, Chungnam National University, Republic of Korea

Abstract

Background/Objectives: This study explores resilience, nursing professionalism, and the college life adaptation of nursing students and identifies the factors that affect college life adaptation.

Methods/Statistical analysis: This study is a descriptive study identifying the effects of resilience and nursing professionalism on college life adaptation in nursing students. Data was collected from April to May 2017. Surveys were distributed to a total of 280 subjects. After excluding 40 incomplete surveys, a total of 240 surveys were used in the final analysis. The analyses were performed using the SPSS 24.0 program. Factors that affect the college life adaptation of nursing students were analyzed with multiple regression.

Findings: This study found that the mean resilience of the subjects was 3.64, the mean nursing professionalism was 3.88, and the mean college life adaptation was 3.22. There were statistically significant differences in the college life adaptation of the subjects by gender ($t=5.41$, $p=0.021$) and academic achievement level ($F=11.41$, $p<0.001$). Furthermore, college life adaptation showed a significant positive correlation with resilience ($r=.650$, $p<0.001$) and nursing professionalism ($r=.395$, $p<0.001$). Performing a multiple regression on the factors that affect college life adaptation showed that nursing professionalism ($\beta=.14$, $p=0.013$) and resilience ($\beta=.56$, $p=<0.001$) were significant factors. The regression explained 44% of the variance in college life adaptation.

Improvements/Applications: It was found that resilience and nursing professionalism affected the college life adaptation of nursing students. In particular, it is necessary to improve resilience to increase the college life adaptation of nursing students.

Keywords:*Nursing, Students, Resilience, Professionalism, Adaptation*

Introduction

Adapting well to college life can be said to be a major factor in successful college life, and academic, social, and psychological factors affect this college life adaptation[1]. College life adaptation is important because it also has a positive impact on adaptation and function in later adulthood. In particular, nursing students experience difficulty with college life adaptation due to academic burdens and stress with clinical practice[2]. Moreover, because some students choose their major at admission for a job, cases of terminating from school due to academic burdens and stress with clinical practice during the school year are not rare[3]. Due to these reasons, there have recently been studies attempting to identify the variables to improve the college life adaptation of nursing students[4]. [5]

Stress events that college students experience do not have the same impact on all students. Even if the same stress event is experienced, the response to the stress is generally different for each person, and the process of recovery also differs. The ability to control stress is deeply related to resilience[5], and resilience helps to positively adapt to adversity by providing the opportunity for students to prepare to overcome

Corresponding Author :
Mi-Kyoung Lee,
lmk@eulji.ac.kr

hardship[6]. Because people with high resilience have a good ability to control patience and tension in various situations[7], nursing students will also be able to respond to changing situations flexibly without panic and adapt successfully.

Nursing professionalism enables having a specific nursing philosophy and goals through a view of nursing as a professional job[8]. Because nursing professionalism forms the perspective of observing and interpreting nursing, having positive nursing professionalism is important. Nursing professionalism formed during college will have an impact on the development of nursing professionalism in practice[9]. Accordingly, it is thought that the nursing professionalism formed in nursing students will also have a positive impact on college life adaptation. Furthermore, as an essential philosophy for nursing students, it must be continuously explored and developed. However, research identifying the relationship between nursing professionalism and college life adaptation in nursing students is currently lacking. Thus, additional research is necessary. Therefore, this study examines resilience, nursing professionalism, and college life adaptation in college students and identify the factors that ultimately affect college life adaptation. Additionally, it provides basic data for the development of a program to help the college life adaptation of nursing students.

Method

1. Study design and sample size calculation

This is a descriptive study that examines the relationship among resilience, nursing professionalism, and college life adaptation in nursing students, identifying the factors that affect college life adaptation. The sample size was calculated using the G*power 3.1.9.2 program by entering an effect size of 0.09, significance level of 0.05, and power of 0.95 for regression analysis. The sample size of 250 was calculated using seven predictive factors (gender, grade, type of residence, monthly living expense, academic achievement level, resilience, and nursing professionalism). Surveys were distributed to a total of 280 subjects. After excluding 40 incomplete surveys, a total of 240 surveys were analyzed.

2. Measurement

Resilience was measured with an instrument developed for college students in Japan[10] that was revised and supplemented[11]. The resilience scale is comprised of a total of 16 items, and the subfactors are positive future orientation (5 items), emotion control (6 items), and diversity of interest (5 items). A higher score indicates a higher level of psychological resilience. The reliability of the revised and supplemented instrument had a Cronbach's α of .84.

Nursing professionalism was measured using an instrument for nursing professionalism[12] that was revised and supplemented[13]. The nursing professionalism scale is comprised of a total of 18 items: six on profession self-concept, five on social recognition, three on the professionalism of nursing, two on the role of the nursing area, and two on the autonomy of nursing. A higher score indicates a higher nursing professionalism. The reliability of the scale in this study had a Cronbach's α of .77.

College life adaptation was measured using the Student Adaptation to College Questionnaire *SACQ) [14] that was revised and supplemented[15]. College life adaptation is comprised of a total of 31 items: six on academic adaptation, five on social adaptation, 11 on personal-emotional adaptation, and nine on college environment adaptation. A higher score indicates a higher level of college life adaptation. The reliability of the scale in this study had a Cronbach's α of .90.

3. Data collection

Data collection occurred from April 10, 2017, to May 30, 2017. Two-hundred and eighty nursing students in D City, South Korea were the subjects. These subjects who understood the purpose and procedures of this study gave written consent and were able to read and respond to the surveys were selected. It was explained to the subjects that they could terminate their participation at any point if they desired and that there were no disadvantages to not participating in the study. Furthermore, it was explained that the collected data was anonymous, only used for research purposes, and destroyed after three years. Structured surveys were distributed to subjects who agreed to participate, and the surveys were collected immediately after completion. After collecting the surveys, the researcher codified them by only marking anonymized identification numbers, and the surveys were stored in the password-protected personal computer of the researcher.

4. Data collection

Collected data were analyzed using the SPSS 24.0

program. The general characteristics of the subjects were analyzed using means and standard deviations. The resilience, nursing professionalism, and college life adaptation of the subjects were analyzed using means and standard deviations, and the reliability of the tool was analyzed using Cronbach's α. Differences in the college life adaptation of the subjects by general characteristics were analyzed using independent t-tests and ANOVA, and the Scheffe test was used for post-hoc tests. The correlation among resilience, nursing professionalism, and college life adaption of the subjects was analyzed with Pearson's correlation coefficient. Finally, factors that affect college life adaptation were analyzed using multiple regression.

Result and Discussion

1. General characteristics of participants

The general characteristics of the subjects are as shown in [Table 1]. For the genders of the subjects, there were more female students (199; 82.9%) compared to male students. For grades, 1st grade was the most common at 69 subjects (28.8%). The most type of residence were 133 subjects in boarding houses or living alone (55.4%). The most common level of monthly living expense was 300-390,000 KRW at 118 subjects (49.2%), and the most common academic achievement level was "middle" at 119 subjects (49.6%).

Table 1. General characteristics of participants (n=240)

Variables	Category	n	%
Gender	Male	41	17.1
	Female	199	82.9
Grade	1st	69	28.8
	2nd	64	26.7
	3rd	47	19.6
	4th	60	25.0
Type of Residence	Own house (with family)	56	23.3
	Boarding house or living alone	133	55.4
	Dormitory	51	21.3
Living Expense (monthly)	<300,000	47	19.6
	300,000-390,000	118	49.2
	≥300,000	75	31.3
Academic Achievement Level	High	67	27.9
	Middle	119	49.6
	Low	54	22.5

2. Resilience, Nursing Professionalism, and College life Adaptation of students

The resilience, nursing professionalism, and college life adaptation of the subjects are as shown in [Table 2]. The mean score for the resilience of the subjects was 3.64. The mean score for nursing professionalism was 3.88. The mean score for college life adaptation was found to be 3.22.

3. The difference of College life Adaptation according to General Characteristics

The levels of college life adaptation by the general characteristics of the subjects are as shown in [Table 3]. The college life adaptation of the subjects showed statistically significant differences by gender (t=5.41, p=0.021), with male students having a higher level of college life adaptation compared to female students. Furthermore, there were statistically significant differences in college life adaptation by academic achievement level (F=11.41, p<0.001). Post-hoc tests showed that the level of college life adaptation was the highest if the academic achievement level was "High," followed by "middle" and "Low."The fact that the college life adaptation of male students is higher, although most nursing students are female students[5,

16] and the fact that the college life adaptation is higher if academic achievements are better[5] are in line with previous findings. In particular, male students adapting to college life better than female students can be thought of resulting from interest and effort in the field for the college life adaptation of male students, who are the minority. However, in the future, an effort to improve the college life adaption of female students, who comprise the majority of the nursing department, will also be necessary. Furthermore, because it was shown that low academic achievement levels were associated with difficulties with college life adaptation, plans to improve college life adaptation—by analyzing the cause for the low academic achievement levels and providing academic achievement improvement plans by academic styles—will be necessary.

Table 2. Resilience, Nursing Professionalism, and College life Adaptation of students (n=240)

Variables	Range (Min-Max)	Mean of Items (Mean±SD)
Resilience	2.00-4.90	3.64±0.45

4. Correlation among Resilience, Nursing Professionalism, and College Life Adaptation

The relationships among resilience, nursing professionalism, and college life adaptation of the subjects are as shown in [Table 4]. College life adaptation of the subjects showed significant positive correlations with resilience (r=.650, p<0.001) and nursing professionalism (r=.395, p<0.001).

Table 4. Correlation among Resilience, Nursing Professionalism, and College Life Adaptation

College Life Adaptation	.650** (<.001)	.395** (<.001)	1

5. Influencing Factors in the College Life Adaptation of Subjects

The results of identifying the factors that affect the college life adaptation of subjects are as shown in [Table 5]. Multiple regression analyses were performed. Among general characteristics, academic achievement level was transformed into a dummy variable and entered as an independent variable. The results of testing the multicollinearity of the independent variables showed a Variation Inflation Factor (VIF) of 1.24-1.82. This is under the threshold of ten, and thus there was no multicollinearity problem. The Durbin-Watson index was 1.936, which means that the independence between the error terms was verified and there was no autocorrelation between the residual terms. Thus, it was suitable to perform a regression analysis, and the regression was significant (F=46.92, p=<0.001). The factors that affect college life adaptation were nursing professionalism (β=.14, p=0.013) and resilience (β=.56, p=<0.001). Of these, resilience was the factor that had the greatest impact. These variables explained 44% of the total.

Table 5. Influencing Factors in the College Life Adaptation of Subjects

(n=240)

Variable	B	SE	β	t	p	VIF
(Constant)	23.91	7.01		3.41	0.001	
Academic Achievement Level*(High) (Ref. Low)	3.35	1.97	.11	1.70	0.091	1.82
Academic Achievement Level*(Middle) (Ref. Low)	2.00	1.70	.07	1.18	0.241	1.67
Nursing Professionalism	0.28	0.11	.14	2.50	0.013	1.24
Resilience	0.98	0.10	.56	9.88	<0.001	1.37
R2=.44, AdjustedR2=.44, F=46.92, p=<0.001 Durbin-Waston's =1.936						
*Dummy variables; Ref.=Reference						

The abovementioned results are in line with the previous findings[17] that resilience is a major factor in college life adaptation. This may be the result of the attitude of viewing the future as positively affecting college life by overcoming the uncertainty and crises that occur during college. Additionally, because it was found that a higher level of resilience was associated with better college life adaptation, it will be necessary to promote various activities that can increase the level of resilience and develop programs.

In this study, the higher level of nursing professionalism perceived by nursing students was found to be associated with better college life adaptation, and it was found that nursing professionalism is a factor that affects college life adaptation. Another previous study[18] has also found a positive correlation between nursing professionalism and college life adaptation, supporting the results of this study. Because nursing professionalism plays the role of mediating between major satisfaction and college life adaptation[19] and positively promotes career preparation, continuous training during college is important. Therefore, various programs that guide the formation of positive nursing professionalism must be developed and implemented.

Combining the abovementioned results, resilience has a positive impact on not only college life adaptation, but also the establishment of nursing professionalism. Therefore, the development of a mediation program that can improve resilience in nursing students may ultimately play an important role in nursing students.

Conclusion

Based on the results of this study, it was found that the college life adaptation of the nursing students studied is affected by the resilience and nursing professionalism. In particular, because it was found that resilience was the factor with the greatest influence, it is necessary to develop programs that can enhance resilience to increase the levels of college life adaptation of nursing students. This study is significant in that it identified factors that can positively affect college life adaption of nursing students, who will lead the future of nursing, through this study.

The Effect of Exercise-Induced Hyperthermia on the Achilles Tendon

Eui Chan Jang[1], **Hee Jeong Kim**[2], **Hyeong Seok Jeong**[3]

[1]Department of Orthopedic, Chung-Ang Medical Center, Chung-Ang University School of Medicine, Seoul, Korea, [2]Department of Nursing, Namseoul University,Cheonan Korea, [3]Department of orthopedic, Chung-Ang Medical center, Chung-Ang University School of Medicine, Seoul, Korea

Abstract

Background/Objectives: An increase in the temperature of the tendon due to repetitive exercise may also be an important cause of injury.

Methods/Statistical analysis: Ten men participated and five fresh frozen cadavers in the thermographic study. The experimental subjects performed hopping exercises using their right leg only for 10 minutes; the core temperatures of both Achilles tendons were measured before the exercise, immediately after the exercise, and 10 and 20 minutes after the exercise..

Findings: The temperature of the skin surface above the right Achilles tendon engaging in the hopping exercise significantly and gradually increased ($\chi 2 = 27.120$, $p < .001$) as time passed. On the other hand, while the temperature of the skin surface above the resting left Achilles tendon decreased immediately after exercise before gradually increasing later, these changes were not statistically significant ($\chi 2 = .392$, $p = .564$). In the cadaveric study, the baseline core temperature of the Achilles tendon was 23.56±0.09℃. This temperature rose to 23.74±0.11℃ after 1000 cycles, 23.9±0.12℃ after 2000 cycles, 24.16±0.09℃ after 3000 cycles, 24.42±0.08℃ after 4000 cycles, and 24.72±0.15℃ after 5000 cycles, it was significantly increased ($r = 0.998$, $p < .001$).

Improvements/Applications: The Achilles tendon is a relatively avascular structure, both direct and indirect methods of measurement suggest that its core temperature rises during exercise. Therefore, it will be the basic data for applying appropriate intervention to exercise

Keywords: *Hysteresis, Achilles, Tendon, Exercise, Temperature*

Introduction

The Achilles tendon is the most commonly injured tendon of the lower limb[1]. Although most injuries occur due to trauma, degenerative changes in the tendon due to repetitive load-bearing, reduced blood flow, and the use of drugs such as steroids may also cause Achilles tendinopathy. Furthermore, cadaveric studies have suggested that chronic degenerative changes and reductions in blood supply are associated with Achilles tendon rupture, though the exact mechanism behind these relationships remains unknown.

An increase in the temperature of the tendon due to repetitive exercise may also be an important cause of injury[2]. Cadaveric studies suggest that chronic degenerative changes and reduction in blood supply are associated with Achilles tendon rupture, yet the exact mechanism behind these relationships remains unknown[3]. The Achilles tendon comprises of relatively avascular tissue that is composed primarily of type 1 collagen with viscoelastic properties [4, 5]. Because the tendon is not perfectly elastic, up to 10% of the energy stored during its repetitive contraction and relaxation is converted to heat, thereby increasing its temperature[6]. This change in temperature may eventually lead to cell death; according to Hall and Giaccia [7] cells begin

Corresponding Author:
Hee Jeong Kim,
yshbb@nsu.c.kr

to die when the core temperature of the tendon rises above 42.5°C. Furthermore, Birch, Wilson &Goodship [8] reported that more than 80% of the fibroblasts in a tendon died after exposure to a temperature of 45°C for 30 minutes. Hall and Roizin-Towle [9], suggested that degenerative changes in the tendon and reduced blood flow and pH after exercise contribute to increased sensitivity to heat. In an in vitro experiment, collagen was shown to be stable at temperatures of 36℃ or less but unstable at temperatures above 36℃ [10, 11]. Wilson and Goodship [12] used the superficial digital flexor tendon of a horse to show that hysteresis during exercise can cause the core temperature of the tendon to rise up to 43℃. Studies on the Achilles tendon in humans have found that the core temperature after exercise rises to more than 41℃ [13. 14]. However, existing reports have calculated the core temperature of the Achilles tendon using mathematical models rather than direct measurements. Thus, it remains unknown whether movement of the Achilles tendon itself causes its temperature to rise. To directly measure the change in temperature of the Achilles tendon in humans, a temperature gauge needle needs to be inserted into the tendon; however, this is a very invasive process in a living person. Fortunately, as the Achilles tendon lies directly beneath the epidermis, the use of infrared thermography to measure skin surface temperature should be able to capture any rises in the temperature of the tendon. This technique is advantageous as it is non-invasive and does not expose subjects to pain or radiation. Thus, the purpose of the current study was to use infrared thermography to approximate the core temperature of the Achilles tendon in experimental subjects who performed a hopping exercise. We also performed a cadaveric study in which we used a digital thermometer to measure the core temperature of the Achilles tendon after a series of similar exercises.

Method

Ethical considerations

All data used in the present study was collected according to the approved guidelines and screening procedures of Chung University, Seoul. All experiments were also approved by the Institutional Review Board [IRB No: C20111192 (642)] at Chung-Ang University.

Infrared thermography

Ten male subjects participated in this study. The average age of the participants was 27.6 ±1.34 years. The average height and weight of the participants were 174.2 ±0.02 cm and 68.1 ±2.83 kg, respectively. All subjects were physically active and had a normal ankle-brachial index (ABI) and toe-brachial index (TBI) (ABI: 1.03 ±0.02, TBI: 0.78 ±0.04). Subjects were excluded if they were a current smoker, displayed coldness in their hands and feet, had a history of perfusion disorder of the legs, or had diabetes, hypertension, or an autonomic nervous system disorder. After subjects put on a simple jogging suit consisting of short pants and a short-sleeved jersey (Figure 1-A), they were allowed to adapt to the ambient temperature of the room for 15 minutes. The temperature of the exercise room was about 24□, which differed from the room that contained the infrared thermography system. Subjects then hopped in place 1000 times on their right leg for about 10 minutes without a break. While hopping, subjects were not allowed to let their heels touch the ground so that the Achilles tendon could be given as much tension as possible. The infrared thermography images (IRIS-5000, Medicore, Korea) were taken on the back side of both legs before, immediately after, 10 minutes after, and 20 minutes after the hopping exercise (Figure 1-B). The regions of interest (ROIs) were the gastrocnemius muscle and the Achilles tendon.

Figure 1 (A). Participant wearing the jogging suit (B) Infrared thermograph measuring his posterior lower

Cadaveric study

Five freshly-frozen, non-paired, human cadaveric legs, from donors ranging in age from 48 to 77 years (mean = 59 years), were used for this study. All specimens had been amputated at the hip joint, were macroscopically intact, and showed no evidence of previous surgeries, preexisting arthritis, or ligamentous instability on clinical examination. The specimens were kept frozen at -20°C before testing and were thawed at room temperature for 24 hours before the experiment

began. We first identified an area 4 cm above the insertion of the Achilles tendon and marked the skin at that spot. Next, the leg position was set so that the ankle had a joint angle of 90 ±5 degrees and the knee had a joint angle of 180 ±5 degrees. In order to approximate the hopping exercise performed by live subjects, a Steinmann pin was inserted horizontally to pass through all of the metatarsal heads and was connected to a strong string for skeletal traction (Figure 2). We then mimicked a hopping movement by repeatedly pulling and releasing the string, while the pulling force was kept constant (at about 60 N) with a spring balance. The core temperature was obtained from the marked position (Figure 3) and was measured with a digital thermometer (TX10, Yokogawa, Japan). To determine the effect of exercise on the temperature of the Achilles tendon, we recorded the temperature before and immediately after 1000, 2000, 3000, 4000, and 5000 cycles of the pulling and releasing exercise.

Figure 2. A Steinmann pin for the hopping exercises in cadavers.

Figure 3. The core temperature of the marked position and a digital thermometer

Statistical analysis

All collected data were analyzed using SPSS 20.0 (SPSS Inc., Chicago, IL, USA). Descriptive statistics, including means, standard deviations, frequencies, and percentages, were used to analyze variables for the infrared thermography study. A Freidman test was also used to determine differences in Achilles tendon core temperatures at the time-points investigated (before, immediately after, 10 minutes after, and 20 minutes after the hopping exercise). Furthermore, the Wilcoxon test was used to analyze differences in temperature between the right and left legs, and the Friedman test was used to perform repeated measures analysis of variance between the right and left legs at the time-points above.

Result and Discussion

Infrared thermography

Table 1 summarize changes in the temperature of the skin surface above the Achilles tendon and gastrocnemius muscle immediately before, immediately after, 10 minutes after, and 20 minutes after the hopping exercise. The temperature of the skin surface above the right Achilles tendon engaging in the hopping exercise significantly and gradually increased ($\chi 2 = 27.120$, $p < .001$) as time passed. On the other hand, while the temperature of the skin surface above the resting left Achilles tendon decreased immediately after exercise before gradually increasing later, these changes were not statistically significant ($\chi 2 = .392$, $p = .564$).

Changes in the temperature of the skin surface above the right gastrocnemius muscle (where temperature increased immediately after exercise and continued to do so for 20 minutes) and left gastrocnemius muscle (where temperature decreased immediately after exercise before increasing again by 10 and 20 minutes) were not statistically significant (right: $\chi 2 = 6.000$, $p = .112$; left: $\chi 2 = 5.788$, $p = .115$). Lastly, changes in the temperature of the skin surface above the Achilles tendon was significantly different between the right and left legs immediately after exercise ($z = -2.023$, $p < .05$), 10 minutes after exercise ($z = -2.666$, $p < .01$), and 20 minutes after exercise ($z = -2.803$, $p < .01$).

Table 1.Comparison of skin temperatures before and after the hopping exercises

The core temperature of the Achilles tendon gradually increased as the number of hopping exercises increased. While the baseline core temperature of the Achilles tendon was 23.56±.089℃, this temperature rose to 23.74 ±.11℃ after 1000 cycles, 23.90 ±.12℃ after 2000 cycles, and 24.16 ±.89℃ after 3000 cycles, 24.42 ±.084℃ after 4000 cycles, and 24.7 ±.15℃ after 5000 cycles. The mean core temperature of the Achilles tendon was positively correlated with the number of hopping exercises (r = 0.998, p < .001; Figure 4.)

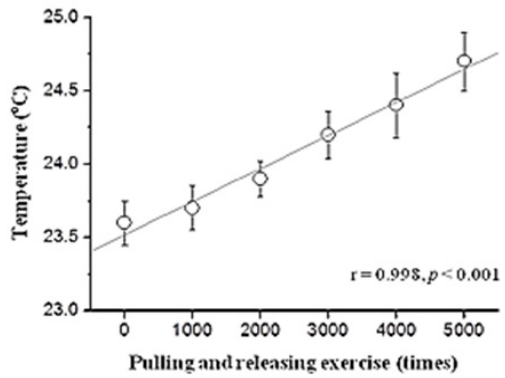

Figure 4. The mean core temperature of the Achilles tendon. (r=0.998, p<.001).

Discussion

This study was found that the temperature of the skin surface above the right Achilles tendon engaging in the hopping exercise rose significantly immediately after exercise. This is the first study in humans to show such a result. Similarly, our cadaveric study revealed that following pulling and releasing exercises, the core temperature of the Achilles tendon increased with the number of exercises performed. The temperature of the skin surface overlaying the right the gastrocnemius muscle also increased after exercise, though this change was not significant. Various factors may account for the patterns of temperature change seen in both the Achilles tendon and gastrocnemius muscle before and after exercise. The Achilles tendon has a viscoelastic structure with relatively low blood flow compared to other tissues [4, 5]. Due to the force applied to the Achilles tendon by repetitive hopping, hysteresis increases both the skin surface and core tendon temperatures [8, 12, 13, 14, 15] thus accounting for why the temperature continued to gradually increase 10 and 20 minutes after exercise. In a previous study, the Achilles tendon hysteresis value was reported to be about 17%, and the energy stored in the tendon during a single stance phase per meter of tendon was calculated to be 108 Jm-^{1}14[13] Using these values,

18 J of this stored energy should be converted to heat per stride. Therefore, in our study, the energy released as heat would have been about 18000 J after 1000 hopping exercises. This stored energy could then cause the temperature of the Achilles tendon to rise in both the thermography study and the cadaveric study. The relatively low temperature of the skin surface above the Achilles tendon compared to that of the gastrocnemius muscle may be also explained by blood flow. Blood flow in the gastrocnemius muscle is greater than blood flow in the Achilles tendon, leading to lower temperatures in the tendon. Indeed, Wilson & Goodship [12] noted that while the core temperature of the Achilles tendon during exercise rises to 43.3℃, but the temperature of the ambient region is about 5.4℃ lower. Therefore, it is possible that the skin surface temperature measured by infrared thermography may be lower than the real temperature rising in the core, resulting in overall lower temperatures recorded for the Achilles tendon than for the gastrocnemius muscle. The sympathetic nervous system is involved in the contraction and relaxation of the blood vessels of the skin [16. 17, 18]. During acute exercise, blood flow is redistributed from nonworking tissue, such as the skin, to active skeletal muscle through the actions of the sympathetic nervous system [19]. Infrared thermography may more accurately reflect the surface temperature than the core temperature. We found that a decrease in temperature occurred immediately after the hopping exercise on the surface of the leg at rest. However, the temperature of the Achilles tendon and gastrocnemius immediately after the hopping exercise did not decrease. As described above, the increase in temperature in the region of the Achilles tendon for the leg that performed the hopping exercise can be explained by hysteresis. The temperature in the region of the gastrocnemius in the leg that performed the hopping exercise did not change significantly after the hopping exercise. This can be explained by an increase in the core temperature due to the amount of blood flow [20]. Hall &Guyton [21] reported that systemic blood circulation increases during exercise; specifically, blood flow to the muscle becomes two to three times greater during exercise than at rest. The gastrocnemius in the leg that performed the hopping exercises may have been affected by the increased amount of blood flow during and after exercise. Thus, we may not have detected a significant change in the temperature of the gastrocnemius because the decreased surface temperature due to the sympathetic system was counterbalanced by the increase in the core temperature due to the systemic blood circulation.

Despite the insights provided by this study, it does have some limitations. Firstly, the sample size was not sufficient for an in-depth statistical analysis. Secondly, we could not determine the stored energy during hopping and the degree of hysteresis because we did not measure the change in the length of the Achilles tendon. However, this could be calculated with data from a previous study. Thirdly, although participants performed 1000 hopping exercises for about 10 minutes, they could not perform additional hopping due to physical deterioration and pain. Likewise, we could not perform more than 5000 hopping exercises in the cadaveric study due to physical deterioration of the samples. Nonetheless, we found a significant change in temperature of the Achilles tendon during exercise. Fourthly, we could not check the surface temperature of the Achilles tendon in the cadaveric study because there was no blood supply, and the sympathetic system differed from that of living humans. Finally, it is possible that the surface temperature measured by infrared thermography does not accurately reflect the core temperature [22]. However, we did measure the core temperature of the Achilles tendon in the cadaveric study using invasive methods, and the results were generally consistent with those measured in living humans through infrared thermography

Conclusion

In this study confirmed that the skin surface temperature and core temperature gradually increased over time through the experiments before and after hopping exercise with 10 men and one cadaver.Although the Achilles tendon is a relatively avascular structure, both direct and indirect methods of measurement suggest that its core temperature rises during exercise.The results of this study are meaningful as a basis for applying and mediating effective programs of exercise in the future..

Relationship among Nunchi, Communication Skills and Critical Thinking Disposition in Nursing Students

Sunsook Sim[1],**Miran Bang**[2]

[1]*Kyungdong University, Dept. Nursing, Korea,* [2]*Hallym University Dongtan Sacred Heart Hospital, Korea*

Abstract

Background/Objectives: This study was done to identify the relationship among Nunchi, Communication Skills, and Critical Thinking Disposition in nursing students.

Methods/Statistical analysis:The subjects of this study were second-year nursing students going to the four-year nursing school located in W city, who understood the purpose of this study and had voluntary participation. A self-report type survey was conducted targeting a total of 164 of nursing students in a city from Nov 26, 2018 to Nov 30, 2018.

Findings:As the results of the study, the relationship between the Nunchi and Critical Thinking Disposition (r=.64, p<.001), the Communication Skills and Critical Thinking Disposition (r=.71, p<.001), the Nunchi and Critical Thinking Disposition (r=.74, p<.001) showed a statistically significant positive correlation.

Improvements/Applications:Therefore, it is necessary to develop and improve nursing students' communication skills and critical thinking disposition as main competency factors of nursing education by activating a variety of case learning or simulation education.

Keywords: *Nunchi, Communication, Critical Thinking, Nursing, Students*

Introduction

Korean society is known to be collectivism based society[1]. In particular, the group of nurses, which needs to have close and cooperative relations with people in diverse fields in order to resolve the issue of health, should pay attention to patients or their colleagues in work relationship so as to find their intention and take a proper action. Such an action appears in the type of Nunchi in Korean society[2]. Nunchi means that one finds the other's mind (thinking, feeling, and atmosphere) or the mood of a situation, and takes a proper action[2]. Since nurses do their nursing behavior four sensitive patients, they can have Nunchi to deal with verbal or nonverbal expressions. Nunchi has positive and negative aspects[3]. According to the research by Kim and Yoo[4], nursing students with "burden aggravation Nunchi type", one of their recognition-coping behavior types for their first clinical practice, tried to "behave with Nunchi in a clinical practice period" and regarded "having Nunchi" as the most important coping behavior for their burden of practice. In addition, the group with a high level of Nunchi has higher self-esteem, subjective well-being, and interpersonal relationship than the group with a low level of Nunchi[2]. Nunchi has a correlation with interpersonal relationship, and Nunchi reduces depression or anxiety in the medium of self-esteem so that it influences psychological health[5] and clinical competency[6]. Given the results, nursing students should have clinical practice in their curriculum, and Nunchi or sense is a necessary factor for nursing students who need to quickly understand the other party's mind or situation and make a quick decision at hospital after their graduation. Most previous studies on Nunchi are related to counselling so that there is not much research on nursing students.

Lee[6] argued that nursing students' communication skills had a correlation with Nunchi, and most influenced clinical competency. It was said that communication skills had a positive relation with self-leadership[7]. It

was said that the higher level of communication skills, the higher level of interpersonal skills[8]. However, nursing students' communication skills were in the level a little higher than the middle level[9].

Critical thinking disposition increases the critical thinking skills that help to find and objectify the nursing issue for a patient critically and resolve the issue creatively[10], is the most influential factor on problem-solving skills[11]. Given that, critical thinking disposition is one of important competency factors for nursing students who need to think and make a decision on the theoretical grounds. It was found that critical thinking disposition had positive correlations with communication skills, clinical competency, attitudes toward patient safety, professional self-concept, and major satisfaction, and that critical thinking disposition influenced basic nursing competency and critical thinking competency[12-17].

Method

1. Research Design

This descriptive correlational study is designed to find the relations between nursing students' Nunchi, communication skills and critical thinking disposition.

2. Subjects

The subjects of this study were second-year nursing students going to the four-year nursing school located in W city, who understood the purpose of this study and had voluntary participation.

3. Research Tools

1)Nunchi

This study made use of the Nunchi scale developed by Heo and Park[2].In the research by Heo and Park[2], Cronbach's α was .87, and in this study, Cronbach's α was .94.

2)Communication skills

This study applied GICC(Global Interpersonal Communication Competency Scale) which was developed by Hur[18] in the way of adding seven concepts to the eight communication competency construct concepts suggested by Rubin[19]'s Interpersonal Communication Competence Scale (ICC) and modifying and improving them. In the research by Hur[18], Cronbach's α was .72, and in this study, Cronbach's α was .88.

3)Critical thinking disposition

This study used critical thinking disposition scale developed by Yoon[20]. In the research by Yoon[20], Cronbach's α was .84, and in this study, Cronbach's α was .91.

4. Data collection

Data had been collected from Nov 26, 2018 to Nov 30, 2018.

5. Data analysis

Data analysis methods were SPSS 23.0 programs.

Result

1. Characteristics of the subjects

The general characteristics ofnursing students are shown in [Table 1].

Table 1. Characteristics of the subjects (N=164)

Characteristics	Categories	N (%)
Satisfaction onnursing major	Satisfied	81 (49.4)
	Neutral	80 (48.8)
	Dissatisfied	3 (1.8)
Academicachievement (grade)	≥4.0	32 (19.5)
	2.9-3.9	114 (69.5)
	≤3.0	18 (11.0)
Health status	Healthy	90 (54.9)
	Usually	61 (37.2)
	Not healthy	13 (7.9)
Friendship	Good	83 (50.6)
	Usually	67 (40.9)
	Poor	14 (8.5)
Personality	Extroverted	34 (20.7)
	Usually	88 (53.7)
	Introverted	42 (25.6)

2. Nunchi, communication skills and critical thinking disposition of the nursing students

The Nunchi, communication skills and critical

thinking disposition of the nursing students are shown in [Table 2].

Table 2. Nunchi, communication skills and critical thinking disposition of the nursing students (N=164)

Variables (range)	M±SD
Nunchi (1-5)	3.84±0.61
Nunchi situation-grasp	3.84±0.63
Nunchi situation-action	3.83±0.69
Communication skills (1-5)	3.55±0.51
Critical thinking disposition (1-5)	3.53±0.43
Intellectual passion/curiosity	3.44±0.61
Prudence	3.27±0.47
Self-confidence	3.47±0.57
Systematicity	3.44±0.59
Intellectual fairness	3.75±0.58
Healthy skepticism	3.56±0.60
Objectivity	3.84±0.57

3.Relationship of nursing students' Nunchi, communication skills and critical thinking disposition

The Relationship of nursing students' Nunchi, communication skills and critical thinking disposition is shown in [Table 3].

Table 3. Relationship of nursing students' Nunchi, communication skills and critical thinking disposition (N=164)

	Communication skills r(p)	Critical thinking disposition r(p)
Nunchi	.74 (<.001)	.64 (<.001)
Communication skills		.71 (<.001)

Discussion

Nunchi of the study subjects scored 3.84 out of 5 points. In terms of the sub categories of Nunchi, Nunchi-understanding factor scored 3.84, and Nunchi-behavior factor 3.83. This result was similar to the result of the study by Lee[6] who used the same scale. In both studies on nursing students, Nunchi scored the points higher than middle points. In the research on general university students by Heo[5], their Nunchi situation-understanding factor scored 3.71 on average and their Nunchi situation-behavior factor scored 2.27, the points which were very low. Given the result, nursing students' Nunchi score seems to be relatively very high. General departments have most theory classes. On contrary, before experiencing hospital practice, nursing students have the in-school practice course that reflects various teaching methods (flipped learning, problem-based learning, team-based learning, case learning, etc.) on the basis of such subjects as basic nursing practice, health assessment practice, and anatomy practice and clinical cases and thereby learn cooperation and consideration in the course and learn Nunchi in the relationship established in clinical practice, and therefore their Nunchi-understanding or behavior influencing interpersonal relationship[2,5] is more developed.Accordingly, it is necessary to develop a variety of programs that help nursing students naturally learn and positively develop Nunchi in their curriculum.

In this study, nursing students' communication skills scored 3.55 out of five full points, which were somewhat higher than the result (3.60) of the research Lee[6] and the result (3.62) of the research by Lee and Kim[12] which used the same scale. The different seemed to be made because the subjects of the previous studies were students who already experienced clinical practice, and the subjects of this study were second-year students who had yet to experience clinical practice. According to the research on convergence communication training program for first-year nursing students by Jeong and Seo[21] and Kim and Yoon[22], their communication skills and interpersonal relationship improved. The communication course of interpersonal relationship and communication based on group activities improved communication self-efficacy[23]. Given the results, it was found that interpersonal relationship and communication skills, which are main skills of professional workers, are influenced by training and a relevant course. Therefore, it is necessary to develop a variety of communication training programs and courses.

In this study, nursing students' critical thinking disposition scored 3.53 out of five full points, which were somewhat higher than the result (3.46) of the research by Lee and Kim[12] who used the same scale. In this study, the sub categories with high points were objectivity

and intellectual fairness, and in the research by Lee and Kim[12], they were intellectual fairness and objectivity. In this study, the sub categories with low points were systematicity and prudence, and in the research by Lee and Kim[12], they were prudence and systematicity. Therefore, the two studies had consistent results. These results seem to be drawn because nursing students are familiar with such words as mistake acceptance, critical thinking, theoretical ground, validity, and explanation and consider them important in their school curriculum in terms of the characteristics of nursing school and specialties of hospital that accepts no mistakes, but they are unfamiliar with logical or systematic problem-solving skills. In order to cope with diverse situations appropriately in the medical environment based on theoretical grounds, it is required to have critical thinking. Critical thinking disposition is an essential factor for qualitative nursing and professional responsibility in nursing practice. Many experts on nursing focus on learning design and strategic development for improving nursing students' critical thinking[24], and get them involved in nursing education performance index. Given the result that critical thinking disposition is the largest influential factor on professional self-concept of nursing, and problem-solving skills[11,25], it is necessary to apply a variety of teaching methods for finding and raising individuals' potential thinking disposition in curriculum in order to raise their critical thinking.

In this study, there were positive correlations between nursing students' Nunchi and communication skills, between Nunchi and critical thinking disposition, and between communication skills and critical thinking disposition. This result is consistent with the results of relevant studies: the positive correlation between communication skills and Nunchi[6], and the strong positive correlation between critical thinking disposition and communication skills[12]. According to the analysis on previous studies, there were significant positive correlations between Nunchi and communication skills[6], between communication skills and problem-solving skills, between critical thinking disposition and problem-solving skills, and between critical thinking disposition and communication skills[12]. Given the results, it is considered that there is a correlation between Nunchi which is the individual personality of taking a proper action in a situation, and critical thinking disposition of judging one's self-control for solving a problem.It is very important to establish the environment for making the educational culture to improve Nunchi helping for interpersonal relationship and environmental adaptation and critical thinking disposition which is the main competency of nursing students and most influence problem-solving skills[25].Therefore, by activating a variety of case learning or simulation education in curriculum, it is necessary to help to develop and improve students' individual dispositions.

Conclusion

It is necessary to develop and improve nursing students' communication skills and critical thinking disposition as main competency factors of nursing education by activating a variety of case learning or simulation education. In addition, it is good to find a method of improving their Nunchi for understanding a situation and taking a proper action through cooperative learning, team projects, group studies, and various activities. This study has a limitation in generalizing its results, since the subjects were second-year nursing students of one university in one city. It is necessary to develop a program for improving nursing students' main competency through repeated research, and to conduct in-depth research on practical tasks through convergent approach.

Effect of Combined Exercise on Bone Related Factors, Cardiovascular Function and Hemodynamic Change in Emerging Adulthood

Hoe-WonKim[1], Sun-Ho Kim[1]

[1]Nambu University, Dept. General Education, Jungangro 23, Gwangsan-gu, Gwangju,506-706, Korea

Abstract

Background/Objectives:Rapid economic growth and development of medical, scientific technology, measuring equipment, and IT & AI technology in 21st century have enabled modern people to live rich and convenient lives but due to the decrease of physical activity, they may cause multiple health problems. The purpose of this study is to find out which influence of the participation to regular physical activity will impact on bone related factors, cardiovascular function, and hemodynamic variables of university students who are in early adulthood

Methods/Statistical analysis: The 19 subjects who are in early adulthood and participated to healthcare program, we made them to perform the combined exercise. Bone related factors, cardiovascular function, and hemodynamic variables according to the combined exercise during 10 weeks were measured and analyzed by comparison. Comparison of related variables before and after combined exercise was verified by paired t-test. Also, the correlation between variables was validated through Pearson correlation analysis.

Findings: After participating to the combined exercise, bone related factors, cardiovascular function and hemodynamic variablesshowed positive changes for each. In addition, bone related factors and cardiorespiratory function showed relations of positive and reverse correlations, cardiovascular function and hemodynamic variables showed a relation of reverse correlation, and bone related factors and hemodynamic variables showed a trend of reverse correlation. Measurement analysis has indicated that participating in combined exercise in early adulthood had a positive effect on bone related factors, cardiovascular function and hemodynamics factors.

Improvements/Applications: In conclusion, university students who are in early adulthood should form a healthy lifestyle which participates regularly to exercise program for health promotion and prevention care while should deal with various types of stresses well.

Keywords*: Combined exercise, T-Score, Z-Score, Maximal oxygen consumption, Physical efficiency index, RPP, PWV*

Introduction

Health life closely related to lifestyle becomes more worst as lack of exercise increases in all age groups and[6] causes various problems of social pathologies. As university students who soon enter the early adulthood from adolescence experience the important period to avoid from the control of parents and to take responsibility for themselves, the lifestyles in this period have close relations with the health in middle ages and elderly people. Therefore, it is very important to encourage university students in the early adulthood to practice healthy life and make them to solidly form the healthy lifestyle[1,2].

In particular, as the better life quality can be enjoyed through the reinforcement of functional ability according

Corresponding Author :
Sun-Ho Kim,
E-mail: sunho100@hanmail.nt

to the increase of age, it is very important to make the university students who are in the early adulthood to have the recognition to the importance of exercise based on the right health knowledge[3].

Also, it is a trend that the occurrence of osteopenia which is frequently occurred to the old ages has increased even to youths before the middle ages who are in lack of exercise. Therefore, in order to maximize and maintain the bone density, active maintenance and prevention are important during the period of university student when bone density is formed and is the best developed, In addition, the importance of exercise is emphasized[4].

As stress may trigger the cause of cardiovascular disease, it is reported that the people who have more tension have more risk factors to degrade cardiovascular function. Therefore, the proper control to this is needed. In particular, it is reported that hemodynamic variables meaning blood circulation related factors are closely related to cardiovascular disease. Under such context, the efficient exercise therapy method are widely recommended to return early to their daily lives through the improvement of cardiovascular function[5].

When generalizing many studies which have been performed before, it is reported that the increase of physical activity amount and regular participation of exercise increase the bone density, improve the autonomic nervous system, improve cardiovascular functions such as cardiac output and maximum oxygen consumption, positively change hemodynamic variables such as heart rate and systolic pressure, improve the human immunity, improve the body functions, and reduce various prevalence rates and death rates[6~8].

However, the subjects of most studies are the youths, the adulthood, the senescence, the disabled but the study about the early adulthood who are threatened to their health conditions due to multiple stresses according to the change of rapid environment is not satisfactory.

Therefore, this study intends to define which influence combined treatment exercise impacts on bone related factors, cardiovascular functions, and hemodynamic variables subjecting to university students who are in the early adulthood and have close relation with healthy lives during the mid-adulthood and the old aged.

Materials and Method

1. Subjects

The subjects of this study are 30 male university students who agreed to voluntary participation by sympathizing to the intent of the study of health care program applicants from N university. In order to enable all subjects to understand and practice the behavior patterns which can impact on the result during this test period, we educated them and received test agreements from them. Also, the subjects who have not faithfully implemented the exercise program during 10 weeks of test period were removed from this test and final test subjects were 19(22.43±1.01yrs, 173.30±3.96cm, 74.07±5.1kg).

2. Experimental procedure & Design

This study implemented the combined exercise for 10 weeks in the frequency of 3 times a weekafter implementing the preliminary exercise for 1 week. The development process of exercise were divided into warming up, main exercise (swimmingfor Monday & Friday, resistance exercise for Wednesday) and cooling down (5 to 10 minutes) respectively. For aerobic exercise, swimming was implemented for 40 – 50 minutes per each time with level 11 – 12 of RPE for 1 – 5 weeks and level 13 – 14 for 6 – 10 weeks based on RPE according to the recommendations of ACSM[9]. Resistance exercises (behind squat, sit-up, bench press, full-up, arm curl, up-right low, triceps extension, shoulder press, power clean, dumbbell) were implemented for 3 sets per each as 10 times a set with 60 % level of 1-RM for 1 – 5 weeks and 70% level of 1-RM for 6~10weeks according to the recommendations of Kraemer et al.[10]Bone related factor which is one of dependent variables used the average value by calculating each after measuring right calcaneal (ankle) area 2 times using SONOST 2000 equipment.Cardiovascularfunction was measured using physical fitness diagnosis system by Korea Institute of Sport Science and O_2run. Physical Efficiency Index is a method of elevating exercise with 30 times per minute at a platform with 50 cm of height and subjects should stand erect after going up to the platform. In addition, for hemodynamic variables, blood pressure was measured using IHB and PWV 3.0 which is the measuring equipment using PWV (pulse wave velocity) after attaching the sensor was used. Rate Pressure Product which is myocardial oxygen consumption was measured by multiplying heart rate to systolic pressure.

3. Statistical analysis

The measured value obtained from this study calculates average and standard deviation to each

measuring item using SPSS Ver.21.0 Program. Comparison of related variables before and after combined exercise was verified by paired t-test. Also, the correlation between variables was validated through Pearson correlation analysis. All statistical significance level was set as=.05.

Results and Discussion

As suggested in Table 1, bone related factors, cardiovascular function factors and hemodynamics factors after participating to the combined exercise showed a significant change after exercise participation, respectively. Also, to bone related factors (BQI, T-Score, Z-Score) and cardiovascularfunction factors(CO, VO_2max, PEI) after participating to the combined exercise, the relation of positive correlation was significantly indicated and to resting heart rate, the relation of inverse correlation was significantly indicated. In addition, cardiovascular function factors (CO, VO_2max, PEI) significantly indicated the relation of inverse correlation with hemodynamic variables (BP, RPP and PWV). Also, it is indicated that the trend of inverse correlation was shown between bone related factors and hemodynamic variables.

Discussion

Development of scientific technology & medical practice in modern society, interests to the health, and improvement of living standard provided comfortable and abundant lives with the coming of with the coming of the age of 100. In particular, during the early adulthood when the basic physical fitness is nearly completed, only improving health related physical fitness by forming healthy habit can be lead to lifelong health. Like this, university students who are in the early adulthood do more behaviors which will rather damage the health than behaviors of health promotion due to periodical characteristics and environmental factors[11].

Osteoporosis is commonly considered as a geriatric disease occurred due to decrease of bone mass from 40's. But, after 20's when forming the maximum bone mass, bone loss is occurred as age increases and osteoporosis which is occurred in high frequency during the old age is reported frequently even to the young age group due to the lifestyle disease such as lack of exercise[12]. Recently, it is reported that arterial stiffness which is used as an index reflecting the functional characteristics of artery while is closely related with cardiovascular disease shows high correlation with osteoporosis[13].The ACSM[9] pointed the most important element to prevent the risk of osteoporosis as the maximum bone mass in the adolescence and the early adulthood, and Rizzoli et al.[14] pointed that high bone density in the childhood and the adolescence is the decisive factor to bone health of adult. This study shows a trend matching with preceding researches by bringing the positive changes

of bone related factors after the regular participation of combined treatment exercise. Such result is considered that the increase of muscle mass according to regular physical activity, continuous stimulation to bone, the change of bone mass, activating promotion of osteoblast, prevention of decrease of bone loss, and the increase of bone strength acted complementarily[15,16].

Scribbans et al.[17] indicated that as maximum oxygen consumption of cardiovascularfunction is used helpfully even as health scale of the public as an index of continuous exercise performance ability, it becomes a decisive factor to long-term physical activity as well as can be maintained and promoted by regular physical activity. In particular, physical efficiency index is an item to recognize the degree of stress given to the heart during the exercise and to expect cardiorespiratory function through recovery period heart rate response. It is reported through cross-sectional study that aerobics exercise ability and cardiorespiratory function have positive correlation[18,19]. This study shows a trend matching with preceding researches by bringing the positive changes of cardiorespiratory function related factors after the regular participation of combined treatment exercise. Such result is considered to be indicated by combining the improvement of autonomic nervous system function, the decrease of sympathetic stimulation, the increase of parasympathetic stimulation, the increase of blood flow, the increase of left ventricular end diastolic volume, and the increase of myocardial contractility after participating to regular physical activity[20].

Hemodynamcis is an influence of physical phenomenon of blood going to blood vessel and inside of it on local blood flow and blood pressure and can be measured by blood pressure, myocardial oxygen consumption, arterial pulse wave velocity. Rate pressure product which is widely used to indirectly measure myocardial oxygen consumption can be an index to evaluate myocardial oxygen consumption during the exercise as well as the rest, and is widely used as its usefulness has been proven clinically[21]. In addition, arterial PWV is used as a major index of arterial stiffness which can predict the degenerative change of blood vessel and the risk of cardiovascular disease as a non-invasive method to measure the elasticity of blood vessel. In particular, it is reported that as arterial stiffness which arterial PWV becomes faster becomes severe, the decrease of bone mass is promoted[22].It is reported that regular participation of exercise brings a positive change to hemodynamic variables[23]. In particular, Sîrbu et al.[24] reported the decrease of PWV after performing the combined exercise subjecting to the young university students. This study has brought the significant change to hemodynamic variables after the combined treatment exercise. Such result is considered that regular physical activity acted complexly on the increase of blood vessel elasticity, the increase of blood flow into skeletal muscle, and the increase of myocardial energy efficiency[25].

Conclusion

As shown in the above, in early adulthood, it is important to understand the importance of exercise participation and physical activity for proper lifestyle and health promotion.

Relationship among Sleep Quality, Fatigue, Resilience, and Nursing Performance Ability in Shift Work Nurses

Sunsook Sim[1], Sangbok Lee[1], Miran Bang[2]

[1]Kyungdong University, Dept. Nursing, Korea, [2]Hallym University Dongtan Sacred Heart Hospital, Korea

Abstract

Background/Objectives: The purpose of this study was to investigate the relationship between sleep quality, fatigue, resilience and nursing performance ability of shift work nurses.

Methods/Statistical analysis: Data were collected for 10 days from September 10 to 19, 2018, among 197 clinical nurses employed by a general hospital having more than 300 beds in Seoul and Gyeonggi-do. Data analysis methods were SPSS 23.0 programs.

Findings: The sleep quality score of shift work nurses was 8.03, Fatigue 4.29, Resilience 2.36, Nursing Performance Ability 3.53. Statistically significant correlation was found between sleep quality and fatigue (r=.430, p<.001), sleep quality and resilience (r=-.293, p<.001), fatigue and resilience (r=-.262, p<.001), and resilience and nursing performance ability (r=.544, p<.001) in shift work nurses.

Improvements/Applications: This study is meaningful in the suggestion that it is necessary to increase shift work nurses' sleep quality and reduce their fatigue in order to improve their nursing performance ability, and to develop a desirable work type model.

Keywords: *Sleep, Fatigue, Resilience, Performance, Nurse*

Introduction

Sufficient sleep improves health and safety, whereas a lack of sleep causes fatigue, drowsiness, failure of memory and concentration, nervousness, and tension, which influence activities of daily living[1]. Shift work generates a pattern of irregular sleep and disturbs biorhythm. For this reason, shift workers have more fatigue than non-shift workers and frequent shift work causes a lack of sleep and fatigue accumulation which negatively influence psychological wellbeing and healthy lifestyles[2]. Nurses' health is a critical factor for accuracy of nursing and safety of patients. Nurses' lack of sleep made by their shift work is likely to increase the risk of hospital accidents directly related to patients, including medication error, malfunction of medical devices, and the error of patient analysis[3], and has very significant relations with nurses' personal health issues, such as increased sensitivity to infection, emotional changes, and physical pains[4].

Fatigue is considered to be a warning response to a health change. Shift work nurses had more fatigue and physical subjective symptoms than non-shift work nurses[3,5]. Sleep quality had correlations with fatigue and neurocognitive function[6].

In previous studies according to which resilience influenced nursing performance ability[7], and job engagement, burnout, job stress, and organizational commitment[8-9], resilience was analyzed in association with social influential factors related to jobs, rather than individual personalities. However, resilience of shift work nurses seems to influence individual personalities such as fatigue or sleep quality.

In the research on nurses' nursing performance ability, Jo and Sung[7] reported that resilience had a

Corresponding Author :
Sangbok Lee,
E-mail: lee2000sb@kduniv.ac.kr

positive correlation with nursing performance ability and resilience was an important predictive factor of nursing. The factors influencing shift work nurses' nursing performance ability vary so that it is necessary to conduct more studies in consideration of physical, psychological, social, and occupational characteristics.

Therefore, this study tries to analyze the relations between shift work nurses' sleep quality, fatigue, resilience and nursing performance ability and to provide a fundamental material for developing a nursing intervention strategy to improve shift work nurses' nursing performance ability.

Method

1. Research Design

This descriptive survey research is designed to find the relations between shift work nurses' sleep quality, fatigue, resilience and nursing performance ability.

2. Subjects

The subjects of this study were 197 nurses working at general wards of small and medium general hospitals with more than 300 wards in Seoul and Gyeonggi-do, who understood the purpose of this study and agreed on their participation.

3. Research Tools

1) Sleep quality

This study used the scale which was made by Cho et al[10] in the way of translating Pittsburgh Sleep Quality Index (PSQI) developed by Buysse et al[11]. The tool has a total of 18 items in the range of 0-21 points. In this study, Cronbach's α was .82.

2) Fatigue

This study used the scale which was made by Chung and Song[12] in the way of translating Fatigue Severity Scale (FSS). The 7-point scale consists of 9 items. The higher the points, the more fatigue. Based on the medium value '4 points', the study subjects were classified into fatigue group and non-fatigue group. In this study, Cronbach's α was .91.

3)Resilience

This study used Korean Resilience Scale (K-CD-RISC) of Baek[13]. The tool has 25 items in the scale of 5 points. In this study, Cronbach's α was .94.

4)Nursing performance ability

This study used the items for evaluating abilities and attitudes in the nurse performance assessment scale developed by Park et al[14]. The tool has 22 items in the 5-point Likert scale. In this study, Cronbach's α was .96.

4.Data collection

Data had been collected for 10 days from Sep. 10 to 19, 2018. All data and personal information collected for research are based on the principle of anonymity and are confidential. Therefore, with the use of codes only, information on each one of subjects was identified.

5. Data analysis

Data analysis methods were SPSS 23.0 programs.

Result

1. Characteristics of the subjects

The general characteristics of shift work nurses are shown in[Table 1]. With regard to age, 48.7% (the largest) accounted for those in their 20s. Regarding to career years, 44.7% (the largest) worked less than 5 years. With regard to work intensity, 61.4% replied that work intensity was in a high level. Regarding how many times they work at night during one month, 86.8% (the largest) worked five times and more. In terms of fatigue, 65.5% of fatigue group had four points or higher. 77.2% replied that they had low sleep quality (six points or higher).

2. Sleep quality, fatigue, resilience and nursing performance ability of the shift work nurses

The sleep quality, fatigue, resilience and nursing performance ability of shift work nurses are shown in [Table 2]. The study subjects' sleep quality scored 8.03 out of 21 full points; their fatigue 4.29 out of 7 full points; their resilience 2.36 points out of 4 full points; and their nursing performance ability 3.53 out of 5 full points.

Table 2.Sleep quality, fatigue, resilience and nursing performance ability of the shift work nurses

(N=197)

Variables (range)	M±SD
Sleep quality(0-21)	8.03±3.37
Fatigue (1-7)	4.29±1.16
Resilience (0-4)	2.36±0.58
Nursing performance ability (1-5)	3.53±0.54

3. Relationship of Shift work nurses' sleep quality, fatigue, resilience and nursing performance ability

The relationship between sleep quality, fatigue, resilience and nursing performance ability of shift work nurses is shown in [Table 3]. As a result, sleep quality had a positive correlation with fatigue (r=.430, p<.001), sleep quality had a negative correlation with resilience (r=-.293, p<.001), fatigue had a negative correlation with resilience (r=-.262, p<.001). Resilience had a positive correlation with nursing performance ability (r=.544, p<.001).

Table 3. Relationship of Shift work nurses' sleep quality, fatigue, resilience and nursing performance ability(N=197)

	Fatigue r(p)	Resilience r(p)	Nursing performance ability r(p)
Sleep quality	.430 (.000)	-.293 (.000)	-.120 (.093)
Fatigue		-.262 (.000)	-.080 (.261)
Resilience			.544 (.000)

Discussion

In this study, sleep quality scored 8.03 out of 21 full points, which are far higher than the diagnosis criterion (five points) of general sleep disorder and mean bad sleep quality. The score was higher than the result (7.46 points) of the research by Jung and Kang[6]. Therefore, it is fair to say that shift work nurses' sleep quality is bad overall. It is necessary to introduce a one-week based work type, expand night-work-only nurse system, develop a desirable shift work model, make customized consulting for a work type in small and medium hospitals, and conduct various approaches.

The study subjects' fatigue scored 4.29 out of 7 full points, which were higher on the basis of the medium value '4 points'. The score was similar to the result (4.44 points) of the research by Jung and Kang[6]. Shift work disturbs work biorhythm and causes fatigue so that it can reduce work adaptation and job commitment. That can influence nursing performance ability and patient safety. In order for shift work nurses to have enough rest, it is necessary to help them secure a sufficient rest time and actively operate healing programs for their hobby.

The study subjects' resilience scored 2.36 out of 4 full points, which were in the middle level and were higher than the result (2.12 points) of the research on ICU nurses of university hospitals by Park and Lee[15]. Kim, Oh and Park[16] reported that the higher the resilience, the lower the job stress and the higher job satisfaction. In order to improve clinical nurses' resilience, it is necessary to develop and apply a customized psychological program, resilience promotion program for training them to have positive and pleasant attitudes.

The study subjects' nursing performance ability scored 3.53 out of 5 full points, which was lower than the 4.0 score of Kim, Song and Lee[17] for the university hospital nurse using the same tool. That seemed to be because of the different work conditions of the nurses working at university hospitals and small & medium general hospitals where there are different work systems and organizational members.

The study subjects' sleep quality had a positive correlation with their fatigue. This result was consistent with the result of the research by Jung and Kang[6]. Nurses can have a changed shift work type even in 1-2 days so that they have difficult with physical adaptation. As a result, it is possible to lower sleep quality and negatively influence their fatigue at work. Therefore, it is necessary to introduce a flexible work type and night-work-only nurse system, give a reward to night work nurses, and take other measures. There were negative correlations between sleep quality and resilience and between fatigue and resilience. Since there is no research on the relations between the two variables, it is hard to compare them directly. In the research by Lee, Kwon and Cho[18], the more work stress, the lower sleep quality. In the research by Kang and Lim[8], resilience influenced stress

and burnout. Given the results, resilience is the internal ability to overcome stress situations well and therefore it is necessary to come up with various intervention methods, including emotional control program and healing program for shift work nurses.

Resilience had a positive correlation with nursing performance ability. This result was consistent with the result of the research by Jo and Sung[7]. In order to improve nurses' nursing performance ability, hospitals and nursing organizations need to recognize the importance of resilience and develop an education program that reflects individual personalities, work characteristics and work intensity. Given the result that chief nurses' leadership influences the improvement in nursing performance ability, it is necessary to improve an organizational culture to exert servant leadership. In addition, it is necessary to find a method of improving resilience and nursing performance ability in consideration of individual personalities, and conduct a wide range of research to develop a variety of practical, realistic, and professional methods.

Conclusion

In this study, the relations between the study subjects' sleep quality, fatigue, resilience and nursing performance ability were analyzed. As a result, there were positive correlations between sleep quality and fatigue and between resilience and nursing performance ability, and there were negative correlations between sleep quality and resilience and between fatigue and resilience. This study is meaningful in the suggestion that it is necessary to increase shift work nurses' sleep quality and reduce their fatigue in order to improve their nursing performance ability, and to develop a desirable work type model. This study is limited to the nurses working at some small and medium general hospitals so that it is difficult to generalize its results. Therefore, it will be necessary to conduct follow-up research in consideration of nurses' internal ability, a hospital size, and regions.

The Effect of Balance Capability on Cold Application of the Soles

Myung-Chul Kim[1], Hang-Sik Park[2], Hae-In Kim[3]

[1]Professor, Dept. of Physical Therapy, Eulji University, South Korea, [2]Professor, Faculty of Liberal Arts, Eulji University, South Korea,[3]M.D. Student, Dept. of Physical Therapy, Eulji University, South Korea

Abstract

Background/Objectives: The purpose of this study was to investigate the effect of cold application of the sole on the balance capability.

Methods/Statistical analysis: Participants selected for a particular standard (n=49) applied cold packs and hot packs for 10 minutes at intervals of 2 weeks. The subjects measured the temperature of the three distinct parts of the foot sole and carried out a dynamic balance test using the stability limit test program of Bio-rescue.

Findings: The areas of limits of stability after the cold pack application has significantly decreased in directions of forward, backward, right and left. However, the areas after the hot pack application did not have significant differences in all directions. These results show that the dynamic balance capability decreases when cold applied to the sole. However, since the change of the moving area due to the hot application is not significant, it is difficult to say that it affects the dynamic ability when the hot application is performed.

Improvements/Applications: The results of this study showed that there is a difference in the balance sensory ability of the central nervous system according to the temperature change.

Keywords: *Foot, Cold application, Temperature, Balance, Bio-rescue*

Introduction

The body has a balance capability when the center of gravity of the body is stably positioned inside the base[1].The body can become unbalanced and unstable during activity in various unpredictable environments, and impairment of balance capacity limits the function of healthy persons[2-3]. In particular, dynamic balance capability plays a key role in maintaining balance and controlling posture, which is important in preventing walking and falls[3-4]. The proprioception of the body sensory system is the greatest sensation that influences balance control, and many sensory information is input to the body, especially through the foot[5-6].In addition, feet are in contact with the ground to maintain balance with weight and help to perform daily activities[7].Sensory degradation of the skin can affect the sense of inherent water solubility, especially at cold temperatures, slowing the sensation of feet and varying the level of threshold at which pressure and vibration are felt[8].It is also known that 10 minutes of cold use causes local insensitivity and that after cold application, there is an anesthetic effect for a certain period of time[9].On the other hand, hot application helps relieve muscle tone by increasing blood pressure, and by providing sufficient oxygen to muscles, it reduces muscle cramps and increases tissue elasticity[10-12].So far, studies have been limited mainly to changes in sole temperature and sensory changes, such as the sensory thresholds that are affected by these factors and those that affect the sensory change of the soles. On the other hand, there are insufficient studies on the effects of temperature changes on the sole, sensory elements that transmit them, and the balance sense of the central nervous system. Therefore, in this study, we

want to find out how the sensory changes of the feet can change the functional role of the feet through changes in temperature of foot sole, and in particular, these effects on the balancing capacity associated with the central nervous system, to find out the effective temperature application for balanced training.

Method

The subjects of this study were 49 students who meet the following conditions for the students who are fully enrolled in OO University and fully understood and agreed on the contents of the experiment[Table 1].

Table 1. Physical characteristics of Subjects

Issue	**Mean±SD**
Age(years)	21.0±1.4[a]
Body weight(kg)	62.5±12.4
Height(cm)	167.0±8.8
BMI(kg/m²)	22.3±3.2
Difference in length of Both legs(cm)	0.3±0.2

[a)]Mean±SD

The temperature inside the laboratory was kept at 25 °C and subjects were asked to wear short sleeves and shorts. Experiments cold application and hot application were conducted at intervals of two weeks to exclude each other's effects.

We measured the sole temperature before and after the application of cold and hot in a stable state with bare feet. In each experiment using cold and hot, the balance of room temperature was measured once through the limits of stability test using Bio-rescue, and the ice pack and hot pack were applied to the soles of the foot and the temperature was measured once to observe the changes in the balance capability[Figure 1].

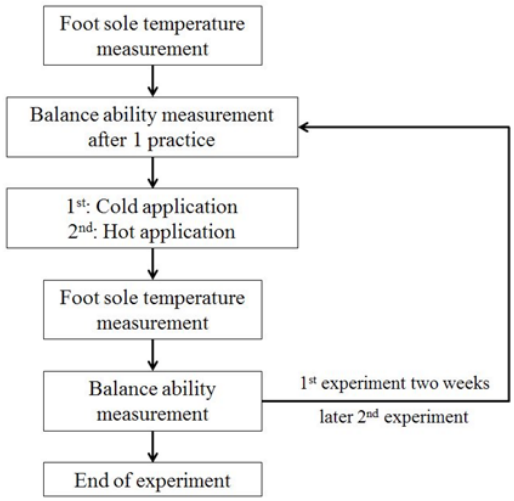

Figure 1. Experimental diagram

The subject was instructed to sit comfortably in a chair with a backrest and to closely contact the sole of the foot with a pack placed under the foot. The time was equally applied to the sole for 10 min.

Measurements of dynamic equilibrium capacities were made using the stability limit test program of Bio-rescue and using a pressure platform(PEDISTAR ELETE 2015, RM Ingenierie, France).

One of the measurement programs of Bio-Rescue, stability limit test, is to measure the maximum limit that the subject can actively move in the standing position to maintain stability. It is judged that the larger the area of the figure made by connecting the point when the maximum weight is moved, the better the balance capability.

An infrared radiation thermometer(DT8380H 2017, Sunche, China) was used to measure skin temperature. The measurement was made by placing the infrared sensor at the first metatarsal head, the 5th metatarsal head, and the heel bone, which are the three anatomical parts of the sole of the foot.

The data collected in this study are statistical program SPSS ver. 25.0, and different analytical techniques were applied according to the purpose. First, the analysis of pre- and post-exercise differences was performed using the corresponding sample T-test. The differences between groups after exercise were analyzed using one-way ANOVA. Statistical significance was set at $p < 0.05$.

Result and Discussion

In the case of cold application, the temperature after application of all three parts of the sole was significantly decreased (p<0.001). In the case of the hot application, all the temperatures of the three parts of the sole were significantly increased (p<0.001)[Table 2].

(*p <0.001)

The results of the comparison of the difference in area size between the two groups of cold application and on application showed a significant difference in p <0.05 in all areas (Figure 2).

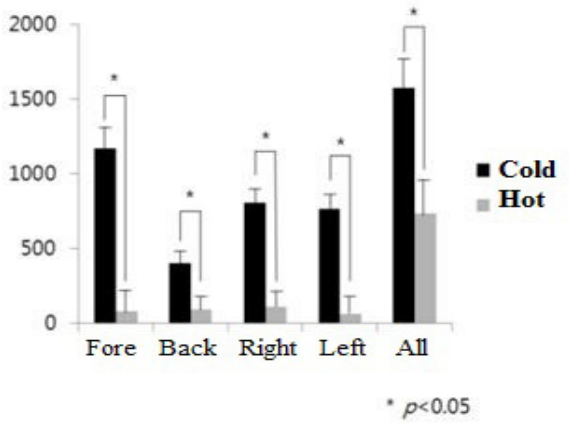

Figure 2. Difference of moving area before and after application of temperature between groups

Conclusion

The purpose of this study was to investigate the change of balance capability after cold application and hot application of the sole for two weeks for Eulji university students in their twenties. The experiment was applied cold and hot to the sole, and after a certain period of time, the temperature difference before and after application was measured and the balance change was examined.

This experiment assumed that the balance capability would be improved when applying hot, but there was no significant difference in balance capability. In this experiment, because the hot pack was applied for 10 minutes, the application effect gradually decreased and the balance capability did not show any significant difference.

However, it showed significant decrease of moving area in forward, backward, right, and left moving area compared to hot applied group in cold application. This is due to the fact that the mechanical sensation level is changed by continuous cooling and cold application causes fatigue more rapidly by interfering with the recovery rate. This experiment was carried out for two weeks between the cold and warm experiments to reduce the influence of the proficiency test that might occur in the stability limit test using Bio-rescue. In addition, before the balance measurement for each experiment, practice measurement was performed in order to become familiar with the Bio-rescue measurement method.

This study was conducted in healthy adults with normal balance capability, so it is difficult to generalize to patients with nervous system and musculo-skeletal system which have a decrease in balance capability. In addition, the subjects were not able to provide a psychological sense of security because the surrounding noise and the movement of people around them did not rule out the influence of the balance capability measurement.

In conclusion, the purpose of this study was to investigate the effects of sole cold application and hot application on dynamic balance capability in 49 college students in their 20s. After applying the temperature to the ice pack and the hot pack, the subjects measured the dynamic balance capability through the limits of stability test using Bio-rescue.

The results of the dynamic balance test were compared before and after the application of temperature, and it was confirmed that the moving area before and after cold application was significantly decreased and the moving area before and after application was not significantly different. The mean of the posterior and posterior area differences were compared by forward, backward, right, left, and all, and it was confirmed that the mean of the posterior and posterior area differences of the cold applied group was statistically significantly lower than the whole applied group.

As a result, it can be seen that the cold application of the sole brings down the dynamic balance capability, and since the change of the moving area according to the hot application is not significant, the effect of the hot application on the dynamic balance capability It is difficult to see it.

Path Analysis of Social Pre-Parental Role of Unmarried Men and Women

Meera Park[1], **Nam Joo Je**[1]

[1]*Depart of nursing, Changshin Unversity, Korea*

Abstract

Background/Objectives: Based on previous studies, this study is to derive a hypothesized model of the causal relationship between variables affecting the social pre-parental role and clarify the path fitness and effect.

Methods/Statistical analysis: Data from 287 unmarried men and women on Oct/1~Dec/31/2018. Independent t-test and ANOVA for social pre-parental role in general characteristics, Scheffe's test for post-verification, Pearson correlation coefficient for observed variables, maximum likelihood for parameter estimation of the model, CFA for validity of latent variable, $\chi 2$, $\chi 2$/df, RMSEA, SRMR, GFI, AGFI, CFI, NFI and TLI for fitness, and bootstrapping for direct effect, indirect effect, and statistical significance of total effect.

Findings: All six pathways presented in the hypothesis model of the study were significant. The $\chi 2$ was not fitted as 45.668 (p<.001) but the $\chi 2$/df was fitted as 2.686. Absolute fit indices all met the recommended level (RMR=.005, RMSEA=.077, GFI=.963, AGFI=.921), and the incremental fit index was also fit (NFI=.966, TLI=.964, CFI=.978). The variables affecting social pre-parent role were the experience of pre-parent education (β=.115, p=.035), pre-parent related knowledge (β=.157, p=.004), and need for pre-parent education (β=.384, p<.001), and the explanatory power was 23.7%. The most influential variable on the social pre-parental role was the need for pre-parent education (β=.384, p<.001), followed by pre-parent related knowledge (β=.211, p=.009), and experience of pre-parent education (β=.194, p=.030). The need for pre-parent education had a direct impact on the social pre-parental role. Experience of pre-parent education and pre-parent related knowledge had a direct impact on the social pre-parental role and indirectly through the need for pre-parent education.

Improvements/Applications: Raising the need is necessary for pre-parent education for the improvement of the social pre-parental role. A Motivational program is needed for recognition of the need precedes the need itself.

Keywords: *Experience of education, Knowledge, Need for education, Social pre-parental role, Unmarried men and women.*

Introduction

In the past, there was an opportunity to learn how to become a parent, both directly and indirectly, by living together, nurturing a child, and watching the child grow up[1]. But at present, the nuclear family has reduced the opportunity to receive knowledge and information about the parental role from parents' generation, learn childcare and family relationships, and prepare mentally for the parental role[2]. It is not easy to play a proper parent role without learning because of a lack of understanding about child development, how to raise children, family relationships, communication skills, etc.[3]. If the parents become parents without learning about the desired parenthood, these lack of understanding makes it hard to play a proper parent role[3]. Due to this, there is no

confidence in the role of the parents because of the confusion of the value of parenting, and the parenting attitude is often inconsistent[4].

Adolescents and young parents need preparation to be ready for the role of married couples and parents before they get married[5]. Parental role education is a more active and effective approach to pre-parents in a preventive way rather than a therapeutic way for people who already are parents[6]Prepared couples or parents can fulfill their roles satisfactorily, adapt roles and solve problems easily[7], which is why it is necessary to examine the awareness of the social pre-parental role of unmarried men and women who can be married.7

Most pre-parent education only emphasizes the desirable parental role of child development, and unable to accurately grasp the awareness of pre-parent education of the times is pointed out to be a limitation[8]. Therefore, to develop a differentiated pre-parent education program, it will be meaningful to check parent-related knowledge, the experience of pre-parent education, the need for education, and awareness of the social pre-parental role of unmarried men and women, and analyze how these variables influence social pre-parental role.

Method

This study was designed to derive a hypothesized model of the causal relationship between variables of unmarried men and women who will later become pre-parents, and the variables affecting social pre-parental role. It is also a covariance path analysis to identify the fitness and the effect of the hypothesis model.

This model consists of variables predicted to be influential factors based on previous studies related to the social pre-parent role. The model was derived from the hypothesis that the experience of pre-parent education and knowledge influenced the educational need, and this influenced the pre-parental role.

The subjects were 287 unmarried men and women aged between 20-30 in G-do from Oct/1~Dec/31/2018. They were from culture centers, churches, and universities, and they understood the purpose of the study and agreed to participate. In the structural equation model, the size of the sample is at least 10 times the free parameter[9] and the ideal recommended size requires 150~400 samples. So, considering the dropout rate of the data, 290 copies were collected, and 287 copies were used for analysis with the exception of 3 copies which had insufficient responses.

The usage of the instruments in this study was all approved by both instrument developers and editors/ revisors.

Based on questions used in previous studies[10], the questions asking characteristics of the subjects were 12, including gender, age, birth order, dating experience, the experience of caring a child, thought of marriage, marriageable age, etc. Pre-parent education and knowledge are tools used in Kim's[11] research. Pre-parent experience was measured by 5-points likert scale of 40 questions, with a higher score meaning more experience and knowledge. The reliability was not measured during development and Cronbach's α=. 97 in this study.

Pre-parent related knowledge was measured by 20 questions answered 'yes', 'no', or 'do not know', with 1 point if correct, 0 point if wrong or do not know. The higher the score, the higher the level of knowledge. The reliability KR 20 was not measured during development and KR 20=.75 in this study.

Need for pre-parent education was measured by 40-question questionnaire originally from Oh[12] and edited and revised by Lee[13]. The questions ask self-understanding, spouse selection and marriage, pregnancy and childbirth, nurture, family relationship and parental role, etc. Each item has a 4-point likert scale, meaning higher the score, the higher the need for education. Cronbach α=.96 in Oh[12]'s study, Cronbach α=.97 in Lee[13]'s, Cronbach α =.97 in this study. For sub-domains, 'self-understanding', 'spouse selection and marriage', 'pregnancy and childbirth', 'nurture', and 'family relationship and parental role, etc', Cronbach α=.90, 88, 91, 93, 93.

Social pre-parental role awareness was measured with Shin[3]'s social parental role and attitude measuring tool reconstructed to a 23question scale by Yeo[14]. Each item has a 5-point likert scale, meaning higher the score, the higher the level of awareness of social pre-parental role. Cronbach's α=.90 in Yeo[14]'s study, Cronbach's α=.73 in this study.

The collected data were analyzed using SPSS-WIN 25.0 and AMOS 18.0.

Mean, standard deviation, skewness, and kurtosis

were obtained from the experience of pre-parent education, pre-parent related knowledge, the need for pre-parent education, and the social pre-parental role awareness. For verifying the difference of social pre-parental role according to characteristics, independent t-test and ANOVA were used, and Scheffe's test for the post-test. For understanding the relationships between variables, Pearson correlation coefficients were calculated. The parameter estimation of the hypothesis model was analyzed using Maximum likelihood, and CFA was performed to confirm the validity of the latent variables analysis. The evaluation of the fitness of the model was done using $\chi 2$, $\chi 2$/df, Root Mean Squared Error of Approximation(RMSEA), Standardized Root Mean Square Residual(SRMR), Goodness of Fit Index(GFI), AGFI(Adjusted Goodness Fit Index), Comparative Fit Index(CFI), Normed Fit Index(NFI), and Turker-Lewis Index(TLI)[26]. For direct effect, indirect effect, and statistical significance of the total effect, bootstrapping was done.

Result and Discussion

Descriptive statistics are shown in Table 1. Experience of pre-parent education was 3.28±0.84 points (out of 5). Pre-parent related knowledge was 14.48±3.46 points (out of 20). Need for pre-parent education was high with 3.48±0.40 points (out of 4). Social pre-parental role was 3.69±0.34 points (out of 5). The variables used in the study can be assumed to be normal distributions for the skewness of the variables was -1.14 ~ 0.20 within ±2, and the kurtosis was -1.30 ~ 3.37 within ±4.

The difference in social pre-parental role according to characteristics is shown in Table 2. There was a statistically significant difference in the items of gender, the experience of caring a child, the thought of marriage, consideration when choosing a spouse, childbirth plan, desired gender of the child, and person in charge of childcare (p<.05). Specifically, gender was higher in women than men(t=-2.32, p=.021), the experience of caring a child was higher in 'yes' than 'no'(t=2.71, p=.007), the thought of marriage was higher in 'will do' than 'will not do' and 'never thought of it'(F=5.54, p=.004), consideration when choosing a spouse was higher in 'family background' than 'physical condition such as appearance'(F=2.73, p=.014), childbirth plan was higher in 'will give birth' than 'will not give birth'(F=8.71, p<.001), desired gender of child was higher in 'no preference' and 'daughter' than 'son'(F=9.98, p<.001), and person in charge of childcare was higher in 'the couple jointly' than 'father'(F=3.70, p=.012).

The analysis of the relationship between variables is shown in Table 3. The social pre-parental role was positively related to the awareness of pre-parent education(r=.256, p<.001), pre-parent related knowledge(r=.242, p<.001), and the need for pre-parent education(r=.383, p<.001), respectively. The correlation coefficient between awareness of pre-parent education, pre-parent related knowledge, and the need for pre-parent education was .185~.231, also positively correlated.

Table 3. Correlation among the research Variables (N=287)

(1)		Need of pre-parent education								
		(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	
(1) Experience of pre-parent education		1								
(2) Pre-parent related knowledge		.231 (<.001)	1							
Need of pre-parent education	(3) Self-understanding	.213 (<.001)	.185 (.002)	1						
	(4) Choosing your spouse and marriage	.162 (.006)	.209 (<.001)	.737 (<.001)	1					
	(5) Pregnancy and birth	.157 (.008)	.206 (<.001)	.704 (<.001)	.738 (<.001)	1				
	(6) Nurture	.153 (.010)	.208 (<.001)	.704 (<.001)	.737 (<.001)	.820 (<.001)	1			
	(7) Family relationship and parent role	.159 (.007)	.219 (<.001)	.691 (<.001)	.740 (<.001)	.774 (<.001)	.808 (<.001)	1		
	(8) Total	.185 (.002)	.230 (<.001)	.841 (<.001)	.875 (<.001)	.907 (<.001)	.932 (<.001)	.901 (<.001)	1	
(9) Recognition of social pre-parent role		.256 (<.001)	.242 (<.001)	.487 (<.001)	.346 (<.001)	.366 (<.001)	.374 (<.001)	.383 (<.001)	.431 (<.001)	1

All six pathways presented in the hypothesis model were significant[Figure 1]. The $\chi 2$ was found to be inadequate($\chi 2$=45.668, p<.001), but the normalized $\chi 2$ was fit as 2.686. The absolute fit indices all met the recommended level(RMR=.005, RMSEA=.077, GFI=.963, AGFI=.921), and the incremental fit indices also met the level(NFI=.966, TLI=.964, CFI=.978).

The analysis of the path presented shown in Table 4. The variables affecting the social pre-parental role were the experience of pre-parent education(β=.115, p=.035), pre-parent related knowledge(β=.157, p=.004), and the need for pre-parent education(β=.384, p<.001). The explanatory power was 23.7%.

Table 5 shows the direct, indirect, and total effects of the variables on the social pre-parental role in this model. The most influential variable in the social pre-parental role was the need for pre-parent education(β=.384,p<.001), followed by pre-parent related knowledge(β=.211, p=.009), and the experience of pre-parent education(β=.194, p=.030). The need for pre-parent education had a direct impact on the social pre-parental role.

The experience of pre-parent education and pre-parent related knowledge had a direct impact on the social pre-parent role, and indirectly through the need for pre-parent education.

	Pre-parent related knowledge	.157(.004)	.054(.035)	.211(.009)
	Need of pre-parent education	.384(<.001)	-	.384(<.001)

Conclusion

In this study, a hypothesized model of the causal relationship between pre-parent related knowledge, the experience of pre-parent education, and the need for pre-parent education of unmarried men and women who will later become pre-parents was derived. Also, path analysis was performed to verify the model's fitness and effect. The most influential variable in the social pre-parental role was the need for pre-parent education. There was a correlation between pre-parent related knowledge and the experience of pre-parent education. They had a direct impact on the social pre-parental role, and also indirectly through the need for pre-parent education.

The results of this study are expected to be used as basic data for the development of pre-parental role enhancement programs for unmarried men and women. For enhancing the social pre-parental role, the need for pre-parent education needs to be raised first. The recognition of the need for education must precede the need itself, so a motivational program must be constructed and its effect verified. Also, for the enhancement of the social pre-parent role, the pre-parent related knowledge and the experience of pre-parent education, which had a direct impact, need to be provided. They had indirect influence through the need for education, therefore a study considering the contents of raising awareness of the need for pre-parent education and providing related knowledge.

Abstract

Objectives: The purpose of this study is to investigate the effect of flank exercise, using various supporting surfaces, on the distance between bottom peaks, cranio-vertebral angle(CVA), and rounded shoulder posture.

Methods: Thirty normal adults in their 20s from A city S University participate in the experiment. They are randomly divided into 2 groups: a stable ground plank exercise group (n=15) and an unstable ground plank exercise group (n=15). The experiment was carried out three times per week for four weeks. Measurement methods were to measure the CVA and the round shoulder in the right lying posture using a goniometer and Vernier calipers, respectively.

Result: There was a significant difference ($p < .05$) between head and spine angle before and after exercise in the unstable surface group, but no significant difference between the stable and unstable surface groups. There was a significant difference in the round shoulder posture in the unstable surface group between pre and post exercise ($p < .05$), but there was no significant difference between the stable and unstable plank groups.

Conclusion: The plank exercise on an unstable support surface is suggested to be effective in correcting the round shoulder posture and CVA.

Keywords*: Unstable support surface, plank exercise, Cranio-vertebral angle, Rounded shoulder, Forward head posture*

Introduction

Recently, problems with posture due to long term use of computers and smartphones have been rapidly increasing, and this characteristic alignment is known to increase forward head postures or round shoulder positions[1]. Mal alignment due to bad habits in adolescence was found to have the greatest effect on the shoulders and neck, and the monthly incidence is increasing from 11.5% to 29%[2].

Forward head posture increases head bending. It occurs when the head is placed forward from the shoulder in the coronal plane, and the compensatory over extension of the upper and lower neck joints shortens the posterior muscles of the head and neck, causing the superior cervical bone to protrude relatively forward. It is defined as being face upward[3].

The rounded shoulder posture is compared with the body's gravity line. The acromion is forwarded and the scapula is elevated. The scapula is protracted with inferior rotation and anterior tilt due to an increase in the curvature of the lower cervical bone and an increase in the kyphosis of the upper thoracic[4-5]. Long-term forward head posture causes upper cross syndrome, weakening of muscles such as rhomboid, serratus anterior, and lower trapezius. Pectoralis major, pectoralis minor, upper trapezius, and levator scapula may stiffen, causing one or more of the complex structures, such as the head, neck, and shoulder, or causing pain and dysfunction

kan717@hanmail.net

in the neck and shoulder areas due to imbalance in the surrounding muscles[6-7].

The rounded shoulder posture requires strengthening of muscles such as the lower trapezius and serratus anterior to restore weakness and range of motion[8]. The closed chain exercise, mainly performed for this purpose, causes simultaneous contraction of various muscles through mechanical compression of the joints, which not only stimulates the concentric receptors but also helps maintain the dynamic stability and posture of the joints by increasing strength and endurance[9-10].

A popular exercise is the plank. The plank is performed to stabilize the core muscles and improve core strength[11]. The plank position is to bend the elbow 90 degrees from the prone position and maintain the head, shoulders, spine, pelvis, knee, and ankles in a straight posture[12].

Core refers to the waist, pelvis, and hip complexes, and core stabilization refers to the interaction of passive and active structures with neuro modulation that contribute to core stability[13]. Core stabilization exercises enhance neuromuscular control, muscle strength, and endurance, helping to maintain dynamic stability between the spine and the trunk[14].

Several different methods are used to study core stabilization exercises, depending on variables such as posture, tools, and the ground[15].Utilizing tools and unstable surfaces has the advantage of increasing muscle action required to maintain postural stability[16]. When the unstable support surface was applied to the upper and lower limbs, it was more effective when applied to the lower limbs. Although there have been studies on the stabilization of the core using various support surfaces, those analyzing this effect on the upper limb are limited[12].

The purpose of this study is to measure the acromion to floor distance and cranio-vertebral angle (CVA) changes in 20-year-old adults by applying plank motion on various grounds . This study also provides basic data on an exercise program effective for round shoulder correction.

Materials and Method

1. Subjects and experiment periods

A total of 30 adults in their 20s from A City S University were selected for this study from June 20, 2018 to July 30, 2018 and 15 participants were randomly assigned to the general mat exercise group and balance pad exercise group. The general mat exercise group was set to perform exercise on a stable ground and the balance pad exercise group was set to perform on an unstable ground. All research subjects received the research agreement before proceeding with the experiment. This study included subjects whose separation between the peak and the floor was more than 2.5 cm in supine posture and head spine angle was above 53° in the upright posture. Exclusion criteria included subjects with spondylarthrosis, those with psychological and neurological lesions, and other diseases that may affect the experiment. The general characteristics of the subjects are as follows [Table 1].

Table 1. General characteristics of the subjects

	Stableground (n=15)	Unstable ground(n=15)	p
Age (years)	21.07±.70*	21.00±.65	.790
Height (cm)	173.93±2.58	173.73±2.09	.817
Weight (kg)	73.86±1.68	74.03±1.69	.598

* mean ± standard deviation

2. Measurement

2.1. The CVA

The CVA, used to measure forward head postures, defines the angle at which the line connecting C7 and tragus forms a horizontal line. Subjects with a forward head posture showed a smaller CVA, indicating increased bends in the lower cervical[17].

Subjects were in a neutral posture from a straight posture, and their eyes looked at the eyes of the other person, and the CVA was measured using the goniometer with C7 as the axis[18-19].

2.1.Round shoulder posture

The straight down method used to measure the distance between the table floor and the peak was used. This method has been used only to measure the length of the pectoralis minor, but has good reliability in asymptomatic or asymptomatic shoulders for assessment of the position of the shoulder blades relative to the round shoulder posture[20].

Subject was placed on the table in a relaxed supine position, with both arms in a neutral position right next to the rib cage, and a vernier caliper was used to measure the round shoulders.

3. Intervention

The subjects were randomly assigned to each group and classified into 15 exercise groups on the stable ground and 15 exercise groups on the unstable ground. The exercise for each group consisted of 5 minutes warm up, 20 minutes plank, 5 minutes cool down. When complaining of pain or discomfort, a 1 minute rest period was provided. A total of 30 minutes of exercise was performed three times a week for a total of four weeks. The experiment was conducted by three physical therapists with more than three years of clinical experience along with six assistants.

The first plank exercise involved lifting the trunk, pelvis, and legs with the forearm and toes in the prone position, keeping the head, back, hips, and lower legs in a straight line.

The second bracing plank exercise was performed in the same manner as the plank exercise while generating abdominal tension in the prone position. The abdominis should be kept constant during exercise.

The third hollowing plank exercise is performed in the same manner as the plank movement after gently pulling the abdominal spine in the prone position. Abdominis should be kept hollowing continuously during exercise[21].

The stable surface exercise was performed on a general mat, and the unstable support surface exercise group used a 33 x 5 cm balance pad to provide an unstable support surface to the upper arm.

4. Analysis

In this study, the Shapiro-Wilk test was conducted to determine the standard normal deviation between subjects. The Wilcoxon signed rank test was used to examine the two groups before and after the exercise, and the Mann-Whitney U test was performed to determine the variation in the differences between the groups. The significance level (α) for verifying statistical significance was 0.05.

Results

1. Change in the CVA

The CVA in the stability group increased from 44.53 ± 1.92 degrees before exercise to 44.86 ± 1.73 degrees after exercise, but there was no statistically significant difference. The CVA in the unstable support exercise group increased from 45.26 ± 2.31 degrees before exercise to 45.73 ± 1.91 degrees after exercise ($p < 0.05$). There was no significant difference in CVA between the two groups [Table 2].

2. Round shoulder posture change

Stable ground exercise group decreased from 8.40 ± 1.45 cm before exercise to 8.20 ± 1.15 cm after exercise, but there was no statistical difference. The unstable support group showed a statistically significant difference from 8.47 ± 1.19 cm before exercise to 7.53 ± 1.13 cm after exercise ($p < 0.05$). The change in the round shoulder posture between the two groups showed no significant difference [Table 3].

Discussion

Several undesirable symptoms related to the neck are seen due to lack of exercise, hectic lifestyle, fatigue due to overload on the neck, and working with an incorrect posture. As the active use of smartphones at various ages increases, the number of people experiencing the Turtle Neck Syndrome increases each year[22].

Prolonged incorrect posture can lead to muscle grinding and muscular imbalances, reduce the effectiveness of muscle, and create mechanical stress, causing pain[23].

In this study, we tried to identify which exercise is more effective for accurate postural alignment by applying the plank motion for 4 weeks on stable and unstable support grounds.

In a previous study by Krawczky et al., 39 healthy adults underwent pilates base exercise and compared the immediate effects of several angles, pain, and postural alignment on the sagittal plane before and after the experiment. After 1 exercise set, a statistically significant difference in the increase of the head horizontal angle, spine alignment, and reduction of thoracic kyphosis($p<.05$) was seen, and after 16 exercise sets, significant differences in head horizontal angle, kyphosis, lordosis, and hip joint angle($p< .05$) were seen[24]. Another study on the effects of pilates on forward head postures in adults was conducted. In this study, the women who had a forward head posture were compared with the pilates group in general. The CVA, range of motion, pain, and neck disability index showed significant differences in the visual analog scale, cervical dysfunction index, and CVA($p<.05$). EMG showed significant differences in the sternocleidomastoid muscle($p<.05$)[25]. In another pilates applied neck function study, pilates-based exercise was performed by 13 patients aged 37-59 years for 6 weeks, which significantly improved neck function. Pilates, which improved stability by focusing on posture perception, had an effect on chronic neck pain[26].

The results of this study are similar to those of Cruz-Ferreira et al., who found that the effect of kyphosis was decreased in adults with forward head postures[27]. Plank exercise positively affects postural changes due to compensatory actions in the lumbar spine and cervical spine because it increases stabilization of the pelvis, reduces kyphosis, and at the same time affects the load on the spine and trunk muscles in the upright position by stiffening the thoracic spine. In conclusion, it is thought to have a positive effect on function[28]. There was also a statistically significant increase in the pilates training group compared with the cervical stabilization group in the comparison of cranio-vertebral group during cervical alignment test ($p <.05$). This is consistent with previous studies, which found that greater the CVA, lower the kyphosis.

These results suggest that the preoperative CVA was increased from 54.39 to 58.32 degrees and kyphosis was reduced by increasing the thickness of the middle trapezius and rhomboid[29]. Further studies are warranted to investigate the relationship between CVA and middle trapezius and rhomboid muscle thickness and to study the application of unstable support to the arms and legs.

Conclusion

The purpose of this study was to identify the most effective ground for the round shoulder position and CVA when planking is performed on different grounds. In conclusion, the unstable ground using the balance pad showed the largest change in the round shoulder posture and CVA.

Normative Study of Attention Tests in a Computerized Comprehensive Neurocognitive Function Test in Adults

Soo-Yeon Kim[1], Jong-Hoon Moon[2], Jin-Hwa Jung[2]

[1]Department of Rehabilitation Medicine, Pusan National University School of Medicine, Research Institute for Convergence of Biomedical Science and Technology, Republic of Korea, [2]Department of Healthcare and Public Health Research, National Rehabilitation Research Institute, National Rehabilitation Center, Republic of Korea, [3]Department of Occupational Therapy, Semyung University, Republic of Korea

Abstract

Background/Objectives: The purpose of this study is to construct standardized data through a computerized neurocognitive function test.

Methods/Statistical analysis: This study involved 180 adults aged 20 to 79 years. All subjects were evaluated with six attention test sub-domains of a computerized neurocognitive function test. The attention tests consisted of a visual continuity performance test (VCPT), auditory continuous performance test (ACPT), visual vigilance test (VVT), auditory vigilance test (AVT), trail-making test (TMT), and stroop test (ST). For statistical analysis, independent t test and Pearson correlation analysis were performed.

Findings: There was no significant attention difference between the sexes ($p > .05$). Correlation analysis showed that attentiveness decreased significantly with age ($p < .05$). We have presented the reference values of six attention tests according to the age group.

Improvements/Applications: The reference value data for the six computerized neurocognitive function attention test sub-domains may be helpful for distinguishing attention problems in clinical practice.

Keywords: *Cognition, Attention, Normative study, Computerized neurocognitive function test, Elderly*

Introduction

In Korea, the proportion of elderly people in society exceeded 7% in 2001, and it is estimated that in 2026, with the proportion of elderly people reaching 20%, Korea will have a super-aged society[1]. Elderly people with impaired cognitive function have an increased risk of progression to mild cognitive impairment or dementia[2]. It is important that early diagnosis and evaluation of cognitive function increase. This is because from the viewpoint of prevention, current health conditions affect future health[3].

Neurophysiological and neuropsychological measurements provide additional information for screening and clinical evaluation, health and disease monitoring, and therapeutic evaluation[4]. Clinical tools for assessing cognitive function are often used to assess various domains that may be linked to a particular disease [5].

In general, cognitive domains are categorized as attention, memory, language, calculation ability, constructive ability, perception - motor coordination ability, and problem solving ability[6]. Attention is the process of filtering out irrelevant information from incoming information and accepting only necessary information into working memory. Working memory and attention are closely related [7]. Attention deficits lead to limitations in daily life, occupation, leisure, and participation in social activities [8].

The purpose of various types of neurocognitive function tests is to systematize quantitative and objective information on neurocognitive abnormalities[9]. Although

Jin-Hwa Jung,
otsalt@nate.com

these tests facilitate the use of clinical assessment and detail the features of the cognitive domain, information on the normative data of the battery, which covers the entire cognitive domain, is somewhat lacking [10].

Neurocognitive function tests are widely recognized as a sophisticated method for detecting neurocognitive impairments due to central nervous system damage or disease [11]. If a neurocognitive function test is performed on a large population, the measurement accuracy may be affected by the physical strength of the evaluator and deteriorate as the evaluator becomes fatigued.

Recently, computerized neurocognitive function tests have been developed. The advantages of computerized evaluation include the accurate measurement of reaction time, ability to manage data, speed of analysis process, and time savings [12]. It is efficient in many respects to be able to integrate various types of assessments into the computer software and to identify the level of the subject without needing evaluators. In order to objectively and quantitatively evaluate each area of cognitive function, a standardized examination with proven validity, reliability, and validation procedure is required, and the standard for interpretation of results should be provided. However, objective information about standardized values is very limited [13].

Therefore, our objective was to construct standardized data for attention tests in a computerized neurocognitive function test.

Method

The present study was conducted on 180 adults aged 20 to 79 years using the convenience sampling method. The subjects did not have cognitive impairment, problems in daily life, or physical health issues. All subjects participated in an experiment after providing written consent for voluntary participation. The subject group consisted of 89 males (49.4%) and 91 females (50.6%). The age of the participants was 49.37 ± 17.42 years. Subjects were recruited by age group of 30 each persons from 20s to 70s. The subjects' six attention tests scores are shown in Table 1.

Table 1. General characteristics of the subjects

		Participants(n=180)
Sex, n (%)	Male	89 (49.4)
	Female	91(50.6)
Age (year)a		49.37±17.42
Accuracy(score)	VCPT	96.39±3.87
	ACPT	94.46±3.66

	TMT	0.95±0.53

Footnotes. amean±SD, VCPT: Visual Continuity Performance Test; ACPT: Auditory Continuous Performance Test; VVT: Visual Vigilance Test; AVT: Auditory Visual Vigilance Test; ST: Stroop Test; TMT: Trail-Making Test.

The subjects were measured with a computerized neurocognitive function test (CNTest, cybermedic. Co., Korea). This test consists of 18 subtests in four categories: attention, memory, sensory and motor coordination, and problem solving ability using a touch screen based computer.The attention tests were the visual continuous performance test (VCPT), auditory continuous performance test (ACPT), visual vigilance test (VVT), auditory vigilance test (AVT), trail-making test (TMT), and word-color (WC).

The collected all data were analyzed using the SPSS 22 (Statistical Package for the Social Sciences version 22). The general characteristics of the subjects were confirmed by frequency analysis. Differences based on age or sex for each of the six types of attention tests were analyzed with an independent t test. Correlation analysis was used to identify relationships between the six concentration tests and age. For the standardization,

values of the 10th, 25th, 50th, 75th, and 90th quintiles were derived. The statistical significance was set at .05.

Result and Discussion

1. Comparison of accuracy and response time of attention test between male and female

There was no significant difference between attention and sex (p>.05) [Table 2].

2. Correlation relationships between age and accuracy and response time of attention test

Correlation analysis showed that attentiveness decreased significantly with age (p< .05) [Table 3].

Table 2. Comparison of accuracy and response time of attention test between male and female

Mean±SD		Male (n=89)	Female (n=91)	t	P

Discussion

Cognitive function is closely related to health and aging[14], and attention is an important component of cognitive function. Attention reduction is one of the major clinical manifestations of brain impairments such as stroke, traumatic brain injury, and dementia as well as psychiatric disorders such as schizophrenia and mood disorders[15-16]. Recently, tests using computerized equipment have been developed. We conducted age-specific standardization studies for six attention tests from a computerized neurocognitive function test.

The results showed that there was no difference in attention between males and females. Attention is dominant in the prefrontal cortex of the brain, which is also associated with higher cognitive function[17]. In this study, we found that the older the subject, the longer the response time and the lower the accuracy. In previous research, it has been reported that errors in attention tasks increase with age[14]. Merritt et al. [18] found that there was no difference in gender-specific attention among adults, and our study obtained the same results.

The continuous performance test and the vigilance test are intended to assess sustained attention [19-20]. The trail-making test evaluates working memory, inhibition and interference control, and visiomotor abilities [21]. The stroop test examines executive function [22]. The results of these six attention tests with age-specific standardization through a computerized neurocognitive function test are presented. These reference values can be used as an indicator for distinguishing between what is normal and abnormal for a given age.

In this study, reference values were determined through age-specific standardization, but the following limitations should be considered. Six attention tests were repeatedly done, and this can lead to learning effects in evaluating the reaction rate during the experiment. We randomly performed a sequence of six attention tests to prevent learning effects. In addition, 30 people were recruited for each age group, but the size of the sample was not very large. Another limitation is that the experiment was conducted in a specific region of Korea.

Conclusion

The purpose of this study was to construct standardized data through a computerized neurocognitive function test. No significant difference between attention and sex were found. Correlation analysis showed that attentiveness decreased with age. The accuracy and response time for the six attention test showed that the reference value changed with age. The normative data from the current study may be used to assess the subject's current level of attention. Reference value data for the six attention test sub-domains of the computerized neurocognitive function test may be helpful in distinguishing attention problems in clinical practice.

A Study on the Enhancement of Male Reproduction Function due to Eucommiae Cortex

Sun Young Park[1], **Sang Hyun Ahn**[2]

[1]*Professor, Dept. of Physiology, College of Korean Medicine, Semyung University, Korea,*
[2]*Professor, Dept. of Anatomy, College of Korean Medicine, Semyung University, Korea*

Abstract

Background/Objectives: This study aimed to investigate whether Eucommiae Cortex ameliorated the age-related decline in male reproductive function.

Methods/Statistical analysis: Eucommiae Cortex (EC) extract was prepared by using a rotary evaporator and a freeze dryer. Experimental animals were spreaded into three groups: the control group, the aged group (AE group), and the EC-treated group. Mice in the EC group received a daily administration of 0.51 g/kg in distilled water for 6 months. After 6 months of treatment, histochemical and immunohistochemical analyses were used to examine.

Findings: EC extract increased sperm production, the number, apoptosis of Sertoli cells, differentiation of spermatogonia in the seminiferous tubules. Moreover, EC increased androgen receptor revelation in Sertoli cells and 17β-Hydroxysteroid dehydrogenase(17β-HSD) expression in Leydig cells, and reduced positive staining for 8-hydroxy-2' -deoxyguanosine (8-OHdG) in the seminiferous tubules, caspase-3 in Leydig cells, and histone deacetylase 1(HDAC1) in Sertoli cells.

Improvements/Applications: The results suggested the following actions for EC: enhancement of spermatogenesis; improvement of testosterone production; regulation of oxidative stress. EC appears to ameliorate the age-related decline in male reproductive function.

Keywords: *Eucommiae Cortex(EC), reproductive function, spermatogenesis, testosterone, oxidative stress*

Introduction

Male reproductive functions are controlled by the testes. They are enclosed by the tunica vaginalis, surrounding the outer membrane, and the tunica albuginea, which forms an inner capsule that contains 250–300 lobules. Each lobule consists of four seminiferous tubules in the shape of a coil, in which sperm is made.

The seminiferous tubules consist of an outer wall made of smooth muscle, an inner wall of epithelial cells known as Sertoli cells, and a basal membrane between these walls. In the space between the seminiferous tubules, interstitial cells called Leydig cells are present. Leydig cells indirectly help sperm maturation through the secretion of testosterone, while Sertoli cells provide the sperm with the necessary nutrition and directly regulate sperm growth[1]. Therefore, observation of the morphological changes in the seminiferous tubules, Leydig cells, and Sertoli cells, which make up the testes, is very important for the understanding of male reproductive function.

A representative male sex hormone is testosterone, a steroid hormone that regulates male reproductive function[2]. Testosterone level decreases by 1%–2% each year after 40 years of age, resulting in a variety of symptoms, including sexual dysfunction, reduced bone density, physical symptoms such as cardiorespiratory depression and fatigue, and mental symptoms such as

Corresponding Author:
Sang Hyun Ahn
Professor, Dept. of Anatomy,
College of Korean Medicine, Semyung University,
Korea, Email: dongana@hanmail.net

depression[3-5]. Testosterone is secreted from Leydig cells in the testes, so testicular or male reproductive function can be measured by the reduction of testosterone.

Therefore, to analyze the use of EC on male reproductive function, histochemical and immunohistochemical studies were performed on the testes of 50-week-old mice treated with EC extract, and the results were compared with 50-week-old mice that did not receive the EC extract.

Method

Eucommiae Cortex (EC; 300 g) was lyzed in 2000 mL distilled water and for 2 hours, heated. The extract was enriched ingredient under reduced pressure by using a rotary evaporator (Eyela, Japan), and desiccated by using a freeze dryer. A total of 37.9g(12.6 %) of powder was prepared.

Three groups of mice were used in this experiment: normal (8-week-old male ICR mice) mice (control group); aged mice (AE group), comprising 50-week-old male ICR mice; and EC-treated 50-week-old male mice (EC group). All animal experiments were accomplished in proportion to the protocols approved by Semyung University IACUC (smecae 18-12-04).

The control group received no treatment. The AE and EC groups received daily administrations of 0.5 mL distilled and EC extract (0.51 g/kg body weight) dissolved in water, respectively, for 6 months.

ICR mice were anesthetized with ether, the lower abdomen was excised, and the testes were removed. After the nearby fat was removed, the testicular tissues were removed and locked in NBF(10%) at laboratory temperature. The locked tissues were set up in paraffin by conventional methods and then sliced into 5 μm sections.

Masson's trichrome staining was used to visualize changes in the seminiferous tubules in the testes. First, for 1 hour, the sample was treated with Bouin's solution at 50℃–60℃; subsequently, In 70% ethanol, picric acid was eliminated. The nuclei were stained, for 10 minutes, with Weigert's iron hematoxylin and then treated for 15 minutes, with phosphomolybdic-phosphotungstic acid and Biebrich scarlet-acid fuchsin, successively. For 5 minutes, treated with aniline blue, after that, the sample was made an observation by using an optical microscope.

The testis sections were proteolyzed for 5 minutes in proteinase K and then non-particular binding to the sections was screened by incubation for 2 hours in normal goat serum(10%). The samples were stained in a humidified chamber at 4℃ for 72 hours with the following primary antibodies: mouse anti-BrdU, mouse anti-R, mouse anti-17β-HSD, mouse anti-8-OhdG, mouse anti-caspase-3, and mouse anti-HDAC1. All antibodies were used at 1:100 dilution and sourced from Santa Cruz Biotechnology, USA. The samples were then cultured with the secondary antibody, biotinylated goat anti-mouse IgG (1:100, DAKO, USA), for 24 hours at 37℃, and then stained for 1 hour by using an avidin-biotin complex kit (Vector Lab, USA) at laboratory temperature. The samples were blocked in 0.05 M Tris-HCl buffer (pH 7.4) containing 0.01% HCl and 0.05% 3,3'-diaminobenzidine (DAB). Hematoxylin was applied as a contrast stain.

The TUNEL (terminal deoxynucleotide transferase-mediated dUTP-biotin nick-end labeling) assay was conducted using an in situ apoptosis detection kit (Apoptag, Intergen, USA) to observe apoptotic changes in the testes. The tissue sections were first proteolyzed for 5 minutes by the application of proteinase K and then treated for 20 seconds with equilibration buffer. Then, the sections blocked with working-strength TdT enzyme (TdT enzyme: reaction buffer = 1:2) were treated at 37℃ in a moistened chamber for 1 hour and washed for 10 minutes with a working-strength stop/wash buffer. Then the sections were blocked by culture for 1 hour with anti-digoxigenin-peroxidase and stained with DAB. Methyl green was applied as a contrast stain, and the resulting sections were observed by using optical microscopy.

One-way ANOVA was used to verify significant differences ($p<0.05$). The immunohistochemistry and TUNEL assay results were quantified as the mean ± standard deviation by using Image-Pro Plus image analysis software. The selected area in each section was photographed at ×200 magnification and analyzed for positive pixels/20,000,000 pixels. Immunohistochemical staining was analyzed by using SPSS.

Result

1. Spermatogenesis

1) Sperm and Sertoli cells in seminiferous tubules

In the AE group, spermatogenesis decreased, and the number of Sertoli cells was lower than in the control group. In contrast, spermatogenesis and the number of

Sertoli cells were increased in the EC group compared with the AE group.(figure 1a)

2) Spermatogonia differentiation in the seminiferous tubules

In the AE group, the number BrdU-positive spermatogonia in the basal part of the tubule was 69% lower than in the control group, and 100% upper in the EC group than in the AE group. (figure 1b)

3) Apoptosis of Sertoli cells

In the AE group, the number of apoptotic Sertoli cells in the seminiferous tubules was 1,104%; higher than in the control group, and in the EC group, 27% lower than in the AE group. (figure 1c)

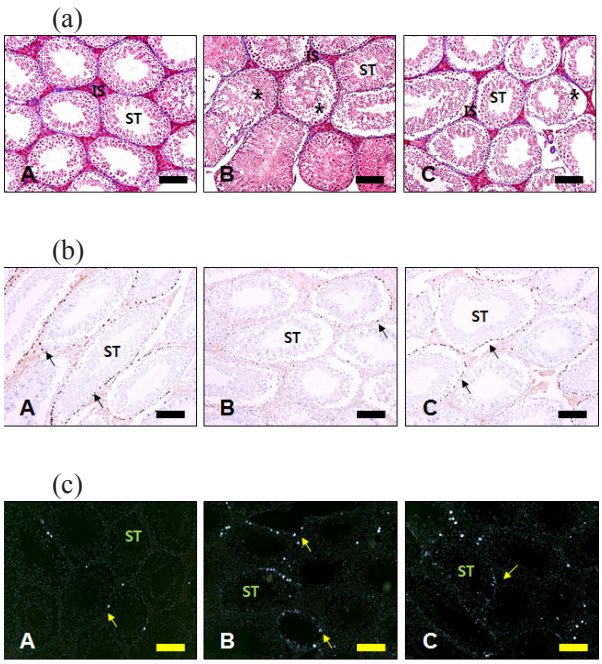

Figure 1. (a) Sperm and Sertoli cells in seminiferous tubules. (b) Differentiation in the spermatogonia in the seminiferous tubules. (c) Apoptosis of Sertoli cells in the seminiferous tubules.

A, Control mice; B, Aged mice; C, Eucommiae Cortex-treated aged mice; ST, seminiferous tubule; IS, interstitial space. Scale bar = 100 µm. The arrows indicate positive reactions; asterisks indicate the atrophied region in the seminiferous tubules.

2. Effect on production of male hormones

1) AR revelation in Sertoli cells

In the AE group, AR-positive reactions in Sertoli cells were 70% lower than in the control group, and in the EC group, were 40% higher than in the AE group. (figure 2a)

2) 17β-HSD expression in Leydig cells

In the testicular Leydig cells from mice in the AE group, 17β-HSD-positive reactions were decreased by 62% compared with the control group, and in the EC group, were 64% higher than in the AE group.(figure 2b)

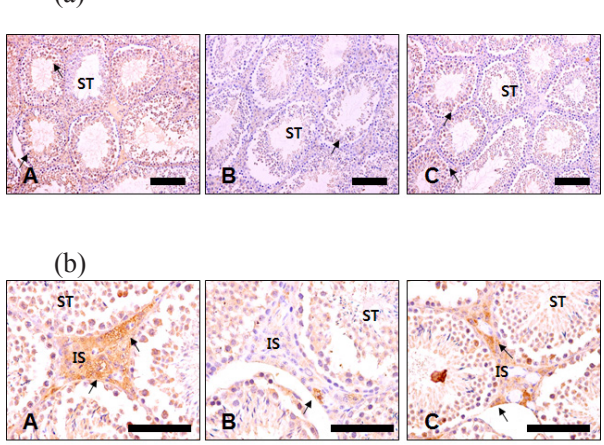

Figure 2. (a) Androgen receptor expression in Sertoli cells. (b) 17β-HSD-positive reactions in Leydig cells. A, Control mice; B, Aged mice; C, Eucommiae Cortex-treated aged mice; ST, seminiferous tubule. The arrows indicate positive reactions. Scale bar =. 100 µm.

3. Modulation of oxidative stress

1) Effect on oxidative stress

In the AE group, the number of 8-OhdG-positive sperm was increased by 557% in the lumen of the seminiferous tubules compared with the control group, and in the EC group, was 36% lower than in the AE group.(figure 3a)

2) Effect of oxidative stress on apoptosis

In the AE group, caspase-3-positive reactions in Leydig cells of the seminiferous tubules were increased by 342% comparison with the control group, and were reduced by 33% in the EC group compared with the AE group.(figure 3b)

3) Effect of oxidative stress on the activity of Sertoli cells

In the AE group, HDAC1-positive reactions were increased by 1,209% comparison with the control group, and were reduced by 33% in the EC group compared with the AE group.(figure 3c)

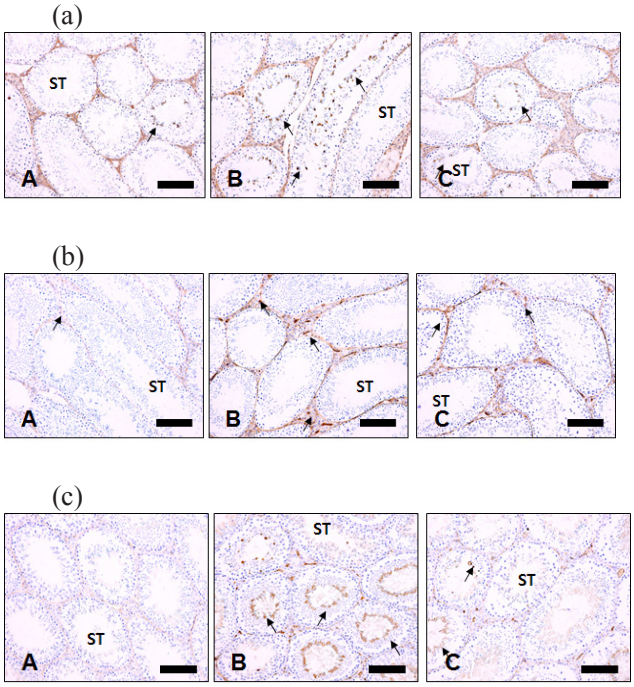

Figure 3. (a) Oxidative stress reactions. (b) Apoptosis due to oxidative stress. (c) Effect of oxidative stress on the activity of Sertoli cells.A, Control mice; B, Aged mice; C, Eucommiae Cortex-treated aged mice; ST, seminiferous tubule. The arrows indicate positive reactions. Scale bar = 100 μm.

Discussion

To investigate the decline in male reproductive function due to aging, experiments were performed on 8-week-old (control) and 50-week-old (aged) male ICR mice. EC, which is reported to exert a relaxation effect on the corpus cavernum, was tested for its ability to ameliorate the decline in male reproductive function. To this end, tests were conducted on the testicles of aged mice that were administered EC over a period of 6 months, and the results were compared with those aged mice that were not administered EC. The analyses included histochemical and immunohistochemical experiments.

First, the sperm, Sertoli cells, and spermatogonia in the seminiferous tubules were observed to determine the effect of EC on sperm production. EC treatment increased spermatogenesis and the differentiation of Sertoli cells and spermatogonia, and decreased apoptosis of Sertoli cells in aged mice.

The increase in spermatogenesis in the seminiferous tubules and the increased division of the spermatogonia indicate that EC increased spermatogenesis; this was confirmed by the enhanced number of Sertoli cells and reduced number of apoptotic Sertoli cells. Overall, EC enhanced spermatogenesis in the testicles, which is normally reduced in old mice.

Testosterone is an important male hormone that is ultimately produced by 17β-HSD from DHEA [6]. Androgen receptors (AR) are necessary to maintain the physiologically active state of testosterone and exert actions on the human body. Thus, the role of testosterone can be defined by the presence and activity level of AR in the human body [7].

The experiments on the effect of EC on testosterone production, which is a key element in male reproductive function and the maintenance of sexual function, revealed that the expression of AR and 17β-HSD was increased by EC treatment in Leydig cells and Sertoli cells, respectively. In other words, testosterone secretion from the Leydig cells increased; subsequently, this hormone enhanced the function of Sertoli cells, which is to induce spermatogenesis. This suggested that EC increased the production and action of testosterone in the testes, thereby ameliorating the loss of male reproductive function due to aging.

8-OHdG is involved in DNA damage to nuclei and mitochondria, an important mechanism of oxidative stress [8-9], and caspase-3 is the first important factor in apoptosis [10]. Histone deacetylase (HDAC) reduces DNA transcription levels in cells [11].

Therefore, to make an observation the uses of EC on oxidative stress on the testes, the presence of these proteins was compared in control, aged, and EC-treated aged mice. EC was found to reduce 8-OHdG-positive reactions in the lumen of seminiferous tubules, caspase-3-positive reactions in Leydig cells, and HDAC1-positive reactions in Sertoli cells. These results confirmed that EC reduced oxidative stress in cells in the seminiferous tubules, reduced apoptosis of the Leydig cells that induce testosterone secretion, and increased the production of Sertoli cells that are involved in spermatogenesis through an increase in DNA transcription. Essentially, EC was shown to ameliorate the age-related decline in male reproductive function by controlling oxidative stress in the testes.

Collectively, EC increased spermatogenesis in the testes by increasing division of spermatozoa, Sertoli cells, and spermatogonia; increased testosterone production and function; and controlled oxidative stress by reducing oxidative stress in the seminiferous tubule and the number of apoptotic Leydig cells; and

increased production of Sertoli cells. Consequently, EC ameliorated the decline in male reproductive function due to aging.

Conclusion

The following results were obtained by using histochemical and immunohistochemical methods to figure out the uses of EC on the age-related decline in male reproductive function:

EC increased spermatogonia and Sertoli cells in the seminiferous tubules. EC increased spermatogonia differentiation, and reduced apoptotic Sertoli cells. EC also increased AR revalation in Sertoli cells and 17β-HSD-positive reactions in Leydig cells. EC reduced 8-OHdG-positive response in the seminiferous tubules, caspase-3-positive response in Leydig cells, HDAC1-positive response in Sertoli cells.

The outcomes of this study present that EC ameliorates the reduction in male reproductive function due to aging by: 1) enhancing spermatogenesis in the testes by increasing the differentiation of sperm cells, Sertoli cells, and spermatogonia in the seminiferous tubules; 2) increasing testosterone production and function; and 3) controlling oxidative stress through a reduction in oxidative stress, apoptotic Leydig cells, and an enhancement in production of Sertoli cells.

Beneficial Effects of Alpiniae Oxyphyllae Fructus (AOF)on Male Reproductive Function

Ho Hyun Kim[1], Sun Young Park[1], Ki Bong Kim[2], Sang Hyun Ahn[3]

[1]Professor, Dept. of Physiology, College of Korean Medicine, Semyung University, Korea, [2]Professor, Dept. of Korean Pediatrics, Hospital of Korean Medicine, Pusan National University, Korea, [3]Professor, Dept. of Anatomy, College of Korean Medicine, Semyung University, Korea

Abstract

Background/Objectives: The object of this study is to establish whether Alpiniae Oxyphyllae Fructus (AOF) will also have an effect on reduced male reproductive function.

Methods/Statistical analysis: The experimental groups comprised of (1) a control group consisting of 8-week-old Institute of Cancer Research(ICR) male mice, and two aging groups consisting of 50-week-old ICR male mice (2) without or with (3) AOF treatment. The AOF group was treated with AOF (0.54 g/kg/day) for 6 months. After 6 months, histochemistry and immunohistochemistry analyses were performed on tissue sections from the testis, and images were analyzed using Image-Pro analysis software.

Findings: AOF increased the distribution of Sertoli cells and spermatids, increased mitochondrial cell division in seminiferous tubules, and decreased the apoptotic cell death of Sertoli cells. Androgen receptor(AR) positive response in Sertoli cells and 17β-Hydroxysteroid dehydrogenase (17β-HSD) positive response, a testosterone-converting enzyme, in Leydig cell, significantly increased in number. In seminiferous tubules, 8-OHdG, caspase-3, and HDAC1 expression decreased.

Improvements/Applications: In this study analyzing the ability of AOF to improve male reproductive function, AOF was able to improve sperm production, increase testosterone production and action, decrease oxidative stress.

Keywords: *Alpiniae Oxyphyllae Fructus (AOF), reproductive function, spermatogenesis, testosterone, oxidative stress*

Introduction

Aging rather refers to a process in which an aging body, regardless of diagnoses of any diseases/illnesses, undergoes an overall decline in physical vigor, as well as deterioration in all physiological functions. As a result, aging-related symptoms include decreased cellular ability to synthesize proteins, compromised immune functioning, lower bone density, declining muscle strength and mass, and decreased sexual and reproductive function [1-3]. Of these, decreased sexual function is marked by erectile dysfunction, a characteristic of male aging, for which extensive research has been conducted to provide effective treatment. Contrastingly, decreased reproductive function in aging males do not manifest in a clear fashion. Therefore, research in this area remains sparse. Although studies have reported the effects of aging on the metabolism of the testes, which act as a major role in male reproductive function, and the secretion of serum testosterone [4-6], as well as on sperm production, serum gonadotropin concentrations, and Leydig cell numbers [7-8], they only confirmed isolated decreases in aging-induced reproductive functioning. The findings thus failed to investigate the underlying mechanisms.

This study speculated that Alpiniae Oxyphyllae Fructus (AOF) can be beneficial for the treatment of aging-induced, decreased male reproductive function, as the effects of this herb have been demonstrated to improve male sexual functioning, and age-related osteoporosis and muscular atrophy [9-10]. The testes were

thus selected as the focal point of this investigation. Experiments were conducted using histochemistry and immunohistochemistry test methods.

Method

Powdered AOF extracts of 17.09 g (17.6%) were generated.

A total of 27 animals were used for the experiments. The animal experiments were approved by the institutional animal care and use committee (IACUC) at Semyung University (smecae 18-12-04) before their implementation

They were divided into 3 test groups, with 9 allocated in each: (1) the control group ("Control Group"); (2) the aging-elicited group (AE Group); and (3) the AOF-administered group (AOF Group). The Control Group comprised of 8-week-old ICR male mice receiving no treatment, while the AE Group and AOF Group consisted of 50-week-old ICR male mice. The AE Group received no treatment except for 10 ml distilled water every day for 180 days. The AOF Group was provided AOF extracts (0.54 g/kg) dissolved in 10 ml distilled water once a day for 180 days

Institute of Cancer Research(ICR) mice were place under anesthesia using ether. An incision was place in the lower abdomen, and the testes were extracted. After removing the fat around the testicle, the testicular tissue was fixed in 10% Neutral Buffered Formalin (NBF) at 37℃ for 24 h. The fixed tissue was paraffin-embedded using the conventional method and serial sections were prepared, each measuring 5 μm in thickness.

Masson's trichrome staining was performed to tent changes in the seminiferous tubules of the testes. The samples were first fastened in Bouin's solution for 1 h at 50-60 ℃. Next, they were subjected to picric acid removal using ethanol(70%). The nucleus was stained with Weigert iron hematoxylin solution for 10 min. The tissue sections were then treated with phosphomolybdic-phosphotungstic acid solutions and Biebrich scarlet-acid Fuchsin reagent for 15 min. This was followed by a 5 min aniline blue treatment before observing the tissue section on an optical microscope (BX50, Olympus, Japan).

The testicular sections were subjected to a 5 min proteolysis reaction with 20 μg/ml proteinase K and cultured with 10% normal goat serum (blocking serum) for 2 h. The sections were placed in a 4℃ humidified chamber after the addition of primary antibodies: 1:100 mouse anti-BrdU (Santa Cruz Biotech), 1:100 mouse anti-AR (Santa Cruz Biotech), 1:100 mouse anti-17β-HSD (Santa Cruz Biotech), 1:100 mouse anti-8-OhdG (Santa Cruz Biotech), 1:100 mouse anti-caspase-3 (Santa Cruz Biotech), and 1:100 mouse anti-HDAC1 (Santa Cruz Biotech), for a total of 3 days. This was followed by incubation with the secondary antibodies: 1:100 biotinylated goat anti-mouse IgG (DAKO), for a 24 h link at room temperature; and the avidin biotin complex kit (Vector Lab) was used at room temperature for an hour-long reaction. The sections were then stained with 0.01% HCl and tris-HCl buffer solutions (0.05 M, pH 7.4) with 0.05% 3,3'-diaminobenzidine (DAB), and counterstained with hematoxylin.

Observation of apoptosis (cell death) inside the testes was conducted using terminal deoxynucleotidyl transferase-mediated dUTP-biotin nick-end labelling (TUNEL) assay using an in-situ apoptosis detection kit (ApopTag, Intergen, USA). First, the tissue sections were subjected to proteolysis for 5 min in proteinase K, and washed, for 20 s, with equilibration buffers. This was followed by treatment with TdT enzyme and cultured in a humidified chamber (37℃) for 1 h, after which the stop/wash buffer, for 10 min, was added. The sections were treated for 1 h with anti-digoxigenin-peroxidase, followed by DAB treatment. Methyl green counterstaining and observation via optical microscopy ensued in succession.

Result

1. Changes in the distribution of sperm and Sertoli cells

In the AOF Group, a significantly larger number of Sertoli cells and sperm distribution was observed compared to that of the AE Group(Figure 1).

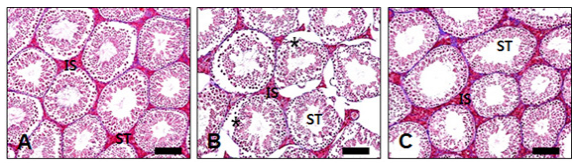

Figure 1.Changes in the distribution of sperm and Sertoli cells. A, Control Group; B, Aging-elicited Group; C, Alpiniae Oxyphyllae Fructus Group. ST, seminiferous tubule; IS, interstitial space; *, atrophied region in seminiferous tubule. Bar size, 100 μm.

2. Changes in spermatogonium cell division

AOF Group indicated a significant (67%) increase in the number of spermatogonium cells that reacted positively to BrdU compared to that of AE Group. (Figure 2)

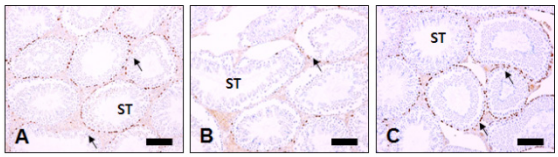

Figure 2. Changes in spermatogonium cell division. A, Control Group; B, Aging-elicited Group; C, Alpiniae Oxyphyllae Fructus Group. ST, seminiferous tubule; arrow, positive reaction. Bar size, 100 µm.

3. Changes in Sertoli cell apoptosis

The AOF Group compared to the AE Group reported a significant (32%) decrease(Figure 3).

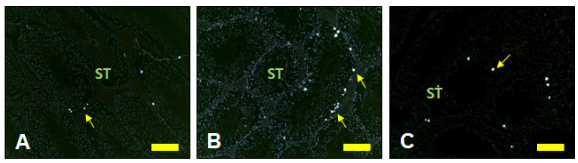

Figure 3. Changes in Sertoli cell apoptosis. A, Control Group; B, Aging-elicited Group; C, Alpiniae Oxyphyllae Fructus Group. ST, seminiferous tubule; arrow, positive reaction. Bar size, 100 µm.

4. Changes in Sertoli cell activation

In the AOF Group, the number increased significantly (39%) relative to the AE Group. (Figure 4)

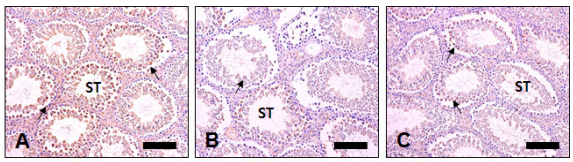

Figure 4. Changes in Sertoli cell activation. A, Control group; B, Aging-elicited group; C, Alpiniae Oxyphyllae Fructus group. ST, seminiferous tubule; arrow, positive reaction. Bar size, 100 µm.

5. Changes in testosterone production in Leydig cells

In AE Group, Leydig (interstitial) cells that were 17β-HSD-positive decreased by 63% when compared to Control Group, whereas the interstitial cells in the AOF Group increased significantly by 62% compared to the AE Group(Figure 5).

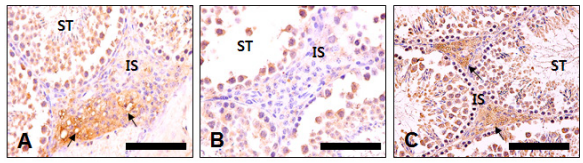

Figure 5. Changes in testosterone production in Leydig cells. A, Control Group; B, Aging-elicited Group; C, Alpiniae Oxyphyllae Fructus Group. ST, seminiferous tubule; IS, interstitial space; arrow, positive reaction. Bar size, 100 µm.

6. Effect of AOF on mediating oxidative stress-induced damage

The AOF Group had a significant (29%) decrease in the number of sperm cells relative to the AE Group(Figure 6a)

7. Apoptosis resulting from oxidative stress

In AE Group, Sertoli cells in the seminiferous tubules that had reacted positively to caspase-3 increased by 330% compared with Control Group, whereas AOF Group showed a significant 29% decrease compared with AE Group(Figure 6b).

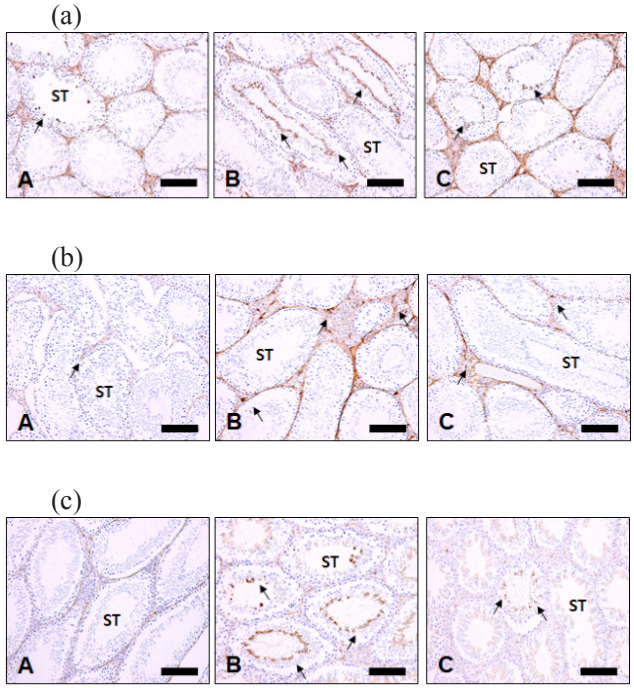

Figure 6. (a) AOF's effects of mediating oxidative stress-induced damage. (b) Apoptosis resulting from oxidative stress. (c) Activation of Sertoli cells in seminiferous tubules as a result of oxidative stress regulation.A, Control Group; B, Aging-elicited Group; C, Alpiniae Oxyphyllae Fructus Group. ST, seminiferous tubule; arrow, positive reaction. Bar size, 100 µm.

8. Activation of Sertoli cells in seminiferous tubules as a result of oxidative stress regulation

Related to the Control Group, Sertoli cells in the AE Group that reacted positively to HDAC1 in the tubules increased by 999%, whereas those in the AOF Group decreased significantly by 32% compared to the AE Group(Figure 6c).

Discussion

This study targeted to examine the effects of AOF on the improvement of lower reproductive function in aging males, and analyzed using histochemical and immunohistochemiscal methods to establish the effect of AOF on production of sperm, male hormone, and regulation of oxidative stress.

The AOF Group, relative to the AE Group, consisted of significantly many Sertoli cells and increased sperm production. In addition, changes in spermatogonium division in the basilar membrane of seminiferous tubules were observed, indicating that the AOF Group had relatively more spermatogonia relative to the AE Group. A TUNEL assay was performed to observe apoptotic cell death of Sertoli cells also revealed that the AOF Group had a significantly decreased number of Sertoli cells died by apoptosis. These findings show that AOF increases spermatogonia division in the seminiferous tubule basement (membrane) and stimulates the production of sperm. AOF also reduces apoptosis of Sertoli cells that provide nutrients for sperm production and increases the number of the cells, thereby improving sperm production previously compromised by the aging processes.

Testosterone is involved in the growth of secondary sexual characteristics and genitalia in males as well as in the production of sperm. Converted from dehydroepiandrosterone (DHEA), produced testosterone requires an enzyme called 17β-HSD in the final stage of the conversion. Completed testosterone in turn requires a receptor, called androgen receptor (AR), to function inside the body [11].

The results showed that AR-positive Sertoli cells had multiplied more in the AOF Group than in the AE Group. Additionally, 17β-HSD antibodies were used to measure any changes occurring in the production of testosterone in Leydig (interstitial) cells. Leydig cells expressing 17β-HSD were observed in larger numbers in the AOF Group than the AE Group. This indicates that AOF increases testosterone production in Leydig cells, and testosterone activates Sertoli cells, thereby improving aging-induced, decreased reproductive function.

The results showed that compared to that of the AE Group, the AOF Group had decreased 8-OHdG positive cells. In terms of oxidative stress-induced apoptosis, Sertoli cells that reacted positively to caspase-3 antibodies in the seminiferous tubules decreased in the AOF Group compared to the AE Group. 8-Hydroxydeoxyguanosine (8-OHdG) is an ROS-converted derivative of a nucleic acid called deoxyguanosine. 8-OHdG is a byproduct of damaged nitrogenous bases (component of DNA), resulting from DNA exposure to ROS and the resulting oxidation [12]. In contrast, caspase-3 is known as the most important factor involved in apoptosis [13]. Therefore, because treatment with AOF decreased 8-OHdG and caspase-3 positive Sertoli cells in the seminiferous tubules, this suggests a role for AOF in oxidative stress reduction generated in the testes.

The next phase of the experiments was to observe oxidative stress regulation. The findings showed that the AOF Group had more HDAC1-positive Sertoli cells than the AE Group. Histone deacetylases (HDAC) are an enzyme group that removes the acetyl group from histone proteins. Once rid of the acetyl group, histone proteins bind to DNA with greater efficiency and draw it to their surface, thus inhibiting the expression of genes in the DNA at that binding site [14]. Therefore, the decreased number of HDAC1-positive Sertoli cells suggests that an AOF-enabled reduction of gene damage from oxidative stress increased the activation of Sertoli cells in the seminiferous tubules.

In summary, AOF improved aging-induced lower male reproductive function by: increasing spermatogonium division in the seminiferous tubule basement (membrane); and decreasing the apoptotic cell death of Sertoli cells and increasing their quantity, thereby stimulating sperm production that was previously compromised by aging processes. AOF also activated Sertoli cells by elevating testosterone production and increasing AR in Leydig cells, reduced oxidative stress in the testes, and decreased oxidative stress-induced gene damage, thus increasing Sertoli cell activation in the seminiferous tubules.

Conclusion

This study targeted to examine the effects of AOF

on the improvement of male reproductive function that are compromised by aging. Our study revealed the following: AOF increased the distribution of Sertoli cells, sperm production, and spermatogonium division in the seminiferous tubule basement (membrane), decreased the apoptosis of Sertoli cells. AOF increased AR positive, 17β-HSD in Leydig cells. AOF decreased 8-OHdG positive cells, caspase-3 positive cells, HDAC1 positive cells.

The Relationship between Resilience and Self-Identity: A Latent Growth Model

Kyoung Eun Kim[1], **Jung-Hyun Choi**[2]

[1]*Dept.of Child welfare, Namseoul University, South Korea,* [2]*Research Associate, Dept. of Nursing, Namseoul University, South Korea*

Abstract

Background/Objectives: Thisstudy utilizes longitudinal data from the KCYPS to examine the relationship between resilience and self-identity in the transition period from elementary school to secondary school.

Methods/Statistical analysis: Participants were 2,002 children. The hypothesized model was examined by structural equation modeling (SEM).

Findings: The results showed that the intercept and the slope of children's resilience will affect positive self- identity fit the observed data well ($\chi^2_{df=30}$= 537.10, p= 0.00, TLI= 0.95, CFI= 0.97, RMSEA= 0.08). Children's resilience in 4th grade subsequently affected the formation of children's self-identity.; there was a significant individual variation in these changes over time.

Improvements/Applications: These results indicate the effect children's resilience may have on their self-identity over time and offer evidence-based practice guidelines for setting self-identity. In this study, however, environmental factors (e.g. Family's and teachers' support) affecting self-resilience and self-identity were not taken into account. Therefore, multiple approaches to identify the developmental trajectories of self-resilience and self-identity would be needed.

Keywords: *Resilience, Self-identity, Latent growth model, Children,Adolescents, KCYPS*

Introduction

In the transition from childhood to adolescence, children are in the conflict between identity formation and role confusion and try to resolve it. They become interested in 'who I am' and 'who I am meant to be; they are in confusion as they were neither a child nor an adult. They get to form a sense of self-identity in this process. A researcher suggested the formation of self-identity as a developmental task in adolescence [1]. Adolescents with a higher sense of identity are not only motivated and confident, but also less likely to be depressive. Conversely, adolescents with a lower sense of identity are more likely to be helpless, confused, and disoriented; They cannot set a purpose in life, and they even fail to launch and subsequently are likely to remain in their parents' homes into early adulthood. Self-identity is 'the self as reflexively understood by the person in terms of her or his biography'[2]. The cores in the formation of self-identity is awareness and mindfulness about one's values, beliefs and prejudices. The process of discovering, challenging and reconstructing the self has been often so confusing and awful that children could get lower self-esteem. If they could manage and get over the problem in forming self-identity, however, they could achieve personal well-being. Self-identity is reported to be not only related to current life satisfaction [3], social development [4], but also closely[8] related to subsequent development [2-3]. Therefore, it is necessary to look at how the self-identity in adolescence relates to the psychological characteristics in childhood. Children who are confused by the formation of self-identity are often less conscious of self and in lower self-esteem and find it difficult to overcome the adversity [4].

Research and policy concerning ego-resilience have increased rapidly during the last decade [5]. Researchers commonly defined resilience as 'the individual's adaptive response to adversity', stress-resistant personality traits' and 'the ability to bounce back'[6]. Therefore, the key of ego-resilience is that people have the ability to react and adjust themselves positively to their circumstances when something goes wrong [7]; ego-resilience was considered as a process that occurred often due to childhood adversity but also from the protective factors of a family [8]. It was also argued that ego-resilience is not something we have, but something we make [7]. The studies also explored the normative assumption of ego-resilience as 'found', 'made', 'unfinished'[5].

Ego-resilience has been considered as an individualized, integrated valuable asset to promotewellbeing and self-identity [8-9]. Ego-resilience showed a statistically significant difference in peer relationship and support, self - identity, and cultural acceptance [10]. Children with high ego-resilience are relatively stable trajectories of continuous healthy adjustment following [1,3]. Children with ego-resilience are likely to have various life skills and knowledge gained from previous stressor as well as their increased ability to control negative emotion [2]. Some studies described resilience as an innate self-righting mechanism and showed a relationship with self-identity [11].

Despite the growing body of literature focusing on the relationship between ego-resilience and self-identity, this work has been limited to cross-sectional studies. Therefore, this study examined the longitudinal relationship between ego-resilience and self-identity

Hypothesis 1: There is a change in child's ego-resilience over time. And there is within-person variability in an individual's level of ego-resilience.

Hypothesis 2: Change in child's ego-resilience is positively related to changes in self-identity.

Materials and Method

Toanalyze the longitudinal relationship between children's resilience and self-identity, a longitudinal research design was used.

This is a longitudinal study designed to examine the developmental changes of children's resilience and self-identity in Korea. Participants were 2,002children who were 1039 males (51.9%) and 963 females (48.1%). Participants ranged in age from 12- to 14-years old (M = 12.98; SD = 0.17) in the 7thgrade. Participants were surveyed from the 7th grade through the 4th and the 6thgrade respectively, which belonged to the 1st elementary school cohort panel of the Korean Children and Youth Panel Survey (KCYPS). This study used the data collected by the KCYPS from 2013 through 2016. To be included in this study, children should have all information at 3-time points: the 4th grade; the6thgrade; the 7thgrade.

Tomeasure children's resilience, Self–Resilience Scale was used [12]. Self–Resilience Scale was originally developed by Block andKremen [13], however, it was translated and revised by Yoo and Shim [12]. It was composed of 14 items asking about the degree of self-resilience (e.g., "I am a very energetic person.") The items were based on a 4 point Likert scale. Self-resilience was reverse coded. A higher score meant a higher level of self-resilience. The Cronbach's α in the 4th, the 6th, and the7thgrade was 0.90, 0.89, .089 each.

Children's self-identity was measured bySelf–Identity Scale which was developed in a previous study [14]. It was composed of 8 items asking about the degree of self-identity (e.g., "I have a clear goal of life.") The items were based on a 4 point Likert scale. Self-identity was reverse coded. A higher score meant a higher level of self-identity. The Cronbach's α in the 6th, and the7th grade was 0.64, 0.67 each.

This study used LGM to model developmental changein self-resilience and self-identity among children.Contrast with traditional methods, LGM has advantages for setting dynamic models with assessing developmentalchange [15]. The LGM could assess both the nature of the mean-level changes across the measurement points and the individual variation in the initial level. In this study, the initial mean level andthe linear change of self-resilience scores were estimated. In Model 1, the Latent Growth Model (LGM) was initially defined considering only three measurement time points. Then, to analyze the association of self-identity, a conditional model was compared with an unconditional model.The parameters of the LGM models were estimated utilizing maximum-likelihood. Goodness-of-fit was evaluated using the $\chi 2$ statistics as well as the following descriptive indices: Comparative Fit Index (CFI) and Root Mean Square Error of Approximation [16].The collected data were analyzed with PSAW 18.0 and AMOS statistical program.

Results

1. General characteristics

Thecharacteristics of the participants in the 4th, 6th, and7th gradeare shown in [Table 1]. Of the participants, 51.9% were boys and 48.1% were girls in the 7th grade. Children were 9-11 years old (*M* = 9.97; *SD* = 0.21) in the 4th grade and they were12- to 14-years old (*M* = 12.98; *SD* = 0.17) in the 7thgrade.

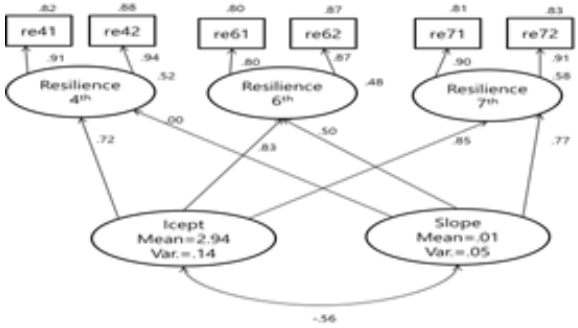

Figure 1. Unconditional linear model: resilience

Table 1.General Characteristics (N=2,002)

Variable	4th			6th			7th		
	Min	**Max**	**Mean±SD**	**Min**	**Max**	**Mean±SD**	**Min**	**Max**	**Mean±SD**
Height	120	166	141.35±6.67	130	178	155.25±7.21	135	182	161.06±7.25
Weight	20	74	36.17±7.46	25	95	46.52±9.48	25	100	51.22±10.35
Subjective health status	1	4	3.40±0.55	1	4	3.39±0.56	1	4	3.32±0.56

2. Correlation between resilience and self-identity

There was a statistically significant correlation between resilience in the 4th, 6th, and 7th grade and self- identity in the 6th and 7th grade (see Table 2).

Figure 2. Conditional linear model (hypothesized latent growth model)

Table 2. Correlation between resilience and self- identity

	Resilience 6th	Resilience 7th	Self-identity 6th	Self-identity 7th
Resilience 4th	0.36**	0.27**	0.30**	0.25**
Resilience 6th	1	0.46**	0.52**	0.32**
Resilience 7th		1	0.35**	0.50**
Self-identity 6th			1	0.48**

** p <.01

3.Interrelation between resilience and self-identity growth model

A latent growth model was estimated for the three measures of resilience, and unconditional linear model (see Figure 1) was shown in [Table 3].

Table 3. Fit-index of model

Model	χ2	p	df	TLI	CFI	RMSEA
NoChange model	209.4	0.00	13	0.96	0.98	0.09
Unconditional linear model	178.11	0.00	10	0.96	0.98	0.09
Conditional linear model	537.10	0.00	30	0.95	0.97	0.08

The research model (see Figure 2, [Table 4]) assuming that the intercept and the slope of children's resilience will affect positive self- identity fit the observed data well ($\chi^2_{df=30}$= 537.10, p=0.00, TLI=0.95, CFI=0.97, RMSEA=0.08). This result shows that the longitudinal relationship between children's resilience and self-identity and there was a significant individual variation in these developmental trajectories.

Table 4. Parameter estimates of the hypothesized latent growth model

path			β	b	S.E.	C.R.
icept	→	6th self-identity	0.88***	0.83	0.04	17.26

6th self-identity	→	7th self-identity	0.43*	0.46	0.14	3.19
icept	→	7th self-identity	0.34*	0.34	0.15	2.21
slope	→	7th self-identity	0.60***	1.17	0.25	4.70

Discussion

The longitudinal relationship between children's resilience and self-identitywasinvestigated in this study. First, thefinding showed that the average growth trajectory for self-resilience revealed significant levels in the 4th grade. The estimate of the slope was not significantly different from zero. This indicated that the children's resilience average slope was not constant. Previous studies concerning the developmental trajectory of self-resilience was mostly conducted on people who experienced trauma or external stress [17-18]. The studies reported that resilience as an adaptive response to adversity was manifested in three different ways: recovery, sustainability, and growth [19].Recovery indicated that people couldmakeanyadjustments and go back to their pre-stress level of functioning; Sustainabilityindicated that people couldendure and continue forward without stressor. Growth indicated that people could get additional gains and advancement after getting over the adversity [19-20]. The reasons

that the rate of increase or decrease in children's self-resilience was not constantin this study, possibly due to the uncontrolled experience of children's previous events. Another reason was that the concept of resilience was varied; The definition of self-resilience in this study focused on how well children could get over difficulties in actual everyday life rather than a great difficulty and traumas to overcome. The term 'resilience'in the past several decades focused on chronic adversity [21], was recently broadened to encompass positive adaptation and adjustmentlabeled minimal-impact resilience [22]. The further researches concerning the developmental trajectory of children with minimal-impact resilience, in this regard, was continuously conducted.

However, the examination of the variance components of the latent factors revealed that intercept latent factors showed a significant individual differences in 4th grade; this result indicated that there were significant individual difference in self–resilience. As a child's self-resilience has a significant effect on the children's emotional and social competence [4,23], active efforts of significant others (e.g. Parents, teachers, and peers, so on) will be needed to enhance their self-resilience. Second, both the initial level and the slope of children's self-resilience influenced positively on children's self-identity. These results are consistentwith the previous studies that children with high resilience are relatively stable trajectories of continuous healthy adjustment following [1,3].These results suggested that children with resilience were likely to continue to form a positive self -identity, and positive self-identity also tended to encourage continued resilience.Self-identity refers 'who I am', 'What I can do', which is an important developmental task in adolescence [1]. Given that self-identity, which is formed from middle childhood through adolescence, is also closely related to later healthy development and adaptation, the self-resilience of childhood is of greater importance. Taken together, these results confirmed children's resilience couldeffect on their self-identity over time and offer evidence-based practice guidelines for setting self-identity. In this study, however, environmental factors (e.g.Families and teachers' support) affecting self-resilience and self-identity were not taken into account. Therefore, multiple approaches to identify the developmental trajectories of self-resilience and self-identity would be needed.

Conclusion

This studyutilizes longitudinal data from the KCYPS to examine the relationship between resilience and self-identity in the transition period from elementary school to secondary school. Participants were 2,002 children. The hypothesized model was examined by structural equation modeling (SEM). The results showed that the intercept and the slope of children's resilience will affect positive self- identity fit the observed data well ($\chi^2_{df=30}$= 537.10, p=0.00, TLI=0.95, CFI=0.97, RMSEA=0.08). This result shows that the longitudinal relationship between children's resilience and self-identity and there was a significant individual variation in these developmental trajectories. These foundings highlights the children's resilience may effect on their self-identity over time and offer evidence-based practical guidelines for setting self-identity. In this study, however, environmental factors (e.g. Family's and teachers' support) affecting self-resilience and self-identity were not taken into account. Therefore, multiple approaches to identify the developmental trajectories of self-resilience and self-identity would be needed.

A Comparison of Angle of Active Knee Extension During Various Modified Contract–Relax PNF Technique : A Cross-Over Study

Jong-Hoon Moon[1], Sung-Jin Heo[2], Jin-Hwa Jung[3]

[1]Department of Healthcare and Public Health Research, National Rehabilitation Research Institute, National Rehabilitation Center, Republic of Korea, [2]Department of Rehabilitation Medicine, Pusan National University School of Medicine, Research Institute for Convergence of Biomedical Science and Technology, Republic of Korea, [3]Department of Occupational Therapy, Semyung University, Republic of Korea

Abstract

Background/Objectives: The aim of this study was to determine the effect of various modified contract-relax PNF techniques on the immediate change of angle of active knee extension (AKE).

Methods/Statistical analysis: Thirty healthy adults participated in this study. Before intervention, all subjects measured the AKE angle. After the measurements, the subjects received a randomized order of traditional contract-relaxation (TCR), modified contract-relax 1 (MCR 1), and modified contract-relax 2 (MCR 2) at day intervals. TCR contracted right knee flexors, MCR 1 contracted left biceps, and MCR 2 co-contracted right knee flexors and contraction of left biceps. Measurements of AKE angle were evaluated immediately after three techniques trial.

Findings: Three contract-relax PNF techniques showed significant improvement compared to AKE angle of baseline. There was no significant difference between MCR 2 and MCR 1, but there was a significant difference from TCR in AKE angle. MCR 1 showed no significant difference from TCR in AKE angle.

Improvements/Applications: These findings demonstrate that contract-relax PNF techniques can have a greater immediate effect as the concentration of muscle co-contraction.

Keywords: *PNF, Contract-Relax, Active Knee Extension, Stretching*

Introduction

Among Proprioceptive neuromuscular facilitation PNF stretching techniques, the contract-relax (CR) technique, the antagonist-contract (AC) technique using antagonistic muscle contraction, and contract relax-antagonist contract (CRAC) technique, the combination of the above two techniques, are widely used, and their positive effects have been reported [1-2].

The contract-relax stretching technique is one of methods performed most frequently among PNF stretching techniques [3]. To perform the contract-relax technique, the joint of the target muscle is lengthened to its end range, and the subject contracts the target muscle isometrically against the therapist's resistance[4-5].

Another opinion about the effects of contract-relax technique is that when the spontaneous contraction of the target muscle occurs just before muscle stretching, it generally reduces the reflex components of muscle contraction, facilitates relaxation, and increases the length of muscle, thereby increasing range of motion [6]. Some researchers, however, don't agree about this PNF stretching technique mechanism [4-10].

Magnusson et al. [11] reported that in comparison between the contract-relax technique and the static stretching, passive torque and the maximum joint angle

Corresponding Author:
Jin-Hwa Jung
Department of Occupational Therapy,
Semyung University, Republic of Korea
Email: otsalt@nate.com

were greater, without difference in sEMG activity, in the group of contraction-relax technique. Mitchell et al. [7] showed that change in perception about stretching performed after the contract-relax technique occurred; however, a mechanism through which the PNF stretching technique changes perception about muscle stretching has not been known.

The hamstring is a muscle that engages in the extension of the hip joint during the stance phase and works in controlling the speed reduction of tibia during the swing phase [12]. The hamstring injury occurs most frequently among sports injuries, and stretching exercise is a method recommended for preventing such injuries [13-14]. Although some questions have been raised about the preventive effects of stretching techniques [15], the flexibility of hamstrings is considered clinically important as a condition necessary for the rehabilitation, body shape management, and muscle force maintenance of osteoarthritis patients [15-17].

Recently, a small number of studies that found the effects of muscle contraction unrelated to hamstrings by appling the contract-relax technique (modified contract-relax technique) were reported [8-9]. Azeveo et al. [8] reported that the contract-relax technique, which conducted the isometrical contraction of the left biceps brachii, (modified contract-relax technique) and the traditional contract-relax technique significantly improved the angle of active knee extension of the right side; however, there was no significant difference between the two techniques. Recently, Moon [9] distinguished the modified contract-relax technique from the traditional contract-relax technique by subdivided the modified contract-relax technique further. He made classification into techniques performing isometric contraction to the right and left biceps brachii and the right and left finger flexors, and reported that the contract-relax technique performing contraction to the left biceps brachii (modified contract-relax technique) showed a two times higher rate of improvement in the angle of active knee extension of the right side than the traditional contract-relax technique. It is thought that the results of the two studies disagreed with each other because muscles not targeted in the modified contract-relax technique were different.

Therefore, this study aims to find out what effects various modified contract-relax techniques can have on the immediate change in the angle of active knee extension.

Method

Healthy 30 adults participated in this study. The criteria for subject selection were those whose dominant side was the right, who had no orthopedic history of low back disease, neurological disorder, and rheumatism [8], and those whose angle of active knee extension was greater than 15 degrees with the right hip joint bent at a 90-degree angle [18]. And those who experienced hamstring injury within one year from the experiment or did exercise related to hamstrings periodically were excluded [19]. All the subjects who participated in the study were educated so that they might understand the experiment procedure fully, and the research was performed after their informed consent was obtained. As for the gender of the subjects, 18 males were 18, and females were 12. The subjects were 26.27±4.08 in age, 169.60±7.17cm in height, and 63.50±11.36kg in weight. Their body mass index was 21.94±2.64kg/m^2 [Table 1].

Table 1. General characteristics of the subjects

		Participants(n=30)
Sex, n (%)	Male	20 (66.7)
	Female	10(33.3)
Age (year)a		26.27±4.08
Height (cm)a		169.60±7.17
Weight (kg)a		63.50±11.36
Body mass index(kg/m2)a		21.94±2.64

Footnotes. amean±SD.

A digital goniometer was used to measure the extension degree of the right knee joint. As for the measuring methods, after the subject assumed the supine position, the anterior superior iliac spines (ASISs) of both sides and the left femur were fastened with a belt. After then, the subject was asked to bend the hip joint at a 90-degree angle, and the movement of the femur was restricted by using strong board and bar so that it might be fixed as far as possible. In this posture, the angles of active knee extension for all the subjects were measured. The measurement of angle was conducted by an inspector who did not know the purpose of this study. The inspector measured the angles after marking the subjects' tibiae. The measurement was conducted three times, and mean values were used as statistical data. The previous study reported angle measurement at ICC = 0.96 for intra-rater reliability [19].

All the 30 subjects who participated in this study were subjected to experiments at the same space. The researcher did not disclose specific effects of each therapy technique to any of the subjects. Prior to the application of various contract-relax techniques, all the subjects' baseline active knee extension angles were measured.

After baseline measurement, the subjects underwent the traditional contract-relax technique, the modified contract-relax technique 1, and the modified contract-relax technique 2 in random order at an interval of one day. The above performance was repeated three times in total. Therefore, the time spent for the contract-relax technique was made to be 30 seconds. This performance time is similar to previous studies [8-9].

The modified contract-relax technique 1 and the modified contract-relax technique 2 were performed basically in a similar way as the basic procedure of the traditional contract-relax technique; however, the number of their target muscles was made different. As for the modified contract-relax technique 1, the subject in a supine position was instructed to spread the left shoulder joint at a 45-degree angle and bend the elbow joint at a 90-degree angle, and then was made to perform the maximal isometric contraction of the left biceps brachii for six seconds. Then, the subject was instructed to relax for four seconds. The time for the performance of the modified contract-relax technique 1 was also made to be 30 seconds [8].

As for the modified contract-relax technique 2, two inspectors performed it together so that the right knee flexor and the left biceps brachi might be contracted simultaneously in the same was as the above. The angle of active ankle extension was measured by using the three techniques, and was assessed immediately.

All the data collected were analyzed, using SPSS 22.Comparison of active knee extension angles among various contract-relax techniques were made, using the repeated measure ANOVA. Post-hoc test was conducted, using the Bonferroni method. The statistical significance level was set to 0.05.

Result and Discussion

1. Angle of active knee extension in various contract–relax technique

As a result of research, significant differences in the angle of active knee extension were found according to various contract-relax techniques (F=37.946, p<0.05) [Table 2]

Table 2.Angle of active knee extension in various contract–relax technique (N=30)

	Baseline	TCR	MCR1	MCR2	F	P
	Mean±SD	Mean±SD	Mean±SD	Mean±SD		
AKE (˚)	35.52 ± 8.08	28.82 ± 6.40	26.38 ± 6.10	24.96 ± 5.43	37.946	<0.001***

Footnotes. *:p<0.05, **:p<0.01, ***:p<0.001, AKE:Active knee extension angle, TCR: Traditional contract-relax, MCR1: Contract-relax with maximal isometric contraction of left biceps brachi, MCR2: Contract-relax with maximal isometric co-contraction of left biceps brachi and wrist flexors.

2.Post-hoc test of active knee extension angle in various contract–relax technique

In the post-hoc test, the angle of active knee extension before intervention showed significant changes, compared with the traditional contract-relax technique, the modified contract-relax technique 1, and the modified contract-relax technique 2. That is, the three techniques showed significant improvement in the angle of active knee extension, compared with before intervention (p<0.05). The traditional contract-relax technique showed no significant difference in the angle of active knee extension from the modified contract-relax technique 1 (p>0.05), but showed significant difference in it from the modified contract-relax technique 2 (p<0.05). That is, the modified contract-relax technique 2 showed significantly great improvement, compared with the traditional contract-relax technique (p>0.05). The modified contract-relax technique 1 and the modified contract-relax technique 2 showed no significant difference in the angle of active knee extension (p>0.05) [Table 3].

Footnotes. *: $p<0.05$, **: $p<0.01$, ***: $p<0.001$, AKE: Active knee extension angle, TCR: Traditional contract-relax, MCR1: Contract-relax with maximal isometric contraction of left biceps brachi, MCR2: Contract-relax with maximal isometric co-contraction of left biceps brachi and wrist flexors.

Discussion

The specific results and discussion of this study have been suggested in three large categories.

First, in this study, the traditional contract-relax technique showed significant improvement in the angle of active knee extension, compared with that measured at baseline. This result agrees with findings of previous studies[20]. Azevedo et al. [8] also revealed that the traditional contract-relax technique showed improvement by seven degrees more than the non-treatment control group. In our study as well, the traditional contract-relax technique showed improvement greater by 6.7 degrees than the baseline value, and thus an amount of change similar to the previous study could be identified.

Second, there was no significant difference between the traditional contract-relax technique and the modified contract-relax technique 1. This is a similar result to that of Azevedo et al. [8]. Youdas et al. [21] reported that the flexibility of hamstrings decreased more among males than females. Therefore, the differences in the angle of active knee extension found in the three studies may be ascribed to the differences in their subjects' gender.

Third, the modified contract-relax technique 2 showed no significant difference in the angle of active knee extension from the technique 1, but significantly improved the angle of active knee extension compared with the traditional contract-relax technique. Therefore, given that there was no significant difference between the technique 1 and the traditional contract-relax technique, it may be deemed that the technique 2 created a little greater effects than the technique 1. Rosenstiel and Keefe [22] stated that emotions and sensory response caused by pain could be aroused by another specific event. That is, they described that the method of distracting attention by pain-coping strategies might be recommended. Jensen et al. [23] also suggested several methods of distracting attention in order to change the chronic pain patient's degree of pain perception and self-efficacy.

The duration of the stretching technique performed by this study was set to 30 seconds, drawing upon Feland et al. [24] dealing with previous PNF stretching techniques. According to systematic review in Decoster et al. [25], they report that the most efficient stretching duration of repetition and sustaining for the immediate effect of stretching is 30 seconds.

The limitations of this study are as follows: First, the small number of subjects makes generalization difficult. Second, muscles subjected to maximal isometric contraction are knee flexor and biceps trachii, and results on the two muscles only can be obtained. Third, experiments were conducted with healthy adults, and the immediate effects of stretching techniques were identified.

Conclusion

The findings of this study suggest that the flexibility of hamstrings can increase according as the degree of simultaneous muscle contraction increases.

Abstract

Background/Objectives: The aim of this preliminary study was investigated the effect of repetitive arm cycling exercise on upper extremity function and satisfaction in patients with acute stroke.

Methods/Statistical analysis: Twenty patients with stroke were participated in present study. All subjects randomly assigned to two groups either the experimental group (n=10) or control group (n=10). The both group conducted the exercise during 30 min/day, three a week, for four weeks. The outcome measures were the FMA (Fugl-Meyer Assessment), MMT (Manual Muscles Test) of shoulder, elbow, wrist joint, and VASS (Visual Analog Satisfaction Scale) was evaluated exercise satisfaction of subjects after intervention.

Findings: Two groups showed a significant improvements in FMA, strength of shoulder, elbow, wrist after intervention ($p<.05$). In comparison of change score between both group, experimental group was significantly improved than control group in strength of elbow ($p<.05$). The satisfaction of experimental group was significant higher than control group ($p<.05$).

Improvements/Applications: We suggest that repetitive arm cycling exercise can have positive effects of the improvements of upper extremity strength and satisfaction than self-exercise in patients with acute stroke.

Keywords: *Cycling, Exercise, Stroke, Upper Limb, Arm*

Introduction

Post-stroke diverse symptoms cause reduction in social participation and quality of life among guardians as well as patients [1-2]. Particularly, the weakened function of upper extremity among physical dysfunctions has bad effects on self-help functions that are essential in daily life [3]. The post-stroke recovery of upper extremity is slower than lower limb, and thus the period of starting the rehabilitation of upper extremity should be recommended earlier than other bodily regions [4].

otsalt@nate.com

As for effective interventions that improve upper extremity function, mirror therapy [5], task oriented training [6], biofeedback [7], motor imagery training) [8], non-paretic upper extremity constraint-induced movement therapy [9], and functional electrical stimulation [10] have been introduced. The above interventions, however, can take great effects only when a therapist trains a patient one-on-one [11].

To facilitate post-stroke recovery, patients come to perform self-exercise in addition to the existing rehabilitation therapy in various environments such as a ward [12-14]. In the area of rehabilitation, studies on improving the physical function of stroke patients by introducing robots have been reported continuously [15-18].

Recently, Park et al. [19] compared effects on patients with stroke between task-oriented training and upper extremity cycling exercise using RECK MOTOmed viva2, which were conducted for three weeks in addition to universal rehabilitation therapy. However, 30% of the subjects included in this study were patients with subacute or chronic stroke, and thus effects on patients with acute stroke could not be identified. Therefore, this pilot study aims to find out the effects of upper extremity cycling repetitive exercise on the upper extremity function and satisfaction of acute stroke patients.

Method

This study was carried out with 20 stroke patients who received occupational therapy at a general hospital. Criteria for the selection of research subjects were as follows: first, one who was diagnosed with stroke by a specialist, second, one whose stroke occurred within one month, third, one who obtained a score of 21 points or more from the Korea mini-mental status examination and can follow instructions of stage 3 or above, fourth, one whose manual muscle test of the paretic shoulder shows the result of fair or below, and fifth, one who can sit down unaided. Criteria for exclusion were as follows: first, one who has serious contracture on both upper extremities, second, one who has a visual problem such as hemispatial neglect or anopia, and third, one who has apraxia. The researcher fully explained the subjects about this study, and carried out experiments after obtaining their informed consent.

We carried out the Fugl-Meyer assessment in order to identify the upper extremity function of the subjects [20-21], and performed the manual muscle test of shoulder joint, elbow joint, and wrist joint in order to check the muscle force of their upper extremities [22]. After intervention, the visual analog satisfaction scale was used to measure satisfaction with exercise among the experimental group and the control group [23].

The two groups were given the same universal rehabilitation therapy according to a treatment schedule for four weeks. The two groups performed exercise additionally in the same way for 30 minutes a day, three times a week, for four weeks. The experimental group carried out active exercise, active assistive exercise, and passive upper extremity cycling exercise, while the control group performed self-exercise using books. As for the self-exercise performed by the control group, a program was created and applied on the basis of previous studies [24-25]. An occupational therapist in charge conducted the education of the control group about self-exercise, and encouraged and supervised them so that they might do self-exercise three times a week.

The upper extremity cycling repetitive exercise carried out in this study was performed with a portable electric upper limbs exercise machine (Q Health PUL, Cybermedic, Korea). This exercise machine was designed so that a patient in a ward or a treatment room could to passive or active exercise for the recovery of upper extremity or motor function. The portable electric upper extremity exercise machine is easily carried like its name suggests, and is divided into the handle-type one and the millstone-type one. As for the handle-type one, cycling exercise appears vertically to the ground, while as for the millstone-type one, cycling exercise appear at a level with the ground. In this electric upper extremity exercise machine, it is possible to set speed, resistance, time, and direction, and after the completion of exercise, speed, resistance, distance, exercise time, and exercise amount are displayed. The speed of pedal rotation may be adjusted between 1 rpm and 60 rpm, and ergo resistance exercise is available in 20 steps. Further, its design allows functional electrical stimulation and biofeedback training using application. This study did not apply the functional electrical stimulation and the biofeedback training, in order to identify only the effects of electric upper extremity exercise machine.

Collected data was analyzed with SPSS 22. For the two groups, general characteristics, upper extremity muscular strength and the Fugl-Meyer assessment before intervention were confirmed by the Mann-Whitney U test and the chi-squared test. The Fugl-Meyer assessment of the experimental group and the control group before and after intervention and the changes of upper extremity muscular strength were analyzed with the Wilcoxon signed-rank test. The statistical significance level of this study was set to .05.

Result and Discussion

1. General characteristics

Before intervention, there was no significant difference between the two groups in the general characteristics of subjects, the Fugl-Meyer assessment, and the muscular strength of shoulder, elbow and wrist ($p>.05$) [Table 1] [Table 2].

3. Comparison of change values of upper limb function between two groups

In the comparison of changes in upper extremity function between the two groups, the experimental group showed greater improvement in elbow muscular strength than the control group (p<.05). In other dependent variables, there was no significant difference between the two groups (p>.05) [Table 4].

4. Comparison of satisfaction of exercise between two groups after intervention

The post-intervention comparison of satisfaction with exercise between the two groups showed significantly higher satisfaction among the experimental group than the control group (p<.05) [Table 5].

Discussion

As a result, both experimental group and control group showed significant improvement in upper extremity functions including upper extremity muscular force at all assessments. This is deemed to be attributed to the fact that the subjects consisted of patients with acute stroke that occurred within one month. Park et al. [19], where approximately 70% of subject stroke patients were at acute stage, also showed significant improvement in both groups between before and after 3-week intervention. The

Findings are similar to those of this study. Nakayama et al. [26] reported that 80% of post-stroke upper extremity recovery occurs within three weeks after outbreak, and 95% within three months. Given that the average outbreak period of patients who participated in this study was 10.05 days, it is judged that relatively much neurological recovery appeared.

In the comparison of changes between the two groups, the upper extremity cycling repetitive exercise showed significantly higher improvement in the muscular force of elbow joint as well as satisfaction with exercise than self-exercise. That is, it was found that the additional upper extremity cycling repetitive exercise for 4 weeks, three times a week, 30 minutes a day can lend positive assistance to the improvement in muscular force than in functional improvement, and give more user satisfaction, compared with self-exercise.

The results showed difference only in muscular strength. These findings can be explained by previous studies. Diserens et al. [17] administered RECK MOTOmed viva2 to chronic stroke patients for three weeks. As a result, they reported that their range of motion increased at shoulder joint and elbow joint. Also, Asanuma & Keller [27] reports that a specific repetitive movement can help functional recovery because it enhances the efficiency of synaptic connection. However, given that there was no difference in upper extremity function between the two groups, it is judged that it is somewhat unreasonable to expect greater functional improvement from mere 4-week training.

In this study, the upper extremity cycling repetitive exercise was applied for improvement in the movement of subjects' shoulder, elbow and in their muscular force, by operating the machine in active, active assistive, and passive mode. Compared with the therapist's performance with manual therapy, when such automated machinery is used, the occupational therapist has no physical burden, and can set resistance to exercise, speed, and repetition frequency.

Since improvement in satisfaction can facilitate motivation for rehabilitation further and habituate patients to exercise, it will be conducive to the promotion of a patient's health.

Although this pilot study confirmed the advantage of upper extremity cycling repetitive exercise, its several limitations cannot be ignored. First, the sample size was small. Second, since the subjects included in the study were only patients with acute stroke, there is no knowing whether the exercise is effective for patients with subacute or chronic stroke. Lastly, the research period was relatively short, and follow-up was not conducted to find how long the effects of exercise continued.

Conclusion

These findings suggest that in case of having to administer additional exercise, together with universal rehabilitation therapy, to patients with acute stroke, the use of upper extremity cycling repetitive exercise can have more positive results than self-exercise.

A Study on Effect of Massage Therapy on Physical Changes

Su-Jeong Ryu[1], Myung-Sun Lee[1]

[1]Department of Beauty Healthcare, Deajeon University, Korea

Abstract

Background/Objectives: This meta-analysis focused on the papers on the massage in field of cosmetology published in the Korean journals from 2008 to 2017 and aims to present the effects of massage on the physical change in an objective way.

Methods/Statistical analysis: The data used in analysis were from papers on massage published in Korean journals from 2008 to 2017 and CMA (Comprehensive Meta-Analysis) version 2 was used in meta-analysis.

Findings: The results of analysis of the effect of massage therapy on the physical changes using a total of 72 papers showed that the total effect size of the massage on physiological and physical variables was -.583, a median effect size, and statistically significant. The effect sizes by age groups were -.037, a medium one in 20s; -.947, a large one in 30-40s; -.789, a medium one in 40-65 years old and -.732, a medium one without significance in 65 years old or older. The effect sizes by types of massage were -.359, -.603, -.572, and -.654 in Swedish, meridian, Ayurveda, and Thai massages, respectively and the statistical significance was observed only in meridian and Ayurveda ones. The effect sizes in fascia massage and cranial sacral therapy were -1.878 and -2.403, large ones.

Improvements/Applications: This meta-analysis aims to present academic criteria for the cosmetology education field and a program that can be used in the field by analyzing the effectiveness of the massage on physical changes.

Keywords: *Massage Therapy, Physical Change, Meta-analysis, Effectiveness, Cosmetology.*

Introduction

Massage, one of the health-promoting methods of correcting and healing the physical deformations by applying a mechanical stimulus [2], has been used as a natural habit since ancient times along with human activity [1]. The massage techniques in the various forms have been developed and advanced around the world and are used to alleviate and treat various symptoms in various fields such as medical, cosmetology, nursing, and psychology [3].

The massage methods most commonly used in Korea include Swedish massage, meridian massage, and manual lymphatic drainage (MLD) [2]. Swedish massage developed by the Swedish doctor Pehr Henrik Ling is the most widely used massage method in the world and allows blood to return smoothly to the heart by applying pressure in the opposite direction of the bones and muscles and the gentle massage from the peripheral area to central area is a principle. In The MLD developed by Dr. Emil Vodder, a pressure of 30-40 mmHg is applied to massage lymphatic vessels to promote lymphatic absorption of connective tissue [5], to reduce excess fluid in the body, and to eliminate toxins [6]. The meridian massage based on the theory of oriental medicine is known to deliver the flow of energy flowing on the body surface [2] and to maximize the flow of energy in the human body [7]. In addition, numerous massage techniques, including myofascia relaxation massage, Thai massage, Ayurveda massage, and cranial sacral therapy, has been studied continuously and their effects has been proved.

The studies on massage have been steadily increasing in the domestic cosmetology field since 2000 and ss the cosmetology education institutions have achieved a global level, studies with academic supports have been continuously accumulated [8]. For the previous Korean studies on massage, Han (2010) reported that the Chuna Massage was effective in reducing weight, abdominal circumference, and BMI in middle-aged women and Choi (2012) observed reduction in body fat mass, body fat percentage, and weight in 29 female college students who received 12 times of meridian massage. In addition, Ryu (2017) reported that the effect of back massage using the Swedish massage on autonomic nervous system stability was demonstrated in 20 women in their 30s who received ten times of the massage and Jeong (2016) reported that cranial sacral therapy for menopausal women led to alleviation of menopausal symptoms and reduced depression. These findings confirm that massage has a positive effect on physiological, psychological and pathological aspects.

This study, in this context, intended to provide a systematic conclusion about the effect of massage. Meta-analysis has the advantage of systematically analyzing existing results, presenting objective results [7], and generalizing studies conducted in different conditions [9]. Recent meta-analysis for the studies on the effects of massage include Ryu(2018) on hand therapy and psychological variables, Park (2016) on the effect of massage on obesity management, Park (2019) on the lavender aromatherapy on pain, and Kim(2018) on the effects of skin care program on skin improvement. The results of these analyzes suggest academic criteria for the effects of massage therapy that can be used in the field as well as in educational institutions. The variables related to the massage treatment effect can be classified into physical, physiological and psychological ones [7]. The purpose of this study was to present a systematic theory of the effects of massage on the body by, following Jeong(2013), assigning the effects of obesity and constipation control to physiological variables and muscle strength, endurance, range of motion(ROM), and capacity to perform daily activities to physical ones.

Method

CAM 2.0 version (Comprehensive Meta-Analysis 2.0 version) was used for meta-analysis and the selection of studies are as follows:

The primary search was performed from January 20, 2018 to January 27, 2018. The academic research information service (http://www.riss.kr) provided by Korea Education & Research Information Service was used and the Korean Journals were searched with the "*Massage"* and "*Manual therapy*" as keywords. A total of 702 papers were searched, and 73 papers in the field of cosmetology were selected based on the title and abstract. A total of 17 papers were included in final analysis after excepting for 39 studies that is far from the purpose of this study, seven papers that were not genuine massage therapy, two papers with inappropriate statistics, and eight papers with subjects with different characteristics.

The selection criteria, in this study, were determined by referring to Lee (2017)'s study. In meta-analysis studies, it is important to present clear criteria for the selection of papers in order to prevent the selection bias that researchers may make in review [10]. The Criteria for the selection of papers used in this study are as follows. Cosmetology paper published through journal since 2008, Quantitative study based on experimental research. Study subjects were adults, no patients. Massage as independent variable and effect on the physiological and physical change as dependent variables. Only the paper that can calculate the effect size were selected.

This study analyzed the effect size by age group and massage method. Massage methods include Swedish massage, meridian massage, fascia massage, Ayurveda massage, Thai massage, and cranial sacral therapy that used in papers analyzed in this study. The age group was classified into 20s, 30-40s, 40-65s, and 65s based on life cycle theory. In addition, the dependent variables to examine the effects on the body were divided into physiological and physical ones. The categorization process of dependent variables is shown in Table 1.

Table 1: Categorization of Dependent Variables

Categorization	Dependent Variables in analyzed Papers
Physiological Variables	Obesity Control Effect – Weight, BMI, Body Fat mass, Lean Body Mass, Waist Circumference, Hip Circumference
	Constipation Control Effect – Number of Defecation
Physical Variables	Muscle Mass, Endurance, Capacity to Perform Daily Activity, ROM

The characteristics of selected papers were coded using Excel, and the program used for meta-analysis was CMA2 (Comprehensive Meta-Analysis version 2). Since there were differences in the treatment methods and samples among papers, the random effect model [10] was used in analysis. The effect sizes were interpreted following Cohen(1988)'s proposition: under .20 small; .20-.80 medium; over .80 large.

Result and Discussion

1. Total Effect size on Physical Change

The total effect size of the massage on physiological and physical variables was -.583, a median effect size, and statistically significant (Table 2).

Table 2: Total Effect Size on Physical Change

Number Studies 72					
Point estimate	**Standard error**	**Lower limit**	**Upper limit**	**Z-value**	**P-value**
-.583	.097	-.773	-.394	-6.031	.000

2.Effect Size by Age Groups

Table 3 shows the effect size of massage therapy by age groups. The effect size in 20s analyzed for 35 individual papers were -.037, a median effect size and 30-40s with -0.947, a large one. The effect size in 40-65 years old analyzed for 26 individual papers were -.789, a median effect size and over 65 years old with -0.732, a medium one with no significance. For those 65 years or older, the number of studies were just three, requiring caution in interpreting the results. The results of the analysis showed that massage therapy was effective in 30-40 and 40-65 age groups. There was no Korean study on massage comparing the effects by age. It is considered, therefore, that the large effect size in 40-64 years old reported in Ryu(2018) that analyzed the effect of cosmetology manual therapy on physical factors is consistent with that in this study [8].

Table 3: Effect Size by Age Groups

Age	Number Studies	Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
20s	35	-.337	.125	-.583	-.091	-2.685	.007
30-40s	8	-.947	.137	-1.215	-.679	-6.917	.000
40-65 years old	26	-.789	.173	-1.129	-.450	-.450	.000
65 years or older	3	-.732	.928	-2.551	1.087	1.087	.430

3. Effect Size by Type of Massage

Table 4 shows the effect size by massage types. The effect size in Swedish massage analyzed for 15 individual papers were -.359, a median effect size without statistical significance. The effect size in meridian massage analyzed for 36 individual papers were -.603, a median effect size and that in Ayurveda massage analyzed for six individual papers was -.572, a median one and that in Thai massage was -.654, a median one without statistical significance. The effect sizes in fascia massage and cranial sacral therapy were -1.878 and -2.403, respectively, with just one paper, requiring caution in interpreting the results. Although the results of this study showed that all massage methods had positive effects on the changes in physiology and body composition, the studies applying Swedish and Thai massages were not statistically significant. This is similar to the results of Choi (2012), on the change of body composition by applying meridian and Swedish massages, that the meridian massage was most effective though there were physical changes regardless of the type of massage.

Table 4: Effect Size of each Massage Method

Type	Number Studies	Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
Swedish	15	-.359	.213	-.776	.058	-1.689	.091
Meridian	36	-.603	.123	-.844	-.363	-4.925	.000
Facia	1	-1.878	.539	-2.934	-.823	-3.487	.000
Ayurvedic	6	-.572	.701	-1.947	.802	-.816	.414
Thai	13	-.654	.115	-.878	-.429	-5.707	.000
CST	1	-2.403	.360	-3.108	-1.697	-6.676	.000

4. Effect Size of Dependent Variables

Table 5 shows the effect size of dependent variables. The physiological variables representing effect on obesity and constipations controls had effect size of -.715, a median one. The physical variables representing muscle mass, ROM, and capacity to perform daily activity had effect size of -.084, small one without statistical significance. These results suggest that the massage may be applied usefully in obesity control programs since it is an effective therapy for obesity control such as weight, BMI, and waist circumference.

Table 5: Effect Size of Dependent Variables

Variables	Number Studies	Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
Physiological	56	-.715	.100	-.910	-.519	-7.167	.000
Physical	16	-.084	.240	-.554	.336	-.351	.726

5. Effect Size of Types of Massage on Dependent Variables

Table 6 shows the effect of type of massage on each dependent variable. The effect sizes of Swedish massage on the physiological and physical variables were -.790 and .358, respectively, medium ones, while only former was statistically significant. The effect sizes of meridian massage on the physiological and physical variables were -.609 and -.419, respectively, medium ones, while only former was statistically significant. The effect size of fascia massage on the physiological variables was -1.878, a large ones, however, requiring caution in interpretation since the data were from only one paper. The effect size of Ayurveda Massage on the physiological and physical variables were -2.125 and .878, respectively, large ones, and statistically significant. The effect size of Thai massage on the physiological variables was -.817, a large one. These results showed that the Swedish, meridian, and Ayurveda massages had no significant effect on physical variables, which was considered to affect the significance of total effect size of these variables. However, according to a statement issued by the American Statistical Association (ASA) in 2016, "statistical significance is not an important index of effect size or results, and it has no meaning that the probability for a given hypothesis to be true is 95% [13]. If the null hypothesis is true and all other assumptions are valid, the probability of obtaining extreme results beyond observed one is 5%." In this context, it is considered that the effect of massage on the physical variables had effect size over medium one, though it was not statistically significant, therefore, had positive effects on muscle mass, ROM, and capacity to perform daily activities.

Table 6: Shows the effect of massage types on each dependent variable.

Types of Massage on Dependent Variables	Number Studies	Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
S-physiological	9	-.790	.231	-1.243	-.338	-3.423	.001
S-physical	6	.358	.365	-.358	1.073	.980	.327
M-physiological	30	-.609	.144	-.893	-.326	-4.220	.000
M-physical	7	-.419	.250	-.909	.070	-1.679	.093
F-physiological	1	-1.878	.539	-2.934	-.823	-3.487	.000
A-physiological	4	-2.125	1.136	-4.352	.102	-1.870	.061
A-physical	1	.878	.444	.002	1.743	1.965	.049
T-physiological	13	-.817	.174	-1.158	-.476	-4.695	.000

S: Swedish
M: Meridian
F: Fascia
A: Ayurveda
T: Thai

Conclusion

The conclusions based on the results of this meta-analysis are as follows:

First, the total effect size of massage on physical change was -.583, a medium one, indicating that the massage is effective for physical change.

Second, the effect sizes by age groups were -.037, a medium one in 20s; -.947, a large one in 30-40s; -.789, a medium one in 40-65 years old; and -.732, a medium one without significance in 65 years old or older. The data for the oldest group were from only three papers, thus requiring caution in the interpretation.

Third, the effect sizes by types of massage were -.359, -.603, -.572, and -.654 in Swedish, meridian, Ayurveda, and Thai massages, respectively and the statistical significance was observed only in meridian and Ayurveda ones. The effect sizes in fascia massage and cranial sacral therapy were -1.878 and -2.403, large ones, however they were from only one paper, necessitating further studies on this type of massages.

Fourth, for the effect size of dependent variables, the physiological variables had effect size of -.715, a median one and the physical variables had effect size of -.084, a small one without statistical significance. These results suggest that the massage may be applied usefully in obesity control programs.

Fifth, For the effect of type of massage on each dependent variable, The effect sizes of Swedish massage on the physiological and physical variables were -.790 and .358, respectively, medium ones, while only former was statistically significant. The effect sizes of meridian massage on the physiological and physical variables were -.609 and -.419, respectively, medium ones, while only former was statistically significant. The effect size of fascia massage on the physiological variables was -1.878, a large ones, however, requiring caution in interpretation since the data were from only one paper. These results showed that the massage had more large effect on physiological variables compared those on physical ones in which massage had negative effect without significance. It is considered that the massage had some values enough to have positive effects on obesity control, constipation control, increase in muscle mass, and improvement in ROM.

A Study on the Resident Radiation Protection Methodology from the Nuclear Emergency: Focused on the Disaster Vulnerable Population

Sang Tae Kim[1], Seokki Cha[2], Minsu Cho[3]

[1]Public Official, Nuclear Safety and Security Commission, Republic of Korea, [2]Research Scientist, Korea Institute of Radiological & Medical Science, Republic of Korea and also Ph.D Candidate in Science & Technology Policy Dept. from Hanyang Univ, [3]Medical Doctor, Korea Institute of Radiological & Medical Science, Republic of Korea

Abstract

Background: Despite the continuing improvement of the radiological emergency preparedness plan (REPP) after the Fukushima nuclear accident, increase in disaster vulnerable population (DVP) due to the transition to aging society renders the preparedness for nuclear disasters more difficult. The present study aims to examine major issues of REPP and propose an improvement direction considering DVP.

Materials and Method: This study focused on the issues of REPP established by the central and local governments and on resident-protection measures, in particular. Technical measures such as technological measures for nuclear facilities and environmental radiation monitoring are described in detail.

Results: According to the analytical results, major issues of REPP include inconsistency in the range of emergency planning zone (EPZ) between local governments, lack of cooperation, lack of budget for radiation emergency preparedness, and the effectiveness of resident evacuation plan and education and/or training on radiation emergency preparedness. Furthermore, there is a lack of consideration for DVP in the preparation, response, and recovery processes for nuclear disasters.

Conclusion: Considering the increase in DVP in the future, the REPP should be supplemented in terms of the resident evacuation plan, education and training on radiation emergency preparedness, preparation of shelters and relief supplies, and preparedness for the prolongation of a nuclear disaster.

Keywords: *radiological emergency preparedness plan, aging society, disaster vulnerable population, nuclear disaster*

Introduction

Since the Fukushima nuclear accident on March 11, 2011, the South Korean government has expanded the emergency planning zone (EPZ) and has drastically increased the potassium Iodide (KI), thyroid protective medicine, as well as Ca-DTPA, Zn- DTPA, and Prussian Blue, which are decorporation drugs to treat internal radionuclide contamination. The government has further revised local government manuals for on-site action. Nevertheless, these improvements have not relieved the anxiety of citizens. Particularly, since the 5.8 magnitude earthquake in Gyeongju in September 2016 and the 5.4 magnitude earthquake in Pohang on November 15, 2017, majority of South Koreans have been increasingly concerned that the Korean Peninsula is no longer safe due to earthquakes; accordingly, social interest in radiation emergency preparedness measures has significantly increased. For instance, this insecurity has led to demands by groups opposing operation and construction of new nuclear power plants on early decommissioning of Wolsong nuclear power plant in Gyeongju and has strengthened measures for radiation emergency preparedness [1]. One of the reasons for the continuing controversy over the Radiation Emergency Preparedness Plan (REPP) of the central and local governments is

Corresponding author:
Minsu Cho,
E-mail: choms@kirams.re.kr

that the revision process does not sufficiently reflect the demands of activist groups. Under this circumstance, there is a growing need for collaborative disaster governance for government officials, expert groups, and activist groups seeking solutions [2]. The increase indisaster vulnerable population(DVP) has been making it difficult to establish and implement the entire REPP, and the legitimacy of the REPP is very likely to weaken due to insufficient DVP protection measures. The United Nations (UN) classifies societies as aging society with 7% or higher of the population aged 65 or older with respect to the total population, aged society with 14% or higher, and super-aged society with 20% or higher. According to the Ministry of the Interior and Safety (MOIS), as of late August 2017, the population aged 65 or higher was 7,257,288, exceeding 14% of the total population 51,753,820 [3]. The case of Futaba Hospital, where the elderly were unable to quickly evacuate due to radioactive contamination, appropriately illustrates the possibility of tragic disasters that could be caused by the combination of nuclear disaster and aging [6].

Research Background

Disasters such as East Japan Earthquake, Hurricane Katrinahave shown that damages tend to be severe in DVPs such as elderly people [4,5,7,8]. First, the elderly have difficulty in rapidly moving and evacuating because their physical functioning is deteriorated [9]. Second, psychosocial characteristics of the elderly further affect disaster response. In particular, it is reported that elderly people tend to refuse to evacuate even if emergency evacuation warnings are issued [9,10]. For instance, after the Fukushima nuclear accident, some elderly people were more concerned about separation from the place where they lived and the livestock they raised due to migration than about the exposure to radioactive spills. [11] Third, the economic vulnerability of the elderly restrains disaster responses. Thus, understanding the characteristics of DVPs in terms of physical, cognitive, psychological, and socioeconomic aspects is crucial in establishing appropriate protective measures. In the case of elderly people, many of them have chronic diseases [9,12]. Furthermore, it is necessary to differently treat the elderly in terms of relief shelters and relief supplies [4,5,12,13]. While the elderly tend to recover relatively quickly from psychological damages such as anxiety and depression due to disasters, they are more sensitive to economic and physical damage, thereby recovering slowly [9,10,12]. Higher the perception of risk, higher is the probability of evacuation, and evacuation is a social process involved at the family level while sharing the identification of situations with other family members and acquaintances [13,14]. In the case of nuclear disasters, it is highly likely that a significantly high portion of the population would follow official evacuation recommendations and a large number of citizens living in areas where evacuation orders have not been issued by the government due to lack of needs, would voluntarily evacuate [15,16,17]. Many people would determine evacuation routes considering family-level movements and evacuate to a place other than a government designated settlement or shelter [13,16]. For instance, after the Fukushima nuclear accident, the evacuation period for the affected residents was prolonged, resulting in various problems such as lack of daily necessities, restrictions on the use of medical services, and unemployment. [8]The residential period of elderly people at shelters became prolonged, resulting in more difficulty managing their health and chronic diseases due to further decrease in physical activity [8]. Programs wherein evacuees can participate, such as small group activities, were provided in temporary residential areas, many of the aged victims had suffered from mental damage due to the community's destruction [8,11]. Due to identification of responsibility for disasters, related litigations, delays in restoration, and social conflict, a corrosive community where the number of conflict-related relationship increases prevails rather than a therapeutic community where cooperative relationship increases [2, 18].

Materials and Method

This study focused on the issues of REPP established by the central and local governments and on resident-protection measures, in particular. Technical measures such as technological measures for nuclear facilities and environmental radiation monitoring are described in detail. It also focuses on the necessity for differentiated disaster response measures required for DVP in seeking the improvement direction for the REPP. This study aims to seek the improvement direction of REPP after dividing the differentiated measures for DVP into physical, cognitive, psychological, and socioeconomic aspects. However, the scope of review was limited to the differentiated measures for DVP that mainly focused on elderly people.

Major Issues in Resident-Protection Measures

Regarding the REPP of the Republic of Korea, since the Act on measures for the Protection of nuclear

facilities, etc. and Prevention of Nuclear disasters (APPRD) was established in 2003, some residents living near the NPP and some activist groups raised complaints about the scope of the EPZ and the effectiveness of the disaster drill. Accordingly, the Nuclear Safety and Security Commission (NSSC) established the "First National Radiation Emergency Preparedness Plan (2015 ~ 2019)" in 2015, and the NSSC has used it as a plan for the nuclear disaster field of the National Safety Management Plan [19]. First, the EPZ was subdivided into the Precautionary Action Zone (PAZ) and the Urgent Protective Action Planning Zone (UPZ), and its range was extended to an NPP radius of 20–30 km from 8–10 km [19]. Second, radiation emergency preparedness drills have been strengthened, and storage range of KI has been expanded [20]. The storage range for thyroid protective medicine was expanded from an NPP radius of 16 km to a radius of 30 km, and the EPZ of HANARO, which is one of research reactors, was newly added into the storage targets. Major changes are summarized in Table 1.

Table 1. Major modifications after expansion of EPZ

Division		**Before revision**	**After revision**	
EPZ range	**NPP**		**Division**	**Range**
		8~10km (single zone)	PAZ	3~5km
			UPZ	20~30km
	research reactor	approximately 0.8km	1~1.8km	
Local government in charge of EPZ	Municipal	7	8	
	County	8	21	
Population within EPZ		approximately 100,000	approximately 2,000,000	
Installation range for alarming facility		2km	PAZ	
Storage range for thyroid protective medicine		16km	30km	
		1~1.8km		
Subject of pre-impact evacuation		pre-impact evacuation, excluded	Residents in PAZ	
Drills	Coordinated drill	Once/five years	Annually	
	Joint drill	Once/four years for each NPP site	Once/two years for each NPP site	
	Field-intensive drill	N/A	Resident protection drill	Once/year for each local government
			Emergency medical treatment drill	Once or more/year
			Environmental exploration drill	Once or more/year

Some have argued that the different ranges of EPZs depending on the region should be unified and expanded to an NPP radius of 30 km [21,22]. As shown in Table 2, the current EPZ is controversial because the ranges depend on the local government based on the same nuclear power plant. For example, in the case of Kori NPP EPZ, Busan Metropolitan City has a radius of 20–22 km, while South Gyeongsang Province and Ulsan Metropolitan City have 20–24 km and 24–30 km, respectively [23].It is the government's view that measures that comprehensively consider weather, terrain, road network, population distribution, and the like are more effective than the uniform rage of EPZ with 30 km [20]. For this reason, some have argued that the EPZ should be extended to 30 km as in Ulsan Metropolitan City [24].

Second, the necessity for a municipal-level REPP has been raised, based on cooperation between local governments. As shown in the case of the Fukushima nuclear accident, because radioactive leaks can occur as far as 30 km depending on weather conditions, local cooperation is essential. However, to establish a more effective REPP, there are many evaluations that the independent REPP of each local government is insufficient [19,25]. For example, shelters of the Gyeongju are typically designated as a facility within 30 km,

and there are no shelters outside 40 km [26]. As shown in Table 2, budgets are still small with large regional variations [28]. Fourth, questions have been posed about the effectiveness of REPP including resident evacuation plan, and education and training on radiation emergency preparedness. Fifth, there are many criticisms that the education and training on radiation emergency preparedness are not effective. Other strongly opposes that pre-distribution is better because KI is effective in ingestion at least 15 minutes before internal exposure due to radioactive iodine [30].

Improvement Direction of REPP in Consideration of DVP

Busan Metropolitan City has been opposing to the expansion of the radioactive emergency planning area due to the difficulty of planning and implementation, the increase in costs, and the damaged image as a dangerous city [31]. Second, in consideration of DVP, the resident evacuation plan should be developed in more detail. For instance, although UljuCounty identified the current status on the elderly living alone, staff members at the social welfare department and the public health center are supposed to coordinate the sequential evacuation without any further detailed action plan [32]. Third, it is necessary to strengthen the education and training program on radiation emergency preparedness in consideration of DVP, and further increase the related staff and budget. Fourth, considering the increase in DVP, it is necessary to prepare appropriate shelters and relief supplies. Only six years after the Fukushima nuclear accident, attempts have been made to dismantle the evacuation zone, while only 10% of the evacuees are reporting their intention to return [33,34].

Conclusion

The REPP should be reviewed in multifaceted manner including evacuation scenarios, education and training on radiation emergency preparedness, shelters and relief supplies, temporary residence facilities, and improvement measures should be sought by reflecting the physical, cognitive, psychological, and socioeconomic vulnerabilities. Regarding the current issue of REPP, the central and local governments, nuclear power operators, and activist groups should collaborate to find solutions, enabling the effective REPP to overcome the actual condition of unprecedently dense population near the.

The Effect of Employee Silence on Organisational Commitment and Turnover Intention of the Public Sports Organisation in South Korea

Sung-Duck Kim[1], **Jongchul Park**[2]

[1]*Baekseok University, Division of Sport Science, South Korea,* [2]*German Sport University Cologne, Institute of European Sport Development and Leisure Studies, Germany*

Abstract

Background/Objectives: This study aims at identifying the relationship among employee silence, organisational commitment and turnover intention in the public sports organisation in South Korea.

Methods/Statistical analysis: 272 employees working for the public sports organisations in Korea were sampled using stratified random sampling, and instruments for questionnaires were developed by previously validated scales. Frequency analysis, confirmatory factor analysis, correlation analysis and structural equation model were conducted via SPSS 21.0 and AMOS 20.0.

Findings: First, acquiescent and prosocial silence significantly affected organisational commitment. Second, acquiescent and prosocial silence had a positive and significant effect on turnover intention. Lastly, there was a positive and significant relationship between organisational commitment and turnover intention. This implied that acquiescent silence with the work torpor and dissatisfaction could cause low attachment toward the organisation, which finally leads to weakening organisational competitiveness and effectiveness. Moreover, prosocial silence based on cooperative and altruistic had a significant effect on organisational commitment, but ironically positively affected turnover intention as well.

Improvements/Applications: It would be essential to carry out further studies adding a variety of attitudinal and behavioural variables to see what kinds of silence can affect the individual and organisation.

Keywords: *Public sports organisation, Employee silence, Organisational commitment, Turnover intention, Employee*

Introduction

The role of public sport is being emphasized since it is spreading as avitaltool for improving the value of welfare and the quality of life of the people in South Korea. Accordingly, public sports organisations have become increasingly important along with a great attention to sport. The public sports organisations perform various roles and missions.Basically, the organisations pursue to provide the people with healthy welfare through sports services. Also, the organisations try to not only carry out friendly customerservice, but also pursue publicness and even profitability.

However, such diverse roles and goals might put a lot of pressure on employees within the organisation. In particular, the Korean public sports organisations traditionally seem to have inflexible and hierarchical culture inside the them. In particular, the organisations must follow bureaucratic organisational culture since they are directly managed or commissioned by the central or local government. Moreover, the organisations have a responsibility for satisfying the needs and expectations of diverse types of the people.

This could cause a sense of insecurity and dissatisfaction of the employees. In this situation,the employees are forced to become insensitive or cynical, which finally deteriorates the organisational

Corresponding Author:
Jongchul Park,
j.park@dshs-koeln.de

productivity[1]. If this situation persists, the employees would refrain from pronouncing their thoughts and notion for the organisation, maintaining their organisational life in a self-defensive manner[2]. This phenomenon is called employee silence where personal opinions, such as improvements and ideas, are not expressed in the job[3]. Also, the employee silence appears in three forms, such as acquiescent, defensive and prosocial silence[4]. Acquiescent silence indicates a state of abandonment or resignation to change a certain circumstance, while defensive silence is an act of avoiding negative consequences of one's speech[5]. Prosocial silence refers to silence about information acquired to prevent damage to the organisation[5]. This prosocial silence differs from the first two forms of silence in that it is self-silencing for the organisation by altruism or cooperative motivation[6].

Silence could turn into a different kind of psychological and behavioural attitudes. More importantly, this silence is likely to be transferred to groups and even the entire organisation. In order to understand the positive and negative attitude of the employee caused by employee silence, organisational commitment and turnover intention are necessary to be examined. In particular, turnover intention could lead to the withdrawal from the organisation for a number of reasons, so that it is no longer possible to manage the organisation. Thus, turnover intention is a critical variable which needs to be addressed in terms of organisational management. Previous study has focused on acquiescent and defensive silence, and reported that continuous employee silence could cause negative organisational attitudes[7-8].

In spite of existing studies, there has been little studies on silence culture within sports organisations. Moreover, it would be important to investigate the silence culture of the public sports organisations which have an unusual characteristic based on a large number of non-regular employees. Therefore, this study aims at exploring the relationship among employee silence, organisational commitment and turnover intention of the public sports organisation in Korea. This study is expected to identify the form of employee silence in the public sports organisation, and find out ways to increase employee engagement for more efficient organisational management and productivity.

Method

A survey was conducted by stratified random sampling among probability sampling techniques to analyse data. The data were collected from 300 employees who work for the public sports organisations in Seoul, Gyeonggi Province and Chungcheongnam Province, South Korea in 2018. After removing 28 cases of incomplete or faithless questionnaires, 272 were used for the study. As table 1 indicates, 177 (65%) were male and 95 (35%)

Table 1. Demographic profile of the respondents

Variable	Categories	Frequency	%
Gender	Male	177	65.1
	Female	95	34.9
Age	Less than 40	172	63.2
	More than 40	100	36.8
Status	Regular worker	157	57.7
	Non-regular worker	115	42.3
Marital status	Single	98	36
	Married	174	64
Education	College or below	65	23.9
	University or equivalent	176	64.7
	Graduate school or equivalent	31	11.4
Job field	Management	15	5.5
	Administration	107	39.4
	Coaching	96	38.6
	Customer service	45	16.5

were female. 172 (63.2%) were less than 40 years old, and 100 (36.8%) were more than 40 years. In addition, the majority of the respondents were regular worker (58%), married (64%), administration and coaching position (78%) and university graduates (65%).

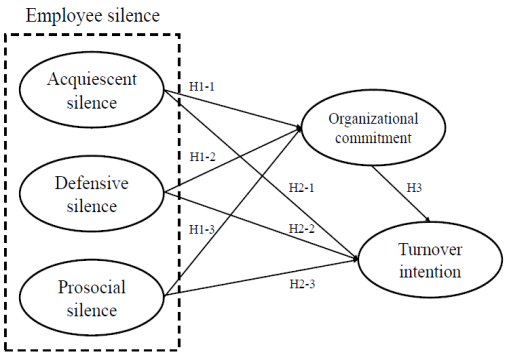

Figure 1. Conceptual model

Figure 1. Conceptual model

As shown in figure 1, a conceptual model of this study is as follow.All items were answered on a five-point Likert-type scale, and instruments to measure data were mainly adapted from previously validated scales. In addition, all items for content validity were examined by 3 experts who are middle administrators in the public sports organisation, a PhD researcher and a professor in the field of sport management. In this study, organisational silence consisted of 3 types of silence, including acquiescent silence, defensive silence and prosocial silence (e.g., 'I don't suggest my idea because I don't want to get involved in my workplace') developed by a previous study[5]. Organisational commitment included 5 items (e.g., 'I want to keep working in my workplace') revised from the relevant study[5]. Turnover intention was comprised of 4 items (e.g., 'I often want to leave my workplace') adopted from an existing study[9].

Table 2. Results of the CFA

Variable	Construct		Estimates	S.E.	t-value	p	CR	AVE
Employee silence	Acquiescent silence	I don't suggest my idea because I don't want to get involved in the workplace	.740				.836	.659
		I don't suggest a good idea to leave the workplace	.713	.080	10.519	.001		
		I don't suggest a way to improve my role and operation system because I don't want to get involved in the workplace	.817	.088	11.442	.001		
	Defensive silence	I deliberately omit information in consideration of my embarrassing situation	.698				.815	.661
		I don't suggest a way to improve my role and operation system in consideration of my embarrassing situation	.881	.117	9.957	.001		
		I am afraid of negative feedback and don't offer a solution to the problem	.687	.126	10.763	.001		
	Prosocial silence	I protect the information which my team has acquired for the benefit of the workplace	.597				.831	.672
		I don't disclose information which might harm my workplace	.915	.122	10.702	.001		
		I properly protect my team's confidential information for the workplace	.905	.118	10.713	.001		
Organisational commitment	I want to keep working in my workplace		.687				.833	.666
	I feel an attachment to my workplace		.932	.103	13.664	.001		
	My workplace is meaningful for me		.922	.104	13.569	.001		
	I feel a sense of belonging to my workplace		.790	.100	11.911	.001		
	I am committed to my work		.530	.100	8.235	.001		
Turnover intention	I often want to leave my workplace		.769				.853	.647
	I am willing to change my job within the same field		.900	.052	14.551	.001		
	I will quit if it gets worse than before		.768	.048	19.3997	.001		
	I will leave immediately if circumstances are possible		.898	.051	14.556	.001		

$\chi 2$ =313.058 (df =125p<001), SRMR=.066, RMSEA=.075, TLI=.918, CFI=.933

*** All t-value were significantly loaded at p<.001

For the study, frequency analysis, Confirmatory Factor Analysis (CFA), correlation analysis and Structural

Equation Model (SEM) were conducted by using SPSS 21.0 and AMOS 20.0.As shown in table 2, the overall validity and fit did not seem acceptable,$\chi^2(df)$ = 313.058 (df=125, p<.001). Nevertheless, CFI = .933, TLI = .918, RMSEA = .075 and SRMR = .066 exceeded fit index suggested by a previous study[10], and therefore overall validity and fit could be regarded as a good model for the study. Moreover, t-value ranged from 8.235 to 19.397, which seems to be acceptable for test. AVE values for convergent validity ranged from .647 to .672, which exceeds the acceptable standard[11]. Meanwhile, the values for construct reliability (CR) ranged from .815 to .853, which exceeds recommended.60 level[12].

Table 3. Correlation analysis

Variable	(1)	(2)	(3)	(4)	(5)
Acquiescent silence(1)	659a)				
Defensive silence(2)	.486**	661a)			
Prosocial silence(3)	-.143*	-.068**	672a)		
Organisational commitment(4)	-.413**	-.235**	.435**	666a)	
Turnover intention(5)	.360**	.316*	.012	-.361**	647a)

*p < .05, **p < .01 a) = AVE

Meanwhile, table 3 indicates the factor correlations among the variables. There were both positive and negative correlations between the variables, r = -.413 to .486. This represents reasonable figures, which means that discriminant validity in the study was verified[13].

Result and Discussion

1. Results

In order to investigate the relationship among employee silence, organisational commitment and turnover intention, path coefficient analysis was conducted. As shown in table 4, acquiescent and prosocial silence affected organisational commitment, respectively, β=-.331, p < .001 and β =.310, p < .001. Acquiescent and prosocial silence influenced turnover intention, respectively, β=.239, p < .05 and β =.279, p < .01. However, defensive silence did not have a significant effect on turnover intention as well as organisational commitment, respectively, β= -.036, p > .05 and β =.173, p > .05. Lastly, organisational commitment significantly affected turnover intention, β=-.560, p < .001.

2. Discussion

The aim of this study is to examine the relationship among employee silence, organisational commitment and turnover intention in the public sports organisation in Korea.

First, acquiescent silence had a negative and significant effect on organisational commitment, butpositively affected turnover intention. In other words, acquiescent silence has an adverse impact on the organisation. This finding supports previous studies[14-15]. They argued that acquiescent silence reduces organisational commitment since employees are unwilling to put in an effort into their job for a feeling of disengagement and low self-efficacy. This negatively leads to their work torpor and dissatisfaction, which finally leaves the workplace[16-17]. Thus, acquiescent silence based on the resignation could cause a lack of attachment toward the organisation, leading to weakening organisational competitiveness and effectiveness. In Korea, it is true that there exists a silent atmosphere in the organisation unless it is a sensitive issue or problem, and further the gap caused by employees' position and status has created the silence culture. For this reason, it is assumed that acquiescent silence tends to be more prominent compared to other types of silence in Korea.

Second, prosocial silence positively affected organisational commitment and turnover intention. It can be inferred that prosocial silence contributes to organisational commitment because of cooperative and altruistic attitudes and mind[4]. Also, it is assumed that prosocial silence is mainly based on a concern for others through which employees finally pursue to help others and share the duties in the organisation. Although silence is motived by the discretionary behavior, however, it is likely to cause the decline of the organisational effectiveness in the end. Thus, the employees who possess prosocial silence seem to have an ambivalent attitude which not only concentrates on their work, but also change their jobs. In other words, it might be a kind of a false action that they show sacrifice, attachment and even dedication for the organisation, and also consider turnover for themselves at the same time. In Korea, non-regular employees are under unstable employment, and even there is invisible discrimination within the organisation. In particular, the public sports organisations in Korea have their own vertical and hierarchical culture due to the employees' major and male-oriented organisational culture. Therefore, such a dual attitude of the employees seems inevitable to sustain stable work within the organisation for a while.

Table 4. Results of the hypothesis testing

H	Path	β	S.E	T-value	p	Testing
H1-1	Acquiescent silence → Organisational commitment	-.331	.079	-4.208***	.000	Accept
H1-2	Defensive silence → Organisational commitment	-.036	.081	-.437	.662	Reject
H1-3	Prosocial silence → Organisational commitment	.310	.064	4.839***	.000	Accept
H2-1	Acquiescent silence → Turnover intention	.239	.112	2.137*	.033	Accept
H2-2	Defensive silence → Turnover intention	.173	.115	1.508	.132	Reject
H2-3	Prosocial silence → Turnover intention	.279	.088	3.176**	.001	Accept
H3	Organisational commitment → Turnover intention	-.560	.110	-5.101***	.000	Accept

***p<.001, **p<.01, *p<.05

Lastly, organisational commitment had a negative and significant effect on turnover intention. This result has also been demonstrated in a number of previous studies. Thus, it is likely that employees with a high level of psychological and emotional attachment concentrate on achieving organisational goals and interests, and stay with the organisation.

Conclusion

The study investigated the relationship between employee silence, organisational commitment and turnover intention in the public sports organisations in Korea. In terms of a practical aspect, the findings implied that silence can be a critical factor, which directly influences organisational effectiveness. Actually, the employee silence is a common choice of the employees, due to concern for others and manager's fear of negative response within the organisation. This in turn lead to the inefficiencies in many aspects. Any organisations cannot achieve creative outcomes through cooperation if they block the exchange of ideas among the employees. In order to deal with the issue, the organisations should improve their culture and belief by motivating and activating communication with each other for the sake of productive working relationship and further customer-oriented operation.

In terms of a theoretical aspect, further study would be necessary to identify various factors that can cause a variety of silence to employees. In addition, apart from other types of silence, it would be important to look at various characteristics of the prosocial silence since it can show both positive and negative outcomes within the organisation. Given that this study only aimed for the types of silence of the public sports organisations, moreover, further study should be conducted to contribute to creating the improved organisational environment and culture through comparative studies with the average companies which possess a more flexible organisational culture. Lastly, it would be essential to carry out further studies which adds a variety of attitudinal and

behavioural variables in order to see how various types of silence affect the individual and organisational levels.

A Study on Development of Nursing Curriculum Customized to the Clinical Field

Do-Young Lee[1], Jin Hee Park[1]

[1]Changshin University, Dept.of nursing, Korea

Abstract

Background/Objectives: The purpose of this study is to carry out the basic survey to develop the field-oriented curriculum around the basic nursing practice subjects of nursing department.

Methods/Statistical analysis: This research is a descriptive survey research to devise a way to improve site-customized curriculum by analyzing performance of core basic nursing techniques among students, professors, and clinical workers in the basic nursing practice course.

Findings: Frequency of performance correlates positively with confidence and accuracy, and confidence correlates positively with accuracy. Importance has a significant correlation with confidence and accuracy, and confidence has a significant positive correlation with accuracy. To achieve educational goals, it is necessary to select curriculum depending on elements constituting the curriculum.

Improvements/Applications: Through the improvement of field-tailored nursing education, it's expected that the quality of nursing will be improved through the promotion of practical skills and low skills for nursing college students.

Keywords:*Curriculum, Customized, Nursing student, University, Clinical Field*

Introduction

Curriculum, Latin for "currerere," means "run" or "run" and refers to a series of daily places or movements. This means 'run' in teaching, or 'study' in teaching, or a curriculum that trains students for a certain period of time. Education process development is the activity of establishing a comprehensive plan for teaching methods, educational evaluation, and educational operation to effectively communicate education contents as a whole plan of systematically organized education in order to achieve educational goals[1]. That is, to achieve the educational goals met the demand of society and the learner, it should be selected and organized according to the educational perspective and should be selected according to the components of educational process. Therefore, the development of curriculum can considered as wide range of concept encompassing from the theoretical background to process of plan, design, assessment and the operation of curriculum. In addition, the curriculum is the concept reflected with the education policy according to the educational theory in that ages, country, society and demand of the ages. It includes the objective, contents, method and evaluation procedure, etc. of the subjects and is the plan having correlation[2].

The ultimate goal of the nursing is to cultivate the profession nurse having the skills demanded by the society. For the characteristics of practical study as nursing, the nursing education has characteristics of vocational education and has a basic purpose of cultivating the manpower having specific skills. In addition, nursing practice is the process to improve the problem solving ability by integrating the theory and practice and applying to actual patient and the experience of integration and coordination that can access to the patient holistically and generally should be given to the student. Therefore, in the clinical training, to perceive the patients in general and to solve the nursing problems,

Corresponding Author:
Jin Hee Park,
parkjh124@cs.ac.kr

the individual knowledge acquired from various subjects of theory should be able to be integrated and applied[3].

The practice education of basic nursing education is the subject that the nursing skills, the core and basic practical skills that the nurses should acquire is learned[4]. More than 70.0% of the nursing students practice the clinical training around the non-invasive basic nursing such as observation of vital sign, etc[5]. Such clinical training causes the lack of clinical skill in nursing student and leads to the degradation of clinical skill in new nurse after graduation[6]. When the nursing students acquire the basic nursing skill through the basic practice room training and engage in the clinical training based on the self-confidence, the effect of clinical training is increased and the positive effect will be made in the nursing of patient after graduation. In that sense, in the practice education of basic nursing, diverse and systematic practice education to enhance the learning satisfaction of the students should be made[7].

Nursing educator should make effort for the nursing students to enhance the basic nursing skills and to acquire the positive value on the nursing in the aspects that the basic nursing practice has important effect on the life and the attitude of the nursing students as a professional nurse and the basic nursing skills are the foundation of all the nursing actions[8]. Because of the characteristics of the basic nursing practice subjects that the nursing students experience in the initiation stage of nursing, since the nursing student experience the basic nursing practice before forming the sufficient knowledge and the solid belief in the nursing, they often have negative experience such as tension, difficulties, fear, anxiety, burden, apprehension, etc[9]. Therefore, the nursing education needs to establish the goal to cultivate the core skills to be cultivated as a results of education as the center of education and to improve the method to achieve such goal, particularly, the improvement focusing on the practice education. To do that, the goal and the level to be achieved in the classroom and the goal and the level to be achieved in the nursing practice education should be suggested establishing the core basic nursing skills as the goal of basic nursing education and the nursing practice education should be organized in order to achieve such goals effectively[3].

Nursing practice education is the process to improve the problem solving ability by integrating the theory and the practice and applying them to the actual patients and should grant the experience of integration and coordination that the students can access to the patient holistically and generally[3]. The field instructors, nurses, head nurses should guide and support the students through the establishment of goals cleared stated and understood so that the students can have learning experience required to achieve that[3].

This research tried to find ways to help nursing school students adjust themselves to clinical sites, and perform nursing jobs well. Nursing practice education integrates theory and practices, and applies them in patients in various conditions, and helps students to improve problem-solving capabilities and approach patients as total and whole beings. Nursing science as practical science should escape from knowledge-delivering education in classroom, and try to educate students as professional nurses equipped with capacities required in clinical sites. Accordingly, this research was performed with the site leader of Basic Nursing practice course to reflect demands of students and professor and the opinions of the site.

Method

This study is the descriptive survey. It study to draw the improvement measures for field-oriented curriculum by performing the survey related to the core basic nursing skills of the student, professors and field instructors and analyzing the degree of clinical practice skill.

To reflect the demand and the needs of the field, the survey and the analysis of the demands were performed through the 203 junior and senior students, 13 professors of this university and 84 field instructors.

The purpose of this study is to carry out the basic survey to develop the field-oriented curriculum around the basic nursing practice subjects of nursing department. The specific objectives for that are as follows. First, to analyze the core basic nursing skills of the basic nursing practice subject for student, professors and filed instructor. Second, to identify the degree of clinical practice skills of the student that the student, professors and the field instructors consider.

This study is theresearch tool. First, the survey on the core basic nursing skills of the students is to identify the degree for the performance frequency, self-confidence and accuracy of the core basic nursing skills that the junior and senior students feel. The subjects can answer the questions from 0 to 10 points and the higher the score the higher the performance

frequency, self-confidence and accuracy of the student. Second, the survey on the core basic nursing skills of the professors is to identify the degree of the student's importance, self-confidence and accuracy of the core basic nursing skills that the professor feels. The subjects can answer the questions from 0 to 10 points and the higher the score the higher the performance frequency, self-confidence and accuracy of the student felt by professor.Third, the survey on the core basic nursing skills of the field instructors is to identify the degree of the student's importance and accuracy of the core basic nursing skills that the field instructors feels. The subjects can answer the questions from 0 to 10 points and the higher the score the higher the performance frequency, self-confidence and accuracy of the student. Forth, the clinical practice ability measurement tool is the nursing practice ability measurement tool developed by Soon, et al.[13] to identify the basic nursing practice ability of general nursing regardless their area based on the core nursing skill-oriented nursing practice educational goal suggested by Kim[3]. It is composed of 5 questions for information gathering, 24 questions for basic nursing performance, 4 questions for communication skill, 6 questions for critical thinking, 9 questions for education and leadership, 11 question for management skill and 5 questions for professional job development attitude and practice skill covering 7 core skill categories and 64 nursing practices. The performance skill for each question was measured with 4-point scale granting 1 point for "Not at all" and 4 points to "I can do it very well" and the higher the score the higher the clinical practice ability. The Cronbach α, the reliability of the entire tools in the research conducted with RN-BSN students by Soon et. al.[10] was .82.

Data were collected from October 01, 2018 to October 15, 2018 using structured questionnaires. To collect the data, the consent of junior and senior students and professors was obtained before starting the survey. In case of field instructors, the permission of the manager was obtained after explaining the purpose and intent of the survey, and the questionnaire was distributed and the subjects were asked to answer. The subjects were explained that their answers were kept as secret, they could stop participating anytime during the survey and they would not have any disadvantage from that. They were explained that the data would be disposed after certain period after terminating the research and would not be used other than the research. 10 minutes were taken to answer the questionnaire.

The collected data were processed statistically using SPSS/WIN 20.0 program according the purpose of this study.For the general characteristics, the data were analyzed with descriptive statistics using real number, percentage, average and standard deviation. The correlation among the variables of the subjects was analyzed using Pearson's correlation coefficients.

Result and Discussion

1. General characteristics of Students

General characteristics of the students are as shown in [Table 1].

The age of junior students was 112 students (100%) and 22.25 years old and the age of the senior students was 91 students (100%) and 23.23 years old.

In the junior students, 73 students (65.2%) had the highest degree of satisfaction with their major in nursing, while 81 students (72.3%) were 'Normal' in clinical practice satisfaction. For the needs of core basic nursing skills in the nursing department, 109 students (97.3%) said "necessary" was needed. While 63 students (56.3%) said "reflects well" for the degree of field demand reflection.

In the senior students, 61 students (67.0%) had the highest degree of satisfaction with their major in nursing, while 60 students (65.9%) were 'Normal' in clinical practice satisfaction. For the needs of core basic nursing skills in the nursing department, 89 students (97.8%) said "necessary" was needed. While 74 students (81.3%) said "reflects well" for the degree of field demand reflection.

Table 1: General characteristics of Students (N=203)

Characteristics	Categories	Junior students (n=112)	Senior students (n=91)
		n(%)	n(%)
Age(years)		112(100)	91(100)
	M±SD	22.25±1.15	23.23±1.96
Gender	Male	9(8)	4(4.4)
	Female	103(92)	87(95.6)
Major satisfaction	Unsatisfaction	16(14.3)	10(11.0)
	Normal	73(65.2)	61(67.0)
	Satisfaction	23(20.5)	20(22.0)
Clinical practice satisfaction	Unsatisfaction	8(7.1)	8(8.8)
	Normal	81(72.3)	60(65.9)
	Satisfaction	23(20.5)	23(25.3)
Needs of core basic nursing skills	Necessary	109(97.3)	89(97.8)
	Not Necessary	3(2.7)	2(2.2)
Degree of field demand reflection	Reflect Well	63(56.3)	74(81.3)
	Not Reflect Well	13(11.6)	3(3.3)
	Don't Know	36(32.1)	14(15.4)

2. General characteristics of professors and Field Instructors

The general characteristics of the professors and the field instructors are as shown in [Table 2].

The professor was 47.33 years old and the field Instructors was 42.4 years old.

In the gender of the professors, the female occupied the most, and the clinical career was 16 years and the career as professors was 5 years. For the needs of core basic nursing skills in the nursing department, 8 professors (61.6 percent) said "necessary" was needed. While 10 professors (76.9 percent) said "reflects well" for the degree of field demand reflection.

In the gender of the field instructors, the female (97.6%) was more than the male (2.4%), and the clinical career was 16 years. For the needs of core basic nursing skills in the nursing department, 84 field instructors (100.0 percent) said "necessary" was needed. While 48 field instructors (57.1 percent) said "reflects well" for the degree of field demand reflection.

Table 2: General characteristics of professors and field instructors (N=97)

Characteristics	Categories	Professors (n=13)	Field Instructors (n=84)
		n(%)	n(%)
Age(years)		13(100)	84(100)
	M±SD	47.33±5.70	42.4±8.23
Gender	Male	0(0)	2(2.4)
	Female	13(100)	82(97.6)

Cont ... **Table 2: General characteristics of professors and field instructors (N=97)**

Work experience(year)	Clinical	16	16
	Professor	5	-
Needs of core basic nursing skills in the nursing department,	Necessary	5(38.4)	84(100)
	Not Necessary	8(61.6)	0(0)
Degree of field demand reflection	Reflect Well	10(76.9)	48(57.1)
	Not Reflect Well	2(15.4)	8(9.5)
	Don't Know	1(7.7)	28(33.3)

3. Correlation among Variables of Core Basic Nursing Skills of Students

The correlation among the variables of the core basic nursing skill of the student are as shown in **[Table 3].**

The performance frequency has positive correlation with the self-confidence (r=.68, p<.001). The accuracy (r=.72, p<.001), and the self-confidence has positive correlation with the accuracy (r=.78, p<.001).

Table 3: Correlation among Variables of Core Basic Nursing Skills of Students (N=203)

Variables	P	S	A

I	1	-.02(.914)	-.05(.831)
S		1	.82(<.001)
A			1

I:Importance, S:Self-confidence, A: Accuracy

Conclusion

To achieve the purpose of education that meets social needs and learners' needs, it is suggested that the continuous site can be explored and analyzed in the environment. Through the improvement of field-tailored nursing education, it is expected that the quality of nursing will be improved through the promotion of practical skills and low skills for nursing college students. In addition, we hope that through field-centered education, we will improve the satisfaction of students and industries and become a reliable university that trains people with skills to meet the needs of the field.

Nursing science education is constituted of closely related training and curriculum through clinical site training. But, depending on the situations and characteristics of hospitals, training environment and nursing works can vary. By doing this research with the leader of the clinical site where nursing school students of C College do training and are employed, it was possible to analyze merits and demerits of the students. This research expects that by revising basic curriculum by adopting opinions of the site leader, this research helps students improve their training adaptability, and efficiently perform nursing works when they are employed.

It is expected that the site-customized nursing science education will generate nurses with site adaptability, and helps nurses improve their nursing quality through promotion of practical and adaptive capabilities. It is also expected that the site-customized nursing science education will improve satisfaction with clinical site of students, leading to the development of the nursing school as reliable nursing college.

This research expects that it can contribute to production of nurses equipped with site adaptability through improvement of nursing curriculum and contribute to improvement of nursing quality when

nursing students get jobs after graduation through improvement of practical capacities and adaptive capacities.

Changes in Balance and Proprioceptive Sensation According to Trampoline Exercise Posture and Resting Time

Da-Hee Kwon[1], Tae-Min Kim[1], Ji-Hwan Park[1],Dong-Yeop Lee[2], Jae-Ho Yu[2], Jin-Seop Kim[2], Ji-Heon Hong[2]

[1]*Student,* [2]*Professor, Dept. Physical Therapy, Sun Moon Univeresity, Asan-si, 31460, Republic of Korea*

Abstract

Background/Objectives: Trampolines are rehabilitative methods that can enhance one's ability to stimulate and balance inherent capacities, which have a significant effect on sensory organs, nervous system, and physical strength.

Methods/Statistical analysis:In this study, 45 healthy subjects were recruited. Subjects were randomly assigned to walking, tiptoeing, or jumping groups. Each group of trampoline interventions was performed for 10 minutes. In all three groups, balance and proprioceptive sensory tests were performed before exercise, immediately after exercise, and 5 and 10 minutes after exercise.

Findings: There was a significant difference in SI data between pre- and post-intervention ($p<0.05$). According to the SI results in the NO condition, the stability was reduced immediately after exercise and restored after 5 minutes in all groups ($p<0.05$). According to SI results in NC condition, there was a significant difference between immediately after exercise and after 5 minutes in all groups ($p<0.05$).

Improvements/Applications:Trampolines are effective for posture stability. A rest time of 5 minutes is required to restore posture stability after trampoline exercise.

Keywords:*Trampoline, Weight distribution index, Proprioception, Joint position sense, Stability index*

Introduction

Trampoline is a training device for the balance that makes the neuromuscular system more tightly integrated[1]. Movements on the trampoline improve physical factors such as trunk stability, muscle coordination response, and range of motion[2]. In addition, it is a rehabilitation method that stimulates proprioception and maintains balance ability[3]. The trampoline has a remarkable influence on sensory organs, nervous system, and physical strength[4]. It has an unstable support base that not only helps to recover the proprioception and joint position sense (JPS), but also improves physical functions such as balance, reaction velocity, space perception, and body perception. It is also effective for motivation because it can induce the interest of the participant in the exercise. The trampoline exercise can rebound due to the spring and perform various actions through the rebound. This exercise improves instantaneous judgment and flexibility by performing the movements that are not easy on the ground and helps to improve balance and sense of direction. Jumping with trampoline improves muscle strength, speed of joint movement, and coordination[5].

Balance is defined as the ability to maintain the center of gravity within the base of support (BOS)[6]. The static balance can be defined as a function of maintaining the support base with control of the posture or minimal movement. Factors such as perceptual adjustment, vestibular systems, sense of sight, and information intensity obtained from sensory responses influence balance ability[7]. In the static stance, humans usually make upright stance close to the vertical array. If sway is expected to occur, typically, the balance is controlled by placing the center of mass (COM) on the body at the edge of the BOS[8]. The vestibular organ assists in performing the coordination among eye, head, and body in space,

Corresponding Author :
Ji Heon Hong,
hgh1020@hanmail.net

controlling posture. The vestibular interacts with visual sense and somatosensory[9]. Vestibular rehabilitation focuses on improving postural stability by maximizing and promoting the remaining vestibular function, as well as using visual and somatosensory cues [10]. Visual signals compose an extra vestibular signal that replaces the lack of vestibular information in daily life[11]. When additional visual feedback is achieved by controlling consciously the center of the pressure displacement underneath the feet during standing, the contribution of the visual control to the balance is greatly increased[12]. It has been found that the subject cannot reduce the amplitude of the sway when using visual feedback[12]. The proprioception is able to recognize the position of body and joints and to perform the exercise by collecting and integrating various data coming from the peripheral parts of the human body. It also reduces errors that occur during a movement through feedback and reflex mechanism[13]. Recent studies suggest that trampoline exercise consists of a multi-component approach that affects many physical factors such as balance, flexibility, strength, body stability, muscle coordination response, the amplitude of joint movement, and spatial integration[3]. To perform such movements as hopping or jumping on a trampoline, more experience should be provided so that a patient doesn't fall while moving on the stable surface in the home[14]. Furthermore, trampoline exercise improves mobility and activities in daily lives[15].

These previous studies suggest that the various movements on the trampoline provide more experiences and relatively more difficult movements produce various results of the movements. However, these previous studies did not investigate the various exercise methods of trampoline and changes with rest time. Therefore, this study was conducted to investigate the changes of balance ability and proprioception according to various trampoline exercise and resting time.

Method

Forty-five healthy adults participated in this study. In this study, a randomly turn allocation method was applied to each subject. The students were randomly divided into the walking group (WG, n = 15), calf raise group (CRG, n = 15) and jumping group (JG, n = 15) using a random number generator [Table 1]. This study was approved by Sunmoon University Institutional Review Board (SM-201805-032-2).

Balance ability and proprioception were measured pre-test and immediately after exercise, 5 minutes after exercise, 10 minutes, and 15 minutes after exercise. TETRAX (Sunlight Inc., Ramat Gan, ISRAEL) was used to measure balance ability and the test was performed under normal base-open eyes (NO) and normal base-close eyes (NC) conditions. Each measurement was performed for 32 seconds [Figure 1]. The stability index (SI) measures the sway of the posture and shows the overall degree of stability. The weight distribution index (WDI) means the degree of weight exerted on the four-foot plates.

The proprioception of the subject was measured using JPS [Figure 2]. Subjects were asked to sit on an isokinetic dynamometer (CSMI, CSMI solutions, USA, 2010) chair. JPS used passive positioning and active repositioning for the target angle. The target angle was set at 45°. The subject closed eyes and wore headphones to reduce the effects of other senses. The subject was asked to remember the target angle for 5 seconds. The target angle was actively reproduced by the subjects. Absolute error values between the target angle and repositioning angle were obtained for data analysis. Three tests were performed and mean values were used.

The procedure consists of three stages: (1) pre-exercise test, (2) exercise performance, and (3) post-exercise test (5 minutes, 10 minutes, and 15 minutes). As a first, a pre-exercise balance test and a proprioception test are performed on all subjects. Second, participants perform the exercise for 10 minutes with their assigned postures. The CRG repeatedly performs the exercise in which subjects take a rest for 2 seconds after

maintaining the posture (lift the heel) for 6 seconds. The JG repeatedly performs the exercise in which subjects take a rest after jumping according to BPM 100 speed. The elapse of break time is divided into three steps: 5 minutes, 10 minutes, and 15 minutes. The post-exercise test was performed in the same way as the pre-exercise test.

Figure 1. Balance test

Figure 2. Proprioception (joint position sense) test

All statistical analyses were performed using the SPSS 20.0 version program. Descriptive statistics were used to assess general characteristics. Mauchly's test of sphericity was used for the homogeneity test of the measurement variables among groups. Repeated measure ANOVA was used to test the effects depending on each exercise type on each group. If it was recognized that there was a significant difference, lysergic acid diethylamide (LSD) post-test was performed. The level of all statistical significance (□) was set at 0.05.

Result

There was a significant difference in SI data between pre- and post-intervention ($p<0.05$) [Table 2]. There was no significant difference between the mean SI, WDI, and proprioception between the groups ($p> 0.05$). According to the SI results in the NO condition, the stability was reduced immediately after exercise and restored after 5 minutes in all groups ($p<0.05$) [Figure 3]. According to SI results in NC condition, there was a significant difference between immediately after exercise and after 5 minutes in all groups ($p<0.05$) [Figure 4].

Table 2. Change of stability index according to condition and elapsed time in three groups

		Before exercise	Immediately after exercise	After 5 minutes	After 10 minutes	After 15 minutes
NO	WG	13.40	*14.67	*14.13	13.81	12.87
	CRG	15.22	*18.31	*15.18	15.41	16.02
	JG	14.46	*17.77	*15.10	15.69	14.61
NC	WG	16.50	17.24	*15.44	15.26	15.44
	CRG	18.30	21.09	*16.99	16.42	16.27
	JG	21.21	21.49	*18.01	17.62	16.03

NO: Normal base, Open eyes, NC: Normal base, Close eyes, WG: Walking Group, CRG: Calf Raise Group, JG: Jumping Group

* Indicates that there is a significant difference from the previous test result.

Discussion

This study was conducted to investigate the effects of the trampoline exercise intervention on proprioception, SI, and WDI according to the time-lapse. According to the results of this study, trampoline exercises did not affect proprioception and WDI. There was a significant difference between the pre-test and immediately after the intervention, and immediately after the intervention and 5 minutes after the intervention in NO condition. With NC condition, there was a significant difference only between the time of exercise and 5 minutes after exercise.

According to our results, trampolines affect SI. Previous studies have also reported that trampoline exercise is effective in maintaining and enhancing posture stability[1,3]. In the elderly, it was argued that the mini-trampoline training intervention had the effect of improving balance ability. Therefore, exercise with trampolines with unstable surfaces is considered to be an appropriate exercise to increase stability[2].

Although vision is not an essential element in standing posture control, it is still reported to contribute positively to posture control[16]. There was a claim that the vestibular system was not important in postural recovery when the surface transversed horizontally[17]. However, it has been suggested that the damaged vestibular system and vision can cause a reaction to false visual information because it has many effects on postural control[14]. When the visual sensory input is removed, the balance ability declines[18]. Instability of patients with neurological problems is due to inappropriate interaction among the three sensory inputs that provide direction to the posture control system. Patients who inappropriately rely on visual information react to unnecessary balance with recognized balance loss and their postures become unstable[19]. In our study, postural stability in eye open condition was reduced immediately after exercise. However, there was no change in the stability with the eyes-closed condition. Thus, this may be due to trampoline exercise confusing the visual system.

Trampoline exercise also influences muscle strengthening[20]. During the measurement of the joint position sense, the amount of relative error may not be significant, since the subject may try to produce force rather than accuracy. Our study also showed that the joint position sense did not improve within 15 minutes.

A weak correlation between weight-bearing and stability has been reported in stroke patients[21]. Their study also measured balance with two index – stability and weight distribution index – and although there was a significant difference in stability, the difference in weight distribution index was not significant.

Immediately after the trampoline movement, the balance ability measured in the eyes open condition is presumed to be due to the confusing of the visual system resulting in increased SI. On the other hand, after 5 minutes, SI decreased again. In the eyes closed condition balance test immediately after exercise, it is presumed that the change of SI is less due to blocking the visual information. It is also assumed that after 5 minutes the confusion is blocked and the SI is reduced. This means that at least 5 minutes of rest after exercise is required to reduce SI. Further studies are necessary to explain why there is a significant difference in SI between immediately after exercise and 5 minutes after exercise.

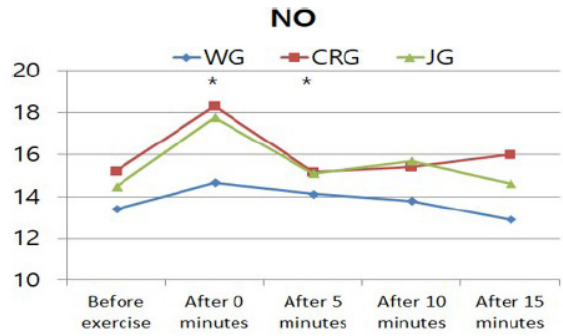

Figure 3. Change of stability index according to elapsed time in three groups (normal base and open eyes)

(* Indicates that there is a significant difference from the previous test result.)

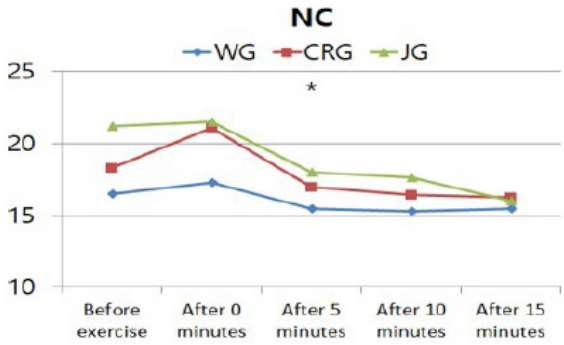

Figure 4. Change of stability index according to elapsed time in three groups (normal base and close eyes)

(* Indicates that there is a significant difference from the previous test result.)

This study has several limitations. First, there was no standard for jumping height during trampoline jump exercises. Second, the maximum rest time after exercise was 15 minutes. Therefore, the change was not confirmed after 15 minutes. Third, as the balance ability measurement uses two conditions (NC, NO), there is a possibility that the learning effect is affected by one condition and other conditions.

Conclusion

The trampoline movement used in this study did not affect proprioception and WDI. All three groups (walking, calf raise, and jumping) showed significant changes in SI after trampoline exercise. It is suggested that trampoline exercise is an effective intervention method for posture stability. However, there was no significant difference between the three groups. Since the trampoline exercises confuse the visual system, it is assumed that a rest time of at least 5 minutes is required to restore posture stability.

Abstract

Electroencephalogram (EEG) is very small amount of electrical signal generated in human brain due to the firing of neurons. Because of this signal information passes through our brain and a human being acts accordingly. These signals are very useful for analysis of various things that are happening in our brain. It can be used for any disease identification in brain, designing brain computer interface, emotion detection etc. In this paper we are going to consider the case of emotion detection by classification of EEG brain signals. For classification Machine Learning techniques are used. But alone one technique is not enough to provide results with high accuracy. Hence an ensemble of classifiers has been used by the help of weighted stacking approach. Through different experimental evaluations it has been proved that the proposed technique outperforms compared to simple machine learning classifier.

Keywords: *Electroencephalogram; Emotion Classification; Stacked Ensemble Classification*

Introduction

The role of the EEG brain signal is for the purpose of human brain investigation[1]. The biomedical signals are highly time varying and there exists a correlation with the signals. The primary objective of this signal is to provide electro-physiological activity for accessibility of the scalp. The detection of the pattern in the EEG signal is considered as one of the most important diagnostic process for neurological diseases. Emotions are one of the crucial parameters for expression evaluation. Identification of emotion in a human being is a difficult task as it is highly dependent on the evaluator. The emotion detection is biased as it depends on the state of the mind of the evaluator. The effect of human emotion affects the body reactions which are very difficult to control. They are like body temperature, heart rate or some other physiological changes. EEG signals are highly used for the identification or detection of the human emotional state[2]. In this research study, focus has been imparted between the emotion state of the human through EEG signal. Ensemble classification is need for EEG signal for the emotion detection. Weighted stacking approach is used along with the ensembling classifier technique for the purpose.

In this paper, the section is divided as follows: section 2 provides an overview about the previous related study based on EEG signal, section 3 provides an insight about the model and the techniques used on this research work follow by section 4 that discusses about the result found and the last section talks about the conclusion.

Related Work

EEG feature extraction and classification is one of the most crucial phase. Many studies related to this along with the emotion detection is have come into existence. Some of them are stated below.

Li et al. [3], proposed a high-resolution time frequency analysis where they stated that the components of the frequency changes over time and hence they went ahead for proposing a short-time Fourier transform for calculation the spectrum density using the sliding window concept. Similarly, another method was proposed by Yi et al.[4], were the classification of EEG signals were

done by a statistical method called approximate entropy method. Keeping the emotion into account, an emotional classifier was proposed by Jatupaiboon et al.[5] were two kinds of emotion were taken into consideration: happy and unhappy. The EEG signals were recorded and techniques like SVM and power spectrum density feature were used for emotion recognition.

Similarly, an IAPS method was used for emotion stimuli where higher order crossing, spectra and spectrum features where detected by Jenke et al. [6]. They used a Quadratic Discriminative Analysis (QDA) for classifying emotions like anger, sadness, happiness etc. Li et al. [7] proposed an emotion recognition algorithm for classifying different types of human expression using fractal dimension, and higher order crossing features that are later classified by SVM. Yoon et al.[8] proposed a classifier based on the probability aspect where perceptron convergence mechanism is used for emotion classification. Chakladar et al. [9] developed and proposed an algorithm based on the movement of cursor for reaching the target specified in a nominal time frame. Similarly, for developing a human machine interaction system like brain computer interface an emotion recognition system was developed using different machine learning algorithm by Nie et al.[10].

Proposed Model and Techniques Used

Emotion classification in human brain is a very complicated task, as it is the god's most complicated creation in this world. But researchers are trying to analyse this classification task by the help of EEG brain signal collected from human brain by an invasive medical technique. Through this invasive technique there is no internal surgery is required, but just by keeping electrodes on the scalp we can collect the EEG brain signals. There are mainly two ways available through which we can classify emotions. First, emotions can be described as discrete and fundamentally different constructs. Second, we can characterise emotions on a dimensional basis in grouping. So, in this work we have considered the second way to classify the emotions. Again, the dimensional representation of emotions can be two or three dimensional but two-dimensional representation is the most efficient way which has been adopted in our work. Figure 1 explains the working procedure of a stacked ensemble approach. In this approach in each level of stacking there are different weights given to decide the estimator performance. There are mainly two levels for stacking is done using three first level models and then use these predictions as features for 2nd level prediction. Figure 2 describes the overall architecture of our proposed model at a bigger level. First the EEG signal are used for feature extraction and then it passes through a stacked ensemble classifier to classify the emotions.

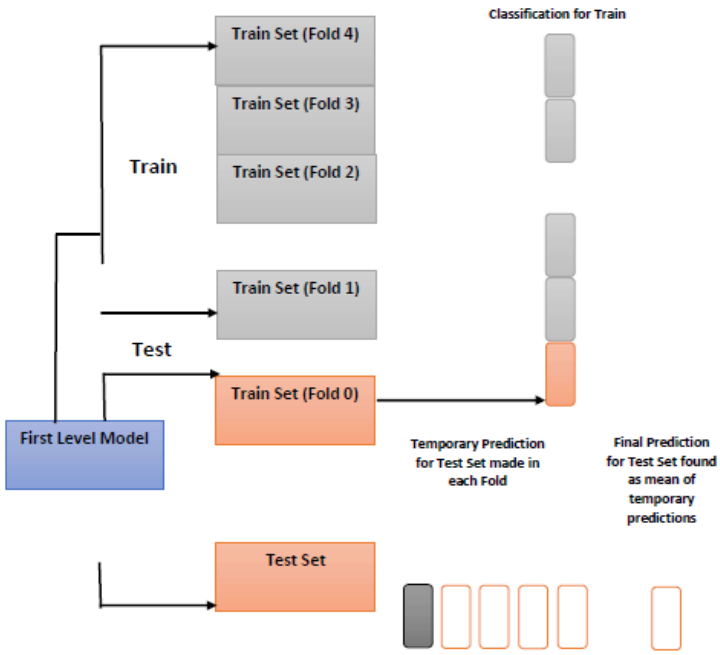

Figure 1: Working model for First level and one-fold Stacking procedure in ensemble learning

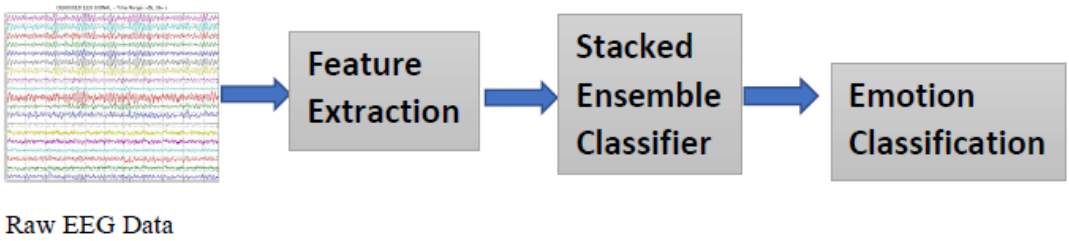

Figure 2: Architecture of proposed emotion classification model

Results and Discussion

1. Dataset Description

In this work for all experimental evaluations we have used the very popular DEAP dataset for emotion classification. It consists of EEG signals for 32 participants when they were watching 40 examples of 1-minute long music videos. The signals are collected by using electrodes placed on scalp using 10-20 electrode placement technique. In this work we have used pre-processed DEAP dataset. The dataset is constructed with a python numpy array with number of trials with number of channels and finally with data for each 32 subjects. There is another data file also constructed for labels discretised in the range of 1.0 to 9.0. These discretised values are decided based on the bi-dimensional classification of emotions, basically valence and arousal.

2. Experimental Setup

In this paper all, the experimental works have been performed by using python environment in windows platform and with a hardware support of intel core i5, 8th generation processor and 8GB RAM. There are few basic python libraries are used like numpy, scipy, scikit-learn, pywt, matplotlib, visdom server and vecstack etc. To visualise the outputs at one place visdom server has been used. By using this we can see all our outputs at one place in a browser window.

3. Result Analysis

All the experiments have been carried out using the pre-processed DEAP dataset. The machine learning algorithms have been applied for solving two class problem of emotion recognition. The two classes are valence and arousal. There are mainly three machine learning classification algorithms have been used Multi-layer perceptron neural network (MLPNN), Random Forest and K-Nearest Neighbour algorithm. These algorithms are used for comparison with our proposed stacked ensemble technique. The different measurement metrics used for comparison are overall accuracy, specificity, sensitivity and f1-score. All the measurements are done in percentage. Table 1 explains the different measurement metrics used for comparison of different machine learning techniques with our proposed stacked ensemble technique.

Table 1: Result analysis for different Machine Learning algorithms along with proposed technique

Performance Measures	MLPNN	Random Forest	K-Nearest Neighbour	Stacking with SVM
Accuracy	92%	95%	88%	98%
Specificity	91%	94%	86%	95%
Sensitivity	92%	93%	89%	97%
F1-score	94%	96%	90%	99%

Figure 2 describes the bar plot representation of different measurement metrics used to compare the performance of different techniques. In the figure blue colour represents MLPNN, green colour represents RF, black colour represents KNN and red colour represents stacked SVM approach. From the figure it can be clearly visualised that the proposed approach having highest values for all measurement metrics. Hence the proposed technique outperforms all the other techniques in classification of emotions for a two-class problem.

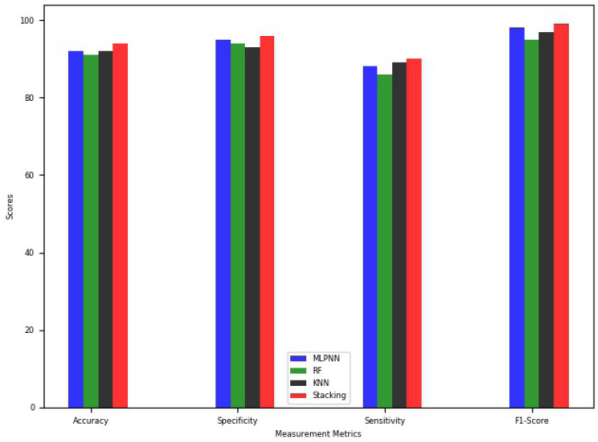

Figure 3: Graphical representation of different measurement metrics for different techniques

Conclusion

Brain signal that is EEG signal is the only way to analyse a human brain with high accuracy without any internal intervention in human brain. These signals could be analysed to classify the emotions of a person with great accuracy. In this work we tried to enhance the performance of machine learning algorithm to classify the emotions in human brain in two different classes that are valence and arousal. There are many machine learning-based classification algorithms are available but we have chosen mainly MLPNN, RF and KNN to compare the performance of our proposed algorithm. The proposed stacked SVM algorithm outperforms all other techniques.

Evaluate the Efficacy of C Arm in Measuring the Range of Dynamic Movement in Temporo-Mandibular Joint

Sanat Kumar Bhuyan[1], Ruchi Bhuyan[1], Manoj Kumar Sahu[1], Jayasankar HP[1], Sidhant Bhuyan[1], Mihir Narayan Mohanty[2]

[1]Institute of Dental Science, SOA University, Bhubaneswar, Odisha, India,
[2]ITER, SOA University, Bhubaneswar, Odisha, India

Abstract

Introduction: The commonest clinical conditions for imaging referral are the temporo-mandibular joint (TMJ) disorders or dysfunctions followed by pathologies specific to the bone and the joints. Various noninvasive and invasive imaging modalities are available to image TMJ. Application of C-arm technology to study the dynamics of TMJ is unique of its kind as this is the only modality where TMJ can be studied in motion. The basic objective of the study to evaluate the efficacy of c arm in measuring the range of dynamic movement.

Methodology: This case control study was conducted among 35 cases having TMJ pathologies and 35 healthy controls in Department of oral medicine during April-December 2018. The inter-incisal distance and the condylar distance was measured using c arm.

Results: The mean inter-incisal distance (controls: 46.5 ± 12.3 mm vs cases: 32.1 ± 10.9 mm) as well as mean condylar distance (controls: 16.8 ± 5.4 mm vs cases: 10.8 ± 3.9mm) were significantly lower amongst cases as compared to controls. The inter-incisal distance as well as the condylar distance was found to be significant between cases and controls amongst both the genders

Conclusion: The programming of c ram in dental use mostly in TMJ needs to evaluate with respect to adjusting the image clarity contrast sharpness and preventing the overlapping of the adjacent structures. In this study, we got a significant result when we compared the overall inter-incisal distance and condylar distance between healthy and diseased individuals.

Key words: *Temporo-mandibular joint, inter-incisal distance, condylar distance, c arm*

Introduction

The TMJ is complex structure considered as a ginglymo-diarthrodial synovial joint that allows motion in one plane (backward and forward) as well as gliding and translational motion. [1] The articular surface is formed by mandibular condyle inferiorly, glenoid fossae superiorly and articular surface of the temporal bone.[2] The mandibular condylar process is around 15-20 mm wide transversely and 8-10 mm wide in the antero-posteriorly.

The articular surface is covered by fibrocartilage instead of hyaline cartilage which lies between the condyle and glenoid fossae.[1] Rotational movement occurs primarily in the inferior joint space, against the inferior surface of the articular disc. Pure rotation, without translation can be created by guided manual manipulation and will allow for up to 25 mm of inter-incisal opening. Translation, or sliding movements of the joint, occurs primarily in the superior joint space, as the superior surface of the disc slides against the articular tubercle.[2]

The opening and closing of the jaw is performed by muscles of mastication (medial and lateral pterygoids, masseter, and temporalis) in addition to other accessory muscles. [3-5]

Temporo-mandibular Joint (TMJ) pain is relatively common in general population with a prevalence of 16-59% reporting symptoms and 33-86% exhibiting clinical signs.[6] Only about 25% of the cases seek medical attention.[7] In clinical practices, the commonest clinical conditions for imaging referral are the TMJ disorders or dysfunctions followed by pathologies specific to the bone and the joints.

Various noninvasive and invasive imaging modalities are available to image TMJ. The noninvasive modules are CT, MRI, USG, CBCT, 3D C – arm CT and other conventional methods while various invasive modalities are arthrography, arthroscopy etc. The limitations of conventional radiography and various Tempromandibular Joint (TMJ) projections to evaluate the soft tissue components of TMJ have been replaced with advanced imaging techniques like Ultrasound, Computed Tomography, Magnetic Resonance Imaging, Cone Beam Computed Tomography and Nuclide Imaging. Within a span of 30 years the technological advances in imaging has gained rapid momentum expanding the arena for diagnosing the TMJ disorders. [8]

C arm was first discovered in 1955 which is an innovative imaging technique composed of flat panel detectors it generates 2D CT like images. In maxillofacial area the c arm is used in root canal treatment, implant dentistry and in maxillofacial trauma.[9] C-arm comprises a generator (X-ray source) and an image intensifier or flat-panel detector, which was discovered by Ziehm in 2006.[10] The insight into the latest procedure guided imaging like C-arm into various medical specialities and its extension into dentistry cannot be undermined. Application of C-arm technology to study the dynamics of TMJ is unique of its kind as this is the only modality where TMJ can be studied in motion and provides an excellent insight into the biomechanics of the most unique joint in the body. The basic objective of the study to evaluate the efficacy of c arm in measuring the range of dynamic movement

Methodology

This is a case-control study conducted in Department of oral medicine and radiology in Institute of Dental Sciences, Bhubaneswar situated in the eastern part of India. The cases were patients diagnosed with TMJ pathologies. The inclusion criteria for cases were patients with a complaint of persistent pain in TMJ region for a duration of 1-2 years or less and those willing to participate. Individuals contraindicated for radiation exposure like pregnancy or patients treated for head and neck cancers were excluded from the study. Patients without TMJ pathologies were taken as controls. A total of 35 cases and 35 controls were included in the study, during the duration of April- December 2018. Matching was done using age and gender criteria.

C arm with a specification of 14 KHz, 1.9KW, 40-120KV, 8.0-250 mA with a fluoroscopy rate of one image per second. Patient were positioned supine with head tilted at 30° from the mid sagittal plane and forming an angle of 10° upwards & Frankfurt Horizontal plane being perpendicular to the floor. The Interincisal distance for each sample was measured (mesio-incisal angle of upper central incisor to the mesio-incisal angle of lower central incisor) and condylar distance (most superior point of articular eminence to most superior aspect of convexity of condyle). The maximum permissible dose was 0.05Sy/year.

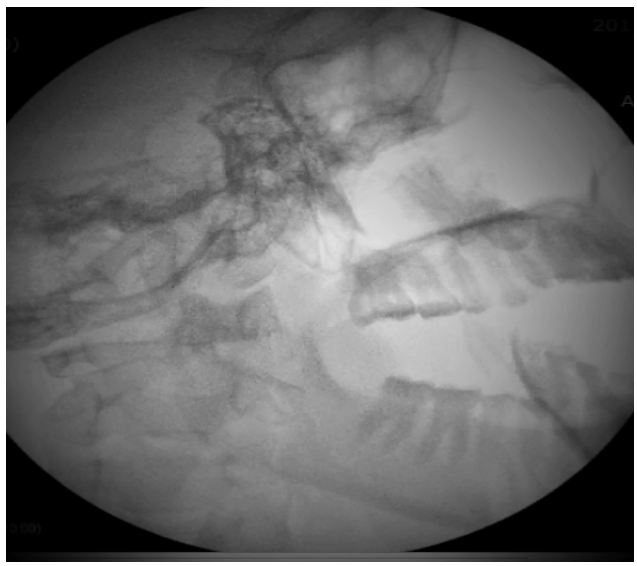

Figure 1. Sectional image of C- arm (Normal TMJ)

Various factors like demographic factors, degree of TMJ pain, jaw dislocation, partially locked jaw, inter-incisal distance, deviation of mandible while opening, TMJ movement on opening were assessed.

The data was entered in Microsoft excel and was analysed using SPSS version 20.0. The qualitative data was represented with mean and standard deviation while the quantitative data was represented with mean

and standard deviation. The difference between two proportions was calculated using chi-square test while the difference between two means amongst two groups was calculated using unpaired t test. P value less than 0.05 was considered to be statistically significant.

Results

This case-control study was conducted to assess the efficacy of C arm in measuring the range of dynamic movement.

Table 1: Comparison of demographic factors among cases and controls

Variables	Cases (n=35)	Controls (n=35)	P value
Age in years	43.34 ± 7.28	42.98 ± 8.96	0.770
Gender (M:F)	24: 11	24: 11	1.000

There was no significant difference observed in age and gender among both cases as well as controls.

Table 2: Comparison of inter-incisal distance and Condylar distance between cases and controls

Variables	Groups	Mean ± SD in mm	T test	P value
Inter-incisal distance	Controls (n=35)	46.5 ± 12.3	5.183	0.0001
	Cases (n=35)	32.1 ± 10.9		
Distance condyle	Controls (n=35)	16.8 ± 5.4	5.328	0.0001
	Cases (n=35)	10.8 ± 3.9		

As per the table 2, the mean inter-incisal distance (controls: 46.5 ± 12.3 mm vs cases: 32.1 ± 10.9 mm) as well as mean condylar distance (controls: 16.8 ± 5.4 mm vs cases: 10.8 ± 3.9mm) were significantly lower amongst cases as compared to controls. The range for inter-incisal distance were 40-71 mm while for intercondylar distance 8- 21 mm.

Table 3: Comparison of inter-incisal distance and Condylar distance between males and females amongst cases and controls

Variables	Groups	Mean ± SD in mm	T test	P value
Females				
Inter-incisal distance	Controls (n=11)	41.8 ± 11.9	2.733	0.012
	Cases (n=11)	29.2 ± 9.6		
Distance condyle	Controls (n=11)	13.4 ± 4.6	2.301	0.032
	Cases (n=11)	9.8 ± 3.3		
Males				
Inter-incisal distance	Controls (n=24)	48.6 ± 12.3	4.999	0.0001
	Cases (n=24)	33.4 ± 8.4		
Distance condyle	Controls (n=24)	18.3 ± 7.8	3.905	0.0003
	Cases (n=24)	11.2 ± 4.3		

As per table 3, the inter-incisal distance as well as the condylar distance was found to be significant between cases and controls amongst both the genders. But the mean distance between males were found to be higher as compared to females amongst both cases and controls.

Discussion

Mouth opening is one of the commonest word clinician use in day to day practices. Patients with Temporomandibular joint diseases often complain of restricted mouth opening. The major aim of the treatment is to restore the mouth opening to normal value from the diseased state. It is thus important to know the normal value as well as in the diseased state. So this study was conducted to evaluate the efficacy of C arm in measuring the range of dynamic movement at TMJ for mouth opening between both diseased and health patients and comparing them.

Interincisal distance and inter-condylar distances are affected by many factors which include age, gender, height and race etc. [11-16] In this study the inter-incisal distance for health individuals were 46.5 ± 12.3 mm which is almost equal to the nepalese populations 47 ± 1 mm. [17] Study conducted by Sohail A et al in UAE observed the inter incisal distance amongst males (59.74 ± 5.26 mm) subjects was higher as compared to female (46.50 + 3.32 mm). [18] Oginni FO conducted a study amongst Nigerian population observed the mean inter-incisal distance (MID) were 45.68 ± 6.7mm, 47.60 ± 7.73 mm, and 46.69 ± 7.29mm in the Southwest, Northwest, and combined groups, respectively which is similar as compared to our study. MID was significantly higher in both males than females, reached the peak at age 33 years in both the genders and, thereafter, decreased with increasing age. [18]

In this study the condylar distance among health individuals was observed to be 16.8 ± 5.4 mm. Study conducted by Haghighat A et al observed the **superior, posterior and anterior condylar distances were observed to be 2.28** ± 0.06mm, 1.91 ± 0.48 mm, 2.02 ± 0.48 mm wgich is similar to our study.[19] Study conducted by Rawi NHA et al in UAE observed that the condylar distance and condylar angle decreases significantly amongst TMJ diseased as compared to normal individuals. This is similar to our study findings.[20]

Conclusion

An ambitious pilot study sample size of 70 patients was considered with 35 diseases and 35 healthy individuals to evaluate the dynamic changes in TMJ using C arm. This machine has been widely used in gastroenterology, neurology and orthopaedics but no considerable work has been done in the field of temporomandibular joint in order to see the dynamic movement. The programming of c ram in dental use mostly in TMJ needs to evaluate with respect to adjusting the image clarity contrast sharpness and preventing the overlapping of the adjacent structures. In this study, we got a significant result when we compared the overall inter-incisal distance and condylar distance between healthy and diseased individuals. This is an eye opener for us and more researches are needed in future.

Correlated Levels of Anti-Inflammatory Interleukins (IL-4 and IL-10) with Allergic Conjunctivitis (AC) in Iraqi Patients

Nihad Khalawe Tektook[1], Osamah Jihad Abdul Qader[2]

[1]Department of Medical laboratory techniques, College of Health and Medical Technics, MiddleTechnical University, Baghdad; [2]Assist. Professor, M.B.Ch.B. – F.I.B.Ms.OPHTH.-F.ICO, College of Medicine, Tikrit University, Iraq

Abstract

Background Allergic conjunctivitis (AC) is caused by an allergic reaction, most common form was hypersensitivity reaction (type 1), that caused to perennial or seasonal AC. Current study was done in the Hospital of Ibn-AL-Hythem for eyes infections in Baghdad from September- August of 2018, one hundred and thirty-two serum were collected from allergic conjunctivitis patients after diagnostic by a specialist ophthalmologist according to have symptoms, who included 60 male and 72 female, with range age (15-51) years. Used the enzyme-linked immunosorbent assay (ELISA kit) from (Pepro-Tech Company , UK) for estimating levels of both Interleukins (IL-4 and IL- 10) in patients serum **Results** current study showed higher significant in age group (≥ 35 years) as percentage (57.6%) compare to age group (25- 35) as (28.1%) , also significantly higher in females (54.5%) than males (45.5%) , also level of IL – 4 in allergic conjunctivitis patients was (23.91± 2.09) compare to control (21.02± 2.99) ,so significantly increased levels of IL-10 in allergic conjunctivitis patients (14.99 ± 2.30) than control (11.10± 1.99).**conclusions** current study were **concluded** higher significant of allergic conjunctivitis Iraqi patients in age group (≥ 35 years), and the AC in females higher than males, as well as level of IL – 4 in allergic conjunctivitis patients were significant with control, and significantly increased levels of IL-10 in allergic conjunctivitis patients compare to control .

Keywords *: interleukins(IL-4; IL-10) ; allergic conjunctivitis(AC) ; Iraqi patients*

Introduction

Allergic conjunctivitis(AC) (or name as "allergic rhinoconjunctivitis," was most commonest allergic eye disorder, in the last decades in Iraqi patients , so allergic diseases were increased dramatically [(1)] Allergic eye usually are associated with others allergic conditions, such as dermatitis (atopic eczema) and allergic rhinitis (hay fever) , so th causing of eye allergies are similar to the allergic rhinitis (hay fever) and allergic asthma [(2)].

Allergic conjunctivitis is type of IgE-mediated hypersensitivity a wide term that recognised as 6 types including perennial allergic conjunctivitis (PAC); seasonal allergic conjunctivitis (SAC), contact lens-induced; atopic keratoconjunctivitis (AKC) drug-induced, and vernal keratoconjunctivitis (VKC)[(3)], However, both (VKC) and (AND) have pathophysiological and clinical pathophysiological characteristics completely different from (PAC) and (SAC), although some common markers of allergy[(4)]. AC common manifests as itchy, red eyes, or watering which included the symptoms of ocular symptom scores[(5)].

Cosmetics and Medication can play important role in causing of eye allergies , Any types of irritant, whether infectious, environmental, or manmade, can cause symptoms that consistent with an allergic of an eye , AC is caused by allergen-induced inflammatory response(AIIR), that allergen (such as animal dander ; pollen; and other environmental antigens[(6)]will be interacting with antibody (IgE bound to sensitized mast cells) causing clinical ocular allergic expression(COA). The pathogenesis of (AC) is predominantly an IgE-mediated hypersensitivity reaction. Activation of mast cells WHICH induces enhanced tear levels of the histamine; leukotrienes ;prostaglandins and tryptase, and this early response lasts clinically(20 minutes

–30 minutes) [2]. also, the degranulation of Mast cell to induces activated the vascular endothelial cells, that turn the expresses chemokines and adhesion molecules such as vascular cell adhesion molecules (VCAM) and intercellular adhesion molecules (ICAM) , so the other chemokines secreted [2] .

Many cytokines that derived from Th1, such as IL(2, 3) and IFN-γ, that mediates recruitment of the macrophages, while the cytokine that derived from Th2, such as IL (4 and 5), that participates in both chemotaxis and activation of the eosinophils[7], therefore aim of current study to assess levels of cytokine interleukin 10 (IL-10) and IL-4 in allergic conjunctivitis(AC) patients.

Material and Method

Sample collected :

Current study was done in the Hospital of Ibn-AL-Hythem for eyes infections in Baghdad from September - August of 2018. One hundred and thirty-two serum were collected from allergic conjunctivitis patients after diagnostic by a specialist ophthalmologist according to have symptoms such as Redness in inner eyelid or white of eye ; Itchy eyes; Blurred vision; Increased amount of tears ; and Swelling of the eyelid (fig.1) , who include 60 male and 72 female, with range age (15-51) years.

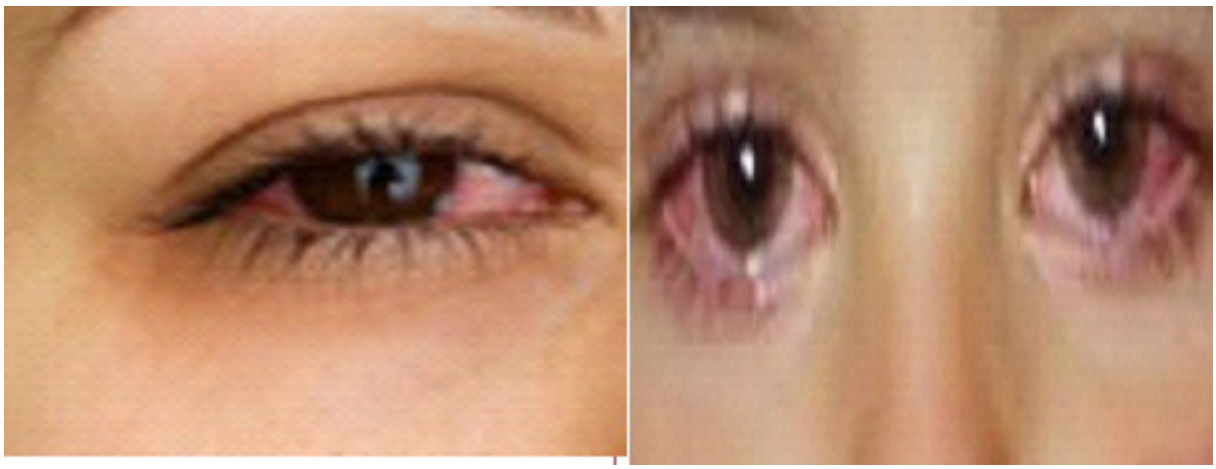

Figure (1): Symptoms of allergic conjunctivitis

Estimation levels of Interleukins (IL-4 and IL- 10) in patients serum

Used the enzyme-linked immunosorbent assay (ELISA kit) from (Pepro-Tech Company , UK) for estimating levels of both Interleukins (IL-4 and IL- 10) in patients serum according to the manufacturer's instructions.

Findings

Table (1): Distribution of allergic conjunctivitis patients according to age groups and gender

Age groups (years)	Patients		Control	
	No. = 132	%	No.= 50	%
≤ 25	19	14.3	12	24
25- 35	37	28.1	20	40
≥ 35	76	57.6	18	36
Total	132	100	50	100
Gender				
Male	60	45.5	25	50
Female	72	54.5	25	50
Total	132	100	50	100

Results in table (1) showed the range age of allergic conjunctivitis patients was (15-51) years, also Majority of allergic conjunctivitis patients within age groups of (≥ 35)years as percentage (57.6%) compare to age group (25- 35) as (28.1%) , also significantly higher in females (54.5%) than males (45.5%) . These results are shown in Figure(2 &3).

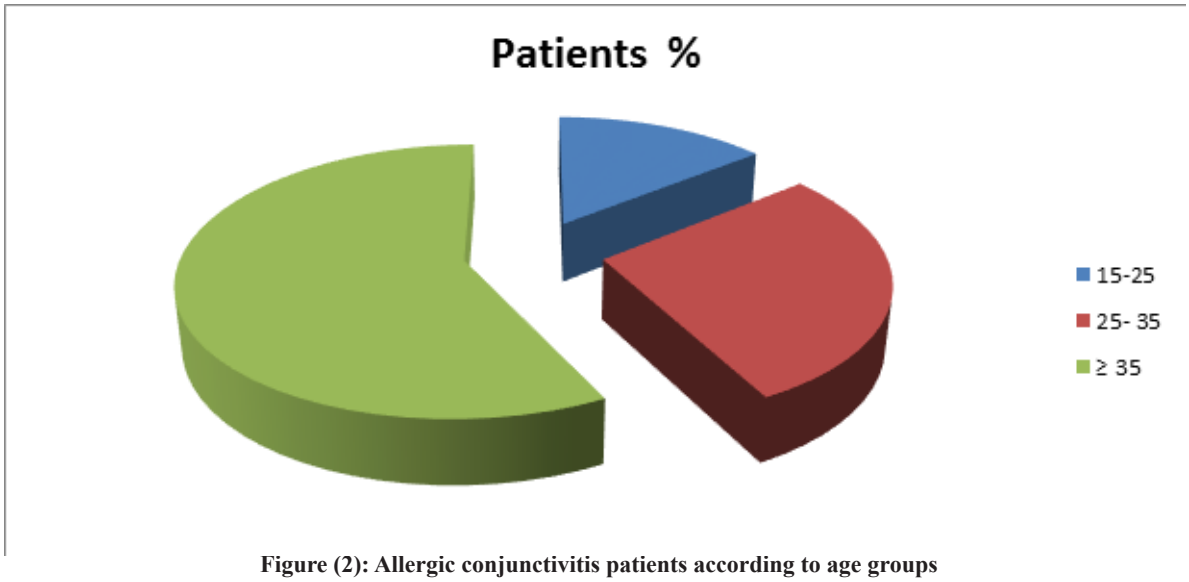

Figure (2): Allergic conjunctivitis patients according to age groups

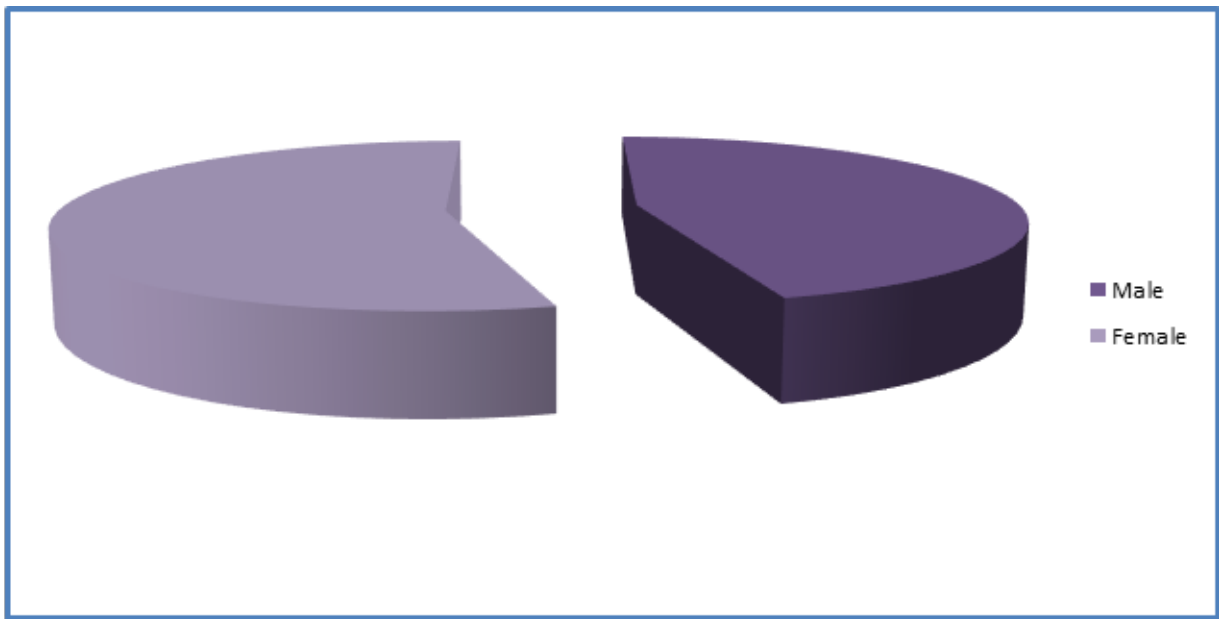

Figure (3): Allergic conjunctivitis patients according to gender

Table (2): comparative of interleukins Level (IL – 4 and IL – 10) in patients (Study group) and healthy (Control).

Levels of interleukins (pg/ ml)	Study group (M± S.D)	Control (M± S.D)	
IL - 4	23.91± 2.09	21.02± 2.99	No significant
IL - 10	14.99 ± 2.30	11.10± 1.99	significant

Results in table (2) showed the level of IL – 4 in allergic conjunctivitis patients was (23.91± 2.09) compare to control (21.02± 2.99) , so significantly increased levels of IL-10 in allergic conjunctivitis patients (14.99 ± 2.30) than control (11.10± 1.99),these results were shown in Fig.4.

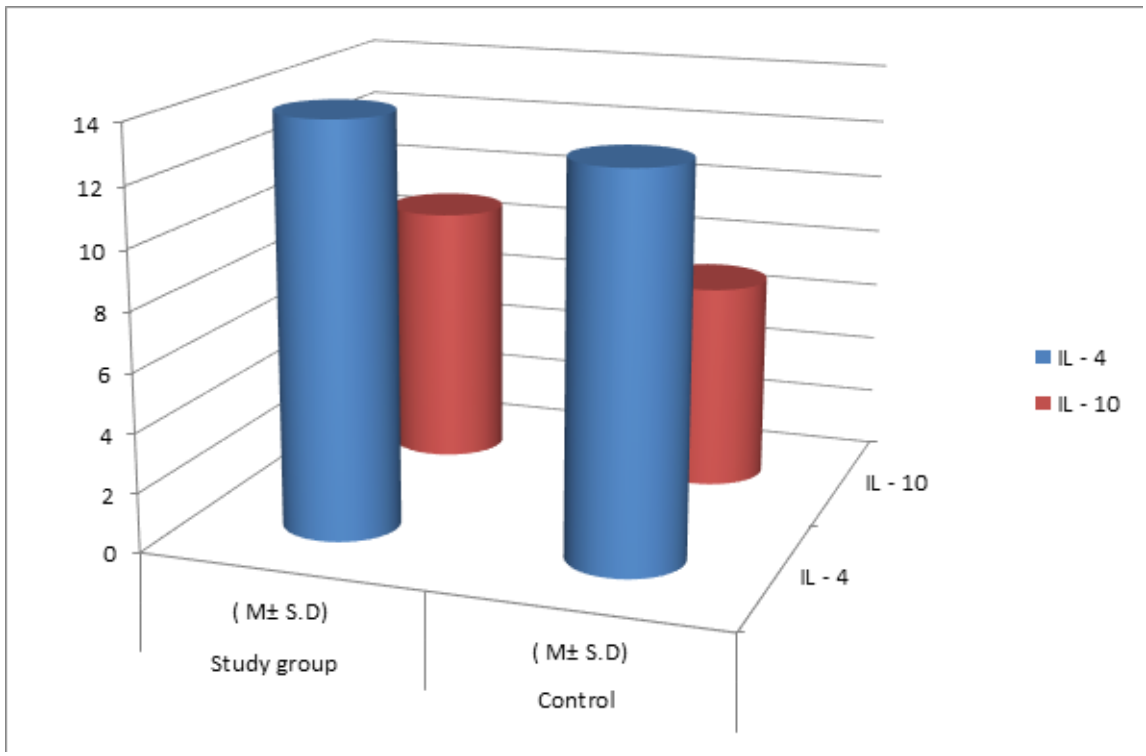

Figure (4): Comparative levels of interleukins (IL – 4 and 10) in allergic conjunctivitis patients and healthy.

Discussion

Current study showed more prevalence of allergic conjunctivitis patients in age group (≥ 35 years) as percentage (57.6%) compare to age group (25- 35) as (28.1%) , this similar results with Fasasi etal., 2014 who showed more prevalence of AC in age groups (17 -33) years as (43.6%), followed by ≥16 years as (42.3%)[8]. Ocular allergy is a higher prevalence in the western countries comparing to Africa and Asia[9]. Allergic conjunctivitis(AC) in (12–13) year old schoolchildren, was(19%)[10] , about (6–30) % of general population, who diagnoses with Allergic conjunctivitis[11], who represents ≥ 90% of all ocular allergies[12].

The current study showed the allergic conjunctivitis are commoner in females (54.5%) than males (45.5%). These results are consistent with the results of previous studies as[13;14;8] ,whilst differ with the results of researcher Hall and Shilio, 2005, who showed males more predominate than females[15].

Both Interleukin (4 and 10) are anti-inflammatory cytokines which mainly functions via suppressing the pro-inflammatory[16] .

During active the inflammatory of allergic eye diseases, the cytokines of T-helper cell (Th1 and Th2) were secretion and over expressed[17].cytokines of Th2 as interleukins (IL- 4; IL-5 ; IL- 9 ; IL -10 and IL-13) will promoting different elements of allergic inflammation as (isotype-switching from IgG1 ; propagation of the Th2 phenotype) to mobilization eosinophil ; maturation and activation mast cell and synthesis immunoglobulin (IgE), that important for allergy[18]

Interleukin (IL)-4 plays a very important role in inflammatory and fibrotic events in many human diseases[19], In Inflammation, such as post-cataract surgical or non-allergic cause slightly increased in production level of IL-4, but high produced level from IL-4 were related to allergic reactions[20], and increased level in the serum of allergic individuals[21], so IL-10 an anti-inflammatory cytokine (Th2-type cytokine) is secreting by different cell types as (B-cells ; T cells ;

macrophages and monocytes under various conditions of immune activation[22] .although IL-10 is been shown to suppress a broad range of inflammatory responses and is known to be an important factor in maintaining a balance of overall immune responses[23].Thus, used IL-10 in developed novel therapy for many human diseases such as autoimmune diseases and allergic responses[24] .

Conclusions

1. Significantly higher of allergic conjunctivitis patients in age group (≥ 35 years) , also significantly higher in females than males.

2. High level of IL – 4 in allergic conjunctivitis patients was (23.91± 2.09) compare to control ,so significantly increased levels of IL-10 in allergic conjunctivitis patients compare to control .

The Role of Zinc Sulfate in Subchronic Cadmium Chloride Toxicosis in Male Mice

Ahmed D. Khudhair[1], Duraid A. Abass[2]

[1]Baghdad University- Collage of Veterinary medicine –Department of Physiology, [2]Pharmacology and Biochemistry, Baghdad, Iraq

Abstract

Aim: study sort of interaction between zinc sulfate and cadmium chloride. **Method:** sixty albino male mice divided equally into four groups as follows (Toxic dose of cadmium chloride 5mg/kg B.W (T1); Zinc sulfate 10mg/kg B.W (T2); their combined dosing (T3) and control group. (C) given D.W. At the end of the experiment, all the animal sacrified and their liver is dissected and prepared for histopathology also, another part of same liver submitted to homogenization process to determine the level of metallothionein 2 (MTII) and malondialdehyde (MDA). **Result:** histopathology of liver section revealed in the cadmium dosed group, a necrosis in hypatocyte, vascular degeneration, diffusion of mononuclear cell and neutrophill infiltration around dilated blood vessels, congestion of blood vessels around portal area and parenchyma, apoptosis of hepatocyte characterize by fragmented nuclei with irregular cytoplasm. While no lesion were recorded in liver section of zinc sulfate dosed group. In combined dosed group, liver section showed either no lesion or less severe lesion consisting of local aggregation of active macrophage and lymphocyte.Result of MTII in liver homogenate recorded highly significant increase in all treated group especially in combined dosed one that showed increase up to 3.3 times; while cadmium and zinc alone dosed group recorded increase 2.1 and 1.9 than control one. The result of MDA in liver homogenate showed highly significant increase level in cadmium toxic dosed group up to 17.8 times, while zinc sulfate group showed only 1.6 time increase than control and combined dosed group that showed no level differences. **Conclusion:** result of liver histopathology and MTII / MDA levels were indicative the protective role of zinc administration to overcome sub chronic cadmium toxicosis by increase their MTII binding protein that reduce the toxic effect or levels of cadmium induce cellular lipid peroxydation damage.

Key Ward: *MTII, MDA, Histopathology and liver homogenate.*

Introduction

Cadmium (Cd) is one of the most dangerous heavy metals, known to produce severe and multi-organ toxicity in humans [1,2]. It is released into the environment by mining, smelting operations, fuel combustion and other industrial process [3] Humans can be exposed to Cd and it can stimulate free radical production, resulting in oxidative deterioration of lipids, proteins, and DNA, manifesting as gross pathology of the liver, brain, and other organs in humans and animals [4]. The extremely long biological half life of cadmium essentially makes it a cumulative toxin, so long past exposures could still result in direct toxic effects of the residual metal [5] The body has limited capacity to respond to cadmium exposure, as the metal cannot undergo metabolic degradation to less toxic species and is only poorly excreted, making long-term storage a viable option for dealing with this toxic element. The long residence time of cadmium is in part attributable to metallothionein (MT), a metal-binding protein that is induced by cadmium and tightly binds the metal. Cadmium accumulates primarily in the liver and kidney where it is bound to MT, and it is felt that cadmium bound to MT is essentially detoxicated, at least temporarily, through this high affinity sequestration [6, 7]. Major detoxification mechanisms protecting the cell from Cd-induced damage is the direct binding of Cd2+ to metal chelators like Metallothionein (MT) is a ubiquitous low molecular weight (usually <10 kDa) protein with high cysteine content and has strong affinity for heavy metals [8].

The other way to induction (MT) is giving zinc which is an essential trace element play important roles in structure and function of proteins, metabolism of RNA and DNA, signal transduction, gene expression, and regulation of apoptosis [9]. It is required for the action of more than 200 metalloenzymes and more than 2000 Zn dependent transcription factors have been recognized [10]. Zinc has antioxidant properties and plays an important role in scavenging reactive oxygen species, and they also hypothesized that in the absence of zinc, the possibility of increased oxidative damage exists [11]. Several research showed that treatment with Zn during Cd exposure prevented or decreased the harmful effects of Cd [12]. Zn might reduce uptake of Cd by competing for a common transporter [13].

Moreover, zinc induced the synthesis of metallothionein in the liver, which caused Cd accumulation in the liver and delayed its transfer to the kidney. The zinc is a well-established antioxidants and it can protect against Cd-induced oxidative stress [14]

Method

In this study we used sixty adult albino mice weighted (30–32 g) that were divided into four groups of 15 for each group. They were administered the dosage daily orally at morning with overnight fasting by using gavages needle lasted for 45 days.

The first group of mice was (T1) administered cadmium chloride once a day at (5mg /kg B.W). The second group (T2) administered dose in the NOAEL range of zinc sulfate (10 mg/kg B.W) orally. The third group(T3) administered combination of both zinc sulfate (10 mg/kg B.W) and after four hours administered cadmium chloride(5mg /kg B.W) (1, 15). The forth group act as a control (C) and administered distilled water orally. At the end of sub chronic study all groups of animal sacrified surgically under anesthesia and their liver submitted to homogenization process to determine metallothionein 2 (MTII) and malon dialdehyde MDA level in liver, while another part of liver used for histopathological examination.

Findings

The table (1) showed a significant (P<0.01) increase in MTII level in liver homogenate of all treated groups after sub chronic dosing. The cadmium chloride group level increased by 2.17 times from the control group; while the zinc sulfate increase by 1.9 times that control one. The combined group showed the largest increase between all treated groups by triplicate level 3.3 times above the control level.

Table (1) Metallothionen II (MTII) level (ng/ml) in liver homogenate of mice groups dosed sub chronically with cadmium chloride and zinc sulfate and their combined:

Group n:15	**MT2 In liver Mean ± SE**
(T1)Cadmium Cloride 5mg/kg	8.17 ± 0.10 b
(T2)Zinc Sulfate 10mg/kg	7.32 ± 0.08 c
(T3)Cadmium and Zinc 5mg/kg+10mg/kg	12.74 ± 0.28a
(C)Control Distilled water	3.85 ± 0.12 d
LSD value	0.356 **
Means having different letters in same column differed significantly. ** (P<0.01).	

Table (2) listed that the level of MDA in liver homogenate showed higher significant increase (p>0.01) in cadmium chloride group with lowest increase but still significant in the zinc sulfate group while the MDA in liver seem to return to normal in the combined dosed group without significant difference from the control group.

Table (2) Malondialdehyde (MDA) level (nmol/g) in the liver of mice groups dosed sub chronically for 45 days with cadmium chloride , zinc sulfate and their combination :

Group n:15	MDA In liver Mean ± SE
(T1)Cadmium Chloride 5mg/kg	47.58 ± 0.19 a
(T2)Zinc Sulfate 10mg/kg	4.30 ± 0.18 b
(T3)Cadmium and Zinc 5mg/kg+10mg/kg	2.68 ± 0.24 c
(C)Control Distilled water	2.67 ± 0.19 c
LSD value	0.615 **
Means having different letters in same column differed significantly. ** (P<0.01).	

The result of histopathology showed in the control group normal liver section with no lesion in (fig.1 Section A)., while in cadmium group liver section showed infiltration of neutrophils and mononuclear cell around dilated and congested blood vessels (fig.1 Section B). There was a diffuse of mononuclear cells infiltration in liver parenchyma(fig.1 Section C) and in portal area(fig.1 Section D). A congested blood vessels and necrosis of hepatocytes seen in(fig.1 Section E).

Granulomatous inflammation were seen in the liver parenchyma in(fig.1 Section F). Also there were apoptotosis of hepatocytes characterized by dense nuclei chromatin with irregular cytoplasm in addition to fragmented nuclei (fig.1 Section G). Vacuolar degeneration and necrosis of hepatocytes also seen(fig.1 Section H). The zinc group showed normal liver section with no clear lesion at NOEAL dose (figure 9). The combined group showed normal liver cell with no clear lesion (fig.1 Section J)., while other tissue appeared with some granuloma consististing from local aggregation of active macrophages and lymphocytes (fig.1 Section D).

A- Section in the liver of control shows no clear lesions (H& E stain 40X)

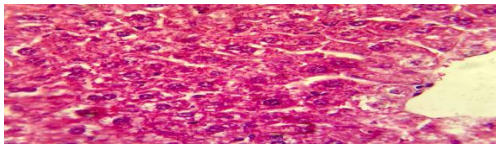
B- Section in the liver of cadmium chloride group (T1) shows neutrophils and mononuclear infiltration around dilated blood vessels (H& E stain 40X)

C- Section in the liver of cadmium chloride group (T1)shows diffuse mononuclear infiltration in liver parenchyma (H& E stain 40X)

D- Section in the liver of cadmium chloride group (T1) shows diffuse mononuclear infiltration in portal area (H& E stain 40X)

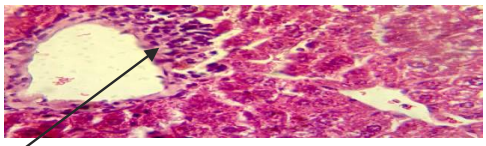
E- Section in the liver of cadmium chloride group (T1) shows congested blood vessels with necrosis of hepatocytes (H& E stain 40X)

F- Section in the liver of cadmium chloride group (T1) shows granulomatous inflammation in the liver parenchyma (H& E stain 40X)



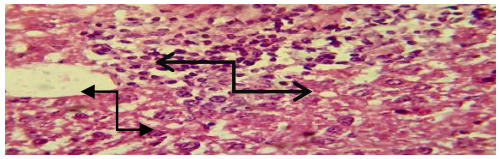
G- **Section in the liver of cadmium chloride group (T1)shows apoptotosis of hepatocytes characterized by dense nuclei chromatin of irregular cytoplasmic of hepatocytes in addition to fragments of nuclei (H& E stain 40X)**

H- Section in the liver of cadmium chloride group (T1) shows vacuolar degeneration and necrosis of hepatocytes (H * E stain 40X)

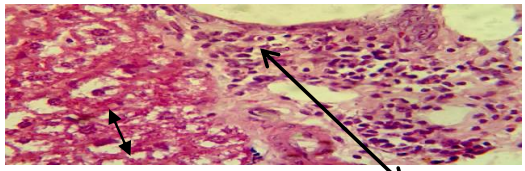


I- Section in the liver of the zinc sulfate group (T2) shows no clear lesions (H& E stain 40X)

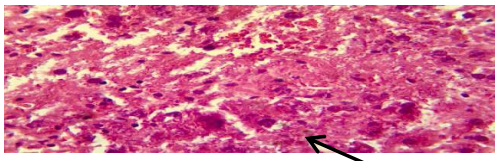
J- Section in the liver of the combined dosing group (T3) shows no clear lesions (H& E stain 40X)



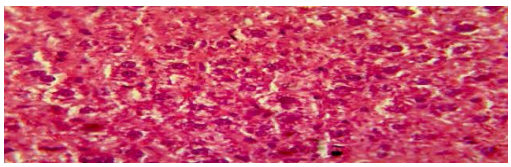
K- Section in the liver of combined group (T3) shows granuloma consisting from the local aggregation of active macrophages and lymphocytes (H& E stain 40X)



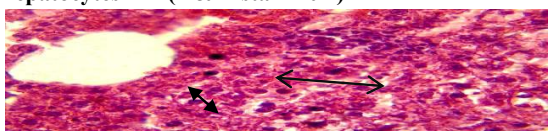
A- Section in the liver of control shows no clear lesions (H& E stain 40X)



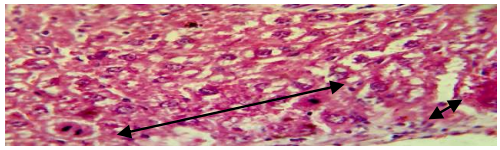
B- Section in the liver of cadmium chloride group (T1) shows neutrophils and mononuclear infiltration around dilated blood vessels (H& E stain 40X)



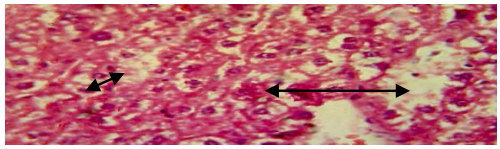
C- Section in the liver of cadmium chloride group (T1)shows diffuse mononuclear infiltration in liver parenchyma (H& E stain 40X)



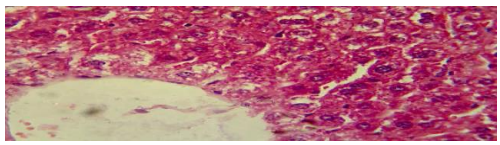
D- Section in the liver of cadmium chloride group (T1) shows diffuse mononuclear infiltration in portal area (H& E stain 40X)



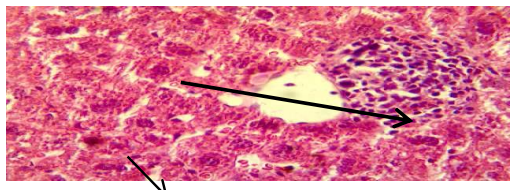
J- Section in the liver of the combined dosing group (T3) shows no clear lesions (H& E stain 40X)



E- Section in the liver of cadmium chloride group (T1) shows congested blood vessels with necrosis of hepatocytes (H& E stain 40X)



F- Section in the liver of cadmium chloride group (T1) shows granulomatous inflammation in the liver parenchyma (H& E stain 40X)



G- Section in the liver of cadmium chloride group (T1)shows apoptotosis of hepatocytes characterized by dense nuclei chromatin of irregular cytoplasmic of hepatocytes in addition to fragments of nuclei (H& E stain 40X)

H- Section in the liver of cadmium chloride group (T1) shows vacuolar degeneration and necrosis of hepatocytes (H * E stain 40X)

I- Section in the liver of the zinc sulfate group (T2) shows no clear lesions (H& E stain 40X)

Discussion

The present study was designed and performed to study the interaction between zinc and cadmium and their combined dosing by performing dosing of them sub chronically for 45 days.

The hypothesis that Zn can protect tissue against Cd-induced tissue damage in adult mice and rats was established by our and several other previous studies [4, 16, and 17]. It is well known that many toxic effects of cadmium (Cd) action result from interactions with essential elements including zinc (Zn). These interactions can take place at different stages of absorption, distribution in the organism and excretion of both metals and at the stage of Zn biological functions. Exposure to Cd leads to disturbance in Zn level in the organism on the one hand, while dietary Zn intake has an important effect on Cd absorption, accumulation and toxicity on the other. The Zn status of the body is important in relation to development of Cd toxicity. Numerous data showed that increased Zn supply may reduce Cd absorption and accumulation and prevent or reduce the adverse actions of Cd, whereas Zn deficiency can intensify Cd accumulation and toxicity [18].

This is in accordance with the fact that the majority of Cd uptake occurs by a process associated with Zn transport, competing for common binding sites and membrane carriers like divalent metal transporter1 (DMT1) or luminal Zn transporter1 (ZTL1). Also, as oral treatment with Zn induces enhanced metallothionein (MT) synthesis in the liver [19].

Metallothionein is efficient intracellular small protein scavenger involved in intracellular detoxification via binding to cadmium. There was a significant increase of metallothionein concentration in all treated groups. The result of MT in sub chronic study indicate that MT level in liver homogenate increase by 2.12 times for Cd and two times for zinc alone group in comparison with control one but MT level in liver of the combined administered group showed higher increase of MT 3.3 times than control.

This could be attributed to the long time of exposure (45 day) that give opportunity for each metal to highly induce synthesis of MT in liver which possibly cause complete protection in Zn alone group while still in Cd a lone group which showed toxicity signs that increase with increase of administration period indicating that the induced MT were not enough to overcome the toxicity signs. And that in agreement with [19,20]. Binding and induction of metallothionein appears to play an important role in the physiologic regulation of zinc levels and, possibly, its reactivity to other legends [21].

The significant increase of the MDA level in sub chronic dosing in cadmium group might be due to increase of the oxidative stress and generation of the free radicals by cadmium. The cadmium group caused an increase of MDA level by 17.6 fold above control group while the combination group, the value of MDA returns to normal one. The reason of that was due to the role of zinc as antioxidant agent. It is well known that Zn is an essential component of the oxidant defense system with participation at multiple cellular levels and improved activity of antioxidant enzymes and as a result minimized oxidative damage [22].

Oxidative stress is considered an important mechanism of cadmium induced toxicity which might be due to the depletion and changes in the activity of antioxidant enzymes or reduced of glutathione (GSH) [23]. Another study recorded that the cadmium caused decreases in the activity and level of antioxidants system elements as well as vitamin C, E and glutathione content and leads to the production of oxygen reactive forms. Also by other route the cadmium toxicity generates free radicals by stimulating the synthesis of inflammatory mediators which in turn stimulates the generation and subsequent oxidative stress [24].

The liver is the primary target organ following systemic Cd exposure. The uptake of Cd into the liver is critical for the development of overall toxicity induced by heavy metal. Approximately half of Cd absorbed systemically is rapidly accumulated in the liver, which resulted in the reduced availability of Cd to such organs as the kidneys and testes, which are more sensitive to its toxic actions [25].

The hypatotoxicity involves two pathways, one for an initial injury produced from direct effects of the metal and the other for the subsequent injury produced by inflammation. Primary injury is produced by the binding of Cd to sulfhydryl groups on critical molecules in mitochondria, causing oxidative stress, the mitochondrial permeability transition, and decreased mitochondrial respiration.

Hepatocellular injury occurs because damage to endothelial cells disrupts the microcirculation and causes ischemia. Secondary injury from acute cadmium exposure is thought to occur from the activation kupffer cells and a complex series of interactive events with a large number of inflammatory and cytotoxic mediators[24].

The histopathological studies of the liver section in cadmium group showed mononuclear inflammatory cells infiltration of in the portal area, infiltration of neutrophils and mononuclear cell around dilated and congested blood vessels, congested blood vessels and necrosis of hepatocytes, which is a damage to membranes by severe, lysosomal enzymes enter the cytoplasm and digest the cell, and cellular contents leak out. That might happen due to oxidative stress and increase the tension on cells membrane lead to lake out of lysosomla content [26].

Histological alterations in liver tissues like degeneration of hepatocytes, vacuolization, congestion of hepatic tissues, subcapsular vacuolization, necrosis, were observed in the liver of mice exposed to Cd.

The initial lesion in the liver during the present study might be due to physiological changes that took place in the liver tissue in the process of trying to homeostatistically regulating and detoxifying the Cd metal during continuous exposure.

In hepatic tissue, the histological alterations noted during the sub chronic Cd exposure as focal necrosis, increased condense and fragment nucleus, cellular necrosis and ruptured hepatic tissue in Cd group. These findings are consistent with cadmium inducing greater hepatic alteration. Further, in this study identified alterations of the liver cells may be the result of diverse biochemical alteration in liver following the Cd toxicity that act as a signal of degenerative processes that suggests metabolic damage also [27].

In addition to above chances vacuolation of hepatocytes is also noted which is suggested to be associated with the inhibition of protein synthesis, energy depletion or a shift in Cd as a poisonous metal that promotes early oxidative stress and later contributes to the development of serious biochemical and pathological conditions because of its long retention in some tissues.

In the present work, the administration of Cd resulted in severe hepatocyte necrosis, fatty changes, degeneration signs and inflammatory cell infiltrations. These results are similar to those reported previously in the literature [28].

Conclusion

Zinc sulfate at low dose might act as antidote in case of cadmium toxicosis this was supported by the result of clinical physiological as well as the level of zinc and cadmium in liver.

Correlation Between Glugometer and Laboratory Methods in Measuring Capillary and Venous Blood Glucose Levels in Type 2 Diabetic Patients

Ahmed Mohammed Alwan[1], Hamza Ali Saleh[1]

[1]Department of Medical Laboratory Techniques, Al-Yarmouk University College, Baghdad

Abstract

Objectives: The aim of the study was to investigate the correlation between levels of blood glucose in samples taken from patients with type 2 diabetes mellitus measured by instrument for self-monitoring of blood glucose (glucometer) and by laboratory methods (photometric method or enzymatic colorimetric method). **Method:** One hundred patients with type 2 diabetes mellitus (T2DM) who were attending a privet medical laboratory during the period December 2017 to March 2018 were participated in the present study. Among the participants, 46 were female with an age range of 40-80 years and a age mean of 53.10± 10.61 years .The male patients were 54 with an age range of 40-79 years and a age mean of 51.17± 9.74 years. Venous and capillary blood glucose levels were determined by laboratory methods and glucometer for each participant. **Finding :** The mean of photometric venous blood glucose (PVBG) was 163.88 ±107.06, Glucometric Venous Blood Glucose (GVBG) was 190.95 ±123.96 mg/dl, Photometric Capillary Blood Glucose (PCBG) was 171.53±116.52 mg/dl, and Glucometric Capillary Blood Glucose (GCBG) was 193.69±123.21 mg/dl. The obtained data was analyzed by Lin's concordance correlation coefficient. Concordance correlation coefficients (r_c) were 0.94 for PVBG vs GVBG and 0.97 for PCBG vs GCBG.***Conclusion:***

The results obtained in this study showed that the values of blood glucose level determined by glucometer are close to the values determined by laboratory methods. Moreover, a positive correlation coefficient showed strong association between capillary and venous glucose measurements.

Introduction

In a global report on diabetes, WHO has noticed an increase in both the prevalence of diabetes and the number of diabetic people. The report has emphasized the need of sufficient lifelong management and regular follow-up for diabetic patients so they can have healthier lives [1].

It is well known that diabetes is associated with complications such as blindness, cardiovascular disorders, limb amputation and nephropathy [2].

Reaching a reasonable glucose control in patients with diabetes depends on the availability of blood glucose (BG) level knowledge. To get this knowledge, patients may check their BG level at hospitals or privet medical laboratories where biochemical methods are applied to measure BG levels [3].

Regular self-monitoring of blood glucose (SMBG) by diabetic patients was recommended by clinical guidelines as a tool for self-management [4]. Self-monitoring of blood glucose has been considered as a fundamental part of self – management and diabetes care as it has many benefits .These benefits include the use of SMBG for the detection of serious hyperglycemia and as an advance notice to detect hypoglycemia. Moreover, real-time data can indicate the effects of life style, such as diet and physical activity, on blood glucose levels[5]

Rapid blood glucose determination has become a requirement for treatments and dose adjustments. Laboratory methods to measure plasma glucose levels are time consuming. Therefore, the use of glucometers has greatly increased [6].

Using glucometer device in SMBG makes it a process where Blood Glucose (BG) is checked by the patient himself. As an out-come of using glucometers, the patients are participating in the therapy process and hence they would have a better life quality [2]

Beside better glycemic management, the benefits of using glucometers include simple usage and operation and the need of one drop of blood. These benefits are not reduced by doubts regarding the precision and accuracy of the devices [2].

According to the international organization for standardization (ISO) acceptable error for a glucometer be within ± 15 mg/dl when laboratory glucose levels are <100 mg/dl; and the acceptable error should be within 15% for laboratory values ≥100mg/dl[6]

The present study was conducted to investigate the correlation between blood glucose concentrations determined by a glucometer and blood glucose levels obtained by laboratory method.

Materials and Method

Measurements were based on two types of blood samplings, venous blood sampling and finger-prick blood sampling. Blood glucose levels of samples collected by the later method of sampling were determined by glucometer and capillary laboratory method.

For the laboratory (photometric) blood glucose level measurements, a 3.5 ml of venous blood samples were collected from participants by applying the blood drawing at the median cubital vein, whenever possible, following normal protocol. A small portion of each sample was used to measure glucose concentration with glucometer. Sodium fluoride was used as glycolysis inhibitor. Blood samples were kept in an appropriate conditions and environments for subsequent analysis.

Capillary sampling from a finger was performed for each and every participant. The entry site was disinfected; the skin was punctured with a lancet. The first drop of blood was wiped away then a blood sample was collected with a capillary tube. A micro hematocrit centrifuge was used at 12000 rpm to separate serum.

The blood glucose levels were determined using an enzymatic colorimetric method according to the kit's protocol using a spectrophotometer .The kit type Linear (LINEAR CHEMICALS, SPAIN) was purchased from local markets.

Glucometric measurements of blood glucose level were performed using a Glucometer (ACCU-CHEK Active Mannheim, Germany). Glucometric measurements were applied for capillary blood glucose (GCBG) and for venous blood samples (GVBG).

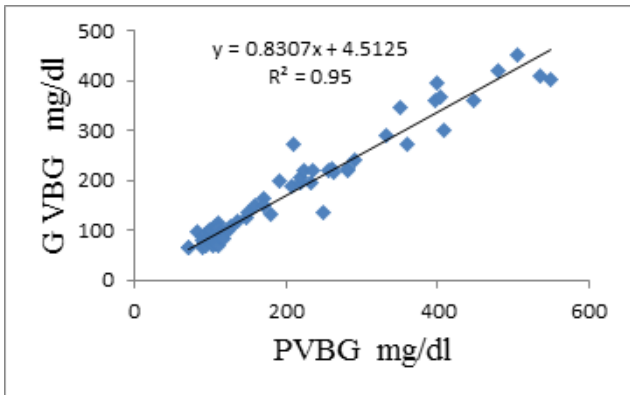
Photometric measurements of blood glucose level were performed using a Uv/Visible Spectrophotometer (Type Apel – china). Photometric measurements were applied for capillary blood glucose (PCBG) and for venous blood samples (PVBG).

Finding

One hundred diabetic patients were participated in this study. In table 1 the statistical data of the participant are presented.

Table 1-Statistical data of the participant patients

	Female	**Male**	**Total**
Sample size	46	54	100
Age range, Years	40-80	40-79	40-80
Mean ± s.d*., years	53.10 ± 10.61	51.17 ± 9.74	± 10.16



*standard deviation

The experimentally obtained blood glucose levels that were measured by glucometric and photometric techniques are summarized in table 2. The mean value of venous blood glucose level and capillary blood glucose level along side with standard deviation are given in table 2.

Table 2. Comparison of different glucose level determination methods. methods and the corresponding correlation coefficients

	Venous blood		Capillary blood	
	Glucometer	**Photometric**	**Glucometer**	**Photometric**
Mean Glucose level ± s.d. mg/dl	190.95 ±123.96	163.88 ±107.06	193.69 ± 123.21	171.53 ±116.52
Correlation coefficient ,R^2	GVBG vs PVBG		GCBG vs PCBG	
	0.95		0.992	
Concordance correlation coefficient, r_c	0.94		0.97	

To assess the strength of association between the glucose levels obtained by the two measurements methods, the linear correlation coefficient R^2 were determined from the linear plots of GVBG vs PVBG and GCBG vs PCBG which are shown in figure 1-a and figure 1-b respectively.

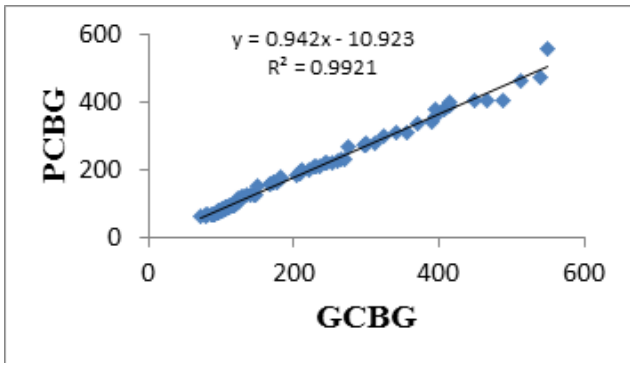


Figure 1- linear correlation plots of : a –PVBG vs GVBG and . b- PCBG vs GCBG

The values of the square of the correlation coefficient, R^2 are given in table 2 These values indicate a high association between glucometric and photometric methods used for blood glucose level measurements. The case of PCBG vs GCBG showed higher association, as the corresponding R^2 has a value of 0.992, in compression to PVBG vs GVBG case where R^2 has a value of 0.95.

The obtained data were further analyzed by the procedure which calculates Lin's Concordance correlation coefficient [7]. The procedure assumes that n observations Y_k and X_k are selected from a bivariate population. Here Y represents a measure from a candidate method and X represents the corresponding measure of the standard test or method, in the present study it is the photometric method. The degree of concordance (agreement) between the two measures is represented by the value of r_c which can be estimated from the formula :

$$r_c = \frac{2S_{XY}}{(Y-X)^2 + S^2_Y + S^2_X}$$

The statistic, r_c , is an index of how well a new test or measurement (Y) reproduces a standard test or measurement (X). It quantifies the agreement between these two measures of the same variable. The values of a correlation, r_c ranges from -1 to 1, with perfect positive agreement at 1[7].

Concordance correlation coefficient (r_c) analyses values are presented in table-2. Those values showed moderate agreement between GVBG and PVBG with r_c value of 0.94. A strong agreement was observed for the correlation between GCBG and PCBG as the corresponding r_c values was 0.97.

Conclusion

The results obtained in this study showed that the level of blood glucose determined by glucometer is close to the blood glucose level measured by laboratory methods. Moreover, a positive correlation coefficient showed strong association between glucometric and photometric methods.

The concordance correlation coefficient (r_c) showed a high agreement between laboratory methods and the use of glucometer.

Hence, from the obtained results of the current study it may be concluded that use of glucometer is benefiter for glucose self monitoring to asses the control of blood glucose level for diabetic patients.

Effect of *Toxoplasma gondii* Infection on DNA Sequence among patients with Testicular Cancer

Ammer Abd. Mohammed[1], Rana S. Nasir[1]

[1]College of Health and Medical Technics, Middle Technical University, Baghdad, Iraq

Abstract

This study was conducted on 20 testicular cancer patients who visited the Al-Barraa privet Laboratory and Al- Sharika Labratory / Baghdad, with mean age of (27.77 ± 6.01) years. The ELISA technique was used to detect toxoplasmosis, and tumor biopsies were taken from 6 patients. The PCR amplifications of the "PIK3CA" gene were performed. The primers were used for exon 9 amplification. During the exon 9 PIK3CA gene amplification process, the first pair of the used primers included PIK3CA-9F-1, "5′- GTATTTGCTTTTTCTGTAAATCATCTG-3" and "PIK3CA-9R-1, 5′ CATGCTGAGATCAGCCAAATTC-3′′. The determination of PIK3CA genome was done by nested polymerase Chain Reaction using primers of PIK3CA gene with amplicon size 161bp. The "oligonucleotide" was tested at 0.05, 0.075 and 0.10 µmol/L concentrations, while ""LNA oligonucleotide" was tested at 0.075 and 0.0375 µmol/L concentrations for *PIK3CA* exon 9", which showed optimal detection for the *PIK3CA* exon 9 LNA mutation.

Key word: *Toxoplasma gondii, Testicular Cancer, DNA sequence.*

Introduction

Toxoplasmosis is a serious condition in which individuals are infected and may then suffer from cancer [1,2]. Toxoplasmosis can reach to most organs of the human body and the latest genetic change in some of these organs may result in carcinoma [3].Testicular cancer is the heterogeneous disorder which was historically shown to be challenge for classification [4]. High levels of their heterogeneity is explained by the emergence of pluripotent germ cell lines, and by long time interval when the oncogenic mutations assemble prior to the quickly invasion growth during or post puberty stage [5]. "TGCT originates from the aberrant arrested fetal gonocyte", which does not progress into "spermatogonium appropriately after birth". During puberty and childhood, this arrested gonocyte shows oncogenic adaptation, which then become germ cell neoplasia in situ (GCNIS) during childhood and adulthood, which then emerges as an invasive TGCT during young adulthood. During the early childhood, GCNIS can be identified histologically, but during the young childhood, it is challenging and difficult to be differentiated from the normal germ cells [6]. In general, histologic classification shows two subtypes of "TGCT", the "Seminoma and "Non-Seminoma" TGCTs. The seminoma is a homogenous cancer similar to the undifferentiated gonocytes, and accounts for about (55%) of the TGCTs, and its peak incidence occurs at the age group (35-39) year, while a "non-seminomatous germ cell tumor "(NSGCT)" constitutes about "(44%)" of the "TGCTs" and in general, they are more aggressive than seminomas, and diagnosed at younger ages "(25-29)" years. The heterogeneity of "NSGCT" composition reflects its dysregulation in differentiation into embryonic cancers, "choriocarcinomas, teratatomas and yolk sac tumors" [7]. The combined or mixed tumors are the tumors which contain both NSGCT and seminoma and classified as a NSGCT subtype. TGCT is usually defined as the curable model of cancer, which is has an exquisite susceptibility to chemotherapy, and has more than (95%) survival rate. Chemotherapeutical treatment of TGCT is usually associated with the morbidity and complications such as infertility, metabolic syndromes or cardiovascular diseases [8].

Materials and Method

In the current study, 20 testicular cancer patients were enrolled. The tumor biopsy specimens were taken from 6 patients, and the other 14 patients were analyzed

for *"PIK3CA"* mutations using PCR. *Elisa technique was used for detection of toxoplasmosis*. In the exon "9 PIK3CA" gene, the "prescreening for mutation detection was done by using direct DNA sequencing", as previously described. Further analysis was conducted on specimens with mobility shifts by the direct DNA sequencing on automated sequencing systems from ("ABI PRISMTM 3100 Genetic Analyzer, Applied Biosystems, Hitachi, Japan") using the "ABI PRISM Big Dye" Terminator version 1.1 Cycle Sequencing Ready Reaction Kit from (Applied Biosystems, Branchburg, NJ, USA).

Statistical analysis:

The Microsoft Office Excel 2007 and SPSS version 16 programs were used for data analysis. The numeric data were expressed as mean ± SEM (standard error of means). The P value (< 0.05) was considered as significant.

Results

Table (1) shows the distribution of testicular cancer according the age groups and residency of patients.

Table (1): Distribution of patients according to age groups and residency

Age groups	No=20))	100 %
(45-49)	5	25.0
(50-59)	5	25.0
(60-69)	6	30.0
(70-75)	4	20.0
Residency		
Rural	12	60.0
Urban	8	40.0

Table (2) "shows the mean toxoplasma (IgG) and (IgM) antibodies detected by ELISA technique".

Table (2): Mean toxoplasma (IgG) and (IgM) antibodies detected by ELISA technique

Disease	Mean IgM	Mean IgG
Toxoplasmosis	(0.48 ± 0.23)	(0.38± 0.20)

During the "exon" "9 PIK3CA" gene" amplification process, the first pair of the used primers included "PIK3CA-9F-1", "5′-GTATTTGCTTTT-TCTGTAAATCATCTG"-3′ and "PIK3CA-9R-1, 5′ CATGCTGAGATCAGCCAAATTC-3′" as shown in figure (1).

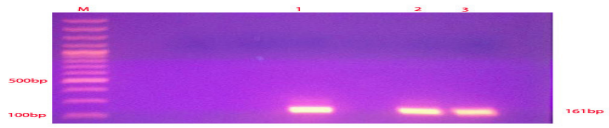

Figure (1): Determine of PIK3CA genome by nested polymerase Chain Reaction using primers of PIK3CA gene.

M: 100 bp DNA ladder (M). Lanes: (1-8) positive isolates (161 bp). At 2.5% agarose gel.

The Electrical current is equal to 60 volte at 30minutes.

Analysis of *PIK3CA* gene

The "oligonucleotid"e was tested at "0.05, 0.075" and "0.10 µmol/L" concentrations, while "LNA oligonucleotide" was tested at "0.075" and "0.0375" µmol/L concentrations for "*PIK3CA* exon 9", which showed optimal detection for mutation as seen in table (3).

Table (3): Polymerase Chain Reaction of *PIK3CA* Exon 9

"PIK3C4 Exon"	"Mutation"	"Nucleic acid"	"Sensitivity with" "LNA probe"
9	"E545K"	"GAC > AAG"	1.0%
	"E545D"	"GAG > GAT"	2.5%

Discussion

Testicular cancer is one of the most common condition observed in the elderly age. Involvement of *Toxoplasmosis* with this testicular histological change is controversial. Our study revealed that the (45-75) years age group is more infected with this disease. Epidemiology is one of the common conditions in Iraq and people suffering from this disease may suffer from other physical complications. This finding agreed with Jenna E. Boyd who found that there are many complications that may take place following the treatment of this malignant tumor [9].

Toxoplasmosis is an age-problem disease that affects most body parts causing apparent damages, and can be very serious causing malignant tumors [3]. Several body organs develop multiple impairments due to the migration of toxoplasma tachyzoites [10]. Thus, cancerous tumors can affect different parts in the body because of toxoplasmosis [11]. Several genetic mutations may take place due to the relationship between toxoplasmosis and various body organs and tissues accompanied by tissue alteration, which matches with the report of Ramakrishnan, Ch. *et al,* 2019, who demonstrated that *Toxoplasma* happens at the site of occupation to the body as a result of its interaction with the body tissues [12]. In our study, the genetic mutations were found in the gene E545K in Nucleic acid GAC > AAG and E545D gene in Nucleic acid GAG > GAT, in PIK3C4 *Exon* 9, where this genetic mutation occurred in this site of the genetic sequence of the DNA of the testicular tissue. Existence of *Toxoplasma gondii* at the affected site reinforced the genetic mutation in the testicular tissue. These findings agreed with Jun Zheng et al, 2019 who showed that A TCTP-like gene was detected in the genome of Toxoplasma [Toxoplasma gondiiTCTP (TgTCTP)], despite its unknown unknown function [13]. This means that the alteration in the epidermal tissue's genetic sequence is due to the existence of toxic toxoplasmosis precisely at the injury site, which can be attributed to the weak immune system of the infected individual, and thus leading to that malignant tumor.

Correlated level of interleukin (IL_10) with Allergic Rhinitis and Effect Study of Steroid in its Levels

Anas Ahmed Saleh[1], Inas Abd Al Majed Rasheed[2]

[1]Department of Surgery / College of Medicine/Tikrit University, [2]Department of Lab.Scienses / College of Pharmacy /Tikrit University/ Salah Aldin /Iraq

Abstract

Background: the allergic rhinitis or hay fever, is the most common diseases or type of allergic, often associated with runny nose ; nasal congestion; sneezing ; sinus pressure and eye problems, that similar to cold, so in recent years allergic rhinitis increased in Iraqi population, because many important factors. The aims of the current study were to assessment (IL_10) in Patients serum and study the effect of Steroid in Its Levels.**Patients and method**: Patients' serums were collected form Salah Aldin General Hospital during period (November ,2018 - March, 2019) a total of 44 patients Suffering from Allergic rhinitis after diagnosis by physician ENT Specialist and control group included 32 (healthy person), the serum IL_10 levels that measured by theELISA (Beckmancompany, USA) according to the manufacturer's protocols (IL_10 ELISA kits), All samples are detected in duplicate. **Findings:** Mean of age ± Standard division was (29.17±7.65) compare to control 30.23±8.90 , high incidence allergic rhinitis in males 29(65.9%) than females 15(34.1%) , also in control group ;males18 (56.3 %)more than females14 (43.7 %); P<0.01. Also Results in of current study showed significant decreased levels of interleukin(10) in serum of Patients with allergic rhinitis as (8.21 ± 0.25), compare to control group (healthy persons) as(11.67 ± 0.33) differed significantly (P<0.01), but significant increased level of IL_10 (10.06 ± 0.23) in serum of Patients with allergic rhinitis who received gluococorticoid (steroid) Patients compare to Patients before received gluococorticoid (steroid), a differed significantly (P<0.01). **Conclusion:** high incidence Allergic Rhinitis in males than females. decreased level of (IL_10) in serum with allergic rhinitis but increased levels of IL -10 in Patients serum with allergic rhinitis who received gluococorticoid (steroid) Patients compare to Patients before received gluococorticoid (steroid).

Key words: *Patients ; Allergic Rhinitis ; Steroid ; IL10 Levels*

Introduction

The allergic rhinitis (AR), is a common disorder which is linked as strongly to conjunctivitis and asthma, nearly 500 million people in worldwide suffering from AR[(1)], so AR is I.g.E-mediated chronic inflammatory, which is considered a classic Th2-mediated disease[(2)]. the symptoms of allergic rhinitis asnasal obstruction ; nasal itching;sneezing as well as rhinorrhea.

Also the nasal and ocular symptoms directly related to the allergic process, as well as leads to sleepiness during the day and less the quality of live because of symptoms[(3)] .

Allergic rhinitis to development requires an interaction between: immune system ;environment factor as well asgenetic susceptibility. the Allergen inducing proliferation of Th-2 lymphocyte in patients with allergies with releasing of their characteristic combination of cytokines including interleukins IL(3; 4; 5 ; 9; and 13). These substances promoting producing the I.g.E and mast cell. Mucosal mast cells which producing the IL (4 ; 5 and 6) and tryptase proliferate in the allergic epithelium[(4)]

The importance of the Th2-type cells, (Th2) cytokines in both pathologies of allergic inflammation and the development the allergic sensitization and well established[(5)].The inflammatory response in the nasal mucosa in patients with allergic rhinitis, that challenging intranasally with the allergen including"immediate I.g.E-mediated mast cell response" and late-phase

response characterized by recruitment of basophiles; eosinophils[6].

Corticosteroids, one important type of steroid hormones, which taken as topical creams; nasal sprays ; pills as well as long-lasting injections. Glucocorticosteroids exert anti-inflammatory effects via at two pathways: transrepression pathway and transactivation pathway, so glucocorticosteroids exert regulatory functions by inducing regulatory cytokines and for khead box P3 (FoxP3) regulatory T-lymphocyte[7,8] .

Patients and methods:

Sample collection: Patients' serums were collected form Salah Aldin General Hospital during period (November ,2018- March, 2019) a total of 44 patients Suffering from Allergic rhinitis (A.R), with average age (29)years after diagnosis by physician ENT Specialist and control group included 32 healthy person who don't suffering from any infections(healthy persons) with average age (30) years.

Detection level of interleukin -10: levels of (L-10) were measuring by the ELISA (Beckman_USA) according to manufacturer's protocols (IL_10 ELISA kits), by pre-coated microtiter plate with an antibody specific to IL_10 , after then added the samples and standard to appropriate wells, then added to each wells in microtiter plate the biotin conjugated antibody and avidin conjugated to Horseradish peroxidase(HRP) and incubation, then adding TMBsubstrate solution for wells. terminated enzyme substrate reaction by adding sulphuric acid solution and by spectrophotometrically measure the colour change at a wavelength (450 nm). concentration of Interleukin-10 in serum of patients determine by compare O.D of samples with standard curve. All samples are detected in duplicate.

Data Analysis

The Statistical Analysis System- SAS (2012) [9] program was used to effect of difference groups in serum IL_10 in allergic rhinitis patients and effect of steroid in its levels. y.

Findings

Table 1: Demographic of the study groups (patients) and control group (healthy).

Variable	Patients	Control	p.value
Age (M ±S.D)year	29.17±7.65	30.23±8.90	P<0.01
Gender			
Males	29 (65.9 %)	18 (56.3 %)	P<0.01
Females	15 (34.1 %)	14 (43.7 %)	
Total	44 (100 %)	32 (100 %)	

Table (1) showed the mean of age ± Standard division was (29.17±7.65) compare to control (30.23±8.90), as well as results in this table showed high incidence allergic rhinitis in males 29(65.9%) than females 15(34.1%) ,also in control group the males18 (56.3 %) and the females14 (43.7 %) ; P<0.01.

Table 2. levels of IL_10 in serum of patients with control group .

Study groups	Level of IL_10 Mean of concentration ± SE (pg/ml)
patients with allergic rhinitis	8.21 ± 0.25
Control (healthy)	11.67 ± 0.33
P-value	0.0001
** (P<0.01)	

Results in table (2) showed significant level decreased of IL(10) in serum patients who have allergic rhinitis as (8.21 ± 0.25) , compare to control group (healthy persons) as(11.67 ± 0.33) differed significantly (P<0.01) (fig.1).

Table 3. Levels of (IL_10) in serum of patients with allergic rhinitis before and after received steroid

Study groups	Level of IL_10 Mean of concentration ± SE (pg/ml)
Patients before received steroid	8.21 ± 0.25
Patients after received steroid	10.06 ± 0.23
LSD value	0.761 **
P-value 0.0001	
** (P<0.01)	

Results in table (3) showed significant increased level of IL_10 (10.06 ± 0.23) in serum of Patients with allergic rhinitis who received gluococorticoid (steroid) Patients compare to Patients before received gluococorticoid (steroid), a differed significantly (P<0.01) (fig.1).

Discussion

Rhinitis is a common disorder is broadly defined as inflammation nasal mucosa. Current study showed high incidence Allergic Rhinitis in males than females,It affects more than 40% of the population of world[10]. The high incidence of new-onset AR was the youngest age group (20-29) years[11] .

Results in of current study showed significant decreased levels of IL_10 in patients serum with allergic rhinitis as (8.21 ± 0.25) , compare to control group (healthy persons) as(11.67 ± 0.33) differed significantly (P<0.01), but significant increased level of IL_10 (10.06 ± 0.23) in serum Patients who received gluococorticoid (steroid) Patients compare to Patients before received gluococorticoid (steroid), a differed significantly (P<0.01).

Whilst other studies, showed no significant difference was detected in Patients with allergic rhinitis and the control[12] .The efficacy of immune therapy for seasonal allergy rhinitis is confirmed but still not in perennial allergy rhinitis in UK, Immune therapy indicated: Evidence of I.g.E mediated disease ; Inability to avoid allergies ; Failure of drug therapy ; Compliance[13].IL10 decrease in Allergic rhinitis so there's reverse relation between IL10and I.g.E. IL10inhibits IL_2 and IL_5 production by $TH_1$and TH_2 , so it act as immune suppresser, and the IL10increase in patient received Glucocorticoid therapy (both act as immune suppressor), short course of oral prednisolone (20 mg) for (5) days are very effective for seasonal symptoms[13], administration of IL10 during allergic attack significantly reduced eosinophils and Mast cells as well as type2 cell helper that leading to decrease the inflammatory process, so it will reduced allergic rhinitis[13], as well as many previous studies showed significant increase in IL10 after immunotherapy [14]

The sodium cromoglycate or Cromolyn have the ability for educing sneezing; rhinorrhea and nasal itching , therefore a reasonable therapeutic option for patients, also anti-I.g.E antibody omalizumab has effective for asthma and seasonal allergic rhinitis[10]. So many studies appearance the relationship between cytokines with AR as IL-4 and IL-13[15].Corticosteroids are worked by decrease inflammation and suppress immune response[16] .

As well as therapy by glucocorticoid caused inducing the T-lymphocytes apoptosis in peripheral lymphoid organs and down-regulated adhesion molecules, and causing reduce the migrated T cells to the site of inflammation[17].

Conclusion

High incidence Allergic Rhinitis in males than females.

Decreased level of (IL_10) in serum of AR patients as but significant increased level of (IL_10) in serum of AR patients who received gluococorticoid (steroid) Patients compare to Patients before received gluococorticoid (steroid).

Recommendation :future study about consider IL_10 as a part of immunotherapy for patients with allergic rhinitis.

Association of Hyperuricemia with Knee Osteoarthritis and Generalized Osteoarthritis in Iraqi Patients

Abbas Hamza Zainel[1], Sundus Awni Wahab[1], Yahya Abdel Aziz Mohammed[2]

[1]M.B.Ch.B.-H.D.R.MR. Azadi Teaching Hospital, Kirkuk Health Directorate, Kirkuk City, Iraq,
[3] M.B.Ch.B.-H.D.R.MR. Kirkuk Genenal Hospital, Kirkuk Health Directorate, Kirkuk City, Iraq

Abstract

A number of 288 osteoarthritis patients involved in this study, their ages, sex, BMI .serum uric acid levels are recorded, knee joints x ray done for them, and classified into 5 grades (grade 0-grade4).serum uric acid level classified into 3 classes (low2.5.normal 2.5-6, high more than 6 mg\dl) establishing the diagnosis of knee degenerative arthritis according to criteria of ACR (American college of rheumatology. The aim of the stud was to find relation between serum uric acid level with knee osteoarthritis and generalized osteoarthritis in Iraqi patients . in this cross-sectional study, 288 patients involved their ages ranged from 45-90 years old mean age 67.5 years; female patients were 216 (75%). Mean age of females 62.5 years. Male patients 72 (25%). Mean age of males 67.5 years. The study shows highest rate of knee OA patients and generalized OA (76.21%,63.16 respectively) have normal level of uric acid ,while only low rate of knee OA patients and generalized OA(21.93%,31.58 respectively)have high level of uric acid which was NS (P=0.547) This cross sectional study conclude that there was no association between hyperurecemia and knee osteoarthritis nor generalized osteoarthritis

Key words: *hyperurecemia, knee OA, Generalized OA.*

Introduction

The risk of mobility and disability attributable to osteoarthritis (OA) alone is greater than any other medical condition among elderly [(1)]. The prevalence of OA that are symptomatic varies between 7 and 26% dependent on the site and definition of OA [(2)]. The burden of OA has been increasing in the past two decades worldwide and its prevalence is projected to be nearly double in the next decade [(3)]. Current treatment paradigms are limited to palliative measures broadly focused on analgesia and joint replacement for end stage disease. Gout is a crystal-induced arthritis caused by deposition of the monosodium uric acid crystal (MSU) related to long standing hyperuricemia. It is also a common inflammatory arthritis affecting around 5% of the middle-aged and elderly population worldwide [(1)]. The association of uric acid and OA has long been observed, and a pathological link between gout and OA has been hypothesized [(4)]. Aging and obesity are significant risk factors shared by both OA and gout, and may confound the association between both conditions[(5-7)]. Degenerative arthritis is the most well known joint arthritis worldwide[(1)]. The link with age, weight, gender and metabolic parts has been studied. [(3)]. These investigations demonstrated a relationship of degenerative arthritis with increase in body weight. A portion of these examinations represented serum uric acid and found no relationship among it and OA [(5)]. Davis *et al* explored a significant relationship among knee degenerative arthritis and uric acid yet a little one not achieving noteworthy level[(2)]. Sun Ye *et al* particularly explored serum uric acid association with osteoarthritis and presumed that albeit uric acid was related with generalized degenerative arthritis in patients experiencing hip substitution, there have been no relationship with knee degenerative arthritis or respective hip or knee degenerative arthritis[(8)]. Others revealed a relationship with degenerative of different joints[(9)]. While a study done in Saudi Arabia found a conceivable relationship among hyperurecemia and knee and generalized OA[(11)]. Suad A *et al* found a relationship between uric acid dimension and knee OA[(12)]. The aim of he current study was to explore the connection among serum uric acid and knee and generalized degenerative arthritis in Iraqi population.

Methodology

The present investigation included 288 patients seeing by rheumatologists in two noteworthy healing centers (Azadi Teaching Hospital and Kirkuk General Hospital) in Kirkuk city in the north of Iraq. Their age, sex, weight index (body mass index) (weight in kg separated by the square of length in meters), serum uric acid were recorded. Body mass index grouped by World health organization into following classes: Table 1.

Establishing a patient suffering from knee OA were according to 'The American College of Rheumatology criteria for diagnosis of rheumatic diseases' and these are:

- Knee pain.
- Osteophytes on X-ray.
- Crepitus on knee range of motion.
- Morning stiffness of short duration (<30 min).

Inclusion Criteria

Patients within the age group of 45-90 years of both sexes, who were suffering from primary Knee OA, were included in the study.

Exclusion Criteria

Patients aged less than 41 years and more than 90 years,

Pregnant women and those suffering from secondary OA,

Rheumatoid arthritis, Diabetes Mellitus, Renal insufficiency, Hepatic disease, gout or with any other systematic disease were excluded from the study.

Blood samples along with the radiographs of the knee joints were also taken. The presence of degenerative arthritis was defined as having stage 2 or more of the Kellgren-Lawrence grading system1957):13. Radiographic appearance of knee joints, the patients was categorized into four stages according to KL staging system (Kellgren and Lawrence.

Kellgren and Lawrence grading system for OA:

1-stage 0- Normal

2-Stage 1-Doubtful narrowing of the joint space and possible

Osteophytic lipping

3-Stage 2-absolute osteophytes and possible decreasing in joint space.

4-Stage 3-Moderate multiple osteophytes, definite narrowing of the joint space, some sclerosis and possible deformity of the bone contour

5-Stage 4- Large osteophytes with marked narrowing of the joint space, severe sclerosis and definite deformity of the bone contour.

Generalized degenerative arthritis was outlined as the coincidental presence of radiographic changes of knee and hand degenerative arthritis.

Laboratory investigations

Blood tests were permitted to cluster and after that centrifuged at3000 rpm for 30 minutes to get serum uric acid levels were evaluated by spectrophotometer strategy

The serum uric acid qualities were arranged into tertiles (low, normal. Abnormal states), (2, 5-6) mg\dl. Low less than 2.5 mg\dl while abnormal state more than 6 mg\dl.

Also, balanced for age, sex, knee OA and generalized OA, utilizing the Q square investigation strategy.

Findings

A number of 288 patients involved in this cross sectional study their ages ranged from (45-90) mean age 67.5 years; female patients were 216 (75%). Mean age of females 62.5. Male patients 72 (25%), mean age of males 67.5. the study shows highest rate of knee OA patients and generalized OA (76.21%,63.16 respectively) have normal level of uric acid ,while only low rate of knee OA patients and generalized OA(21.93%,31.58 respectively)have high level of uric acid which was NS (P=0.547), Table:2.

In this study we found that 6 female patients (2.78%) has low level of uric acid and 180 female patients (83.33%) have normal level .and 30 female patients (51.39) have high uric acid level. while 35 patients (48.61%) of male have an high level of uric acid and 35 male patients (48.61) have high level of uric and no

one of the have decreased level. The result was highly significant (P: 0.0001)(Table-3)

The study shows that the highest mean level of uric acid was observed in male patients comparing with females (6.087±0.190 V.S 4.577±0.81 mg/dl) with highly significant relation(Table-4).

In Table 5, there was no significant relation between knee O A and generalized O A regarding the sex and 94.44% of males have knee O A and 93.05% of female have knee O A. BMI ≤30was observed in 101 Knee OA (91.1%) and 9generalized OA (8.9%). BMI>30was in 178 knee OA (95.2%) and 9generalized OA (4.8%).P value=0.17 NS .table 6.

>30	187	178	95.2	9	4.8	

Discussion

In this cross sectional study we found no relationship among hyperurecemia and knee O A or generalized O A as reported before hand [3,5]. Additionally Palazzo al [6] discovered that the elements, including: diabetes mellitus, ischemic coronary illness, hypertension, physical action, conjugal status, serum uric acid, triglycerides, cholesterol and blood glucose levels) did not correspond to radiographic O A , Howard [10] inferred that (serum uric acid dimension not related with OA of knee in men). Iqbal et al [11] found in study (In all classes of knee OA serum uric acid was no significantly increased). We believed this no relationship between uric acid dimension and knee OA could be because of high serum uric corrosive in patient will prompt arrangement of uric acid crystals in the joint along these lines quicken the advancement of gouty joint inflammation which is an inflammatory arthritis, while knee OA is the most well-known type of non inflammatory joint diseases.

Different studies found a conceivable relationship among hyperurecemia and knee OA. Al-Arfaj *et al* [13], Anderson *et al* [14], Ding *et al* [15], in their studies presumed that serum uric focus and predominance of hyperurecemia are emphatically connected with OA of the knee in the female population. We additionally found a relationship between knee OA and obesity as announced already by Srikanth *et al* [16] noted positive associations of uric acid concentration with OA, but these associations became insignificant when body mass index (BMI) was controlled as confounder. On the other hand, uric acid levels at the highest tertile may be associated with OA. In a cross-sectional study, the highest serum uric acid tertile were associated with generalized OA in subjects who had undergone arthroplasty for hip OA, but not with those who had undergone arthroplasty for knee OA [1-2]. We found higher rate of knee OA among female patients as revealed beforehand by Srikanth *et al* [16] indicated that there is more serious hazard in females for common and episode knee and hand. There

was no connection between radiological evaluations of knee OA and serum uric acid dimension. Another cross-sectional study involving over 4,000 participants in China has shown that women with the highest tertile of uric acid showed the highest degree of radiographic features suggestive of knee OA after adjusted for various confounding risk factors including BMI [17]. Bevis *et al* [17] sowed in a multivariable logistic analysis model was applied to test the target associations after adjusting a number of potential confounding factors. Ma *et al* [18] he prevalence of OST was increased in the highest tertile of uric acid compared to the lowest in female subjects

Conclusion

This cross sectional study conclude that there was no association between hyperurecemia and knee degenerative arthritis nor generalized degenerative arthritis ,our suggestion for more studies to found a correlation of presence of uric acid crystals in synovial fluid of knee joints with degenerative arthritis .

Conflict of Interest: Non

Source of Findings: Self findings.

Ethical Clearance: This research was carried out with the help of my colleagues mentioned with me. The oral and paper approval of the patients in this study, which included the withdrawal of blood samples from them and laboratory tests.

Relationship Serum Thyroid Stimulating Hormone with Body Mass Index in Patients with Thyroid Disorder

Athraa Fouad Kadhuim

Middle Technical University, Institute of Medical Technology/Baghdad/ Nursing Department, Iraq

Abstract

Hypothyroidism and hyperthyroidism have clear effects on body weight. In this study, we aimed to find the possible association between the serum thyroid stimulating hormone (TSH) and the body mass index (BMI). The weight, height and (TSH) were estimated for a total of (150) subjects whose ages ranged between (30-60) years during the period from March 2018 to July 2018. Participants were divided into three groups according to the BMI values: Normal weight (18.5-24.9Km/m^2), overweight (25-29.9Km/m^2) and obese (BMI $\geq$ 30Km/m^2). The normal value for TSH was (0.25-5µIU/ml). Levels of serum thyroid hormones were assayed by Chemiluminescence immunoassay at the laboratory of Baghdad teaching hospital/Baghdad. A significant difference ($P<0.001$) was found in our study between TSH value and increased BMI. Subjects with higher (BMI) had also higher TSH, and this trend continued from normal weight to obese individuals. The mean (TSH) for normal subjects was (0.7093±0.384 mIU\L), for overweight was (0.7316±0.7309 mIU\L) and for obese was (1.2752±0.8258 mIU\L). The mean serum (TSH) concentrations demonstrated a significant increasing trend with the increasing (BMI) ($p<0.01$). It can be concluded from these findings that mean serum TSH levels increased with increased BMI values. To confirm the relationship between thyroid hormone levels and BMI, further large scale studies are required.

***Key words**: Body mass index (BMI),Overweight; Obesity, Thyroid stimulating hormone (TSH).*

Introduction

Obesity has been increasingly identified as a main global raising health problem. Several previous studies were performed regarding the association between body mass measures including (BMI) and thyroid profile, but they were not fully understood. There was a continuous conflict between the majorities of studies on the results of this association. The BMI profile can be influenced by even a small alteration in the TSH values [1]. In euthyroid individuals, significant positive correlations are found between BMI and TSH values [2,3]. However, no findings were revealed by other studies to confirm the relationship between BMI and thyroid status [4]. The question that jumps into our minds is how to demonstrate the TSH level of people in regard to their BMI , and how to support and prove this association on scientific basis among our studied population. The major aim of our study is to show the relationship between BMI and TSH levels among healthy adult people whose TSH range between 0.4 mlIU and 10 mIU.

Thyroid gland is stimulated by a pituitary hormone called thyroid stimulating hormone, which is also known as (thyrotropin or thyrotropic hormone or TSH) to form thyrotoxin or (T4) and then triiodothyronine or (T3) that, in turn, stimulates most body tissue metabolisms [5]. TSH is a glycoprotein hormone, which is made and released by thyrotrope cells of the anterior pituitary gland to regulate thyroid's functions.

Thyroxin or (T4) is converted into triiodothyronine or (T3), the active hormone that plays a key role in stimulating metabolism. Nearly (80%) of T4 is converted into T3 in the liver and other organs, while (20%) is converted in thyroid gland itself [5]. There is a continuous secretion of TSH throughout the life, but it reaches its highest levels during the times of rapid development and growth. The thyrotropin releasing hormone or (THR) is

Corresponding author:
Athraa Fouad Kadhuim
E-mail: drnihadkhalawe@ gmail.com

produced by the hypothalamus, which is located in the brain base, and the pituitary gland, in turn, is stimulated by THR to produce TSH.

The hypothalamus also produces somatostatin hormone, which has an inverse effect on the production of TSH by pituitary gland, leading to a decrease or a reduction of its release.

The levels of serum T4 and T3 control and adjust the TSH production and release by the pituitary gland. When the levels of T4 and T3 are low, there is an increase in TSH production, whereas when the levels of T4 and T3 are high, there is a decrease in TSH production, which represents a negative feedback loop [6].

Tertiary or central disease or TSH to THR pathology may be indicated by any improper measuring of thyroid values e.g (low to normal TSH together with low to normal T4). Euthyroid sick syndrome is indicated by high reverse values of T3 (RT3) along with normal TSH and low and normal T4 and T3 levels, which may also be investigated for chronic sub-acute thyroiditis.

With a previous diagnosis of an auto immune thyroid disease, this may always be suspected to develop into SAT even when normal TSH exists, as no recovery has been yet found from autoimmune diseases.

It is necessary to state that the secretion of TSH is based on a pulsatile manner, in order to interpret the clinical laboratory results [6][7][8], leading to both ultradian and circadian rhythm of their serum levels [9].

[10] Showed that fine tuning between energy intake and consumption regulates the body weight. The factors which determine energy consumption involve: resting energy expenditure, no activity of exercise as well as the voluntary physical activity. T3 is responsible for about 30% of resting energy expenditure, and plays a key role in the homeostasis of temperature of human beings. The resting energy expenditure may also be affected by T3 via spontaneous motor activity regulation.

Subjects and methods

Our study was conducted on 150 adult subjects (59 males and 91 females). The study was performed in Baghdad teaching hospital / Baghdad city, during the period from March 2018 to July 2018. Serum thyroid stimulating hormone (TSH) was used to assess their thyroid disorders, and BMI was used to measure their body weights. Being an Iraqi adult was the only inclusion criteria for an individual to be enrolled, while exclusion criteria included any present or previous thyroid disorder, cigarette smoking, and chronic renal or hepatic diseases, taking drugs that change serum TSH levels such as metformin in addition to pregnancy. A data collection form was prepared including age, gender, height, weight as well as the laboratory results of TSH estimation. Before enrollment in the study, all participants were informed about its methods and objective. Written informed consents were taken from all persons who were told that their participation in the study is entirely voluntary. The weights in Kilograms) and the heights in meters were measured, while the participants were barefooted and putting on light clothing. The body mass index (BMI) was calculated by dividing the body weights in Kilograms by the heights in meters, and the grouping of the participants was done according to their BMI in the following form: Normal weight (18.5-24.9Km/m^2),overweight (25-29.9Km/m^2) and obese (BMI $\geq$ 30Km/m^2) [11].

Serum samples were analyzed immediately by Chemiluminescence immunoassay at the laboratory of Baghdad teaching hospital. Results of serum thyroid hormones of the participants were compared with their BMI grades. For data entry and statistical analysis of results, the statistical package of social science (SPSS version-22) program was applied, and the appropriateness of significance (ANOVA or chi square) were used for the descriptive statistics.

Findings

The current studied showed the correlation between the mean body mass index (BMI) and the mean serum (TSH) among the studied group. Table (1) indicated the distribution of gender percentage according to (BMI) among participants as follows: In the normal weight whose (BMI) ranged between (18.5-24.9Kg\$m^2$), the result of gender distribution was 11 males (18.64%) and 18 females (19.78%) , while in the overweight whose (BMI) ranged between (25-29.9 Kg\$m^2$), the result of gender distribution was 20 males (33.89%) and 23 females (25.27%), whereas in the obese group whose (BMI $\geq\geq$ 30 kg/m^2), the result of gender distribution was 28 males (47.45%) and 50 females (54.94%). It was shown that the obesity was significantly higher among females than male participants.

Table (2) and figure (1) showed the mean (TSH) values and the standard deviation (±±SD) for every (BMI) group. The mean serum (TSH) for the normal weight group was(0.7093 ±(0.7093 ± 0.384mIU\L)0.384mIU\L) , while for overweight group was (0.7316 ± 0.3709mIU\L), (0.7316 ± 0.3709mIU\L), and for obese group was(1.2752 ± 0.8258mIU\L)(1.2752 ± 0.8258mIU\L). The mean serum (TSH) concentrations revealed a significant increasing trend with the increasing (BMI) values (< 0.01).

Table (1): Distribution of body mass index (BMI) according to gender

BMI	Male (59)		Female (91)		Total	%
	N	%	N	%		
Normal weight (BMI: 18.5-24.9 kg/m^2)	11	18.64	18	19.78	29	19.33
Over weight (BMI: 25-29.9 kg/m^2)	20	33.89	23	25.27	43	28.66
obese (BMI ≥≥ 30 kg/m^2).	28	47.45	50	54.94	78	52

Table (2): Distribution of (TSH) according to (BMI)

BMI	N	TSH mean	Standard Deviation ±SD	P-value	
Normal weight	29	0.7093	± 0.3842	0.15	NS
Over weight	43	0.8612	± 0.3709	0.005	*
obese	78	1.2752	± 0.8258	0.001	**
Total	150				

NS:- non significant, *:-significant ≤ 0.05 , **:- highly significant ≤ 0.01.

A great deal of attention was given by medical researchers to the relationship between BMI and thyroid hormones in euthyroid adult people [12]. Thus, the aim of the current study was to measure serum thyroid hormone levels in Iraqi adults and correlates them with their (BMI). In this study, the results showed that the majority of participants fall within overweight (28.66%) and obese (52%) categories, and there was a highly significant obesity conditions in females than males.

These results were in agreement with the study of [13] who found a significant correlation between mean TSH levels and BMI. Our results demonstrated that serum TSH levels of the studied individuals recorded a highly significant trend with the increasing (BMI).

Other researchers such as [14] found no relationship between serum TSH levels and free thyroxin levels within the normal BMI range when they studied the effect of thyroid hormones on BMI. In contrast, other researchers such as [1] reported that thyroid function may be among those factors which function in conformity for body weight determination.

Chan *et al* [15] clarified the TSH-BMI relationship to be under the adipose tissue signal impacts, and they also indicated the possible significant effect of leptin on the central regulation of thyroid function via TRH. [16] Hypothesized that the positive association between serum TSH and leptin levels is also positively associated with the TSH-BMI relationship.

High triglyceride (TG) and low high density lipoprotein (HDL) levels were detected in subclinical hypothyroidism patients by [17].

Furthermore, [18] showed the presence of a positive relationship between (TSH) and (BMI), assuming the possibility of presence of other subclinical hypothyroidism condition, i.e elevated (TSH) concentrations, although the serum concentrations of the hormone are normal.

However, whether the verification of elevated serum TSH to be the cause of the influence is certainly confirmed or not, A. The [19, 20] observed that thyroid function disorders could be the primary and BMI alterations could be the secondary cause and vice versa.

The well-established receptor expression and the message transfer inside the adipocytes affirm the biological significance of the positive association between obesity and serum TSH levels. The possible existence of ''Hypothalamus-Pituitary-Adipocyte axis'' is proven when the expression of multiple pituitary hormone receptors is considered. In regard to downward regulation, the association between obesity and TSH levels may be stable. In addition, a system of feedback regulations may be necessary for this axis, therefore, the positive relationship between obesity and TSH may be reversely interpreted [21]. There is an association between weight gain and thyroid gland as thyroid gland releases hormones which help in metabolism regulation. This process controls the body utilizing of energy, when an individual may feel cold, tired or stagnant. Human's body is clogged by salt and water due to hypothyroidism, which in turn leads to body swelling [22, 23].

Conclusion

It can be concluded from this study that there was an elevation in the levels of mean serum TSH when the BMI increased. Additional large scale studies are recommended to confirm the correlation between thyroid hormone concentrations and BMI values in euthyroid adults.

The Long Term Outcome of Graft Urethroplasty by Buccal Mucosa in Penile and Bulbar Stricture

AzzawiM.Hadi[1], Yassir Ismael Abbass[1], Mazin Anwar Yadgar[1]

[1]M.B.Ch.B. FIBMS. Urology. Department of Surgery, Tikrit Medical College

Abstract

Background Urethral stricture is widely prevalent disease and its management is a challenging surgery. Nosoleideal surgical procedure appropriate inevery situation. The Grafting by Buccal Mucosa (BMGurethroplasty) represents the most appropriate and widely used procedure torepairstricture of urethra. We disclosedtheextended followup thecasesof stricture of urethrathat managed by (BMG urethroplasty) aiming to determine the success rate, recurrence and complications rate. **Patients and Method** A study was orchestrated to prospectively followup a 39 patients with bulbar and proximal penile urethral stricture disease repaired by BMG urethroplasty. Retrograde urethrography done to confirm the diagnosis , measure the length and locate urethral strictures. Patient demographics, stricture aetiology and anatomy all were recorded. Follow up data in term of success and failure rate, and complication. **Results** thirty-nine patients (the mean age was 35.4 years) with urethral strictures disease diagnosed by urethrography of more than 3 cm in length(the mean ofstricture length was 5.34cm). 23, 7, and 9 patients had bulbar, penile and long combined (bulbar and penile) strictures respectively. Early peri- and post-operative complications occurred in 35% it was almost minor complications included scrotal swelling, minor hematoma, urinary infections, and urgency. 4 patients only developed re-stricture 2 of them had a failure. The most frequent major complications were a urethrocutaneousfistula. **Conclusion** Buccal mucosal graft urethroplasty appear to be a rightful and durable treatmentchoice for cases with urethral strictures, moreover it has a fewer major complications.

Keywords: *Buccal mucosal graft (BMGurethroplasty) Urethra, spongiofibrosis, stricture.*

Introduction

Urethral stricture is a most prevailing cause of snag of lower urinary tract in the males between 3rd and 5thdecade, carrying an evaluated overall prevalence of 0.5%. Stricture of urethra is an aberrantdiminished diameter of the urethra, that due to a varying degrees of spongiofibrosis, with 50% confined to the bulbar urethra, and 20% penile part[(1)]. We can broadly categorize the causes of strictures in urethra into trauma, infection and inflammation[(1)]. Sexually-transmitted diseases (mostly gonorrhea), result in chronic bacterial urethritis and responsible for up to 20% of cases, while 30% of urethral strictures are considered idiopathic [(2)]

The presenting features tend to be related to obstructive voiding symptoms, with a poor urinary stream, post void dripling and a perceivean incomplete evacuation of bladder, or symptoms of recurrent urinary tract infections [(3)]. Non-invasive investigative methods such as uroflowmetry, the results of which produces a pathognomonic curve with a prolonged voiding time and low-level flow, and ultrasound post-void residual measurements will demonstrate reduced bladder emptying.

Endoscopic visualisation via cystourethroscopy can identify the location of the stricture but provides minimal information on stricture length. Ultrasonography is useful in demonstrating depth of spongiofibrosis, whilst contrast studies such as retrograde urethrography and voiding cystourethrography accurately demonstrate the anatomical location and length of the stricture, which guides further treatment[(4)]

The Traditional management of urethral stricture was by direct visual urethrotomy, however the reported recurrence rates are as high as 60%.[(5)] Poor long-term

outcomes from these endoscopic methods have presented an opportunity for open reconstruction (urethroplasty) to develop[6]

Urethroplasty is a surgical operation that aimed to reconstruct or repair the urethra. Many surgical techniques used nowadays, but the most commonly practiced are anastomotic and augmentation urethroplasty, the latter using either buccal or lingual mucosal grafts [7]Differing types of autograft tissues have been described, with buccal or sublingual mucosal grafts (OMG),penile and scrotal skin [8], bladder mucosa, colonic mucosa[9] and tissue engineering of grafts [10].

First described by Humby in 1941[11], BMG urethroplasty is now widely used in contemporary practice. The donator area left for healing by the mean of secondary healing, whichmends successfully [12], but we don't achieve that an improvement in postoperative pain and oral intake that can be seen with primary closure [13].

Postoperative complications of urethroplasty include swelling and bruising around the wound, numbness or discomfort around the buccal mucosal graft donor site or spraying of urine (all up to 50% of patients). Less common complications include wound infection, erectile dysfunction (up to 10%), anastomotic leak and urinary fistula (around 2%).Stricture recurrence is a major complication, with reported rates of up to 14% for anastomotic and 42% for augmentation / substitution urethroplasty, after long-term (more than 10 years) follow-up [14]. However, through comparison with stricture recurrence rates in other treatments (up to 60% in urethrotomy[5]), it is apparent that urethroplasty offers superior results in terms of restricture.

Patients and Method

With this prospective study we aimed to follow 39 casesofproximal and bulbar penile stricture disease of urethra and to determine the long term result of their repair by using BMG urethroplasty which was conducted at Tikrit city from April 2007 to December 2018 with a followup duration mean of 28 months.

Pre-operative evaluation includes a detailed medical and surgical history as well asclinical examination aimed at detecting the etiological factors such as instrumentation, prostatectomy, urethral catheterization, TURP, trauma, and urethritis. Pre-operative evalution also include culture of urine, postvoiding residual volume of urine measured by ultrasonography, as well uroflowmeter to evaluate urine flow rate. Patients evaluated with a combined retrograde urethrography and micturatingcystourethrography. This helps the determine of the site, length, and multiplicity of the stricture (although thechoice of the surgical technique do not influenced by stricture causenor length).

The procedure done under general anesthesiathrough a midline perineal incision. Division of bulbocavernosus muscle through the midline exposes theanterior urethral corpus spongiosum, which is the part affected by spongiofibrosisand lead to narrowing of the urethra. The identification of the stricturedpartbegins at the tip of the catheterincerted within the urethra,whichincised dorsally. The incision then extended proximally distal to the end of the stricture until healthy spongiosal tissue is experienced. An adequate lengthgraft of buccal mucosa obtained from the interiorcheek just below the duct of Stensen's. Up to 10 cm in length and 3.5 width can be obtained, the extra length gained by extending the dissection into the tonsillar fossa posteriorly and to the lower lips anteriorly. Infusion of the buccal area with (1% lidocaine with 1:100,000 epinephrine to a volume of 5 to 10 cc) may help to reduce the hemorrhage as well as the graft will be elevated and adissection plane will be provided.

Tailoring of the graft to a proper size is done after defatting. The lumen of distal andproximal urethraare assessed. The graft fixed to the dorsum using few 4-0 vicryl sutures forsupport and reinforcement as well toocclude the dead space. Insertion of 18F silicone, or silicone coated Foley catheter through the urethra into the urinary bladder as a cast of healing and for drainage. Urethra is then rotated back to its position and the mucosal margin of the urethra sutured to the free margin of the graft. Drainage by suprapubic catheter is obsolete. Cover with antibioticsare continued until the catheter is removed usually after3-4 weeks. Three months later, after removal of catheter, flow rate and retrograde urethrography is done. Uroflowmetery with normal flow rate is regarded as a successful resultswhilecases with lowflow rate are referred to (Direct Visual Internal Urethrotomy(DVIU)), accepted voiding rate after onetrial of DVIU is regarded as a succeeded procedure . A recurrent weak stream after even this single trial of DVIU will be considered as failed treatment.

Results

A thirty ninecases of different age groups(the mean 35.4 years) with urethral strictures disease diagnosed by urethrography. Single session dorsal reconstruction of urethra usingBMG was performed toevery one of these cases with indwelling silicone Foley's catheter removed after 3-4 weeks with a mean followup time for themwas 28months(Fig. 1).

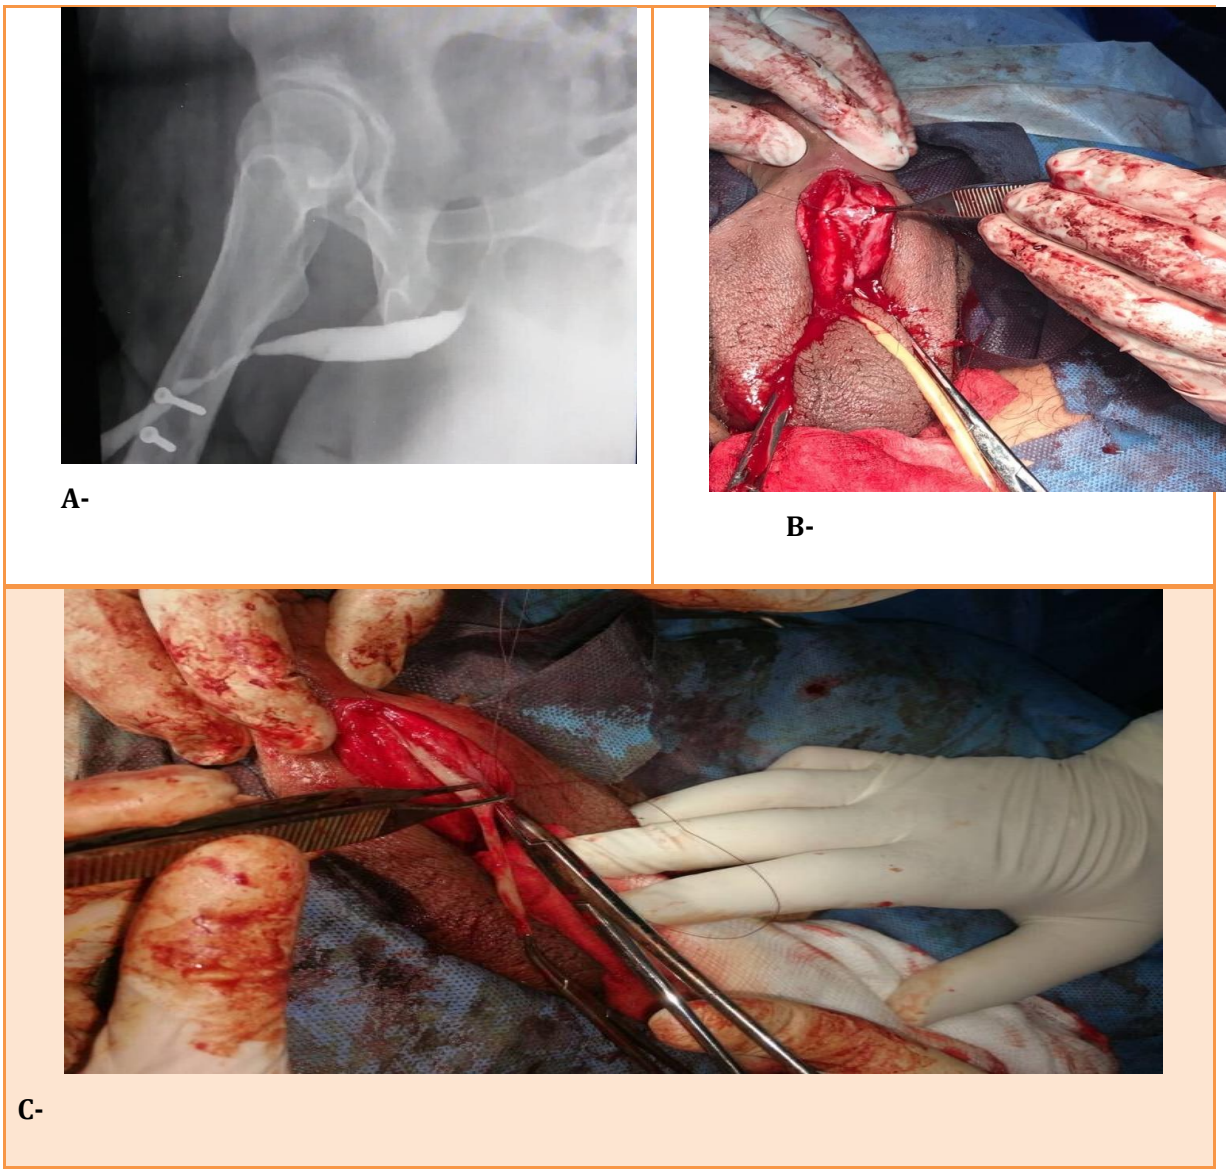

Figure (1): Single stage dorsal BMG reconstruction of urethral stricture. A) urethrography shows narrowing of the anterior part of urethra. B) Penoscrotal incision. C) Dissection of corpus spongiosum and fixation of graft.

Complication at the donator site occurred only in one of the cases with infection and ulcer that took up to one month to heal completely. Although swelling of the face, numbness and limitationofthe opening movement of the mouth are uncommon, though they are fade uneventfully. Early peri- and post-operative complications occurred in 35% it was almost minor complications included scrotal swelling, minor haematoma, urinary infections and urgency. 4 patients only developed stricture again at the site of operation 2 of them got good stream after a trial of DVIU, the other 2 patients did not responded and required another urethroplasty and regarded as a failure of the technique (failure rate 5.1%). The most frequent major complications were urethrocutaneous fistula that occur in 6 patients(15%) mainly those with involvement of penile urethra. Urinary infection

happened in 10 patients and responded well with good antibiotics directed by the results of urine culture. Erectile dysfunction and mild chordee noted in few patients. Improvement in the Peak urinary flow rates was dramatically noted postoperatively (range 18.2 to 24 ml/sec) as compared with preoperative data base of a range 0 to 9.3 ml/sec(see table 1 and 2) .

Table(1): complication of BMG

Complications	No.

Iatrogenic	8
Idiopathic	15
Injury (blunt)	5
Shell injury	2

Mean of the extent of the stricture, as spanned by preoperatively done RGU was 5.34 cm (all of it was more than 3 cm). Twenty three of cases sustained bulbar stricture, while only seven had proximal part of the penile urethra affected,meantime theinvolvement both areas synonymously was faced in 9 patients(table 3).

Table 3: the location of the strictured part of urethra.

Location	Number
bulbar	23
Bulbar-penile	9
penile	7

Discussion

Humby in 1941 was the first described graft urethroplasty using buccal mucosa.[15] Due to itsglowingfeatures that made it typical urethral deputy, as iteasilygleaned, easily handledsurgically , glabrous, moist environmentaccordance, and paramountearly ingrowth and uptake[16] . However, adisputation raised whether the graftpositionmust be ventrally or to the dorsum. The dorsal place is preferred by most of experts, however many trials shown that the dorsal place of grafthas a generous blood supply and back brace as theventralonlayplaced one. The rateof succeeds was of no significant difference according to Barbagli et al, who involved a fifty cases in their study and the graft was placed ventrally, dorsally or laterally on the urethral surface. The dorsal BMG on-layannounced a 85 and 100 %prosper rate[17].

In our present series, Dorsal BMG urethroplasty has a flourished succeed rate of 94.9 % with followupmeantime of 28months. Elliott SP et alseries published in the 2003 [18] who escortedsixtycases of buccal graft reconstruction with mean followup of forty seven months, announced a 97% prosper rate after single attempt of internal visual optical urethrotomy. These results underpinned by Kane CJ et al. [19] who reported disclose a 94.3 % successful results in their series with a mean followup of twenty five months postoperatively. Iselin & Webster published a study at1999 in which they accomplished29 dorsal on-lay graft urethroplasty, and describe a soaring early successfulresults reaches up to 97%, at a median followup of 19months, but they emphasize that a long time of followup is required as the succeeded urethroplasty operation is spaned in decades[20].

In general, complications of BMG urethroplasty are uncommon . Pitfalls occurred as a postoperative complications can happened in 2 areas, the donor area and the repair site in the strictured urethra.[21] Potentially buccal mucosal pick up site complications encompassed facial swelling, bleeding, discomfort and pain, numbness and paresthesia, limitationof movement in mouth opening and damage to the duct ofStensen. Facial edema and limitation in mouth opening are frequent, though they are selflimiting and usually resolved within a couple of months after operation[22]. Wood et al, reported that closure of the donator site was followed by awful complains and nasty pain, this

make him to suggest that this may be ameliorated by left open.[22]In contrast Dublin et al. announced that a preponderance of casesshowed a good responce with the primary suturing of the pickup site, and they disclose that restriction in mouth openingwas the most frequent long-term complaint, and occurred in 32% of cases, and half of this number hadnumbness. In general, the interior cheek pickup site for BMG appears to heal without long-term pitfallsregardless of management[21].

Complications of implantation site at perinium are asuncommon as donor site complications. Urethro-cutaneous fistula, re-stricture, local infections of perineal wounds or urethral anastomosis site , hematomas, and paresthesia of the skin, do sometimes occur. Fichtner*etal.*,[23] found in their study that an all-inclusiverate of complications was 25%. In general the complication rate in other study[24]was found to be 5.4%, of them 5.7% had a re-stricture rate while in our case series we faced ageneral complication rate of about 18.6 % which include urethrocutaneous fistulae, re-stricture, urinary tract and local wound infection.

Conclusion

Regardless of the etiology, length and site of urethral stricture disease, BMG urethroplasty seems to be the prime surgical procedure referred to its high rate succeed, low recurrence rate, as well as infrequent and short standing complications if compared with other techniques. It is picked up easily and unchallenging to be handled. It also resist infections and withstand the moist environment. We used graft urethroplasty with buccal mucosa victoriously for managinglong strictures in urethra, with fewer complications and few donator placerate of morbidity.

Acknowledgment: We would like to express our great appreciation all those who participated in this study, patients and hospital staff.

Hardness and Roughness of Flexible Denture Base at Different Injection Time and Different Temperature

Amal Abdul Latif Rashid

(B.D.S, M.Sc Preventive Dentistry) Middle Technical University / College of Health and Medical Technology / Dental Technologies Department

Abstract

Most problems with heat cured acrylic are difficult to address, in recent time flexible dentures have become more popular, although the search for the ideal option is still on, so this study was conducted to study the effect of different temperature and different injection time to study the effect on the hardness and roughness of flexible denture. 60 specimens from metal pattern were prepared with dimension (60mm, 10mm, 3mm) length, width and thickness respectively. Specimens were allocated into two group;30 specimens for surface roughness measure(groupI)and 30 specimens for hardness measure(group II),these two group subdivided into three subgroups according to time of injection and temperature (10 specimens for each subgroup), group A: injection at (270◦C) in (14 min.) (control). group B: injection at(300◦C) in (10 min.) and group C: injection at (250◦C) in (24 min.). For hardness measure all specimens were tested by (shore D device DINISO electrometer). All specimens were tested for roughness measure by surface roughness tester (profilometer , digital) the result expressed in micrometer. Result showed there were no significant differences in hardness and roughness measures between both group B and group C with control group (A) P0.05. The max. mean value of roughness was recorded by group(A)which was the control group and group (B) recorded the min. mean value of roughness. While for the hardness the min. mean value was recorded by group(B),while group(C) recorded the max. mean value of hardness, however there were no significant different(P0.05) between three groups A, B and C both in hardness and roughness measures.

Key Words *:flexible acrylic hardness roughness injection temperatures*

Introduction

One of the most important needs for patients attending clinics to restore esthetics and/or function is the replacement of missing teeth, for replacing missing teeth many treatment modalities are available.

The choice between many treatment options is influenced by clinical, dentist and patient immanent factors[1].Excellent alternatives to conventionally methyl-methacrylate dentures are flexible denture, which not only provides excellent aesthetics and comfort, but also adapt to the constant movement in partially edentulous patients [2]. adapt well in the undercut areas and not cause sore spots. They also have almost no porosity and lower elastic modulus [3]. Furthermore, the aesthetic of removable partial denture with heat cured acrylic, may be compromised by the visibility of metal clasps [4], however, reported cases of intolerance to monomers present in acrylic materials among patients and medical staff have been increased[5,6].

The increase in processing temperature under pressure during polymerization of acrylic materials could result in a more complete polymerization reaction and thus producing a harder polymer network[7,8and9]**.** but no study concerning the effect of increase temperature on flexible acrylic material

Since the surface roughness is an important factor because rough denture surfaces can cause biofilm formation, fungus and bacteria have more propensity to adhere to rough surface so accumulation of microorganisms affect oral health [10] and the hardness test has been used for characteristic of the mechanical quality of polymer [11], so this study was performed to

evaluate the hardness and surface roughness of flexible denture material at different injection time and different temperature.

Material and Method

Flexible denture base material

The material was available in the form of granules in cartridges (Lingchen dental /china)as seen in(Fig.1) the cartridges contain thermoplastic grains are heated to plasticize the resin. All material were suited for the thermoplastic process (injection thermo press machine / china) by injection molding technique the resin material were injected under very high pressure.

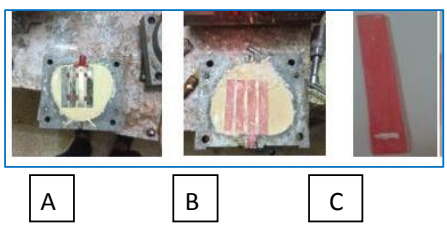

Fig. (1) sample of cartridges

Preparation of mould:

Total sample were 60 specimens all sample were prepared in the form rectangular metal shaped pattern according to ADA Specification NO.12(1999) [12] the dimension (65mm*10mm*2.5±0.1mm) length, width, thickness as seen in (Fig.2) were constructed to be used (30 samples) for indentation hardness and (30 samples) for surface roughness.

The preparation of mould was done by conventional procedures and the wax elimination was done by using boiling water, , after that flask was opened for cooling (at room temperature),the flexible denture base material was injected in the electrical furnace (injection thermo press machine Lingchen dental /china)according to manufacture instruction and study design ,then left to cool at room temperature. The conventional flasking, packing procedures were followed in the preparation of the specimens [13].

Fig(2) Flexible acrylic resin samples: A-Metal sample in the flask B-Wax sample in the flask C-Flexible acrylic sample

Distribution of the sample

60 specimens divided into two groups according to measuring test (30 specimens for each group), group I for surface roughness and group II for indentation hardness, both groups were subdivided into 3subgroups A, B and C(10 samples for each subgroup)according to injection time and temperature.

Group A: injection 10 samples at (270◦c) in (14min) (control that inject according to manifuctural instructions).

Group B: injection 10 samples at (300◦c) in (9 min).

Group C: injection 10 samples at (250◦c) in (24 min)

Finishing and Polishing: Take the specimen of flexible and remove grass of excess resin from the border by large acrylic burs until make specimen smoothing is. The polishing done by pumice with water and store it in the plastic container of water until needed.

Measurement of surface roughness:

The surface of the test specimen was analyzed with surface roughness tester (Profilometer-Digital, China, TR200)(Fig3) to study the micro geometry of the test surface. The diamond stylus of the profilometer was moved about 4mm across the surface of the acrylic specimen. According to the manufacture instructions of the device, the vertical displacement of the stylus is measured as the surface variations, usually measuring from 10 nm to 1mm ,the height position of diamond stylus is converted to a digital signal ,which is stored and displayed a(2mm) distance separated each reading and all measures were carried out by same researcher. three readings were recorded for each specimen and the mean value for each specimen was the average of three readings, all the specimens were examined after finishing & polishing. The results were expressed in micrometer.

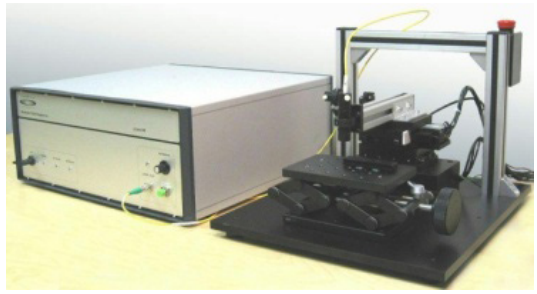

Figure (3) Profilometer device for measuring surface roughness Measurement of indentation hardness:

Shore hardness tester was use in this study for measuring the indentation or measuring the hardness of the specimens (DINISO 7619electrometer/Germany) (Fig4){according to ASTM D2240-03 standard}[14]. The Shore D hardness device was vertically placed over flat sample supported by flat, rigid base. The readings were taken after three second of stable contact over specimen, when indenter was pressed down quickly and firmly on, to record the maximum reading. The reading was taken directly from the reading scale The contact surface of the shore hardness tester must be parallel to the specimen support of the test stand to prevent error in measurements. The distance between the specimen surface and the indentor of the hardness tester to be 5-12 mm. During carrying out the test the contact was set period between the specimen and the indentor was 6 seconds. For each specimen, 5 points were marked with 6 mm distance between each other, the hardness value was calculated and the average of these five reading After the measurements were taken directly from the scale reading was calculated.

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Group (A) (control)	10	66.5000	.97395	.34434	65.6858	67.3142	65.20	68.20
Group (B)	10	66.4375	3.48299	1.23142	63.5256	69.3494	58.00	69.00
Group (C)	10	67.8000	.71714	.25355	67.2005	68.3995	66.60	68.60
Total	30	66.9125	2.13283	.43536	66.0119	67.8131	58.00	69.00

Table (3) show the descriptive of groups mean, S.D, S.E, max., and min. values of the hardness groups ..The min. mean value was (66.4375) recorded by group(B),while group(C) recorded the max. mean value of hardness which was (67.8000).

Table(4) : ANOVA test between groups of hardness test

	Sum of square Squares	Df	Mean Square	F	Sig.
Between groups	9.468	2	4.734	1.045	.369
Within groups	95.159	21	4.531		
Total	104.626	23			

Table(4) show the ANOVA test between groups ,there were no significant differences between groups (n-sig) p> 0.05

Discussion

Using flexible denture has increased drastically in the late decade. The excellent tissue friendly and good mechanical properties had open up a new clinical application in dentistry and since heat cured acrylic are hard material so they may be disturbing patients during use and an increasing rate of intolerance to monomers present in acrylic materials among medical staff and patients has been reported [5,6]. Furthermore, the aesthetic appearance of removable partial dentures with heat cured acrylic bases may be compromised by the visibility of metal clasps [4,15].While the flexibility of flexible allows retentive elements that match the color of the gums or teeth. Despite the sore formation in heat cured acrylic in comparison to flexible that not cause sore spot [16,17],the flexible denture appears to have a greater role to play in futures. Material (without chemical changes) is softened by heat and injected afterwards and partial dentures might be pressed in one piece including clasps, minor and major connectors, and denture bases [15]. The surface roughness is an important factor because many studies have shown there was a direct link between surface roughness, color stability and accumulation of

dental plaque as well as adherence of candida albicans [18,19]. Furthermore the irregularities of the surface act as a nucleation sites for corrosion[20]

Hardness has been widely used as a method of investigation factors that influence the degree of conversion of resin and for characterization of the mechanical quality of acrylic [21,22]. In this study both hardness and surface roughness measures of flexible denture base material were tested at different temperature and different injection time.

The result show that the all groups that injection at different temperature (300◦C), (250◦C) and different injection time (9min), (24min) respectively ,there were no significant difference between them (p>0.05) both in hardness and roughness measures when compared with control group that injection at (14min) in(270◦c) .

In this study, the injection molding system was used, its advantages that the resin is delivered in a cartridge that eliminates dosage errors, to ensure long term stability of the shape, reduced contraction, and mechanical resistance with aging. In addition, superior physical properties, more esthetic and comfortable for the patient[23] the increasing in surface roughness may be related to injection process, melted material during the injection will roll into sprue (smaller tube) until it reaches the mold cavities and during this flow movement a small nucleus will form and cause increase in the surface roughness.

For hardness the max. mean value recorded by the group(C). this might be due to higher crystallization of resin material at this time and temperature (the higher crystallinity in a flexible, the harder material will be) [24].

In acrylic material the increase in processing temperature under pressure during polymerization reaction produced a harder polymer network[9], this may related to complete polymerization reaction that occur in high temperature for optimum time which support the result in this study, in flexible material increased time with decreasing temperature lead to result that gave more hardness material as result by group C [that injected with increased time of injection and decreasing temperature (24min. in 250◦c)] and because of increase time of exposure to heat which produce greater degree of polymerization, however ,there were no significant differences between group C and group B(300◦c-9min.) this might be due to increasing the polymerization temperature lead to harder network that result in a hard material[9].

There were no previous studies found related on the properties of flexible material with changing in temperature and injection time ,in order to compare with this study. Search for ideal properties for flexible material is still on.

Conclusion

This study show hardness and surface roughness measures of flexible denture base material when tested at different temperature and different injection time(300◦c in 9 min, and 250◦c 24 min.),there were no significant differences P0.05 with control group that inject according to manifuctural instructions(270◦c in 14min).

Prophylactic Antiepileptic Drugs for Intraparanchymal Hemorrhage Patients in Salah Al-Den General Hospital

Ayied Mutob Turki[1], Mohamed Ghalib Zakari[2], Abdulsattar Hussein abdullah[2]

[1]Assistant Professor, [2]Lecturer, Tikrit University College of Medicine/ Department of Medicine

Abstract

Background: Intraparenchymal hemorrhage considers the most severe form of stroke and has a significant cause of death. There are many cases associated with seizures development. Risk factors for post-hemorrhagic stroke seizure are cortical involvement, large lesion (involving more than one lobe), lobar hemorrhage, and male sex. The post- hemorrhagic stroke seizures affect inversely on fatality rate, recovery period and neurological outcomes.the aim of the research is to assess the effect of depakin to prevent the incidence of seizure in patient with spontaneous non-traumatic, non-aneurysmal intraparenchymal hemorrhage (NTNA-IPH) and to evaluate the effect of depakine on the fatality rate. **Patients and method** the study involved 100 patients with a definite diagnosis of NTNA-IPH. Type of the study was prospective comparative, which done in Salah-Al-den general hospital. The duration period was 10 months. The cases were classified into two groups A and B, each one consist of 50 patients. Depakine in a dose of 400mg per day for 30 days was given for group A while group B didn't be given the drug, and this is a control group. The cases of each group were followed up for 6 months from the starting of attack and during follow up, patients were monitored for development of seizure. **Results** The study result represent 14.28% of patients taking depakine had been developed seizure (6 patients from total 42 patients) and about 34.10% of patients not taking depakine had been developed seizure (13 patients from total 38 patients) with a significant difference between the two groups. Partial seizures were represent about 13.75% of post-hemorrhagic stroke seizures, myoclonic seizures 5% and tonic clonic seizure 5% in total of both groups.The overall incidence of post-hemorrhagic stroke seizure in the total 80 patients was 23.75%. The study showed that fatality rate in patients receiving depakine was 12% while fatality rate in patients not receiving depakine was 24% with a significant difference between patients with depakine and patients without depakine. **Conclusion** of this study shows that NTNA-IPH founds most commonly between 45-71 years old. The incidence of seizures can be decreased by two-folds by using of depakine as a prophylactic drug in a patients with IPH and the use of depakine in the prophylaxis against post-hemorrhagic stroke seizure have a significant role in reducing the fatality rate and improving survival.

Introduction

Non traumatic intraparenchymal hemorrhage (IPH) is bleeding into the parenchyma of the brain that may extend into the ventricles and, in rare cases, the subarachnoid space [(1).] Each year, about 37,000 to 52,400 people in the United States have an IPH [(2).]IPH represent 10-15% of stroke and is associated with the highest fatality rate, about 38% of patients surviving the 12 months[(3).] The majority of surviving patients to hospital presentation, the prognosis remains poor, with 35% of patients dead was dying in the first seven days and 50% within thirty days.

The prevalence of seizures after ICH varies widely from less than 10% [(4,5)] to more than 20% [(6).] The prevalence of seizures after IPH depends on study design, diagnostic criteria, duration of follow-up, and the patient studied. Risk factors for post-hemorrhagic seizure were found to be IPH , SAH, cortical involvement , large

lesion (involving more than one lobe) and male sex[7]. Stroke is the commonest cause of seizures in the old patients [8].

IPH-related seizures classified as early and late-onset. Usually most of the early- seizures found in the first two weeks [9].Patients who had frontal lobe hemorrhage were high incidence to develop early as well as late onset seizures due to the presence of motor phenomena, early seizures may be result from cellular biochemical dysfunction and structural disruption, late seizures may be caused by gliosis and the development of meningocerebral cicatrices [10].

Patients and methods

Prospective study was done in salah-Alden general hospital through the period from beginning of December 2016 to end of July 2017. The patients were selected randomly from those who admitted to medical ward with IPH in all age groups and both sexes. The sample consist from100 patients with IPH. The patients involved in this study were divided into 2 part as follows:-

Group **A** consist of 50 patients with IPH who prescribed depakine in a dose of 400mg once daily for 30 days as a prophylactic drug and was follow up for 6 months to see whether seizure occurred or not during or after the attack of IPH and the follow up was by re-examination or by telephone number of the patient if he can't get coming to hospital.

Group **B** include 50 patients with IPH , who didn't be given depakine as control group, were follow up for 6 months to show whether seizure present or not. If the patient developed fit in this group, was treated by anti-epileptic drugs(AED).

(Questionnaires): Full and detailed history from the patient or witness (if consciousness is impaired) was taken regarding age, sex, address, past medical history, previous attack of IPH, drugs , previous attack of seizure or family history of seizure and whether seizure found or not before admitted to the hospital. If the patient had seizure, detailed history was taken about the seizure including time, single or recurrent, description of seizure (partial or generalized seizure) and how many times found.

Clinical examination: Patient with intraparanchymal hemorrhage through the period of study was admitted in the medical ward, neurological examination was done for every patients involved in this study. The examination included consciousness level, motor examination of upper and lower limbs, sensory examination, cranial nerve examination and examination of cerebellar signs.

Imaging study : Every patient admitted to the hospital with acute neurological features like focal signs, disturbances in the consciousness , new onset of epilepsy, etc, was sent for taking urgent native (CT) of the brain and the radiology report was made by the radiologist. The magnetic resonant angiography (MRA) was done in selected patients in whom SAH was very suggestive clinically. This was helped the study to identify and exclude aneurysmal hemorrhage or A-V malformations. According to the result of the CT study and MRA (if needed), the patient will be included in the study if the inclusion criteria met while those with exclusion criteria were excluded from the study.

Blood tests: Blood samples were taken from every case. Routine investigations were perform include complete blood count, renal and liver function tests, blood sugar and electrolytes to exclude metabolic causes of the neurological deficits in addition to bleeding time, prothrombin time and INR to exclude bleeding tendency as a cause.

Patient group & follow up: The number of patients involved in this study was 100 patients. The study started from the first of December 2016 until the end of July 2017 and every case was follow up for 6 months, so the patients selected at Decemer 2016 ,their follow up stopped at May 2017and so on. The cases were classified into two groups , group **A** and group **B**, in which group **A** patients were given depakine for 30 days and group **B** patients didn't be given the drug and each group were follow up for 6 months.

Statistical analysis and data management: The Statistical Package for Social Sciences (SPSS, version 18) was used for data entry and analysis. The associations between categorical variables and seizure occurrence during the study period were analyzed using Paired Student t test. The differences in seizure occurrence were compared between groups using Paired Student's t-test to compare means of numerical variables. P value of ≤ 0.05 was regarded as statistically significant.

Funding

Table (1) Age distribution in 100 patients with IPH.

Age/years	Number of Patients	Mean(years)	Percentage (%)
<45	20	**38.5**	20%
≥45	80	**62.4**	80%

One hundred cases were participated in the study. 56 patients were male and 44 patients were female.

Table (2) the frequency of seizures in group A and B.

Group	Number of patients	Patients develop fits	Patients not develop	Incidence of fit	P value
A	42	6	36	14.28%	
B	38	13	25	34.10%	
A+B	80	19	61	23.75%	

Eighty patients were aged over 45 years and the remainder 20 was under 45 years. Mean for aged group less than 45 was 38.5 years .The range of age was 33-45 years , while mean for aged group more than 45 was 62.4, the range is 52-78 years.

Group A : The number of patients was 42(after subtracting the dead number of patients and loss of them during follow up in this group) 6 patients (14.28%) from total 42 developed seizure in spite of taking a depakine . The patients in group **A** who didn't developed fits throughout the period were 36 cases (85.72%) and they are taking the treatment in regular period in its dose 400mg daily.

Group B: This group included 38 patients (after subtracting the dead number of patients in this group), the result show that 13 patients (34.10%)from 38 patients had developed seizures . The other remaining 25 cases (65.78%) didn't get seizures throughout the follow up. The incidence of seizures in both aged group were 23.75%, while the remainder 61 cases (76.25%) not develop seizures.

Table(3) Types of seizure seen in group A and group B

Groups	Total number of cases	Number of patients With fits	%	Partial seizure	%	Myoclonic seizure	%	Tonic clonic seizure	%
Group **A**	42	6	14.28	4	9.52	1	2.38	1	2.38
Group **B**	38	13	34.21	7	18.42	3	**7.89**	**3**	7.89
Total sample size A+B	80	19	23.75	11	13.75	4	**5**	**4**	**5**

The study result show that the most common type of fits in the acute stage of IPH was partial type, which was characterized by a focal movements in limbs or face which was described by the patients or the witness.

Group A Sixth patients (14.28%) from the 42 patients developed fits. four patient (9.52%) was partial seizure and one patient was myoclonic seizure (2.38%), and another one had tonic-clonic (2.38%).

Group B This group involved 38 patients, 13 patients (34.21%) had been developed fits. 7 patients (18.42%) developed partial fits and three patients (7.89%) developed myoclonic fits and another three patients (7.89%) were developed tonic clonic type. The incidence of partial seizures in the total number of both sample size was (13.75%), while incidence of myoclonic type was (5%) and tonic clonic type was (5%).

Table (4) Time of seizure incidence in groupA and group B.

Group	Total number	Number of fit patients	%	Number of fit cases<14 days	%	Number of fit cases>14 days	%
Group A	42	6	14.28	4	9.52	2	4.76
Group B	38	13	34.21	8	21.05	5	13.15
Total	80	19	23.75	12	15	7	8.75

Chi square =0.046; Correlation=0.049; P-value=0.08;Significant association

The result of this study show the following: the early seizure was defined as any seizure found in the first two weeks after the time of IPH, while late seizures was determined after 2 weeks, the result show as follow; the patients who take depakine developed early fits in a low incidence (9.52%) than those who didn't take the drug (21.05%). There was a significant difference in incidence of early and late seizure in group **A** and **B**.

Table (5)Distribution of death causes in group A and group B.

Causes of death	Total number cases Group A(50)	Fatality rate %	Total number cases Group B(50)	fatality rate %
Overall	6	12	12	24
Deep coma	3	6	4	8
Multiple bleeds	2	4	1	2
complications	1	2	3	6
Past attack(s)	-	-	2	4
Others eg.drugs	-	-	2	4

Group A consist from50 patients participate in the study, 6 patients died (12%) (4 during hospitalization and 2 after discharge) and another 2 patients(3%) were missed during follow up period of the study, the remaining was 42 patients. The died patients were those who were in deep coma (6%), who have multiple sites of bleeding on CT of brain (4%) and those who got complications e.g. aspiration pneumonia or bed sores is (2%).

Group B (50)patients included in this study, 12 patients died (24%) 7 during hospitalization and 5 after discharge. The died cases were those who have coma (8%) and those who have multiple sites of bleeding on CT of brain(2%) and those who got complications e.g. aspiration pneumonia or bed sores (6%), while those who have past attack and drugs history were (4%) for each one. The overall incidence fatality rate of both group were 18%. The study show that there is a significant difference in fatality rate between two groups {P value= -1,402(<0.05)S}.

Discussion

This study is used to prevent or decrease the attack of early and late post IPH seizures by using depakine. The results show, 80% of the IPH were above 45 years**,** this finding was approximately similar to the other studies [11] which showed 77.3% were between 50-79 years and this study utilized the same criteria of our study.

Our study represent 14.28% of those received prophylactic depakine developed seizures, this finding relatively agreement with study used same criteria and give prophylactic antiepileptic agent , showed that the frequency of post stroke seizures has been reported from 5-10% in the far West[12]. A slightly higher frequency i.e. 13% is reported from India [13].

Regarding time of fits,4 patient 9.52% (of total 6 patients with fits in group A) developed early seizure less than two weeks in IPH , who treated with depakine, when performed comparison with patients not received depakine in which 8 patients 21.05% (of total 13 patients with fits in this group) associated early seizure less than 2 weeks. Theirs is a significant difference between the two groups.

This result is agreement with study [13] which was show that prophylactic depakine used in IPH was associated with reduced early seizures (<two weeks) to 8.7%, as well as improved neurological deficits at 30 days. Whereas in a retrospective study [14, 15] of patients with IPH, prophylactic used of phenytoin was associated with an independent poor outcome at three months increased incidence of early and late seizures as compared with depakine, the reasons could be due to the high risk for adverse reactions of phenytoin such as sedation, intolerability and high risk of toxicity. moreover ,Phenytoin had a high incidence of cognitive disturbance [16] as compared with depakine and for these reasons present study didn't choice phenytoin.

Other study [17] result show the majority (92% n=90) of post IPH seizures were late type and only 9% were early seizures in cases using depakine.

Our study result show that in group A, 9.52% (4) patient from (6) patient were partial seizure , the other one patient (2.38%) was myoclonic and one (2.38%) had tonic clonic , while in control group patients the types as follows; 18.42% (7 patients) are partial, 7.89% (3 patients) were myoclonic and 7.89% (3 patient) were tonic clonic in type.

Our study result show a better outcome in IPH in states of giving prophylactic depakine regarding post-stroke seizure incidence and consistent results obtained by *Passero et al*.[18] reported that the administration of prophylactic anticonvulsants reduce the risk of acute seizures.

But in certain retrospective study [19] to assess the effect of prophylactic AED on outcomes, found that prophylactic AED use was associated with poor outcome, independent of other established predictors.

The analysis in this difference in two studies result from used type of drug, regarding our study , the drug used is depakine as a AED which is a good popular AED, free of major neurological side effects, low toxicity rates and good tolerability except for pregnancies, while the other study had been used the phenytoin that is known to be full of side effects like CNS depression, drug-induced toxicity especially elderly are highly susceptible to this effect and other effects and there is a study emphasized that phenytoin prophylaxis was also associated with poor outcome [20].

According the fatality rate, our study observed a low fatality rate in IPH patients taking depakine 12% than patients without depakine treatment 24% and the positive effect of prophylactic AED on fatality rate, these finding approximately similar to the study [21] that assessed the fatality rate of IPH in general without giving prophylactic AED, show result that the fatality rate six months after spontaneous intracerebral hemorrhage ranges from 23- 58%.

Conclusion

The non-traumatic non-aneurismal intraparanchymal hemorrhage occurs most commonly between 45-78 years.

The overall incidence of seizure is 23.75%.

The incidence of seizures can be reduced by administration of depakine as a prophylactic anticonvulsant in a patients with IPH.

Partial seizures are more common than other seizure types occurring.

The fatality rate after IPH is 24%.

The use of depakine as prophylaxis drug for IPH fits had a significant role in reducing the fatality rate and in improving survival.

Comparison of Prophylactic Effect of (Metoclopramide Plus Dexamethasone) And (Ondansetron) in Female Patients Underwent Laparoscopic Gynecological Surgeries

Enas Ibrahim Mehdi[1] , Abdulrahman E. Abdulsattar[2]

[1]Department of Anesthesia, College of Health And Medical Technology, Middle Technical University, Baghdad, Iraq, [2]Department of Anesthesia, Ibn-Sina Training Hospital, Baghdad, Iraq

Abstract

Post-operative nausea and vomiting were common complicationsin laparoscopic gynecological surgeries. The study was done to evaluate the effectiveness ofondansetron againstcombination of metoclopramide plus dexamethasone in preventionof postoperative nausea and vomiting (PONV) in laparoscopicgynecological surgeries. Fifty ASAI and II consenting patients aged 20–50 years scheduled for laparoscopic gynecological surgeries wererandomlyallocated into two groups ; each group was received either intravenous ondansetron (4 mg) or intravenous metoclopramide (10 mg) plus dexamethasone (8 mg)before inductionof anesthesia. post operativenausea and vomiting then monitoredin period of 4 hours before discharging the patients. Nausea was seen in10 (40%) of patients of ondansetron groups as compared with 16 (64%) in metoclopramide plus dexamethasone .Nausea with blenching developed in 1 (4%) patients of ondansetron group as compared with 8 (32%) patients ofmetoclopramide group. The post operative nausea and vomiting in the ondansetron group was significantly minimum as compared with metoclopramide plus dexamethasone group as p value was 0.01, only 1 (4%) patient of metoclopramide plus dexamethasone group was develops less than 3 times vomiting and non of both groups were develop more than 3 times .Ondansetron was superior to metoclopramide plus dexamethasone in prophylaxis of post operative nausea and vomiting in patients undergoing gynecological laparoscopic surgeries.

Keywords: *Metoclopramide, nausea, ondansetron, vomiting*

Introduction

Postoperative nausea and vomiting, defined as nausea and/or vomiting that occurs within 24 hour after surgery, affects 20%-30% of patients [1][2], the etiology of PONV is thought to be multifactorial, involving individual, anesthetic, and surgical risk factors [3]

Nausea and vomiting are under control of the vomiting center which is found in the medulla. This center takes its stimulations from five primary afferent pathways which include:[4] The chemoreceptor triggering zone , The vagal mucosal pathway in the gastrointestinal tract ,Neuronal pathways from the vestibular system, Reflex afferent pathways from the cerebral cortex c2,3 and Midbrain afferents.

The activation of the vomiting center is done by stimulation of the muscarinic, dopaminergic, histaminergic or serotonergic receptors[5]

The Risk Factors for PONVare either patients , anesthetic or surgical causes; the Patient-specific factor which increase the risk of PONV are female gender [6]; no smoking habit[6]; history of previous PONV or history of motion sickness.[7] while Anesthetic factors aredue to use of volatile anesthetics[8]; nitrous oxide[9]; or postoperative opioids[10].

Surgical factorsincludes type of surgery and duration of surgery, where there is an increase in the PONV in 60 % of patients with each 30minute increase in the duration of the surgery .[7]

Aim of Study

Compare the effectiveness of prophylactic dose of Ondansetron versus (Metoclopramide plus

Dexamethasone)dose in prevention of postoperative nausea and vomiting in female patients undergoing Laparoscopic Gynecological Surgeries.

Material and Method

From September 2017 to September 2018 in the post anesthesia care unit (PACU) and surgical ward at the Baghdad Teaching Hospital, 50 female patients had (American Society of Anesthesiology (ASA) Grade I and II), aged (20-50) years old, weights (65-85)kg were undergoing gynecological laparoscopic surgery (diagnosed and therapeutic) that not exceeded 1hour.

The studied sampleswere divided in to two groups (group A and group B), 25 cases for each group. Group A was received ondansetron (4mg/2ml) I.Vwhile group B was receive dexamethasone (8mg/2ml) plus Metoclopramide (10mg/2ml) I.V.before induction of anesthesia.

Same standard anesthesia technique was used in all cases. Patients were monitored during anesthesia by continued noninvasive blood pressure (NIBP), electrocardiogram (ECG), and peripheral oxygen saturation (SpO2). General anesthesia was induced with Propofol (1.5-2)mg/kg, Ketamine 0.5mg/kg I.V and Rocuronium 0.6mg/kg was given to facilitate tracheal intubation which was done with an appropriate-sized endotracheal tube Midazolam 0.15 mg/kg I.V, and tramadol up to 100mg I.V. was given to patients ,Anesthesia was maintained with (0.7%) (inspired concentration) of halothane in oxygen.

At the end of the surgery, residual neuromuscular block was reversed by neostigmine (0.05 mg/kg) with atropine (0.02 mg/kg) I.V. Extubation was done and after achieving adequate recovery, then patients were transferred to the post-anesthesia care unit (PACU).

The first 4 hours post-operatively nausea and vomiting were assessed by trained nursing staff and the resident doctors, as a routine work in PACU and surgical ward.

The nausea and vomiting were assessed at 0.5 hour ,0.5 hour -1 hour,2 hours ,3 hours and 4 hours . and the intensity of vomiting was assessed by less than 3 times or more than 3 times vomiting

Findings

Table (1): Number and percent of patient with PONV in each group within first 4hr post-operatively.

Time	PONV	Group A	Group B
First 30 mints	Nausea	**1 (4%)**	**2 (8%)**
	Nausea and Belching	0 (0%)	0 (0%)
	Vomiting <3 time	0 (0%)	0 (0%)
	Vomiting >3 time	0 (0%)	0 (0%)
0.5-1hr	Nausea	**5 (20%)**	**8 (32%)**
	Nausea and Belching	**1 (4%)**	**4 (16%)**
	Vomiting <3 time	0 (0%)	0 (0%)
	Vomiting >3 time	0 (0%)	0 (0%)
After 2hrs	Nausea	**4 (16%)**	**5 (20%)**
	Nausea and Belching	0 (0%)	**3 (13%)**
	Vomiting <3 time	0 (0%)	0 (0%)
	Vomiting >3 time	0 (0%)	0 (0%)
After 3hrs	Nausea	0 (0%)	0 (0%)
	Nausea and Belching	0 (0%)	**1 (4%)**
	Vomiting <3 time	0 (0%)	0 (0%)
	Vomiting >3 time	0 (0%)	0 (0%)
After 4hrs	Nausea	0 (0%)	0 (0%)
	Nausea and Belching	0 (0%)	**1 (4%)**
	Vomiting <3 time	0 (0%)	**1 (4%)**
	Vomiting >3 time	0 (0%)	0 (0%)
Total		**11 (44%)**	**25 (100%)**

Group A :ondansetrone I.V.

Group B : Metoclopramide plus dexamethasone I.V.

Table (2) : Numbers and percent of patients with post-operative nausea and vomiting and need of antiemetic drug for each group.

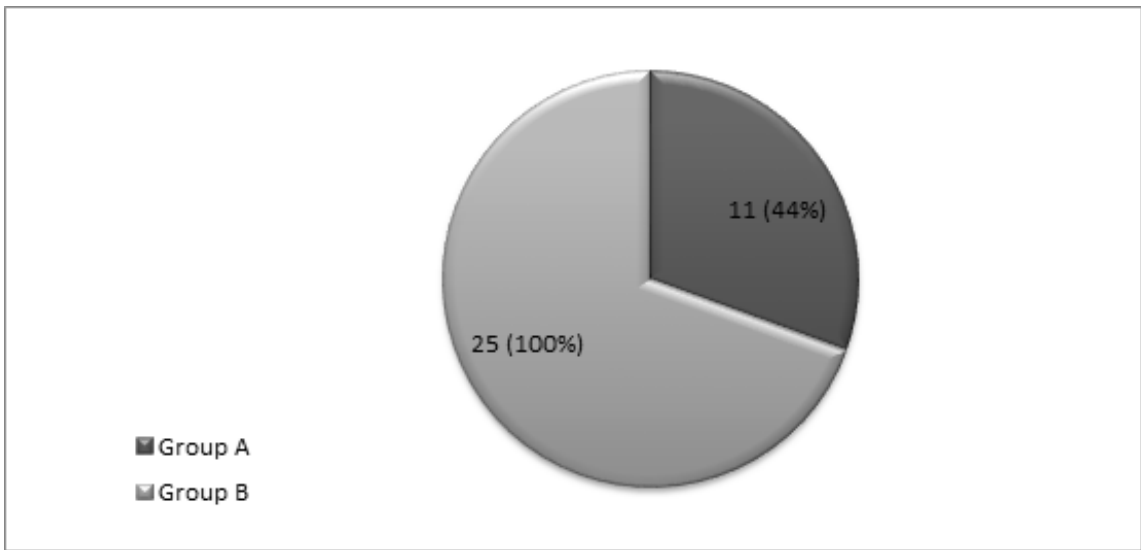
Group	No.of Patient	Post-operative Nausea and Vomiting				
		Null	Nausea	Nausea and Belching	Need of anti-emetic drug Post-op.	No. of patient with complication
Group A	25	14 (56%)	10 (40%)	1 (4%)	0 (0%)	11 (44%)
Group B	25	0 (0%)	16 (64%)	8 (32%)	1 (4%)	25 (100%)
P-Value						**MCP<0.01 (HS)**

Group A :ondansetrone I.V.

Group B : Metoclopramide plus dexamethasone I.V.

Table (3) Numbers and percent of patients that not develop PONVand those needed to anti-emetic drug post-operatively in each group.

Type of Group	Patient without PONV	Need for anti-emetic drug post-op.
Group A	***14 (56%)***	0 (0%)
Group B	0 (0%)	***1 (4%)***



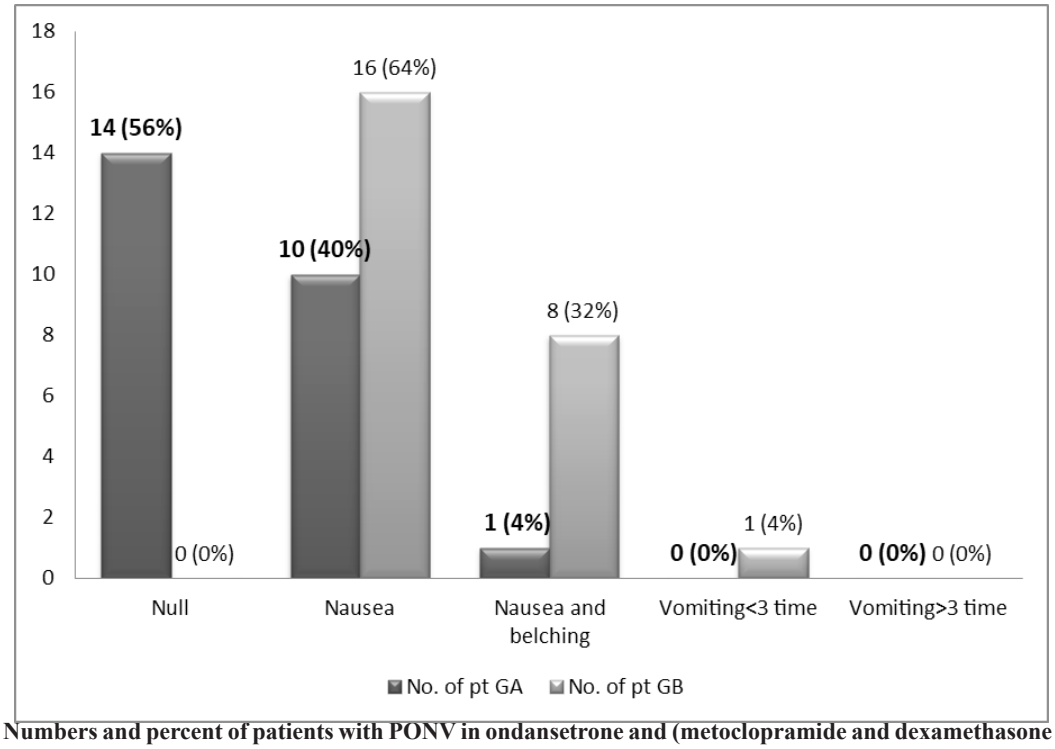


Figure (1): Numbers and percent of patients with PONV in ondansetrone and (metoclopramide and dexamethasone combination)

Figure(2): Numbers and percent of patients with PONV in ondansetrone and (metoclopramide and dexamethasone combination)

Discussion

In this clinical study, there were no significant differences between the two groups regarding the age and duration of surgery. during 4 hours period PONV was significantly minimum in ondansetron group as compared with metoclopramide plus dexamethasone combination group, p value was 0.01ondansetron group 11(44%) patients were developed PONV as compared with metoclopramide plus dexamethasone combination group in which all patients 25 (100%) were developed PONV . This high number of PONV was due to gender of patients (female) ,undergoing laparoscopic surgery and due to uses of volatile and opioid during operation.The patients with no PONV were 16 (56%) in ondansetron group while all patient with metoclopramide plus dexamethasone group had PONV.Patients with nausea only develops in 10 (40%) in ondansetron groups as compared with 16 (64%) in metoclopramide with dexamethasone combination .Nausea and blenching were developed in 1 (4%) patient in ondansetron group as compared with 8 (32%) in metoclopramide with dexamethasone combination group.The majority of patients were develop nausea with or without blenching in both groups , Only 1 patient (4%) develop vomiting after 4 hour of extubation of less than 3 times and treated with antiemetic .

The other studies that were compatible with our study :Tabari M et al.(Iran ,2014) in which they compare the ondansetron , metoclopramide and dexamethasone and shows that the ondansetron had the minimum incidances of PONV as compared with other groups [11]. When compare the Ondansetron with metoclopramide ,granisetron and dexamethasone and they showed that the Ondansetron had the minimum incidances of PONV as compared with metoclopramide but the granisetron had minimum as compared with ondansetron[12]. In Nigeria study conclude that ondansetron was more effective than metoclopramide in the prevention of nausea in patients undergoing elective day−case gynaecologicallaparoscopic procedures. Both metoclopramide and ondansetron were effective in the prevention of vomiting but ondansetron still offered superior prophylaxis. There were no significant side effects for both metoclopramide and ondansetron when used as prophylaxis.[13]. So results of Waqas *etal.,* they conclude that Ondansetron was more effective as compared to combined metoclopramide and dexamethasone, in the prevention of post-laparoscopic surgery nausea and vomiting[14]

Conclusion

We conclude that the ondansetron had better prophylactic antiemetic action than metoclopramide

Conflict of Interest: Nil

Effect of Silver Nano-Fillers and Aging on Tensile Strength of Heat Cured Acrylic

Hawraa Khalid Aziz

Assist. Prof. Prosthetic Dental Technologies Department,College of Health and Medical Technology, Middle Technical University, Baghdad, Iraq

Abstract

Background: Silver nanoparticles are attracting interest as antibacterial and antimicrobial agents as incorporating materials into PMMA denture resin, but the need for application without side effects on resin properties is essential.This study was oriented to investigate the addition of silver nano-fillers(AgNPs)and aging on tensile strength of acrylic resin polymerized by two techniques water bath and autoclave.

Materials and method: 120specimens made of heat-cured acrylic were divided into two main groups depending on curing methods water-bath and autoclave processing technique, and then each group was subdivided into experimental groups according to the addition of silver nano-fillers in two concentration(0.2% and 2%AgNPs)and control groups(0%AgNPs). Each subgroup was divided into 2groups according to the period of immersion in distilled water(1day and 1month)with(N= 10).The WDW200Esteel tensile strength tester was used for measuring the tensile strength for all groups.Data were statistically analyzed using One-way ANOVA-test and Independent t-test to detect the significant different among tested and control groups at significance level ($P \leq 0.05$).

Results: A highly significant decrease in tensile strength was observed with the addition of silver nanofillers to PMMA.According to curing methods, the results showed that there wasnon-significant difference of curing in water-bath and autoclave technique. In addition, by aging specimens for one month period, there was a highly significant decreasein the tensile strength of acrylic in all groups .

Conclusions: The addition of AgNPs to acrylic lead to reduction of its tensile strength.No change in the tensile strength by using autoclave method for acryliccuring. In addition, the prolong storage period was reduced tensile strength of the resin.

Keywords: *AgNPs, heat-cured acrylic, aging, autoclave, tensile strength.*

Introduction

The poly methyl-methacrylate was introduced by Wright in1937, from this period it considered as the main polymer for fabrication of denture base[1]. It is well-known that acrylic resins may act as a reservoir for microorganisms and contribute to re-infection in denture users;there was a demand for effective widely-spectrum antimicrobial resin materials in dentistry[2]. Therefore, more attention has been directed towards the AgNPs as incorporated particles into acrylic to improve its characteristics. The silver in nano-form is used to avoid the contamination or to make better various physical and mechanical properties of denture[3]. There are lot of researches on introducing nano-silver to acrylic. One of these studies allowed to obtain materials which show increased antifungal effectiveness in vitro tests[4],and relevant basic mechanical properties[5]. Hamedi-Radetal.,2014compared the conductive thermal,compressive strength, and tensile strength of the resinthat reinforced with nano-silver[6].A research has revealed the incorporation of AgNPs to the polymer powder was higher in thermal conductivity than that of the conventional polymer[7].Other study investigated there was improvement in viscoelastic properties of acrylic denture reinforced with AgNPs[8].Ghaaffari

and Hamadi Rad,2015studied the effect ofAgNPs on the tensile strength of PMMA[9].Furthermore, over the years, curing procedures have been modified with a view to improve the physical and mechanical properties of resin materials, the water bath processing technique has been the most conventional polymerization technique[10]. In spite of the advantages provided by this technique like the ease, simplicity and cost-effectiveness, a major disadvantage has been long processing time need[11]. The use of pressure cooker for denture polymerization was first reported in1976.The investigation by Indian researchers of the pressure cooker for curing resin was done and they revealed that itrequires less than 1hour for curing and utilizes conventional equipment[12].

On the other hands,variousstudies in which distilled water was used for aging[13,14].The flexural strength and bond strength of denture base and relined resins wereobserved after water immersion[15,16].AlsoJagger etal.,2000 studied the effect of 6months of storage in water at 37°C on heat polymerizing acrylic[17].

So this study was aimed to evaluate the effect of:

1.Incorporating 2% and 0.2%AgNPs into heat-cured acrylic denture-based material on the tensile strength of resins.

2.Two processing techniques: water-bath and autoclave on the tensile strength of heat-cured resins.

3.Immersion in distilled water in two periods(1day and 1month)on the tensile strength of heat-cured resins.

Materials and Method

A total of 120 specimens were prepared from heat-cured denture base resin,(Superacryl`plus, Modern Medical equipment, Czech Republic) which were divided into two groups according to processing technique:water bath and autoclave. Each onedivided into three groups according to AgNPs concentration:0%AgNPs,0.2%AgNPs,and2%AgNPs. The samples for each group were subdivided depending on the period of immersion in distilled waterfor 1day and 30days(N=10).The AgNPs(Silver Nano-powderproduct no.MKN-Ag-090,MK Nano,MKImpexCorp.,Lot no. 0729,Canada),silvernano-powderof 90nm particle size according to manufacturer instruction(Fig.1).

Sample preparation

The wax patterns(Polywax, Bilkim chemical company, Turkey)were constructed in form ofFlat dumbbell-shaped with dimensions**(80mm,9mm,3mm)** length,width,thickness respectively[18](Fig.2).

The mould preparation was utilized by placing the wax pattern after coating with separating medium in the lower portion of the flask within dental stone typeIV(Elite stone, Zhermack, Germany)that was mixed according to the manufacturer's instructions.The wax patterns were placed about 1/2 of their thickness. After that,the opening of the flask was carefully done and the patterns were removed from the mould**.**

Incorporation of silver nanoparticles:

For experimental specimens,AgNPs were added in two percentages(0.2%,2%) to the monomer through the extremely sonication of the fillers which had been well dispersed in the liquid by a probe of sonication equipment (Soniprep150, England)at 120W and 60KHzto split them into nano-crystals for 3minutes individually[19]. The monomer with AgNPs were mixed with acrylic powder immediately to reduce the possibility of particle aggregation and separation.

The proportion of acrylic mixing was 10g: 4.4ml(P/L)according to the manufacturer's instruction and left to stand until a dough stage was reached. An electronic balance with 0.0001g accuracy (StaroiusBP 30155, Germany)was used to measure the weight of materials of this study.

Packing and Curing

The dough stage of the mixture was packed in the mould after lining with a separating medium and become ready for curing by **water-bath technique**,the curing was done byplacing theconventional brass metal flask (Broden,Sweden)in water bath (Memmert, Germany) and processed by heating at 74°C for an hour and a half.The temperature was increased to the boiling point for 30 minutes[20].Then, the metal flask was allowed to cool at room temperature for 30minutes, followed by complete cooling of the metal flask for 15 minutes before deflasking. For curing by **autoclave processing technique**,it was carried out by placing the clamped flask in a fully automatic autoclave(QD, England)and processed by the preprogrammed cycles (121ºC/210KPa,30min). Before placing the clamped flask inside the autoclave, the autoclave must be leveled and filled with distilled water. Then, the clamped flask

placed in the tray and pushed inside the chamber, then closed and secured the door. The autoclave operated and started heating the water, then the temperature and pressure were raised till its reached(121ºC and 210KPa) respectively. When the temperature reached(121ºC), temperature and pressure held automatically at(121ºC and 210KPa) respectively for 30min[21], then automatically exhausted the steam and the programmed cycle was finished, then removed the clamped flask.Then the flask was opened and the specimens were removed from the stone mould, smoothing and polishing in conventional way with continuously cooled with water to avoid overheating which may lead to the distortion of the specimens[20].

Half of the specimenswere soaked indistilled waterfor 1day.While other half immersed in distilled water 30days in incubator(Gallenbamp, England) at 37±1ºC and the water changed daily within the mentioned period[13].

Testing Procedures

The acrylic specimens were utilized to measure the tensile strength(Fig.3),that was achieved by using(**WDW200E steel tensile strength tester with tensile strength testing machine)(**Fig.4). Each specimen was positioned on bending fixture, consisting of 2 parallel supports(50mm)apart, the full scale load was(50g),and the load applied with cross head speed 5mm/min by rod placed centrally making deflection until fracture occurred and the force were recorded in Newton.

The tensile strength values were calculated by following equation:

Tensile strength=F/A[18].

***F* =force at failure(Newton).**

***A*=Minimum cross sectional area(mm).**

Data was analyzed by Statistical Package for Social Science (SPSS) version #21(SPSS, Chicago, Illinois, USA).Descriptive statisticsand inferential statistics: One-way ANOVA-test and Independent t-test were used to detect significant differences between tested and control groups at a significance level($P \leq 0.05$).

Results

Descriptive statistics of tensile strength values of the groups without the addition of AgNPs group showed higher mean values than the experimental groups with addition of 0.2%, 2% AgNPs.The tensile strength for those ofone day immersion in distilled water showed higher mean values thanthose immersed for thirty days (Table1, Fig.5).

For comparing the effect of silver nano-filler addition on the tensile strength of the heat cured acrylic, One-way ANOVA-test showed there was a highly significant different between the tested groups(Table2). Further analysis by LSD-test was showed there was a highly significant different between the control group and experimental groups(Table3).

In comparison, the effect of curing technique the Independent t-test was showed there were non-significant differences in the tensile strength between the water bath groups and autoclave groups**(**Table4**).**

Furthermore, the means values of the tensile strength of the acrylic resin depending on the time of immersion in distilled water were compared using the Independent t-test which showed that there were highly significant differences among the study groups(Table5)**.**

Discussion

Many studies pointed onAgNPseffect when added into acrylic for the treatmentof oral infections like denture stomatitis and other antifungal and antibacterial infections. So, the modification of denture resins by silver additive in nano-form to get the possible positive influence of its addition[3].Silver nanofillers are smaller in size andthey possess physical, chemical, and biological properties that are distinctive from those presented by traditional bulk materials. Finer size and larger surface area provide potent antibacterial impact at a low filler level, so determining AgNPs concentration necessary for its efficacy and avoiding negative effect on mechanical properties[22],so the decision was made to choose two percentages of AgNPs about 0.2% and 2% depending on the previous study that was revealedthe addition of different percentageof silver nanoparticles to acrylic resinabout 0.2 and 2% result in increasein the compressive strength of acrylic[9],other research conducted that the use of 0.2%,2% nano-silver with acrylic resin increases its thermal conductivity[7],the study was showedthere was decrease in tension properties as a result to addition of5%AgNPs[9].Furthermore, increase the percentage ofsilver nanoparticlesthat leads to adverse effect on properties of resin such as the addition ofsilver nano-filler lead to color change of acrylic because the fillers tend to fill any spaceswithin the polymer,and decrease the amount of transmitted light[23].As well as silver nano-fillers are metal fillers which are changing thecolor of acrylic resin that limits its application inthe esthetic zone that was increase with the use of more amount of nano-filler[7].

The result of effect of silver addition in nano-formon the tensile strength was decrease in this properties when compared with no addition, this was probably attributed to AgNPs acts as impurities and tensile strength would decrease by increasing their content.Anotherexplanation was the reductionof monomers reaction and increases the amount of unreacted monomer, behaving like a plasticizer[24].The plasticization effect of the resultant residual monomer will reduce the molecular binding force, that lead tomultiple micro-fracture in high

deformation upon stretching that weaken the resin[2]. In addition, there was an increase in impurity action of nanofillers which cause a stress concentrated points in the matrix and weakening the resin[25].This result in the brittleness of resin may be attributed to the dysfunctional effect of high percent of AgNPs because the low absorbed energy ion within fracture and Ag^{+}ions being reduced as the concentration of silver increase that was generating atom clusters and smaller particle size during the polymerization process[26].These findings are consistent with previous studies who reported that the mechanical and physical properties of the composite are influenced by silver nanofiller concentration since mechanical properties of composites decreased by increasing silver nanoparticles[27,4].

According to the result of this study, there was no difference between the curing in water bath and autoclave curing. This result in agreement with the findings of previous study that showed that there was non-significant difference between the autoclave and water-bath curing regarding tensile strength[28].This could be explained that "autoclave" utilized the temperature and pressure when water is heated in a sealed vessel such as an autoclaveand the pressure rises due to the constant volume of the container. The boiling point of water is then raised because the amount of energy needed to formssteam against the higher pressure is increased[29,30]. Another cause is high heat treating,could be attributed to increase in cross-linking that provides a sufficient number of bridges between linear macromolecules to form three-dimensional network that decreases water sorption, decreases solubility, and increases the strength and rigidity of resin, as well as the most important determinant of resin strength is the degree of polymerization exhibited by the material.As the degree of the polymerization increase, the strength of the resin also increases, the polymerization cycle employed with a heat activated resin[31].

On the other hand, the effect of the aging in distilled water on the tensile strength of the acrylicwas showed the decrease with increase the period of exposure,this result confined with the study that found the prolonged storage in water badly effecton acrylic resin[17], another research showed the aging in water or aqueoussolutions lead to decrease the mechanicalproperties of the resin, they explainedthe reasons by the use of water may affect the mechanical properties of the acrylicand cause a reduction in the denture strength. This could be attributed to the plasticizer, the materials become softer and tougher, with lower tensile strength[13],this may be due to the gap between polymer chains that wascaused distilled water penetration and resulted the change in the mechanical properties of the polymer[32].

Conclusion

There was weakening in the tensile strength of resin due to 0.2% and 2% silver addition in nano-form. On the other hand, the autoclave polymerization technique can be used as alternative method for processing denture resins, but the prolong storagein water decreased the tensile strength.

Formulation and Evaluation of Acetic Acid Lotion for the Treatment of Wound Infection

Fitua Al-Saedi[1], Ibtihal Abdulkadhim Dakhil[1], Adil Hummod[1], QabasNather[1]

[1]College of Pharmacy, Al- Mustansiriyah University, Iraq

Abstract

Acetic acid has been used as a topical agent for healing wound infections. However, no studies have been done to formulate acetic acid based lotion and investigate its role in wound dressing. Therefore, the current workinvolved study the antibacterial activity of acetic acid against pathogenic bacteria associated with wound infections in vitro. In addition to formulate acetic acid lotion and study its role in the treatment of infected wounds, using mice model.

The results show that acetic acid has antibacterial efficacy at different concentrations against pathogenic bacteria tested; *Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Acinetobacter* sp, *Proteus*sp and *Salmonella* sp.

The application of acetic acid based lotion on wound infected with *P. aeruginosa*twice a day for 6 days leads to prevent bacterial infection and treat wounds.Herein, we reveal that acetic acid lotion has potent antibacterialefficacy and plays a significant role in wound healing.

***Key words**: Wound, bacterial infection, Acetic acid, wound healing.*

Introduction

Wound infection is a main problem contributing to mortality and morbidity due to the rise in the infections that are caused by multidrug resistant bacteria.To overcome this problem, variety alternatives have been suggested such as bacteriophages, vaccines, antimicrobial peptides, and plant extracts, etc. [1].Organic acids, such as acetic acids, are promising alternatives for infection inhibition [2].

Acetic acid has been used in medicine for thousands years.Many studies address antimicrobial activity of acetic acid against a wide range of pathogens.Acetic acid has been used to inhibit bacterial biofilms of both Gram negative and Gram positive bacteria such as *P. aeruginosa*, *K. pneumoniae*and *S. aureus* [3].In addition, it has been shown that using 6% acetic acid leads to reduce *Mycobacterium tuberculosis* after 30 min of exposure [4].

In literature, Acidic acid was used as a topical agent for healing war-wound infections caused by *P. aeruginosa* [5]. It has been reported that treating burn wounds with 5% acetic acid result in inhibit *P. aeruginosa* infection [6].

In addition to antibacterial activity, acetic acid has anti-fungal activity against pathogenic fungi. Recently, it has been found that low concentrations of acetic acid were active against Mucorales species [7].

Antimicrobial activity of acetic acid is attributed to low pH. However, it has been found that using another acids such as HCl does not show same antimicrobial effect as acetic acid even when they wereused at the same pH. Thus, the antimicrobial activity of acetic acid could be result of the acetic acid molecule itself [3].

To date, no study has been done to formulate acetic acid lotionand investigate its role in wound healing.Acetic acid is available, cheap, non-toxic and has antimicrobial activity. We propose suggest that initial application of Acetic acid lotion may represent an effective way to impede bacterial growth, and thus inhibit wound infection.

Materials and Method

Bacterial strains& Media

Pathogens cause wound infections such as

S. aureus, *E. coli*, *P. aeruginosa*, *Acinetobacter* sp, *Proteus*sp and *Salmonella* sp. were diagnosed and kindly provided by clinical laboratories at Al- Yarmouk hospital.*S. aureus* was grown on mannitol salt agar plates. Gram negative pathogens were grown on MacConkey agar plates at 37 °C. Agar well diffusion experiments were performed in Muller- Hinton agar.

In vitro, antibacterial effects of acetic acid.

Agar well diffusion method was used to determine antibacterial activity of the acetic acid. Acetic acid was diluted in sterile distilled water to prepare the following concentrations 5%, 4%, 3%, 2% and 1% (V/V).

Muller-Hinton agar was inoculated with one of the following bacteria (10^6 cfu/ml, adjusted to 0.5Mcfarlandstandard):*S. aureus*, *E. coli*, *P. aeruginosa*, *Acinetobacter* sp, *Proteus*sp and *Salmonella* sp. 100µl from each concentration was added into 6mm diameter wells. Amoxcillin- (30µg/disc) was used as a positive control. Plates were incubated at 37 ºC for 24 hours.

Formulation of acetic acid based lotion

Table (1) materials used in acetic acid lotion formula

Ingredients	Quantity per 100ml
Acetic acid	5 mL
Mineral oil	10 gm
Tween80+span 60	4 gm
Propylene glycol	5 ml
Xanthan gum	0.5 gm
Methyl paraben	0.03 gm
Propyl paraben	0.02 gm
triethanolamine	Q.S
Perfume	Sufficient quantity
Distilled water	Q.S to 100ml

Q.S: quantity sufficient

Preperation of acetic acid lotion

Oil in water emulsion based lotion was formulated .the emulsifier (span60) and other oil soluble components (mineral oil) dissolved together as oil phase and heated to 75 ºC. the prservatives (methyl paraben and propyl paraben and other water soluble(acetic acid, tween80, propylene glycol) dissolved in aqueous phase and heated to 75 ºC, after that aqueous phase added to oil phase in portions with continuous stirring until the lotion formed then put aside until cool. Xanthan gum prepared as asolution by adding 0.5 gm per 100ml then added to formed lotion with continuous stirring to give suitable consistency. triethanolamin added in drops to adjust the lotion pH at 5.5 which mimic to skin Ph and not cause any irritant [8].

Characterization of acetic acid lotion formula:

Visible inspection

Each emulsion was evaluated to detect visible modifications or instabilities such as color, creaming, coalescence, and/or separation of phases.

In vitro characterization of lotion formulation

1- Viscosity: measurement of viscosity was conducted using a Model Brookfield viscometer. A C-61 spindle was employed with a rotation rate of 2.5, 5, 6 rotation per minute (rpm). Temperature was set at 25°C ± 2 and these experiments were conducted in triplicate 2-detrmination of pH: Lotion pH was recorded with a digital pH meter (Mettler& Toledo, Giessen, Germany) by inserting probe into the lotion formulation and allowing it to equilibrate for 1 minute[9] [10].

The viscositiy was measured to determine rheological properties of formulations.

Brookfield Rheometer viscometer at 30˚C with a CPE 61 spindle at 30 rpm was used to

serve this purpose. Results were taken in triplicate and the average was taken in to

consideration.[1]

The viscositiy was measured to determine rheological properties of formulations.

Brookfield Rheometer viscometer at 30˚C with a CPE 61 spindle at 30 rpm was used to

serve this purpose. Results were taken in triplicate and the average was taken in to consideration.

Technique of application

6 mice (age 8 weeks, weight 30–35 g) were randomly divided into two groups. Group forAcetic acid lotion applicationand group as a control (no treatment). Mice were individually put in clean cages. Following shaving, a skin wound (10 mm x 10 mm) was excised from the dorsum part of mice. Wounds were infected with*P. aeruginosa* (10^6 cfu / ml).The application of acetic acid lotion was started after two hours of infection. Wounds treated with lotion twice a day. The experiment was repeated twice.

Statistical Analysis

Statistical analysis of values was performed with Graph Pad Prism version 5. Unpaired two-tailed t-test was used for statistical significance.

Data were stated as the mean ± SD. *$p < 0.05$.

Findings

Acetic acid displays antibacterial activity against the tested pathogenic bacteria.

In the current work, antibacterial effect of acetic acid was investigated on *S. aureus*, *E. coli*, *P. aeruginosa*, *Acinetobacter* sp, *Proteus*sp and *Salmonella* sp. Agar well diffusion method was used for detecting antibacterial potency. Antibacterial activity was evaluated by measuring an inhibition zone around the well containing acetic acid. Different concentrations of acetic acid (5%, 4%, 3%, 2% and 1%) (v/v) were used.

The results revealed that acetic acid has antibacterial activity against all tested bacteria. All concentrations exhibited antibacterial activity against *Acinetobacter*sp and *Salmonella* sp. The inhibitory effect shown for *Acinetobacter*sp by 5%, 4%, 3%, 2% and 1%) (v/v) was 36, 28,25, 23, and 19 mm, respectively. And the mean of inhibition zone recorded for *Salmonella*sp was 28, 26, 25, 18 and 10 mm, respectively. Acetic acid inhibits *E.coli*, *P. aeruginosa*, *S. aureus* growth at concentrations of 5%, 4%, 3%, and 2%. The mean of inhibition zone revealed for *E.coli* was 29, 28, 27 and 25mm, respectively. And the records for *P. aeruginosa* were 24, 21, 18, and 17mm, respectively. *S. aureus* was also sensitive to these concentrations. The mean of inhibition zones was 25, 20, 17 and 13 mm, respectively.

Only 5% and 4% exhibited antibacterial activity against *Proteus* sp. with mean of inhibition zone of 22 mm and 20 mm respectively. Amoxicillin –clavulate (30µg/ disc) inhibits *E.coli* and *Acinetobacter* sp. growth with mean of inhibition zone of 10 and 12 mm, respectively. Whereas, *Salmonella*sp, *Proteus*sp, *P.aeruginsa* and *S. aureus* shown resistance to this antibiotic (Table 2) & (Figure 1).

Table 2: Antibacterial activity of acetic acid against bacteria related to wound infections

Pathogenic bacteria	**Acetic acid concentrations(v/v) Inhibition zone mean (mm)±SD**					**Amoxcillin-clavulate 30µg/ disc**
	5%	4%	3%	2%	1%	
E. coli	29±1	28±1	27±1.52	25±1	0	10±0.57
Acinetobacter sp	36±1.53	28±1	25±1	23±1.15	19±1.52	12±0.58
Salmonella sp	28±1	26±0.57	25±1	18±1.15	10±1.32	R
Proteus sp	22±0.57	20±0.76	0	0	0	R
P. aeruginosa	24±0.58	21±0.57	18±0.57	17±1	0	R
S. aureus	25±0.57	20±0.28	17±0.57	13±1	0	R

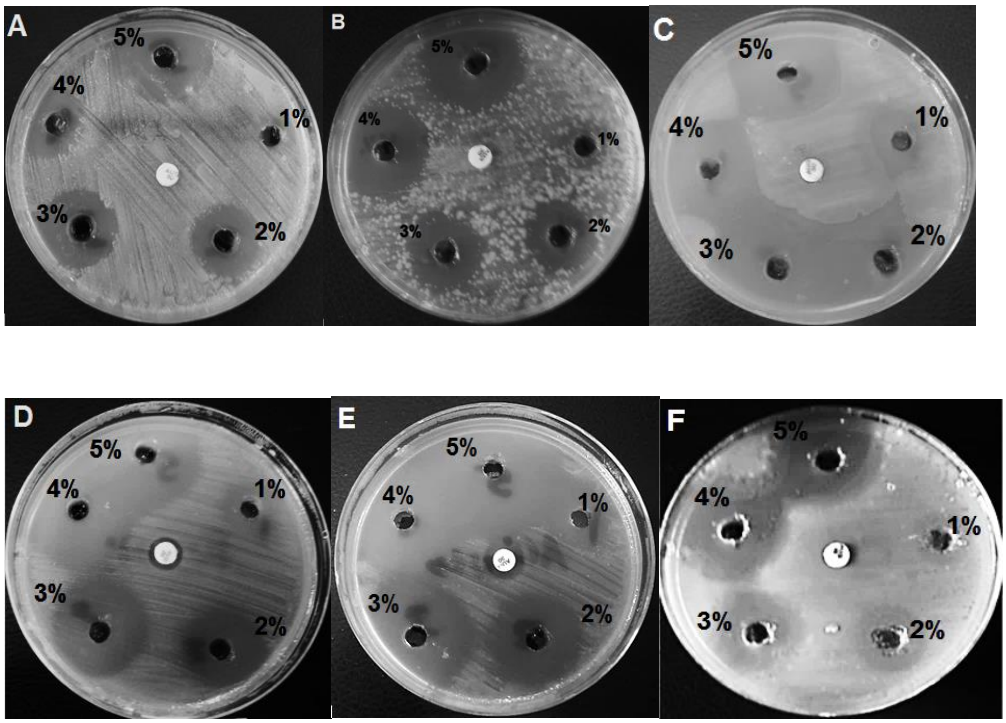

Figure (1): Antibacterial efficacy of Acetic acid.

The figure shows antibacterial activity of acetic acid against (A):*S. aureus,* (B):*P. aeruginosa*,(C):*Salmonella* sp.,(D):*E.coli*,(E): *Acinetobacter* sp. and (F): *Proteus* sp.

Application of acetic acid lotion twice a day for six days leads to prevent *P. aeruginosa* infection as well as wound healing. The results show marked differences between the treated mice and the control (no acetic acid lotion application) (Figure 2). Significant differences between the treated wound size and untreated wounds (Figure 3).

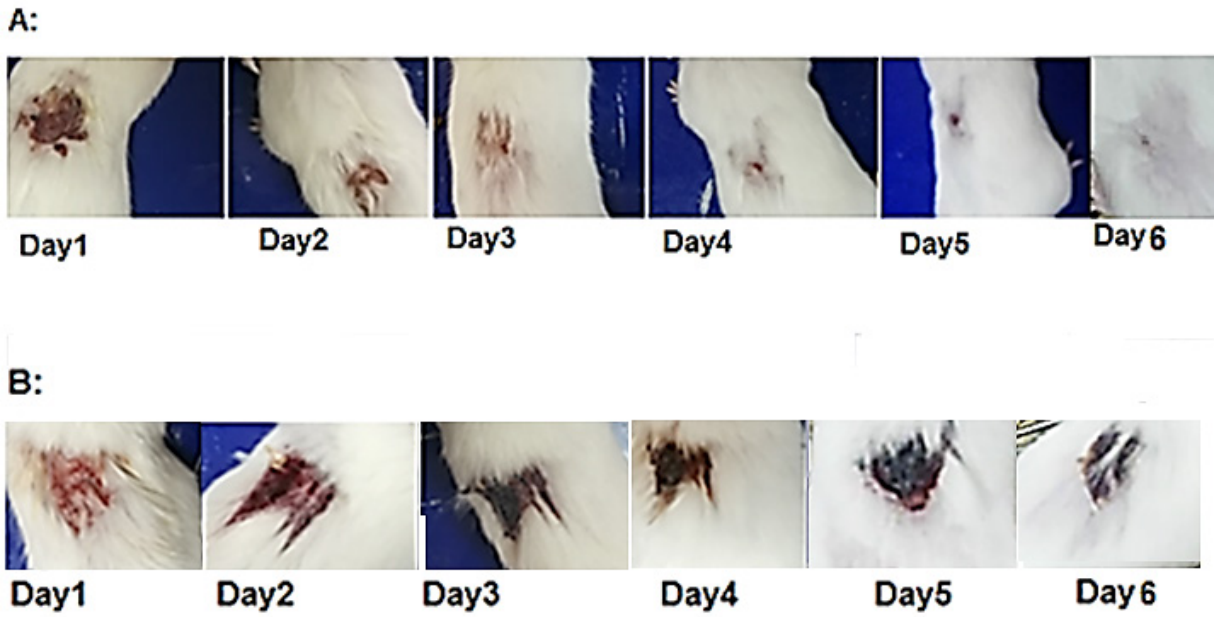

Figure2: Acetic acid based lotion for wound healing.

: Control mice infected with *P. aeruginosa.*

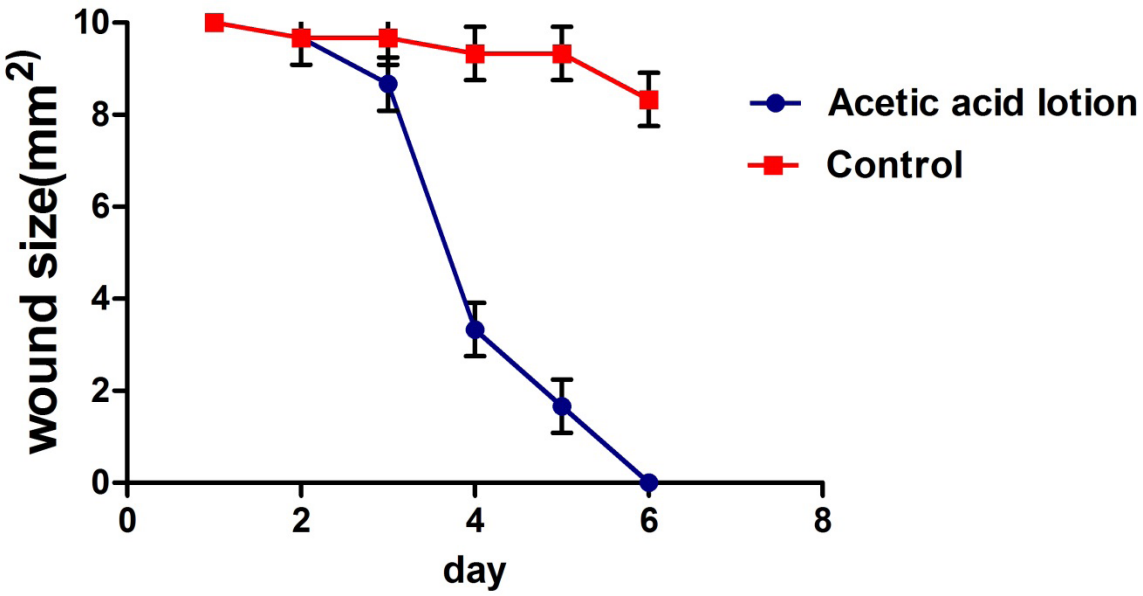

Figure 3: The treatment with Acetic acid lotion enhances wound healing.

Discussion

In the current study, the work involved using acetic acid to inhibit bacterial wound infection and formulate an acetic acid lotion to heal wounds. Pathogens infections are a key problem in the curative of chronic wounds. Usually, antibiotics have been used to treat wound infections, but in the majority of chronic wounds, these antibiotics are un useful. In addition to the cost and the resistance to antibiotics.,Acetic acid is available, cheap, non-toxic and has antimicrobial activity. Thus, we chose it to formulate acetic acid lotion and investigate its ability for wound dressing. In the current study the following pathogenic bacteria that cause wound infections were used: *S. aureus*, *E. coli*, *P. aeruginosa*, *Acinetobacter* sp, *Proteus*sp and *Salmonella* sp.Herein, different concentrations of acetic acid were used to inhibitbacterial growth.

In the current study, we found that acetic acid is effective againstall tested bacteria. Acetic acid demonstrated antibacterial activity against all pathogens. Many studies demonstrate the antibacterial activity of Acetic acid. Anti- bacterial activity of different concentrations of acetic acid (0.5—2%) was investigated against *P. aeruginosa*. The results revealed that 2% acetic acid exhibited the highest inhibition zone [11]. Acetic acid inhibits *E. coli* growth [14]**.** This inhibition was due to diffusion ofthe acetic acid molecule leads to lowering the cytoplasmic pH[15]. The pH is one of the crucial factors that affect bacterial growth.

Next step in our study was formulating acetic acid based lotion (5% acetic acid). The prepared oil in water emulsion based lotion was milky color, acceptable odor, homogenized and stable. The viscosity of acetic acid lotion measured in different rotation per minute (R.P.M) was 1344 centipoise at 2.5R.P.M, 1081centipoise at 5R.P.M and 938centipoise at 6R.P.M so it behave as psudoplastic and has viscosity within normal range. The pH of prepared lotion was 5.5.

To evaluate the role of Acetic acid lotion in wound dressing, acetic acid lotion was applied directly to the infected wounded skin. Wounds were infected *P. aeruginosa*. *P. aeruginosa* is the most frequent Gram negative pathogen that causes chronic wound infections [12]. The results show that the application of acetic acid lotion into the infected wounded skin twice daily for 6 days result in wound healing. 5% acetic acid is a harsh environment for bacterial growth. Thus, the lotion prevents bacterial growth. It has been shown that application of 1% acetic acid for 10-14 days in burn wounds leads to elimination *P. aeruginosa* infection [13].

It is well known that lowering the pH of the wound leads to wound healing. Low pH result in inhibit bacterial protease and decrease bacterial toxicity. In addition, low pH induces host macrophages activity. The pH of the formulated acetic acid lotion in the current work was adjusted to 5.5. This pH does not cause skin irritation since it is close to the pH of skin. In addition, adding Perfume leads to disappear cetic acid smell that makes it acceptable. Antibiotics resistant bacteria are a critical problem in wound healing process. Acetic acid lotion accelerates the treatment of the infected wounds .Thus, no needs to use antibiotics, especially with multidrug resistant bacteria. Since Acetic acid lotion has potential role for wound dressing. We suggest that the application of acetic acid lotion on infected wounds could be a good way to inhibit infections and induce wound healing.

Conclusion

Acetic acid lotion has potent antibacterial efficacy and accelerates the treatment of the infected wounds. Thus, we suggest that initial application of this lotion may represent an effective way to treat wounds especially with multidrug resistant bacteria.

Evaluation the Effects of Incorporation of Silver Nitrate on Some Mechanical Properties of Soft Liner Materials

QussayAbdl-Latif Hassan[1], Israa Mohammed Hummudi[2]

[1]Ministery of Health; [2] Department of Prosthodontic Technologies, College of Health and Medical Technologies-Middle Technical University, Baghdad-Iraq

Abstract

Background:- Soft liners placed in dentures have been used as carrier for antifungal drugs in treating denture stomatitis.The aim of this study is to evaluate the effect of incorporated of silver nitrate in different volume into acrylic soft denture liner and to assessment the effect of these additions on some mechanical properties.

Materials and methods: One hundred and twenty (120) specimens were prepared from heat cure soft liner material and divided into three groups according to the test that carried out. Forty specimens for each (hardnesstest, compressive strength test, water sorption and solubility test) . Then each test subdivided into four subgroups according to the volume of the silver nitrate solutionincorporation. Controlgroup which have ten specimens without incorporation of silver nitrate and experimental groups which have thirty specimens with incorporation of(0.05ml ,0.1 ml and 0.2 ml) of silver nitrate solution. All specimens were constructed as in conventional method then stored in distilled water for seven days be ready for measurement.

Findings:- The results of this study showed that highly significant increase in the hardness tested groups also compressive strength group at 0.1 ml of silver nitrate incorporation while significant decrease in 0.05 and 0.2 ml groups.Watersorption and solubility showed that highly significant increase in all volumes of silver nitrate incorporation groups.

Conclusions:- Silver nitrate incorporation was significantly increases the hardness of soft lining material while Compressive strength was significantlyincreased after incorporation of 0.1 ml of silver nitrate .The incorporation of 0.05 and 0.2 ml of silver nitrate to soft liner material significantly was decreased. Regarding water sorption and solubility were significantly increased after incorporationof silver nitrate to soft lining material in all experimental groups.

Keyword*: silver nitrate, soft lining material, hardness, water sorption and solubility*

Introduction

Soft lining materials are able to form an absorbing layer on the part of the denture in contact with oral mucosa and this allow less traumatic transmission of occlusal forces[(1)].Soft liners are often used for patients who cannot tolerate a conventional denture base [(2)]. Disinfection of denture base materials[(3)] as well as denture liners was recommended as a methods of reduction in the microbial contamination or growth and reduces oral infection as well as cross contamination[(4)]. Silver is well known for its antimicrobial activity against different positive and Gram- negative fungi and certain viruses[(5)], and recently the antimicrobial properties of nanoparticles have drawer attention of researchers[(6)]. Smaller particle size results in greater surface area to volume ratio, which enhances its chemical and biological activity[(7)]. Silver ions have been reported to inactivate important enzymes and affect the application mechanism of the DNA in bacteria .It has been reported to attach to the outer membrane and affect the permeability as well as induce structure changes in the cell –ultimately leading to cell death .In addition ,silver does not cause resistant bacterial strains to develop[(8)].The incorporation of silver–supported antimicrobial agent into denture base materials to investigate the distribution and to study

the release mode of silver ions from the base[9].In this study silver nitrate used by three volume (0.05ml,0.1ml and 0.2 ml) were incorporated into acrylic based soft denture liner to evaluate whether this addition would significantly affect some of properties of the soft lining material such as hardness, compressive strength, water sorption and solubility test.

Materials and Method

Preparation of silver nitrate solution, 0.1 N silver nitrate preparations:

_Normality (N) =weight/equivalent weight×1/ volume by litter

_Equivalent weight =molecular weight/valance

_Molecular weight of silver nitrate=169, 8731.

_Valance of silver nitrate =1.

_N=16.990/169,8731×1/1=0.10001584=0.1N

Taken (16.990±0.0001 g) silver nitrate is electronic balance. 1litter of purified water is poured into the light –proof glass bottle. The solution is prepared by pouring the pre-scaled silver nitrate into purified water; the solution prepared between 6 to 10 minutes is diluted by mixing[10,11].

Specimens grouping:-

One hundred and twenty (120) specimens were prepared from heat cure soft liner material (Vertex) to be used in this study and divided into three groups according to the test that carried out.Forty specimens for hardness test, forty specimens for compressive strength test and forty specimens for water sorption and solubility. Then each test subdivided into four subgroups according to the volume of the silver nitrate solution incorporation (0, 05 ml, 0.1ml and 0.2 ml) .Each have ten specimens.

Hardness test specimens:

A soft liner disk with the dimension of (30mm diameter, 3mm thickness)[12, 13] was used for hardness test.

Incorporation of silver nitrate with soft liner material :-

The resilient lining liquid was added to the powder and the material was mixed in accordance to the manufacturer instructions, the volume of the silver nitrate and liquid that had been added to the monomer of soft liner was taking into account and subtracted from soft liner monomer volume to achieve correct P/L ratio.

The soft liner dough was packed as a conventional method. Curing was done as instructed by manufacturer (heating up to 70 C^{O} and kept for 90 minutes then the temperature was raised up to 100c and kept for 30 minutes)[14]. A sharp blade was used to remove all the excess materials, fine grit sand paper and fine grit silicone polishing bur was used to remove the flashes .Then the specimens placed into the distilled water for seven days in the incubator at 37C°[15].

Testing procedure:-

The shore adurometer was used to measure soft liner hardness specimens .The testing value was taken as an average of different reading that were taken directly from the scale reading of durometer by using pointed dibbing tool.

Compressive strength specimens test:

A metallic molds with thickness of (12.7mm in diameter and 19mm in length was constructed for compressive strength test[16].

Testing procedure:

The specimens were subjected to compressive strength load by using compressive strength test machine. The specimens were subjected to the load with cross head speed of 0.5 mm/minute using load cell with maximum capacity 250N according to the following formula:-

Compressivestrength =F/A=(MPa)

F: Maximum load A: Cross section area

Sorption and solubilityspecimens test:-

A metallic molds of (50±1mm diameter and 0.5±0.05mm thickness) were made for sorption and solubility test[17].

Testing procedure:

After processing and finishing, all disc –shaped specimens were dried in a desiccators containing dried silica gel.The desiccators stored in an incubator at 37 c± 2c for 24 hours, after that the specimens were removed at

room temperature for one hour, and then weighted with digital electronic balance. This cycle was repeated until constant weight was determined. This was considered to be the initial weight (W_1). The specimens were immersed in distilled water for 7 days at 37 ^{0}C ±2^{0}C .After this period of time ,each disc was removed from the water with tweezers ,wiped with clean, dry hand towel until free from visible moisture ,waved in the air for 15 seconds and weighed one minute after removal from the water .This weighted represents (W_2).After that the specimens dried by the desiccators and they were weighted every 24 hours until a constant weighted (±0.5 mg) wasobtained, this weighted represents (W_3). Water sorption and solubility measured as a relative sorption and solubility in (mg/cm^2).Calculations were made according to the following formulae:

Sorption (mg/cm^2) = w_2-w_1 /surface area.

Solubility (mg/cm^2) = w_1-w_3/surface area.

Findings

Hardness test:

Table (1) showed that majority mean value are accounted in (0.2 ml) group while low level are recorded in control group,

Table (1): Descriptive statistics for hardness test

Groups	No.	Mean N/ mm	S.D.	S.E.	95% C.I. for Mean		Min.	Max.

Discussions

Hardnesstest:-

The results of this study showed high significant increase in the mean value of hardness for experimental groupsas shown in table (1), This findings can be explained by the fact that added silver nitrate into soft liner material may effect to the plasticizer ability for softening gel formation and its ability for polymeric chains penetration, it may act fillers that increase soft liner hardness and resistance when bonded inside it, silver nitrate may act fillers that increase or decrease soft liner hardness and resistance when dispersed inside it. And high significant increase mean value of hardness for silver nitrate groups could be the result of insufficient water absorption by these groups during the elongation and higher hardness value for specimens is explained by the incorporation of silver nitrate into soft liner material which may increase stiffness and reduce the flow of the material under load [14]. This explanation is in agreement with the work of others which showed the hardness significant increased as the result of leaching plasticizer with time for soft liner material by antifungal drugs [18].

Compressive strength:-

Denture bases would have a superior cushioning effect during occlusion and mastication .Many of these forces are compressive in nature ,and therefore effect of compression load on the test materials must be evaluated. In the methodology of this research ,determination of the compressive strength of the experimental material in compression with the control material was established ,the material were prepared in a cylindrical discs . During testing compressive load continued to compress

cylindrical discs, this design of testing is simulating in a degree compressive load during function of occlusion or mastication [12]. Statistical analysis showed high significant differences regarding ultimate compressive strength and deflection value .Higher compressive strength value recorded by the experimental material may give an indication of the rigidity in comparison with control material. Silver nitrate that is recorded by the experimental material indicated more rigid properties. By this study, the ultimate compressive strength as will showed that the compressive strength of the experimental material is significant high in (0.1ml) concentration than that of the control group material (table 3).The lower deflection value recorded by the experimental material indicated more rigid properties, this is attributed to the presence of silver nitrate polymer which made the experimental material more rigid. The compressive strength of the experimental material is high significant increase after 0.1ml concentration showed that of control material, but 0.05-0.2ml is high significant decrease with the control group (table 4). Lower compressive strength value recorded by the experimental material give an indication that the silver nitrate reduced water sorption and gave more rigidity to the experimental material in comparison with control material. This study is agreement with others work that showed reduce the molecular binding force between the reactant molecules and allows greater deformation upon stretching or flexion through exhibiting multiple micro fracture that weaken the silver nitrate loaded resin samples[19].

Water sorption and solubility:-

The results of sorption test showed that an increase in the mean value of soft liner material after incorporation with silver nitrate (table 5). This result obviously is due to leaching out of water –soluble ingredients, residualmonomer ,plasticizer and initiators from the soft liner in addition to silver nitrate ,during immersion in distilled water ;as a result there will be more micro porosity which will be eventually filled by water [20]. The findings of this study was done by incorporation of silver nitrate into soft liner material result high significant increase in mean value compare with control group(table 6).The chemical interact between soft liner material and silver nitrate explain the high water sorption of soft liner material after addition silver nitrate this is in agreement with the other work who suggested that variation in chemical composition could create some of structural spaces that might lead to higher water up take[21] .

Conclusions

Silver nitrate incorporation was significantly increases the hardness of soft lining material..

Compressive strength was significantlyincreased after incorporation of 0.1 ml of silver nitrate while incorporation of 0.05 and 0.2 ml of silver nitrate significantly was decreased.

Water sorption and solubility were significantly increased after incorporationof silver nitrate in all experimental groups.

Evaluation of Transaminases,Total Bilirubin and Ferritin in Iraqi Thalassemia Patients

KhetamHabeeb Rasool[1], NadheemaHammood Hussein[1], Butheina M. Taha[1]

[1]Department of Biology, College of Science, Mustansiryah University/Baghdad-Iraq

Abstract

Background: Thalassemia is a hereditary disease which characterize by a severe form of anemia occurring early in life associated with splenomegaly and bones changes.

Aim: The aim of this study was to evaluate the serum levels of ALT (Alanine transaminase), AST (Aspartate transaminase), bilirubin and ferritin in Iraqi β-thalassemia patients.

Subjects and Method: Fifty Iraqi patients diagnosed clinically by hematology doctors as β-thalassemia major(TM) were enteredin this study, they conducted to Ibn AL-Baladi hospital/Baghdad during the period from December, 2017 to march, 2018.The age ranges of patients were (6-36) years,twenty healthy age match were used as control group(Cot). Blood samples (3-5) ml, were collected from the two groups under study TM and control group.Serum was separated, drawn in two plane test tubes, and kept frozen (-20 ◦c) till the use. Ferritin levels were measured by using Ferritin (Kit Ref 04491785 of cobas e 411 analyzer) according to the manufacturing company. Total Serum Bilirubin concentration(TSB),Transaminases (GOT&GPT) activity were also measured by colorimetric methods, according to ELITech kit,Ref. BITO-0250 France for Bilirubin,and according to ELITech kit,Ref.ALSL-0455 France, for Transaminases/ France,using flexor 150 apparatus.

Findings: Results indicated that serum GOT and GPT were significantly elevated in TM patients (47.560 ± 30.472) U/L and (58.755± 5.369) U/L respectively in comparisons to their levels in the control group (19.940 ±9.427) U/L and (8.231 ± 3.830) U/L respectively,also a significant increase in serum Ferritin concentration (2668.±1775.436) ng/dl in TM patients in comparison with control group (31.000±4.735) ng/dl,with an elevated levels in mean value of serum TSB in thalassemia patients (34.76 2 ± 18.526) in comparison to control group (8.231 ± 3.830) .

Conclusion: Increase ALT (Alanine transaminase), AST (Aspartate transaminase), bilirubin and ferritin inthalassemiapatients may refer to liver dysfunction.

Keywords: *Beta thalassemia major (TM), ALT (Alanine transaminase), AST (Aspartate transaminase), bilirubin and ferritin.*

Introduction

Thalassemia is a form of inherited autosomal recessive blood disorder which it characterized by abnormal formation of hemoglobin[1]results in the adequate oxygen transport and the destruction of red blood cells inthe bone marrow (ineffective erythropoiesis) and the peripheral circulation (hemolysis)[2]In normal cases,most of adult hemoglobin (HbA) is consist of 4 protein chains, two α and two β globin chains which arranged in a hetero- tetramer. Thalassemia patients have defects in either the α or β globin chain, causing production of an abnormal red blood cells[3]due tothe variant or the missing genes that affect hemoglobin(the protein in red blood cells that it carries oxygen) synthesis. The people with thalassemia have less hemoglobin and also have fewer circulating red blood cells than normal which result in mild or sever microcytic anemia[4]. Thalassemia word was derived from the Greek word *thalas*which means sea and *emia*that stands for the blood

anemia, indicating its prevalence in the regions around the Mediterranean Sea[5].For many patients who they were with chronic anemia,regular blood transfusions have affectively extended life suspense in thalassemia major patients [6]Blood transfusions contain red cells that reach the end of their life due to the aging or defects they are broken down, and then hemoglobin molecule broken up and the iron recycled. Humans are unable to eliminate the excess iron and regulate the body iron stores by limiting absorption [7]

Too much iron in the body of human is called iron overload [5]Iron was transported as transferrin to the liver or the spleen where it was stored as ferritin[8]. Serum ferritin levels were measured in patients as a part of the iron studies workup for the anemia. Ferritin is also used as a marker for the iron overload disorders, such as hemosiderosis, hemochromatosis and porphyria in which ferritin level may be abnormally raised[9] Iron accumulation (ferritin) in the liver and the heart worsening of hepatic fibrosis, and development of the cardiac fibrosis [10]

Beta-thalassemia major patients suffer from many problems rather than severe anemia including; increased susceptibility to bacterial infections which plays the major role in the patient's morbidity and mortality[11] Degradation of the hemeafter 120 days in the circulation to produce the green pigment biliverdinand the bilirubin. Bilirubin binding to the albumin and enters a hepatocyte then excreted to the bile.Bilirubin can be measured as direct or conjugated. Sometimes, total amount of the bilirubin in the blood measured [12]

Alanine Transaminase (ALT) which called also serum glutamate -pyruvate transaminase (SGPT). Alanine Transaminase is present in high concentration in the liver lesser extent in skeletal muscle, heart and kidney[13], measurement the activity of ALT in serum is used as an indicator of hepatocellular damage [13] Aspartate Transaminase (AST) enzyme is called also glutamate oxaloacetate transaminase (SGOT), which present in high concentration in the following organs: heart, skeletal muscle, liver, kidney and erythrocytes[14] The damage to any of these tissues may be result in the increased plasma AST [15].

The study was aimed to determination of serum transaminase (ASOT, GPT), ferritinand the total serum bilirubin levels in β-thalassemia patients receiving multiple blood transfusions.

Materials and Method

Subjects

Fifty Iraqi patients of both sexes (28 male and 22 female)which were diagnosed clinically with β-thalassemia major were participated in the present study, they conducted to Ibn AL-Baladi hospital during the period extended from December,2017 to March, 2018. Their age ranges were (6-36) years old; all the patients were having chelating therapy (desferrioxamine). Twenty healthy age match were used as a control group.

Samples collection

Blood samples (3-5) ml, were collected from the patient group and healthy control group, left to stand for an hour then centrifuged(2500r pm) for fifteen minutes . Serum was separated, drawn in two plane test tubes, and then kept frozen (-20 ◦c) till the testing day.

Determination of serum ferritin levels

Ferritin levels were measured by using Ferritin Kit Ref 04491785 of cobas e 411 analyzer according to manufacturing company (Roche Diagnostic).

Determination of serum liver function

Total Serum Bilirubin concentration (TSB),Transaminases (GOT&GPT)activity and Creatinine were measured by the colorimetric methods,according to the ELITech kit,Ref. BITO-0250 for Bilirubin,and according to the ELITech kit,Ref. ALSL-0455, for Transaminases, and according to the ELITechkit. Ref, CRCL-0250 France for Creatininedetermination,by using flexor 150 apparatus.

Statistical Analysis

Statistical analyses for this study done by using Microsoft office (SPSS version 10.01). The data were present as mean ±SD. Alsothe t-test for two independent means, *P* value 0.05 levels or less considered as a significant result.

Finding and discussion

In this study Fifty Iraqi patients were diagnosed clinically with the β-thalassemia major wasparticipated, they conducted to the Ibn AL-Baladi hospital during the period extended from December, 2017 to march, 2018.

Their age ranges were (6-36) years old; twenty healthy age match persons were used as a control group.

About (3-5)ml of the blood were collected from the two groups,and serum was used for the detections of transaminase [Glutamic Oxaloacetic (GOT),Glutamic Pyruvic Transaminase (GPT)]Total Serum bilirubin and the ferritin levels in both groups.

Table (1) showed findings of Ferritin,total serum bilirubin, and transaminase expressed as mean ±SD in 50 patients with the major thalassemia(TM) and 20 control group(Cot). As seen in Table(1)and figure (1) there was a significant increase in the serum Ferritinconcentration (2668.±1775.436) ng/dl in TM patients in comparison with the control group(31.000±4.735) ng/dl,(P≤0.05).

TSB titers were elevated in the TM patients(34.76 2 ± 18.526) mm/l compared with the control group(8.231 ± 3.830)mm/l,(P <0.001) table(1)and Figure (2).

Serum GOT and GPT were significantly elevated in the TM patients(47.560 ± 30.472)U/L and (58.755± 5.369)U/L, respectively in comparisons to their levels in the control group(19.940 ±9.427)U/Land (8.231 ± 3.830)U/L respectively,Table (1), Figure (3) and Figure (4).

Table (1):Mean±SD values of serum ferritin,TSB,GPT and GOT in β the thalassemia patients group (TM), and the control group (Cot).

Parameters	Cot(I) Mean±SD	TM(II) Mean±SD	p-value
Ferritin ng/dL	31.000±4.735	2668.880±1775.436	<0.001
TSB mm/L	8.231 ± 3.830	34.76 2 ± 18.526	<0.001
GPT U/L	17.600 ± 4.654	58.755± 5.369	0.0147
GOT U/L	19.940 ±9.427	47.560 ± 30.472	0.0065

TSB=Total serum bilirubin, Glutamic Oxaloacetic (GOT),Glutamic Pyruvic Transaminase (GPT).

From FigureS (1),(2), (3) and (4) we showed that the highly significant differences in TSB,GOT,GPT and serum Ferritin between the β-thalassemia infected group and the control group.

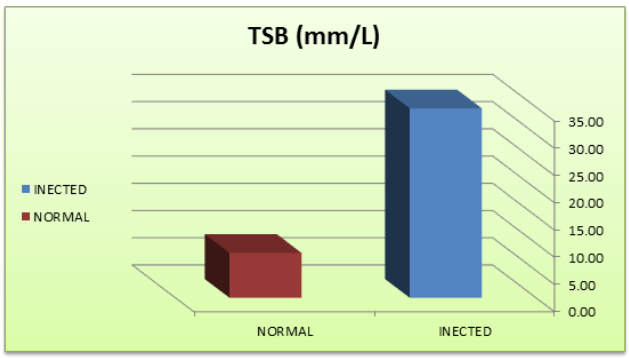

Figure -1: Mean differences of Total serum bilirubin(mm/L) between the thalassemia infected patients and the control .

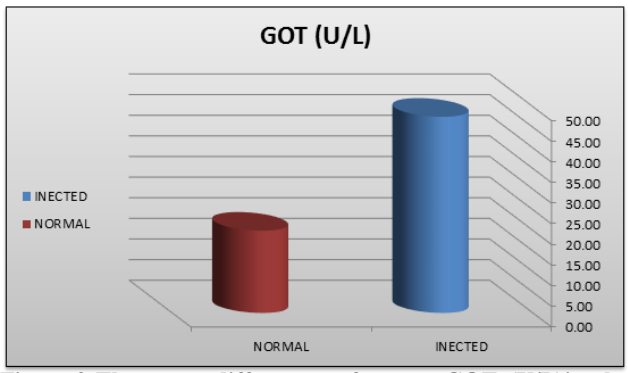

Figure-2:The mean differences of serum GOT (U/L)in the thalassemia infected patients and the control .

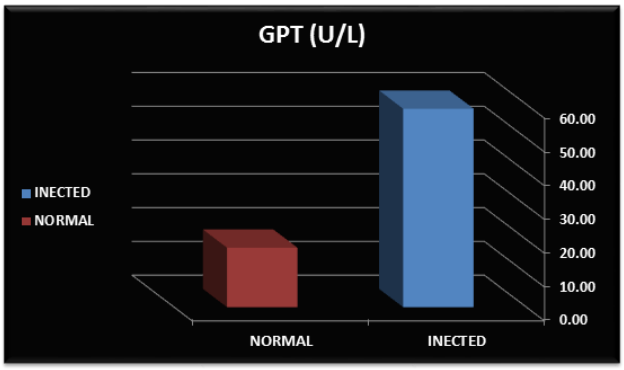

Figure -3:The differences of GPT value (U/L) in the normal and the thalassemia patients expressed as Mean±SD.

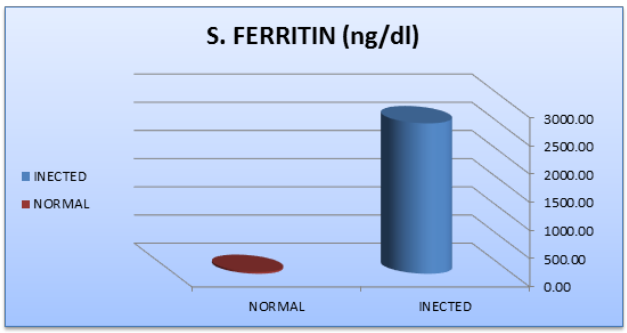

Figure -4: Mean value of serum ferritin level(ng/dl) inthe β-thalassemia patients and the control.

The findings showed significant increase ($p<0.05$) inthe ferritin levels ofthalassemia patients comparing with the healthy control group. Iron initially stored as ferritin, is deposited in organs as hemosiderinwhich is toxic to the tissue.Most humans avoid iron overload solely by regulating the iron absorption. Those who cannot regulate the absorption well enough get complaints of iron overload. In these diseases, the toxicity of the iron destroyed the body's ability to bind and store iron. Patients with thalassemia major accumulate body iron over time as a consequence of the continuous red blood cell transfusions which cause endocrine, hepatic and cardiac complications [16,17,18]. all of these studies are associated with the current study results.

The total bilirubin level measured sum of direct bilirubin and indirect bilirubin, when the total bilirubin level increased this indicted that increased both or only one of them [19]. Bilirubin, is the first point that helps tothe recognized jaundice,hemolysis induces deposition of the bilirubin causing intrahepatic cholestasis and the cholelithiasis[20,21]. This study had demonstrated a higher mean value of TSB in the thalassemia patients (34.76 2 ± 18.526) in comparison to its value in the control group(8.231 ± 3.830).These findings were disagreed with another study done by Chakravarti*et.al*, 2005 [22]. which found that the bilirubin levels were not significantly altered in these patients. The study findings were similar to the other findings reported by Sarkis, (2000)[23]. who stated that there was a higher mean value of the total serum bilirubin and a highly significant difference between the patients with HCV positive andthe patients with HCV seronegative.

The study results had demonstrated that the mean value of GPT, was (47.560± 30.472)U/L in the thalassemia patients, compared to (19.940 ±9.427)U/L in the control cases,and the difference statistically was significant ($P<0.002$). This was compatible with the other studies Wanachiwanawin*et.al*, 2000 [24]. which reported that the thalassemia patients had significantly abnormal level of the serum GPT.

Shindo*et.al,*1995 [25]. found that patients of anti-HCV positive who have elevated serum GPT level are more likely to have a significant liver disease than those who have normal level of serum GPT. Serum GPT elevation in anti-HCV positive individuals suggests the presence of the liver damage such as viral replication [25]. and iron overload .The study results have also demonstrated that there was significant difference in the GOT between the patients and the control group this findings was similar to Al Hawsawi,2000 [26] found that there was a highly significant difference in the GOT level between thalassemic patients with HCV seropositive and patients with HCV seronegative.

The thalassemic patients have a greater risk of liver damage (as indicated by the elevated aminotransferase and the serum bilirubin) compared to the control groups [27]. probably resulting from the infection, cholestasis, hemosiderosis or as a result of congestion due to the heart failure.

In addition, seropositive thalassemic patients have significantly higher levels of the aminotransferase enzymes and the serum bilirubin. This can be explained either by direct damage of the hepatocyte by viral invasion or by the development of an immune complex. Consequently it is necessary in these patients to measure the aminotransferase levels monthly for six months; if there is persistent elevation, it should be to considered as chronic hepatitis and liver biopsy is indicated[28].

Conclusion

Our results showed significant increase in the ferritin levels with higher mean value of TSB and GPT of thalassemia patients comparing with the healthy

control group.

Evaluation the Effect of Black Seed Oil and Taramira Oil on the Hardness and Surface Roughness of Heat Cure Acrylic Resin Denture base Material

Makarem Abdul-RassolJaber

[1]*Assistant Professor, Prosthetic Dental Technology Department, College of Health and Medical Technology, Middle Technical University (MTU), Baghdad, Iraq*

Abstract

Background: Separating medium is a layer of coat which is applied to a mouldsurface to avoidthe adhering the second surface to the first surface. The mould must be coated during acrylic resin processing to inhibit liquid resin from penetrating into the gypsum and water from gypsum leaking to acrylic resin. For several years, tin foil was the most acceptable separating medium, and because it's challenging to apply a tin-foil substitute, a cold mold seal is utilized.

Objective of this study: The aim of thecurrent study was to assess the effect of black seed oil and taramira oil on surface roughness and hardness of heat acrylic resins.

Materials and Method: Sixty samples were made from the heat acrylic resins and divided into two categories (30 samples in each categories) depended on test; surface roughness and hardness, each categories contain three groups: group 1;(10) samples of heat acrylic resins treated with cold mol seal (control group), group2; (10) samples of heat acrylic resins treated with black seed oil and group3;(10) samples of heat acrylic resins treated with taramira oil. The average of the hardness of the specimens has been determined with using the Shore D hardness device¸ also the average of the surface roughness of the specimens has been determined with using profilometer device.

Findings: The results showed that there was a statistically significant difference in the hardness and non-significant difference in surface roughness of heat acrylic resinsamong the testing groups.

Conclusion: In this study concluded that black seed oil gives more hardness in comparison with cold mold seal and taramira oil; also black seed oil gives more smoothness (less surface roughness) followed by taramiraoil.It is concluded, that black seed oil and taramira oil could beutilized as a separating medium.

Key wards*: Denture base,acrylic resin,black seed oil,taramira oil,cold mold seal.*

Introduction

Polymethylmethacrylate (PMMA) is the most popular dental material used in the construction of removable prostheses, it is necessary to apply separating medium to the gypsum surface before packing of PMMA[1].

Separating medium is a "coat of layer applied to surface to prevent a second surface from adherence to the first surface"[2]. A layer of gypsum impregnated with polymer remains would be attached to the denture surface If the mold surface is not separated with a separating material leading to an unaesthetic and poorly fitting denture base [3].Thus; the separating medium must be applied to the surface of the mold [4].

Many materials are used for dental stone separation; cold mold seal is one of commonly used separating medium. The literature indicated thatthe tin foil separating medium is the best, but it istime-consuming and difficult to apply. Consequently, the use of other separating medium has been developed[5].

Wally in 2014[6] used olive oil and found that non-significant difference between cold mold seal and olive oil regarding tensile strength of heat acrylic resins. While Mohammed in 2014[7] studied the influence of glycerin on the hardness of heat cure resin and found that glycerin gives highly hardness than cold mold seal. Altaie et al., in 2015[3]used olive oil, tin foil and cold mold seal as separating medium and found that using olive oil not affect on hardness of heat cure acrylic resin.

The purpose of this study was to evaluate the effect of black seed oil and taramira oil as a separating medium on hardness, and surface roughness of heat cure acrylic resin denture base materials

Material and Method

Samples grouping:

60 samples were made from heat cure acrylic resin (Superacryl Plus, Colombia)**;** Specimens were grouped into: 30 specimens made for hardness testand these where subdivided into:

*(10) samples of heat cure acrylic treated with cold mold seal (control group);

(Switzerland).

*(10) samples of heat cure acrylic treated with black seed oil, (Kingdom Saudi Arabia),

*(10) samples of heat cure acrylic treated with taramira oil **(**Pakistan).

30 samplesmade for surface roughness test and these where subdivided into:

*(10) samples of heat cure acrylic treated with cold mold seal (control group).

* (10) samples of heat cure acrylic treated with black seed oil.

*(10) samples of heat cure acrylic treated with taramira oil**.**

Preparation of the specimens:

Two metal patterns (stainless steel)were customized into desired shape and dimension using aturning machine:

A- Surface hardness test with dimension of (65 mmx10 mm x2.5mm) length, width and thickness respectively [7]**,** figure (1-A).

B- Surface roughness test with dimension of (80mm x 10mm x 2.5mm) length, width and thickness respectively [8],figure (1-B)

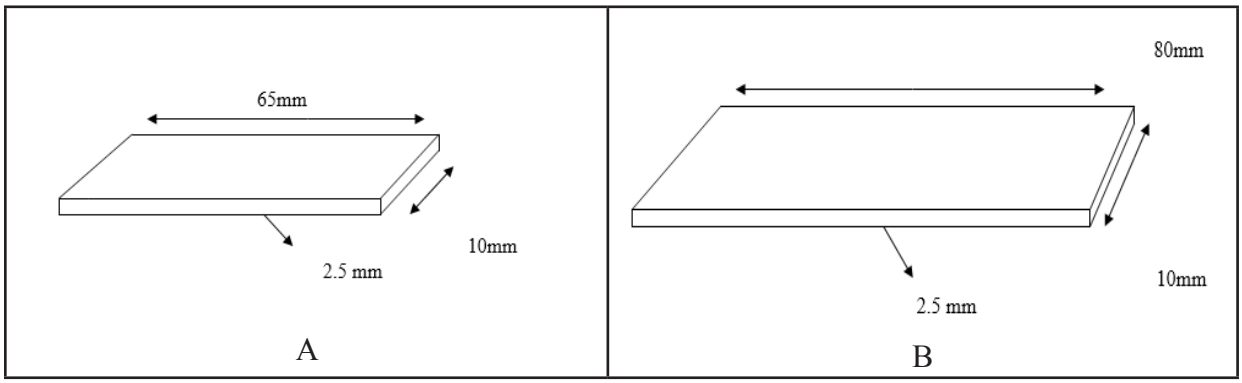

Figure (1):A-surface hardness test B- surface roughness test

The 2 metal pattern werelayered with separating medium.The lower part of a flask was covered with dental stone(Durguix, Spain). Once complete set of the stone surface, bothmetal patterns and stone were separated withcold mold seal. The upper part of the flask was positioned over the lower part, andthen filled with stone. The flask was left for 60minutes, after that the upper and lower parts were opened carefully and patterns were removed.A disposable syringewas utilized to measure 2cc of separating media (cold mold seal, black seed oil and taramira oil). The measured separating medium was applied onto the stone surface by a fine brush [9]. This

technique of applying material (cold mold seal, black seed oil and taramira oil) was repeated with all moulds of the specimens in this study.

Heat cured acrylic resin was mixedandpacked according to manufacturers instruction,and then the flask was positioned under the hydraulic pressand the pressure was applied slowly in order to make sure even flow of the acrylic dough throughout the mould space. Thenthe pressure was released and the flask was opened and the excess material (flash) was taken away. Then the two halves of the flask were finally put in contact and left under the press (1500psi) for 5 minutes. Then the flask was placed in a flask clamp.According to ADA specification, No.12 (1999), short curing cycle was conducted[10]. the flask was left to cool for thirty minutes at room temperature and then with tap water for 15 minutes. All acrylic specimens were then taken from the stone mould.

Acrylic patterns of surface roughness were cut into equal rectangular plates with an acrylic separating disk to obtain the final measurement of 20mmlength x10 mmwidthx2.5 mm thickness. Thethickness of 2.5mm represents the average thickness of acrylic denture base, while the length and width coincides for suitable measurements in the surface roughness tester [8].To remove all flashes of acrylic,the acrylic bur was utilizedfollowed by using sand paper (120 grain size)[9] in order to get smooth surface for the specimens used for hardness test. On the contrast, the specimens for surface roughness test, are not be polished.All specimens were kept in distilled water at 37Cº before testing [10], figure (3).

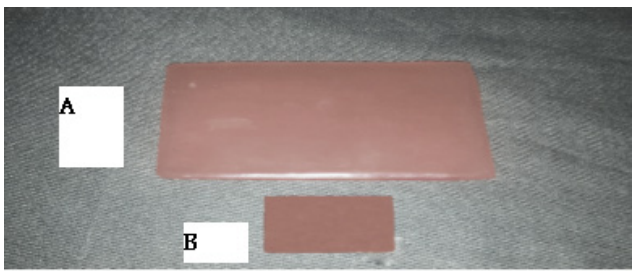

Figure (2) :(A): Hardness specimen. (B): Surface roughness specimen

Shore D hardness tester device (Italy) was used in this study for measuring procedure, figure5.According to the device instruction the hardness value is determined by the penetration of the Durometer indenter into the specimen. Three reading was done on different areas of each specimen and the mean of the three reading was calculated.

Figure (3): Shore D hardness tester device.

The surface roughness of each specimen was measured by using profilometer surface roughness device, figure (4). The profilometer was supplied with stylus made of diamond; the specimen's surfacewas fixed in a flat position to the base of the profilometer by glue. The stylus was moved for a distance of 1.7 mm across thesurface of the specimen in three different directions depending on apparatus design. Three reading was recordingfor each specimen, and the mean value for each specimen was the average of the reading. Then the data was collected and subjected to statistical analysis.

Figure (4): Profilometer surface roughness device

Findings

Surface hardness test**:**

All values of mean and standard deviation for each group is listed in table (1). The highest mean value is (79.340) for black seed oilgroup, followed by the taramira oil group which is (77.400), while the control group showed the lowest mean value (74.720), figure (5).

Table (1): Descriptive statistics test for surface hardness of studied group

Studied group	N	Mean	SD	SE	Min.	Max.
Control	10	74.720	1.6 80	.495	71.54	79.44
Black seed oil	10	79.340	2.196	.594	74.80	80.67
Taramira oil	10	77.400	1.540	.400	73.90	81.85

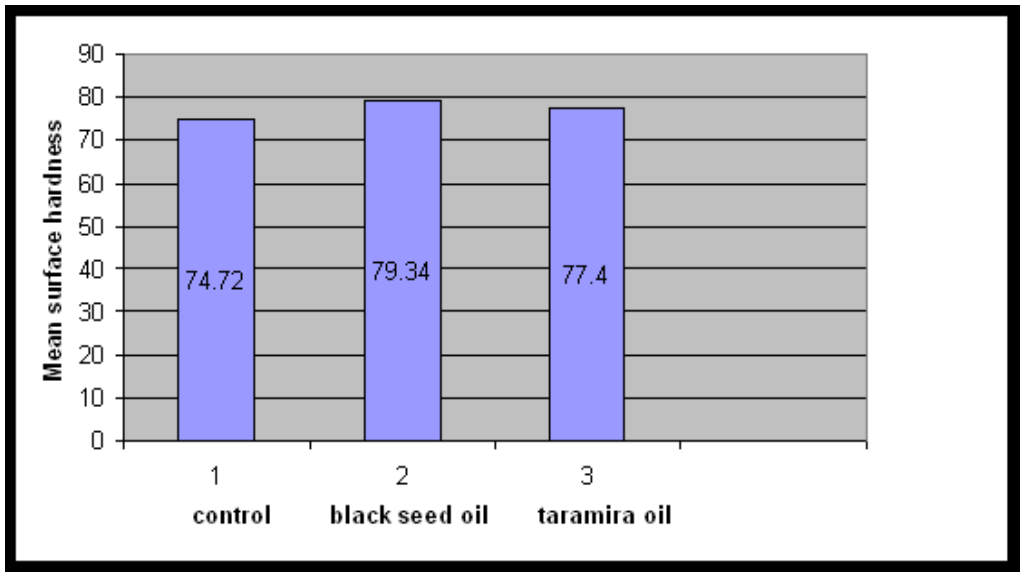

Figure (5): Bar chart of mean of surface hardness test

The ANOVA test indicated that there were significant differences for surface hardness among all groups as demonstrated in Table (2) where (P<0.001).

Table (2): ANOVA test for surface hardness among studied groups

	Sum ofSquares	**df**	**Mean Square**	**F**	**Sig.**
Between groups	107.635	2	53.817	10.866	.000 (HS)
Within groups	133.710	27	4.953		
Total	241.345	29			

Furthermore**,** therewas a highly significant difference (P<0.001) between each groups as demonstrated in table 3(The LSD test).

Table (3): LSD test for studied groups

Studied Groups P-value		**LSD (test)**	
		Sig.	
Control	Black seed oil	0.000	HS (P<0.001)
	Taramira oil	0.000	HS (P<0.001)
Black seed oil	Taramira oil	0.000	HS (P<0.001)

Surface roughness test:

The values of mean, standard deviation, standard error, minimum and maximum of surface roughness for all groups are list in table (4). The control group created the highest value of mean (1.349μm), while the black seed oil group produced the lowest value of mean (1.346μm), figure (8).

Table (4): Descriptive statistics test for surface roughness of studied group

Studied group	N	Mean(µm)	SD	SE	Min.	Max.
Control	10	1.349	0.241	0.073	1.020	1.610
Black seed oil	10	1.346	0.223	0.071	1.011	1.659
Taramira oil	10	1.347	0.232	0.096	1.077	1.660

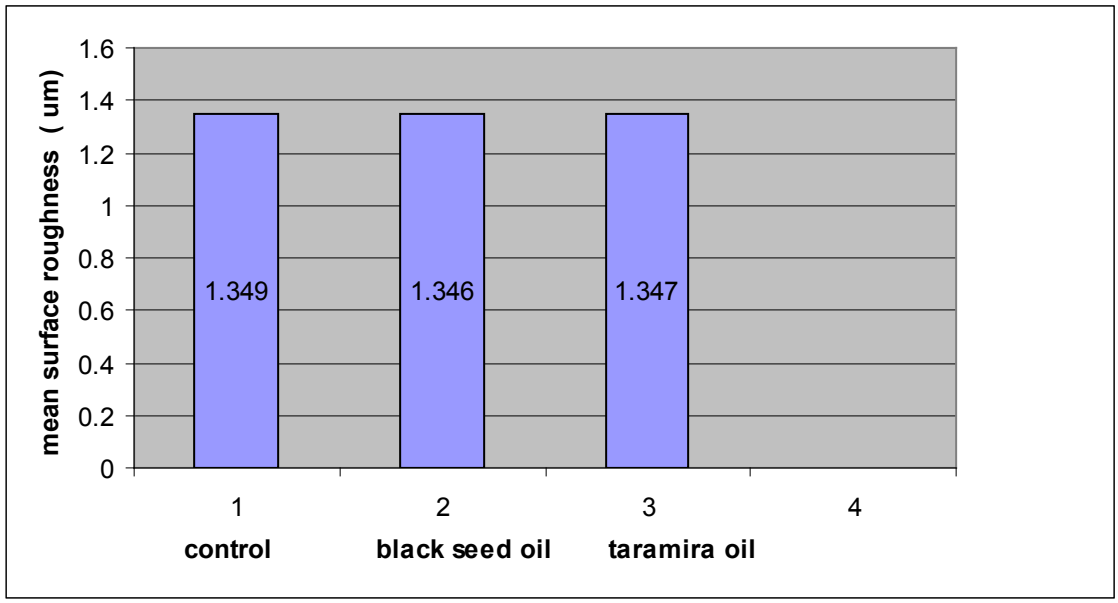

Figure (6): Bar chart of mean of surface roughness test

Among all groups , there were no significant differences as demonstrated in Table (5).

Table (5): ANOVA test for surface roughness

	Sum of Squares	df	Mean Square	F	Sig.
Between groups	.000	2	.000	.000	1.000 (NS)
Within groups	1.799	27	.067		
Total	1.799	29			

Discussion

Separating medium is considered as the mainfeature which influence thesuccess of dental because of its effect on the mechanical and physical properties of acrylic resin. For dental stone, many substances areutilized such as cold mold seal [11].

In this study, black seed oil and taramira oil used as separating materials with cold mold seal (control group) to evaluate their effect on the hardness and surface roughness of acrylic denture base material.

Surface hardness test:

The results of the current study revealed thatthe black seed oilgroup created the highest mean value followed by the taramira oil group, while the control group showed the lowest mean value (table 1), also the result showed highly significant difference among them (table 2,3). Black seed oil andtaramira oil improved the hardness of the acrylic resins, this could be explained

by water sorption phenomenon of methyl methacrylate denture base material that is mean the cold mold seal film is not fully water eliminator and this inhibit complete polymerization of acrylic [12,13]. Black seed oil showed highly significant difference than taramira oil this could be due to chemical composition of the major unsaturated fatty acids were linoleic acid followed by oleic and lignoceric acid in chemical composition of the black seed oil [14]. This result agrees with Hatim et al., [15] who found that addition of black seed and thyme oils improved the transverse strength and hardness of acrylic resins. Altaieet al., [3] used olive oil as separating medium, and revealed that therewere no significant differences between olive oil andcold mold seal on hardness of acrylic resin.

Surface roughness test:

Smooth surface of acrylic resin resists the buildup of stain, debris and plaque. Increase surface roughness has a detrimental effect on the aesthetic of the denture and health of oral tissues [4].

The results of the current study indicated that the cold mold seal (control) group hadgreatest mean value of surface roughness followed bytaramiraoil group, while the black seed oil group showed the lowest mean value (table 4), this decrease in the mean value of surface roughness may be due to the nature of oil which makes the surface smooth [3]. Also the result showed that there is a non significant difference among groups (table 5). This could be related to the present of glycerin in the composition of cold mold seal that is similar to the chemical oil nature of black seed and taramira oils [4].

However, there is no previous studies in this field to correlate the results of this study (hardness and surface roughness test) with it.

Conclusion

From the present study the following conclusion can be with drawn:

1-Black seed oil gives more hardness in comparison with cold mold seal, andtaramira oil which is gives more hardness than cold mold seal.

2- Black seed oil gives more smoothness (less surface roughness) in comparison with taramira oil and cold mold seal.

3- Instead of cold mold seal, black seed and taramira oils can be utilized as the separating medium

G- Protein Coupled Receptor Purification from Whole Blood of Iraqi Diabetic and Diabetic Nephropathy Patients

Sulaiman M. Hasan[1] , Zeinab M. Al-Rubaei[2]

[1]Ph.D, Clinical Biochemistry, Department of Biochemistry, Collage of Dentistry, Al-Farahidi University/Iraq;
[2]Deptrtment of Chemistry/ Ibn-Al-Haitham College of Education for Pure Science / University of Baghdad /Iraq

Abstract

The study aimed to purified G- Protein Coupled Receptor (GPCR) from the whole blood of control ,G1, diabetic,G2, and diabetic nephropathy ,G3,patients by different chromatography techniques for the first time in world that may be important in early detection and active treatment in these patients.

The GPCR extracted from whole blood by precipitation of proteins with ammonium sulfate,then purified by ion exchange chromatography, as a first step using DEAE-Sepharose .A gel filtration chromatography was applied as a second step of purification using Sepharose 6B.The molecular weight and purity of GPCR was determined by electrophoresis.

Results of ion exchange chromatography for G1 showed two proteins peaks that appeared after elution by the gradient concentration of sodium chloride. Data indicated that GPCR is located in the first protein peak at fraction numbers between (6 and12). Results for G2 showed two proteins peaks that appeared after elution with the gradient concentration of sodium chloride .Then, fractions were collected and concentrated to be applied in gel filtration chromatography.Results showed a single active protein peak after eluted with elution buffer that was identical with the peak that presented GPCR concentrations at fractions number (14)for control group and show of single active protein peak that was identical with the peak that presented GPCR concentrations at fractions number (12)for G2and G3 .

The molecular weight of GPCR that estimated byelectrophoresis that two bands of GPCR appear in G1at (~ 30 KD) and (~ 51 KD) .Results ,also , showed appearance of three bands in G2 related to GPCR in (~ 29 KD) and (~ 47,49 KD) .

The conclusion could be drawn from this studythat GPCR appear in groups is a marker in detection and treatment of diabetic and diabetic nephropathy.This finding could be useful in the early detection and active treatment of diabetic and diabetic nephropathy patients based on type of GPCR that be identified .

Keywords: *GPCR Purification, Whole blood , Diabetic , Diabetic Nephropathy.*

Introduction

The (GPCRs) are receptors encoded by the human genome.Several GPCRs have been identified as a potential therapeutic targets for the treatment of diabetes and diabetes complications, including retinopathy, nephropathy, and neuropathy [(1,2)].

Study ,revealed that GPCRs are expressed in the pancreatic islets and may play an important role in the normal glucose homeostasis [(3)].

Many GPCRs are directly involved in the development of insulin resistance and β-cell dysfunction that can lead to T2DM[(4,5)] . Sweet taste receptor appear to dominate postprandial glucose-dependent insulin and GLP-1 release [(6)] .

Glucose-dependent stimulation of insulin secretion is observed with$G_{\alpha s}$and $G_{\alpha q}$-coupled receptors linked to protein kinase C activation and inositol triphosphate which linked to insulin secretion [(7,8)] .Researches demonstrated that these receptors are expressed in high

levels in pancreatic β-cells [9] .

Purification is a major challenge in the field of GPCR research because many GPCRs are denatured by detergents (due to the difficulty of purifying GPCRs) [10,11] .So,this study designated to purified GPCR from the whole blood of control, diabetic and diabetic nephropathy patients.

Material and Method

1- Extraction of GPCR from wholeblood :

One hundred fifty individuals with age ranged between (40-65) years were enrolled in this study.They divided into three groups (N=50 per each group) as follows: group 1(G1) represent control group .Group2 (G2) represent diabetic patients andgroup 3 (G3) represent diabetic nephropathy patients.

Blood that obtained from subjects were centrifuged at 2500g for 15 minutes to separate pack cell volumes . Supernatant plasma and buffy coat were discarded . RBCs were washed with (3) volume of normal saline and hemolysis by adding (5) volumes of water . After 20 minutes , hemolysis was centrifuged at 3500g for 20 minutes . Supernatant was collected and filtered through qualitative filter paper (whatmen-1) to remove left out cell debris . It was followed by precipitation of proteins with 50 – 75% ammonium sulfate . For precipitation an equal volume of saturated solution of $(NH_4)_2SO_4$ was mixed with filtrate and after 15 minutes , it was cooled and centrifuged at 3500g for 10 minutes . Finally , the pellet was dissolved in a minimum volume of (1.5 mM) of Phosphate Buffer Saline pH 7.3 .The Pellet cells were thawed and suspended in extraction buffer (1.5 mM PBS buffer, pH =7.3, 1 mM AEBSF) and then protease inhibitor cocktail (up 10 ml for 1ml) was added with gentle swirling on ice. The DDM(n-Dodecyl-B-D-Maltoside) (1%) was added to the lysed sample and stirred on ice for 1 hour.The dissolved pellet was dialyzed for 72 hours against 1500 ml of dialysis buffer (1.5 mM PB, pH 7.3) in a cold room .buffer was changed three times during 72 hours.

Protein concentration was estimated according to the Bradford method (1976)[12].

GPCR concentration was estimation by ELISA [13] using kit from Blue Gene Biotechnology, China .

2 - G-protein Coupled Receptor Purification:

GPCR that extracted from blood was purified by using ion exchange chromatography as a first step of purification, and gel filtration chromatography as a second step of purification.

2.1- Ion Exchange Chromatography[14]:

Five ml of crude extract was applied on the DEAE-sepharose column (2.5 x 8) cm . The column was equilibrate and washed with an equal volume of 50 mM of phosphate buffer saline contained DDM (pH=7.4) to wash uncharged and positive charged proteins in protein mixture of crude GPCR . The bound proteins were then eluted using NaCl (0.1- 0.5) M . Fraction were collected in 5 ml tube at a flow rate of 0.5 ml/min and eluted with gradient (0.1 – 0.5) of sodium chloride solution .Then GPCR crude was eluted with buffer.The fractions that gave the highest absorbance were collected. Protein and GPCR concentrations were estimated for each fraction .

2.2-Gel filtration chromatography[14] **:**

Aliquot of five mL of concentrated fraction was injected into sepharose 6B column (65 x 1.5) cm which previously equilibrated with 1.5 mM phosphate buffer saline (pH=7.4) , and eluted with elution buffer PBS pH =7.4 containing (0.5Mm) DDM . Flow rate was (1ml / min) with 5 ml for each fraction that monitored at 280 nm .Protein and GPCR concentration were determined for each fraction.Fractions which gave the highest absorbance and concentration of GPCR were collected.

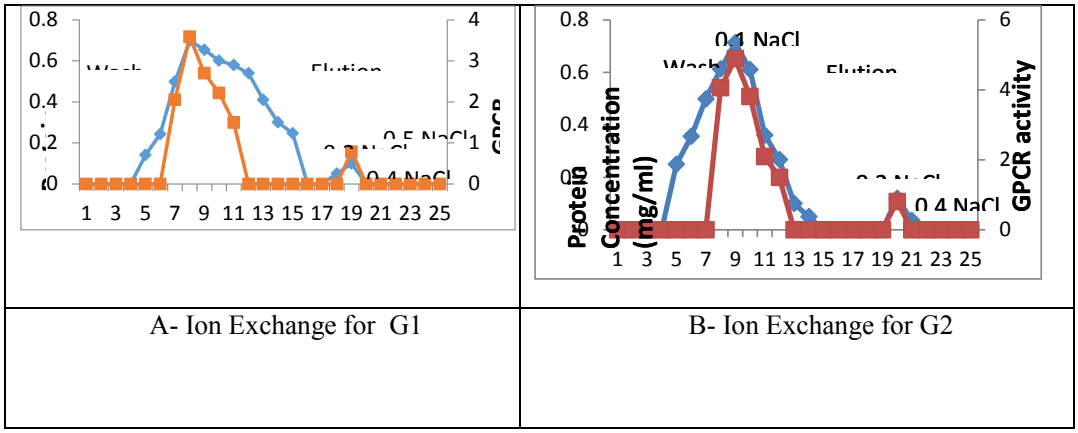
3- Estimation of GPCR Molecular Weight [15]**:**by SDS-PAGE Electrophoresis .

Findings

Table (1) shows protein and GPCR concentrations for extraction and solubilization steps of lysate . Results show a decrease in protein and GPCR concentrations after extraction and solubilizationsteps .

Table (1): protein and GPCR concentrations for extraction, solubilization and precipitation steps of lysate

Control



Sample	**Volume(ml)**	**Protein con.(mg/ml)**	**GPCR con.(ng/ml)**
Crude	30	0.89	6.61
Precipitate by $(NH_4)_2SO_4$ (50-75%)	15	0.718	5.34
Diabetic			
Sample	Volume(ml)	Protein con.(mg/ml)	GPCR con.(ng/ml)
Crude	30	0.92	6.19
Precipitate by $(NH_4)_2SO_4$ (50-75%)	15	0.799	6.052
Diabetic nephropathy			
Sample	Volume(ml)	Protein con.(mg/ml)	GPCR con.(ng/ml)
Crude	30	0.94	5.322
precipitate by $(NH_4)_2SO_4$ (50-75%)	14	0.801	4.95

Non –ionic detergent ,dodecal-β-D-maltoside (DDM) was used in the extraction and solubilization of GPCR based on previous study[16,17].

Purification of GPCR Extracted fromf blood

Ion Exchange chromatography[18,19]:

Results of G1 showed two proteins peaks ,figure (1-A) that appeared after elution by the gradient concentration of NaCl , while no protein peaks appeared in the washing fractions . The GPCR concentration were measured in the fractions of these two protein peaks . Data indicated that GPCR located in the first protein peak (eluted at 0.1 M of NaCl) at fraction numbers between (6 and12) . The second peaks (eluted at 0.2 M of NaCl) gave a peak between (18-20), thus its neglected .

A- Ion Exchange for G1

B- Ion Exchange for G2

Figure(1) : Ion Exchange for A- G1 B-G2

Results for G2 , figure (1-B), showed two proteins peaks that appeared after elution with the gradient concentration of sodium chloride , while no protein peaks appeared in the washing fractions . Data indicated that GPCR located in the first protein peak (eluted at 0.1 M of NaCl) at fraction numbers between (7 and13) . The second peaks (eluted at 0.2 M of NaCl) give peak between (18-20) .

Results for G3 in figure (2) showed two proteins peaks that appeared after elution by the gradient concentration of NaCl , while no protein peaks appeared in the washing fractions . Data indicated that GPCR located in the first protein peak (eluted at 0.1 M of NaCl) in fraction numbers between (7 and13) . The second peaks (eluted at 0.2 M of NaCl) give peak between (19-21) .

Gel filtration	8	0.512	4.89	9.55	1.42
G3					
Crude GPCR	30	0.94	5.322	5.66	1.0
Ion exchange	9	0.723	4.49	6.21	1.1
Gel filtration	7	0.525	3.52	6.7	1.18

Determination of purity and molecular weight of GPCR by SDS-PAGE:

The molecular weight and purity of GPCR that purified from G1,G2 and G3 were determined by sodium dodecyl sulfate –polyacrylamide gel electrophoresis (SDS-PAGE) ,as shown in figure(5) .

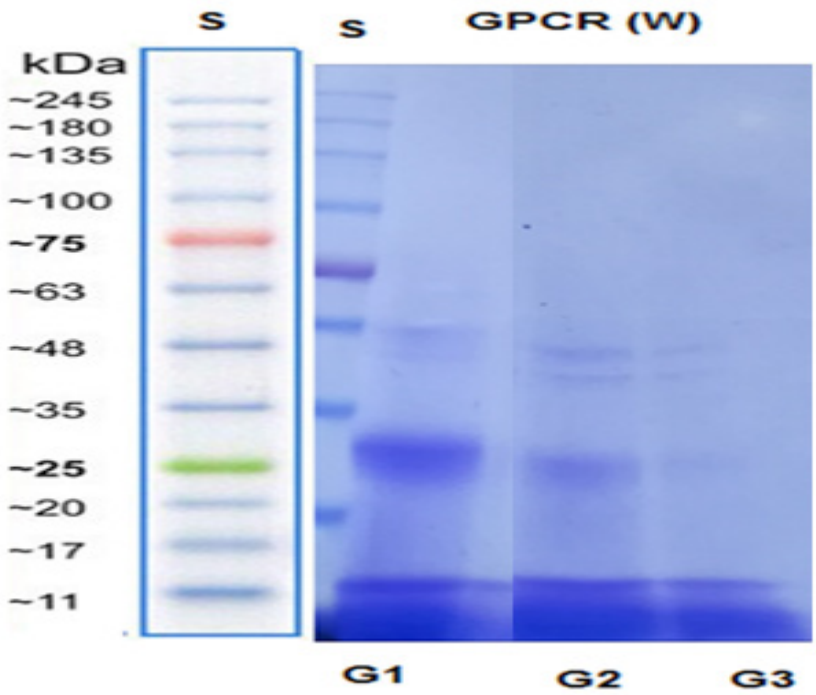

Figure (5) SDS-PAGE for purified GPCR in G1,G2 and G3

Results indicated the appearance of two bands of GPCR in G1at (~30 KD) and (~51 KD) . This could be due to the isoform of GPCR. As it was reported that the monomeric form is important to activate G-protein for binding , and they stated that further studies are required to understand the function of the dimerization of such receptor for its biological function [20].

Results ,also , showed the appearance of three bands in G2 that related to GPCR in (~ 29 KD) and (~ 47,49 KD) . In G3 the bands appeared similar to that in G2 but with highly clearance related to its highly concentration as show in table (2) .

The glucagon – like peptide -1 receptor (GLP1R)is a class B GPCR with molecular weight of 53 KD, that found in type two diabetes in previous study .According to the previous researches that improved molecular weight of GPCRs about ~30 and ~50 KD , such as GLP-1R (~53 KD), GPCR 40 (31.438), α_2- Adregeric receptor (~50 KD) ,β_2- Adregeric receptor (47.058KD) [21] . So, in this study may be one or more of the above receptors were purified in diabetic and diabetic nephropathy . further study is important to know amino acid sequences in the purified receptors to know the type of GPCR that purified in these patients exactly.

Conclusion

Conclusion that obtained from this study that 2 bands of GPCR appear in control group while there are three bands appeared in G2 and G3 with different concentrations which may be useful in early detection and active treatment to controlling diabetic and diabetic nephropathy patients .

The Role of Overexpression of Rab1A in Human Pancreatic Cancer and its Association with Poor Prognosis

Susan Zwyea

Department of Radiological Techniques, College of Health and Medical Technology/Baghdad, Middle Technical University, Baghdad, Iraq

Abstract

Rab1 is a member of RAS oncogene family,its role ismediating vesicle transport between the endoplasmic reticulum (ER) and Golgi. Rab1A contributed to human prostate cancer,colorectal cancer (CRC), hepatocellular carcinoma(HCC), gliomasand tongue squamous carcinomas(TSCCs) tumor proliferation and migration.Because pancreatic carcinoma is one of the common human cancers with high lethal malignancy rate,we investigated the expression of Rab1A inpancreatic carcinoma.171 samples with normal pancreatic tissues and 176 samples of pancreatic cancer tissues were obtained and prepared atthe Pathology Clinic, Uppsala University Hospital (Uppsala, Sweden).This study was noticedthat Rab1A is overexpressed in pancreatic carcinoma tissues both in mRNA and protein levels. Moreover, survival analysis showed that Rab1Aoverexpression in human pancreatic carcinoma is associated withpoor prognosis ($p<0.05$). Strikingly,aberrantexpression of Rab1A in pancreatic carcinoma patients is associated with an elevated level of mTORC1 (p-S6K1) signaling. Our results demonstrate that Rab1A may have apotential role in pancreatic cancer progression in anmTORC1 dependent manner, and further emphasizes the role of Rab1A in human malignancies. Together, these results indicate that Rab1A overexpression couldpromote a new prognostic predictor for human pancreatic cancer.Thus, studying the regulation of Rab1A in pancreatic cancer is urgently needed.

Key words: *Rab1A, pancreatic cancer, prognostic marker, mTORC1*

Introduction

Pancreatic cancer is an aggressive and common leading cause of cancer related death after lung, breast or prostate and colorectal cancer worldwide.[1] Because the lack of the reliable diagnosis methods, the majority of patients are diagnosed too late with advanced disease. In general, there arefew curative options appreciably can change itsaggressivenessand lethality.[2,3] Thus, Survival rate with pancreatic cancer is fairly low, with one-year relative survival of less than 25%.[1,3] Genetic mutationsdrives pathogenesis in the pancreas with a total of 5%–10% of all pancreatic cancers.[4-6] Chronic pancreatitis seems to be associated with 4% of cancer cases. [7] Aside from mutations or pancreatitis, overexpression of certain oncogenes has been previously reported to promotethe development of human pancreatic cancer.[8] Becauseof the high lethality rate of pancreatic cancer, there is urgent need to identifynew target genes underlyingpancreatic cancer to improve treatment and survival.Rab1A is a member of RAS oncogene family which is highly conserved in mammals. It is a GTPase predominantly anchored to Golgi membrane and mediates ER to Golgi vesicular trafficking. [9]Beyond Rab1A role in vesicle trafficking, it has been found aberrant level ofRab1A act as anoncogenein colorectal cancer,which is associated with poor prognosis.[10]Overexpression of Rab1A has been linked to multiple human diseases particularlycancer including colorectal cancer (CRC) [10], hepatocellular carcinoma (HCC) [11], glioma[12], prostate cancer [13,14] tongue squamous carcinomas (TSCCs) [15] and cervical cancer.[16]Consistently with the role of ER-Golgi membrane system in cell signaling,Rab1A overexpression has been proposed to promote the pathogenesisof CRC and HCC by activating the mTORC1 signaling pathway.[10]mTORC1 is well known as a central regulator of cell growth and its elevated level

is associated with multiple human diseases particularly cancer.[10,17]The recent findings [10-16]indicate that Rab1A might be a new therapeutic target for cancer therapy. Despite the contributory role of Rab1A in different types of human malignancies,until now, Rab1A has not been deliberated in the context of pancreatic cancer studies. In this study, we investigated Rab1A expression in human primary tissues from pancreas adenocarcinoma, andassess the relationships between Rab1A expression and patient survival.

Material and Method

Patients and pancreatic tissue samples: 171 samples with normal pancreatic tissues and 176 samples of pancreatic cancer tissues were obtained from October 2015 to November 2018. The pancreatic tissue array was prepared by at the Pathology Clinic, Uppsala University Hospital (Uppsala, Sweden).The overall survival time was calculated from the day of therapyto the end of the follow-up or the date of death because of the recurrence andmetastasis. The median patients' follow-up was of 33 months (range: 2-80 months). Patients with low Rab1AmRNA expression were all alive while patients with high Rab1AmRNA expression were 84 alive and 92 dead.

Immunohistochemistry (IHC): The standard streptavidin-biotin-peroxidase complex method was used for IHC staining. Tissue sections were incubated with a Rab1A-specific antibody (Antibody HPA039442, Antibody CAB003838, Antibody CAB018346) or S6K1 specific antibody (Antibody HPA056141 andAntibody CAB005331). The intensity of the staining was calculated as follows: no staining (0 positive cells); weak staining (0-10% positive cells); intermediate staining (10-50%positive cells); high stainingin the tissue cells (50-100% positive cells).

Analysis of Rab1A mRNA and protein levels: The genomic data from The Human Protein Atlas databases (https://www.proteinatlas.org) was used to analyze Rab1A mRNA expression alteration and protein expression level in normal and primary pancreatic cancer tissues. The website (proteinatlas.xml.gz) was utilized to download data including protein expressionand RNA seq data.

RNA seq: The standard RNA-seq protocol was used for measuring mRNAquantity. In short,RNA was extracted from tissue samples using the RNeasy Mini Kit (Qiagen, Hilden, Germany).Samples of high-quality RNA were used in the sequencing.

Statistical Analysis: Survival analyses were carried outby Kaplan-Meier plots and the log-rank test. Results are considered significant when p value is less than 0.05.

Findings

Rab1A is overexpressed in human pancreatic tissues

Genomic findings from previous studies suggest that Rab1A gene acts as an oncogene and is amplified in many cancer cases. [1-4]Therefore this studyinvestigated Rab1A mRNA and protein expression in 176 pancreatic cancer samples and 171 normal pancreatic tissues available in The Human Protein Atlas database (https://www.proteinatlas.org).Analysis of the primary data shows Rab1A mRNA and protein levels are both higher in pancreatic cancer tissues compared to normal pancreatic tissues (Figure 1A, 1B and 1C). Since the increase in Rab1A occurs both at transcriptional and translational levels, this suggests Rab1A mRNA and proteinexpressions are positively correlated and that increased in Rab1A level is due to change in gene expression. Generally, our results indicate that high Rab1A expression level in pancreatic cancer resemble those seen in other studies with particularhuman tumors such as HCC and CRC. [10,11]Therefore,we think that the results of this study are useful for supporting evidence that may explain many of the findings related to the development of pancreatic cancer.

Rab1A overexpression is significantly associated with poor prognosis in pancreatic cancer patients

To evaluate the clinical significance of Rab1A overexpression in pancreatic cancer patients, we analyzed the relationship between Rab1A expression levels and patient survival.Kaplan-Meier survival analysis of pancreatic cancer patients was separated into two groups by the median value for Rab1A-positive staining then validated. Our analysis reveals that overall survival of pancreatic cancer patients with high Rab1A expression is significantly worse than those with low Rab1A expression in pancreatic patients (Figure2A). Thus, Rab1A level can provide predictive value for the outcome of pancreatic cancer patients and our observation resembles those seen in HCC and CRC. [10,11]Our analysis further supports the finding that Rab1A overexpression is significantly associated with an elevated risk of pancreatic cancer related death.These findings demonstrate that Rab1A is an independent prognostic signature of poor survival in pancreatic cancerpatients.

In support the task of high Rab1A expression in signaling pathways and oncogenesis[1-4], we investigated the level of P-S6K1, the effector of mTORC1, in pancreatic cancer patients. To investigate this phenomenon, we checked the P-S6K1protein levels of pancreatic cancer patients by using IHC primary data deposited in The Human Protein Atlas database. Protein primary data analysis reveals that P-S6K1 protein level is generally higher in pancreatic cancer tissues compared to normal pancreatic tissues (Figure 2B and 2C). Our results are useful as supporting evidence that may explain many of the findings related to the development of pancreatic cancer.Altogether these outcomesdemonstrate that enhancingmTORC1 signal may be crucial for Rab1A to advance the pathogenesis of pancreatic cancer and that Rab1A could be new guide for targeted cancer therapy as seen in other malignancies. [18]

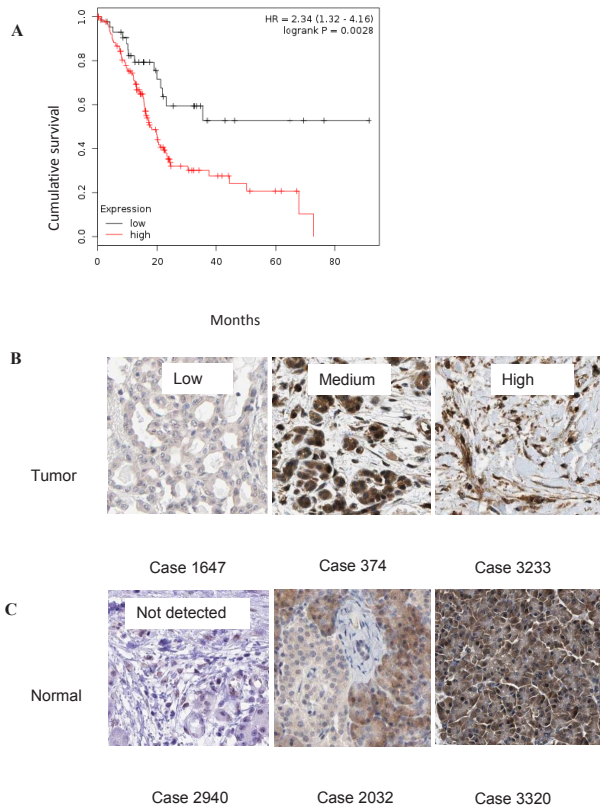

Figure 2: Overexpression of Rab1A in pancreatic cancer is associated with poor survivalA.

Conclusion

Rab1 is aGTPase generally mediate vesicle shuttle betweenthe ER to Golgiapparatus.[19] Moreover, Rab1A involves in stimulating signaling pathways such as mTORC1 pathway.[10] To date, its role in human disease particularly oncogenesis remains unknown. Only until was Rab1Afound to be involved in oncogenic growth in many human cancer types. [1-3]Thepreviously mentioned

studies suggest that Rab1A could play important role in hyper-proliferative cancer.Sincepancreatic cancer is an aggressive disease, therefore we think that Rab1A could play important role ininitiation and development of pancreatic cancer.The present study finds that Rab1A is highly expressed in pancreatic cancer. These results further support the idea of that abnormal Rab1A expression could be a common phenomenon in certain human cancers.[11,20] Although our findingsdemonstrate that Rab1A is highly expressed in pancreatic tumors, the importance of elevation Rab1 expression in pancreatic cancer remained unclear.

Significantly, human pancreatic cancer patients with elevated Rab1A expression associate with poor survival. Log rank analysis demonstrates that mRNA level of Rab1A is anself-sufficient prognostic marker for pancreatic cancer patients.In contrast,low Rab1A expression associate withbettersurvival. These findings further support that Rab1 A hyperactivation can promote development of pancreatic cancer. [6]

mTORC1 is a principal regulator of signal transduction pathway in reaction to amino acid signals. [10] Recently, studies show amino acid signalsare capable of phosphorylatingS6K1, final effector target of mTORC1, in a mechanism is dependent on Rab1A.[10,11]Here we show that p-S6K1 is overexpressed in pancreatic cancer. This overexpression is closely correlated with Rab1 overexpression in primary pancreatic tissues. If that is true, these results may explain mechanisms of high Rab1A expression are in the cancer pathobiology.Thus, more studies need to be done to further investigate whether this common phenomenon drive oncogenic growth in pancreatic cancer. In addition, more analysis needs to be done to investigate whether Rab1A overexpression is correlated with pancreatic cancer sensitivity to rapamycin, mTORC1 inhibitor. Further investigation in this field could lead to a predictive marker for enhancing mTORC1-targeted therapy in pancreatic cancer.

Prevalence of Urinary Tract Infections in Adult and Child Patients

Estabraq A. AL-Sudani[1], Sameer A. Alash[2]

[1]*Middle Technical University /College of Health & Medical Techniques/ Medical laboratory techniques dep.*
[2]*Baghdad University / Collage of Science / Biology /Microbiology, Baghdad/ Iraq*

Abstract

Urine Samples collected from three hospitals in Baghdad city from adult and child patients suffering from urinary tract infections for 6 months. The samples get reached 1152 , the patients old were between few days to 80 years after urine cultured isolation and diagnosis of bacteria done with a modern methods *Escherichia coli* reached the highest ratio reached 36.36% , In adults between . 49.35-50% , In child 42.56% followed by *Klebsiella spp*. In ratio . 11.08% , 6.06-12.98 in adult and 10.49% in child, followed by *Proteus mirabilis* 8.86% where they ranged from 6.93-9.09% in adult to 9.91% in child . Also recorded others species from Enterobacteriace in lowest ratio where they ranged from 0.16% to 3.48% Also observed Gram positive bacteria in highest ratio *Streptococcus spp*. 7.43% followed by *Staphylococcus aureus* in 5.53% , *Enterococcus* in 3.48% and in lowest ration . Species from .*Staphylococcus* between 0.16% -0.79% .Also observed .*Candida spp* were about 3.32% in adult and child .*Proteus mirabilis* were Selected because there different complications in UTIs Patients specially Stone formation , obstructed the catheter, and renal damage. These bacteria were diagnosis in API 20 E and Vitek2 , sensitivity test its performed depended on gender and age of patients *p .mirabilis* the highest percentage in the age groups 31-40, 41-50 .yeras old , 18.75% 25.0% respectively in adult both sexes .while in child the highest percentage in the age groups 10 years old ,55.88% in male than female , also observed highest ratio adult patients with Urinary catheter who are in hospital many significant differences when used different antibiotics. There was a significant impactor effects , for Impenim(IMP) and Meropenemin both sexes in adult and child. Also seen adult samples sensitive for Gentamicin, Cefoxitin,

Aztreonam and Ticracillin highest in male than Female, the same results shown in child samples .In addition sensitivity to others antibiotics such as Levofloxacin, Ceftazidim, Cefepime.Inadult,female samples were sensitive to pipracillin,ceftriaxone and Cefotetan highest than male .Many , significant differences were observed for *P. mirabilis* resistant to different antibiotics such as Cefepime,Cefotaxime, ceftriaxone, pipracillin, Levofloxacin,nitrofurantion,Cotrimaxz in adult male highest than adult female.While in child samples were resistant to Meropenam , Naldalie acid, Trimethprim . nitrofurantoin ,cifxime, Ticaracillin and ceftriaxone. Highest in male than female and female child resistant to Sulfanethoxazonl , highest than male.

Keywords: *UTIs bacteria, Antibiotic , Proteus mirabilis and UTI.*

Introduction

Urinary tract is the one of most common area of bacterial infection caused UTI occurring from the neonate to the geriatric age groups encounters in medicals today , especially in females. In men are less common may be occur after 50 years of age [1][2]. UTIs caused by bacterial colonization of the urethra. Bacteria normally colonized the urethral opening then colonize the urine [3][4].The most prevalent agent for UTI ***Escherichia coli*** which caused 80-90% of UTIs in adults[5]Followed by ***Klebsiella*** spp. and ***Proteus mirabilis*** which frequently contributed with stone disease [6][7], and other different species of Gram positive and negative [8].Urine is normally a sterile fluid,UTIs are two typesUpper UTIs (U-UTIs) and Lower UTIs (L-UTIs) [9][4]. Occurrence of UTIs in adult males aged under 50 years is low, with adult women being 30 times more than men. In most

cases of UTIs bacteria is the most common causes,while some cases of UTIs by fungi and viruses are rare[2][10][11]. In children up to 7% of girls and 2% of boys will have asymptomatic UTI. [12]. The prevalence of urinary tract infection depended on age and sex of children [8]. In infants is greater than younger age, and with7% among newborns[13]. Most UTIs in children produced by ascending infections and the hematogenous spread may be more common in the first 12 week of life[14].The most commonest UTIs in children ***Escherichia coli***60-80% of cases ***Proteus spp***. (common in boys and in children with renal stones) ***Enterococcus , Klebsiella***, and Coagulase–negative Staphylococci [15].Risk factors for UTI in children is limited, and it associated with constipation,bladder instability,encopresis[16][17].Bathing and back to front wiping[14].Reflux of urine from the bladder up to the ureter, is common in children with anatomic abnormalities of the urinary tract and may be caused ascending infection and kidney damage [2].In UTIs , sometimes the urethral catheter a closed sterile system that is consist from tube inserted via urethra is used as urinary drainage [18].Many types of bacteria can be colonized this catheter and caused catheter associated urinary tract infections (CAUTIs)[19][20][21]. Microorganism can invade and cause UTI through three major routes: lymphatic pathways , ascending ,and hematogenous[22][23].Urinary catheterization and cystoscopy the mean instrument that cause of hospital acquired UTIs in both sexes[22][24]. Hematogenous or blood borne route spread occurs as a result of bacteremia[22].WHO report that UTI bacteria resistant for antibiotic[25]. *Proteus mirabilis* bacteria caused many complications such as renal stone , catheter obstruction ,kidney damage[26][27][28]. Objectives of the study investigation bacterial species that caused UTIs , isolation and diagnosis *P. mirabilis* that caused complicated UTIs, and study *P. mirabilis* sensitivity for different antibiotics .

Method

Urine samples collection

Urine samples(1152) were collected from three sites, for 6month,from patients suffered from UTIs,mid stream urine samples were collected in sterile containers[29]. sampleswere cultured on blood agar and MacConkey agar plates.Gram negative bacteria isolates were identified byA.Different standard biochemical : 1.API20 E system 2.IMVC test 3.TSI4.Gelatin liquefaction 5.VITEK2 system for *Proteus mirabilis* B. Oxidase test and pigment production for *Pseudomonas* spp.

Gram positive isolates were identified by:1. catalase test 2.coagulase test 3.mannitol salt agar *S.aureus* .Tests were done according to Collee *et al* and Realonds[30][31].

Antibiotic sensitivity test

56 samples of *Proteus mirabilis* cultured in Mullar-Hinton agar then different antibiotic disc as shown in Table1were placed on the plates .

Table1: List of antibiotics with its abbreviation

Antibiotics	Company	Origin	Abbreviation
Cefotetan 30 µg	Biotech	UK	CIN
Gentamicin 30 mcg	Biolab	Budapest	GN
Amikacin 30µg	Biotech	UK	AK
Cefepime 30µg	Biotech	UK	FEP
Cefoxitin 30µg	Biotech	UK	FOX
Cefotaxime 30µg	Biotech	UK	CTX
Ceftraxone 30 mcg	Biolab	Budapest	CTR or CRO
Chloramphenicol 30 µg	MAST	UK	C
Pipracillin 30 mcg	Biolab	Budapest	PIP
Ceftazidime 30µg	Biotech	UK	CAZ
Ciprofloxacin 5µg	Biotech	UK	CIP
Tetrcycline 30µg	Biotech	UK	T or Te
Aztreonam 30 µg	MAST	UK	AT
Levofloxacin 5µg	Biotech	UK	LE or LEV

Cont... **Table1: List of antibiotics with its abbreviation**

Meropenem 10 µg	MAST	UK	MRT or Mem
Tobramycin 10µg	MAST	UK	Tob
Nitorfurantoin 100 mcg	Biolab	Budapest	F
Impenim 10µg	Biotech	UK	IMP
Ticaracillin 25 mcg	Biolab	Budapest	TIC
Ampicillin 25 mcg	Biolab	Budapest	AMP
Azithromycin 15µg	Biotech	UK	AZM
Cefepime 30 µg	Biotech	UK	CFP
Trimethoprim Sulfanethoxazol 1.25L23.75µg	MAST	UK	STX
Nalidixic acid 30 µg	MAST	UK	NA
Nltrofurodontin 100 mcg	MAST	UK	NIT
Ceftazidime 30 mcg	Biolab	Budapest	CAZ
Trimethprim 15 mcg	Biolab	Budapest	Tm or TTR
Aztreonam 30 µg	MAST	UK	ATM
Cifxime 30 µg	Biotech	UK	CFM

Statistic Analysis

The statistic analysis system-SAS (2012) program was used to clarity the effect of difference factors in study parameters .Chi –square test was used to significant compare percentage.

Findings

1152patients suffering from UTIs distributed in both sexes and different age between few days to eighty years old .In the current study, *Escherichia coli* is the largest causes of UTIs in different olds (46.36%) distributed in Child ,42.56% -50% in adults followed by *Klebsiella spp*. 11.08% distributed in adults 6.08%_12.08% , and 10.49% in child.Followed by *Proteus mirabilis* 8.86% ,6.93-9.09% in adult and 9.91%in child .*Enterobacter spp.*distributed as 3.48-3.90% in adult and 4.08% in child *Acinetobacter spp.*1.37-3.48 in adult while 5.25% in child *Citrobacter spp.,Serratia spp.* Was the lowest percentage 0.16% in adult and child respectively all these species from Enterobacteriaceae family.*Pseudomonas aeruginosa*8.06% distributed 4.54%-8.06% in adult and 8.16% in child while *Pseudomonas fluorescens*0.16% in child only *Morganella ,Burkholdericepecia*in 0.16% in adult and child respectively .All these species as Gram negative bacteria also isolated Gram positive bacteria such as *Staphylococcus aureus*5.53% distributed in 1.51-1.73% in adults and 8.74% in child ,*Staphylococcus haemolyticus* 0.79% and *Staphylococcus xylosus*0.32%, *Staphylococcus saprophyticus 0.16%* all in child , *Streptococcus spp.* 7.43% as6.06%-8.66% in adult to 6.70% in child , *Enterococcus spp.* 3.48% as 4.08% in child only and the last causes of UTIs *Candida spp. 3.32%* distributed as 5.19 -7.58% in adult and 1.16% in child only as show in Figure (1,2,3,4) .

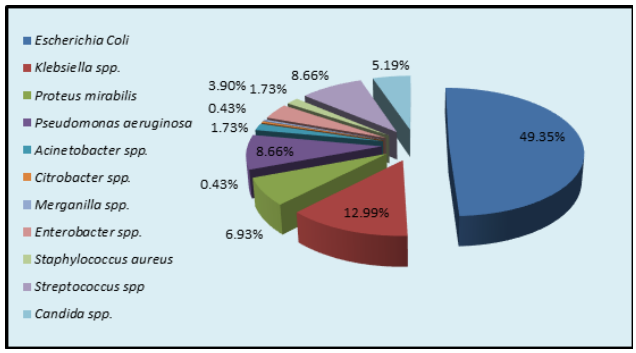

Figure (1) Distribution of bacterial specsies in three hospital isolated from UTIs

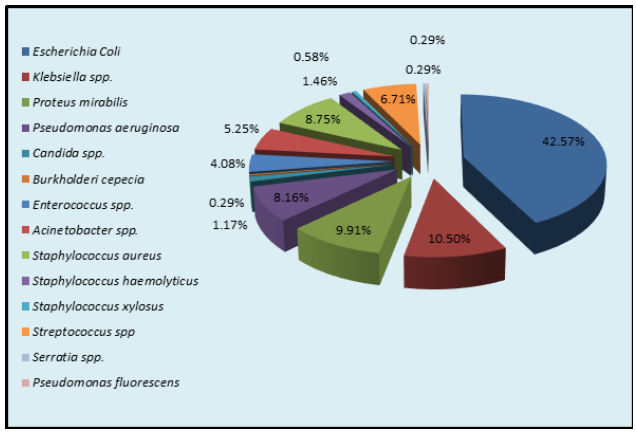

Figure (2) Distribution of bacterial species in Martyr Ghazi AL-Hriri hospital

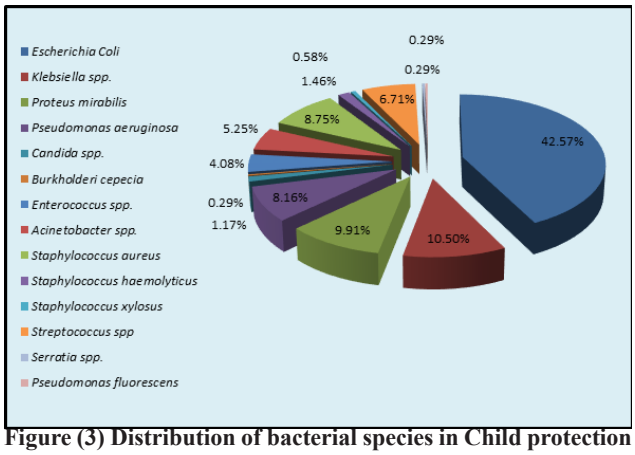

Figure (3) Distribution of bacterial species in Child protection hospital

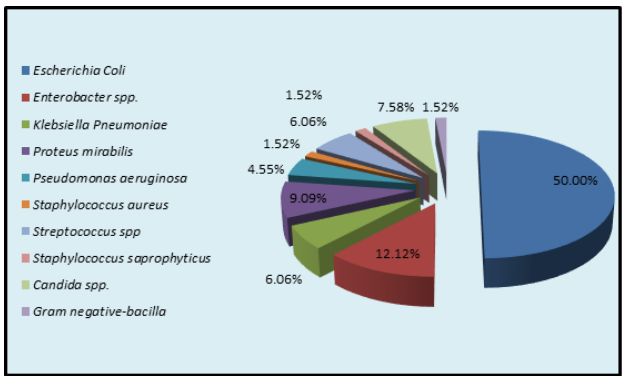

Figure (4) Distribution of bacterial species in Educational laboratoeries hospital

Proteus mirabilis 8.86% distributed in both sexes,the highest rate in adults age categories with highly significant value(**P<0.01) in 31-40 ,41-50 ,18.75% , 25.00%** the rate of infection in both sexes was equal , While in child the highest rate in age categories with highly significant value**(P<0.01) in 1 year – 10 year 55.88%**, the incidence of males was higher than females ,The highest rate with urinary catheter in **adult patients** than child.There are many significant differences**(P<0.01)**, **(P<0.05)**, when test different antibiotics depended on the gender and age, observed *proteus mirabilis* sensitive for Impenim, Meropenem. In both sexes to adult and child patients Also noted in adult patients *p. mirabilis* sensitive for Gentamicin ,Cefoxitin , Aztreonam,and Ticaracillin are higher in males than females . Moreover noted in child with same ratio for Gentamicin and Ticaracillin, Amikacin, Levofloxacin, Ceftazidim ,Ceftraxone ,and Cefepime. Also observed in adult females *p. mirabilis* sensitive for Pipracillin,Ceftraxone , Cefotetan higher than males.

Discussion

UTIs ,is one of common bacterial infection in adult and child in both sexes particularly in females than males[2][34]. Results of bacterial types infection in this study agree with WHO report for 2018 that which they pointed to increased the ratio of different types of bacteria to caused UTI complication and mortality vale of patients with UTIs[35].*Escherichia coli ,Klebsieella spp , Proteus mirabilis* respectively agreement with Ana et al[36]. This study were also agree with adult and with same the results of child and other Enterobacteaceae family members Karen[37].Gram-negative and Gram positive bacteria agreement with Wilson and Gaido[38]. The Recurrent UTI in different sexes specially pregnant women with higher percentage of *E. coli, P.mirabilis* and *klebsiella* than other women[39][40] . The study showed that child with highest ration UTI from adult specially in male than female in age **1-10 years** ,because male uncircumcised infants, anatomical abnormalities in urinary tract , poor toilet habits and hygiene[41] and obstructive anomalies , vesicoureteral reflux[42] .The similarities and differences in the type and distribution of uropathogens show a discrepancy from country to another due to many factors as environmental conditions , health practices , patient conditions, personal hygiene, number of patients examined, and laboratory procedures. *Proteus mirabilis* samples sensitive to Impenim (IMP) and Meropeneiem (MRT, MEM) in both sexes in adult and child , these results agreement with others study[43] [44][45][46].*P. mirabilis* also sensitive indifferent degree to other antibiotic in adult male for Gentamicin , Aztreonam, cefoxitin, Ticracillin , Amikacin and more ever in child also sensitive to Levofloxacin Ceftazidim, Cefepime,In different levels most result agree with AL-Jmaily and Zgaer and Mahmoud et al[46][47].In this study adult female highest sensitive more than male to Pipracillin, Ceftraxone agreement with Mahmoud et al[47] and Cefotetan.There are many different Significant in adult male resistant for antibiotics in this study Cefepime , Cefotaxime , Ceftriaxone, Pipracillin, Levofloxacin , nitrofurantion, Cotrimaxzol, Chloramphenicol , In child in both sexes Meropenam, Naldalic acid Trimethoprim , nitrofurantoin, Cifxime,Ticaracillin and child female more resistant than male for Sulfamethoxazole .There are many study proved that development of resistant for antibiotics or other drugs from *P .mirabilis* characterized as plasmid-borne drug resistance.[48]

Conclusion

1.*E. coli, Klebsiella, P. mirabilis* the highest rate of G-ve bacteria .

2. *P. mirabilis* infected both sexes in different age.

3. *P. mirabilis* resistant to different antibiotics depended in sexes.

Conflict of Interest : Non conflict of interest with any side

Assessment the Health Awareness of Pregnant Women's Concerning Toxoplasmosis Infection

Hanaa Adel

Assistant Prof, Middle Technical University, Medical Institute of Technology /Baghdad, Iraq

Abstract

A descriptive study was conducted on pregnant women to assess their health awareness concerning toxoplasmosis infection. Randomized samples were selected (100) pregnant women during various trimesters of gestations attending MCHC. Questionnaire from was designed and consist socio-demographic and reproductive data, general information and questions related to samples awareness regarding the toxoplasmosis infection. The data were collected by using interview method and descriptive statistical procedures were analyze the data. The result of the study revealed that the highest percentage of the study sample were in age group 20-29 years, primary school graduate, house wife ,had no previous history to toxoplasmosis infection, had no close contact with cats, in third trimester of gestation, have more than two children and had no history of abortion.Regarding the health awareness of the study sample about their general information ,signs and symptoms, and effects of toxoplasmosis infection were below cutoff point which mean poor awareness while their awareness of concerning methods of transmission and preventive behaviors about toxoplasmosis were above cutoff point which mean good awareness. The study recommended for the importance of health education about toxoplasmosis risk factors to women of child bearing age.

Key words: *Pregnant women ;Toxoplasmosis infection ; Awareness*

Introduction

Toxoplasma gondii is one of the infectious agents of congenital TORCH infections cause's severe clinical outcomes in fetus and newborn[1]. Toxoplasmosis is a parasitic disease caused by toxoplasma gondii[2].The infection is characterized by non-specific symptoms with the consequent formation of cysts that may remain latent form in many organs[3].

There are four groups of individuals in whom the diagnosis of toxoplasmosis is most critical:-Pregnant woman who acquire their infection during gestation, fetus and new born who are congenitally infected, immune compromised patients, and these with chorioretinitis[3,4]. It is one of the most prevalent chronic infections affecting one third of the world's human population. The prevalence of toxoplasma gondii infection varies among different geographical regions [3].Up to half of the world's population is infected with toxoplasmosis .In the united states about 23% are affected and in some areas of the world this is up to 95% .about 200,000 cases of congenital toxoplasmosis occur a year[2].It is most common in Central America and central Africa, and much less common in the US. This variation can be explained partly by climate since temperature and humidity affect how long toxoplasma cysts remain infectious [5,6].

The infection in pregnant woman may cause devastating effects in the fetus. If the infected tissue of an animal being consumed it acts as a transmission mode of infection [1].Awareness and practice regarding this disease and preventive measures in life style for this parasitic infection should be given to the pregnant woman [1].Therefore, this study aimed to evaluate the level of awareness and practices on toxoplasmosis among pregnant woman who visiting the antenatal clinics or hospitals.

Objectives of the study:- To assess the health awareness of pregnant women's concerning toxoplasmosis infection**.**

Materials and Method

Design of the study:A descriptive study was carried

out to assess the health awareness of pregnant women regarding the toxoplasmosis infection.

Setting and sample of the study :The study was conducted of (100) pregnant women selected randomly during various trimesters of gestation visiting antenatal care center**.**

Tools of the study :The questionnaire was constructed for the purpose of the study through review of available literature and relevant studies. The questionnaire covered respondents general information , symptoms, transmission methods ,risks and effects on fetus and newborn baby and preventive behaviors regarding toxoplasma infection .

Data collection :The data were collected by using interview method and self – report techniques with study participants after obtaining permission from each of them.

Statistical data analysis:Methods were used in analyzing the data of the study were included the measurement of the following:-Frequency (F), Percentages (%) ,Mean of score and standard deviation, Rating and scoring of the scale**(**Yes) for correct answerscored (2),and (No) for incorrect answer scored(1)

Evaluate the awareness of the study sample according to the Cutoff point 2 +1÷ 2=1.5

Mean score above 1.5 means good awareness (adequate) and mean score below 1.5 means poor awareness (inadequate).

Findings and discussion

Table (1) Distribution of the study sample according to socio-demographic and reproductive characteristics N=100

Variables	%
Age group / years	22%
<20	39%
20 -29	30%
30-39	9%
>40	
Mean ± SD 27.1± 3.84	
Education level	
Illiterate	5%
Primary school graduate	32%
Intermediate school graduate	22%
Secondary school graduate	18%
University graduate and above	23%

Cont... **Table (1) Distribution of the study sample according to socio-demographic and reproductive characteristics N=100**

Occupation	
Worker	15%
House wife	85%
Previous history to disease	
yes	30%
No	70%
Close contact with cats

2nd trimester	27%
3rd trimester	39%
No. of children	
None	25%
1	28%
>2	47%
History of abortion	
Yes	39%
No	61%

Table (1) showed that the highest percentage 39% of the study sample were in age group 20**–**29 years, while the lowest percentage 9% of them their age were above 40 years and mean with standard deviation (27.1 ± 3.84), this result is agree with the finding of study conducted on pregnant women from Malaysia their findings reveals that the majority of Malaysian pregnant women were in age group of 20-29 years[1].Regarding the education level the results reveals to the highest percentage 32% of the Study sample were primary school graduate while the lowest percentage 5% of them were illiterate, the majority of them 85% were house wife , and 70% of the study sample had no previous history to toxoplasmosis infection and 90% of them had no close contact with cats. Previous study reported that level of education play an important role in preventing toxoplasma infection[1].

The same table showed that the highest percentage 39% of the study sample in their third trimester of gestation, 47% of them have two and more children and this result agree with other study who found that the most of the study sample were in their third trimester, also reported that the trimester of pregnancy and the number of children play an important role in preventing toxoplasma infection and this may be for increased women's awareness and continuous follow up[1,7], and 61% of the study sample had no history

of abortion ,while 39% of them had history of abortion our finding is supported by a previous study who stated that women who become infected while they are pregnant more exposed to abortion or still birth or the infection could spread to the baby and cause serious complications[8].

Table (2) Distribution of the study sample according to their awareness about general information of toxoplasmosis.

Items	Yes		No		Total	MS*
	F	%	F	%		
1-Have you read , heard or seen any information about toxoplasmosis	74	74%	26	26%	100	1.74
2-Have you ever been tested for toxoplasmosis?	34	34%	66	66%	100	1.34
3-Is toxoplasmosis caused by an Infection	33	33%	67	67%	100	1.33
4- Is toxoplasmosis caused by a poison?	15	15%	85	85%	100	1.15
5- Is toxoplasmosis caused by parasite?	55	55%	45	45%	100	1.55
Grand mean	1.42 (Inadequate)					

*MS= Mean of score

Table (2) demonstrated the grand mean of score (1.42) for women's awareness about the general information of toxoplasmosis were below cutoff point which mean poor awareness (inadequate). this finding is consistent with the previous study who founded that in the respondents answers on the general knowledge of toxoplasmosis ,majority of these pregnant women have no awareness or unsure about this parasitic infection[9].This finding indicates the importance of educating the pregnant women with the preventive measures [1].

Table (3) Distribution of the study sample according to their awareness about signs and symptoms of toxoplasmosis.

Items	Yes		No		Total	MS*
	F.	%	F.	%		
Can toxoplasmosis in pregnant women cause? 1-Fever and fatigue	38	38%	62	62%	100	1.38
2- Feeling like influenza (Headache, sneezing).	46	46%	54	54%	100	1.46
3-loss of appetite	41	41%	59	59%	100	1.41
4-Vomiting and diarrhea	44	44%	56	56%	100	1.44
5-Swollen glands	37	37%	63	63%	100	1.37
Grand mean	1.41 (Inadequate)					

*MS= Mean of score

Table (3) this table showed that the grand mean of score (1.41) for women's awareness about signs and symptoms of toxoplasmosis were below cutoff point which mean poor awareness (inadequate). Our finding is supported by a previous study which found that the most of pregnant women 83% were not sure about the risk factors and symptoms of toxoplasmosis and medical staffs had lack of knowledge on this parasitic infection so an appropriate health education could then be provided to pregnant women and the health care related staff to better understand manifestation of this parasitic infection [1,10].

Table (4) Distribution of the study sample according to their awareness concerning methods of transmission.

Items	Yes		No		Total	MS*
	F.	%	F.	%		
Can people get toxoplasmosis by 1-direct contact with cats feces	76	76%	22	22%	100	1.76
2-Cats eating infected rodents , birds or other small animals.	74	74%	24	24%	100	1.74
3-Eating under cooked meat.	52	52%	45	45%	100	1.52
4-Receiving blood transfusion	63	63%	35	35%	100	1.63
5-Ingestion of raw or partly cooked meat.	54	54%	46	46%	100	1.54
6-Un washed fruits or vegetables contaminated with infected cat feces.	77	77%	23	23%	100	1.77
7-Mouth touch after gardening without gloves.	78	78%	20	20%	100	1.78
8-Changing cat litter box.	82	82%	12	12%	100	1.82
9- Drinking untreated water and milk (un boiled).	33	33%	67	67%	100	1.33
10- Receives a transplanted organ.	35	35%	65	65%	100	1.35
Grand mean	1.62(Adequate)					

*MS= Mean of score

Table(4) this table demonstrated the grand mean of score (1.62) for women's awareness concerning methods of transmission were above the cutoff point which mean good awareness (adequate) ,other study showing that having a close contact with cats and cleaning their litter may transmit the disease to pregnant women [11], while the results of present study were disagree of the finding of previous study who founded that there was a low level of awareness about methods of transmission[1].

Table (5) Distribution of the study sample according to their awareness about the effects of toxoplasmosis.

Items	Yes		No		Total	MS*
	F.	%	F.	%		
1-Can toxoplasmosis passed from mother to fetus through placenta	64	64%	36	36%	100	1.64
2-Can toxoplasmosis cause congenital malformations	33	33%	67	67%	100	1.33
3- Can toxoplasmosis cause damaged the baby's eyes	38	38%	62	62%	100	1.38
4- Can toxoplasmosis cause brain and nervous system damage (seizures)	44	44%	56	56%	100	1.44
5- Can toxoplasmosis cause fetus death	48	48%	52	52%	100	1.48
6- Can toxoplasmosis cause miscarriage	75	75%	25	25%	100	1.75
7-Can new born baby born with no symptoms but the symptoms developed after that	28	28%	72	72%	100	1.28
8- Can pregnant woman develop serious complications after infection with toxoplasmosis	55	55%	45	45%	100	1.55
Grand mean	1.48(Inadequate)					

*MS= Mean of score

Table (5) this table demonstrated the grand mean of score (1.48) for women's awareness about the effects of toxoplasmosis were below cutoff point which mean poor awareness (inadequate).Some studies have been reports that exposure to infected cats by these women could lead to severe out comes to her carried fetus [11,12]. Other previous studies high light the importance of health education among the pregnant women to reduce the seroprevalence of this disease hence minimizing the adverse effects of infection in the fetus or newborn [10].

Table (6) Distribution of the study sample according to their awareness regarding preventive behaviors.

Items	Yes		No		Total	MS*
	F.	%	F.	%		
Toxoplasmosis can be prevented by 1-Feeding your cat dry or commercial cat food and not letting it kill and eat rodents	75	75%	25	25%	100	1.75
2-Avoiding stray cats	85	85%	15	15%	100	1.85
3-Wear disposable gloves in changing cats litter box.	89	89%	11	11%	100	1.89
4-Making sure the cats litter box is changed daily.	88	88%	12	12%	100	1.88
5-Wash your hands after gardening	84	84%	16	16%	100	1.84
6- Washing all fruits and vegetables before eating	93	93%	7	7%	100	1.93

Cont... **Table (6) Distribution of the study sample according to their awareness regarding preventive behaviors.**

7-Cleaning all catting boards and utensils thoroughly after each use.	89	89%	11	11%	100	1.89
8-Wash your hands after handling raw meat.	84	84%	16	16%	100	1.84
9-Cook food to safe temperature.	85	85%	15	15%	100	1.85
Grand mean	1.86(Adequate)					

*MS= Mean of score

Table (6) this table demonstrate the grand mean of score (1.86) for women's awareness regarding preventive behaviors a bout toxoplasmosis were above cutoff point which mean good awareness (adequate). This finding is supported by a previous study in Malaysian and Thailand showed that pregnant women appear to have better precaution or preventive practices toward toxoplasmosis infection[13,14].Awareness about toxoplasmosis and its related preventive knowledge and behaviors may reduce the infection rate and its disease burden in pregnant women[1].

Conclusion

The study has concluded the following:-

The highest percentage of the study sample were in age group 20-29 years , primary school graduate , house wife , had no previous history to toxoplasmosis infection , had no close contact with cats , in third trimester of gestation , have more than two children and had no history of abortion

Regarding the health awareness of the study sample, the findings indicated that inadequate level of awareness about the general information, signs and symptoms, and effects of toxoplasmosis infection, while concerning methods of transmission and preventive behaviors about toxoplasmosis indicated adequate level of awareness.

Abstract

The present study investigated the cytotoxic effects of aqueous crude extracts of *Vinca rosea* leaves , flowers and seeds on cell line (L20B Cell line)*in vitro ,* by using double dilution series (concentration between 1.95 – 1000 µg/ ml.

The results showed that the cytotoxic effect of extract is dependent on type of extract, amount of dose and exposure time. The concentration 1000 µg/ml gave the highest growth inhibition (IR) (74 and 74%) to leaves and flowers respectively compared with control 100% after 24 hours exposure time, but seeds were (49%) after 48 hours. However, low concentrations of aqueous extracts were found to induced the L20B cells growth and proliferation (PR), which recorded (122, 123) % by treatment with flowers extract in 1.95 µg/ml after 72 hours. Crude aqueous extract of *Vinca rosea* had hormetic effect (Hormesis), because it also induced the proliferation of cancer cells by using low concentrations of the extract.

KeyWords: *L20B,* ***Vinca rosea****, cytotoxicity, Inhibitory Rate.*

Introduction

Cancer emerged as a leading cause of death in the world. It is a serious disease that kills millions of people every year, and during lifetime, it affects one in two men, one in three women, while it causes death of one in four women[1].Cancer remains a problem for scientists despite the existence of several methods of treatment. There are chemotherapy, physiotherapy and surgical therapies, but all of them were not convincing for doctors or the patient himself. Thus, research centers and researchers turned to find other alternative therapies for the existing treatments and took another approach that may have great hope to eliminate the disease. Commercial drugs cost large amounts to import, and their effectiveness is gradually lost by continuous use due to the resistance of cancer cells to these medicines [2]. Therefore, many countries worldwide paid much attention to their plants as the natural source of drugs [3]. The discovery of anticancer effect of alkaloids of *Vinca rosea* plant gave it a great medical importance, because these alkaloids are chemotherapeutical agents for different types of human cancers [4,5].

About 75 types of alkaloids have been discovered, some of which have anticancer effects, including vinblastine and vincristine [6], as well as the use of this plant for the treatment of diabetes [7]Several studies were also carried out to use the plant extract in the treatment of microbial diseases such as skin diseases[8].Mitosis inhibitors such as Vinca alkaloids, derived from the *Vinca rosea (Cathathanthus roseus)* occupy a special place among chemotherapeutical drugs used in the treatment of many types of cancer [4,9].In this sense, and in order to enhance the study of the effect of natural plant extracts found in the Iraqi environment against some cancerous and transformed cell lines as a first step to explore their counter effects, this study was designed (as a part of an extensive study of different cell types) to investigate the effect of crude extracts of the *Vinca rosea* plant in the local Iraqi environment in inhibiting the growth of the L20B mouse fibroblast cell line.

Materials and Method

• **Plant collection**: The *Vinca rosea* was collected as an ornamental plant in the gardens of the College of Education/University of Karbala, and the plant was classified by the Iraqi National Herbarium/

Public authority for the examination and certification of seeds of the Ministry of agriculture. After the plant was collected and cleaned, it was washed thoroughly by tap water, and the plant parts (leaves, flowers and seeds) were separated and left to dry in the dark and at room temperature in a well ventilated dry environment to prevent damage of the samples. After drying of these three parts, they were finely grinded with an electric mill, then preserved in clean plastic containers away from light, heat and moisture until use.

Preparation of crude aqueous extracts of *Vinca rosea*: The cold aqueous extract was prepared according to the method used by Harborne *et al*[10], by taking 50 g of the dry powder for each part of the plant and adding 250 ml of distilled water and left the mixture on the magnetic stirrer at room temperature for 3 days, then the mixture was filtered by gauze then by filter paper (Whatman No.1). After that, the supernatant was dried to get the dry powder from which the required concentrations were prepared.

Indicative chemical detection of effective compounds: The types of secondary chemical metabolites found in the studied plant extracts (alkaloids, terpenes, flavonoids and glycosides) were determined, depending on what is stated in [10].

Study toxic effects of *Vinca rosea* extracts on the growth of (L20B) cell line

Type of the studied cancer cells: The (L20B) mouse fibroblast cell line was used by passage (18). The cells were grown on tissue culture medium with Minimum Essential Media (MEM), supplied by Sigma (USA) company with 5% (Fetal Calf Serum / FCS) supplied by the company itself.

Cytotoxic effects: Multiple (96) tissue culture microtiter plates, flat bottom were used to perform this experiment, which included three stages:

Cell seeding:

- After the growth and multiplication of cells, the containers with monolayer were taken, then cells were harvested using Trypsin-Versin (T.V) solution.

- Twenty ml of the serum-containing culture medium was added to each container and mixed well. Then, the cells were counted by the (Haemocytometer) using the (1%) trypan blue dye according to what indicated by Freshney [11].

- By a micro pipette, (0.1) ml from the cell suspension was taken and placed in each well of the plate. Each well contained (1×10^4) cell / well. The surface of the plate was then covered with a special sterile transparent adhesive paper for this purpose and the plate was moved gently, after that incubated at ($37C^0$) until the next day to allow (cell attachment).

2- Exposure of cancer cells to the plant extract:

The next day of seeding, serial dilutions were done in sterilized test tubes for each type of plant extract using the MEM-Serum free media, and dilutions from 1/2 to (1/1024) started gradually, which yielded the concentrations from 1000 to 1.95 µg/ml) respectively, taking into account to prepare the dilutions simultaneously at work. The culture media was poured from the wells after lifting the adhesive paper. The column No. (1) was considered as a negative control, as 0.2 ml of the serum free culture medium was added to it, while to the columns from 2 to 12 the dilutions of the extract, which were prepared as (0.2 ml / well / concentration) were added, and then a new layer of adhesive paper was re-placed on the surface of the plate.

The plates were incubated at (37C), while exposure times were (24,48 and 72) per hour.

Cytotoxicity assay:

Crystal violet stain was used to detect the cytotoxic effect of the extracts on cells pursuant to the following:

After the end of each incubation period, the plates were taken and their contents were poured and then washed with Phosphate Buffer Saline (PBS) solution, and 0.1 ml of crystal violet stain.

was added to each well, and left for (20) minutes. The cells were then washed with PBS solution several times until the excess stain disappeared. After the plates were dried completely, the results were read using the ELISA microplate spectrophotometer at a wavelength of 492 nanometers. The mean inhibitory Rate / I.R was measured according to the equation indicated by [12], and the mean proliferation rate / PR was calculated according to[13].

Finding

Indicative detection of active chemical

compounds: Detection of chemical compounds in the *Vinca rosea* extract showed that they contained (alkaloids, terpenes, flavonoids and glycosides)**.**

Cytotoxic effect of *Vinca rosea* extract on (L20B) Cell Line

Cytotoxic effect of the leaf extract: The toxic effect of leaf extract was studied in the L20B cell line by passage (18). The results shown in figure (1), revealed that the inhibitory toxicity effect was on the first day of exposure because it gave the best results, when the highest percentage of inhibitory rate (IR) growth inhibition was 74% at the concentration of 1000 µg/ ml of the extract after the first 24 hours of exposure. After that, the inhibition decreases as the concentration decrease, however, it remains effective. The lowest concentration used of 1.95 µg / ml gave a 41% growth inhibition. It is also noticed that the inhibitory effect 48 to 72 hours after treatment with plant extract was generally similar to the treatment after 24 hours, although it began to decline over time, because the highest rate of growth inhibition was 61% and 40% (with a viability rate of 39% and 60%) at 1000 µg/ml concentration after 48 and 72 hours of treatment respectively.

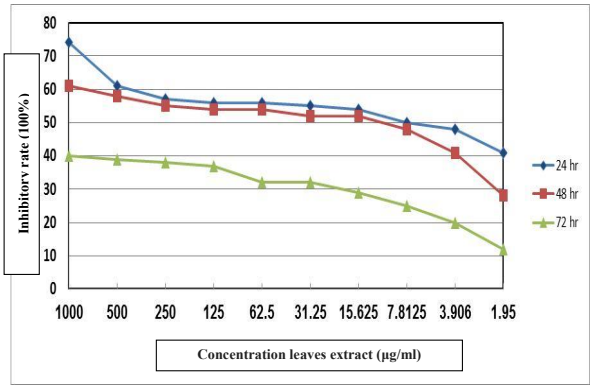

Figure (1): Effect of aqueous extract of the *Vinca rosea* leaves on the percentage of inhibitory rate on L20B cell line after different exposure time.

Cytotoxic effect of the flower extract: The results of the treatment of the L20B cell line with the *Vinca rosea* flower extract revealed that the inhibitory effect was similar for the three periods of time and gave a similar growth inhibition rates (IR) when using the first three high concentrations, reaching (74, 74, 65)% after 24 hours and (74, 73, 58)% after 48 hours and (71,62,56)% after 72 hours at the concentrations (1000, 500 , 250) µg / ml respectively. After that, the inhibition gradually began to decline with decreasing the concentration reaching to (8.3)% at 1.95 µg/ ml after 24 and 48 hours of exposure respectively as shown in figure (2). While the rate of cell growth was gradually increased beginning from 62.6 µg / ml making the proliferation rate reach to 123% at 1.95 µg / ml after 72 hours of treatment compared with control (100%).

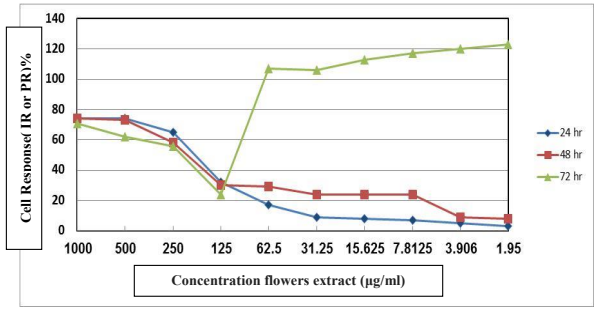

Figure (2): Effect of aqueous extract of the *Vinca rosea* flowers on the percentage of inhibitory rate onL20B cell line after different exposure time.

Cytotoxic effect of seed extract: There was less inhibition effect of the extract of *Vinca rosea* seeds on the L20B cell line compared with the two previous extracts (leaves and flowers). The best results were observed after 48 hours of exposure and then the rate of inhibition of growth decreased after 72 hours (increased cell viability). The toxic effect reached to 42% (cell viability 58%) after 24 hours of treatment at the highest used concentration of 1000 µg/ ml. In addition, the growth-stimulating effect appeared after 72 hours of treatment only, ranging from (110-122)%, and began to appear at the concentration of 7.8125 µg/ ml reaching to a minimal concentration of 1.95 µg/ ml respectively. figure (3).

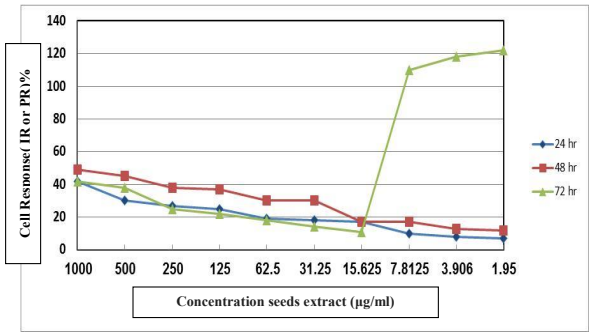

Figure (3): Effect of aqueous extract of the *Vinca rosea* seeds on the percentage of inhibitory rate onL20B cell line after different exposure time.

Comparison effect of the exposure time on the viability of the L20B cell line of the three studied extracts.

When a comparison between the viability of the three studied extracts (leaves, flowers and seeds) at each time of exposure, it was found that the first 24 hours of treatment showed the highest growth inhibition rates, as the viability of the cells was (26)%, (growth inhibition rate was 74%) for leaf and flower extracts and at the highest treated concentrations with 1000 µg/ ml (Fig. 4). In addition, results of 48 hour exposure were generally different from the 24 hour exposure, since the inhibition rate of leaves and flowers declined, while the highest rate appeared when the seed extract was used reaching to (49%), (51% viability) at 1000 µg/ ml concentration, and these rates decreased for all used concentrations compared with the exposure time of 24 hours (figure 5). The cell inhibitory rate within 72 hours of exposure was (40%, 71% and 42%) at 1000 µg/ml, (the viability rate was 60%, 29% and 58%) respectively, compared to control 100% (figure 6). It is observed that the viability rate of these cells begin to increase when low concentrations of flower and seed extracts are used to reach the highest viability rate (122 and 123)% respectively at 1.95 µg/ ml concentration. The results obtained showed that L20B cells were more sensitive to leaf and flower extracts and less sensitive to seed extract due to the high rate of cell viability.

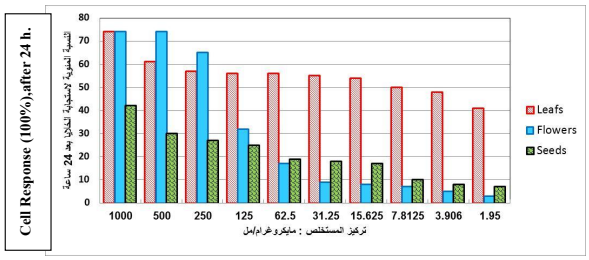

Figure (4): Comparison the effect of aqueous extracts of *Vinca rosea* on L20B cell viability after 24 h. exposure time.

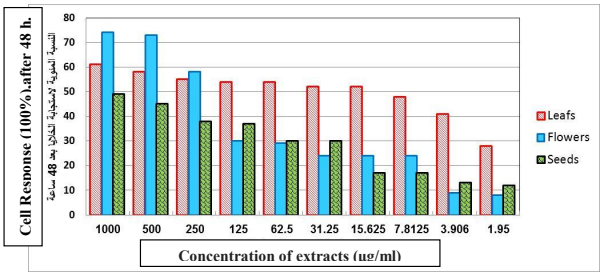

Figure (5): Comparison the effect of aqueous extracts of *Vinca rosea* on L20B cell viability after 48 h. exposure time.

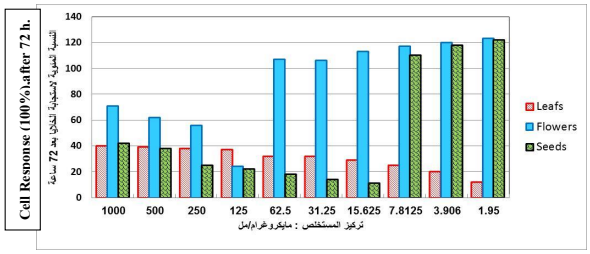

Figure (6): Comparison the effect of aqueous extracts of *Vinca rosea* on L20B cell viability after 72 h. exposure time.

Due to the importance of finding effective substances against cancer and finding more types of plants that possess these substances, the *Vinca rosea*, one of the locally available medicinal plants with different therapeutic properties, was [selected to identify the effects of crud aqueous extracts on L20B cell line] (as part of an extensive study in this field in many cancer cell lines) and the extent to which these extracts can be used as anticancer medical treatment in the future.The extracts of *Vinca rosea* contain many compounds and, as shown in the indicative chemical detection, the presence of alkaloids, terpenes, flavonoids and glycosides which may contribute to the better killing of cancer cells as a result of synergistic effect between them, which may reduce the toxicity of the used pure compounds.

The results showed that the crud extracts played a role in killing LB20 cells and inhibiting their growth and their division *in vitro*. The results indicated that the toxic effect of *Vinca rosea* on L20B cells was based mainly on the concentration used, exposure time and type of extract. The leaves extract had the best effect. On the other hand, it is observed that this type of cell, according to the results of this study, is sensitive to the prepared therapeutic aqueous extracts, as it inhibited the growth of cells, on contrary to the seed extract, which did not exceed the percentage of 49% inhibition after 48 hours of treatment using the high concentration of 1000 µg/ml, then the inhibitory effect is reduced when the exposure time is increased for all types of extracts. These results indicate that the effect of leaves and flower extracts is during the first 24 hours of exposure and at high concentrations, so when its effect is diminished, the living cells begin to reactivate and divide, showing the importance of giving repeated and continuous high doses to ensure the killing of all remaining cancer cells. The same thing occurs with the seed extract, which gives the best results after 48 hours of exposure and then the inhibition decreases and the cells reactivate.

A study performed by Yaseen *et al*[14]who compared between the two types of alcohol and aqueous extracts, and found that alcohol extracts are more effective than their aqueous counterparts on Hep-2 cells. This may be due to the fact that the ratio of the active substance extracted with ethanol (70%) is greater when using the aqueous extract, and this is reported by Harborne *et al*[10]. In two local studies on the same extracts in two cancer cell types - human cervical cancer cells (Hela-cells) [15] and human brain cancer cells (AMAG) [16], the results showed that both types of cancer cell lines were resistant to the aqueous *Vinca rosea* extracts (Leaves, flowers and seed), where low inhibition rates were recorded (not exceeding 46% in Hela cells and 64% in AMAG cells) using the highest concentrations (1000 µg/ml), while the L20B cells were shown to be sensitive to the same extracts. This is likely due to different receptors and antigenic determinants on the surface of each of the cancer and transformed cells.

The crud extracts of *Vinca rosea* contain a high percentage of alkaloids, which contain more than 75 types [17], as well as the presence of terpenes, phenols [18] and many mineral elements [19]. The proportion of secondary metabolic products in the plant varies according to the type of plant organ (leaves, flowers or seeds), and this is also affected by surrounding environmental factors[18]. Alkaloids are themost important and most effective substances in these extracts. The mechanism of their action is to inhibit the mitotic division, to keep the cells in the metaphase by inhibiting the polymerization of the protein Tubulin which is responsible for the formation of spindle fibers [9,20]. In addition, alkaloids inhibit the building of nucleic acids *in vitro*[21]. Several previous studies have also indicated that *Vinca rosea* alkaloids are effective against cancer cells, including human cervical cancer cells (Hela cells), because low concentrations cause inhibition to spindle fibers action [22,23]. On the other hand, Parekh and Simpkins [24] confirmed that these alkaloids affect on cancerous lymphocyte cells of rat and on human ovarian cancer cell line that are resistant to commonlychemotherapies used such as Cisplatin, as well as its being more effective than Taxol and Adriamycin.

Regarding the effectiveness of phenolic compounds, including flavonoids, which have an antioxidant effect by removing the generated free radicals and they direct the cell to enter apoptosis stage [25].

Many effective compounds effect on opposite directions depending on the concentration used. As noted by the above results, high concentrations inhibited the growth of L20B cells, while the low concentrations stimulated growth of these cells, increasing the viability by (122-123)% compared to the control (100%), indicating that the extract under study has a Biphasic effect [26], or Hormetic effect. There are many chemical therapeutical compounds, antibiotics, and toxins whose action is governed by the Hormesis phenomenon (abiological phenomenon common in toxicology), which act at low concentrations to stimulate, and may be useful to the organism, especially when the immune cells are activated, while high doses cause partial or total inhibition to the cells [27].

It is worth mentioning that the extract used in this study is crud extract, it contains many types of active compounds whose effectiveness was previously indicated or not mentioned, which supports the results of the emergence of antagonism in the influence on L20B cells depending on the concentration used. It is likely that its effect on the genetic material is in two directions, the first causes the inhibition of certain genes, while the other stimulates growth and multiplication.

Conclusion

The results showed that L20B cells were more sensitive to leaf and flower extracts and less sensitive to seed.

Detection of Human Papillomavirus in Cervical Mucus of Women with Spontaneous Abortion by Real-Time PCR

Asmaa M. S. Al-Bayati[1], Muhannad Abdullah Alazzawy[2]

[1]Ph.D. Medical Microbiology, Department of Medical Lab, University/Technical College, North Technical, Kirkuk City, Iraq, [2]Ph.D. Medical Microbiology, Medical Lab Consultant, Children Hospital, Kirkuk Health Directorate, Kirkuk City. Iraq

Abstract

The aim of the study was to detect of human papillomavirus (HPV) in cervical mucus of women with spontaneous abortion by real-time PCR. Cervical mucus of 200 women with spontaneous abortion and 100 full term pregnant women were included in this cross-sectional which carried out in Kirkuk city-Iraq from beginning of 1st of October 2018 to the end of December 2018. HPV DNA was detected real-time PCR of genotype 16, 18 and 58 in cervical samples. The study showed that the highest rate of HPV DNA (29.5%) was detected in women with abortion comparing with pregnant women (12%) with highly significant relation of HPV with abortion (P. value: <0.05). The study stated that the highest rate of aborted women was infected with HPV 16 (37.29%) followed by HPV 58 (30.26%) while HPV 18 was found in 12.26% of those women and 13.56% of them was infected with both HPV 16 and HPV 58 genotypes. The study exhibited that 36.37% of aborted women with one time in their marriage age was infected with HPV followed by 28.995 in women with 2-3 time, the study presented that 52.5% of women with abortion was belonged to the age group 27-36 years.

Conclusion: Spontaneous abortion was highly associated with HPV infection specially with HPV 16 genotype.

Keywords: *Abortion; HPV; cervical mucus; real-time PCR*

Introduction

Recurrent miscarriage (RM) is defined as the occurrence of three or more consecutive losses of pregnancy. According to this definition, it affects about 1% of couples trying to have a baby [(1)]. However, many clinicians define RM as two or more losses; this increases the percentage of RM from 1% to 5% of all couples trying to conceive [(2)]. The role of infectious diseases in recurrent miscarriage is not clarified yet, but proposed an incidence of 0.5–5% [(3)]. There are some candidate infectious diseases such as *Listeria monocytogenes*, *Toxoplasma gondii*, rubella, herpes simplex virus (HSV), measles, cytomegalovirus, and coxsackie viruses. Infectious diseases may cause pregnancy loss by the following mechanisms such as direct infection of the uterus, fetus, or placenta, placental insufficiency, chronic endometritis, endocervicitis, amnionitis, or intrauterine miscellaneous infections[(4)]. Human papillomavirus (HPV) is one of the most prevalent sexually transmitted viral infections in men and women worldwide [(5)]. Human papilloma virus is a group of more than 200 related viruses, some of which are spread through vaginal, anal, or oral sex. Sexually transmitted human papilloma virus types fall into two groups, low risk and high risk[(3)]. Low-risk HPVs mostly cause no disease. However, a few low-risk HPV types can cause warts on or around the genitals, anus, mouth, or throat. In rare cases, they can cause recurrent respiratory papillomatosis, a condition in which benign tumors grow in the respiratory tract[(6)]. High-risk human papilloma virus can cause several types of cancer. There are about 14 high-risk human papilloma virus types. Two of these, HPV16 and HPV18, are responsible for most HPV-related cancers. The existence of more than 180 HPV genotypes has been reported [(7)]. According to the basis of oncogenic potential, HPV can be divided into 2 different groups-high-risk HPV (HR-HPV) and low-risk HPV (LR-HPV).

Generally, the HR-HPV included HVP16, HPV18, HPV31, HPV33, HPV35, HPV39, HPV45, HPV51, HPV52, HPV56, HPV58, HPV59, HPV66, and HPV68 [8]. It is well established that infections with HR-HPV can lead to cervical cancer. Moreover, recent evidence has shown that HPV infection is associated with the risk of colorectal, head, and oropharyngeal carcinomas [9]. To date, a succession of studies has been published to show the association between HPV infection and adverse pregnancy outcomes[6]. The aim of the study was to detect of human papillomavirus (HPV) in cervical mucus of women with spontaneous abortion

Methodology

A cross-sectional study was carried out in Kirkuk city-Iraq from beginning of 1st of October 2018 to the end of December 2018, including 200 women who attended to Kirkuk general hospital for curettage, and 100 controls (pregnant women at term of delivery) to find out DNA of HPV of HPV 16, 18 and 58 in cervical samples by real-time PCR (using Sacace biotechnology, HPV High Risk Screen Real-TM Quant). Women with positive TORCH serology IgM tests (against *T. gondii*, CMV, HSV) were excluded from the study. Cases were defined as women experiencing spontaneous abortion up to 20 weeks of gestation, who attended for medical attention and/or a curettage procedure. Controls were defined as women attending for delivery at term, with viable products.

Cervical swabs:

- Remove excess mucus from the cervical os and surrounding ectocervix using a cotton or polyester swab. Discard this swab.

- Insert the Sampling Cervical Brush 1.0-1.5 centimeters into the cervical os until the largest bristles touch the ectocervix. Do not insert brush completely into the cervical canal. Rotate brush 3 full turns in a counterclockwise direction, remove from the canal.

- Insert brush into the nuclease-free 2,0 ml tube with 0,3 mL of Transport medium (Sacace). Vigorously agitate brush in medium for 15-20 sec.

- Snap off shaft at scored line, leaving brush end inside tube, DNA were extracted and PCR was performed on all samples according to manufacture instructions. HPV DNAA is extracted from using RT-amplification and detected using fluorescent reporter dye probes specific for HPV or HPV IC. The HPV IC is an internal control and represents recombinant RNA-containing-structure which carried through all steps of analysis from nucleic acid extraction to PCR amplification-detection. The total reaction volume was 25 µl, the volume of RNA sample was 12.5 µl.

1. The reagents were thawed, and the tubes were vortexed and centrifuged briefly.

2. Requested quantity of reaction tubes were prepared including 3 extraction controls, negative amplification control and 4 standards.

3. The entire contents of the tube with RT-PCR-mix-2-FRT was added to the tube with DTT, thoroughly vortexed.

4. Tubes for samples, controls and standards were prepared. The results are interpreted by the presence (or absence) of the intercept between the fluorescence curve and the threshold line which determines the presence (or absence) of the Ct values for the sample. Based on the Ct values and on the specified values of the calibrators, QS1 HPV and QS2 HPV, the calibration line will give the values for the number of HCV cDNA copies (JOE channel) and for the number of internal control (FAM channel) in a PCR sample.

Statistical Analysis

Computerized statistically analysis was performed using IBM SPSS V23.0.0 statistic program. Comparison was carried out using; Chi square and T-Test.

Finding

The study showed that the highest rate of HPV DNA (29.5%) was detected in women with abortion comparing with pregnant women (12%) with highly significant relation of HPV with abortion (P. value: <0.05), Table 1.

Table 1: Detection of HPV DNA in mucus of cervix of aborted and pregnant women

HPV result	Aborted Women		Control group (Full term pregnant women)	
	No.	%	No.	%
HPV +ve	59	29.5	12	12
HPV -ve	141	70.5	88	88
Total	200	100	100	100

P. value: <0.05.

The study stated that the highest rate of aborted women was infected with HPV 16 (37.29%) followed by HPV 58 (30.26%) while HPV 18 was found in 12.26% of those women and 13.56% of them was coinfected with both HPV 16 and HPV 58 genotypes, Table 2.

Table 2: Coinfection between HPV genotypes (16,18 and 58) in women with abortion

HPV genotype	Aborted Women	
	No.	%
HPV16	22	37.29
HPV 18	9	12.26
HPV 58	18	30.51
HPV 16/18	1	1.69
HPV 16/58	8	13.56
HPV 16/18/58	1	1.69
Total	59	100

The current study exhibited that arte of 36.37% of admitted women who aborted one time in their marriage age was infected with human papilloma virus followed by 28.99% in women with 2-3 time of abortion with infection of human papilloma virus, Table 3.

Table 3: Distribution of HPV infection according to number of abortion

Number of previous abortion	Total No. (200)	Aborted Women	
		No (59).	%
1	88	32	36.37
2-3	69	20	28.99
More than 3	43	7	12.28

The study presented that 52.5% of women with abortion was belonged to the age group 27-36 years

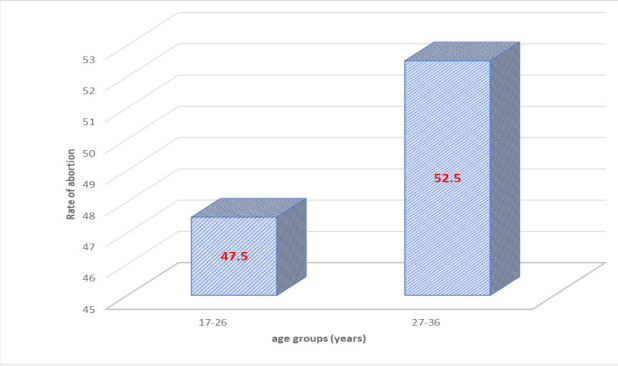

Figure 1: Distribution of women with abortion according to age

Discussion

It is important to study human papilloma virus detection in pregnancy, which represents a special immunological state that may be a risk factor for HPV infection [6]. Some studies have shown a higher frequency of human papilloma virus cervical infection in pregnant women compared to non-pregnant controls, possibly because of an effect of elevated estrogens which may affect the viral replication, or due to the altered immunity [7-9].

Human papilloma virus infection is common in the general population, including normal pregnant women. In normal full-term pregnancy, prevalence of HPV was reported to vary between 2.2 and 75% in the cervical tissue, with a summary estimate of 17.5% [5]. Correspondingly, the prevalence of human papilloma virus was significantly higher in the cervix and placental and aborted tissue of women who underwent spontaneous abortions [8]. Although the prevalence of HPV was significantly different in normal pregnancies and the spontaneous abortion group, our results based on 5 cohort studies and 3 case-control studies indicated that there was no significant association between human papilloma virus infection and spontaneous abortion. When the included studies reported HR-HPV infection alone. However, the pooled OR of 4 cohort/case-control studies [9-11] reported that the HR/LR–HPV infection indicated that HPV infection was a risk factor for spontaneous abortion. It was reported that there are 2 different pathways in the natural history of HPV infections, namely, the infectious virion producing pathway and the clonal transforming pathway [10]. The infectious virion producing pathway can lead to subfertility or early abortion and it is infectious. Oncogenic (HR) HPV types induce more rapid cell division arrest than LR-HPV or intermediate HR-HPV types. It takes the embryo longer to die after LR-HPV infection, which makes it possible to measure the spontaneous abortion [12].

In China, a 10.2% HPV prevalence was reported, with genotypes 16 and 58 being the most frequent (29% and 19% respectively) [13]. In the United States human papilloma virus prevalence reported was 35.6%, (11.6% low risk and 29.5% high risk types) [14]. Another study in the United States reported 29% prevalence, the most frequent genotypes being HPV16 (21%), HPV31 (12.7%), HPV18 (9%) and HPV51 (9%) and HPV6/11 (6%) [11]. In Spain, HPV prevalence found was 6.5%,

with HPV16 and HPV6/11 being the most frequent genotypes [15].

Coinfection with multiple HPV types has been associated with a higher risk of cervical abnormalities [16,17]. Longitudinal studies are needed in order to determine the risk associated with multiple infections in obstetric patients. Of relevance are the high risk genotypes, which may clear spontaneously after the inmmunological state is restored, or persist and may cause lesions. Also of importance are genotypes 6 and 11 identified in the mothers: if they are transmitted they could represent a risk for the newborn, because of the possible of development of laryngeal and respiratory papillomatosis later in childhood. The most common causes of pregnancy loss in the first trimester are of genetic origin [6]. Amongst other important risk factors are maternal age younger than 20 or older than 35 years old, placental inflammation and infection, but the etiology is often uncertain [5]. Conde-Ferráez *et al* [18] demonstrated that spontaneous abortion was associated to a previous pregnancy loss and to women's age older than 35 years old.

Conclusion

Spontaneous abortion was associated with HPV infection specially with HPV 16 genotype.

Conflict of Interest: non

Source of Findings: Self findings.

Ethical Clearance: This research was carried out with the patient's verbal and analytical approval before the sample was taken. According to this approval, all the samples were collected and the tests were carried out. A copy of the results of the tests was then given to the patients

The Role of Proinfalmatory Cytokines (Interleukin-1 Beta and 6) in Pathogenesis of Breast Cancer

Maad Mohammed Sulaiman[1], Khalid Nafi Salih[1], Muhannad Abdullah Alazzawy[2]

[1]M.B.Ch.B.-FIB.M.S. K, Kirkuk General Hospital, Kirkuk Health Directorate, Kirkuk City, Iraq,
[2]Ph.D. Medical Microbiology, Medical Lab Consultant, Children Hospital, Kirkuk Health Directorate, Kirkuk City. Iraq

Abstract

A cross-sectional study was carried out in Kirkuk city from of November 2017 to March 2018. The number of breast cancer women under study were 55 women whose ages were between 30-70 years old. These patients admitted to Kirkuk oncology center. The control group who were matched to the breast cancer patients studied, included 35 unaffected women and their ages were between 30-75 years old. These women presented Kirkuk General Hospital Four ml of blood was collected by vein puncture using Vacutainer tubes from each patient enrolled in this study for determination the level of IL-6 and IL-10 by using ELISA. The study showed that the highest mean level of IL-1 beta was found in women with breast cancer comparing with healthy control women (36.92±11.1 v.s. 10.1±3.7 pg/ml) (P: ≤0.05). The highest mean level of Il-6 was found in BC women comparing with control (97.13±14.7v.s. 22.13±6.91 pg/ml) (P: ≤0.05). The study showed that the highest mean level of IL-1 beta was found in women with breast cancer in the first stage of disease (33.2±9.1 pg/ml) and the level was still decreased to be the lowest level in the stage IV of breast cancer (20.18±2.9 pg/ml), the result was significant (P: ≤0.05). The study showed that the highest mean level of IL-6 was found in women with breast cancer in the first stage of disease (92.1±15.8 pg/ml) and the level was still decreased to be the lowest level in the stage IV of breast cancer (67.9±9.81 pg/ml), the result was significant (P: ≤0.05)

It was concluded that there was a highly significant relation of IL-1 beta and IL-6 with breast cancer and especially in first stage of disease

Keyword: *breast cancer; interleukin-1, interleukin-6*

Introduction

Breast cancer is the malignant tumor in which normal cells in the breast begin to grow without control and no longer die most commonly form the inner lining of milk ducts or the lobules that supply the ducts with milk [(1)]. In Iraq, breast cancer (BC) is the commonest type of female malignancy, accounting for approximately one third of the registered female cancers according to the latest Iraqi Cancer Registry [(2)]. As proposed by the World Health Organization (WHO), early detection and screening, especially when combined with adequate therapy, offer the most immediate hope for a reduction in breast cancer mortality [(3)].

Breast cancer is a heterogeneous disease witch results from a series of genetic and epigenetic events that lead to dysregulation of cell growth, circumvention of apoptosis, and development of the ability to invade the underlining tissue through the basement membrane[(4)]. The causes of these events remain largely unknown, although epidemiologic studies have implicated lifestyle, environmental, and germ-line genetic factors in predisposition to this disease. Familial forms comprise approximately 20% of all breast cancers and appear to have a distinctive pathogenesis dependent on the particular susceptibility gene involved[(5)]. Interleukin 6 (IL-6) is a proinflammatory cytokine, which is produced by a number of immune system cells; fibroblasts, macrophages, T and B Lymphocytes, endothelial cells, keratinocytes and tumor cells [(6)]. Interleukin 6 (IL-6), as major mediator of the inflammatory response, plays a primary role in the patho-physiology of cancer [(5)]. Cancer

cells exposed to IL-6 or which secrete the cytokine as an autocrine factor, show malignant features, such as an enhanced capacity to invade the extracellular matrix and an increased drug resistance [7]. Based on these data, the inhibition of the IL-6/IL-6 receptor interaction with specific antibodies has been proposed as a support cancer therapy [8,9]. The cytokines interleukin-6 (IL-6), tumor necrosis factor alpha (TNFalpha) and interleukin-1 beta (IL-1beta) are critical mediators of the inflammatory response. So the aim of the study was to estimate the level of IL-1 beta and IL-6 in women with breast cancer

Material and Method

A cross-sectional study was carried out in Kirkuk city from of November 2017 to March 2018. The number of breast cancer women under study were 55 women whose ages were between 30-70 years old. These patients admitted to Kirkuk oncology center. The control group who were matched to the breast cancer patients studied, included 35 unaffected women and their ages were between 30-75 years old. These women presented Kirkuk General Hospital Four ml of blood was collected by vein puncture using Vacutainer tubes from each patient enrolled in this study for determination the level of IL-6 and IL-1 beta by using ELISA technique.

Statistical Analysis

Computerized statistically analysis was performed using Mintab ver 18.0 statistic program. Comparison was carried out using Chi-square (X^2) for determination of the *P.* value.

Findings

The study showed that the highest mean level of IL-1 beta was found in women with breast cancer comparing with healthy control women (36.92±11.1 v.s. 10.1±3.7 pg/ml) (P: ≤0.05). The highest mean level of Il-6 was found in BC women comparing with control (97.13±14.7v.s. 22.13±6.91 pg/ml) (P: ≤0.05), Table 1.

Table 1: Level of IL-1 and IL-6 beta in breast cancer women and the control group.

Interleukins levels (Mean±SD) pg/ml	BC women	Control group	P. value
IL-1 beta	36.92±11.1	10.1±3.7	≤ 0.05
IL-6	97.13±14.7	22.13±6.91	≤ 0.05

The study showed that the highest mean level of IL-1 beta was found in women with breast cancer in the first stage of disease (33.2±9.1 pg/ml) and the level was still decreased to be the lowest level in the stage IV of breast cancer (20.18±2.9 pg/ml), the result was significant (P: ≤0.05). The study showed that the highest mean level of IL-6 was found in women with breast cancer in the first stage of disease (92.1±15.8 pg/ml) and the level was still decreased to be the lowest level in the stage IV of breast cancer (67.9±9.81 pg/ml), the result was significant (P: ≤0.05), Table 2.

Table 2: Comparison among Level of IL-1 and IL-6 beta levels regarding stage breast cancer

Interleukins levels (Mean±SD) pg/ml	Stage I	Stage II	Stage II	Stage IV	P. value
IL-1 beta	33.2±9.1	29.8±3.6	26.8±3.8	20.18±2.9	≤ 0.05
IL-6	92.1±15.8	80.6±13.2	77.8±10.8	67.9±9.81	≤ 0.05

Discussion

The role of other inflammatory cytokines (possibly TAM derived), IL- 1 was also addressed in breast carcinoma [10]. The role of the IL-1 system in human breast cancer is conflicting. Initial analyses regarding IL-1 indicated that its levels were significantly higher in invasive carcinoma than in ductal carcinoma in situ or in benign lesions, implying that elevated levels of IL-1 are directly correlated with a more advanced disease [6]. In addition, IL-1 has been shown to inhibit growth of breast cancer cells and to promote cellular differentiation in vitro, but it is equally known to stimulate the expression of several proteolytic enzymes in human cancer [11]. The consecutive degradation of extracellular matrix is a key element of local invasion and metastasis [12]. The mitogenic activity by IL-1 can be explained by induction of growthrelated oncogene (GRO) gene expression or induction of IL-8 expression via activation of the Nuclear factor B (NFκB) and activator protein (AP)-1 signal transduction pathways [13]. The robust response of the metastatic- or mesenchymal-appearing breast carcinoma cells to either IL-1 or TNF may be because of elevated expression of transcription factors needed for transcription of the IL-8 gene. TNF- B, a transcription factor, which can be activated by either IL-1, is an example of such a transactivator. Activated NF- B recognizes and binds to a consensus sequence in the promoter region of the IL-8 gene[14]. In this study, serum IL-6 level was evaluated in breast cancer patients as compared to healthy controls. Interleukin-6 is found to be elevated in various inflammatory and malignant diseases including metastatic breast cancer and their levels are found to correlate with the extent of the disease [9]. It is produced by some types of cancer cells and by normal stromal cells, such as fibroblasts and endothelial cells. By acting as growth factor, IL-6 is able to promote tumor cell proliferation through upregulation of anti-apoptotic and angiogenic proteins in tumor cells. Also IL-6, is a major mediator of the inflammatory response, plays a primary role in the pathophysiology of cancer [15]. The study results were in agreement with a recent study in Iraq made by Ayed [16] carried out on 75 breast cancer patients and 15 healthy controls. He found that serum IL-6 level for the patients was significantly higher than normal women and strongly correlated with disease progression. Also in Egypt, Ahmed *et al* [16] found that serum level of both IL-6 and IL-8 were found to be higher in patients than in healthy volunteers. In addition Sullivan [17] have mentioned that breast cancer patient serum and tumor IL-6 levels are clinically relevant, and therefore, should be routinely evaluated upon diagnosis . Statistically highly significant differences were seen in the Mean serum (IL-6) concentration of all disease stages as compared to the Mean (IL-6) serum concentration of the control group ($p < 0.01$). We suggest that higher mean serum (IL-6) level in early disease stage may be due to the high immune response of the body in this stage of the disease. It was reported that IL-6 antitumor activity was enhanced by induction of induction of T cell and B cell differentiation, stimulation of cytotoxic T cells and help in producing lymphokineactivated killer cells [18]. We thought that This immune response trigger synthesis and release of this cytokine leading to augmentation of its serum level that might be utilized as a marker of immunity status and immune system activation in prognosis and monitoring of the course of cancer [19]. This immune response might be attenuated with the progression of disease stage and cancer overwhelming which reflect decrease in (IL-6) synthesis. Our hypothesis could be supported by some literatures , mentioned that IL-6 and other IL-6-type cytokines are expressed in many primary breast tumors [20]. However, IL-6 expression is reduced in invasive breast carcinoma relative to normal mammary tissue and appears to be inversely associated with histological tumor grade [21]. The role of IL-6 in cancer progression is dependent on the balance of multiple pathways triggered simultaneously by the cytokine. However, concomitant stimulation of the cells by other endogenous or exogenous factors, even at low concentrations, may tip the balance toward one biological response, e.g., proliferation and antiapoptosis, or another, e.g., growth arrest and differentiation [22]. IL-6 has also been shown to influence the proliferation of normal and tumor-derived cells. IL-6 promote proliferation of hematopoietic progenitors, keratinocytes, myeloma/ plastocytoma, and Kaposi's sarcoma cells, whereas it inhibits the proliferation of M1 myeloid leukemia cells, early-stage melanoma cells, and lung and breast tumor cells. Thus, depending on the target cell, IL-6 induces various and sometimes contrasting biological responses[7-9].

Conclusions: There was a highly significant relation of IL-1 beta and IL-6 with breast cancer and especially in first stage of disease.

Conflict of interest: non

Source of Findings: Self findings.

Ethical Clearance: This research was carried out with the patient's verbal and analytical approval before the sample was taken. According to this approval, all the samples were collected and the tests were carried out. A copy of the results of the tests was then given to the patients

Production of Iodine-125 in Useful Medical Energy Possibilities

ImanTarik Al-Alawy[1], RaghadSadoon Mohammed[1], WaleedJabbar Mhana[1]

[1]Departmentof Physics, College of Science, Mustansiriyah University, Baghdad, Iraq

Abstract

The goal of the present work is to achieve the nuclear data for medically important radioisotope Iodine-125. The Measured data of excitation functions for direct reactionsof particle induced nuclear reactions, which produced ^{125}I, are available in EXFOR library have been evaluated and recommended in this work. This evaluation is used to calculate the integral yield of radioactive Iodine-125. The average values was derived and used to calculate the most useful reaction for the production of Iodine-125which is ^{124}Te(d,n)^{125}Ireaction with no impurity, yield 0.611MBq (0.02mCi)/μAh, and useful energy range 5.5→7.5MeV from cyclotron using high enrichment for ^{124}Te.

Keywords: *enrichment, excitation functions, I-125, useful energy, yield*

Introduction

Iodine-125 is a medical radioisotope of Iodine. Its half-life is 59.49 days and it decays by electron capture(isomeric transition) with daughter ^{125}Te of spin 5/2+ (stable isotope). This state is not the metastable ^{125m}Te, but rather a lower energy state that decays immediately by gamma decay with a maximum energy of 35keV[1]. Iodine-125 used as nuclear imaging tracers to evaluate the anatomic and physiologic function [2]. Many studies have been developed for using Iodine-125 by Goolden et al. (1968) [3];Venikov et al. (1993)[4]; Bastian et al. (2001) [5]; Hohn et al. (2001) [6]; Audi et al. (2003) [7], Weinreich and Knust (2005) [8]; Gul (2009) [9];Uddin et al. (2011) [10]; Augustine et al. (2013) [11]; Al-Alawy and Mohammed (2016) [12]and Solovev and Merkusheva (2017) [13] for different applications in diagnostic and treatments by studying the excitation functions, enrichments, differential and integral yields, useful energy and impurities levels.Iodine-125 is commonly used by radiation oncologists in low dose rate brachytherapy in the treatment of cancer at sites other than the thyroid (using positron emission tomography (PET)), especially in prostate cancer[14, 15].

Theoretical Basics

In the scope of this work, the stopping powers are programmed and calculated using the Ziegler formulae expressions valid for the energy range as follows [16, 17, and 18]:

1- Energy range (1-10)×10^{-3} MeV $-\frac{dE}{dx} = A_1 E^{1/2}$ (1)

2- Energy range (10-999) ×10^{-3} MeV

$$\left(-\frac{dE}{dx}\right)^{-1} = \left(-\frac{dE}{dx}\right)_{Low}^{-1} + \left(-\frac{dE}{dx}\right)_{High}^{-1} \quad (2)$$

$$\left(-\frac{dE}{dx}\right)_{Low} = A_2 E^{0.45} \text{ and } \left(-\frac{dE}{dx}\right)_{High} = \left(\frac{A_3}{E}\right)\ln\left[1+\left(\frac{A_4}{E}\right)+A_5 E\right] \quad (3)$$

3- Energy range (1000-100.000)×10^{-3} MeV

$$\left(-\frac{dE}{dx}\right) = \left(\frac{A_6}{\beta^2}\right)\left[\ln\left(\frac{A_7\beta^2}{1-\beta^2}\right) - \beta^2 - \sum_{i=0}^{4} A_{i+8}(\ln E)^i\right] \quad (4)$$

Where: E is the proton or deuteron energy in (MeV), A_i are the coefficients given by Ziegler, β is the ratio of incident corpuscle velocity and the velocity of light. Hence, the stopping powers are also programmed and calculated using the Ziegler formulae expressions valid for different energy range of incident alpha as follows[16, 17, and 18]:

1- Energy range 1kev – 10MeV $\left(-\frac{dE}{dx}\right)^{-1} = \left(-\frac{dE}{dx}\right)_{Low}^{-1} + \left(-\frac{dE}{dx}\right)_{High}^{-1}$ (5)

$$\left(-\frac{dE}{dx}\right)_{Low} = A_1 E^{A2} \text{ and } \left(-\frac{dE}{dx}\right)_{High} = \left(\frac{A_3}{E/1000}\right)\ln\left[1+\left(\frac{A_4}{E/1000}\right)+\left(\frac{A_5 E}{1000}\right)\right] \quad (6)$$

2- Energy range >10 MeV

$$\left(-\frac{dE}{dx}\right) = \left(A_6 + A_7 EE + A_8 EE^2 + A_9 EE^3\right) \quad (7)$$

Where $EE = \ln(1/E)$ and A_i (i =1 – 9) are the coefficients given by Ziegler [16, 18]: for incident alpha.For any energy E, the Yield of product nuclei (activity in Bq) can be expressed as the function of the cross section as[19]:

$$Yield = I(\phi\ n)\ H\ \left(1-e^{-\lambda t}\right)\int_{E_{out}}^{E_{in}} \sigma(E)\left(\frac{dE}{dx}\right)^{-1} \quad (8)$$

Where I is current of projectile in (μA), *ø*is beam flux in (s^{-1}), n is number of atoms per unit volume, N is Avogadro's number, A is the mass number of the target in (amu), H is isotopic abundance (or enrichment) of the target, λ is decay constant of the product in (h^{-1}), t is time of irradiation in (h), and $\sigma(E)$ is cross section at energy E in (mb).

Data Reduction and Analysis

Table 1 shows the agreement of recommended energy range with the international EXFOR library energy range used in the present work for available measuring data for proton, deuteron and alpha particle induced reactions for the ^{125}I production. Table 2 shows the results of the calculated threshold energies and Q-values compared with the experimental values which are taken from National Nuclear Data Center (NNDC) [20]; both are in a very good agreement. The table also provides a natural and enriching abundance of the target material.

Table 1: Energy range recommended for iodine-125 production

Target Element	Reaction	Product	Energy Range (MeV)	Author's Ref. No.
^{125}Te	(p,n)	^{125}I	5.5−100.5 5.5−100.5	Hohn et al. (2001) [6] (pw)
^{124}Te	(d,n)		5.8−14.1 5.8−14.1	Bastian et al. (2001) [5] (pw)
^{123}Sb	(α,2n)		14.8−39.6 14.8−39.6	Uddin et al. (2011) [10] (pw)

Table 2: Nuclear properties of the reactions that produce iodine-125

Reaction Process used	Threshold Energy (MeV) [20]	Q-Value (MeV) [20]	Target Material		
			Isotope	Natural Abundance% [21]	Enrichment %
^{125}Te(p,n)	0.975926(0.0605) 1.487301(pw)	-0.968117(0.06) -1.475403 (pw)	^{125}Te	7.07	98.3[6]
^{124}Te(d,n)	0.0(0.0) 0.0(pw)	3.3762842(0.07) 2.874795 (pw)	^{124}Te	4.74	99.8[5]
^{123}Sb(α,2n)	14.34 15.608386 (pw)	-14.11 -15.116233 (pw)	^{123}Sb	42.7	98.28[10]

Method Used to Obtain the Recommended Cross Section

The interpolations of the nearest data for each energy interval as a function of the sets of experimental cross sections and their corresponding errors for each value (with different energy intervals) are re-arranged according to the energy interval 0.01MeV for each author. The normalization for the statistical distribution of cross sections errors to the corresponding cross section values for each author has been done. The interpolated values are calculated to obtain the recommended cross section which is based on the weighted average method[22]:

Findings and Discussion

Recommended Cross Sections

The experimental results in the International Atomic Energy Agency (IAEA); (EXFOR) library leaves little doubts that the hypothesis of cross section gives an excellent account of many diverse types of nuclear reactions. The features of iodine production nuclear reactions induced by protons, deuteron and alpha mainly on the $_{52}$Te and $_{51}$Sb target elements have been evaluated. It is important to note that the energy range of the reaction, taken from different authors, is not identical.

For this reason, the determination of the energy range has been processed. The results for each reaction are discussed as follows:

^{125}Te(p,n)^{125}I Reaction

The measured data for the cross sections of this reaction reported by Hohn et al. (2001) [6], interpolated, and recalculated in fine steps of 0.01MeV from 5.5MeV up to 100.5MeV for incident proton.

^{124}Te(d,n)^{125}I Reaction

The measured data for the cross sections of this reaction reported by Bastian et al. (2001) [5], interpolated, and recalculated in fine steps of 0.01MeV from 5.8MeV up to 14.1MeV for incident deuteron.

^{123}Sb(α,2n)^{125}I Reaction

The measured data for the cross section of this reaction reported by Uddinet al. (2011) [10], interpolated, and recalculated in fine steps of 0.01MeV from 14.8MeV up to 39.6MeV for incident alpha.

Our trails were directed to fit the evaluated cross sections for the data taken from EXFOR library. Using the recommended cross sections as an input data, a Matlab-8 has been executed to obtain a Polynomial fitting expression and the fitting parameter of the fit formula with lower chi squared value (χ^2_{min}).

Stopping Power and Calculated Yield

The stopping power of target elements for proton, deuteron and alpha particles has been calculated in the present work using SRIM (2003) [23], as an experimental results and Ziegler equations (1→7) as a theoretical calculation results. For (p,n), (d,n) and (α,2n) reactions calculations. Therefore, the calculated yield for ^{125}I has been calculated using equation (8). The main aim of this study is to increase calculated yield from these reactions by increasing the energy of proton, deuteron or alpha beams which can interact with different targets.

Useful Energy and the Production Yield

The excitation function for the production of iodine radioisotopes in natural Tellurium target for 10 to 35MeV of incident proton is measured byOropeza et al. (1994) [24] andArcerbitet al. (1974) [25]. Table 3 shows the cyclotron production of ^{125}I and the reaction contribution as a function of the energy range of incident particles on the Antimony ^{123}Sb and Tellurium (^{124}Te, ^{125}Te) targets elements. After certain degree target enrichment, the following sequences are to be performed: In radioisotope production from a nuclear reaction, the optimization of production routes is needed. This process involves a selection of the projectile energy range that will maximize the yield of the product and minimize that of the radioactive impurities. With particular emphasis on the data needed for the production of medicalsignificance radionuclide ^{125}I.

Table 3: Useful energy and the production yield for the production of iodine–125

Target Element	Reaction	Useful Energy (MeV)	Yield MBq(mCi)/μAh	Radioiodine impurity %	Author's Ref. No
^{123}Sb	(α,2n)	20→30 20→30	——— 1.64(0.044)	——— (0.059)^{126}I, (2.411)^{124}I, (0,23)^{126}I	[10] (PW)
^{124}Te	(d,n)	5.8→7.5	0.613 (0.017)	No Impurity	(PW)
^{125}Te	(p,n)	7→18 5.5→10	——— 2.63 (0.071)	——— No Impurity	[3] (PW)

Incident proton on enriched ^{125}Te target to produce ^{125}I

The production of $^{123,124,125}I$ has been carried out byHohn et al. (2001) [6]. Hohnet al. performed that the^{125}Te target was an isotopic enrichment with different compositions as; ^{120}Te(0.1%); ^{122}Te(<0.1%); ^{123}Te(0.5%); ^{124}Te(0.8%); ^{125}Te(98.3%); ^{126}Te(0.1%); and ^{130}Te(<0.1%). The recommended cross section of the^{125}Te (p,3n)^{123}I, ^{125}Te(p,2n)^{124}I, and ^{125}Te(p,n)^{125}I reactions over the entire energy range 21.5−68.2MeV, 10.6−100.5MeV, and the 5.5−100.5MeV respectively were calculated. The excitation functions are plotted in Figure1.

The useful energy range for the production of ^{124}I is carried out over the interval of E_P=15 to 20MeV, which is agree with the result of Koehler et al.(2010) [26]. The calculated yield should be 91.13*MBq* (2.46*mCi*)/*μAh*, which is also agree with Ref.[26]. Theproductionof ^{125}Iwithin this energy range is regarded to be as an impurity of 21% with ^{124}I.

The useful energy range for the production of ^{125}I is carried out over the interval of E_P=5.5 to 10MeV, with no impurity, but with very low calculated yield 3.35MBq (0.091mCi)/μAh. While the useful energy ranges for the production of ^{123}I may be carried out over the interval of E_P=30 to 40MeV, with an impurity of 44% of ^{124}I and 1.5% of ^{125}I. The calculated yield is 297.401MBq (8.04mCi)/μAh, for ^{123}I. This high impurity and high energy need high cost for cyclotrons.

Incident deuteron on enriched ^{124}Te target to produce ^{125}I

The production of ^{123}I ,^{124}I , and ^{125}I have been carried out by Firouzbakht et al. (1993) [27] and Bastian et al. (2001) [5]. The recommended cross section of ^{124}Te(d,n)^{125}I, ^{124}Te(d,2n)^{124}I, and ^{124}Te(d,3n)^{123}I reactions over the entire energy range 5.8−14MeV, 7.5−23.6MeV, and 7.5−23.6MeV respectively were calculated. The excitation functions are plotted in Figure2.

Bastian et al. performed that the^{124}Te target was an isotopic enrichment with different compositions as:^{123}Te (0.2%) and ^{124}Te (99.8%) for ^{124}Te(d,2n)^{124}I, and ^{124}Te(d,3n)^{123}I reactions. While Firouzbakht et al. gave no data for the enrichment. This useful energy range for the production of ^{123}I is Ed=18 to 22.5MeV. The calculated yield should be 45.9MBq (1.2mCi)/μAh. The production of ^{124}I in this energy range is regarded to be an impurity of 26% with ^{123}I. It can be seen from Figure2, that below 18MeV the contamination of ^{124}I is 100% while the energy range Ed=5.5 to 7.5MeV can be regarded as useful energy for the production of ^{125}I without any impurities.

Incident Alpha on enriched ^{123}Sb target to produce ^{125}I

The production of ^{123}I has been carried out by Ismail (1990) [28], Singh et al. (1991) [29], and Al-Alawy and Mohammed (2016) [12], while the production of ^{124}I has been carried out by Watson et al. (1973) [30], Ismail (1990) [28], Singh et al. (1991) [29], and Uddin et al. (2011) [10]. ^{125}I has been carried out by Uddin et al. (2011) [10], and Al-Alawy and Mohammed (2016) [31]. While the production of ^{126}I (half-life=13d) has been carried out by Ismail (1990) [28], Singh et al. (1991) [29], Singh et al. (2006) [32] and Uddin et al. (2011) [10]. The recommended cross section of ^{123}Sb(α,4n)^{123}I, ^{123}Sb(α,3n)^{124}I, ^{123}Sb(α,2n)^{125}I, ^{123}Sb(α,n)^{126}I reactions over the energy range 34.4−58.4MeV, 9.72−58.8MeV, 14.8−39.6MeV, and 9.7−40.2MeV were calculated. The excitation functions are plotted in Figure3.

Singh et al. used enriched (99.9%) for ^{123}Sb target, whileIsmail gave no data for enrichment. Watson et al. used enriched (99.999%), andUddin et al. used enriched (98.28%) of the target. It can be seen that the useful energy range for the production of ^{124}I is carried out over the interval of Eα=32 to 40MeV. The calculated yield should be 11.4*MBq* (0.31*mCi*)/*μAh*, which can be compared with the result obtained by Uddinet al. of 11.7*MBq* (0.32*cmCi*)/*μAh*. Therefore, below 32MeV, the production of ^{125}I and ^{126}I are regarded to be an impurity of 23% and 13.2%, respectively with ^{124}I. Above 40MeV, the production of ^{123}I is regarded to be an impurity of 101.2% with^{124}I. Hence, the useful energy ranges for the production of $^{124}I$is selected to be Eα=32 to 40MeV, with a minimum impurity 4.8%, 2% and0.2% of ^{123}I, ^{125}I, and ^{126}I respectively.

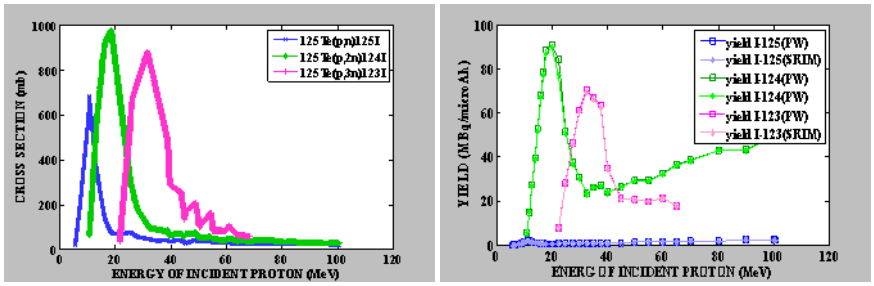

Figure1 Left side: Recommended cross sections of (p,n), (p,2n), and (p,3n) reactions on ^{125}Te, versus incident proton energy. Right side: Calculated yield of the incident proton in ^{125}Te.

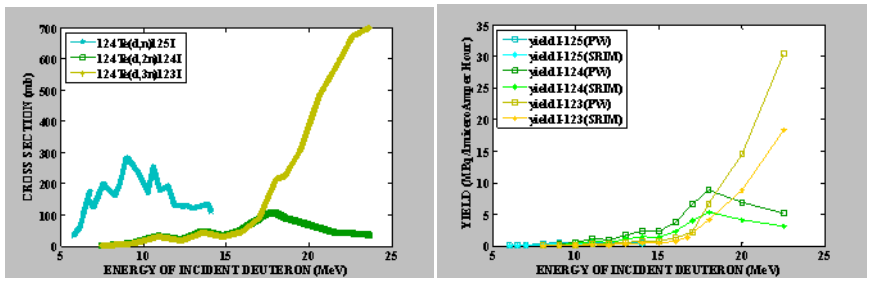

Figure2 Left side: Recommended cross sections of (d,n), (d,2n), and (d,3n) reactions on ^{124}Te, versus incident deuteron energy. Right side: Calculated yield of the incident deuteron in ^{124}Te.

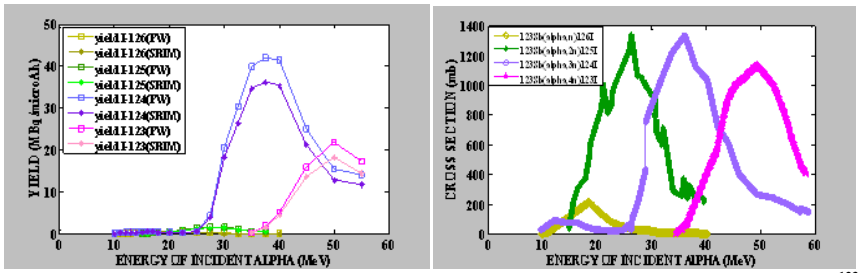

Figure3 Left side: Recommended cross sections of (α,4n), (α,3n), (α,2n), and (α,3n) reactions on ^{123}Sb, versus incident alpha energy. Right side: Calculated yield of the incident alpha in ^{123}Sb.

Conclusion

Although higher enrichment of the targets ($_{51}$Sb, $_{52}$Te) has been used, for the production of Iodine isotopes, to reduce the appearance of impurities, this impurity not disappears. So that, the area of the energy range for the cyclotron must be specify to obtain a higher production of radioactive Iodine required with less percentage of impurity.

The characteristic of the diagnosis and treatment radioisotopes is to ensure the access of radiation to the organ for diagnostic or treated without moving to the tissue. Therefore, among three reactions for the production of ^{125}I (^{125}Te (p,n), ^{124}Te(d,n), ^{123}Sb(α,2n)); the most useful reactions are:

For incident deuteron: The ^{124}Te(d,n)^{125}I reaction with no impurity, with yield 0.611MBq (0.02mCi)/μAh and the useful energy range 5.5→7.5MeV.

For incident proton: The ^{125}Te(p,n)^{125}I reaction with no impurity, with yield 3.35MBq (0.091mCi)/μAh and the useful energy range 5.5→10MeV.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Physics, College of Science, Mustansiriyah University, Baghdad, Iraq and all experiments were carried out in accordance with approved guidelines.

Detection of Mycoplasma Pneumonia Infection in Sinusitis's Patient

Khadija S. AL-Mizury

Assist. Prof. (M.Sc.), Collage of Health And Medical Technology/ Baghdad, Middle Technical University, Baghdad, Iraq

Abstract

"This study aims to detecting the probability of M. pneumonia prevalence in sinusitis patients the study in rolled (178) patients had a history of respiratory infection.Were included (135) patients suffering from sinusitis disease and (43)Control group of patients had no radiological evidence of sinusitis disease.The range age in cases was (18-62) years with a mean of(40) years , in controls it was 18-51 years witha mean of(34.5).

Blood samples were examined for M. pneumonia antibodies IgG and IgM by enzyme linked immune sorbent assay (ELISA). Elevated antibody titers were found in (124) patients (80%),and in 31control (20%). Acute and previous immunities "M. pneumonia IgM and IgG antibodies " were observed in (17%) and (67.7%) of cases, and (2.5%) and (12.2%) of controls, respectively.

Finding demonstrate that the predominant M. pneumonia antibodies type "IgG, IgM" in sinusitis patients and symptoms like headache and fever. The study showed that the positivity rate of M.pneumoniae infection reach peak level in crowding index (+4) and (3- 3.9) in both case and control.

Keywords : *M. pneumonia, antibodies , IgG, IgM, enzyme linked immune sorbent assay, sinusitis patients, crowding index.*

Introduction

"Mycoplasma pneumonia living bacteria which can cause upper respiratory tract infections, including pharyngitis, sinusitis, ear pain are extremely small self-replicating free-rhinorrhea and pneumonia[1][2]. *M. pneumonia*e is described as atypical and accounts for 1–29% of community-acquired pneumonia cases"[2]. "The causative bacteria can be transmitted through aerosols as well as in settings which promote close physical contact, such as homes, schools, military barracks and dormitories"[3]. "The post-exposure incubation period is between two to three weeks and infections are more prevalent among children and young adults"[4]. "Common risk factors include age (i.e. younger children or older adults), immune status (i.e. immuncompromised individuals with HIV or those undergoing chemotherapy or taking steroids), smoking and pre-existing lung disease"[5]."Sinusitis, also known as rhinosinusitis, is inflammation of the Paranasal sinuses. It can be due to infection, allergy, or autoimmune problem. Most cases are due to a viral infection and resolve over a course of 10 days. It is a common condition, with over 24 million cases in the unites states"[6]."Evidence of maxillary sinusitis has been found in human archeological specimens discovered in Africa, north America, and Europe"[7]."Reported association between the M. pneumonia and sinusitis a range of various disorder similar in nasal and Paranasal sinuses mucosa inflammation for as long at least 12 consecutive weeks are called chronic rhinosinusitis. *M. pneumonia* was previously detected in human nasal which implicates *M. pneumonia* as a causative agent in the etiology of sinusitis"[8].

"Because of our concern about the possibility of unrecognized *M. pneumonia* infection among different group of population and to determine the etiology of *M. pneumonia* among these groups the study aimed as following:

Prevalence study of *M. pneumonia* IgM and IgG antibodies by ELISA test.

A comparative study for the occurrence of *M. pneumonia* infection in different population groups."

Material and Method

Patients, controls, place, and time

"The study design consist of(178) patients had a history of respiratory infection with onset of symptoms (1 to 20) days before inclusion in the present study. (135) patients suffering from sinusitis disease attending ENT clinic and Baghdad hospital. Control group of (43) patients were visited an ENT clinic with comparable age and had not radiological evidence of sinusitis disease . All samples from patients and controls were collected from beginning of December 2017 to the end of July2018.**"**

Specimens :

Collection of serum sample:

"3-5ml of blood sample was collected, centrifuge for ten minutes x 3000 rpm. Serum dispensed in aliquots' of 0.5 ml. all sera were immediately frozen at -20c until used. This was used for detection of IgG and IgM antibodies to Mycoplasma pneumonia in human serum. The evaluation of specific M. pneumoniaIgG and IgM antibodies were carried out with commercial kits (Chemi-Con- Germany)."

Statistical Analysis:

"Quantitative variable were described as frequencies and percentage for each group. Statistical analysis including, Chi square values and p values were calculated for all categorical variables. "

Finding

Table(1) Seroprevalence of Mycoplasma pneumonia among study group

Study group	M.pneumonia IgG no.(%)	M.pneumonia IgM no.(%)	Total No.(%)
Patient	105(67.7)	19(12.2)	124(80)
Control	27(17)	4(2.5)	31(20)
Total	132(84.7)	23(14.7)	155(100)

Table (1)demonstrate that Acute infection IgM antibodies was detected in (12.2%) of cases and (2.5%) of controls. And for previous immunity IgG antibodies were (67.7%) and (17%), respectively

Table(2) clinical symptoms associated with Mycoplasma pneumonia

Symptoms	Patient		Control	
	M.pneumoniae IgG antibodies No(%)	M.pneumoniae IgM antibodies No(%)	M.pneumoniae IgG antibodies No(%)	M.pneumoniae IgM antibodies No(%)
Headache	56 (45)	25 (20)	6 (19.3)	3 (9.6)
Fever	43 (34.6)	11 (8.8)	18 (58)	8 (25.8)
Throat pain	17 (13.7)	6 (4.8)	4 (12.9)	-
Fatigue	32 (25.8)	12 (9.6)	7 (22.5)	2 (6.4)
Dry cough	88 (70.9)	31 (25)	-	-
sputum	12 (9.6)	2 (1.6)	9 (29)	4 (12.9)

Table (2) show the most common symptoms in patients with this atypical pathogen " M.pneumoniae" were headache

and dry cough in both IgG and IgM antibodies. While in control group the most common symptoms were fever and sputum.

Table(3) Distribution study group according to the crowding index

Crowding index	Patient		Control		total
	Positive M.pnumonia antibodies	Negative M.pnumonia antibodies	Positive M.pnumonia antibodies	Negative M.pnumonia antibodies	
1-1.9	21(16.9)	5 (45.5)	5(16.2)	6(50)	37(20.7)
2-2.9	16 (12.9)	4 (36.3)	3(9.6)	4(33.3)	27(15.2)
3-3.9	42 (33.9)	-	12(38.7)	2(16.7)	56(31.5
4+	45 (36.3)	2 (18.2)	11(35.5)	-	58(32.6)
Total	124(100)	11(100)	31(100)	12(100)	178(100)

As shown in table (3) that the high M. pneumoniae infection was seen insinusitis patients and control living with crowded family(3-3.9 and +4) .

Table (4) Respondent study group about practices regarding mycoplasma infection

practices	Patient		control	
	Yes No.(%)	No No.(%)	Yes No.(%)	No No.(%)
Stay away from people who have symptoms of mycoplasma	29(21.4)	106(78.6)	33(76.7)	10(23.3)
Wash hand before eating	113(83.7)	22(16.3)	40(93.1)	3(6.9)
Cover the nose and mouth when they sneeze or cough	17(12.6)	118(87.4)	29(67.4)	14(32.6)
Eat a balanced diet	98(72.6)	37(27.4)	32(74.4)	11(25.6)
Get 6-8 hrs. Of sleep night	54(40)	81(60)	15(34.8)	28(65.2)

With respect to some practices regarding Mycoplasma pneumoniae infection table (4) show that the Most of the study patients (87.4%) were answered no cover the nose and mouth when they sneeze or cough followed by 106(78.6%) the answered no stay away from people who have symptoms of mycoplasma pneumoniae infection.

Discussion

(80%) of the patients showed a fourfold or greater rise of antibodies to Mycoplasma pneumonia (table 1). In the control group, a corresponding rise in antibody titer was seen in 20%, acute infection (IgM)was detected in (12.2%) of cases and (2.5%) of controls. These number for previous immunity (IgG) were (67.7%) and (17%), respectively. Antibodies in serum (IgM, IgG) had shown significant difference (p>0.05) between case and control).

"Current study shows that M.pnumonia has a possible etiologic role in development of Sinusitis patients, Our result acceptable agreement with other

study that suggest the respiratory M. pneumonia may be potential etiological agent in a sinusitis alone or in combination with the common bacterial pathogens of sinusitis"[9].

"Other study finding that no significant difference between case and control"[10]." The incidence rate of mycoplasma antibody in our study is lower than that of other study that detected M. pneumonia in (93%) of sinusitis patients but was seen only in (14%) of the control group this may be due to we use serum instead of DNA- PCR for diagnosis of active M.pnumonia"[11]. "M. pneumonia is known to produce a gradual tracheobronchitis with malaise and non-productive cough, which can progress to pneumonia and extra pulmonary manifestations"[12][13].

"In our study dry cough and headache were the most common symptoms observed for patients with samples positive for M. pneumonia antibody IgM, IgG. However the fever and sputum the most predominant symptom found in control group. our study came in a agreements with other study that found that both cough and fever were the most common symptoms"[14].

"In this study, overcrowding were associated with a history of M. pneumonia infection (table 3), our study finding patients from household with 1 or 2 people per room were less likely to have M. pneumonia infection compared to patients from households with more than 3 people per room. other study found consistent evidence of an association between bed sharing with someone with cough in sever and non-sever pneumoniae"[15].

"This due to M. pneumonia is spread when a person who is sick cough or sneezes while in close contact with others who then breath in the bacteria. Most people who are exposed for a short amount of time do not get sick. However ,it›s common for this illness to spread between family members wholiving together"[1]." Regarding practice of mycoplasma infections, the present study revealed most of studygroup was noStay away from people who have symptoms of mycoplasmaAnd no Cover the nose and mouth when they sneeze or cough,the causative agent can be transmitted through aerosols as well as in setting which promote close physical contact, such as homes, schools, military barracks and dormitories"[2].

Conclusion

"M. pneumonia might be of importance in the etiology of sinusitis patients. Macrolides potential to reduce the virulence of some bacteria may be an important feature in reducing tissue damage in cases with chronic infection.ىc"

Immunopathological Study of *Brucellaabortus* in White Mice Immunize with Killed Antigen

Khalied Yassen Zakair[1], Alwan M.J[2]

[1]*Department of Pathological Analysis, Kut Technical Institute, Middle Technical University, Iraq,*
[2]*Department of Pathology, Veterinary Midecine Collage, Baghdad University, Iraq*

Abstract

The study was aimed to evaluate the protective efficiency of the formalin killed *Brucellaabortus*antigen against *Brucella* infection in mice . Inorder to achieve of thisgoal.Fifty white mice were divided into three groups randomly. The 1st group (20 mice) was immunized 0.3ml of formalin killed *Brucellaabortus*antigen, two doses, two weeks interval, the 2ndgroup (20 mice) was served as control positive while 3rd group (10 mice) was inoculated with 0.3ml of sterile normal saline and it served as control negative group.At 30 day post immunization, the 1st and 2nd group were inoculated I/P with 0.3ml of bacterial solution containing 1X10^{8}cfu/ml, I/P all animals were sacrificed at day 30 post infection,blood samples were collected for measurement IL 4,1L six and TNFa, and small pecies from internal organs were fixed in I0 percentage of formaline for histopathologicalexamination.The results showed that the serum levels of IL-4, IL-6and TNFα were (36.22±3.81),(29.74±2.79) and (161.214±2.98) respectevlly. The results of histopathological changes showed severe pathological changes including granulomatous lesions in the liver parenchyma and dilated of sinusoids with fibrin networks deposition, neutrophils infiltration in the lung and RBCs in thickness pleura,the spleen showed depletion of white pulp and congested red pulp as well as shownacute cellular degeneration in epithelial cells of kidney, atrophy of glomerula tufts, with dilated of Bomana spaces and hemorrhage in capsular region,while immunized infected animalswere showed mild to moderate cytopathological effect with mononuclear cells aggregation around blood vessels of examined organs particularly liver. we concluded that killed Brucellaabortous antigen can stimulated good cell mediated immune response against *Brucellaabortous* infection of mice.

Key Words:*Brucellaabortus , Immunopathological , Antigen ,Histopathological, Interleukin.*

Introduction

The epidemelogy of zoonotic disease brucellosis that caused by *Brucella*about(500,000) people in year[1]. Majar causal agent is*Brucellamelitensis*, *Brucellasuis*, and *Brucellaabortus*. There are different mode of infection method like inhalation of infected aerosols. Many studies concluded that airborne transmission consider major method of infected human with diseasethat result from bovine and porcine slaughterhouses, preparation of vaccines as well as rural places[2–6].*B. abortus*isis a pathogenic bacteriacan live in the intracellularenvironment. Inside cells, there exist adverse conditionsincluding acidic pH, proteases, and reactive oxygen species(ROS) and reactive nitrogen species (RNS) [7].This bacterium contain lipopolysaccharide (LPS) in cell wall structure that play important role in pathogenicity [8]. Lipid A protein contain large amount of fatty acidmoleculesthat act on decrese immune response of the human body through serve as a poor TLR4 agonist. O-polysaccharide portion that consider cytotoxic of macrophage is absence in content of lypopolysaccaride.The long chain of fatty acid in lipid A neded more experimntale evidences. Reduce activation of TLR4 led to enhanced uptake observedwith rough Brucellathrough enhanced activity of PI3K[9].

Vaccine play important role in activated two arms of immune response that play crucial role in eradication

of Brucella infection, live attenuated vaccine elicited efficient protective immunity against Brucellaabortus but these vaccine may associated with persistent infection or reversion their virulence[10] ,therefore application other type of vaccine antigens are safety when used in the human immunization these vaccine include killed Brucella antigens ,crude extracts , subunit and DNA vaccine[11].Therefore the aim of the current study was to determine the efficiency of killed Brucellaabortousantigen in the stimulatedprotecive immune response against infection by virulent *Brucellaabortous* strain.

Materials and Method

1- Bacterial isolates

Brucellaabortus was obtained from advanced biotechnology lab. and diagnosed by biochemical tests according to [12].

2- Cultural media

Thecultural media were used this study brucella agar, blood agar,Tryptic soya agar. The media were prepared according to instruction of the producer company.**3-Antigens(killed Brucellaabortus antigen)**

Prepared by Hiallibartion and Blazkovec (1975)[13] as follows: The activated and purified bacteria was planted on the heart and brain broth and incubated at 37 ° C for 24 hours. Examine bacterial growth to ensure purity by preparing a glass slide and chromed dye.Transfer 4 ml of the broth and plant on the center of the acre and cut the heart and brain and distribute this quantity equally on the surface of the plant center by moving the dishes and then left to dry after the dishes were transferred to the incubator and left 48 hours. Take the non-contaminated dishes and the bacteria were harvested as follows:Harvested with PBS solution and placed in test tubes.The total number of bacterial harvesting was calculated in Colonies Forming UintCFU / ml[14].After washing the microbial growth by centrifugation at 3000 cycles / min for 30 minutes using PBS and two consecutive times and then discard the floating fluid.The neutralized formalin solution was added to the harvest to the original volume level and the implant was left for 24 hours to ensure homicide. The concentration was for the formalin solution (0.03% - 0.05%).Wash bacterial growth twice by PBS solution and using centrifuge at 3000 rpm for 15 minutes.Ensure that killing is done by taking part of the growth by means of a vector of germs and laying on the blood acar medium and it is ascertained that there is no bacterial growth.The precipitate was suspended using PBS solution and stored in sterile bottles until use.

4- Challenge dose

The *Brucellaabortus* was cultured ,growth and purification on the media of this study , the live bacterial cell counted according to [14].

5- Cytokine assessment

Interleukin-4, Interleukin-6 and TNFα Assay Procedure, The procedure is performed at room temperature according to manufacturer's instructions (Boster´s –Korea).

6- Experimental design

Fifty white mice were used (male and female), the ages (8-10weeks) and their weight ranged between (25-30gram), obtained from institute of sera and vaccines \ ministry of health, and reared in cages furnished clean sawdust , and fed concentrate feed during the duration of the experiment. The white mice were divided into three groups were first group includes 20 mice immunized inoculated with 0,3ml of formalin killed antigen,,two dose ,2weeks intervals at day 30 post immunization, and it was inoculated I/P with $1X10^8$cfu /ML.The second group includes 20 mice was considered as positive control.it was inoculated I/P with as 1stgroup. Third group includes 10 mice was inoculated I/P with 0.3ml ml of sterile normal saline ndservedas control negative group.At day 30 post infection ,all animals were sacrificed and blood samples were collected for determine cell mediated immune response by measurement of cytokines including TNF a,IL 4 and IL 6 and small pieces were fixed in 10 formalin for Histopathological examination according to [15].

Funding

Immune response

The cellular immune response

The results were revealed that serum levels of IL-4,IL-6 and TNF-α were 36.22±3.81, 29.74±2.79 and 161.214±2.98respectively as shown in table 1.

Table 1: Cytokine profile of*Brucellaabortus* in immunized mice post infection

groups	IL-4(pg/ml) mean±SE	IL-6(pg/ml) mean±SE	TNF-α (pg/ml) mean±SE
G1immunized group	36.22±3.81	29.74±2.79	161.214±2.98
G2 positive group	28.12±2.65	20.61±1.56	113.325±3.172
G3 negative group	4±0.23	2.5±0.31	21.4±0.578

Histopathological examination:

Non-immunized infected animals at day 30 post-infection

Section in the liver of animal at 30 days post infection showed of kupffer cells proliferation , with granulomatous lesions consisting from aggregation of active macrophages and lymphocytes in the liver parenchyma and dilated of sinusoids (Fig.1).

Lung Anatomy

After 30 days of infection, the anatomy of lung showed revealed fibrin networks deposition, neutrophils. infiltration and RBCs in thickness pleura (Fig.2).

Spleen Anatomy

After 30 days of infection, the anatomy of spleen showed depletion of white pulp and congested red pulp with inflammatory cells infiltration (Fig.3).

Kidney Anatomy

In antomy of kidney was clearly acute cellular degeneration of epithelial cells and shownatrophy of glomerula tufts, with dilated of Bomana spaces with hemorrhage in capsular region(Fig.4).

Immunized infected animals

In immunized infected animal, The pathological effect was were mild to moderate with mononuclear cells aggregation around blood vessels of examined organs particularly liver.

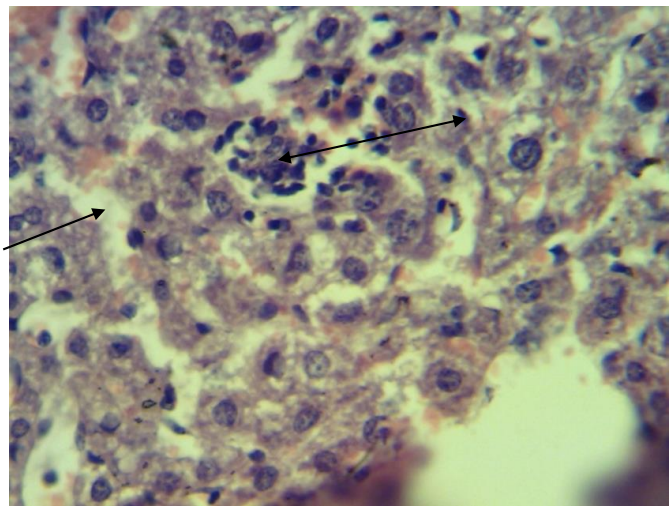

Figure 1. Anatomy of animal liver after infection that explanedproliferation of kupffer cells and granuloma that result from accumulation of active macrophages and lymphocytes in the liver parenchyma and dilated of sinusoids (H & E stain 400X).

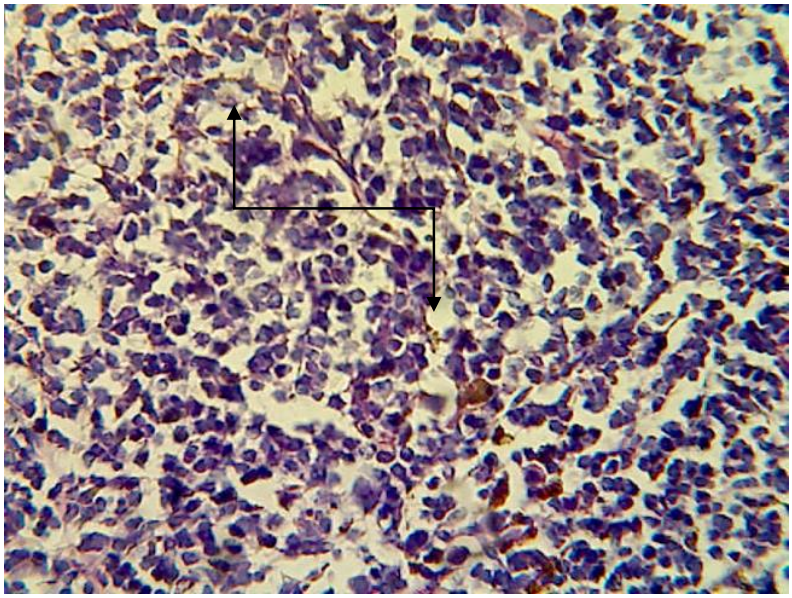

Figure3.Anatomy of animal spleen after infection showed depletion of white pulp and congested red pulp with inflammatory cells infiltration (H & E stain 400X)

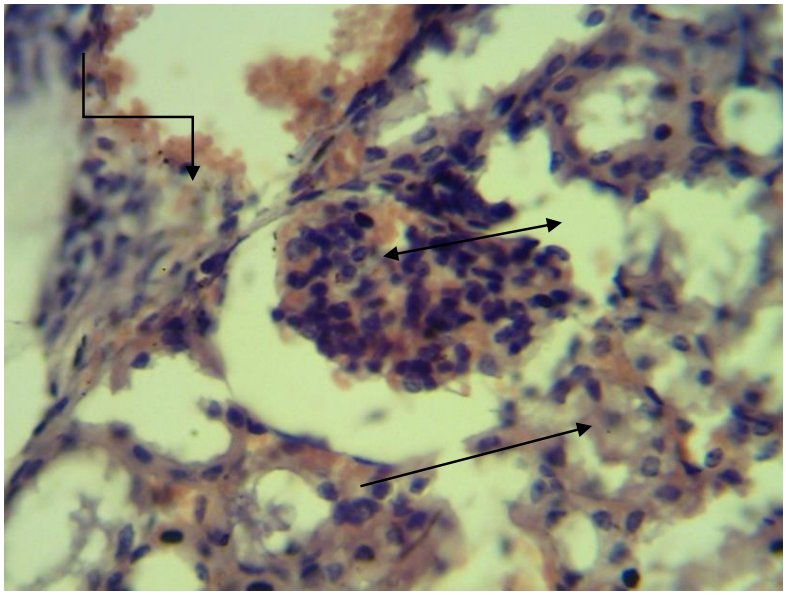

Figure4.Anatomy of animal kidneyafter infection interpreted of acute cellular degeneration in epithelial cells, atrophy of glomerular tufts, with dilated of Boman spaces with hemorrhage in capsular region (H & E stain 400X)

Discussion

Brucellaabortus is intracellular zoonotic pathogen cause brucellosis in human and wide range of animals [16] ,the pathogenesis of Brucella was dependent on its ability intracellular survival and replication in the vacuolar phagocytic compartments of macrophages [17], therefore cell mediated immunity play crucial role in eradicated the Brucellainfection. The current study revealed high levels of serum TNFa in immunized animals as comparedwith those levels in non immunized animals post infection,these result may indicated that the killed Brucella antigens may stimulated better cell mediated immune response against Brucellaabortous infection, these idea was agreent with [18] who demonstrated that the TNFa play important role in host defense mechanisms through activated microbicidalactivity of macrophages and neutrophils in addition it act on NK cells with IL 12 to produced INF y.protective immunity against Brucella can mediated by cytokines, INF y which produced by active Th1 cells that mediated by activated NK cells to produce INF y, these cytokine can facilitate differentiated of Tho cells to Th1 that additionally produce INFy, activator macrophages , also TNFa produced from macrophages and NK cells can maximally activated INF y [19].

The present result showed that the serum levels of TNF a in control positive animals were higher than those of control negative group ,these result may indicated these cytokines play role in inflammatory response against B.abortus infection and in clearance of these pathogens , these evidence was agreement with [20] who investigated that the important cytokines play role in scavenge Brucella consist from TNF a,IL six, INFy and IL 12.INF y and the TNF a secreted from NK cells can activated macrophages to kill Brucella . INF y,1L 12 and TNFa play role in control Brucella infection [20]. the role of TNF a was dependent on presence of INF y in early infection in which it activated macrophages during acute and early chronic phase [21]. INFy is rise in serum of infected mice at acute phase but less amount during chronic phase [22]. while IL six reached peak at acute phase and remain high at first 2 weeks of chronic phase [23] also in the immunized animals at middle chronic phase post infection. The present finding revealed high levels of serum IL six in immunized animals as compared with other groups, these result also indicated that formalin killed Brucella. antigen can elicited IL six that play role in resistance, due to Brucellaabortus is intracellular pathogen in which cell mediated immune response play role in killing these pathogen, the current idea was agreement with Zaitseva et al.[24] who revealed that immunized animals with heat killed B.abortuselicited strong TH1 response against infected by these pathogen,also[25], demonstrated that CD4 Th1 immune response play a major role in the protective host against Brucellaabortus ,however, high levels of IL six in immunized animals in the present study may indicated that activated CD4 Th1 cells stimulated production these cytokines ,these evidence was in consistent with [26].who found that CD4T cells can promote production of IL six.CD 4 T helper play important role in the protective immunity against Brucella infection in addition to cytotoxic T cells [27].

The rseults in current study showed that high levels of serum IL 4 in immunized animals as compared with control positive group but lower than levels of TNF a,, these result may gave indication that IL 4 may play role in immune response against Brucella infection in which both arms of immune responses can play role in protective host against these pathogens ,these idea was agreement with [28] who demonstrated that both type of immune response CMI and antibody play effective role against *Brucella* but CMI are more efficiency in protective host against intracellular pathogens [28] however, TH1 cells involved in the DTH and in CMT while TH2 cells can promote B cells to proliferation and differentiation into plasma production antibodies ,TH1 cells produced INF y,TNFa,IL 2 that mediated the immune related cytotoxic activity a,local inflammation and assist in antibody production ,also all above idea were agreement with present result due to the IL 4 play role in differentiation of Th0 to Th2 cells which produce additional IL 4.[29] that activated B cell and T cells proliferation and differentiation of B cells into plasma producing antibodies as well as decrease development of Th1 cells [30] also it play role in activated alternative macrophages M2 and inhibit classical macrophages and induced decline in the inflammatory reaction [31].

We concluded that killed *Brucellaabortous* antigen can stimulated good cell mediated immune response against *Brucellaabortous* infection of mice.

Study of CD69 upon T-cells for SLE Iraqi Patients

Zahraa Saad Aziz Al-Hasan[1], Qater Al-nada Ali Kanaem AL-Ibady[2], Midean Ali Hussein[3]

[1]Department of laboratory, Neurosurgical Teaching Hospital / Iraqi Ministry of Health, [2]Department of Medical laboratory, College of Health and Medical Technology; Middle Technical University, Baghdad / Iraq, [3]Department of laboratory, Al-Yarmouk Teaching Hospital / Iraqi Ministry of Health

Abstract

Systemic lupus erythematosus (SLE) represented one of the chronic auto-immune multi systemic diseases affecting females more than males especially during childbearing age. A fluctuating nature of SLE disease activity deprive this disease from of any monitoring test, at likewise both of SLE disease activity index (SLEDAI) criteria or even the laboratory analyses do not confirm the disease activity, especially when a patient have normal serological results although during the disease activity (flare). This study done as a case control study, whereas the total sample size included 86 peripheral blood samples, which subdivided into: first the disease group comprised from 68 blood samples voluntary obtained from SLE patients. while the second group included 18 blood samples obtained from healthy individuals (controls) who matched in gender and age with the disease group. however, the disease group were be divided into active group (flare) and inactive group (remission) according to SLE disease activity index criteria by a specialized consultant. This study based on an immunological evaluation of CD69/CD3+ percentages of peripheral blood T-lymphocytes tested as SLE disease activity monitoring marker, owing to that purpose the CD69/CD3+ markers were be isolated from freshly blood T-lymphocytes. moreover in order to getting the best precise for Cluster Differentiation markers percentages CD69therefore were analyzed by Immunophenotyping flow cytometer of multi-color immunofluorescent staining. Whereas the CD69/CD3+ marker ratio can be obtained from data analysis (CY flowsoftware). such ratio set up CD69test as Comparison with SLEDAI criteria, as well as with age and gender factors. whereas CD69% described as early activation marker for T-lymphocytes, so tested for such aim. the results were gave insurance about over expression of CD69T-cells for the active (flare) group. Moreover the most important indicative parameter for disease activity that systemic lupus erythematosus disease activity index whereas CD69/CD3+% has a positive correlation matching with SLEDAI score for SLE disease groups,. Through these results about CD69 which proved as milestoneof SLE monitoring disease activity as independent parameter rather than SLEDAI criteria. Ultimately such results rewarded this study by finding cut off value for SLE disease activity described as CD69/CD3+ SLE activity≥ 21.5000%, within sensitivity71% and specificity 91.7% according to receiver operating characteristic curve. This study proven own aims through of the test named as CD69/CD3+ ratio marker that can be done as more easy, simplest, and accurate singular test instead of various decentralized a huge number of the clinical and laboratory investigations.

Key words: *CD69 upon T-cells, SLEDAI, Flowcytometre, CD3, SLE Iraqi patients.*

Introduction

Systemic lupus erythematosus defined as one of a complex, chronic, inflammatory autoimmune disease [(1)]. That has fickle manifestations follows a relapsing and remitting course. More than 90% of SLE cases affects females [(2)], predominantly at child bearing age [(3)]; with ratio 8:1female –per-male [(4)]. Characterized by impairment within tolerance to the self-antigen and formation of many different auto-antibodies [(5)],as well as the gender especially womenaffected at child-bearing age [(6)]. The chronic sterile inflammation and tissue destruction all these events occur as a result of auto-antigen responsiveness at (SLE) disease mechanisms [(6)]. Thus, T-lymphocytes have a positive correlation with (SLE) Disease Activity Index (SLEDAI) score [(7)]. The

T-cell receptor (TCR) is a complex of total membrane proteins essentially contribute in T-cells activation as a response to induced antigen, such antigens presented in the context of the MHC molecule by APCs. The probability of the increasing CD 69% on T-lymphocytes can be as pure reflection of the increasing CD3 popularity in SLEpatients [8].Already CD69 was described as earliest induced marker on the T-lymphocyte surface after TCR/CD3 complex activation, this expression and appearance of CD69 on plasma membrane of the activated lymphocytes [9]. The expression of CD69 on T-cells surfaces at peripheral blood may give novel insight indicator about monitoring of early activated T-cells population leading to level of T-cell mediated immune responses can also be expected in the body [10].

Materials and Method

-Study population: Whole samples population of such study were 86 individual samples subdivided into first part Disease group that included Active group and Inactive group their samples obtained from both of In-patients and out-patients whom attended AL-Yarmouk Teaching Hospital. As well as patients who attended Al- Al-Karama teaching hospital. and second part of the study wasHealthy group obtained from selected 18 healthy individuals. During the period between October/2017 to June/2018.

(a) Disease group:it wassubdivided according to SLEDAI into:

(a1) Active group (disease flare): The samples were being obtained from 32 patients; 1male and 31females with aging ranged13-60years systemic lupus erythematosus (SLE) patients diagnosed according to disease activity assessed with SLEDAIby specialized physicians.

(a2) Inactive group (SLE remission): these Samples were obtained from 36 patients; 3 males /33 females with aging ranged 13-60years diagnosed by the specialized physicians as SLE patients within remission status according to (SLEDAI).

(b) Healthy control group: The samples were being obtained from the 18 healthy Individuals 2 males, 16 females their age ranged 13-60years volunteer after take their conceptions.

Samples collection: All samples were be collected at the same manner from each individual, which described as 2.5ml of whole venous bloodhave been collected under sterile conditions then it was poured into heparin tube for CD3 & CD69 flow cytometric analyses.

The preparedantibodies againstCD3 marker was mouse IgG1 conjugated with FITCwhile suchprepared antibodiesagainst CD69 marker were mouse IgG1 conjugated with R-PE, Ultimately both markers were be diagnosed by BD FACs™ brand flow cytometer.

Flow cytometer: one improved table flow cytometer (Cy Flow) instrument used for detecting and analyzing of T-lymphocytes CD3 and CD69 markers, that must be equipped for appropriate fluorescence laser excitation at 405nm, 488nm, and 635nm with appropriate software (Cy View) software for data acquisition as well as analysis.

Flow- cytometer kits: I- CD3(SK7) monoclonal mouse anti-human, **II-**PE Mouse Anti-Human CD69Becton, Dickinson and company BD Bioscience, BD Bioscience Pharmingen™/USA.

Procedure:20 µl were used for both of CD3 fluorochrome- conjugated monoclonal- antibody and CD69 fluorochrome-conjugated monoclonal antibody then were added to 100µl of freshly whole blood in 12x75-mm capped polystyrene test tube;at the sametime. The tested sample was thoroughly vortexthenmustbe incubated 15-30 minutes in the dark place at room temperature 20°C-25°C.Anyway about 2µl of 1x BD FACS lysine solution also were added after incubation, then thoroughly vortex and incubated for 10 minutes in the dark place at 20°C-25°C. whereas tested sample was centrifuged at 300g for 5minutes. Washing 3times by adding buffer solution, yet supernatant were discharged. Finally2µl from (FITC) solution were addedto thesample. the samples were tested byPartec Cy Flow® instrument; then the tested results were displayed on data show within a special program named as (Cy View software).

Statistical analysis: Analyses of data were carried out using the available statistical package of SPSS-24. Data were presented in simple measures of frequency, percentage, mean, standard deviation, and range. The Students-t-test was used for difference between two independent means or Paired-t-test for difference of paired observations or ANOVA test for difference among more than two independent means. Statistical significance was considered whenever P value ≤ 0.05[11].

Findings

Frequency of CD69/CD3^{+}T-cells % Expression among this study groups

The distribution of such study groups displayed on Figure 1 explained the distribution of tested samples within each group according to CD69/CD3^{+}% of peripheral blood.

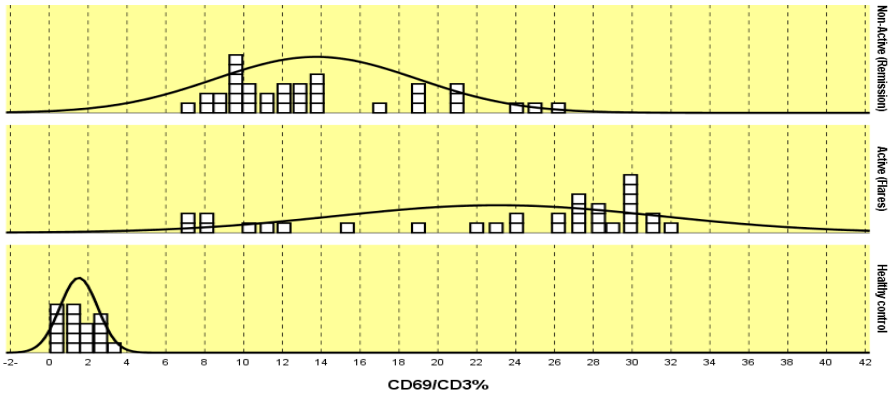

Figure1: Distribution of CD69/CD3^{+} ratio means± SD for studied groups within lighting highly significant differences among studied groups.

Comparison ofCD69/CD3^{+} frequency for the studied groups according to age and gender

Table1 shows the frequency of distributed groups according to age and gender with CD69 T-cells mean ±SD as a monitoring marker for SLE disease activity. the most highly significant means and standard divisions with age group <30 years for active group mean ±SD=26.80±0.34, likewise inactive group mean ±SD=11.56±1.83, finally healthy group mean ±SD=1.73±1.47. the tested marker CD69/CD3^{+}% pointed mean differences between male/female for each studied groups with highly significant differences p value 0.0001, P≤ 0.05.

Table1: CD69/CD3^{+}% frequency among studied groups as comparisons depending on age & gender

Parameters Active (Flares) Mean ±SD (Range)		**CD69/CD3^{+}%**			
		Non-Active (Remission)	**Healthy control**	**P- value**	
		Mean ±SD (Range)	**Mean ±SD (Range)**		
Age (years)	<30	26.80±0.34 (26.41-27.0)	11.56±1.83 (9.86-13.50)	1.73±1.47 (0.47-3.34)	0.0001#
	30--39	25.57±3.91 (19.0-30.0)	11.98±3.32 (6.95-19.0)	1.31±0.46 (0.92-1.82)	0.0001#
	40--49	20.01±9.84 (7.45-32.0)	13.80±5.61 (8.39-26.0)	1.52±1.21 (0.35-2.91)	0.0001#
	=>50	25.60±9.36 (6.83-31.14)	16.32±6.41 (8.36-25.0)	1.52±0.78 (0.25-2.38)	0.0001#
Gender	Male♂	25.34±	15.96±5.63 (9.89-21.0)	1.63±0.07 (1.58-1.68)	0.083
	Female♀	23.33±8.39 (6.83-32.00)	13.53±5.21 (6.95-26.0)	1.50±1.04 (0.25-3.34	0.0001#
*Significant difference between two independent means using Students-t-test at 0.05 level.					
#Significant difference among more than two independent means using ANOVA test at 0.05 level.					

CD69/CD3^{+}T-cells ratio frequency among studied groups according to SLE disease activity index scores

the correlation between CD69/CD3^{+}%T-cells with SLEDAI scores showed no shared points among the studied groups which displayed on Figure 2 follows:

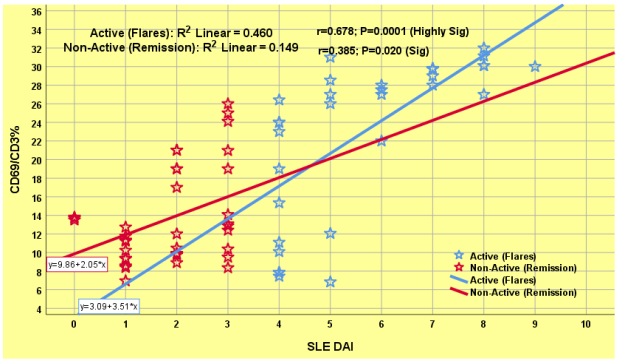

Figure 2 : Linear Regression of CD69/CD3^{+} depending on SLEDAI scores for each of SLE active group that indicated highly significant positive correlation while SLE in active g group low significant positive correlation.

Speculation sensitivity and specificity for CD69/CD3+T-lymphocytes of peripheral blood ratio marker according to ROC curve

According to Receiver Operating Characteristic (Roc) curve CD69/CD3+ ratio giving sensitivity 71.9%while marked specificity 91.7% both in at SLE flare group CD69/CD3+ ≥ 21.5000 % which considered as cut off SLE disease activity ratio.

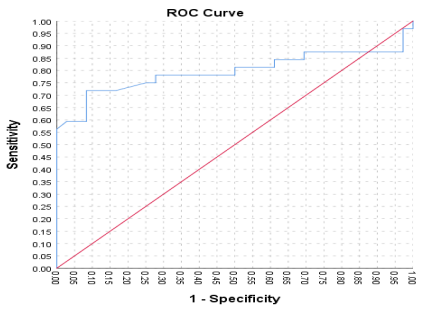

Figure 3: Receiver Operating Characteristic (ROC) curve indicating fundamental area under CD69/CD3+ curve.

Discussion

This study detects SLE disease age ranged from 21to 59 years among samples of SLE disease group patients. These results agreed with Al-Haidary was records the peak range of SLE Iraqi patients from20to69 years[12], while the range 14-61 years was recorded by Al-Saady [13], and Noori *et al*. reported the mean age of Iraqi SLE patients was±SD=27.8± 10.7[14]. also, This study results corresponds with Arabic researches about SLE disease like Al Dhanhani *et al*. who reported the Arab United Emirates mean age was ±SD=28.6± 12.4 years[15]. Moreover Ku *et al*. referred to range of Chine's' women age was 9-40[16]. actuallythis results agreed with Noori *et al*. who reported the percentages of the males 2.0% , and females 98% [14].these results pointed thecut off scorefor diseaseactivity was ≥4score. Whereas inactive group patients pointed at less than or equal 3 score ≤3 according to this study. However Bonelli *et al*. who reporting that the score of their patients was higher than usual score because they were have lupus nephritis ≥6 score, but also they reported about all previous studies opinions which considered the lower cut off disease activity at >3[17]. Compagno who reported there was a significant correlation between SLEDAI score and lupus nephritis[18]. Furthermore this study provides the percentagesbout some Iraqi SLE patients depending on SLEDAI scores. However there is no Iraqi study matched with SLEDAI scores% results. the current pointed highly significant correlation with SLE disease activity among groups under study depending on CD69/CD3^{+}T-cells ratio as immunological markerthat played an early inducible marker for T-lymphocytes activation and migration according to Radulovic *et al*. [19]. our results approved with Martin *et al*. who ensured that CD69 considered as early activation receptor within an intrinsic differentiation program where determined immune inflammatory process in SLE patients [20]. Whereas the previous researchers results corresponds with the current study, like Su *et al*. and Syh.Jae *et al*.[10,21].Finally, the previous researchers supported CD69/CD3+ T-cells % as accurate independent marker for SLE disease activity assessment.Also about American females SLE disease activity age ranged 20-30 years by Weckerle and Niewold [22]. Moreover Ku *et al*.claimed that optimum activity age was 28± 4.96 years[16]. Furthermore, although that SLE disease mostly effects females than males, which may be due to immune system differences by Weckerle and Niewold [22],Actually, SLE disease activity index consider as an essential requisite for CD69/CD3+% T-cells evaluation test whereas successfully signify highly correlation with its scores reached to mean ±SD >30± % at 9 score. also disease activity was assessed by measuring SLEDAI scores, the weighted average of SLEDI scores>10" by Kakati *et al*.[23]. So according to SLEDAI scores selection process done accordingto the patients of this study within scores lower than average >10 score in order to investigate the early activation process prior disease flare.Ultimately the ROC test was

gave cut off disease activity value ≥ 21.5000% for CD69/CD3$^+$%. This study suggested that CD69/CD3$^+$ratio can be considered as immunological laboratory test for SLE disease activity control as independent monitoring test rather than SLEDAI criteria. this study was deemed as the first study seeking about CD69/CD3$^+$ T-cells of peripheral blood for Iraqi SLE patients by using flow cytometer which detects cut off SLE disease activity. the conclusion: There is highly significant correlation between CD69ratio with age 21-59 years for female gender.this marker CD69/CD3$^+$% T lymphocytes of peripheral blood may be considered as accurate singular independent monitoring test for SLE disease activity (flare) within cut off value ≥ 22.5%.

Effect of *Fusariumgraminarum* Silver Nanoparticles on IL-10 and IFN-γ cytokines in Mice after Infected by *Leishmaniadonovani*

SabaaTaher Mohamed[1], Haydar Hassan Ghadi[1], Nidaa Mohammed Sulaiman[1], Sura Basil Kamal[1], Hassan Ali Aja[2]

[1]Department of Biology, College of Science, University of Al-Mustansiriyah, [2]Tikirt University

Abstract

Leishmaniasis remains one of the fatal diseases worldwide, and the conventional antileishmanial therapies are toxic and most are expensive. Biological silver nanoparticles possess broad-spectrum antimicrobial activities and could be a future alternative to current antimicrobial agents. In the present study an approach was made to synthesize silver nanoparticles using a *Fusariumgraminarum* fungus.To investigates the efficiency of silver nanoparticles against ***Leishmaniadonovani***compared with pentostam drug *in vivo* by measuring the levels of immune cytokines (IL-10 and IFN-γ) in serum infected mice and treated with AgNPs (0.1 ml / day) and comparisons with pentostam drug (0.01 / day) after 7,14 and 21 days of treatment. The results showed that the level of IFN-γ in grouptreated with AgNPs increased significantly in third weeks, compared withpentostamgroup.While treated the infected mice withpentostam/AgNPs together, gradualdecreaseoccured in the level of IFN-γ in all groups, compared with negative control. Also a significant increaseoccurs in the IL-10 level within 21days when mice were treated with AgNPs compared with pentostam.

Key word: *Leishmaniadonovani*, ***pentostam, silver nanoparticles, IL-10, IFN-γ***

Introduction

Leishmaniasis is one of the vector-borne diseases caused by obligate protozoan parasites of the genus *Leishmania*, they are transmitted by different species of sand flies belong the genus of *Phlebotomine* as extracellular flagellated promastigotes that replicate as an intracellular parasite (aflagellateamastigotes) in mononuclear cells of mammalian hosts[1]. Visceral leishmaniasis is considered as the second cause of mortality and the fourth cause of morbidity after malaria, schistosomiasis and African trypanosomiasis[2]. Pentavalentantimonials are a group of compounds used for the treatment of leishmaniasis. The compounds currently available for clinical use are sodium stibogluconate and meglumineantimonate. The Role of cytokines such as IFN-γ is to activate macrophages and enhance the microbicidal activity of these cells to kill intracellular pathogens through the generation of reactive oxygen species and reactive nitrogen species. IL-10 promotes intracellular infection, including human visceral leishmaniasis, by disabling Th1 cell type responses and/or deactivating parasitized tissue macrophages[3].

Nanotechnology continues to attract significant attention due to its impact on many currently important areas such as energy, medicine, electronics and the aerospace industry. Nanoparticles that possess one or more dimensions of the order of 100 nm or less continue to attract significant attention due to their unique properties in the realms of chemistry, optics, electronics and magnetism[4].

The use of eukaryotic organisms such as fungi, *Fusariumgraminarum* and other species offers considerable promise for large-scale metal nanoparticle production since the enzymes that are secreted by the fungi represent an essential ingredient for the biosynthesis of metal silver nanoparticles has attracted high interest

Correspondence:
drnihadkhalaw@gmail.com

due to their unique and excellent properties in addition to its therapeutic potential for the treatment of a variety of diseases that includes retinal neovascularization and acquired immunodeficiency syndrome due to human immunodeficiency virus [5].

Materials and Method

Silvernanoparticles (AgNPs) preparation:

Silvernanoparticles (AgNPs) preparation according to *Birla et al*.,l[6]methode**.**

Characterizationof nanoparticles

The exact configuration of the, size, concentration, morphology of crystals, aggregation state and even bioconjugation and was measuredby using particle the following techniques:Atomic force microscopy (AFM) (AA-3000, Angstrom, USA), X-Ray diffraction (XRD) (Shemadzu, Japan), Ultraviolet-visible spectroscopy (UV-VIS)(Shemadzu, Japan)[7].

Parasite strain and culture

Leishmaniadonovani was isolated from the bone marrow of an infected child , the strain was obtained from biotechnology center/ AL- Naharin University, it was cultured and maintained by serial passage in NNN media each 8 days and incubated at 26°C.

***Leishmania* antigen preparation**

One milliliter of promastigote culture in stationary phase washed three times with phosphate buffered saline by centrifuge 4000 rpm in 15 minutes then adjusted to concentration 1× parasite\ml.

Animals

Ninety six Male *albino* mice aged between 8-12 weeks, weighing 20-28 gm was obtained from The National Center for Drug Control and Research, housed under standard condition in animal house in the biology department in College of Science/AL-Mustansrya university . Seventy eight mice were infected with 1×10^7 parasite/ml *L. donovani*promastigotes by injectionintraperitonial[9]. Then the groups were inoculated as a follow:

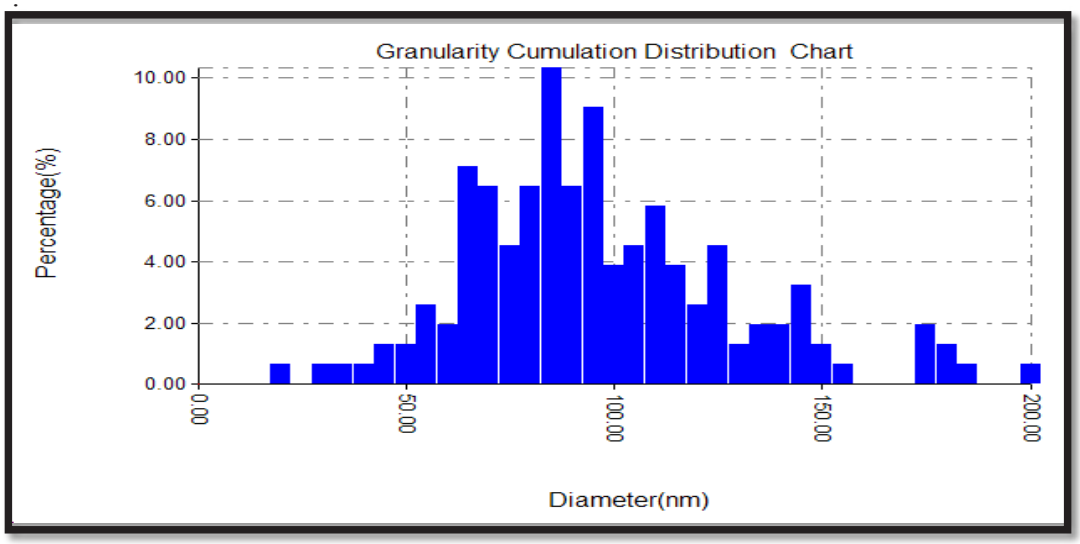
- Group 1 : inoculated orally by stomach tube (0. 1ml/day) normal saline considers as control positive group.
- Group 2 : inoculated orally by stomach tube AgNPs (0.1ml/day) for 21 days considers as an AgNPs treatment group.
- Group 3: injected with (0.01 ml/day) from Pentostam drug by intramuscular each day for 21 days considers as Pentostam treatment group.
- Group 4 : inoculated orally by stomach tube AgNPs (0.1ml/day) and injected with (0.01ml/ day) from Pentostam drug by intramuscular for 21 days consider as AgNPs and Pentostam treatment group.
- Group 5: inoculated orally by stomach tube (0. 1ml/day) normal saline considers asnegative control without infecting by *L. donovani* parasite..
- **Blood collection and animal anatomy**

In the days 7th, 14th, 21th the blood samples were collected from all experiment, mice from facial vein collected 2 ml of blood in the sterile plane tube, then left at room temperature, after 35min centrifugation the clotting blood, obtained clear serum and stored at -20°C until the examination for immunologic test.

Determination of cytokine levels

The serum levels of IL-10 and IFN-γwere analyzed by ELISA (human Systems, Germany). The cytokines were quantified usingmanufacturer's protocol.

Statistical analysis



The Statistical Analysis System- SAS (2012) program was used to effect of different factors in study parameters. Least significant difference –LSD test (ANOVA) was used to significant compare between means in this study[9].

Findings

Detection of the existence of *Fusarium*AgNPs

After adding of silver nitrate ($AgNO_3$) to filtered cell, the color of the mixture changed from colorless to blackish brown compared with negative control remain clear (colorless), the changes in color which confirms the reduction of $AgNO_3$ by *F. graminarum*indicated the presence of AgNPs[10].

Morphology of*Fusarium*silver nanoparticles by atomic forcemicroscopy Determine *Fusarium* silver nanoparticles (AgNPs) sizes and surface morphology were measured ,using the software of the AFM , the images of AFM for *Fusarium*AgNPs in fig. (1)represents particle size distribution, where average diameter is 94 nm. While in fig.(2A,B) is AFM picture in three dimensions (3D) and two dimensions (2D), it explains structural shape for grains,found that the average roughness (Ra) is 9.33 nm and Root mean square (Sq) is 11.6 nm.

Figure(1):Granularity volume distribution chart of silver nanoparticles produced by *F. graminurum*

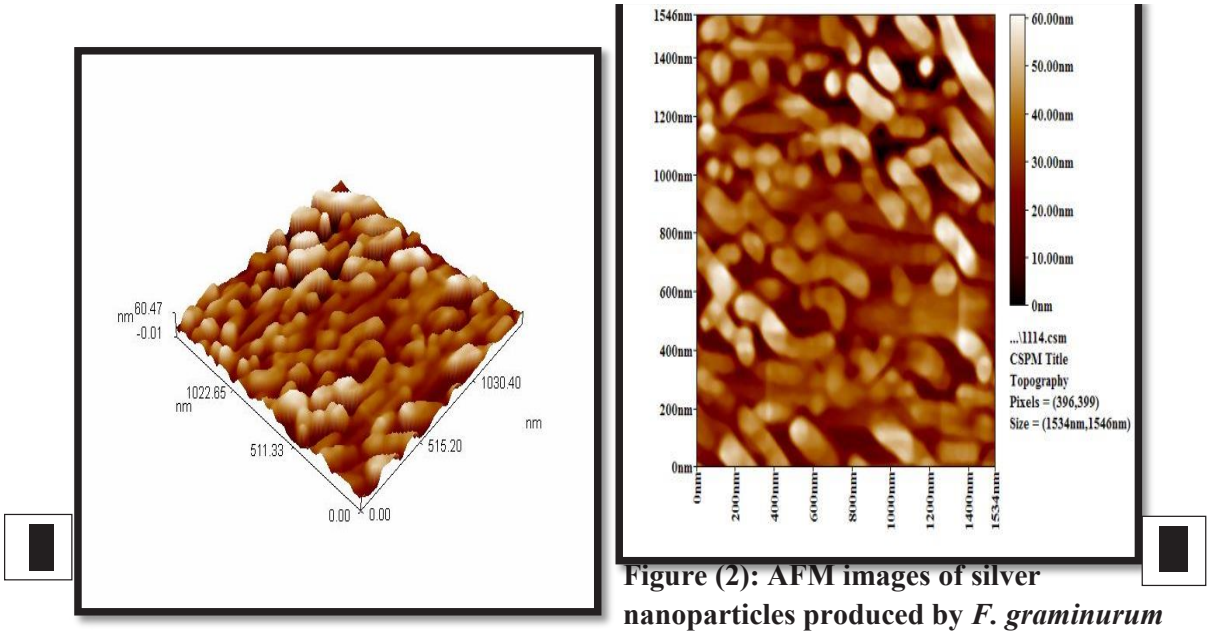


Figure (2): AFM images of silver nanoparticles produced by *F. graminurum* (A) three dimensions 3D and (B) two dimensions 2D

Characterization of *Fusarium*AgNPs by X-RayDiffraction

A typical XRD pattern of *Fusarium*AgNPs as shown in fig.(3), the diffraction peaks at 38.05°, 44.22°, 64.32 and 77.31° were correspond to the (111), (200), (220) and (311) facets of the face centered cubic crystal structure, therefore the average crystallite size was 28.225 nm.

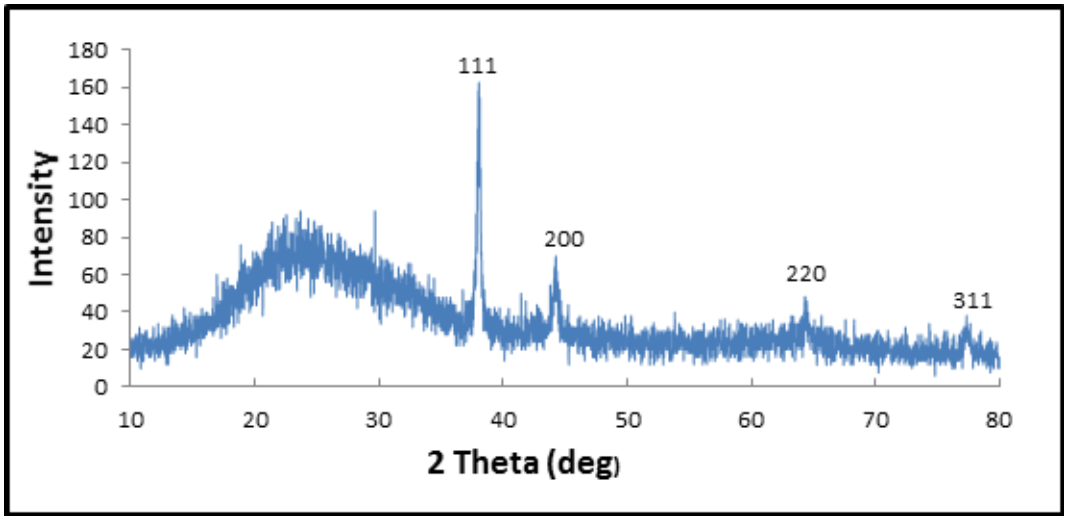

Figure (3): X-Ray pattern of silver nanoparticles produced by *F. graminurum*.

Optical properties of*Fusarium*AgNPs by UV–Visible Spectral:

This technique confirms the presence of *Fusarium*AgNPs by measuring the absorbance of the bioreduced solution at wavelengths between 300 and 800 nm. Extinction spectroscopy of ultraviolet (UV) and visible (Vis) light (UV–Vis spectrum) allows confirming the presence of *Fusarium*AgNPs because of the characteristic plasmon resonance, which showed an absorbance peak at 420 nm, fig (4)..**Figure (4):UV-Visible spectroscopy of silver nanoparticles produced by *F. graminurum***

Determine sera level of cytokines in mice serum

Serum level of Interferon-γ (INF-γ)

After mice are infected with *leishmania* parasite, the level of INF-γ was increased in the three weeks and after treated of these mice with pentostam and *Fusarium*AgNPs observed that the level of INF-γ has increased in all groups compared with the negative control group, shown in table (1) significant differences ($P<0.01$) between all groups compared with control .In control positive group the level of cytokine was elevated from the first week was (183 ± 13.44pg/ml). While the pentostam group was observed to increase occurredin the first week (305.17 ± 40.76 pg/ml). InAgNPs group the level of INF-γ has increased gradually over the three weeks (284.17 ± 42.97Pg/ml , 303.83 ± 51.98Pg/ml and 410.00 ± 10.52Pg/ml)respectively. In P/AgNPsgroup gradual decrease occurred since the first week (284.17 ± 42.97 pg/ml) ,and gradually continues to declinein second and third weeks (218 ± 36.63 pg/ml and169.50 ± 8.41 pg/ml) respectively .

Table 1.The serum level of INF-γin the experimental groups after three weeks (Mean ± SD)

The Groups	Time (day)			LSD value
	7	14	21	
Control(–ve)	115.67 ± 4.80	118.33 ± 5.04	123.33 ± 1.63	18.542 NS
Control(+ve)	183 ± 13.44	239.17 ± 4.35	323.17 ± 14.79	31.602 **
Pentostam	305.17 ± 40.76	301.83 ± 49.94	315.67 ± 61.46	26.524 NS
AgNPs	122.50 ± 8.87	303.83 ± 51.98	410.00 ± 10.52	37.277 **
P/AgNPs	284.17 ± 42.97	218.00 ± 36.63	169.50 ± 8.41	31.842 **
LSD value	42.668 **	47.073 **	61.905 **	---

****a significant difference at P<0.01 , NS: Non-Significant.**
Means having with the different small letters in same column differed significantly.

Serum level of Interleukin–10 (IL-10)

The serum levels of IL-10 in treated groups of the present study were high level in groupspentostam and *Fusarium*AgNPs infected with *leshmania*parasite were (338 ± 16.07 and 467.83 ± 34.43)respectively in the third week. While the level of IL-10 in control positive group was lower level (320.67 ± 6.37 pg/ml) in third weeks compared with other control negative group was (97.67 ± 6.62 pg/ml). As well as in the P/AgNPs group also elevated, but less than other treated groups in the third week (336.17 ± 22.06 pg/ml) as illustrated in table (2). There was significantly different ($p \leq 0.01$) between all groups compared with positive control.

Table 2.The serum level of IL-10in the experimental groups after three weeks (Mean ± SD)

Groups	Time (day)			LSD value
	7	14	21	
Control(-ve)	95.17 ± 2.31	96.33 ± 1.97	97.67 ± 6.62	11.547 NS

**** mean significant difference at P<0.01 , NS: Non-Significant.**
Means having with the different small letters in same column differed significantly.

Disscusion

The synthesis of silver particles by using *Fusariumgraminarum*was observed during change the color of the mixture from colorless to blackish brown, the color change confirmed the formation of nanoparticles,these results corresponding withBawaskar*et al.*[11], Mahmoud *et al*[11] .

This study, the results are near to results of Shafiq*et al*.[12].showed that, the XRD diffraction measured in Ag-NPs resulted in four intense peaks and this further confirms that the Ag-NPs formed in the extracellular filtrate are present in the form silver nanocrystals. Vijayan*etal.*[13] observed that AFM topology is very helpful in revealing the exact size and shape of silver nanoparticles.Jebali and Kazemi[14]reported that highest anti-leishmanial drug was observed for Ag NPs, and AuNPs were in the second level, as well as they found that anti-leishmanial activity of metal nanoparticles is higher than metal oxide nanoparticles that may be due to oxidation capacity of metal nanoparticles, leading to moredamage to membranes, enzymes and DNA.

The results of cytokine indicated an increase occurs in serum level of IL-10 and INF-γduring three weeks post-infection as showed by Kamil*et al*.[15]reported a significantly increased serum level of IFN-γ and IL-10 in VL patients compared to healthy controls, also confirmed by Khoshdel*et a.l*[17] reported thatthe levels of the serum cytokines, IL-10, IL12, and IFN-γ were higher in patients than in family members and control individuals.

Also, in a previous studydemonstrate the elevation of both IFN-γand IL-10 mRNA levels in the lesional environment of thebone marrow in patients with kala-azar before therapy, findings which may be of importance in understanding how thisorganism is able to avoid immune-mediated destruction by itshost macrophages[17].Inactive visceral leishmaniasis, Al-Autabbi*et al.*[18]reported that the immune system is highly activated and produce both the macrophage-activating cytokines IFN-γ and the macrophage-deactivating cytokines IL-10.

IL-10 is able to inhibit Th1 cell and macrophage activation; therefore, higher levels in the sera of VL might be expected, IL-10 also plays an important role in regulation of inflammatory response, and is important for the survival and persistence of the parasite inside macrophages [19]. In other reports showed that, the data favor a role for IL-10 in conditioning the host cells so that they become poorly responsive to even high levels of IFN-γ for intracellular killing [20].

IFN-γ plays an essential role in macrophage-mediated antileishmanial activity, contributing to parasite elimination and the subsequent resolution of infection [21]. Also, IFN-γ cytokine is the main factor in inducing the transcription of inducible nitric oxide synthase (iNOS) and the production of nitric oxide (NO) [22].

Nanoparticles can undergo a series of processes, including binding and reacting with proteins, phagocytosis, deposition, clearance, and translocation. At the same time, nanoparticles can elicit a spectrum of tissue responses, such as cell activation, generation of reactive oxygen species, inflammation, and cell death[23]. A significant increase in the level of IFN-γ was detected in the serum of patients during treatment with pentostam when compared to its level before treatment, this explains that a successful drug therapy were restored T-cell proliferation and IL-2, IFN-γ production in response to *Leishmania*antigen [24].

Conclusion

Silver nanoparticles synthesis from *Fusariumgraminarum*is safety, nontoxic andit can be considered as a new antileishmanial agent. Also*Fusarium*AgNPslead to induce pro and anti-inflammatory cytokines.

Antifungal Activity of *Boswellia serrata* Gum Extracts on Antifungal Drugs Resistant *Aspergillusfumigatus* Isolated From Diyala Patients

OmarD.Abdul Sattar[1], Sahar R.Fadhel[2], Thuraya Kadhim Ismael[2], Anaam Fuad Hussain[3]

[1]University of Diyala, College of science, Department of chemistry Baqubah, [2]Iraq Ministry of Health and Environment, Diyala Health Department, Baqubah Teaching Hospital, [4]University of Diyala College of Science Department of Biotechnology Baqubah, Iraq

Abstract

This study focused on antifungal activity of alcoholic extracts of *Boswellia* gum onthe potent antifungal resistant opportunistic pathogen for humans, *Aspergillus fumigatus*. The antifungals used were: Terbinafine, Nystatin and Clotrimazol.Antimicrobial susceptibility testingof alcoholic gum extracts of *Boswellia* was done by well diffusion methodagainst the mold. Results showed that Boswellia extracts had the ability to inhibit fungal growth *in vitro* and the statistics revealed different inhibition zones gradually increased with the increasing in the concentration of theextract and that acetonic extract was more effective than ethanolic. Confirming the presence of saponins,volatile oils,terpensand phenolic compounds in acetonic extract withphenolic compounds in ethanolic extract.

Key words: *Aspergillus fumigatus, Antifungal resistance, Boswellia extract*

Introduction

Aspergillus is an important pathogen of humans and animals,it is a leading cause of human fungal ailments with *A. fumigatus* as the main causative agent of invasive fungal diseases. *A. fumigatus*[1]. Aspergillosis is the name given to a wide variety of diseases caused by infection by this fungus, the majority of cases occur in people with tuberculosisor Chronic Obstructive Pulmonary Disease [2], but with otherwise healthyimmune systems[3][4].It is estimated that otitis externa make up 9 to 25% are caused by fungi, calledfungal otitis or otomycosis[5][6].However, antifungal resistance occurrence has to be considered independently for each antifungal class, fungal genus and epidemiological data regarding incidence of distributed worldwide [7].Despite improvement of antifungal therapies over the last 30 years, the phenomenon of antifungal resistance is still of major concern in clinical practice[8].Since the thousands of years, people used to take plant originated products and the natural extracts prepared from various species of *Boswellia* tree for the treatment of several diseases[9][10].Many previous studies indicated itsbiological therapeutic effectssuch as inflammation and antioxidant[11][12][13],anticancer[14] and antimicrobial[15].

Many of studies indicated its significant antifungal properties against toxigenic Aspergillii [16][17].We need the medicinal plants as antifungal agents instead of using artificial drugs which have several toxic and side effects. Therefore, the objective of this study was to estimate antifungal potential of *Boswellia* against selected mould species.

Materials and Method

Preparation of Plant extract: The gum resinsof *B. serrata*waspurchased from local market ofBaqubah, Diyala, Iraq. The extraction was prepared according to Matny*et al*[18] with slight modifications using Lyophilizing technique. The two extractswere stored in a well-closed containers, protected from light and kept at 4°C until use.

Phytochemical analysis: Screening of most secondary metabolites in the crude extracts of*B. serrata*was determined as following:

- Test for alkaloids and terpens was performed according to Njoku and Obi [19].
- Test for saponins, tannins and glycosides was

performed according to*Obasi et al*[20].

- Test for phenolic compoundswas carried out according to the method described byHarborne[21].
- Test for volatile oilsperformed according to Indian Herbal Pharmacopoeia[22].

PreparationofPlantExtractConcentrations: Stock solutions (200mg ml^{-1}) was prepared by mixing 2 g of the dried extract with 10 ml ethylene glycol50% (solvent used as diluents solution), and then it was sterilized with millipore filter membrane (0.22 µm),then different concentrations of(100,50)mg ml^{-1}were prepared by mixing known volume from the stock solution with ethylene glycol.

Antifungal drugs Preparation: The commercially available samples of antifungal drugswere:Terbinafine, Nystatin, and Clotrimazol. Each antifungal was prepared as an initial concentration ‘’working stock solution’’ of 10 mg ml^{-1}[23]

Preparation of tested microorganism: Twenty samples were collected from patients with Aspergillosis Otomycosis in Baqubah Teaching Hospital (Diyala Governorate). The samples were 8 of sputum, 2 nose swabs and 10 ear swabs. All specimens were collected from January to April 2018. The samples were examined directly under the light microscope objectives to detect fungi and their septate hyphae [24]. Then culturing on the Sabouraud dextrose agar to observe the macroscopic characteristics and the isolates were identified to the species level on the basis of microscopic characteristics[25] [26][27][28]. Fungal inoculum was prepared by the use of haemocytometer to count fungal conidia[29].

The activity of the antifungal drugs and plant extracts*in vitro*: Antifungal susceptibility testing was done by agar well diffusion method to detect anti-fungal effect for all *A. fumigatus* isolates towardantifungals(Nystatin, Terbinafine and Clotrimazol),andthe extractswere performed against only the antifungal drug resistant isolate. All tests were in triplicateusing the solventethylene glycol [30].

Statistical Analysis: The results were analyzed by using one-way variance analysis (ANOVA). All of our analysis were done by SPSS-18. Differences at $P < 0.05$ were considered statistically significant.

Findings

Physical and PhytochemicalInvestigation: Acetonic extract of *B. serrata* was viscous to colloidal texture with tan to brown color, not soluble in water and the percentage was14% of crude gum resin. While ethanolic extract was powdery texture with pale yellow in color, less soluble in water and the percentage was 6% of crude gum resin. Phytochemical analysis for active compounds was illustrated in table 1.

Isolation and Identification of *A. fumigatus:* Cultural and microscopic examination illustrates that the infections belonged to the fungus *A. fumigatus* in 20 specimens were 13 isolates. Figure (1) show the microscopical and cultural feature of the fungus.

The Sensitivity of *A. fumigatus* o the antifungal drugs*In Vitro*:The isolates were a variable in their sensitivity to drugs (figure 2). However one isolate was resistant to all antifungal drugs.

Antifungal activity of the plant extracts *In Vitro:* As shown in figure 3, the results of statistical analysis showed significant ($P \leq 0.05$**)** inall concentrations (200,100 and 50 mg ml^{-1}) of the acetonic extract of *B. serrata*gum resin which showed inhibitory activity against*A. fumigatus* incomparison to the ethylene glycol (control).While ethanolic extract shows the inhibitory activity at high concentrations (200 and 100 mg ml^{-1}) only with less efficient incomparison to acetonic extract(Figure 4).

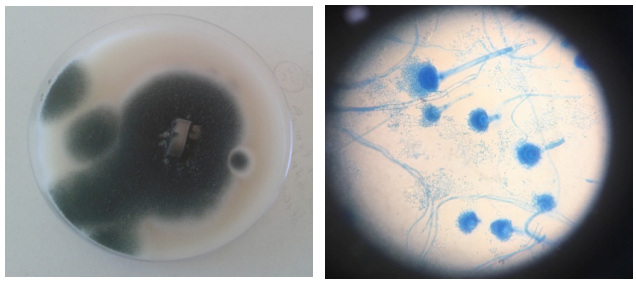

Figure 1: (a) *Aspergillus fumigatus* grown on SDA at 37°C after 7 days of incubation,(b) Microscopic feature of *A. fumigatus* stained with Lactophenol cotton blue.

Discussion

Phytochemical screening of many active materials of *B. serrata*acetonic extract showed positive. While, ethanolic extract was positive for phenolics only(Table 1).Many of studies were made about the chemical composition of this plant. In 2009,Upaganlawar and Ghule[31]isolated boswellic acid and many of terpenoids. Al-Ogaili *et al*[15], showed positive results for saponins and negative for phenolic compounds in on aqueous extract. Another studies showed that resins chiefly contain higher terpenoids which are mainly the former of its pharmacological effects [9][32].Methanolic and ethyl acetate extract of this plant showed the presence of tannins, phenols, steroids, flavonoids, and saponins [33].Venkatesh *et al*[34]extracted the essential oil from this plant. Study the plant extracts by polar solvents such as alcohol (acetone or ethanol) provided more consistent antifungal activity compared to those extracted by water; this might have resulted from the lack of solubility of the active constituents in aqueous solutions[35]. Further trials using solvents of various polarities will explore the effects of solvent composition on extract efficacy. While, alcohol extract showed some degree of antifungal activity. Therefore, Ethylene Glycol used in this study as a solvent, it is chemically colorless, odorless and possessed sweet taste alcohol used as solvent or co-solvent offers wide range of advantages such as; biocompatibility, biodegradable, stable, hygroscopic, non-toxic and more importantly water-solubility, it possess fungistatic properties thus acts as preservative [34]. In the present study, Ethylene glycol solution was used as a solvent for crude alcoholic extracts and to investigate the inhibitory activity of the crude extracts against antifungal drugs resistant *A. fumigatus*.

Aspergillus fumigatus biofilm associated infections are emerging as life-threatening infection with a very high mortality rate even after antimycotic therapy [36]. In spite of the extensive research dedicated to the

development of new therapeutic strategies, there are only a limited number of available drugs to fight against invasive fungal infections[37]. In this study, the effect of three antifungal agents (Terbinafine, Nystatin and Clotrimazol) on *A. fumigatus* was illustrated in (figure 2). Statistical analysis had shown significant difference at a level of probability P (< 0.05) between antifungal drugs and *A. fumigatus* isolates. This result was agreed with Brinboum [38]who concluded that Terbinafine was characterized by its impact on enzymatic activity of pathogenic fungi.Mechanisms leading to Clotrimazol (azole) resistance may be decrease in azole affinity for their target, increase in azole target copy number, alteration of ergosterol biosynthetic pathway after azoles action, and decrease in intracellular azole accumulation [37]. In this study, by increasing the concentration of alcoholic extract, inhibition zone around the well was increased (Figure 3 and 4). Antifungal activity of *B. serrata* may be due to the active components which are present in plant gum extracts (Table 1);Sharma *et al*[33] found that methanolic and ethyl acetate extract showed good antifungal activity against *A. niger* with a zone of inhibition 20 to 22 mm.Venkatesh *et al*[34]showed that the essential oil of *B. serrata* had fungicide activity against *A.fumigatus* at MIC (0.15 µg ml^{-1}) and MFC (5 µg ml^{-1}). Cowan[39] showed the mechanism that thought to be responsible for toxicity of plants active materials to microorganisms, he suggested that phenolic compounds mechanism includes enzyme inhibition by the oxidized compoundsthrough reaction with sulfhydryl groups or through more nonspecific interactions with the proteins and there is also evidence for direct inactivation of microorganisms: low tannin concentrations modify the morphology of germ tubes of fungi.

Conclusion

The present study demonstrated that the acetone extract of *B. serrata* hold an excellent potential as an antifungal agent. Further *in vivo* studies are necessary. More importantly there is need for detailed scientific studyto investigate other active compound in addition to essential oils of *B. serrata* that affects in the studied mold.

Conflict of Interest and Authorship Conformation: All authors have participated in analysis and interpretation of the data; they drafting the article or revising it critically for important intellectual content. And finally, this manuscript has not been submitted to another journal.

Source of Funded: This research is self-funded and the authors have no affiliation with any organization with a direct or indirect financial interest in the subject matter discussed in the manuscript.

Ethical Clearance: We undertake to follow the ethical principles and institutional requirements guiding (Baqubah hospital), this research and ensure that they sign the personal declaration of responsibility prior to their isolates involvement in the research.

Prevalence of β-lactam Resistant Klebsiella Pneumoniae Isolates among Clinical Specimensin Baghdad Hospitals

Qasim Obaid Bdaiwi [1], Amal Aziz Kareem [2], Sana'a Noori Hussein[3], Ali Muhsin Ali[3]

[1]Directorate of Education in Babylon, Ministry of Education, [2]Faculty of Health and Medical Sciences, Medical Technical University , [3]Department of Biology, Collage of Science, Mustansiriyah University, Baghdad, Iraq

Abstract

One hundred forty three of *Klebsiellapneumoniae* isolates had been collected from some hospitals in Baghdad city. The isolates were taken from different clinical specimens.Antimicrobial susceptibility test was carried out towards fifteen antimicrobial agents by using Vitek2 system with Antimicrobial susceptibility test cards. The results of antibiogram showed that the local isolates were possess highly resistance towards most antimicrobial agents under study. The high resistance wastoAmpicillin while the low resistance was to Imipenem.Two methods were used for detection of Extended Spectrum Beta Lactamases (ESBLs) production; first methods by using of Vitek2 system,thesecondmethods by using of polymerase chain reaction (PCR) technique to discoveryESBL encoding gene *bla*CTX-M-1-all gene. The results revealed the prevalence of ESβL encoding genes in local isolatesof*K. pneumonia(bla*CTX-M) 93.1% oftheisolates while 6.99% isolates were not harbored this gen.

***Keywords**: KlebsiellaPneumoniae*, Resistant, β-lactam, ESβL,Cefepime,Imipenem, *bla*CTX-M, gene.

Introduction

Klebsiellapneumoniae is the most clinically pertinent Klebsiella species and is in charge of over 70% of human contaminations because of this genus[(1)]. In humans, *K. pneumonia*frequently colonizes the gastrointestinal tract, skin, and nasopharynx and is an imperative reason for genuine network beginning contaminations, for example, necrotizing pneumonia, pyogenic liver abscesses, and endogenous endophthalmitis[(2-3)].

The expanding predominanceof antibiotic obstruction and the absence of new antibiotic drug improvement has progressively decreased the treatment choices for bacterial diseases[(4-5)]. Extended-spectrum β-lactamases (ESBLs) keep on being a noteworthy issue in clinical setups the world over,resistant microorganismare developing worldwide as a danger to good result in the treatment of basic diseases in medical clinic settings. Amongst the wide exhibit of antibiotics, β-lactamis the most broadly utilized agents. Creation of β-lactamases is the greatest common cause of resistance to β-lactam antibiotics[(6-7)]. theproduction of β-Lactamase enzymes by the microorganisms hydrolyzedthe β-lactam ring amide bond. In latest years, there has been an growth in the rate and prevalence of ESBL producing infectious diseases. Two hindered or more types of extended spectrum β- lactamases (ESBLs) have been establish worldwide[(8)]. β-Lactam antibiotics are commonly used in the handling of infections caused by *K. pneumonia*. Medicinal isolates of this bacterium are disreputable for protecting a widespread range of β-lactamases and are obviously resistant to ampicillin and amoxicillin[(9-10)].

Material and Method

isolate collection

More than (392) clinical samples of *K. pneumoniae* isolates ware collected from some hospitals in Baghdad city from the period between October - December 2017. The isolates were taken from different clinical specimens including: sputum 12(8.39%) isolates, ear swabs 15(10.48%) isolates, burns 27(18.88%) isolates, blood 39(27.27%) isolates and urine 50(34.96%) isolates. Conventional methods (standardized biochemical methods) and Vitek2 system were used to identify the isolates.

Antibiotic susceptibility testing

The isolates were tested for 15 antimicrobial agents (Imipenem, Levofloxacin, Tazobactam, Ciprofloxacin, Nitrofurantoin, Clavulanic acid,Tobramycin, Gentamicin, sulbactam, Cefepime, Ceftazdime, Ceftriaxone, Sulfamethaxazole, Cefazolin and Ampicillin) by using of Vitek2 system with antimicrobial susceptibility test (AST 69) cards.Vitek2 system with the using of (AST69) cards was used for phenotypic detection of ESBLs production.

DNA extraction

Genomic DNA was extracted by (Geneaid GBB100) kit. DNA extraction was done according to the company instruction. Nanodrop framework was utilized to assess DNA fixation and immaculateness . Extraction DNA was stored at -20 ºC for PCR assay[11].

PCR Reaction Condition

MonoplexPCR was performed with GoTaq Green Master Mix. The primer which used to detect ESβL encoding gene was *blaCTX-M-1-all* (table 1). PCR mixture was set up for amplification of ESβL encoding gene *blaCTX-M-1-all* in a total volume of 25 µl contained within 12.5µl of Go Taq Green Master Mix, 4 µl of template DNA, 1 µl of the primer (10 picomole/ µl) and7.5 µl sterile nuclease free water.DNA amplification was completed with the accompanying warm cycling (initial denaturation 95 °C for 6 min, 35 cycles of amplification : denaturation 94 °C for 40 s, annealing 57 °C for 40 s, extension 72 °C for 50 s and final extension 72 °C for 6 min)[12].

Table 1: Sequences of the primer.

Finding and Discussion

Isolation and identification of *K. pneumoniae*

Out of 392 clinical samples only 143 samples were *K. pneumoniae*depending on colony morphology, Gram stain, biochemical test and Vitek2 system. Isolates ware collected from some hospitals in Baghdad city from the period between October - December 2017. A recent study by Ali and Sana'a (2019) found that Out of (140) clinical samples only (70) samples were *K. pneumonia* isolates[13]. The isolates were taken from different clinical specimens including: sputum 12(8.39%) isolates, ear swabs 15(10.48%) isolates, burns 27(18.88%) isolates, blood 39(27.27%) isolates and urine 50(34.96%) isolates (figure 1) show distribution of *K. pneumonia*e isolates in clinical specimens. The higher percentage was in urine while the lower percentage was in sputum.Study byIkeda*et al*.(14) establishmentof the 130 investigation cases, 68 and 62 cases showed the presence of *K. pneumoniae* in the sputum and urine, respectively[14].

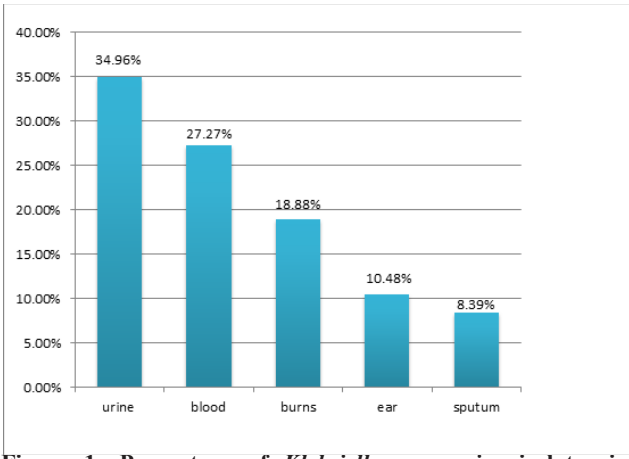

Figure 1: Percentage of *Klebsiellapneumonia*e isolates in clinical specimens

Antibiotic susceptibility

Antimicrobial susceptibility test was carried out towards 15 antimicrobial agents using by Vitek2 system with antimicrobial susceptibility test cardsnumber 69 (AST 69). The results showed that the local *K. pneumoniae* isolates were possess highly resistance towards most antimicrobial agents under

study. The patterns of resistance were as follows: 16.78% forImipenem, 24.47% for Levofloxacin, 26.57% forTazobactam andCiprofloxacin, 35.66% for Nitrofurantoin, 44.05% for Clavulanic acid, 58.04% for Tobramycin, 65.73% for Gentamicin, 81.11% for sulbactam, 84.61% for Cefepime,86.71% for Ceftazdime, CeftriaxoneandSulfamethaxazole, 88.11% forCefazolin, and 100% resistance for Ampicillin. All isolates were resistance toward ampicillin while the lower resistance percentage was toward imipenem as shown in figure 2.Study by Ali *et al*. (15) showed that the imipenem resistance was (58.97%) of *K.pneumoniae*isolates,the highest resistance rate was (100%)for ampicillin, ciprofloxacin was (10.26%) and levofloxacin reached to (7.69%)[15].

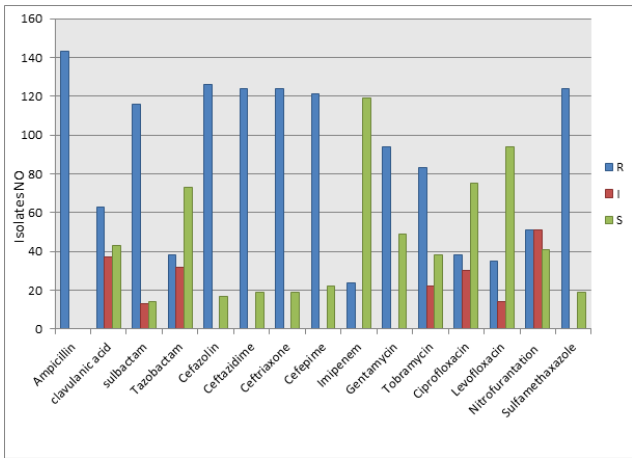

Figure 2: Antibioticssusceptibility for antimicrobial agents (R=Resistance, I= Intermediate and S= Sensitive).

Detection of ESβL encoding gene by amplification of *bla*CTX-M gene

Monoplex PCR technique was used for the detection of the*blaCTX-M* gene. The quick and strict diagnosis of the antibiotic resistance gene in the treatment is very important foravoiding the spread of infections. The present study aim was detectionof existence and prevalence of common ESβLs encoding genes(*blaCTX-M*)amongst143 clinical isolates of *K. pneumonia*. The results as in (figure 3)displayed the presence of *blaCTX-M* gene in 133 (93.1%) oftheisolates while 10(6.99%) isolates were not harbored this gen. while a study by Alyousef*et al.* (16)appear among the 97 *K. pneumoniae* isolates, 47.4% (*n* = 46) isolates demonstrated ESBL creation[16]. Expandingdevelopments of resistance to antibiotics due tocreation of β-lactamases. ESBL are the most across the board systems recognizable in *K. pneumoniae*.

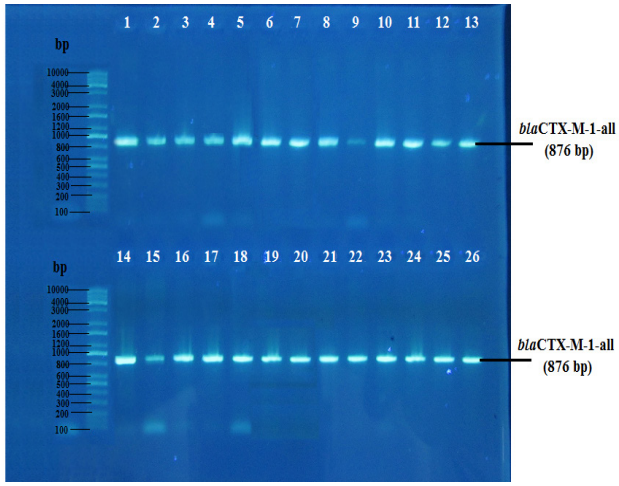

Figure 3: Gel electrophoresis (1% agarose,7v/cm² for 60 min) for PCR products *blaCTX-M-1-all* gene 876 bp lane M 100 bp DNA Ladder, lanes1-26: *K.pneumoniae* isolates. Detection was done on agarose gel (1.5%) at 5 V/cm for 1 hour, stained with RedSafe dye and visualized on a UV transiluminator documentation system.

Conclusion

From this research, it could be concluded that the higher percentage of *K. pneumoniae* isolates in urine and the lower percentage was in sputum,the local isolatesof*K. pneumoniae* were possess a highly resistance towards most antimicrobial agents under this study, all isolates were resistance toward ampicillin while there was low resistance percentage toward imipenem.high presence of *blaCTX-M* gene in theisolates.

Bond-Strength of Porcelain to Nobel and Non-Nobel Casting Alloys

Sabiha Mahdi Kanaan[1], Lateef Essa Al-Jorani[2]

[1]Assistant Professor, Prosthetic Dental Technology, [2]Professor, Prosthetic Dental Technology Department, College of Health and Medical Technology, Middle Technical University (MTU), Baghdad, Iraq

Abstract

Purpose: This study was designed to evaluate the bond strength of porcelain to white gold (Pd-Ag) and Nickel-Chromium (Ni-Cr) alloys. **Material and Method**: Rectangular-shaped specimens (25×3×0.5) mm were cast with white gold and Ni-Cr alloys and used as adherent materials. The Pd-Ag bonding surfaces were abraded with an airborne-alumina particle of 100 µm while that of Ni-Cr abraded with 250 µm. Specimens were fabricated by applying an opaquer and two dentin layer up to 1.1 mm in thickness at different cycling temperature. Bond strength for each group (n=7) was measured and compared statistically (α=0.05). **Results:** There were significant differences in bond strength of porcelain to Nobel and non-Nobel experimental alloys.

Conclusion: Based on the study results, it can be stated that the type of metal to ceramic alloys of different element composition may affect the porcelain bond-strength.

Keywords: *Bond-strength; porcelain; nobel alloy; non-nobel alloy; white Pd-Ag; and Ni-Cr*

Introduction

Metal to ceramic restoration has been widely used in the clinic since the 1950s. It provides a natural aesthetic of veneering porcelain alongside the marginal fit and the durability of metal casting alloy[(1-3).]

Metal-ceramic restoration may contain Nobel and non-Nobel alloys. Nobel white gold alloy made up of gold, silver, nickel or palladium and chromium plating. The color is whitish similar to that of platinum and silver. White gold is considered to be an alternative to yellow gold, silver or platinum. It characterized by superior castability, ductility, corrosion, and malleability. Also, it provides easiness in polishing with high biocompatibility affect, [(4)]. On the other hand, Nickel-Chromium (Ni-Cr) considered as one of the non-Nobel alloys. The major component of the Ni-Cr elements by weight is 90% of Ni-Cr (Ni: 70-80%; Cr: 12-20%), 3-6% molybdenum, 2-6% aluminum, 0.5% beryllium and 4-8% silicon and manganese[(5)]. Generally, the composition of the base alloy plays a major role in influencing on their properties such as surface hardness, Yield strength, and modulus of elasticity, corrosion, color, low weight, elongation and biocompatibility,[(2,6-8)].

In metal ceramic restoration, the demands for aesthetic restoration were increased,[(9,10)]. So, an application of porcelain opaque by mixing with the distilled water was used to block or mask the color of metal coping. This is to improve the natural color expression and to reduce the exposure of metal in the cervical area which aesthetically required. Also, it provides strength to marginal fit and limits the fracture in contactor areas,[(11-13)]. Clinically, the application of ceramic restorations have been increased, and the use of tooth-similar color materials made is possible to stimulate the appearance of the fabrication of highly aesthetic restorations,[(14,15)].

The strong bonding between the metal coping and the veneering porcelain is one of the essential requirements of clinically successful metal-ceramic restorations,[(16-17)]. The metal-ceramic bonding could either be chemically[(18-24)], mechanically[(25-28)] or due to generated forces such as Van Der Waals[(,29,30)] or coefficient of linear thermal expansion (CTE) between the metal and porcelain[(31-35)]. Therefore, this study was designed to assess the bond strength of the white gold alloy to porcelain in comparison with that of many Ni-Cr alloys at different casting treatment.

Material and Method

Material

In this study, the white gold was used as a Nobel alloy (Pd-Ag), while, the Ni-Cr of the different foundation was the non-Nobel alloy. The composition of the study alloys was detailed in table (1)

Table 1: The composition of the study alloys

White Gold Alloy (Pd-Ag) (Degussa, Germany)	**Super 11 Ni-Cr (Argen dental, USA)**	**Bego Ni-Cr (Bego, Germany)**	**Kera NH Ni-Cr (Kera, Germany)**	**EX-3 Ni-Cr (Noritake, Japan)**
Pd: 53.8%	Ni: 61.2%	Ni: 61.4%	Ni: 58.48%	Ni: 62.8%
Ag: 36.3%	Cr: 25.89%	Cr: 22.9%	Cr: 26.85%	Cr: 19.1%
Au: 0.7%	Mo: 11.09%	Mo: 8.8%	Mo: 12.73%	Mo: 7.1%
Sn: 7%	Si: 1.59%	Nb: 3.9%	Si: 1.72%	Ga: 1.9%
Ga: 2%	Mn: < 1%	Fe: 2.5%	Others: <0.1%	
Others: <0.2%	Fe: >1 %	Mn: 0.4%		
	C: >1 %,	Ti: 0.1%		
	Al: >1%			

Method

Sample preparation

A rectangular wax specimen design of (25x 3x 0.5) mm length, width, and thickness in dimension was prepared for bond-strength test,[4]. The wax patterns were connected to the plastic sprue cones at the middle line which in turn sealed to the plastic ring base that mounted on it to be ready to be invested.

The wax patterns were invested in using plastic rings. The vibrator was used to prevent the air bubbles to be trapped within the phosphate-bonded investment material (Rebi dental, Turkey). The investment was mixed and prepared according to manufacture instruction, then left for one hour for the final set.

After plastic ring removal, the set investment cylinder with wax patterns was placed in the furnace for wax burnout at 900°C and then left for one hour inside the furnace. According to the manufacturer instructions, the white gold and Ni-Cr metal alloys then were melted to be directed into the muffle mould entrance using casting centrifugal machine. After casting, the muffle was left to cool at room temperature and then the investment material was removed from the metal sample specimens.

The Pd-Ag specimens were finished using the abrasive wheel and the aluminum oxide (AL_2O_3) airborne-particle abrasion of 100 µm particle sizes. This applied for 20 seconds at air-pressure of 3 bars. To increase the surface area and enhance the porcelain wetting on the surface, the distance was of 20 mm from the metal specimen. On the other hand, the Ni-Cr specimens were abraded using of 250 µm of AL_2O_3 followed by ultrasonic cleaning in distilled water for 10min.

The Oxidizing layer was created for Pd-Ag group specimens while the degassing layer was performed for Ni-Cr groups as seen in figure (1).

Application of ceramic material

The porcelain was applied in layers (Vita-Germany) after mixing with distilled water (Salsal Company, Albasra, Iraq). An opaque (Op2, Vita-Germany) and two layers of dentin material (3L 2.5, Vita-Germany) were mixed with distilled water and applied using ceramic furnace (Ivoclar, Germany), and following the timetable

scheduled in the table (2) and as seen in figure (2). According to[4,36] the final thickness of 1.1 mm of the restoration was achieved by finishing and then finally polished specimen.

Figure 1: Oxidizing layer was created for Pd-Ag group specimens and the degassing layer was performed for Ni-Cr groups

Table 2: Scheduled timetable for application of ceramic to metal alloy study groups

Alloy	**Al_2O_3 Air-borne particles**	**Porcelain phase**	**Starting temperature (°C)**	**Heat rate (°C/min)**	**Firing temperature (°C)**	**Holding time (min)**	**Vacuum start (°C)**	**Vacuum end (°C)**
Pd-Ag	100 µm (20 Sec)	Oxidation	600	-	600	5	-	-

Ex-3 Ni-Cr								

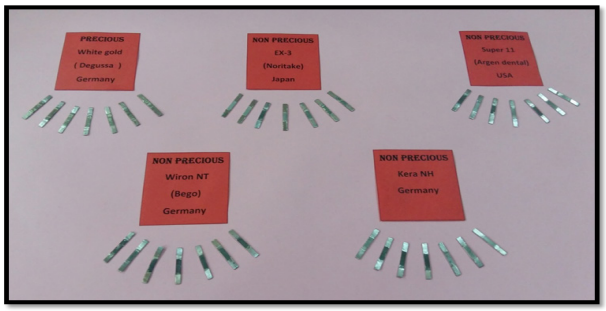

Figure 2: Firing of ceramic to metal alloys

Testing procedures

The specimens were tested using the computer-controlling universal testing machine (Laryee, China). According to ISO 9693 standards, the bond strength was calculated[,37,38].

Statistical Analysis

One-way analysis of variance (ANOVA) test was applied to analyze the study data using the SPSS (V-20),[39]. The statistical analysis revealed a significant difference among the means, and post hoc Games-Howell test was applied as seen in the table (3). Study tests were conducted at a confidence level of 95% (P<0.05).

F	df1	df2	Sig.
2.795	4	30	.044

Results and Discussion

In this study and as seen in the table (4) and figure (3), the bond-strength of the porcelain to the white gold alloy was statistically significant than that of the Ni-Cr alloys (P<0.01). However, statistically non-significant differences were noticed between the Ni-Cr alloys of Kera NH and that of both Bego and EX-3 (P>0.05).

This study was designed to identify the bond strength between porcelain to white gold and Ni-Cr alloys at different heat treatment. Study specimens were prepared by using conventional laboratory techniques, equipment's, and materials used for construction crown and bridge. A universal testing machine was used to evaluate adhesion durability of metal bonded porcelain. The metal surface treated with porcelain to strength the bonding, this test determines the best bond strength from interface adhesion after surface treatment with porcelain to white gold and Ni-Cr alloys.

According to [29], Chemical connection is one the most important factor among the mechanisms of metal to porcelain bonding rather than the mechanical one,[29]. This may influence the metal-ceramic interface by the formation of the oxide layer which in turn affected by the compassion alloy. The chemical bonding of the oxide layer could result from the ionic or covalent bond between the oxides inside the porcelain and those oxides diffused from the metal surface. This may in agreement with,[11,12] as they conducted that effect of bonding by oxides.

Economically, the replacement of gold alloy by an alternative metal-ceramic alloy is on the rise up. A noble Pd-Ag alloy may offer a high biocompatibility alongside physical properties. This could due to less damage or deformity caused by casting. Yet, insufficient studies were introduced for the clinical application of Pd-Ag alloy in the dental restoration. The bond-strength may determine the alloy potential for bonding with porcelain by their oxidation behavior,[20,23,24]. According to the researchers, the nature of the metal-porcelain adherence may be indicated by the form of the oxides during the degassing cycle which in turn reflect the quality of the bond to porcelain,[20-22].

The resistance to bonding failure may be enhanced by the metal-ceramic interface of an appropriate oxide layer. The firing of porcelain may help in completely remove of the thin oxide layer. In addition, a weaker bond strength may notice as a result of low cohesive strength to thick oxide layer,[34,35].

Stable oxide layers in white gold alloy incorporating some elements such as tin may increase the bond strength of porcelain to such alloys.

According to,[16,17] the degassing of Ni-Cr alloy at a high firing temperature above 950 °C may produce excessively thick oxide layer. Regardless the manufacturer standards, alloys may require a different oxidation process instead of the traditional degassing procedure.

In addition, the alloy surface topography may improve the bond strength as well. Metals that treated by airborne-particles could improve the energy at the surface and increase the wettability of the porcelain. However, in the present study reported that the Ni-Cr alloy that sandblasted by 250 µm Al_2O_3 airborne-particle decreases in bond strength than that of Pd-Ag alloy of 100 µm. This could disagree with[,25] which stated that the highest bond strength could be achieved by using large particle to abrade surfaces.

According to[,4,31] the bond strength of flat interface of metal-ceramic can only measure the forces directly imposed on this boundary. As a result, the present study was performed in accordance with the ISO 9693 standards[,37]. The thickness of a metal plate and porcelain layer was clinically acceptable[,36].

Conclusions

Despite the limitation of this study, the results were concluded that the type of metal-ceramic alloys may affect the porcelain bond-strength. Ni-Cr alloy revealed a significantly decreased in bond-strength to porcelain in comparison with white gold alloy.

Textile Wastewater Treatment by Application of Advance Oxidation (AOPs) Process and Recycling for Industrial Uses

Shyamaa A. Mohammed[1], Ahmed Hassan Ali[2]

[1]Chemistry Department \ College of Science, Al Muthanna University, Samawa, Iraq,
[2]Chemical Engineering Department, College of Engineering, Al-Muthanna University, Samawa, Iraq

Abstract

In the present study, the treatment of industrial wastewater and recycling for industrial uses. Photocatalytic degradation of dyes like methylene Blue dye has been used as technique for treatment in a batch reactor under solar light in heterogeneous slurry utilizing various concentrations of commercial powder TiO_2as photocatalysts semiconductors. Also the parameters have been studied catalyst type, catalyst concentration, pH of dye solution and dye concentration at the beginning. Therefore the results show that the best dose of TiO_2 is 4.5 gm/l , and the optimum pH is 6. But the percentage removal of chemical oxygen demand (COD) of the dye solutions were for higher than that of the degradation of dye for the same conditions of catalyst.

While the water quality of treated wastewater depends on a greatextent of the quality for the industrial water supply, nature of thewastes added during use, and the degree of treatment the wastewater has received. Then wastewater quality data routinely measured andreported at the wastewater treatment plant are mostly for treatedeffluent disposal or discharge requirements in terms of gross pollution parameter.

Introduction

Photocatalytic processes to degrade organicpollutantsinwaterbyutilizingcatalysthavebeenthe subject of research recently. Semiconductoroxidessuchas ZnO and TiO_2 have been recognized to be preferable materials for photocatalyticprocesses, dueto their high photosensitivity, non-toxicnature, lowcost and chemical stability, so thesemiconductororphotocatalysisis initiated bythesurfacetrappingofphoto-generatedelectrons(e^-) and holes(h^+), whichinducesinterfacialelectron-transfer reactions withadsorbedsubstrates. However, because of the wide band gap of ZnO and TiO_2[1,3]. A considerable problems in treatment plants caused by dyes presents in textile industry wastewaters since those compounds are complex to degrade by biological methods. Some of the effective chemical and physical methods state a high activity of color removals such as coagulation-flocculation, advanced oxidation and electrochemical methods [4,5]. All these methods have operational problems such as high sludge formation in chemical ways in addition to that more expensive[6,7]. Adsorption can be considered an unattractive method for degradation objective because of the cost of adsorbent and regeneration requirement. However, recent studies specified the possibility of using some natural or low-cost adsorbents for color removal such as wood, ash and soil[8,9].

In the present paper, the photocatalytic degradation of Methylene Bluedye in aquatic solutions using commercial powder TiO_2 as aphotocatalysts has been tested and recycle wastewater has been treated for agricultural uses. The major aims of the study were compared thechange of the following parameters withrespect to the degradation efficiency.Effect of catalyst concentration ;effect of pH ; effect of initial concentration of the dye; kinetic of reaction; and COD removal

Materials and Method

Materials

In present studycommercial TiO_2 powder were gained from Merck Co. (Germany Company), Methylene Blue dye was taken up from Merck (Germany Company)

and was applied without further purification. Distilled water was used fora preparation of different solutions. HCl (0.1 N) and NaOH (0.1 N) were used for change pH of solution.

Instruments

Photochemical degradation was carried out in specially designed insulation walled reaction containers with volume 800 ml under UV-light chamber equipped with 8 UV tubes each of18W (Philips) having a wavelength of 365 nm, so the spectra were taken with UV–vis spectrophotometer (ShimadzuUV-2101 PC) and chemical oxygen demand (COD) was analyzed withCOD meter (HANA HI9146). But constant stirring of the solution was covered by using magnetic stirrers. Then the temperature was kept constant during the reaction time by spreading the water in the photocatalytic reactor vessels.

Irradiation experiments

For 500 ml of the dye solution (25 ppm), photocatalyst was added with different concentration and a suspension was anexhibit to irradiation. While experiments were carried out under UV-light. The aqueous suspension was magnetically stirred over the experiment. At different time periods,an aliquot was taken out with the help of a syringe and then filtered through Millipore syringe filter of 0.45 µm[10,11].

Absorption Measurements

The absorption spectrum was recorded using double beam UV-2101(Shmadzospectrophotometer)compared with distilled water as a reference liquid and the percentage rate of degradation was noticed in terms of change in intensity at λ_{max} of the dyes during irradiation time[12,13]. While the degradation efficiency (%) has been calculated as:

$$\% \text{ Degradation} = [Abs_0 - Abs_t) / Abs_0] * 100$$

Where:-

% Degradation is a percentage of dye disappearance.

Abs_0 is initial absorption of dye (at time = 0 min.)

Abs_t is absorption of dye (at time = t min.)

Therefore the similar experiments haveused different catalyst concentration (2–5 gm/l), to select the bestconcentration of catalyst TiO_2at the same dye concentration of the solution (25 ppm).

Results and Discussion

Effect of Photocatalyst Concentration

The effect of catalystconcentration on the degradation of Methylene Blue(50 ppm) was investigated using commercialTiO_2 from (2 to 5 gm\L) keeping another parameters like pH , temperature , light intensity and dye concentrationconstant. The results in theFigure 1 showed that the degradation percentage increased with an increase in TiO_2 commercial concentration up to (4.5 gm\L for TiO_2). This observation can be explained in terms of availability of active sites on the catalyst surface and the permeation of solar light into the suspension. The total active surface area increases with increasing catalyst dosage. At the same time, due to an increase in the turbidity of the suspension, there is a decrease in UV-light permeation as a result of increased scattering effect and hence the photoactivated volume of suspension decreases. Furthermore, at high catalyst loading, it is difficult to maintain the suspension homogenous due to particles agglomeration, which decreases the number of active sites [14,15]. Also the results also shows the maximum photodegradation for commercial TiO_2 (4.5 gm/L) achieved after 150minute (see Figure 1).

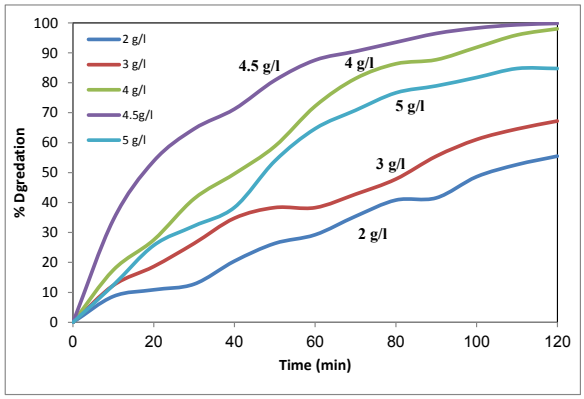

Figure 1 : Effect the catalyst dose of TiO_2 on degradation of Methylene Blue dye

Effect of pH on Solution Treatment

The wastewater is produced at different pH values, therefore, study of pH is very important on photodegradation of Methylene Bluedye. So experiments have been done at different values of pH varying from (4 to 12 for 20 mg/L) dye solution concentration and for the best of catalyst concentration (4.5 g/L)of TiO_2. But the figure 2 shows the percentage photodegradation

of against values of pH. It is clearly increasing in pH up to 11 for TiO_2because increasing in photodegradation activity [16]. Whilest the utilizing of TiO_2 as the catalyst is more appropriate at high pH values with the textile effluent. The interpretation of pH effects on the efficiency of the decolonization is a complex subject because many reactions can be occur to dye degradation such as "hydroxyl radical reaction, direct oxidation by the positive hole and direct reduction by the electron in the conducting band". Therefore the importance of each one depends upon the substrate nature and pH values[17,18].

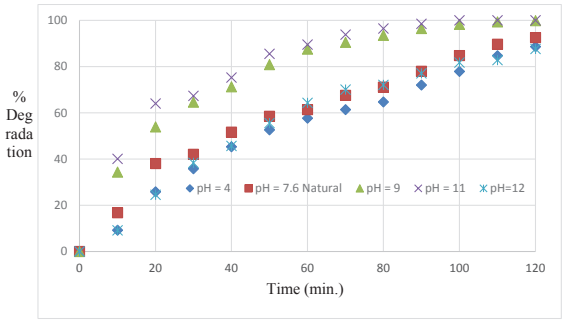

Figure 2: Effect the pH on degradation of Methylene Blue dye

Figure 2 : Effect the pH on degradation of Methylene Blue dye

Effect of Methylene Blue Dye Concentration

The photodegradation of Methylene Bluewas carried out by varying the initial concentration of the dye from (15 mg/L) in order to determine the effect of initial dye concentration on the best catalyst type and dose TiO_2. As the concentration of the dye was increased, the percentage of degradation decreased indicating for either to increase the catalyst concentration or time span for the complete removal. The figure3 depicts the time-dependent graphs of degradation of Methylene Blue at different concentrations of dye solutions(25–100 mg/L) . But in the case of dye solutions of (25 mg/L and 50 mg/L), 100% degradation occurred within 120 and 210minutes respectively. While in case of (75 and 100 mg/L) , the degradation with 240 minutes are 64% and 40%respectively,for the complete degradation of the dye and the percentage degradation further decreased on increasing the concentration of dye. Finally the reason for this behavior was the path length of the photons entering the solution decreases in highdye concentration that means the photochemical reaction is decreased but the number of photons absorbed by catalyst is high at low initial dye concentration the number of photon absorption by the catalyst in lower[19,20].

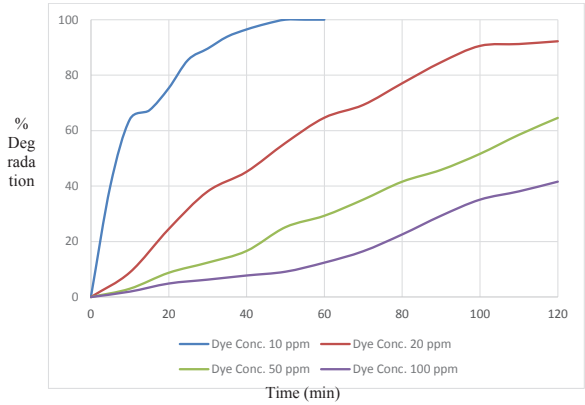

Figure 3 : Effect the dye concentration on degradation of Methylene Blue dye

Kinetic Study

Figure 4 shows the kinetic of the disappearance of Methylene Blue dye for an initial concentration of (50 mg/L). The results show that the photocatalytic degradation of Methylene Blue dye with commercial powder TiO_2concentration (1.3 gm/L)can be described by the first order kinetic model, $\ln (C_0/C) = kt$, where C_0 is the initial concentration and C is the concentration at any time t (y=0.0229x-0.2054). But the semi-logarithmic plots of the concentration data gave a straight line. Then the correlation constant for the fitted line was calculated to be $R^2 = 0.9739$ for commercial TiO_2[21,23].

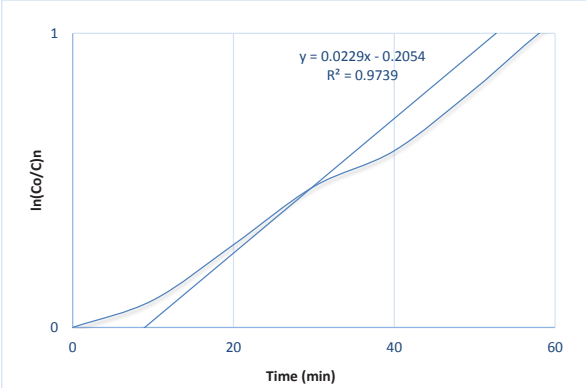

Figure 4 : Kinetic study of the disappearance of Methylene Blue dye

Conclusions

The photocatalytic degradation of aqueous solutions of Methylene Blue dye has been examined with the use of a UV-light-irradiated ZnO catalyst. It has been found that the process leads to decolorization and, eventually to complete mineralization of the dye solution. Also evolution of intermediates and final products on photocatalyst surface and the solution has been

monitored with a variety of techniques, which enable the identification of the reaction pathway, from adsorption of the dye molecule on the photocatalyst surface, to the formation of final products.Finally the photocatalytic degradation followed pseudo-first order kinetics.

Recommendation: We can develop this subject to covered agriculture uses or irrigation

Spa gene Typing among *Staphylococcus Aureus* Isolates in Microbiology Laboratories of Scientific Research Center

Suaad S. Mukhlif[1], Mohammed Taha[1], ZainabT.Hussein[1], Maha M. Taen[1]

[1]Ministry of Science & Technology/ Environment & Water Directorate

Abstract

This study aimed to *S.aureus* typing using gene encoding protein A (*spa* gene typing) in some clinical and environmental samples collected from microbiology laboratories at scientific research center

A total of 50 different environmental and clinical samples were collected from laboratories of ministry of science & technology (25 samples from environmental surfaces (benches, tables, sink,), 10 samples from mobile and 15 clinical samples. during the period from March / 2018 to May / 2018.

Biochemical and morphological characterization tests showed that thirty five isolates were identified as *Staphylococcus aureus* of it 20 isolates from environmental surfaces, 5 isolates from mobiles, 10 isolates from researcher's hands.

Antibiotic susceptibility tests of all isolates towards eight antibiotics were carried out and results showed that many isolates (25 %) were multi-resistant, DNA was extracted by wizard DNA extraction kit and it was amplified by specific primer of polymorphic X region of spa, which were determined by Ridom Staph Type software.

spa typing was carried out on all positive isolates. A total of 14 spa types was detected from 35 *S. aureus* isolates. t008 was the most common spa type (8; 29.6%), followed by t346 (4; 14.8%), t189 (2; 7.4%), t688 (2; 7.4%), t002 (2; 7.4%). All other spa types were less than 1% of *S. aureus* isolates.

The most common types of spa in our region were t008 (8; 29.6%), which indicate prevalence of community acquired *S.aureus*(CA-*S.aureus*) followed by t346 (4; 14.8%) from 27 spa types which were identified in this study.

In conclusion, we have shown that the laboratory environment could be a reservoir contributing to dissemination of virulent *S. aureus*, and The proposed surveillance protocol successfully allowed the detection of *S.aureus* contaminating important high-touch surfaces in a representative microbiology Lab. Frequently contaminated surfaces must be targeted for routine cleaning and disinfection.

Key words *: spa gene,Staphylococcus aureus, PCR .*

Introduction

Staphylococcus aureus is the most common cause of human bacterial infections, it is a major global public health problem causing serious, often life threatening infections in the community and hospital setting that are becoming more difficult to manage with current antibiotics therapy regimens [(1)], *Staphylococcus aureus* is a commensal organism that colonizes nasal mucosa in 25-30% of the healthy human population [(2)], so it considered an opportunistic pathogenic bacterium due to its ability to take advantage of damaged cutaneous layers [(3)].

The pathology of a *S. aureus* infection is often dependent on which toxins are expressed and the virulence factors with which they are associated. It can cause infections ranging from mild skin irritation or a simple rash to severe illness including Toxic Shock Syndrome, abscesses, bone infections, and sepsis [(4)].

The primary cause of lower respiratory tract and surgical site infections and is the second leading cause of bacteremia, pneumonia, and cardiovascular infections.

The severity of infection is often dependent on which toxin genes are present, and the virulence factors associated with them[5].

S. aureus encodes many virulence factors including the surface Ig-binding protein A (*spa*) whose function is to capture IgG molecules in the inverted orientation and therefore prevent phagocytosis of the bacterial cells by the host immune system[6]**.** Genotypes known as "*spa*-types", based on highly variable Xr region sequences of the *spa*-gene, are frequently used to classify strains.

The purpose of this study was to examine the prevalence of *spa* gene of *S. aureus* in microbiology laboratories environment

Materials and Method

Sample Collection

Five microbiological laboratories were selected in ministry of science and technology, each sampling was selected based upon the most common areas touched by hands of staff working in the Lab, 25 samples from environmental surfaces (benches, tables, sink,), 10 samples from mobile and 15 clinical samples. during the period from(March / 2018 to May / 2018)were coded.

Samples Processing

Samples were collected using sterilized Swiffer pads as previously described. was it placed into a Whirl Pack™bag (Nasco, Fort Atkinson, WI), sealed, and added 50 ml peptone water ,then mixing well , after that was added 50 ml Baird Parker broth (2 times concentrations) with tellurite enrichment in 250 ml sterile screw cap jar and incubated for 18-24 hr at 37C. after incubation was inoculated onto Baird Parker agar and manitol salt agar and incubated 24-48 hr at 37C and examined for bacterial growth. Presumptive *S.aureus*(black colonies with clear halos on BPA) and then confirmed bydoing Gramstain, catalase test, coagulase test. Swabs were inoculated onto Baird Parker agar and manitol salt agar.

Antimicrobial Susceptibility Testing (AST)

S. aureus isolates were tested for susceptibility to benzylpenicillin, tetracycline, erythromycin, ciprofloxacin, trimethoprim-sulfamethoxazole, gentamicin, vancomycin, and nitrofurantoin using the Kirby-Bauer disk diffusion method on Mueller Hinton agar in accordance with the Clinical Laboratory Standards Institute standards and previously described methods[7].

Molecular Analysis

All isolates positive for *S.aureus* were selected for molecular testing.16SrRNA gene and nuc gene for the confirmation isolates, PCRwas carried out in a total volume of 25 µL[8]. For spa gene mixture to achieve 50 m LPCR products were run on a 1.5% agarose gel using electrophoresis, stained with gel red at 70 volts for 60 min and visualised under UV light using a gel documentation system .

Primers name	Sequences for (16SrRNA)	Product size(bp)
16SrRNA-R	5`-AGA CCC GGG AAC GTA TTC AC -3`	~800
16SrRNA-F	5`- GTG CCA GCA GCC GCG GTA A -3`	

Primers name	Sequences for (nuc) gene	Product size(bp)
Primer -R	**5′-GCGATTGATGGTGATAC-GGTT-3′**	**270**
Primer -F	**5′-AGCCAAGCCTTGAC-GAACTAAAGC-3**	

Determination of *spa* type was performed using published methods and primers . Based-Upon Repeat Pattern (BURP) analysis to identify *spa* cluster complexes (*spa*CC) was conducted using the RidomStaphType software using default parameters (version 2.2.1; Ridom, GmbH, Wurzburg, Germany).

The sequences of used primer are as follow:

Primers name	Sequences for (spa)	Product size(bp)
spa-1113f	**5'-ATC TGG TGG GGT AAC AACTG-3'**	1100
spa-1514r	5'-CGC TGC ACC TAA CGC TAA TG-3'	

Findings and Discussion

A total of 50 environmental and clinical samples

were collected from Five microbiological laboratories were selected in ministry of science and technology, The overall prevalence of *S. aureus* was 80% (20/25) for environmental samples, 50% (5/10) for mobile samples, 66.6% (10/15) for clinical samples respectively.

The most common places that were contaminated were areas touched showing up at 80% of total samples. This included bench,Sink, keyboards at the Laboratory. As environmental contamination increases, the prevalence of researcher hands carriage also increases [9]. This fact clarifies why these areas were the most contaminated[10]**.** The determinants that may have played a role in the areas that were most contaminated are hand hygiene among researcher [11], frequency of these areas being used, level of contamination among surfaces, and the amount of time and interaction that happens with environmental laboratory by researcher working in these areas[12].

There is a limited understanding of the dynamics and determinants of spread in this setting [13]with little research done in microbiology laboratory environments. Dynamics of *S.aureus* in hospitals have been sought, but the laboratory environment is still poorly understood[14].

Antibiotic susceptibility tests of all isolates towards eight antibiotics were carried out and results showed that many isolates (25 %) were multi-resistant. Overall (n=35), 94.2% (33/35) of isolates were resistant to penicillin, 65.7 % (23/35) were resistant to erythromycin, 60% (21/35) of isolates were resistant to meth prim, 48.5 % (17/35) were resistant to clindamycin , 40% (14/35) of isolates were resistant to tetracycline, 34.2% (12/35) of isolates were resistant to gentamicin, 22.8% (8/35) of isolates were resistant to chloramphenicol, 5.71% (2/35) of isolates were resistant to vancomycin. and 34.2.4% (12/35) were Multi-Drug Resistance (MDR) .

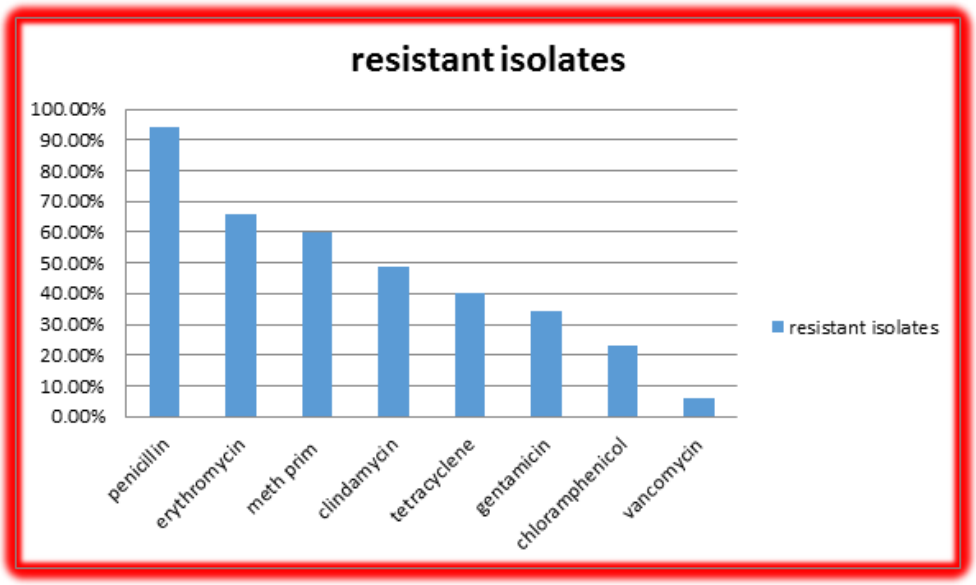

Figure-1- resistant isolates

Molecular characterization

Molecular characterization of all isolates were conducted by amplification of *spa* typing. The spa genewasamplifiedbyPCR forconfirmed *S. aureus* isolates . The control showed only one band of spa gene of 1100 bp (figure-4-)

14 spa types was detected from 35 *S. aureus* isolates. t008 was the most common spa type (8; 29.6%), followed by t346 (4; 14.8%), t189 (2; 7.4%), t688 (2; 7.4%), t002 (2; 7.4%). All other spa types were less than 1% of *S. aureus* isolates.

The most common types of spa in our region were t008 (8; 29.6%), which indicate prevalence of community acquired *S.aureus* (CA-*S.aureus*) followed by t346 (4; 14.8%) from 27 spa types which were identified in this study. (CA-*S.aureus*) appears to be more virulent than (HA-*S.aureus*). the clinical infections associated with it include severe skin and soft tissue infections and necrotizing pneumonia.

The concept of biosafety in laboratory practice is one that is of most important; and as such it must be given top priority at all times, and There is the need for biosafety to be placed in the first stage of issues in laboratory practice in over respective facilities [15]There must be a continuous concerted effort on the part of laboratories to ensure that their testing procedures are safe and in line with international best practices both for the safety of staff and patients and also to safeguard the immediate environment from potentially hazardous pathogens[16], The absence of appropriate biosafety policies and practices is one of the challenges facing researcher in laboratory

Table-1- *spa* gene typing

***Spa* typing item**	**No.of isolates**	**% of isolates with valid values**
t008	8	29.6%
t346	4	14.8%
t189	2	7.4%
t688	2	7.4%
t002	2	7.4%
t045	1	2.8%
t065	1	2.8%
t067	1	2.8%

Recommendation and Conclusion

1- Rapid and accurate determination of the different spa gene prevalence of *Staphylococcus aureus* isolated microbiological laboratories are a great help in understanding the epidemiology of this bacteria in workplace area.

2- detection of bacterial contamination source in microbiology laboratories of all scientific research center using molecular typing.

3- comparison between microbiology and chemical Laboratory related bacterial contamination.

Nutritional Knowledge and Practices amongpregnant Women attending Primary Health Care Center in Baghdad City

Suhair M. Hassoon[1], Muna A. Zeidan[1]

[1]Assist. Prof. (M.Sc), Collage of Health and Medical Technology/ Baghdad, Middle Technical University, Baghdad, Iraq

Abstract

Objective: To estimate the grade of knowledge and practice of nutrition among women of pregnancy. **Method:-**A cross-sectional study carried out in at al- Kadmayha& Bab-almoadham primary health care. The sample was selected by (non probability convenient sampling) and sample size was (100). Data was collected done by interview to take out demographic information. **Results:-** The result display that the multitude of cases were (45%) through age group (20-29) years. As for education (3%) were illiterate As for occupation (61%) were workers and about (39%) housewife. and this research explore that (67%) of gravid female had kindly knowing and about (56%) of gravid women had good practice on feeding pending pregnancy. Conclusions: This project displays the factors that found significant combination with nutrition knowledge.Consist of standard of awareness and nourishment acquaintance through conception and significant convenient relevance between the age group and nutrition habit during pregnancy.

***Key words**: knowledge, practice, factors, nutrition, pregnancy, Baghdad*

Introduction

Nutrition during preconception as long as throughout pregnancy has a central influence on the impactof pregnancy [1]. Balanced and adequate maternal assimilation of macro nutrition and micronutrients guaranty not only the health situation of the pregnant mum, the luxury of the foetus and the newborn but future soundness status of herself (safeguard of life) and her three descent (protection of progeny) [2, 3] .Besides, pauper and extravagant alimentation of gravid women may leading to maternal harm and death[4, 5]. Nutritional imponderables causes fail of the embryo to extent its full development prospect recognized as embryonic growth limitation, which is combined with child together little and long duration complications, mortality and mortality[6, 7].

On the inversion women who are suffering from malnutrition previous and throughout pregnancy are probable to experiment inverse pregnancy consequence. Before pregnancy the woman needs nutrients for growth and maintenance of her body. Good nutrition keeps her healthy. During pregnancy additional requirement for all nutrients occurs to enable the fetus to grow normally in the uterus [8].

Healthy eating behavior in pregnancy support to inhibit pregnancy complications, aids reform from childbirth, efficiently tolerate breastfeeding and also prevents the manifestation of diseases in maturity [9, 10]. The incidence of dietary supplement impairment as an outcome of dietary attitude and modality in pregnancy is major than during pregnancy than at any other juncture of the life period, It was shown that, nutrition knowing was oracular of alteration in dietary habits and health exhortation motivate expecting women to amelioration their food assimilation [11].

It was usually reasonable that the fetus was feed adequately at the expenditure of maternal storage and needs; however, it is becoming clear that this may not always be the case, and that fetal expansion can be less than optimal if certain nutrients are not obtainable during intrauterine life [12]. Therefore the advancement of female validity and other preventive health auspices practice should onset before birth, during intrauterine life and expand by means of various phases of their lives in order to incur their general as well as their reproductive health [13].

Method

Design of the Study:A cross sectional study design (convenient sampling) for pregnant women was conducted starting from (1st September 2018 to 1st of March 2019).

Setting of the Study: The study is conducted atal-Kadmayha& Bab-almoadham PHC centers.

The sample of the study: A convenient sampling, purposive sample of 100 female.The fact was collected by direct interview using special questionnaire to acquired socio-demographic information. (Age, education, occupation……..ect

Scales and scoring:

The items have rated and scored accord to the following patterns:

1. Knowledge scale: three points likert scales are applied for rating the knowing of study sample items as score of three for (correct answer), 2 for (don't know) and score 1 for (false answer).
2. Practice scales: three points are used for rating items as score of three for (always), 2 for (sometimes) and score one for (never).
3. Determination of a grades of the samples knowledge was Divide into three faces (poor, fair , and good)
4. $$\text{Rating Range of score} = \frac{\text{Max-Min}}{3} = \frac{3-1}{3} = 0.66$$
   - Poor knowledge score : 1-1.66 (<55%)
   - Fair knowledge score : 1-67-2.33 (56-78%)
   - Good knowledge score :2.34-3 (>78%).
   - Determination of a grades of the samples practice was be included three grades (poor, fair , and good):-
   - Poor practice e score : 1-1.66 (<55%)
   - Fair practice score : 1-67-2.33 (56-78%)
   - Good practice score :2.34-3 (>78%).

Data analysis by SPSS version 18, x^2 test was appliedfor significance of p value of <0.05 was considered significant.

Findings

Table 1:- Distribution of sample according to age, education level occupation, Receiving information and exporter of input and nutritional habits.

Variables		No 100.	%
Age	<20	17	17.0
	20-29	45	45.0
	30-39	38	38.0
Education level	Illiterate	3	3.0
	Read and write	4	4.0
	Primary	15	15.0
	Intermediate	11	11.0
	Secondary	18	18.0
	College and above	49	49.0
Occupation	workers	61	61.0
	housewife	39	39.0
Receiving information	Yes	94	94.0
	no	6	6.0
Sources of information	Health staff	47	47.0
	Pregnant women	11	11.0
	Friends	15	15.0
	Family and relative	14	14.0

Table (6) display that pregnant women whose receiving information on nutrition had good practice about (96.4%).As for sources of information that good practice of pregnant female who were health staff.

Discussion

The period of pregnancy is remarkable by enormous physiological variation that demands healthy dietary lifestyle option in arrangement to enhance the physical and psychological development of the unborn child [4]. The nutritional state of pregnant woman remains critical in determining healthy pregnancy outcomes. In this study, most of the pregnant women belongs to the age 20-29 years the finding of the current study is agreement with findings reported in Ethiopia [14], and in Nigeria [15], this may be because the extreme ages of reproductive years are well know about nutrition during pregnancy.

And almost about (49%) of them were collage education the finding of the attend study is agreement with findings reported in Nigeria [15],found a highest knowledge score were obtained by women of higher education. Health staff in this study was the source of information for 47% of the pregnant women. The outcome of this research was more than the study proceed in Gambia [16], that showed the provenance of acquaintance for the study participants were 35% being informed on nutrition and feed by their antenatal nutrition care providers .

Although the outcome of this research was additional than the study conducted in Gambia much effort was consequence needed to get better nutrition teaching to adequately supply the necessary information which is crucial to prevent the Intergenerational effect of malnutrition. The result of this study also present that the ratio of mothers who have appropriate knowledge on maternal nutrition during pregnancy was found to be 67%.

As a consequence of this study is similar with the study proceed in Ethiopia [14], in which great than semi of the women in the study had the basic and essential knowledge concerning prominence of nutrition during pregnancy . This result also similar the study completed in Malaysia[17], 65.7 % and Swaziland [18], 67% of mothers had compatible knowledge across maternal nutrition .

Whereas the finding of this research is more than the study finished in Ethiopia[19], 52.5% of mums had

compatible knowledge related maternal nutrition . A this discrepancy might be regarding to socioeconomic factors and cultural difference of the study participants. The peak level of nutrition knowledge demonstrated in our study maybe due to high educational level of the participants .

The finding of this study was also reveal that the proportion of gravid women with good pregnancy specific nutrition practice was set up to be 56%. Similarly the study conducted in Swaziland [18], reported that 51% pregnant women had good practice regarding nourishment during gravid . On the other hand a higher proportion of gravid women with good nutrition workout were notify from another study conducted in Malaysia 74% and Pakistan 65.5% [17, 20].

The potential reasons for these variation might be regarding to the diversity in socioeconomic status, cultural believes, access to nutrition and health services among the study participants. This study shows the age was not important predictor of knowledge of graved female in the research area. The results of the discuss are not comparable with the results from Ghana [21], where women aged 25 to 35 years had the elevated ratio of dietary knowledge, compared with those younger than 25 and older .The probable reason for observed discrepancy may be the difference in socio-cultural of the two-study population with respect to food and exposure to nutrition information during pregnancy.

Educational level, Nutrition information has been specified during pregnancy and the importance of women's knowledge of nutria during pregnancy among the study is similar to the one in Malaysia [22], demonstrated that women with preferable nutritional knowledge are significantly higher in educational level, nutritional formation .

The finding of the research stated that individuals with a higher educational standard had best nutrition knowledge in study may be explained by more access to internet, books and magazines as source of information in work area [22]. This study shows that there was statistically significant company between dietary practices of mothers and age the finding of the present discuss is disagreement with findings reported in Ethiopia [23],found that age had no combination with dietary practices of mothers. This could be explained by different in time and place of the study.

Conclusions

The finding of the study fixed that (67%) of pregnant women had good knowledge on nutrition during pregnancy. The results of the study particular that (56%) of pregnant women had good practice on nurture during pregnancy.

There was a correlation between you and a statistical indication between the level of education, information and nutrition there was significant positive relation between the age and nutrition practice during pregnancy.

Levels of Calcitonin and Procalcitonin in Different Types of Thyroid Cancer in Kirkuk City-Iraq

Maad Mohammed Sulaiman[1], Khalid Nafi Salih[1], Noor Falah Raheef[2], Muhannad Abdullah Alazzawy[3]

[1]M.B.Ch.B.-FIB.M.S. K, Kirkuk General Hospital, Kirkuk health directorate, Kirkuk, [2]M.B.Ch.B.-M.Sc. Biochemistry, Kirkuk health directorate, Kirkuk, [3]Ph.D. Medical Microbiology, Medical Lab Consultant, Children Hospital, Kirkuk health directorate, Kirkuk, Iraq

Abstract

Thyroid cancer is the most common endocrine malignancy, accounting for 1.9% of all new malignant tumors. Thyroid cancer begins in the follicular cell of the thyroid gland. The aim of the study was to estimate the level of procalcitonin and thyroid tests in patients with different types of thyroid cancer. The number of thyroid cancer women under study were 40 women whose ages were between 25-75 years old were included in this cross-sectional study which carried out in Kirkuk city from the period of September 2016 to March 2017. These patients admitted to Kirkuk oncology center. The control group who were matched to the thyroid cancer patients studied, included 30 heathy individuals (blood donors). Blood was collected from patients and control for estimation of serum total TSH, T3, T4, FT3, FT4, and procalcitonin using immunefluorescent technique. The study showed that that the highest rate of increased PCT level was recorded among thyroid cancer patients comparing with the control group (25% *v.s.* 10%), the highest mean level of PCT was noticed among medullary thyroid cancer (8.22 ± 3.16 ng/ml) comparing with follicular and papillary thyroid cancer. The highest mean levels of TSH, T3 and T4 were noted among thyroid cancer patients (16.3± 4.22, 2.01 ± 0.55 and 144.1 ± 45.6) respectively comparing with the control group which showed the least means of TSH, T3 and T4 and with highly significant difference between the two groups. The study showed that the lowest mean of TSH was noted among MTC patients (0.88±0.61) comparing with FTC and PTC patients and the high means of FT3 and FT4 were noted among MTC patients (5.89±0.31and 19.25±2.48) respectively. Table 5 demonstrates that the lowest mean levels of FT3 noted among thyroid cancer patients comparing with the controls (2.99±10.91 *v.s.* 15.91±0.43). It was concluded that there was a highly significant relation procalcitonin and thyroid cancer specially medullary type.

Keyword: *Thyroid cancer, MTC, Procalcitonin, Thyroid.*

Introduction

Thyroid cancer is the most common endocrine malignancy, accounting for 1.9% of all new malignant tumors. Thyroid cancer begins in the follicular cell of the thyroid gland [(1)]. There are 2 types of cells located within the thyroid parenchyma: the follicular cells and the supporting cells (also called the *C cells*) [(2)]. Cancers derived from follicular cells are generally differentiated thyroid carcinomas (DTC). Although these cancers are not usually aggressive, they can eventually mutate into more aggressive variants. They have been traditionally classified as well differentiated thyroid carcinoma, including papillary thyroid carcinoma (80%) and follicular thyroid carcinoma (PTC and FTC, respectively) (10-15%)[(3)]. Medullary thyroid carcinoma (MTC) accounts for up to 5% of thyroid cancers, four in five cases occur as a sporadic and the remaining 20% are part of familial disorders [(4)]. The detection of MTC still represents a challenge and not infrequently MTC is only diagnosed histologically after surgery done for nodular goiter. This is due to several reasons[(1)]. In particular, several technical pitfalls can affect the measurement of serum calcitonin (CT) which represents the main presurgical and postoperative serum marker of MTC; no fixed CT thresholds to diagnose and exclude MTC are available and non-specific increase of CT in several non-thyroidal conditions may exist; MTC with undetectable CT is rarely reported [(5)]. Thus, further markers are

advocated to better manage MTC cases before and after their initial treatment. Traditionally, MTC patients are treated by thyroidectomy and central (with or without lateral) neck-dissection, and after surgery CT is the pivotal tumor marker[7,8]. However, several limits affect CT accuracy. High CT might be observed in C-cell hyperplasia, non-thyroidal neoplasia (neuroendocrine tumors, leukemias, systemic mastocytosis, small cell lung, breast and pancreatic cancer) renal failure, endocrine disfunctions [9]. The aim of the study was to estimate the level of procalcitonin and thyroid tests in patients with different types of thyroid cancer

Material and Method

The number of thyroid cancer women under study were 40 women whose ages were between 25-75 years old were included in this cross-sectional study which carried out in Kirkuk city from the period of September 2016 to March 2017. These patients admitted to Kirkuk oncology center. The control group who were matched to the thyroid cancer patients studied, included 30 heathy individuals (blood donors). 5 ml of blood was collected and placed in plane tubes, left for 30 minutes at 37 °C for clotting and centrifuged at 3000 rpm for 15 minutes, the obtained sera was aspirated using automatic micropipette and transferred to Eppendorf tubes and stored in deep freeze at -20°C for for estimation of serum total TSH, T3, T4, FT3, FT4, and procalcitonin using immunoflurescent technique (Minividas Immunofluorescent, France).

2.2. Statistical analysis: Computerized statistically analysis was performed using Mintab ver 18.0 statistic program. Comparison was carried out using Chi-square (X^2) for dtermination of The *P.* value.

Findings

Table 1 showed that the highest rate of increased PCT level was recorded among thyroid cancer patients comparing with the control group (25% *v.s.* 10%) with highly significant difference between the two groups regarding PCT level. In relation of PCT level with the type of thyroid cancer the study showed that the highest mean level of PCT was noticed among medullary thyroid cancer (8.22 ± 3.16 ng/ml) comparing with follicular and papillary thyroid cancer with significant differences among them(Table 2).

Table 1: Relation of PCT level with thyroid cancer patients and the control group.

Procalcitonin (PCT)* (ng/ml)	Thyroid cancer		Control	
	No.	%	No.	%
increased	10	25	3	10
Normal	30	75	25	90
Total	40	100	30	100

P. value: 0.031

Table 2: Differences of PCT levels among types of thyroid cancer

PCT ng/ml	Thyroid cancer (n:52)		
	Follicular (n:5)	Medullary (n:5)	Papillary (n:30)
Mean	0.49	8.22	0.93
S.D	0.12	3.16	0.45

P. value: 0.008

In Table 3, the highest mean levels of TSH, T3 and T4 were noted among thyroid cancer patients (16.3± 4.22, 2.01 ± 0.55 and 144.1 ± 45.6) respectively comparing with the control group which showed the least means of TSH, T3 and T4 and with highly significant difference between the two groups. The study showed that the lowest mean of TSH was noted among MTC patients (0.88±0.61) comparing with FTC and PTC patients and the high means of FT3 and FT4 were noted among MTC patients (5.89±0.31and 19.25±2.48) respectively, Table 4.

T4	83.5±6.1	144±12.1	128.3±51.7	0.48
FT3	3.44±1.55	5.89±0.31	2.91±1.22	0.37
FT4	7.22±3.18	20.6±2.34	113.2±4.9	0.22

Table 5 demonstrates that the lowest mean levels of FT3 noted among thyroid cancer patients comparing with the controls (2.99±10.91 *v.s.* 15.91±0.43) with highly significant relation, while FT4 was slightly decreased in thyroid cancer patients comparing with the controls (1.83±6.99 *v.s.* 2.61) with no significant difference between the two groups regarding FT4 levels.

Table 5: Relation of FT3 and FT4 mean levels with thyroid cancer and the control group.

Parameters		Thyroid cancer (n:40)	Control (n:30)	*P. value*
FT3	Mean	2.99	15.91	0.0002
	S.D	0.91	0.43	
FT4	Mean	13.83	16.33	0.26
	S.D	6.99	2.61	

Discussion

Procalcitonin is determined by several analytical tests with different immunore active isoforms and fragments which leads to poor comparability of results [7,8]. In addition, even if PCT stimulation may improve its reliability, there is high variability of results from different articles in different populations. For all these reasons, the management of MTC in clinical practice may hide some pitfalls. In example, some MTC patients show a persistent biochemical disease [7,8]. The studies of D'herbomez *et al* [10] emphasize the need of PCT assessment every time the results of CT measurement are unclear. The authors noted the interference between CT and PCT detection in the case of the use of a sensitive immunometric assay. Abilities of procalcitonin and calcitonin to distinguish MTC from other conditions, revealed comparable utility [11]. In previous studies better performance of PCT in comparison with CT have been recorded. Specifically, when the same antibodies were used, all of the commercial PCT assays yielded similar results[12]. One study noticed that the evaluation of PCT as a marker for the initial preoperative detection of MTC[13]. Kaczka *et al* [14] showed that PCT levels were higher in all active MTC patients mean PCT 3.5 ng/ml with active carcinoma which was markedly elevated levels and significantly higher than in the control group.

Antonelli *et al* [15] demonstrated that TSH, and other thyroid hormones levels were decreased among thyroid cancer patients specially in MTC type. This study supports that serum TSH concentration at presentation is an independent predictor of thyroid malignancy. We demonstrated that the risk of malignancy increased in parallel with serum TSH concentration at presentation which is in agreement with previously published data by Boelaert *et al* [16] Although our study included fewer patients when compared with Boelaert *et al* (1500 patients). Fiore *et al* [17] reported in their study that the serum TSH was significantly higher in PTC than in patients with benign nodular thyroid disease, whereas serum concentrations of both free T3 and free T4 were not significantly different, this observation is relevant on clinical grounds to define the risk of PTC in patients with nodular thyroid disease. In this regard, Rago *et al* [18] evaluated possible clinical and biochemical criteria useful to predict the likelihood of thyroid malignancy in patients with thyroid nodules. It stands to reason that if the levels of TSH are elevated in patients with thyroid cancer, it is possible that elevated levels of thyroxine (T4) and triiodothyronine (T3) may also be correlated with malignancy as well. Cho et al has shown that free T4 (fT4) is elevated in patients with thyroid cancer (odd's ratio (OR) of 1.73) [19]. However, the inverse has been shown to be true for total T3 (TT3) by Jonklaas *et al*[20]. Rinaldi *et al* [21] who non-significantly found high fT3 to be indicative of cancer risk. Given that this study has not found any evidence in support of either group, it is possible that it was not sufficiently powered to find such a correlation, or that no relationship exists between the two.

Conclusions

There was a highly significant relation procalcitonin and thyroid cancer specially medullary type.

Conflict of Interest: Non

Source of Findings: Self findings.

Ethical Clearance: This research was carried out with the patient's verbal and analytical approval before the sample was taken. According to this approval, all the samples were collected and the tests were carried out. A copy of the results of the tests was then given to the patients

Detection of Klebicin Gene Cluster from *Klebsiella Pneumoniae* Isolated from Sputumat Baghdad City

Amal A. Kareem[1], Tuqa S. Al-Salmani[1], Mustafa S. Al-Salmani[2]

[1]Middle Technical University/ College of Health & Medical Technology /Baghdad, Iraq, [2]Al-Nahrain University/ College of Biotechnology/ Department of Molecular and Medical Biotechnology/ Baghdad, Iraq

Abstract

Klebicins (bacteriocins) are natural antimicrobial peptides that produced by ribosomes of *Klebsiella* species. The fatal action of klebicin is directed to closely related bacteria to the producing strains. The present study aims todetect theklebicin genecluster in *Klebsiella pneumoniae isolates*.Thirty one *K. pneumonia*isolates were specified by biochemical and microbiological methods, eventually confirmed by API 20E system and VITEK-2 system.Antibiotic susceptibility test was done five antibiotics (Amikacin, Ampicillin, Augmentin, Azetreonam and Tetracycline). DNA extraction was carried out for 31 *K. pneumonia* isolates andklebicingene cluster was amplified from extracted DNA by PCR technique. Results of current study were shown that the resistance rate of studied antibiotics was registered as Amikacin 32.26%, Ampicillin 64.52%, Augmentin 51.61%, Azetreonam48.39% and Tetracycline 41.94%.Amplification results revealed that Klebicin gene cluster was isolated from15(48.39%) of *K. pneumoniae* isolates.

Keywords: *Bacteriocin,Klebicin, Antibacterial agents,Klebsiellapneumoniae.*

Introduction

K. pneumoniae is Gram-negative, non-motile encapsulated rod-shaped bacterium, facultative anaerobic andlactose-fermenting[(1)].*K. pneumonia*is a dangerousopportunistic pathogen due to their role in causing both nosocomial andcommunity acquired infections[(2)].In healthy human, it can be situatedasymptomatically in the intestine, skin, nose, and throat. On the other side, it can cause a large spectrumof infections including mostly pneumonia, wound, soft tissue, or urinary tract infections[(3)].Becausethey survive in the environment and require their competition with other microorganisms, whole bacteria yield antimicrobial peptides act as inhibitor or killer for other competing bacteria. These peptides are included two groups, the bacteriocins and the antibiotic peptides[(4)]. Since 1925, the first bacteriocin in *Escherichia coli* was discovered by Andre Gratia. In 1963, Hamon and Peron were first described bacteriocins of *Klebsiella*[(5)].

Klebicins or klebocins (Bacteriocins)are ribosomally synthesized natural antimicrobialpeptides. These peptides are excreted by most bacteria for killing other bacteria[(6)].They differ from classical antibiotics in having fatal action against only bacteria which are closely linked to the producing strains[(5)]. The action of Klebicin includes several steps for killing the sensitive bacteria. These steps starting with binding of klebicinto specific receptors, which are outer membrane proteins utilized for the entry of particular nutrients then transport through the outer membrane and pass across the periplasm by either the Tol or TonB systems[(7)]. Klebicins would reach their target and their action would do either by forming a voltage-dependent channel into the inner membrane or by utilizing their endonuclease activity on DNA, rRNA or tRNA[(8)].Klebicins were proteins encoded chromosomallyand byKlebocinogenic plasmid[(9)].

The present study aimed to detect klebicin (bacteriocin) genecluster among *K. pneumonia*isolated from sputum in Baghdad city.

Materials and Method

Samples Collection: Thirty one isolates of *K. pneumoniae* were isolated from sputum samples collected from patients suffered from pneumonia admitted at Baghdad Medical City (Baghdad Teaching Hospitaland Gazi Al-Hariri Hospital) during the period

from January/ 2015 to May/ 2015.

Identification of Isolates: The identification of all *K. pneumonia*isolates were carried out by inoculation on blood agar andMacConkey agar for primary identification. They were incubated aerobically at 37˚C for overnight. All *K. pneumonia*isolates were specified to genus and species level based on the standard biochemical and microbiological methods[10]. API-20 E system wasutilized to affirmthe identification[11]. The confirmative testshave been crowned byVITEK-2 System.

Antimicrobial Susceptibility Test: Antimicrobial susceptibility test was achieved against five antibiotics (Amikacin, Ampicillin,Augmentin, Azetreonamand Tetracycline) by using the disk diffusion methodand the outcomes were interpreted in based on the CLSI, 2014[12].

Amplification of klebicingene cluster: DNA extraction was carried out for 31*K. pneumonia*isolates by using ZR Fungal/Bacterial DNA MiniPrep™ kit.The klebicingene cluster was amplified from extracted DNA. A 2300bpklebicin gene cluster was amplified using the primer forward (5'-GCTCTGTAACCTTCAAGTTCTC-3') and reverse (5'-CAAGCAAGATTACGGTCTACTC-3')[8]. The PCR reaction mixture was composed of 12.5µl of green master mix, 3µl of template DNA, 2µl of each forward and reverse primer (10µM), then the volume completed to 25µl by free nuclease water.The PCR program was applied as the following: 10min at 94˚C (initial denaturation temperature);32 cycles including 1min at 94˚C (denaturation temperature), 40S at 54˚C (annealing temperature) and 2min at 72˚C (extension temperature);and 5min at 72˚C for finalextension. Amplified DNA productswere resolved by electrophoresis on 1% agarose gels containingRedSafe™ Nucleic acid staining.

Findings and Dscussion

K. pneumoniae is classified as most important "Gram negative bacteria"[13], because their pathogenic role in hospital acquired infections[14]. In the past decades, thepersistentrising in the incidence of bacterial infections has led to continuous and unlimited utilization of antimicrobial drugs as therapythroughout of the world. Subsequently, this cause increasing the emergence of "multidrug resistance" among *K. pneumoniae* and other strains of bacteria[15].

Antimicrobial susceptibility testing has givenvariouslevel of resistance against antibiotics as appeared in Table1.There is an evidence for increasing the antibiotic resistance.The higher percentage of resistance was recorded against ampicillin 64.52%,followed by augmentincame in second-step with 51.61%. On the other hand, the percentages of resistance against azetreonam and tetracyclinewere convergent (48.39%and 41.94% respectively), while the percentage was 32.26% for amikacin resistance. *K. pneumoniae* resistance to various antibiotics as discussed, this is thought to be in relation with Kaye *et al*[16].

Table 1: Antibiotic Resistanceamong*K. pneumoniae* isolates (n=31).

Antibiotics	Resistant K. pneumonia	
	No.	%
Amikacin	10	32.26%
Ampicillin	20	64.52%
Augmentin	16	51.61%
Azetreonam	15	48.39%
Tetracycline	13	41.94%

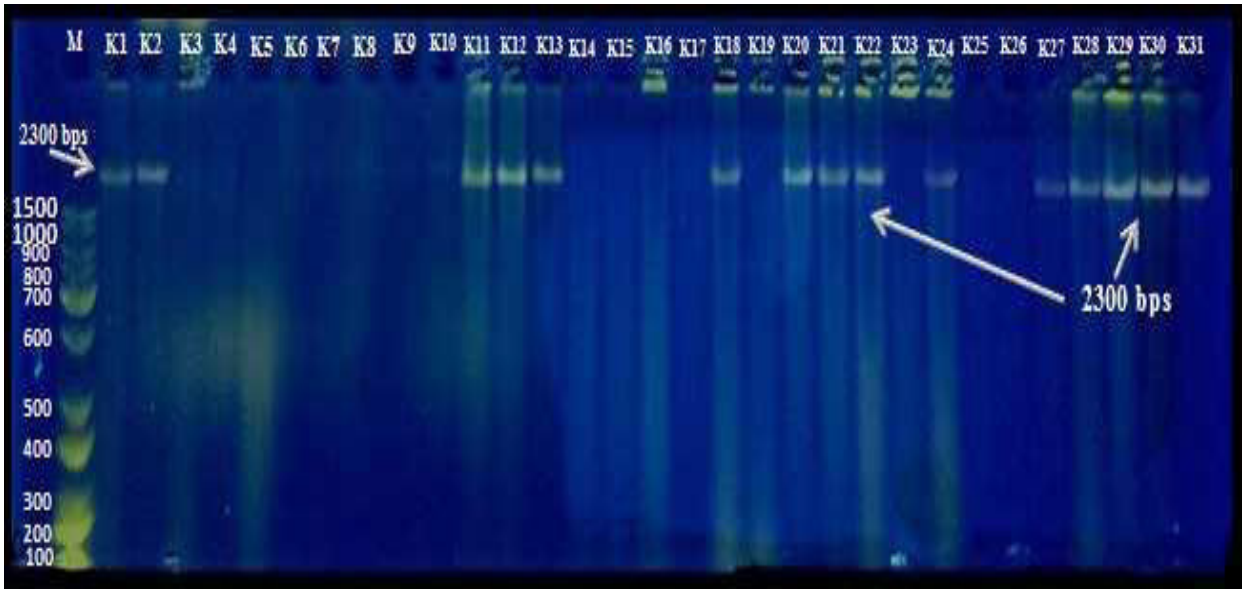

Figure (1): Analysis of *Klebicin gene cluster* of *Klebsiellapneomoniae* isolates. Lane(M): 100bp DNA Marker. Lane(K1,K2,K11-K13,K18, K20-K22, K24,K27-K31):*Klebsiellapneomoniae* isolatespositive for*Klebicin*gene cluster. All positive isolates for *Klebicin*gene clusterare generated (2300bp) PCR product.

Amikacinusually act bybinding to 30s ribosome leading to misreading of mRNA, eventually inhibiting of bacterial protein synthesis [17]. The study findings showed that ten *K. pneumoniae* isolates were resistant to amikacin with percentage (32.26%) which is close to the result (28.12%) that reported by Aljanaby and Alhasani, (2016) in Kufa city [18]. This result is lower than other studies documented by Bratu*et al*, 2005 (45%) and Castanheira*et al*, 2008 (53.3%) [19,20].Ampicillin belong to one group of "beta-lactam antibiotics" and consider as a member of the amino-penicillin family.The action of ampicillin occursby inhibition of the transpeptidase enzyme, therefore it categorized as cell wall inhibitor for bacteria [21].In present study, most isolates showed high degree of resistance to ampicillin (64.52%). These findings were in agreement with those reported by Alain *et al*[22], and Kevin *et al*[23].The study showed that 16(51.61%) of the isolated*K. pneumoniae*recorded resistance againstAmoxicillin/Clavulanic acid. Another result was documented in a study carried out byAljanaby and Alhasani (2016) in Iraq, on the *K. pneumoniae* isolates showed resistance (93.75%) to this antibiotic [18].*K. pneumoniae* isolates were showed high resistance to azetreonam. Fifteen*K. pneumonia*isolates (48.39%) were resistant to azetreonam. This prevalence rate ofazetreonam resistance was higher than these reported from 1998 to 2010 by Sanchez *et al*[24].

Tetracycline are a broad group of antibiotics that was isolated from different species of the genus Streptomyces. Tetracycline was discovered in 1945 by Benjamin Duggar[25]. Tetracycline act as inhibitor for protein synthesis by binding to the rRNA components of 30S ribosomal subunit and leading to inhibit the addition of aminoacyl-tRNAs to the ribosome [26].The study recorded that the tetracycline resistance was 41.94% which was higher than result reported by Aljanaby and Alhasani (2016), who found that the tetracycline resistant *K. pneumonia*was 34.37% [18].

The klebicins actionis homologous activity due to lethal action on limited spectrum of bacteria which are closely related to the producing isolates [27], and they have a broad antimicrobial spectrum that not limited by the genus and family [28]. Klebicins are divided into two types, A and B, according to cross resistance [29], their action on the goal cell, causing pores in the outer membrane of the target cell making ionic channels in it. The other endonucleases klebicins hydrolyze the nucleic acid of the target cell in the cytoplasm.Just two bacteriocins [klebicins B [30] and CCL (NCBI accession AF190857)] from *Klebsiella*have been sequenced[30]. Klebicin gene cluster among 31 of *K. pneumoniae*isolates were conducted using specific primers.Figure (1) shows the result of PCR amplification. PCR products corresponding to Klebicin gene cluster (2300bps) were appeared in 15 isolates (48.39%).

The impact of ZnO Fillers on the Tensile Strength of Self-Polymerizing Acrylic Resins Specific for Orthodontic Appliance

Wael Abdul Alrazzaq

Lecturer, Prosthetic Dentistry department, College of Health & Medical Technology, Baghdad,Middle Technical University, Baghdad, Iraq

Abstract

Background : self-polymerizing acrylic resins are the common materials used for the construction of orthodontic appliances. These materials have to be deficient some mechanical properties. The aim of the present research was to assess the impact of adding zinc oxide fillerstoself-polymerizing acrylic resins on their tensile strength.**Materials and method**: thirty samples were fabricated in total. They were made from self-polymerizing acrylic resin. 20 specimens were strengthened with zinc oxide powder at 1% and 2% by weight respectively, and the other ten specimens were considered as control. The tensile test was conducted for each specimen. The data were analyzed using SPSS v 20, and comparison between main groups was obtained by ANOVA and Duncan's test. **Results**: The results showed that the ZnO enhanced significantly the tensile strength of self-polymerizing acrylic resin compared to the control group. The ZnO 1 experimental group has the highest mean of tensile strength (6.97 N/mm2) followed by ZnO 2(5.91 N/mm2).**Conclusion**: the incorporating of ZnO powder to self-polymerizing acrylic resins affects significantly the tensile strength. It is suggested to add ZnO fillers with different concentrations to see whether there is any improvement in the mechanical properties of self-polymerizing acrylic resins or not.

Keywords*: self-polymerizing, Zinc oxide, tensile strength.*

Introduction

In dentistry, self-polymerizing acrylic resins are the most common restorative substances used for fabrication of orthodontic appliances [1, 2]. The advantage of such materials is that usually cheap and easy to be manipulated, and being chemically activated [3, 4]. However, the degree of polymerization of these materials is not perfect as heat polymerizing acrylic resins, results in a high unreacted residual monomer leading to lowering flexural strength of acrylic resin [5]. To overcome such problems, researches have been carried out by adding several reinforcements (i.e. titanium dioxide) to enhance the mechanical properties of acrylic resins. It was found in the literature that the addition of fillers enhanced the mechanical properties of acrylic resins [6]. However, others found that the addition of fillers has a negative impact on some mechanical properties of acrylic resins[7]. Zinc oxide powder is found as the mineral zincite and can be produced synthetically. It is white in colour with a formula of ZnO, which can insoluble in water [9]. The zinc is found in pure form as brittle metal and it is a white-blue coloured metal. The zinc, when heated, oxidizes results in a low-density metal oxide [10-11]. In dentistry, Zinc oxide has utilized in wide applications (i.e. root canal sealer) [12-13]. The present research was to assess the influence of incorporating ZnO fillers to self-polymerizing acrylic resins on their tensile strength

Materials and Method

Materials and samples groups:

In the present study, 30 Samples were prepared in total. There are 3 main groups and each group had ten samples. The experimental groups involved the adding the zinc oxide powder (Golchadent, Iran) with a concentration of 1% and 2% respectively. The control group involved fabrication of self-polymerizing acrylic samples (Spofadental, Czech Republic) without the addition of zinc oxide filler. The dental stone (Zhermack,

Italy) was utilized to fabricate the mould for acrylic samples.

Fabrication of self-polymerizing acrylic samples

A metal pattern with dimension of 65mm length, 12.5mm width and 2.5mm thickness was utilized to construct the acrylic samples for tensile strength test [14]. The specimen's preparation and procedure were done depending on ADA specification number 12 for denture base resin (1999) [15]. The process of fabrication of stone mould began by lubricating the lower part of the metal flask with a Vaseline to allow removal of stone mould following deflasking. The lower part was then filled with dental stone, and the metal pattern was placed gently into mid of stone surface with taking into consideration half of its thickness was exposed (figure 1).

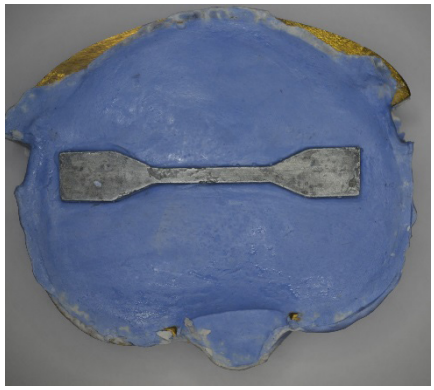

Fig1.Metal pattern located onto stone mould

The stone surface was left to set for one hour. It was then coated with a separating medium (ISODENT, Spofadental, Czech Republic). The upper half was separated with a Vaseline and filled with dental stone completely; the lower half was inverted over upper half gently and left to set for one hour. Then, the flask was carefully opened; and the pattern was taken away in order to be prepared for packing the acrylic resins.

Mixing and proportioning of acrylic resins:

In the present research, an electronic balance with an accuracy of (0.0001g) was used (fig 2). The amounts of acrylic polymer, monomer and ZnO nano-fillers are shown in table 1.

Table1. Proportioning and Mixing of the Acrylic resin

ZnO Percentage	Amount of ZnO.	Amount of PMMA.	Amount of monomer.
1%	0 .22 g	21.78 g	10 ml
2%	0.44 g	21.56 g	10 ml

Fig 2.An electronic balance used in the current study

According to manufacturers' instructions, the materials were hand -mixed in a clean and dry ceramic jar for 30 seconds. The mix was then left at the room temperature for 6 min. When it reached a dough stage, the acrylic dough was rolled and positioned in the mould. Then,the two halves of the flask were put in contact and positioned under press (up to 20 bar). Then the two halves of flask wereseparated and the excess materials were removed with wax knife. The two halves of the flask were put under pressure till metal to metal contact and left-handed under press for five minutes. The stone bursand sandpapers (120 grain size) were utilized to get a smooth surface. A bristle brush and pumice were used for polishing the acrylic samples. A wool brush and polishing soap were utilized to get a glossy surface. The specimens were conditioned for two weeksat (37°C)in distilled water [15].

Testing procedure: -

The Instron machine (Instron/ Germany) was used to test Acrylic samples (figure 3).

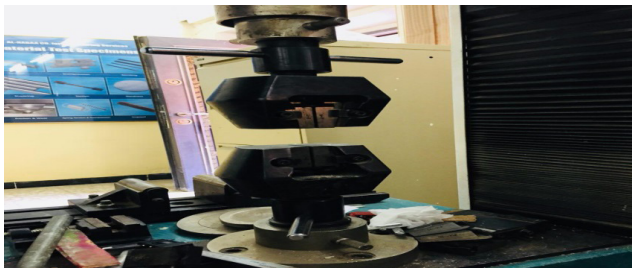

Fig3. Specimen under tensile strength test.

All acrylic samples were subjected to the force with a crosshead speed of 0.5 mm/min until fracture occurred and the values were recorded in kilograms (Kg) and then converted into Newton (N)[17]. Tensile strength values were then calculated by the formula below [18]:-Tensile strength(T.S) (N/mm2)= force at failure(F) / the area of cross-section at failure (A)

Results

The values of Mean and Standard deviation (SD) are listed in the table (2). The results indicated that the ZnO enhanced significantly the tensile strength of self-polymerizing acrylic resin compared to the control group. The ZnO 1 experimental group has the highest mean of tensile strength (6.97 N/mm2) followed by ZnO 2(5.91 N/mm2).

Table 2. Mean, standard deviation of groups for tensile strength.

Group	Number	Subset for alpha = 0.05		
		1	2	3
Control	10	5.18		
ZnO 1	10		5.91	
ZnO 2	10			6.97
Sig.		1.000	1.000	1.000

Furthermore, there is significant difference amongall group (P<0.001) as shown in Duncan multiple comparison test (table 3).

Table 3. comparison between the groups

group	mean	Standard deviation
control	5.18	.51
Experimental group ZnO 1	5.91	.76
Experimental group ZnO 2)	6.97	.12

In addition, there were significant differences among all samples groups(P<0.001)as illustrated in table 4(ANOVA test).

Table 4.ANOVA test.

ANOVA					
tensile					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	16.183	2	8.092	28.512	.000
Within Groups	7.662	27	.284		
Total	23.845	29			

Discussion

The present study has been conducted to evaluatethe influence of adding ZnO fillers to self-polymerizing acrylic resins ontheir tensile strength. In the literature, there were no published papers about the effect of ZnO fillers on mechanical properties of the self-polymerizing acrylic resins. The present study indicated that the addition of ZnO micro filler enhanced significantly the tensile strength shown in the table (3). The rise in tensile strength values following incorporating 1% and 2% of ZnO powder is because of good distribution of particles enable them to inter between liner macromolecules chains. The segmental motion of the macromolecular chains was restricted and lead to increase strength and rigidity of the resin. Consequently, this enhanced the

fractural resistance and lead to improve tensile strength [19,20].

Conclusion

From the present study, it is concluded that the incorporation of zinc oxide improves slightly the tensile strength of self- polymerizing acrylic resins. It is suggested to do more research using the ZnO fillers with different concentrations to see if there is any improvement in the mechanical properties of self-polymerizing acrylic resins.

Hormonal Changes in Sodium Fluoride Exposed Female Rats and its Amelioration by *Urticadioca* Leaf Extract

Zinah Mohammed Al_Shammari[1]

Department of Biology, College of Basic Education, University of Wassit, Iraq

Abstract

The present study was carried out to investigate the protective role of *Urticadioica*leaf extract on the hormonal profile in sodium fluoride exposed female rats. Thirty two mature female rats were randomly divided to four equal group and treated for 4th weeks as follows: control group administered tap water; group T1 administered tap water containing 100 ppm NaF; group T2 administered tap water containing 100 ppm NaF plus 300 mg/ kg *Urticadioica*leaf extract; group T3 administered 300 mg/ kg *Urticadioica*leaf extract only. Blood sample were obtained at zero and 28 days of the experiments for estimation of serum progesterone, estrogen, FSH,LHconcentration. The result revealed significant decrease in serum progesterone, estrogen, FSH, LH concentration in group T1 (NaF treated group). On the other hand, the result showed the beneficial effects of *Urticadioica* leaf extract to improvement the previous parameters against NaF(T2), through a significantincrease in hormonal profile concentration. Therefore, it could be conclude that *Urticadioica*extract has a potent ameliorative effects on hormonal profile in NaF stressed rats .

Keywords: *Hormonal profile, sodium fluoride, urticaleaf, rats*

Introduction

Fluoride surely exists in water, soil, and nutrition. Ingesting water that have high concentricity of fluoride, mainly from natural origin, is the major source of human environmental exposure throughout the world[1]. Fluoridation is a safe and efficient method for the preventing of dental caries[2,3]. In several countries, water fluoridation is used for this reasons. However, the advantageous will be narrow, and healthiness may be affected adversely if excessive fluoride be absorbed. Fluoride accumulation in soft tissues causes oxidative stress through inhibition of different enzymatic systems and increased generation of reactive oxygen species (ROS)[4]. As the case of the many chronic degenerative disease, increase of ROS and lipid peroxidation (LPO) has been considered to play an important role in the pathogenesis of fluoride toxicity[5]. NaF may have toxic effects on the brains of suckling mice[6], may impair learning and memory in rats[7,8],and may impairment of liver function[9].

Excessive exposure to environmental pollutants and chemicals is a main principle to reproductive health problems[10,11]. Fluoride is a common natural pollutant with certain toxic effects, and the association between long term fluoride exposure and fertility impairment has be attracted to concern[12,13].

It is well known that folk medicine was assistance in disease prevention and control have been attributed to antioxidant properties of their constituents, broadly termed as polyphenolic compounds. In addition to their role as antioxidants, these compounds have broad spectrum of medical property. It has been known that antioxidants protects the cell directly or indirectly from the damage caused by toxic radicals reactions through different mechanisms[14].*Urticadioica*belongs to the Urticaceaeitsthe chemical compounds are Lignans, sterols,flavonoids, polysaccharides, lectins and fatty acids also rich in vitamins A,C and D and such minerals as Magnesium and Calcium.*Urticadioica*has an antioxidants, anti inflammatory and anticancer properties, as well as, blood glucose and lipid lower effects[15]. Different effects of it plant have been notified in various worldwide districts. Therefore, the objective of this study was to explore the protective effect of *urticadioica*leaf extract on hormonal profile against sodium fluoride in female rats.

Materials and Method

The leaf were taken from north of Iraq. To prepare 70% ethyl alcohol,100 grams of dried leaves which was mixed with 500 ml of alcohol in each extract process by using magnetic stirrer at 40 °C for 24 hours[16,17], the extract have been filtered and the process have been repeated 3 times. The filtrate was concentrated by using incubator at 40 C° for 72 hr to obtained crude plant extract, the result kept at 4 C° in sterile and dark glass container until used.32adult female rats were randomly divided to 4 equal group and handles as follows for 4th weeks: control group were administered tap water; group T1rats of this group were allowed to *ad libitum* supply of drinking water containing 100 ppm of sodium fluoride**;**group T2rats of this group were allowed to *ad libitum* supply of drinking water containing 100 ppm of sodium fluorideplus ethanolic extract of*Urticadioica* (300 mg/kg)**,** groupT3rats of this group were receivedEthanolic extract of*Urticadioica*at dose of 300 mg/kgonly**;**Collected of blood sample were obtained via cardiac puncture from each anesthetized animal at zero and28 days of the experiments then centrifuged at 3000 rpm for 15 minutes, and sera was isolated and frozen at -18C° till analysis of serum estrogen,progesterone,FSH, LH concentrations by using immunoenzymometric assay kits (monobindInc, USA). Statistical analysis of data was performed on the basis of two way analysis of variance (ANOVA)using a significant level at($P<0.05$) and using Least Significant Differences (LSD)test for specific group differences[18]**.**

Finding and Discussion

Data pertaining to serum progesterone hormone concentration (table 1) showed a significant($P<0.05$) decline in NaF treated group after 4thweeks of experiments comparing to other treated groups.The results also clarified a significant($p<0.05$) increment in T2 as compared to T1 treated group. It was also noted highly significant ($p<0.05$) increase in this parameter in T3 group comparing to other treated groups.

In comparison within time for T2&T3 groups, recorded significant($p<0.05$) increment, whereas T1 group registered significant ($p<0.05$) decrement as compared to pretreated period.

After 4th weeks of experiments, group T1 showed highly a significant ($p<0.05$) decrease in estrogen hormone concentration compared to other treated groups (table 2). Whereas, the result registered that oral intubation of extract concurrently with NaF normalized estrogen hormone near to control group after 4th weeks of treatment. On the other hand,estrogen hormone concentration in T3 group recorded significantly ($p<0.05$) elevated after 4th weeksof experimental periods comparing to other treated groups. Time dependent, a significant($p<0.05$) increment was observed after 4th weeks of treatment in T3 group, also a significant($p<0.05$) decrement in C,T1,T2 treated groups when compared with zero time.

LSD 0.4

Note for details show table 1

The ovary it is an prominent target organ of many reproductive toxicants. Organ coefficients can better express organ toxicity follow exposure at toxic chemicals. Exposure to NaF is associated with deterioration of reproductive system organs functions specifically the Gonads (ovaries)[19]. The results have exhibit that NaF causes a significant ($P<0.05$) drop off in estrogen & progesterone concentration (T1) compared with control group, this reduction may produce direct effect of NaF on ovarian tissues specially the granulosa cells that have specialized receptors for FSH hormone, in order that these cells does not response to FSH hormone and the release of estrogen will be decrease[20]. To maintenance of fertility investigations have confirmed that steroid hormones, such as estrogen &progesterone, role in the growth and differentiation of reproductive tissues[21]. Estrogen can increase the sensibility of granulosa cells to FSH and LH, through rising the biosynthesis of progesterone by granulosa cells[22], E2 modulates steroidogenesis, promotes granulosa cell proliferation,and maintains follicular development[23]. Beside, NaF that caused significant($P<0.05$) decrease in cholesterol which considered as precursor of steroid hormone may be the second cause of this reduction in estrogen and progesterone concentration[24].

Its well-known that the secretion of reproductive hormones from the ovary is regulated by the release of LH and FSH from the anterior pituitary gland. Based on the reproductive the results obtained in this study, showed that FSH and LH secretion was significantly inhibited in the sodium fluoride-exposed groups[25]. The main function of FSH is to stimulate ovarian growth and promote follicular development. LH participates in ovarian regulation, plays a critical role in follicular maturation, ovulation, and corpus leutum development, and intervenes in the synthesis of steroid hormones[26]. As well, the present study the prevalent mechanism of action of the harmful effects of NaF occurs at the level of the hypothalamus–pituitary axis may be indicates that NaF inhibits the secretion of FSH and LH from the pituitary gland, thus weakening the promotional activity of FSH and LH on ovarian granular cells.

On the other hand, the result exhibited that the elevation of steroid hormones progesterone and close control group of estrogen hormone after treatment with NaF and *Urticadioica*(T2) may be due to role of plant extract to reduce the negative effects of toxicity of NaF[27]. Lignans, sterols and beta sitosterol are identified phytoestrogens in *Urticadioica*[28,29]. They suggested that nettle can be used in diet as an appropriate pharmaceutical alternative for synthetic prescription of estrogen hormone in patients with osteoporosis[29], besides, nettle extract improves levels of such minerals as calcium and magnesium that were decreased in patients with osteoporosis.Calcium plays a major role in reproduction. Deficiency in this macro mineral can affect fertility[30]. Calcium-dependent reproductive mechanisms include steroid biosynthesis in adrenal glands and ovaries. Calcium may also affect delivery of cholesterol or using cholesterol in mitochondria or stimulating conversion of pregnenolone to progesterone in steroidogenesis[31,32].

From results obtained it can be explained that *Urticadioica* have an important role in elevation of LH and FSH level. This elevation may be due to the active constituents of *Urticadioica* in activation of synthesis mechanisms of these hormones by stimulation of hypothalamus or pituitary glands to release and secretion

gonadotropin hormone[27].On the other hand, the increase of LH and FSH hormones may be due to the high constituents of *Urticadioica*from essential nutrients such as flavonoids, sterols, polysaccharides,fattyacid, also rich in vitamins and minerals,theseantioxidant nutrients may stimulate hypothalamus and pituitary gland to increase synthesis and release of these hormones[34].The increase of FSH and LH hormones in(T2) group compared with control group may be increase the follicular growth so that there were increase in the number of Graffian follicles which increase the synthesis and release of estrogen hormone [34]. Also the increase of LH hormone in (T2) group compared with control may be increase the level of estrogen because the high level of LH hormone leads to increase of its binding with the receptors on theca cells[35].

The increase of LH hormone is considered as a principle factor to stimulate the theca interna to elevate production of pregnenolone compound which converted by granulose cells to progesterone[35]**.** Also the increase of progesterone may be due to the role of LH hormone to stimulate the corpus leutum to production of progesterone[34]. In conclusion *Urticadioica*extract has a potent ameliorative effects on hormonal profile in NaF stressed rats.

Application of Silver Nanoparticles (Silver NPs) in Assisted Reproductive Techniques (ART) as a Carrier Vehicles to Improve the Therapeutic Influence of Doum Extract for Sperm of Asthenozoospermic Patients

Nabaa Al-Nawab

Dentistry Department, Al- Israa Private University College, Baghdad, Iraq

Abstract

Assisted reproductive techniques are a tool practiced worldwide to help couples achieve pregnancy and preserve fertility. However ART reveals several limitations which needs for new alternatives to overcome these limitations. Over recent years, nanotechnology has been applied as a tool to improve strategies to enhance the outcome of ART. This study has investigated for the first time the impact effect of implication of silver NPs to boost therapeutic effect of Doum palm (*HyphaeneThebaica*) extract on enhancing sperm quality of asthenozoospermic patients. The findings of this study has showed the implication of silver NPs has significantly enhanced theSuperoxide dismutase activity, and reduced Malondialdehyde expression and sperm DND fragmentation percentage. These encouraging results suggest that nanotechnologies could be easily included in the routine procedures of ART to improve sperm quality and thus increase the rate of successful pregnancy and preserve fertility.

Keywords: *Asthenozoospermia, Silver nanoparticles, Doum palm (HyphaeneThebaica), Extract.*

Introduction

Asthenozoospermia (or asthenospermia) refers to decreases of sperm motility, which is one of the major causes of infertility or reduced fertility in men.Oxidative stress plays important role in causingdecreases of male fertility and has a significant roleon semen quality assessment. Oxidative stress is mainly caused as a result of accumulation of excessively reactive oxygen species (ROS) or reactive nitrogen species (RNS). ROS/RNS results in severe damage of sperm DNA, reduced sperm motility, reduce sperm fertilising ability, and decrease sperm membrane integrity via lipid peroxidation; all of which are underlying mechanisms lead to sperm dysfunction [1].

In reproductive medicine, the application of medicinal herbs has extensively investigatedfor their pharmacological therapeutic activities on improving sperm quality. Many medicinal plants have been reported to have beneficial effects in combination with assisted reproductive technology (ART) to increase the chances of pregnancy rate and reduce the cost of treatment. *Hyphaenethebaica* which, belongs to the family Palmae and this plant is commonly known as a Doum palm, has reported to has many medicinal therapeutic activities[2, 3]. In these studies, fruits of Doum showed antimicrobial, anti- oxidant, hypolipidemic, antidiabetic, and antihypertensive activities, suggesting that the active biological effectsof Doum fruits may ascribed to its active components [3, 4].

In fact, ART has been highly applied and practiced worldwide as a set of methodologies to cases related to infertility. However, ART still has some challenges, which still needparticular focus[5].Therefore, it is highly important for identifying new alternatives to overcome these challenges.Recent advances in nanotechnology have encouraged the application of nanoparticles (NPs), which has already been developed for non-human animals, in assisted reproduction in humans[5-7]. Nanoparticles characterised by various physical and chemical properties that make them more stable, soluble and more biologically effective to employed in the field of drug delivery. In fact, silver NPs are type of metallic NPs and have been frequently used in many

biomedical application due to their unique physical, chemical, and biological properties[8-10]. In fact, there is a little information is available about their activity in the reproductive system. Therefore, this study has adapted innovative different strategy to improve male fertility diagnosed with asthenozoospermia, particularly by enhancing sperm cell quality using silverNPs as a carrier vehicles for Doum extract components.

Materials and Method

Preparation dried extract of Doum palm (HyphaeneThebaica)

The Doumpalm fruit was dried and grinded, once it has been obtained from the local market. A 20gm of Doumpalm fruit powder was mixed with 100ml of distilled water and refluxed for 3hours. As the powder was completely dissolved, the mixture was filtrated by using a sheet of gauze in a clean suitable flask. Finally, the filtrated solution transferred to sterile petri dishes (Falcon, USA) and dried on an incubator at 73ºC [11].

Preparation of aqueous Doum palm (HyphaeneThebaica) extract for in vitro sperm activation

Following complete drying of extract of Doum palm, the aqueous working solution of Doum extract was prepared by dissolving 0.5mg of dried Doum extract with 10ml of phosphate buffer solution (PBS) (Sigma-Aldrich, USA) in plastic test tube (Falcon, USA) contained broad spectrum antibiotic. TheDoum aqueous working solution has prepared at 20% concentration by adding 2ml of the aqueous working solution of Doum extract to 8ml of PBS,to be used for the purpose of in vitro sperm activation experiment. The solution was filtered using Millipore (Millipore, USA) 0.45µM. Media was adjusted at pH 7.5-7.8 and stored at 25ºC.

Mixture preparation of silver nitrate nanoparticles with aqueous Doum extract for in vitro sperm activation

The aqueous Doum extract was mixed with silver nitrate nanoparticles by adding 0.58mg of silver nitrate to 50ml distal water. Then 10ml of aqueous Doum extract was added to the 50ml of silver nitrate solution. The final mixture of aqueous Doum extract and silver nitrate nanoparticles kept on magnetic stirrer until the brown colour of mixture changed to the brown red colour.

Experimental design

Semen samples were collected from ten patients diagnosed with asthenozoospermia, following the ethical approval and informed consent from all donors. Each semen sample was divided into three groups. The sperms in first group (i.e. control group) were treated with PBS, sperms in second group were treated Doum extract only (Extr. alone group) and sperms in third group were treated with Doum extract with silver NPs (i.e. Extr. +NPs group). Samples were incubated for 1-2hours at 37ºC in an incubator for further experiments.

Superoxide dismutase (DOS) activity assay

Using the commercially available colorimetric assays (Cohesion Biosciences. LTD. China) and following the methodology provided by the manufacturer DOS was detected in all sample groups. Briefly, sperm samples at 5x 10^6 were centrifuged. Following centrifugation, the supernatant was discarded and 1 ml of assaybuffer was added. Then, samples were sonicated (with power 20%, sonication 3s and intervention 10s, repeated 30 times) and centrifuged at 8000g 4°C for 10 minutes. Following centrifugation the supernatant was moved into a new centrifuge tube and kept on ice for further processing. 19µl of samples, stander and distilled water as (blank) were added into 96 well plate. Then, 30µl of reaction buffer, 100µlsubstrate, 1µl of enzyme and 50µldye reagent were added to samples, stander and blank. Finally, the plate was incubated at room temperature for 30 minutes and absorbance measured at 560nm.

Malondialdehyde (MDA) measurement assay

Using the commercially available colorimetric assays (Cohesion Biosciences. LTD. China) and following the methodology provided by the manufacturer MDA was detected in all sample groups. Briefly, sperm samples at 5x 10^6 were centrifuged. Following centrifugation, the supernatant was discarded and 1 ml of assay buffer was added. Samples were sonicated (with power 20%, sonication 3s and intervention 10s, repeated 30 times) and centrifuged at 8000g 4°C for 10 minutes.Following centrifugation the supernatant was placed into a new centrifuge tube and kept on ice for further processing. 100µl of samples were added into new micro centrifuge tubes with 200µl dye reagent and placed into oven with 90ºC for 30 minutes. Then, micro centrifuge tubes were placed on ice for few seconds and centrifuged at 10000g, 25°C for 10 minutes. 200µl of samples supernatant were

added to 96-well microplate absorbance measured at 532nm or 600nm.

DNA fragmentation assay

The assessment of sperm DNA normality was performed usingthe microscopicacridine orange (AO) test following the protocol described previously in 1984 by Tejada et al. [12]. Briefly, Smears of10 semen samples were fixed in Carnoy's solution (3:1,methanol:glacial acetic acid) at 4°C and left overnight , washed and air-dried. The slides were then immersed in AO working solution (0.19 mg/ml in 0.1 M citric acid and 0.3 Na2HPO4 7H2O, pH 4) for 10 minutes. Smears were assessed on the same day using fluorescent microscope (Zeiss Co., Germany) with a 460nm. Normal DNA (double stranded)emitted green fluorescent when stained with AO,whereas the stain emitted red fluorescent when it bind to fragmented DNA (single stranded).

Statistical analysis

GraphPad Prism 8.0.2 software was used for data analysis. Data of N=10 was tested for normal distribution using three different tests D'Agostino& Pearson test, Shapiro-Wilk test and Kolmogorov-Smirnov test.

Finding

According to The World Health Organization (WHO), couples may classify as infertile couples if they fail to achieve a clinical pregnancy after, at least, 1 year of regular unprotected sexual intercourse[13]. The application of ART methodologies to cases related to infertility is common and practiced worldwide. However, there are some challenges, which still require special attention[5].

Over the recent years, nanotechnology has been considered to help overcome some of challenges in reproductive medicine. NPs are owning unique physical and chemical propertiesmaking them a valuable and useful materials for various applications[5, 14]. The recent advancing in nanotechnologies have increased their possible applications in ART methodologies.

This study has investigated for the first time the influence of implication of silver NPs on improving the effect of Doum extract for enhancing sperm quality of asthenozoospermic patients. The results obtained by this study have showed that silver NPs have improved sperm motility. Sperm motility was examined using simple layer technique (data not shown).

In recent years, extensive studies have emphasis the role of oxidative stress on causing male infertility. The excessiveaccumulation of ROS or RNS lead to oxidative stress, which in turn has harmful effect on sperm functionality [15-17]. Oxidative stress is a keystone cause of sperm dysfunction,since, it underline several mechanisms that lead to sperm dysfunction including; extensive sperm DNA damage, reduced sperm motility, decline in sperm fertilising ability, and defective sperm membrane integrity via lipid peroxidation[18-21]. In infertile male, major sources of ROS and RNS are produce by mitochondria in the spermatozoa and activated inflammatory leukocytes. In fact the activated leukocytes produce 1000 times more ROS/RNS than the spermatozoa does [1].

This study has estimated the concentration of SOD in sperm following their treatment with Doum extractwith/without silver NPs. Interestingly, the data of this study has showed for the first time the application of silver NPs have boosted the antioxidant effects of Doum extract by increasing SOD concentration. The results showed significant increase in SOD concentration in treated sperms in both Doum extract with NPs group and Doum extract only group compared with control group (****$p<0.0001$, **$p= 0.0032$ respectively) (Figure -1). Although, Doum extract with NPs group had slightly higher influence on SOD concentration when compared with Doum extract only group, but this was not significant ($p= 0.1229$).

Inside human body, oxidative stress occurs due to an imbalance occurs, causing potentially serious health consequences. The body has several defends scavenging mechanisms to maintain normal balance of ROS and RNS. These mechanisms include a number of antioxidant enzymes and antioxidant molecules. SOD provide a very important antioxidant defense mechanism against oxidative stress in the body.There is a strong evidence suggesting that foodstuff has a potential source of antioxidant phytochemicals, which act to prevent or reduce oxidative stress by scavenging free radicals , such as vitamins and, in particular, the flavonoids, coumarins, hydroxycinnamates and lignin component. Many studies have reported that Doum extracts contain significant amounts of flavonoids which have demonstrated antioxidant and antibacterial activities[3, 22, 23]. Flavonoids possess a significant biochemical property to act as antioxidant. The mechanisms of antioxidant action of flavonoids can include; scavenging ROS and/or

RNS, upregulating or protection of antioxidant enzymes defenses, or by inhibition of enzymes involved in free radical generation [24-26].

Spermatozoa are susceptible to ROS-induced damagedue to contain large quantities of polyunsaturated fatty acids. Also, it has been suggested that ROS induce membrane lipid peroxidation in sperm[27, 28]. Since,MDA is one of toxic lipid peroxides that known to cause different impairments of sperm cells,therefore, this study has examined the level of Lipid peroxidation formMDA.

Pathological high level of ROS, which may originated from endogenous sources or exogenous sources can be potentially toxic to sperm, leads to curtail sperm damage and impaired sperm functionality. In fact, sperm dysfunction occursdue to the peroxidation of high polyunsaturated fatty acids found within the plasma membrane of spermatozoa[29]. This study has measured the level of MDA(as an indicator of lipid peroxidation) in sperm samples following their treatment with Doum extract with/without silver NPs. The results showed that silver NPs have significantly enhanced the uptake of Doum extract and consequently the Doum extract has significantly reduced the level of MDA when compared with the non-treated group (*p= 0.045) (Figure -2). This finding demonstrated the significant role of the implication of silver NPs to amplify Doum extract effect. Also, the finding has emphasised the antioxidant influence of Doum extract, asan antioxidant has an important role in reducing lipid peroxidation.The implication of silver NPs has enhanced the therapeutic effect of Doum extract on reducing MDA.However, the underlying mechanisms of action still uncovered, therefore, further investigation to fully understand the role of silver NPs and medicinal properties of Doum extract is required. This study suggest that the implication of nanotechnology in ART to treat infertile male has a significant impact effect on enhancing sperm quality and increase the chances for pregnancy.

Moreover, oxidative stress has serious effect on the integrity of sperm DNA. One of sperm DNA damage causes,is the presence of unbalanced ROS in semen plasm. Sperm DNA damage is the main cause to infertility, miscarriage and birth defects in the offspring[30].

The data obtained by this study has showed significant therapeutic effect of Doum extract on improving and reducing sperm DNA fragmentation. Moreover, the results showed there was significant higher therapeutic effect on improving and reducing in the percentage of DNA-fragmented spermatozoa when silver NPs was implicated with Doum extract. In fact, both treatment groups (Doum extract only group or Doum extract with NPs group) were significantly enhanced the percentage of DNA-fragmented spermatozoa when compared with non-treated group i.e. control group ***p = 0.0002, **** p <0.0001 respectively (Figure 3).Interestingly, the data of this study has showed for the first time the application of silver NPs with Doum extract have remarkable and significant influence on decreasingthe percentage of DNA-fragmented spermatozoa compared with group treated with Doum extract only **p= 0.0033 (Figure -3). Research has been reported that oxidative stress had a great role in the aetiology of this pathological condition. Based on this finding, the reduction in the percentage of DNA-fragmented spermatozoa may ascribed to the antioxidant activity of Doum extract. Many studies have suggested that the aqueous extract of Doum fruits had an antioxidant activity; this was attributed to the substantial amount of their flavone components. About five flavone glycosides were isolated and identified from Doum fruits these include: viz, luteolin 7-O-β-glucuronoide, apigenin 7-O-β-glucuronoide, luteolin O-β-glycoside, luteolin 7-O-rutinoside and chrysoeriol 7-O rutinoside[22]. Clearly, there is a need for future studies that could address the fundamental molecular basis of mechanisms of action of biological activities of Doum extract.

Conclusion

The study has demonstrated for the first time the application of nanotechnology for ART to enhance sperm quality has a beneficial impact.The study has proved that enhancing the levels of antioxidant defense mechanisms could improve sperm functionality. Actually, the study has showed that the antioxidant therapeutic activity of Doum extract has improved the level of SOD, reduced MDA and reduced the percentage of DNA-fragmented spermatozoa. It is worthy to mention that this antioxidant activity was significantly higher when silver NPs was implicated with Doum extract. Although, there is still need to understand the mechanisms of action that underlying the biological and therapeutically activities of Doum extract components but,clearly, the findings in this present study has provided an additional set of information and encourage the application of nanoparticles with ART to bridge the gap between traditional uses of medicinal herbs and nanotechnology.

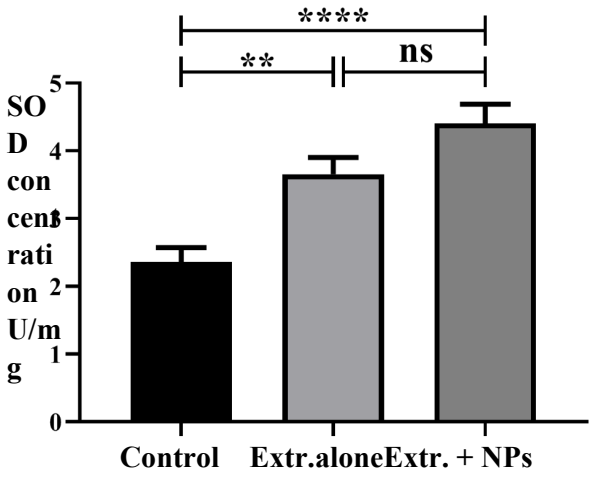

Figure 1: Silver NPs have significantly upgrade the antioxidant effect of Doum extract by elevating the level of SOD.

The level of SOD was measured using colorimetric assays. The differences between groups were tested for significance using Ordinary one-way ANOVA of One-way ANOVA with Sidak's multiple comparisons test. Data shown as M±SEM. *p* values of <0.05 were considered significant. (Extr. Alone= group were treated Doum extract only and Extr. +NPs = group were treated with Doum extract with silver NPs).

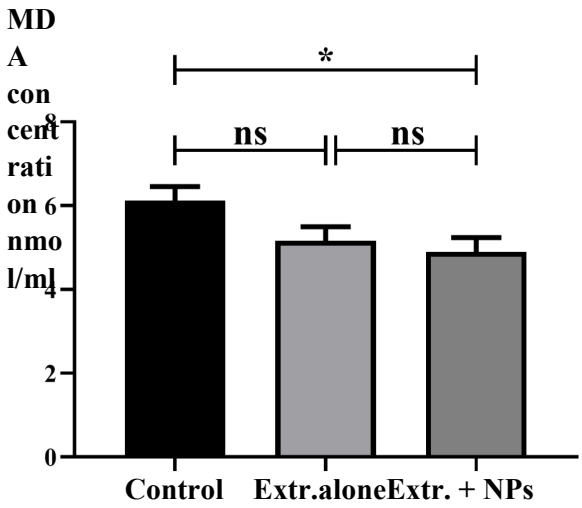

Figure 2: Silver NPs have significantly upgrade the antioxidant effect of Doum extract by reducing the level of MDA.

The concentration of MDA was measured using colorimetric assays. The differences between groups were tested for significance using Ordinary one-way ANOVA of One-way ANOVA with Sidak's multiple comparisons test. Data shown as M±SEM. *p* values of <0.05 were considered significant. (Extr. Alone= group were treated Doum extract only and Extr. +NPs =group were treated with Doum extract with silver NPs).

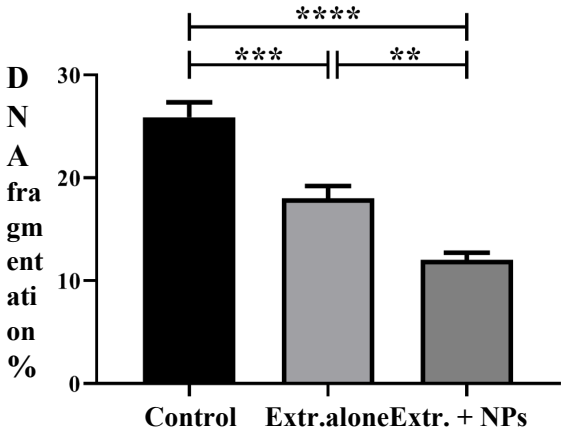

Figure 3: Silver NPs have significantly enhanced the effect of Doum extract on improving DNA fragmentation index.

The percentage of sperm DNA fragmentation was reduced when sperms were treated with Doum extract either with or without silver NPs. The differences between groups were tested for significance using Ordinary one-way ANOVA of One-way ANOVA with Sidak's multiple comparisons test. Data shown as M±SEM. *p* values of <0.05 were considered significant. (Extr. Alone= group were treated Doum extract only and Extr. +NPs =group were treated with Doum extract with silver NPs).

Musculoskeletal Hand Manifestations in Patients with Diabetes Mellitus

Yahya Abdel Aziz Mohammed[1], Abbas Hamza Zainel[2], Sundus Awni Wahab[2]

[1] M.B.Ch.B.-H.D.R.MR. Kirkuk Genenal Hospital, Kirkuk health directorate, Kirkuk City, Iraq,
[2,]M.B.Ch.B.-H.D.R.MR. Azadi Teaching Hospital, Kirkuk health directorate, Kirkuk City, Iraq

Abstract

A random sample of 505 patients with DM, evaluated in a discriptive study for the evidence of MSK hand manifestations of DM, they were collected attending diabetic centre, in Sulaimani city, from Novembor 2008 to February 2009 . All the patients were interviewed by using questionnaire forms . Comprehensive history, clinical examination, radiological, and laboratory studies performed to role out other causes of musculoskeletal hand manifestations . Chi- square and ANOVA procedure have used for management of statistical data. One hundred ninety six diabetic patients had MSK hand manifestations represents (39.52%), with nearly equal male and female involvement, majority of the patients with DM (84.2%) were type 2, while most of patients with hand manifestations (47.7%) were type 1 DM, (50.3%) of them had DM for less than 5 years, most of them (71.9%) use OHD for treatment of diabetes, and (51.1%) of them had uncontrolled glycemic control status. The relation of hand manifestations with gender, duration, type of treatment, and glycemic control status of DM was statistically significant (P value < 0.05) . Our patients got different hand manifestations with significant association with gender, duration, type of treatment and glycemic control status of DM . Majority of the patients with MSK hand manifestations had type 1 DM . MSK hand manifestations were more in patients with uncontrolled blood glucose, with almost equal male and female involvement .

***Key words**: Musculoskeletal hand; Diabetes mellitus; T2DM; MSK*

Introduction

Diabetes mellitus (DM) is a syndrome with disordered metabolism and inappropriate hyperglycemia due to either a deficiency of insulin secretion or to a combination of insulin resistance and inadequate insulin secretion to compensate. Diabetes mellitus is classified on the basis of the pathogenic process that leads to hyperglycemia, as opposed to earlier criteria such as age of onset or type of therapy [(1-3)]. The two broad categories of DM are designated type 1 and type 2. Both types of diabetes are preceded by a phase of abnormal glucose homeostasis as the pathogenic processes progresses. Type 1 diabetes is the result of complete or near-total insulin deficiency[(4-6)]. Type 2 DM is a heterogeneous group of disorders characterized by variable degrees of insulin resistance, impaired insulin secretion, and increased glucose production[(8-11)]. Diabetes mellitus is associated with a wide variety of musculoskeletal problems, some of which are unique to the disease [(7)] including Syndromes of limited joint mobility (Diabetic hand syndrome, Adhesive capsulitis, Trigger finger, Dupuytren's contractures), Osteoporosis, Diffuse idiopathic skeletal hyperostosis, Neuropathies (Charcot joints, diabetic osteoarthropathy [(12-14)], Carpal tunnel syndrome, Diabetic amyotrophy, Reflex sympathetic dystrophy,Various other neuropathies), and Diabetic muscle infarction [(15-17)] . As early as 1957, it was noticed that many people with diabetes complained of stiffness in the hands or stiff joints. This was eventually called limited joint mobility (LJM)[(18)] . LJM is also known as diabetic cheiroarthopathy (after the Greek word "cheiros" for hand)[(19)] or diabetic stiff hand syndrome[(14,15)] . In Dupuytren's contracture, a thickening and shortening of the palmar fascia occurs[(20-23)]. The aim of the current study was to find out the prevalence of MSK hand manifestations of DM to make early diagnosis, and to identify its relation with type, duration, and type of treatment of DM.

Materials and Method

Five hundred and five patients with DM were evaluated in this descriptive study The patients recruited consecutively with clinical diagnosis of DM by consultant physicians . They were attending diabetic centre in Sulaimani city, in a period of 4 months from Novembor 2008 to February 2009 .

Patients were interviewed, history taken, examination done for each case by using special questionnaire forms, patients with MSK hand manifestation sent to laboratory tested for (erythrocyte sedimentation rate, C reactive protein, rheumatoid factor, general urine examination, renal function test, liver function test) and conventional radiograph of hands to role out other causes of hand manifestations. The control status of DM assessed according to International Diabetes Federation (IDF)-2005 guidelines which considers that the patient is strictly glycemic controlled if HbA1c is < 6.5% or fasting blood sugar < 110 mg/dl or random blood sugar < 145 mg/dl (glycosylated hemoglobin HbA1c was not available, so we depend on fasting or random blood sugar).

Statistical analysis

Statistical package for social science (spss) program version 15 was used for statistical analysis, the frequency distributions were obtained, after the grouping of data to different variables.

Findings

The sample enrolled 505 patients with DM diagnosed by consultant physician, 175 (34.65%) patients were males and 330 (65.35%) were females (Figure 1), patient's ages ranged from 13 to 82 years with mean of ages 52.21 years and standard deviation 12.02 (Table 1) .

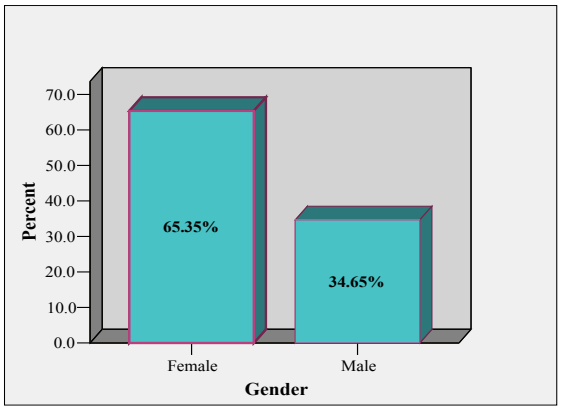

Figure 1: Sex distribution of DM

Table 1: mean age of diabetic patients

Variables	Minimum	Maximum	Mean	Std. Deviation
Age (Years)	13	82	52.21	12.02

Majority of diabetic patients was type 2, 452 (84.2%) . 363 (71.9%) of them were on oral hypoglycemic drugs and the others were on insulin, mixed therapy, or diet alone . About half of the patients 254 (50.3%) had diabetes mellitus (DM) for less than 5 years . According to the glycemic control status 247 (49.9%) were controlled while 258 (51.1%) were not . The family history of DM were almost equal, 243 (48.1%) had positive family history of DM, and 262 (51.9%) had negative history (Table 2) .

Table 2: Type, duration, treatment, control status, and family history of DM

Variables	Frequencies	Percentages
Type of DM		
Type 1	80	15.8
Type 2	425	84.2
Duration of DM		
Less than 5 years	254	50.3
6-10 years	118	23.4
11-15 years	59	11.7
16-20 years	38	7.5
More than 20 years	36	7.1
Treatment of DM		
Diet	23	4.6
Oral hypoglycemic drugs	363	71.9
Insulin	79	15.6
Mixed	40	7.9
DM control status		
Uncontrolled	258	51.1
Controlled	247	48.9
Family history of DM		
Negative	262	51.9
Positive	243	48.1

The MSK hand manifestations of DM are summarized in (Figure 4-2) which shows that 196 (39.52%) patients had MSK manifestations in the hand which were cheiroarthropathy, flexor tenosynovitis, Dupuytren's contracture, and CTS { 69 (13.91%), 48 (9.68%), 42 (8.47%), 37 (7.46%) } consecutively, while 309 (60.48%) patients had no MSK hand complications .

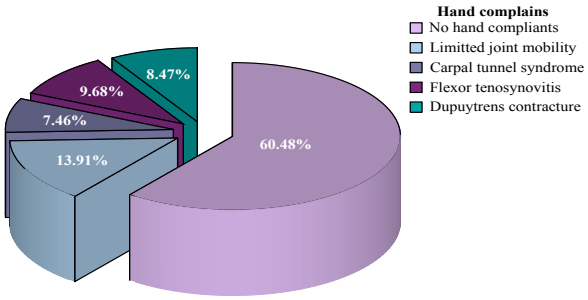

Figure 2: MSK hand manifestations of DM

In Table 3, we found a positive relation between MSK hand manifestations and duration of DM which is statistically highly significant (P value = 0.000), with a mean of (2.222 ± 1.304) showing that frequency of hand complications increase with duration of DM, while there is no relation with age (P value = 0.119) .

Table 3: Relation of MSK hand manifestations with age and duration of DM

Hand complains	Age		Duration of DM	
	Mean+ S.D	P value	Mean+ S.D	P value
No hand compliants Limited joint mobility Carpal tunnel syndrome Flexor tenosynovitis Dupuytrens contracture	51.46±12.01 53.25±12.54 49.76±10.88 53.44±11.45 55.76±12.73	0.119	1.74±1.10 2.04±1.29 2.16±1.40 2.50±1.29 2.67±1.44	**0.000**

Discussion

Diabetes mellitus (DM) is associated with a wide variety of musculoskeletal (MSK) problems, some of which are unique to the disease . The nomenclature of these conditions can be confusing, with some having more than one name in the medical literature. Out of 505 patients we found 196 (39.52%) had one or more types of MSK hand manifestations including (LJM in 13.91%, flexor tenosynovitis in 9.68%, Dupuytren's contracture in 8.47%, and CTS in 7.46%). This result is comparable to that of Sanjeeb *et al* [28] who recorded the LJM to be the most common MSK hand manifestations followed by flexor tenosynovitis, then Dupuytren's contracture, and lastly CTS . Sanjeeb *et al* mentioned the frequency for each hand manifestation but didn't mention the frequency of total number of MSK hand manifestations in his patients . In the other hand in a study done in Greece by Kim *et al* [29] found the prevalence of MSK hand manifestations as high as (82.6%) which is higher than ours.

In a recent study done in USA, Rachel P.K. et al.[11] claiming prevalence of LJM among diabetic patients to be (8 - 50%) which is very wide range, while in a study done by Grgic *et al* [30] the prevalence of LJM was (28.4%) . Triasman HS. et al.[31] reported the prevalence of LJM as (8.4%), while Das *et al* [32] reported it as high as (30-40%) . In Ardic *et al* [33] which is a study done in Turkey, found that non of his patients had LJM and this might be due to short duration of DM in patients he chose . The prevalence of flexor tenosynovitis in our study (9.68%) is lower than that of Mackenzie *et al* [34] in which the prevalence was (11-63%), and higher than that of Ardic F.et al.[33] who shows that (3.8%) of diabetic patients had flexor tenosynovitis . Rachel et al.[11], and Kozak *et al* [35] reported the frequency of Dupuytren's contracture continuant to be (16-42%) and (12-32%) consecutively, this figure having a wide range and higher than ours . Regarding the prevalence of CTS, it was (20%) in a study done by Rachel *et al* [11] which is higher than ours (7.46%), while it is only (1.3%) in that of Ardic *et al* [33] . The difference in the prevalence of MSK hand manifestations of DM may be belongs to the difference in the duration, type, and glycemic control status of DM between the patients included in each study . We found the relation of MSK hand manifestations with duration of DM is highly significant and shows that MSK hand manifestations increase with duration of DM and this is consistant with the results of Petrulewicz-Salamon *et al* [36], Enrico Cagliero *et al* [37], Aydeniz *et al* [38], Sanjeeb *et al* [28], Starkman *et al* [39], Rachel *et al* [11], and Yosipovitch [40] who all reported the MSK hand manifestations to be increased with duration of DM . Regarding gender the occurrence of MSK hand complications were had almost equal males and females with a significant statistical level in our

study, while other authors like Enrico Cagliero et al.[37] in a study done in USA recorded higher prevalence of hand complications in their female patients . A number of author looked at relation between type of DM and MSK hand complications . Douloumpakas *et al* [41] found that MSK hand complications is more in type 1 DM, while Petrulewicz-Salamon *et al* [36] found that it is more in type 2 DM, while in ours the relation of type of DM and MSK hand complications did not reach a significant level. Starkman *et al* [39] recorded that hand complications were more common among diabetic patients on insulin therapy. Glycemic control is being the key treatment of DM, according to our results there is a significant relation between MSK hand manifestations and glycemic control status (P value = 0.027) and shows that MSK hand manifestations were more common in patients with uncontrolled glycemic status .This result is comparable with that of Petrulewicz-Salamon I. et al.[36], a study done in turkey by Aydeniz *et al* [38], and a study done in India by Sanjeeb *et al* [28], while it is differ from that of Enrico Cagliero *et al* [37] which shows that there is no relation between glycemic state and hand manifestations .

Conclusion

Our patients got different hand manifestations with significant association with gender, duration, type of treatment and glycemic control status of DM . MSK hand manifestations were more in patients with uncontrolled blood glucose, with almost equal male and female involvement .

Correlation Study between *H.pylori* Bacteria Qnd Biochemical Tests In Type 2 of Iraqi Diabetic Patients

Mohammed Flayyih Tareef[1], Abdulrazzaq Neamah Zghair[1], Nihad Khalawe Tektook[1]

[1]Middle Technical University / College of Medical & Health Technology, Medical laboratory Techniques Dep. Iraq

Abstract

Background/Aims: many important pathogenic bacteria as Helicobacter pylori (H. pylori) can infect diabetic patients and causing inflammation, therefore aimed of the current study was study the Correlated between a demographic characteristic and biochemical tests of H.pylori in type 2 of Iraqi diabetic patients. **Materials and Methods:** study was carried out on diabetic patients infected or non-infected with *H. pylori*, during period (February-July)2017,in specialized centre for endocrinology and diabetes, study group (Patients) , collected information from all patients by pretested questionnaires , biochemistry testes were done by enzymatic methods. **Results:** Out of the 185 patients of type 2 diabetes, *H. pylori* infection was found higher prevalence of *H. Pylori* infection in diabetics (38.4%) as compared to non diabetic patients (59.4%), as well as significant increase FBG(228 ± 27.9) ; HbAlc(8.1± 1.2) ; *S.*Creatinine(1.3 ± 0.4); Cholesterol(303.7± 9.8), HDL(40.6± 33.2) and LDL (146.4± 26) levels in *H. pylori* seropositive diabetic patients whilst increased level of WBCs (7.1±2.3); HB(13. 23± 0.9); S.Albumin(5.3 ± 0.1) and triglycerides (164.9 ± 17.4) in *H. pylori* seropositive non-diabetic patients. **Conclusion :**higher prevalence of *H. Pylori* infection in diabetics more than no diabetic patients , also high rate of *H. pylori* infection among age group (35-45) years , and significant increase FBG; HbAlc; *S.*Creatinine ; Cholesterol, HDL and LDL levels in *H. pylori* seropositive whilst increased level of WBCs ; Hb; Albumin and triglycerides in *H. pylori* seropositive non-diabetic patients.

Keywords: *H. pylori (Helicobacter pylori*);biochemical tests ; type 2 diabetic patients.

Introduction

Helicobacter pylori are considered as worldwide public health problems which more prevalent in the developing countries, mainly acquired in childhood by the oral-oral; fecal-oral; or gastro-oral route [(1)] .so *Helicobacter pylori* (*H. pylori*)- induced gastritis could potentially affect the secretion of important hormones such as ghrelin; leptin ; somatostatin ; gastrin, and somatostatin, that could affect insulin sensitivity and glucose homeostasis, also, other mechanisms may be involved in the possible causative correlated between infected of *H. pylori* and T2DM[(2).]

In worldwide, About 3.8 million deaths patients have type 2 diabetes mellitus [(3)] as well as many previous showed high correlated between *H. pylori* infection and T2DM[(4)] .Many important factors are important in the development of H. pylori-associated gastroduodenal diseases, such as host factor (as sex; age as well as genetic susceptibility); virulence antigens and environment-related factors[(5)].

Materials and Method

The study was carried from (February 201– July) 2018, in specialized centre for Endocrinology and diabetes , Collected 5 ml of blood from diabetic patients infected or non-infected *H. pylori* and for clotting , left at room temperature for (1) hour , the centrifuged at 3000 rpm for 10 minutes and serum was at – 20C until the used.

Biochemical test : the biochemistry testes were done in morning after fasting overnight (12hours), collected venous blood sample for testing : fasting blood sugar (FBS) level ; glycosylated haemoglobin (HbAlc); Total cholesterol ; HDL (high-density lipoprotein

cholesterol; Triglyceride; serum creatinine and FBG measured for both study and control group by routine enzymatic methods , used the diagnostic kit (Biolabo SA.;France), All testing were done in the laboratory of specialized center for Endocrinology and diabetes in Baghdad. Diagnosis of *H.Pylori* by used ELISA (IgG, EIA , Trinity Biotech , U.S.A).

Data Analysis

Values were expressed as mean ±SD, differences between the mean values were analyzed by chi- square test ,the criterion for significance was ($p \leq 0.05$) .

Finding

In table 1 appearance prevalence of *H.pylori* infections in diabetic patients were (15.6%) in the age group(35 45) years;(10.2%) in (25 – 35) years whilst in control group (non- diabetic patients) was 13% and 21.7 %, respectively which was founded significant ($P = 0.5$), and showed high percentage in age group (≥ 45) years , so in this table the gender high distribution in male (24.4 , 20.5)% in both groups (diabetic patients and healthy) compare to female (14, 14.7) % with and without diabetes mellitus .

Table (1): distribution of diabetic patients and Control Group(healthy) according to *H.pylori* infected .

Type Groups	*H.pylori*				Total (No.,%)
	(+)		(-)		
	No.	%	No.	%	
Study Group (diabetic patients)	35		57		92
Control Group	50		34		84

The present study found higher prevalence of *H. Pylori* infection in diabetics (38.4%) as compared to nondiabetic (59.4%) .

Table (2): Corelationshipe between biochemical test and *H.pylori* in diabetic and non- diabetic patients .

Biochemical test	Study group (diabetic patients No.= 185)		Control group (healthy voluntary No.= 185)		Normal value (mg/ dl)
	H.pylori		*H.pylori*		
	(+)	(-)	(+)	(-)	
F.B.G	228 ± 27.9	203.4 ± 22	95.0 ± 12.11	89.9± 12.3	60 -110
W.B.Cs	6.9 ± 1.5	6.5 ± 1.4	7.1±2.3	6.9 ±2.1	4.0 – 11.0
Hb	10.2± 0.7	10.6 ± 0.8	13. 23± 0.9	12.50± 0.12	
HbA_1c	8.1± 1.2	7.9 ± 0.7	4.96±0.43	4.1±0.43	3.0 – 6.0
S. Albumin	4.5 ± 0.5	4.2± 0.5	5.3 ± 0.1	4.3 ± 0.5	3.5 – 5.3
S. Creatinine	1.3 ± 0.4	0.9 ± 0.3	0.50 ± 0.08	0.61 ± 0.05	0.2 - 1.2
S.Triglycerides	151.9± 3.9	106.7± 13.2	164.9 ± 17.4	130.4± 3.2	< 150
Cholesterol	303.7± 9.8	236.1± 16.5	201.3 ± 5.2	209.7± 5.5	130- 200
HDL	40.6± 33.2	41 ± 18.8	42.9 ± 3.2	40.5 ± 3.0	< 40 male < 50 female
LDL	146.4± 26	134.2± 16.8	133.5 ± 20.3	135.6±21.0	< 100

The (mean values± S.D) of FBG ; WBCs ; HB ; HbAlc ; S.Albumin ; S.Creatinine ; triglycerides ; Cholesterol, HDL and LDL for diabetic patients type2 infected with H. pylori(+) and non infected(-) compare to control were illustrated in table(2).

The present results showed significant increase FBG(228 ± 27.9) ; HbAlc(8.1± 1.2) ; *S.*creatinine(1.3 ± 0.4); Cholesterol(303.7± 9.8), HDL(40.6± 33.2) and LDL (146.4± 26) levels in *H. pylori* seropositive diabetic patients whilst increased level of WBCs (7.1±2.3); HB(13. 23± 0.9); S.Albumin(5.3 ± 0.1) and triglycerides (164.9 ± 17.4) in *H. pylori* seropositive non-diabetic patients.

Chen and Blaser showed that H.*pylori* play directly or indirectly in increases HBA_{lc} levels in the adults[11], so Chen and Blaser ,2012 elucidate *H. pylori* regulates leptin and ghrelin, which play important role in energy homeostasis and metabolism[11], so several studies as [12,13] showed elevation or increased level of LDL in *H. pylori* infection, so [14] found in *H. pylori*-infected patients have higher serum cholesterol and lower HDL than in negative patients ,However regarding HDL, similar results were previously reported[15, 16, 17].

Aarabi*et al.,* 2010 appearance in his study level of triglyceride level was higher in *H. pylori* infection than in negatives[12]. However VolanenI *et al.,*2005found that serum triglyceride and HDL level can change during acute phase of bacterial infection[18].

Glycated haemoglobin (HbAlc) was correlated to glucose levels measurements obtaining that HbAlc could be used as an objective tool of glycemic control[19] other hands [7]elucidate increased levels of HbAlc associated with *H. pylori* infection in type 2 diabetes group[7] , As well as HbAlc in *H. pylori* infection among diabetics were greater than *H. Pylori* non diabetics[7] ,but [20] founded no correlated between *H. pylori* infection with HbAlc in men aged40-70 years with or without diabetes , Whilst [21] found that *H. pylori* eradication in type 1 diabetes does not affect glycemic control in patients as evidenced by HbAlc level and daily insulin requirement.

So Bajaj *etal*., 2014 study provides evidences that *H. Pylori* infection was associated with increase in LDL level and triglyceride but no effect on levels of both total cholesterol and HDL[7].

In healthy Korean adults was associated with lipid profile as increase in LDL ; total cholesterol and triglyceride, but decrease in HDL[22] .

Dursen *et al*., found no significant in lipid profile in both *H. pylori* infected in diabetics and non-diabetics[23,24].

Conclusions

H.pylori infections are one of the risk factor may be considered in the evaluation of diabetic patients .

H.pylori infections were higher in diabetic patients compare to healthy controls.

Serum cholesterol, FBG; HbAlc; *S.* Creatinine ; Cholesterol, HDL and LDL were higher level in *H. pylori*-positive diabetic group as compared to negative diabetics.

incidence of bacteria in smokers, and who drinking the coffee; tea and water also source of water (natural or minerals) in both groups (diabetic and non-diabetic), and highly prevalent in low income patients.

Correlation of Serum Amylin Level to Polycystic Ovarian Syndrome

Aied M. Talaq[1], Salam S. Ahmed[2]

[1]Salah Al-din General Hospital; [2]College of Medicine – University of Tikrit

Abstract

Background: Polycystic ovary syndrome (PCOS) is the most common endocrine disorder in women of reproductive age, affecting 6%–10% of women worldwide. Objective: The study aimed to assess the relation of serum amylin level in women with polycystic ovarian syndrome. **Materials and Methods:** A cross−sectional study was carried out in Salah Al-din City from 10th of November 2018 , to 20thof May 2019. The number of polycystic ovary syndrome women under study was 51 women whose ages were between 18 and 45 years old. These women admitted to obstetrics and gynecology unit at Salah Al-din Teaching Hospital. The control group who were matched to the patients studied included 37 women.F**inding :**The study showed that there is the significant difference between PCOS women and the control group concerning serum amylin level and the highest mean of amylin was occurred in PCOS women (183.12 ± 10.021 vs. 23.62 ± 1.97). There was a weak positive correlation between body mass index and amylin level among PCOS women in this study. The highest rate of PCOS women had irregular menstrual cycle. The study showed that most PCOS women included in the study had hirsutism. The high rate of acne recorded among PCOS women. **Conclusion:** It was concluded that there was a highly significant relation of amylin to PCOS.

Keywords: *Hirsutism, menstrual irregularity, polycystic ovary syndrome, amylin.*

Introduction

Polycystic ovary syndrome is the most common endocrine disorder in women of reproductive age, affecting 6%–10% of women worldwide.(1) Polycystic ovary syndrome is characterized by chronic anovulation, hyperandrogenism, and multiple small subscapular cystic follicles in the ovary on ultrasonography.(2)

Amylin is a 37 amino acids polypeptide hormone with a molecular weight of 3.9 kDa, was firstly isolated from amyloid deposit in pancreatic islets of type 2 diabetic patients.(3) Amylin is mainly co-secreted with insulin by pancreatic β-cells in response to stimulation of glucose, free fatty acids, and nutrient intake.(4) Amylin inhibits food intake and delays gastric emptying, leading to the reduction of blood glucose levels and body weight. Moreover, pramlintide, an amylin analogue also reduces body weight in humans.(5) However, studies assessing serum amylin levels in PCOS women have yielded inconsistent results(6).

Materials and Method

A cross-sectional study was carried out in Tikrit City from 10th of November 2018 to 20th of May 2019. The number of PCOS women under study was 51 women whose ages were between 18 and 45 years. The diagnosis of PCOS was based on Rotterdam Criteria: oligo and/or anovulation clinical and/or biochemical signs of hyperandrogenism, and polycystic ovaries in ultrasound, meaning presence of 12 or more follicles measuring 2 – 9 mm in diameter in each ovary and/or ovarian volume more than 10 cm^3. In addition the control group consisted of 37 apparently healthy volunteer females with regular menstrual cycles aged between 18 and 45 years. A volume of 5 mls of blood sample was taken by vein puncture from each subject enrolled in this study. Blood samples were placed into sterile test tubes, after blood clotting, the samples were centrifuged at 3000 rpm for 15 min then if a clot was developed, then was removed and re-centrifuged at 3000 for 10 min, and the obtained serum were aspirated using mechanical micropipette and transferred into clean plain tubes with

screw which labeled and stored in deep freeze at - 20 °C for the biochemical measurement of amylin by ELIZA.

Statistical Analysis

The statistical analysis was performed using Statistical Package for the Social Sciences version 23 (SPSS, IBM Company, Chicago, USA).

Finding

This study showed that there was a significant difference between PCOS women and the control group concerning serum amylin level. The mean serum amylin in PCOS women was 183.12 ± 10.021 vs. 23.62 ± 1.97 in control group, as shown in table 1. There was a weak positive correlations between body mass index (BMI) and serum amylin level among PCOS women in this study, figure 1. The highest rate of PCOS women had an irregular menstrual cycle (84.31%) and 15.69% of them had normal menstrual cycle, as shown in figure 2. The study showed that most PCOS women included in the study had hirsutism (66.70%), while only 33.30% were without hirsutism, as shown in figure 3. The high rate of acne recorded among PCOS women was 53% and 47% of PCOS women without acne, as shown in figure 4.

Table (1) : Serum level of amylin in women with PCOS and the control group.

Amylin level (pg/ml)	PCOS women	Control group	t. test	P. value
No.	51	37		
Mean	183.12	23.62	7.28	0.0001
SD	10.021	1.97		

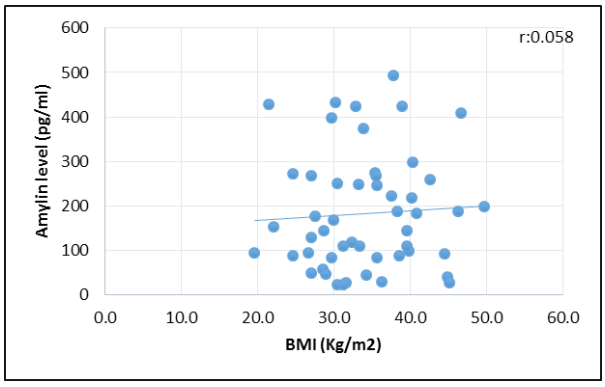

Figure (1): Correlation between amylin hormone and BMI of PCOS women.

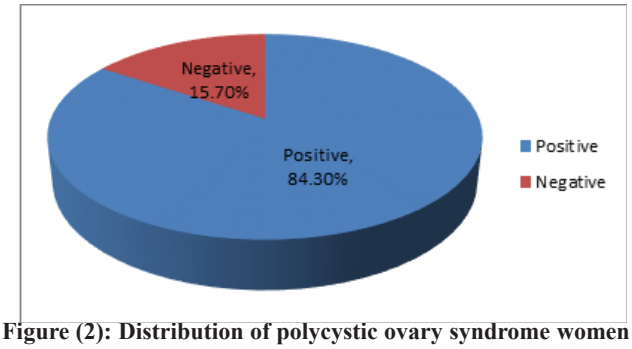

Figure (2): Distribution of polycystic ovary syndrome women according to irregularity of menstrual cycle.

Figure (3): Distribution of PCOS women according to hirsutism.

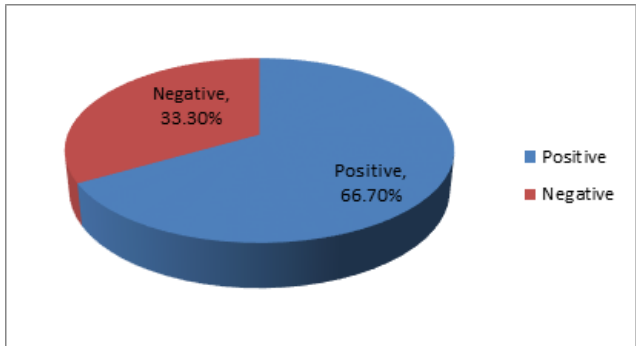

Figure (4): Distribution of PCOS women according to presence of acne.

Discussion

PCOS is an endocrine disorder with multifactorial etiology and various clinical manifestations. It is the most common cause of menstrual disorder and an ovulatory infertility in women.[7]This study showed that there is the significant difference between PCOS women and the control group concerning amylin level which was found to be significantly higher in women with PCOS comparing with the apparently healthy women at of less than 0.01, suggesting the presence of a hormonal disturbance in women with PCOS, which may reflecting a significant effect of the pancreatic hormones on the ovarian function. These results were in agreement with JAMES *et al,* [8] who found an increment in serum amylin level in women with PCOS. The precise mechanism of increased serum amylin levels in women with PCOS currently is unknown, PCOS is a complex disorder and carries an important pathophysiological role. Therefor women with PCOS have a higher chance for insulin resistance and compensatory hyperinsulinemia leading to an increased risk of obesity, type-II diabetes mellitus, metabolic syndrome, as well as hyperandrogenemia. Amylin may contribute to their progression of diabetes, and beyond their risk for diabetes, women with PCOS also have higher risk of developing dyslipidemia and

hypertension.[9]

This study showed that the rate of PCOS women to had an irregular menstrual cycle, hirsutism, and acne were higher in women with PCOS as compared with the control group.some studies report a prevalence of hirsutism in women with PCOS in the range of 50–76%. [10][11] Hirsuitism is defined as excessive hair growth in area usually associated with male sexual maturity, that is, on the face, chest, lineal alba, lower back, buttocks, and anterior thighs. Hirsuitism results from androgen effects on the pilosebaceous unit and is commonly associated with acne and oily skin. It is usually due to an increase in androgen production from the ovaries or adrenal glands.[12] The results noticed by this study were in agreement with Azziz *et al* [13] and Ovalle and Azziz, [14] they concluded the source of hyperandrogenism due to the genetic abnormalities in insulin receptor resulting in the thickening of the ovarian theca that increased the androgen production and inhibition of sex hormone binding globulin synthesis. The degree of hirsutism might be influenced by the relative activity of the 5α-reductase enzyme that convert testosterone to the more active metabolic dihydrotestosterone.[15] [16] The high concentrations of testosterone, one of the factors that contribute to some symptoms of PCOS such as infertility, polycystic ovaries, hirsutism, and acne.[17] Gowri *et al* [18] showed that the acne was seen in highest percentage (67.5%), followed by hirsutism (62.5%) in women with PCOS compared to healthy women of a comparable age group and fasting insulin levels was the most common hormonal abnormality seen along with both acne and hirsutism. Sharma *et al* [19] Majumdar and Singh [20] also showed that acne was the most common cutaneous manifestation in PCOS group.

In addition, women with PCOS are frequently obese and obesity is associated with menstrual cycle abnormalities in the general population.[21] The prevalence of these cycle abnormalities may vary in unselected women with PCOS because they reflect the subgroup of PCOS women who have sought medical attention and thus are more likely to demonstrate a more severe phenotype.[22] On the other hand, menstrual cycle irregularity is a relatively accurate surrogate of ovulation and is easily obtained from the medical history.[23] *Strowitzki et al* [24] reported that in women with PCOS, insulin resistance was significantly lead to an amenorrhea (cycle length > 6 mo) when compared with those with normal cycles.

Conclusion

In conclusion, women with PCOS had a higher serum level of amylin compared to other women without PCOS of a similar age group.

MMP-13 Gene Polymorphisms Associated with KOA in Iraqi Population

Mustafa Saleam Khalaf[1]; Estabraq Abdulrasool Kwaeri[1]; Abbas Toma Joda[1]

[1]Al-Nahrain University – College of Medicine

Abstract

Knee osteoarthritis (KOA) is disease occur in knee joint characterize by cartilage degradation that mediate via pro-inflammatory marker such as matrix metalloproteinase-13 (MMP-13) . MMP-13 is enzyme expression in chondrocyte ,encoded by MMP-13 gene , act to degraded it and joint degenerative .This study explained association the rs2252070 single nucleotide polymorphisms (SNP) of MMP-13 gene in KOA . The result demonstrate that G alleles have significant association with KOA development . our results are the first ones reporting an association between MMP-13 and KOA in Iraqi populations .

Key words */ MMP-13 gene polymorphisms and Knee osteoarthritis (KOA).*

Introduction

Knee osteoarthritis (KOA) is the disease occur in the knee joint .It's degenerative arthritis in cartilage matrix of knee , is a group of overlapping distinct diseases, which may have different etiologies but with similar at biologic, morphologic, and clinical outcomes[(1)]. The most common form of arthritis is KOA , 6%of adults are affected it and the women more affected than men at age more than 45 years .KOA always has many soluble mediators for example prostaglandins and cytokines ,these mediators can stimulat matrix metalloproteinase-13 (MMP-13) in chondrocyte. MMP-13 production is consider the first step in theory of inflammation and degenerative knee joint[(2)] .

MMP-13 (also called collagenase) is enzymes that break the collagen peptide bonds in cartilage (Collagen, a key component of the extracellular matrix of chondrocyte) encoded by MMP-13 gene. MMP-13 is a protein of 81 875 Da and 739 amino acid residues as deduced from the DNA sequence analysis [(3)] . MMP-13 protein is synthesized in precursor form (preprocollagenase), then the signal peptide and pro region are removed and the resulting mature form is secreted. Plays a role in the degradation of extracellular matrix proteins(cartilage degradation) including fibrillar collagen and fibronectin .Cleaves triple helical collagens, including type I, type II and type III collagen, but has the highest activity with soluble type II collagen [(4)] .

Materials and Method

Study design : This study designed according to approved via Institutional Ethics Committee in Medical College / Al-Nahrain University / Iraq and it done in Rheumatology & Rehabilitation Consultation Unit in Al-Yarmouk Teaching Hospital / Iraq . The consents obtained from all patients and healthy persons that involved in the study . Diagnosis of cases with KOA was according to American College of Rheumatology (ACR), all the patients are classified as primary KOA will include in this study .The ACR depends on signs and symptoms of KOA that show on patients also depend on clinical examination and X- ray (anteroposterior (AP) view and skyline view) [(5)] . This study involved collected 50 primary KOA grade 1 (G1) and 50 grade 4 (G4) cases and 50 controls, age of the cases and controls were more than 40 years . Table 1.

Table 1 : Numbers and age of the KOA cases and controls

	Number	Age (years)
KOA (G1) cases	50	Mean ±SD (48.1± 5.8)
KOA (G4) cases	50	Mean ±SD (48.8± 6.1)
Controls	50	Mean ±SD (49.1± 6.6)

SD/ Standard deviation

Samples collection : Five ml of blood drawed from cases and controls collected it in EDTA tube .DNA was isolated from blood sample by DNA extraction kit (Zymo company / USA) according to special method at kit . The isolate DNA stored in -20 C until future use . The DNA sample had purity ratio 1.7 to 2 that used in PCR-RFLP method . The Gene Runner software (Version 3.05) was used to design of MMP-13 gene primer , all primer information in table 2.

Table 2: Data for analysis of SNP in the human MMP-13 gene.

Gene name	SNP	Primers	GC %	Restriction enzyme	Tm (C)	PCR product size (bp)
MMP-13	rs2252070	Forward 5'- GAT ACG TTC TTA CAG AAG GC- 3'	45	BsrI	50.4	445
		Reverse 5'-GAC AAA TCA TCT TCA TCA CC - 3'	40		48.7	

PCR used for DNA amplification : Polymerase Chain Reaction (PCR)The extracted used to amplification of DNA . PCR was applied on AURA TM PCR Cabinet (Labnet – Italy). The PCR reaction was consisted of 1.5µl of 110 ng DNA, 1μL of mM dNTPs , 10 pmols/µl (1µl) of forward and 10 pmols/µl(1µl) of reverse primer , 0.3 μL of 5U/µl iTaq DNA polymerase , 3 μL of Taq polymerase Buffer A , and 16.5 µl of deionized water . The thermal cycling conditions showed in table 3.

Table 3: The thermal cycling conditions

No.	Phase	Tm (^{o}C)	Time	No. of cycle
1-	Initial Denaturation	95^{o}C	3 min.	1 cycle
2-	Denaturation -2	95^{o}C	45sec	35 cycle
3-	Annealing	56^{o}C	45sec	
4-	Extension-1	72^{o}C	45sec	
5-	Extension -2	72^{o}C	7min.	1 cycle

The production of PCR were separated by use a 2% agarose gel containing 2 μL ethidium bromide. A 100 bp DNA marker was used as a size standard for each gel lane. The UV light used for visualization of gel

Restricted Fragment Length Polymorphism (RFLP) Analysis: The productions of PCR was digested by restriction enzyme , BsrI (Biolab/England). The digested fragments were electrophoresis on 2.5% agarose gel mixed with red stain. The genotype frequencies. found by RFLP analysis .

Statistical Analysis

The GraphPad PRISMstatistical software (version6 .0, San Diego, CA, USA) was used to data analyses . The Chi-square (χ 2) test used to find the difference between allelic frequencies and genotype in KOA cases and control. The odds ratio and confidence interval (CI) (95%) was used to calculate association between KOA cases and control's genotypic and allele frequencies . Odds ratio was used to statistically demonstrate a positive dose response relationship of mutant allels (G allele) with KOA .

Finding

A / KOA Patients: This study involved 50 patients with G1 KOA and 50 patients with G4 KOA ,and

studied Genotype frequencies by using PCR -RFLP to detect the found of SNP of MMP gene (rs2252070).

rs2802292 SNP is characterized by A>G in G1 KOA patients .The AA mutant type (homozygous) of genotype frequency was high (58.7%) , and GG mutant type was low (2.1%) also AG mutant type (heterozygous) was (39.1%) . This study calculated the allel frequencies by genotype frequencies and showed that A allele was high (79%) but G was low (21%) in G1 KOA patients .

rs2802292 SNP is characterized by A>G in G4 KOA patients .The AA mutant type (homozygous) of genotype frequency was (26%) , and GG mutant type was low (20%) also AG mutant type (heterozygous) was high (54%) . This study calculated the allel frequencies by genotype frequencies and showed that A allele was high (57%) but G was low (43 %) in G4 KOA patients .

B / Controls. This study involved 50 healthy persons and studied Genotype frequencies by using PCR -RFLP to detect the found of SNP of MMP gene (rs2252070) .

rs2802292 SNP is characterized by A>G in controls .The AA mutant type (homozygous) of genotype frequency was high (56%) , and GG mutant type was low (0%) also AG mutant type (heterozygous) was (44%) . This study calculated the allel frequencies by genotype frequencies and showed that A allele was high (78%) but G was low (22%) in controls .

C/ Association Studies : This study included compared between G1 KOA with controls and G4 KOA with controls . The results showed that χ 2 forG1 with controls were non significant but for G4 with controls were significant correlation. The odds ratio and Cl 95% forG1 with controls were non significant but for G4 with controls were significant correlation . As per genotype frequency analyzed data, KOA cases are more likely to have a AG allele as compared to AA and more likely to have a GG allele. These association depend on CI that consider significant when to be above 1.0. If GG allele can be considered as a higher exposure to G as compared to AG , then the above statistics demonstrate a positive dose-response relationship of G allele with KOA . Table 4, 5and 6 .

Discursion

The KOA is degenerative disease of cartilage in knee joint , it's inflammatory disease because it occur with inflammatory mediators and the age consider as risk factor to OA development therefore consider as within age related diseases [1].

The chondryocyte with age suffer of high expression of nitric oxide (NO) (high level of NO act as risk factor against survival of cell) this considered as factor for chondryocyte degredation and OA development due to the NO is one of triggers for MMP-13 in cell [6]. MMP-13 are enzymes that break the peptide bonds in collagen (Collagen, a key component of the animal extracellular matrix, is made through cleavage of pro-collagen by collagenase once it has been secreted from the cell) encoded by MMP-13 gene and it's act as mediator the cartilage degradation [7].

This study showed association between MMP-13 gene polymorphisms with KOA through the mutant of A>G . This association explained when compare control with G4 KOA and G1 with G4 KOA and obtained significant association in this comparisons. This result demonstrate that MMP-13 gene polymorphisms can develop the KOA , This effect occur by NO that mediate the MMP-13 expression.

NO act as 2nd messenger , such as reactive oxygen species , in cell for activation of many biological functions therefore it can activate the Guanylate cyclase (GC) . GC act to convert the GTP to cGMP .cGMP mediate the phosphorlation of protein kinase G (PKG) and activation it (8). PKG also act to phosphorlate the Core-binding factor alpha 1 (Cbfa1) in presence of cGMP exclusively ,this lead to activation of Cbfa-1 . Cbfa-1 is localize in cell nuclei , this lead to it effect on MMP-13 gene and elevate MMP-13 expression [9] . Therefore , the NO cGMP- PKG pathway promot MMP-13 expression .The NO cGMP- PKG pathway might drive Cbfa-1-dependent gene expression in chondryocte by regulating nuclear translocation of Cbfa-1. This can be stimulate and hyperactivation of proinflammatory cytokines (such as MMP-13) [10].

Our study for the first time shows that MMP-13 SNP (rs2252070) is significantly associated with KOA in Iraqi population . In addition to the highly significant association of MMP-13 and OA , based stratification also indicated that the mutant "G" allele has a much more pronounced risk rate of OA in Iraqi populations . Increase of G allele have association with elevate MMP-13 activity and KOA development . The our study is first time shows association between KOA and MMP-13 SNP (rs2252070) , and some study in China (Sun G1, Ba CL1 and et al . 2019) show same association but different allele , at Chinese population the A allele but in Iraqi G allel is risk factor in KOA development due to it can increase the encoded and activity of MMP-13 [11].

Conclusion

The our study conclude that genotype frequencies of KOA patients and controls were studied using PCR-RFLP technique to detect the presence of SNP of MMP-13 gene (rs2252070). The Chi-square test indicated significant positive relationship between KOA and TG and GG genotypes

Rejuvenation of Under Eye by Nanofat Grafting

Aasem Mohamed Al-Byti[1], Abdulrazzaq Abbas Waheeb[1], Saygin Abdulkadir Chakmakchy[1]

[1]M.B.Ch.B.-FICM (Plastic), Tikrit University, College of Medicine, Tikrit, Iraq

Abstract

Over the past decade, we have seen unprecedented growth in the popularity of elective cosmetic surgery. In a prospective study, a total number of 22 female patients under the age of 40 years (range from 20-40 years) all complaining form dark pigmentation involving the lower eyelids in Kirkuk city in north of Iraq ,all patient had been treated by intradermal nanofat injection . Those patients were selected, evaluated and operated during the period from March to November 2018. In all cases the diagnosis confirmed clinically; none of these patients in this study received previous medical or surgical therapy. Their ages were ranging between (20 years to 40 years). All were treated by single stage nanofat injection in the lower eyelids ;Nanofat injected to improve the pigmentation and skin rejuvenation for all patients injected with intradermal nanofat ; all patients injected by nanofat using small sharp needle 27-gauge in repeated fan-shaped patterns intradermally with 1 cc of nanofat in each side followed by Simple digital massage over the lower eyelids ;at the end of the injections erythema and a yellowish discoloration was noticed in whole lower eyelids; this discoloration disappeared within 5 weeks by a gradual lightening of the skin. After an average follow-up of six months (range 3–9 months), Assessment of the results by the surgeon were good in 50%, fair 36.4 and poor 13.6, patients satisfaction were good in 59.1%, fair in 31.8% of cases and only 9.1 were poor as shown in. Only 2 patients (9.1%) in this study had prolong ecchymosis as postoperative complications , all other patient healing pass smoothly and uneventful .

Keyword: *Lower Eyelid Skin; Nanofat grafting; fat graft*

Introduction

Over the previous decade, unprecedented growth in the popularity of elective cosmetic surgery have been seen. According to the American Society for Aesthetic Plastic Surgery, there has been a approximately 8% elevation in plastic surgery[(1)]. different factors can cause dark circles around the eyes. One cause is excessive pigmentation due to dermal melanocytosis. This can be congenital or occur secondary to such conditions as atopic or allergic contact dermatitis [(2)]. Another common cause of dark circle is a thin, translucent lower eyelid skin overlying the orbicularis oculi muscle. Transparent eyelid skin allows visualization of the underlying subcutaneous vascular plexus or vasculature within the muscle [(3)]. Shadowing due to skin laxity and tear trough is another cause of infraorbital dark circle [(4)]. This can worsen with time because of age-related loss of subcutaneous fat and hollowness of the periorbital area. Many causative factors of the dark circles include translucent, thin skin with excessive pigmentation of the lower eyelids skin overlying the orbicularis oculi muscle and shadowing due to laxity of the skin and tear trough deformity, periorbital edema, superficial location of vasculature may also exacerbate the condition [(5)]. Etiologic factors likewise incorporate hereditary/ established, post provocative hyperpigmentation ,dermal melanin affidavit, hypersensitive contact dermatitis, optional to sickliness, stress, flawed propensities [(5)]. So this condition may be challenging to treat due to it complex etiopathogenesis, and lacking straightforward and repeatable therapeutic options [(6)]. Many treatment modality had been used like IPL, and Q-switched ruby laser, local creams ,Chemical peels, as well as fillers have all been tried for treatment but none have provided a satisfactory treatment [(7)]. All mentioned treatment option are not effective for patients with dark pigmentation in lower lid due to thin, translucent skin. In this type of dark pigmentation, injection of autologous fat has been reported as a good method [(8)]. A new treatment technique called Nanofat has been introduced by Tonnard *et al*. In which autologous fat graft harvested manually

by closed syringe lipoaspiration then it's emulsified mechanically until a liquid suspension is obtained and then superficially injected in intradermal plain with fine sharp needles [2]. Autologous fat grafting firstly reports in the early twentieth century and used clinically after the introduction of liposuction by Illouz in the 1980s as a lipofilling treatment in which fat injected deep subcutaneously [9]. Zuke *et al* determined that stem cells could be isolated from human adipose tissue obtained by suction-assisted lipectomy (liposuction) was processed to obtain a fibroblast-like stem cells [10]. In this clinical study, nanofat technique evaluated the reliability of a practical method in which intradermal nanofat injection used to rejuvenate skin and treat dark pigmentation in lower eyelids.

Material and method

2.1. Patients:

In a prospective study, a total number of 22 female patients under the age of 40years(rang from 20-40 years) all complaining form dark pigmentation involving the lower eyelids in Kirkuk city in north of Iraq ,all patient had been treated by intradermal nanofat injection. Those patients were selected, evaluated and operated during the period from March to November 2018. In all cases the diagnosis confirmed clinically; none of these patients in this study received previous medical or surgical therapy. Their ages were ranging between (20 years to 40 years).

To evaluate clinically the benefit of Nanofat injection for skin rejuvenation and dark pigmentation of the lower eyelids as an outpatient procedures with short term follow up. Preoperative evaluation in all 22 patients included medical history, a complete physical examination, thorough history and physical examination. Collected information about patient associated illnesses, smoking, drug use and medication history, and family history, preoperative photograph were taken to all patients in frontal view. Liposuction was performed and harvested from the lower abdomen after infiltration with a modified Klein solution, prepared by 1 liter of physiological solution (RL) + lidocaine 800 mg with adrenaline 1mg (1:1000).

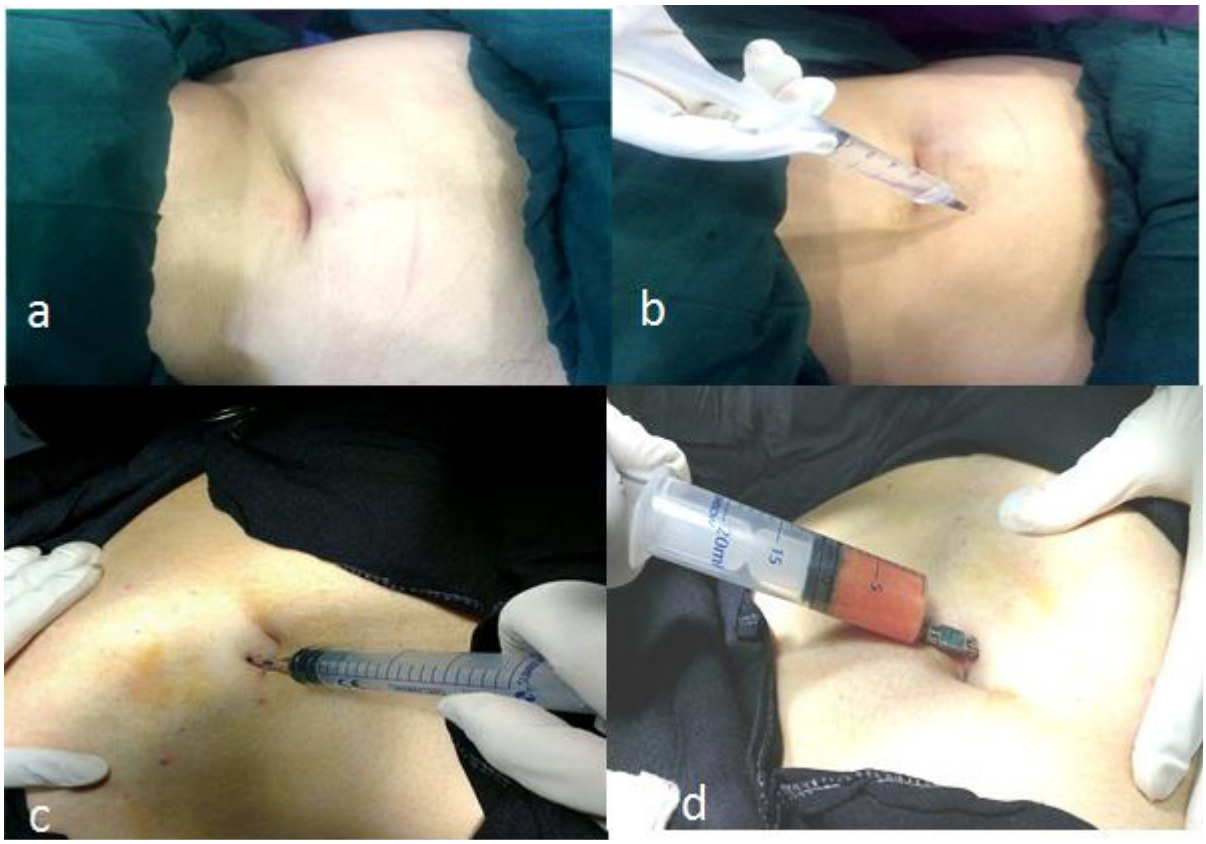

Fig 1. Operative procedure: (a)-Lower abdomen draping (b-c)- infiltration with a modified Klein solution (d)-Closed syringe liposuction.

Then the collected fat (Fig.2), in order to reduce any residual local anesthetic solution and red blood cells lipoaspirated fat was rinsed with sterile saline (Fig.2:2b), then by using Tonnard's technique [8] the lipoaspirate fat is mechanically emulsified this achieved by 30 passes shifting between two 10-cc syringes connected each other by a female-to-female Luer-Lock connector.

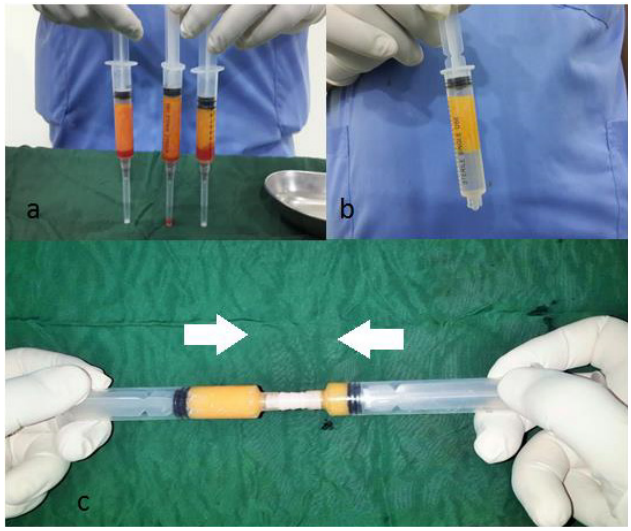

Fig 2: Nanofat preparation: (a) - Collected fat (b) - lipoaspirated fat was rinsed with sterile saline (c) - Emulsification of lipoaspirate fat by achieved mechanically by 30 passes shifting between two 10-cc syringes connected each other by a female-to-female Luer-Lock connector

Emulsification process liquefy fat to emulsion and changed it color from yellow to pale yellow white (Fig. 3b), the fat becomes liquid and emulsified so it can be injected easily by small needle 27-gauge intradermally (Fig. 3a) the injection started from medial aspect of the lower eyelids to lateral aspect (Fig. 3c-d) followed by simple digital massage to injected area (Fig. 3e) to prevent skin irregularity due to nanofat localization and also decrease post injection erythema and yellow discoloration

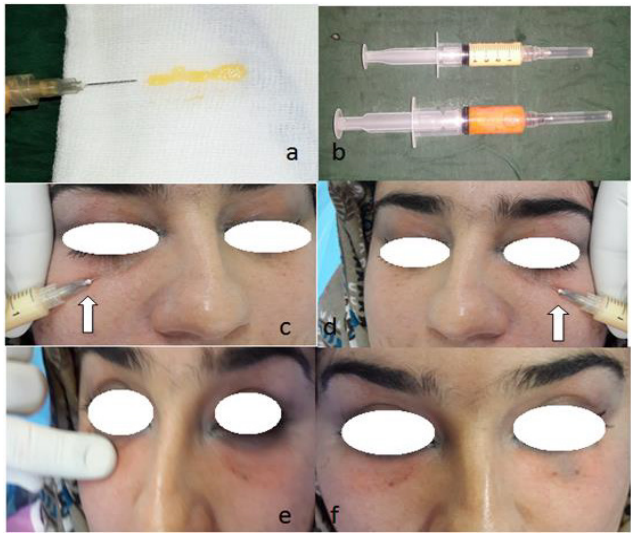

Fig 3 (a-f) Nanofat injection(a)- Nanofat infused effectively by little needle 27-measure (b)- Emulsification procedure modify fat shading from yellow to light yellow white (c-d)- Intradermal nanofat infusion in both left and right lower covers (e)- Simple computerized back rub to the infused region (f)- post infusion erythema and yellow staining.

2:5 Post-operative measure:

Dressing made with local eye ointment apply to the lower eyelids. Oral Antibiotics with local eye antibiotic ointment were continued for five days postoperatively, usually patients were return to normal life style on the 3th postoperative day. The patients were followed up (3 to 9 months post operatively) for the evaluation.

Findings

Twenty two female patients were included in this study ,there age range from 20 to 40 years as shown Table 1, Patients concern was variable between dark pigmentation alone or pigmentation with rejuvenation as shown in Figure 4; all were treated by single stage nanofat injection in the lower eyelids ;Nanofat injected to improve the pigmentation and skin rejuvenation for all patients who injected with intradermal nanofat ; all patients injected by nanofat using small sharp needle 27-gauge in repeated fan-shaped patterns intradermally with 1 cc of nanofat in each side followed by Simple digital massage over the lower eyelids ;at the end of the injections erythema and a yellowish discoloration was noticed in whole lower eyelids; this discoloration disappeared within 5 weeks by a gradual lightening of the skin. After an average follow-up of six months (range 3–9 months), Assessment of the results by the surgeon were good in 50%, fair 36.4 and poor 13.6, as shown in Table 2; patients satisfaction were good in 70%, fair in

25% of cases and only 5 were poor as shown in Table 3. There were no significant wound complications, no infections, no cysts, or permanent discolorations, or other side effects were observed right after the treatment and also at the follow up visit. ; Only 2 patients (9.1%) in this study had prolong ecchymosis as postoperative complications , all other patient healing pass smoothly and uneventful .

Table 1: Number and percentage of patients according to their ages

Age of patient	No. of Cases	Percentage
20-30 year	8	40
30-40 years	14	60

Result	No. of Cases	Percentage
Good	14	70
Fair	5	25
Poor	1	5

Discussion

Dark circles under the orbital affect individuals of both sexes, all races, and a wide range of ages. Circumcision factors are known to cause the appearance of dark circles, including excessive pigmentation of the skin, thin, dry, thin skin that rises above the circular eye muscle, and shingles caused by skin laxity and tear pelvis. The most appropriate method of treatment varies according to the main causative factor of the dark circle. Topical skin lightening agents are the mainstay of treatment for hyperpigmentation [(10)]. Factors commonly used in hyperpigmentation include hydroquinone, retinoic acid, meicinol, azylic acid and corticosteroids [(11)]. Various combination therapies of these topical agents have been used to increase their efficacy while reducing side effects [(12)]. Autologous fat injection has been reported as an effective method for treatment dark lower lids pigmentation caused by thin, translucent skin in which many modalities of treatment cannot treat it [(13)]. But fat injection may cause visible lumps of fat, contour irregularities, or fat necrosis or fat loss as it injected subcutaneously [(14)]. Tonnard's *et al* change fat particles to semi liquid emulsify by mechanical emulsification process change fat particles to nanofat which completely disrupts the adipose tissue structure so it can be injected by small gauge needle intradermal not subcutaneously in order not to have a volume-adding effect. But the major benefit of nanofat injection is to relate to stem cell activity [(8)]. In the current study, nanofat grafting combined with microfat grafting produced satisfactory results in treating lower eyelid dark circles. Microfat grafting at the nasojugal folds compensated for the lack of volumetric effects of the nanofat grafting technique, and nanofat grafting at the lower eyelids improved the dark circles effectively, without any noticeable irregularity. This technique produces effects that are similar to those achieved by injecting purified stromal vascular fraction, but without the complicated technique or expensive laboratory equipment required for the latter. As well, the skin rejuvenating effects from stem cell activity are augmented by the fat graft acting as a soft tissue filler, to produce the final effect. In this study we have use nanofat injection by the same steps used by Tonnard's *et al*. in which they inject in each lower lids 1.6 cc of nanofat intradermally ;instead we use to inject 1 cc of nanofat in each lower eyelids and use simple digital massage to decrease postoperative erythema and pale yellowish skin discoloration which last for around

five week in compare to Tonnard's et al they notice that skin yellowish skin discoloration remained for 1 month postoperatively and eyelid skin erythema for three months after the procedure. In this study the final results was satisfactory, In all patients, healing was uneventful with no significant complications. The postoperative outcomes were satisfactory after an average follow-up of six months assessment of the results by the surgeon were accepted in more than 80% of all of the patients satisfaction also accepted in more than 80% of all the cases (good in 59.1%, fair in 31.8% of cases and only 9.1) and nearly the same results were obtained by other study. Most patients showed Satisfaction ranging from fair to good ,improvement in skin texture the lighting of dark skin color in the lower eyelids and this agreed with both Dong et al and Tonnard's *et al* which shows also good improvement and rejuvenation of skin and lighting of dark pigmentation; postoperative complications was minimal ,neither fat lumps nor texture irregularities were notice [14] and Tonnard's *et al* [8] also observed no significant complications. Intradermal Nanofat injection shows both rejuvenating affect and skin lighting due its Capability of stem cell production rather than volume build as in fat injection which injected in subcutaneous plain. As Tonnard's *et al* shows in there study that a number of good quality mesenchymal stem cells are still present in the nanofat sample [8].

Conclusion

our nanofat grafting technique provided substantial improvements.. Nano fat injection is one of the new modality of treatment which may consider an affordable option as an outpatient procedures that can be performed with ease in clinics to relive deep dark pigmentation and skin rejuvenation of the lower eyelids. This simple, cost effective procedure seems to be suitable for the correction of dark circles

Synthesis, Characterization and Antimicrobial Activity of Pd(II) and Cu(II) Complexes of Schiff base Derived from Phenylethyl amine

Wasfi A. Al-Masoudi[1], Adel A. Hama[2], Rana A. Faaz[3]

[1]Department of Physiology, Pharmacology and Chemistry, College of Veterinary Medicine, University of Basrah-Iraq, [2]Department of Anaesthesia, College of Health and medical technology, Middle Technical University, Baghdad, Iraq, [3]Department of Microbiology, College of Veterinary medicine, University of Basrah- Iraq

Abstract

Condensation of phenyl ethyl amine with 2-Hydroxy-3-naphthaldehyde yielded Schiff base derivative in good yield. Palladium and copper were selected for preparation of complexes. The structures of new compounds were assigned by FTIR and ^{1}H NMR spectroscopy. The synthesized compounds were tested for their antibacterial activity against Staphylococcus aureus, Escherichia coli, Bacillus cereus, and Klebsella pneumonia. Additionally, they evaluated for their antifungal activity against Candada albicans, Candada trobicalis, candida krusi, Aspergillus multi, and Aspergillus niger. All compounds revealed significant antibacterial and antifungal activity.

Key words: Phenylethyl amine, 2-Hydroxy-3-naphthaldehyde, Schiff base, Microbial activity, HSQC-NMR

Introduction

Phenylethylamine or β-phenethylamine is a trace amine, an organic compound, and a natural mono amine alkaloid. Phenylethyl amine well known for psychoactive drug and stimulant effects(1). It functions as a neuromodulator or neurotransmitter in the mammalian central nervous system(2). The carbon-nitrogen double bond chemistry plays a vital role in progresses of chemistry science. Schiff base reveals activity against tubercular, cancer, bacterial, fungal, analgesic, CNS depressant, inflammatory, convulsant, insecticidal, mouse hepatitis virus (MHV), herpes simplex virus type 1 (HSV-1) and adenovirus type 5 (Ad 5), mosquito larvae and herbicidal activities(3,4). Previously, the biological activity for Pd(II) complexes containing S and N donor ligands on several tumor lines was investigated(5). This work aimed to synthesis new complexes Schiff base derived from phenylethyl amine and 2-Hydroxy naphthaldehyde (Scheme l) and study their antimicrobial activity.

Material and Method

Physical measurements

The IR spectra were recorded on a Pye-Unicam SP3-300 spectrometer using KBr discs at Department of Chemistry, College of Education for Pure Sciences, University of Basrah, Iraq. 1H, 13C and 2D NMR spectra were measured on a Bruker at 600 MHz with TMS as internal reference at Konstanz University, Germany. Melting points were measured by a Philip Harris melting point apparatus at College of Veterinary medicine, University of Basrah, Iraq.

Synthesis

Synthesis of Schiff base[6] 1

Phenyl ethyl amine (0.4 g, 13.36 mmol) in ethanol(25ml) was added to (0.58g, 13.36 mmol) of hot ethanolic solution of 2-hydroxy naphthaldehyde. Then two drops of glacial acetic acid was added. Resulting solution was heated under reflux for 3h and stand overnight in refrigerator. After that the solid product obtained was filtered, washed with acetone, and recrystallized by using chloroform: ethanol (8:2 ratio) to yield yellow crystal of (E)-1-[(2-phenylethyl) carbonoimidoyl] naphthalene 2-ol.

Yield:80%,M.p.:192-194°C.

FT-IR (KBr, ν, cm^{-1}): 3300(OH); 3068,3024(CH-aromatic); 2929, 2858(CH- aliphatic); 1639-1537(C=C, C=N).

^{1}HNMR(600MHz,$CDCl_3$,δ,ppm):14.35(s,1H,OH); 8.39 (s, 1H, CH=N);6.80(d.1H,$H_{arom.}$ 3^-); 7.15-7.19(m,4H, $H_{arom.}$ 3,5,6^-,9);7.26(t,1H, $H_{arom.}$ 4);

3.73 (t, 2H, CH_2-N), 2.93 (t, 2H, CH_2-Ar).

^{13}C NMR (600 MHz, $CDCl_3$, δ, ppm), 37.40 (CH_2-Ar), 54.72 (CH_2-N), 106.48-137.96

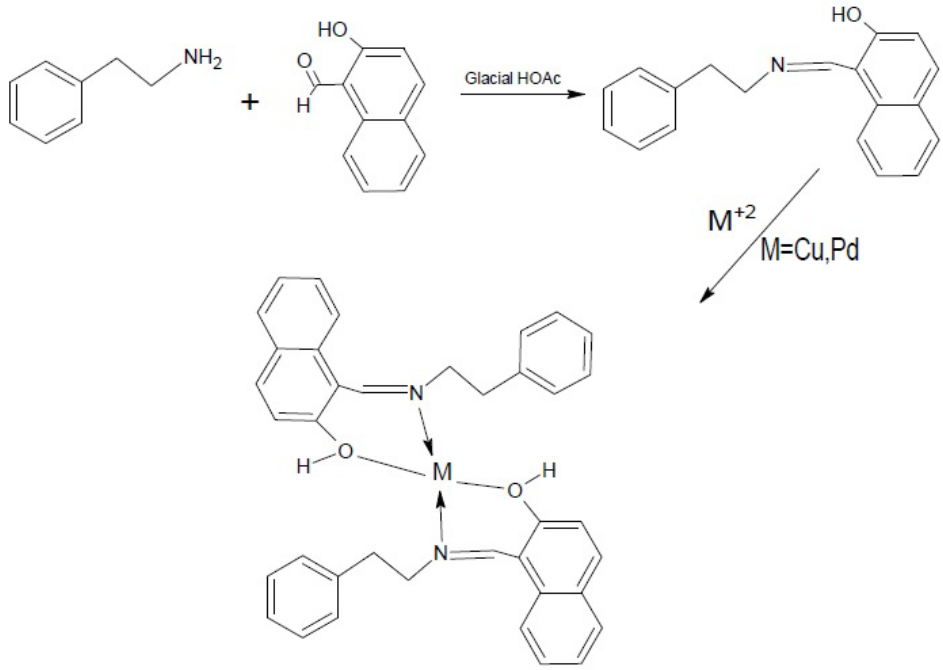
(C-Ar), 158.01 (C-CH=N), 176.47 (C-OH).

Synthesis of copper complex 2

Schiff base (5mmol) was dissolved in 20ml of ethanol solution. Copper(II)chloride (2.5mmol) was then added. A stirrer was then inserted and the reaction mixture heated to 75-80^{0}C for 2h. After that, the precipitate was filtered, washed with ethanol, and dried in oven at 70^{0}C to yield green crystals of copper complex. Yield; 73%, M.P.= 202-205 ^{0}C. FT-IR (KBr, ν, cm^{-1}): 3400(OH); 3068,3022(CH-aromatic); 2927, 2862(CH-aliphatic); 1631-1530(C=C, C=N). ^{1}H NMR (600 MHz, DMSO 6d, δ, ppm):14.05(s,2H,OH); 9.03 (s, 2H, CH=N);6.71-7.72(m, 22H, Ar-H); 3.92 (t, 2H, CH_2-N), 2.99 (t, 2H, CH_2-Ar). ^{13}C NMR (600 MHz, DMSO 6d, δ, ppm), 36.96 (CH_2-

Ar), 52.64 (CH_2-N), 106.14-138.95 (C-Ar), 159.50 (C-CH=N), 177.77 (C-OH).

Synthesis of palladium complex 3



Palladium(II) complex was prepared using palladium(II)chloride instead of copper(II)chloride to yield yellow-brown crystals of palladium complex. Yield; 77%,

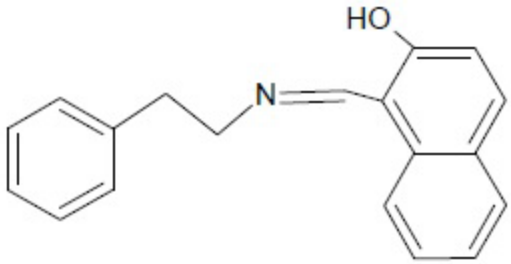
CH_2-N), 2.07 (t, 2H, CH_2-Ar). ^{13}C NMR (600 MHz, DMSO 6d, δ, ppm), 36.58 (CH_2-Ar), 56.58 (CH_2-N), 110.54-141.76 (C-Ar), 160.10 (C-CH=N), 171.07 (C-OH).

Scheme 1: Preparation of palladium and cupper complexes derived from phenylethyl amine.

Antimicrobial activity



In vitro, the synthesized compounds (1-3) were tested for their antibacterial activity against Staphylococcus aureus, Escherichia coli, Streptococcus, Bacillus cerius, salmonella, klebsella, and Pseudomonas b y using disc-agar diffusion method[7]. For antibacterial activity, Muller Hinton Agar (20 ml) was used as culture media in petri dish. The synthesized compounds (1-3) were also tested for their activity against Candida albicans, Candida trobicalis, Candida krusi, Apergillus multi and Aspergillus niger by using the same method. For antifungal activity, Sabouraud's dextrose agar (20 ml) was used as culture media in petri dish. Concentrations at 100, 200 and 300 µg/ml of the test samples in DMSO solvent was introduced in the respective method. Filter paper (sterile Whatman No. I) disks (6mm in diameter) was soaked with the solution in dimethylsulfoxide (DMSO) and put on the Petri plates. I n negative control, a paper disc was soaked with (DMSO). The plates were then incubated a t 3 7 °C for 24 h and at 28°C for 72 h for bacteria and fungi, respectively. The inhibition zone diameters were measured in millimeters by using a caliper **vernia.**

Findings

In current study, Cu(II) and Pd(II) complexes of• Schiff bases was synthesized. To produce the Schiff base derivative (L) Scheme 1 in good yield, the reaction of ethyl phenyl amine with 2-hydroxy naphthaldehyde (1:1 ratio) was used. The ligand (L) reacted with metal ions(II), Cu, and Pd forming complexes was done (2:1 ratio). The FT IR and NMR spectral analysis were used to confirm their structures. The presence of the azomethine group (-CH=N) stretching with a sharp region around revealed by the FT IR spectra 1530-1539 cm-1 due to azomethine protons (CH=N) at 8.39, 9.03 and 10.83 ppm respectively, all compounds (1-3) showed signal by using1 H NMR spectra. The high field of complexes due to the high electronegativity of metals of all compounds showed a triplet at the range 2.07-2.99 ppm due to CH2-Ar and triplet at range 3.17-3.92 ppm due to CH2-N group. The region at 6.80- 7.99 ppm was due to aromatic protons. The synthesized compounds (1-3) showed singlet's at 14.35, 14.05, and 12.00 ppm, respectively due to phenolic groups Ar-OH. All compounds were measured in DMS0-d6 by using 1HNMR spectrum. In addition, the formation of these compounds was provided by 1HNMR spectra. The presence of CH=N group around 158.01-160.0 ppm was revealed by the spectra. The signals around 171.07-177.77 ppm was due to C-OH. These spectra data sports the structure of synthesized compounds. The 1H, 13C HSQC-NMR spectrum(8) of compound 1 showed a cross peak at δH/δC =14.35/178.4 ppm, belonged to Ar-OH. The cross peak at δH/δC =8.39/158 ppm due to azomethine group (N=CH), Thus, the correlation of protons and carbon in aromatic rings such as δH/δC = 7.57 /137, 7.48/129 ppm and other positions can be assigned to the protons and carbon atoms of the aromatic rings(9) (Table 1).While, the cross peak at δH/δC= 3.73/54.7 and δH/δC =2.93/37.4 ppm might be attributed to methylene groups(Table l, Figure 1). The 1H, 13C HSQC- NMR spectrum of copper complex 2 showed a cross peak at δH/δC = 9.03/159.5 ppm due to azomethine group (N=CH). Thus, the correlation of protons and carbon in aromatic rings such as δH/δC= 8.00 /118, 7.71/137.48 ppm and other positions can be assigned to the protons and carbon atoms of the aromatic rings (Table 2). While, the cross peak at δH/δC =3.90/52.64 and δH/δC =2.99/36. 96 ppm can be attributed to methylene groups, (Table 2, Figure 2).

The activity of the synthesized compounds against bacteria a n d fungi was evaluated by using the agar disk

diffusion method [7]. The current study revealed that the compounds activities elevate against bacteria and fungi

with an increase the solution concentration (Table 4 and Table 5). The synthesized compounds showed low activity against *E. coli,* S.*aureus,* and *Pseudomonas* for Schiff base (L) and copper complex, but palladium complex showed good antibacterial activity against *salmonella, klebsella* and *Pseudomonas*(Table 4).

Conclusion

A Schiff bases of phenyl ethyl amine and their copper and palladium complexes were characterized by using Infra red (FTIR) and nuclear magnetic resonance (NMR) spectroscopy. The antimicrobial activity and antifungal activities were evaluated against bacterial (seven strains) and fungal (five species), respectively. The Schiff base compound revealed better antifungal activity compare with metal complexes. These results are promoted us to continue the study such as, physiological parameters and histopathological study to complete the pharmaceutical studies.

Bacterial Isolate Isolated from Mobile Medical Staff of Immam Ali Hospital – Baghdad

Eptissam Younan Pirko[1], Hayat Kadhim Salman[2], Burooj Mohammed Razooqi[1], Nihad Khalawe Tektook[3]

[1]Lecturer, Medical College, Dyala University, [2]PhD, Medical Technical Institute –Baghdad – Iraq,
[3]PhD, Middle Technical University, Collage of Medical & Health Technology

Abstract

Background: mobile phones used by medical staff of hospital often become carriers and may serve as important vectors play role in spread microorganisms special bacteria in hospital and causing many infections.

Material and Method: By rotating the swabs on 142 contaminated mobile phones which including all parts of phone and inoculated into transport medium (brain heart infusion) then incubated aerobically at(37°C) for 24 hours , then subcultures Macconkey and blood agar and were incubated aerobically a37°C for 24 hours.

Results : most common bacterial isolated from contaminated mobile phones were Coagulase-negative Staphylococci bacteria 16 (19.2 %), *S. aurous* 8 (10 %) and12 (14.4 %) for both isolate of mixed culture as *S. aureus + Bacillus spp* and single culture as *Bacillus spp.* As well as most bacterial isolates isolated from contaminated mobile of staff were high percentage as 12(14.5 %)from both Women's Internal Medicine and Emergency ,so isolated from female 46(55.5%) more than males 37 (44.5 %) , so high percentage of CONS as 6 (7.2%) isolated from male and high percentage of CONS and Bacillus spp. as 7 (8.5%) were isolated from both age group (15-25 and 35-45) years respectively, whilst 5 (6%) of all isolated *CONS* ; *S. epidermidis* and *Strep.sp* from the age group (25-35)years .

Conclusion : *Coagulase-negative Staphylococci* and mixed culture of *S. aureus + Bacillus spp* were most common bacterial isolated from contaminated mobile phones of staff from both Women's Internal Medicine and Emergency ,as well as most isolated from female than males ,also most isolate of CONS and *Bacillus* spp. from both age group (15-25 and 35-45) years respectively,

Introduction

In this time , mobile phones Considered important devices for both the social and professional of their users as doctors ; medical staff ; health care workers; patients and visitors , However, Medical Staff in hospitals, are play important factor via distribution the pathogenic and non pathogenic bacteria as well as Considered play role in increased acquired hospital infections because some of these users of mobile phone staff don't sterilized his mobile after used by antibacterial to make their mobile phones germ free at all times as well as prevent the possibility of phones as vehicles of transmission of both community and hospital acquired bacterial infections (Akinyemi *et al*.,2009), these bacteria may be caused multi-drug resistant (MDR) and caused difficult treatment (Angadi *etal.,* 2014).

In worldwide, millions people are suffering from the hospital acquired infections (H.A.I), So the all Contaminated of hospital environments and equipments are known as infections sources, also used Mobile phones in the hospitals without restrictions, caused increased the bacterial contamination in the hospital (Misgana *etal.,* 2014), in hospitals at least 90% of H.A.I were caused by the bacteria (Jain etal.,2007), source of infectious agents may be from exogenous or endogenous sources(Horan and Dudeck 2008).

Corresponding author:

The healthcare staff and doctors who worked in the critical areas as operating units and intensive care units (ICUs) were highly exposed to the deadly to wide range of the pathogenic bacteria and multi-resistant microorganisms during the work , So the healthcare staff who used mobile phones often became carriers and may serve as vectors and spread bacterial contaminated (Kokate *etal.*,2012).

Material and Method

Sample collection :

using cotton swaps all samples were collected by rotating the swabs on 142 contaminated mobile phones which including all parts of phone .

Bacteriological diagnosis : The samples were collected aseptically using damp cotton swaps by rotating the swabs on all parts of mobile , and inoculated into transport medium (brain heart infusion) then incubated aerobically at(37°C) for 24 hours , then subcultures Macconkey and blood agar and were incubated aerobically a37°C for 24 hours(Forbes et al. ,2007) .

Statistical Analysis: Analysis of the data were performed by measuring percentage and means value, according to (McCall , 1980).

Results and Discussion

Table (1): Types of bacterial isolates isolated from the contaminated mobile phones.

Bacterial isolates	No.	(%)	No bacterial isolate
Coagulase-negative Staphylococci (CONS)	16	19.2	59
S. aureus	8	10	
S. aureus+ Bacillus spp.	12	14.4	
K. pneumonia	6	7.2	
K. pneumonia + CONS	2	2.4	
Proteus.sp	1	1.2	
Bacillus spp.	12	14.4	
E. coli	10	12	
S. epidermidis	11	13.2	
Strep.sp	3	3.6	
Pseudomonas aeruginosa	2	2.4	
Total	83	100	

In table (1) showed most common bacterial isolated from contaminated mobile phones were Coagulase-negative Staphylococci bacteria 16(19.2%), *S. aureus* 8(10%) and 12(14.4%) for both isolate of mixed culture as *S. aureus + Bacillus spp* and single culture as *Bacillus spp.* As well as 11 and 10 (13.2 , 12) % for both *S. epidermidis* and *E.coli* respectively .

Table (2): Types of bacterial isolates isolated from the contaminated mobile phones of medical staff according department.

Department	bacterial isolates	
	No.	%
Women's Internal Medicine	12	14.5
Emergency	12	14.5
Consultation clinic	11	13.2
General Surgery	11	13.2
General Medical Laboratories	10	12
Pharmacy	10	12
Men's Internal Medicine	10	12
Orthopedic surgery and fractures	7	8.6
Total	83	100

In table (2) showed out of 83 cases , most bacterial isolates isolated from contaminated mobile of staff according to department were high percentage as 12(14.5%)from both Women's Internal Medicine and Emergency followed by 11 (13.2%) from both Consultation clinic and General Surgery, whilst 10(12 %)from both Pharmacy and Men's Internal Medicine and low percentage 7 (8.6 %) from Orthopedic surgery and fractures.

Table (3): Types of bacterial isolates isolated from the contaminated mobile phones according to gender .

Bacterial isolates	Male No. (%)	Female No. (%)	Total No. (%)
CONS	6(7.2 %)	10(12%)	16(19%)
S. aureus	3(3.6%)	5(6.1%)	8(10%)
S. aureus+ Bacillus spp.	6(7.2%)	6(7.2%)	12(14.5%)
K. pneumonia	5(6.1%)	1(1.2%)	6(7.2%)
K. pneumoniae+ CONS	2(2.4%)	0 (0%)	2(2.4%)
Proteus.sp	1(1.2%)	0 (0%)	1(1.2%)
Bacillus spp.	4(4.8%)	8(10%)	12(14.5%)
E. coli	4(4.8%)	6(7.2%)	10(12%)
S. epidermidis	4(4.8%)	7(8.5%)	11(13.2%)
Strep.sp	1(1.2%)	2(2.4%)	3(3.6%)
Pseudomonas aeruginosa	1(1.2%)	1(1.2%)	2(2.4%)
Total	37(44.5 %)	46(55.5%)	83(100 %)

According to the staffs gender results shown in table 3.1, out of 83 cases , bacterial isolated from female 46(55.5%) more than males 37(44.5 %), so high percentage of CONS as 6(7.2%) isolated from male , whilst 10 (12 %) isolated from male , as well as 6 (7.2 %) isolated mix culture as *S. aureus*+ *Bacillus spp*. in both males and females.

Table (4): Types of bacterial isolates isolated from the contaminated mobile phones according to age .

Bacterial isolates	**Age group (years)**				
	15-25	**25-35**	**35-45**	**≤ 45**	**Total**
CONS	7(8.5%)	5(6%)	4(4.8%)	0(0%)	16(19.2%)
S. aureus	2(2.4%)	4(4.8%)	2(2.4%)	0(0%)	8(9.6%)
S. aureus + Bacillus spp.	5(6%)	4(4.8%)	1(%)	2(2.4%)	12(14.4%)
K. pneumoniae	4(4.8%)	2(2.4%)	0(0%)	0(0%)	6(7.2%)
K. pneumonia + CONS	0(0%)	2(2.4%)	0(0%)	0(0%)	2(2.4%)
Proteus.sp	1(1.2%)	0(0%)	0(0%)	0(0%)	1(1.2%)
Bacillus spp.	2(2.4%)	1(1.2%)	7(8.5%)	2(2.4%)	12(14.4%)
E.coli	2(2.4%)	4(4.8%)	1(1.2%)	0(0%)	10(12%)
S.epidermidis	4(4.8%)	5(6%)	0(0%)	0(0%)	11(13.2%)
Strep.sp	1(1.2%)	5(6%)	0(0%)	2(2.4%)	3(3.6%)
Pseudomonas.sp	2(2.4%)	0(0%)	0(0%)	0(0%)	2(2.4%)
Total	30(%)	32(%)	15(%)	6(%)	83(%)

According to the age groups , our results showed in table (4) Out of eighty - three cases , high percentage of CONS and *Bacillus spp*. as 7(8.5%) were isolated from both age group (15-25 and 35-45) years respectively, whilst 5(6%) of all isolated CONS ; *S. epidermidis* and *Strep.sp* from the age group (25-35) years.

Discussion

In this study, 142 contaminated mobile phones from 8 different departments of a health care setting were screened for the presence of bacterial contamination , highly contaminated of mobile phones by bacterial agents, most of them were found having one or more bacteria, Similar results were reported by Rana *etal.,*2013 who showed the contaminated mobile staff were *S. aureus(10)* , CONS(4), both and *Pseudomonas* spp. *E.coli only one.* so results by Raghavendra *etal.,*2014 revealed that mobile phones contaminated by *S. aureus (* 52%) , Whilst the results of Kokate *etal.,*2012) showed the dominant bacteria was CoNS as percentage (72%) followed diphtheroids as (22%) and only 2 (6%) for a*spergillus niger* , also Bhoonderowa *etal.,*2014) showed the most prevalent bacteria in mobile phones was CoNS (69 %).

The type of bacteria and level of the contamination depend on the geographical setting and clinical setting (Brady *etal.,*2009),most frequently observed in samples obtained from of the tested mobile phones laboratory (100%), followed (90%) dialysis units and(70%) triage , but 60 % from ICU (Selim *etal.,*2015), Whilst in Kuwait prevalence contaminated of mobile phone were highly in the NCUs ; PICUs and ICUs (Mohammed *etal.,*2015), whilst 94.5 % in phones of ICUs and operating rooms were contaminated(Ulger, 2009), and high percentage as 97.8 % in phones of all departments were contaminated(Ustun, 2012). Both women and men

shared pathogenic bacteria in mobile phones, women appeared to have a stronger bacterial connection in the phones than men (Meadow *etal*.,2014).

Conclusion

1- Coagulase-negative Staphylococci and mixed culture of *S. aureus* + *Bacillus spp* were most common bacterial isolated from contaminated mobile phones were

2- Most bacterial isolates isolated from contaminated mobile of staff according to department were 12(14.5%)from both Women's Internal Medicine and Emergency followed by 11(13.2%)from both Consultation clinic and General Surgery.

3- Bacterial isolated from female 46 (55.5 %) more than males 37 (44.5 %) , so high bacterial isolate were CONS as 6 (7.2 %) isolated from male , whilst 10 (12 %) isolated from male , as well as 6 (7.2 %) isolated mix culture as *S. aureus*+ *Bacillus spp*. in both males and females.

4- CONS and *Bacillus spp*. were high percentage as 7 (8.5%) of isolated from both age group (15-25 and 35-45) years respectively, whilst 5(6.1%) of all isolated *CONS* ; *S. epidermidis* and *Strep.sp* from the age group (25-35) years .

Call for Papers / Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialities. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper: A general invitation is extended to authors to submit papers papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article as attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your Affiliation (designations with college address)
- Abstract
- Key words
- Introduction or back ground
- Material and Methods
- Findings
- Conclusion
- Acknowledgements
- Interest of conflict
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file

All articles should be sent to: **editor.ijphrd@gmail.com**

Send all payment to :

Indian Journal of Public Health Research & Development

CALL FOR SUBSCRIPTIONS

About the Journal

Print-ISSN: 0976-0245 **Electronic - ISSN:** 0976-5506, **Frequency:** Quarterly

Indian Journal of Public Health Research & Development is a double blind peer reviewed international Journal. The frequency is half yearly. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, Public Health Laws and covers all medical specialities concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and south east Asia.

The journal has been assigned international standards (ISSN) serial number and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases.

Journal Title	Print Only
