Having said that, the effectiveness of the treatment counselling modules used to treat athletes, is still uncertain. Psychological problems such as mental game and yips also happen to athletes in other sports such as baseball and cricket[13]. Therefore, this study focuses to clarify these problems and results from this study can be used as input for programmes carried out by organisations which are involved in the development of sports in our country such as the National Sports Council (NSC) as well as other sports organizations.

One of the sports that clearly require counselling services for their athletes is golf. Alike other sports that are either individually assessed or by teams, golf can be given great attention by nurturing hard work towards

continuous development. This includes strengthening the athletes' mental capacity. Efforts should be done to meet the needs in all aspects such as physical and skills, nutrition and psychological aspects of the athletes. In this study context of this study, efforts are taken in the form of the construction of an appropriate module in addressing the psychological aspects among athletes.

Methodology: Using a qualitative research design, this study has been conducted with four respondents from National Golf Academy, Universiti Utara Malaysia. This study uses the primary data from face to face interviews between researchers and respondents to collect key information as well as secondary data to support several findings obtained. After approval from the academy committee was obtained, the procedure for conducting semi-structured individual interviews began. The selected respondents were contacted to arrange for the face-to-face interview session. The preparation of the protocol interview was guided by the previous research and recent literature on developing cognitive and behavior framework.

Findings: Three main components emerged from the thematic analysis on the data collected from the interviews between researchers and respondents. The themes are determined based on the effectiveness of the module implemented in the study conducted previously, the need to continue its implementation and any improvements needed to be done which can be implemented in the future. In addition, the components are also determined based on the frequency of the themes mentioned by the respondents. To make it easier to understand, the themes are arranged and depicted in a tree diagram as follows.

Tree Diagram on qualitative themes frequency

Discussion

Compared to other sports, golf is considered to be a fragile game[14]. Therefore, mastering a strong mental is very important in this game. The change of mood and game patterns can occur in split seconds, especially among amateur golf players. A popular term among golfers is 'lost my golf swing' which is a phenomenon that occurs among all amateur players. The importance of mental strength has been acknowledged by most major international golf instructors. There are two important things to master in golf are in the technical aspects and mental aspects[14]. According to him, great golfers like Hogan and Nicklaus are famous not only because of their golf skills but also their mental strength which always being portrayed in every major competition.

Based on the Rational Emotive Behaviour Therapy (REBT) theory, an individual emotional state depends on his belief, method of valuation, method of interpretation and response towards his surroundings, thus this therapy module requires a process capable of disputing all forms of thinking which leads to the client's irrational beliefs[15]. In addition, REBT also focus more on thinking, consideration and decision making which include judgment, analysis and actions[15]. Based on this, the focus in this therapy is highly suitable with the mental game problem which is closely related to the needs of the orientation of the athletes' rational and controlled thinking throughout the game period. This study focuses on the changes in intellectual understanding among players and sports concept changes and monitoring of after treatment effects[16]. In order to test the consistency of the module effectiveness applied in the study in 2014, this study was conducted to follow up and evaluate the implications of the use of the relevant module on athletes.

Conclusion and Recommendations

In conclusion, the study of the psychology and counselling in sports is important in order to enhance the development of sports in Malaysia. The Malaysian sports industry is evolving in becoming an industry that can generate substantial income to the country[16]. Therefore, studies relating sports psychology is seen as important to support training in all sports categories[17]. National Sports Institute[18] has also set their targets in helping athletes with mental stress problem by increasing the amount of counsellors in the field of sports. Similar with other sports, golf is also expanding with facing many opportunities and challenges of its own. Since golf is played by individual player, golf is likely be able to bring the country chances to win medals at the Southeast Asian level or a higher level, for example in the 2016 Olympics. Nevertheless, golf has different challenges from other sports. Among others, the problems include those involving psychological aspects faced by the players which could easily affect their performance.

Golf is a game that is very fragile. The problems that are either due to a player's psychological aspects or non-psychology, such as climate, change can change the player's performance. Realizing that external factors cannot be controlled, thus, the control over internal factors especially in strengthening the psychological aspects of the player, must be prioritized. With this regard, efforts to overcome psychological problems such as mental game and yips need to be conducted. Previous studies including those using counselling approaches have proven that these problems can be treated. In this study, treatment using REBT approach has contributed good decisions on how mental problems and game yips can be reduced. Thus, this study becomes an effort that could help address the psychological aspects of sports players and contributes an added value towards other training programmes that the players participate in.

Abstract

The aims of study to examine the relationship between job demands, job resources and job stress among staff in nursing home. The data collected from staffs that work in Malaysian private nursing home including nurses, medical attendance and caregivers. The data has been analyzed through descriptive statistic, correlation analysis and linear regression. The results revealed that there is a negative relationship between job resources and job stress and there is a positive relationship between job demand and job stress. Increase in job demands will affect employees' mental and physical and it leads to health problems as well as exhaustion of energy. In contrast, job resources foster employee engagement and extra-role performance.

Keywords: *Job Demands, Job Resources, Job Stress, Nursing Home.*

Introduction

Worldwide ageing populations are speedily rising[1]. Malaysia similarly faces evolution dramatically from young citizen to ageing society in the next 10 to 20 years. In 2017, there are 1,895,030 people 65 years and older living in Malaysia, which presented 6.3% of the population according to the data from World Bank Group[2]. The number of ageing population in Malaysia is estimated to increase to almost 6 million, or 15.3% of the total population in the next 13 years[2]. Even though, most of the ageing population living and cared at home, an increasing number will be living at nursing home[3]. This fastest growing leading to an increasing demand for nursing homes. Nursing homes plays an important role in the provision of care of elderly people. Due to rapid change with the increasing number of older people as well as the need of expansion and diversity in care service, nursing homes are faced to provide high level of quality care, while at the same time experiencing difficulties in recruiting and retaining a trained workforce. This phenomenon happened due to stressful job in nursing homes[4-6] with associated with decreased in motivation of work and risk of burnout that caused to high worker turnover rates[4,7,8]. This vital issues and challenge in nursing homes worldwide should be studied to improve the quality of care and paramount for mitigating future labour shortages in the nursing home sector.

There are numerous encounters in daily work of nursing homes workers, as the work has been described as physically and emotionally difficulties due to the workload that carried by workers and affect their physical and psychological acceptance[9,10]. This kind of pressure will lead to difficulties at work and also related to the negative of psychological and emotional impact. Therefore, the nursing home staffs are facing the challenges of potential risk factors towards work-related pressure and stress.

It is clear that turnover rate was highest in the nursing care staff or caregivers (39.5%) and lowest for administrative staff. Housekeeper rate was the second highest (33.7%) among others related job as housekeeper also involved in caregiving services as assistant for the nurses. There are numerous factors related to job demands demonstrated in previous studies, but most of these studies did not provide enough empirical evidence to support the role of nursing homes staff in Malaysia. Most of work-related stress focusing on nurses in Malaysia. Thus, the first objective of this study is to examine the direct effects of job demands on job stress among nursing home staff. The second objective is to investigate the direct effects of job resources on job stress among nursing home staff in Malaysia. This paper is organized as follows: first, an introduction; second, a review of the literature on job stress, job demands, and job resources are provided; third, development of the hypotheses and conceptual framework; fourth, methodology, fifth, the results of study and finally, the implications and conclusion of the paper.

Job Stress: Major issues in nursing homes was related to occupational stress and it reflected the absenteeism of staff, low morale and high staff turnover[11]. The word of stress is defined as individual response and emotional caused to the person who discover imbalance between the job demand and the workplace resources[12]. Whereas, job stress is defined as the detrimental emotional and physical responses that happen when the job that needed by individual does not match the resources, motivation to work or workers' capabilities[13]. In a simple word, stress refer to the non-specific response of the body to any demand[14] and also job stress is related with a distraction of an employee physiological homeostasis or psychological[15]. Work related stress can lower the happiness in life and it penetrate the hypertension, decrease immunity, cardiac issues, contribute to substance abuse and it reflect the mental and physical wellbeing[16] and lead to turnover intention, burnout, quality of care problems and absenteeism[17, 18].

Nursing industry are facing occupational stress and it can be defined as emotional and physical response that occur when the nurses unable to utilize their abilities and resources to meet their job requirement[13, 19]. Numerous studies have shown that nursing industry faced the high levels of occupational stress that related with environmental, individual, organizational factors and social[20, 21]. Nursing industry are beneficial to the country, but at the same time it very stressful work[16].

Job Demands: Based on study by Woodhead, Northrop, & Edelstein (2014), conceptualized the job demands-resources model of burnout according to job and personal stressor as job demands[22]. Job demands refer to psychological and physical abilities or skills that are sustainably needed at work, for example like emotional demands and work pressure.

Nursing staff at nursing home face several physical and psychological burden that were not experienced by others department nursing staff. This situation will lead to the nursing job satisfaction and increate burnout rate. Numerous studies reported that high number of dementia residents might lead to verbal abuse and direct physical pain toward residents or organization staff[23, 24].

Job Resources

The Relationship between Job Demands and Job Stress: A review by Vermeerbergenet al[25] which studied four job demands that consists of demand of emotional, completeness of job, variability of job and pressure of time suggest that levels of job control and job demands are higher in normalized small-scale homes than in conventional large-scale nursing homes[25]. Whereas pressure of time is lesser in normalized small-scale homes than in non-normalized large-scale homes. Study by Vermeerbergenet al[25].also found that care workers in normalized small-scale homes facing high time pressure, high task and workload as well as incompatible work demands[25].

According to Verbeeket al[26].four job demands were studied namely job variability, job completeness, time pressure and emotional demands[26]. An analysis of comparative study shows that the nursing care staffs in small-scale nursing home are emotionally involved with residents rather than care nursing care worker in traditional home[26]. This study supported by Loe and Moore (2012) by showing that emotional demands increase when normalized small scale home implemented. It is because the care workers spend more time with the residents and their family better. As a consequence, emotional demand increases when a resident become ill or dies.

H1: Job demands will be positively related to job stress

The Relationship between Job Resources and Job Stress: The Job Demands-Resources (JD-R) model[27, 28] are used to estimate stress and engagement of employee, and consequences of organizational performance. At the heart of the JD-R model found the assumption that every occupation may have its own causes of employee well-being, these factors can be classified in two general categories which included of job demands and job resources, thus establishing an principal model that may be applied to various occupational settings, irrespective of the particular demands and resources involved. Extensive research has provided evidence for the presence of two simultaneous processes. Increase in job demands will affect employees' mental and physical and it leads to the exhaustion of energy and to health problems. This is the health impairment process. In contrast, job resources foster employee engagement and extra-role performance. This is the motivational process.

A study by Hsu et al[29] shows that an unfixed schedule also positively associated with poor management, working time problem and heavy workload[29]. The unsuitable work schedule designates not only poor rotation management or day and night schedule, but it implies insufficient human resources. The shortage of formal caregivers in nursing home will lead to increasing workload and insufficient time to caregivers and finally they will suffer stress and burnout.

H2: Job resources will be negatively related to job stress

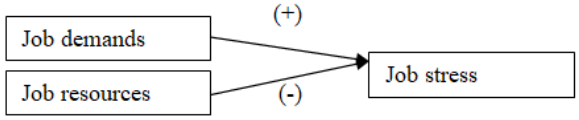

Figure 1. Research framework

Methodology

Sample and Procedures: The sample size, as in the case of the sampling frame drawn from each registered private nursing home in Peninsular Malaysia. Total nurses, medical attendance and caregivers working in private nursing home in Malaysia are 333 (Welfare Department of Malaysia, 2018)[30]. According to Krejcie and Morgan[31], Formula 1 is used to determine the sample size[31]:

Formula 1:

$$S = \frac{X^2 NP(1-P)}{d^2(N-1) + X^2 P(1-P)}$$

S=Size of population selected

X^2=Refer to confidence level, 3.841 (95% = 1.96)

N = Population size

P = Population ratio and assume it as 0.50 due to it will maximum the size of sample

d=Degree of accuracy which is 0.05

Sample size calculation:

$$S = \frac{(3.841)(333)(0.5)(1-0.5)}{0.05^2(333-1) + (3.841)(1-0.5)} = 178.6 \approx 179$$

The sample size will be 179 of respondents; it was impossible picking the respondent by the decimal place. Therefore, researcher rounded off the decimal place and increased the number of respondents for reducing the error. Thus, the sample size adopted in this research was 179 respondents. The participants in this study were staff nurse, medical attendance and others (such as caregivers and guardians) from private nursing home in Malaysia. The authors contacted 179 nursing home in the region of north, south, east and west Malaysia, and only 65 agreed to participate. Each staff in nursing home were the respondents. The questionnaires were distributed in each nursing home through the drop-off and pick-up method. Respondents were given one week to complete the questionnaire. After the specified period, 65 questionnaires were collected and found to be useable for analysis. The statistical tools used to analyze the reliability analysis, correlation analysis, linear regression analysis and descriptive statistics.

Results

Respondents' Profile: As shown in Table 1, Male representing 21.5% (14 respondents) and female representing 78.5% (51 respondents) in this study. The highest numbers of age were between 20-29 years old that representing 52.3% (34 respondents) and the lowest numbers of age were below 20 years old that representing 1.5% (1 respondent). There were 41.6% of respondents were married (27 respondents) and 58.4% of respondents were single (38 respondents). Most of the respondents were Malay representing 61.6% (40 respondents), followed by Chinese that representing 18.5% (12 respondents), India representing 16.9% (11 respondents) and others representing 3.0% (2 respondents). Most of the respondents' job tenure in the industry is 1 year and below representing 50.8% (33 respondents). The job

tenure for the remaining respondents are as follow: 2 to 5 years representing 26.2% (17 respondents), more than 10 years representing 15.3% (10 respondents) and 6 to 10 years representing 7.7% (5 respondents). The highest number of respondents' education level were Diploma that representing 58.4% (38 respondents) and lowest number of respondents' education level were Master/PhD representing 3.1% (2 respondents). Most of the respondents' salary were between RM1001 to RM2000 that representing 72.3% (47 respondents) and the smaller number of the respondent's salary was above RM4001 that representing 1.5% (1 respondent). The highest number of respondents' job position were others such as caregivers that representing 55.4% (36 respondents), followed by nurse representing 33.8% (22 respondents) and medical attendance representing 10.8% (7 respondents).

Objective 1: To examine the relationship between job demands and job resources towards job stress.

The objectives of this analysis were to examine whether the correlation exists between the independent variables (job demands and job resources) and the dependent variable (job stress). If the correlation existed, the researchers next had to decide the strength and the direction of association between the variables.

Table 1: Percentage and Frequency of Respondents' Profile

Variables	Frequency	Percentage (%)
Gender:		
Male	14	21.5
Female	51	78.5
Age:		
Below 20 years old	1	1.5
20 – 29 years old	34	52.3
30 – 39 years old	11	16.9
40 – 49 years old	9	13.9
50 years old and above	10	15.4
Marital status:		
Married	27	41.6
Single	38	58.4
Ethnicity:		
Malay	40	61.6
Chinese	12	18.5
Indian	11	16.9
Others	2	3.0
Job tenure:		
1 year and below	33	50.8
2 – 5 years	17	26.2
6 – 10 years	5	7.7
More than 10 years	10	15.3
Education level:		
PMR	7	10.8
SPM	13	20.0
Diploma	38	58.4
Bachelor's degree	5	7.7
Master/PhD	2	3.1
Salary:		
RM1000 and below	6	9.2
RM1001-RM2000	47	72.3
RM2001-RM3000	9	13.9
RM3001-RM4000	2	3.1
RM4001 and above	1	1.5
Job Position		
Nurse	22	33.8
Medical attendance	7	10.8
Caregivers	36	55.4

Table 2 illustrated Pearson's Correlation Coefficient, significant value and the number of cases which were 65. The p-value was 0.000, which was less than the significant level of 0.01. Thus, this study accepted the hypotheses one (H1). The correlation coefficient of 0.544 suggested a moderate positive correlation between job demand and job stress.

Table 2: Correlation Coefficient for Relationship between Job Demand and Job Stress

		Job Demand	Job Stress
Job Demand	Pearson correlation	1	0.544**
	Sig. (2-tailed)		0.000
	N	65	65
Job Stress	Pearson correlation	0.544**	1
	Sig. (2-tailed)	0.000	
	N	65	65

H1: There is a positive relationship between job demand and job stress.

Table 3 illustrated Pearson's Correlation Coefficient, significant value and the number of cases which were 65. The p-value was 0.010, which was equal to the significant level of 0.01. Thus, this study accepted the

hypotheses two (H2). The correlation coefficient of -0.318 suggested a low negative correlation between job resources and job stress.

This study revealed that job demand has positive relationship with job stress (0.544, p-value= 0.000) and job resources has negative relationship with job stress (-0.318. p-value=0.010). Therefore, the research objective one has been answered.

Table 3: Correlation Coefficient for Relationship between Job Resources and Job Stress

		Job Resources	Job Stress
Job Resources	Pearson correlation	1	-0.318**
	Sig. (2-tailed)		0.010
	N	65	65
Job Stress	Pearson correlation	-0.318**	1
	Sig. (2-tailed)	0.010	
	N	65	65

H2: There is a negative relationship between job resources and job stress.

Objective 2: To develop a theoretical framework of stress that is suitable for nursing homes staff in Malaysia.

The Extent of Job Demand and Job Resources for Explaining Job Stress

Simple Linear Regression Model (Job Demand and Job Stress): Simple linear regression model was proposed to explain the job stress (Y). The variable proposed was job demand (X_1). The data was further analysed using linear regression to see the relationship between the variables. According to the result presented in Table 4, there is positive relationship between job demand with job stress. However, in Table 5, there is negative relationship between job resources with job stress.

Table 4: Results coefficient for job demand and job stress

	Unstandardized Coefficients		Standardized Coefficients			95.0% Confidence Interval for B	
	B	Std. Error	Beta	t	Sig.	Lower Bound	Upper Bound
(Constant)	.679	.389		1.734	.086	-.099	1.456
Job demand	.645	.125	.544	5.150	.000	-.395	.895

The correlation coefficient between job demand with the job stress is 0.544. Hence, there is positive relationship between job demand with job stress. In regression analysis, the p-value in Table 4 is less than 0.05. Based on Table 4, the regression equation is:

$$\hat{Y}\ (Job\ stress) = 679 + 0.645\ (\text{job demand}) + e \quad ...(2)$$

The R^2 value of 0.296 implied that the predictor variable explained about 29.6% of the variance in the job stress (Y). In addition, for every unit increase in job demand scores, job stress is expected to be increased by .645. As a conclusion, there is a positive relationship between job demand and job stress. For every unit increase in job demand scores, job stress is expected to be increased by 0.645.

Simple Linear Regression Model (Job Resources and Job Stress): Simple linear regression model was proposed to explain the job stress (Y). The variable proposed was job resources (X_1). Therefore, the equation of the proposed regression model is as follows:

Table 5: Results coefficient for job resources and job stress

	Unstandardized Coefficients		Standardized Coefficients			95.0% Confidence Interval for B	
	B	Std. Error	Beta	t	Sig.	Lower Bound	Upper Bound
(Constant)	4.181	.583		7.167	.000	3.016	5.347
Job demand	-.421	.158	-.318	-2.659	.010	-.738	-.105

The correlation coefficient between job demand with the job stress is -0.318. Hence, there is negative relationship between job resources with job stress. In regression analysis, the p-value in Table 5 is less than 0.05. Based on Table 5, the regression equation is:

$\hat{Y}$ *(Job stress)* = 4.181 + (-0.421) (job resources) + *e* ...(2)

The R^2 value of 0.101 implied that the predictor variable explained about 10.1% of the variance in the job stress (Y). In addition, for every unit increase in job resources scores, job stress is expected to be reduced by .421. As a conclusion, there is a negative relationship between job resources and job stress. For every unit increase in job demand scores, job stress is expected to be reduced by 0.421.

Thus, the theoretical framework of stress among nursing homes staff in Malaysia is suitable due to the current result of the study. There was positively related between job demand and job stress (Hypothesis 1), and also there was negatively related between job resources and job stress (Hypothesis 2). Both of the results show that the significant value (p-value is less than 0.05) and the framework is suitable for application among nursing home staf.

Discussions

Due to rapid change with the increasing number of older people and the need of expansion and diversity in care service, nursing homes need to provide high level of quality care, while at the same time facing difficulties in recruiting and retaining a trained workforce[32]. This phenomenon happened due to stressful job in nursing[4-6]. Thus, the first objective is to examine the relationship between job demands and job resources towards job stress and it found that there is a moderate positive correlation between job demand and job stress with correlation coefficient of 0.544. This finding supported by Hoboubiet al[33].which demonstrated that there were negatively associated between job demands and stress[33].

The second objective of this study is to develop a theoretical framework of stress that is suitable for nursing home staff in Malaysia. The results revealed that there is positive relationship between job demands and job stress; and there is negative relationship between job resources and job stress. The negative relationship between job resources and job demand has been supported by Oshio, Inoue and Tsutsumi[34]that found there is significant negative relationship between job resources and job demand[34]. Both of the results show that the significant value (p-value is less than 0.05) and the framework is suitable for application among nursing home staff.

Conclusion

Work stress in nursing home is not the new phenomenon in the nursing industry. It frequently exists and is related with services of professional. In reality, the issues of job stress have attained courtesy by psychologists and previous research indicated that there was a negative consequence rising from stress that affect the commitment of employee and their performance. Job demands in organizations will results in a great loss to the organization due to the job stress. In contrast, job resources will reduce job stress and increase the performance of organization in future.

A Review on the Factors of Elder Abuse and Neglect in Nursing Homes

Nur Liyana Amirah[1], Hasif Rafidee Hasbollah[1]

[1]*Faculty of Hospitality, Tourism and Wellness & Universiti Malaysia Kelantan, Pengkalan Chepa, Kelantan*

Abstract

In recent years, elder abuse has become a common phenomenon as it becomes a sustained interest and concern to the society and an emerging global problem that was identified as an important research agenda for the 21st century climate. A review of the literature demonstrated a gap on the factors contributing to elder abuse and neglect in nursing homes. The need for greater attention to this topic stems from several factors. The aim of this review is to identify the factors of the elder abuse in nursing homes. Review process was employed in this research including inclusion and exclusion. A comprehensive search of multiple database of Science Direct, and health and social care related databases such as SCOPUS were used during the search process. The search was conducted using search terms such as 'elder abuse', 'elder mistreatment', 'factor', 'causes', and 'nursing homes'. It is reported that over 80 of elderly are more likely to be abused in nursing homes compared to elderly who are younger in age. A study observed that older females have a higher tendency to be abused in nursing homes. In several studies, caregiver abuse when providing care to older people with the physical impairments and cognitive tends to be a factor of elder abuse and neglect, especially in Japan and caregivers' childhood experiences are associated with abuse and neglect due to of trauma from the caregivers. This systematic review highlighted that elderly characteristics and perpetrator characteristics are the factors that cause elderly abuse and neglect in nursing homes.

Keywords: *Elder Abuse, Factors, Neglect, Nursing Homes.*

Introduction

Nowadays, elder abuse has received significant attention in public health as it causes serious health, social, and economic consequences. In the past year, global prevalence of elder abuse in community settings is approximately one in six of older adults which is equivalent to 15.7%[39]. World Health Organization (WHO)[35] defined elder abuse as a single or repeated act occurring within in any relationship where there is expectation of trust that causes harm to older people[36]. Elder abuse is categorized into several types of physical, sexual, financial abuse and neglect, type of abuse-psychological, type of abuser-family members, formal and informal caregiver, or acquaintance or setting in which occurs-in the community or institution[14]. In institutional settings, abuse can be broadly categorized into resident-to-resident abuse or staff-to-resident abuse[19]. Compared to other research and other forms of interpersonal violence, research on elder abuse especially in institutional still lacking[23]. However, it is unarguable that elder abuse occurs in every country with residential facilities and nursing while anecdotal evidence showing that elder abuse has become prevalent[25].

Recent years has witnessed elder abuse becoming a common phenomenon as it becomes a sustained interest and concern to the society and also emerging as a global problem century[31]. In comparison to Australia, USA, Canada and other European countries, elder abuse remains under-researched in Asia, Africa, and Latin America[26]. Walsh et al[32] criticized the current status of global research on elder abuse by giving minimal attention in investigating the experiences of elderly. World Health Organization predicted that the rapid population growth among developed countries associated with socioeconomic problems tend to increase the vulnerability of abuse to elderly. It is because the relative inattention of elder abuse is out of sync with the increasing number of current social issues.

The current literature highlighted a gap on the factors contributing to elder abuse and neglect in nursing homes. The need for greater attention to this

topic stems from several factors. The aim of this review is to identify the factors of the elder abuse in the nursing homes with three specific research questions of 1) What types of risk factor of elder abuse in nursing homes? 2) Do elderly characteristics affect abuse and neglect? 3) Do perpetrator characteristics affect elderly abuse and neglect in nursing homes.

Aim of the Review: A scientific review of this issues is necessary since there is a lack of accurate information on the factors of elder abuse and neglect. As many studies have not reported the factors of elder abuse and neglect, this review aimed to identify the factors of elder abuse and neglect in nursing homes.

Method

A review was conducted for this research. It was performed to identify the factors of elder abuse in nursing homes. It involved a comprehensive literature search with explicit inclusion and exclusion criteria.

The inclusion criteria were:

- Population aged 60 and over.
- Older people living in nursing homes.
- Written in the English language.
- Factors of elder abuse in nursing homes.

Exclusion criteria were:

- Abuse happens in their house.
- Perpetrators are the elderly's family.

Information sources: The comprehensive search of multiple databases of Science Direct, and other databases related to health and social care such as SCOPUS. These databases were used during the search process. The keyword search was conducted based on several key terms including 'elder abuse', 'elderly abuse', 'elderly abuse and neglect', 'elder mistreatment', 'factors of elderly abuse', 'factors of elderly abuse in nursing homes', 'causes of elder abuse', and 'causes of elderly abuse in nursing homes'.

Data Collection and Analysis: Basedon the literature search, thirty-nine studies were gathered. Thirty articles are concerned about the factor of abuse and neglect of elderly. Thirty-nine articles met the inclusion and exclusion criteria. Six of the articles examined the factors influencing elder abuse and neglect in nursing homes where the perpetrators are the caretakers in nursing homes while the remaining three articles examined the factors influencing abuse and neglect among elderly in home institutions where family members are the perpetrators.

Results

a. Risk factor of elder abuse and neglect in nursing homes

Elderly abuse can be divided into several types of abuse which encompass physical abuse, sexual abuse, psychological or emotional abuse, financial or material exploitation, neglect, self-neglect, and abandonment[34]. Living in nursing homes becomes a risk factor for physical and emotional abuse as it is estimated that 90 percent of abuse cases reported to adult protective services occur in domestic settings[3].

Physical abuse impacts individuals physically by caregivers including wounds, and injuries such as physical pain and soreness[17]. It is approximated that 91.4% of elderly have suffered from physical abuse yet only 2.9% reported[18]. An effect of abuse and neglect is the upper extremity injuries that comprised of 36.7%, which is in the shoulder and can be a nonspecific injury[21]. Elders who have experienced abuse have a 300% higher risk of death when compared to those who had not been abused despite experiencing only modest abuse.

Emotional abuse includes any attempt to demoralize, dehumanize, or intimidate older adults[4]. It can be difficult to identify emotional abuse because there are no apparent physical signs of this abuse. Verbal abuse only leads to greater decline in mental health than physical abuse as presented in a study of older women[20]. The impact of psychological abuse includes distress, emotional symptoms, and depression which is found higher than elders who have not experienced this abuse[8].

Psychological abuse wreaks mental anguish using threats, manipulation, or other cruel conduct. It can be inflicted via verbal or nonverbal communication cues. Treating an elder with physical punishment or the deprivation of basic needs is a particularly heinous form of emotional or psychological abuse. It is the systematic perpetration of malicious and explicit nonphysical acts against an elder including harassment, scolding, insults and stalking[9]. Elder neglect is the most common type of elder mistreatment. Based on the need for early assessment and intervention, neglect is often recognized[2]. In a systematic review of the prevalence

of elder mistreatment, researchers concluded that about 20% of all dependent older adults suffer from neglect[34]. All elder mistreatment cases that were brought to the attention of adult protective services constituted approximately 60%-70%[13,30]. Older adults that experience elder mistreatment and neglect are likely to experience lower quality of life, depression, and poorer self-rated health[8]. A contemporary study emphasized that older adults whose needs are not met following hospital discharge have a greater likelihood of hospital readmission[7].

b. Victim Characteristics

Age: In most Asian societies, advanced age became the protective factor to elder abuse. Elders living in nursing homes tend to experience abuse and neglect[9,12] and Dong[11] reported that 68% of elderly suffered abuse and neglect. The findings in another research have shown over 80% of elderly to have likely been abused in nursing homes compared to the younger age of elderly[22].

Gender: A study conducted in nursing homes observed that among older people, older females are more likely to be abused[10]and women tend to experience verbal and physical abuse and neglect compared with male elderly[5]. Another study in Korea pointed out that the most prevalent abuse among older men were emotional and verbal abuse[22].

Physical health: Disability and poor visual ability chronic illness among older people tend to increase the risk of abuse[37]. The levels of psychological abuse increase with the number of chronic diseases and functional dependence of Taiwanese elders[33]. Studies in India[5], Japan[27] and Korea[22] all showed agreement that poor health and functional impairment are risk factors for abuse.

c. Abuser Characteristic

Caregiver burden: In several studies, the burden of the caregiver role in providing care to older people with physical impairments and cognitive tends to be a factor of elder abuse and neglect, especially in Japan[1] The association between abuse and caregivers was pointed out in several studies conducted in Hong Kong and Korea[38].

Lack of caregiver experience and reluctance: It is often assumed that caregivers working in nursing homes are experienced to handle older people and bed-ridden people in nursing homes, but many people do not know that the lack of caregiver experience and reluctance promotes elder abuse and neglect in nursing homes. Not all caregivers have prior experience in caring for elderly since several caregivers are forced to do this job due to the poor socio-economic circumstances. The need to care for elderly is a burden as it goes against the caregiver's will. Caregivers may feel hostile and inadequate due to the lack of the experience in handling elderly. Reluctance among the caregivers can also increase of the risk of abuse and neglect of elderly in nursing homes due to the negative feelings of incomplete caregiving to help the elderly[16,29].

Conclusion

As the number of elderly increases, the demand for nursing homes is gradually increasing. However, the number of abuse and neglect of the elderly is sadly increasing too. The findings from this article show that a total of 23 respondents or 74.2% experienced at least one incident of physical mistreatment by staff or other caregivers in the form of hitting, pushing, slapping and kicking.

A total of 62 respondents or 79.5% reported at least one incident of emotional or psychological mistreatment by being treated disrespectfully and disallowing contact with family or friends. A total of 86.9% or 86 respondents reported neglect which encompasses failure to provide food, water, shelter, hygiene, medicine and personal safety.

According to Cooper et al[6] abuse cases was defined as $\geq$ 1 abusive act occurring $\geq$ 2-3 times per month, which is about 1.9% reported physical abuse, 2.4% neglect and 4.2% psychological abuse. Six of the seven articles described the rates or percentages of elder abuse and neglect in nursing homes. The data underlying were collected from various articles and journals. Findings from Kennedy et al[15] that 31% of physicians had encountered elder mistreatment cases in the preceding year mainly comprise of neglect (57%), physical abuse (19%) and emotional abuse (7%) in Ohio.

In conclusion, the findings of this study are aligned with the report by WHO[36] who estimated that 1 in 10 older people experience abuse monthly, especially in developing countries. Although the data are limited, a previous study has estimated that the most common types of abuse in high – or – middle – income countries demonstrated that physical abuse ranges from 0.2-4.9%, psychological abuse ranges from 0.7-6.3% and

neglect from 0.2-5.5%. Pillemer and Finkelhor[24] stated that older people who have poor health are three to four times more likely to be abused than those who are in good health. In this systematic review, elderly characteristics were identified as a critical factor in the rise of elderly abuse and neglect in nursing homes. The perpetrator characteristics were also determined as another vital factor in affecting elderly abuse and neglect in nursing homes. Thus, it is recommended for future studies to further examine the influencing factors of elder abuse and neglect since the factors re important in the prevention of elder abuse and neglect.

Acknowledgement: Authors would like to thank Dr. Hasif Rafidee bin Hasbollah for the cooperation and advice and also for his helpful feedback and comments on earlier drafts.

Abstract

Two plant species from the Melastomataceae family, *Melastomamalabathricum* Linn. and *Melastomadecemfidum* Roxb, which grow in abundance in tropical and subtropical regions have been well-documented to possess various medicinal values including anti-inflammatory properties. The present study was undertaken to examine the anti-inflammatory potential of *M. Malabathricum* and *M. Decemfidum* methanolic extracts (MME and MDE respectively) on lipopolysaccharide (LPS)-induced macrophage cell line (RAW 264.7). The cytotoxic assays of MME and MDE against RAW264.7 cells were conducted using 3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium (MTS). Production of nitric oxide (NO) from both *Melastoma* sp. was measured using Griess assay. MME and MDE exhibited high cell viability (>90%) at concentrations from 0.39 to 1.56µg/mL and 6.25 µg/mL respectively. Although the results obtained were not significantly different from control,NO production by LPS-induced RAW264.7 cells were observed to be lower for both extracts at concentration of1.5µg/mL when compared to untreated cells (control). The present study confirmed that MME and MDE have the potential to inhibit anti-inflammatory mediator against LSP-induced RAW264.7 cells.

Keywords: *Anti-inflammatory, Melastomamalabathricum, Melastomadecemfidum, RAW264.7 Cell line.*

Introduction

It is well-documented that plants have been the basis for most medical treatments through much of human history. Despite advancement in science and technology, traditional medicine is still widely practiced today. Herbal products have been used in the maintenance of health including prevention, diagnosis, improvement or treatment of a large number of physical illnesses[1]. It has been estimated that about 70 to 80% of the world's population are using herbal products as complementary and alternative medication (TM/CAM) as their primary medicines[2,3]. Malaysia's percentage was reported to be 73[4].

Inflammation is the body's way of protecting itself from infection, illness, or injury. It is an important biological defence mechanism in maintaining good health which otherwise could lead to serious complications such as rheumatoid arthritis, inflammatory bowel disease, atherosclerosis, Alzheimer's disease, dementia and cancer[5,6]. During an inflammatory

e-mail: ssalwaag@upm.edu.my

process, the immune response is modulated by activated macrophages and various inflammatory mediators such as reactive oxygen species (ROS), cytokines and nitric oxide (NO)[7,8]. Present day measures taken to cure inflammation include the use of healing promoting, non-steroidal, anti-inflammation drugs (NSAIDs). However, prolonged use of NSAIDs has been reported to lead to various serious side effects[9-11]. Bioactive compounds from plant extracts which are mostly free from serious side effects[12] have been utilized in various formulations in treatments for inflammation[13].

Two plant species from the family Melastomataceae, *Melastomamalabathricum* Linn. and *Melastomadecemfidum* Roxb., abundantly found in tropical and sub-tropical regions, have been reported having a variety of bioactive compounds that serve as important and highly potential sources for medicinal purposes[14-18]. The present *in vitro* study was conducted to evaluate cell toxicity and anti-inflammatory activities of leaf extracts from the two species of Melastomataceaeon RAW264.7 macrophage cell line.

Methodology

Plant Materials: Leaves of *M. malabathricum* and *M. decemfidum* were collected from their natural habitats at Universiti Putra Malaysia (UPM)'s Ayer Hitam Forest Reserve, Puchong, Selangor, Malaysia, and brought to UPM's Halal Products Research Institute laboratory for analyses.

Preparation of Crude Extracts: The plant materials were thoroughly washed under running tap water and air-dried under shade for two weeks. The air-dried leaves were ground into powder form using a mechanical grinder. The dried leaf powder of both *Melastoma* sp. was subsequently extracted twice by maceration in methanol in the ratio of 1:10 for 3 days. The mixtures were filtered using filter paper (What man No.1) and evaporated using a rotary evaporator (Yamato, Rotary Evaporator, Model- RE 801, Japan)[19]. The percentage yield of the extract was calculated using the following equation[20]:

$$\% \text{ Extraction yield} = \frac{(\text{Dried weight of crude extract})}{(\text{Dried weight of finely grounded} - \text{dried plant})} \times 100$$

Cell Culture of RAW264.7 Cell Line: RAW264.7 macrophage cell line (ATCC TIB-71 ™) was obtained from Immunology Laboratory, Faculty of Medical and Health Sciences, UPM. The cells were cultured in Dulbecco's Modified Eagle's Medium (DMEM, Gibco) supplemented with 10% heat-inactivated fetal bovine serum (FBS, Gibco) and incubated in a humidified incubator at 37 °C containing 5% CO_2 until the cells reached confluence. Subsequent to the procedures, the cells were washed using phosphate-buffer saline (PBS, Gibco) and detached using 0.25% trypsin-EDTA (Gibco).

RAW264.7 Cells Cytotoxicity Assay: RAW264.7 cells cytotoxicity was measured using MTS 3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxy-phenyl)-2-(4-sulfophenyl)-2H-tetrazolium (MTS) assay. CellTiter 96®AQueous One Solution Cell Proliferation Assay (MTS) (Promega, Madison, WI, USA) was used following the manufacturer's instruction to determine the cytotoxicity of the two *Melastoma* sp. crude extracts toward RAW264.7 macrophage cells. A volume of 100 µL medium (DMEM supplemented with 10% FBS) containing 5×10^3 cells per well were seeded in 96-well plate and incubated for 24 hours at 37 °C in a humidified incubator with 5% CO_2. After resting the cells for 24 hours, the previous medium was removed and changed to fresh medium (total volume: 100 µL) with different concentrations (0.39, 0.78, 1.56, 3.125, 6.25, 12.5, 25, 50 µg/mL) of MME and MDE, and 5% Abs. methanol in triplicate and incubated for 24 hours. Untreated cells were served as the control and the vehicle control group (without MME and MDE) was defined as 100%. Thereafter, 20 µL of MTS was added to each respective well and the procedure was performed in dark condition. The plate was incubated in 5% CO_2 at 37 °C atmosphere for 1 hour. Absorbance was measured at 492 nm on a microplate reader[21]. The data, calculated using the following formula, are presented as percentages of viable cells:

$$\%\text{Viability} = \frac{(\text{Abs sample} - \text{Abs blank})}{(\text{Abs control} - \text{Abs Blank})} \times 100$$

Determination of Nitric Oxide (NO) Production: RAW264.7 cells were seeded in a 24-well plate at a density of 5×10^4 cells/ml for 24 hours. After incubation, the previous culture media were removed, and new phenol red-free media were added. The cells were pre-treated with 1 µg/mL of lipopolysaccharide (LPS) for 2 hours to induce inflammation. Following this, the cells were treated with different concentrations of treatments (0.5, 1.0, 1.5 µg/mL) for an additional 24 hours. The culture media (500 µL) were collected after 24 hours for

the Griess assay. A Griess reagent assay was conducted to determine the nitrite accumulation in the culture media. The culture media (50 µL) were mixed with an equal volume of Griess reagent (1% sulfanilamide in 5% phosphoric acid and 0.1% naphthylethylenediamine dihydrochloride in distilled water) in a 96-well plate and the mixture was incubated for 10 minutes at room temperature. The procedure was performed in dark condition. Absorbance was measured at 540 nm using microplate reader, and the concentration of nitrite in samples was back-calculated from a previously constructed sodium nitrite calibration curve (0–100 μM).

Statistical Analysis: All data were derived from three independent experiments. Statistical analysis was conducted using SAS software (version 9.4). In this report, the values are presented as means ± standard deviations. Significant differences between the groups were determined using One-Way Analysis of Variance (ANOVA) followed by Tukey and LSD post-hoc Tests.

Results and Discussion

Effect of MME and MDE Extract on Viability of RAW264.7 Cell Line: The RAW264.7 cell toxicity assay was a study to determine the effect of MME and MDE toward RAW264.7 cell viability. The cytotoxicity of the methanolic extracts of both species was evaluated by MTS assay based on the conversion of yellow tetrazolium salt to form a purple formazan product. *In vitro* cytotoxicity assay was performed due to it low cost, convenience, direct detection for toxicity, and less duration needed[21]. Percentage of cells viability was determined by comparing cells viability value of treatments to the control. Table 1 showscells treated with MME at concentrations of 0.39, 0.78 and 1.56 µg/mL resulted in high cell viability percentage (>90%). Meanwhile, MDE showed high cell viability percentage (>90%) at concentrations of 0.39, 0.78, 1.56, 3.125, and 6.25 µg/mL. Concentrations of 12.5, 25 and 50 µg/mL resulted in low cell viability (<50%) for both extracts, which indicated toxicity to RAW264.7 cell line. Therefore, for further determination, the tests must be performed in the range of concentrations from 0.39 to 1.56 µg/mL for MME and 0.39 to 6.25 µg/mL for MDE.

Table 1: Effect of MME and MDE toward viability percentages of RAW264.7 cell line after 24-hour treatment

Conc. (µg/mL)	MME	MDE
Control	100 ± NIL^{a}	100 ± NIL^{bc}
0.390	93.36 ± 7.62^{a}	114.94 ± 4.06^{ab}
0.780	93.07 ± 10.86^{a}	122.65 ± 8.87^{a}
1.560	95.47 ± 12.29^{a}	113.86 ± 9.19^{ab}
3.125	85.08 ± 9.24^{a}	92.85 ± 0.77^{dc}
6.250	61.86 ± 23.82^{ab}	99.73 ± 3.31^{bc}
12.500	32.83 ± 14.30^{bc}	79.65 ± 6.56^{d}
25.000	09.29 ± 16.74^{c}	34.30 ± 9.19^{e}
50.000	10.15 ± 15.51^{c}	6.70 ± 0.53^{f}

Data presented as mean percentage ± SD of three replications; different superscript letters ($^{a-f}$), in each column indicate significant difference among concentrations based on Tukey post-hoc test with $p<0.0001$

The range of concentrations from 0.39 to 1.56 µg/mL of MDE show the higher cell viability percentage compared to control (Figure1). Effects of both MME and MDE extracts on RAW264.7 cell lines were evaluated after 24-hour of treatments.

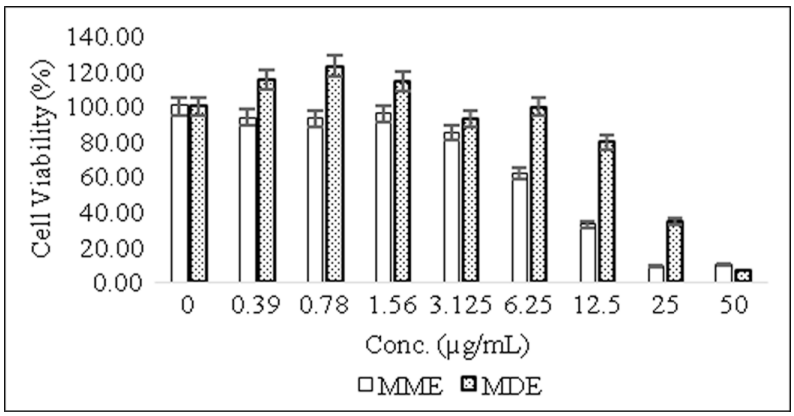

Figure 1: Effects of MME and MDE at concentrations from 0.39 to 50 µg/mL toward viability percentagesof RAW264.7 cell line after 24-hour treatments

It is crucial to know and understand that some bioactive compounds may be toxic to human health hence, when performing cytotoxicity test or assay, safety measures must be adhered[22]. When consuming herbal medication, proper dosage must be observed to avoid overdose which could result in various serious illnesses and even death[23].

Anti-inflammatory Activities of MME and MDE on LPS-Induced RAW264.7 Cell Line: The quantification of NO levels revealed that MME and MDE in concentration of 1.5 µg/mL was able to inhibit the production of NO (Table 2). Both extracts significantly resulted in lower NO than control which indicated that they reduced NO level in inflammation-induced cells. This suggests that both species were promising in their roles as anti-inflammatory agents. Anti-inflammatory properties of both MME and MDE were correlated with chemical compositions found from the leaves extracts. They were flavonoids (phenols) and terpenoids and these two compounds have gained much interest in various medicinal plants.

Since MME and MDE were methanolic plant extracts, phenols can be easily extracted by this methodology[24]. Chromatographic analysis of these species also showed having indole-2-one[25] compounds, which are known to have efficacy as anti-inflammatory[26]. The concentrations of NO in all samples were back-calculated from a sodium nitrite calibration curve, as shown in Eq. (1):

$$y = 0.0061\,x - 0.0084 \quad (1)$$

where $R^2 = 0.9966$, y = average absorbance,

x = concentration of NO

Table 2. Effect of MME and MDE toward NO level onRAW264.7 cell line after 24 hour-treatment

Samples	MME
Control	22.50 ± 1.08^{a}
MME 0.5 µg/mL	19.90 ± 1.08^{b}
MME 1.0 µg/mL	17.85 ± 0.77^{bc}
MME 1.5 µg/mL	16.95 ± 1.26^{c}
MDE 0.5 µg/mL	18.74 ± 0.98^{b}
MDE 1.0 µg/mL	17.78 ± 1.13^{b}
MDE 1.5 µg/mL	17.33 ± 1.77^{b}

Data presented as mean ± SD of three replications; different superscript letters ($^{a\text{-}c}$), in each column indicate significant difference among concentrations based on LSD post-hoc test with $p < 0.05$.

The present study used lipopolysaccharide (LPS), a component of the outer membrane of gram-negative bacteria and is known to be the most common cause in macrophage activation[27]. Various pro-inflammatory responses are known to be caused by LPS-induced activation of macrophage and lead to production of pro-inflammatory mediators; for example, NO, IL-1, IL-6, TNF-α, interleukins, prostanoids and leukotrienes[28]. Therefore, treating inflammatory disorders by suppressing activated macrophage would be a valuable therapeutic goal to treat inflammation. Antioxidant and inflammation immune responses are involved when there is an imbalance between free-radical and endogenous antioxidant defence mechanisms. When the imbalance happened, oxidative stress could take part, and this is the major cause of immunopathology. Oxidative stress can result in numerous diseases, and one of themis causing inflammation to the body[29,30]. A study conducted on anti-oxidative potential from the same extracts of *Melastoma*sp.[19] by analysing 2,2-diphenyl-1-picrylhydrazyl **(**DPPH)-radical scavenging activity, total phenolic content and FRAP-reducing antioxidant assay. The result showed that, both extracts, followed by, *M.decemfidum* (MeOH)> *M. malabathricum* (MeOH) showed among the highest DPPH-radical scavenging activity, phenolic contents and the highest fluorescence recovery after photobleaching (FRAP) values, suggesting that the extracts have potential to act against oxidation and protect human body from free radicals causing inflammation[31].

Conclusion

Crude leaf extracts of *Melastomasp.* revealed low toxic effect on RAW264.7 cell line at lower concentrations while at high concentrations, the extracts were toxic. In other previous studies, it has also shown that Melastomataceae family serves as medicinal plant with potent anti-inflammatory activity. The present study confirms the use of *Melastomasp.* leaves for treatment of inflammatory related diseases.

Abstract

This research employs the benefit of phototherapy as part of a sustainability value of visual in significant to the industry revolution 4.0. This ongoing process might be utilised in different ways from time to time. The research featured a random audience of Myanmar Refugees, aged 7 to 55 years old. Each participant was asked to pick one random image from 200 that reflected their background, ethnicity, visual experience preferences and interests. From selected image, participants were asked to talk about the visual chosen. This study used photo elicitation technique, with the aim being to measure the ability of phototherapy can become part of the alternative therapeutic process, mainly in visual studies. The methodology adopted for this study was based on qualitative interviews. From the discussion of the results, this research has developed an appropriate framework. From these observations, the research found Phototherapy evokes the communication process by indirectly encouraging people to open up and talk while describing the visual. The result from this research aims to provide data for any related agency, art therapy guidelines and a method for determining individual emotional states. In addition, this study narrowed the findings into the source of understanding of the Sustainable Development Goals (SDGs) agenda THREE (3) on the section of **Non-communicable diseases and mental health.**

Keywords *Phototherapy Technique, Health Management, Visual Studies.*

Introduction

Over the past decade, technology has driven a social resolution, especially in respect of the camera. The Daguerreotype, which started the camera revolution in 1839, has given new meaning to the photography industry. The visual image has produced its share of history year by year. However, with the development to industry 4.0, the value and sustainability of photographs and its new techniques, elements, principles, and the impact of picture continues to persuade viewers, one of the values that remain important is the Phototherapy technique.

So, what is Phototherapy? Phototherapy is traditionally valued for complementing some of the limits of verbally asking questions of therapy participants. Phototherapy is a technique of image therapeutic therapy, using photos for expressing feeling, beyond words. Therapeutic Photography does not just mean only photo-taking. It also includes other photo-interactive activities, such as photo-viewing, posing, planning, discussing, or even just inspiring memory or imagination when viewing photographs[1]. In addition[2], in her article titled *History and Development,* specified that the terminology and the use of Photographs as a therapeutic platform was started in 1844 by Dr Thomas Kirkbribe, which was followed up by Dr Hugh Diamond in 1856. Phototherapy can also provide mental health benefits without the need for medication, which is why it has received so much interest. The advantages of introducing photographs as part of interviews are: (a) to facilitate rapport, (b) to trigger participants' memories, and (c) to facilitate the articulation of ideas[3].

The photo elicitation technique is a well-known alternative therapeutic technique in photography research, which can also be used to determine or find the results through the interview process, but it is an uncommon practice in Malaysia. Since early practice until today, the use of phototherapy has produced many positive outcomes.

Meanwhile, Saita.el[4] discussed the impact of photograph use to gain memories from participants to travel experience. Pachmayer and Andereck[5] agreed, and confirmed the impact of photographs would gain more support in terms of client sharing information. Research also indicated that elicitation techniques are capable of reducing the imbalances between interviewers and respondents, as it provides participants with a greater ability to elaborate meaning in different ways[6]. The photographic approach can be anything related to visuals such as a video, print photograph, digital slide, animation, short story video or any type of visual representation of images[7]. In this study, photo elicitation also helps to define participants' experience, thoughts and feeling about the photos, and can help jog participants' memories, especially with tacit knowledge[8]. The study seeks to assess if the phototherapy technique can affect the conscious mind and mental state of Myanmar Refugees in Malaysia. According to the United Nation Refugees Agency, as at January 2019, 142,370 Myanmar Refugees had been registered with UNCHR and an estimated 30,000–40,000 more remain unregistered[9]. The number included 84,030 Rohingyas, 25,700 Chins, 9,770 Myanmar Muslims, 4,000 Rakhines and Arakanese refugees. From the report published in 2017[10], it was confirmed that most of the refugees arrived by boat in Thailand after undertaking dangerous journeys across the Andaman Sea prior to being smuggled or trafficked into Malaysia.

According to World Health Organization[10], Mental Health is a fundamental human condition, which also determines the main points of how we act and the way that our body and mind process. As depression becomes the main agenda to Mental Health disorders and categorised under Non-Communicable Diseases or Mental Disorders, it is concluded that without appropriate care, there is a high possibilities it can lead to suicide. Reporting in article, *page progress and info* (Sustainable Development Goals, United Nation) SDGs no 3 shows since 2015, globally there have been 800,000 cases of commit suicide every year[11].

Therefore, the National Institute of Mental Health divides depression into two major categories, clinical depression and depressive disorder. The form of major or persistent depressive disorder is also known as dysthymia. In addition, both forms of Depression develop from high emotional Stress.

Objectives of the Study: This study is focused on two (2) objectives. Firstly, the research process aims to assess whether the usage of phototherapy can form part of an alternative treatment technique for Myanmar Refugees. The second objective is to determine what kind of visual preferences can be applied to certain groups of Myanmar refugees as part of the therapy technique.

Methodology of the Study

The research used a qualitative approach for data collection. The qualitative method involved observations, case studies, and interviews. The location for the conducting of this study was the Myanmar Refugees Centre, Kuala Lumpur. Twelve respondents participated in the session. They were aged between seven and fifty five years, and included females and males from multiple region, race and Ethnicity. In association with this research, an interview was conducted after the visual selection session. In the visuals, 200 random images were present, which referred to the experience, culture, nature, background and other exhibits of interest to humans. From those images, respondent were asked to talk about the pictures. After the session, the researcher transcribed the information into transcript data using the available software - Atlas TI. The following figure (1) indicates the detailed design framework that was applied to the research process, which is further explained in the following sections of this work:

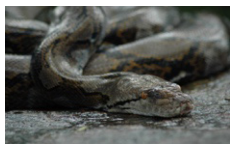
Phase 1	• Identification Respondent, and Specification of Visual Data • [Respondent: Myanmar Refugees/7-55years old] • [Visual Preferences: 200 images - based on background, ethnicity, visual experience preferences and interest]
Phase 2	• Phase 2: Phototherapy Method Study • Photo Elicitation Interview [PEI] Respondent asked to choose ONE(1) picture, and talk about it with develop interview question
Phase 3	• Phase 3: Analyzing Transcript Data • Tool: Atlas TI • Result from Data Transcription

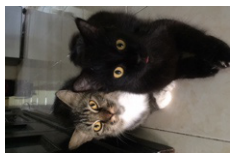
Figure 1. Framework Structure from Interview Process, Analysis and Results

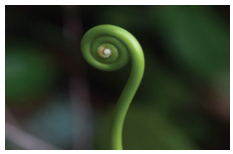
Phase 1: Identification Respondent, and Specification of Visual Data

Respondents randomly chose one of the 200 printed images (photographs) that were most directly related to their background and ethnicity. All 200 visual data selections used ADSee 20, the software that helps

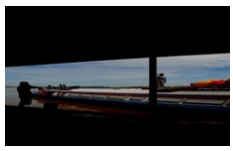
researchers to separate images according to metadata, category and keywords. A total of 12 male and female respondents, from ages 7 to 54 participated in the study.

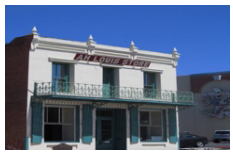


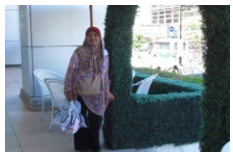


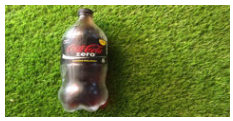


Phase 2: Phototherapy Method Study









The Photo Elicitation Interview (PEI) technique, using a photograph, formed part of the interview. From the one random image chosen, the interviewer will ask the participant why he or she selected the photo.

Phase 3: Analysing Transcript Photo Elicitation Interview (PEI).

The interview results were compiled into a table (1) and analysed using Atlas TI software as a measurement tools to analyse the interview data.

Table 1. Interview Details

No.	Participant Details	Ethnicity	Visual/ Picture	Images	One to One interview [Information Data]
1	Female [20+ yrs old]	Chin	Beach		I want to live nearby a beach, I want to feel free. I eat grass from the jungle and can't sleep at night because I'm too scared. Army kills my brother.
2	Female [15-16 yrs old]	Chin	Snake		I scared of snake because of the poison. My father kill snake and we ate. So much fun
3	Female [20+ yrs old]	Rohingya	Bags		I want to go to London, have nice life, nice handbags so I can carry my baby.
4	Male [8 yrs old]	Rohingya	Cat		They're cute and I use to have cute cats
5	Male [54 yrs old]	Chin	Building/ House		I want home, love and peaceful life
6	Male [30 yrs old]	Chin	Guitar		So I can play some music but we try not to be happy. If we happy, there always bad things happen.
7	Female [17 yrs old]	Rohingya	Midin/ Vegetable		I like this photograph. Reminding me the situation how much we need "women tampon" I just need some clothes. So, I made some. Right now, we just wash and dry same pad, and recycle.
8	Male [17 yrs old]	Rohingya	Malay Bride		Funny dress and make me laugh

9	Male [35 yrs old]	Chin	Boat		So I can go fishing, and have good food to eat
10	Female [30+ yrs old]	Chin	Building		Beautiful, very nice colour, nice building, near the market
11	Female [7 yrs old]	Chin	Woman wearing Hijab		I saw this video in town, woman with towel on the head
12	Female [14 yrs old]	Chin	Coke		Good food and expensive food. I want to work and buy them a lot

Phase 4: Result output

The results from the transparency data using Atlas TI appeared to attract hidden information for certain interview processes, which forms a compass to develop honest information for the research study. The transparencies of the data indirectly build trust in the form of giving, receiving and transcription of the data.

Findings

According to the data analysis, the result showed the frequency of the information and the variable of basic needs, made up of 13 words, which are mentioned at least 8 times (see figure 2). These are in addition to the mention of other words such as belongingness {6-0}, psychologic needs {4-0}, Self-fulfilment need {4-0}, and Safety and Security {1-0}, to ensure the acquiring of a code co-occurrence pattern.

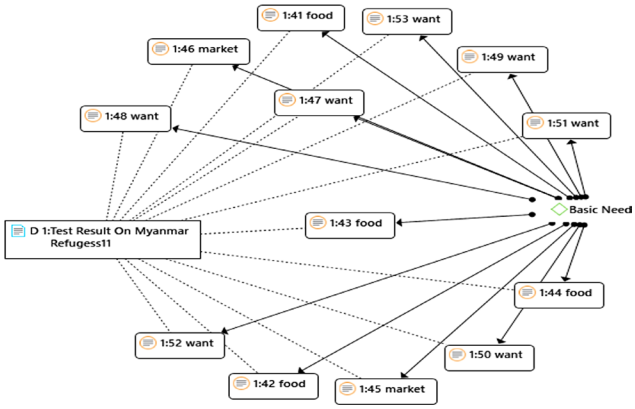


Figure 2. Diagram of Ratio Domination Choice of Words from Transcript Data

The code data shows the Word "I" had been mentioned 23 times, which represents 6.37% out of the ratio of 34.7% in Total. Self-belongingness to the indication ratio of females shows a focus on psychologic needs, whereas male choices were more directed towards basic needs. The results of the cloud analysis of the data are presented below (Figure 3):

Figure 3. Cloud Image of Interview Transcript Result

From a visual viewpoint, the cloud interpreted the value of psychology to self as the roots to the interview response. The frequency of word choices was dominated by the word "I", which was mentioned 23 times by the participants. This was followed by ethnicity and value of need, represented by such words as "build", and food, happy, eat and good were also mentioned between 8-12 times.

Conclusion

From the findings of the study, the research found the Phototherapy was deeply focused on the basic need of living while talking about the pictures. The data concluded using a standard deviation, which has aspecific variable of Median. The median shows the average number of 1:4, which is detailed in figure 2. In addition, from the observation the interviewer found that on average, the participants choose images related to their hobbies, age, and living life.

The study utilised one of the phototherapy techniques *ie*: Photo Elicitation Interview (PEI), as part of the process, therefore, it enhances the indirect message, which is important information for the organisation and therapists involved with supporting these refugees. Thus, it will provide an improved Mental Health assessment as an alternative treatment for Myanmar refugees. Equally, it might help participants to overcome the trauma they have experienced. The evolution of Photography 4.0 is so varied. Regardless, the movement of camera technology has develop immensely. However, the value of visual communication still dominates the individual and society.

Impact And Recommendation: The conclusion leads to a new idea, which enhances the new knowledge attained on the United Nation Sustainable Development Goals (SDGs) as a platform for reference and knowledge sharing with other countries. From the research findings, it can expand the development standard guideline to all sectors of society.

Research data benefit awareness to Family, Partners, Job Sectors or Government regarding understanding the behavioural patterns of a target study. The recommendations from the study are expected to benefit and help raise awareness among the public on the mental health issue of depression, with phototherapy being considered an option as an alternative treatment technique for Myanmar Refugees. Furthermore, the conclusion from the study would benefit further investigations regarding other usages of this fundamental therapeutic method.

Acknowledgement: The authors would like to thank the Refugees Community in Kuala Lumpur. Malaysia for their kindness and making us feel welcome and comfortable.

Effectiveness of Nutrition Education and Lifestyle Interventions in Obesity

Dr. Sheela Shenai1, Jolly Jose2

[1]*Principal, Malankara Orthodox Syrian Church College of Nursing Kolenchery,*
[2]*Professor cum Vice Principal, Govt. College of Nursing, Thiruvananthapuram.*

Abstract

Introduction: Globally the prevalence of obesity is increasing at an alarming rate. WHO has declared it as global epidemic and no country is free from this phenomenon. Promotion of healthy diets and physical activity in schools is essential to fight the childhood obesity epidemic[1].

Objectives: Of the study were to estimate the prevalence of obesity, to determine the risk factors and to test the effectiveness of nutrition education and life style interventions in obesity among the higher secondary school children.

Method: The study adopted multiple research designs. A descriptive cross sectional survey was conducted through multi stage random sampling to estimate the prevalence of overweight and obesity based on BMI cut offs as per Agarwal's standards. Risk factors were determined by a case control design. Nutrition education and life style interventions were given to the children in the experimental group along with a module but the control group was given only the module.

Results: Combined prevalence of overweight/obesity among boys was 9.52%(7.02 - 12.02% at 95% CI) and it was 10.59% (8.53 - 12.65% at 95% CI) among girls. Higher income of the family, parental obesity and fast food consumption were identified as the main risk factors of obesity. Repeated measures ANOVA showed a significant reduction in BMI among obese children in experimental group after intervention.

Conclusion: Individually tailored strategies will have a desired result in obesity intervention program.

Keywords: *Overweight, obesity, BMI, nutrition education, life style interventions.*

Introduction

Childhood obesity is one of the most serious public health challenges of the 21st century[1]. According to IOTF at least 155 million school age children worldwide are overweight or obese and out of this 30-45 million children are classified obese[2]. A positive transition is occurring in Indian children and adolescents commencing from new born period with a considerable decline in severe forms of undernutrition in underprivileged rural population.

Background: A few available Indian studies point to the growing menace of obesity. A study in Hyderabad among affluent adolescent school children (12-17 years) revealed that the prevalence of overweight and obesity was 11% which was comparable among boys and girls. The prevalence was significantly higher among students in private institutions[3]. A study on obesity among adolescent girls (13-15 years old) in eight schools in Thiruvananthapuram put the prevalence of obesity at 5%[4]. Another study among 13-19 years old children in Thiruvananthapuram showed 5.4% overweight and 2% obesity as per IOTF standard[5].

The school system is the appropriate channel to convey the essential educational health and nutrition

messages to the crucial sizeable segment of Indian population. They are the citizens who will shape the future of the nation and hence a most important priority. Thus the adolescent children were selected as the target group of this study. Kottayam district being a commercial capital of Kerala there is convergence of all the risk factors of obesity in this area. This district has been in the forefront of modern education in Kerala and so it is a suitable place to study the effect of interventions in obesity among school children.

Objectives of the study were (1) to estimate the prevalence of obesity and overweight among higher secondary school children (2) to determine the risk factors and (3) to evaluate the effectiveness of Nutrition education and lifestyle interventions in obesity among higher secondary school children.

The hypotheses tested in the study were

H_1 – There is significant association between obesity and demographic characteristics among higher secondary school children.

H_2 – There is significant association between obesity and dietary habits among the school children.

H_3 – There is significant association between obesity and physical activity level among higher secondary school children.

H_4 – There is significant difference in BMI and physical activity level of obese children in the experimental group than in the control group after intervention.

Materials and Method

Research Approach: The study was done in three phases. Descriptive survey, true experimental approach and again a descriptive survey approach were adopted in the first, second and third phases respectively.

To accomplish the objectives of the study, multiple research designs were used.

In the first phase, a cross sectional survey design was used to estimate the prevalence of obesity among the children. A case control design was used to describe the relationship between the variables under study such as socio-economic status, parental obesity, family size, birth order, number of siblings, type of family, food pattern and physical activity level.

During the second phase true experimental deign was adopted where the researcher manipulated the independent variables like nutrition education and lifestyle intervention. The teaching learning sessions were given on nutrition concepts, causes of obesity, health consequences and preventive measures of obesity by using a module 'Nutrition for Health' and on progressive exercise therapy to the children in the experimental group. Individual counseling and telephonic reassurance was also given during the follow up visit. Only the module was given to the children in the control group during the intervention period.

In the third phase a longitudinal survey design was adopted to make a comparison of change or effect over time. The effect of intervention was studied at sixth month (post) and twelfth month (follow up) in the experimental and control group.

Setting of the study was higher secondary schools in Kottayam district.

Sample and sampling technique: Students studying in +1 classes in selected schools of Kottayam district. Children who were on treatment or had skeletal deformities were excluded from the study. The selection of the schools for the study was based on multi stage stratified random sampling.

Thirty schools were selected based on their student strength to satisfy the required sample size. In the selection of students, clusters of the size of a division ranging from 40-50 students were selected from the chosen schools. The selection of clusters was done at random by taking lots.

Sample size for the survey was calculated using prevalence estimate of 11% obtained from previous studies conducted by Laxmaiahetal in Hyderabad[3]. With prevalence of 11%, alpha error fixed at 0.05 and precision of 2%, sample size required for prevalence estimation was found to be 979. The sample size was increased by 10% to 1100 considering attrition.

Assuming the prevalence of overweight and obesity as 11%, the sample size for risk factor assessment was 363. Considering the risk ratio and expected reduction in the event rate in the treatment group to be 40%, alpha error fixed at 0.05 and 80% precision the sample size estimated was 705 in each group. Since the required sample size for the intervention was more than the sample size required for prevalence study, the sample size for the latter was fixed at 1500.

Tools and Technique: The tools and techniques used for the data collection were proforma for anthropometric measurement, dietary assessment questionnaire (DAQ), socio-personal proforma (SPP), module on 'Nutrition for health', compliance record, booklet and counseling sessions.

Anthropometric measurements were taken using a portable weighing machine to record the weight of the subject with an accuracy of 0.5kg and portable stadiometer to measure height with an accuracy of 1mm. BMI was used to classify the students into obese, overweight, normal and underweight as per Agarwal's standards. Validity and reliability of the tools were tested. The duration of the data collection was two years. The data were fed into the computer and statistical analysis was done with the help of R software.

Results

Section I: Prevalence of overweight and obesity

Table 1: Distribution of obesity, overweight, normal weight and underweight among study subjects according to gender-Boys n=672

Age	Underweight		Normal		Overweight		Obese		Total	
	n	%	n	%	n	%	n	%	n	%
15	23	9.70	193	81.43	15	6.33	6	2.53	237	100.00
16	40	12.54	245	76.80	29	9.09	5	1.57	319	100.00
17	11	12.22	72	80.00	3	3.33	4	4.44	90	100.00
18	2	7.69	22	84.62	2	7.69	0	0.00	26	100.00
Total	**76**	**11.31**	**532**	**79.17**	**49**	**7.29**	**15**	**2.23**	**672**	**100.00**

Table 2. Prevalence of overweight and obesity - BMI distribution among study subjects according to gender-Girlsn= 897

Age	Under weight		Normal		Overweight		Obese		Total	
	n	%	n	%	n	%	n	%	n	%
15	51	11.75	342	78.80	28	6.45	13	3.00	434	100
16	35	9.54	291	79.29	29	7.90	12	3.27	367	100
17	14	19.72	48	67.61	3	4.23	6	8.45	71	100
18	9	36.00	12	48.00	4	16.00	0	0.00	25	100
Total	**109**	**12.15**	**693**	**77.26**	**64**	**7.13**	**31**	**3.46**	**897**	**100**

The tables 1 and 2 depict that the combined prevalence of overweight and obesity was 9.52% (7.02-12.02% at 95% CI) among boys and 10.59% (8.53-12.65% at 95% CI) among girls.

Table 3. Distribution of obesity, overweight, normal weight and underweight among the study subjects according to type of school (Private/Government). n=1569

BMI	School				Total	
	Government		Private			
	n	%	n	%	n	%
Under weight	70	11.1	114	12.2	184	11.7
Normal	516	81.8	714	76.1	1230	78.4
Over weight	33	5.2	78	8.3	111	7.1
Obese	12	1.9	32	3.4	44	2.8

The above table shows higher percentage of obesity among students of private schools than in Government schools.

Section II: Identification of risk factors of overweight and obesity

420 boys and girls were studied for identification of risk factors of obesity. 140 obese and overweight adolescents were the cases and 280 non obese adolescents were the controls.

Table 4. Association of overweight and obesity and major risk factors among subjects. n = 420

Sl. No.	Variable	Category	Obese n = 140	Non obese n = 280	χ^2	df	p value
1	Parental obesity	Yes	85	74	41.71	3	0.001***
		No	55	206			
2	Socio-economic status	Upper	122	194	13.47	2	0.01**
		Lower	18	86			
3	Fast food intake	Yes	56	78	7.98	2	0.01**
		No	84	202			
Caloric intake/day							
4	Boys	<2640	42	106	3.9	1	0.04*
		≥ 2640	16	19			
	Girls	<2060	76	145	0.638	1	0.8
		≥ 2060	6	10			
5	Fat intake/day	<22g	52	77	3.88	1	0.04*
		≥ 22g	88	203			
6	Physical activity level (PAL)	Mild	126	261	2.80	2	0.24
		Moderate	8	7			
		vigorous	6	12			

*** significant at 0.001; ** significant at 0.01; * significant at 0.05

As shown in table 4, chi ($\chi 2$) square statistic revealed that there was significant association between overweight and obesity in children and parental obesity, socio-economic status of the family, habit of fast food intake, calorie and fat intake/day. There was no significant statistical association found between overweight/obesity and physical activity level (PAL) among the study subjects. Thus H_1 and H_2 are accepted and H_3 is rejected in the present study.

Table 5. Predictors of overweight and obesity using Univariate Logistic Regression Analysis (n = 420)

Sl. No.	Variable	Category	Obese n=140	Non obese n=280	OR	Lower	Upper	p value
1	Parental obesity	Yes	85	74	4.50	2.88	6.83	0.000*
		No	55	206				
2	Socio-economic status	Upper	122	194	0.46	0.228	0.54	0.000*
		Lower	18	86				
3	Fast food consumption	Yes	56	78	3.66	2.360	5.58	0.000*
		No	84	202				

*Significant at p<0.000

The above table shows that the predictors of overweight and obesity among the study subjects were parental obesity, socio-economic status and fast food consumption.

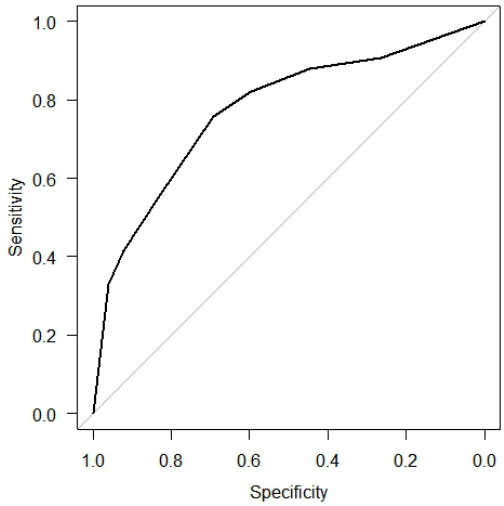

Figure 1: ROC curve showing the multivariate logistic regression model for the predictors of obesity

Results of ROC analysis show that the area under the curve is 0.77. This regression model is good enough to predict that there is higher probability of children for becoming overweight and obese if their parents are obese, consume fast food and belong to high socio-economic group.

Section III. Effect of interventions

Table 6. Repeated measures ANOVA table showing the effect of intervention on BMI and physical activity level at three points among experimental obese subjects (n= 59) and control obese subjects(n= 81)

	Group	Time points	Mean	SD	Source	df	Sum of squares	Mean squares	Fstatistic	p value
BMI	Experimental: obese n = 59	BMI (pre)	26.51	3.96	Between group	2	166.85	83.42	6.31	0.002*
		BMI (post)	25.06	3.52	Within group	174	2298.25	13.20		
		BMI (follow up)	24.17	3.32	Total	176	2465.10			
	Control: obese n = 81									
		BMI (pre)	26.43	3.38	Between group	2	10.91	5.45	0.28	0.75
		BMI (post)	26.47	3.36	Within group	240	3350.16	19.25		
		BMI (follow up)	25.64	5.24	Total	242	3361.08			
PAL	Experimental group: obese n = 59	PAL (pre)	1.40	0.10	Between group	2	0.43	0.21	12.05	0.000**
		PAL (post)	1.50	0.15	Within group	174	3.11	0.017		
		PAL (follow up)	1.51	0.13	Total	176	3.54			
	Control group: obese n = 81	PAL(pre)	1.45	0.12	Between group	2	0.024	0.012	0.47	0.62
		PAL(post)	1.46	0.13	Within group	240	4.46	0.025		
		PAL (follow up)	1.48	0.12	total	242	4.48			

* significant at $p < 0.001$; ** * significant at $p < 0.000$

When the changes in mean BMI of obese children in experimental group were examined there was statistically significant reduction in BMI after intervention. A significant improvement in physical activity level of obese adolescent children was also observed. Accordingly H_4 is accepted.

Effect on food habits and physical activity: There was significant increase in the frequency of consumption of GLV and fruits and reduction of intake of bakery items and fast food among children of experimental group than in control group which was statistically significant.

There was reduction in the mean TV viewing time, improvement in timespent for aerobic exercises and household activities among the experimental group than in the control group.

Discussion

The prevalence of overweight and obesity obtained in this study using Agarwal's standards is reflective of the situation in Kerala. The study results are supported by many other studies in Thiruvanathapuram city[4,5]. There was difference in prevalence in Government and private schools[7]. The trend of higher rates for overweight and obesity especially in affluent groups necessitates intervention at school level focusing on Nutrition education and physical fitness programme utilizing the National Adolescent Health Programme in India.

There is abundance of evidence supporting genetic susceptibility as an important risk factor for obesity[7]. The genetic component of obesity was brought out in this study also. But it is explained that the behavioral or mental factors which can have an interaction with the genescan also lead to obesity[8,9]. The present study also proved that there is a significant relationship between overweight and obesity in children and socio-economic status. Ramesh K Goyal has also reported comparable results[10].

The findings of the study also revealed that there is a definite behavioral modification among the school children after the intervention. There was significant reduction in BMI and improvement in physical activity among obese children in the experimental group. One of them is the APPLE project in 2008, a two year follow up of obesity intervention initiative in children that enhanced extracurricular physical activity and promoted healthy eating habits in children and teachers.[11]

Conclusion

The food habits such as fast food consumption with more calories and more fat intake has led to overweight and obesity in adolescents. Behavioral treatment is considered to be an essential component of any obesity treatment program. Family based interventions to prevent excess weight gain in young children including high risk population using multi component multi level approaches may be undertaken as future studies.

Conflict of interest: None

Source of funding: Self

Ethical clearance: Ethical clearance was obtained from Ethics committee of Medical College, Thiruvananthapuram. Permission from Directorate of Higher Education, Kerala was obtained to conduct the study in higher secondary schools and informed consents were received from Principals of the concerned schools, parents. Assent was obtained from the participants of the study.

Lived Experiences of Mothers of Children with Intellectual Disabilities: A Phenomenological Study

Lata Shelke[1], Sheetal Barde[2]

[1]PG Scholar, [2]Assistant Professor, Department of Psychiatric Nursing, Symbiosis College Of Nursing, Symbiosis International (Deemed University), Pune, India

Abstract

This study explored the lived experiences of five mothers who were primary caregivers for their children with intellectual disabilities. It provided an opportunity to explore the nature of their mothering experience and understand the meaning they attribute to their caregiver role. The mothers of mentally disabled children showed significantly more psychiatric morbidity and stress than mothers of normal children, but fathers did not show the same deleterious effect on psychological health.

Purpose: The purpose of this study was to investigate the intricacy of the lived experiences of mothers.

Method: A qualitative, phenomenological research design was used in this study,five mother were taken as sample Here the sample is mothers of children with Intellectual Disability and data was to be collected by interview method. The interviews were transcript into word file. Analysis was done by Colaizzi's Strategy.

Result and Discussion: By using phenomenological method several themes and subthemes emerged which is provided the description of the live experience of mother of children with intellectual disability. This work explore the live experience of mother of children with intellectual disability and provide recommendation for further study. Interview results show that participants are going through the same level experience at the certain stage.

Summary and Conclusion: In summary research study used aqualitative, phenomenological method by which to gain a greater understanding the live experience mother of children with intellectual disability. The specific circumstance associated with the pivotal moment were different from each participant, but the clarity of the moment was universal. In conclusion, this study explored the lived experiences of five mothers who resided with and were primary caregivers for their children with intellectual disabilities. It provided an opportunity to explore the nature of their mothering experience and understand the meaning they ascribe to their caregiver role.

Keywords: *Live Experience, Mother, Children, and Intellectual Disability.*

Introduction

This study explored the lived experiences of five mothers who were primary caregivers for their children with intellectual disabilities. It provided an opportunity to explore the nature of their mothering experience and understand the meaning they attribute to their caregiver role.

Intellectual disability involves problems with general mental abilities that affect functioning in two areas i.e. **intellectual functioning** (such as learning, problem solving, and judgment) and **Adaptive functioning** (activities of daily life such as communication and independent living). Intellectual disability affects about one percent of the population, and of those about 85

e-mail: shitalbarde@scon.edu.in

percent have mild intellectual disability. Males are more likely than females to be diagnosed with intellectual disability[1].Intellectual disability is identified as mild (most people with intellectual disability are in this category), moderate or severe.[1]

The number of people with an intellectual disability also rose between 2011 and 2016. 66,611 people reported having an intellectual disability in 2016 (up from 57,709 people in 2011).[2]

Studies on severe mental retardation from low-income countries report a prevalence of higher than 5 per 1000, which is greater than figures reported for high-income countries.[4]

The mothers of mentally disabled children showed significantly more psychiatric morbidity and stress than mothers of normal children, but fathers did not show the same deleterious effect on psychological health, which may be related to the differing responsibility assigned to child rearing for each parent, as the literatures showed that fathers are less involved in caregiving activities.[5]

According to disability statistics in India 1.5 Million persons suffer from Mental Disability, out of which 0.9 million is Male and 0.6 million is Female.[6]

Material and Method

- **Research approach:** Qualitative study
- **Research design:** Phenomenological Research Design

  Interpretative phenomenological research design
- **Inclusion Criteria:**
  a. Mother's co-residing with their adult child with intellectual disability for more than 10 Years.
  b. Who can understand English/Marathi.
  c. Only Mothers will be included in the study.
  d. Mothers having only single child with Mental Disability.
- **Exclusion Criteria:**
  a. Mothers not willing to participate in the study
  b. Mothers with psychological problems
- **Research Setting:** Kamyani School for special Children.
- **Population:** Mothers of children with intellectual disability.
- **Sample:** Mothers of children with Intellectual Disability
- **Sample size:** 5
- **Sampling Method:** Non-probability sampling technique

  [Purposive Sampling Technique]
- **Tools for Data Collection:** Open ended questionnaires
- **Techniques of Data Collection:** Interview Method [semi structured and depth interview]
- **Data Analysis:** After collecting data,

  Creating a meaning/theme from collected information

  Formulating meaning into several theme and subtheme

  Description given regarding the particular theme

  Findings:

Theme: Mothers' Actions to Organizing Daily Life for Their Sons: These mothers compose, arrange, and oversee all aspects of their sons' lives, including daily routines and finances, health and safety, relationships and social connections, opportunities to experience competence, and opportunities for renewal.

Monitoring daily schedules: All five participants acknowledged that their own routines revolve around the temporal, and for Mamta the physical, demands of their sons' schedules. Mamta, whose son Harsh has cerebral palsy, described the routine she and Harsh follow on weekday mornings, starting early:

"When I come down first thing in the morning [between 6 and 6:30], I have him lay flat on his stomach, to stretch his hamstrings. And he stays there for a while, and I say, 'It's time to get up.' And he gets up and goes to the bathroom, and gets into the shower. This all takes a very long time, and a lot of prodding. He uses the walker, to get out of bed, he probably has to be reminded three or four times, and in the bathroom, 'keep moving,' and in the tub, and I help him with the shower.**"**

Creating social connections of their son's: All five mothers understand the importance of their sons having social connections outside home and have established routines for their sons that include social relationships. All the sons, except Peter, Esther's son, work or attend day programs on weekdays.

Rama's son, Arjun, studies in Special school. Arjun has no additional source of social contact, beyond family and School, is an area of despair for Rama, as she said,

"[He doesn't socialize], not outside of School, no. He's a homebody. I would like him to have [friends outside school], but he hasn't had, he won't initiate it.**"**

Summary of theme:

Mothers' Schedules: While all five mothers acknowledge their lives revolve around the schedules and needs of their sons, each is engaged in personally meaningful activities beyond mothering. All five women have social connections with friends and family in addition to participating in activities they enjoy. These mothers acknowledge that their aging and health have changed, or will ultimately change, their routines and their need for assistance from their sons or others.

Mothers' Skill: All five of these mothers used their in-depth knowledge of their sons' physical, cognitive, social, and emotional abilities and disabilities as the base from which they translated and interpreted both social norms and expectations to their sons and from their sons to the broader social world. These mothers described responding to situations that arise naturally in the course of their sons' lives and actively sought opportunities to mediate between their sons and the larger social context. In doing so, these mothers smoothed the way for the social acceptance of their sons.

Mothers' Thoughts on Raising a Son with Intellectual Disabilities: The mothers who participated in this study were asked to reflect on the lifelong effect of mothering their sons with intellectual disabilities. These mothers recognized that their lives were shaped by their parenting experiences in ways that were different from their peers who did not have children with disabilities. All five mothers felt they had learned significant lessons from their sons and from mothering their sons. Finally, all of these mothers accepted that they can plan for their sons' futures but cannot control their sons' destinies.

Mothers' actions to Organizing Daily Life for Their Sons: While these families varied in terms of structure and lifestyle, all five of these mothers compose, arrange, and oversee all aspects of their sons' lives. All five mothers create and maintain the lifestyles of their adult sons and themselves. The data demonstrate that while there are variations in the lifestyles and the daily routines, each of these women has created a life for her son that is healthy and safe and includes social connections and relationships.

Accepting how life is different than friends' lives: All five mothers were aware that their lives were configured differently than their same-aged peers because of their ongoing responsibilities for their sons. Rama, who had a very full social and recreational life by most people's standards, still lamented that she had less freedom than many of her friends because she drove Arjun to and from his School.

Asha also couched her comments in terms of freedom, saying,

"[My friends] do have a certain amount of freedom that maybe I don't have. Like I always try to think of things that we are going to do that he likes, too, you know.**"** She included him in most of her activities and saw this in a positive way: "But everybody likes him and enjoys his company.

Accepting the coming future for son: The mothers who participated in this phenomenological research believed they knew their sons' disabilities and abilities better than anyone else and much of their thinking about their sons' futures centered on this expertise. Even Rama, who had been very frustrated by her sons, Arjun's, lack of initiative and the difficulties they have in their day-to-day routines, acknowledged albeit tearfully that, "... nobody is going to take care of him the way I am.

Conclusion

In conclusion, this study explored the lived experiences of five mothers who resided with and were primary caregivers for their children with intellectual disabilities. It provided an opportunity to explore the nature of their mothering experience and understand the meaning they ascribe to their caregiver role. The broad question this study sought to answer was: What are the lived experiences of perpetual mothers who live with their adult child with intellectual disabilities?

The results of this interpretive phenomenological study raise interesting issues for continued research about mothers of children with intellectual disabilities, as well as about children with intellectual disabilities, as they move into middle- and old-age. There is much that is unknown about the experiences of mothering children with intellectual disabilities over time and, certainly, about their daily lives, and the transitions these families

make. This research has added substance to the call for research that elicits the perspectives of mothers and their children to better understand the day-to-day nature of their lives.

Conflict of Interest: The authors declare no conflict of interest with respect to the authorship/or publication of this paper.

Source of Funding: The authors declare that the research study is Self-Funding.

Ethics: The study was conducted with the permission of the Parents of Intellectually disabled children to whom we explained the implications, purpose and voluntary nature of participation. Similar information was made available in written form to all participants. Ethical approval for the conduct of the study was obtained from the Institutional research review board of Symbiosis College of Nursing, Pune.

Development of an Energy Management System for Tertiary Care Hospital, with Special Emphasis on Lighting

Shrinidhi Prasad K.H.[1], Shalini D[2]

[1]Post Graduate Student, [2]Assistant Professor, Department of Hospital Administration, M.S. Ramaiah University of Applied Sciences, Bangalore

Abstract

Energy efficiency in the hospitals is the growing concern. The hospitals work 24/7 in the very critical situation and having very huge and crucial equipment to use, which consumes energy. India is the third biggest consumer of primary energy after USA and China by 5.6% global share in 2017. In the hospitals the cost spending on the energy expenditure is in lakhs/month so we need to use the energy efficiently to save energy and to reduce the cost. Hospitals can't be run without energy. Critical equipment used in ICU, operation theatres, emergency department etc. are highly dependent on energy as in its absence there may be chances of interruption in patient care. The aim of this study is to assess the energy efficiency level of the hospital to propose an energy management policy and energy management system. The retrospective study was conducted on the energy efficiency in the facility department, tertiary care hospital, the results showed the compliance to the energy efficiency, the expenditure on the energy and also the Number of lighting fixture which is used in different departments. Based on the study results, peer literature reviews the Energy Management System is developed and policy is made to achieve the energy efficiency in the hospitals, the prioritization is made in the lighting system to switch towards the efficient lighting with the help of pareto principle and ABC analysis which are given to the facility department. The suggestions could help in the tertiary care hospitals to check the compliance on energy efficiency to implement the energy management system by using the PDCA cycle and to move- towards energy efficiency.

Keywords: *Energy efficiency, Energy management system, Hospital, Light fixtures.*

Introduction

India is the third biggest consumption of primary energy after USA and china by 5.6% global share in 2017. India is mainly depends on the fossil fuel for the production of the electricity, around 75% production of the energy is from the fossil fuels. Energy efficiency is something which use less energy and gives the maximum output or that which uses the same amount of energy and gives the better results (in terms of cost, life cycle, consumption, maintenance etc.). Health care facilities and the hospitals consume more energy compared to the other buildings because of more equipment's and various departments and 24/7 services in the tertiary care hospitals. The increase in the consumption of energy and the electricity bills we need to focus on the energy efficiency in the hospital. For Health care administration, this energy consumption is made worse by repeatedly increasing energy prices. Thus far this also means preventative actions and efficiency plans can be extremely worthwhile. Estimations display that $1 saved on energy by a non-profit Health care is same to creating $20 in profits. Additionally, decreasing energy use by 5% can increase for-profit hospitals' earnings by as much as penny per share[1].

Classification of energy consumption areas the hospital based on the percentage of consumption: The HVAC and lighting system consumes around 43% and 23% respectively in the total energy consumption in the hospital. Cooling and hot tap water consumes around 10% and finally the offices, the other teaching and medical office equipment's comes under another category they consume around 26% of the total energy consumption[2]. So it's a very important to evaluate energy efficiency and change current lighting system to energy efficient lighting. Researches focused on energy efficiency, saving potentials and energy management and the special emphasis on the lighting system.

Literature Review: Energy is the most important for the social and economic development of every country[3]. From International Energy Agency the building sectors final energy consumption of the whole world has increased to 2,794 millions of tons[4] of oil equivalent in 2007. 34% of the whole world final energy consumption is represented by building sector hence it is the first consumer sector of energy[5]. From the reference scenario of International Energy Agency, before 2030 with consumption share of 32% will be consumed by the building sector and it will be the first consumer of the energy[6]. The need for the energy will raise through with an average of around 1.2%/year to 1.4%/year will be the entire ultimate energy intake[5-1]. The study on analysis of audits for 30 health care buildings in Greece (Hellas) quantify the potential global energy showed that smaller health service buildings in Scotland signified 29% of energy efficiency of the total floor area of all the buildings[7]. The use of thermal energy storage in combination with a heat pump compared to a gas-based boilers and water chiller can save up to 71% of the primary energy the demonstration was done by the authors in the Belgium hospitals[8]. The energy expenditure will be increased up to 50% by the use of lighting system, if the occupants will become more in the building with respect to the standard design of the buildings[9].

B: A. S. Da'as, 2008 in his study mentioned the potential energy conservation by usage of energy savings measure in Palestinian hospital. The hospital achieved the average total savings of 17% for hospitals 43%, 14% and 17% for freezing and O2 generation components, heating, power issue rectification and 5% in the illumination systems, correspondingly. Apollo Hospitals in Chennai by the usage of centrifugal and screw type compressors instead of reciprocating compressors, CFL with electric chokes for lighting, old elevator machines using variable frequency drive, sustaining power factor of 0.97, using filters, excess vapour used to heat water, and reducing diesel requirements by using steam generation by this they achieved 57.62 units/day instead of 61.31 units/day. Periodic maintenance of equipment's, LED exit signage and electronic ballast and energy proficient lights are used in minimum three quarters of the hospitals. Other than these, roughly around half of the organizations are purchasing "energy star certified products" (55%), advancement of structure control systems (53%) or applying energy preservation programs (49%) [10].

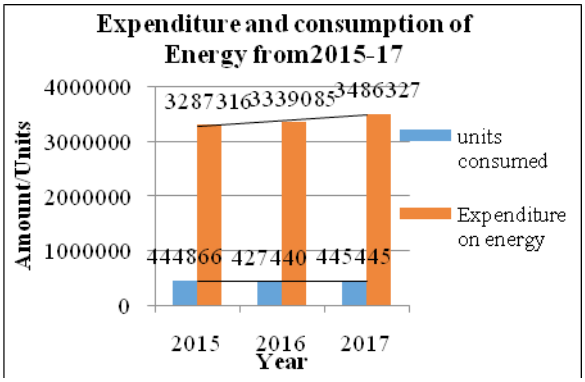
Methodology

Aim: To study the energy efficiency of the hospital and propose the energy management policy and energy management system.

Objective:

1. To study present power consumption rate and the expenditure on the electricity.
2. To identify the factors affecting the energy efficiency.
3. To check the energy efficiency of the hospital building.
4. To propose the energy management policy and energy management system for the hospital with emphasis on lighting.

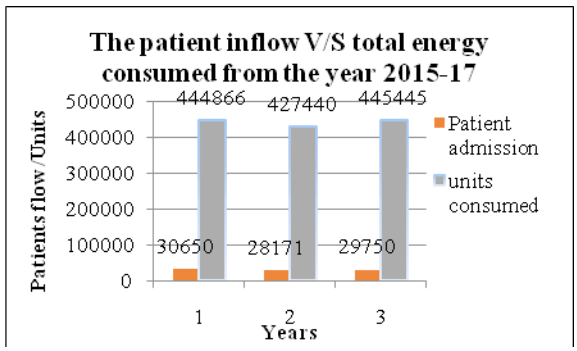
Method



A retrospective study was conducted in the tertiary care hospital Bangalore, based on the energy efficiency in the tertiary care hospital and the data was collected in the facility department on the energy expenditure of the past three years, the checklist was prepared by using the New Mexico Interfaith Power and Light and U.S Energy protection agency guidelineson the basis of the checklist the compliance was checked for the whole hospital. A formal interview guide was prepared based on the literature and used for the interview; interview questionnaire covers adequate information regarding Energy Efficiency in the hospital, the management aspect of the energy in the hospital and different challenges faced by the facility manager.

Results

This research is been conducted through various ways i.e. by record review in the facility department, through the literature reviews of 50 different journals and articles which were Scopus indexed like Science direct, ebsco, Elsevier, Shodhganga, Google scholar etc. After the literature study the checklist was prepared and the compliance was checked for the Energy Efficiency in the hospital. And the formal interview with the facility manager with the help of interview guide which was prepared by using the literatures[9-1].

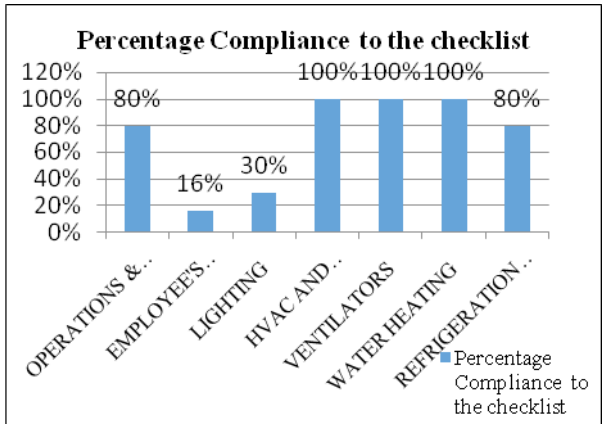


Power consumption rate and the expenditure on the electricity: The study was conducted in a tertiary care hospital to know the energy expenditure and total number of light fixtures present in the hospital and the

patient's inflow to the IPDs in the hospital by using the record review of the past three years data.

Graph 1 Consumption rate and the Expenditure on energy from past three years

The three years energy consumption and the amount spending to pay the electricity Expenditure pattern showing that. The energy consumption during the year 2015, 2016 and 2017 is 44866 Rs,427440Rs and 445445 Rs respectively increase in the 18,005 units in the year 2017 compare to 2016 and also the expenditure is increased by 1,47,242 Rs from the year 2016 to 2017. And also increase in the tariff plans by the government



Graph 2 Patient inflow V/S total energy consumed from the year 2015-17

The above graph represents the patient inflow to IPs versus the total energy consumption of the three years from 2015-2017. The IPD patient inflow is decreased in the year 2016(28,171) compared to the 2015(30,650) and it is again increased during the year 2017(29,750) compare with 2016. The energy consumption rate in the year 2015 is 444866 units, in 2016 is 427440 units and during the year 2017 is 445445 units so from this we can see the difference between the year 2015 and 2017, during the 2015 the patient flow is 30,650 energy consumed is 444866 units but in the 2017 patient inflow is comparatively less(900 patients less in the year 2017) to the 2015 but the energy consumption is increased (579 units) so we need to think on this even though the patients inflows to IPs is comparatively less the energy consumption is increased.

Factors affecting the energy efficiency in the hospital: There are different factors affect the building energy efficiency, the study was done through the literature review of Scopus indexed journal of latest from 2013-2018. The following are the factors affecting the energy efficiency[11]

- Architecture of the building
- Shape of the building
- Orientation
- Building envelope
- Insulation
- The age and size of the building
- HVAC system
- Electricity and control systems in buildings
- How the building is used
- Up- gradation of mechanical equipment
- Outside air temperatures

Energy efficiency compliance of the hospital building: The study is conducted by using the checklist prepared by using the New Mexico Interfaith Power and Light and U.S Energy protection agency, from the checklist the energy efficiency of the hospital is measured. The checklist is evaluated through the direct observation, record review and staff interview. The results were analyzed by using the excel.

Graph 3 Percentage of Compliance to the checklist

The above graph showing the compliance to the energy efficiency in the hospital From the evaluation its

showing that the HVAC and Plant system, ventilators and water heating showing the 100% compliance, the compliance of the employees behaviors towards the energy efficiency is showing 16.666%, the lighting system is showing the 42.875% compliance and the Operations and management is showing 80% compliance. So we need to focus on these three sections to bring the energy efficiency measures in the hospital.

Energy management policy and energy management system for the hospital: Based on the guidelines of the ISO 50001[12] energy management standards,the policy and the Energy Management System prepared by using the guidelines in the Energy management system requirements. Policy contains the introduction to the policy with achievable target, scope of the policy which tells who all comes under this policy with the aim tominimize the energy consumption, reduce the energy costs and the operational cost and Create the awareness in the staffs regard to the energy management in the hospital. And the policy covered the different dimensions like roles and responsibities,definitions,tr aining, consultation and implementation. The Energy Management System is designed to manage the energy in the hospital to cut down the cost.

Discussion

From the above results we can see the necessity of the energy efficiency in the hospital, so the hospital needs to move towards energy management to cut of the waste costs spending on the expenditures. The most challenge comes here inhospital buildings, which are complicated structureand the behavior of the occupants working in the organization and the total number of different type of equipment's used. The temperature of the rooms should be maintained in the labs and the air changes in the OT so it's very difficult to be energy efficient. The hospital are serve the people around the clock, so it's very complicated thing to move towards energy efficiency because the projects may affect the patient's service.

The following are the various challenges facing by the organization to implement energy efficient techniques[13]:

Economic challenges: Most of the hospitals lack of huge funds refuse to implement these strategies in their organization, because the hospitals are need to spend on the wages to their employees and also they need to meet their daily operation expenses to run their shows so it's very difficult to spend on these strategies.

Organizational challenges: The energy efficiency plans and the medical equipment management is comes in the similar capital pool so they need to focus on the management of medical equipment for the direst support of hospital business they may loose focus on the energy efficiency measures.

Physical/Operational challenges: Hospitals run 24/7 and deal with patients and also they have complicated building architecture. This could be the problem during the retrofit to the energy efficiency and also the HVAC system is the very complicated area. Hospital need to maintain the same pressure in all the patients rooms. If one of the patient area get less air pressure the air comes to this room from other room, which make the patients vulnerable to the cross infection.

Behavior challenges: Most of the staffs who are working in the hospitals don't know the importance of the energy efficiency in the hospitals and they don't know how much they could save the energy by switch off the equipment's and lights when they are not in use.

Suggetions: Hospitals consume huge energy, obviously they need to pay the huge amount of electricity bills so we need to control the wastage of energy consumption in the hospitals by using the power efficiently.

- The policy has been developed for the maintain of the energy efficiency for the hospital
- Energy Management system (EMS) to control the energy consumption and to cut the expenditure on the electricity bill in the hospital
- The EMS can be implemented by using the PDCA cycle with the use of required resources
- Prioritization of the departments to replace the light fixture to the more energy efficient one by applying the Pareto principle and the ABC analysis
- The newer technology in the lighting like super capacitors,Indoor location tracking, Self-learning control systems, Li-Fi etc. Helps the hospitals to move towards more energy efficient

Energy saving areas in the hospital[14]

Heating system

- Set the thermostatand radiator levels to their max efficiency level
- Insulation of needy areas and equipment a

- Use efficient equipment

Mechanical ventilation:

- Set up variable speed drives on fans and also in the large pumps
- Evaluate existing scheme, particularly regulator adjustments
- Use outdoor fresh air aimed at ''free cooling'' based on the availability
- Explore chances for heat recapture by exhaust air

Combined heat & power:

- Regulate the heating and power needs (MVA) wisely
- Consistent performance maintenance, checking and assessment of steam turbine
- Less use of the steam outlet controller

Building fabric & air-conditioning

- Insulate roof
- Proper shading of windows

Lighting system

- Check feasibility for time controls, existence sensors and daytime compensators
- Upgrade the lighting system

Conclusions

The energy efficiency in the hospital is very important because of the increase in the electricity tariffs day to day and also the increase of energy consumption. The different factors affect the building energy efficiency so need to focus on those factors in the building and also hospital uses more light fixture compare to the other buildings, by using the prepared checklist the compliance to the energy efficiency is checked the results shows that the hospital is having very poor compliance in the lighting and the behavior of the staffs. There is no Prioritization of the actions in the lighting fixture to switch from CFL and Tube lights to more energy efficient LEDs.

Abstract

The use of medicinal plants is used as the main therapy as well as additional therapy to enhance one's immunity or maintain health and fitness. Nggorang Leaf Extract (EDG) polyphenol and flavonoid compounds and essential oils. Flavonoids are powerful antioxidants that work as a cancer prevention and also have antimicrobial effects. This study aims to prove the potential of EDG as an antioxidant and antiproliferation of Hela cancer cells. This research includes *Quasy experiment* research The conclusion of this study shows that Nggorang Leaf Extract (EDG) has potential as an antioxidant against DPPH radicals at IC50 = 34,407 ppm; Nggorang Leaf Extract (EDG) has potential as an antiproliferation of T47D IC50 cancer cells = 201 ppm; Nggorang Leaf Extract (EDG) has potential as an antiproliferation of Hela IC50 cancer cells = 187 ppm; Nggorang Leaf Extract (EDG) has the potential to reduce ROS activity in T47D cancer cells by 54.34% at a concentration of 50 ppm; Nggorang Leaf Extract (EDG) has the potential to reduce ROS activity in Hela cancer cells by 58.33% at a concentration of 50 ppm; Nggorang Leaf Extract (EDG) has the potential to increase P53 gene expression in T47D cancer cells by 94.13% at a concentration of 50 ppm; Nggorang Leaf Extract (EDG) has the potential to increase P53 gene expression in Hela cancer cells by 92.05% at a concentration of 50 ppm. The novelty of this study is that Nggorang leaves (*Salvia occidentalis)* can be used as a preventative for breast cancer and cervical cancer.

Keywords: *Salvia Occidentalis, Ethnopharmacology.*

Introduction

The tendency of *back to nature* today, causing the use of herbal medicines become popular not only among rural communities but also urban communities. herbs are also popular in the community based on the information of herbal products in pharmaceutical dosage forms. *World Health Organization* estimates that 80% of the world's population still entrusts health with traditional medicine, especially those sourced from medicinal plants.

Research on the efficacy of herbal medicine has long been done, but until now there are still many aspects of herbal medicine that have not been disclosed by researchers. One of the uses of herbal medicines that are being developed is to help cure cancer [2] ·One of the plants used by the Manggarai community is nggorang leaf (*Salvia occidentalis)*. This plant is commonly found in Tenda Village, when harvesting leaves are one year old and used as medicine. Preventive efforts for these leaves are hereditary used as an anticancer (7 leaves boiled with 200 ml of water until ½ then drunk), for wounded breast cancer, stamina enhancer, cough, influenza, hemorrhoids[3].

Preliminary studies on Nggorang Leaf Extract (EDG), have been proven to have strong antioxidants and potential as cervical anticancer (hela cells); potential as an antibacterial *Candida albicans* has a inhibitory power of 12, exceeding positive control (Nystatin) [4]. Polyphenols are also antioxidants, which inhibit enzymes that can stimulate the growth of cancer cells and suppress the immune response and help slow the development of tumors [1]

Although it has been used empirically by the Manggarai community for anticancer treatment, scientific proof does not yet exist. So that nggorang leaves (*Salvia occidentalis)* are very potential to be

researched and developed considering that cancer cases in Indonesia are still very high.

Research Location and Time: Extraction process and standardization will be carried out in the Laboratory of Polytechnic ice MoH Makassar and Biofarmaka Laboratory Faculty of Pharmacy UNHAS, Anatomy Parasitology and Pathology Section of the Faculty of Medicine UGM. Research time 2014-2015.

Materials and Research Tools: The research materials used were (1) nggorang leaf extract, (2) material for standardization of extract (3) materials for cytotoxicity activity(4) materials for cytotoxicity activity apoptosis and cell cycle analysis: *flow charts reagent* and kit PI/RNase *staining buffer* (5) materials for cytotoxicity activity analysis of P53 and ROSprotein expression. The tools needed in this research tool maceration, rotary evaporator, freeze dr yer, UV-Vis spectrophotometer, *atomic absorption chromatography* (AAS), high performance liquid chromatography (HPLC), column C18, plate TLC F254, scales analiti k incubator $CO_{2,}$ inverted microscope,

Data Collection Procedure

1. **Antioxidant Activity Test d ith Radical DPPH:** Preparation of 0.4 mM DPPH Solution: A DPPH 0.4 mM solution was prepared by dissolving as much as 15.7 mg DPPH with ethanol 96% pa to 100 mL.
2. **Anti-oxidant activity test of EDG extract with free radical DPPH:** Antioxidant activity test of ethanol extract of leaves of Nggorang by DPPH method was carried out in accordance with the method carried out by Hua with a slight modification (Hua, 2014). A total of 1 mL decocta and ethanol extract of leaves of people with a concentration of 50 µg/mL, 75 µg/mL, 100 µg/mL, 125 µg/mL and 150 µg/mL were added to 1 mL DPPH 0.4 mM and sufficient volume with ethanol 96% pa to 5 mL. The mixture is then shaken and incubated in a room temperature for 30 minutes in a dark place. This solution was then measured for absorbance at λ516 nm. The same treatment was also carried out for blank solutions (DPPH solutions that did not contain test material) and positive control of vitamin C with concentrations of 2 µg/mL, 3 µg/mL, 4 µg/mL, 5 µg/mL, and 6 µg/mL. The absorbance measurement data was analyzed by the percentage of antioxidant activity using the following equation:
3. **Cytotoxicity Activity Test:**
    1. **Making Culture Medium:** The culture medium used in this study was the RPMI 1640 medium for T47D, Hela cancer cell culture while the Vero normal cells used M199 medium.
    2. **Creation of a Growing Medium:** Growing medium of RPMI 1640 and M199 was prepared by mixing 20 0 mL medium solution with 20 ml BSA, 4 mL penicillin-streptomycin and 1 mL fungizone.
    3. **Making MTT Solution 5 mg/mL:** MTT solution 5 mg/mL was prepared by dissolving 50 mg MTT with PBS pH 7.4 to 10 mL.
    4. **Manufacture of PBS solution pH 7.4:** A total of 80 g NaCl, 0.2 g $KH_2PO_{4,}$ 115 g Na_2HPO_4 and 0.2 KCl were dissolved to 900 mL with aquadest. The solution is then adjusted to pH by adding 0.1 N HCl solution or 0.1 N NaOH to 7.4 and then the volume is sufficient to 1,000 mL with distilled water. The solution was then sterilized with an *autoclave* at 121 ^{0}C for 30 minutes.
    5. **Making SDS 10%:** A total of 10 g of SDS was dissolved with distilled water up to 100 mL HCl 0.01 N.
    6. **Thawing cells:** Cancer cells T47D, HeLa and normal cells Vero obtained from the Department of Parasitology Faculty of Medicine. All mediums were given a 10% BSA supplement, penicillin-streptomycin 1% and fungizone 0.5%. Cells in the *flash culture disk were* incubated at 37 ^{0}C with 5% CO_2 gas flow. Cell proliferation was observed under an inverted microscope and confluent cells (80-90%) were harvested.
    7. **Cell Harvesting:** The medium is discarded, then the *flash culture disk is* washed with PBS pH 7.4. Then trypsin-EDTA 0.5% to taste and then incubate in a 37 ° C incubator with a flow of 5% CO_2 for 1-3 minutes. Add enough growth medium and then poured into a sterile *conical tube* then centrifuged for 5 minutes at 4 $^\circ$C. Then count the number of cancer cells with a *haemocytometer.* Cell suspension was added by a number of growing medium to obtain a cell concentration of 1 x 10 ^{4} cells/100 µL medium and cells were ready for use for testing. Sample Testing with MTT Method **assay**

4. **Examinationof P53 Protein Expression (KIT):** Analysis of P53 protein expression was performed by the immunohistochemical (IHC) technique.

Data analysis: Percentage inhibition data obtained in the antioxidant test and the subsequent cytotoxicity test were calculated by IC_{50} by probit analysis using SPSS software. Data on percent cell accumulation at each phase of the cell cycle, percent apoptosis, percent P53 protein expression were tested for normality with the *Shapiro-Wilk test* and homogeneity with the *Levene test.* If the data is normal and homogeneous distributed, then *Anova one way* statistical analysis will be performed. If the data is not homogeneously distributed then proceed with the Anova parametric test and continue with the Mann Whitney test.

Results and Discussion

Research result

1. **Effects of EDG on Hela Cell Viability:** Observation of the effect of EDG administration on Hela cell viability was carried out using the *ELISA* method.

Table 1 : Results of Testing the Effect of Giving Nggorang Leaf Extract on Hela Cell Viability After 24-hour Incubation

Concentration	Viability	Elementary school
15,625	114,2693	0.1418

Based on tables 5.8 - 5.10 and figures 5.7 - 5.9, various IC_{50} values are obtained. The data shows that the incubation time of EDG in hela cell culture gave different results of viability and IC_{50} values. The longer the incubation period, the smaller the IC_{50} concentration used to kill cells. The EDG concentration needed to produce 50% activity after 24-hour incubation obtained IC_{50} values 523.7039 ppm ; after 48 hours incubation obtained Value IC_{50} 327.00 ppm ; after 72 hours of incubation obtained Value IC_{50} 187,000 ppm

2. **Effect of Doxorubin on Hela Cell Viability:** Testing of doxorubin drug activity on cell viability was carried out using the *ELISA* method.

Discussion

Effect of leaf extract nggorang on the viability of HeLa cells is determined by the number of hela cells were still alive after nggorang leaf extract incubated together with various variations. *HeLa* cells that are still alive will look like elongated and clustered leaves attached to the bottom of the well. Meanwhile, dead *HeLa* cells will form irregular dots and float on the media. After treatment with the MTT method, will be seen formazan crystals that show *HeLa* cells that are still alive[5].

Giving extracts ranging from a concentration of 31,675 ppm to 1000 ppm. More and more living cells show that the concentration of extracts of leaves given by people is not effective. Likewise the concentration of extracts that provide viability of Hela cells is very little is an effective dose. This is consistent with the statement that cell viability is the number of cells capable of developing in a culture medium. Cell viability is used as a marker of cytotoxicity of a material to determine the biological properties of a material that is toxic to certain cells. One that indicates the cytotoxicity of a substance is a decrease in cell proliferation and decreased viability[6].

The longer incubation, the more T47D cells die, so the EDG dose needed to kill T47D cells gets smaller because the number of living cells has decreased. This means that the use of EDG drugs has the potential to be anti-cancer. In this study the IC50 value of EDN on Hela cell viability was obtained at 187.00 ppm. This means that a dose of 187.00 ppm was quite effective in killing Hela cells.

The activity of EDN in killing cancer cells is thought to be related to the content of active substances including flavonoids. The mechanism of flavonoids in inhibiting tumor/cancer proliferation is to inhibit the activity of tyrosine kinase receptors so that they can inhibit the signal transduction pathway from the membrane to the cell nucleus. Increased tyrosine kinase receptor activity plays a role in the growth of cancer cell malignancy. Besides flavonoids also function to reduce tumor resistance to chemotherapy agents[7].

As a comparison in this study, the anti-cancer drug doxorubin was used. The effect of doxorubin on cell viability showed analogous results with the results of EDG on cells. IC50 value of doxorubin administration on viability of hela cells after 72 hours incubation was 149.00 ppm. While the IC50 value of EDG on cell viability after 72 hours incubation was 149.00 ppm. Based on this, it can be stated that EDG can potentially be as anti-cancer as doxorubin.

The results of observations of the effect of EDG administration on P53 gene expression in helper cells showed that cells expressing brownish P53 genes at their core. This result is different from cells that do not express the P53 gene. The data shows that the higher the EDG concentration given, the greater the hela cells expressing the P53 gene. So it can be stated that EDG has the potential to increase the expression of the P53 gene in cancerous cells. P53 gene expression in cells that appear brown is a P53 gene with wild type in cytoplasm that plays a role in the process of cell apoptosis[8].

In the study it was found that EDG has the potential to cause apoptosis in cancer cells in concentrations of 10ppm - 50 ppm. EDP 50ppm potential as a haem cell apoptosis because the number of cells expressing the P53 gene is 92.05%. In the event of apoptosis the P53 gene is expressed when DNA damage occurs so that an error occurs in the cell cycle that is the P53 gene induces cell

cycle arrest. It is intended that DNA damage in damaged cells has time to be repaired. But if the damage cannot be repaired then the expression of the P53 gene will increase so that it will trigger cell apoptosis (Hanahan and Weinberg, 2000). Conversely, if the P53 gene is not expressed in cells, then a mutation occurs in p53 so that the gene becomes unstable and has the potential to become cancerous. The p53 gene is a signal of apoptosis because it suppresses the formation of tumor formation and inhibits malignant progression. The mechanism that occurs in cells is the p53 gene eliminates cells that have DNA damage that has the potential to become cancerous cells by cell cycle arrest, apoptosis or repair[9].

Conclusion

Nggorang Leaf Extract (EDG) has potential as an antioxidant against DPPH radicals at IC50 = 34,407 ppm

1. Nggorang Leaf Extract (EDG) has the potential as an antiproliferation of Hela IC50 cancer cells = 187 ppm
2. Nggorang Leaf Extract (EDG) has the potential to increase P53 gene expression in Hela cancer cells by 92.05% at a concentration of 50 ppm.

Evaluation of Operational and Financial Feasibility of Robotic Surgery in Tertiary Care Hospital

Sneha Ashwani Sharma[1], Shalini D[2], Arun Mavaji S[3]

[1]Post Graduate Student, Department of Hospital Administration, Ramaiah University of Applied Sciences, Gnanagangothri Campus, [2]Assistant Professor, Department of Hospital Administration, Ramaiah University of Applied Sciences, Gnanagangothri Campus, [3]Assistant Administrator, Ramaiah Memorial Hospital, New BEL Road, MSR Nagar, Bangalore

Abstract

Health care witness new technologies frequently as there is always need to improve patient care. One of such technology emerging rapidly in surgical field is robot assisted surgery. This technology has proven its efficacy all around the world and now gaining popularity in India. Study of robotic system technology will provide benefits in health care sector. This study will focus on feasibility of robotic surgery from hospital perspective. An elaborate discussion will be done on operational and financial parameters to assess the feasibility of robotic surgery in a tertiary care hospital in Indian set up. An explorative study design based on retrospective data is used to forecast the possibility of success of robotic program in future. The associated parameters will be assessed with the use of checklist, survey and financial aspects in form of return on investment and break-even analysis. The study suggests that number of da Vinci system installed and robotic procedures done are increasing every year world-wide as well as in India. Result of this study is 100% surgeon's readiness to adopt, get trained and perform the robotic surgery. Hospital infrastructure supports robotic program with requirement of small modifications in form of dedicated uninterrupted power supply for the equipment, internet facility and plasma sterilizer. Hospital can attain positive return on investment by 7th year if 25% surgeries out of the potential cases performed through da Vinci X® every year. 731 surgeries to be performed by da Vinci X to attain breakeven point.

Keywords: *Robotic Surgery, da Vinci Robotic System, Surgical Indications, Feasibility,Robotic setup.*

Introduction

Earlier benefits of laparoscopy in form of reduced hospital stay, less postoperative pain and small incisions made this procedure, choice of surgeons for various surgeries(1). However, its limitation in form of 2-D vision camera and straight instruments made it difficult to choose this process for complex surgeries like Pancreatectomy (2). To address these limitations new technology was developed during the beginning of 21st century in form of Robotic Surgery. The number of procedures done by Robotic surgery is continuously increasing since then(3). This technology proving its efficacy all around the world including India. However, in India there is lack of evidence-based evaluation of robotic surgery especially from hospital perspective. As India is a cost sensitive country it is of utmost important to find out whether adopting this expensive technology would be viable for the hospitals or not. This study aims to explore various parameters required to implement robotic surgery and to assess their feasibility in a tertiary care hospital in Indian setup.

Method and Methodology

An Explorative study based on retrospective medical records review was carried out in a tertiary care hospital in Bangalore. Four departments - Urology, Gynecology, General surgery and Cardiothoracic surgery were included in the study. To assess the operational feasibility OT infrastructure was studied with the preparation of checklist and a survey was conducted with the use of structured questionnaire. To assess financial feasibility retrospective data of surgical volume for past three years was collected and average number of potential surgeries that can be performed through robotics was calculated in three scenarios that is worst (10%), most likely (25%) and best case (50%). For that number of surgeries ROI (Return on Investment) and Break-Even Point was calculated for Da Vinci® X.

Literature Review: Vast study has been done on robotic surgeries covering almost all aspects related to it especially the da Vinci® system its acceptance in various field of surgery, critical analysis and its cost effectiveness. Most of the studies were found from year 2002 onwards.

Since the Da Vinci® surgical system got FDA clearance, there is continuous increase in robotic procedures all round the world. Robotic surgery has been successfully implemented in several hospitals around the globe and has received world-wide acceptance[4]. Robotic system is most commonly used in Urology, Gynecology and Gastrointestinal studies[5]. Other than these, cardiothoracic surgery including coronary bypass and valve repairs, surgical oncology and pediatrics departments also using robotic system although at a lesser frequency[6].

USA leading in performing robotic assisted surgeries followed by Europe, Asia and Australia. In India first robot assisted urology procedure was done at AIIMS, new Delhi in 2006. After that the number of da Vinci® system and robotic procedures showing an increase every year[7]. If these robotic surgical systems are used across multi- specialties the cost effectiveness will be improved. Especially, in a country like India where health care is economic as compared to western countries the cost of robotic surgery will also be lesser comparatively and can promote medical tourism[8].

Planning of Robotic system in hospital starts by creating a multidisciplinary team including surgeons, nurses and administrators. Main aim of this team is to assess all components of robotic system that is surgical indications, equipment, personnel, training, facilities, operational issues, finance and marketing[9] Successful robotic program is the result of well supported infrastructure, well-coordinated robotic team and timely review of outcomes[10]. Study for robotic prostatectomy states that the high capital investment and maintenance cost can be returned by optimum utilization of the system through performing around 100-150 procedures per year per robotic system[11].

Assumptions

- As per listed surgeries in the study patient can opt for robotic surgery among all these indications
- Only the cash (General ward excluded) and private insurance patients are taken as potential candidates
- Average robotic surgery cost has been taken irrespective of clinical specialty
- All calculations done with no cost adjustment assuming all costs remain same throughout the product life
- Average increased OT time taken as 2 hours extra per robotic procedure.

Results and Analysis

Surgeon's Survey: A questionnaire was prepared for surgeon's survey aimed to find out their point of view for robotic surgery and also to get a possible percentage of patients who can opt for robotic surgery as per their opinion. From the list of 18 surgeons, 11 surgeons responded. 100% positive responses were received for adopting robotic surgery by the hospital. Majority of surgeons agreed to the better clinical outcome, surgeon's satisfaction and patient satisfaction option. Out of 11 surgeons 8 surgeons believe that Robotic will emerge as future of surgical procedures, 2 were not agree to that and 1 was not sure. For the question possible percentage of patients who may opt for robotic surgery in future, 3 out of 11 surgeons were in favor of less than 10%, 4 agreed to 10-25% and another 3 says it can be 25-50% and only one opinion was in favor of more than fifty%. Out of 11 responses 7 were in favor of option where no patient left the hospital to get robotic surgery done, 3 surgeons were coming across less than 10% cases who left the hospital to get robotic surgery done andonly 1 surgeon agreed that the percentage of such cases was around 10-50%.

OT Infrastructure: OT checklist was prepared for da Vinci® system requirements and all parameters were checked through direct visit to OT complex that has four OTs. OT-3 and OT-4 were considered suitable on basis of size and having cabinets to store consumables. OT-4 was also excluded from the study as it was dedicatedly used for orthopedic cases. OT-3 found to be the most suitable and studied further for all the other specific parameters that include electrical power points, Power backup and LAN port. CSSD facility also checked for presence of plasma sterilizer as many of robotic instruments are highly heat sensitive. OT Layout was prepared with all the physical and equipment measurements in the direct proportion of actual sizes. The OT-3 was found Spacious enough for Robotic System both in Functional and Stored state.

Modifications Required for OT are as follows:

- To establish a dedicated uninterrupted power supply source of 10KV for the system.
- Extension electrical cables for surgeon's console as there is no plug point on third wall where console can be set up.
- LAN port extension cables.
- Plasma sterilizer required in CSSD.

Financial Feasibility: To assess financial feasibility two parameters used in this study, return on investment and break-Even point. Both parameters are used for both models, da Vinci® X and da Vinci® Xi for comparative analysis and to choose the most beneficial model among them.

Formulas used:

- Break Even Point (BEP) = Fixed cost/Selling Price– Variable cost
- Return on Investment (ROI) = Net Profit/Total investment X 100

Surgical Volume: Data for 15 surgical procedures was collected for past three years from four departments-Urology, Gynecology, General Surgery and Cardiothoracic. Among all the cases, patients who paid through cash excluding those who were in general ward and patients who paid through private insurance were taken as potential candidates for robotic procedures assuming these types of patients can afford robotic surgery. The average number of potential cases per year among all the surgeries performed in past three years was found to be 501.

Various cost involved: Total revenue generation calculated by taking the potential case into consideration with an average charge of INR 300000 per robotic procedure.

Total expense calculated with the sum of acquisition cost of system, modification cost, hidden cost, training cost, maintenance and supplies cost.

Variable cost included cost of robotic consumables and OT rental for extra time taken in robotic procedure.

ROI calculation done for 3 possible scenarios: 10% (Worst case), 25% (Most likely case) and 50% (Best case) surgeries converted to robotic surgeries out of potential cases.

Table 1.0 Da Vinci® X - RO

da vinci®X	Year of Positive ROI
10% robotic procedures out of potential cases	NA
25% robotic procedures out of potential cases	7
50% robotic procedures out of potential cases	4

Table 2.0 Break Even Point

Break Even Point (da Vinci® X)	
Fixed Cost (INR)	
Acquisition cost	110000000
Supplies cost	5000000
Modification cost	4515000
Hidden cost	100000
Year 2 onwards:	
Supplies cost	5000000
Training cost	4,00,000
Maintenance cost	8000000
Total	13,30,15,000
Variable Cost (INR)	
Consumables	100000
OT rental	18000
Total	118000
Selling Price (INR)	300000
Break Even Point(Number of Surgeries)	731

Results

Infrastructure of OT 3 is best suitable for robotic surgery. Hospital CSSD department will require a plasma sterilizer as some of the instruments used in robotic surgeries are highly heat sensitive. Modification required in terms of dedicated power backup and extension of electrical and LAN port cables is feasible and comes at almost negligible cost as compare to da Vinci® System.

Surgeons of hospital are in favor of getting this technology in hospital and are ready to get trained for it. 3 out of 11 surgeons anticipate less than 10% robotic surgeries, 4 agreed to 10-25% and another 3 says it can be 25-50% and only one opinion was in favor of more than 50%.

Break Even Point as number of surgeries to be performed by da Vinci® is 731 surgeries. If robotic procedures would be 25% out of the total potential cases

which is the most likely situation, then ROI will become positive from 7th year in case of da Vinci® X.

Discussions

The number of Robotic procedures performed across India in last few years has been steadily rising. In 2013 the total number of Robotic procedures performed were 2600, in2014 it was 2800, whereas in 2015, over 4000 robotic procedures were performed in India(12). Apollo Hospital leading corporate hospital in India believes robotics will be the future of surgery. The hospital group, has invested in this technology at four of its centers, is keen to expand it to other centers(13). In the past 3-4 years there has been a steep increase in the installation of da Vinci®robotic systems across the country. In India, robotic procedures would be economic compared to robotic surgeries performed in other countries. This positive point can be used to promote medical tourism(14).

In this study percentage of possible potential cases was taken in three bands of 10%, 25% and 50% on basis of surgeon's opinion. It's an estimation of future possible cases for robotic surgery that gives an idea of approximate cash flow in worst, most likely and best scenario. Actual percentage can vary depending on patient's consent. Robotic system is expensive in terms of capital and maintenance costs, these costs could be brought down with multidisciplinary use of the system.

Break-Even Point was calculated to find out how many surgeries should be performed so that hospital achieve the state of no profit and no loss state after buying the equipment. However, as to find out the actual variable cost of the surgery other factors should be considered such as pre and post operating OT utilization time and long operating time, that can increase the variable cost and break-even point may shift towards higher number. Also, any change in supplies cost can affect the Break-even point if the surgery charges are not increased accordingly. As this study is an estimation study for robotic surgery these factors can only be taken into consideration once the robotic system is actually established in the hospital.

Return on Investment (ROI) shows how much percentage of investment is coming back and in how much time period. When ROI value started coming positive, it shows that investment has started giving profit out of it. This value is in alignment with the break-even point.

Conclusion

Study concludes that robotic surgery is emerging as well accepted technology in health care. The number of da Vinci® system installed and robotic surgeries are increasing every year world-wide as well as in India. To further spread its status in tertiary care, hospital can think to get this technology. The studied Hospital has a well-supported OT infrastructure with few modifications required, that can be made possible at a negligible cost as compared to the robotic system. Surgeons are ready to get trained to perform robotic surgery. Hospital also showed a surgical volume that is capable of providing a positive return of investment in 7th year if 25% procedures done by robotics out of the potential cases. However, there is huge capital investment, which can be returned only if hospital will be able to convert enough surgical volume to robotic procedures for optimum use of equipment.

Student, Department of Electronics and Communication Engineering, KKR & KSR Institute of Technology and Sciences, Vinjanampadu, Guntur DT, A.P.

Abstract

Due to aged and physically disabled persons there is necessity of wearable and wireless sensors which are the remote health care systems will observe the health condition of patient to overcome sudden deaths. Biotelemetry plays vital role to suggest patients who are at remote conditions. So that "Practical Remote Health Care Monitoring Systems" (PRHCMS) are designed and used. Mainly the scope of this is to eliminate the artifacts by giving the high motion cardiac waves from the recordings for observation. In this study various leaky adaptive algorithms are proposed for enhancement and reduction of noise parameter in ECG signal. Precisely the Circular Leaky Normalized Least Mean Square Algorithm gives the good outcome. To enhance the filtering capability normalization, leaky, circular leaky with variable step size to LMS in both time domain and frequency domain are applied. In final these all algorithms results are taken from the MIT-BIH database and these will be compared over proposed algorithms like circular leaky Normalized Least Mean Square Algorithm (CLNLMS) and Variable Step Size CLNLMS (VSS-CLNLMS). The concert of the CLNLMS algorithm is better over the LLMS algorithms with parameters like signal to noise ratio improvement (SNRI), Excess Mean Square Error (EMSE) and Misadjustment (MSD). Evaluated with all other algorithms the VSSCLNLMS results better SNRI than all other algorithms. Those values are 15.6202 db and 14.2809 db for Power Line Interference (PLI) and Electrode Motion artifacts (EM) removal.

Keywords: *Adaptive filtering, artifacts, ECG signal, Bio-telemetry and Leaky algorithms.*

Introduction

ECG resembles the visual illustration of the heart functions. If any discrepancies occur in the heart leads to the illness to the heart. From the World Health Organization and other reports [1,2,3,4] studied about the heart diseases which causes health problem to the physical body. The WHO reports studies on the heart abnormalities and they gave the clinical reports on the ECG. Such that they mainly focused on the high-resolution ECG signal in accordance with clinical reports. But at the time of measuring the ECG waves there are different artifacts like Power line interference (PLI), Electrode Motion (EM), Motion artifacts (MA), Baseline Wander (BW) and other movement artifacts are being observed. So that different techniques like empirical mode decomposition (EMD), fixed-lag kalman[5], 160μA bio-potential amplifier[6] and Baseline Wander tracking (BWT)[7] are to eliminate power line interference and the baseline wander. For the motion artifacts we utilized 3-channel bio-potential along with ASIC, capacitive coupled electrodes, an alarm gating system, portable Bluetooth device for the improvement of ECG wave and the electrode motion artifacts sternness can be minimized and in addition an innovative imaging technique like Cardiac tomography angiography (CTA) besides this a seismocardiogram (SCG)[8] used. Another artifact like Cardiopulmonary Resuscitation (CPR) can be improved. The muscle artifact in ECG can be extracted by using adaptive spectro temporal filtering

and marginalized particle-extended kalman filter (MP-EKF). For the removal of EMI and movement artifacts like Magnetic Field Gradient (MFG) and EMG the hemodynamic recording, Bayesian artifact reduction monitoring (BAGARRE-M), Adaptive Line Enhancer (ALE) and Ag-Agcl electrodes[9]are innovated which consumes less power and good signal quality.

The new method to improve the ECG signal quality, low SNR, offers perfect precision and good convergence rate with variable step size and artifact extraction can be done by Signal Quality Analysis (SQA) related to machine learning and heuristic result regulations, spectro temporal named as MD-HRV (modulation-domain HRV), modified with algebraic in combination with Elgendi's and Adapted Martinez's PT and wavelet transform (WT) give perfect P wave, an 'UNSW' QRS algorithm, QRS complex variations,Cyclostationary Source Extraction method[10] will minimize the surface EMG in ECG.Modernly the wearable Seismocardiogram (SCG) and wireless sensors with remote health care system having low power consumption and reliable battery are implemented using method like an ASIC and magnitude as 30μV and a power consumption of 58nW, a lossy compression technique SURF, a subject adaptive unsupervised signal compressor[11] and characteristic tracking method for pre-ejected period (PEP) earlier and stationary wavelet transform (SWT), a contactless dry and non-contact bio-potential skin electrodes[12,13], flexible poly-dimethylsiloxane (PDMS) dry electrodes done on rats,a low-complexity technique for taking out fiducial points from ECG, protocol named fast link exchange, minimum cost forwarding (FLE-MCF) communication and the pulse oximeter oxygen saturation (SpO_2). Recently studies gone through capacitive coupling[14] which are wireless and wearable with unremarkable physiological observation for removal of noise efficiently and effectively[15] which works under brain computer interface, a microwave related Microwave stethoscope[16] (MiSt), analog signal processor (ASP), mechanized BP meter, middle cerebral artery occlusion (MCAC)[17]and various classifiers to find out the brain activities is the multivariate pattern analysis[18] (MVPA)result in improvement of ECG signal with less computations and complexity.Adaptive signal enhancers (ASE) like Block Based SRNLMLS (BB-SRNLMLS) are designed to improve SNRI and EMSE with better filtering capability and mechanized techniques to remove the single and combined noises included in ECG automatically.

Adaptive Artifact Cancellers for ECG Enhancement: The Figure 1 explains the artifacts removal in the ECG signal. Figure 1 resembles a filter with a primary input as a_1 and the noise like b_1 is added to it whereas the allusion input is noise b_2 is correlated with noise b_1. If the filter result is said as f and the filter error as $r= (a_1+ b_1) – s$, then the equation can be written as

$$r^2 = (a_1+ b_1)^2 – 2s (a_1+ b_1) +s^2$$

$$= (b_1-s)^2 + a_1^2 + 2 a_1 b_1 - 2s a_1 \quad (1)$$

Therefore, signal and noise are uncorrelated functions, such that the mean squared error (MSE) can be represented as

$$E [r^2] = E [(b_1-s)^2] + E [a_1^2] \quad (2)$$

Reducing the MSE results in a filter error performs the best least – squares estimate of the signal a_1. The adaptive filter extorts the signal a_1, a noise free signal.

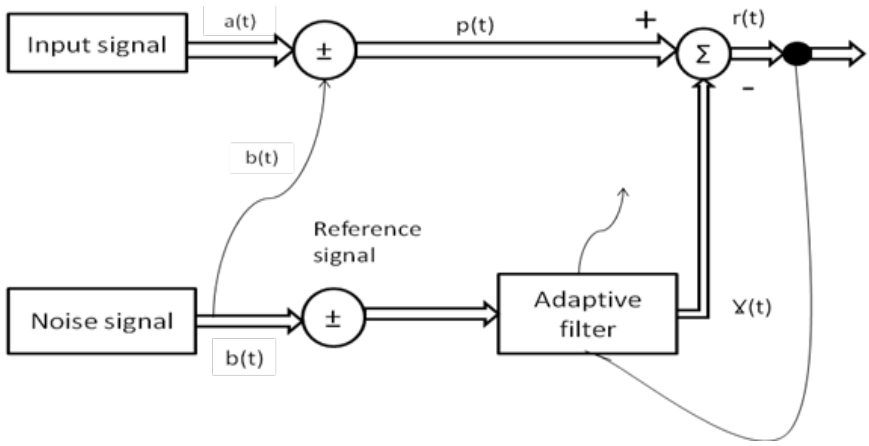

Figure 1: Fundamental adaptive noise canceller arrangement

In the second case the noise b_1 will be extorted. From equation (1) we can write it as

$$E[r^2] = E[(a_1\text{-}s)^2] + E[b_1^2] \quad (3)$$

Reducing the MSE effects the filter output f which is estimation of mean square signal a_1.

In this paper the LMS algorithm with transversal filter composition can be written as

$$h_{t+1} = h_t + 2\alpha r_t X_t \quad (4)$$

Where $h_t = [h1_t, h2_t, \ldots\ldots. hi_t, \ldots. hm_t]^T$ are the filter weights at time t, $X_t = [X1_t, X2_t, \ldots. Xi_t, .Xn_t]^T$ is the input vector at time t, the parameter p_t is the desired primary input, s_t is the filter output.

$$r_t = p_t - s_t \quad (5)$$

The constraint α defined to generate the convergence rate, the higher the value the larger is its convergence as $1/(4\alpha\text{Ɛ})$ where Ɛ is the greatest eigen value. If the convergence rate exceeds then there is a limitation of misadjustment and also not having stability, $1/\text{Ɛ} > \alpha > 0$.

Proposed Technique: In extension to LMS algorithm some more adaptive algorithms are introduced those are Leaky Least Mean square (LLMS) algorithm with excess weights flow generation and less stability, good performance with reasonable precision so it points to technique like NLMS at which the wished step size and good convergence rate can be achieved so we added the Leaky and Normalization to forms as Leaky NLMS which overcome the limitations in NLMS with limited weights. But it has a problem of high cost, as result CLNLMS along with Variable Step Size CLNLMS is considered. The constraints like convergence rate, Misadjustment and stability will monitor by the step size constraint α.

From equation (4) further the LLMS equation can be written as

$$h_{t+1} = (1\text{-}\alpha\gamma)\, h_t + \alpha\, X(t)\, r(t) \quad (6)$$

Where ɣ is the positive constraint, the larger the ɣ value it reduces the weight drift problem.

From the Equation (4) the NLMS can be explained as

$$h_{t+1} = h_t + \alpha\, r(t) \frac{X(t)}{||X(t)||^2} \quad (7)$$

Where $\alpha(t) = \alpha\, ||X(t)||^2$ (8)

The above equation can be rewritten as

$$h_{t+1} = h_t + \alpha(t)\, r(t)\, X(t) \quad (9)$$

Furthermore, applying both the Leaky and Normalization to LMS (LNLMS) that can be written as

$$h_{t+1} = (1\text{-}\alpha\gamma)\, h_t + \alpha\, r(t) \frac{X(t)}{||X(t)||^2} \quad (10)$$

By substituting equation (8) in (10) it can be rewritten as

$$h_{t+1} = (1\text{-}\alpha\gamma)\, h_t + \alpha(t)\, r(t)\, X(t) \quad (11)$$

The multiplications and additions are maximum reduced because of both leaky and normalization applied to the LMS algorithm.

The filtering and weight stabilization of CLNLMS with finite number of filter weights of W and changed in equation (12) also leakage factor is applied to one weight at a time t, and this procedure continues in a circular form iteratively.

$$h_{t+1} = \phi_t\, X(n\text{-}t) + h_t\, (K\text{-}\, \alpha(t)\, h_t\, r(t)\, r(t))$$

$$\text{Where } \alpha = \begin{cases} 0.00001 & if\ |ht\ r(t)| < \sigma \\ 0 & otherwise \end{cases} \quad (12)$$

At which ϕ is the adaption factor and σ is small positive invariable and its value is 0.00004.

The projected algorithm has few changes to weight adaption factor ϕ_t those are (1)error signal r sends through the deviation limiter (2) the given key power is utilizing long term average (3) this varies the fixed step size to variable step size. So that $\phi_t(t)$ is

$$\phi_t(t) = \left(\frac{\propto_t(t)}{y_x(t)} \frac{y_{mod}(t)}{y_x(t)} b'(n)\right) \quad (13)$$

From above equation (12), $\propto_t (t)$ is variable step size and proportional to leakage constraint ɣ(t), $y_{mod}(t)$ is the customized error signal by deviation limiter, $y_x(t)$ is the long term average of de-correlated noise signal and $b'(n)$ is the reference signal.

The fixed variables such as the smoothened preceding error $y_y(t)$, long term average of the error signal $y_u(t)$, long term average of the filter input key

$y_z(t)$, and learning accelerate counter j(t) denotes number of times the weights are iterated. The deviation limiter and the probability of Long -Term Averages releases the outcome as

Deviation Limiter:

$$y_{mod}(t) = \text{sign}(r(t)) \min(\gamma_0 y_y(t), |y(t)|) \quad (14)$$

$$h(b) = \begin{cases} y_y(t), & if\ (b'(t) = 1) \\ \gamma_2 y_y(t) + \gamma_1 |y(t)|, & \text{if } (\gamma_0 y_y(t) \le |y(t)|) \\ \gamma_2 y_y(t) & elsewhere \end{cases}$$

Finally, VSSCLNLMS explained in the flowchart as given below

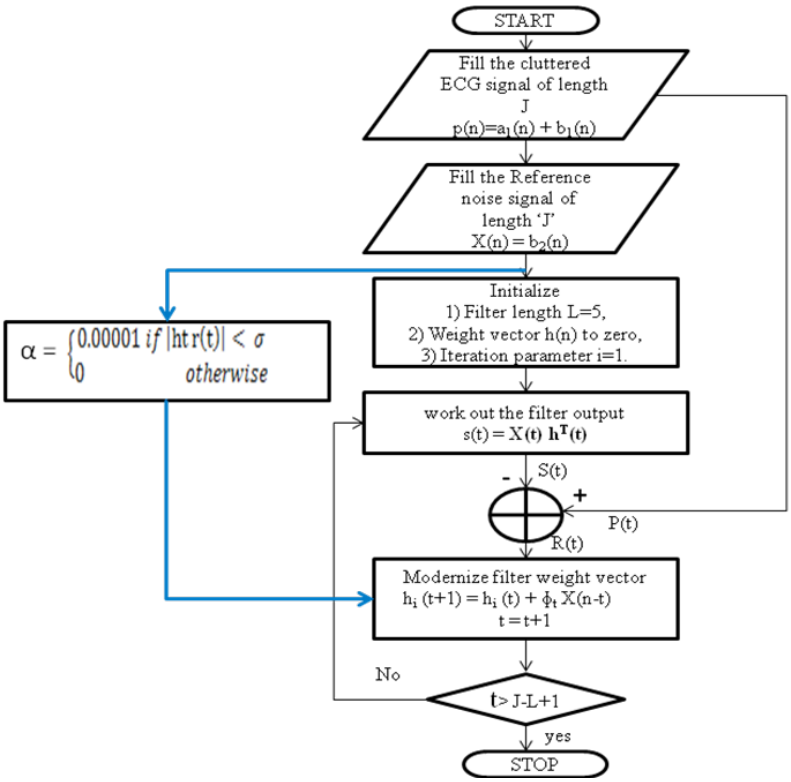

Figure 2:The flow chart of VSSCLNLMS related adaptive noise canceller

The probability of Long-Term Averages:

The long-term averages produce the equation as:

$$y_u(t) = y_u(t-1) + \gamma_4 (|\, y(t)\,| - y_u(t-1)) \quad (15)$$

$$y_p(t) = y_p(t-1) + \gamma_4 (|\, p(t)\,| - y_p(t-1)) \quad (16)$$

$$y_i(t) = y_i(t-1) + \gamma_4 (|i(t)\,| - y_i(t-1)) \quad (17)$$

Where, γ_4 is a constant and its value is (1/(A+1)). The convergence of the artifact elimination are monitored by the leakage constraint $\gamma(t)$ and it produce the equation as

$$\gamma(t) = \frac{y_u(t)}{y_p(t)} \quad (18)$$

Results and Discussions

In this paper we focused on the non-physiological noises like PLI and EM removal from the ECG and aimed to filter ECG. In detail we related with four adaptive techniques like LMS, NLMS, CLNLMS and VSS-CLNLMS and their waveforms are visualized in the Figures 3-4. The output waveforms in accordance with data 105 are studied.From the Figures 3-4 we attained the more positive outcome and the error free ECG signal at VSS-CLNLMS. Tables 1-3give the concert of techniques in terms of SNRI, EMSE, and MSD. According to our researches the VSSCLNLMS performs better when compared to another algorithm.

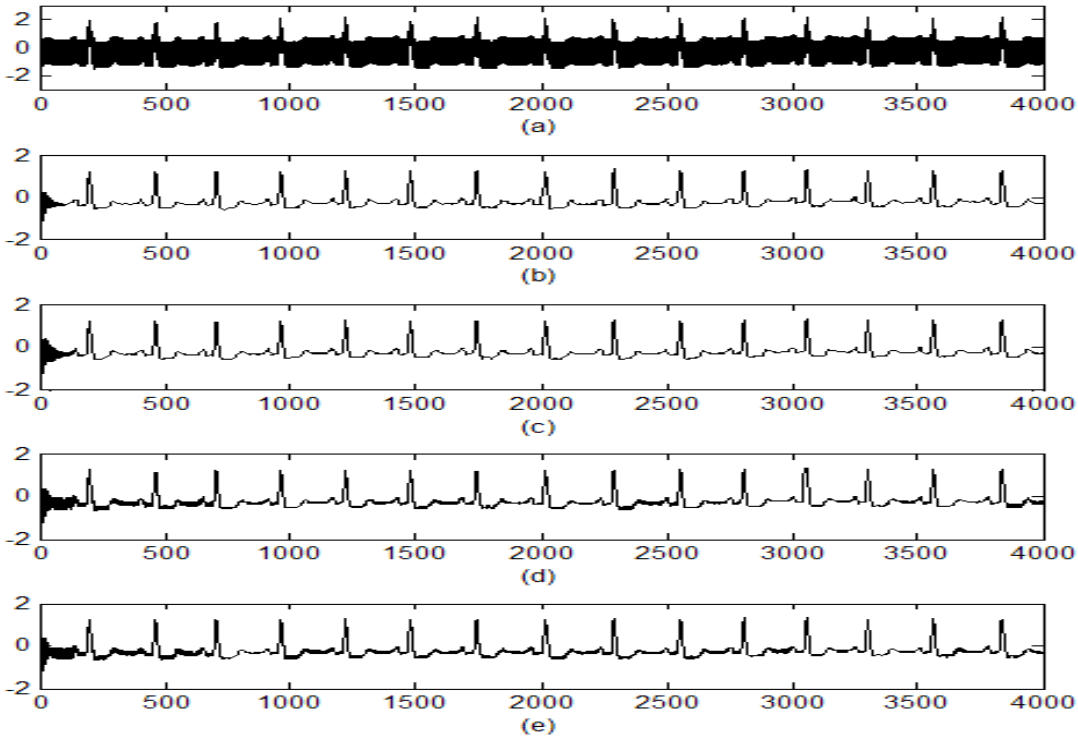

Figure 3:Distinctive filtering outcomes for PLI artifact removal utilizing the information of normalized adaptive filtering algorithms: (a) ECG signal effected by PLI, (b) improved signal using LMS algorithm,(c) improved signal utilizing NLMS algorithm, (d) improved signal utilizing CLNLMS algorithm,(e) improved signal utilizing VSSCLNLMS algorithm.

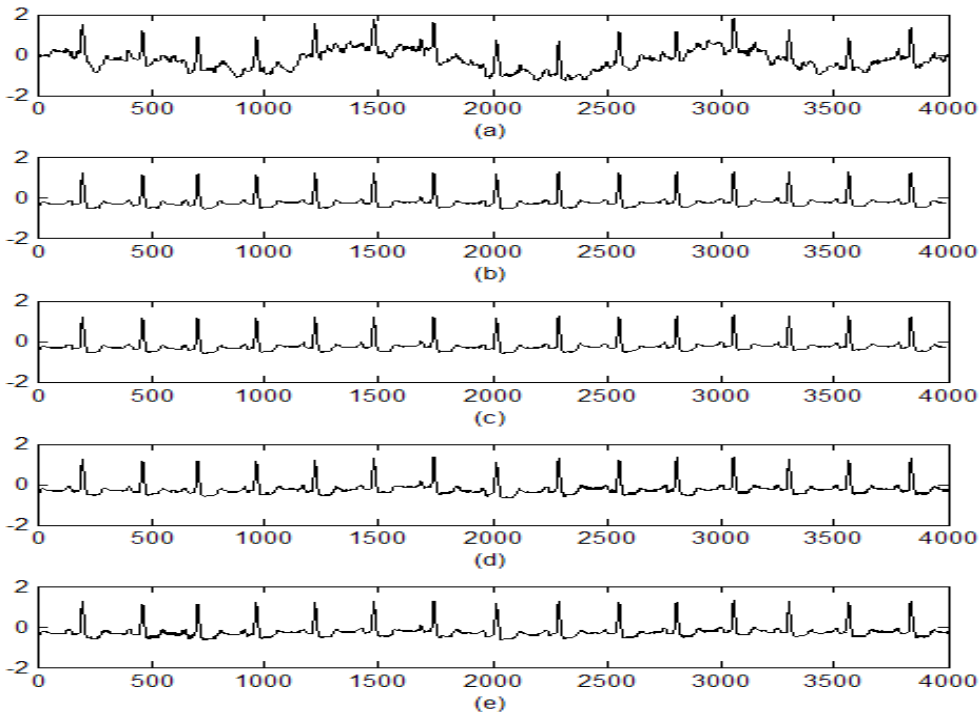

Figure 4:Distinctive filtering outcomes for EM artifact removal utilizing the information of normalization adaptive filtering algorithms: (a) ECG signal effected by EM, (b) improved signal utilizing LMS algorithm,(c) improved signal utilizing NLMS algorithm, (d) improved signal utilizing CLNLMS algorithm,(e) improved signal utilizing VSSCLNLMS algorithm.

Viewing above Figures 3-4 the noise in the signal gets minimized additionally in VSSCLNLMS algorithm, compared to other algorithms. Moreover, from the below Tables 1-2 we studied majorly the PLI and EM are non-physiological signals and worked out utilizing the SNRI and EMSE concert measures.

Table: SNRI assessment for several algorithms in ECG signal improvement procedure (In dBs)

Artefact Type	Data Number	LMS	NLMS	CLNLMS	VSSCLNLMS

	102	-9.9675	-12.3826	-20.2543	-20.9321
	103	-10.3248	-13.2453	-21.4823	-23.2636
	104	-10.6527	-13.6237	-21.4567	-23.2698
	105	-10.7349	-13.6584	-21.8654	-23.6754
	Average	-10.0840	-12.7772	-20.9172	-22.3074

Consequently, the VSSCLNLMS gives the enhanced outcomes evaluated with the supplementary adaptive techniques and also verified them from the Figures 3-4 and from the concert measures as shown in the Tables 1-2.

Conclusions

In this proposal, noise extracted more by the leaky and normalized algorithms in both time and frequency domains. The method like LMS, NLMS, CLNLMS and VSSCLNLMS are progressed for ECG noise extraction. We attained fast convergence and fewer computations due to the circular based algorithms. The SNRI, EMSE and MSD results are visualized in Tables 1-2. From the Figures 3-4 PLI and EM can be extracted efficiently because of VSSCLNLMS when differentiated with LMS and their variants. In our researches, for the PLI removal, the VSSCLNLMS reaches higher SNRI as 16.8565 dBs, for EM removal 15.4978 dBs.

Abstract

Hypertension is a silent killer" is the indication of different cardiovascular disorders. Hypertensions become a greater global burden in the next 15 - 20 years. Hypertension is an important and growing major public health challenge in worldwide. If one believes that 'old is gold', then pranayama is quite effective and widely used to decrease blood pressure, respiration, pulse rate. Yoga is becoming most popular science due to its positive effects on health. Pranayama require inhaling and exhaling through alternative nostril selectively. When each respiratory cycle is completed through the alternative nostril, the practice is called Nadishodana pranayama, which means a 'heat dissipating or cooling breathing practice'.

Aims of study: The present study has been carried-out to assess the effect of pranayama on hypertensive patients.

Material and Method: 60 hypertensive patients who were on regular treatment took part in the study. A baseline record (which served as control) of pulse rate/min, systolic blood pressure (mmHg), diastolic blood pressure (mmHg) respiration were recorded. They carried out ANB for 5-15 minutes and all parameters were recorded again every 3rd, 6th, 9th, 12th day. ANNOVA and unpaired t test was used as the statistical tool to analyse the acquired data.

Results: This study indicates that p value < 0.05 and BP, respiration, and pulse rate can be decreased. Hence, this technique can be used as a regular practice for combating the stress and strain of everyday life

Conclusion: The findings of the study showed that pranayama therapy was effective to reduce the physiological outcomes among elderly with hypertension

Keywords: *Pranayama, physiological outcomes, elderly with hypertension.*

Introduction

Ageingis a vital part of life and brings along two inconvenient events: physiologic decline and disease state. According to geriatric age group grading, 55-66 years, 65-67 years, above 75 years are graded as grade 1, grade 2, and grade 3 respectively. Despite rise in blood pressure (BP) is not a normal part of ageing; the incidence of hypertension in the elderly population is high. After the age of 69 years, the prevalence of hypertension rises to 50%. The systolic blood pressure and diastolic blood pressure increase with age. Systolic blood pressure rises progressively until the age of 70 or 80 years, whereas diastolic blood pressure increases until the age of 50 or 60 years and then tends to level or even decline slightly. This combination of changes probably reflects stiffening of the blood vessels and reduced arterial compliance.[1]

The normal blood pressure is generated in the circulation by pumping action of the heart (cardiac output) and resistance offered by the blood vessels that is commonly known as peripheral resistance. There are numerous determinants and variables which influence both cardiac output and peripheral resistance.

Hypertension is the end results of several adjustments the body makes in response to small, unnoticed disturbance in one or more determinants of cardiac output and peripheral resistance.[2]

Primary hypertension was previously called as, "essential hypertension" because of a long-lasting view that high pressure was sometimes "essential" to perfuse diseased and sclerotic arteries. When the disturbance taking place in the cardiac output, peripheral resistance or both and it will continue without any interval, in the end the blood pressure become permanent and it is called as "essential hypertension" that is, about 90%. [3]

The remaining 10% are termed "secondary hypertension" for which specific movements for the blood pressure elevation can be seen. When any one of the numerous factors influencing normal blood pressure is upset to the extremes, it alone can manifest as hypertension. Primary hypertension is remarkably common in the UK population and the prevalence is strongly determined by historic period and lifestyle components.[4]

Material and Method

The data collection was done from 10/01/2018 to 25/01/2018. Formal permission was obtained from the authority to conduct the study. As per the inclusion and exclusion criteria, samples were selected using non probability purposive sampling technique. Samples from selected old age homes were chosen as experimental group and control group. obtained consent from the subjects followed by an interview schedule to obtain the demographic data and pre test physiological outcomes (blood pressure by sphygmomanometer, pulse and respiration by manually).The experimental group practiced pranayama and those in the control group did not. Pranayama was taught to the experimental group. Post test physiological outcome was assessed in all 60 subjects on 3rd, 6th, 9th, and 12th, day during intervention period.

Statistics

Chi-square test, Unpaired 't' test. and ANNOVA

Section IV: Effect of pranayama on physiological outcomes

This section deals with the effectiveness of pranayama on physiological outcomes among elderly with hypertension. In order to test the statistical significant difference between the mean pre-test and mean post-test pain scores the following are stated

Table 1: Mean, SD, F Value and p value for Pre-test and different Post-test score on systolic blood pressure among experimental group. n =60

Observation	Experimental group		F value	p value	t value
	Mean	SD			
Pre-test	138.2	5.93			
Post test 1	135.8	5.30			
Post-test 2	133.5	5.24	89.622	<0.001*	2.42

Discussion

Findings of the study are discussed under the following sections

Section 1: Demographic characteristics.

Section 2: Effectiveness of pranayama on physiological outcomes.

Section 3: Association between pre test levels of physiological outcomes with the selected demographic variables.

Major findings of the study

Section 1: demographic characteristics

- In this study, age of the samples ranged between 60-80 years and majority (50%) of them were in the age group of 66-70 years in experimental group and (40%) samples were in the age group of 71-75 years in control group.
- Majority of the samples are males in both experimental groups (53.3%) and in control group (73.3%).
- The majority (33%) of the samples had secondary education in experimental group and, (43%) had primary education in control group.
- Majority of the samples follow Christian religion in both experimental group (70%) and control group (66.7%).
- In experimental group all the samples had 100% supports from family and control group (86%) of the samples had support from the family.
- Most of the samples are non vegetarian in both experimental group (70%) and in control group (66.7%).

Section II : Effectiveness of pranayama on physiological outcomes

- The present study result shows that the pranayama has an effect on physiological outcomes (such as BP, pulse, respiration) among elderly.
- The pre-test and post-test score of systolic blood pressure in experimental group shows that, there is a significant difference (p<0.05)between mean pre-test (138.2) and mean post-test4 (130.2) score. This indicates, pranayama was effective in reduction of systolic blood pressure among elderly.
- ANOVA test shows that in experimental group the calculated value (89.622) was more than table value (2.42) at 0.05 level of significance, hence pranayama was effective in reduction of systolic blood pressure among elderly.
- The pre-test and post-test score of systolic blood pressure in control group shows that there is no significant difference (p>0.05) between mean pre-test (140.6) and mean post-test 4 (142.2) score. This indicates, in control group there was no reduction of systolic blood pressure among elderly.
- ANOVA test shows that in control group the calculated value (1.467) was less than table value (2.42) at 0.05 level of significance, hence in control group there was no reduction of systolic blood pressure among elderly.
- The pre-test and post-test score of diastolic blood pressure in experimental group shows that there is a significant difference(p <0.05) between mean pre-test (83.5) and mean post-test 4 (74.2) score. This indicates, pranayama was effective in reduction of diastolic blood pressure among elderly.
- ANOVA test shows that in the experimental group, the calculated value (168.722) was more than the table value (2.42) at 0.05 level of significance hence pranayama was effective on reduction of diastolic blood pressure among elderly.
- The pre-test and post-test score of diastolic blood pressure in control group shows that there is no significant difference (p>0.05) between mean pre-

test (86.1) and mean post-test 4 (88.0) score. This indicates, in control group there was no reduction of diastolic blood pressure among elderly.

- ANOVA test shows that in the control group,, the calculated value (2.226) was less than the table value (2.42) at 0.05 level of significance, hence in control group there was no reduction of diastolic blood pressure among elderly.

Section 2: Association between pre test level of physiological outcomes and selected demographic variables

In the present study researcher found that there is an association between physiological outcome and selected demographic characteristics such age (p=0.036) hobbies and interest (0.05) Duration after diagnosis (0.001). The obtained p values are <0.05, Hence there is an association between selected demographic variables and physiological outcome.

Conclusion

The entire process of carrying out the present study was an enriching experience to the investigator. It helped in exploring and improving the knowledge and ability of the researcher and the respondents. This has helped to compare the effectiveness of pranayama on physiological outcomes among elderly with hypertension

Effect of Training Programme on Quality of Life among Postmenopausal Women: An Intervention Study

Sreerenjini B.[1], M. Muthulakshmi[2]

[1]Prof & HOD of OBG Nursing Department, PSG College of Nursing Avinashi Road, Peelamedu, Coimbatore, India, [2]Prof & HOD of OBG and Gynaec, SRMMCH & RC, Katamkulathur

Abstract

Objective: Menopause is the permanent cessation of menstruation. Majority of women suffering with severe menopausal symptoms which in turn affect their health related QOL. The purpose of this study is to evaluate the effect of 12 week training programme on quality of life among postmenopausal women.

Design: A true experimental design was used for the study. 250 women were randomly selected, 125 in study group and 125 in control group

Measures: The tool used for the study were Structured questionnaire on demographic information and standardized MENQOL-I to assess the quality of life. Study group underwent 12 week training programme. Post test was conducted with the same questionnaire.

Results: A positive change in all domains in the study group was observed after the training but in the control group the mean digfference remains the same.

Conclusion: The overall well being and quality of life is a major public health concern.This study highlights the omportance of physical activity to improve the quality of life among postmenopausal women.

Keywords: *QOL,Exercise, Yoga and MENQOL-I.*

Introduction

Menopause is a natural phenomenon which marks the permanent cessation of reproductive fertility. According to Indian Menopause Society, by 2016 the estimated people over 60 years is 173 million, and the menopausal population is 103 million. Average age of menopause in Indian women is 47.5 years with life expectancy of 71 years. With the increase in life expectancy women spend almost one third of their life during menopause. Women may experience many symptoms due to lot of hormonal fluctuations in postmenopausal periods. The common symptoms are hot flushes and night sweats, problems with vagina and bladder, changes in sexual desire,sleep problems and mood changes which affect their personal and psychosocial quality of life.[1]

QOL has been defined by the WHO as the 'Individual's perception of their position in life in the context of the cultural and value systems in which they live and in relation to their goals, expectations, standard and concerns'. Health related quality of life is usually lower in postmenopausal women when compared to middle aged men and young adults. Menopausal aged women report a low physical activity and sedentary lifestyle which deteriorate their health and quality of life. Controlled and regular physical activity was significantly correlated with a positive change in vitality and mental health.[2]

Karmakar et al found that most reported psychosocial symptoms were feeling of anxiety and nervousness (94%) and depression (88%), vasomotor symptoms were hot flushes (60%) and sweating (47%), physical symptoms include decrease in physical strength and lack of energy (93%) and 26% have vaginal dryness. Complementary therapies such as life style modifications,yoga and exercises play a vital role in the management of menopausal symptoms. Deriving from ancient Indian philosophy, yoga includes physical postures as well as spiritual practice with the goal of unity of mind and spirit. Yoga interventions help to decrease anxiety, distress, blood pressure, pain and fatigue. A

systematic review with randomized controlled trials shows the evidence of short term effectiveness of yoga for psychological symptoms in menopausal women.[3]

Lunny and Fraser evaluated the effect of complementary and alternative therapies in menopausal women. Majority were reported that they are using different approaches such as vitamins (61.5%), relaxation techniques (57%), yoga (37.6%), soy products (37.4%) and prayer (35.7%) for their symptoms. Among that prayer, relaxation techniques, counseling therapy and therapeutic touch were reported more effective complementary and alternative therapies.[4]

A study was conducted to assess the effect of yoga technique on treatment of menopausal symptoms at the Babol Medical University, Iran. A total of 47 postmenopausal women aging 45-63 years participated in a 12 week restorative yoga intervention. During the study the subjects practiced breathing techniques, postures and relaxation poses three times a week for one hour. Significant pre to post test improvement were found for total scores on menopause questionnaire. subjects had decrease in hot flush, 28.4% of subjects anxiety reduced, 57.3% of subjects joint pain and 56.1% 0f subjects muscle pain reduced. The researcher concluded that yoga is a powerful technique that can help menopausal women accept and nourish the inevitable change of life.[5,6,7]

However there is minimal literature available on QOL in Indian postmenopausal women and the women are less aware about the menopausal symptoms and its management. So there is a need to address the QOL especially in rural areas by using a complementary approach to alleviate the postmenopausal symptoms. The present study evaluated the effect of 12 week training programme on QOL among postmenopausal women.

Materials and Method

A true experimental study was conducted in Karadivavi health centre, which is a rural area in Coimbatore district, Tamilnadu. It covers 14 villages from that 8 villages were selected by lottery method. During second phase a list of addresses for all women aged 46-60 years was obtained from the health centre and women who fulfill the inclusion criteria were selected by lottery method.

Sample size was calculated based on pilot study and also by power analysis prior to the commencement of the study. The estimated sample size was 113, by considering 10% attrition the sample size was rounded to 125 in each group. So the total sample size was 250, 125 in study group and 125 in control group. Women who are mentally challenged, women with medically or surgically induced menopause, women who used hormone replacement therapy were excluded. Women aged between 46 to 60 years of age one year after menopause were selected for the study. After obtaining the consent, information was collected by face to face interview, each interview lasted 10-15 minutes.

Initially demographic data and QOL data were collected using structured questionnaire. After the pretest a 12 week training programme were conducted for the menopausal women in a public hall to the study group. The training programmes include physical exercise and yoga and it was demonstrated by the investigator. After one week intensive training, the reinforcement sessions were conducted three days in a week for 12 weeks. Control group received no intervention. At the end of the study QOL was assessed using the same questionnaire both in study and control group.

Ethical Considerations: Formal approval was obtained from the Institutional ethical committee and official permission was obtained from the medical officer of karadivavi health center and panchayat presidents at selected villages. Written informed consent was obtained from the postmenopausal women. The objectives, practices, goodness, problems and the time period and the confidentiality were explained in the consent form.

Data Collection: Data's were collected by using a predesigned questionnaire which comprises two sections. Section 1- Demographic information which includes age, marital status,religion and obstetrical variables. Section 2- standardized Menopause Specific Quality of life Questionnaire (MENQOL-I) intervention version by John R. Hildich to assess the quality of life in postmenopausal women. Formal permission was obtained from the Mapi trust to use this scale in the present study. It was initially written in English, and then translated in to Tamil and then back to English for validation. It was checked and pretested for clarity and suitability in a small pilot study for 10 women. MENQOL-I contains 29 items under four domains such as vasomotor, psychosocial, physical and sexual domain. The severity ranges from 0 (No) to 6 (severe). The overall questionnaire score is the mean of the domain means.

Description of Training session: Study group underwent a training session under the supervision of investigator. The programme consists of the following

1. Physical exercises which includes Head to foot exercises and Kegel's exercises 5 times for 5 minutes.
2. Yogasanas (Swastikasana, Vajrasana, Tadasana and Savasana) for 25-30 minutes
3. Breathing exercises for 5-10 minutes

After one week of intensive training for two hours per day women practiced yoga in their home for 40-45 minutes a day. Reinforcement session was given to them for three days in a week for 12 weeks under the supervision of the investigator. A practice dairy was used to confirm the regular practice and a booklet was distributed to them which explains the life style modifications and detailed steps of training sessions. Control group received no intervention. But after the completion of the study they also underwent the training programme for 5 days.

Statistical analysis: Statistical package for the social sciences version 16 were used for data analysis for a level of statistical significance 5% with the help of qualified statistician. Data was analyzed by using descriptive and inferential statistical method. Frequency, percentage distribution, mean and standard deviation were used for the assessment of demographic variables and QOL. The student independent t-test was used to compare the values between study and control group.

Result

250 women were recruited for the study. After randomization 125 were allocated in the study group and 125 to the control group. The baseline characteristics of the postmenopausal women were shown in Table 1. The mean age of all participants was 51±3.82. most rural post menopausal women were married(96.8%), had menarche at the age of 10-13 years (64.8%), post menopausal duration was 5-10 years(37.65), had normal weight (56.8%) and ideal B.P (75.2%).

Table I: Demographic characteristics of postmenopausal women

Variables	Study group		Control group	
	Count	Percent	Count	Percent
Age				
46-50	41	32.8	40	32
51-55	47	37.6	45	36
56-60	37	29.6	40	32
Marital status				
Married	121	96.8	121	96.8
Unmarried	0	0.0	1	0.8
Widow	4	3.2	3	2.4
Age at Menarche				
<10	18	14.4	17	13.6
10-13	81	64.8	84	67.2
14-16	26	20.8	24	19.2
Post Menopausal Duration				
<5yrs	41	32.8	49	39.2
5-10 yrs	47	37.6	45	36.0
>10yrs	37	29.6	31	24.8
BMI				
Underweight	16	12.8	16	12.8
Normal weight	71	56.8	76	60.8
Over weight	38	30.4	33	26.4
Blood pressure				
Low	5	4.0	3	2.4
Ideal	94	75.2	94	75.2
Pre high BP	26	20.8	28	22.4

Table II presents the mean scores of each domain in both study group and control group before training programme. The mean scores in the study group were vasomotor 5.1, psychosocial 4.0, physical 3.7, sexual 3.8 and in the control group vasomotor 4.9, psychosocial 4.1, physical 3.7 and sexual 3.8. the differences between both the groups were small.

Table II: Mean QOL scores in postmenopausal women before training programme

QOL Domain	Study group Mean±SD	Control group Mean±SD	P value (t test)
Vasomotor	5.1±1.0	4.9±1.0	0.190
Psychosocial	4.0±0.5	4.1±0.5	0.507
Physical	3.7±0.3	3.7±0.3	0.837
Sexual	3.8±0.7	3.8±0.7	0.771
Overall quality of life	4.1±0.3	4.1±0.3	0.626

Table III: Mean QOL scores in postmenopausal women after trainingprogramme

QOL Domain	Study group Mean ±SD	Control group Mean ±SD	P value (t test)
Vasomotor	1.9 ±0.6	4.9±1.0	0.000*
Psychosocial	1.4±0.3	4.1±0.5	0.000*
Physical	1.5±0.1	3.7±0.3	0.000*
Sexual	1.7±0.4	3.8±0.7	0.000*
Overall quality of life	1.6±0.2	4.1±0.3	0.000*

*significant at 0.01 level

Table III summarizes the mean changes in QOL in study group and control group after 12 week of training programme. A positive change in all domains in the study group was observed and in the control group the mean difference was remains the same. In all the domains mean changes in QOL score was statistically significant.

Discussion

The present study clearly demonstrates the effect of 12 weeks training programme on quality of life among postmenopausal women. During menopause women experience severe and multiple symptoms and it affects their quality of life. Hormonal therapy is the effective treatment but it can cause complications including malignancy. The benefits of regular physical activity and yoga are frequently cited and it is associated with higher QOL scores.

In a quasi experimental study the effect of Group counseling on QOL among postmenopausal women were tested. 80 postmenopausal women were randomly selected and allocated to case and control group. Pretest was conducted before the intervention. Three months after intervention information were collected from both the groups. Before the intervention, mean ± standard deviation for QOL in case group was 101.2 ± 31.4 and it was significantly decreased to 96.9 ± 27.0 after intervention ($P< 0.05$). While no significant change was observed in the control group (from 98.9 ± 35.5 to 102.3 ± 35.0, $P = 0.443$). Symptoms of physical ($P = 0.033$) and sexual ($P< 0.001$) dimensions significantly decreased in the case group. While significant increase was observed in terms of psychosocial ($P = 0.049$) and sexual symptoms in control group.[8]. Likewise the present study also shows that QOL in postmenopausal women was significantly improved in all the domains after practicing 12 weeks training programme.

The overall mean score was 4.1 in both study group and control group before training programme. But the mean gain score in the study group 1.6 versus 4.1 in the control group. This shows that the training programme was effective in improving the quality of life in study group. These findings are consistent with those of a study in which a telephonic survey was conducted to describe the use of alternative therapies for menopausal symptoms in Washington State. The study findings revealed that women who used alternative therapies are found to be beneficial for menopausal symptoms.[9]

The main limitation for the present study is that few women ignored their problems and were not willing to discuss their menopausal symptoms freely. Recommendation for further study is QOL can be assessed when the woman practicing yoga and exercises continuously in a 1-2 year follow up study.

Implications for public health nursing: Public health nurses play a vital role in disseminating these findings to help menopausal women in alleviating their problems. They should update their knowledge about various therapeutic approaches and should try to teach all women those who are coming in contact with them. This can be enhanced with the help of various awareness programmes which can be conducted in community areas so that information can be transferred in to the grass root level.

Conclusion

The present study concludes that 12 week training programme is effective in improving the QOL among postmenopausal women in rural areas. Menopause is the third phase of life. A large number of women all over the world are suffering from menopausal symptoms. Education, creating awareness and providing suitable intervention to improve the QOL are important social and medical issues which need to be addressed.

Abstract

The process of modern sports training depends on the focus of its objectives for the development of energy production systems and associated functional variables. Since the game of futsal also depends on the anaerobic system because of the speed and variety of high and strength in physical performance and skill, so emerged the need to use coaches and focus on exercises similar to play, including the tactical system. This is where the importance of research through the development of special exercises similar to play to improve the level of physical and physiological and the proportion of possession of the ball, which contributes to the development of the levels of players and enable them to achieve better results in the games.

The study aimed to prepare similar exercises to play in the development of offensive performance and blood PH and the percentage of possession of the ball for young football players as well as to identify the impact of similar exercises which it plays in the development of offensive performance and blood PH and the percentage of possession on the ball for young football players.

Keywords: *Performance, healthy performance, blood PH.*

Introduction

While the researchers used the experimental method, the research community has identified from the clubs of the province of Karbala and the sample was selected by drawing lots and they are youth players Karbala club football halls and the number (16) players have been divided into two groups control group and the other experimental and each (8) players used exercises Competition according to the tactical system and strongly (80-90%) I performed exercises 3 units per we

The twenty-first century is characterized by rapid scientific progress in the field of sports in general and futsal in particular [1].This game is one of the most important indicators of scientific achievement in this century, because of its components; it makes it a true mirror of the level of progress and advancement of nations. Futsal football occupies a prominent place among the various sports activities because of its popularity in all age groups [2].

The development in the technical level of the various sports activities in general and the sport of futsal in particular indicates that there is an escalation in the level of skill [3]. Also, motor and technical performance of the players, which did not come arbitrarily but came through the selection of modern training method in turn helped in the process of skill development, and through Continuous and standardized physical and skill practice that gives emphasis on the importance of repeating skill-related exercises to enable the learning process to be optimized and developed. Here we must introduce modern curricula in the training process in order to raise the physical and skill level of the players through which Players can apply the duties assigned to them by the coach within the field [4,5,6].

One of the method aimed at the development of some physiological variables during ensuring the creation of functional adaptations in the different organs of the body is similar exercises to play that these variables are important for the sports body [7.8]. Also, it works on the

development of physical abilities, including carrying performance that have an important and effective role in the game of futsal because they require special physical abilities, especially in the development[9,10].

Since this game where the competition is intense and continuous, therefore, competition exercises are of great importance, which in turn works to develop physiological variables and tolerate offensive performance and possession of the ball according to scientific bases [11,12].

Methodology

The research community is represented by the players of the team of education of the holy province of Karbala football halls for the preparatory stage and the number of (20) players with goalkeepers for the academic season 2018-2019, and (16) players were selected randomly as a sample of the research was divided randomly also and equally into two experimental and control groups and by (8) The first experimental group used competition exercises, the second group was the coach's training, and the members of the research sample and both groups were homogeneous.

Method Used

- Arab and foreign sources and references
- Tests and metrics.
- Assistant team
- Observation and personal interviews.
  - Ballrooms number (10).
  - Persons number (22) different height.
  - Medical cooler for keeping blood tubes.
  - Pluntnbe blood plastic tubes.
  - Electronic stopwatch Chinese industry number (2).
  - Japanese type SONY camera.
  - Futsal field

Measurement of blood pH: Researcher used a cadre * medical assistant also to carry out the process of blood withdrawal for the purpose of measuring the proportion of blood PH after the effort and the process of drawing blood by (4) C from the position of sitting in a chair immediately after the voltage endurance test performance.

Modified withstand performance test

Purpose of the test: Measure the bearing performance

- The necessary tools: field of futsal, different people's altitudes (22), and futsalballs (10), colorful adhesive tape, electronic stopwatch, and whistle.
- Performance description: The player stands on the starting point of the test, which is at the beginning of the field of play next to the goal on the left. At the start of a whistle, the player receives the ball from one of the assisting team members. The player then makes Zakzak between the 8 characters and the distance between each person and another is (1) meter and the start to the first person (8) meters. After the completion of the signs, a player stands between the players, receive and deliver the ball to the players. Each player will receive and deliver the ball for (5) times. Then the player rolls fastball for a distance of (15) meters to make a shot (5) balls placed on the front of the goal area (10) meters. Then the player performs Zakzak between the characters again for (8) persons and when finished and after the completion of the player stands between the players and leads (10) times received and delivered the ball. Then he does aZakzak between (6) signs away from the centerline a distance of (10) meters and without a ball. Then the process of rotation behind a fellow player standing in the middle of the field of play and receiving a ball and a rolling and then shot on goal.
- Time recording: Records the time of the laboratory from the beginning of the test to the end.

Acquisition ratio test: The acquisition rate was tested by taking the views of the supervisors of the research by adopting the arithmetic mean no eight attacks and counting the number of touches by conducting a mini tournament consisting of four teams from the youth category (the experimental group, the control group), the league system, each team plays three games, Distributed over three days, the rate of two games per day, the games were filmed and copied on CD and then the acquisition rate was evaluated by supervisors and researcher and the results are fixed.

Pre-test: The pre-test was conducted on the sample of the research sample, which consists of (16) players divided into two experimental and control groups on (Sunday and Monday) corresponding to (30-31/12/2018) at four o'clock in the afternoon and the Martyr Al-Hakim

square in the holy province of Karbala And physiology laboratory in the Faculty of Physical Education and Sports Science - University of Karbala.

The main experiment: After completing the pre-tests, the researcher introduced the competition exercises he prepared, as part of the training program for the research sample at the beginning of the main section of the training unit.

1. The exercise was scheduled to begin on Saturday, January 1, 2019.
2. Exercises were applied at the end of the general preparation and special preparation phase.
3. The duration of the experiment (8) weeks distributed over (24) training modules at the rate of three units per week (60) days continued the training curriculum.
4. A special trainer was assigned to each group to be given special exercises scheduled for them at the beginning of the main part and on the closed martyr's hall on Saturdays, Mondays and Wednesdays at the same time, and after the completion of the special exercises are re-integrated to complete the training module under the supervision of their trainer.
5. The researcher determined the intensity of exercise between (80-90%).
6. The researcher used high intensity instinct training.
7. The trial ended on Wednesday 27/2/2019.

Post-test: The post-test was conducted on the research sample on (Friday and Saturday) corresponding to (1-2/3/2019), on the field of play Martyr Hakim Hall closed in the province of Karbala and the physiological laboratory in the Faculty of Physical Education and Sports Science - University of Karbala, taking into account The same conditions and conditions in the pretest.

Discussion of the Results

Blood pH: through the presentation and analysis of the results of pre and post measurements in the blood pH after the effort in the test of tolerance performance. The trainer who contributed to the development of the control group in this variable As for the development that took place in the experimental group is due to exercises similar to toys prepared by researchers with high rigidity and this was confirmed by Rahim Ruaih "when using non-oxygen training exercises characterized by intense shear Lack of oxygen required to produce energy and thus produce energy in insufficient oxygen and thus the accumulation of lactic acid in muscle and blood as a result of increasing the rate of production of lactic acid more than the rate of disposal and as a result becomes acidic, then The amount of blood produced by lactic acid becomesgreater than the amount of disposal and therefore low blood PH, especially when biological organizations are not adaptive and unable to neutralize the blood and the body's organs to get rid of lactic acid.

Bearing Performance: Through the presentation and analysis of the results of the performance tests shown in the tables (5,6) showed significant differences between the tests (pre - post) and for the benefit of the post-test and for both experimental and control groups, which shows the evolution of the character of the performance tolerance and the researchers attribute this development to the curriculum prepared by the trainer for the development of the control group, which contains special exercises to withstand the performance of football players Futsal, which was organized in terms of the components of the training load and this confirmed by Hashim Yasser "The ability of the athlete to perform a movement or a group of movements targeted for the purpose of accomplishing a certain duty without a decrease in physical level" As for the development of the experimental group, the researchers attribute this development to two reasons. The first reason is the specificity of the competition exercises prepared by the researchers in accordance with the specificity of the game of futsal for what this ability requires to carry no oxygen and this is confirmed by Hashim Yasser. The second reason is the functional ability acquired by the player as a result of training in the anaerobic system and this is confirmed by Serageldin Abdel Moneim "can be seen in a range of functional effects that get players Presented lounges during the implementation of exercises to withstand performance in general through increased blood vessels and the activity of the enzyme carbs cycle "This was confirmed by Abu Ela and Nasr El-Din Sayed" The use of exercises that are consistent in the nature of its performance with the general form of the performance of specialized skills lead to better results in the acquisition of variables Physical. "

Conclusions

Through the findings of the researchers, conclude the following:

1. Competition exercises resulted in the development of blood PH for the players of the Holy Karbala breeding football team for the halls.
2. Competitive exercise led to the development of bearing performance and acquisition ratio

Recommendations:

1. Focus on the use of similar exercises to play by the football coaches of the halls.
2. Competition exercises have a role in the development of blood PH and withstand the performance and proportion of futsal acquisition.

Exercises used:

Exercise 1: The exercise includes playing two teams 5 against 5 The exercise begins with the ball goalkeeper passes to the player who cuts in front of the goal to receive the ball and rolling to the middle of the field of play and then pass to the colleague who in turn receives it to go to the side to reach the goal of the opposing team and pass it to the colleague Who is in the far column of the goal and shot it on goal or passes to the next colleague from behind to turn it in turn and guess a goal.

Exercise 2: The exercise includes two teams 5 against 5 The exercise begins with the ball goalkeeper pass to the close colleague and in turn pass to the colleague standing on the other side and then passed to the colleague who moves and down to the middle of the field of play to receive the ball and return it to his colleague, who in turn does a pass Long for the teammate, who took the emptyplace of the player who did the attribution and then go towards the goal and then shot on goal or handled by a colleague of support and his goal.

Abstract

Introduction: Hang-out can trigger health risk behavior in adolescents. This qualitative study aimed to explore hang-out related to health risk behavior in adolescents.

Method: Five focus groups were carried out with 44 adolescents aged 12–25 in Surabaya, Indonesia. Participants were purposively selected and had all experienced hang-out activities. A thematic analysis approach was used for analysis and data collection was completed at the point of data saturation.

Results: Hang-out activities can encourage health risk behaviors such as smoking, alcohol consumption, drugs use, sweet beverages and fast food consumption. They interpret hang-out as interaction, socialization, entertainment and leisure time.

Conclusions: Adolescents who have free time will use it with hang-outas a form of self-expression. This has led to the culture of hang-out activity that can trigger health risk behavior. They spend time in places that they feel comfortable, the availability of the facilities they need and can show social classes among them. The government can formulate strategies to prevent health risk behavior in adolescents such as providing health promotion on prevention of health risk behavior.

Keywords: *Hang-out,health risk behavior, adolescents, qualitative research, focus groups.*

Introduction

Human behavior plays an important role in maintaining health and preventing disease.[1] World Health Organization states that health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.[2] Activities carried out by adolescents when they have free time are hang-outs that can encourage health risk behavior, which is an activity that increases the risk of disease or injury.[3] Health risk behavior relates to risk-taking behavior which has three forms, biological, psychological and social.[4] Health risk behavior during hang-out includes smoking, alcoholconsumption, drugs use, sweet beverages and fast foodconsumption.[5,6,7,8] Health risk behaviorin adolescents is caused by multifactors[9,10], one of them is caused by peer influence.[11,12] Adolescence is a transitional period of development between childhood and adulthood. The development of adolescent social life is characterized by the influence of peers in adolescent life.[13]

Health risk behavior in adolescents in Indonesia and Surabaya is still high, such assmoking, alcoholconsumption, drugs use, sweet beverages and fast foodconsumption.[14] Health risk behavior in adolescents can be a long-term risk factor for chronic health conditions in adulthood.[15,16,17,18] The purpose of this study is to explore hang-out related to health risk behavior in adolescents.

Materials and Method

Study Design: This study used qualitative description[19] as a design and focus group[20] for information gathering to explore hang-out activities related to health risk behavior in adolescents. This study chose focus groups because this method possible to acquire valuable data.[21]. Ethical approval was granted by The Faculty of Public Health Airlangga University Health Research Ethics Committee (No: 69-KEPK).

Recruitment process: Participants were male and female students who attend organizations in schools with peer groups. We used a purposive sampling technique, aiming to be inclusive of experiences of boys and girls from diverse backgrounds. Recruitment ended once theoretical saturation was achieved.[22] In total, 44 adolescents ranging in age from 12 and 25 years, 20 participants were girls and 24 were boys.

Conduct of focus groups: Data collection was carried out by the main researcher from August 2016-December 2017. Focus group were conducted with pupils in same year group to get naturalistic discussions. We designed a questioning route informed by existing mental and social well-being literature and guidance on focus groups.[20,23] Focus groups lasted 45-60 minutes and were digitally audio recorded. The researcher assistant took field notes including verbal and non-verbal communication. Audio recordings were transcribed verbatim.

Data analysis: All data emerging from interviews and field notes helped inform the data-analysis process, were reviewed and coded by the researcher. This study using a thematic analysis approach.[24]Pupils were given the opportunity to feedback on results to encourage participation validation.

Results

Five focus groups were conducted in this study with 44 participants. Four interconnected themes emerged from the data; (a) smoking behavior, (b) alcohol consumption, (c) drugs use and (d) sweet beverages and fast-food consumption.

Smoking behavior: Participants reported about smoking behavior along join a hang-out activity in peer groups. Smoking behavior is part of health risk behavior.

Pupil 1: "I smoked when I join hang-out with peers, I started smoking since I join with my friends in his group in order to equality in groups."

Pupil 19: "I smoked 2-4 cigarettes along join hang-out with close friends, I follow their activity as group solidarity."

Pupil 25: "3-5 cigarettes in hang-out with peers in order to look masculine."

Participants reported that they smoked along join hang-out from 2-5 cigarettes. It can be concluded that hang-out can trigger health risk behavior such as smoking behavior. They smoked caused by peers influence in order to look masculine and equality in groups.Smoking can cause addiction, illness, and death. Diseases that often arise due to smoking are respiratory disorders and lung cancer.

Alcohol consumption: Participants also reported about alcohol consumption in hang-out activities. One of health risk behavior also alcohol consumption.

Pupil 7: "I consume alcohol in the hang-out activity together with my friends, because my friends invite me to do it."

Pupil 29: "Sometimes I consume alcohol with my friends when I join the hang-out activity in order to same with others."

Pupil 11: "Consume alcohol when I meet my friends in the hang-out activity."

Participants reported that they consume an alcohol when joining the hang-out activity. They consume an alcohol because of peer influence in order to no gap in their group. It can be concluded that adolescents have a risk to consume an alcohol when joining the hang-out activity. The impact of alcohol use can cause various illnesses and deaths.

Drugs use: Interviews related to drugs use when the hang-out activity, participants reported that they also use drugs when joining the hang-out activities in peer groups.

Pupil 23: "I use marijuana when I am joining hang-out because my friends have brought it and I use together with my friends. I use it in order to get relax and solve my problems."

Pupil 15: "I use amphetamine when I am joining hang-out together with my friends to solve my problems."

Participants said that they use a drug such as marijuana and amphetamine caused by peers influence. They also said that they use it in order to get a relax and solve their problems. This study can be concluded that adolescents have a risk to use a drug along joinhang-out activities. The use of drugs can cause addiction, illness, and death.

Sweet beverages and fast-food consumption: Participants reported that they consume sweet beverages and fast-food along join hang-out activities.

Pupil 17: "I eat fried chicken and tea for drinking."

Pupil 39: "I eat fried potato and softdrinks for drinking."

Pupil 21: "I eat burger and coffee for drinking."

It can be concluded that adolescents eat fastfood such as fried chicken, fried potato and burger when joining hang-out activities. They also consumed tea, coffee, and soft drinks. It can be concluded that adolescents consume fast-food and sweet beverages. Fast food consumption can have an impact on disease, whereas sweet drinks can cause diabetes.

Discussion

This qualitative study used focus groups to explore health risk behavior in hang-out activities in adolescents. This study has shown that hang-out can trigger health risk behavior.

Health risk behavior for adolescents most often was smoking behavior, alcohol consumption, drug abuse, sweet beverages, and fast-food consumption.[25,33,35,37,39]

Participants reported that they smoked along join hang-out from 2-5 cigarettes. It can be concluded that hang-out can trigger health risk behavior such as smoking behavior.[32,36] They smoked caused by peers influence in order to look masculine and equality in groups. The results showed that there was a relationship between peer influence and risk behavior.[11,26,27] Smoking can cause addiction, respiratory disorders, lung cancer, and death.[15,16,17] The other factors that influence a person to smoke were biological, psychological, social, environmental, demographic, socio-cultural and socio-political factors.[32,43]

Participants reported that they consume an alcohol when joining the hang-out activity.[7] They consume an alcohol because of peer influence in order to no gap in their group. It can be concluded that adolescents have a risk to consume an alcohol when joining the hang-out activity. The impact of alcohol use can cause various illnesses and deaths.[28,46] Drunk from alcohol consumption was related to anxiety, depression and suicide.[29] Alcohol consumption affects poor educational attainment and results in early morbidity and mortality.[8,38] The informants who consumed alcohol majority with low education or dropping out of school and wrong parenting provided the risk behavior. They involved in the alcohol consumption influenced by environmental factors especially peers.[38,45,46,47]

Participants said that they use a drug such as marijuana and amphetamine caused by peers influence. They also said that they use it in order to get a relax and solve their problems. This study can be concluded that adolescents have a risk to use a drug along join hang-out activities. Risk factors for drug abuse were men, have family members who support young people to drugsabuse, never engage in religious activities and worship, have low education and have more money to have the opportunity to health risk behavior.[10]The use of drugs can cause addiction, illness, and death.[18]Psychological, social and behavioral factors related to health risk behavior in adolescents such as smoking, drinking alcohol and drugs abuse.[30]

It can be concluded that adolescents eat fastfood such as fried chicken, fried potato and burger when joining hang-out activities. They also consumed tea, coffee, and softdrinks. It can be concluded that adolescents consume fastfood and sweet beverages. Fast food consumption can have an impact on disease, whereas sweet drinks can cause diabetes.[41,44] Environmental factors could influence health risk behavior such as sweetened beverages and fast food consumption include peer, family and school.[12,41,42]

Conclusions

This study has shown that hang-out activities caused health risk behavior such as smoking, alcohol consumption, drugs use, sweet beverages,and fast food consumption. It can be caused by psychological, social and behavioral factors.

Health risk behavior along hang-out activities important to get prevention efforts for decrease effects on health based on five levels of prevention. Health promotion is one prevention that can be done. It is the

first and foremost stage in preventing a disease, where the process of providing health information to the community occurs so that all communities are willing and able to maintain and improve their health.[31,34,40]

Conflict of Interest: The author(s) declared no potential conflicts of interest with respect to the research, authorship,and/or publication of this article.

Social and Environmental Performance of Private and Public Sector Banks in India: A Comparative Study

Sukhpreet Kaur

Assistant Professor, Mittal School of Business, Lovely Professional University, Phagwara

Abstract

The present study is an effort to know about the social as well as the environmental performance of private and public sector banks of India after taking into account the guidelines regarding CSR by Companies Act, 2013. The major CSR initiatives undertaken by Indian Banks are found and ranking of banks is done on the basis CSR scores calculated through content analysis technique. A comparison is made between the social and environmental performance of Indian private and public sector banks by applying t-test. Eradication of extreme hunger and poverty (70%) followed by promotion of education (52%), reduction of child mortality and improving maternal health (45%), environmental sustainability (41%) and rural development (40%) are the major CSR areas of concern in case of private sector banks while rural development (67%) followed by eradication of extreme hunger and poverty (65%), promotion of eduction (52%) and employment enhancing vocational skills (42%) are major CSR initiatives of public sector banks. But both the sectors could not achieve even 50% of the total expected CSR score. J & K Bank (76%) is the biggest social performer followed by Yes Bank, Federal Bank and ING Vysya (60%) and Axis Bank (58%), all the top performers from private sector only. Bank of Baroda and Punjab National Bank (54%) are the top performers of public sector banks. Overall no significant difference is found in the average CSR scores of both the sectors.

Keywords: *Social and Environmental Performance, Private Sector Banks, Public Sector Banks, CSR initiatives, CSR Scores.*

Introduction

Social responsibility is not a novel subject of Indian business but it has traditionally been followed by the corporate sector. From the phase of simple charity to participation of the various stakeholders' interests, Indian business sectors follow various method of undertaking social responsibility. There is not lack of energy available for the exploitation in the area but there is a need of suitable method on the basis of which, Government, corporate sector and the society can work together to take the benefit of the same. A company can generate wealth and long term sustainability for itself by presenting responsible behaviour towards society, environment and ethics in the process of its operations and playing positive and meaningful role for the betterment of society. There is no doubt that Indian economy is growing at a fast pace in the current decade, but still it is facing major challenges because of the basic problems like poverty, illiteracy, malnutrition etc. These challenges need to be addressed by government by providing suitable framework and innovative solutions to these challenges so that corporate sector can contribute towards social work under that framework.

Literature Review: Irrespective of location, the nature of CSR activities undertaken by banks is found to be similar. Banking sector is not a mature one, the responsible actions undertaken by the Romanian banks are in line with the ones of their European counterparts [(1)]. Major areas of concern for banks are education, balanced growth, health, environmental marketing and customer satisfaction as their core CSR activities[(2),(3)]. Various categories of CSR disclosures are environmental, equal opportunity, human resource, community involvement, product quality, political, energy, etc.[(4)]. All the financial and banking institutions of the country are directly engaged in social banking and development banking approach focussing on education, rural development and women empowerment[(5)]. Some advertising companies do engage in CSR activities and disclose them in their annual reports, but the level of these CSR disclosures is different between the organizations and the pattern of CSR reporting was far away from expectations [(6)].

Content of CSR disclosure is not comprehensive and is highly varying, even in the same branch of industry[7]. There are written narrative but not quantifiable method to disclose CSR in their reports[8]. Despite the increasing popularity of CSR, most reporting is still concentrated in areas that are either mandatory or seen as important in establishing legitimacy for continued, profitable operations[9]. As a matter of fact, the standards for rating CSR practices are less uniform in comparison to that for financial ratings[10]. The major thrust areas for CSR practices in Indian banks are children welfare, community welfare, education, environment, healthcare, poverty eradication, rural development, vocational training, women's empowerment, protection to girl child, employment[11]. Environmental duties are the critical element of CSR and although companies ''negotiate''philanthropic responsibilities with the communities, ethical responsibilities are defined by the headquarters and not negotiated locally[12]. The major reasons for involving CSR practices by companies are to create and maintain a favourable corporate image[13]. According to Tewarialthough both Indian and the MNCs target and lay importance to similar group of stakeholders for their CSR communication but for the Human Resource the MNCs address quality of work life more while the Indian companies focus upon the monetary benefits provided[14].41% of listed financial sector companies made some kind of CSR disclosures and is quite impressive compared to CSR disclosures in other sectors, like ceramics, Engineering, IT, paper and printing. [15].CSR reporting as regards the amount spent on those initiatives is poor [16].The major constraints to the discharge of CSR include self-induced vices, regulatory laxity, inauspicious macro-economic environment, and endemic corruption in the economy[17]**.** Though the Indian banks are making efforts in the CSR areas but still there is a requirement of more emphasis on CSR. Public sector banks have overall highest contribution in CSR activities as compared to private and foreign banks[18].Environment reporting practices of companies and found that there is no specific framework for reporting these practices in the company reports[19]. CSR initiatives need more support and motivation both from society as well as government[20].Statistically there is no significant relationship between CSR and financial performance of banks in Nigeria but it has a positive impact on the performance of banks[21].

Need of the study: Corporate social responsibility was taken differently by different companies before the clear cut guidelines came under Companies Act, 2013. There was no set criterion as to how it should be discharged in a meaningful and useful manner. Moreover Banking Sector of a country is always expected to work for society as they mobilise the societal resources for the development of the country.Thus a study becomes imperative to know the focus area of CSR in the Banking Sector of India, the level of social performance this sector is contributing and how private and public sector players differentiate themselves on the basis of this social performance.

Objective of the study: The main objective of the study is to find out the difference in the level of social performance of Indian private and public sector banks and the priority being given by Indian banks to social initiatives as per Companies Act, 2013.

Research Methodology: A well defined research process has been used to collect the data as well as to apply the appropriate research technique to achieve the set objectives.

Source of data collection: Banking sector of India is majorly covered by the private and public sector banks. 21 Public Sector and 20 Private Sector Banks of India as per recent list of RBI are taken to study the social performance of banks. Secondary data is collected by downloading annual reports of banks from capitaline. com and the websites of banks under study. Annual reports of all private and public sector banks of India for the past five years (2012 to 2018) are taken. Ten CSR areas as per Companies Act, 2013 are taken into consideration for calculating the social performance of banks.

Research Technique: Annual reports of banks are analysed through the technique of content analysis. In case a CSR parameter is taken care by a particular bank, then CSR score '1' is assigned otherwise '0'. In this way, total expected CSR score of all Public Sector Banks of India for five years comes out to be 1050 (21*5*10) for all the CSR parameters collectively and 105 (21*5) for each individual CSR parameter. Similarly, total expected CSR score of all Private Sector Banks of India for five years comes out to be 1000 (20*5*10) for all the CSR parameters collectively and 100 (20*5) for each individual CSR parameter. For each individual bank, expected CSR score for all CSR parameters for five years comes out to be 50 (10*5). Social performance of each bank in the private and public sector as well

as of each individual CSR parameter being performed by banks is calculated on the basis of percentage of actual CSR performance in comparison to expected CSR performance. T-test is used to compare the social performance of both the sectors and bar diagrams are used to present the data bank wise as well as parameter wise.

Comparison of Private and Public Sector Banks on the basis of Social and Environmental Performance: Social performance of banks is calculated by analysing the annual reports of banks for the past five years (2012 to 2018). There are 21 public sector banks and 20 private sector banks as per the latest list published by RBI. Since five years and all private and public sector banks are taken into account, so the total expected CSR score of all Public Sector Banks for each CSR parameter is 105 i.e. 21*5 and in case of all Private Sector Banks is 100 i.e. 20*5. Accordingly actual social performance is calculated on the basis of percentage of expected CSR score for each CSR parameter.

Table 1: Comparison of Social Performance by public and private sector banks

CSR parameters	Public Sector banks		Private Sector banks	
	CSR Score (Out of 105)	Social Performance	CSR Score (Out of 100)	Social Performance
Eradicating extreme Hunger and Poverty	65	61.90	70	70.00
Promotion of Education	52	49.52	52	52.00
Promoting Gender equality and empowering women	32	30.48	8	8.00
Reducing child mortality and improving maternal health	38	36.19	45	45.00
Combating human immunodeficiency virus	5	4.76	11	11.00
Ensuring environmental sustainability	28	26.67	41	41.00
Employment enhancing vocational skills	42	40.00	33	33.00
Social business projects	30	28.57	36	36.00
Contribution to fund for socio-economic development and for welfare of SCs, STs, BCs and minorities and women	31	29.52	21	21.00
Rural Development	67	63.81	40	40.00
Grand Total Score	390/1050	37.14	357/1000	35.7

Table 1 clearly depicts that out of all the CSR paramaters, eradication of extreme hunger and poverty (70%) got the maximum CSR score in case of private sector banks and rural development (67%) is the major area of concern in case of public sector banks. There is a huge difference in the CSR score of two parameters in both the sectors wherein promotion of gender equality and women empowernment parameter is given more weightage in case of public sector banks but least important to private sector banks while combating human immunodeficiency parameter is more important in case of private sector banks but least important to public sector banks. Contribution to social business projects is more by private sector banks and contribution to funds for SCs, STs and minorities is more by public sector banks. The results also show that although the overall the social performance of public sector banks (37.14%) is better than the private sector banks (35.7%) but this difference seems to be very marginal. In case of individual score of each CSR parameter, actual social performance is as high as 70% but overall this social performance by both the sectors does not seem to be satisfactory when compared with the total expected CSR scores as both the sectors could not achieve even 50% of the total expected CSR score.

The expected CSR score of each individual bank comes out to be 50 i.e. 10*5. Actual social performance of each bank is calculated by taking the percentage of expected CSR score.

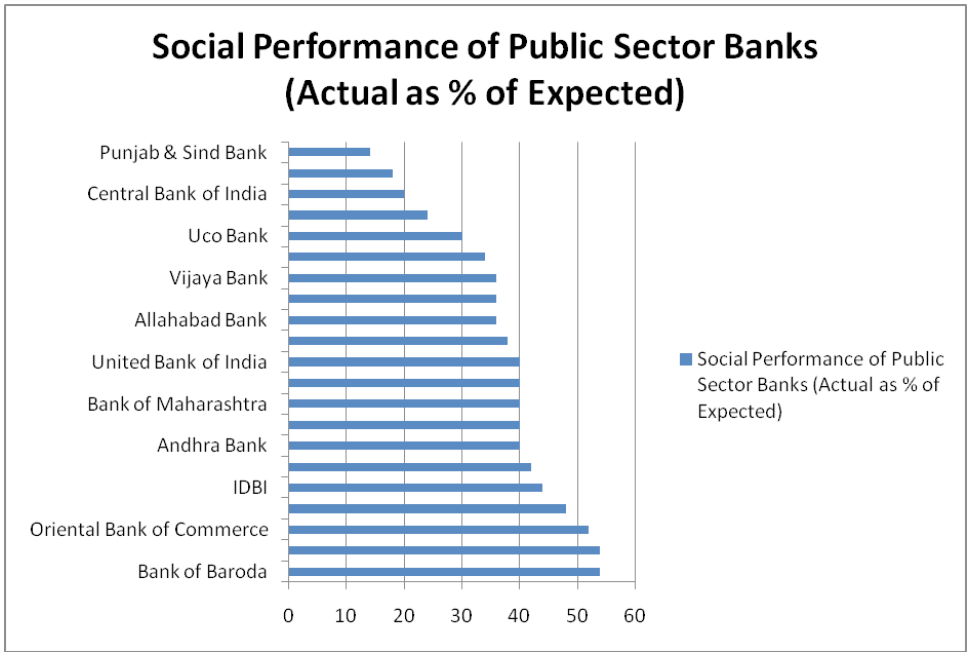

Fig 1: Social Performance of Public Sector Banks

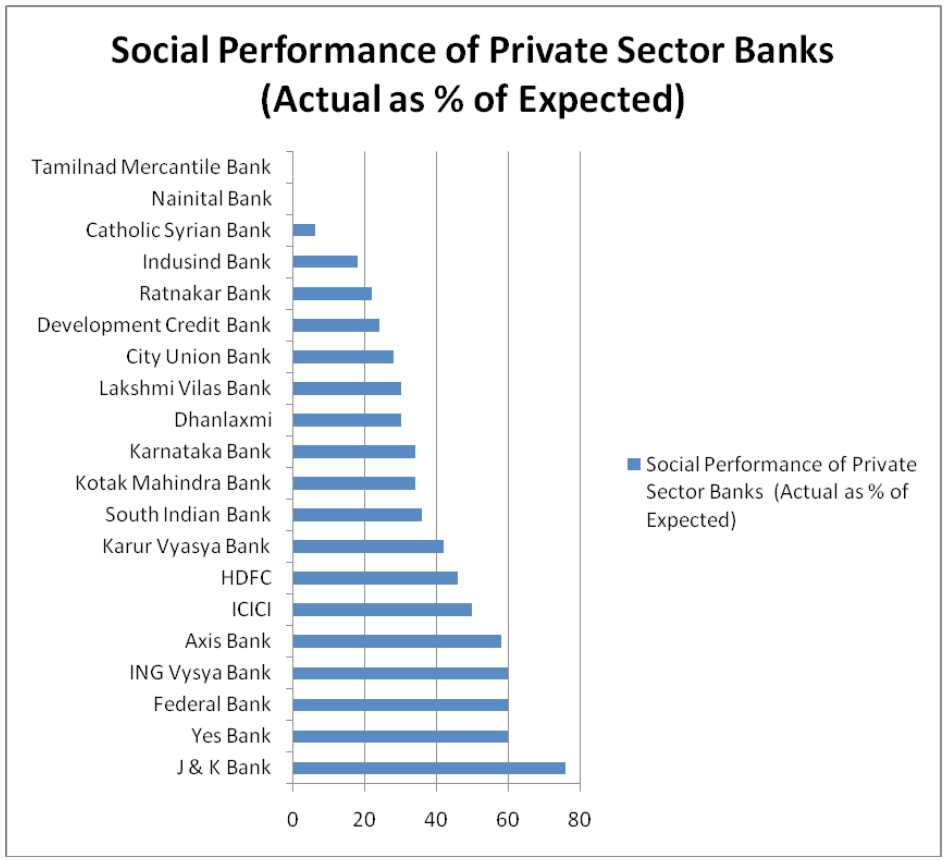

Fig 2: Social Performance of Private Sector Banks

Figure 1 and Figure 2 show that J & K Bank (76%) got the first position with the highest CSR score while Yes Bank, Federal Bank and ING Vysya (60%) got second and Axis Bank (58%) got the third position from all the private and public sector banks in India. It means all the first three positions in case of social performance

are achieved by private sector banks of India. The range of social performance in case of public sector banks varies from 54% to 14% while in case of private sector banks, it varies from 70% to 0% indicating that there is huge diversity in the social performance of private sector banks as compared to public sector banks. Tamilnad Mercantile Bank and Nainital Bank have not taken any social initiatives. Thus although the social performance of private sector banks is more than public sector banks but all the public sector banks contribute towards social work unlike private sector banks. This may be due to the reason that public sector banks are expected to be more responsible towards society rather than private sector banks which are established with the motive of profit making.

Table 2: Group Statistics

	Banks	N	Mean	Std. Deviation	Std. Error Mean
CSR Scores	Public Sector Banks	21	18.5714	5.53689	1.20825
	Private Sector Banks	20	17.8500	10.53952	2.35671

Table 3: Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means				
		F	Sig.	t	d.f.	Sig. (2-tailed)	Mean Difference	Std. Error Difference
CSR Scores	Equal Variances Assumed	7.283	.010	.276	39	.784	.72143	2.61104
	Equal variances not assumed			.272	28.435	.787	.72143	2.64838

Results of Levene's test for equality of variances in table 3 depict that null hypothesis for equal variances assumed is rejected and hence there are not equal variances of CSR scores in case of private and public sector banks. Table 3 reveals that there is no significant difference in the average CSR scores of public and private sector banks of India which prove that social performance of both the sectors is same, (18.57±5.54σ, 17.85±10.54σ), t(39)=.272, p =.787.

Conclusion

The study concludes that the social performance of Indian Private and Public Sector banks is far from satisfactory as the actual performance of Indian banks is just 35% to 38% of the expected which shows that overall Banking Sector of India is not paying much attention on discharging their social obligations although a well defined CSR framework has been suggested under Companies Act, 2013 and it has become a mandate for the corporate sector. It has also been observed that private sector banks of India are making more efforts towards their social goals as compared to public sector banks even though the average social performance of both the sectors do not show much of the difference. This may be because CSR has become a major component to attract the customers and a tool for marketing in the present business scenario. Eradication of extreme hunger and poverty and rural development are the priority areas among the various CSR initiatives in Indian banking sector.

The Association between Type 2 Diabetes Mellitus and Quality of Life among Workers at Textile Industry

Sumardiyono[1,2], Hartono[3], Ari Probandari[2], Prabang Setyono[4]

[1]Doctoral Student of Environmental Science, Graduate School, [2]Department of Public Health, Faculty of Medicine, [3]Department of Physiology, Faculty of Medicine, [4]Department of Biology, Faculty of Mathematics and Natural Sciences, Universitas Sebelas Maret, Surakarta, Indonesia

Abstract

Background: A good quality of life(QoL) is necessary for fitness and to achieve high work productivity. Workers' quality of life is determined by several factors, including type-2 diabetes mellitus(T2DM). This study aims to examine the association between T2DM and workers' quality of life exposed to high noise level.

Method: This was a cross-sectional study conducted on textile workers in Surakarta. Data from 200 workers were collected. T2DM diagnosis was measured by HbA1c test. Quality of Life (QoL) was determined by 36 item short form survey (SF-36). Statistical analyses was conducted using Spearman's rank correlation coefficients.

Results: This study found a significant association between T2DM with quality of life in textile workers ($p<0.05$). Workers with T2DM had lower quality of life compared to those without T2DM. Quality of life dimension that were directly associated with T2DM were physical function, physical role, pain, general condition, vitality, social function, emotional role, and mental health.

Conclusion: T2DM was associated with reduced quality of life in textile workers.

Keywords: *Type 2 diabetes mellitus, quality of life, textile industry.*

Introduction

Industrial workers, including in textile industry, are often exposed to hazardous condition that can influenced their health. In textile industry, workers are exposed to several risk factor i.e. noise, manual handling, hazardous chemical and machine[1]. Chronic exposure to noise above the permissible exposure limit can affect workers health[2]. Previous studies have shown that noise above 80 dB can increase cortisol level[3], which is associated with type-2 diabetes mellitus(T2DM)[4]. T2DM is a major public health concern with the International Diabetes Foundation (IDF) reported that over 387 million people worldwide live with this condition[5]. In Indonesia, the prevalence of diabetes mellitus(DM) among people 15 years old and above are approximately 6.9% [6]. Diabetes mellitus and other chronic diseases contributed to over 40 million deaths each year globally[7].

Diabetes mellitus is closely associated with quality of life (QoL), which can be measured by four components: physical, psychological, social, and environmental[8]. Previous studies showedthat older people and diabetes mellitus patients had lower quality of life[9].Lu et al. found that quality of life is associated with general health condition[10]. Patients with uncontrolled diabetes mellitus have lower QoL score compared to patients with controlled diabetes mellitus[11], with relatively bad quality of life[12].

Previous studies examining the association between diabetes mellitus and quality of life focused on diabetes mellitus in general. Therefore, they provided limited understanding on the different types of diabetes mellitus. This study aims to examine more specifically the association of T2DM measured by HbA1c level on quality of life, of textile workers who are exposed to noise.

Material and Method

This was a cross-sectional study conducted in a textile industry in Surakarta, Central Java, Indonesia. Data was collected on May 2018 with purposive random sampling. Inclusion criteria includes: at least one year experience in textile industry, 20-55 years old, and was not taking any medication to reduce blood glucose level. Sample size was calculated using the correlated samples formula (Hulley et al, 2013, with $Z_{\alpha(5\%)} = 1.96$, $Z_{\beta(20\%)} = 0.84$, r value from pilot survey =0.166. Using the formula $n = [(Z_\alpha+Z_\beta)/C]^2 + 3$,and calculated through theonline software from Clinical & Translational Science Institute[13], the required sample was 284 workers.

Noise level was measured using sound level meter. Demographic characteristics were obtained through validated questionnaire. Quality of life were measured using Short-Form Health Survey (SF-36). Anthropometric tools (SZ-200 scale to measure height and BR-9807 scale to measure weight) were used to obtain height and weight. HbA1c was measured using *High Performance Liquid Chromatography (HPLC) method*. Statistical analyses were conducted using *Spearman's rank correlation coefficient* and*Chi Square Test*s with SPPS version 23. This study was approved by the Health Research Ethics committee at Faculty of Medicine, Universitas Sebelas Maret, with ethical clearance number 62/UN27.6/KEPK/2018, protocol number: 01/18/04/058.

Findings: The study setting was a textile factory that used cotton and rayon thread to produce grey cloth. There were three eight hour shifts i.e. morning, afternoon, night. The machine, the main cause of the noise,was used continuously, with one hour break for each shift. The noise measurements in the working area were relatively high, ranging from 93-104 dBA. Approximately 84 (29.6%) workers that could be classified as having diabetes (HbA1c > 6.5%), 67 (23.6%) as having pre-diabetes (HbA1c between 5.7-6.4%),and 133 workers (46.8%) as normal (HbA1c < 5.7%).

The quality of life were classified based on Ware et al category, as follow: perfect (score 100), very good (score 84 through <100), good (score 61 through 84), fair (score 25 through <61), poor (score 0 through <25). For this study, the quality of life measurements were classified into two category: good (score >= 61) and poor (score <61) [14]. From 284 respondents, there were 115 (40.5%) who were categorized as having good quality of life, and 169 (59.5) were categorized as having poor quality of life.

Table 1. The association between Type 2 Diabetes Mellitus and Quality of Life (n=284)

Independent Variabel	Mean (SD)	Dependent Variable	Mean (SD)	r	p
		Quality of life	67.71±12.84	-0.708	0.000*
		Physical Functioning	75.00±17.97	-0.415	0.000*
		Role-Physical	65.58±28.69	-0.547	0.000*
		Bodily Pain	62.45±17.04	-0.464	0.000*
HbA1c (%)	6.35±1.90	General Health	72.44±12.12	-0.416	0.000*
		Vitality	64.73±16.88	-0.478	0.000*
		Social Functioning	71.30±16.23	-0.339	0.000*
		Role-Emotional	67.74±29.64	-0.465	0.000*
		Mental Health	68.42±17.58	-0.458	0.000*

* are significant at $p < 0.05$ (2-tailed)

Table 1 showed that increased HbA1C level can lower the quality of life score in noise-exposed textile workers. Table 2 showed the results contingency coefficient tests which were used to examine the magnitude of T2DM effect on workers' quality of life.

Table 2. The association between T2DM on quality of life (n=284)

HbA1c	Quality of life			X^2	p	C
	Poor n (%)	Good n (%)	Total n (%)			
Diabetes	47 (56.0)	37 (44.0)	84 (100)	10.915	0.004	0.192
Pre diabetes	22 (32.8)	45 (67.2)	67 (100)			
Normal	48 (36.1)	85 (63.9)	133 (100)			

*significant at $p < 0.05$ (2-tailed)

Table 2 showed that T2DM were associated with workers quality of life score. The HbA1c level influenced 19.2% of the quality of life reduction. Other factors combined influenced 80.8% of quality of life score. These other factors might include sex, body mass index, age, and work duration. Table 3 demonstrated the association between these demographic characteristics with quality of life.

Table 3. The association between demographic characteristics on quality of life (n=284)

Characteristics	Quality of life (%)						X^2	p	OR (95%CI
	Poor		Good		Total				
	n	%	N	%	N	%			
Sex									
Male	26	42.6	35	57.4	61	100	0.146	0.702	1.1
Female	89	39.9	134	60.1	223	100			(0,630 – 1,985)
Body Mass Indeks (BMI)									
> 25 kg/m^2	54	44.3	68	55.7	122	100	1.261	0.261	1.315
≤ 25 kg/m^2	61	37.7	101	62.3	162	100			(0.815 – 2.121)
Age									
> 43 years old	64	47.4	71	52.6	135	100	5.105	0.024*	1.7
≤ 43 years old	51	34.2	98	65.8	149	100			(1.074 – 2.794)
Work duration									
> 18 years	60	42.9	80	57.1	140	100	0.640	0.424	1.2
≤ 18 years	55	38.2	89	61.8	144	100			(0.755 – 1.950)

*significant at $p < 0.05$ (2-tailed)

Table 3 showed certain demographic characteristics can reduce quality of life, although the association was only significant for age ($p < 0.05$). Meanwhile, other characteristics showed non-significant association with quality of life ($p > 0.05$). Based on findings on table 2 and 3, we can infer that quality of life in this study was associated with both HbA1c and age.

Noise exposure can influence the auditory and non-auditory system. These influence can happened both acutely and chronically[2]. With the increasing industrialization and urbanization, noise pollution become one important factor in environmental health. Sorensen M. *et al*., based on their 10 years longitudinal epidemiological study, stated that every 10 dB increase in noise exposure from road traffic, could significantly increase the risk for diabetes mellitus by 11%. Furthermore, there would be approximately 14% increase in the risk for diabetes mellitus, if the exposure to road traffic happened for more than 5 years[15].

In occupational health, it has been well established that noise exposure is associated with work-related stress. The presence of stress can be identified by the increasing level of cortisone hormone[16]. This psychological stress can further increase the risk of type 2 diabetes mellitus[17]. Consistently, Zare Sakhvidi et al. also stated increasing risk of type 2 diabetes mellitus due to noise exposure from road traffic that happened in 6% of exposed population. Another study also showed that noise exposure from road traffic increase the risk of diabetes mellitus by 1.17 times, and increasing the

risk of type 2 diabetes by 1.07 times[18]. These findings consistently showed that noise exposure increase the risk of type 2 diabetes mellitus. The findings from these study as well as the findings from our study suggest the association between noise exposure, T2DM, and quality of life.

In this current study, increasing HbA1c level significantly reduce quality of life in textile workers who were exposed to noise above the permissible exposure level (PEL) The association between the HbA1c level and quality of life were observed both when quality of life was assessed in general, or when assessed based on its components i.e. physicalfunctioning, role-physical, bodily pain, general health, vitality, social functioning, role-emotional, andmental health.

Our findings were consistent with studies by Brown et al., which reported the association between diabetes mellitus and quality of life in elderly. On average, elderly with diabetes mellitus scored lower on the quality of life measurement compared to elderly without diabetes mellitus. Furthermore, elderly patients without insulin therapy were more likely to have poor quality of life compared to elderly patients receiving insulin therapy or 14 days[19]. Schunk et al. stated that patients with type 2 diabetes mellitus had poorer quality of life compared to people without diabetes mellitus, on physical dimension. However, on mental health dimension, the poorer quality of life in diabetic patients only happened in women[20]. Bourdel-Marchasson et al. also stated that diabetes mellitus patients with HbA1c level of 8.1–10.0% had lower quality of life on mental health dimension [21]. Another study by da Mata et al. also stated that type 2 diabetes mellitus patients had an average of 65.8% quality of life score which was significantly lower compared to people without the diagnosis. Furthermore, in patients with type 1 and 2 diabetes mellitus, men were generally had better quality of life compared to women[22].

The findings from our study corroborate our hypothesis on the association between T2D Mdiagnosis, indicated by level of HbA1c $\geq$ 6.5%, with the quality of life of the workers in textile industry who were continuously exposed to noise exposure above the PEL. In our study, there was no significant association between sex and the quality of life of the workers exposed to noise. This is slightly different from the study conducted by Rwegerera *et al.*, that found significant differences in the quality of life between men and women, particulalry in physical dimension. Women had signifcantly poorer quality of life in the physical dimension compared to men. However, there were no significant differences in the mental health dimension between men and women[23].

In this study, age was significantly associated with the textile workers' quality of life. Our finding corroborate previous studies that found the association between age and quality of life. Netuveli & Blane, stated that older age, adaptation, and physical fitness were important factors for quality of life[24]. However, Rwegerera *et al.*, found that the association between age and quality of life differed by the quality of life dimension that was examined. In elderly (age 65 years old and older), there were sognificant decrease in the physical dimension of quality of life. However, there was no statistically significant decrease in the mental health dimension of quality of life[23].

Our study found no significant association between body mass index (BMI) and quality of life in noise-exposed textile workers. This finding was consistent with previous study by Rwegerera *et al.*, that found no significant association between obesity and quality of life, either in the physical and mental dimension[23]. In contrast, Xu et al., found that there was nonlinear statistically significant association between BMI and quality of life[25]. We found no significant association between quality of life and the working duration of the noise-exposed textile workers. To our knowledge, there were limited studies that have examined the association between textile workers' working duration and quality of life.

Conclusion

Workers with type 2 diabetes mellitus had significantly poorer quality of life compared to workers without type 2 diabetes mellitus. In addition, elderly also had poorer quality of life compared to younger people.

Conflict of Interest: We declare no conflict of interest in this study.

Acknowledgments: We thank the Ministry of Research, Technology, and Higher Education; and the Institutes of Research and Community Service of Universitas Sebelas Maret that fund this study. We also thank the director of the textile industry as well as workers involved in this study.

Development and Standardize the Radiation Awareness Tool for Medical Practitioner in Indian

Suresh Sukumar

Associate professor,Department of Medical Imaging Technology, SOAHS, MAHE, Manipal

Abstract

Background: Radiological examination play an important role in the decision making process for clinical management. However, the application of radiology services is not fully justified, indeed there is extensive literature supporting the notion that a large number of unnecessary and inappropriate diagnostic imaging examinations are requested instead. There is also little or no understanding by medical practitioners on radiation hygiene, or on which imaging test is appropriate in order to provide the greatest sensitivity and specificity for a specific condition.

Method: A combination of both qualitative and quantitative method was used to carry out to develop and standardize the radiation perception tools for medical practitioners in India. Data was analyzed using the SPSS 15 where descriptive, Frequency analysis, Cronbach's Alpha coefficient and Exploratory Factor analysis were used to standardize the tool.

Results: The content validity, pilot test, factor loading and internal consistency reliability of the final forty-one items which measuring the Medical Practitioner's perception on radiology examination were found to be highly adequate.

Conclusions: In conclusion, a valid scale has been developed to evaluate the patient and Medical Practitioner's perception on radiology examination. This scale is the first instrument of its kind to assess the perception on radiology examination.

Keywords: *Standardization, Validity, Reliability, Medical Practitioner, Radiation.*

Introduction

The use of imaging has increased dramatically in recent years and modalities such as multi-detector computed tomography (MDCT) has been used often. The MDCT scanners with helical imaging have enhanced diagnostic capabilities and substantially reduced scanning times, making computed tomography (CT) both patient-friendly and the physician's preferred tool. In developed countries, the increase of CT usage has raised from 2% to 9% in the span of fourteen years. Of this 5 – 11% of them are pediatric population is of major concerned[1].

Radiation dose reduction in pediatric radiology deserves special attention since it is assumed that children are more sensitive to radiation than adults[2]. Radiation dose reduction can be achieved by justification and optimization[3]. Of which Justification of radiology examination can only be achieved with proper communication between patients, radiologist and requesting physicians[4][5].As per the International Commission on Radiological Protection guideline, patient who are undergoing the radiology examination have to get the information about the benefit, risk and radiation dose imparted during the radiology examination[6]. But actual practice is that the physicians

who prescribe the radiology examination give less or no information about the radiology examination to the patient[7].

Recent research shows poor knowledge of referred medical practitioners about radiation dose, exposure unit and age related radio-sensitivity involved in the Radiology examination [8]. In Indian scenario no similar study has been reported. The aim of this work was to develop and standardize a valid and reliable tool to measure the perception of radiation awareness among the practitioners in Indian scenario.

Aim: To Development and standardize the radiation awareness tool for Medical Practitioner in Indian

Methodology: The study protocol was approved by Institutional Ethical Committee and following methodologies were employed to achieve the aim of the study.

Items generation of the scale: The items was constructed based on 5 point Likert scale using systematic literature review and conceptual framework. The scoring criteria for the scales was formed to represent the perception of the medical practitioners on Radiology examination on a 5 - point scale ranging from 0 to 4, where 0 is strongly disagree and 4 is strongly agree.

Content validation of the scale: The content validation of the items was performed by the experts in the field Radiology. The fifteen experts identified were given an information explaining the purpose of the study along with the consent form. The validation of the questionnaire was based on usefulness, appropriateness, and relevance of the items in the different sections of the preform. Percentage level of agreement between experts was used to evaluate the content validity of items. The criteria to include the items and domains were fixed at 80%. Descriptive statistics was used to summarize the demographic characteristics of experts and the agreement of experts for each item in the scale was reported in percentages.

Factor loading of the scale: The participant identified for the study were screened for the inclusion and exclusion criteria and informed consent was obtained. The scale was administered on the participant respectively by the interview. The tester provided adequate explanation and ensured that all the items in the scale were scored. To establishing construct validity of the medical practitioner's tool, the sample size was calculated based on ten samples per items in the tool [9]. A total of five hundred and thirty samples data were collected. The exploratory factor analysis was used to determine the domains and the items loaded with a factor value >0.4 was included. Cronbach's Alpha coefficient ≥ 0.7 was used to analyze the internal consistency of all the items.

Result

Generation of domains from literature: Based on the systemic literature reviews (table 1) and conceptual framework formed through the Qualitative interview, fifty five items were generated for the medical practitioners. Literature search articles were scrutinized to identify the articles consisting of scales and questionnaire which measure medical practitioner's perception toward the radiology examination.

Table 1: Summary of the studies in the systematic review

Year	Countries	Study sample	MRI and ionizing radiation	USG and ionizing radiation	Positive influence of course	Knowledge of radiation hazards
2003 (11)	South Wales and Oxford	130	92% recognize	95 recognize		
2004 (12)	Hospital, Plymouth, UK	240	71.6 recognize	90.4 recognize		
2007 (13)	Turkish	156	27.4% failed	4% failed		
2007 (14)	Dublin, Ireland	269	25 failed			
2008 (15)	USA				yes	
2010 (16)	Bergen, Norway	200	44% failed	45% failed		
2010 (17)	Norway	213	10.5 failed	4.8% failed		
2011 (18)	Hong Kong	133	65% recognize	100 % recognize		
2011 (19)	Hong Kong	80	15 % failed	5%failed		93% not discussed

Year	Countries	Study sample	MRI and ionizing radiation	USG and ionizing radiation	Positive influence of course	Knowledge of radiation hazards
2012 (20))	Germany	811	80.0% recognize	90.5% recognize		
2012 (8)	28 countries	728				15.3% Had discussed
2013 (21)	Europe	124	21.7% failed	66.1% recognize		
2013 (22)	Australia	608	2.8% failed	1.8%failed		
2013 (23)					yes	
2013 (24)		403			yes	
2014 (25)	Sub-Saharan African Country, Cameroon	151	41.1% failed	2.6% failed		42.4% Had discussed
2014 (26)	Turkey	300	86 %recognize	92.7% recognize		

The scoring criteria for all the items under the Medical Practitioners scale are given in the table 2.

Table 2: Scoring criteria for medical practitioners perception on Radiology examination

Score	Percentage of perception	Criteria
0	0	Very poor perception on radiation and its hazards used in radiology examination
1	1-25	Poor perception on radiation and its hazards used in radiology examination
2	26-50	Neutral perception on radiation and its hazards used in radiology examination with our clarity
3	51-75	Good perception on radiation and its hazards used in radiology examination
4	76-100	Very good perception on radiation and its hazards used in radiology examination

Content Validity: After grouping, the items were subjected to content validation by the experts in the field of health professions who were radiologist, radiation safety officer and medical practitioners who prescribe the radiology examination..

The mean age of the expert group was 35.40 ±5.52 years and the mean experience was 8.40 ±5.20 years.

In our study, twenty-seven items had 100% agreement, thirteen items had 90% agreement and thirteen items had 80% agreement between experts. Hence fifty-three items which had 80% or more agreement were considered relevant and included. The three items which had less than 80% agreement between experts were eliminated. The item excluded in the study lacks clarity and difficulty in assessing or scoring such attributes in the medical practitioner's population. These suggestions were considered while drafting the scale.

Exploratory Factor Analysis: The social demographic profile of the medical practitioners (N = 535) revealed that 64.7% of the medical practitioners are males and 35.3% are females (Table - 4.25 1). Among the participant 45.4% are MBBS intern, 16.6% participant are BDS intern 37.9% participant are MD postgraduate and above. We had calculated the EFA from the sample of 535 subjects which result in five factors and the scree plot of Exploratory Factor Analysis for medical practitioners as shown in figure 1.

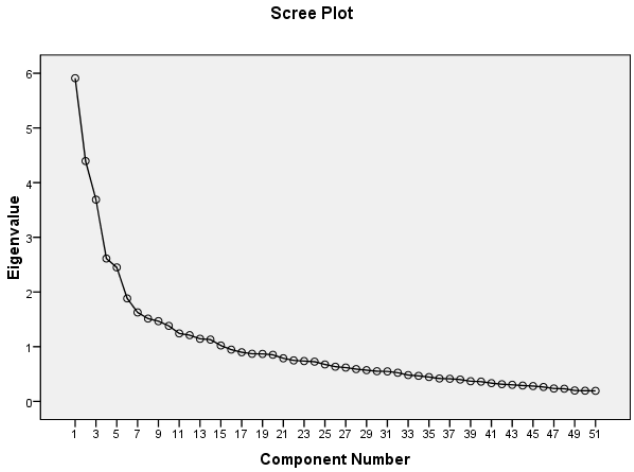

Figure 1: Scree plot of Exploratory Factor Analysis for medical practitioners

Grouping of items under domains

The outcome of the Exploratory Factor Analysis resulted in five domains. Based on Exploratory Factor

Analysis result, the items were grouped under the specified domains as per the relevance. While grouping, explanations were sought from the experts when there was an ambiguity. This procedure resulted in fit of 41 items under the five domains.

Discussion

When developing a new instrument, focus needs to be given to have a clear conceptualization of the target construct. Thus without established content validity, users cannot be confident that variance in obtained scores is due to latent construct[10]. Expert panel method, which is the most commonly used and convincing approach[11]for determining content validity. The expert pool consisted of members from diverse specialty which enabled us to identify the relevant items and domains suitable for the medical practitioner's perception about the radiology examination. The experience of experts, which is an important prerequisite for the content validation, has been the added strength of our method. Thus, the expert analysis helped us in refining the domain and item.

Exploratory factor analysis is a useful analytic method that can determine, in a way that reliability coefficients cannot, empirically, how many constructs, or latent variables, or factors underlie a set of items[12] [10]. Currently there are no similar studies which describe scale ratings for the perception of Radiology examination among the medical practitioners.

The Cronbach's Alpha of 0.781 in the new scale for the medical practitioners respectively suggests that, all the items were to the construct and hence capable of measuring the perception of radiology examination. This suggests that items in the subscale or domains were adequately grouped in the new scale and possesses good internal consistency[13].

In conclusion, a valid scale has been developed to evaluate the medical practitioner's perception on radiology examination.This scale is the foremost instrument of its kind to assess the medical practitioner perception on radiology examination. The scale is adequately responsive to test the effect of intervention and possess strong internal consistency

Conflict of Interest: There is no conflict of interest

Influence of Cognition on the Motor Skills of Preterm Infants

A. Rajarajeswari[1], P. Ramachandran[2], L.N. Padmasani[2], Sailakshmi Ganesan[3]

[1]Associate Professor, Faculty of Physiotherapy, [2]Professor, Department of Paediatric Medicine, Sri Ramachandra Institute of Higher Education & Research, Porur, [3]Head of Department, Department of Physiotherapy, Spastic Society of Tamil Nadu, Taramani, Chennai-600116, Tamil Nadu

Abstract

Background: According to WHO preterm is defined as babies who were delivered prior to the completion of 37 weeks which accounts for 23.6% of worlds birth. The neuro developmental growth of preterm infants constitutes 88.8% of cognitive disability and 84.4% of motor disability. To understand an infant, motor aspects together with cognition should be considered and emerging trends should focus on these priorities. If not focused the brain will go for "use it or lose it" principle. Relationship between cognitive and motor skills ranges from weak to strong in different age groups but still the extensibility of the relationship is not established.

Aim: To study the influence of cognition on the motor skills of preterm infants.

Methodology: Preterm infants around 4 months of age of both genders who come under inclusion criteria were taken to the study. Prior informed consent was obtained from the parents. Infants were screened using Bayleys scale of infant development for cognition and motor skills.

Results: The analysis of this study concludes that cognition and motor skills are affected in pre term infants.

Conclusion: So the cognition and motor skills goes hand in hand majority of the times and cognition is influencing the motor skills of preterm infants. Addressing the cognitive exercises and imparting the same to the infants will help to provide basic knowledge of the exercises and provide a better platform to work on the outcomes through rehabilitation.

Keywords: *Cognition, preterm infants, gross motor function, fine motor function.*

Introduction

According to WHO preterm is defined as babies who were delivered prior to the completion of 37 weeks which accounts for 23.6% of worlds birth.

The neurodevelopmental growth of preterm infants constitutes 88.8% of cognitive disability and 84.4% of motor disability. The development of preterm infants differs widely than term infants and the these infants are at risk of developing neuro sensory, intellectual and behavioural disabilities[1].

Research suggests maximum synaptic density at 1-2 years of life. Increased production of the above leads to adaptation, leading to better recovery. Also the first stage of psychosocial development occurs between birth and one year of age,which gets disrupted when infant born preterm[2].

Recovery of preterm infants depends on plasticity which refers to good prognosis and vulnerability referring to poor outcomes. The immature brain lacks to do skills resulting in slow recovery[3,4].

Cognitive and motor impairments are the major sequelae, in which innate ability of understanding environment constitutes higher order complex

Corresponding Author:

Associate Professor, Faculty of Physiotherapy,
Sri Ramachandra Institute of Higher Education & Research, Porur, Chennai-600116, Tamil Nadu, India
e-mail: araji21@yahoo.com

skills(cognition),and ability to interact with environment constitutes simple lower order skills (Motor)[5,6].

Even though the chronological growth of infants are fine, as infant ages, the demands placed by the environment on them increases resulting in inability to manage the environment leading to deficits[7].

An infant with deficits is often assessed for motor outcomes predominantly than cognition, that is often ignored. To understand an infant, motor aspects together with cognition should be considered and emerging trends should focus on these priorities. If not focused the brain will go for "use it or lose it" principle. Relationship between cognitive and motor skills ranges from weak to strong in different age groups but still the extensibility of the relationship is not established[8].

If studied, in turn helps to identify the

a. emerging problems in absence of impairment
b. to find catch up over time during delayed development
c. to find out the stages of recovery.

Also double hazard, the problems with neural processes and environmental factors affecting the infants recovery can be ruled out. Some factors affecting the relationship include gender (ie female brain has large dendritic volumes than males)and birth weight[9]. But the motor learning of preterm infants are not clearly understood and predictable conclusions are not met.

This study aims to find out the relationship between cognition and motor skills and its extensibility of relationship.

Material and Method

Aim of the study: To study the influence of cognition on the motor skills of preterm infants.

Objectives:

To find out

1. Cognitive involvement in preterm infants.
2. Motor involvement in preterm infants.
3. The relationship between the cognitive and motor impairments in preterm infants.

Methodology: Study Setting: Sri Ramachandra Medical center and hospital

Study Design: Cross sectional Study

Sample Size: 32 preterm infants around 4 months of age.

Sampling: convenient sampling.

Inclusion Criteria:

- Preterm infants around 4 months of age
- Both Genders

Exclusion Criteria :

- Congenital anomalies
- Un cooperative infants.

Procedure: Data collection was initiated following the approval of Institutional Ethical Committee. Preterm infants around 4 months of age of both genders who come under inclusion criteria were taken to the study. Prior informed consent was obtained from the parents. Infants were screened using Bayleys scale of infant development for cognition and motor skills.

Cognition was checked and the infant should obtain the score of 1 for first three consecutive items at the the start point of any age to go forward. If the infant obtains a score of zero on any of the first three items, then the starting point of previous age is went and those items were administered. If the infant obtains a score of zero then administration was stopped.

Findings:

Table 1: Gross motor function distribution

Grossmotor			
		Frequency	Percent
Valid	Below Average	13	40.6
	Average	17	53.1
	Superior	2	6.3
	Total	32	100.0

	Average	11	34.4
	Total	32	100.0

Table: 4 Correlation between cognition, gross motor and fine motor skills

Correlations					
			Grossmotor	**Finemotor**	**Cognition**
Spearman's rho	Grossmotor	Correlation Coefficient	1.000	.684**	.718**
		Sig. (2-tailed)		.000	.000
		N	32	32	32
	Finemotor	Correlation Coefficient	.684**	1.000	.763**
		Sig. (2-tailed)	.000		.000
		N	32	32	32
	Cognition	Correlation Coefficient	.718**	.763**	1.000
		Sig. (2-tailed)	.000	.000	
		N	32	32	32

**. Correlation is significant at the 0.01 level (2-tailed)., There is a significant correlation between fine motor and cognition e=.763 at, p=.0005<.01, There is a significant positive correlation between gross motor and cognition e=.718 at p = .0005<.01.

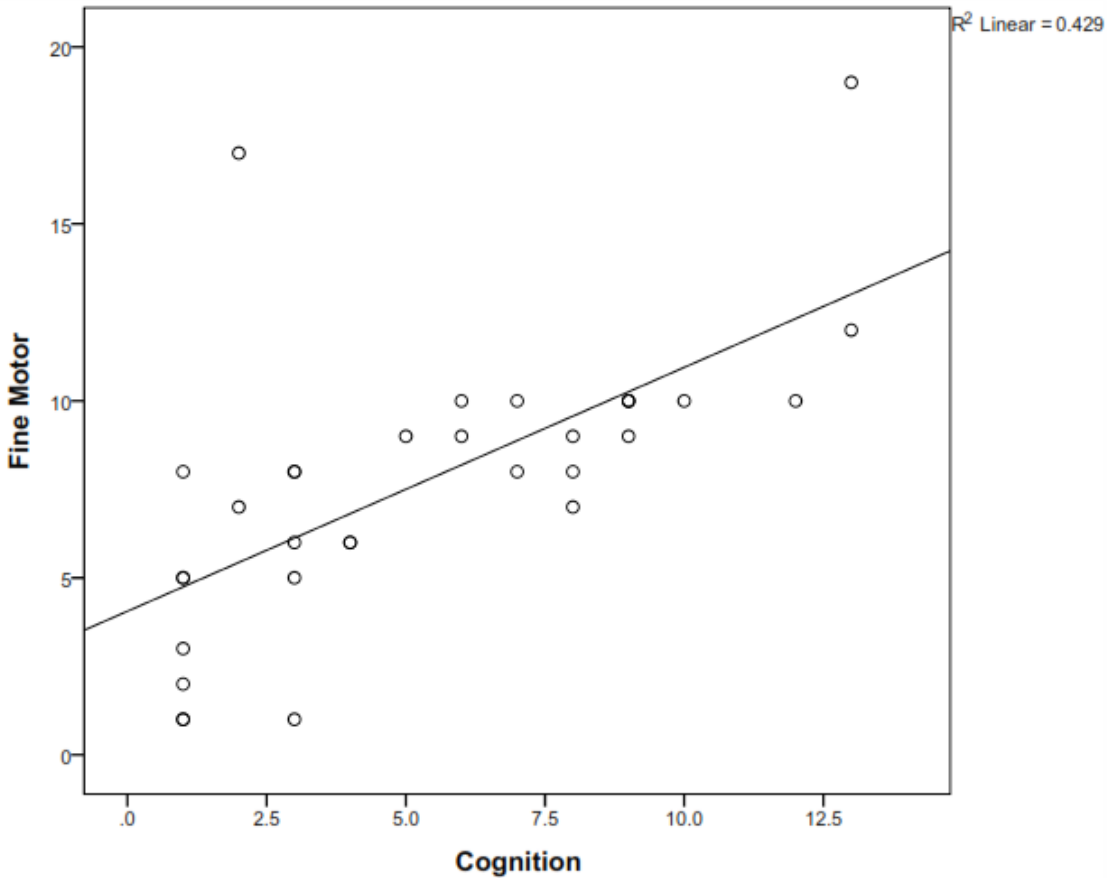

Figure 1: Graphical representation of cognition and fine motor skills

The graph describes when cognition is affected, fine motor is also affected .

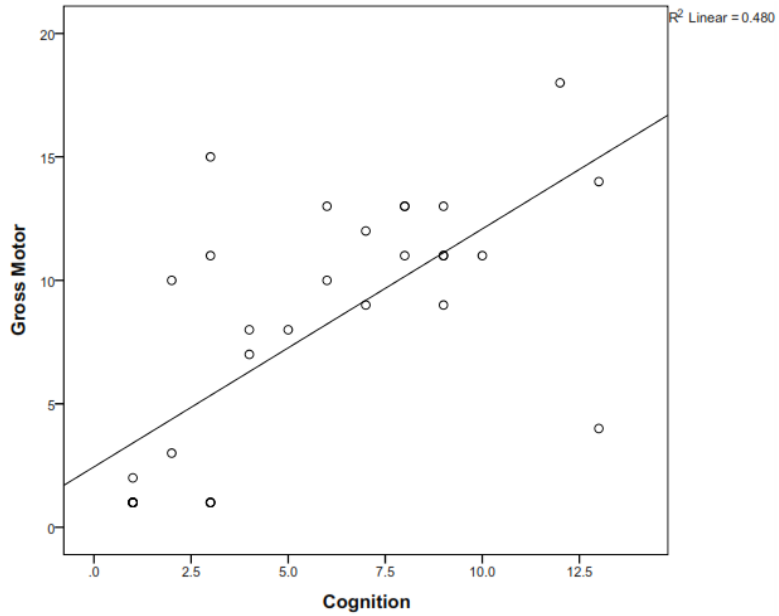

Figure 2: Graphical representation of cognition and gross motor skills

The graph represents cognition and gross motor skills are directly proportional.

Discussion

32 preterm infants with varied birth types were assessed and male and female genders constituted equal percentage in the group. The age of each infant is corrected for comparing the skills.

During the assessment, infants who were considered as normal in spite of preterm was found to have deficits in either cognition, and motor skills.

This implies even though the appropriate growth is fine, minor deficits are present that was not identified by the parents which may impair the performance in later ages.

These 32 preterm infants who came from different educational, socio economic status were kept as "one" so that these variables doesn't affect the assessment outcomes.

In these 32 infants, 40% were late preterm, 43% moderate preterm and 15 % were late preterm.

Bayleys scale[10] analysed the skills in infants and it comprised of raw score, scaled score and composite score. The composite score were used for the association between the skills. From these scores, the results showed there is significant association between the cognitive and motor skills determined by the Pearsons correlation coefficient. Very few studies are concentrating on the relationship of these skills, however were being studied in elder age groups.

The scaled scores were used to analyse the extensibility of relationship between the skills, which concluded that for every cognitive impaired infant, the motor skills were affected which means, for an average cognitive impaired infant, the motor skills are also in an average level most of the times. This also supports the study that if cognition is affected, motor skills are affected either equally or deviated mildly from the result of cognition.

As said ina study, motor disability is associated with Gestational age and cognitive disability is associated with small for gestational age which supports our study on the basis of gestational age . Also by the result from the type of preterm there is no association with the disabilities ie both the impairments are happening irrespective of the type of preterm. The above is supported by Mc Gowas JE, that late pre terms have an advantage in both the skills like terms which also supports that infants performed in the study expressed superior in both the skills even though born late preterm[11]. Study by Stephen

Christine, concludes that SGA contributes to the cognitive impairments[12].

Conclusion

The analysis of this study concludes that cognition and motor skills are affected in pre term infants . So the cognition and motor skills goes hand in hand majority of the times and cognition is influencing the motor skills of preterm infants . Addressing the cognitive exercises and imparting the same to the infants will help to provide basic knowledge of the exercises and provide a better platform to work on the outcomes through rehabilitation.

Assessment of B12 in the Pregnant Women and their Correlation with the Blood Hemoglobin

Dhuha Hasan Al_haidery

Kerbala Maternity Teaching Hospital, Karbala, Iraq

Abstract

Various nutrients such as vitamins, carbohydrates etc. are required during pregnancy. Among different classes of vitamins, Vitamin B12 (cobalamin) is the most important during pregnanacy. Hence, the present study aims to study the correlation between the serum B12 and blood hemoglobin in the pregnant women. This study included 60 pregnant women enrolled in Kerbala maternity teaching hospitalin January 2019 to April 2019. The pregnant women with 23rd to 25thgestational week were included in the present study. Fasting blood was collected and analysed for Vitamin B12 levels. The parameters like child birth weight, type of delivery and duration of pregnancy was recorded. Some social, demographic characteristics such as monthly income, education level, marital status, previous number of pregnancies etc. were also recorded. Average weeks of child delivery were found to be about 35.72 and 38.10 weeks in women with vitamin B 12 supplementation and healthy women, respectively. The vitamin B12 content was significantly lower (234.0±52.23 pg/ml) in the B12 deficient group as compared to healthy control (495.8±42.09 pg/ml). The blood hemoglobin levels was significantly lower (11.07±0.94 g/dl) in the B12 deficient group as compared to healthy control (14.38±0.58 g/dl). The vitamin B12 deficiency was associated anaemic condition in the mother which inturn affect the birth weight of the child. The vitamin B12 level should be monitored before planning of pregnancy.

Keyword: *Vitamin B12, anaemia, birth weight, pregnancy.*

Introduction

Maternal health during gestation has been very serious and imperative for intergenerational health. The genetic regulation of fetal growth is influenced by the intra-uterine environment in which the fetus grows[1,2]. Nutrients and oxygen supply from the mother is a one of the factors for fetus good healthy and survive[3]. This supply depends on the mother body size, nutritional status, body composition and metabolism. The mentioned parameters are itself being established throughout the mother's own fetal life, childhood and adolescence[3].

Various nutrients such as vitamins, carbohydrates etc. are required during pregnancy[4]. Among different classes of vitamins, Vitamin B12 (commonly known as cyanocobalamin) is the most chemically complex of all the vitamins. The structure of vitamin B12 is based on a corrin ring, which is similar to the porphyrin ring found in heme, chlorophyll, and cytochrome and has two of the pyrrole rings directly bonded[5]. Vitamin B12 is used by the body either as methylcobalamin or 5-deoxyadenosyl cobalamin for DNA methylation and production of hemoglobin which is the substance that carries oxygen in red blood cells[5]. Similarly, hemoglobin is another important parameter in pregnancy. It is a Fe-containing metal protein found in the erythrocytes, and is responsible for O2 transportation in vertebrates[6]. The foremost nutrients responsible in the production of haemoglobin are iron, folic acid, and vitamin B12. Succinyl co- A formed as intermediate from B12 metabolism pathway leads to production of hemoglobin in red blood cells[7]. Vitamin B12 is responsible of RBCs maturation, a deficiency of vitamin B12 and the interruption of this reaction leads to the development of megaloblastic anaemia. Folate deficiency independent of vitamin B12

Corresponding Author:

also causes megaloblastic anaemia[8]. Methylmalonyl CoA mutase converts methylmalonyl CoA to succinyl CoA, with 5-deoxy adenosylcobalamin required as a cofactor.

Foods contain various vitamin B12 compounds with different upper ligands; methylcobalamin and 5-deoxyadenosylcobalamin function, respectively, as coenzymes of methionine synthase (EC 2.1.1.13), which is involved in methionine biosynthesis and of methylmolonyl- CoA mutase (EC 5.4.99.2), which is involved in amino acid and odd-chain fatty acid metabolism in mammalian cells[9-10]. Humans have a complex process for gastrointestinal absorption of dietary vitamin B12[11].

The recommended dietary allowance of vitamin B12 for adults is set at 2.4 μg/day in the United States and Japan; however, daily body loss of the vitamin is estimated to be between 2 and 5 μg/day[12]. Bor et al[13]reported that a daily vitamin B12 intake of 6 μg appears to be sufficient to maintain a steady-state concentration of plasma vitamin B12 and vitamin B12-related metabolic markers.

Vitamin B12 deficiency is usually caused by the malabsorption of vitamin B12 although dietary inadequacy is common in the elderly, vegans or ovo-lacto vegetarians with poor diets. Causes can also relate to inadequate Intrinsic factor production, atrophic gastritis, interference with the ill uptake of vitamin B12 due to disease, resection or interference by bacterial overgrowth, drug-nutrient interactions as well as some less common genetic defects[14].

Decrease levels of Hemoglobin may be owed to a deficit in one or numerous nutrients. The foremost nutrients responsible in the production of haemoglobin are iron, folic acid, and vitamin B12. On a biological level, this deficiency is characterized by a reduction in hemoglobin levels due to a lack of essential nutrients, such as B vitamins, zinc, protein and iron. Hence, the present study aims to study the correlation between the serum B12 and blood hemoglobin in the pregnant women.

Material and Method

Study design: This study included 60 pregnant women enrolled at Kerbala maternity teaching hospitalin January 2019 to April 2019. The pregnant women with 23rd to 25th gestational week were included in the present study. The test was performed at Kerbala maternity teaching hospital.

Fasting blood (n=60) was collected by a single puncture form the Vitamin B12 deficient group (B12D group) and healthy participants after obtaining informed consent. The parameters like child birth weight, type of delivery and duration of pregnancy was recorded. Some socio demographic characteristics such as monthly income, education level, marital status, previous number of pregnancies etc. were also recorded.

Blood collection and biochemical analysis: The fasting blood was collected (2ml) in the plain vacutainers from the veinafter getting participant oral consent. The samples were kept at room temperature for 30min. Followed by the centrifugation at 3000rpm for 15min. The serum was separated and kept at 20°C for further study. Serum vitamin B12 content and blood haemoglobin were estimated by commercially available kits (Sigma, USA).

Statistical analysis: Results were presented as Mean ± Standard Error (SE). Obtained data were subjected to statistical analysis using GraphPad Instat (3.0, Trial Version). The unpaired t-test was done to estimate the statistical significance.

Results

A pregnant women (n=60) attending at Kerbala maternity teaching hospitalfrom January to March 2019 were enrolled in the present study. About 97.41% response rate was observed. The average respondent age was 25.81±2.4 years. About 5 (8.3%), 43 (71.6%) and 12(20%) women were included in the age group of less than 20, 21-30 and 30-40 years, respectively.

Vitamin B12 deficient women showed decreases in the fetus weight: Vitamin B12 deficient women showed significant (p=0.0382) decreased in the fetus weight as compared to the healthy women. The birth weight of the fetus is shown in the Figure 1. This decrease in the fetus birth weight and due to other complications, about 79.21% women underwentthe C-section delivery. While only20.79% normal delivery occurs.

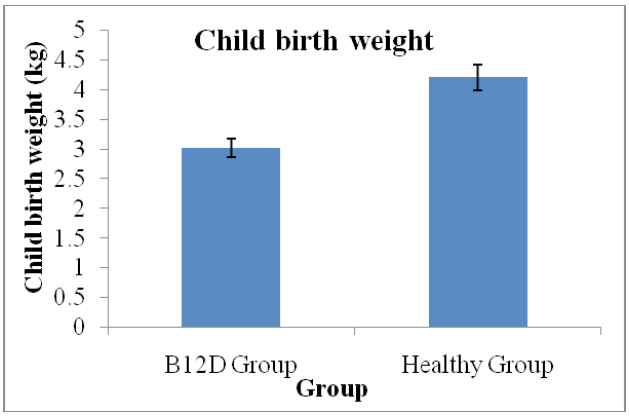

Figure 1: The birth weight of the fetus delivered by B12D group and healthy women

Results are represented as mean±standred error. B12D group showed $p<0.05$ as compared to healthy control (unpaired two-tailed test)

Average weeks of child delivery were found to be about 35.72 and 38.10 weeks in women with vitamin B 12 supplementation and healthy women, respectively. The presence of vitamin B12 deficiency leads to the premature delivery. However, the women are on viamin B12 supplementation, none of the child showed any birth defect. The fetus birth weight is negatively correlated with the presence of vitamin B12deficiency. The vitamin B12 content of enrolled women was depicted in the Figure 2. The vitamin B12 content was significantly lower (234.0±52.23 pg/ml) in the B12 deficient group as compared to healthy control (495.8±42.09 pg/ml).

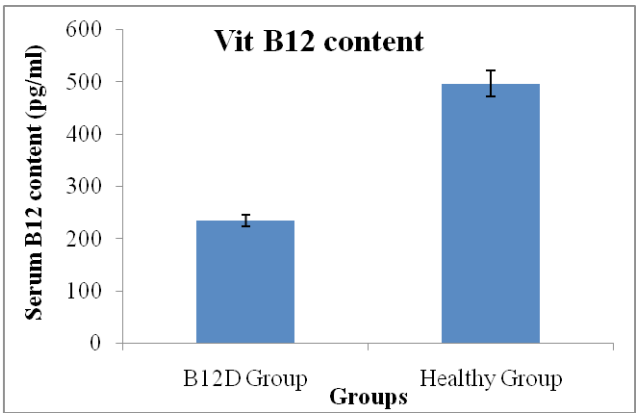

Figure 2: The vitamin B12 content ofB12D group and healthy women

Results are represented as mean±standred error. B12D group showed $p<0.05$ as compared to healthy control (unpaired two-tailed test)

The blood hemoglobin levels was significantly lower (11.07±0.94 g/dl) in the B12 deficient group as compared to healthy control (14.38±0.58 g/dl). The blood hemoglobin levels were depicted in the Figure 3.

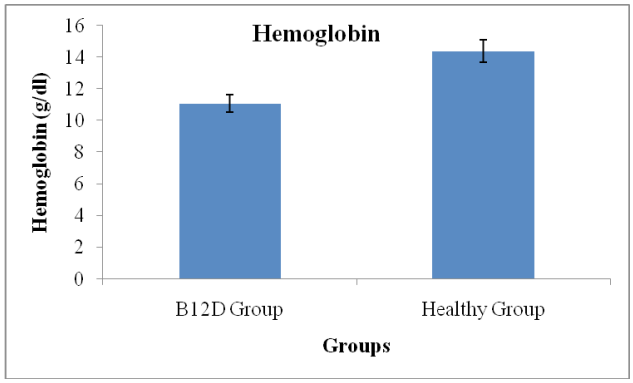

Figure 3: Blood hemoglobin levels ofB12D group and healthy women

Results are represented as mean±standred error. B12D group showed $p<0.05$ as compared to healthy control (unpaired two-tailed test).

The normal Vitamin B12 values are depicted in the Table 1.

Table 1: Normal Vitamin B12 levels in the serum at different stages of pregnancy

Units	Nonpregnant Adult	First Trimester	Second Trimester	Third Trimester
B12 (pg/ml)	279 - 966	118 - 438	130 - 656	99– 526
Hemoglobin (whole blood) (g/dl)	12 -15.8	11.6 - 13.9	9.7 - 14.8	9.5 -15

The details adapted from the Abbassi-Ghanavati et al[15].

A positive correlation was observed between serum vitamin B12 levels and blood hemoglobin content. This, in turn, can be positively correlated with the birth weight.

Discussion

As defined by the WHO, Fe deficiency is the most common nutritional disorder and the leading cause of anaemia in the world[16].Any abnormality in the intra-uterine environment can be detrimental to fetal growth. Failure to supply the adequate amount of nutrients to meet fetal demand, for example, due to maternal malnutrition, inadequate placental function or increased nutritional demand, leads to fetal undernourishment[17-18].

Pernicious anemia is the end stage of an auto-immune gastritis and results in the loss of synthesis of intrinsic factor (IF). It is this loss of IF that causes

vitamin B12 deficiency and if untreated, megaloblastic anaemia and neurological complications develop[19-21]. The process of anemia develops durin pregnancy is well understood. The haemoglobin concentration was fall due to haemodilution during the first and second trimesters of normal pregnancies[22].

Vitamin B12 (B12)-deficiency in pregnancy is most prevalent, and it was found to be associated with preterm birth (length of gestation <37 weeks) and lower birth weight (birth weight <2,500 g)[23].Many reports are published about the correlation of vitamin B12 and low birth weight[23-27]. In the present study, we found that the low birth weight was associated with the vitamin B 12 deficiency. Our study is accordance with these reports. It was also reported that the higher B12 was connected with higher birth weight in low- and middle-income countries, but not in high-income countries[23]. The maternal obesity can be one of the reason for the B12 deficiency in several populations[28-29].

Very few reports are available regarding the correlation between the vitamin B12 and low haemoglobin levels i.e. anaemia[30-31]. A study in the Korean children reported that the inadequate iron and vitamin B12 intake is directly proportional to the growth retardation and anemia[30].

From the above study, we can conclude that the vitamin B12 deficiency was associated anaemic condition in the mother, which inturn affect the birth weight of the child. The vitamin B12 level should be monitored before planning of pregnancy.

Ethical Clearance: The blood was collected from the Karbala maternity teaching hospital after their investigation. Oral consent was taken before enrolled the patients in the study.

Comparison of Coliform, E. Coli, E. Coli O157, and E. Coli O157:H7 Bacteria in Bali Cattle in Mengwi, Bali

Hamong Suharsono[1], Yuli Darmawan[1], Ida BagusNgurah Swacita[1], I. Wayan Suardana[1]

[1]Faculty of Veterinary Medicine, UniversitasUdayana, Bali, Indonesia

Abstract

This study aims to determine the comparison of the number of Coliform, E. coli, E. coli O157, and E. coli O157:H7 bacteria in Bali cattle in Mengwi, Bali. Samples were taken as many as 58 faecal samples, which were further identified through several stages, namely growth on the eosin methylene blue agar media, Gram staining, indole test, methyl red, vogesproskauer, citrate, growth on sorconolMacConkey agar media, serological tests with E. coli O157 latex agglutination test and serological test with E. coli Anti-serum H7. From 58 Bali cattle feces samples taken, 100% were positive for Coliform, 55.1% were positive for E. coli, 6.8% were positive for E. coli O157, and 3.4% were detected as positive for E. coli O157:H7. Spearman's rho analysis results showed that the high Coliform and E. coli bacteria did not significantly affect the discovery of E. coli O157 and E. coli O157:H7 bacteria. The conclusion that can be drawn is that from 58 faecal samples taken, 32 were positive samples of E. coli bacteria, whereas only 2 positive samples contained E. coli O157:H7 bacteria which were harmful to human health.

Keywords: *Foodborne disease, Bali cattle, coliform, E. coli O157:H7, Spearman rho correlation test.*

Introduction

Escherichia coli in cattle grow normally in the intestine because E. coli is a normal flora in the human digestive tract and in warm-blooded animals with the most population in the back of the digestive tract.[1]E. coli bacteria can also endanger health, because it is known that E. coli bacteria are part of the normal digestive tract microbiota and it has been proven that strains certain strains can cause moderate to severe gastroenteritis in humans and animals.[2]

Some strains of E. coli can cause disturbances in the digestive system, namely the strain EPEC (Enteropathogenic Escherichia coli), strain ETEC (Enterotoxigenic Escherichia coli), strain EIEC (Enteroinvasive Escherichia coli), strain EAEC (Entero Aggregative Escherichia coli), strain DAEC (Diffuse Adherent Escherichia coli), and EHEC strain (Enterohemorrhagic Escherichia coli).[3] One strain of EHEC bacteria is E. coli O157 with E. coli O157:H7 serotype, which is a pathogenic bacterium and can cause hemorrhagic colitis and hemolytic uremic syndrome (HUS).[4] Based on the above problems, the study of the comparison of Coliform, E. coli, E. coli O157, and E. coli O157:H7 in Balinese cattle in Mengwiis interesting, in the hope of considering preventive measures or further precautions.

Research Method

Sample: In this study, the sample used was Bali cow feces that were taken randomly and proportionally from cattle that were in Mengwi. Criteria for Bali cattle whose feces may be used as research samples are cattle of all ages and originating from both female and male Bali cattle. Fresh fecal samples taken were then placed in a sample pot and carried with a thermos filled with ice to carry out an initial laboratory analysis in the laboratory of Biology and Biotechnology at Udayana University. Based on the estimated prevalence of disease events of 2.5% and 5% error, the number of samples needed for the 95% confidence level is a minimum of 39 samples, calculated by the formula according to Martin et al. (1987) which is 4PQ/L2. The number of samples taken in the study was 58 samples.

Phase Isolation and Identification of Samples: Stool samples were diluted first with buffered peptone water (BPW) 0.1% to a dilution level of 10-3 before growing on solid and liquid media (broth) so that after incubation a number of bacteria can be calculated.

EMBA Media: 15 ml eosin methylene blue agar (EMBA) media was put into each petri dish for sterilization by autoclaving at 121 °C for 15 minutes. After sterilization, the media is taken from the sterilizer and then left at room temperature (37 °C) so that the media becomes solid. From the dilution of the desired sample as much as 100 µl the solution was put into a petri dish with a scattering method with a bent glass. Incubation is carried out at 37 °C for 18 to 24 hours. After the end of incubation, the colonies that grow in metallic green with a dark colored center, small round colonies with flat edges and have convex surfaces are counted as E. coli colonies. Growing colonies are collected by inoculating on nutrient media so that they are slanted for further examination.[5]

Gram staining: Positive E. coli samples were then confirmed by Gram staining to see the shape and color of the bacteria. Bacterial colonies were taken with one needle placed on an object glass and dripped with distilled water to be fixed at room temperature. The preparation is then dripped with gentian violet solution, left for 1.5 minutes then rinsed with running water. It was then dropped with lugolsolution, leave it for 1 minute, then drop it with alcohol (acetone alcohol) for 5 minutes, then rinse with running water. The preparation is then dripped with safranin solution, left for 5 seconds, then rinsed with running water. Fixation of aerated to dry or left at room temperature then examined under a microscope.[5]

Test IMVIC: E. coli bacteria from EMBA media which were Gram-negative positive were then tested for fecal and non-fecal groups with indole (SIM) test, methyl red, Proskauer and citrate Voges (IMVIC) by inoculating each one into a tube containing tryptone broth for indole test, MR-VP Medium for methyl red and Proskauer votes and into the citrate medium for testing the use of citrate as the only carbon source. All tubes were incubated at 35 °C for 5 days, except MR-VP medium for methyl red test (with an incubation time of 6 days). E. coli gave a positive result on the indole test because it was able to break down the amino acid tryptophan, E. coli during the fermentation process produced more acid so that the methyl red test gave a positive reaction, namely the methyl red indicator turned red. The Voges-Proskauer E. coli test gave a negative result because E. coli could not form acetyl methyl carbinol (Estonia), as well as the E. coli citrate test, gave a negative reaction to the test because E. coli was unable to use citrate as a carbon source. After that, from the positive tube in the IMVIC test one was taken and inoculated on the nutrient media to tilt for further examination. [5]

Growth on SMAC media: Positive results from the EMBA media and showed the properties of fecal coli in the IMVIC test and in the form of a short red stem in the Gram staining test which was planted on nutrient media to be slanted, then inoculated on MacConkey agar (SMAC) selective media. After being inoculated at 37 °C for 20-24 hours, E. coli O157 was detected with characteristics of clear/colorless colonies or Sorbitol negatives and compared characteristics with E. coli O157 control isolates (Oxoid).

Serological test with E. coli O157 Latex Agglutination Test: Serological test with E. coli O157 isolates, which showed colorless properties in the SMAC media in the hope that it would be more convincing that the colony was an E. coli O157 strain, then tested further using E. coli O157 latex agglutination test. Positive reactions are characterized by the formation of precipitation on latex paper in accordance with the positive controls provided by the Kit (Oxoid).

Serological Test with E. coli Antiserum H7: This stage is the final stage to ensure that the colonies isolated are E. coli O157:H7 serotypes, the test is carried out on the flagellum antigen by testing the H7 antiserum. Positive colonies in the latex test are first grown on motile media as much as 2 times the planting. Positive results on this medium are characterized by the spread of growth from the puncture site. After growing on motile media, the isolates are then grown in the brain heart infusion (BHI) media. Isolates were incubated at 37 °C for 24 hours. Isolates that grow are characterized by turbidity in the media. Isolates in BHI media were then inactivated by adding 40% formalin with a ratio of 0.3 parts of formalin in 100 parts of BHI, hereinafter referred to as antigens. This antigen is then tested with H7 antiserum which has been diluted with a ratio of 1: 500. The test was carried out by reacting 50 µl of the antigen with 50 µl of antiserum in the plate. The plate is then incubated at a temperature of 50 °C for 2 hours. Positive results are characterized by the formation of agglutination (precipitation) on the base of the plate (Difco Laboratories, Detroit, MI, USA).

Results

The results of examination of Balinese cow feces samples taken from 10 villages in Mengwiagainst coliform showed that from 58 samples examined all

positive samples contained Coliform. The results of the number of Coliform were 7.0×106 while the number of E. coli bacteria was 3.7×106. All Bali cattle stool samples examined found the average number of Coliform was 1.2×105 CFU/g, and the average level of contamination of E. coli bacteria from E. coli positive samples was 6.2×104 CFU/g.

Moreover, from the results of the study it can be described the percentage comparison between Coliform contamination, E. coli, E. coli O157, and E. coli O157:H7 namely that of 58 samples taken, 100% positive containing Coliform, E. coli bacteria reaching 55, 1%, E. coli O157 is 6.8%, while E. coli O157:H7 is only 3.4%.

The results of examination of Balinese cow feces samples taken from 10 villages in Mengwi Badung against Coliform showed that from 58 samples examined all positive samples contained Coliform. The results of the number of Coliform were 7.0×106 while the number of E. coli bacteria was 3.7×106. All Bali cattle stool samples examined found the average number of Coliform was 1.2×105 CFU/g, and the average level of contamination of E. coli bacteria from E. coli positive samples was 6.2×104 CFU/g.

All Bali cattle stool samples examined showed the highest number of Coliform of 4.8×105 CFU/g in Baha Village. Whereas the E. coli bacteria with the highest amount of 3.5×104 CFU/g was also found in Baha Village. The highest number of Coliform and E. coli bacteria is in Baha Village because the social culture is still quite traditional and the average level of education of farmers in Baha Village is elementary school graduates, so their knowledge of good cattle management is not understood by them. The example seen in the field is that cattle are not grounded and the cleanliness of livestock and the surrounding environment is less noticed.

The high number of E. coli bacteria in cattle found in several villages from Mengwishows that factors such as geographical conditions and maintenance management that are less influential on bacterial growth in Mengwi. The high contamination of E. coli bacteria in Bali cattle in Mengwiprovides an opportunity for the discovery of pathogenic E. coli namely E. coli O157. This statement is corroborated by the results of a study stating that cattle were known as the main reservoir of Verocytotoxin-producing Escherichia coli O157, as well as being the main source of transmission to humans.[6]

The Spearman rho correlation test from the data shows that Coliform showed a very strong correlation ($p<0.01$) to E. coli bacteria contamination with a Spearman rho correlation value of 0.6. Different results were shown from the Spearman's rho correlation test between Coliform and E. coli O157 and E. coli O157:H7 which showed an unrealistic correlation ($p>0.05$) with a correlation value of 0.02 and 0.13 respectively. Likewise, the contamination of E. coli bacteria showed no significant correlation ($p>0.05$) to E. coli O157 and E. coli O157:H7 contamination with a correlation value of 0.16 and 0.17, respectively. While the Spearman rho correlation test between E. coli O157 and E. coli O157:H7 showed a very significant correlation ($p<0.01$) with Spearman's correlation value rho 0.6.

The results of Spearman's rho's analysis show that with the presence of a high number of Coliform found in cattle in Mengwi, it is very significantly correlated with the emergence of E. coli bacteria. Likewise, the discovery of E. coli O157 bacteria was highly correlated with the discovery of E. coli O157:H7 bacteria. However, from the high number of Coliform and E. coli bacteria contamination, it was found that there was no significant correlation with the discovery of E. coli O157 and E. coli O157:H7 bacte. The presence of E. coli O157:H7 contamination in Bali cattle feces in Mengwi,Badung indicates that E. coli agents are pathogens especially E. coli O157:H7 is indeed there. Escherichia coli O157:H7 in humans can cause hemorrhagic colitis whose symptoms include stomach cramps followed by diarrhea, nausea, vomiting, sometimes mild fever. Possible complications are hemolytic uremic syndrome (HUS), urinary tract infection that can cause kidney failure in children.[7] E. coli O157:H7 infection in humans is often caused by consumption of contaminated meat and consumption of water that has been contaminated by feces that are positive for E. coli O157:H7.[8]

Conclusion

Coliform and E. coli were found, respectively at 7.0×106 CFU/g, 3.7×106 CFU/g, and from the number of E. coli bacteria found, E. coli O157 bacteria were identified as much as 4 isolates and E. coli O157:H7 only 2 isolates. The presence of Coliform correlates very significantly with E. coli bacteria, as well as the presence of E. coli O157 bacteria with E. coli O157:H7. However, the presence of Coliform did not correlate with the discovery of E. coli O157 bacteria, nor between the discovery of E. coli bacteria and the discovery of E. coli

O157. The same thing also found no correlation between the discovery of Coliform with E. coli O157:H7 and E. coli bacteria with E. coli O157:H7. To the farmers, the management of Bali cattle raising needs to be improved in Mengwi, Badung. Given the high number of Coliform and E. coli bacteria found and E. coli O157:H7 detected as zoonotic agents. Preventive measures are also needed to prevent transmission of E. coli O157 agents:H7, such as counseling about sanitation and hygiene (washing hands with soap after contact with cattle, making livestock pens, maintaining clean cages, handling livestock waste properly).

Identify Factors that Influence Healthcare Quality by Adoption Mobile Health Application in KSA E-Health

Dr. Karim Said Okour[1], Dr. Mohammed Atiah Alharbi[2], Dr. Malik Bader Alazzam[3]

[1]Asst. Prof., Health Management Department Taif University Kareem, [2]Asst. Prof., Management Department Taif University, [3]Asst. Prof., Software Engineering Department Ajloun National University Jordan

Abstract

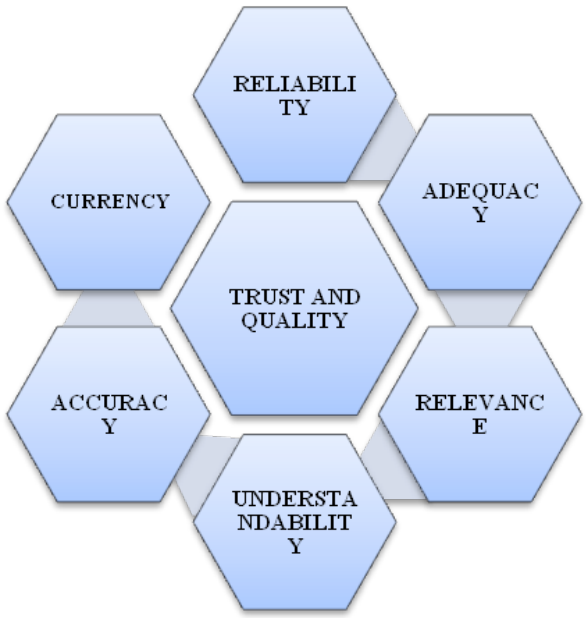
The main purpose of this study was to identify factors that effect healthcare quality in the KSA context Mobile Health Application (MHAs) identified to positively influence the quality of health service provision in different health centers with a decrease in the number of health costs in various centers. Often lack of awareness and lack of education on the use of the MHA system makes the system not to be maximally used for the benefit of the people. This research proposes the use of the Unified Theory of Acceptance and Use of Technology (UTAUT) framework, which will highlight the positive gains to be identified with the acceptance of the MHA system. Across the health care, sector UTAUT model has been used to evaluate the adoption and integration of the MHA system. The study proposes to use the UTAUT model to check on the physicians' behavioral exercise and their propensity to use the MHA system for healthcare delivery. The primary aim of the research is to test trust information elements which are identified to influence adoption and integration on the preference to use MHA by different healthcare practitioners. The study focuses on Saudi Arabia hospitals which are using MHA. Furthermore, the study will evaluate various factors that influence the adoption and acceptance of the MHA system by conducting comprehensive examinations, the use of questionnaires, and did in-depth studies.

Method: The study proposes to use surveys across the Saudi Arabia hospitals to gather all required data from different healthcare centers and professionals who are already familiar with the MHA system. Total of 266 respondents is used from 522 surveyed forms and conduct necessary data analysis.

Keywords: *Quality, MHAs, Healthcare, acceptance new technology, Trust factors, Ehealth.*

Introduction

The Mobile Health Application (MHAs) systems are defined to be a collective of diverse information instruments, which includes: emergency information, test systems, electronic prescription, telemedicine, and digital imagery, among others. The system is designed to positively impact on the healthcare professional decision-making for the doctors for different conditions presented. The preference to integrate the use of the MHA allows the daily hospital operations to be safer, and patients are identified to get better benefits from the respective hospitals they are seeking treatment . Some of the advantages of using the MHA system include: quality healthcare with ease accessibility of health-care-related data by the doctors,(1) increase efficiency on the primary caregiver, motivate the patients to be active participants when making decisions regarding their healthcare (2), appropriately transfer the information as suggested by precautionary healthcare with preference to use primary-care guide(3). Furthermore, the system is used to encourage knowledge exchange and technology transfer, which allows the doctors to make sound update decision regarding the patients' health [1].



Current knowledge of MHA acceptance: MHA system is mainly used across developed nations(4). "USA Institute of Medicine" has explained the MHA as "an important technology" for "eHealth". However, despite its numerous activities MHA hospitals across Canada, the UK and USA have not widely accepted the system(5). A study conducted on the MHA system explains the integration projects are often withdrawn as soon as the research stage has commenced(6). The significant common barriers that are associated with MHA explains is due to lack of start-up funds, subpar technology, lack

of monetary benefits, opposition from the healthcare providers and professionals, and non-prioritization[7]. MHA integration and acceptance in different healthcare systems require the presence of large-capitalization and massive investments which involves a lot of attempt and era and ensure there is motivation on the radical changes in hospital works and different services being provided [8][9]. Within the pluralist eHealth regime, it has resulted in MHA system acceptance to be complicated with the MHA system varying across the health professional groups.

The use of the MHA system allows the health facility to get the required knowledge and enjoy technology transfer to ensure they make the best decision-making process, and they can issue up-to-date information for the patients[10].

The Contribution:

Trust in information (TI): Trust in knowledge (TI) indicated the level of trustworthiness in the online medium currently being used by the users. Research conducted by Chopra and Wallace (2003) explores about the level of trust, the users are allowed to examine their most conversant e-environments and ensure there is better delivery of quality[11], accuracy, currency and better coverage. To enjoy utmost trust in the e-health system, it is paramount to have quality delivered through the e-government systems. With belief established, it becomes easy to utilize different e-government services that are currently provided[12]. Therefore, the trust on MHA system will significantly depend on the reliability, accuracy, and relevance of the information provided by the system which is considered[13] **Information Accuracy:** guarantee accuracy in the information provided.

Research Hypothesis

Figure 1: Trust and Quality Model

MHAs and UTAUT2: The UTAUT model identified to be in operation across many health centers which are keen to use the MHA system to analyze better and get the necessary approval and espousal, which allows the health sector to manage better[1][14][15][16][17]. Table 1, in the case of Saudi Arabia hospitals, the employees are identified to find the MHA system to be useful and helpful. The preference to use UTAUT model allows it to issue different tasks on the directorate and ensure it is efficient and effective, performance expertise, social influence, effort expectancy, price vale, hedonic motivation and habit which are identified to have a direct impact on the behavior on the use of MHA system for many medical professionals and staff. Moreover, with high intentions to use the MHA system translated to increased adoption on the preference to use MHAs.

H1. Studies have explained, performance expectancy to be correlated to a positive manner in the preferential use of the MHA system. H2. Effort expectancy is identified to be connected to the optimization of the B1 of the MHA system. H3. When there is a positive social influence, there is a higher likelihood of the MHA system being used across different health sectors. H4. The same principles are identified to be true for facilitation conditions. H5. When a company has hedonic motivation, it is determined to directly linked to using the MHA system. H6. The preference to use the Price Value is correlated in a progressive mode to the inclination to use the MHA system. H7. Exploreshabit positivity is influenced by B1 to use the MHA system. H8 explains that Trust in information is essential when using the MHA system[18][19].

Data Analysis and Results: This paper gives an analysis that is required and ensures there is a proper display of empirical results to examine the hypothesis of the research. The research uses SMART-PLS 2.0 and SPSS version 18. The chapter comprises of Nine Major sub-sections.

Table 1: Summary of Sampling Size in KFH and KAH

Name of Hospital	No of Population	Physician p=91	Nurses P=325	Pharmacists P=22	Laboratory Technicians P=33	Administrative P= 61	Total Sample 522
KFH	433	*P=40 S=9	P=163 S=99	P=12 S=10	*P=15 S=12	*P=31 S=26	156

Measurement Model (CFA)–SEM: Measurement model or confirmatory factor analysis (CFA)has been used over the years to establish any links between the variables. Thus, by using this form of study,there is observation done on the variables and manifestations which define the matter [29]. To guarantee quality, operationalization is an essential step .Different scholars used established scales to ensure theoretical accuracy is guaranteed.

Scholars are often affected by a lack of established scales despite the availability of varied number so scales; thus, they are required to modify existing scales to ensure new context is accommodated. Therefore, based on the SEM analysis, there is a proper selection of items to ensure there is a measure of constructs [30].

Conclusion

The study explored factors that influence MHA system adoption in Saudi Arabian hospitals and their association on trusting the information provided plus the Behavioral Intention to use the MHAs system in Saudi Arabian hospitals and this has created better room for research. The paper also exploits the significance of UTAUT2 theoretical knowledge.

UTAUT2 model has been used for the study to exploit different external factors and behavioral intention on the use of MHA systems. Based on the findings, there is further exploitation of the UTAUT2 model in various Saudi Arabian hospitals. The preference to use UTAUT2 model allowed the introduction of trust across the social arenas. The study has been eminent to positively contribute to ensuring there is professional acceptance of the MHA system use across the Saudi Arabian hospitals,primarily where EMRs uses mandatory. Based on the results, there is better utilization, evaluation, and identification of different factors that translated to MHA acceptance in various Saudi Arabian hospitals.

Conflict of Interest: Nil

Mobile Health (mHealth) Intervention for Family Planning Program: An Evidence from Systematic Review

Kuky Cahya Hamurajib[1], Nurulita Ainun Alma[1], Lutfan Lazuardi[1]

[1]Faculty of Medicine, Public Health, and Nursing Universitas Gadjah Mada, Yogyakarta, Indonesia

Abstract

High number of unintended pregnancies in developing countries occur in women who have unmet need for modern family planning. To fill this gap, several approaches have been implemented including the use of mobile phone. Some studies about mobile health (mHealth) and family planning were conducted, but there is no systematic review was made to evaluate the effectiveness. This paper aim to characterize existing evidence of the use mHealth for family planning program. For this review, published original articles written in English from last 10 years were extracted from leading databases (Pubmed, Sciencedirect, and Scopus). Relevance keywords have been applied i.e. "mHealth AND family planning" and "mobile phone AND family planning". The review structure was conducted in accordance with PRISMA guideline for systematic review. We included eight papers that passed critical appraisal process. Among them, 75% papers used randomized controlled trial and 25% used cohort as their study design. Several intervention strategies were used, included text messages (37,5%), text messages and application (37,5%), phone calls (12,5%), and voice messages (12,5%). The studies purposes were to evaluate the use of mHealth to improve knowledge and change contraceptive-related behavior. The findings showed that 62,5% studies were able to improve contraceptive use while 12,5% studies were not. Additionally 25% studies showed that mHealth might delay pregnancy and 12,5% studies were able to increase knowledge. Mobile Health intervention might support family planning program by improving knowledge and contraceptive use, but factors influencing contraceptive-related behavior changes should be further studied.

Keywords: *mHealth, mobile phone, family planning, contraception, contraceptive use.*

Introduction

The number of unwanted pregnancies in the world is still high. About 40% of births in the world is an unwanted pregnancy.[1] Unwanted pregnancies at ages 15-42 mostly occurs in developing countries. Every year around 74 million unwanted pregnancies is estimated occurring in developing countries.[2] Unwanted pregnancies may increase the risk of poor nutrition during pregnancy, mental health disorders, inadequate domestic relationships, domestic violence, miscarriage and low birth weight.[3-5]

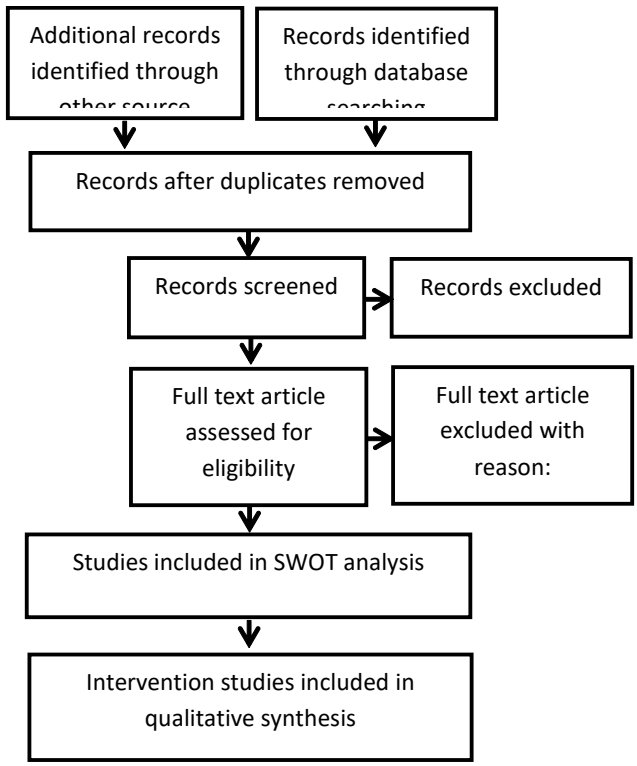
Most unwanted pregnancies occur in women who are unmet need for contraception. Increasing access to family planning (FP) by providing education and counseling, effective contraceptive method and community based services had been done in full filling unmet need pregnancy.[6-7] A low ratio between health worker and community encourages innovation by using health information technology to support family planning programs.[8]

Mobile phones for health or mHealth is a promising alternative method for increasing family planning knowledge and has a positive impact on the use of contraceptives.[9] The use of mobile phone is increasing rapidly and become a need for people in the world. In 2014, 90% of the population in developing countries already had mobile phones.[10] The wide availability and their ease of use, has provided space for mHealth to support health and medical practice.[11] mHealth can be used to provides various functions including health

information, support, reminders, emergency response and monitoring.[12] In developing countries mHealth is an alternative solution to cut costs and time, distance to health services and limited number of health workers.[13]

Various studies have been conducted to determine the impact of mHealth use on family planning programs. As a promising alternative, the development and use of mHealth widely requires evidence of the effects of mHealth on family planning programs. Therefore, this study aims to the current evidence of effectiveness of mHealth interventions for family planning program.

Method



Protocol: This study was a systematic review and conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) statement for systematic review.[14]

Eligibility Criteria: Original studies focusing on the domain of family planning and the determinant mHealth were eligible for inclusion. Participants were any age who received mHealth intervention for family planning. Family planning was defined by Merriam-Webster Dictionary as planning intended to determine the number and spacing of one's children through birth control.[15] Mobile Health (mHealth) was defined as provision of health services and information via mobile and wireless technologies.[16] Intervention strategies and outcomes were not pre-specified in search or eligibility criteria. Article are eligible for inclusion when primary study that written in English from year 2008, contained pre-defined domain and determinant. Article which duplicated counted as one. Exclusion criteria included article not matching the domain and determinant, reports, proceedings, conference abstracts, projects protocols, and secondary analysis.

Search Strategy: We identify relevant studies from period 1 January 2008 until present with English language restriction. The leading database to be searched include PubMed (NLM), Sciencedirect, and Scopus. The studies to be included will be selected using predifined search terms i.e. "mHealth AND family planning" and "mobile phone AND family planning". **Graph 1** describe the search strategy to be used in this study. All duplicate articles were remove manually. Screening of title and abstract was reviewed by two reviewer independently for database result. Any discrepancies from the review will discussed together.

Data Collection Process: Data extraction from database and information was extracted on study design, intervention strategies, duration of intervention, place, contraception method, user, and result of the study.

Synthesis of the Results: Data synthesis aims to give description and narration review of the use of mHealth intervention to family planning program. Quantitative results of intervention studies were summarized in table.

Graph 1: Flow Diagram

Results and Discussions

The search yielded a total 431 papers, and after duplication removal and screening process, eight papers that passed critical appraisal process were included. Among them, 75% papers used randomized controlled trial and 25% used cohort as their study design.

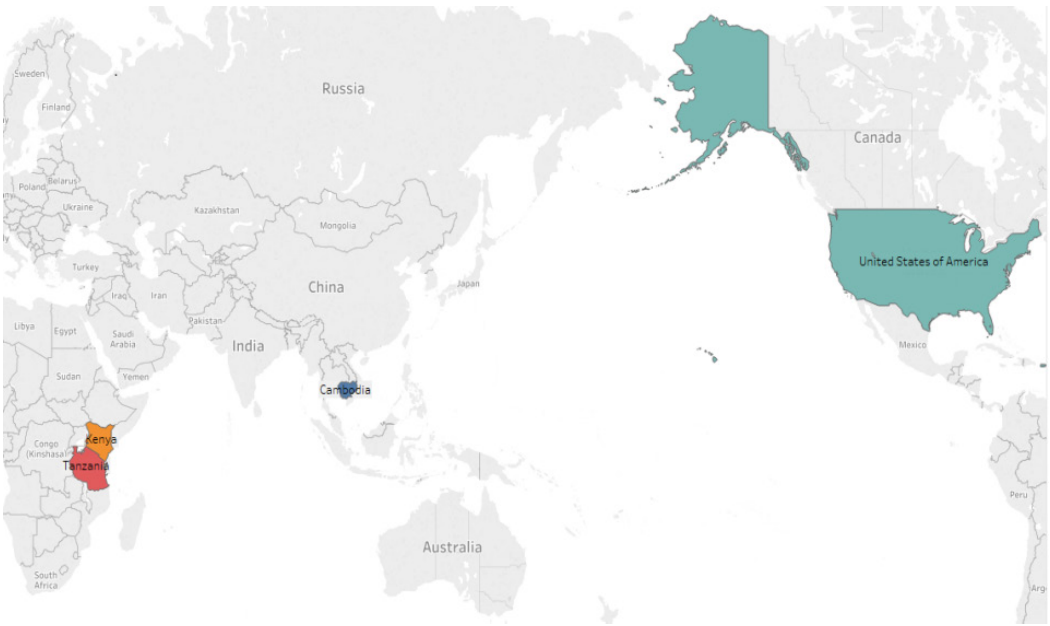
Scope of the study: Studies was held both in developed and developing countries. Of the papers, 50% were conducted in United of States, 25% in Tanzania, 12,5% in Kenya and 12,5% in Tanzania (**Fig 1**).

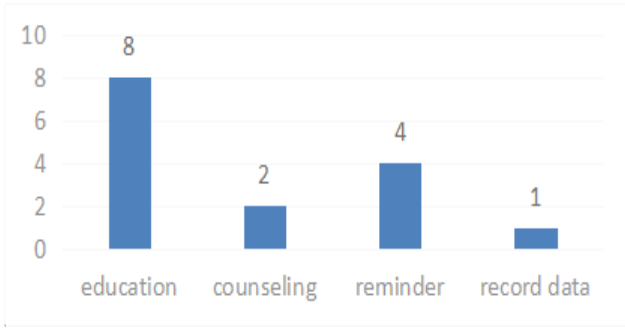
Study design, characteristic, and results of studies: Only original articles with primary data included. Among them, 75% papers used randomized controlled trial and 25% used cohort as their study design. Several intervention strategies were used, included text messages (37,5%), text messages and application (37,5%), phone

calls (12,5%), and voice messages (12,5%). mHealth were used in intervention to give education (100%), as remainder tool (50%), counseling tool (25%), and data recorder (12,5%). Some studies specified intervention for specific types of contraception (50%), with 60% of them used long-acting reversible contraception (LARC) and 40% used non-LARC.

The studies purposes were to evaluate the use of mHealth to know its acceptability (37,5%), improved level of knowledge (12,5%), change contraceptive-related behavior (87,5%) and accessibility (25%). Percentage of the purpose of the study was showed in **Graph 3**.

Acceptability: Acceptability was evaluated in 37,5% studies and all of them concluded that mHealth was acceptable intervention in FP program. Braun et al. (2016) found that mobile job aid is acceptable to support community health worker in providing FP services and highly acceptable for their client because of the information shared was confidential (96%) and comfortable sharing personal information. L'Engle et al. (2013) concluded the feasibility of m4RH system by the high number of queries. Trent et al. (2015) stated the acceptability of Depo Text for Urban Adolescent by high number of recruitment rate and low refusal rate.





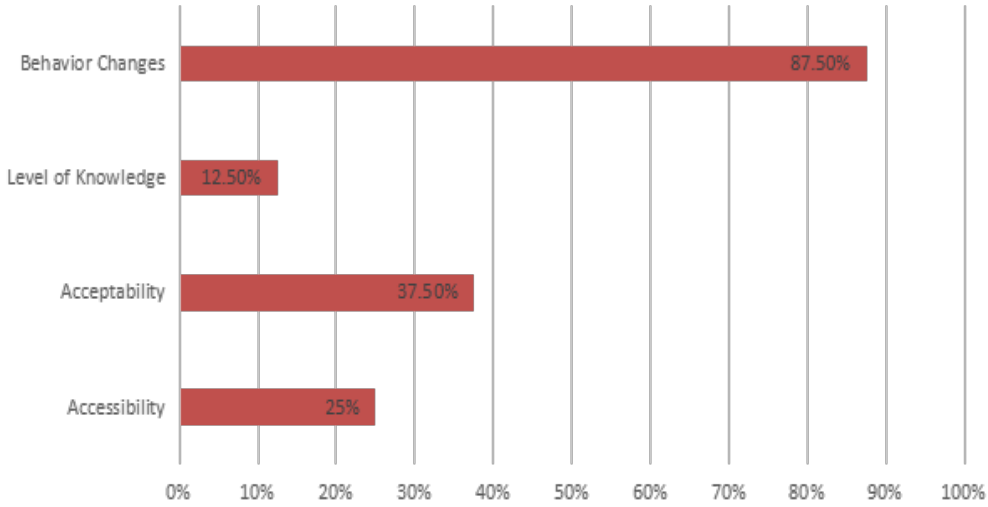


Fig 1. Scope of the study

Behavioral changes: Contraceptive-related behavior changes were evaluated by 87,5% studies. Behavior changes included changes in contraceptive use and method, improving clinic attendance, and delaying subsequent pregnancy. The findings showed that 62,5% studies were able to improve contraceptive use while 12,5% studies were not. Additionally 25% studies showed that mHealth might delay pregnancy. A paper showed there were changes in method include long-acting method which was popular in younger group, short acting method which was popular in older group, and coitally dependent method.[21] Changes in using contraception and whether they visit or discuss about contraception method was small and statistically insignificant.[18] Continuation of OCP use was improved by 10% in intervention group[23] and maintained prolonged adherence for DMPA or selected a more efficacious contraceptive method.[20] Depo Text also improved clinic attendance in FP visit in 1st and 2nd visit.[24] For delaying pregnancy, GirlTalk was not successfull in reducing time to subsequent pregnancy across 24 months follow up.[22]

Variation in results of behavior changes parameter may influenced by several factors. It may influenced by duration of intervention. Intervention duration varies from <6 months in 25% studies; 6-12 months in 62,5% studies; and 12-18 months only 12,5%.

Graph 2. Function of mHealth

Graph 3. Study purpose for mHealth intervention

Level of Knowledge. Johnson et al. (2017) found score for family planning increased about 14% by using m4RH (full-access group members correctly answered 2.19 questions out of 5, while limited-access group members correctly answered 1.92 questions (P<0.001)).

SWOT Analysis: SWOT analysis showed that mHealth was acceptable for community health worker and community.[17-19,22-24] Health worker could accept mHealth intervention because it was easy to use, could simplify work, improved data management, and could be a solution to the problem of time and distance between health worker and community for family planning service.[17] For community, mHealth intervention was acceptable because it was comfortable sharing personal information, and confidential.[17-19,22-24] Important Weakness of described mHealth intervention was the need for trained personnel so that there was an additional cost and time to do the training.[17] Opportunities could be enhanced such as appropriate text massage timing, and make teen friendly content.[17,20,24] Potential threats of acceptability included cultural aspect that influence women to make decision and external factor that limit women from following health guideline.[19-24]

Accessibility of mHealth intervention was enhanced when the information in simple, easy to understand[18,20] and in different (local) language was provided[21], was developed using locally based software[18], and could be reach for adolescence and adult[21] in both urban and rural area[19]. Weakness of mHealth intervention accessibility included lack of mobile phone ownership/ sharing of phone with partner[18,19,22,23], english literacy[18], and rural demographic[18]. As such, opportunities for mHealth intervention were providing phone to user[18,19, 23], the use of incentive schemes to increase recruitment[20,23,24], and feasibility of the study done prior to implementation[21]. Important threats that need to be tackled are the need for electricity to charge[17], the need for a functioning network[18,19,22-24] and user with not active or changing[19,22-24] or more than one mobile phone number.[19]

Strength of mHealth intervention on usability include could provide information and counseling related to family planning method[17,23,24], increase knowledge[18] and have positive impact on the use of family planning method.[19-24] However, in some studies the use of mHealth intervention has a weakness that is the decrease of efficacy in long term use or the cessation of intervention.[19,22-24] Social and mental health support provide an opportunity for future intervention.[21,22]

Discussion

The systematic reviewed suggests that mHealth were accessible as family planning intervention. The increase of mobile phone use around the world, both in developed and developing countries, as well as in rural and urban area made mHealth easy to access by community.[19] Local language availability to deliver information was important to rise mHealth coverage in unmet need for family planning population.[21] Practically, communication mode in mHealth such as voice message or phone call would useful for population with language barrier.[19, 23]

Mobile-phone intervention was acceptable with precaution. mHealth intervention needed training and technical accompaniment for the user which gave time and cost consequences.[17] Sustainability of mHealth needed a further study. In some study, mHealth users were given incentive and mobile phone.[18-20,23-24] Long-term sustainability to provide mobile phone and incentive, especially in national level should be explored.

The effect of mHealth on behavioral changes of contraception use still inconclusive.[19-24] Around 85,7% studies concluded mHealth could change behavior and the remaining studies otherwise. Contraceptive-related behavior changed only short-term and could not maintain the change of behavior after the intervention was discontinued.[19,22-24] We assumed that education had limited effective in duration of intervention.[25]

Knowledge of community about family planning program could increase after mHealth intervention.[18] This mHealth intervention increased knowledge transfer trustworthy personnel without space and time barrier.[17]

A study stated that Increased of knowledge in groups with mHealth intervention was not followed by significant behavioural changes.[18] While knowledge is a necessary first step, it is not sufficient to tip the scales to change behavior.[26] A systematic review has shown that many educational interventions that have successfully increased community knowledge have failed to have a significant impact on community behavior.

Conclusions

Mobile Health intervention for family planning program was acceptable and accessible. It might support family planning program by improving knowledge and contraceptive use, but factors influencing contraceptive-related behavior changes should be further studied.

Acknowledgements: None.

Conflict of Interest: The authors declare that they have no competing interests.

Source of Funding: Self funding.

Ethical Clearance: The systematic review is exempt from ethical clearance because we collected and synthesized the data from previous clinical trials which the informed consent were already obtained by trial investigators.

Evaluating Minimum Inhibitory Concentration Values of Levofloxacin and Azithromycin on Haemophilus Influenzae

Mithileshkumar Jha[1], Suchitra Shenoy M.[2], Sevitha Bhat[2]

[1]Senior Resident, Microbiology, AIIMS, Rishikesh, Uttarakhand, [2]Associate Professor, Microbiology, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education, Manipal, Karnataka, India

Abstract

Background: Community Acquired Pneumonia (CAP) is leading cause of morbidity and mortality in all age groups globally. 4 million cases of Community Acquired Pneumonia occur annually. *Haemophilus influenzae* is a causative organism of CAP. Empirical treatment with antibiotics like levofloxacin and azithromycin is recommended in these cases.

Objectives: This study was conducted to evaluate the minimum inhibitory concentration of levofloxacin and azithromycin in *H. influenzae* isolates from respiratory specimens.

Design: Minimum inhibitory concentrations of levofloxacin and azithromycin in 40 clinically significant *H.influenzae*isolates were tested using E-test method after the approval of Institutional Ethics committee. The results were analyzed according to 2019 CLSI guidelines.

Result: MIC_{50} for levofloxacin was 0.008 µg/ml, MIC_{90} 1.5 µg/ml and the 3 resistant isolates had MIC ranging between 8 and 12 µg/ml. Azithromycin MIC_{50} was 0.047µg/ml, MIC_{90} 6.4 µg/ml and 5 resistant isolates had MIC between 6 and 32µg/ml.

Conclusion: The rising MIC of levofloxacin and azithromycin in *H.influenzae*emphasizes the need to monitor the antibiotic susceptibility pattern on a regular basis. It is also advisable to restrain the use of fluoroquinolones to make it available for use in the tuberculosis treatment and also to avoid any adverse effects.

Keywords: *Haemophilus, azithromycin, levofloxacin, minimum inhibitory concentration.*

Introduction

Community Acquired Pneumonia (CAP) is leading cause of morbidity and mortality worldwide in all age groups. In spite of having potent new antimicrobials and vaccines it still remains a serious and common health problem. Annually 4 million cases of CAP occur annually and of which 20% require hospitalization. In out-patient settings mortality rate ranges 1- 5% but in ICU patients it approaches 25%[1,2]. *Haemophilus influenza* are responsible for 2– 12% of CAP[3].*H.influenzae* are known to be commensals in the respiratory tract. They cause both upper and lower respiratory tract infections as well as invasive infections like meningitis.

Many guidelines have been brought about to evaluate the need for admission, risk stratification, type of treatment and the period of treatment in case of CAP. Guidelines recommend use of either combination therapy with a beta-lactam plus a macrolide or plus ciprofloxacin or monotherapy with moxifloxacin or levofloxacin for empirical treatment in case of patients in non ICU admission. This has increased the use of azithromycin and levofloxacin in CAP[4]. This study

was conducted to evaluate the minimum inhibitory concentration of azithromycin and levofloxacin in the *H.influenzae* isolates from respiratory infections.

Materials and Method

This study was laboratory based time bound study conducted in the Department of Microbiology, Kasturba Medical College, Mangalore for a study period of eighteen months from October 2015 to March 2017.

Clinically significant 40 *H.influenzae* isolated from respiratory specimens like sputum and bronchoalveolar lavage were included in the study. The MICs of antimicrobial agents Levofloxacin and Azithromycin were measured using the E-test methodology. Levofloxacin E-strip showing MICs in the range of 0.02µg/ml to 32µg/ml and Azithromycin E-strip showing MICs in the range of 0.016µg/ml to 256µg/ml were used to perform E-test (bio Mérieux, Marcyl'Etoile, France). The MICs was interpreted according to Clinical Laboratory Standard Institute (CLSI 2019) guidelines[5].

Results

A total of 40 *Hemophilus influenzae* isolates were included in the study. They were isolates from various respiratory samples like sputum and bronchial lavage of patients with CAP. Isolates were defined as resistant for levofloxacin at MIC>2µg/ml; 3 resistant isolates had MIC between 8 and 12. In case of azithromycin, isolates were defined as resistant at MIC>8; 5 resistant isolates had MIC between 6 and 32 (Table 1).

Table 1. Susceptibilities and MIC results of H.influenzae isolates (n=40)

Antibiotics	MIC_{50} (µg/ml)	MIC_{90} (µg/ml)	MIC Range (µg/ml)	No.(%) Susceptibility to antibiotics			Breakpoint values(µg/ml)		
				Sensitive	Intermediate	Resistance	Sensitive	Intermediate	Resistance
Levofloxacin	0.008	1.5	0.002->32	37	-	3	≤2	-	-
Azithromycin	0.047	6	0.016->256	35	-	5	≤4	-	-

Discussion

H.influenzae were responsible for invasive infections like meningitis or septicaemia until the use of Hib vaccine. Thereafter the non typeable strains have been responsible for the CAP worldwide[3]. With the significant risk of bacteremia in such cases antibiotics with good lung tissue penetration and active against *H.influenzae* must be chosen. Oral antibiotics levofloxacin and azithromycin fulfil both these criteria.

Levofloxacin is a fluoroquinolone which directly inhibits bacterial DNA synthesis. It inhibits bacterial enzymes DNA gyrase and DNA topoisomerase leading to bacterial DNA damage and bacterial cell death. In our study we found that out of 40 isolates of *H. influenzae* 37 (92.50%) were sensitive for Levofloxacin and 3(7.50%) isolates were resistant. $MIC_{50}$was 0.008µg/ml and MIC_{90} was 1.5µg/ml. A similar study conducted in USA by Thornas berry *et al* for Levofloxacin showed MIC50 was 0.0015 (µg/ml) and MIC_{90} was 0.003(µg/ml) and they reported 100% susceptibility to levofloxacin[6]. Another study from USA conducted by Kitzis*et.al* showed MIC_{50} as 0.0015(µg/ml) and MIC_{90} as 0.003(µg/ml)[7]. Similar MIC50 value 0.008(µg/ml) as seen in our study was observed in the study done by Pettigrew et al but MIC90 value was 0.015(µg/ml) but reported 100% susceptibility[8].Fluoroquinolone resistance is primarily mediated through parC and gyrA mutations that encodes the subunits of DNA gyrase and topoisomerase IV that control bacterial DNA replication and also regulate the expression of cytoplasmic membrane efflux pumps. Therefore, fluoroquinolone resistance is mainly due to alteration in target and permeation mechanism.

Azithromycin is a bacteriostatic macrolide which inhibit bacterial protein synthesis by reversibly binding to 50S ribosomal subunits of susceptible microorganisms. Bacterial growth is inhibited due to suppression of RNA-dependent protein synthesis. In our study with respect to azithromycin 35(87.5%) out of 40 isolates of *H.influenzae* were sensitive and 5(12.5%) isolates were resistant. MIC_{50} was 0.008(µg/ml) and MIC_{90} was 6(µg/ml). A similar study conducted in USA by Thornas berry *et al* for azithromycin reported MIC50 as 1(µg/ml) and MIC 90 as 2 (µg/ml) and resistance rate for azithromycin was reported as 0.3%[7].Another study conducted by Pettigrew *et.al* showed MIC50 as 1(µg/ml) and MIC90 as 4 (µg/ml) and they also reported 100% susceptibility for azithromycin[8].Macrolide resistance occurs by two

mechanisms, that is alteration in target binding site and efflux mechanism. The ribosomal RNA methylases encoded by erythromycin ribosomal methylase (*erm*) *B* gene cause methylation of an adenine residues in the 23S ribosomal RNA of the 50S subunit and alter the target site. The efflux mechanism on the other hand is encoded by the *mef E* gene and it results in an inadequate concentration of drug within the cell to inhibit protein synthesis.

Our data suggests that there is a growing resistance to azithromycin among *H.influenzae* isolates. The rising MIC also raises an alarm about the future use of this wonderful antibiotic which has a prolonged half-life and added immunomodulatory action[9]. The use of fluoroquinolones has been advocated in most of the CAP treatment guidelines. But these are from areas where the incidence of tuberculosis is minimum. According to the Indian chest society and National college of Chest Physicians, India recommendations it is wise to restrain the use of fluoroquinolones in the backdrop of increased incidence of pulmonary tuberculosis in the Indian scenario[10]. Fluoroquinolones are known to cause some serious side effects like mental side effects, hypoglycemia and muscle tendon effects. Therefore, these drugs should be prescribed only in the absence of alternative treatment options in uncomplicated CAP[11]. The beta lactam drugs are still sensitive in our geographic area and is an effective treatment options in case of CAP due to *H.influenzae*[12].

Conclusion

Azithromycin and Levofloxacin are commonly prescribed antibiotics in case of community acquired pneumonia. The rising MIC values against these antibiotics in case of *H.influenzae* is of great treatment concern. Similar studies may be taken to see the susceptibility pattern of other pathogens to these drugs. This would help in laying down some guidelines in the appropriate use of antibiotics in case of CAP.

Vaccines: Purified Macromolecules as Vaccines and DNA Vaccines

Mohamed Jamal Saadh[1], Hala Mousa Sbaih[1], Ali Mohammed Mustafa[1], Abeer Mohammad Kharshid[1], Mohd Alaraj[1]

[1]Faculty of Pharmacy, Middle East University, Amman, Jordan

Abstract

Preventive vaccines work to protect an individual from infection or disease by introducing a small component or a nonharmful form of the pathogen (called the foreign antigen) into the body. The body produces an immune response to the pathogen by generating antibodies (via the humoral response), killer cells (via the cell mediated response), or both and development of immunologic memory. We reviewed the recent literature on types of vaccines and older studies were included selectively if historically relevant but none of these vaccines is ideal and can be recommended unrestrictedly therefore, the use of biotechnology could allow cheap production of valuable vaccines, while providing enhanced safety by avoidance of both human and animal viruses or other contaminants. Vaccine have been studied extensively to help eradication the infectious disease and thereby decrease the need for drugs.

Keywords: *Vaccines; Biotechnology; Immune response; humoral response; cell mediated response.*

Introduction

The terms vaccine and vaccination are derived from Variolae vaccinae (smallpox of the cow) [1]. The administration of vaccines is called vaccination. Vaccination is the most effective method of preventing infectious diseases. Vaccination is the most effective means of controlling infectious disease. It has been mainly responsible for the eradication of smallpox and for control of yellow fever, poliomyelitis and German measles in the human population, and Newcastle disease, foot and mouth disease and Marks disease in domestic animals[2].

Several factors must be considered to developing a successful vaccine. The first step is which branch of the immune system is activated, therefore the vaccine designer must recognize and considered the important differences between activation of the humoral and the cell mediated branches. A second factor is the development of immunologic memory. For example, a vaccine that induces a protective primary response may fail to induce the formation of memory cells, leaving the host unprotected after the primary response to the vaccine subsides[3].

The memory cells depends on the incubation period of the pathogen. For example, the influenza virus has a very short incubation period (1 or 2 days). Symptoms of the disease will appear at the same time as memory cells are activated therefore the maintaining high neutralizing antibody levels by repeated reimmunizations is effective for protection against influenza[4].On other hand, pathogens with longer incubation period such as poliovirus requires more than 3 days to begin infected the nervous system so it is designed to induce immunologic memory[5].

Purified macromolecules as vaccines: Some of the risks associated with attenuated or killed whole organism vaccine can be avoided with vaccines that consist of specific purified macromolecules derived from pathogens. Three general forms of such vaccines are in current use: capsular polysaccharide, toxoid, and recombinant antigens.

Polysaccharide vaccines: Prokaryotic cells, such as bacterial cells has a hydrophilic polysaccharide capsule layer that lies outside the cell envelope of bacteria to protects the bacteria against desiccation, and it is a part of the outer envelope of a bacterial cell. The polysaccharide capsule can be the cause of various diseasesdue to prevent phagocytosis. A coating of the capsule with antibodies and/or complement may be required for phagocytosis to occur [6].

The vaccine for *Streptococcus pneumoniae* used to prevent some cases of pneumonia, meningitis, and sepsis. The vaccine induces formation of opsonizing antibodies and is administered to high-risk groups such as infants, splenectomized patients, other immune-suppressed individuals, and elderly[7]. Meningococcal vaccine consists of purified capsular polysaccharides used to prevent infection by *Neisseria meningitidis*[8].

One limitation of polysaccharide vaccine is their inability to activate $T_H$cells. They activate B cells T-independent type 2 manner, resulting in IgM production but little other class and the vaccine is ineffective in children less than 2 years old. The subcutaneous pneumococcal polysaccharide vaccine have reported the induction of IgA secreting plasma cells but the T_H cells are not involved in the response and non-responders are also common amongst older adults. Immunization is not lifelong, so individuals must be re-vaccinated at age 65 if at least 5 years after initial vaccination[9, 10].

The capsular polysaccharides conjugated with some sort of protein carrier to generated conjugated vaccine. This conjugated vaccine is highly immunogenic but non-toxic and activates T_H cells which allow for immunoglobulin type switching and can induce memory B cells but it cannot induce memory T cells specific for the pathogen. Among other things, this results in mucosal immunity and eventual establishment of lifelong immunity after several exposures[10]. For exampleof conjugated vaccine is*Haemophilus influenzae* type b vaccine (Hib) consist from type b capsular polysaccharide covalently linked to tetanus toxoid to decrease the rate of meningitis, pneumonia, and epiglottitis in children under 5 years of age[11],another example is Pneumococcal 7-valent Conjugate Vaccine (Diphtheria CRM197 Protein), is a sterile solution of saccharides of the capsular antigens of Streptococcus pneumoniae serotypes 4, 6B, 9V, 14, 18C, 19F, and 23F individually conjugated to diphtheria CRM_{197} protein [12].

Toxoid vaccine: Toxoid vaccines are used when a bacterial toxinis the main cause of illness therefore, bacterial toxin are inactivated to produce bacterial toxoids in such a way that toxicity is lost but antigenicity retained. The usual method of treatment is with formaldehyde [13].Absence of toxin activity in toxoid preparations has to be demonstrated in an animal model or in cell test. The activity of the dermo-necrotic toxin of *pasteurella multocida* can be measured with the aid of Vero cells[14].

Toxoid are normally adsorbed on to an adjuvant to stimulate an immune response, usually a mineral salt such as aluminum hydroxide or mineral oil [15].

The free formaldehyde concentration must be not more than 0.05 percent m/v of free formaldehyde unless the higher concentration has been shown to be safe[15].

In some cases anacultures was used to obtain both antibacterial and antitoxic immunity because in some cases where high levels of challenge lead to large quantities of toxin which overwhelm the antitoxic activity. A typical example of this was seen in *Clostridium perfringens* type C and *Cl. Chauvoei*[16].

When the immune system receives a vaccine containing a harmless toxoid, it learns how to fight off the natural toxin. The immune system produces antibodies that lock onto and block the toxin. Vaccines against diphtheria, Botulism and, tetanus are examples of toxoid vaccines[17].

The obtaining sufficient quantities of the purified starting materials with toxoid vaccine is difficulty due to one the problems with toxoid vaccine is consisting from purified macromolecules. This problem has been overcome by cloning the exotoxin genes and the expressing them in easily growth host cells therefore large quantities of the exotoxin can be produced, purified, and subsequently inactivated[18].

Recombinant antigen vaccines: The alternative vaccines which are more safe and effective such as highly purified recombinant proteins, subunits of pathogens or DNA vaccine for replacing these conventional vaccines[19]. The recombinant antigen vaccines are the DNA encoding any immunogenic protein can be cloned and expressed in a variety of expression systems for antigenic protein components, such as bacteria, yeast, mammalian cells and insect cells. Bacterial expression systems are the most used due to the ease of handling and

to their capacity for high level expression. However, for antigens in which post-translational modifications (e.g., glycosylation) are necessary, the use of mammalian or insect cells should be considered [20, 21].

The current vaccines are produced by expressing the hepatitis B surface antigen (HBsAg) in yeast cells then purified by conventional biochemistry techniques. The HBsAg assembles into virus-like particles (VLPs), which are extremely immunogenic [22, 23, 24]. Furthermore, yeast cells are responsible for the post-translational modification of proteins, being capable of rendering proteins glycosylated.

The recombinant antigen vaccines has several advantages when compared with traditional vaccines, such as safety and production cost, most of them present weak or poor immunogenicity when given alone, and thereby require the use of adjuvants such as aluminum salt to elicit a protective and long-lasting immune response[25].

DNA Vaccines: DNA vaccination is a technique for protecting against disease by injection plasmid DNA encoding antigenic proteins into the muscle of the recipient so some cells will take up that DNA and directly expressed the encoded protein antigen[26]. The cells secrete the antigens and display them on their surfaces. In other words, the body's own cells become vaccine-making factories, creating the antigens necessary to stimulate both humoral antibody response and a cell-mediated response. The surprising about injected DNA vaccine is expressed by the muscle cells with much greater efficiency than in tissue culture. The DNA appears either to maintain for long periods in an episomal form or integrated into the chromosomal DNA[27].

The viral antigen is also expressed by dendritic cells by take up the plasmid DNA and expresses the viral antigen, therefore the DNA vaccines have valuable potentials of dendritic cells. Dendritic cells can be present the vaccine antigens on MHC class I and II products because it is ability to transduced with DNA vaccine and the presenting of cellular antigen by dendritic cells allow dendritic cells to expand and sustain vaccine memory in the CD4 helper and CD8 killer compartments[26, 27].

DNA vaccine offer advantages over many existing vaccines. There is no risk for infection, no denaturation or modification on the encoded antigen because it is expressed in the host in its natural form, obviates need for peptide synthesis, expression and purification of recombinant proteins and use of toxic adjuvants, refrigeration is not required for handling and storage of the plasmid DNA, andDNA vaccines are relatively easy and inexpensive to design and produce[26, 28].

Several DNA vaccines are available for veterinary, including the influenza virus and West Nile virus. Currently no DNA vaccines have been approved for human use. Research is investigating the approach for malaria, AIDS, influenza, and herpesvirus in humans, as well as for several cancers[28]. New experimental trials of DNA vaccines will mix gene for antigenic proteins with cytokines or chemokines to enhance the immune response to the optimum pathway. For example, IL-12 gene may be included in a DNA vaccine because the expression of IL-12 will stimulate TH1 type immunity induced by the vaccine[29,30].

To determine the DNA vaccine ADVAX could induce efficient antiviral CD4+ T cell responses mediated by shared high-affinity TCRs. efficient antiviral CD4+ T cell responses mediated by shared high-affinity TCRs therefore, the DNA vaccination by electroporation primed for TCR clonotypes that were associated with HIV control, highlighting the potential of this vaccine delivery method [31].

Some disadvantage might prevent their universal application, for example, only protein can be immunogen that is mean the DNA vaccine are not useful for non-protein antigen such as pneumococcal and meningococcal infection, use protective polysaccharide antigens. Another shortcoming are coming from the risk of affecting genes controlling cell growth, possibility of inducing antibody production against DNA, potential for atypical processing to bacterial and parasite proteins, and inability to use DNA vaccine as oral vaccine or those given as nasal spray, that are applied to mucosal surfaces[32, 33].DNA vaccines also present a slight risk of potentially disrupting normal cellular processes because the introduction of foreign DNA into the body could affect a cell's normal protein expression pathways[34].

Two concerns regarding the effectiveness of the vaccine itself revolve around the body's reaction to the vaccine. The first is the chance of an immune response against the DNA itself, or the DNA delivery vector, which would defeat the point of the vaccine as a whole. If such a reaction were to occur, no protein immunogens would be expressed, and there would be no immune

response to those immunogens. Secondly there is a chance that the body develops a resistance or tolerance towards the protein the vaccine introduces [35, 36].

DNA vaccine consist of DNA can be administered with a needle. Recently, Cationic derivatives of polyprenols were used as effective DNA vaccine carriers in chickens and mice result, induced strong humoral response to the antigen encoded by the DNA vaccine plasmid. Another method called gen gunthat uses high-pressure gas to shoot microscopic gold particles coated with DNA directly into cells[37].

Conclusion

Purified macromolecules as vaccines,and DNA vaccines have been studied extensively as a future vaccine to help eradication the infectious disease development, and thereby decrease the need for drugs.

An Evaluation of Internet Addiction and Psychological Distress among Undergraduate Nursing Students at College of Health Sciences, UOB, Bahrain

N. Gayathri Priya[1], Rajeswari Krishnasamy[2]

[1]Asst. Professor, [2]Senior Lecturer, Nursing Department, College of Health Sciences, University of Bahrain

Abstract

Background: Life and technology has become two sides of the coin. We are living in a era, where we cannot live without internet especially during student period. At the same time, if we are addicted to the internet, which causes deleterious effect on the psychological well being and caution should be taken while we use internet for longer period.

Objective: To evaluate internet addiction and psychological distress among Undergraduate Nursing students.

Design: Descriptive, cross–sectional survey design.

Setting: Nursing Department, College of Health Sciences, University of Bahrain.

Method: The sample size was 120 final year nursing students selected through convenience sampling technique. Internet Addiction Scale (IAT) and Kessler Psychological Distress Scale (K10) were used.

Results: The level of internet addiction scored as mild 12.5 %(15), moderate 63(52.5%) & severe 42(35.0%). The level of psychological distress scored as low 18(15%), moderate 25(20.8%), high distress 40(33.3%) & very high distress 37(30.8%). There was a significant relationship between gender (p=0.01), age(p=0.02), marital status (p=0.03), mother's occupation (p=0.02),and number of hours spent on internet per day (p=0.02) with internet addiction. There was also an association seen between gender (p=0.04), age(p=0.04), marital status(p=0.05), number of hours spent on internet per day(p=0.02) and frequency of internet usage(p=0.05) with psychological distress.

Conclusion: Proper utilization of technology will help nursing students to decrease the symptoms of psychological distress such as anxiety, depression and sadness. Internet addiction leads to increase absenteeism, low grade performance, decreased communication among students and even failure in academic studies.

Keywords: *Internet addiction, Technology, Psychological distress, Nursing students. Internet provides tremendous educational benefits for college students and also provided better opportunities.* ***Background:*** *Internet provides tremendous educational benefits for college students and also provided better.*

Introduction

The internet is considered as the greatest active tool in all areas of discipline[1]. Internet offers excellent educational benefits for college students and provides better opportunities for communication, information, and social interactions. Adolescent group are driven to use Internet and exhibit addictive behaviors parallel to those related to alcohol abuse and other substance use[2]. Internet addiction (IA) has been defined as "excessive

or poorly controlled preoccupations, urges or behaviors regarding computer use and internet access that lead to an impairment or distress [3].

Psychological well-being and internet addiction were studied among university students at Turkeyrevealed that psychological well-being was affected by reduced impulse control, loneliness/depression, social comfort, and distraction[4]. Worldwide, collegiate students are believed to be ahigh risk group with a marked increase in internet usage. Internet addiction was found to be correlated with emotional disorders as anxiety,depression, low self-esteem,stress and low psychological well-being[5].

The use of smartphones and internet lead to anxiety, low academic performance, decreases physical activity and well-being[6]**.** Some studies have revealed that sleep disturbance, depression and psychological distress can result from spending too much time on smart phones and internet[7]. It is important to study the impact of technology on psychological distress because technology is used in academic and non-academic activities[8].

Materials and Method

A crosssectional study was conducted among the nursing students between 17 and 25 years age group at College of health Sciences (CHS),University of Bahrain. Ethical permission was obtained from Institutional Ethical Committee Review Board (No.515/2018, UOB). A total of 120 students were selected by non-probability convenience sampling technique.

The data were collected throughself-administered the questionnaire consisted of three parts. Part 1 divided into section A and Section B. Section A, background information and section B, characteristics of Internet usage by the students. Part 2 follows Young's scale of internet addiction (IAT)[9] consists of 20 items ranging from 0 to 5. Internal consistency of the tool was r = 0.8. Part 3 was Kessler Psychological Distress Scale (K10) used for the assessment of Psychological wellbeing[10]. It consists of 10 items, wherein each item is scored using a five point Likert scale ranging from 0-5. Internal consistency of the tool was r = 0.7, showed good internal consistency.

The inclusion criteria were students who are currently enrolled in fourth year undergraduate program and nursing students who are willing to participate in the study.Nursing students who are studying in first, second and third year and who are on leave were excluded. Confidentiality was assured, and informed consent was taken from students. SPSS, version 16 statistical software was used.

Findings: The study enrolled both genders of 120 (33 Males and 87 females) nursing students. Out of 120 students, 66 (55%) of them were in the age group of 20-21 years. In relation to marital status, majority of them were single 71(59.17). Major proportion of the students was residing in a nuclear family 80(66.67%).Among the nursing students, it was found that they depended on internet on daily basis and the number 103(85.83%) was very high. Only few of them 6(5.0%) were depending on the internet once in a while per month.(Table. 1).

Analyzing the student's response onthe internet addiction it revealed that 82.6% (% of mean score) of them reported as fear of life without the internet would be boring, empty or joyless and equal percentage scored (82.6%) finding themselves saying "just a few more minutes" when they were online. Eighty percentage of them reported that they used to be in online longer than what they were intended to be online. Majority of the students (75.0%) tried to cut down on the amount of time spent on online and it was failed. (Table. 2).

Figure 1. Describes the level of internet addiction among nursing students. Among them, 35.0% of students were having severe level of internet addiction score.

As depicted in table 3, 56.4% (% of mean score) reported that they felt tired out without any reason and felt nervous over a month by 55.2% of the students. Over 55.80% of the students felt that everything was done through a great effort. Analyzed data revealed 30.8% 0f them were having very high distress and 33.3% were having high psychological distress(Fig. 2). The present study identified that there was significant, positive, moderate correlation (r=0.55) between internet addiction and psychological distress (Fig.3). And also our study identified that there was a significant relationship between gender (χ^2=9.11,p=0.01), age (χ^2=15.46, p=0.02), marital status (χ^2=6.86, p=0.03) mother's occupation (χ^2=7.35, p=0.02)number of hours spent on internet per day (χ^2=15.27,p=0.02) with internet addiction. There was also an association seen between gender (χ^2=8.32, p=0.04), age (χ^2=17.67, p=0.04), marital status (χ^2=7.81, p=0.05), number of hours spent on internet per day (χ^2=7.35, p=0.02) and frequency of internet usage (χ^2=13.22, p=0.05) with psychological distress.

Nowadays, technology influencing the students to the maximum extent of spending more time with mobile and less communication with human beings[11]. The analysis revealed that majority (85%) of them was using the internet through mobile or laptop every day and 43% of the students were surfing more than 3 hours per day at college and home. Whereas, a study conducted in Jordan found that (85%) of the college students surf the internet more than four times per week shows that our students were overusing the internet. At the same time if the internet is used for more than 3 hours per day leads to deleterious effect on psychological aspects especially beginning with a "habit to addiction"[12].

As evident in our study, the overall percentage of mean score (71.8%) and moderate level (52.5%) of internet addiction of the nursing students expressed that they were addicted to the internet. This score was very high when comparedtoother placesin Iran[13] medical students had 21% of internet addiction, 22.8% in Mazandaran province[14,] 38.4% in Jeddah[15,] 30.1% in Palestine[16,] 34.7% in Greece. A similar study carried out among the Turkish college students revealed that there was a higher level of internet addiction with the diagnosis of depression[17].

The current study found that the students scored high and very high level of psychological distress 33.3% & 30.8% respectively. Few studies found that there was direct relationship between students who are having higher level of psychological distress & chance to get internet addiction[18].

In our study, age is associated with internet addiction. In contrast,a study conducted among Jordanian students found that there was a negative relationship between internet addiction and age[19]. Some studies proved that first and second year nursing students are more prone to internet addiction than the third and fourth year nursing students at the college level[20].

Implications: Family support and the parental control play a key role to guide the students in a right path. Universities should take some steps to incorporate the psychosocial educational intervention during the counseling session. Faculties and mentors should create awareness on misuse (or) overuse of internet among the students irrespective of any discipline.

Table 1. Characteristics of internet usage among nursing students (n=120)

Characteristics of internet Usage		No.	%
1. Age at first internet use	Less than 10 yrs	27	22.50%
	11-15 yrs	68	56.67%
	16-20 yrs	20	16.67%
	Above 20 yrs	5	4.16%
2. Number of hours spent on internet per day	Less than 1 hour	7	5.83%
	1-2 hrs	35	29.17%
	2-3hrs	26	21.67%
	More than 3hrs	52	43.33%
3. Frequency of internet usage	Few times a day	103	85.83%
	Few times a week	11	9.17%
	Few times a Month	6	5.00%
4. Accessibility of the internet at the residence	Availability	113	94.17%
	Unavailability	7	5.83%
5. Purpose of the internet usage	Academic Non Academic	102 18	85% 15%

Table 2. Mean and SD of students response on internet addiction test among nursing students (n=120)

Internet Addiction test	Mean score	SD	% of mean score
1. Do you find that you stay online longer than you intended?	4.00	1.53	80.0%
2. Do you neglect household chores to spend more time online?	3.63	1.47	72.6%
3. Do you prefer the excitement of the internet ?	3.27	1.50	65.4%
4. Do you form new relationships with fellow online users?	3.25	1.53	65.0%
5. Do others in your life complain to you about the amount of time you spend online?	3.56	1.51	71.2%
6. Does your work suffer because of the amount of time you spend online? (E.g., postponing things, not meeting deadlines, etc.)	3.38	1.50	67.6%
7. Do you check your email before something else you need to do?	3.56	1.41	71.2%
8. Does your job performance or productivity suffer because of the internet?	3.29	1.36	65.8%
9. Do you become defensive or secretive when anyone asks you what you do online?	3.56	1.44	71.2%
10. Do you block disturbing thoughts about your life with soothing thoughts of the internet?	3.48	1.53	69.6%
11. Do you find yourself anticipating when you will go online again?	3.69	1.43	73.8%
12. Do you fear that life without the internet would be boring, empty or joyless?	4.13	1.50	82.6%
13. Do you snap, yell, or act annoyed if someone bothers you while you are online?	3.70	1.44	74.0%
14. Do you lose sleep due to late night internet use?	3.72	1.44	74.4%
15. Do you feel preoccupied with the internet when not online, or fantasize about being online?	3.67	1.39	73.4%
16. Do you find yourself saying "Just a few more minutes" when online?	4.13	1.54	82.6%
17. Do you try to cut down on the amount of time you spend online and fail?	3.75	1.50	75.0%
18. Do you try and hide how long you've been online?	3.47	1.56	69.4%
19. Do you choose to spend more time online over spending time out with others?	3.33	1.43	66.6%
20. Do you feel depressed, moody, or nervous when you are not online, and do these feelings go awhile when you go back online?	3.19	1.59	63.8%
Overall	71.80	18.12	71.80%

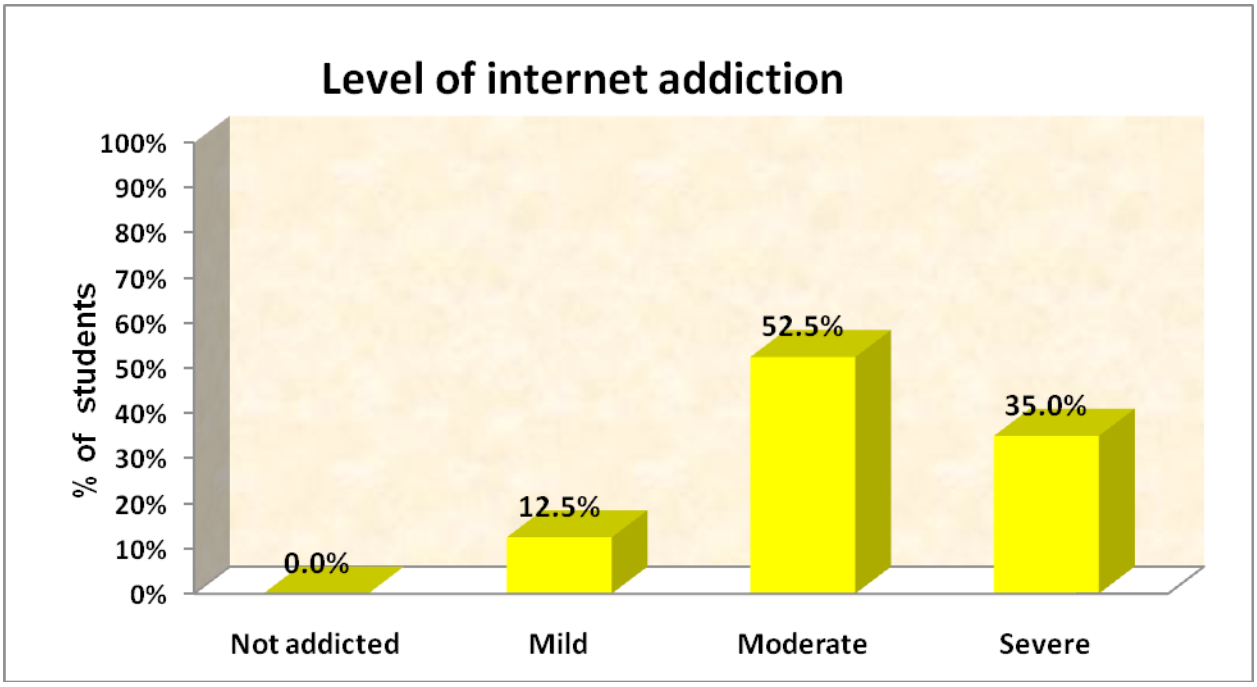

Figure 1: Levels of internet Addiction among nursing students (n=120)

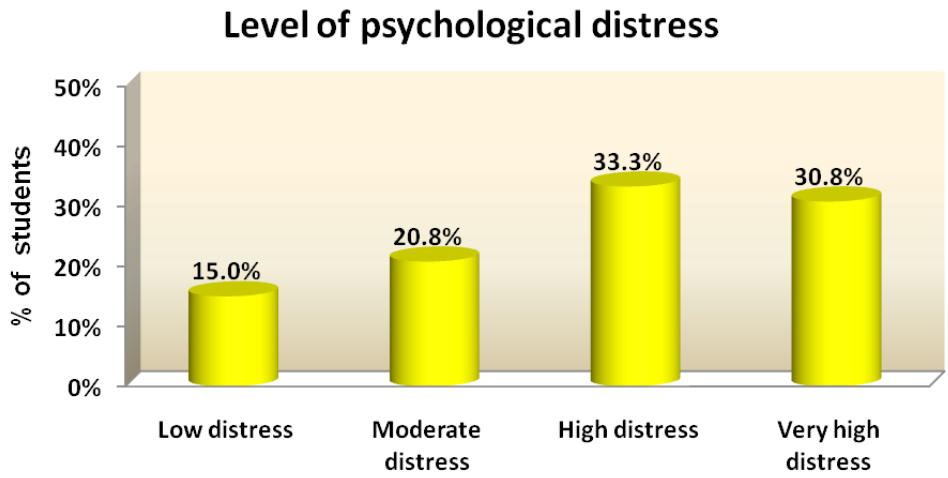

Figure2 .Levels of psychological distress among nursing students (n=120)

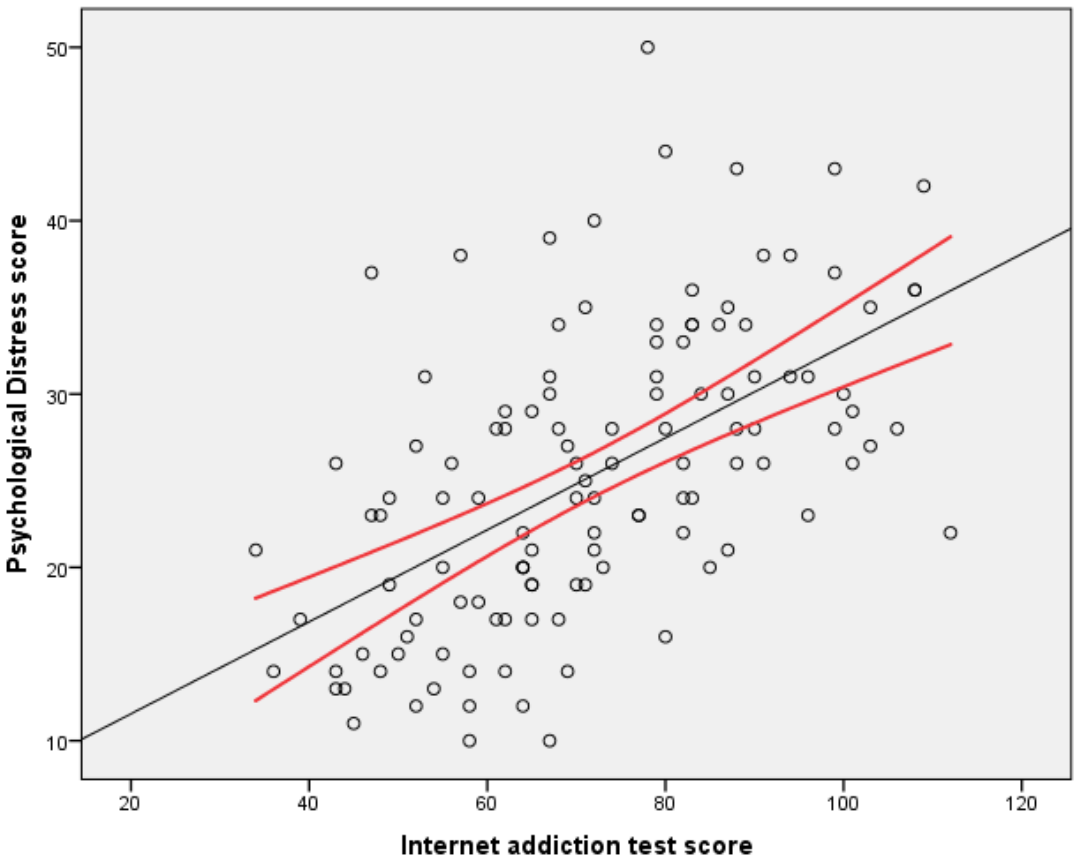

Figure 3: Correlation between internet addiction and psychological distress score among nursing students (n=120)

Conclusion

Internet addiction is an emerging problem among university students. The psychological wellbeing of the students areadversely affected by internet addiction. The consequences of the internet addiction results in psychosocial disorder and psychological morbidity. Hence, it is time to develop for the prevention of internet addiction and develop therapeutic interventions for college students who are affected by internet addiction.

To Evaluate the Effectiveness of Combined Chain Exercises on Pain in Female Patients Suffering with Osteoarthritis of Knee

Sampath Baireddy[1], Chiranjeevi Jannu[2], Ajeet Kumar Saharan[3], Vinod Kathju[4], Manisha Saharan[5]

[1]Research Scholar, Maharaj Vinayaka Global University, Amer road, Jaipur, Rajasthan, [2]Associate Professor, Vaagdevi College of Physiotherapy, Warangal, Telangana, [3]Principal, Jaipur Physiotherapy College, Maharaj Vinayak Global University, Amer Road, Jaipur, Rajasthan, [4]Prof. Dept. of Orthopedics, Maharaj Vinayak Global University, Amer Road, Jaipur, Rajasthan, [5]Research Scholar, Maharaj Vinayak Global University, Amer Road, Jaipur, Rajasthan

Abstract

Introduction: Osteoarthritis (OA) is a condition marked by two features, the progressive destruction of articular cartilages and formation of bone at the margins of the joint. OA is the most common type of arthritis mainly in older people. At times it is also called as degenerative joint disease. OA occurs in old age, mainly in the weight bearing joints like knee joint. OA is one of the widespread causes of physical disability in adults. 50% of older persons affecting after 55 years of age. Some young people get arthritis from the joint injuries.

Method and Methodology: 60 female patients suffering with knee pain due to osteoarthritis were selected based on the inclusion criteria. They were divided into three groups i.e., 20 in each group and they were named as Group A, B and C. Group A were trained with closed kinetic chain exercises (CKC), group B were trained with open kinetic chain exercises(OKC) and group C were trained with combined chain exercises (CCE) for 6 weeks.

Results: The groups were analyzed by using ANOVA and Mann - Whitney U test for analyzing the VAS. The mean and standard deviation of pre- test, week 3 and week 6 for VAS of group A, B and C were given in Table.1 and ANOVA in Table.2, Mann– Whitney– U test for Group A, B and C was given in Table.3

Keywords: *Osteroarthritis (OA), Knee arthritis (KA), closed kinetic chain exercises (CKC), open kinetic chain exercises (OKC) and combined chain exercises (CCE).*

Introduction

Osteoarthritis (OA) is a condition marked by two features, the progressive destruction of articular cartilages and the formation of bone at the margins of the joint[1]. OA is the most common type of arthritis mainly in older people. At times it is also called as degenerative joint disease. OA occurs in old age, mainly in the weight bearing joints like knee joint[2]. OA is one of the widespread causes of physical disability in adults. 50% of older persons affecting after 55 years of age. Some of the young people get arthritis from the joint injuries[3]. The estimated population prevalence varies from 4 to 30% depend on age, gender and disease condition. After 50 years of age the incidence and prevalence of knee joint OA is incredible more rapid in women than in men[4]. It imposes noteworthy health care burden and account for hospitalization[5,6,7,8]. The predominant symptoms are pain, mild swelling, early morning stiffness, minimal tenderness and coarse crepitus[9] it leads to decreased fitness and increases the risk of cardio

metabolic co-morbidity and early mortality[10,11,12]. It has been estimated that nearly 40 to 80% of people will have symptomatic changes on radiographs mainly in rural areas where people were involved in occupational tasks[13].

OA should be managed primarily by non-operative means than by operative means, little consensus exist concerning the most appropriate non-operative means[14]. There are numerous evaluation and treatment options for KA however, there is no prefect treatment for everyone at any age so treatment must be individualized based on severity of symptoms[15]. Open kinetic chain (OKC) leg extension exercises have been the traditional means of strengthening the quadriceps muscle, but few authors reported that these exercises exacerbate the symptoms in many patients with KA[16]. Closed kinetic chain (CKC) exerciseswere significantly increased during the past several years[17].

The purpose of this study was to investigate, the Effectiveness of combined chain exercises (CCE) on pain and function, in female patients with OA of knee. This study is to specifically determine whether combined chain exercises offer any advantages over convention OKC exercises and CKC exercises. Therefore patients with KA may tolerate combined chain exercises better and consequently may exhibit better functional results after such as exercise programs.

Materials and Method

Subjects: Sixty female patients suffering with OA of knee were selected for the study from Vaagdevi Physiotherapy and Rehabilitation centre and MGM Hospital, Warangal, Telangana were selected.

Type of Study: It's a Comparative Study, i.e., closed kinetic chain exercises; open kinetic chain exercises and combined chain exercises, on pain in female patients suffering with Osteoarthritis of knee were compared.

Duration of study: 6 weeks.

Inclusion and exclusion criteria: Female patients suffering with knee pain more than 6 weeks, tenderness on palpating the patella, pain during resisted knee extension, climbing up and down the stairs were included. Patients with any knee surgeries, any infectious conditions of knee, traumatic knee conditions, congenital abnormalities, neurological and cardiac issues were excluded from the study.

Outcome measures: The outcome measure is visual analog scale (VAS).

Methodology: Sixty female patients were selected based on the inclusion criteria and divided into three groups (Group A, B and C), each group has 20 patients correspondingly. Group A were trained with CKC exercises. Which consists of seated leg presses, stationary bicycling and step up - step down exercises. 3 seconds rest was given between each repetition. Group B were trained with OKC exercises like static quadriceps muscle contraction with knee in full extension, straight leg raising with patient in supine lying and leg abduction, and adduction exercise in side lying position. In this each exercise was held isometrically. Rest was given for 6 seconds between 10 repetitions. Group C were trained with CCE like seated leg presses, stationary bicycling, step up-Step down exercises, static quadriceps muscle contractions with knee in full extension, straight leg raising with patient in supine lying and leg abduction, and adduction exercise in side lying. At the end of 6 weeks evaluation was done by using visual analogue scale (VAS).

Results

The mean and standard deviation of pre- test, week 3 and week 6 for VAS of group A, B and C were given in Table 1 and ANOVA for VAS is given in Table. 2, Mann-Whitney–U test for VAS of Group A, B and C was given in Table 3.

Table 1: For Mean & SD of VAS Scale

	Group– A			Group– B			Group– C		
	Pre-test	Week 3	Week 6	Pre-test	Week 3	Week 6	Pre-test	Week 3	Week 6

Post	3.6	0.88		3.9	0.99		2.6	0.46	

Discussion

This study is done to compare the effectiveness of Closed Kinetic Chain Exercise, Open Kinetic Chain Exercises and Combined Kinetic Chain Exercises. 60 subjects were diagnosed with Osteoarthritis of knee are taken and divided into three groups. The total duration of study was 6 weeks. The patients were treated in Physiotherapy department. The subjects were assessed before the treatment (Pre) and at the end of third week (Post) up to 6 weeks by VAS scale for pain assessment.

For Group A: The calculated value of intervention group was 10.03, the table value at 5% level of significance at 14 degrees of freedom 2.05, as the calculated value is more than the table value, the null hypothesis is rejected and alternate hypothesis is accepted. So there is a significant between before and after applying the treatment.

For Group B: The calculated value of intervention group was 8.52, the table value at 5% level of significance at 14 degrees of freedom 2.05, as the calculated value is more than the table value, the null hypothesis is rejected and alternate hypothesis is accepted. So there

is a significant between before and after applying the treatment.

For Group C: The calculated value of Control group was 14.31, the table value at 5% level of significance at 14 degrees of freedom 2.07, as the calculated value is high than the table value, the null hypothesis is rejected and alternative hypothesis is accepted. So there is a significant difference between before and applying treatment.

Hence we can conclude that the Group– A, Group– B & Group - C is showing significant difference between Pre-Treatment & Post-Treatment, but the Group– C is more effective than the Group– A & B. It can be concluded basing on the calculated values resulted i.e., regarding VAS Scale the calculated value i.e., 't' statistic is more for Group– C than Group– A & B, indicates the effectiveness of the treatment for Group– C patients.

Conclusion

The present study included three established treatment i.e., (Group-A) Closed Kinetic Chain exercises, (Group-B) Open Kinetic Exercises and (Group-C) Combined Chain Exercises in reducing pain and improving functional activity in patient with Osteoarthritis of Knee.

The calculated values show that the calculated values of Group-C is more effective than the calculated values of Group-A & B. This study can be continued further with larger sample size and more duration for better results in future.

Vitamin C Reverses Endosulfan-Induced Testicular Toxicity in Prepubertal Male Rats: A Histopathological Study

Vasanthalaxmi K.[1], Sucheta P. kumar[2], Manjula S.D.[1]

[1]Associate Professor, [2]Selection Grade Lecturer, Department of Physiology, Kasturba Medical College, Manipal Academy of Higher Education, Manipal, Karnataka

Abstract

Background: Endosulfan causes male reproductive toxicity due to oxidative stress. Vitamin C is a potent antioxidant, reduces cellular oxidative stress. The present study was aimed to investigate protective effect of vitamin C against Endosulfan induced testicular toxicity in Wistar rats

Objective: To investigate the protective effect of Vitamin C against endosulfan-induced testicular histopathological changes in male Wistar rats.

Materials and Method: Seventy male neonatal Wistar rats were divided into seven groups. The group I was taken as the control group, The endosulfan-treated rats were grouped into II (3mg/kg body weight (BW) and group III (6 mg/kg BW), Group IV (9 mg/kg BW) and Group V (12 mg/kg BW). Group VI (9 mg/kg BW) and group VII (12 mg/kg BW) were pretreated with vitamin C (20 mg/kg BW) for 60 days. After 60 days, animals were sacrificed, testes were removed and processed for histopathological analysis.

Result: Histopathological analysis of testes shows significant damage such as necrosis, decrease in spermatogenesis, and increase in congestion of the capillary system in endosulfan treated rats. Pretreatment with vitamin C with endosulfan treated group showed cytoprotective effect and marked reduced testicular changes.

Conclusion: Treatment with Vitamin C decreases the toxic effect of endosulfan on testes irrespective of dose. This protective effect of Vitamin C is probably due to its antioxidant property.

Keywords: *Endosulfan, Vitamin-C, Histopathology, Testes, Rats.*

Introduction

Endosulfan is a cyclodiene group of organochlorine pesticides, that is extensively used as an insecticide in agriculture and in some countries. As a result of its widespread use, it is an environmental contaminant and a public health hazard. WHO classified endosulfan in the category of terminal products and hazardous[1]. Endosulfan having estrogen like action, is known to cause reproductive toxicity in males by inducing degenerative changes in seminiferous epithelium and testicular atrophy. It affects the differentiation and function and reduction in the weight of secondary sex organs in males.[2,3]

Endosulfan also reduced plasma FSH, LH, 3β- hydroxysteroid dehydrogenase (3β-HSD), 17β-hydroxysteroid dehydrogenase enzymes (17β-HSD) and testosterone in rats and caused testicular damage. [4, 5,6]

Vitamin C (L-ascorbic acid) is one of the bio-antimutagens, prevents damage caused by toxicants, mainly by interfering with free radical generation and formation of toxic metabolities.[7,8,9] Vitamin C is known not to cause any cytotoxic and genotoxic effect of its own

at even comparatively high doses or concentrations. [10,11] The present study aims to know the protective effect of Vitamin C against endosulfan-induced histopathological changes in neonatal rats.

Materials and Method

Study Design: In the present study, one-week-old albino Wistar male rats were used. Animals were kept in the Central animal facility, Kasturba Medical College, Manipal Academy of Higher Education. Breeding and maintenance of animals were according to the national guidelines protocol. The institutional animal ethical committee has approved the study, before starting the experiment.

Rats were kept in polypropylene cages with paddy husk bedding under standard conditions (temperature 28 ± 1°C temperature and 50±5% humidity) with a maximum of three animals in each cage. Animals were fed on laboratory rat feed (Gold Mohur; Lipton India Ltd) and water *ad libitum*.

Animals (one week old, weighing between 8-12 g) divided into seven groups of 10 rats each. Group I served as control received vehicle (groundnut oil), Groups II-V received 3, 6, 9 and 12 mg /kg doses of endosulfan (Endosulfan was purchased from Meerut Agro Chemicals Industries Ltd., Meerut, India). Group VI and VII received endosulfan at 9 and 12 mg /kg dose, respectively along with 20 mg/kg dose of Vitamin C (Vitamin C purchased from Loba Chemicals (P) Ltd.,Mumbai, India). All the agents were administered orally daily till 60 days.

Histological Analysis of the Testes: The testes from each animal were dissected and placed in Bouin's fixative for 48 h and stored in 70% ethanol until preparation of the slides. The tissues were later dehydrated using graded alcohol and then embedded in paraffin. From each tissue 5µ thin sections were obtained with a microtome followed by staining with hematoxylin and eosin. The slides were mounted and evaluated for histopathological analysis under a light microscope.

Result

Histopathological Examination of Testis: In endosulfan treated rats moderate to severe histological changes were observed in testis. There was an increase in congestion of capillary system (+++), necrosis (+++), germinal epithelial damage (+++), and increase in tubular space and diameter of seminiferous tubules. Spermatogenesis in the seminiferous tubules was severely decreased (+++). There was a severe testicular atrophy and cellular atypia (+++). Capillaries of testes showed congestion and there was a decrease in spermatogenesis (Table & Fig 1, 2, 3).

These changes were severe in 9 and 12 mg /kg endosulfan treated rats. The degenerative changes also included inflammation and edema (+) which was not seen in control, 3 and 6 mg/kg endosulfan treated rats. Pretreatment with vitamin C showed cytoprotective effect on endosulfan induced testicular changes. The changes were markedly reduced compared to endosulfan treated groups; but it could not completely prevent the changes (Fig 4, 5).

Table: Histopathological changes in testicular tissue of Wistar rats subjected to various treatments

Parameters	Control GN Oil	End-3	End-6	End-9	End-12	End 9 + Vit C	End 12 +Vit C
Congestion of capillary system	N	N	++	++	+++	+	++
Spermatogenesis	N	↓	↓↓	↓↓↓	↓↓↓	↓	↓↓
Necrosis	-	+	++	+++	+++	+	++
Germinal Epithelial damage	-	+	++	+++	+++	++	++
Cytosis	N	N	↓	↓↓	↓↓↓	↓	↓↓
Degeneration	-	-	-	++	+++	+	+
Atrophy	-	-	+	++	+++	+	++
Inflammation and edema	-	-	+	+	+++	-	+
Tubular space	N	N	↑	↑↑	↑↑↑	↑	↑↑
Diameter of seminiferous tubules	N	↑	↑↑	↑↑	↑↑↑	↑	↑↑

Control GN Oil=Groundnut oil; Vit C=Vitamin C; END= Endosulfan; N= Normal; + Mild; ++ Moderate; +++ Severe; ↑ Increase; ↓ Decrease.

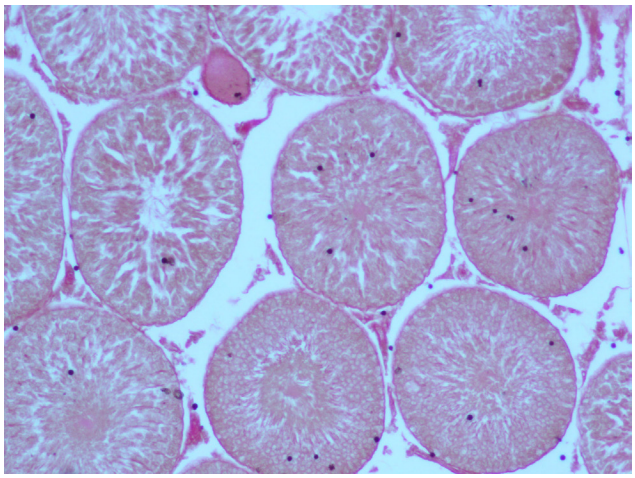

Figure 2: The Endosulfan treated group 3 & 6 mg showed similar mild to moderate-------- Under 100X

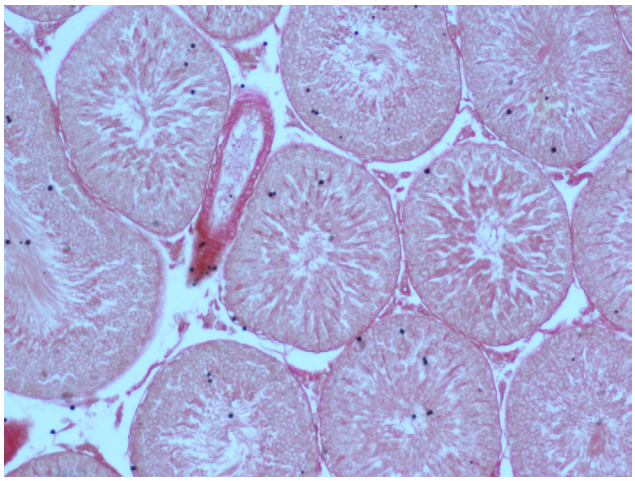

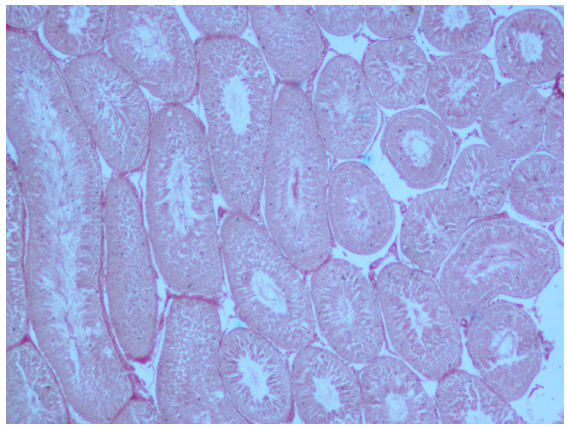

Figure 3: The Endosulfan treated group 9 mg showed -------- Under 100X

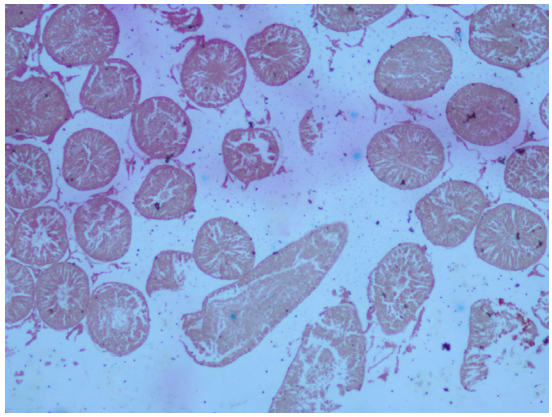

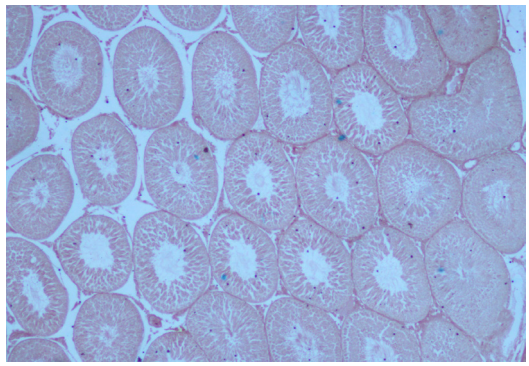

Figure 4: Endosulfan 12 treated groups showed Under 100X

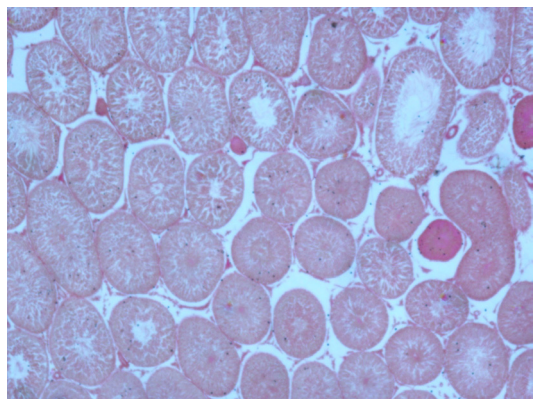

Figure 5: The Endosulfan treated group 9 & 12 mg with pretreatment of 25 mg Vitamin C Under 100X

Discussion

WHO classified, Endosulfan as moderately hazardous and has been considered to possess estrogenic activity and male rats are more sensitive to the chronic effect of endosulfan than female rats.[1-3]

The histopathological analysis conducted in the present investigation has shown that endosulfan has testicular cytotoxicity. The necrotic changes in the testes and the vascular damage were observed in endosulfan treated rats.

The reproductive effects of endosulfan on the male offspring of rats were studied by treating the rats with 1.5 and 3 mg/kg endosulfan from day 15 of pregnancy to postnatal day 21 of lactation. The histological changes were studied in the testes at postnatal day 65 and 140, corresponding to the pubertal and adulthood stage development. A significant decrease in the percentage of seminiferous tubules and consequently the spermatogenesis at puberty, which indicated an adverse effect of endosulfan on spermatogenesis. This finding may explain the decrease in daily sperm production in endosulfan exposed male rats.[12] A variety of pesticides are known to cause atrophy of testes, inhibition of spermatogenesis, histological changes, and decrease in hormone and steroid level.[13-16]

The histological changes in the testes exhibit a close correlation with organ weight changes. [17] The amount of endosulfan induced oxidative damage depends on the initiation rate of the oxidation, the concentration of the oxidant and the progression of the chain reaction.[18] Free radical production is known to alter testicular function.[19,20]

In our study pretreatment of vitamin C along with endosulfan significantly decrease the extent of cytogenetic damage induced by the endosulfan. Vitamin C reversed the effect of endosulfan on reproductive toxicity as it can modify response to oxygen radicals and is known to be an excellent antioxidant and its observed protective effect is probably due to its antioxidant property.

Conclusion

Estrogenic action of Endosulfan, would cause testicular damage by releasing free radicals which causes oxidative damage. In our study, the protective effect of vitamin C on gonadotoxic effect of endosulfan in prepubertal rats is due to the ability of Vitamin C is to inhibit oxidative damage depends upon its ability to scavenge the free radicals, its local concentration and its ability to interfere with the initiation and progression of lipid peroxidation.

White Collar Crime and Pharmaceutical Industry: A Medico-Legal Study

Abstract

Aayushi Goel[1], Aqueeda Khan[2]

The topic titled as "White Collar Crime and Pharmaceutical Industry: A Medico-Legal Study" is a topic of substance keeping in view the industrialization on one side and white collar crime on the other side. The pharmaceutical industry with its global expansion is not lacking behind in becoming the subject of white collar crime. The main aim for such crime is gaining financial crime at the cost of society. The white collar crime has different dimensions keeping in view the subject matter and subjectivity of the person involved in the said crime which may be in relation to price fixing, bribery, tax fraud, embezzlement identity theft, securities fraud, insider trading, and so on and so forth. The white collar crime itself suggests the commission of the crime by person at higher levels of the society having dominating impact in the social hierarchy. The pharmaceutical industry cannot keep itself without any impact of white collar crime. The adulteration practices of psychoactive illicit drugs have emerged which is most threatening hazard to consumers. The research topic is based on doctrinal study. The source of data is primary and secondary as well.

Keywords: *Cutting agents, clenbuterol, illicit psychotropic drugs, levamisole, new psychoactive substances, paracetamol, unjust enrichment.*

Introduction

One should understand the depth of crime that why white collar crimes takes place and by whom. And for this one be thorough about the activities involved in white collar crime and how it is different from other types of crime. And what level of activity is important to commit a white collar crime. Other crimes like burglary or any type of assault can be committed by anyone but white collar crime is committed by a person who has some special privilege or access to some authority in that concern.

Motivation for White Collar Crime: The main aim for such crime is to gain financial gain to one self and to provide loss to anybody. But to understand the roots of white collar crime one had to understand the psychology that makes them perform illegal activities and they are ready to break the law. Psychological factors that motivate for white collar crimes are:

- They don't have any respect for the company or the ethics of the company.
- People also have the feeling that they won't be caught as they have done it many times.
- They think that their actions are not loud that they would be detected.
- The feeling that they won't be caught as they have attained higher post in that company.

Types of White Collar Crime: White collar crimes are different from other crimes as they are non violent crimes and so it is hard to detect such crimes and the offender as well. At first instance a crime may be seen victimless but every crime as a victim and it may be employee of a company, shareholder of a company or company's consumers. Even the government can suffer loss when such crimes take place.

Few examples of white collar crimes are: Price fixing, Insider trading, Bribery, Securities fraud, Tax fraud, Embezzlement, Identity theft, Using of government corporate fund for personal use.

"An individual can act alone or he can work with part of a group to commit a white-collar crime. Depending on the offense, an individual convicted of this type of crime can face prison time, probation, fines, restitution, loss of professional licenses or community service."[1]

Pharmaceutical Industry: The industry in which the discovery, manufacture and development of drugs either by governmental sector or by private sector is done is known as pharmaceutical industries."The modern era of the pharmaceutical industry of isolation and purification of compounds, chemical synthesis, and computer-aided drug design is considered to have begun in the 19th century, thousands of years after intuition and trial and error led humans to believe that plants, animals, and minerals contained medicinal properties. The unification of research in the 20th century in fields such as chemistry and physiology increased the understanding of basic drug-discovery processes."

There are certain challenges which pharmaceutical industry had to face in this era like identification of targets of new drugs, getting approval from agencies of government, searching refining techniques in the discovery of drugs, and their development. For eliminating the disease all over the world there should be continual development of this pharmaceutical industry and should be considered of fundamental consideration.

Pharmaceutical Science in 16th and 17th Century: In 16th and 17th century the field of pharmaceutical sector improved. "In 1546 the first pharmacopoecia, or collected list of drugs and medicinal chemicals with directions for making pharmaceutical preparations, appeared in Nurnberg, Ger. Previous to this time, medical preparations had varied in concentration and even in constituents. Other pharmacopoeias followed in Basel (1561), Augsburg (1564), and London (1618). The London Pharmacopoeia became mandatory for the whole of England and thus became the first example of a national pharmacopoeia. Another important advance was initiated by Paracelsus, a 16th-century Swiss physician-chemist. He admonished his contemporaries not to use chemistry as it had widely been employed prior to his time in the speculative science of alchemy and the making of gold. Instead, Paracelsus advocated the use of chemistry to study the preparation of medicines."[2]

In 1617 the society of Apothecaries was found in London. This was a pharmacist society. This led to the development of pharmacy as a separate entity. King James I led to the separation of grocers from Apothecaries. It was also mandated that apothecary's shop could be kept by only one member of the society and he could only sell pharmaceutical products. In Great Britain, Pharmaceutical Society was founded in 1841. Education and training of pharmacist was taken into consideration by the members of society. And in today's world its development is really vital and thus education is supervised to all the members of the society.

"In 1783 the English physician and botanist William Withering published his famous monograph on the use of digitals (an extract from the flowering purple foxglove, Digitalis purpurea). His book, An Account of the Foxglove and Some of Its Medicinal Uses: With Practical Remarks on Dropsy and Other Diseases, described in detail the use of digitalis preparations and included suggestions as to how their toxicity might be reduced. Plants containing digitalis-like compounds had been employed by ancient Egyptians thousands of years earlier, but their use had been erratic. Withering believed that the primary action of digitalis was on the kidney, thereby preventing dropsy (edema)."[3]

Afterwards, it was also discovered that water used to be transported with blood in circulation. Cardiac performance improvement was the foremost concern of digitalis and for the improvement of cardiovascular function there should be reduction in edema.

Pharmaceutical Industry in Modern Era: Today we know the pharmaceutical industry as a wide and complex sector. World's largest companies of pharmaceutical were located in Europe, North America and Japan in 20th century. Industries were divided according to the activities like research, manufacturing, and sales. Pharmaceutical companies are often profitable and so many countries are preparing the structure for the drug companies so that they have a good competition worldwide.

"The industry has also come to be characterized by outsourcing. That is, many companies contract with specialty manufacturers or research firms to carry out parts of the drug development process for them. Others try to retain most of the processes within their own company. Since the pharmaceutical industry is driven largely by profits and competition each company striving to be the first to find cures for specific diseases it is anticipated that the industry will continue to change and evolve over time."[4]

Capital Infusion: "Generic maker Leading Pharma recently completed a financing transaction for $40 million of growth capital. The growth capital, led by Signet Healthcare Partners and Crestline Investors, will be used to expand the Fairfield, N.J.-based company's pipeline and pay off debt."[5]

"This investment allows us to accelerate the development of our robust pipeline to build a more comprehensive product portfolio," CEO and co-founder Ronald Gold said. "We are excited to partner with prudent investors who have experience in the pharmaceutical industry and believe in our business model as well as our ability to develop and market new generic drugs."[6]

Leading Pharma not only did funding but also made a statement that board of Leading's Parent Company will be joined by Signet Healthcare Partners, and the managing director namely Nikhil Puri and Crestline and the investors managing director Chris Sample.

Adulteration Practices of Psychoactive Illicit Drugs: We have heard about the powered drug which is being easily adulterated in medicines and some foods and drinks. This not only increases the quantity of something but also increases the profit level of the manufacturer or the dealer. These drugs are diluted and then mixed with the products to enhance the effect of it on the consumers.

A search was made on MEDLINE, Web of Science and Reports and documents of international agencies, Scopus, etc up to 2017.

Active substances of pharmacologically like dextromethorphan, paracetamol, clenbuterol, caffeine for heroin; phenacetine, hydroxyzine, diltiazem, lidocaine and levamisole for cocaine; phentermine and caffeine for amphetamine, have been discovered over the years.

The latter of heroin which is precursor namely, morphine and cocaine are extracted from products which are natural in nature. There may be possibility of having impurities or minor alkaloids at their final stage of preparation. In this concern we can say that new psychoactive substances can be used as cutting agents as well.

The Risks of Consuming Adulterated Chinese Medicine: It has been proved by scientists of Hong Kong that Chinese medicines do have a range of substances which can harm the health adversely.

Assian Scientists: A study was published in British Journal of Clinical Pharmacology. Serious dangers or harms that could be caused by using adulterated proprietary medicines of China were revealed by the scientists in this study. Traditional Chinese medicine was often used as complementary medicine in whole world. It was used for various symptoms and for the betterment of health. PCMs are generally composed of Chinese medicines and are contained in a finished form of dose and they are considered to be safe and natural as well. But anyhow the reports were documented the adulteration of PCMs and other health products with agents (undeclared). They also include prescription drugs, banned drugs and also drug analogs. Health consequences can be really adverse or may be fatal.

"In this study, a team of researchers led by Dr. Tony Wing Lai Mak, consultant pathologist at the Hospital Authority Toxicology Reference Laboratory located in Princess Margaret Hospital, Hong Kong, retrospectively reviewed cases involving the use of adulterated pCMs from 2005 to 2015. The investigators identified 404 cases involving the use of 487 adulterated pCMs or health products with a total of 1,234 adulterants. The six most common categories of adulterants detected were nonsteroidal anti-inflammatory drugs (18 percent), anorectics (15 percent), corticosteroids (14 percent), diuretics and laxatives (11 percent), oral antidiabetic agents (10 percent) and erectile dysfunction drugs (6 percent)."[7]

Sibutramine is an anorectic. This has been withdrawn because of its association with high cardiovascular strokes and events from the market. This was the rarest adulterant known. Over the counter drug store; the internet and Chinese medical practitioners are the sources of illicit products. We know from the study that sixty five percent of patients were adversely infected due to these illicit products. It also included fourteen severe cases and two fatal cases.

White Collar Crime: White collar crimes are considered to be non violent crimes. They are generally performed in commercial places for some financial gain.

Some of the examples of white collar crime are as follows:Bankruptcy, Computer and internet fraud, Antitrust violations, Bribery, Financial institution fraud, Credit card fraud, Environmental law violation, Insider trading, Economic espionage and trade secret theft, Counterfeiting, Insurance fraud, Tax invasion, Government fraud, Intellectual property fraud, Money laundering, Healthcare fraud, Embezzlement, Securities fraud, Public corruption, Mail fraud, Telemarketing fraud, kickbacks, etc.

Defenses: There are certain defenses which are available to non white collar crimes and white collar crimes as well, which are as follows:

- In Robert v. United States[8] proximate cause elements of the crime was challenged by some individuals in the cases of fraud of real property.
- In financial institution fraud cases, the argument was done by the individuals that a crime is required to prove the intention of the prosecutor but this argument was rejected by the Supreme Court in Loughrin v. United States[9].
- In mail fraud cases, it was argued by the individuals that a person can be charged of misrepresentation only if false documents are received by the party or person. In layman language it is said that a person is not considered responsible if third party is harmed by his mail fraud. This argument was also rejected by the Supreme Court stating that if the parties are harmed collaterally then they can claim their damages and are entitled to recover. This was held in Bridge v. Phoenix Bond & Indem Co[10].
- In Pasquantino v. United States[11], it was a case of wire fraud in which foreign countries were in involved. "Individuals have challenged their convictions on grounds that the conviction violated the common law revenue rule, which forbids courts from enforcing tax laws of foreign countries. however, the Supreme Court upheld Pasquantino's conviction, holding that fraud involving foreign countries fell within the wire fraudstatute.

Penalties and Regulations: According to the report of Federal Bureau of Investigation, the estimated cost of white collar crime is more than dollar three hundred billion annually in United States. Even the individuals can be charged for the crime of white collar crime by the government and the corporation can also be sanctioned for such activities. The penalties which are granted for such crimes are community confinement, forfeiture, fines, supervised release, home detention, imprisonment, restitution and paying the cost of prosecution, etc. sanctions granted can be lessen if the offender takes the responsibility of the crime and helps the cops or defendant in investigating the crime further.

"The Commerce Clause of the U.S. Constitution gives the federal government the authority to regulate white-collar crime. A number of federal agencies, including the FBI, the Internal Revenue Service (IRS), and the Securities and Exchange Commission (SEC), participate in the enforcement of federal white-collar crime legislation. In addition, most states employ their own agencies to enforce white-collar crime laws at the state level."[12]

In Dotterweich, he was prosecuted by the government. He was the president and general manager of the company named as Buffalo Pharmaceutical Company. And he was prosecuted as he had shipped the poor quality products of pharmaceutical and hence violated the Federal Food, Drug and Cosmetic Act. No evidence could be given by the government on his shipping but he was prosecuted as he could not prevent his company form the commission of a offence of public welfare and therefore the conviction was held by the Supreme Court.

Public Fraud: Stolen Valor Act: Public fraud was prevented and the reputation of military service medals was prevented by the Act. "On December 20, 2006, President George W. Bush signed into law the Stolen ValorAct, which made it a federal crime to fraudulently claim receipt of the Medal of Honor, the Distinguished Service Cross, the Navy Cross, the Air Force Cross, the Purple Heart, and other decorations and medals awarded by the President or the Armed Forces of the United States."[13]

In United States v. Alvare[14],The Stolen Act was constitutionally challenged. At Congressional Medal of Honor, Xavier Alvarez was introduced as a recipient by himself in 2007 when District Board meeting was held and was convicted under the Act namely The Stolen Valor Act. This Act was even challenged by Alvarez in order to violate his freedom of speech which was given by the first amendment. The decision was in his favor and The Stolen Valor Act was held unconstitutional in order to violate the first amendment.

"On June 3, 2013, President Barack Obama signed into law a revised version of the Stolen Valor Act, now 18 U.S.C. § 704(b)-(d). Unlike the original Stolen Valor Act, which punished an individual for fraudulently claiming receipt of a medal or a decoration, the 2013 Stolen Valor Act punishes individuals who, through such fraudulent claims, intend to obtain money, property, or other tangible benefit."[15]

Conclusion and Suggestion: The pharmaceutical industries with thrust and profit making wanted to be regulated and monitored so as to prevent the crime. It seems to be divided of any malafide or criminal activity. There is a need for regulatory mechanism to prevent white collar crime especially in pharmaceutical firms because of the fact that such crimes not only generate

unjust enrichment but disturb the society stability in a way turning to human rights violation. Now-a-days we can find the crime of money laundering in every sector of the society and even the pharmaceutical industries are stained by this crime.

White collar crime in such an industry is really hazardous for the society and the health of people. This crime is giving profit to the offenders and health issues to the consumers. The concerned authorities should waken up and take the remedial steps to be prevented from the supply of illicit drugs in order to earn more and more profit and hence conducting white collar crime.

Abstract

Diabetes mellitus is a common disease. This disease also has several complications, which is the main reason for the development of other diseases. For the study of diabetes, various markers are considered. Analysis of such markers allows us to draw conclusions about the degree of development of diabetes mellitus. We are considering expanding the analysis of various markers in diabetes. To do this, we use wavelet ideologists - the wavelet coherence method. We have identified periods of agreement between FBS and serum vitamin A, FBS and serum vitamin C, serum vitamin A and serum vitamin C, serum vitamin A and MDA for different levels of HbA1c. This allows us to evaluate the effect of various markers on the development of diabetes. To conduct this study, a group of 300 patients with type 2 diabetes was considered.

Keywords: *Diabetes mellitus, correlation, wavelet coherence, glyclated hemoglobin, fasting blood sugar, malondialdehyde.*

Introduction

Diabetes mellitus is one of the common chronic diseases. According to the World Health Organization (WHO), diabetes will be the 7th leading cause of death worldwide by 2030[1]. At the same time, 90% of all patients with diabetes are diagnosed with type 2 diabetes[2]. Type 2 diabetes is a metabolic disease. This type of diabetes occurs as a result of a violation of the interaction of insulin with tissue cells. Diabetes mellitus is a risk factor for other diseases and complications. In particular, this is a violation of vascular permeability and, as a consequence, the development of vascular atherosclerosis. Violation of vascular permeability can also be the basis of various heart diseases [3]. Diabetes is also the basis for the early development of cataracts, retinopathy, kidney damage, changes in the psyche and mood [4]. As a result of diabetes, oxidative stress often occurs, which in turn leads to various diseases, including the further development of diabetes. Therefore, an important task is the process of controlling the development of diabetes. This can be done by analyzing various markers that identify and show the development of diabetes. It is important to analyze such markers correctly. Therefore, the main objective of this study is to consider a new approach for the analysis of such markers in their relationship with each other.

Materials and Method

Brief overview of the research topic: The work[5] addresses several issues that are devoted to various markers of type 2 diabetes. Moreover, such markers allow you to control changes in renal decline. The authors consider plasma and urinary markers. Among these markers are considered: the level of antioxidant vitamins in plasma, the level of triglycerides in the blood and cholesterol, the level of malondialdhehyde and much more. To analyze such markers, the authors use method of descriptive statistics, factor and variance analysis. A similar study can be found in [6], where the authors also use classical method of statistical analysis to study the corresponding markers. In[7], markers are considered that allow one to consider the relationship between type 2 diabetes and cardiovascular diseases. The authors, first of all, study the effect of various vitamins on the development of diabetes mellitus, the possibility of slowing down the rate of development of cardiovascular disease. For their conclusions, the authors of the study use the method of correlation and regression analysis.

DNA methylation markers, level glucose and HbA_{1c} are discussed in [8]. For this analysis, the authors used multidimensional linear models. Markers of oxidative stress are the basis of the study in S. Seyyedebrahimi, H. Khodabandehloo, E. N. Esfahani and R. Meshkani [9]. For such an analysis, descriptive and comparative statistics method were used. A comprehensive review of various markers for studying the development of type 2 diabetes mellitus was considered in [4, 10]. Here, the authors also use classical statistical method to carry out the corresponding analysis: descriptive statistics, linear regression analysis, factor analysis, correlation analysis. Thus, based on the foregoing, we can say that there are various markers for the analysis of the development of diabetes and the manifestation of its influence in the form of complications of certain diseases. This allows you to conduct multifaceted research and draw various conclusions. However, the analysis apparatus used for such studies is standard. This limits the possibility of carrying out advanced analysis. Therefore, we will consider one of the tools that can be used in this study.

Wavelet ideology as a tool for analyzing data markers: Data markers for diabetes analysis can be represented as a sequence. The structure of such a sequence is a time series or a set of data for a certain period of time. Thus, for analysis we can use the ideology of wavelets. The input for wavelet ideology method is data that has the structure of a time series [11, 12]. In general, the ideology of wavelets makes it possible to identify singular points in the data structure that is being studied. Such an analysis is based on a series of different maternal wavelets [12, 13]. We can also analyze the mutual influence of two data sets. For this, the wavelet coherence methodology is used. This methodology is based on an analysis of a cross-reference for data series (z and z_1), which are analyzed[14,15]

$$R^2(z,z_1)=\frac{\left|\Psi(z_1^{-1}\Delta_y(z,z_1)\right|}{\Psi(z_1^{-1}\left|\Delta_x(z,z_1)\right|^2)\Psi(z_1^{-1}\left|\Delta_y(z,z_1)\right|^2)}$$

where ψ – is a smoothing operator,

$\Delta(z, z_1)$ – cross wavelet spectra for different time series z and z_1

x – data number in the test series,

y – characterizes the depth of cross-references,

$0 \le R^2(z,z_1) \le 1$.

If we have several series of data for a certain date, then we can use one of these series as a ranking tool. To do this, we select one of the data series and perform ranking on this series for other data series. Thus, we determine the cross wavelet spectra by some series u $\Delta^u(z, z_1)$, which allows us to rank the data and apply the wavelet coherence methodology:

$$R^2(z,z_1)=\frac{\left|\Psi(z_1^{-1}\Delta_y^u(z,z_1)\right|}{\Psi(z_1^{-1}\left|\Delta_x^u(z,z_1)\right|^2)\Psi(z_1^{-1}\left|\Delta_y^u(z,z_1)\right|^2)}$$

This approach allows you to structure the data series and carry out the corresponding analysis. Then along the axis x we have some parameter that is structured. This allows you to evaluate the reciprocity of some data series relative to another parameter. Therefore, we are expanding the possibilities of analysis.

Data: We review the data that was obtained for patients with the second type of diabetes. This group of patients consists of 300 people. This study was conducted by the Jabber Abu Ezz Center for treatment and care of diabetics in Khartoum– Sudan [4].

As individual markers are considered: Glyclated hemoglobin (HbA_{1c})% in human whole blood; fasting blood sugar (FBS), mg/dl; serum vitamin A, µg/dl; serum vitamin C, µg/ml; malondialdehyde (MDA), mol/l.

Some statistical parameters of markers are presented in Table 1.

Table 1: Statistical indicators markers

Markers	Diabetics (n=300)	P value
Vitamin A means (Max-Min)	50.3±20.0 (14.0-95.0)	0.001*
Vitamin C means (Max-Min)	3.9±1.3 (1.2-6.9)	0.0003*
MDA means (Max-Min)	6.7±6.2 (1.0-35.0)	0.001*
HbA_{1c}% means (Max-Min)	7.5±1.4 (6.0-13.3)	0.001*
FBS means (Max-Min)	160.4±65.5 (75.0-480.0)	0.0002*

*Significant differences in all blood parameters between control and test group (P value < 0.05).

These are the most commonly used markers for analyzing the development of diabetes. At the same time, our task is to show the possibility of applying the ideology of wavelet analysis to study the development of diabetes.

Results

One of the key markers in the study of the development of diabetes is the marker HbA_{1c}. HbA_{1c} shows the average blood sugar over a long period. Therefore, for further analysis, we chose the HbA_{1c} marker as the data for the ranking base. We do this ranking by increasing values of HbA_{1c}. These values are in the range: 6.0-13.3%.

Data for the remaining markers are given in accordance with the ranking of HbA_{1c}. Thus, we consider wavelet coherence for different marker groups, subject to the ranking of the HbA_{1c} marker. Then we can evaluate the change in the relationship between different markers for different levels of the HbA_{1c} marker.

In Fig. 1 shows the wavelet coherence between the values of the FBS and serum vitamin A.

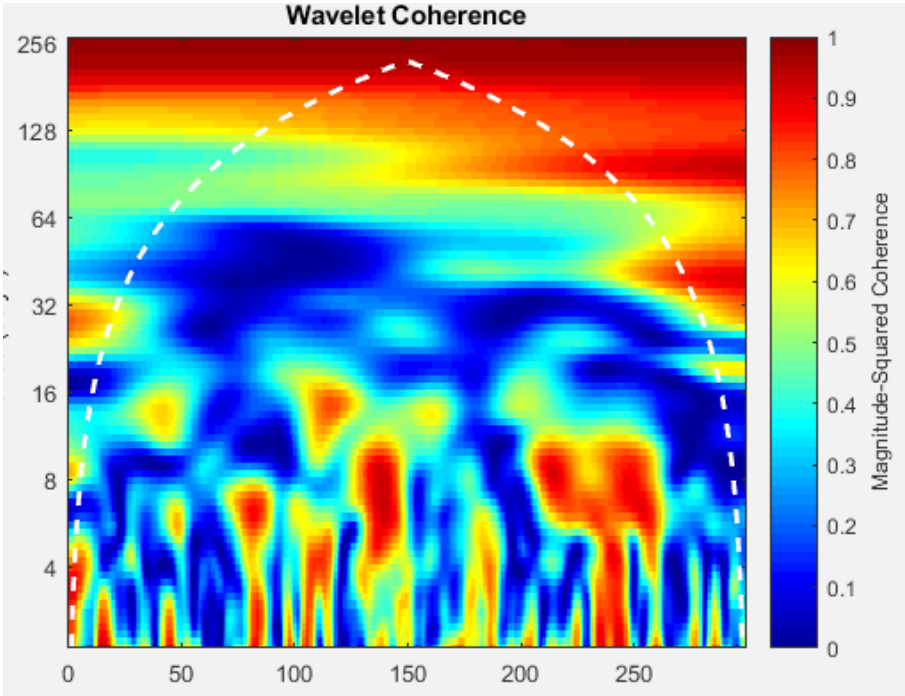

Fig. 1. Wavelet coherence between the values of the FBS and serum vitamin A markers when ranking by the HbA_{1c} marker

In Fig. 1 (and for other similar figures that are presented below) shows: along the axis *x*, the ranked values of the HbA_{1c} marker for 300 patients from the group (for Fig. 5, this is the ranking by the FBS marker); along the axis *y*, the depth of the relationship between the data values for the FBS and serum vitamin A markers (for other figures, this is the depth of the relationship between the other markers that are considered); the dashed white line limits the region of reliable values of wavelet coherence (at a confidence level of not less than 0.95). These values are inside the dashed line; the figure also shows a scale for analyzing the significance of wavelet coherence data. The significance of wavelet coherence is in the range from 0 to 1. Such data for clarity also have color values. Separate areas are the localization of the consistency (the significance of the wavelet coherence tends to 1) or the inconsistency of the data (the significance of the wavelet coherence tends to 0), which are investigated.

Fig. 1 show, that the consistency between the values of the FBS and serum vitamin A markers is different depending on the values of the HbA_{1c} marker. The greatest consistency between the values of the FBS and

serum vitamin A markers is characteristic for the range of changes in the HbA_{1c} marker: 8.0-8.7%. We can also observe the alternation of such significance that is associated with certain values of the HbA_{1c} marker.

In Fig. 2 shows the wavelet coherence between the values of the FBS and serum vitamin C.

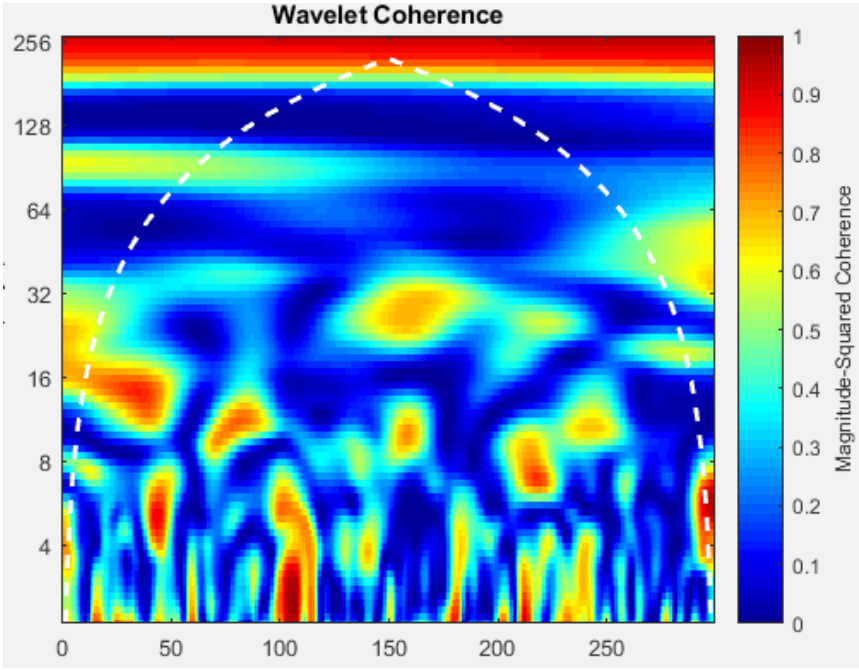

Fig. 2. Wavelet coherence between the values of the FBS and serum vitamin C markers when ranking by the HbA_{1c} marker

Comparing Fig. 1 and Fig. 2 we can see different consistency between the markers that are considered. The consistency for the data in Fig. 1 is higher than for the data in Fig. 2.

In Fig. 3 shows the wavelet coherence between the values of the serum vitamin A and serum vitamin C.

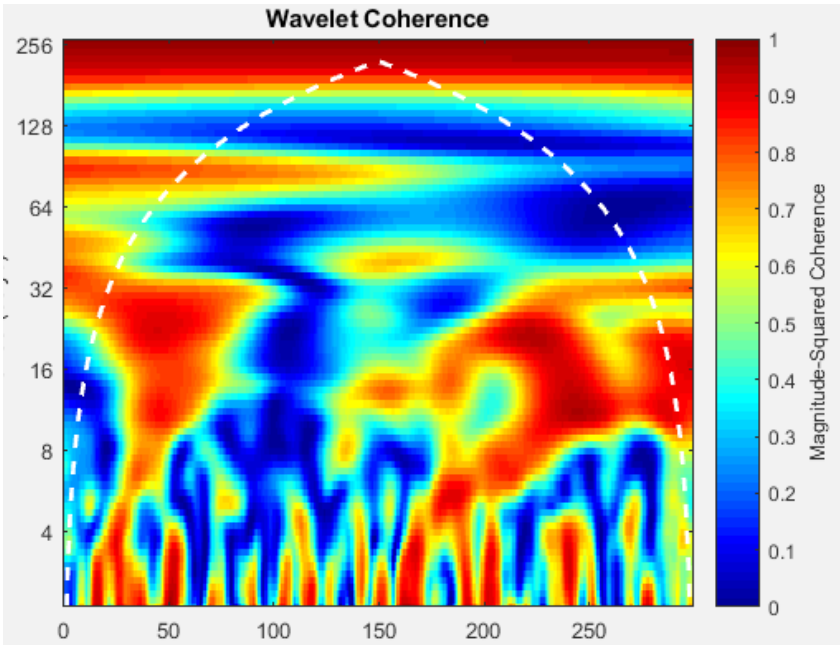

Fig. 3. Wavelet coherence between the values of the serum vitamin A and serum vitamin C markers when ranking by the HbA_{1c} marker

In Fig. 3, we see a significant agreement between the values of the serum vitamin A and serum vitamin C. Thus, serum vitamin A and serum vitamin C play an important role from the standpoint of analysis of the conditions for the development of diabetes mellitus, the effect on the change in the level of the HbA_{1c} marker.

In Fig. 4 shows the wavelet coherence values between serum vitamin A and MDA.

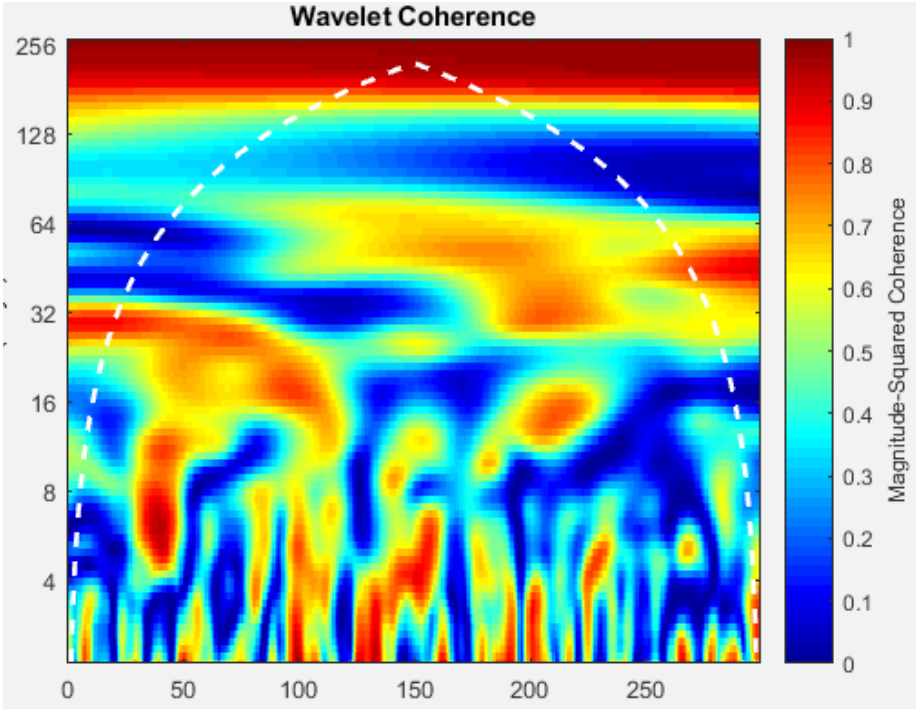

Fig. 4. Wavelet coherence between the values of the serum vitamin A and MDA markers when ranking by the HbA_{1c} marker

At the same time, in Fig. 5 shows the wavelet coherence between the values of the serum vitamin A and MDA when ranking by the FBS marker.

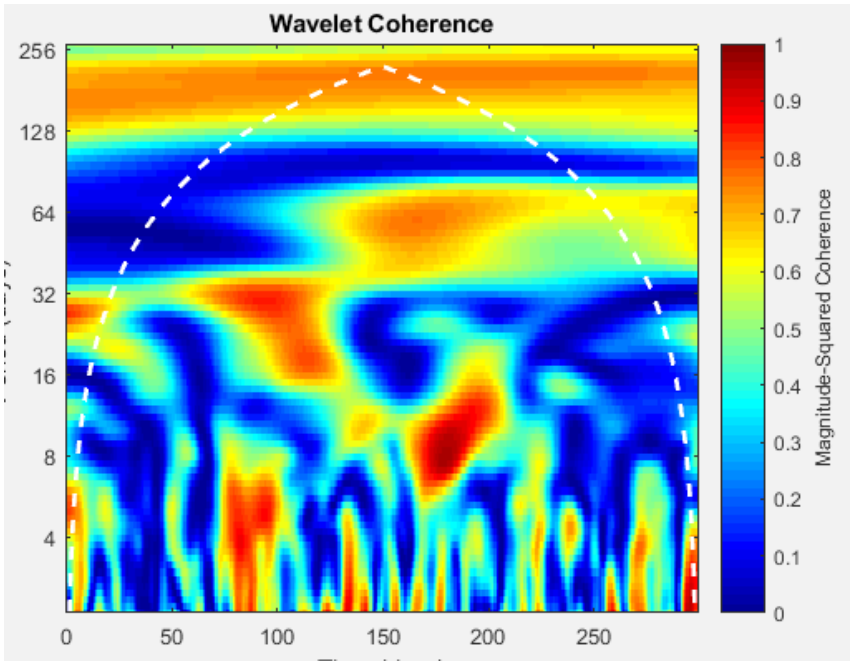

Fig. 5. Wavelet coherence between serum vitamin A and MDA values when ranking by FBS marker

Comparing the data in Fig. 4 and Fig. 5, we can see a different degree of consistency between serum vitamin A and MDA markers when ranking by HbA_{1c} or FBS. However, the greatest consistency is characteristic for lower values of HbA_{1c} or FBS.

Discussion

The high prevalence of diabetes and the possibility of its influence on the development of other diseases make it necessary to conduct various studies. Such studies involve the analysis of markers that characterize the development of diabetes. Among such studies, a special place is occupied by the analysis of correlation between individual markers. This allows us to analyze the development of diabetes and evaluate the effect of various components on such a process.

In[16], based on the analysis of correlation relationships, the relationship between neutrophil-lymphocyte ratio and insulin resistance is considered. This allows you to correctly diagnose patients with diabetes.

In the study[17], on the basis of correlation analysis between different markers, connections with complications that arise in diabetes were determined.

We can also note other studies, where the basis of the study of various markers in the study of the development of diabetes is a correlation analysis[3,5,18,19].

However, when considering correlations, we consider the pairwise influence of markers. In some cases, this can lead to mixed results [20]. For example, when we compare several markers, we can have different correlation values. As a result, it is difficult to draw general conclusions.

In this study, we are expanding the possibilities of conducting correlation analysis. This is possible through the use of wavelet ideology. For this we use wavelet coherence. As a result, we are able to estimate the correlation value between three different markers. This makes it possible to expand the conclusions based on the studies.

Conclusion

We considered the possibility of expanding the correlation analysis to study various markers in diabetes mellitus. For this, we used wavelet coherence. In particular, periods of agreement between FBS and serum vitamin A, FBS and serum vitamin C, serum vitamin A and serum vitamin C, serum vitamin A and MDA for different levels of HbA1c are shown. This allows us to evaluate the effect of various markers on the development of diabetes. Different periods between serum vitamin A and MDA were also observed, taking into account the analysis of HbA1c and FBS levels.

Capacity Creation in Health Infrastructure and their Outcomes: A Study in Spatial Disparity in Assam

Afshana Parveen[1], Nissar A. Barua[2]

[1]PhD Research Scholar, [2]Professor, Department of Economics, Gauhati University

Abstract

Health sector development is highly correlated with the level of human development of a region and is an important factor determining the efficiency of the human resource of a country. In fact, there is a strong nexus between economic growth and human development which again depends on an efficient health sector. In this backdrop, the rationale for a detailed exploration of capacity creation in health and its outcome in terms of attainments in health parameters appears to be strong. This paper seeks to explore capacity creation in the health sector and examine how it has affected health outcomes in the Indian state of Assam. This is sought to be exercised through the construction of three independent indices and one composite index. The indices have been constructed on three dimensions, namely, Health Infrastructure, Health Manpower, and Health Outcome. The composite health index so constructed unfortunately exposes the poor attainments of the state in all the three dimensions considered. Moreover, health outcomes in Assam is extremely asymmetrical with high attainments in a few districts as opposed to poor performance in the majority of the remaining districts. Though it must be stated that the attainments indicated by the indices presents only a partial picture of the health infrastructure and manpower in the state as the study domain includes only the public interventions while ignoring the installed capacity in the private sector.

Keywords: *Health Infrastructure, health outcome, health manpower, Composite Index.*

Introduction

World Health Organization defined health as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity",[1] which helps a person to lead a socio-economically active and productive life. But in economics, for a meaningful analysis,health status is evaluated in terms of measurable parameters like life expectancy at birth, infant mortality rate (IMR), maternal mortality rate (MMR), etc.

To promote, restore and maintain the health of its people through a multitude of proper healthcare as well as medical care services, every country has a healthcare system. Health sector development is highly correlated with the level of human development of a region and is an important factor determining the efficiency of the human resource of a country. As the health sector develops, the quality of life improves, leading to better quality human capital and higher total factor productivity, which enhances economic growth. However,in spite of the primacy of health sector in augmenting the development process, access to basic health services has continued to remain poor in developing countries like India.

India had experienced rapid economic growth over the years and has been overtaking other countries both in terms of GNP and GNP (PPP). However, on social front, India's performance is poor and is probably behind most of the important developing economies which is evident in its rank of 130 out of 189 countries in terms of Human Development Indicators.[2] More particularly, India's health care sector has been a matter of serious concern as it had remained a lacuna for the country over the years. In India, despite considerable investment in health infrastructure, both access to and use of services remain suboptimal and vary considerably across states and regions. This is especially reflected in parameters like IMR and MMR which have been historically adverse. The Sustainable Development Goal Report 2019 has set a target to reduce the IMR and MMR respectively to 25 per 1000 and less than 70 per 100,000 live birth by 2030. In that perspective, India's maternal mortality rate of 174 deaths in 2017 and the infant mortality rate of 34.6 was alarmingly high.[3] It has been argued that the lackluster performance of the health sector of India is mainly because of poor healthcare facilities, especially at the primary level. While India does have some world-

class health infrastructure providing topnotch treatment facilities, but they are way out of reach of the common people. In fact, the basic health care facilities available to the common masses, especially in the countryside, is very poor. In this backdrop, the rationale for a detailed exploration of capacity creation in health and its outcome in terms of attainments in health parameters appears to be strong. This paperseeksto explore capacity creation in the health sector and examine how it has affectedhealth outcomes in the Indian state of Assam.

Assam has an area of 78,438 sq Km with thirty-three districts and a population of about 3.12 crore.[4] The state ranks 30th among the country's major states and union territories in terms of Human Development Index.[2] More importantly, in terms of attainments in health, *India Today Ranking* has positioned it at 19thamong 21 states of the country.[5]

Table 1: Health Indicators-A comparative profile

Indicators	Assam	India
IMR	48	41
Under 5 Mortality Rate	56	50
Full Vaccination Coverage	47.1%	62.0%
Children's Nutritional status (children age below 5 years who are underweight)	29.8%	35.8%
Anemia among children (children age 6-59 months who are anemic)	35.7%	58.6%
Underweight women with BMI below normal	25.7%	22.9
MMR	237	130
Life expectancy at birth	63.6(men) 64.8(women)	67.3(men) 69.6(women)

Source: NFHS-IV, 2014-16,M/O Health & F.W., GOI.[6]

The poor ranking of Assam is reflected in Table-1 where the state lags behind the national average in most of the important health parameters. A cause of serious concern is particularly the MMR, IMR and Vaccination Coverage which are very adverse relative to the national average.

These limitations in Assam's health sector have been taken into cognizance by both the state and central governments in terms of affirmative actions to correct the existing state. Over the years, the state has created a health infrastructure of 4644 Sub-Centres (SCs), 946 Primary Health Centres (PHCs), 172 Community Health Centres (CHCs), 14 Sub-divisional Hospitals (SDHs), and 25 District Hospitals (DHs) spread across the state. However, as is evident in the health attainments of the state viz-a-viz the national average, there still exists an infrastructural gap as well as a shortage of manpower to run the healthcare institutions. The most recent summary data put out by the 4th National Family Health Survey shows that while the state has succeeded in improving its health indicators, the current situation leaves a lot more room for improvement.

The paper seeks to document the spatial differential in capacity creation in health infrastructure. It extends the research to assess the health outcomes across districts of the state following the differences in the existing physical and human infrastructure through the construction of three independent indices and one composite index covering various dimensions.

Material and Method

Assessment of the health attainment of various districts of Assam and an inter-district comparison can be very revealing. Accordingly, ranking and comparative analysis of the health status of various districts of Assam has been undertaken on the basis of a Score Index using the UNDP method.[7] The score index for each dimension has been constructed to track the performance of each district in each dimension and subsequently clubbed to form a composite health index. The methodology used is as follows:

Construction of Score index: First of all, each district is given a score based on the individual indicator. The score index ($S_{indicator}$) is given by the following formulae:

- For a positively increasing indicator,
  $$S_{indicator} = 1 - ((max-I)/(max-min))$$
- For a negatively increasing (declining) indicator,
  $$S_{indicator} = 1 - ((I-min)/(max-min))$$

Where "max" is the maximum value of a given indicator across all districts in the sample set; "min" is the minimum value of that indicator in the set of districts, and 'I' is the actual data value of an individual district on that indicator. A score of zero implies that the particular district is the poorest performing in the sample; while a score of oneindicates that the particular district is the best performing in the sample. This has been used to demonstrate an inter-district ranking based on the score index.

Dimension score: Next, by averaging across the indicator scores of each district a dimension scoreis arrived at for each dimension. For instance, dimension 2 i.e. health manpower has 3 indicators; all the score indices ($S_{indicator}$) of all the 3 indicators would be averaged so as to provide equal weight to all the indicators within that dimension into a single Dimension score.

Composite index score: Finally, by averaging all the Dimension scores the composite index is arrived, based on which the final ranking of the districts has been done.

Colour coding: Four coloursnamely, red, yellow, green and pink representing four different categories of performance, namely, very poor, poor, comparatively better and satisfactory respectively have been used to rank the districts and the range for each of these four categories is based on breaking up the index values into four equal quartiles.

The indicators that are being used for the construction of the index are shown in Table 2.

Table 2. List of Indicators used for district ranking

Health Infrastructure	Health Manpower	Health Outcome
Total Health Centres per 1000 population	Doctors per 1000 population	Infant Mortality Rate
Total Health centers per 100 square Km	Nurses per 1000 population	Maternal Mortality Rate
	Para Medicals per 1000 population	Vaccination Coverage

Findings:

Dimension 1: Health Infrastructure: The health status of a country or a state depends to a great extent on the availability of health-related infrastructure. Though over the years the number of physical health infrastructure in Assam has been increasing, in relation to population growth and advancement in health-related technology, the attainments have not been satisfactory. While primary health centres have been created across the various districts in the state but spatial disparity still prevails. Moreover, the availability of CHCs, DHs and SDHs, which constitute the most important tier of the health sector, is grossly inadequate relative to the area it has to cover. This is also reflected in the estimates of accessibility of the health centers which is conspicuously low. This uneven creation of health care infrastructure in the state is sought to be captured with an inter-district health index. Table 3 shows that 21 districts out of 27 are categorized as “very poorly” and “poorly” performing districts while only 5 districts qualify among “comparatively better” category. Among the districts, Tinsukia is the worst performing with a score of only 0.20 while Nalbari is the only district in a sole “satisfactory” position with 0.79 scores.

Table 3: Ranking of the Districts based on Health Infrastructure

Districts	$S_{indicator}$	Districts	$S_{indicator}$	Districts	$S_{indicator}$	Districts	$S_{indicator}$
Tinsukia	0.20	Lakhimpur	0.36	Dima Hasao	0.50	Nalbari	0.79
KarbiAnglong	0.21	Jorhat	0.36	Darrang	0.51		
Dhemaji	0.22	Chirang	0.36	Barpeta	0.54		
Kamrup Metro	0.25	Baksa	0.36	Karimganj	0.55		
Golaghat	0.27	Udalguri	0.39	Kamrup Rural	0.58		
Sonitpur	0.30	Hailakandi	0.40				
Cachar	0.31	Nagaon	0.40				
		Kokrajhar	0.40				
		Marigaon	0.40				
		Dibrugarh	0.42				
		Goalpara	0.43				
		Dhubri	0.45				
		Sibsagar	0.46				
		Bongaigaon	0.48				

Dimension 2: Health Manpower: Just like health infrastructure, the accessibility to health manpower is evidently low. Table 4 summarizes the comparative picture for the districts in terms of the health manpower index. Out of 27 districts of Assam, 19 are categorized as "very poorly" performing districts while 6 districts are "poorly" performing ones. There is only one "comparatively better" and one "satisfactorily" performing district. Thus this dimension is in need of special focus because the state suffers from a very adverse status with regards to accessibility to health manpower.

Table 4 Ranking of Districts based onHealth Manpower

Districts	$S_{indicator}$	Districts	$S_{indicator}$	Districts	$S_{indicator}$	Districts	$S_{indicator}$
Cachar	0.06	Chirang	0.31	Nalbari	0.61	Dima Hasao	0.99

Baksa	0.23						
Golaghat	0.24						
Bongaigaon	0.26						
Lakhimpur	0.26						
Darrang	0.27						
Goalpara	0.27						
Dhemaji	0.28						
Kokrajhar	0.28						

Dimension 3: Health Outcome: Health outcomes in Assam is extremely asymmetrical with high attainments in a few districts as opposed to poor performance in the majority of the remaining districts. This is evident in the fact that most of the districts expect a few are lagging behind the state average with respect to maternal and child health as reflected in the MMR and IMR. This is also true with regards to attainments in vaccination coverage.

Table 5: Rankings of the districts based on Health Outcome

Districts	Score Index	Districts	Score Index	Districts	Score Index	Districts	Score Index
Kamrup Metro	0.04	Cachar	0.25	Sonitpur	0.46	Kamrup Rural	0.67
		Dibrugarh	0.25	Goalpara	0.47	Morigaon	0.71
		Golaghat	0.28	Hailakandi	0.47	Tinsukia	0.77
		Karimganj	0.28	Barpeta	0.48	Nagaon	0.82
		Kokrajhar	0.30	KarbiAnglong	0.54		
		Dhemaji	0.35	Baksa	0.56		
		Udalguri	0.36	Dima Hasao	0.60		
		Jorhat	0.37	Dhubri	0.62		
		Bongaigaon	0.42	Lakhimpur	0.63		
		Chirang	0.44	Sibsagar	0.64		
		Darrang	0.44				
		Nalbari	0.45				

The index in health outcomes as presented in Table 5 surprisingly ranks Kamrup Metro (which includes Guwahati city) as the worst-performing district. This however is a paradox as Guwahati city boasts off the best health infrastructure in the state. The state however, has done relatively better in this dimension with 4 districts performing satisfactorily and 10 others doing comparatively better.

Composite Index and Overall Ranking: Index constructed on individual dimensions provide an incomplete picture of how districts are faring in overall health status. To obtain the comprehensive picture, a composite index (CI) is constructed, which takes into account all the three dimensions namely, Health Infrastructure, Health Manpower, and Health Outcome. This section presents an overall ranking of all the districts of Assam based on the Composite Index.

Table 6: Rankings of the districts based on Composite Index

Districts	CI	Districts	CI	Districts	CI	Districts	CI
Kamrup Metro	0.21	Hailakandi	0.34	Sibsagar	0.47	Nalbari	0.62
Cachar	0.21	Tinsukia	0.34	Kamrup Rural	0.54	Dima Hasao	0.7
Golaghat	0.26	Jorhat	0.35				
Dhemaji	0.28	Chirang	0.37				
Dibrugarh	0.28	KarbiAnglong	0.37				
Sonitpur	0.30	Baksa	0.38				
Udalguri	0.31	Dhubri	0.38				
Karimganj	0.31	Goalpara	0.39				
Kokrajhar	0.33	Bongaigaon	0.39				
		Barpeta	0.4				
		Darrang	0.41				
		Morigaon	0.41				
		Lakhimpur	0.42				
		Nagaon	0.43				

Table 6 shows that out of 27 districts, 23 districts are either ranked as “very poor” or “poor” implying that they suffer from inadequate health infrastructure and subsequently are experiencing very adverse outcomes. The index also demonstrates the fact that a handful of districts had been favored in capacity creation which has enable them to attain more privileged status in the ranking. This applies to two districts who are ranked as “satisfactory” and two others are ranked as “comparatively better”.

Among the districts Kamrup Metro has the lowest rank in the composite index which is consistent with its adverse status in all the dimensions.

Discussion

The results appear quite inexplicable especially in the case of Kamrup Metro which is the most endowed district of the state in terms of medical infrastructure and health personals. This is in consonance with the fact that the city constitutes the principal health destination for people across the North-east.

In the context of the standing of Kamrup Metro in the composite index, it can be deduced that a large number of health centers and health professionals in the district, can be negated by a relatively bigger population. Using the same rationale the favorable position of Dima Hasao as one of the best performing district despite poor health infrastructure and dearth of health personals, can be explained by its scanty population.

Another reason for the adverse status of Kamrup Metro in the composite index can be attributed to the fact that only state interventions in health is incorporated into the calculations. However this result in a downward bias in the score of the district as a considerable part of the health infrastructure is provided by the private sector which is ignored under the scope of the study.

Conclusion

This paper has ranked the health status of all the districts of Assam in terms of infrastructure, medical personals and health outcomes. As most of the dimensions are expressed relative to the population they serve or the area they cover, the parameters are affected by the size of the population and area of the districts. Despite the biases thus generated, the rankings do reveal to an extent the health infrastructure that is created in the district, the health personals available to man them and the subsequent health outcomes.

The composite health index besides exposing the poor attainments of the state in all the three dimensions considered, reveals the huge disparity that exists between the few well-endowed districts and the rest of the poor achievers. However, it must be stated that the attainments indicated by the indices presents only a partial picture of the health infrastructure and manpower in the state as the study domain includes only the public interventions while ignoring the installed capacity in the private sector. This is one of the reason why Kamrup Metro constituted by Guwahati city is ranked as the worst performing district.

Carbonic Anhydrase IX Expression in Renal Cell Carcinoma: An Immunohistochemical Study

Deepika Chandrasekaran[1], Anukiran[2], Gurunandha Raja[2], Sandhya Sundaram[3], Padmavathi R.[4], Kathiresan N.[5]

[1]Ph.D. Research Scholar, Department of Physiology, [2]MBBS Undergraduate Student, [3]Professor & Head, Department of Pathology, [4]Professor & Head, Department of Physiology, SRMC & RI, Porur, Chennai, [5]Senior Consultant, Apollo Speciality Hospital, Teynampet

Abstract

Introduction: Over the past two decades, Renal cell carcinoma(RCC) has become one of the lethal tumors of growing concern among the Indian population due to its heterogenic pattern. It is asymptomatic and chemoradioresistant. Most patients present with metastasis at the time of diagnosis. The treatment is limited. The inactivation of von Hippel-Lindau (VHL) gene produces Hypoxia Inducible Factor-1α. In response to hypoxia, Carbonic anhydrase IX (CA IX) modifies intracellular pH to aid tumor progression by regulating cell proliferation and invasiveness. CAIX is over-expressed in VHL mutated ccRCC. It is essential to improve the host immunity by targeting the CAIX, thereby destroying the tumor progressionto improve the survival rate.

Aim: To evaluate the CAIX expression in renal carcinoma tissue and adjacent normal tissue and to compare its expressions with the tumor characteristics.

Method and Materials: This study was conducted using 150 tissue blocks of histopathologicallyproven RCC patients. Ethical clearance was obtained from the institute Ethics Committee. CAIX was analyzed by Biotin Streptavidin Immunoperoxidase method. Q scoring was done.

Results: 74% of RCC cases were CA IX positive whereas the adjacent normal tissue area showed negative staining. In this study, most of theCcRCC patients(91.7%) expressed strong and diffuse staining and the other subtypes were weak and focally stained. Collecting Duct and sarcomatoid Carcinoma subtypes showed negative staining. The intensity of staining was inversely proportional to grading.

Conclusion: CAIX was strongly expressed in low grade clear cell RCC. CAIX could play a role as potential diagnostic marker in renal cell carcinoma, assessing prognosis and designing therapy.

Keywords: *Carbonic anhydrase IX,Diagnostic marker, Immunohistochemistry, Renal Cell Carcinoma.*

Introduction

Over the past two decades, renal cell carcinoma (RCC) has been studied in detail both clinically as well as molecularly. It has a heterogeneous pattern with different subtypes, each with a distinct histology, genetics, molecular profiles, and biologic behavior. There are many clinical trials going on and new targets being identified for therapeutic development[1].

The incidence of both early and late stage renal cell carcinoma cases is rising in the recent years. It is characterized by absence of symptoms, varying clinical presentations and resistance to radiation and chemotherapy[2]. Despite the recent advances in field of oncology, the prognosis is very poor and the treatment is restricted. Nowadays metastatic renal cell carcinoma

(mRCC) which was previously a fatal disease became a chronic progressive disease with several new therapeutic options like targeted therapy, immunotherapy. Advances in targeted drug development have led to a number of new regimens for advanced RCC. RCC management is a promising area of ongoing clinical investigation[3].

Carbonic Anhydrase IX: Carbonic anhydrase ix (CAIX)is a hypoxia inducible metalloenzyme over expressed in cancer cells. Its main role is to maintain the intracellular pHand also lowers the E-cadherin mediated cell adhesion.It is over-expressed in many hypoxic tumours especially in VHL mutated ccRCC and low-expressed in normal renal tissues[4]. The tumour cells limit the process of oxidative phosphorylation and favour glycolysis for their growth thereby proving the Warburg effect noticed in VHL mutations[5,6].

CAIX is a cellular biomarker of hypoxia. During hypoxia it maintains a neutral intracellular pH and an acidic extracellular environment favourable for tumor progression as well as tumor invasion and metastasis[7]. CAIX expression in RCC is very distinct as it is completely absent in normal renal tissue.Many pharmacological agencies are conducting various preclinical trials for development of a suitable targeted therapy for RCC. Antagonism of the CAIX activity using specific inhibitors can play achief role in management and treatment of RCC[8,9]. Hence CAIX can become a novel targeted therapy for RCC. Targeted drugs after surgery especially for patients at high risk of recurrence play a very beneficial role in improving their survival rates.

Aim: With this background, the aim of this study is to evaluate the CAIX expression in renal tumor cells and adjacent normal tissue and to compare its expressions with the tumor characteristics.

Materials and Method: This is a retrospective study conducted using 150 tissue blocks ofhistopathologically proven RCC patients. Ethical clearance was obtained from the Ethics Committee, Sri Ramachandra Institute of Higher Education & Research (Deemed University). Tissue blocks of all renal cell carcinoma patients who underwent nephrectomy in Sri Ramachandra Hospitalfrom January 2011 to September 2018 were included in the study. Their corresponding paraffin embedded formalin fixed blocks were carefully chosen. The case details were obtained from the medical records department. Study included 111 males and 39 females. The mean age is 55yrs and the mean tumor size is 7.3cm. The common complaints during admission were abdominal pain (73) and hematuria (39). Clear cell renal cell carcinoma (ccRCC) subtype contributes around 72.7% of the RCC cases in our study. The other common subtypes of RCC are chromophobe (14.7%), papillary (9.3%), sarcomatoid (2.7%) and collecting duct (0.7%). It is graded according to the WHO-ISUP grading and staged based on the TNM staging.

Immunohistochemistry (Biotin Streptavidin Immunoperoxidase method) was done to assess the expression of CAIX in the tumor cells. CAIX rabbit polyclonal antibody [CAIX (H-120); Santacruz, 1:100dilutions] was used for immunostaining. The prepared slide was focused under high magnification x200. Brown colorationin the tumor cell membrane explained the expression of CAIX in the tumor cells[10]. Then Q scoring was done to quantitatively score the expression of CAIX.

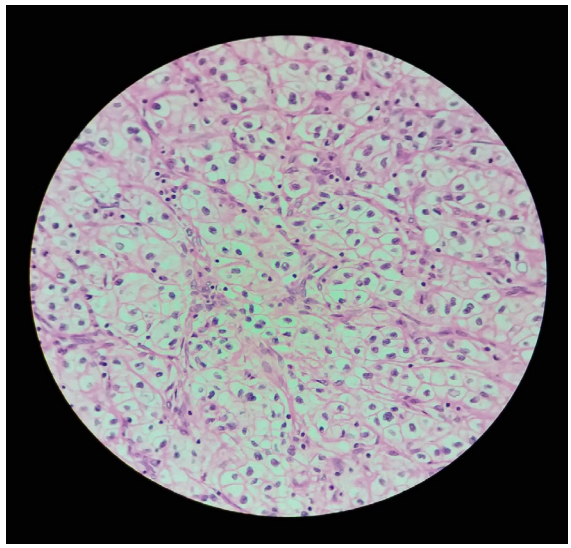

Fig 1: H & E clear cell renal cell carcinoma(X200)

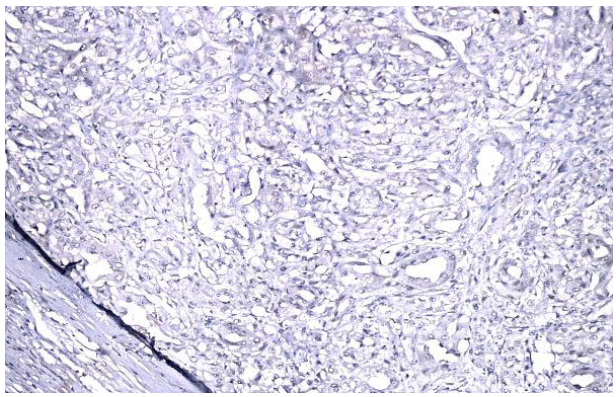

Fig 2: CAIX–Negative immunostaining collecting duct RCC (X200)

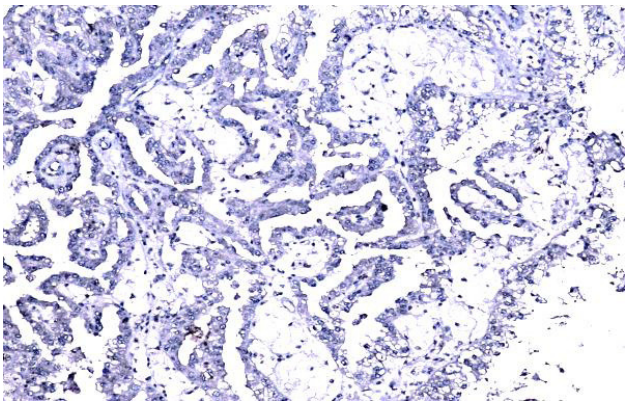

Fig 3: CAIX - Moderate immunostaining papillary RCC (X200)

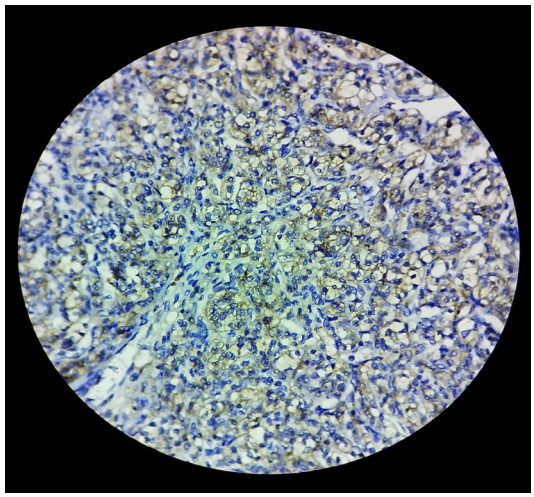

Fig 4: CAIX - Strong immunostaining clear cell RCC (X200)

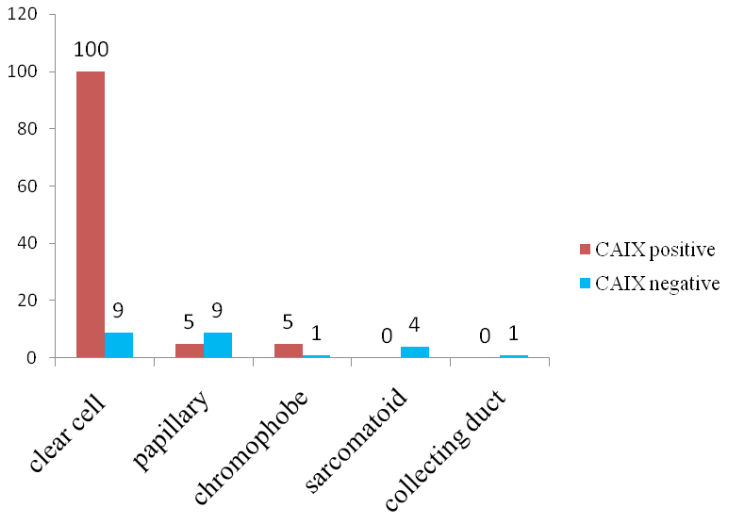
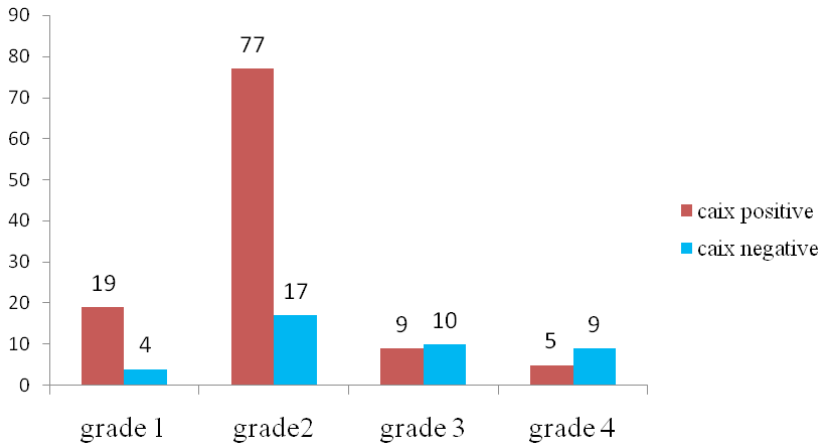
Score	**0**	**1+**	**2+**	**3+**	**4+**
Positive Cells	<10%	10-25%	25-50%	50-75%	>75%

Score	**1**	**2**	**3**
Intensity of Staining	weak staining	moderate staining	strong staining



Q score was calculated by multiplying the percentage (P) and the intensity (I). Formula: Q = P x I; Maximum = 12; The Qscoring results range from 0 to 12[11]. Values 0 and 1 are considered immunoscoring negative (fig :2); Values 2 to 12 are considered immunoscoring positive (fig:3; fig:4). The immunoscoring values were compared with the various parameters (type of RCC, grade and stage) and analyzed.

Results



The tumor characteristics of the subjects involved in the study are highlighted in the table:1. The study included 150 RCC cases. Among the 150, 110(73%) expressed CAIX in the tumor cell surface whereas 40(27%) were negatively stained. The classical histological subtypes of RCC are clear cell (ccRCC), papillary, chrompphobe, collecting duct and sarcomatous. Graph 1 explains the increased expression of CAIX among the clear cell subtypes. Graph 2 explains the increased expression of CAIX among the low grade tumors. From the table: 2, it clearly shows us that CAIX expression is significantly associated with the clear cell subtype of RCC (p value =0.004) and WHO ISUP grading (p value =0.001).

Table 1: Baseline parameters

Characteristics	**No. of Patients (n)**	**%**
Gender: male	111	74.0
Female	39	26.0
Histology: clear cell	109	72.7
Papillary	14	9.3
Chromophobe	22	14.7
Collecting duct	1	0.7
Sarcomatous	4	2.7
Grade: I	23	15.3
II	94	62.7
III	19	12.7
IV	14	9.3
Stage: I	63	42.0
II	43	28.7
III	28	18.7
IV	16	10.7
CAIX positive	110	73.0
CAIX negative	40	27.0
	Median	**Min to Max**
Mean Age	55	23 to 90
Mean tumor size	7.3	1.8 to 21

Graph: 1 Distribution of CAIX expression among the Renal cell carcinoma histological subtypes; X axis is the RCC subtype, Y axis indicates the no. of cases in each subtype of RCC; 91.7% of clearcell subtype were CAIX positive, 35.7% of papillary and 22.7% of chromophobe were CAIX positive.

Graph: 2 Distribution of CAIX expressions among the Renal cell carcinoma grading.

X axis is the RCC grading, Y axis indicates the no. of cases; 82.6 % of grade 1, 81.9% of grade 2, 47.4% of grade 3 and 35.7% of grade 4 were CAIX positive.

Table 2: Comparison of the CAIX expression with the Clinical and pathologic features of Renal cell carcinoma patients:

Feature	CAIX Positive (110)	CAIX Negative(40)	P value
Age at surgery			
<= 50	34(72.3%)	13(27.7%)	0.853
>50	76(73.8%)	27(26.2%)	
Sex			
Male	80(72.1%)	31(27.9%)	0.556
Female	30(76.9%)	9(23.1%)	
Sub-types			
Clear cell	100(91.7%)	9(8.3%)	0.004
Papillary	5(35.7%)	9(64.3%)	
Chromophobe	5(22.7%)	17(77.3%)	
Sarcomatoid	0	4(100%)	
Collecting duct	0	1(100%)	
Grade			
I	19(82.6%)	4(17.4%)	0.001
II	77(81.9%)	17(18.1%)	
III	9(47.4%)	10(52.6%)	
IV	5(35.7%)	9(64.3%)	

Feature	CAIX Positive (110)	CAIX Negative(40)	P value
Stage			
I	53(84.1%)	10(15.9%)	0.037
II	31(72.1%)	12(27.9%)	
III	17(60.7%)	11(39.3%)	
IV	9(56.3%)	7(43.8%)	

Chi-squared tests were used to compare the CAIX expression with the tumor characteristics. SPSS software version 20.0 was used to perform the statistics. p value < 0.05 was considered as statistically significant.

CAIX was found to be strongly expressed in the tumor tissue. 73.3% of tumor cells were CAIX positive andthe adjacent normal tissue area expressed negative staining. 91.7% of the CcRCC patients expressed strong and diffuse staining. 5 each of the papillary and chromophobeRCC patients showed weak and focal staining. Collecting Duct Carcinoma and sarcomatous subtype showed negative staining. The comparison of CAIX Q scoring with the tumor characteristics (p value for type = 0.004, grade = 0.001, stage = 0.037)revealed significant association between ccRCC and CAIX expression. CAIX expression was well noticed in low grade tumors. The intensity of staining was inversely proportional to WHO ISUP grading.

Discussion

The CAIX expression was studied in various American and European countries. But very few studies have been done in Indian population. In the last few decades, due to the increase in RCC incidence, many research works have begun in India[12].

In a study conducted by Pretzel et al. in 2012, RCC was found to be common in elderly males. Our study also shows similar findings since most of the RCC patients were males. Majority of the RCC cases were clear cell type(77%). 73.3% of samples were CA IX positive whereas the adjacent normal tissue area showed negative staining.Some studies have shown that the low expression of CAIX may be related with the tumor progression and poor survival rate of clear cell RCC[13].

In a study conducted by Matthew H. T. Bui et al, 2003 in 321 RCC samples, CAIX was found to be the most important molecular indicator for renal cell carcinoma till date. In this study,CcRCCshowed diffuse and strong staining, papillary and chromophobe expressed moderate positivity for CAIX[14,15]. Few studies have also documented the usefulness of CAIX in differentiating clear cell type from other subtypes according to Elizabeth M Genega et al[16]. A study conducted by Gigante M et al explained the prognostic role of CAIX in metastatic ccRCC.It is clear that distinct morphological types underlie each histological type[17].

The molecular role of CAIX in tumor growth is currently under research. The combined expressions of CAIX and VHL mutations have been studied in various RCC[18]. It has been postulated that CAIX regulate acid-base balance creating an acidic environment favoring the tumour growth and invasiveness. Acidification of the extracellular matrixinduces angiogenic factors and inhibit the host immunity, which promotes tumor aggressiveness[19,20].

Few studies have explained the role of CAIX as a serum marker for RCC using ELISA test[21]. The plasma levels of CAIX were highly active in RCC individuals. Latest studies have substantiated the role of CAIX as a treatment approach for metastatic ccRCC. CAIX can prove to be an attractive target for anticancer therapy. Its restricted expression in the normal tissue and extracellular surface staining in most tumor cells indicate its role in tumor genesis and metastasis[22.]

Several pharmacological trials are being under study to find the perfect CAIX antibody to target the tumor. Girentuximab(G250), an antibody for CA IX is an investigational agent in RCC clinical trials[23]. Phase I & II trials proved it safe well tolerated and positively impact disease burden alone or with interferon 1 alpha. Phase III trials are now initiated aiming at reducing recurrence in surgically treated RCC with high risk of relapse and for metastasis[24].Many western studies have proved CAIX antibodies can assist the tumor cells to respond to immunotherapy[25].

Conclusion

Thus our study showed the significance of CAIX as a major role inccRCC. This may prove to be a potential diagnostic and prognostic marker. Studies are needed to assess which patient might respond to which targeted therapy, but it is a vast field needing tremendous literature research before beginning such a correlation study which is our next field of interest. This information can provide additional insights in renal cell carcinoma diagnosis and management. Thus, CA IX marker may therefore prove useful as potential diagnostic marker, in assessing the prognosis and designing therapy in these tumors.

A Study on Complementary Feeding Practices and Diet Quality among Tribal Populations in North-East India

Th Eloni Vida[1], Virginia Paul[2], Th Kayia Priscilla Kayina[3]

[1]PhD Research Scholar, [2]Professor, Department of Food Nutrition and Public Health, ECHS, SHUATS, Allahabad, [3]Assistant Professor, Department of Community Medicine, Jawaharlal Nehru Institute of Medical Sciences, Manipur

Abstract

Introduction: Complementary feeding practices have a significant impact on life from childhood to adulthood. It is important to understand the practices followed to bring about policy changes. The study aims to assess complementary feeding practices among the tribal population of North-East India

Material and Method: A community-based, cross sectional study was conducted among 820 pairs of mother and child in two North-Eastern states of India, using a pre-tested questionnaire based in Infant and Young Child feeding Guidelines.

Results: In the study it was seen that, majority of the study population (73.7%) followed timely introduction of complementary feeding. The type of food commonly used as introductory food were rice (62.8%) and commercial infant formulae (18.66%). Infant and Young Child Feeding indicators such as intake of Minimum Diet Diversity (32.2%), and Minimum acceptable diet (30.85%) were found to be inadequate except for Minimum meal frequency where it was found to be on the higher side at 93.8%.

Conclusion: The feeding practices were found to be unhealthy. It is recommended more intensive awareness generation activities along with emphasis on diverse dietary intake be taken up to improve health literacy to bring about a conducive environment for holistic the growth and development of the individual, society and nation as a whole.

Keywords: *IYCF, Tribal, Complementary-feeding Practices, Nutrition, North-East.*

Introduction

Inappropriate complementary feeding practices are considered one of the important reasons for development of malnutrition, and childhood under-nutrition is responsible for 45% of all under-five deaths.[1] The period of 6 months to 2 years of age also set the antecedent for many of the health conditions that occur later in life. The eating habits that are developed, and the nutritional status during this period has long lasting impact on the health conditions of adult life especially the diseases of Chronic non-communicable diseases.[2] Maintaining a healthy diet in infants and young children is therefore not only important for the early stages of life, but also for future, and the foundation for a healthy eating lifestyle begin especially in this period of complementary feeding initiation.

Tribal population in India are among the population who are backward in all growth and development indicators including health, and researches in them are underdone (NFHS-4).[3] The region of North-East India is one of the two major geographical regions of the country which hosts the tribal population, and they have different cultural and food practices. Generally diverse food are consumed by the tribes of North-East (NE)which includes rice and maize, beans, various green leafy vegetables including wild foraged leaves,

e-mail: priscilla.kayina@gmail.com

different fruits both cultivated and wild, insects and meat including game meat.[4] But with urbanization and imposition of laws regarding wildlife preservations, a change in food habits of tribal populations, and adoption of foreign eating habits are seen. It is imperative that researches are done among them to understand their feeding habits and practices so as to encourage healthy behaviours and change the unhealthy practices in order that healthy behaviours are promoted and when required, bring about policy changes. The study aims to assess the complementary feeding practices among the tribal populations of NE India.

Materials and Method

A community-based cross sectional study was conducted among pairs of mother and child,whose children were in the age group of 6 to 23 months,in the NE hill terrains among tribal population. Two states were selected through purposive sampling. From the selected states, through simple random sampling onehill district each were selected, followed by choosing one sub-division each and then selection of villages till the required sample size was reached using similar sampling technique. The total sample size calculated was 820 pairs of mother and child based on the prevalence of practice of 60% of exclusive breastfeeding (NHFS-4) as an indicator for the practice of healthy behaviour among the mothers, with 95% confidence interval, 5% allowable error, and 10% non-response rate. A house-to-house interview of the study participants were done using a pre-tested questionnaire consisting of questions mainly based on the standard questionnaire of Infant and Young Child Feeding practices indicators including their socio-demographic details. Data were collected from April 2018 to January of 2019 and the collected data were entered into excel and were analysed using SPSS v.20. Descriptive data are presented as Mean, Standard Deviation, percentage and proportions, and whereas for analytical statistics, chi-square and logistic regression were used and p-value less than 0.05 was considered significant.

Results

The total number of samples included in the study was 820 from thirteen villages of two states of North-East India.

Study population characteristics: In the study majority (54.1%) of the mothers were in the age group of 26 to 35 years and three-fifth of them had completed their education up to higher secondary, with only 11.3% of them as illiterates. They were mostly home-makers (49.87%) and farmers (37.3%), and many of them were involved in agricultural activities although they identified themselves as home-makers. Father of the children in the study were also mostly educated up to higher secondary, with two-fifth of them involved in agricultural activities. As for their income, a third of the family of study participants live on less than Rs. 5000 per month,although almost all of them owned the house they live in. Three-generation type of family were seen in 57.1% of the population, and the rest were nuclear families.

Table 1: Characteristics of children

Variables	Frequency (%)
Age-Group	
6-8 Months	254 (31)
9-11 Months	133 (16.2)
12-23 Months	433 (52.8)
Birth Order	
1-2	599 (73)
3-4	206 (25.1
5-6	15 (1.9)
Number of Siblings	
0-1	598 (72.9)
2-3	206 (25.1)
4-5	16 (2)
Family Income per month (Rs)	
≤ 5000	235 (30.2)
5001-9999	153 (19.7)
10000-19999	171 (22)
≥ 20000	218 (28.2)

Majority of the children included were aged 6 months, with median age of 12 months. Almost equal representation from both the genders (Male-50.5%, Female-49.5%). Two-third of the children were of the birth order of 1 or 2, with median number of siblings being 1(Table 1).

Complementary Feeding Practices: Timely initiation of complementary was done by 73.7% of the study population with mean age of initiation at 5.7 months. Early initiation of complementary feeding was seen in 18.7% of the study population, and late introduction was seen in 7.5% of the population. The most common reasons for early introduction were “inadequate breast-milk production” (by half of the practising population), lack of knowledge regarding the right time of introduction

and lastly insistence by relatives to start feeding. As for the reasons for late introduction, the common common reason which was given by almost half of the population practising was "Child was not interested in eating", which was followed by late of knowledge regarding the correct time of introduction and there was "Excess of breast-milk production".

The common food which were given as introductory food includes, home-made preparations of rice and its combination with various pulses and vegetables and given by almost 62.8% of the study population, and commercial infant formula (CIF), and its combination with other food such as fruits, pulses, roots etc were used given by approximately 24% of the population. The usual mode of food preparation was by boiling which is a practice followed even in preparation of adult food, which are then mashed or grinded.In cases where only CIF were given, it was seen that all the participants did not follow correct dilution, with most of them reporting excess addition of water.No culture of food restrictions or myths regarding complementary food were reported in the study.

The usual mode of feeding is through spoons and bowls or plates in 85.49 % of the population. The other method were using feeding bottles (5.7%), feeding by hands or chewingof food by mothers and then fed mouth to mouth.

Current Dietary habits of the Children and associated factors: The different food itemsare almost same for all the different age groups except for the consistency in which they are given, where for the younger group of children the texture was softer. The different items included, rice, vegetables such as mustard, colocasia, collard greens, ferns, ash gourd etc and roots such as sweet potato, cassava, etc dal, fruits and rarely meat, eggs, and milk products. Minimum diet diversity (MDD) is an indicator given by IYCF to measure the intake of balance diet, in terms on intake of different variety of food according to the seven food groups given. In the study it was found only 32.2% of the population consumed the required number of diverse diet on the previous day. The consumption of food belonging to the group of Grains, roots and tubers was found to be highest at (97.7%), which was followed by intake of vegetables at 62% of the population. Particularly the intake of vitamin A rich fruits and vegetables (14.8%), dairy products (20%), eggs (21.3%), flesh food (38.4%) and legumes and nuts (47%). Although the intake in vegetables was seen to be on the higher side, it was observed the variety of fruits and vegetables given were limited to a small number of varieties. Fruits and vegetables which they were in the habit of giving and which were considered acceptable to be given to children in their community only were given. There were apprehensions in introduction new food for fear of harming their children, and the benefits of giving a variety of fruits and vegetables were not known to them. Consumption of eggs were discouraged as they were believed to harm children and cause allergies.

As for the requirement of number of meals in a day, as per IYCF indicator in the study it was found that 98% of the children belonging to the age group of six to eight months and were breastfed had adequate number of meals and for those who were not breastfed in the same age group, all the three children were taking the minimum required number of meals. In the age group belonging to nine months up to eleven months 89.3% of the children were taking the minimum required number of meals, and among those who were not breastfed, all were taking the minimum adequate number of meals. From among the age group of twelve to twenty three months, among the breastfed 94.8% of the population were taking the minimum required number of meals, whereas from those who were not breastfed only 52% of them were taking the minimum required number of meals.

Minimum acceptable diet which is the indicator used for measuring adequacy of intake in terms of quality and frequency, it was seen that only 30.85% of the study population followed both the recommended number of frequency and quality.

Factors which are associated with complementary feeding practices:

Table 2: Determinants of complementary feeding practices

Sl. No	Variables	Minimum Dietary Diversity		OR	p-value
		Yes, n(%)	No, n(%)		
1	**Age of Mother**				
	≤ 30 Years	182 (31.6)	394 (68.4)	0.91	0.56
	> 30 Years	82 (33.6)	162 (66.4)		
2	**Family Type**				
	Nuclear	143 (40.6)	209 (59.4)	1.96	<0.0001
	Joint	121 (25.9)	347 (74.1)		
3	**Number of Siblings**				
	≤ 2	250 (32.7)	514 (67.3)	1.45	0.29
	≥ 3	14 (25)	42 (75)		
4	**Mother's Education**				
	Illiterate	19 (20.4)	74 (79.6)	1	
	Up-to High School	70 (33.5)	139 (66.5)	0.37	<0.0001
	≥ Intermediate	175 (33.8)	343 (66.2)	0.52	0.002
5	**Father's Education**				
	Illiterate	104 (42.1)	143 (57.9)		
	Up-to High School	28 (28)	72 (72)	1.5	0.05
	≥ Intermediate	132 (27.9)	341 (72.1)	0.6	0.06
5	**Child's Gender**				
	Male	132 (31.9)	282 (68.1)	0.97	0.8
	Female	132 (32.5)	274 (67.5)		
6	**Income Group (Rs)**				
	≤ 5000	43 (18.3)	192 (81.7)		
	5001-9999	40 (26.1)	113 (73.9)	0.29	<0.0001
	10000-19999	57 (33.3)	114 (66.7)	0.54	0.05
	≥ 20000	111 (32.3)	107 (67.7)	0.48	0.01

Factors such as type of family, education of mother and father, and income group were found to be significantly associated with poor MDD practices on bivariate analysis as seen in table 2, but in multivariate only education of mother was found to be statistically significant.

Discussion

Although the studied population are tribal who generally show poorer health indicators, in this study it was seen that timely initiation of complementary feeding was found to be on the higher side (73.7%) as compared to many other studies conducted in India, which varied from 31.6% to 77.5%.[5-8] This could be due to educational levels of the mothers which was seen to be on the higher side and was found to be important predictor of healthy complementary feeding practices.

Regarding the type of food given during the period of introduction of complementary feeding, it was seen that most of the participants gave homemade food which are considered better as compared to commercially prepared packaged food, which was found to be a positive deviant behaviour. The most common food material used in the preparation was found to be rice, which is a staple food of the region and the next most common food used were vegetables. Similar common use of rice was seen in studies where the staple food of the area was rice.[9] Use of green leafy vegetables in the food of the children were found to be on the higher side as compared to other studies conducted in India.[10] The practice could be because of the common use of different types of vegetables in the adult diet too. Even though the participants were non-vegetarian, use of meat in the diet was not very common which again could be due to

lack of knowledge regarding its benefits. Another food which was found to be used less commonly is the use of oil in the diet. As the method of preparation of food is mostly boiling, use of oil to the food were found to be very limited, almost non-existent. Use of milk and dairy products were limited in the areas as their availability are limited in the regions studied. The limited use of egg in the children diet, although available may be a result of the myths being passed on from outside of the community, which may be seen as a result of the effect of invasion of the tribal lifestyle by the outside population. The use of infant formula is no more an outside commodity among the tribal population too as seen in current the study. The use especially remains a concern as the ratio of infant formula powder to water was not found to be in the right ratio, over-dilution was seen among all the users. Use of spoon for feeding was a common practice which could be due to the type of food which are given to children. As most of them were giving rice based food preparation, using spoon to feed children would were easier for feeding.

As for the IYCF indicators used for assessing adequacy of food intake, it was seen that the performance were low and similar picture was seen in studies from rest of India(13-47.8%).[11-14] Low practice of Minimum Dietary Diversity in food could be due to lack of knowledge regarding the requirements and recommendations.

Although many of the practices do not differ much in the tribal population of the region as compared to rest of India, the variety of food use was found to be different. There were not many societal or cultural impositions seen in the study regarding the behaviour. Increasing awareness among the population at this stage can bring about a drastic healthy change in the behaviour among the community.

Ethical Clearance: All procedures performed in the study involving human participants were in accordance with the ethical standards of the institution and conducted according to the principles of the Declaration of Helsinki.

Mediating Effects of Self-efficacy in the Relation between Depression and Health Conservation in Community Dwelling Elderly

Hee Kyung Kim

Professor, Department of Nursing, Kongju National University, Gongju, South Korea

Abstract

Background/Objectives: The purpose of this study is to identify the relationship between depression and health conservation of community dwelling elderly and to confirm the mediating effect of self-efficacy in their relationship.

Method/Statistical analysis: This study is a descriptive study and consists of collected data using questionnaires for 129 elderly people who use the elderly community health center as an elderly person living in C, D, and S city.

Findings: The elderly depression and self-efficacy were appeared to have significant correlation with health preservation. The elderly depression has a significant effect on self-efficacy (R^2=12.9%). Depression had a statistically significant effect on health conservation (R^2=3.1%). Depression (β=-.02, p=.779) and self-efficacy (β=.47, p<.001) were significant predictors of health conservation and explanatory power was 21.8%. Self-efficacy was found to have a mediating effect of depression and health conservation of the elderly (Z=-3.13, p=.001).

Improvements / Applications: It is suggested to develop a nursing intervention program that focuses on reducing depression and enhancing self-efficacy in order to conserve the health of the elderly in daily life.

Keywords: *Self-efficacy, Depression, Health conservation, Community, Elders.*

Introduction

In Korea, the elderly population aged 65 and over entered the aged society, which accounts for more than 14% of the total population in 2018.[1] The population aged 65 or older is 13.8% of the total population in 2017, up from 7.2% in 2000 and 12.2% in 2013, and is expected to increase steadily in the future.[2] On the other hand, the life expectancy of the people is 80.4 years and the life expectancy of health is only 71 years, so it is important task of national health policy to reduce the gap, such that people are encouraged to promote the health in the daily life since they need to have preventative health care.[3] According to the report of the social survey in 2013, 70% of elderly people have health problems, and elderly people aged 65 years or older have at least one chronic disease.[4,5] For these elderly people, health is the key to how live the rest of life in pleasant and happy.

Approximately 15 to 25% of the elderly population suffers from depression, and this depression affects physical illness, cognitive function and social relations causing a risk of making and committing suicide.[6]

In general, there are increasing numbers of elderly people experiencing psychological and mental health problems such as alienation in addition to the physical and economic difficulties caused by aging, so they need support of health professionals.[7]

On the other hand, the term “health conservation” means that the elderly maintains their balance as

Corresponding Author:
Hee Kyung Kim
Professor, Department of Nursing, Kongju National University, Gongju, South Korea
e-mail: hkkim@kongju.ac.kr

physical, mental, and socio-psychological integrity while maintaining goodwill and happiness.[8] The elderly can improve their health by making efforts to manage and preserve health out of their daily lives. Health conservation is a concept that is appropriate to use in managing the health of the elderly and maintains physical, mental and social well-being. Previous studies have shown that the health conservation of elderly residents in the community is also at an average level of 93 points out of full points of 148, that it needs an effort to enhance the health conservation level of the elderly.[9]

In addition, reviews on the health maintenance of the elderly showed that the depression of the middle-aged adults had a negative correlation with the health conservation suggesting that elderly people would be similar.[10] Result of this study is as follows. First, elderly had a high negative correlation with the self-care, that they do not care their health well out of their daily lives as the depression gets serious,[11] and the self-efficacy of in-home elderly were positively correlated with health conservation. Therefore, it is necessary to grasp the relationship between depression and self-efficacy and health conservation, because depression of the elderly is a factor to harm health and the self-efficacy can be regarded as a factor promoting health.

Self-efficacy is an important variable in changing human behavior and has a significant impact on maintaining that change.[12] It is also considered to be a major factor to be able to adopt desirable health behaviors, and to maintain the factors that have a positive effect on health promotion. When people have self-efficacy that they can do something themselves, they can conserve their health by leading health-led behaviors[10] and give effect to the synchronization and maintenance of health promotion behaviors out of their daily lives.[13] It is thought the self-efficacy will affect the preservation of health.

Therefore, if elderly people feel depressed, they may not be able to preserve their own health in daily life, therefore, if a nursing intervention plan that can increase self-efficacy can be suggested, depression may be lowered and the health will be conserved to improve their life quality. Hence, when self-efficacy is included as a mediator variable in the relationship between depression and health conservation of the elderly, the researcher would like to check whether the health of the elderly could be well conserved in the relationship between them to utilize it as a basic data to improve the health conservation of the elderly.

Method

Subjects: The researcher selected residents of 65 years old or older who were registered in 5 health clinics in C city, 2 health clinics in D city and 1 health clinic in S city, those who were able to participate in this study and read and write Korean alphabet to communicate. The number of subjects was calculated according to the G * power 3.1 program. That is, 130 questionnaires were distributed considering the sample size of 107 persons and dropout rates, 0.15 of the effect size of multiple regression analysis, 0.95 of verification power, and 2 predictive variables, and 129 copies were collected to be used as research data.

Instruments

Depression: Depression was measured using Korean version of the Geriatric depression scale (GDSSF-K), which modified the Geriatric Depression Scale for the elderly of Yesavage et al.[14] This tool has been standardized by Kee[15] suitable for Korean elderly people. The score for each question is 0 for yes and 1 for no. It means that the degree of depression is significant as the score becomes higher. The Cronbach's α value of the instrument was .88 at the time of development and was .82 in this study.

Self-efficacy: In order to measure the self-efficacy of the elderly, the tool which Noh[16] adapted general self-efficacy scale developed by Chen, Gully, & Eden[17] was used. Total 8 questions with 5 points Likert scale, the higher the self-efficacy level. The reliability of Cronbach's α = .83 in Noh[16] and was .91 in this study.

Health conservation: Health conservation was measured using the Health Conservation Scale developed by Sung.[8] Total 37 questions were classified into four areas. The higher the score, the better the degree of health conservation. The reliability of the tool was Cronbach's α =.94 and .75 in this study.

Data collection: Data have been collected from June 1, 2019 to June 30, 2019, and the researchers attended the meeting of the health care clinic directors, explained the research purpose and method, and received permission from the heads. 8 health care directors explained the purpose of the research and how to prepare the questionnaires to the elderly over 65 years old who visited the heal care clinics and directly reading questionnaires after obtaining their signatures to complete the questionnaires. It took 20-25 minutes required for preparation of the questionnaires.

Ethical consideration: This study was approved by the IRB of K University submitting a proposal for the purpose, method and ethics of the research. Ethical regulations were observed during the research period.

Data analysis: The general characteristics of the elderly, depression, self-efficacy and the degree of health conservation were determined by descriptive statistics such as percentage, mean, and standard deviation using the SPSS Window 23.0 program. The relationship of variables was assessed using Pearson's correlation coefficients. The mediator effect of self-efficacy in the relation between depression and health conservation was analyzed using multiple linear regression and Sobel test.

Results

General characteristics of elderly: The average age of the elderly people was 78 years old. 49.6% (64) of the elderly were over 80 years old and the elderly women accounted for the majority, 73.6% (95). 51.2% (66 persons) were widowed, divorced, separated, and single. 57.0% (73 persons) answered that the health status of the elderly was normal and the education level of 75.8% (97 persons) was below the elementary school. 85.9% (110 patients) had more than one disease. It shows that 41.4% (53 patients) answered that they exercised occasionally not regular, while 71.1% (91 patients) answered that their economic status was normal (Table 1).

Table 1. General characteristics of subjects (N=129)

Characteristics	Division	N (%)	M±SD
Age(years)	65~69	13(10.1)	78.00±7.56
	70~79	52(40.3)	
	Over 80	64(49.6)	
Gender	Male	34(26.4)	
	Female	95(73.6)	
Spouse	Live together	63(48.8)	
	Bereaved, divorced, separate, single	66(51.2)	
Health condition	Good	30(23.4)	
	Moderate	73(57.0)	
	Bad	26(19.6)	
Education	Elementary school graduate or under	97(75.8)	
	Middle school ~ high school	28(21.9)	
	University graduate or above	4(3.1)	
Number of diseases	None	19(14.1)	
	One or above	110(85.9)	
Exercise status	Regularly	42(32.8)	
	Sometimes	53(41.4)	
	None	33(25.8)	
Economic status	Difficult	23(18.0)	
	Normal	91(71.1)	
	Good	14(10.9)	

Correlation between depression, self-efficacy and health conservation of subjects: The depression and self-efficacy ($r = -.37$, $p < .001$) of the elderly showed a negative correlation and the health conservation and depression ($r = -.20$, $p = .025$) also showed a negative correlation. Health conservation and self-efficacy ($r = .48$, $p < .001$) were positively correlated (Table 2).

Table 2. Correlation between depression, self-efficacy, and health conservation in subjects

	Depression r(p)	Self-efficacy r(p)	Health conservation r(p)
Depression	1		
Self-efficacy	-.37 (<.001)	1	
Health conservation	-.20 (.025)	.48 (<.001)	1

Mediating effect of self-efficacy between depression and heal conservation in subjects: The Durbin-Watson index for autocorrelation was 1.85, independent of the autocorrelation between autocorrelation and independent variables. The multi-collinearity between the independent variables showed that there was no multicollinearity because the VIF index was less than 10, which was 1.16. This data was suitable for regression analysis.

In this study, the mediating effect of self-efficacy in the relationship between depression and health preservation in the elderly was significant in self-efficacy as a parameter between depression and health preservation in the three-step regression.

In the first step regression analysis, depression as an independent variable had a statistically significant effect on self-efficacy (β=-. 37, p<.001), and explanatory power of self-efficacy was 12.9%. In the second step regression analysis, depression, which is an independent variable had a significant effect on health preservation (β=-. 20, p=.025) and explanatory power of health preservation was 3.1%. As a result of regression analysis with depression and self-efficacy as predicators and with the health conservation as dependent variable in order to verify the effect of the self-efficacy on the health conservation, which is dependent variable in the third stage, the depression (β=-.02, p=.779) and self-efficacy (β=.47, p<.001) were significant predictors of health conservation.

In addition, the non-standardized regression coefficient decreased from -.18 in the second step to -02 in the third step, indicating that self-efficacy was completely mediated. These variables accounted for 21.8% to explain the health conservation degree. Self-efficacy was found to be a significant mediator in the relationship between depression and health conservation (Z =-3.13, p =.001). (Table 3).

Table 3: Mediating effects of self-efficacy in the relation between depression and health conservation

Variables	B	β	t	p	Adj.R^2	F	p

Discussion

The purpose of this study is to identify the mediating effects of self-efficacy in the relationship between depression and health conservation of the elderly to provide basic data for developing a nursing intervention program that can conserve the health of the elderly in daily life by lowering depression and increasing self-efficacy.

Depression and self-efficacy of the elderly were negatively correlated, and health conservation and depression were negatively correlated as well, and self-efficacy and health conservation were positively correlated. The depression of the elderly women was more depressed as the health condition was worse. The main affecting factors of depression are health status[18] and are related to conserve the health of the elderly out of daily life. In addition, depression is negatively correlated with health conservation in middle-aged adults, and it is found to be a major affecting factor. Therefore, depression of elderly people has a close relationship with health maintenance, so intervention

nursing[19] which may lower the depression of the elderly is needed. In addition, since the self-efficacy has been appeared to indirectly affect the depression of the elderly, an intervention nurse related to the depression and self-efficacy is required for health conservation of the elderly.[20]

The results of this study showed that the self-efficacy of the elderly had a significant mediating effect on depression and health conservation. In other words, depression and self-efficacy have a major impact on the health care of the elderly, especially self-efficacy has a significant effect on lowering the depression and conserving health of the elderly. Self-efficacy is a belief in the ability of an individual to successfully perform the actions necessary to obtain results and become a social intellectual factor that is important in determining the behavior of the elderly. Self-efficacy and self-integration, self-efficacy and successful aging of elderly people have a high correlation. That is, as the self-efficacy gets high, the self-integration and successful aging are possible that the elderly may well care his/her own health and successfully carry out the role to take care of himself out of daily lives.[21] Thus, the improvement of self-efficacy in lowering the depression of the elderly and conserving the health can lead to the successful integration of the elderly. Nurses who care the health of the elderly in the community should seek for interventions to improve the self-efficacy by the elderly themselves.

Conclusion

Elderly people should be more interested in health, encourage them to lower their depression, increase their self-efficacy, conserve their well-being and improve the life quality by developing and distributing the nursing intervention program. In addition, the self-efficacy of the elderly can be enhanced when encouraging participation of the elderly in the program under the leadership of specialists in order to conserve the health of the elderly in their daily life. It is suggested to operate programs that lead the practice not only the simple recognition and related studies will be continuously carried out.

'Fasting' the Forgotten Fortune of Fitness and Ayurveda

Shripathi Adiga H.[1], Krishna Raghava Hebbar[2], Ramya S. Adiga[3]

[1]Associate Professor, Division of Ayurveda, Centre for Integrative Medicine and Research, Manipal Academy of Higher Education, Manipal, [2]Selection Grade Lecturer, Division of Ayurveda, Centre for Integrative Medicine and Research, Manipal Academy of Higher Education, Manipal, [3]Consultant Ayurveda Physician, Aryavartha Ayurveda Centre, Udupi

Abstract

Fasting has been an integral part of Indian culture, festivities and tradition since time immemorial and also an important, incredible part of Ayurveda, the science of life. Ayurveda describes fasting as Upavasa and considers it to be an important component among the 10 depletion therapies. It is defined as refraining from all forms of food intake for a given period, under supervision of a qualified physician. Fasting is said to possess preventive, promotive and curative values, when practiced in a proper manner, considering the Dosha (humours), Agni (digestive fire), Vaya (age), Kala (time/season) Bala (strength) ...etc., Fever, conjunctivitis, diarrhea, obesity, diabetes, skin diseases are some of the indications of fasting described. In today's world, with increasing exposure to toxic substances and increasing lifestyle disorders, fasting is said to bring about elimination of accumulated toxins, cleansing of the body and boosting up of the immunity. As there is a need to integrate balanced nutritious diets with controlled meal size and periods of fasting for prevention and management of diseases and promotion of health, there emerges a wide scope to appropriately apprehend and analyze the concept and canons of fasting as described in the science of Ayurveda. The distinctive descriptions on the principle of fasting, its indications and contra indications, the signs and symptoms of adequate, inadequate and excessive fasting ... described in the humongous texts of Ayurveda demand further apprehension and apt application.

Keywords: *Ayurveda, fasting, preventive, diseases.*

Introduction

India is the salient land of ancient civilizations and treasure house of ancient wisdom, copious cultures, fun filled festivities and timeless traditions. Ayurveda is the kernel of ancient Indian wisdom, the art of holistic medicine and the science of life.

Indian society is an example par excellence where in the principles of protection of health and practice of medicine have enjoyed symbiotic relationship and exist crisscrossed with the culture.

Since time immemorial, fasting has been an integral part of Indian culture, festivities and tradition. The concept of 'fasting' has been exceptionally explained and exemplified in authentic Ayurveda.

Ayurveda considers health as the state of equilibrium between the three physical humours(Tridoshas; Vata, Pitta, Kapha) and three psychological humours(Trigunas; Satva, Rajas,Tamas) while disease/ill health is considered as the consequence of the vitiation of this equilibrium.

Ayurveda appreciates and affirms the importance and impact of food on health and disease and explains different types of food, their sources, preparation procedures, qualities, incompatibility...etc., besides the importance and influence of 'fasting' on health and disease.

Ayurveda apprehends, analyses and acknowledges the preventive, promotive and curative attributes of 'fasting'.

This article is an earnest attempt to expound and establish the efficacy of 'fasting' as explained and exemplified in the classical texts of Ayurveda with modern parameters.

Definition and Description: The classics of Ayurveda describe fasting as 'Upavasa'. 'Upavasa' is defined as the abstinence from all the four forms of food; chewing, licking, swallowing and drinking, executed in a systematic form, under medical supervision.[1]

The classics illustrate that alike the ash particles on fire which reduce its intensity and adversely affect the process of cooking, vitiated dohas(humours) in the body, especially those in the Aamashaya(digestive viscera) reduce the intensity of the digestive fire. This is said to cause digestive impairment, production and piling up of aama(metabolic toxins) which block the minute channels of the body, causing innumerable diseases.

It is further elucidated that during fasting, absence of food in the viscera brings about digestion of the metabolic toxins, kindles the digestive fire, removes the blockage in the channels and checks the progressive pathology besides minimizing the manifestation of the disease.

Furthermore, various researches have put forth the fact that activation of adaptive cellular stress response signalling pathways that enhance mitochondrial health, DNA repair and autophagy during Intermittent fasting as well as stem-cell based regeneration and long lasting metabolic effects are the crucial cellular and molecular mechanisms by which 'fasting' establishes itself as an efficient tool in improving general health, preventing and managing various diseases.[2]

Preventive and promotive principles: Ayurveda advocates that Shishira Rtu(late winter) is the apt time for a healthy individual to benefit from fasting. It is also considered to be the best time for therapeutic fasting, even for treating diseases caused due to vitiated Vata dosha.[3] And also, the time of the day, season, features of the particular land, pathology and progress of the disease, the strength, age of the patient are all to be considered while advising fasting.[4]

Recent research suggests that fasting or going without food may boost human metabolic activity, generate antioxidants and aid in reversing a few effects of aging. Thereby, the possibility of a rejuvenating effect by fasting, which was not well known and well established has been made evident.[5]

The potential health promoting mechanisms of fasting can be summarized to be increased production of neurotrophic factors, fasting-induced neuroendocrine activation and hormetic stress response, reduced mitochondrial oxidative stress, general decrease of signals associated with aging, promotion of autophagy and such others.[6]

Curative concepts and considerations:

Ayurveda describes two fold therapeutic modalities;

- Langhana/depletion therapy
- Brihmana/nourishing therapy

Depletion therapies are enumerated to be 10 in number,viz; Fasting, control of thirst, exposure to sun, exposure to wind, consumption of digestive stimulants, physical exercise and four elimination therapies(therapeutic emesis, purgation, decoction enema, nasal instillation of medicaments).[7]

However, the classics define depletion therapy as that which brings about reduction/depletion of bodily virtues and causes lightness of the body.

Ayurveda logically and legitimately establishes the relation between Upavasa (fasting) and Roga bala (severity/intensity of diseases) as follows;

- In diseases of milder intensity–fasting is the treatment of choice
- Moderate intensity–fasting along with digestive stimulant diet is to be considered
- Maximum intensity–fasting along with purificatory procedures is to be advised

However, Ayurveda classics have precisely proposed that the duration of the fast should be longer in diseases due to vitiated Kapha dosha and shorter in those due to predominancy of Vata dosha.

Fever, conjunctivitis, vomitting, cough, diarrhoea, skin diseases, herpis, urinary disorders, obesity, diabetes, abscess, splenic disorders and disorders of head and neck are a few conditions in which fasting is indicated.[8] Acharya Sushruta explains fasting in the context of indigestion and diseases due to aama.[9]

The therapeutic importance of fasting in a few diseases can be apprehended and analysed as follows:

JWARA: Jwara, obscurely referred to as fever, is a disease which manifests due to the accumulation of

'ama' (toxins) in the 'Amashaya' (digestive system) resulting in the blockage of the bodily srotas (channels), causing loss of appetite and loss of perspiration.

Fasting is of prime importance during the treatment of Jwara, especially when the disease is in purva roopa avastha (prodromal stage)[10] and alpa doshaja (with mild variation of humours)[11]

Acharya Sushrutha opines that fasting should be given prime importance when the patient is weak and when agni(digestive fire) is not stable.[12]

Considering the mode of action of fasting during the prodromal phase of a disease, it has been stated that during this phase, the doshas (humours) are associated with ama(metabolic toxins) and these amayukta doshas (toxin embedded humours) adhere to the body tissues. Fasting facilitates 'paka'(liquefication) of the toxins associated with the humours, further leading to dissociation of the impurities from the tissues which is very much necessary for the implementation of other therapeutic modalities.

Other therapeutic conditions were the classics of Ayurveda provide direct preference to fasting include;

- Netra roga (eye disorders) especially Vataja abhishyanda (Conjunctivitis), for a duration of 3 days or restricting the intake of food only to night time[13]
- Atisara (diarrhoeal diseases) where in there is association of ama (metabolic toxins)[14]
- Pratishyaya (rhinorrhea) in chronic stage
- Chardi roga (vomiting), as the pathology is associated with amashaya (gastrum/stomach), which is the Sthana (seat) of Kapha dosha[15]
- Visoochika (gastroenteritis), especially after Vamana (therapeutic emesis), considering the strength of the patient[16]

The science of Naturopathy also acknowledges that fasting is beneficial in cases of fever, cold, obesity, digestive disorders, diarrhea, abdominal pain, body ache, back ache, stiffness of joints, irregular menstruation and infertility.[17]

Fasting in various forms such as intermittent fasting, periodic fasting, alternate day fasting, time-restricted feeding …etc., have all been found to improve physiological indicators of health and delay onset/slow the progression of diseases in various researches carried on laboratory animals and humans.

Few responses to fasting can be summarized as; reduced levels of insulin and leptin which parallels insulin and leptin sensitivity[18], Improved glucose tolerance[19], Reduced blood pressure [20], reduced body fat, elevated ketones[19,21], preservation of cognitive function and sensory– motor function during the process of aging[22], increase in overall fitness and resistance to injury and a wide array of diseases[23], delaying onset and slowing down the progression of neuronal dysfunction and degeneration in models of Alzheimer's, Parkinson's disease and such others.[24,25]

Recent small trials of intermittent fasting in patients with cancer[26] and multiple sclerosis[27] have appeared as a silver lining for patients and professionals. All these however, have generated promising results that provide a strong foundation for further research and clinical trials in these and various other conditions.

Practice of fasting: Ayurveda proposes that fasting is to be executed in a systematic form, under medical supervision, in order to benefit from it.

However, fasting is cleverly considered to be contraindicated in;

- Vata predominant disorders
- Emaciated, very old, very young persons, pregnant lady
- Those who are experiencing excessive hunger, thirst
- Those with emotional extremities such as excessive anger, jealously…etc.,

The contraindications during fasting include;

- Anointing oil over the body and scalp
- Day sleep
- Sexual indulgence
- Beautifying oneself
- Walking long distances
- Smoking, alcohol intake

Feasting before and after fasting is said to be avoided.[28]

Ayurveda advocates the intake of freshly prepared rice gruel, which is easy for digestion and a good appetizer

soon after fasting. The drugs to be administered during fasting should be light for digestion, hot, dry, subtle, fast acting/sharp and fluid in consistency.

The exclusive explanations on the signs and symptoms of adequate, excess and inadequate fasting in the exhaustive classics can be summarized as follows:

Signs and symptoms of proper/adequate fasting:

- Proper excretion of wastes(urine, flatus, faeces) from the body
- Sense of lightness
- Feeling of freshness/purity of heart, throat, mouth
- Proper belching
- Lack of drowsiness and exertion
- Sweating
- Increased appetite, taste for food
- Increased thirst
- Tranquility of mind
- Clarity in sense perception
- Enthusiasm
- Decreased signs and symptoms of diseases[29]

Inadequate fasting;

- Loss of taste
- Frequent expectoration
- Predominance of Kapha dosha
- Excessive salivation
- Malaise

Excessive fasting;

- Loss of appetite, anorexia
- Excessive thirst, belching
- Cough
- Dryness of mouth
- Cracking pain in joints
- Impairment of vision and sense of hearing
- Loss of strength and vitality
- Loss of memory

Thus, the science of Ayurveda recommends that a clever physician should advice fasting to a subject until he is able to appreciate Niraama lakshanas such as reduction of the bothering symptoms, proper excretion, proper salivation, feeling of lightness of the body and mind ...etc.,

Conclusion

Ayurveda, the glorious science of holistic healthcare, acknowledges and admires the therapeutic importance of depletion therapies, which includes Upavasa/fasting by affirming "langhanam paramoushadam". This implies that depletion therapies are the best therapeutic modalities a physician should adopt.

The texts such as Charaka Samhitha, Ashtanga Hridaya, Ashtanga Sangraha have separate chapters dedicated to them while texts such as Sushrutha Samhitha, Bhavaprakasha, Bhaishajya Ratnavali…etc., have elaborately explained the same.

In the present global scenario with increasing exposure to toxic substances, increasing life style disorders and sensory overload, it is very much essential to eliminate the toxins and cleanse the body besides making earnest efforts to boost up its immune system. As the natural processes of elimination and cleansing are not sufficient to maintain optimum health, there is a need to focus on Alternative and Comprehensive health care systems such as Ayurveda, which provide a holistic approach to preventive and curative dimensions of health and disease.

Fasting is one such important therapeutic modality of this all-inclusive science which endorses and establishes itself as a preventive as well as curative tool.

Furthermore, future researches should be directed to the integration of balanced nutritious diets with controlled meal size interlaced with periods of fasting with a view to prevent diseases, promote health and effectively cure the ailments.

Even though the concepts and canons of fasting are found scattered in various texts and clinical recordings of alternative and complimentary medical sciences across the globe, there is a necessity to apprehend, analyze, amalgamate and appreciate the molecular mechanisms and clinical applications of fasting on health and disease.

Based on the priceless, productive, protective, promotive principles and practices of fasting found in the ancient science of Ayurveda, it is very much evident that

there is a great potential for lifestyles which incorporate 'fasting' as an indispensable portion in health protection and promotion. Further, it can bring about decline in the disease processes and reduce the risk of several chronic, age related disorders. Appropriate, authentic observance of fasting as described in the science of Ayurveda can emerge as a new horizon in the all-round development of the individual and the society.

The realisms in the ancient classics, thus, demand all-encompassing apprehension and apt admiration.

Impact of Social Media Advertising on Consumer's Health

Vanishree Pabalkar[1], Ruby Chanda[2], Priya Tayal[3], Rohini Singh[3]

[1]Assistant Professor, [2]Associate Professor, [3]Research Student, Symbiosis Institute of Management Studies, Range Hills, Kirkee, Pune 411020

Abstract

If the message on the social media message isn't clear and focused, it's unlikely to be effective, resulting in wastage of time and resources. This leads to failure of the advertisement. This leaves an impact on the health dimensions of a customer. An ideal social media message must convey the message to the audience about the product and should not give an impression to one that it is an overtly like advertising. As per Global Digital report, 2019, the number of internet users worldwide in 2019 is 4.388 billion, up 9.1% year-on-year. The number of social media users worldwide in 2019 is 3.484 billion, up 9% year-on-year. The number of mobile phone users in 2019 is 5.112 billion, up 2% year-on-year.

40% of people read and refer to articles on social media platforms to procure information on how does a patient cope up with the chronic conditions when affected with a disease.(Health Care Finance News) [1]

More than 1,500 hospitals across the country have their presence online. The popular social media sites used by them include Facebook and Linkedin. (WHPRMS-Wisconsin Healthcare Public Relations & Marketing Society. Wisconsin)[2]

Social media users are in a state where there is plethora of information on various topics. With the rise of social media platforms there has been an increasing need for research in this field as it creates more platforms for the marketers but it also faces challenges of creating unnecessary noise which leads to avoidance behaviour on the consumer's part. In this study an attempt is made to understand the different noise creating factors such as irrelevant content, cluttered content, no emotional connect, excessive advertising etcetera to find out what exactly drives the customer to avoid a product or brand. The purpose of this study is to measure and evaluate the ways in which a consumers buying behaviour changes due to the noise created by advertisements and find prominent factors which cause such behaviour. The key observations from the study state that when a particular advertisement is placed repetitively in different platforms the customer tends to ignore the ad and subconsciously ignore the brand or product. When an Advertisement is too cluttered, customer might miss the actual part of the ad and the visual appeal also drops due to clutter.

Keywords: *Social media, Advertisement, content, consumer behaviour, health.*

Introduction

Social media is one of the powerful tool that keeps the customers engaged and connected through out. The several platforms of social media include facebook, twitter, LinkedIn and other such platforms. It is estimated that the users of social media are over and above 4.2 billion worldwide. Approximately more than 3.5 billion of them use social media platforms.

The emergence of Internet-based social media has made it possible for one person to communicate with hundreds or even thousands of other people about products and the companies that provide them. (W. Glynn Mangolda,, David J. Fauldsb, 2009)[3]

Technology has provided consumers with the means to control and edit the information that they receive and share effectively, especially in the online environment. Though the literature conducted reveals that there have been abundant studies carried out on conventional advertising through social media. Yet there are mot many studies done on advertising on social media and

its and its impact on health (Louise Kelly, Gayle Kerr & Judy Drennan, 2010)[4] World Health Organization uses twitter as the social media platform to educate the people. It provides customers with updates on Health and local crises. Flu was epidemic in the 2018 and Dengue prevalent in the current year in most parts of city. Hospitals and Government agencies ensured to update people through social media platforms on all the necessary care to be taken to avoid the spread of the disease.

Advantages and Challenges of Advertising through Social Media:

Promoting the Health: The promotion of a Brand on Social media is one of the effective way of promoting health of customers. This is done by celebrity endorsing the Brands like energy drinks, fitness gadgets etc. The Brand value can therefore be enhanced by highlighting on the core attributes of the product. The Promotion of the brand can happen through various social media platforms like Facebook, Instagram, etc.

Chat bots for addressing health issues: Through chat bots, wherein the Artificial Intelligence is used for answering the queries that a customer has and resolves the problems of the customer within no time. The Artificial Intelligence is used by many hospitals to address the queries of customers on various health related issues. This information is stored for further improvements to be done by hospitals.

Cost effective for Hospitals: Though creating a your profile or the profile of your product is free on websites like facebook, where you can advertise and promote your product, and access and provide information to customers based on the current health conditions in the market

Demerits

Defaming the Practitioner: Since the negative messages spread faster, this can defame your product within no time. The entire efforts behind creating the bran value of that product go futile. The message rapidly gets spread on various social media platforms, leaving absolutely no time for the marketer to respond on the comments. One of the crucial factor that the marketer has twice to think about before advertising on the social media platform.

Saturation in content: The Social media being already saturated with abundant flow of information on various aspects. This is challenge for the marketer to establish a space for his product in the minds of the customer in a short span of time. This task is challenging.

Security concerns: The concerns on security include hacking. There are many software available in the market to ensure that the information of your product on the social media is safe and secured, yet there are apprehensions on the information being leaked. This is a major concern.

Literature Review: The literature review comprises of papers on social media and its effectiveness on advertising and customers, social media advertisements and its effect on customer's health. The following papers are the one which have been referred to in this research, One such paper acknowledges the great rise of social media's impact and how it has made it possible for one person to contact thousands in one go with their reviews about anything, thus an example of how great an impact consumer to consumer communication can be the authors also then say that argue that social media is an important tool that managers need to include social media when developing marketing strategies in the current scenario.

By advertising on a social media platform there is more likeliness of the fact that your advertisement is going to be avoided by the people due to user's negative experience previously, of the relevance of the advertisement to the segment or the scepticism the audience holds towards the message of the advertisement or towards the medium.

31% of Practitioners use Social media platforms for the sole purpose of networking and developing contacts. (Med Tech Media)[5]. 30% of people share information relating to their health, fitness etc. through social media platforms. Statistics of information sharing is as follows: 47% of people share the information of health with doctors, 43% of people share the primary information with hospitals, 38% people share information for health benefits and reward points with a health insurance company and 32% with a chemist. (Fluency Media)[6]

Integrated marketing communications is the tool that enables communication of the organizations on health of customers. It ensures that coordination amongst the various levels of organizations happens across

departments to come with customer-centric message in order to attain objectives of the organization. (Boone & Kurtz, 2007)[7]

Methodology

Data Collection and Analysis: A non-probability random sampling was chosen for primary data collection. Since sample was chosen based on the age group, targeted sample was 120 but valid data was around 80.

Secondary Data: Study of different research papers to identify gaps and also to identify various factors. The factors identified helped in formation of questionnaire and further the research.

Results and Interpretation: Based on the data collected through the Questionnaire, we ran Factor Analysis on the data through SPSS.

Table 1: KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.	.791
Bartlett's Test of Approx. Chi-Square	433.096
df	55
Sig.	.000

KMO Test: KMO measures sampling adequacy of a questionnaire. It shows how much proportion of variance is there between the variables included in the study conducted. A high value of this statistic indicates the appropriateness (from 0.5 to 1) of the factor analysis and a low value indicates the inappropriateness (below 0.5) of the factor analysis, from the total data we have. For our data, the KMO value came to 0.791, which indicates that the value is in the acceptance region of the factor analysis model.

This can be identified by the significance level and degree of relationship between variables. If the value is less than 0.05 it indicates the data does not produce an identity matrix. This means that there exists significant relationship among the variables taken for the analysis. For our data, chi square statistic is 433.096 with 55 degrees of freedom. This value is significant at 0.000 level.

Communalities

Table 2: Extraction Method: Principal Component Analysis

	Initial	Extraction
Irrelevant information J	1.000	.751
No Emotional Connect	1.000	.774
Dodgy Stuff leads to headache	1.000	.642
Too Cluttered creates giddiness	1.000	.729
Excessiveness creating fatigue	1.000	.788
Hindrance To Searches	1.000	.650
Distraction creating convulsions	1.000	.744
Email Ads	1.000	.705
Long Video Ads leading to headaches	1.000	.759
Ads From Website Recently Visited	1.000	.676
Pop Up Ads While Brows in G	1.000	.579

Communality: It describes the amount of variance a variable share with all other variables taken into study. For our data, initial communality level is equal to 1.000 for all the variables taken into factor analysis model. This is assigned by default by SPSS. The extracted communalities are shown in the third column. "Excessiveness creating fatigue" shares the maximum variance with all the other variables as it has the highest extraction value of 0.788 followed by "No Emotional Connect" at 0.774 and "Long Video Ads leading to headaches" at 0.759 respectively.

Total Variance Explained

Table 3: Extraction Method: Principal Component Analysis

Component	Lnal Eigenvalues			Extraction Sums of Squared Loading's			Rotations Sumsof Squared Loading's		
	Total	% variance	Cumulate %	Total	% of Variance	Cumulated %	Total	% of Variance	Cumulative %
1	4.806	43.694	43.694	4.806	43.694	43.691	3.395	30.866	30.866
2	1.762	16.011	59.716	1.762	16.on	59.716	1485	22.589	53.456
3	1.228	11.166	70.883						
4	.660	6003	76.885						
5	.599	5.444	81.319						
6	.511	4.746	87.075						
7	.397	3.613	90.688	1.118	11.166	70.883	1.917	17.417	70.883
8	.324	1.949	93.637						
9	.295	2.680	96.3t6						
10	.241	2.195	98.511						
11	.164	1.489	100.000						

Eigen Value and Total Variance: It explains the proportion of variance explained by each factor. The "Total" column gives the amount of variance in the variable attributed to the concerned component or factor. Factors explaining 60-70% of the variance should be retained in the model. For our data the total variance accounted for by all the factors is equal to 11, which is equivalent to the number of variables. The variance attributed to factor 1 is 4.806/11*100 = 43.694% for factor 2 = 1.762/11*100 = 16.022%, and Factor 3 = 1.228/11*100 = 11.166% similarly the total variance attributed to all the factors can be computed.

Rotation Method: Varimax with Kaiser Normalization

Rotated component matrix: It shows the correlation between factor and variables. Higher the correlation, better the result.

The cut off selected for the data is 0.80 for 3 components.

Component 1,

The following variables have value greater than cut-off:

- Excessiveness creating fatigue
- Too Cluttered creating giddiness
- Long Video Ads leading to headaches

Component 2, the following variables have value greater than cut off:

- Distraction creating convulsions
- Ads from websites recently visited
- Email Ads (Offers etc.)

Component 3, following variables have value greater than cut off:

- Irrelevant information
- No Emotional Connect

The first parameter i.e. Placement, 3 factors came to light which were; Excessiveness creating fatigue, Too cluttered and Long video ads leading to headache. Hence buying behaviour is affected. The customer tends to subconsciously overlook product which may also lead to lesser conversion from an online advertisement.

For the 2nd factor when an Ad content is too cluttered creates giddiness, the customer might miss the actual of the message of the ad and the visual appeal also drops due to the clutter. For E.g. an optimally placed ad will get more conversion than advertisements that are placed to cover up space and just gain impressions.

This 3rd factor proves to be true as most of the target audience want shorter video ads and would skip long video ads.

The 2nd Parameter i.e., Hindrance Parameters deals with factors such as; distraction creating convulsions, Advertisements from websites recently visited, email advertisements including offers. These factors hinders the daily work of customers and brings down their efficiency, while using digital platforms. The 3rd parameter i.e., content parameter brings out two factors; irrelevant information and no emotional connect. Traditional marketing theories state that a need must exist. Only when there are needs, demand arises. Marketer must be able to satisfy the customers need. If brand is unable to solve then the product is irrelevant leading to irrelevant advertisement to that audience.

Discussion

Through Literature review and the study conducted the gaps were identified. There is ample data on how social media creates impact through advertising and targeting potential audiences. As well the targeting must be done ensuring that the health of the customer does not get affected. From the results at hand from the questionnaire few prominent factors were identified, that must be avoided at all costs in social media adverting such as; Excessiveness creating fatigue, Too cluttered creating giddiness, Long video ads, Distraction creating convulsions, Ads from websites recently visited, Email ads including offers, Irrelevant and No emotional connect. The marketer must make content keeping these parameters in mind where the experience from the content is a pleasant unhindered one for the potential audience instead of wasting resources on repetitive advertisements by bombarding the screen of an untargeted audience.

Conclusion

Factors were identified in the analysis that acted as key factors which cause impact on the health of the

customers. Audience placed more weightage towards the content and placement of advertisements and the impact of on their daily activities. If the practitioner is very sure that such claims are entirely without merit, the best long-term strategy is to ignore them. Since, social media is a highly visible, public platform, forum, commenting once to the extent that what they are saying is inaccurate and unfair would certainly give other viewers the true picture of the facts.

Abstract

Purpose: Aim of the current is to develop a test to assess the perception of jitter in frequency modulation and also to assess its test-retest reliability. The motivation behind the development of such test is to detect subtle deficits such as hidden hearing disorder.

Study design: Observational study

Method: Nine young adults participated in the current study. Initially, frequency modulation detection limen (FMDL) of the participants were assessed for 500 carrier frequency with 2Hz frequency modulation. Upon obtaining the FMDL, the jitter threshold was estimated as the lowest jitter at which the individual could differentiate the jittered frequency modulation from the sinusoidal frequency modulation. FMDL, jitter threshold at FMDL, and jitter threshold at 10Hz above the FMDL were measured twice. Both test and retest measurements were performed on the same day with the time gap of 20mins.

Results: All participants could perceive frequency modulations and jitter in frequency modulation. Intra-class correlation coefficient revealed good test-retest reliability for all measurements.

Conclusion: Since the developed test has good test-retest reliability, it has a potential implication in the assessment of subtle deficits such as hidden hearing disorder.

Keywords: *Frequency modulation, FMDL, Temporal fine structure, TFS, Jittered frequency modulation, hidden hearing loss.*

Introduction

Temporal cues for speech recognition can be broadly classified into a temporal envelope, and temporal fine structure (TFS) and the definition of envelope and TFS vary across the studies. Moore[1] defined the envelope and TFS by considering the speech signal as a complex modulated signal where the slowly varying temporal envelope is superimposed on the relatively rapid TFS. The dichotomy of envelope and TFS in the auditory perception has been topic research interest since the last decade [2]. Many studies have assessed the relative contributions of temporal envelope and TFS for speech perception [1,3,4]. The envelope is sufficient for speech recognition in quiet [5,6]. However, for speech recognition in noise, envelope cues alone are not sufficient [3,7–10]. Providing TFS cues improves speech recognition in noise[11]. TFS cues also aid in the identification of pitch and location of the sound source [1,2,12,13] while the envelope cues contributed to the identification of speech [4,14,15]. TFS plays an essential role in speech recognition in tonal languages where changes in F0 over time can change the meaning of words [16,17].

Since TFS cue supports many critical functions

related to speech recognition in noise, it is essential to assess the TFS sensitivity in individual reporting speech recognition problems in noise. The TFS sensitivity can be psychophysically assessed using Frequency Modulation Detection Limen (FMDL) test as the detection of frequency modulations (FM) requires phase locking to TFS [18]. FMDL test assesses the individual's ability to perceive the FM. While assessing the FMDL, the listener's task is to detect frequency fluctuation in a carrier frequency (e.g., 1 kHz) at a certain modulation rate (e.g., 4 Hz). The underlying mechanism of FM detection is controversial. Some authors believe that temporal fine structure and excitation pattern cues may contribute to FM detection. The temporal mechanism is involved in the FM detection but only for carrier frequencies below 4000 Hz and for low modulation rates (10 Hz). At higher modulation rates, place mechanism is known to contribute to FM detection [19]. However,Chen and Zeng[20] reported that, up to 80Hz modulation rate, the FM is coded through temporal mechanism. Hence FMDL measured for low carrier frequency and low modulation frequency will reflect the TFS sensitivity.

FMDL has been used as a method to study TFS sensitivity and related speech perception difficulties in noise in various clinical populations such as cochlear implants [20]and auditory neuropathy [21]. In both the clinical populations, there is a gross deficit in the TFS sensitivity. However, a significant number of individuals experience speech perception difficulties despite having normal hearing thresholds. An auditory perceptual difficulty in the presence of normal audiogram is termed as hidden hearing loss [22].It would be meaningful to increase the complexity, instead of using this traditional FMDL procedure to detect a subtle disorder like hidden hearing loss. In the current study, we propose to increase the complexity of FMDL procedure by jittering the frequency modulator. The modified procedure intends to measure the minimum amount of jitter required discriminate the jittered FM from sinusoidal FM. Prior to measuring the jitter threshold, FMDL would be measured and the jitter thresholds would be estimated at FMDL and 10Hz above the FMDL. The aim of the current study is to assess the test-retest reliability of the modified procedure.

Method

Participants: Nine young adults within the age range of 19-29 (Mean=22.37) years participated in the current research. Participants were recruited through a convenient sampling method and observational study design was utilized. All the participants of the current research had hearing thresholds ≤15dBHL at octave frequencies from 250 to 8000 Hz. It was ascertained that the participants were devoid of any history of neurological and/or otological disorders. Informed consent was obtained from all participants of the study and the experiments were conducted as per the ethical guidelines of Helsinki declaration [23].

Signal processing: FMDL was defined as the smallest frequency modulation rate required for perceiving the frequency modulations in the signal. Peak frequency deviation was adaptively varied to estimate FMDL at the modulation frequency of 2Hz. Both carrier and modulation frequencies were generated at a sampling frequency of 44100Hz and for a duration of 500 milliseconds. An unmodulated tone that was used as one of the choices for the 2AFC task was generated at the sampling rate of 44100 Hz and for the duration of 500 milliseconds. Both modulated and unmodulated signals were gated with 20 millisecond cosine onset/ offset ramps. Frequency modulations were computed in the time domain using following formula.

$$x(t) = \sin\left[2\pi f_c t + \frac{\Delta f}{f_m}\sin(2\pi f_m t)\right]$$

f_c = Carrier frequency

f_m = Modulation frequency

Δf = Peak frequency deviation.

To add the jitter to FM a random noise was added to the modulator prior to the frequency modulation. The magnitude of the noise was systematically varied to estimate the jitter thresholds

Procedure: An adaptivetwo-down one-up psychophysical procedure converging on 70.71% correct responses was used to estimate FMDL[24]. Participants responded on a 3I3AFC paradigm in which participants heard three intervals in each trial. One interval contained the frequency modulated signal and the other two intervals contained the un-modulated pure tone whose frequency is same as the carrier frequency of the frequency modulated signal. Both the intervals were presented sequentially with an inter-stimulus interval of 250 milliseconds. The intervals were randomized for each trial. The participant's task was to identify the interval in which frequency modulated tone was present.

Participants responded by clicking on button either '1' '2' or '3' depending on the position in which frequency modulated tone appeared in sequence. Feedback was given to participants regarding the response correctness during each trial. The test trial started with a peak frequency deviation of 50Hz. After two consecutive positive responses, peak frequency deviation was decreased by a ratio of 1.25 and increased by a factor of 1.25 after a negative response. Eight reversals were administered to each participant. Midpoints of last six reversals were averaged to obtain FMDL. A similar procedure was adopted to estimate the jitter threshold. Wherein 2 intervals contained smooth sinusoidally modulated signal and other interval contained jittered FM signal participant was instructed to identify the interval containing the jittered FM. The test started with the jitter magnitude of 0.2. Number reversals, up-down rules and threshold calculations were similar to that of FMDL. Jitter thresholds were estimated at the level of FMDL and 10Hz above the FMDL. To estimate the test-retest reliability, measurements were performed on the same day with the time gap of 20mins.

Results

Ability to perceive TFS was evaluated by measuring the FMDL. FMDL was obtained by estimating the minimum peak frequency deviation required to perceive the frequency modulations. FMDL of the participants were assessed for 500 carrier frequency with 2Hz frequency modulation. Upon obtaining the FMDL, the ability to perceive irregularity in the FM was assessed by adding a temporal jitter to the modulator. Jitter threshold was estimated as the lowest jitter at which the individual could differentiate the jittered frequency modulation from the sinusoidal frequency modulation. To assess the test-retest reliability, FMDL, jitter threshold at FMDL and jitter threshold at 10Hz above the FMDL were measured twice. Both test and retest measurements were performed on the same day with the time gap of 20mins. The mean and standard error of mean of FMDL, jitter threshold at FMDL and jitter threshold at 10Hz above the FMDL are represented in Figures 1, 2 & 3 respectively. Intra-class correlation co-efficient for FMDL, jitter threshold at FMDL and jitter threshold at 10Hz above the FMDL were 0.60, 0.64 & 0.44 respectively. Intra-class correlation co-efficient suggests a good test retest reliability of the test.

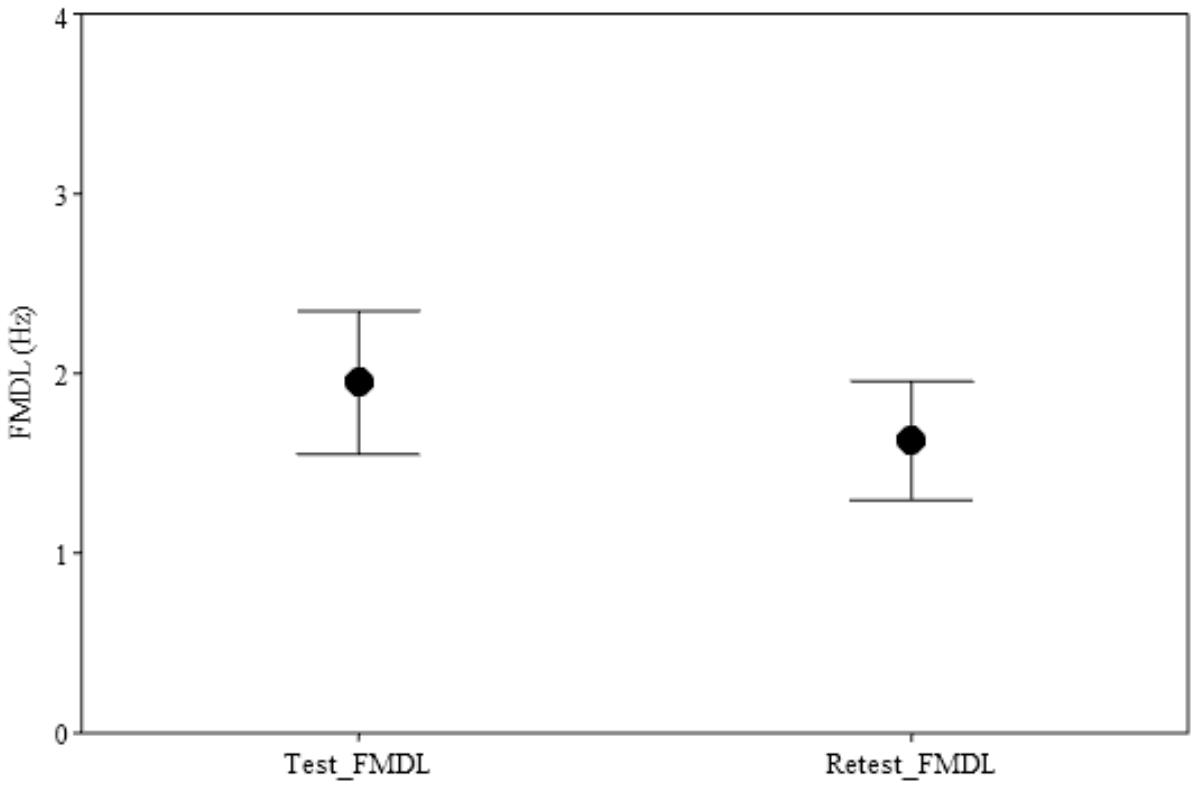

Figure 1: Error bars depicting mean and standard error of the mean of FMDL both test and retest sessions.

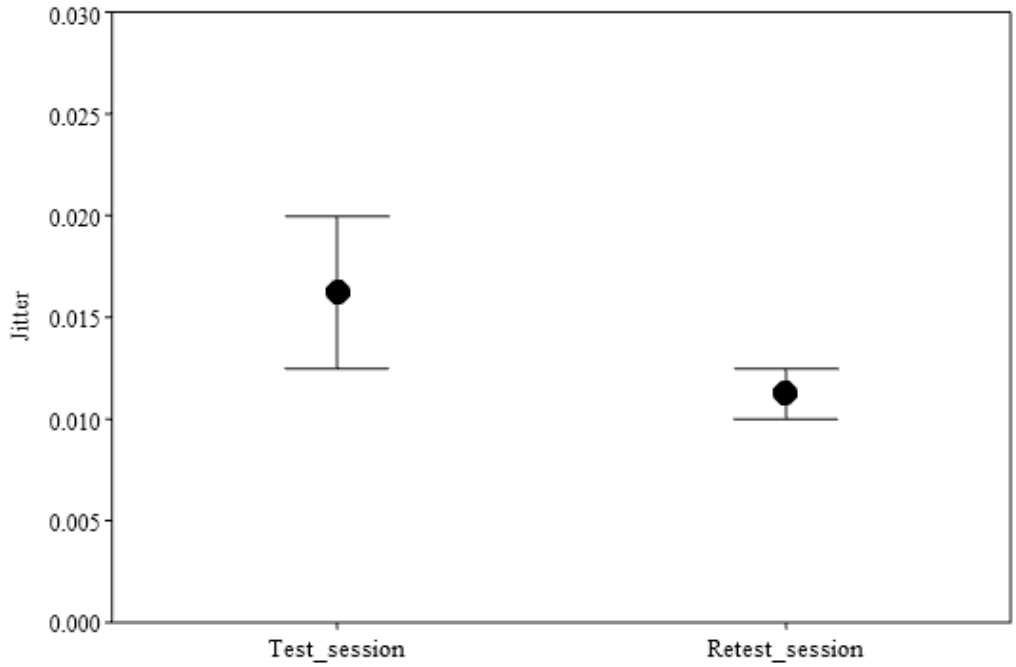

Figure 2. Error bars depicting mean and standard error of the mean of Jitter thresholds at FMDL for both test and retest sessions.

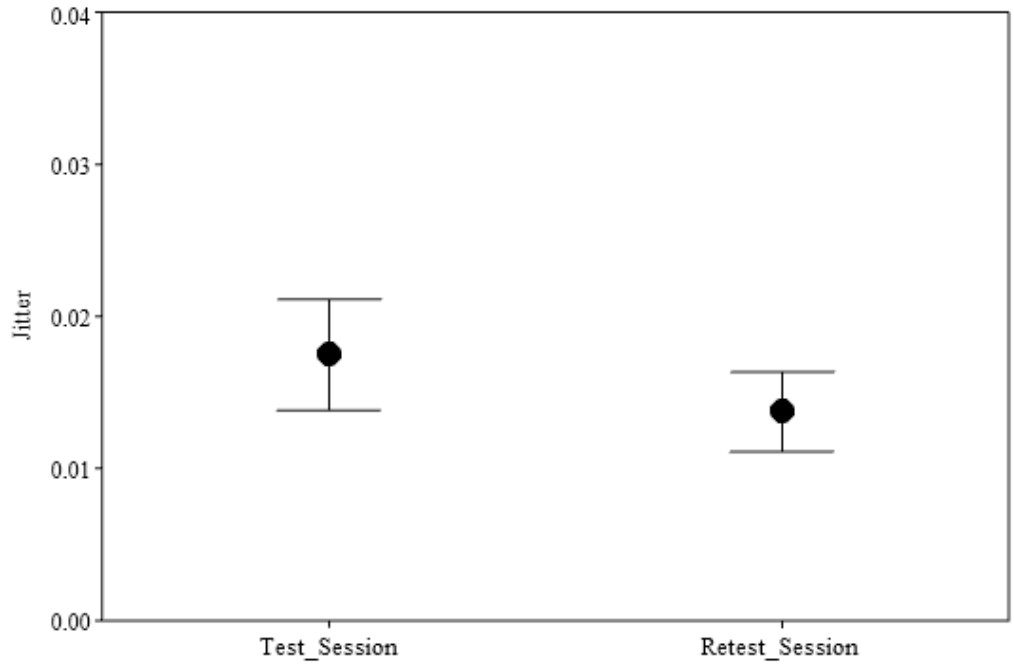

Figure 3. Error bars depicting mean and standard error of the mean of Jitter thresholds at 10Hz above FMDL for both test and retest sessions.

Discussion

Intra-class correlation coefficient analysis revealed good test-retest reliability of the jittered FM. Hence, this test has a potential application in the assessment of an individual with speech perception difficulties. The motivation behind developing the jittered FM test is to detect the subtle speech perception deficit such as hidden hearing loss. A significant number of individuals with self-perceived hearing difficulties have normal hearing

thresholds. Hind et al.,[25] reported that 5-7% individuals who seek audiologist support for hearing problems have normal audiograms. An auditory perceptual difficulty in the presence of normal audiogram is termed as hidden hearing loss [22]. One potential cause for the hidden hearing loss is cochlear synaptic lesions. The synapses between hair cells and cochlear nerve terminals are more susceptible to degenerative effects of aging and noise exposure. Thisprimary neural degeneration does not affect hearing sensitivity or the hearing thresholds but leads to difficulty in understanding speech in difficult listening situations[26].

With the growing prevalence of hidden hearing loss, there is a need for a diagnostic test or test battery to detect hidden hearing loss. Currently, there is no gold standard test to detect hidden hearing loss. Various physiological and behavioral tests have been proposed for the same. Many researchers have recommended using amplitude Wave I or V/I amplitude ratio of ABR as a diagnostic indicator for hidden hearing loss. However, the wave I of the ABR is highly variable among the individuals[27].

On the other hand, attempts are being made to develop behavioral tests to detect hidden hearing loss. The commonly recommended behavioral test for detecting hidden hearing loss is a speech in noise test (SPIN). However, the perception of speech in noise is a complex task constituted by the various auditory and cognitive processes. The involvement of multiple processes may increase the redundancy thereby decreasing the sensitivity of the test. Hence it would be meaningful to assess the underlying auditory process rather than speech perception in noise as a whole. Hence, developing a test based on TFS processing could be useful in identifying hidden hearing loss. Frequency modulation detection limen (FMDL) for low modulation frequencies is used as one of the tests to assess TFS processing. Since hidden hearing loss is a subtle disorder, it would be meaningful to increase the complexity, instead of using this traditional procedure. Carney[28], reported that even a 50% loss in auditory nerve fibers would deteriorate the perception only by the factor of $\sqrt{2}$. Hence, to identify this subtle deficit the task needs to be modified.Since the jittered FM test has more complexity and good test retest reliability, it has a potential application in the assessment of hidden hearing loss.

Conclusion

The current study investigated the test reliability of the jittered FMDL test. Jitter thresholds were measured at the FMDL threshold as well as 10Hz above the FMDL threshold. The test-retest reliability was good at both levels. Hence, the proposed test may a potential implication in the assessment of individuals with poor speech recognition ability in noise.

Funding Source: No financial support was recieced from any funding sources to conduct the study

Ethical Guidelines: Experiments were conducted as per the Helsinki declaration[23]

Working Posture among Bank Employees in Chennai: A Cross Sectional Study

W.M.S. Johnson[1], Archana R.[2], Jinu Merlin Koshy[3],

[1]Professor & Head of the Department, [2]Associate Professor, [3]Assistant Professor, Department of Anatomy, Sree Balaji Medical College and Hospital, BIHER, Chennai. Tamil Nadu

Abstract

Aim and Objective: The aim of the present study was to analyze the working posture and the postural problems arising due to the awkward working posture among bank employees.

Materials and Method: One hundred and seventy-four bank employees working in different banks in and around Chennai were randomly selected and included in this study, over a period of three months. The randomly selected subjects were given the Standardized Nordic Questionnaire to find out the perception of musculoskeletal symptoms. The data were analyzed with Binary Logistic Regression using the Mini Tab (14) statistical software. The prevalence of postural problems in the study population was calculated and statistical significance was accepted for $p< 0.05$.

Results: Bank employees cited the reason that prevented them from work during the last 12 months were pain at low back(21.8%), upper back(13.8%), neck (9.7%) and hand pain(9.7%). The findings of this study shows the most prevalent MSD for the bank employees for the last one year were seen in the low back (70%), upper back (66%) followed by neck (62 %), shoulders (48%). Generalized regression model was used to estimate presence or absence of work related musculoskeletal disorders among the professionals.

The values of the variables age, work experience, BMI, were found to be significant since the Wald Chi-Square tests indicate that $P < 0.05$.

Conclusion: The study revealed that professionals report a high prevalence of various types of work related musculoskeletal symptoms due to prolonged awkward postures at work. Good job design can lead to a reduction of musculoskeletal disorders.

Keywords: *Bank Employees; musculoskeletal disorders;Standardized Nordic Questionnaire; Posture; Work Related Musculoskeletal Disorders.*

Introduction

People adopt postures mostly without any conscious decision to deal with the work place and the surrounding environments they find. The goal is to perform an action or a task and the posture is chosen to achieve that goal. This adaptability is made possible by the complex anatomy of the musculoskeletal system which has the freedom to adopt numerous postures and postural adjustments. The redundancy provided by the multiple degrees of freedom ensures that for performing a particular task several alternative postures can be adopted.

The posture that an individual can adopt to perform a task is solely depending upon the interaction between the layout of the work place and his or her own anthropometry. The posture adopted for a particular task is most directly determined by the work place and the equipments particularly in relation to work height,

reach distance, field of view, and space to move freely. The dimensions and arrangements constrain the range of postures that are possible while performing the task.

A person working in an esteem or awkward posture will have to use more force to accomplish the same amount of work compared to using a neutral posture, which in turn affects muscle loading and compressive forces on the intervertebral disc[1].

Rapid technological developments, especially in the use of electronic data, have affected workers. Electronic data are mainly displayed on visual display screen. Improper body posture and long hours in front of these instruments can result in many health hazards.

Global Burden of Diseases' statistics developed by the World Health Organization (WHO) reveal that musculoskeletal disorders (MSD) contribute 37% of the disease burden attributable to occupational risk factors[2].

The National Institute of Occupational safety and Health (NIOSH 1997) in the USA defines Musculoskeletal Disorders (MSD) as a disorder that affects part of the body's musculoskeletal system, which includes bones, nerves, tendons, ligaments, joints, cartilage, blood vessels and spinal discs[3]. These are injuries that result from repeated motions, vibrations and forces placed on human bodies while performing various job actions. The individual factors that can contribute to musculoskeletal symptoms include heredity, physical condition, previous injury, pregnancy, poor diet, and lifestyle. Musculoskeletal disorders (MSDs) refers to more than 200 conditions that affect the joints, ligaments, muscles, tendons, peripheral nerves and blood vessels causing ache, pain and functional impairment[4] .Since the beginning of 18th century, it has been shown that MSDs may have occupational causes. Musculoskeletal disorders are sometimes called ergonomic injuries and illnesses. Ergonomics is the study of the worker's interaction with tools, equipment, environment, jobs, tasks, work method, work rates, and other systems.

The International Labour Organization estimates that each year around 2.3 million workers die as a result of occupational accidents and work-related diseases. A latest estimate based on 2003 data indicates that fatal occupational accidents are about 358,000 every year. Across the globe, there are some 337 million occupational accidents and 160 million occupational diseases each year. Fatal work-related diseases are around 1.95 million per year[5].

Extreme working postures are one of the major reasons for musculoskeletal injury. With faulty posture, the body is balanced less efficiently over its base of support. Therefore, any restriction, imbalance or misalignment of the musculoskeletal structures will have an adverse effect on the efficiency of movement. Ergonomic problems at the workplace and bad work organization are part of the contributing risk factors to the above occupational safety and health problems.

Muscular discomfort may also lead to the adoption of postures that pose a secondary risk for developing a WMSD. People experiencing localized muscle fatigue would adapt their work posture in an attempt to displace the workload from the overworked muscles to less fatigued tissues[6]. Two different method for assessment of postural load and duration of computer use among office workers were compared and the study emphasizes that the challenge to develop quick and inexpensive techniques for assessing exposure to postural load and duration of computer use is still open[7]. Endurance is considered as the ability of a person to withstand the stress caused during prolonged activity. Endurance time is the maximum length of time an individual can sustain a given workload[8].

The one thing that has greatest impact on our lives in modern time is Computer. Introduction of the computer into the workplace has changed in work organization, and a different use of worker physical and mental potential. It is generally agreed that the etiology of work related neck disorders is multidimensional which is associated with, and influenced by, a complex array of individual, physical and psychosocial factors. Among these various risk factors, work-related psychosocial factors appear to play a major role. Work-related psychosocial variables may include aspects of the work content, organization, and interpersonal relationships at work, finances and economics[9]. Individual factors are considered as confounding factors that influence the relation between psychosocial demands and the occurrence of neck pain[10]. Furthermore, psychosocial demands maybe highly correlated with physical demands, which also indicate confounding effectof physical factors on the relation between work-related psychosocial variables andthe occurrence of neck pain[11].

Along with smaller size and affordable prices, there has been the advent of the internet. This has ensured that people use this technology either at their place of work or at home. All the banks are currently computerized.

This has led to an increase in computer related injuries like eye strain, wrist and back pain, etc. Bank employees will be assuming a forward head posture when they are using the computer. When they are sitting, many people slouch, relaxing the postural muscles of the back. This tends to transfer weight and stress to the body's ligamentous tissues, which can become permanently lengthened if the stress persists for extended periods of time. This lengthening can lead to instability around the joints that the ligaments normally stabilize.

Aim & Objective: The aim of the present study was to analyze the working posture and the postural problems arising due to the awkward working posture among bank employees.

Material and Method

One hundred and seventy-four bank employees working in different banks in and around Chennai were randomly selected and included in this study, over a period of three months. The study proposal was submitted to the Institutional Ethics Committee and due clearance was obtained from them.

Inclusion Criteria:

- Bank employees age group ranging from 20 to 50 years.
- Subjects with minimum 3 years and a maximum of 25 years of work experience.
- Subject who were willing to participate in the study
- Subjects with proficiency in reading and speaking English fluently.

Exclusion Criteria:

- Persons with acute ailments or any other systemic diseases.
- Pregnant and lactating mothers
- Subjects who had major accident or major surgery in any part of the body

Informed consent: Informed consent was prepared as per ICMR guidelines and administered to all subjects prior to the data collection. The subjects were clearly explained about the study, its purpose and the benefits/ risks of participating in the study. Confidentiality with respect to the information gathered was assured to the subjects. The subject's rights to participate/ withdraw from the

The background information consisted of data relating to age, gender, work experience, work duration and other occupation related risk factors. Exposure was assessed through direct observation of the person at work and also by interview.

Stature and body weight of the subjects was measured with the help of Martin anthropometric rod and a properly calibrated weighing machine. Body Mass Index (BMI) was calculated from the stature and body weight of the respective subjects[12].

The self- administered questionnaire was handed over to the participants and the he method for answering the questionnaire was explained in a general meeting before dissemination of the questionnaire. The questionnaire was collected according to the convenience of the participants over a maximum period of two weeks. The instrument used in this study is the Standardized Nordic Questionnaire (SNQ) (License No. 3316900588799)[13]. This questionnaire records the prevalence of MSD in terms of musculoskeletal symptoms (ache, pain, discomfort) in the preceding 12 months. SNQ consists of structured, forced, binary, or multiple choice variants. It consists of two parts a general questionnaire and a more specific questionnaire focusing on the neck, shoulders, and low back regions. The general questionnaire records whether musculoskeletal symptoms are present and if so in which area are they localized and whether they are ongoing (presence of musculoskeletal symptoms during the last seven days).

After completion of the questionnaire, the candidates were interviewed to clarify any confusion and to furnish any missing data. We assigned '1' to each positive response to each question and a '0' to each negative response.

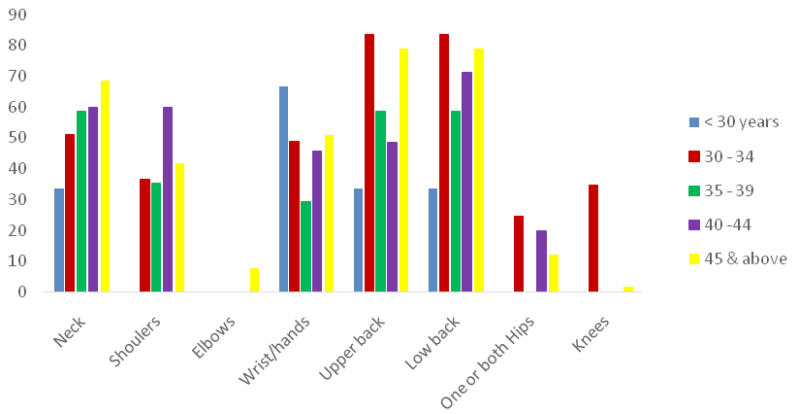
The reliability of Nordic questionnaire for MSDs measured by Cronbach's alpha test was 89.5%.

The collected data were thoroughly screened and entered into MS-Excel spread sheets and analysis was carried out. Descriptive statistics such as mean with Standard Deviation (SD) and proportions were reported for socio demographic variables, respectively. The prevalence of postural problems in the study population was computed as percentages. Binary logistic regression was done as pain in different regions as the dependent variable. The independent variables entered were age, gender, and work experience; working hours per day, number of patients attended per day, height, weight

and BMI. Mini Tab version 14 software was used for performing all statistical analyses. A value of $P<0.05$ was considered as statistically significant.

The acquired data was analyzed by using the Mini Tab statistical software version 14.

Results

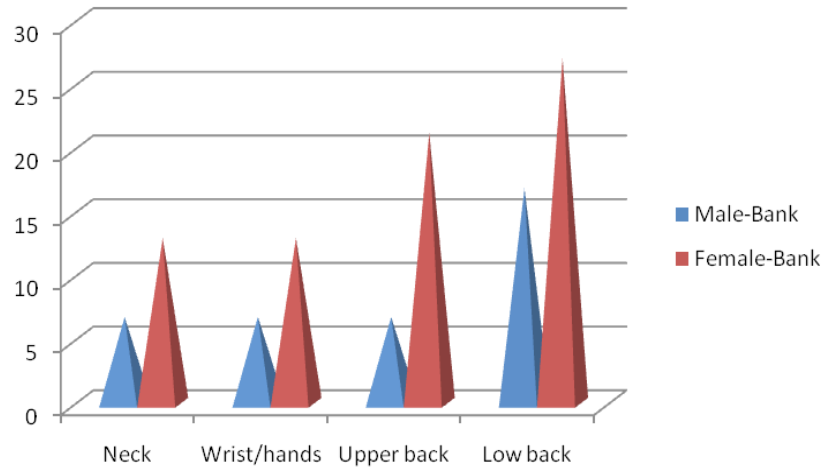


The sample population included 89 males and 84 female bank employees working in different banks in and around Chennai with an average age of 39.7 years and average work experience of 15.9 years. The general characteristics of the study population like age, work experience, working hours, height, weight, body mass index (BMI) were shown in Table 1. Graph 1 depicts the scale of MSD s reported in different parts of body comparing the prevalence of MSD among different age groups.

The percentile of subjects having the persistence of the pain for the past 12 months, persistence of pain which prevented the subjects from work, and the persistence of pain for the past 7 days were shown in Graph 2. The upper back, lower back and neck are the most affected body parts among the bank employees. Bank employees cited the reason that prevented them from work during the last 12 months were pain at low back (21.8%), upper back (13.8%), neck (9.7%) and hand pain (9.7%). The findings of this study shows the most prevalent MSD for the bank employees for the last one year were seen in the low back (70%), upper back (66%) followed by neck (62%), shoulders (48%).

Table 1. Demographic characteristics

Age	39.7±6.4
Work experience	15.9±5.7
Working hr/day	8±0.00
Height	159.6±8.3
Weight	63.5±6.7
BMI	24.9±2.2



N=174, data are mean ± Standard deviation

Graph 1: Comparing the Prevalence of MSD among different Age Groups

Graph 2: Prevalence of pain and discomfort in different regions of the body in respect to the past 12 months, trouble causing prevention of work and the trouble in the last seven days

Graph 3: Comparing the Prevalence of MSD among males and females

Binary logistic Regression: An attempt has been made to estimate presence or absence of pain or discomfort a using binary logistic regression equation based on age, work experience, working hours, height, weight, BMI.

The model has a precision of nearly 73.1% in correctly identifying a bank employee without neck pain and has an accuracy of level of about 86.9% in identifying a bank employee having the pain. However, the overall percent of cases that are correctly predicted by the model is nearly 81.6%.

The table 2 gives regression coefficients and their corresponding standard errors (SE), Wald Chi-square tests and their significance, odds ratio [Exp (B)] with their 95% confidence interval of the binary logistic regression model.

Table 2: Variables in the Binary Logistic Regression Equation

	B	S.E.	Wald	Df	Sig.	Exp (B)	95% C.I. for Exp (B)	
Age (X_1)	.439	.175	6.255	1	.012	1.551	1.100	2.187
Work experience in years (X_2)	-.403	.195	4.291	1	.038	.668	.456	.979
BMI (X_3)	-2.073	.349	35.261	1	.000	.126	.063	.249
Weight kg (X_4)	.609	.125	23.805	1	.000	1.838	1.439	2.347
Constant	79.654	18.458	18.622	1	.000	3918205		

Binary logistic regression is given by $\text{Log}(p/1-p) = \beta_0 + \beta_1 * X_1 + \beta_2 * X_2 + \beta_4 * X_3 + \beta_5 * X_4$

Where p is the probability of having pain and discomfort 1-p is the probability of not having.

Expressed in terms of the variables given in the table, the logistic regression equation is given by Log (p/1-p) = 79.654+0.439 X_1 - .403 X_2– 2.073 X_3

Binary logistic regression had been done using the equation based on age, work experience, working hours, height, weight, BMI. These estimates indicate the relationship between the independent variables and the dependent variable, where the dependent variable is on the logit scale.

The values of the variables age, work experience, BMI, were found to be significant since the Wald Chi-Square tests indicate that $P < 0.05$.

Discussion

A healthy posture reflects on the physical and mental well being. Incorrect posture is critical for several neurological, musculoskeletal and systemic manifestations. Of several risk factors, certain occupations are at increased risk for incorrect posture and musculoskeletal problems. In our study, we have explored the vulnerability of bank employees for Work related Musculoskeletal Disorders (WMSD).

Considering the duration of work and the extent of strain on the muscles, our study makes an effort to put forth the need for preventive strategies to combat the health problems among these occupation groups.

This study was carried out among 174 Bank Employees. Among the 174 participants 89 were males and 85 females. The working hours of the participants were ranging between 4 and 12 hours per day. A study done by Sandeep Kumar observed a significant difference in the mean working hours among IT employees[14]. The mean age of participants was 39.7 years and therefore, the years of work experience also higher with mean years of experience as 15.9 years.

In our study we observed a significant group was affected with MSD. The upper back, lower back and neck are the most affected body parts among the bank employees. Bank employees cited the reason that prevented them from work during the last 12 months were pain at low back(21.8%), upper back(13.8%), neck (9.7%) and hand pain(9.7%).

The findings of this study are similar to the findings of studies performed by Arun Vijay. Neck pain problems were the most frequently reported in both studies but the present study had a higher prevalence rate (71.43%) compared to Arun Vijay's findings which reported only 30%[15].

The findings of this study shows the most prevalent MSD for the bank employees for the last one year were seen in the low back (70%), upper back (66%) followed by neck (62 %), shoulders (48%) which is contrary to what reported by Rajinder Kumar Moom et al which reported low-back pain (40.4%), upper back (39.5), neck 38.6%), hand/wrist (36.8%) and shoulder (15.2%) [16].

Occupational risk factors such as force, posture, movement and vibration can affect the WRMSD[17]. The risk of work related upper limb disorders (WRULDS) may be caused by the postural stress and demands of work[18]. The present study revealed neck pain as one of the main disorders among the professionals.

Generalized regression model was used to estimate presence or absence of WRMSDamong the professionals. Binary logistic regression had been done using the equation based on age, work experience, working hours, height, weight, BMI. These estimates indicate the relationship between the independent variables and the dependent variable, where the dependent variable is on the logit scale.

The values of the variables age, work experience, BMI, were found to be significant since the Wald Chi-Square tests indicate that $P < 0.05$. The results of this study are similar to the study performed by Frymoyer and Moone. In this study they concluded psychosocial factors including psychological stresses, job dissatisfaction, and complex social issues, such as compensation laws and disability system also contributed to the increase in magnitude of musculoskeletal disorder[19].

Because these coefficients were in log-odds units, they were often converted into odds ratios and these were given as Exp (B). The odds ratios are found to be statistically significant since the 95% confidence intervals do not contain the value 1 in the interval. A logistic regression analysis proved that bank employees were at increased risk of WMSD especially neck pain, back pain and shoulder pain, and the predominant factors which proved to be statistically significant were age, work experience in years, weight andbody mass index. Sharan D conducted a similar analysis and reported similar findings and duration of working hours was a very significant risk factor for pain[20].

It was observed that the increase in magnitude of WRMSD is more more in females. The risk factors identified by Surajo Kamilu Sulaiman et al.as being responsible for MSD were job tenure, psychosocial stress, and female sex while those responsible for the disabilities were job tenure and psychosocial stress[21]. Study by NA Ansari reported similar findings done on employees working in small scale industries in Wardha[22]. 69.66% of males and 81.18% of females among Bank employees were affected with low back problems, which are similar to the findings of the studies performed by Bassett and Marshall ED[23, 24]. The higher prevalence of musculoskeletal disorders in women is attributed to some physiological factors. One of them is the presence of more type 1 fibres in the trapezius muscle in women than in men, and others are the sexual dimorphism of the spine and the high incidence of dysmenorrhoea, which sometimes is confounded with mechanical low back pain. Multi tasking also accredited to the higher MSD among women.

The relationship between physical work load, postural workload and work related musculoskeletal disorders (WMSD) could be well documented in this study. The development of MSD increased with age as aging is associated with a progressive decrement in various components of physical work capacity,

including aerobic power and capacity, muscular strength and endurance, and the tolerance of thermal stress. The participants of the present study can be categorized into 5 groups according to the age. Kim Sherman in 2003 reported older workers report more MSD problems at work[25].

In the present study the prevalence rate for MSD at neck region for the age group 30-34 years was 51.02% and that of 40-44 years group it was 60% also it was increasing as the age advances. This is because many older workers will have spent more time working in MSD risky situations. In addition, jobs are generally designed for young and healthy male workers. Continued work with chronically fatigued muscles will increase the risk of developing an injury. Time to develop an injury likely depends on the physical requirements of the task and the amount of recovery time between fatiguing exertions. The potential of a risk factor to cause injury is also affected by the duration of the worker's exposure to it . The present study also revealed the MSDs increasing as the age advances. Studies showed that persons with sedentary jobs and a positive family history had a probability of having diabetes [26]. Hence for bank employees, along with MSDs the risk of obesity and diabetes also is alarming. To sum up these professionals report a high prevalence of various types of work related musculoskeletal symptoms due to prolonged awkward postures at work.

Conclusion

The goal of ergonomics is to reduce work related musculoskeletal disorders by adapting the work to fit the person, instead of forcing the person to adapt to the work. Design of successful work method requires the use of ergonomic principles that best match human capabilities with job demands. A mismatch of this interface can increase expenses, thus affecting the net profit by causing human operators to make mental mistakes, work inefficiently, or work beyond their physical capabilities to the point of injury. The field of industrial ergonomics thus uses knowledge of human capabilities to evaluate task demands, with the goal to design or redesign jobs so that they are kept within the range of human capabilities, thereby minimizing the risk of injury and maximizing the quality. Its general purpose is to adapt people's activities, equipment and environments to fit their needs and capacities. Good job design can lead to a reduction of musculoskeletal disorders, which in turn will result in a decrease in workers compensation costs, increased productivity, a decrease in lost time cases, and also reduced employee turnover.

Analysis of Factors Associated with Self-Stigma (PLHIV) on the HIV and AIDS Incidencein Jongaya Positive Care Supporting Group of Makassar City

Arlin Adam[1], Adam Badwi[1], Sukri Palutturi[2]

[1]Senior Lecturer, School of Public Health, Universitas Pejuang Republik Indonesia, [2]Professor, School of Public Health Hasanuddin University, Makassar, Indonesia

Abstract

HIV and AIDS in many countries show the iceberg phenomenon. Community stigma makes people living with HIV and AIDS become closed so that someone judges himself as a useless person. The purpose of this study was to analyze Stigma people with HIV and AIDS on the incidence of HIV and AIDS in peer support groups of Jongaya Care. The type of research used was non-experiment with an analytic approach through a cross-sectional study design to assess the relationship of attitudes, motivation, experience, expectations, level of education, length of illness, age, and sex of PLHIV with self-stigma against HIV and AIDS. Data were analyzed by Fisher's test exact test with a significance level of $\alpha = 0.05$. Statistical test results of Fisher exact test showed that $p > 0.05$ for attitudes, motivation, experience, expectations, duration of illness, and sex so that the conclusion of the study there was a significant relationship between the six factors with self-stigma of PLHIV, whereas there was no significant relationship between level of education and age to self-stigma of PLHIV.

Keywords: *PLHIV, Self Stigma, HIV and AIDS Incidence.*

Introduction

HIV and AIDS have now become a global problem[1-3]. HIV and AIDS in many countries experience an iceberg phenomenon[4,5]. The speed of the spread of HIV is mainly influenced by sexual behavior such as changing partners, especially in women sex workers who do not use condoms and use syringes simultaneously for drugs[6,7]. The World Health Organization (WHO) and the special AIDS prevention agency from the United Nations (UNAIDS), report that the number of people living with HIV and AIDS in the world in 2013 was estimated at around 35 million people with a new infection of 2.1 million consisting of 1.9 million adults and 240,000 children aged <15 years[8].

Meanwhile, the number of HIV and AIDS cases in Indonesia is increasing rapidly every year. In 2011, the number of PLHIV in Indonesia was at 545,428 people, in 2012 it was at 591,825 people, in 2013 it was at 638,643 people, in 2014 it was 686,319 people. The average PLHIV above is those who frequently change partners, same-sex couples, and syringe users simultaneously on drug use[8].South Sulawesi is included in the 10 provinces with the highest number of HIV and AIDS sufferers in Indonesia. The number of HIV infections reported in South Sulawesi was at 4,314 people, and the number of people living with AIDS reported was at 1,734 people. However, it is estimated that this number will continue to grow[8].

There are several cases in the community that is caused by a lack of knowledge about HIV and AIDS[9-11] as in the example cases where doctors and paramedics in the emergency department are very often received counseling on how to transmit HIV and AIDS and how to prevent transmission at home sick in everyday work. However, all know only by touching and examining patients who claim to be HIV positive, once they hear the patient's statement, the doctor immediately washes his hands repeatedly with new soap and then sits down and continues with the patient. Therefore, you do not think about checking and talking with the patient out of fear and want to wash your hands as if the doctor was afraid of contracting. A lack of understanding about HIV and AIDS in the community needs to be minimized to deal with HIV and AIDS. If the stigma or environment

is negative, the burden of their sufferers will be greater and accumulate[12,13].

The purpose of this study was to analyze Stigma people with HIV and AIDS on the incidence of HIV and AIDS in peer support groups of Jongaya Care.

Materials and Method

This type of study was a type of non-experimental study with an analytic approach through a cross-sectional study design to assess the relationship of attitudes, motivation, experience, expectations, level of education, length of illness, age, and sex of PLHIV with self-stigma against HIV and AIDS. The population in this article was people with HIV and AIDS whose names are recorded in the Jongaya Positive Care Peer Support Group (58 people). The sampling technique used the entire sampling method. The data obtained in the field were grouped into primary data and secondary data. Data were analyzed by using Fisher's exact test with a significance level of $\alpha = 0.05$.

Results

Univariate Analysis: This analysis explains the frequency distribution of all variables including attitudes, motivation, experience, expectations, education, length of illness, age, and sex of PLHIV in the peer support group (Table 1).

Table 1:The frequency Distribution of All Variables

No.	Variables	Categories	Frequency (N=58)	Percentage (%)
1	Attitude	Positive	46	79.3
		Negative	12	20.7

Discussion

A relationship between attitude and self-stigma: The attitude of PLHIV are very influential on the self-stigma of PLHIV against HIV and AIDS. This proves that the discriminatory actions experienced by PLHIV cumulatively will develop into very dangerous behavior. PLHIV who stigmatize themselves due to discrimination received so far, psychologically experience disappointment [14,15]so that it can develop into a risky attitude.

The knowledge of PLHIV on HIV and AIDS issues related to self-stigma of PLHIV is a necessary capital in developing preventive measures. Conceptually, the right knowledge encourages the creation of attitudes and actions that are appropriate and in line with the objectives of the knowledge that has been formed. With this logic, the formation of knowledge is considered as an entry point, the formation of new attitudes or expected behaviors. This is in line with the attitude shown by respondents where respondents who have a negative attitude also have a negative stigma, which means that there is a need for improvements in the social system and the structure of the community by elites, mass media, and health services[16].

A relationship between motivation and self-stigma: Motivation is a human psychological characteristic that contributes to a person's level of commitment[17,18]. This includes the factors that cause, channel and maintains human behavior in certain directions. Good motivation can help PLHIV in understanding the self-stigma against HIV and AIDS because motivation is one of the ways to make PLHIV stay motivated and have the determination to recover[19,20]. Motivation is also related to the utilization of health services[21].[22]The results of the research show that good motivation will greatly affect the positive self-Stigma in PLHIV.

The results of this study are in line with the results of research conducted by [23] which said that there is a relationship between motivation and self-stigma in the prevention of HIV and AIDS. The concept of knowledge is the main element of change in motivation of PLHIV, as well as attitude, knowledge is also an entry point of this problem which can trigger the growth of strong motivation to recover from HIV disease and stay productive.

A relationship between Experience and Self Stigma: This research shows that a good experience

will greatly affect having a positive self-perception in PLHIV. This study is similar to the research conducted by [24] who said that bad experience when first knowing that he was positive with HIV and AIDS greatly affected his stigma so that he or she experienced stress bad feeling. Social stress that occurs in most participants is uncomfortable and assume that HIV is embarrassing.

The interpretation of PLHIV towards discriminatory experiences carried out by the community is based on an assessment of the three social arenas of life, namely information reported by the mass media, attitudes and actions of community elites in responding to people with HIV and excessive actions by health workers in handling AIDS cases.

A relationship between Hope and Self Stigma: Weil [25] stated several factors can influence expectations, namely social support, religious beliefs, and control. A hope has a close connection with social support. In his research on patients suffering from chronic diseases said that family and friends are generally identified as a source of hope for patients with chronic diseases in some activities such as visiting a place, listening, talking and providing physical assistance. A lack of social ties is attributed to worse health outcomes such as increased initial morbidity and mortality. Individuals express feelings of helplessness when they are unable to communicate with others.

Difficulties in the field, generally there are still many who are closed to others, especially when they will meet and be interviewed by researchers, so this becomes a challenge for researchers, this happens because the hope of people with the disease is still lacking and tend not to have hope to recover from HIV and AIDS are suffering from the future because the stigma that occurs has been very difficult to get rid of themselves, especially the community.

Relationship to Education with Self Stigma: An adequate level of education is the basis for developing insight, and a means to facilitate a person to motivate and help determine a person's way of thinking in accepting knowledge, attitudes, and behaviour[26,27]. It is hoped that the high level of education of PLHIV can help in improving its stigma against HIV and AIDS

Tthe level of education of PLHIV is never separated from knowledge because the higher the level of education of the sufferer, the higher the insight possessed by PLHIV although in the results of this study there is no significant relationship to self-stigmatization of PLHIV, but the level of education is a factor of a person to get knowledge compared to people with less education.

The duration of the relationship with self-stigma: This study shows that the duration of the disease is related to the self-stigma possessed by PLHIV.Same with the results of research conducted by Vitriawan, Sitorus, & Afiyanti, (2007) suggested that the duration of having a bet on the stigmatization of HIV and AIDS, a participant expressed stress when he was first diagnosed with HIV and AIDS which caused imbalances, malfunctioning and discomfort physical when first diagnosed with HIV and AIDS.

The length of time it affects the stigma of self greatly because the peer support program is prioritizing PLHIV in order to be more enthusiastic in living life and can be more motivated to achieve a better future, this then becomes the routine of sufferers in peer support groups so that the sufferers themselves can re-organize the future without having to think about discrimination that has been provided by the community.

Relationship of age with self-stigma: The stigma associated with the disease is its psychological challenge for PLHIV, when adolescents are known to have HIV. In fact, PLHIV needs full support from their social environment, because they experience severe psychological distress. Stigmatization for adolescents is very large, so this raises concerns for people to be open to their social environment. Another form of stigma develops through internalization by PLWHA with negative perceptions about themselves, including the age of PLHIV, so that age also strongly affects the stigma of itself.

Relationship of sex with self-stigma: Gender is a variable that can give a difference in the incidence of men and women. For researchers, the difference between men and women in looking at HIV and AIDS is the same, but the stigmatization of oneself is different, as we know that women are naturally created, they tend to be more sensitive to problems, especially this related to health problems. This study shows that more women have negative self-stigma. This is normal because women are naturally created as feeling beings.

Conclusion

This study concludes that there isa significant relationship between attitudes, expectations, duration of

suffering, and gender and the stigma of people with HIV and AIDS (PLHIV) in the group peer support care in Makassar City while the level of education and age, there isno significant relationship to self-stigma of PLHIV.

Early and Late Complications of Haemorrhoidal Artery Ligation Compared to Milligan Morgan Surgery

Jassim Mohammed Auib Al Taha

Al Fayhaa Teaching hospital, Al Askary street, Basra, Iraq.

Abstract

Haemorrhoidal artery ligation (HAL) is a non-excisional procedure involves ligating the haemorridal arteries with sutures. Other method is known as milligan-morgan surgery (MMS) which is most widely used surgical technique for treating hemorrhoids. In the present study, 120 patients with heamorrhoid visited at Al Fayhaa Teaching hospital between March 2017 and March 2018 were enrolled. The patients were divided into two groups *viz*. haemorrhoidal artery ligation (HAL, n=60) and milligan-morgan surgery (MMS, n=60). Early and late complications, degree of bleeding and postoperative pain were recorded for the enrolled patients. About 45 males and 15 females were included in HAL. While, 32 males and 28 females were included in the MMS. The number of individual, grouped in the age range i.e. 20-39, 40-59 years and about 60 years. HAL surgery was done on the 37, 16 and 07 patients of age 20-39, 40-59 and 60 years, respectively. MMS was done on the 25, 24 and 11 patients of age 20-39, 40-59 and 60 years, respectively. HAL showed significantly ($p \leq 0.001$) less urine retention, infection and mild bleeding as compared to MMS. It also showed significantly less post operative pain and complications ($p \leq 0.001$) as compared to MMS. Maximum HAL patients (n=31) showed fast recovery i.e. within 7-10 after an operation. In the present study concluded that the haemorrhoidal artery ligation (HAL) was found to be more effective than milliganmorgan surgery (MMS).

Keywords: *Haemorrhoidal artery ligation, Milligan Morgan surgery, Surgery, Open hemorrhoidectomy.*

Introduction

Hemorrhoids are normal parts present in anorectum in humans. It consists of arterioles, venules and arteriolar-venular communications supported by fibromuscular tissue. Haemorrhoidsare also known as piles. They are mucosal folds which are enlarged and contains blood vessels. They are associated with itching, bleeding and pain too. Many a times these haemorrhoids result in pain after removal[1]. The surgery procedure involves blood vessels which are tied up in a manner to reduce the blood flow towards the haemorrhoids. After this the haemorrhoids shrinks inside the bowel. This type of surgery makes very less complications since there is no excision of tissue.

There are many surgical method for treatment of advanced hemorrhoidal disease. This include classical hemorrhoidectomies (Milligan-Morgan, Fergusson), longo-stapled hemorroidectomy, and others. All these method has its own advantages and disadvantages. It is also associated with method-specific complications which includes anal canal strictures, sensation impairment, and sphincter damage, resulting in fecal incontinence etc.

Haemorrhoidal artery ligationis a non-surgical procedure which includes ligating the haemorridal arteries with sutures. This suturing reduces the blood flow or supply to haemorrhoids. This ligation does not involve risk of bleeding or pain. Open hemorrhoidectomy often called milliganmorgan method which is most widely used surgical technique for treating hemorrhoids. It was developed by two surgens Milligan and Morgan in 1937

hence named so. It was considered as most effective technique for hemorrhoids of grade II and IV and also safe, simple and cost effective treatment. However, this method reported to have few side-effects *viz*, pain, acute urine retention and bleeding which is most prevalent complications[2].

The process involves incision by scalpel in the skin at the base of hemorrhoid. Then dissection in the submucous space is done to remove the entire hemorrhoid from its root. The incision is later ligated with strong catgut. The wound is left open whereas a hemostatic gauze pad is placed in anal canal. This requires general general or epidural anesthesia. Postoperative pain and acute urine retention are common complications. In milliganmorgan method, hundreds of personal alterations have been introduced. The changes vary from the patient's position on the operating table to the type of anesthesia, intestinal preparation or not, type of suture for pedicle and vessel ligation, cutting instrument (scalpel, scissors, cautery, laser, etc.), the direction of resection (from the skin towards the mucosa or the opposite).

Haemorrhoidal artery ligation are "non-surgical interventions". It considers HD above the pectineal line, without the innervations of cerebrospinal or reflexion. This does not cause pain. Sclerotherapy destroys internal hemorrhoids with the help of chemical agents. Photocoagulation application and freezing with the help of nitrogen, mechanical strangling with help of rubber band, are a few ways that destroys internal hemorrhoids. Due to mechanical strangling the internal hemorrhoids do not get blood supply and can be removed by tissue necrosis. In Doppler Guided Hemorrhoidal Artery Ligation (DGHAL) technique in patients with Crohn's disease, it was observed that it was safe and effective. The DGHAL technique is similarly safer and effective in people suffering from with grade II and III hemorrhoidal disease. It has less postoperative pain and also requires less analgesics. It is associated with no early or late complications, but recurrence of hemorrhoids may occur. In case of grade IV of the disease, it needs careful evaluation[3].

Surgical treatment is the only truly curative method of hemorrhoidal disease. It is prescribed in patients who have developed complications and other measures have failed. Of the several surgical techniques, the milligan-morgan hemorrhoidectomy is till now considered the "gold standard" treatment for its best results. But postoperative pain associated with it still remains a major problem. Milligan-morgan hemorrhoidectomy requires a considerable number of days hospitalization. It also needs higher use of opiates[4]. The problems of early and delayed bleeding, anal verge and mucosal stenosis, pain, and prolonged healing due to a persistent anal ulcer are the most frequent complications after milligan-morgan haemorrhoidectomy[5].

With this background, we aim to study the efficacy and safety of heamorrhoidal artery ligation compared with milliganmorgan as a surgical treatment of heamorrhoidal disease.

Material and Method

Patients enrollment: In the present study, 120 patients with heamorrhoid visited at the Al Fayhaa Teaching hospital between March 2017 and March 2018 were enrolled in the present study. The patients were divided into two groups *viz*. haemorrhoidal artery ligation (HAL) and milliganmorgan surgery (MMS). This study involved 120 patients with heamorrhoid. In Basra between March 2017 and March 2018.

Surgery procedure: All patients operated on under general anasthesis, lithotomy position. Haemorrhoidal artery ligation (HAL) group (n=60) was treated with the doppler guided hemorrhoidal artery ligation (DGHAL) using special prop with doppler transducer in its tip. The tip was introduced into anal canal and distal rectum. Once the pulsation of the branch of haemorrhoidal artery was detected, 2/0 vicryl suture used to ligate the artery. The device rotated slowly in a clock wise direction to repeat the ligation of another branch, usually 4 to 7 branches are lighted.

In the milliganmorgan surgery group (n=60), standard milliganmorgan surgery was operated. The patients were followed for 18 months after surgery for their post-operation obsrvation.

Statistical analysis: Results were presented as Mean ± standard error (SE). Dunnett multiple comparison test and one way analysis of variance (ANOVA) was done to estimate the statistical significance.

Results

In the present study, patients with heamorrhoid (n=120) was treated with two ways, *i.e.*haemorrhoidal artery ligation (HAL) and milliganmorgan surgery (MMS). About 45 males and 15 females were included in haemorrhoidal artery ligation. While, 32 males and

28 females were included in milliganmorgan surgery. Table 1 showed number of individual, grouped in the age range i.e. 20-39, 40-59 years and about 60 years. Haemorrhoidal artery ligation surgery was done on the 37, 16 and 07 patients of age 20-39, 40-59 and 60 years, respectively. Milligan morgan surgery was done on the 25, 24 and 11 patients of age 20-39, 40-59 and 60 years, respectively.

Table 1: Grouping of the patients, according to age

Age	Haemorrhoidal artery ligation	Milligan Morgan surgery
20-39	37	25
40-59	16	24
> =60	7	11

Early and late complications, degree of bleeding and post-operative pain haemorrhoidal artery ligation and milliganmorgan surgery were depicted in the Table 2. Haemorrhoidal artery ligation showed less urine retention, infection and bleeding as compared to the milliganmorgan surgery.

Table 2: Early and late complications of haemorrhoidal artery ligation and milliganmorgan surgery

Parameters	HAL	MMS
Early complications		
Urine retention	03±0.02***	09±1.37
Infection	01±0.01***	07±2.41
Bleeding	01±0.00***	04±2.69
Degree of bleeding		
Mild bleeding controlled by packing	01±0.00***	03±0.21
Severe bleeding controlled by suturing of the bleeder	--	01±0.00
Post operative pain		
Mild pain controlled with paracetamol only	37±4.83**	28±3.71
Moderate pain controlled with paracetamol and NSAID	14±3.32***	21±4.18
Severe pain controlled with narcotic analgesia	09±1.53*	11±5.15
Late complications		
Anal stenosis	00±0.00***	07±2.54
Recurrence of heamorroid	00±0.00***	04±1.89

The results are presented as Mean ± standard error (SE). ***p≤0.001, **p≤0.01 and *p≤0.05 when compared with the MMS (Dunnett multiple comparison test). HAL: Haemorrhoidal artery ligation; MMS: Milligan morgan surgery

Table 3: Time needed to return to normal life and activity

Days	Haemorrhoidal artery ligation	Milligan morgan surgery
7-10	31	18
10-13	14	20
13-16	08	11
16-19	06	08
> 19	01	03

Discussion

Surgical heamorrhoidectomy is still the gold standard treatment for heamorrhoidal disease but is associated with post operative pain and complication rate up to 15%[11]. Haemorrhoidal artery ligation is a non excisional technique used to reduce these complications[12,13]. Our results are accordance with these studies[11-13]. Haemorrhoidal artery ligation showed less urine retention (p≤0.001), infection (p≤0.001) and bleeding (p≤0.001) as compared to the milliganmorgan surgery.

The pain is the most common problem of heamorrhoidal surgery. However, the intensity of pain was found to be reduced with the use of heamorrhoidal artery ligation as compared to the milliganmorgan. This might be due non-excisional technique of HAL and the suture ligation applied above the dentate line. In the present study, the pain was treated by paracetamol or (Nonsteroidal Anti-inflammatory Drugs) NSAID. About 9 and 11 patients showed post-operational pain in HAL and MMS group, respectively. They were treated by the narcotics and severe pain were grade 3 and 4 hamorrhoids. In case of second and third degree hemorrhoids, Doppler-guided hemorrhoidal artery ligation has proved to be superior technique in resolving hemorrhoidal disease. This causes reduction of blood flow, which causes fibrosis. This causes less pain and quick recovery[8]. After hemorrhoid ligation, it will drop with the bowel movement in 7-14 days. It may not be noticed except ocassional bleeding. In cases of many hemorrhoids 2-4 treatments at regular interval is recommended at 2-4 weeks interval. Minor bleeding or protrusion may remain until all the treatment is completed.

In haemorrhoidal surgery, bleeding is an early postoperative complication. However, It was less common (p≤0.001) with HAL group. If slipped ligature occurs in initial 24 hrs, intencehaemorrhage were

observed in the MMS while it was very mild in case of HAL. Similar findings were observed in the present study. Only 1 patient showed mild bleeding in the HAL group while 3 patients showed sever bleeding in MMS group. Our results are in agreement with previous reports[14]. The reasons for delayed (or secondary) bleeding is not clearly understood. However, this might be due to the infection which was frequently incounted in the MMS. It mostly occurs in the 2nd postoperative week, and tissue necrosis was also implicated[5].

Thus altogether complications in milligan-morgan procedure includes early or delayed postoperative hemorrhage, recurrence of hemorrhoids, and passive or urge incontinence. The milligan-morgan technique can also cause secondary stenosis of the anal canal through adhesions of the preserved skin areas[6]. While in HAL no patient developed post operative anal stenosis ($p \leq 0.001$). Regarding the recurrence of heamorrhoid following HAL was zero while in MM was 4 patients . In other study the recurrence rate was 1-3%[15,16].

Several randomized control trials (RCTs) have reported the benefits of haemorrhoidal artery ligation as compared to milligan– morganhaemorrhoidectomy. There was a balance observed between benefits and adverse effects with each technique. Benefits included quality of life improvement, shortened length of hospital stay and adverse effects like postoperative pain, anal stenosis and other complications[7].

Transanalhenorrhoidal dearterialization (THD) is more widely used now a days. This treatment primarily focuses on main symptoms like bleeding, prolapsed and pain. It intervenes in its pathological processes. It is based on two steps mainly dearterialization and mucopexy.. The first step includes targeted artery ligation of hemorrhoidal arteries, which encompass very sensitive Doppler probe. This probe identifies maximal blood flow. Then comes placation and lifting of prolapsing rectal mucosa or submuosa[9]. In patients diet, which is rich in fluid and fiber is highly recommended. Oral intake of water must be increased. Stool softeners can also be added as a supplement. If complains appear, laxatives can also be prescribed. Disruption of rectal sutures may occur in case of diarrhea or irritable bowel syndrome. In such patients probiotics can be prescribed. Chronic inflammatory bowel disease or chronic radiation proctitis must continue the specific therapy as prescribed; a sudden worsening of their condition should be diagnosed early and treated.

To control pain and tenesmus proper care should be taken. Inflammatory response and edema may occur. Bloody anal discharge is almost common in these patients. Patients who undergo dearterialization may suffer minor pain and also rectal discomfort. This may last for a few hours to a few days. In these patients, anti-inflammatory drugs and/or analgesics is given as needed. In these patients, non-steroidal anti-inflammatory drugs (NSAIDs) are given for at least 3 days, and other analgesics if pain persists. With these measures, both edema and related symptoms are reduced. Usually, patients can discontinue this postoperative regimen after a few days, and only a minority of them needs it for more than 7 days. Urinary retention develops in about 10 % of patients, especially those with MM procedure and males. To prevent this, restriction of excessive intravenous infusion of fluids is advisable. Treatment should consist only in temporary bladder catheterization. Tenesmus can be accompanied by a transient sensation of the urge to defecate. This is usually transient, with resolution within 7–10 days, and does not give rise to any form of persistent urgency, soiling, or fecal incontinence.

Conclusion

The heamorrhoid is a common disease and there are many method to deal with it. The main goal of treatment is to cure the symptom with minimal rate of complications and low rate of recurrence. In the present study, haemorrhoidal artery ligation (HAL) was found to be more effective thanmilliganmorgan surgery (MMS).

Assessment of the Knowledge Regarding HIV/AIDS among Nursing College Students in University of Basrah

Zainab Alag Hassan[1], Sajjad Salim Issa[2], Abdulameer Abdullah Al-Mussawi[3], Saja Kareem Jasim[4]

[1]Lecturer, [2]Assistant Professor, [3]Professor, [4]Assistant Lecturer,College of Nursing, University of Basrah, Basrah, Iraq

Abstract

Background: AIDS is a common infectious disease worldwide, so every health staff have to have a knowledge about it, specially nursing staff .

Aim: To evaluate the knowledge of nursing college students about HIV/AIDS.

Method: The study was carried out on 150 nursing students at University of Basrah College of nursing during the 2018-2019**.** Structured questionnaire was used for data collection,which was consisted of twenty multiple choice questions to assess knowledge of students about HIV. Data was analyzed by using SPSS statistics version 23.

Results: The current results reveal that(76%) of nursing students have poor knowledge toward HIV/AIDS,and there was a nostatistically significant difference between the stages.

Conclusion: The study concluded that nursing students need to increase their knowledge regarding HIV/AIDS by for example developing the curriculum of nursing college.

Keywords: *Assessment, nursing, knowledge, HIV/AIDS.*

Introduction

World Health Organization (WHO) estimated that 75 million people have been infected with HIV while about 32 million people have died of it. Globally, 37.9 million people were living with HIV at the end of 2018[1].

In Iraq about 0.1% of the total population are living with HIV comparing to other parts of the world, it is considered low-prevalence HIV epidemic[2,3].

Nurses play an important role in prevention of HIV by providing care and treatment for people living with HIV/AIDS. Therefore, nurses should be competent in caring and solving health problems of them[4].

Nurses have to deal with collecting various body fluid samples of patient for investigation, giving medication as per instructions, taking care of patients, and giving injections[5].

Nurses and nursing students' attitude toward HIV/AIDS patient is determined by their knowledge of the same. It is important to assess the knowledge of nurses regarding the HIV/AIDS to evaluate the prevailing conditions and gap so that policy measures can be taken to improve the knowledge,if there is a gap. Since health care professionals including nurses have the responsibility of educating people about the ways of HIV contamination, their knowledge regarding HIV/AIDs patients play an important role in communicating with patients[6].

The purpose of this study is to assess the knowledge of nursing students regarding HIV/AIDS.

Amongst the health care professionals, nurses and nursing students are an important component of the health care delivery system. Since they are the one who

are responsible for the constant care of in-patients and thus, they come in close contact with blood and other body fluids of patients. Due to frequent and prolonged contact,they are being identified as a potential risk group for the HIV/AIDS spread. To reduce the transmission, adequate knowledge about the disease and practice of safety measures are of great importance. Generating awareness regarding HIV/AIDS in this group is crucial for AIDS management and the prevention of HIV spread[7].

Methodology

Design of study: Descriptive cross-sectional study carried out to evaluate knowledge of students about HIV.

Setting of study: The study was conducted at university of Basrah college of nursing 2018-2019

Sample of study: Sample [150] from first, second, third and fourth stage of the college of nursing. Number of male [59] and female [91].

Study instruments: Structured questionnaire was used for data collection, consisted of two part:

Partone: Included demographic data [age, sex, type of study(morning or evening), residency (rural or urban), marital status, stage, to identify effect of demographic variables on students' knowledge.

Part two: Questionnaire was consisted of twenty multiple choice questions to evaluate knowledge of students about HIV. Right answer given 5 score and false answer given zero score. Data was analyzed by using SPSS statistics version 23.

Results

Table 1: Demographic characteristics of the study sample

Variables		Frequency	%
Sex	male	59	39.3%
	female	91	60.7 %
Stage	first stage	40	26.7 %
	second stage	33	22 %
	third stage	38	25.3 %
	fourth stage	39	26 %
Marital status	single	140	93.3 %
	married	10	6.7 %
Study type	morning study	91	60.7 %
	evening study	59	39.3 %
Residency	urban	70	46.7 %
	rural	80	53.3 %

The table (1) showed that the number of females were more than males(60.7%, 39.3% respectively). Majority of the samples was single(93.3%).Students from morning study were relatively more than students from evening study(60.7%, 39.3% respectively), rural and urban areas had a slight difference in number of students(53.3%, 46.7%). Only(24%) of students had good knowledge regarding AIDS(table 2).

Table (2):Students' knowledge regarding AIDS

Variable	F	%	Mean of score	Std. Deviation	p-value	Result
Good knowledge	36	24 %	37.64	10.035	0.000	significant
Poor knowledge	114	76 %	60.92	8.611		
Total sample =150		Mean of score =55.33		Std. Deviation =13.395		

Table (3): Relation between variables and students' knowledge regarding AIDS

Variables		Mean of score	Std. Deviation	p-value	Result
Sex	Male	55.93	13.566	0.661	Insignificant
	Female	54.95	13.344		
Stage	first stage	53.88	13.936	0.149	Insignificant
	second stage	54.55	13.132		
	third stage	59.61	13.968		
	fourth stage	53.33	11.994		
Marital status	Single	55.39	13.345	0.839	insignificant
	Married	54.50	14.804		

Variables		Mean of score	Std. Deviation	p-value	Result
Study type	morning study	54.12	13.976	0.169	insignificant
	evening study	57.20	12.327		
occupation	Urban	59.21	10.654	0.001	significant
	Rural	51.94	14.637		

When comparing the variables under study with knowledge, the result showed that there was no statistical significant difference between sex, stage, marital status and type of study butthere was a significant difference between students residency and knowledge (table 3). This difference may reflect the development in urban areas in terms of social and cultural communication, the Internet, the large number of schools, health centers, hospitals, and the multiplicity of occupations and businesses, as opposed to those in rural areas.

Table (4): Source of information regarding AIDS

Source of information	Frequency	Percent
Books and social media	83	55.3%
Schools & colleges	71	47.3%
Friends & family	42	28%
Heath care provider	20	13.3%

Books and social media were the major source of information for students about AIDS(55.3%)which can be used as a way to educate students about various diseases, where health care provider (13.3%) could not be consider as a good source of information for students (table 4).

Table (5): Students' answers regarding HIV

True and False Questions	Right Answer	Wrong answer
AIDS is considered viral diseases	143	7
AIDS Attacks Immune system	142	8
AIDS is transmitted by Sex with the infected person	132	18
HIV infection leads to joint pain	17	133
HIV infection leads to Swelling of the lymph nodes	18	132
HIV infection leads to Diarrhea	29	121

Table (5) showed that Most students knew that HIV / AIDS was viral, attacked the immune system and sexually transmitted. On another hand most of them did not know the signs and symptoms of the patient, especially: pain joints, swollen lymph nodes, and diarrhea .

Discussion

This study was done to assess the knowledge regarding HIV/AIDS among students of nursing college at Basrah University. In this study, it was found that main source of information among nursing students was Books and social media,followed by Schools and colleges. They got very less information from Heath care provider. This result reflects the weak role of health care centers in educating the community about the seriousness of the disease and its transmission.

Large proportion of students had misconception regarding symptoms and complications of the disease. In Iraq there is a kind of silence on the cases of AIDS for religious and social reasons, because of the disease is association with forbidden sexual relations which makes people believe that there are no cases.

Iraq is considered a country with a low level epidemic of HIV/AIDS. The prevalence of HIV in Iraq is currently less than 0.1% of population, but associated risk factors may increase because of liberalized trade relations and increased drug use. As of December 2014, less than 100 people living with HIV were reported. They were nationals and foreigners. 57% were infected by blood transfusion and blood products (WHO). Iraq faces greater HIV risks as a result of poverty,low literacy and inadequate knowledge of modes of transmission[2].

Nursing students should have adequate information about the disease because in future they will play important role in educating peoples and saving the life of patients and save themselves from infection.

Low knowledge regarding HIV/AIDS among nursing college students need national awareness programs.

Ethical Clearance: Approval to conduct the study was obtained from the dean of college of Nursing, University of Basrah.

Laser Technology in Prosthodontics: A Review

Dr. Pradeep S.

Additional Professor, Dept. of Prosthodontics, Manipal College of Dental Sciences

Abstract

Laser is an acronym, which stands for light amplification by stimulated emission of radiation. Several decades ago, the laser was a death ray, the ultimate weapon of destruction, something you would only find in a science fiction story. Then lasers were developed and actually used, among other places, in light shows. The beam sparkled, it showed pure, vibrant and intense colors. Today the laser is used in the scanners at the grocery store, in compact disc players, and as a pointer for lecturer and above all in medical and dental field. The image of the laser has changed significantly over the past several years. With dentistry in the high tech era, we are fortunate to have many technological innovations to enhance treatment, including intraoral video cameras, CAD-CAM units, RVGs and air-abrasive units. However, no instrument is more representative of the term high-tech than, the laser. Dental procedures performed today with the laser are so effective that they should set a new standard of care. The scientific method and artistic details prescribed for reconstructive dentistry are well has been documented. The current use of lasers in reconstructive dentistry encompasses a wide variety of soft tissue procedures. The future may hold promise for hard tissue laser use in crown preparation, bone recontouring, and implant placement.

Introduction

Laser is an acronym, which stands for light amplification by stimulated emission of radiation.[12] Several decades ago, the laser was a death ray, the ultimate weapon of destruction, something you would only find in a science fiction story. Then lasers were developed and actually used, among other places, in light shows. The beam sparkled, it showed pure, vibrant and intense colors. Today the laser is used in the scanners at the grocery store, in compact disc players, and as a pointer for lecturer and above all in medical and dental field. The image of the laser has changed significantly over the past several years.

With dentistry in the high tech era, we are fortunate to have many technological innovations to enhance treatment, including intraoral video cameras, CAD-CAM units, RVGs and air-abrasive units. However, no instrument is more representative of the term high-tech than, the laser. Dental procedures performed today with the laser are so effective that they should set a new standard of care. [3]

The scientific method and artistic details prescribed for reconstructive dentistry are well has been documented. The current use of lasers in reconstructive dentistry encompasses a wide variety of soft tissue procedures.[13] The future may hold promise for hard tissue laser use in crown preparation, bone recontouring, and implant placement. Laser use during soft tissue procedures for fixed, removable, and implant dentistry can enhance esthetics, improve impression outcomes, and provide a foundation for the restorative appliance nearer to ideal in fit, form, and function.

Underlying structures, such as the attached gingiva, gingival sulcus, epithelial attachment, periodontal ligament, and alveolar crest, are important and must be evaluated carefully. When sound principles are followed, the outcome of laser surgery provides a more predictable, improved foundation for fixed, removable, and implant dentistry.

Laser Physics: Laser is a device that converts

electrical or chemical energy into light energy. In contrast to ordinary light that is emitted spontaneously by excited atoms or molecules, the light emitted by laser occurs when an atom or molecule retains excess energy until it is stimulated to emit it. The radiation emitted by lasers including both visible and invisible light is more generally termed as electromagnetic radiation. The concept of stimulated emission of light was first proposed in 1917 by Albert Einstein. He described three processes:

1. Absorption
2. Spontaneous emission

Stimulated emission: Einstein considered the model of a basic atom to describe the production of laser. An atom consists of centrally placed nucleus which contains +vely charged particles known as protons, around which the negatively charged particles. i.e. electrons are revolving. When an atom is struck by a photon, there is an energy transfer causing increase in energy of the atom. This process is termed as absorption. The photon then ceases to exist, and an electron within the atom pumps to a higher energy level. This atom is thus pumped up to an excited state from the ground state. In the excited state, the atom is unstable and will soon spontaneously decay back to the ground state, releasing the stored energy in the form of an emitted photon. This process is called spontaneous emission. If an atom in the excited state is struck by a photon of identical energy as the photon to be emitted, the emission could be stimulated to occur earlier than would occur spontaneously. This stimulated interaction causes two photons that are identical in frequency and wavelength to leave the atom. This is a process of stimulated emission. If a collection of atoms includes, more that are pumped into the excited state that remain in the resting state, a population inversion exists. This is necessary condition for lasing. Now, the spontaneous emission of a photon by one atom will stimulate the release of a second photon in a second atom, and these two photon will trigger the release of two more photons. These four than yield eight, eight yield sixteen and so on. In a small space at the speed of light, this photon chain reaction produces a brief intense flash of monochromatic and coherent light which is termed as 'laser'.

Laser in fixed prosthetics: Complete control of the oral environment at the operative site is essential during restorative dental procedures. This control extends beyond suppressing saliva and blood to managing the gingiva surrounding the teeth. Frequently, cases are encountered in which the gingival tissues need to be altered because of areas of inflammation, previous sub-gingival restorations, or sub-gingival caries. The finish line may need to be placed near the epithelial attachment, making it impossible to retract the gingiva without stripping the attachment, bruising the periodontal ligament, and creating uncontrolled bleeding.[14] Resulting hemorrhage in the gingival sulcus can make impression making impossible as well as healing unpredictable. In these cases, laser sulcular gingivoplasty can be used to develop a new, healthier gingival sulcus; to control hemorrhage; and to remove just enough epithelial attachment and periodontal ligament to facilitate the placement (not packing) of retraction cord. Laser sulcular gingivo-plasty improves impression techniques and minimizes gingival recession. They are alsoused where crown lengthening and are specified within esthetic zone that need attention to attain esthetic results. There are many causes of the unsuitable ponticsposition. The most common causes are inadequate compression of the buccal and the palatal/ lingual alveolar plates after an extraction and non-replacement of the missing tooth for a long time. such pontic sitemight result in unesthetic and non-self-cleansing pontic design. For such situations to have a favorable pontic design, re-contouring of soft and bony area may be required. They may be achieved by using soft tissue lasers and for osseous surgery erbium family of lasers may be used. Fixed restorations such as crown and bridge removal can be done without cutting using laser beams. The laser energy passes through porcelain glass unaffected that is occupied by the water molecules present in the adhesive. The debonding happens at the junction of the silane and the resin without causing any trauma to the underlying tooth.

Laser in soft tissue pre-prosthetic surgery: The key to successful removable prosthetics is the preoperative planning of the surrounding oral structures. The prognosis for success often is in direct proportion to the proper preparation of these supporting structures. Dentistry has come a long way from just replacing missing teeth to replacing lost alveolus, supporting facial structures, recreating esthetics, reestablishing phonetics, and, most important, providing retention of the appliance. For a removable appliance to accomplish this task, hard and soft tissues must be evaluated for pre-prosthetic surgery. The resultant surgery should provide the patient with ridges and mucosal coverings free of disease and of a quality and quantity sufficient to provide stability

and retention so that the appliance may function as close to ideal as possible. They areused to perform most pre-prosthetic surgeries. These involve hard and soft tissue tuberosity reduction, torus removal, and treatment of inappropriate residual ridges involving undercut and irregularly resorbed ridges, treatment of unsupported soft tissues, and hard and soft tissue malformation. They have been also used to treat the problem of hyperplastic tissue and nicotinic stomatitis under the palate of a full or partial denture and ease the irritation of epulis, denture stomatitis, and other problems related with long term wear of ill-fitting dentures. Stability, retention, function, and esthetics of removable prostheses may be increased by proper laser manipulation of the soft tissues and underlying osseous structure. Prosthetic problems may arise if maxillary tori or exostoses are large or irregular in shape these bony protuberances may interfere with the prosthesis,soft tissue lasers may be used to expose the exostoses and erbium lasers may be usedin case of osseous reduction. [11.] The most common cause for enlarged tuberosity usually is soft tissue hyperplasia and alveolar hyperplasia leading to overeruption of unopposed maxillary molar teeth leading to a then problem of construction of the prosthesis, such tissue hyperplasia's can also be cleared using soft tissue lasers

Advantages:

1. Laser surgery is precise and self-sterilizing because the tissues are vaporized.
2. It is relatively blood–less, because any blood vessel with a diameter less than the width of the laser beam will be vaporized and heat sealed.
3. It is relatively pain-free because nerves that are transected are also heat sealed by the laser beam
4. Postoperative edema and swelling appear to be minimal presumably because lymphatics are also sealed.
5. Laser wounds contract less than other types of wounds, possibly because fewer myofibroblasts are seen in the wounds and these cells are believed to be the etiologic agents in wound contraction.

Disadvantages:

1. Laser wounds have less tensile strength than scalpel wounds, although after 3 weeks the strengths are similar.
2. Although the laser beam is focused, it can potentially injure tissues that might be inadvertently contacted by the laser beam if the arm is bumped or slips.

The pre-prosthetic surgeries that can be performed most advantageously with a dental laser are the following[5]:

1. Soft tissue tuberosity reduction
2. Removal of labial, buccal, and lingual frena
3. Treatment of hyper plasia of the oral mucosa
4. Removal of fibromas, papillomas, or soft tissue cysts

Laser in implant dentistry: Implantology has been an area of considerable interest for dental application of laser technology. They are used for implant recovery, implant site preparation and detachment of diseased tissue around the implant.[4]An emphasis is placed on lasers which are available commercially in dentistry at the present time, carbon dioxide, neodymium-yttrium-aluminum-garnet (Nd:YAG), argon, and erbium:YAG[2]. Implant can be exposed, and impressions can be obtained at the same appointmentas minimal tissue shrinkage is seen after laser surgery.[10]

Procedure	Laser
Laboratory Procedure	
1. Welding of metallic implants	Nd:YAG
2. Welding of ceramic implants	Nd:YAG or CO2
3. Drilling of ceramic implants	Nd:YAG or CO2
4. Sterilization of implants	Not recommended prior to insertion
Clinical Procedure	
1. Preparation of bone	Not recommended
2. Implant exposure (Stage II)	CO2 or Erbium:YAG
3. Gingival surgery	CO2 or Erbium:YAG
4. Scaling and plaque removal	Not recommended

Laser in Maxillofacial Prosthodontics: The use of lasers in the maxillofacial prosthetics is used for the initial work up of the three dimensional addition of optical data oral defects. Usage of the Laser technology has showed to be useful for designing the shape and position of the prostheses. They can remove the need for conventional impression techniques and related disadvantages like distortion of the soft tissue and irritation to patients. They also overcome the disadvantages of 3D CT and MRI reconstruction as the patient is not exposed to considerable radiation and any stress.[9]

Science of holography: A hologram is a photographic film, slide, or plate upon which is recorded the interference pattern produced by the reinforcement

or cancellation of two different intersection light wave fronts. Holography is the science of recording the reflected light waves from an object onto a hologram and subsequently reconstructing the stored image of the object in the space where the original object had been. The terms holo, meaning complete, and gram, meaning message, give rise to the hologram or complete message [1].

The three-dimensional aspect of the hologram image is unique. Unlike 3-Dimensional stereoscopic slides the hologram, as a single slide, recreates the object's natural parallax effect in the image. Thus the viewer of the hologram, by changing his position, can see objects blocked by foreground objects-an important factor when recording images in an area as severely restricted as the oral cavity.

Laser holography: A laser is a device that generates and amplifies coherent electromagnetic energy at optical frequencies. One important application of the laser has been in the field of optical image storage and image reconstruction known as holography. The principle of holography was discovered by Gabor in 1948. when the laser light source was applied to holography in 1963 by Leith and Upatnieks, the practical application of holography became possible for three-dimensional recording of objects. [1]

Review of Literature

M.A. Pogrel et al (1989) described the ability of Co_2 laser to vaporize soft tissues with little bleeding, pain, swelling, or wound healing by evaluating the laser on 27 patients requiring soft tissue pre-prosthetic surgery, including frenectomies, tuberosity reduction, hyperplasia removal and sulcus deepening. And concluded that it had several advantages as follows: -

1. Laser surgery is precise and self-sterilizing.
2. It is relatively blood-less.
3. It is relatively pain-free.
4. Postoperative edema and swelling appear to be minimal.

M. Fentzen et al (1990) described that lasers are heat-producing devices converting electromagnetic energy into thermal energy. These lasers are used in oral surgery for cutting or coagulating soft tissues or in welding of dental prostheses. New types of lasers have offered non-thermal modes of tissue interaction, called photoablation, photodisruption and photochemical effects.

M. Midda et al (1991) described that clinical lasers are two types; soft lasers act as an aid in healing. Surgical hard lasers can cut both hard and soft tissues and replace the scalpel and drills. The most commonly used laser systems, are the argon, Co_2 and Nd:YAG systems. The Nd:YAG engine provides hand-pieces of similar size to conventional instrumentation and are being fed by a fibre-optic 'cable' for intra oral use. The Co_2 laser is widely used in oral surgery. The procedures with lasers can usually be performed without a local anesthetic and sterilizes the area as it cuts. Further more the Nd:YAG lasers can be used for caries removal, endodontics and gingival curettage.

Laurence J. Walsh et al (1992) described the unique interactions of particular laser wavelengths with tissues and restorative materials. There is no one laser, which is suitable for use in all laboratory and clinical procedures in the field of implantology. All lasers are capable of generating thermal effects, considerations should be given to the extent to which energy will be absorbed or reflected by the target material, injudious use of lasers can cause thermal injury to implants as well as to bone and soft tissue

Thomas. E. Gordon et al (1970) described laser welding of fixed and removable partial prostheses done on the master cast at energy levels ranging from 6 to 12 joules, with pulse length of approximately 4m secs. The inaccuracies in assembly caused by transfers from master cast along with investment and heat distortion are avoided and (laser-welded joints had strength compatible with the adherent strength of substrate metal). Anatomic form of the inter proximal region is not obliterated with maximum esthetic in the anterior section of the mouth.

Discussion

Lasers are an important aspect to dental treatment regarding contamination control, wound recuperating control, draining control and vibration control in hard tissue expulsion. Success in clinical uses of lasers depend on a firm premise of laser material science. Distinctive laser wavelengths are caught up in changing degrees by the real oral tissue parts in particular; water, hydroxyapatite, hemoglobin, and melanin. From the most reduced vitality conveyance to the most elevated. The possibilities for laser dentistry to upgrade for clinical steps in the dentist's ability is by controlling the power

output and the duration of exposure on both hard and soft tissues, permit for treatment of a highly particular area of focus without damaging surrounding tissues, he or she requires to fully understand the character of the wavelength being used, and the thermal inference & check of the optical energy.[8]

Conclusion

The dental community wants to find a method to remove infected dental hard tissues that is less noxious than today's rotary hand pieces. Much interest has been aroused in lasers as replacements.

Although there has been research done in laser dentistry since the development of the ruby laser in the early 1960s, only recently has clinical use grown. But with this growth, there hasn't been an equal flurry of research to substantiate the claim that the laser is a more efficient and better method of treatment for dental disease. Dental use of lasers can be divided into two areas soft-and hard tissue applications[8]. Researches have examined both areas using all existing lasers. These include the carbon dioxide, neodymium: yttrium-aluminium-gamet, argon, holmium: YAG, erbium:YAG and excimer lasers.

There is a quest to find a method to remove diseased and healthy dental hard tissues without the negative stimuli associated with dental hand pieces. Today, lasers are being considered as a potential replacement. Various reports evaluate thermal effects of three lasers. FDA approval for soft tissue removal has now been granted and thus procedures such as laser gingivoplasty, operculeutomy and frenectomy can be carried out without the use of local anaesthesia in a bloodless field. The combination of the laser's ability to sterilize, and in the case of Nd:YAG (and some other laser), to be transmitted along a fibre-optic cable opens up further areas of application.

The surgical carbon dioxide laser appears to have a number of potential advantages in soft tissue pre-prosthetic surgery that merit further exploration. It enables a number of procedures to be performed in the dental office quickly. The surgical carbon-dioxide laser has a number of claimed advantages over other modalities for soft tissue surgery. Many of these advantages appear to be particularly applicable for soft tissue pre-prothetic surgery. Because of this unique interaction of particular laser wavelengths with tissues and restorative materials. There is no one laser, which is suitable for use in all laboratory and clinical procedures in the field of implantology. Lasers are further being used for welding of prosthesis with better results.

Caution is required in interpreting the results of experimental or clinical reports. It is important not to prematurely assume the applicability of a particular treatment before sufficient evidence, substantiates both its safety and efficacy. It is also important to recognize the limitation of our current understanding of the long-term effects of laser energy on oral tissues and the mechanisms by which lasers affect biologic systems

An Observation on Employee Performance Appraisal System in Hospitals and their Clinical Sectors

Ramila Devi Ram Sing[1], S. Vadivelu[2]

[1]Research Scholar, [2]Professor & Head, Dept of Management Studies, Bharath University, Chennai, India

Abstract

Health care and clinical research sector and their professional has become more involved in performance management as hospitals organize to increase their effectiveness towards various growth sectors. Although they are hospital employees specialized in their health care professions and research activities, they are subject to performance appraisals because the hospitals are accountable to patients and the community for the quality of hospital services and recent research activities. The necessity for having a performance appraisal program in hospital and researchers is to direct the employee's performance, motivate staff and improve hospitals self esteem growth. The performance of a health care professional may be appraised by the appropriate departmental manager, by other professionals in a team or program, based on prior consistency. Appraisal approaches may vary in different ranks. They include behavioral approaches such as rating scales, peer rating, ranking or nomination and outcome approaches such as management by objectives and their achievements. Yes, professionals should give and receive timely feedback on a flexible schedule. There are various parameters to measure the efficiency and capabilities of the employee and their dedication towards the organization. Where, in this article an attempt has been made to observe and study the Performance Appraisal systems in hospitals and their clinical sectors especially in Kanchipuram village and to offer suggestions for their growth and improvement.

Keywords: *Employees, Performance appraisal, Human resource management, Organizations.*

Introduction

Performance appraisal is one of the important components in the rational and systematic process of human resource management. The information obtained through performance appraisal provides foundations for recruiting and selecting new hires, training and development of existing staff, and motivating and maintaining a quality work force by adequately and properly rewarding their performance. Without a reliable performance appraisal system, a human resource management system falls apart, resulting in the total waste of the valuable human assets a company has[1].

The British Association of Medical Managers (BAMM, 1999) has defined appraisal as "the process of periodically reviewing one's performance against the various elements of one's job". Certainly this paper will describe the purpose & developmental criteria of an appraisal program that will regularly assess the performance of hospital employee[3].

Necessity of Performance Appraisal System in Hospital: The primary reason for having a performance appraisal program in hospitals is to monitor employee's performance, motivate staff and improve hospital morale. In the hospital, monitoring employee performance requires routine documentation, which is accomplished through completing a performance appraisal form[1]. When employees are aware that the hospital is mindful of their performance and they could be rewarded with increment and promotions, they will work harder.

Confidence is enhanced when employees get acknowledgment or reward for their work. A powerful performance appraisal program will help the hospital and assist in accomplishing its objectives and goals[2]. Not just, preparing necessities will be recognized and tended to amid performance appraisal survey; yet in addition concealed talent and approach to patients can be found too. Through distinguishing these preparation needs, staff can play out their positions at the great level and be in a superior position to address customers, individuals and clients concerns and questions[3]. A best and active staff is bound to be proactive, beneficial and ingenious,

all of which helps give the hospital an aggressive edge, from enhanced customer relations to expanded profits and benefits.

Who Will Appraise Performance?: Physicians, nurses, social workers, clinical pharmacists and other professionals often work interdependently to care for patients; but during performance appraisal, they have formal input into each other's appraisals[4]. As hospitals increasingly focus on care delivery processes, physicians may be appraised by other professionals who share the responsibility for patient care and outcomes. Ensuring the quality of medical care is the responsibility of both regulatory bodies and hospitals[7]. The way an organization is structured has a direct bearing on who conducts the appraisal. Hospitals generally use a combination of functional and, team or program approaches[5]. In a functional approach, professionals focus on performing their own functions under the direct supervision of one boss. Teams or programs comprise individual professionals who also belong to traditional functional departments[6]. In this case, however, professionals may have two supervisors - one in the department and one in the team or program.

What Performance Will Be Appraised?: Health Services Research Group (1992) wrote an article in CMAJ and reviewed the challenge of developing standards, guidelines and clinical policies as well as defining "quality" in relation to performance. Performance measures often include both process expectations (how the work gets done) and outcome expectations (the results of the process). Simon, L. (1992) suggested the following criteria to assess the performance of department head in the hospital: quality of service in the specific department, operational efficiency and effectiveness, and budget responsibility and accountability.

How Performance is appraised?

To date, health care organization literature on performance appraisal method has tended to focus on employee-employer relationships instead of the practitioner-organization interface. Although, in the new era, most of the doctors are not hospital employees, their performance will be examined in the light of the strategic direction of health care organizations. McAuley, R.G., Paul, W.M & Morrison, G.H. et al (1990) conducted a peer assessment program in the College of Physicians and Surgeons of Ontario that is mainly covering the office practices. Kilshaw, M.F., (1992) said that these programs are traditionally based on peer review and include a well defined committee structure involving medical staff representatives.

The specification of performance appraisal criteria is a recurring problem (Leatt, P. & Fried, B., 1988). One of the central issues is whether to evaluate traits, behaviors or outcomes of work. The trait approach, which is now outdated, evaluated such items as appearance, self confidence, alertness and ambition rather than job-related behaviors, productivity or quality of work.

The behavioral approach can be used in conjunction with peer evaluation. Three types of peer evaluation have been described: peer rating, peer ranking and peer nomination (Stone, T.H. & Meltz N.M., 1993). In peer rating, group members rate each other; in peer ranking, group members assign rankings to one another; and in peer nomination, each member of a well-defined group designates a number of group members as highest (and sometimes lowest) in an aspect of performance. The third type has been shown to distinguish with a high degree of reliability and validity group members whose performance is very good or very poor in the particular area (Kane, J.S., & Lawler, E.E., III, 1978).

Methodology

The study covered about 400 employees across 5 hospitals in Kanchipuram village sectors.

1. Meenakshi Medical College Hospital and Research Institute
2. Dr. Agarwals Eye Hospital Research center
3. Life care Hospital
4. Manohar General Hospital
5. CSI Hospital

These hospitals approximately suited with 500 to 1000 bedded multi-specialtyfacilities providing comprehensive care to patients - Gynecology, general medicine, general surgery, pediatrics, ENT division, Ortho, Anastasia, physic Therapy, Ultra Sound Scanning, Endoscopy, Urology, Nephrology, Rheumatology and others.

The data's were collected from employees through questionnaires which were based on random analysis and the sampling techniques. Discussions and informal interviews of the personnel revealed the first hand data.

This data collection method can come out with good quality data. Questionnaires was based on Cascio et al., (1988)

- Sampling Units: Employees of Hospital and senior employees
- Sampling Technique: Convenience and Judgment
- Sampling Research Instrument: Questionnaires and Interviews

Performance Appraisal Process in Hospitals: The performance appraisal system forms an essential part of the employee development process in any organization. It reflects the aptitude of an organization to define goals and expectations from employees. An upright and consequential performance appraisal process is essential for the hospitals prosperity and at the same manner it plays a significant role in bringing out the best in workers[8]. Salary revision following a performance appraisal is a great motivating factor and an upright performance appraisal process goes a long way toward reducing effectiveness rates.

The hospitals are applying 180 degree appraisal system. 180 degree performance appraisals mean that employees are appraised by two people (self and Boss/ Manager). The time interval for performance appraisal is six months to one year. The performance appraisal system holds up both employees and organizational management and leaders benefit from a well-structured performance appraisal system which helps to built successful organization. These systems offer feedback and rewards to employees who perform well, while at the same time holding employees accountable for their performance[9]. Where, each report will describe the purpose, benefits, and elements of a good performance appraisal system and outline a unique performance appraisal system for a human service organization.

The purpose of a performance appraisal system is to provide an evaluation and feedback on an employee's performance. Most hospitals perform appraisals yearly and may call the appraisal by other terms-such as a review. Even if appraisals are performed annually, management should have weekly consultations or meetings with staff to ensure each employee is kept up-to date with policies and each employee knows what is expected of him or her. A manager should not wait until the end of a year to let an employee know that there has been a performance problem for the last eight months[10]. Problems should be addressed as they arise to prevent any surprises during the appraisal process. The evaluation portion of an appraisal system is normally performed by management.

During this portion, management evaluates an employee's performance to determine if there are any areas that need improvement. Ideally, all employees should ne meeting or exceeding organizational standards[11]. If an employee is not meeting standards, or has not met standards at some point within the previous year, his or her appraisal may have suggestions for improvement or there may be other consequences as a result of poor performance.

The feedback portion of an appraisal systemnormally takes place between management and the employee who is being apprised. Then management provides counseling. But many of the employees don't understand the counseling purpose. So that should be in methodical and systematic manner. The main procedure for hospital is that first appraise fill the form, where they rate for themselves[12]. Appraise writes his view over the actual achievement for the task and target assigned to him. Comments on fulfillment of task and target are written by the HOD. Both appraise and HOD sits together. Comment over strengths and weaknesses and areas for development are written which is undersigned by both. Then compilation of ratio with the target is done. But the main problem occurs with this 180 degree performance appraisal is compilation, collation of data and it is time consuming process. This method is useful if done in a methodical and systematic manner.

Data Analysis:

1. Are you aware about your performance appraisal system or any evaluation done by your superior?
   a. Yes
   b. No
2. A performance appraisal technique makes you eligible for promotion, demotion and transfer?
   a. Yes
   b. No
3. Do you think performance appraisal is useful or just a waste of time?
   a. Useful
   b. Waste of Time
4. Does the proper and adequate performance appraisal play crucial role in your career development?

a. Very important

b. Important

c. Maybe in future

d. Useless

5. Performance appraisal system is most of the time fair and unbiased, is it right?

a. Yes

b. No

6. Does the organization provide counseling after appraisal?

a. Yes

b. No

Results

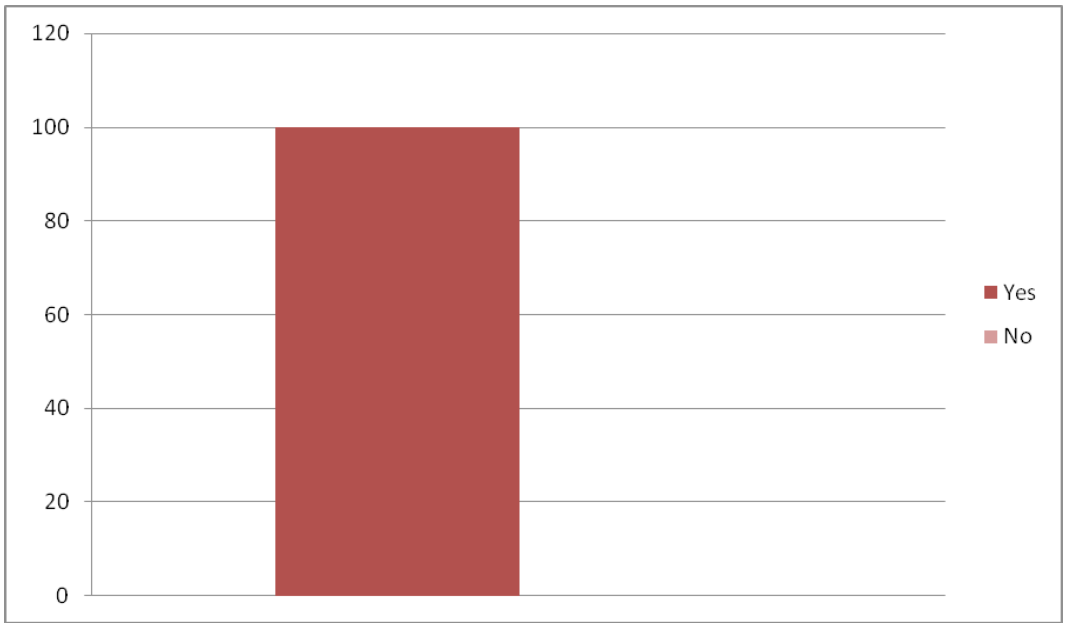

Fig 1: Shows that 100% employees among (400 out of 400)in the individual organization is aware about performance appraisal system and evaluation done by their superiors in the organization

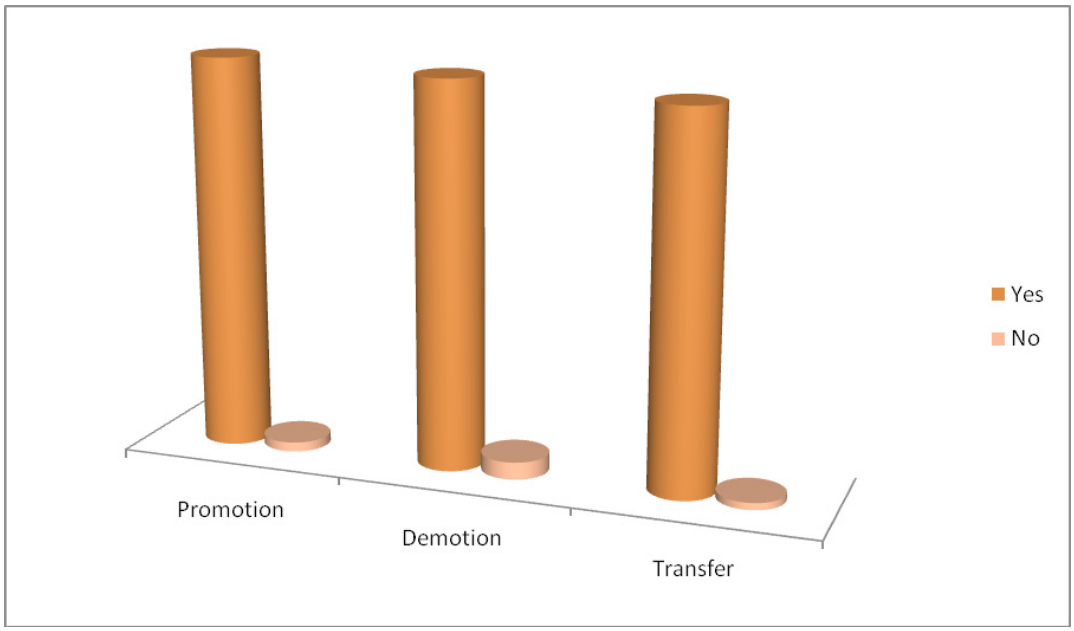

Fig 2: Shows that 100% employees think performance appraisal system in the hospital is more beneficial for promotion, demotion & Transfer.

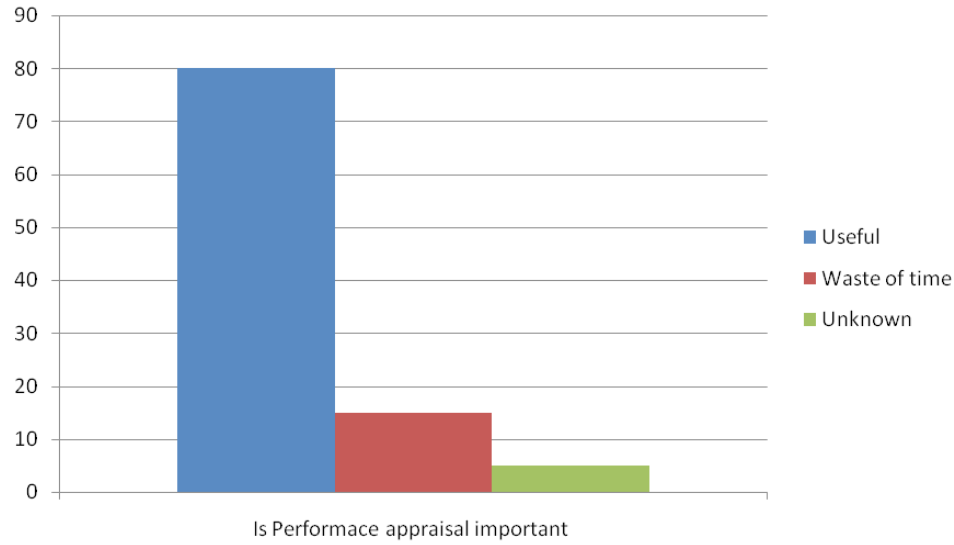

Fig 3: Shows that 85% employees think performance appraisal is useful.

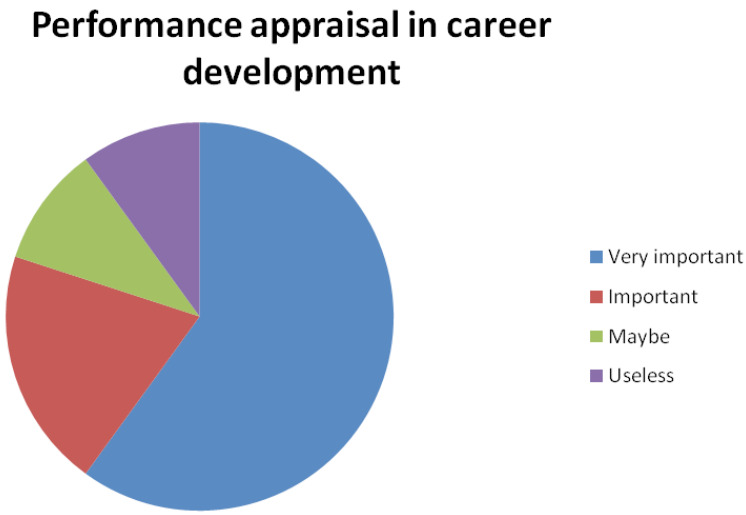

Fig 4: Shows that 60% employees think current performance appraisal plays a crucial role in career development. So there should be more improvement in performance appraisal system than current system.

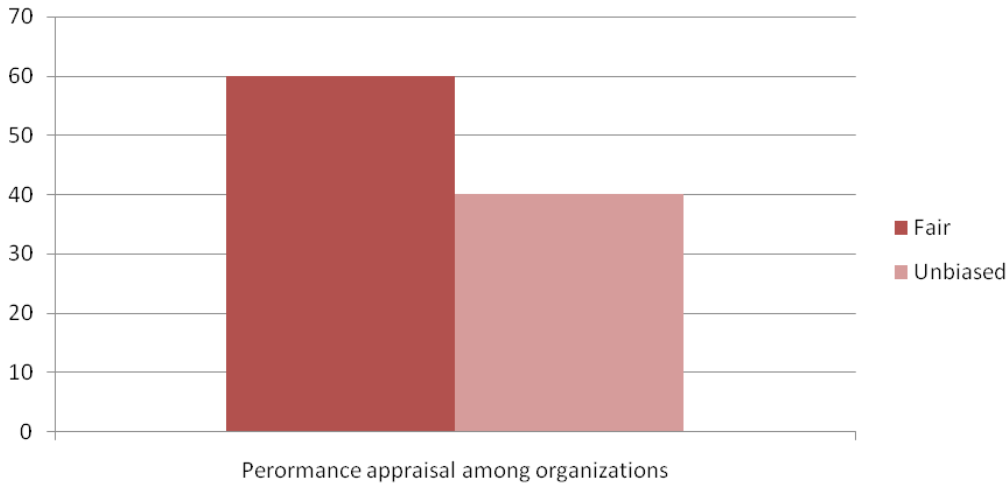

Fig 5: Shows that 40% employees think performance appraisal system is biased. So management has to take care of it.

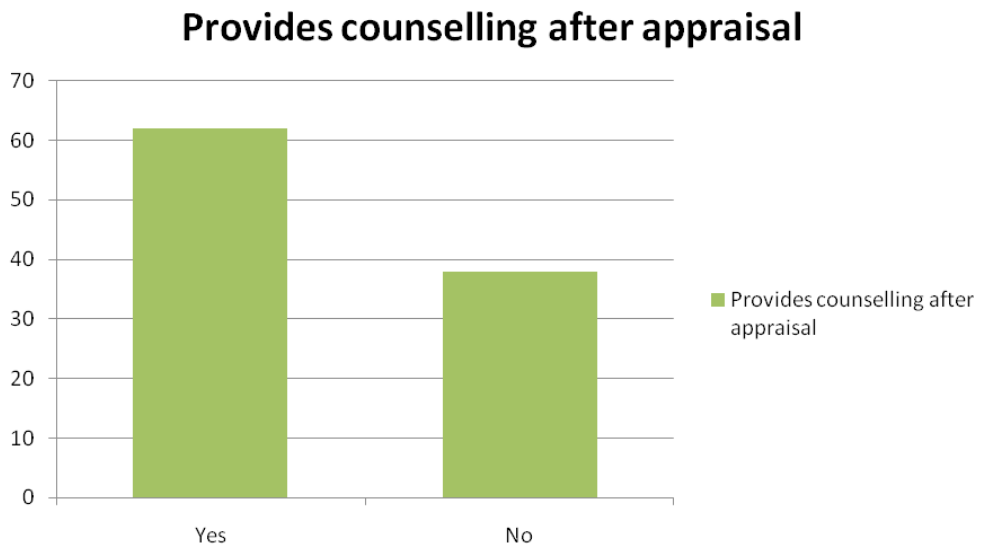

Fig 6: Shows that organization provides 62% counseling. But that should be formal so other employee also get counseling.

Recommendations:

- Performance appraisal should be transparent, timely and effective for employees.
- People should be made more understood about appraisal process and benefits.
- Performance appraisal should be 360 degree appraisal.
- They should provide appropriate training or counseling after appraisal.
- Employees should be given feedback regarding their appraisal. This will help them to improve on their weak areas.

Conclusion

Health care organizations and clinical research sectors depend greatly on a professional strategy; concerned with their effectiveness they must pay attention to employee and physician performance. For an essentials and effective performance system an upright thing should be followed up priory which preferably includes documentation, standard goals, practical and simple format, evaluation technique, communication, feedback and personal bias. The main challenges lies in developing performance appraisal systems are the demand of flexible and appropriate system to the professional staff. This paper has suggested that performance is improved when outcomes or expectations are defined, goals are set and timely feedback is given. These principles also apply to physicians, nurses and other staff of hospital, particularly as their roles are affected by the restructuring of health care.

Ethical Clearance: Since this article is on performance appraisal no need for ethical clearance.

Deciphering Learning Disability: Impact of Cueing Strategies on Academic Performance for Learners with Field-Independent and Field-dependent Cognitive Styles

Rashi Jain[1], Neelam Pandey[2]

[1]Research Scholar, [2]Assistant Professor, Amity Institute of Psychology & Allied Sciences, AUUP, Noida

Abstract

The study has been undertaken to understand and evaluate the learning disabled students in schools and academic settings. They are mentally stable but face difficulties while reading, writing, mathematics, listening, speaking, and logical reasoning. It was expected and asserted that the successful design of instructional environments with enhanced computer technologies and visualization as educational tools should enhance their learning outcomes and sustain their level of performance in schools and professional careers bringing them at par with every other student with normal reflexive. Intervention with use of colour-highlighted keywords and colour-highlighted key phrases becomes essential to attack the root cause. The study proves the fundamental requirement of such strategies with the adoption of special educators reflected in their academic performance. It is noted that students with field-independent cognitive style tend to have the more exceptional analytical and differentiating ability as compared to field-dependent students who tend to view events without considering the details such as accepting an entire phrase without focusing his or her attention on the crucial information.

Keywords: *Learning disabled, cueing strategy, cognitive style, field-independent, field-dependent.*

Introduction

Learning inabilities will, in general, be analysed when youngsters arrive at school age, as it centres on numerous things that might be hard for kids perusing, composing, math, tuning in, talking, and thinking. As learning inabilities are not visible, they regularly go undetected. Distinguishing and perceiving a learning handicap is much progressively troublesome because the seriousness and attributes change. Restricted endeavours are seen by the educating authorities for the concerned populace to advance special education and related services, helping them to motivate these children to strive for excellence by empowering their positive miens, knowing their defects, understanding training framework, working with experts and finding out about methodologies managing specific challenges. As observed and experienced the need is to promote the successful design of instructional environments amongst school authorities with enhanced computer technologies, visualization as educational tools that surely enhance learning outcomes as well to support and sustain their school-level performance, success in professional careers. In certain circumstances as part of the inspection, teachers and parents notice that the child is not learning as expected, monitoring to reach to the root cause and exercising the best handling available. The urgent situation here is to sustain their school-level performance, success in professional careers at par with every other individual student with normal reflexive, yes this is what was seen to be lacking for the population of interest, as well as limited knowledge and efforts are made for the right support and intervention.

Understanding and evaluating the Learning Disabled [LD] students that lack behind in schools and academic situations yet are mentally stable but face difficulties while reading, writing, math, listening, speaking, and logical reasoning or otherwise is still widely needs to be promoted for the population concerned. Not only limited work is seen for LD students in India but also improper help and parental support deemed insignificant. The particular research justifies the role of special educators with an appropriate strategy, assistive technology such as absorbing words and phrases embedded within a computer screen full of information, the involvement of

supportive parents; as such a curing process necessitates help in continuation at home as well as in schools.

In this study, we briefly review the relevant literature on (1) main determinants of field-independent and field-dependent cognitive style of learning and absorbing information, (2) irrelevance of Intelligence Quotient (IQ), and (3) efficiency of cueing strategies and the role of special educators as an intervention to enhance learning outcomes. Combining these three strands of research in a systematic study for learning disabled students, that can be interpreted as suggestive evidence of improved learning response, in turn for helping them to motivate and strive for excellence by empowering their positive miens.

First, our empirical model caters to a large literature on the determinants of field-independent and field-dependent individuals, as they have different, preferred ways of gaining, storing, processing, and using information.[16] Every individual with a learning disability is uniqueand shows a different combination as well as the degree of difficulties. Uneven areas of ability come in many forms, and their effects are different from individual to individual. These individual differencesdo interfere with a person's ability to think and remember.

For instance, Davisreported field-independent cognitive competence and more significant restructuring skills makes them more adaptive in educational contexts, and their achievements are more valued within the educational setting.[17] Similarstudies have shown that field-independent learners are more successful than field-dependent learners when performing learning tasks that involve higher-order thinking skills, such as the restructuring of information.[181920]

Second, Intelligence is the ability to make profitable use of experience, there is no significant difference between healthy children and children with Learning Disabilities (U.S. Department of Education, 2001). On logical and empirical grounds, Intelligence Quotient [IQ] test scores are not necessary for the definition of learning disabilities as per (Linds S. Siegel, 1989). While assessing the mental level of children, coming from different environments, it was observed neither end of the cognitive continuum is superior in Intelligence.

Third, strategically designed environment with facilitating cues to pinpoint information which the memory retrieves are the essential task, on which the research intervention depends. The behavioural component and condition of the population (LD) characterize to search for information stored in memory. The strategy focused on external episodes of visual cues-colour-highlighted keywords and colour-highlighted key phrases and verbal cues - instructional driven, signal, feedback to focus the attention of learners with LD by providing cues for critical parts of the information. Brown mentioned that cues had been described as attention-directing techniques in research studies.[21]

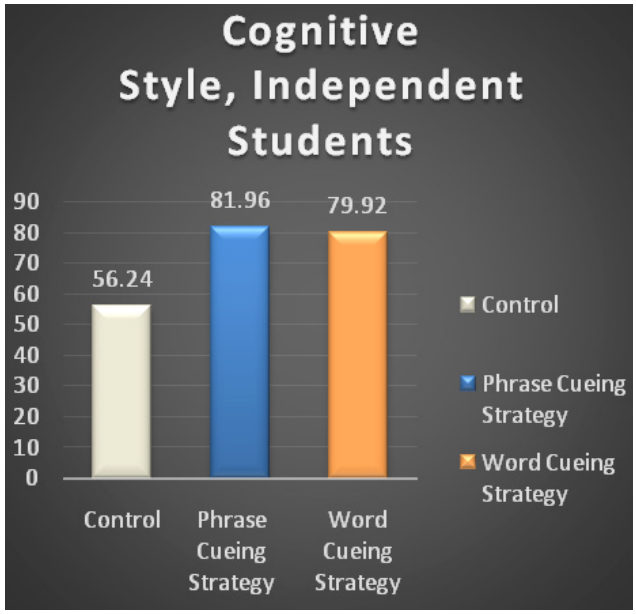
Goldstein referred to cueing as "a type of rehearsal strategy that involves the presentation of a word associate (usually a category name) to be utilized for the retrieval of items in the recall".Researchers pointed to the limited functioning of working memory requiring learners to distinguish core and enrichment content by allocating more attention to the text components they perceive as most important, proved that instructional designers could assist by focusing on essential elements within the text.

Bloomdescribed various critical points about cues to assist educators, concluded that the advancement of technology could allow for different instructional method.[9] Researchers mentioned that understanding and learning from instructional text is a tough task that involves many cognitive processes, such as recognizing the words and identifying the valuable ideas within the text.[8,10,11]Gibsonstated that the ability of learners to distinguish the most crucial information within a text message and give it the proper attention is vital for successful academic achievement.[12]

Materials and Method

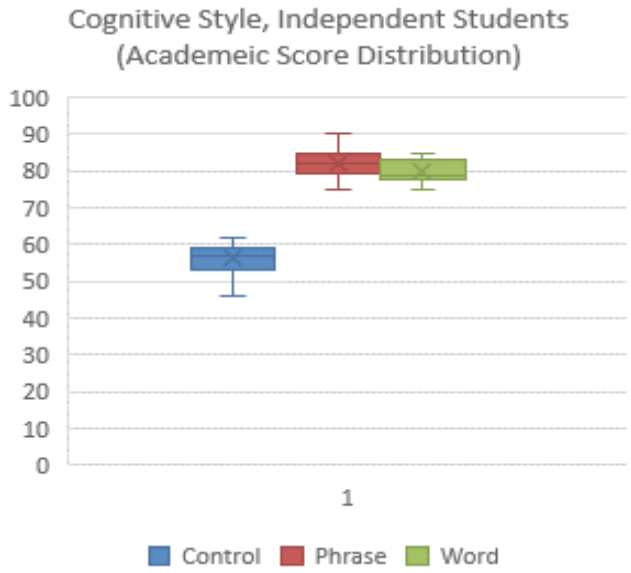
Study population, data and sample size: For the study, pre-diagnosed Learning Disabled [LD] students were taken into account. The team of Mental Health & Clinical Psychologist already made this diagnosis. The sample population for the study which screened for the initial evaluation was 200 LD students who were attending schools at Delhi/NCR India, of which there were 50 dropouts from the sessions due to exclusion criterion which was the interest of students to participate in the intervention. The prospective study eventually consists of 150 cases that were taken in the age category of 8-12 years that belonged to the LD population. Random sampling technique was used, and categorized depending upon their cognitive styles to have equal opportunity to get exposed to different cueing strategies. Counselling schedules and follow up sessions were conducted as needed to ensure unbiased collection of

observations and efficient outcomes while comparing them on experiment groups vis. Word (n=25), Phrase (n=25) and Control (n=25) for both cognitive fields dependent and independent. Priori sample calculation showed n = 25 for each group is quite good enough to determine large (Cohen's f) effect in the population with the power associated is > 80%, so that the observed sample reflects true effect in the population.



Scale and statistics: Assessment visit evaluation for the academic performance with the usage of word and phrase-based cueing strategy for the LD students visited, observed and completed evaluation for an observed duration of 10 months at schools in Delhi NCR, India, was performed using Between Group Analysis of Variance [ANOVA] for students with field-independent cognitive style students and likewise Non-Parametric Between Group ANOVA for students with field-dependent cognitive style accounts for improvement of students' academic scores for the respective follow up along with intervention. Systematic improvements in the field parameters are noticed with the corresponding magnitude of such effect in the population of interest. It was ensured that all assumptions made tenable before applying appropriate statistics and its validity.

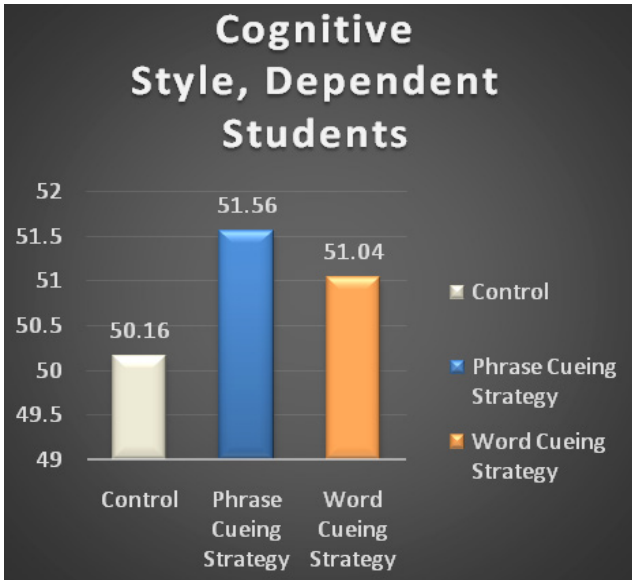
Results



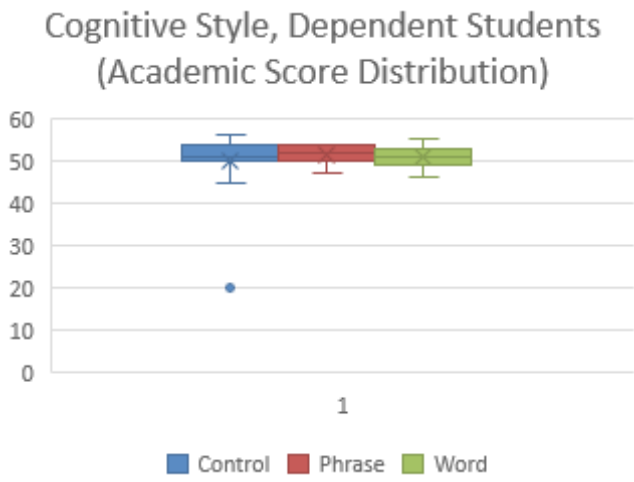
The field dependence-independence cognitive style dimensions are studied experimentally, forming case-control using cueing strategies as the intervention. Noticeably, students whose cognitive style is field independence tend to have greater analytical, absorbing and differentiating ability compared to field-dependent students.

For instance, the task assignment required absorbing words and phrases embedded within a computer screen full of information, and seemingly field-dependent learners ignored their attention to critical information; hence, they needed additional guidance. They have shown difficulty selectively attending to relevant cues, especially when they are presented with complex cues lacking attention on critical features of the information to be learned as an outcome - such an experimental design expected to reveal individual differences in performance particularly relevant in adaptive teaching.

Field-Independent Cognitive Style Students: Analysis of Variance Assessment: A one-way between-subjects ANOVA was conducted for Independent style student observations to compare the effect of cueing strategy on learning outcomes of the academic performance for word-based, phrase-based and control group. There was a significant effect of cueing intervention on enhancing learning at the $p<.05$ level for the three conditions [$F(2, 72) = 387.55$, $p = 0.000$]. Post hoc comparisons using the Bonferroni correction test indicated that the mean academic score for both the intervention group vis. word-based (M=79.92, SD=3.23) and phrase-based (M=81.96, SD=3.95) was significantly higher than the group of students with no intervention vis. Control (M=56.24, SD=3.67). The word-based cueing strategy had low post-academic value than the phrase-based cueing strategy which was statistically non-significant (M_{diff} = -2.04, 95% CI [-4.56, .48], $p > .05$) confirming that both these intervention strategies are equally effective to enhance learning outcomes. All together research experiment markedly ensures the competency of cueing strategy to enhance learning outcomes of the disabled students indicating that field-independent learners responded well to restructuring skills, memory processing (both short term and long term), analytical ability and well-organized teaching responses while processing information revealed in their post-intervention academic scores. Experimental manipulation is highly successful. The effect size for such a good fit model reported being 91.5%.



Graph 1: Illustrating academic mean response, after intervention for field independent students by randomized experiment manipulation groups



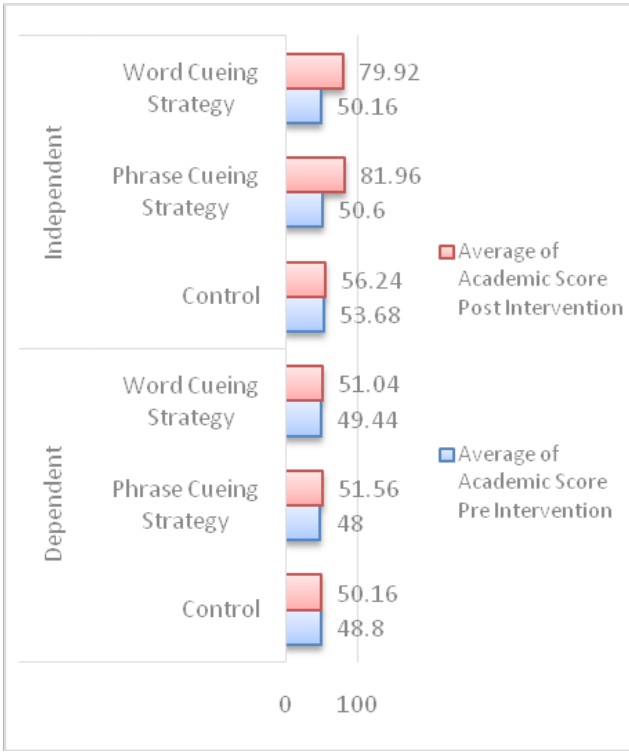
Graph 2: illustrating box and whisker distribution of academic scores after intervention

Field-Dependent Cognitive Style: Non-Parametric Analysis of Variance Assessment: Kruskal Wallis Test was conducted to examine the effect of cueing strategy on learning outcomes for the academic performance. No significant differences (Chi-square $\chi 2$ = .683, df=2, p = .711, >.05) were found, apparently Mean Ranks of post intervention academic scores are equivalent across groups: Control (38.52) ≈ Word (35.26) ≈ Phrase (40.22) possibly lacking to memorize, process, structure and organize information for the type of population under study.

Graph 3: Illustrating academic mean response, after intervention for field dependent students by randomized experiment manipulation groups

Graph 4: Illustrating box and whisker distribution of academic scores after intervention

Discussion and Conclusion



The study aimed to support children with learning disabilities by encouraging their positive dispositions, knowing their flaws, understanding education system, working with professionals, and learning about strategies dealing with specific difficulties. A student looks perfectly healthy and seems to be a very bright and intelligent yet may be unable to demonstrate the skills level expected from someone of a similar age. Such hidden parameters can be figured out, cured and fixed, but not by conventional ways of teaching. Identifying and recognizing a learning disability is even more difficult because the severity and characteristics vary.

It was observed that independent students are active in processing information, analysing existing information even when it lacks an apparent or inherent one focus their attention on task-relevant exercise, and ignore distractions better than field-dependent individuals. The difference lies in terms of restructuring skills where psychological domain, social domain, and learning context play an integral role. At circumstances, it was realized dependent students are passive in perceiving information, taking a spectator approach to concept attainment and accepting the structure of a field as it exists. They tend to perceive information in an interconnected manner, are less flexible in their search strategies, and have a difficult time attending to relevant cues.

Accounting for individual differences and the effect of cueing strategy revealed that independent students were to have more of both short-term and long-term working memory, better able to access and process

information, similar characteristics in the population concern reported by various authors.[282930] Dissimilar features noticed for dependent population students were less attentive owing to their sensitivity nature, while solving academic task they pick up most essential or noticeable portion only, used more time (trouble attending to the relevant part of a visual cue) in addition tend to ignore texture of an intricate part as were found to be less flexible in their search strategies, making more errors, easily distracted by unrelated information. Similar observations were there in the previously done researches.[16,17,18,19]

Holding unique advantage in terms of cognitive restructuring skills, the research experiment showed parallel results wherein the academic performance for the independent cognitive style were statistically significantly higher in both the intervention groups i.e. phrase cueing intervention (Mdiff = 25.72, 95% CI [23.20, 28.24], $p < .000$) and the word cueing intervention (Mdiff = 23.68, 95% CI [21.16, 26.20], $p < .000$) vs. the control but contrarily for field-dependent, the experiment returned insignificant involvement, in support.[20]

Graph 5: Cueing strategy effect after intervention, independent vs. Dependent cognitive style

With hard work and proper help, children with learning disabilities can learn more efficiently and successfully, assistive technology, such as absorbing words and phrases embedded within a computer screen full of information, can facilitate many students work around their learning disabilities, it is crucial to bear in mind that a child's learning disabilities need help in continuation at home as well as in school.

In closing, field-independent learners outperformed field-dependent learners when presented with cueing strategies containing colour-highlighted-key words, colour-highlighted-key-phrases because of their better short and long-term memory route, leading to more efficient learning responses thus enabling them to restructure, and apply analytically very well.

Unexpectedly field-dependent learners failed to show success, no sufficient evidence detected for the type of population under study possibly lacking to memorize, process, structure, and organize information. As a way forward need exist to innovate and bring in new ideas as a new approach to find out the best enhancing (learning) strategy for this class of students.

Conflicts of Interest: Authors declare no conflict of interest.

Funding: Self

Ethical Clearance: This study was based entirely on the interest of the child to participate. Formal permission was taken from the parents and schools to conduct research procedures. Control group of students were provided with extra curriculum sessions for the respective follow-up.

Electronics and Communication Engineering, Koneru Lakshmaiah Exploring the Role of Hatha Yoga in Altering Dispositional Mindfulness

Teesta Saksena[1], Ritu Sharma[2], Ishwar V. Basavaraddi[3]

[1]Research Scholar, Amity Institute of Psychology & Allied Sciences, AUUP, Noida, [2]Assistant Professor, Amity Institute of Psychology & Allied Sciences, AUUP, Noida, [3]Director, MDNIY, Ministry of AYUSH, Govt of India, New Delhi

Abstract

The present research study was an intervention study conducted to elucidate the effects of different Hatha yoga practices on dispositional mindfulness among young adults not characterized by any clinical condition. 280 participants were assigned to three different Hatha yoga intervention groups and a control group for duration of three months. Baseline and post interventions cores for mindfulness were recorded for all the four groups using the Five Facet Mindfulness Questionnaire. Data was analyzed using analysis of covariance for measuring the mean difference between-groups. A highly significant difference was observed between groups on the ability to observe and describe emotions/inner experiences and act with awareness, all of which are positive indicators of dispositional mindfulness. Analysis of*t*-test revealed maximum significant and positive change in dispositional mindfulness in the combined intervention group of yoga asana and pranayama and meditation, followed by the pranayama and meditation group and the yoga asana group, respectively. Findings reinforce Hatha yoga as a significant predictor of dispositional mindfulness and further contribute to the insufficient literature examining the psychological benefits associated with Yoga among adult masses with no specific clinical condition. It further suggests employing stronger interventional research designs and a mixed-method approach for in-depth assessment of participant experience to accurately evaluate the benefits associated with specific yoga practices and their effects on dispositional mindfulness.

Keywords: *Hatha yoga, mindfulness, FFMQ,clinically healthy adults.*

Introduction

This research is intrigued and inspired by the growing emphasis on Yoga in the effective management of mental health problems and as an aid to improve mental health status.[6,16] Much awareness and popularity is witnessed among the clinically healthy populationtoadopt Yoga as a medium for advancing health standards, preventing health-related issues, and as a spiritual pursuit. Research identifies Yoga as an integral component of mindfulness-based interventions.[24] Empirical efforts in relation with investigating the effects of yoga-based interventions on mindfulness among young Indian adults have largely targeted an audience characterized with specific conditions associated with aggression[2,4], stress[11], emotional regulation[17], memory and concentration[5], clinical conditions[15], thereby, creating a need to understand the effects of Yoga on dispositional mindfulness among young adults recruited in an intervention without the basis of a clinical condition. Sizeable research efforts in the previous years have been vested into examining Yoga in relation to mindfulness as a single measure.[20] However, a noticeable gap has been identified in literature addressing how Yoga affects different facets of mindfulness independent of each other. This research investigation was conducted with an aim to examine the association between Hatha yoga and the five facet construct of mindfulness.[1] Along with endorsing mindfulness as a multidimensional construct, this study also intended to examine a greater need of its individual subcomponents– observing of emotions/inner experiences, describing of emotions/inner experiences, acting with awareness, non-judging towards emotions/ inner experiences and non-reactivity towards emotions/ inner experiences as critical aids in mental health

promotion among young adult masses characterized with no specific clinical condition.

Materials and Method

Aim: To examine the difference in effects of Hathayoga practices on five facets of mindfulness among young adults characterized with no specific medical condition.

Objectives: To investigate the mean difference between groups– (I) yoga asana (II) pranayama and meditation (III) combined intervention of yoga asana and pranayama meditation, and (IV) control groupafter 3-months of intervention.

Hypotheses: It is hypothesized that Hatha yoga will play a significant role in enhancing the subcomponents of mindfulness. Further speculations are made that the intervention group III will exhibit most significant and positive effects on five facets of mindfulness as compared to intervention groups I and II, as a result of a composite, more advanced, and systematically designed approach.

Participants: Study recruited 280 participants aged between 25-35 years and selected as a result of convenience sampling. Participants were divided into Intervention Groups (N=210) and Control Group (N=70). The intervention groups were further subdivided into three groups with equal number of participants (70 each), in order to study the difference in effects of three different Hatha yoga interventions– (I) Yoga Asana, (II) Pranayama and Meditation, and (III) Yoga Asana + Pranayama and Meditation. The Control Group (IV) comprised of participants who were not actively engaged in any form of mind-body-spiritual practices or physical exercise. The premises was the intervention Morarji Desai National Institute of Yoga, New Delhi.

Interventions:

Yoga Asana: The intervention schedule was designed for a period of 3-months with 3 days in a week. Everyday module included theory as well as practical ranging between 2.5-3 hours on an average. The content of theory and practical was evenly distributed and covered over the intervention period.

Pranayama and Meditation: The intervention schedule was designed for a period of 3-months with 3 days in a week. The everyday module included theory as well as practical ranging between 2.5-3 hours on an average. The content of theory and practical was evenly distributed and covered over the intervention period.

Combined Intervention: This intervention incorporated a combination of both, yoga as an as well as pranayama and meditation. The intervention schedule was designed for a period of 3-months with 6 days in a week. This group was given the yoga as an a intervention for 3 days and the pranayama and meditation for 3 days. The module for each day included theory as well as practical ranging between 2.5-3 hours on an average.

Instrument

Data was collected using the preliminary information form standardized by the institution and the Five Facet Mindfulness Questionnaire (FFMQ).[1]

In order to test the hypotheses, the measurement of following dependent variables was required:

1. Observing of Emotions/Inner Experiences
2. Describing of Emotions/Inner Experiences
3. Acting with Awareness
4. Non-Judging towards Emotions/Inner Experiences
5. Non-Reactivity towards Emotions/Inner Experiences

Data Analysis: Data analysis was performed using SPSS 24.0. The analysis involved computation of means and SD. The mean difference between-groups was calculated through ANCOVA along with the effectiveness of the interventions which was ascertained using Paired t-Test.

Results

The results obtained upon analysis of covariance indicated an overall significant difference between groups on the facets of '*Observing'* ($F=4.93$, $p<.01$), '*Describing*' ($F=2.68$, $p\leq.05$), and 'A*cting with Awareness*' ($F=3.30$, $p<.05$), with their corresponding pretest scores used as covariate.

Table 1: Pairwise Comparisons of Post Adjusted Means

Dependent Variable	(I) Groups	(J) Groups	Mean Difference (I-J)	Sig.b
Observing	4	1	-1.13**	0.00
		2	-1.02**	0.01
		3	-0.96*	0.02
Describing	4	1	-0.27	1.00

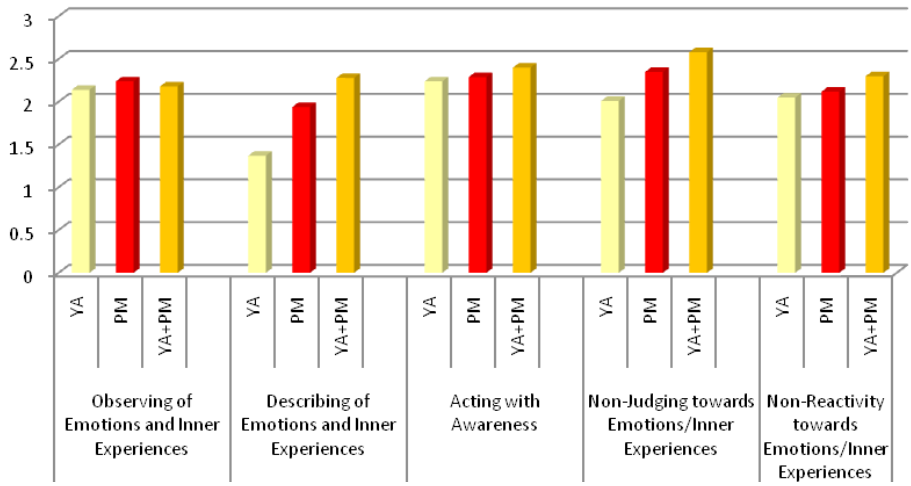

Figure 1: Graph Representing Effects of Intervention in Intervention Groups

Table 2 and Figure 1 validate the speculations made for the group III, wherein findings for within-group difference indicate that this group exhibited greatest significant difference and scored highest on four out of five facets of mindfulness followed by group II and group I, respectively.

Discussion

Analysis of covariance indicated a significant effect on the mean difference between intervention groups on observing emotions/inner experiences, describing of emotions/inner experiences, and acting with awareness post intervention. A common trend is observed across the findings of observing emotions/inner experiences, describing emotions/inner experiences, and acting with awareness, with the intervention group II experiencing most considerable positive change, followed by the intervention group I and III, respectively, in comparison to the control group.

Practices of pranayama and meditation operate primarily on the mind principle to conquer mental processes under voluntary control through the practice of concentrated attention and awareness[23], reinforcing a more significant role of mental faculties in practicing mindfulness. This claim was later reinforced by examining that pranayama and meditation involve greater voluntary control of mental capacities[3] necessitating concentrated breath control, centering of attention on bodily sensations, maintenance of posture, and guided instructions at short intervals; aiming at elevating deeper states of consciousness by reassessing the state of mind[12] and heightening mindfulness.[19] Yogasanas, on the other hand, are a balanced blend of effort and ease, which teaches one to put in efforts to get into a posture, experience relaxation in that posture, and try to detach from the result.[13] They operate on gross body level and are more than just mere physical exercises and a fundamental medium for a deeper understanding of mind and body.[14] Every movement of the body has a direct correlation with the way mind responds to it.[14]

A gain in mean scores of observing emotions/inner experiences after the interventions of pranayama and meditation and yogasana respectively, is attributed to the principles on which these practices operate. Pranayama and meditation are advanced practices with potential to lead to positive effects on observing inner experiences.[21] Yogasanas involve equal engagement of mind and body on the premise of shaping the physiological state of the body to regulate emotions, thoughts, and attitudes[10], thereby maximizing the ability to observe internal and external experiences.

Describing of emotions/inner experiences refer to being able to explain inner experiences in words or label them.[1] Participants reported guided meditation practice in playing an instrumental role in enabling them to reflect upon the experience of different thoughts and emotions and in allowing them to flow freely without fixating the mind on them. Obtained findings are supported with earlier research suggesting a positive impact of yoga and meditation on cognitive functionality.[22] Meditation has reportedly led to a significant decrease in cortisol[7], a hormone which is responsible for having a quietening effect on mind. Lower pace of processing equipped the participants with an increased ability to differentiate between positive and negative affective states, which in turn helped them to attain clarity in thought and be able to identify and label their feelings and experiences with great ease. Active inhalation and exhalation during yogasanas and meditation have the potential to lead to significant structural changes in orbitofrontal and hippocampus regions in brain[8], larger volumes of which may account for positive emotions, retention of emotional stability, and engagement in mindful behavior.[39] Regularity in these practices accounts for habitual changes among practitioners. Research findings indicate an increase in levels of oxygen and serotonin after practicing yogasanas, agents which are chief contributors in channelizing the mind towards experiencing higher positivity, emotional stability, calmness[18], and organization in thoughts.

Obtained findings indicate significant positive effects on acting with awareness, suggesting greater control over thoughts and maximized attention towards the moment in hand after engaging in yoga. Participants reported feelings of a mental slow down post intervention allowing them more time for conscious engagement in everyday actions and self-reflection. This finding may be supported with a research investigation regarding yoga as a complex blend of physical, moral and spiritual practices aiming at attaining self-awareness and working on activating the inner energies to reduce the pace of mental activity, thereby leading to a clear state of mind.[9]

Results of the study add to strength of association between yogasana, pranayama, and meditation, and components of dispositional mindfulness among young adults with no specified clinical condition. Obtained

findings may substantively support yoga-based controlled trials investigating the difference of effects between clinical and nonclinical population groups. A significant chunk of research in mindfulness has examined it as a single overarching construct, with less emphasis on investigating its subcomponents independent of each other. This investigation intended to bridge this gap by studying the five facets of mindfulness in relation with Hatha yoga to find them as independent yet interacting.

Implications: This study implicates adopting a more qualitative approach, such as a well-designed interview method, in gathering knowledge about participant experience after engaging in mind-body-spiritual practices. Considerable research initiatives have been undertaken in support of the health benefits associated with aggregated practice of yogasanas, pranayama, and meditation. Yet the results seem less conclusive of which one would be more favorable. Therefore, this study implicates stronger interventional research designs to provide in-depth insight into benefits associated with specific yoga practices. The study suggests further research incorporating and exploring the effects of extrinsic variables such as length of practice, time of practice and consistency in teaching instruction on psychological components, as these factors are integral to the success of a yoga-based intervention.

An Analysis of India's Public Health Expenditure and Economic Growth

P. Gokula Krishnan[1], N. Savitha[2]

[1]Ph.D., Research Scholar, Department of Social Sciences, [2]Assistant Professor Senior in Economics, Department of Social Sciences, School of Social Sciences and Languages, Vellore Institute of Technology, Vellore

Abstract

Health expenditure is considered as an investment, because its returns result in building a strong human capital, which serves as a crucial lever of economic growth. Public health expenditure in India is affected by population and the GDP (1). The main aim of this paper is to ascertain the relationship of India's health care expenditure with its population and GDP growth rate between 2009-10 and 2016-17 and also to analyze the annual growth rate of these economic factors using a trend line. To analyze the health care expenditure in comparison with population and GDP, the multiple linear regression models was used. The finding of the study shows that there exists a linear relationship among public health expenditure, population, and GDP. The trend line of the annual growth rates shows that allocations for health care expenditure are decreasing but the population and GDP are increasing. India's health spending found to very less when compared with America, England and China.

Keywords: *Health Expenditure, GDP Growth Rate, Annual Growth Rate, Population and Multiple Linear Regression Model.*

Introduction

An important determinant of a nation's economic growth and the health of her population is public health expenditure (1). Expenditure allocated predominantly by the government for improving the health status of her people is defined as health expenditure. Government spending on health includes rural and urban health services, medical education, research and training programs, on various health schemes, and health insurance programs. Health expenditure is considered as an investment, because its returns and result in building a strong human capital, which serves as the crucial lever of economic growth(2). In India, health care expenditure as a percentage of its GDP is highly unequal when compared to developed countries. The USA, Russia, and China spend more than 10% of their GDP on health care. In 2018, India spent only 1.02% of its GDP on health care, which is even lower compared to what the low-income countries. The total expenditure on health for the year 2014-15 was Rs. 1.121 lakh crores, which was 0.9% of the country's GDP and it increased just to 1% in 2017. When government spending on health care is low it means that people incur significant out-of-pocket to maintain their health. The government needs to step up its expenditure to reduce the financial burden of medical care of her people. Data from India, Pakistan, Bangladesh, and China suggest that when the government increases its health care expenditure, the GDP growth rate shows a positive trend (3). Empirical studies conducted in several developed countries showed, that changes in population or GDP growth rate will have a considerable impact on health care expenditure (4). In India, the health care expenditure hasn't gone much beyond 1% of GDP, even after the liberalization of the economy in 1991. This suggests that as an emerging economic power, appropriate measures have not been for the future growth of the economy in India.

India's Health Expenditure and GDP Growth: India is one of the emerging economies showing

significant growth in both population and GDP [5]. India's public spend on health is very low, when compared to low- and middle-income countries. It is also five times lower than the world's average. During the first five-year plan of 1951–56, the total plan outlay was Rs.1960 crores, out of which Rs. 65.2 crores was allocated to the health sector. When the allocation is compared between the pre-liberalization and post-liberation periods, it has only marginally risen from 0.22% of the GDP in 1950–51 to 0.96% in 1990–91[6]. After the liberalization period, it declined from 0.96 % in 1990–91 to 0.91% of the GDP in 2003-04. After a three-year gap, in 2006-07, it again narrowly increased to 1.03% of the GDP. Even after the economic reforms in 1991, health care expenditure touched a peak of only 1.02% of GDP in 2018, which is lower when compared with low-income countries.

Health forms one of the key elements of economic development [7]. The first national health policy was introduced only in 1983 in independent India. The allocation for public health was Rs. 2569.93 crores in 2000–01 and Rs. 21,635.6 crores in 2011–12, showing the government's keenness to increase steadly. In 2016–17, the allocation went up to Rs.1,80,656.77 crores. This effort is reflected in the enhanced per capita health expenditure of the individual from Rs.1058 in 2000–01 to Rs. 3068 in 2011–12. These data indicate that allocation for health care as percentage of GDP in the near future would be at a least proportionate level.

The average annual growth rate of per capita health expenditure was 9.28% between 2001 and 2012. The percentage share of public health expenditure in the total social service expenditure of the country in 2000 – 01 was 13.65%. In 2002 – 03, it fell by a slim margin to 13.42%. In 2006–07, this figure reached 18.9%, which was the highest proportion out of social service expenditure by the government. But, it slipped to 17.4% in 2011–12. For the past two decades, which was 1% to 2 % of the GDP, makes it challenging for the government to achieve the World Health Organization's (WHO) millennium development goals [8].

Developed countries like Australia and England allocate more than 6% of the GDP on health care expenditure. China stands first among the Asian nations in terms of allocating a higher percentage of GDP in the last two decades [8]. Recently, China has reduced its public health spend as a percentage of GDP due to the steady increase in the health status of her people. India has increased in the past two decades, but it's still lower than China. Pakistan and Bangladesh lag behind India in allotting funds for health care and have to focus more on their public health care spends [8].

Countries with a high level of public health expenditure have achieved better health outcomes when compared with the countries having a low level of public health expenditure. Health care expenditure and population are the two measurable indicators of economic growth rate; an increase in the health care expenditure boosts economic growth [9]. Positive economic growth in a country has made her people better off with higher income. The health care spend plays a major role in the economic development of the country by making the population healthy which translates into higher total productivity. Healthy people can act more productively and earn higher income thereby increasing the efficiency of the country's human resources.

To know the effect of economic growth on health, economic indicators like health care expenditure, population, and GDP have been used. Other social factors like health care inequalities and income are required to be investigated deeper to arrive at a strategy to improve the economic growth rate [10]. Long-term studies done taking into account the enhancement of lower level to higher level health care expenditure have revealed significant gains for economic development. As the average spending on health services a percentage of GDP is found to be low and declining over time in India, it is not a healthy indicator for progressive development of the country.

Concrete empirical studies have stated that a positive trend in health care expenditure depends on the country's GDP, population growth rate, health sector infrastructure, and the health system [10]. Moreover, it is crucial for the emerging economy. But appropriate measures have not been taken and there is a lack of focus in India with regard to public health care expenditure considering the future growth of the economy.

The government has not been able to achieve a sustained economic growth rate because of low public health care expenditure and improper use of human resources, which has led to an increase in the household health care expenditure [11]. Low-level public health care expenditure has forced 8% of the population to move below the poverty line in 2015. Population at a high risk of spending on health has increased in the last one

decade. Therefore, government intervention is required for giving financial assistance to the people living below the poverty line. The central government provides one-third of the spending and the remaining amount is contributed by the state and local governments.

Health has the capability of realizing higher production functions in a lower population growth rate scenario. Neglecting health leads to an inconclusive economic growth. Health is an important indicator of human development and the government's role is to institute policy measures to achieve the health of its population by spending more than 2% of its GDP on public health [12].

Objectives:

1. To study the relationship between the health expenditure and population
2. To examine the health expenditure and GDP
3. To analyze the annual growth rate of health expenditure, GDP and population

Methodology

Secondary data was collected from the World Bank from 2009–10 to 2016–17. To analyze the health care expenditure in comparison with population and GDP, the multiple linear regression models was used. For trend analysis, the annual growth rate has been employed for ascertaining the trend of health expenditure, GDP and population. The E–Views 10 software is used for analyzing the data.

Result and Analysis

This paper mainly focuses on the relationship between health care expenditure and population and GDP growth rates.

Table 1: India's Public Health Expenditure, Population, and GDP from 2009-10 to 2016-17 (in Crores)

Year	Health Expenditure	Population	GDP
2009–10	72536	117	6477827
2010–11	83101	118	7784115
2011–12	96221	120	8736039
2012–13	108236	122	9951344
2013–14	112270	123	11272764
2014–15	121600.23	125	12433749
2015–16	157743.37	126	13675331
2016–17	180656.77	128	15251028

Source: World Bank, 2017.

Formula for Calculating the Annual Growth Rate (AGR): The annual growth rate is very much useful to know the moving trends for the given data. It is also used to understand how the annual percentage varies year on year. By analyzing the annual growth rate, the data can be used to predict future outcome and its probable progressions. Using the appropriate formula, the author has calculated the annual growth rate of India's public health expenditure, GDP, and population for the period of seven years from 2010-11 to 2016-17.

Table 2: Annual Growth Rate of Health Expenditure, GDP and Population

Year	Annual Growth Rate of Health Care Expenditure	Annual Growth Rate of GDP	Annual Growth Rate of Population
2010–11	13%	17%	1%
2010–12	14%	11%	2%
2010–13	11%	12%	2%
2010–14	4%	12%	1%
2010–15	8%	9%	2%
2010–16	23%	9%	1%
2010–17	11%	10%	2%

Figure 1: Annual Growth Rate of Health Expenditure, GDP, and Population

The trend lines in Figure 1 show, the annual growth rate of India's health care expenditure, GDP, and population from 2009–10 to 2016–17. In 2011–12, the health care expenditure increased from 13% to 14%,

population from 1% to 2%, but the GDP decreased from 17% to 11%. In the following year, 2012–13, the trend line for health expenditure decreased from 14% to 11%. The government spent 8% of the total expenditure on health care in 2010 – 11 and it was reduced to 3.68% in 2012– 13 of the total expenditure allotted in the general budget. The health care budget is allocated based on the national health account, which includes morbidity rate, child sex ratio, infant mortality rate (IMR), and different health schemes. The GDP increased from 11% to 12% and the population remained constant at 2%. The annual growth rate of health care expenditure found to be very high at 23% in 2015 – 16. The India's per capita health care expenditure increased to Rs. 621 in 2009–10 and Rs. 1112 in 2015–16. The government allocated Rs.140 crore to the total public health care expenditure in 2015–16, (National Health Profile, 2018). The annual growth rate of health care expenditure increases over time very slowly [(12)]. This indicates that the trends of these three variables do not move in the same direction. It is to be observed that when health care expenditure decreases, the population also tends to decrease at a different proportionate level.

Multiple Linear Regression Model: As population and GDP growth rate are considered as two independent variables, it is appropriate to apply the multiple linear regression models for this study.

Table 3: Multiple Linear Regression Model Output

Dependent Variable: Health Expenditure				
Independent Variables: Population, GDP				
Method: Least Squares				
Sample:18				
Included observations: 8				
Variables	**Coefficient**	**Std. Error**	**t-Statistic**	**Prob.**
C	840699.3	1058078.	0.794554	0.4629
GDP	0.021831	0.012560	1.738144	0.1427
Population	-7825.927	9738.124	-0.803638	0.4581
R-squared	0.948353	Mean dependent var		116545.5
Adjusted R-squared	0.927695	S.D. dependent var		36623.28
S.E. of regression	9847.863	Akaike info criterion		21.50789
Sum squared resid	4.85E+08	Schwarz criterion		21.53768
Log likelihood	-83.03157	Hannan-Quinn criteria		21.30697
F-statistic	45.90593	Durbin-Watson stat		1.563540
Prob(F-statistic)	0.000606			

Econometric Model for Multiple Linear Regression Model:

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + U_i \quad ...(1)$$

$$Y_i = \beta_0 \text{ Constant} + \beta_1 \text{ GDP } (X_1) + \beta_2 \text{ Population } (X_2) + Ui \quad ...(2)$$

Y_i = health expenditure

X_1 = GDP

X_2 = population

β_0 = constant

β_1, β_2 = co-efficient of predicators

U_i = error term

Estimated Equation Value:

$$Y^\wedge = \beta_0^\wedge (840699.3) + \beta_1^\wedge (0.0218) + \beta_2 ^\wedge (-7825.9) + U_i \quad ...(3)$$

The above results shows that the multiple regression value of health care expenditure, population, and GDP are highly significant, as the p value is less than 0.05. The coefficient value for GDP is positively correlated and if GDP increases by 1%, at an average, the health care expenditure increases by 2.2% with other variables

remaining constant. As the R square value shows, 95% of health care expenditure allocated in India is based on the country's population and GDP. Increase in GDP and population will definitely lead to increase government spending on health. The coefficient value of population depicts the negative relations with health care expenditure at -78.3% at the 5 % level of significance. This shows that when population increases, health care expenditure does not increase as much. Therefore, there is a strong positive association between health care expenditure and GDP growth rate [10], but health care expenditure has a negative relationship with population.

Conclusion

The trend of population growth and GDP highly influenced the government's spending on public health during the years 2009 to 2017. India has the second largest population in the world (17% of the world's total) next to China, but the percentage share of health expenditure in GDP terms was only 1.02% in 2018. The government must increase this figure to at least 2% GDP to sustain the economic growth the country is achieving at present [11, 12]. The government has to improve the public health expenditure for increasing the economic growth as well. Not only in India, but across the world, there is a growing interest to examine the impact of GDP growth rate and population growth on public health expenditure. Other than GDP, there are many factors like population and, socioeconomic variables that influences the health care expenditure of a nation. But many studies suggested that, GDP and population are prime factors because the Indian states that have a higher GDP growth rate have a healthy population. This present study concludes that the effect of health care expenditure on GDP is found to be significant. A rise in the population or GDP must also be reflected by an increase in the health care expenditure.

Conflict of Interest: Nil

Source of Funding: It is an independent self-study.

Ethical Clearance: The present study is mainly based on descriptive analysis and the experiments are not conducted on human and animal's subjects.

Vandalism against Doctors: Clinician's Perspective

Paridhi Dolas[1], Sourya Acharya[2], Samarth Shukla[3], Kushagra Mathur[4], Neema Acharya[5]

[1]MBBS Student, [2]Professor, Dept. of Medicine, [3]Professor, Dept. of Pathology, [4]Intern, Dept. of Medicine, [5]Professor & Head, Dept. of OBGY, Jawaharlal Nehru Medical College, Datta Meghe Institute of Medical Sciences (Deemed to be University), Sawangi (Meghe), Wardha-442001, Maharashtra, India

Abstract

Background: Medicine is considered one of the most difficult streams after completing school. Doctors are considered as the most knowledgeable people. However, since the past few years, there have been numerous cases of brutality against doctors- from verbal abuses to even murders. In this study, we plan to look at such events from the clinician's point of view- their awareness about the situation and the laws about it and what they think is required to be done for its prevention.

Aim: To assess the views of medical professionals regarding the rising incidence of medical vandalism in the country.

Methodology: After due clearance from Institution's Ethical Committee and obtaining a written consent, a validated questionnaire was distributed to 200 doctors of Acharya Vinoba Bhave Rural tertiary care Hospital (AVBRH) as well as the private practitioners and doctors working in corporate hospitals , Nursing homes, and members of IMA (Wardha Branch)in Wardha district of Central India. Their responses were recorded and tabulated. The results were then analyzed using descriptive statistics and represented in frequency percentages through pie charts.

Results: Out of the 200 doctors that were interviewed, 100% believed that vandalism exists, out of which 58.8% believed it to exist both in government setup as well as well as private sectors, 23% believed overcrowding to be the major triggering factor for vandalism. Some 35.2% did not have any idea whether their institute had any policy against vandalism. Around 40% believed that installation of more CCTV cameras and tightening the security system in workplace would help against vandalism and prevent it.

Conclusion: Thus, it can be concluded that medical vandalism exists and its most common triggering factor is overcrowding in the hospitals. It can be prevented by good communication between doctors and the patients, improving the infrastructure of work place, improving the security systems and by organizing mass rallies in the community.

Keywords: *Medical, vandalism, abuse, doctors, community.*

Introduction

Doctors, once considered equivalent to 'Gods', have lately become victims of an increasing amount of brutality and violence. Developing countries today, especially India, where the healthcare sector is progressing by leaps and bounds in terms of the level and quality of care being provided, but ironically, so are the cases of violence against doctors being reported every day.

Workplace violence is defined by the World Health Organization (WHO) as incidents where staff are abused, threatened or assaulted in circumstances related to their work, including commuting to and from

Mobile No.: 9371454269

work, involving an explicit or implicit challenge to their safety, well- being or health. [1] A study conducted by Indian Medical Association has shown that more than 75% of doctors face violence at work. [2] Recent notable cases have begun to shed light on this gross misconduct that is slowly getting rampant. [3] Gradual worsening of communication skills is thought to be the main cause.[4] This is quite detrimental to India where diseases and illness continue to act as the biggest challenges to its growth curve, and such behavior only furthers anger, frustration, and a lack of workplace satisfaction amongst the Medical fraternity.[5,6]

Even legislative measures such as the Prevention of Violence against Medicare Persons and Institutions Acts, active currently across 19 Indian states, have failed to address this pressing issue. Thus, a study was planned to identify which factors act as triggers for such incidents, what the current scenario is, and which preventive measures can be taken, all from the perspective of the Medical Practitioner.

Aim: To assess the views of Medical professionals regarding the rising incidence of medical vandalism in the country.

Objectives:

- To assess physician's perspective on Medical Vandalism in current day practice.
- To assess factors predisposing to violence against medical practitioners.
- To determine the ways through which Medical Vandalism can be prevented.

Methodology:

After obtaining due approval from the Institutional Ethics Committee, a questionnaire based cross-sectional survey study was conducted in the Dept. of Medicine, Acharya Vinoba Bhave Rural Hospital (AVBRH), Wardha, a 1500 bedded Tertiary Care Centre located in the Vidarbha region of rural Maharashtra, over a period of 2 months from July 2019 to September 2019.

Study Population: Two hundred medical professionals working in AVBRH and medical practitioners working in private sectors, corporate hospitals, nursing homes, members of Indian Medical Association (IMA), Wardha branch who are into private practice were interviewed. The doctors who did not give consent were excluded.

A validated questionnaire, made in consultation with the Dept. of Preventive and Social Medicine, AVBRH, and School for Health Professionals, Education and Research (SHPER), AVBRH, was administered, to obtain information and views on prevalence of medical vandalism, situation witnessed, type of violence that clinicians most commonly encountered, or heard about, conditions that they believe can act as triggering factors, steps that they have personally taken to prevent further untoward incidences, and what measures they feel can help in curbing such occurrences. They were also encouraged to include their own suggestions.

After administration of the questionnaire, a booklet written in both, English, and the vernacular language, was distributed to each doctor. This contained information regarding statistics of medical vandalism from the previous few years, milestone rulings and laws that have been put in place by the state's High Court and the national Supreme Court, to ensure greater workplace safety for doctors, key features that are essential for good Doctor-Patient communication, and important steps that each individual can take to prevent incidences of vandalism.

Statistical Analysis: The data collected was entered in Microsoft Excel, Descriptive statistics was utilized and the results were presented in percentages in form of pie charts.

Observations and Results

All of the 200 doctors knew about medical vandalism and agreed that it exists. It can therefore be concluded that violence against doctors is not only evident but also well known. Out of these, 92% of the doctors believed that the problem is increasing day by day.

It was seen that 58.8% of the doctors believed that it exists both in government hospitals as well as private setups out of which 22.1% thought it exists only in private setups (Figure-1). They explained that the high cost, expensive laboratory tests as well as unnecessary investigations often prescribed at private clinics were the cause behind it. The remaining 19.1% believed it to be existing only in government healthcare systems stating that poor infrastructure, hygiene, low management costs as well as improper care provided at government hospitals lead to frustration and anger among the patient and their relatives.

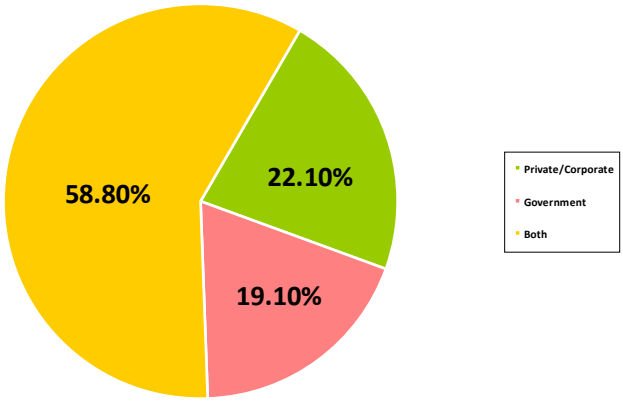

Figure 1: Sectors where medical vandalism is prevalent

When inquired about the various laws against medical vandalism, 54.8% of the doctors were aware about such laws. (Figure-2) of the total, 40.2% thought that their knowledge about such laws might not be accurate.

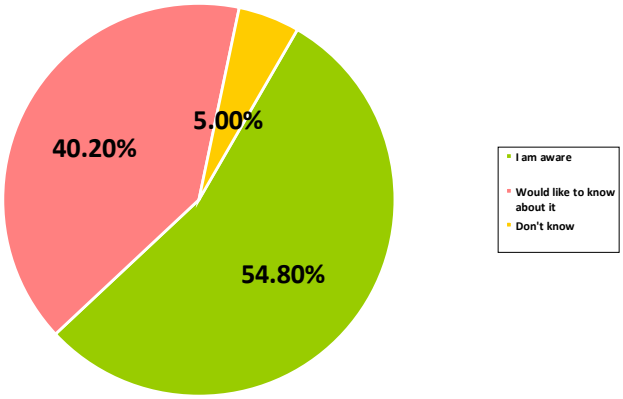

Figure 2: Knowledge about the laws regarding medical vandalism

When inquired about the triggers, 20.36% and 15.13% agreed that overcrowding as well as sudden death of a patient respectively, were the most important factors that trigger frustration and anger amongst the patients and their relatives resulting in abuse against doctors. (Figure-3) Vandalism was 86% times, in form of verbal abuse, including threatening and 14% physical abuse. Lack of skilled healthcare providers and non-availability of medical goods in the casualty were the least responsible (11% and 10.45% respectively). Over half of the resident doctors (63%) who faced vandalism kept quiet about it as they believed it to be a powerless and harmless verbal attack, while remaining reported it to the heads of their departments or senior authorities.

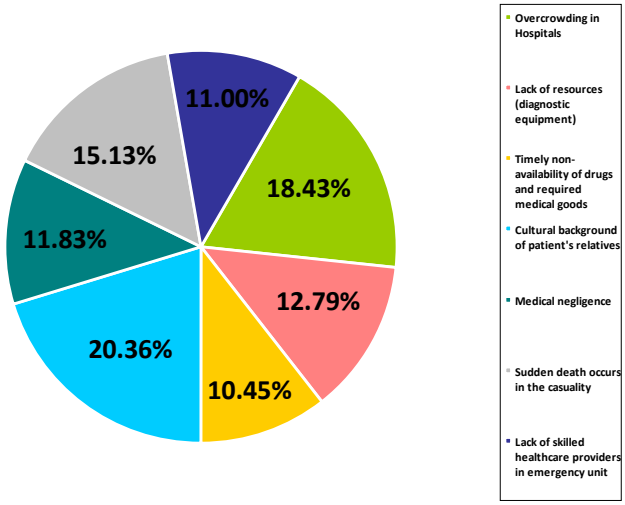

Figure 3: Triggering factors of medical vandalism

Over half (55.3%) said that they knew about policies and rules that their institute had for crimes against doctors. (Figure-4) Further, 72% of total doctors included in the study said that they were under stress of threat of medical vandalism while working in the hospitals.

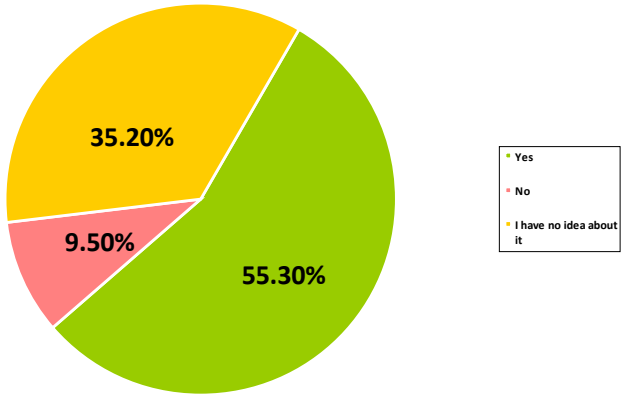

Figure 4: Idea about institutional policies

When asked to vote for the most effective method to spread awareness and information about vandalism, 29% medical professionals voted for mass rallies being the best way to spread awareness, followed by awareness campaigns (27%), reason being that these method are an efficient way to attract majority of the people. (Figure-5) One third (35%) of the doctors believed that placing more CCTV cameras in the emergency department and at areas near it was the most common action their institute took to combat vandalism in the hospital premises.

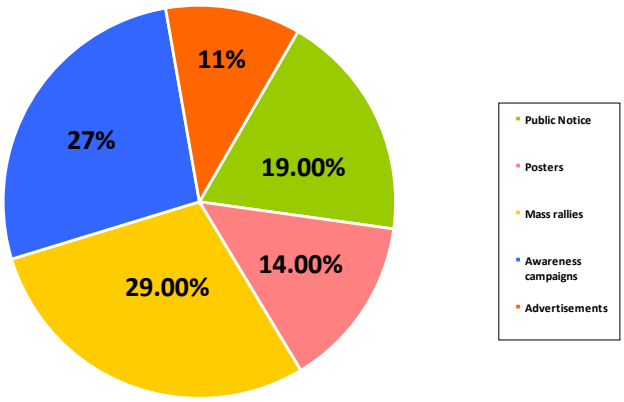

Figure 5: Methods to spread awareness about medical vandalism

Twenty-six percent of the doctors suggested that improving counseling skills can help prevent vandalism against medical professionals. Few 20% believed that limiting the number of relatives of the patient in the emergency room can help prevent vandalism. Twenty-eight percent agreed that improving the security system will curb vandalism to a great extent. (Figure-6)

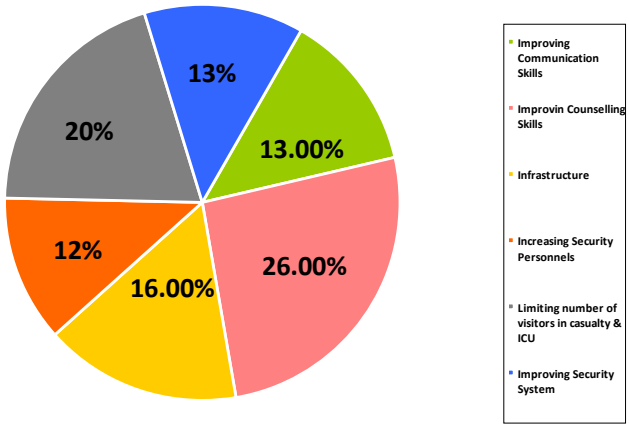

Figure 6: Ways to prevent medical vandalism

Discussion

The rising occurrence of medical vandalism is becoming a huge burden in current medical practice. Our study provided an opportunity to assess the prevalence of medical vandalism, various factors leading to vandalism and the initiatives taken by the treating medical professionals and institutions to combat vandalism. Violence against the healthcare providers signifies lack of trust and an unhealthy doctor-patient relationship.

Out of the total, 58.8% believed it to exist both in government as well as private setups. This is because the doctors in their private clinics write unnecessary investigations, expensive tests without proper evidence and rationale. In contrast, poor sanitation and hygiene along with high patient load and inadequate and low quality medical devices are evident in government hospitals, leading both the sectors susceptible to frustration, anger and doctor abuse. Over 70% medical professionals confessed that they are under a stress of getting verbally or physically abused in the hospital.

A study conducted in 2009 by **El Gilany et al**[12] showed that over 80% of doctors and nurses were exposed to at least one violent event which mainly comprised an emotional (92%). The study concluded that the main triggering factors for medical vandalism and frustration amongst patients was overcrowding, sudden deaths and unmet needs of the patients.

Another study by **Zafar et al**[13]also confirmed that verbal abuse is far more common than physical abuse in various countries. Thus vandalism is evident all over the globe. It further showed that the likelihood of confessing or reporting vandalism is low; that is, both male, female as well as young and aged doctors kept quiet about the event. Furthermore, when they were asked to rate how stressed they are during duty hours due to fear of vandalism, a mean came out to be 3.57 on a scale of 1-5 where 5 was 'very worried', concluding that the doctors feel that they are under a huge threat of violence.

Our study was similar to several studies in terms of low rates of workplace violence in the form of sexual harassment varying from 0.7-9% .[14-16] The most common type of sexual harassment in female physicians was in the form of 'telling sex jokes' followed by unwanted touching and being stared at.

Roakes DK [17] , showed that the various causes of workplace violence as perceived by the physicians were lack of education amongst patients' relatives and long waiting time (56%) followed by cultural differences, overcrowding and lack of security, Drug abuse was also noted in up to 22% of patient relatives who caused a menace in the emergency department.

In our study over 32% of the doctors agreed that they have been vandalized verbally or physically and 60% kept quiet about it since they thought that the insult is powerless with no strong motive behind it. Approximately 35.2% of the doctors didn't have any idea whether their institute had any policy against vandalism or not, while 40.2% of the doctors were not clear about the laws and policies of the central or state government for crimes against medical vandalism. Around one-

third (35%) believed that installation of CCTV cameras would help curbing vandalism. Few (27%) believed that awareness camps would help spread awareness about it and 26% believed that improving counseling skills would help curb vandalism.

Over the last 40 years vandalism in western world has subtly changed. In most of the European countries and in Canada, the healthcare cost is borne by the government, and often, the first contact of the patient is with designated general practitioners hence, there is no financial anxiety for medical treatment in these countries. [18] In the USA, though the standard of medical care may be high, yet this comes at a cost mostly through payment by insurance companies or directly being paid by the patient. Studies have also shown that even if USA is an affluent country, still a large number of citizens could not afford to pay for the health insurance and fall out of care net. [19,20]

Pai SA. [21]; in his study suggested that heightened anxiety about the disease and the financial aspect of treatment are the main factors of initiation of violence and the doctor should train himself/herself for anxiety alleviation techniques. The behaviour of the treating clinician staring from the first point of contact with the patient and relatives is the real golden milestone. The suffers and their close relatives and friends should get a humane touch in form of empathy and a good communication from the treating clinician.

Safety of the patient in hospitals is the core of an efficient healthcare system. This can only be achieved when doctors and other medical personnel are ensured a safe working environment. Strict laws must be implemented by the government to punish violators. On the other hand, treating clinicians and other staff associated with patient care should also initiate steps to avoid medical negligence. Efficient communication skills and a touch of empathy are needed most. It is necessary to be vigilant so that mishaps are avoided and patient should receive best care available.

Conclusion

To conclude, many remedies have been advised to tackle medical vandalism. There are responsibilities of doctors and other healthcare workers, and similarly, responsibilities are there to be borne by patients and their relatives, hospital authorities, media and above all the governments to ensure that health care facilities improves and incidents of medical vandalism is strongly dealt with. It is high time now to act and stop vandalism against doctors and take preventive measures. Obtaining this information and spreading awareness about the same on a larger scale can help reducing the high pressure circumstances under which today's clinicians are practicing.

Institutional Ethical Committee Clearance (DMIMS deemed to be University) was obtained before starting this Study.

The study is funded by: Indian Council of Medical Research (ICMR)

Flexible Dentures: An Review

Dr Pradeep S.

Additional Professor, Dept. of Prosthodontics, Manipal College of Dental Sciences

Abstract

Patients looking for a comfortable alternative to traditional dentures could be interested in Flexible dentures, using advanced technology to fit around the shape of teeth and gums upon insertion, the flexible denture can be used when there is not enough bone for fitting dental implants to replace missing teeth. The flexible denture works by flexing into position, not needing the use of metal clasping mechanisms to hold the dentures in place. Individuals with irregularities in the shape of their mouth could benefit greatly from the treatment and experience a growth to their self-confidence.

Keywords: *Removable partial denture, flexible denture, undercuts.*

Introduction

The concept of flexible resins is based on their inherent flexibility and ability to engage hard and soft tissue undercuts for retention.[1] Flexible partials were first developed in the early 1950s. Arpad Nagy of New York commercialized the first nylon-based flexible partial denture system, called Valplast, in 1953. At the time, academics felt that a partial denture must be rigid in order to distribute masticatory forces to the remaining dentition. As a result, the usage of flexible plastic partial dentures was limited.

As the 'Hollywood Smile' became a quest for dental patients in the 1970s and '80s, dentists were forced to look for prosthetic solutions that were both aesthetic and functional. Flexible partial dentures were becoming an accepted treatment plan for some patients who demanded high aesthetics and had healthy remaining dentition.

The fabrication of removable denture for completely edentulous or partially edentulous arches encounters a special challenge when soft tissue and bony undercuts, interferences, various paths of placement, tilted teeth and deranged occlusion are present to complicate the treatment plan.[3] Various treatment options have been suggested in literature for the management of such situations. With recent advancements in material science flexible dentures have emerged as a viable option to treat various edentulous conditions. Therefore, for clinical cases such as Kennedy's Class I & II, which involve distal extension, the flexible dentures by engaging the severe soft tissue undercuts and clasping the adjacent teeth provides excellent retention.[8]

Dr Pradeep S.
Additional Professor, Dept. of Prosthodontics, Manipal College of Dental Sciences, Manipal-576104
e-mail: paddusb@gmail.com

Advantages:

Highly retentive & comfortable due to flexibility

Clinically unbreakable

50% less bulky than conventional acrylic dentures

Highly esthetic

Monomer free

They are clinically unbreakable due to their property of shock resistance as well to repeated stressing i.e., under fatigue conditions

Translucency of the material picks upunder lying tissue tones, making it almost impossible to detect in the mouth.

No clasping is visible on tooth surfaces

Applications

- Aesthetics
- Strength
- Accuracy

- Management of undercuts
- Biocompatibility
- Provisional dentures
- Management of midline fractures
- Better comfort of the patient

Other applications: Flexibe dentures can also be used for fabricating night guards and sleep apnoea appliances, microstomia, scarring in the oral and facial areas due to disease, trauma, or burning injuries

Materials for flexible dentures:

Pro-flex: Pro-flex is the flexible denture base material which can be used for Full & Partial Flexible Dentures. Pickett Dental Laboratory has been offering Pro-flex full and partial flexible dentures since 1998.

Pro-flex denture material be indicated in some of the Anatomical considerations-enables the material to effectively engage tooth and tissue undercuts. Also, Pro-flex is hypoallergenic-recommended for patients with known acrylic or metal sensitivities.

Aestheticallythematerialissemitranslucent,allowing the prosthetic to better blend with the colour of the natural gum tissue. With Pro-flex flexible partials, there are no metal clasps. Proflex full and partial flexible dentures are easily adjusted by the dentist

Valplast: Valplastis a flexible denture base resin that is ideal for partial dentures and unilateral restorations. The resin is a biocompatible nylon thermoplastic with unique physical and aesthetic properties that provides unlimited design versatility and eliminates the concern about acrylic allergies.

The Valplast Flexible Partial allows the restoration to adapt to the constant movement and flexibility in your mouth. The flexibility, combined with strength and light weight, provides total comfort and great looks.

Valplast partial is virtually invisible because there are no metal clasps and the material itself blends with the tissue in your mouth. While the cost is often higher than a partial made with visible metal clasps.

Sunflex: Sunflex Partial Dentures are made from a strong biocompatible nylon thermoplastic, and are unbreakable, yet lightweight and translucent which allows natural tissue to show through.

The sun flex flexible denture base materials are virtually Invisible, Unbreakable, Metal-Free, Lightweight and incredibly Comfortable.

Discussion

All the efforts to overcome denture fracture in complete or removable denture prosthesis against natural mandibular teeth by improvising techniques and improving conventional materials did not provide the requisite results[4] Thus a material had to be used in contemporary practice which could be flexible and fracture resistance polyamide is a nylon based plastic. Although this technology has been in use since 1954, it has become popular only recently. It is stronger, more flexible than acrylic and thus can be used as a viable alternative.[6]

Conclusion

The fabrication of the optimum restoration depends on the clinicians skills in selection of the type of the restoration which is required for the patient.

The fabrication of prosthesis for the partiallyedentulous arches encountered a special challenge where many interferences, variouspath of placement, tilted teeth and deranged occlusion will complicate the treatment plan. In these situations, Flexible dentures will stand in a superior position in fulfilling the various patients demand.

Knowledge on Ethical Codes among Undergraduate Medical Students and Faculty Members

Rashmi K.S.[1], Uma Kulkarni[2], Prasanna Mitra[3]

[1]Assistant Professor, Department of Physiology Kasturba Medical College, Mangalore, Manipal Academy of Higher Education (MAHE), [2]Professor, Department of Ophthalmology, Yenepoya Medical College, Yenepoya, [3]Associate Professor, Department of Community Medicine, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education (MAHE)

Abstract

Background: Present study is designed to assess the knowledge of ethical codes among para-clinical and clinical students of medicine and faculty members.

Methodology:

Study setting: KMC, Mangalore, Karnataka, India.

Study design: A cross sectional self-administered questionnaire based study.

Study group: II, III, IV MBBS students and faculty members.

Using self-administered 5 item structured questionnaires on knowledge on ethical codes, a cross-sectional survey of second, third and fourth year (para-clinical and clinical) medical students and faculty of Kasturba Medical College, Mangalore were conducted in August 2018.

Results: Present study showed overview of knowledge of ethical codes among faculty members and students in the medical college**.** Among the study population, knowledge on informed consent was well understood by 62 % of respondents. Again 34% of the population was not aware of the contents of Hippocratic Oath, However 32% of the population knew the contents of Hippocratic Oath. More than 50% of study population including students and faculty members were not aware of contents of Nuremberg oath, Helsinki oath and Belmont reports. Studies of the present study showed that faculty members and students had a sound knowledge on informed consent in ICMR guidelines and it was well understood by study population. Knowledge on other ethical codes were poor, like Nuremberg code, Helsinki declaration were not familiar with respondents. Majority of participants agreed that they are not aware of Nuremberg oath (64%), whereas equal proportion (18%) agreed and disagreed with the Nuremberg code even though the Nuremberg oath was not given appropriately.

Conclusion: Present study findings demands the prioritization for incorporation of knowledge on ethical codes into curriculum and training programme for faculty members.

Introduction

India being one of the highly populated country has the largest health care system. It has the privilege of having highest number of medical colleges (412) and turnover of 50,000 fresh medical graduates per year[1]. Present undergraduate medical curriculum has

been constructed around specific learning objectives concerned with primarily three domains, Cognition (Head), Psychomotor (Hand) and affective (Heart). However, affective component is greatly neglected and it has become a kind of informal curriculum [2]. Thus Indian Medical Degree fails to provide holistic care to patients with empathy.

There is no uniformity in what the students learn through the hidden' or 'informal' curricula, and there is no way of ensuring that a minimum standard is being met. The relative decline of ethical/professional standards, coupled with the deterioration of the doctor-patient relationship and the increasing criticisms of physicians by the public, have heightened the need for undergraduate medical ethics education[3]. Sadly, it has been shown those medical students' moral sensitivity drops as the courseprogresses[4] This has been attributed to hidden curricula[4].

Samaj Adhikari el al (2016) stated that significant portion of doctors and nurses are unaware of the major documents of health care ethics which depicts the core principles[5]. Onochie Okoye et al(2017) reported that35.7 % of final year medical students in the University of Nigeria were satisfied with their medical ethics knowledge, 97.9% indicated that medical ethics should be taught formally. There was a strong desire by the contemporary Nigerian medical students for medical ethics education[6].

Little is reported about knowledge of ethics in undergraduate medical curriculum. As MCI is stepping forward with **ATCOM** curriculum, it's crucial at this point to assess the knowledge about medical ethics codes among undergraduate students and faculty members. Hence the present study is designed to assess the knowledge of ethical codes among para-clinical and clinical students of medicine and faculty members.

Objectives: To assess the current status of knowledge of para-clinical and clinical medical students and faculty members about medical ethics.

Methodology

Study setting; KMC, Mangalore, Karnataka, India.

Study design: A cross sectional Self-administered Questionnaire based study.

Study group: II, III, IV MBBS students and faculty members.

Questionnaires will be validated for its relevance, ambiguity and difficulty by 3 medical educators/ bioethicists. Questionnaires will have three major components.

1. General data: sex,educational qualification
2. Knowledge on ethical codes

Using self-administered 5 item structured questionnaires, a cross-sectional survey of second, third and fourth year (para-clinical and clinical) medical students and faculty of Kasturba Medical College, Mangalore will be conducted in August 2018. Questionnaire was adapted and validated (Johnston and Haughton 2007, Chatterjee and Sarkar 2012, Chopra, Bhardwaj et al. 2013).

Ethical committee clearance was taken from the Institutional Ethics Committee (IEC)

[IEC KMC MLR 06-18/117] prior the conduct of the study

Statistical analysis: Data was analyzed using **SPSS 16**. Data analysis was done using proportions and percentage. The Chi-square test was used to determine the levels of significance,with **P value<0.05** being considered statistically significant

Results

Demographic details: Out of the total 180 respondents, 57% were males and 43% were females. The majority of participants were students being 87% and faculty members 13%. Proportion of subjects from II MBBS were 85, III MBBS were 67 and final year MBBS were 3.

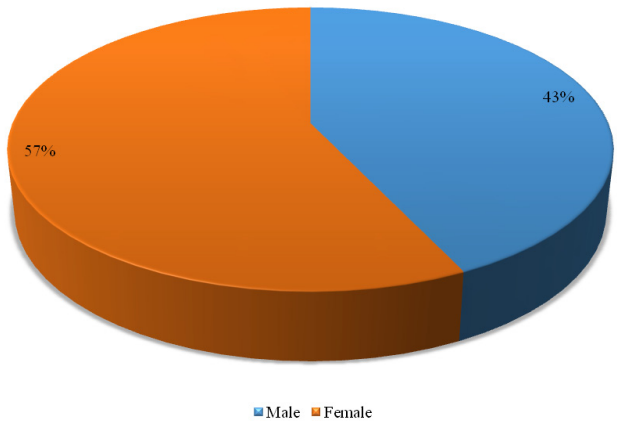

Fig 1: Distribution of male and female participants among study populations (including students and faculty members (n=180)

Fig 2

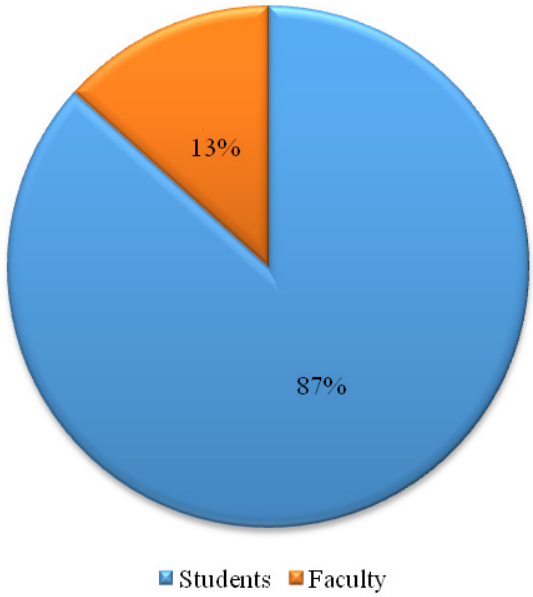

Fig 2: Distribution of students and faculty among study population (including students and faculty members (n=180)

Fig 3

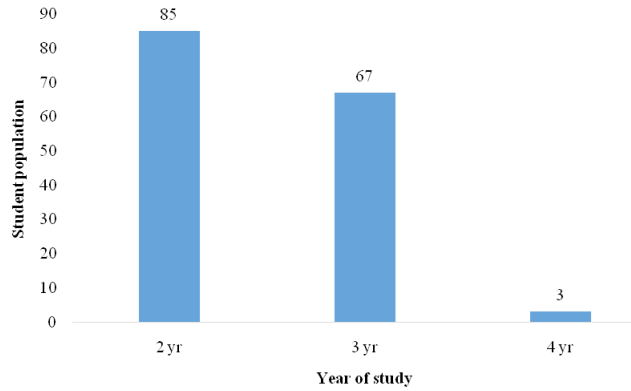

Fig 3: Distribution of students across different years of medical course among students (n=156)

Among the study population, knowledge on informed consent was well understood by 62 % of study population. Again 34% of the population was not aware of the contents of Hippocratic Oath, However 32% of the population knew the contents of Hippocratic Oath. More than 50% of study population including students and faculty members were not aware of contents of Nuremberg oath, Helsinki oath and Belmont reports. [Table 2].

Table 1: Status of knowledge on ethical codes among study population

Characteristics	Number (%)				
	1	2	3	4	5
	Strongly disagree	Disagree	Don't know	Agree	Strongly agree
1. Hippocratic oath respects the privacy of patients	3(1.7)	2(10)	62(34.4)	48 (26.7)	57(31.7)
2. Nuremberg oath states that experiments could be conducted when there is a reason to believe that it implies a risk of death or disabling injury.	15(8.3)	15(8.3)	114(63.3)	18(10)	15(8.3)
3. The fundamental principle of Helsinki oath is respect for the individuals participating in research	2(1.1)	5 (2.8)	102(56.7)	41(22.8)	27(15)
4. According to Belmont report person with diminished autonomy are entitled to protection	2(1.1)	3(1.7)	113(62.8)	34(18.9)	24(13.3)
5. Informed consent should be a part of research proposal according to the ICMR guidelines	5(2.8)	2(1.1)	27(15.0)	33(18.3)	112(62.2)

Present study showed overview of knowledge of ethical codes among faculty members and students in the medical college**.** Among the study population, knowledge on informed consent was well understood by 62 % of respondents. Again 34% of the population was not aware of the contents of Hippocratic oath, However 32% of the population knew the contents of Hippocratic Oath. More than 50% of study population

including students and faculty members were not aware of contents of Nuremberg oath, Helsinki oath and Belmont reports **[Table 1].** Studies of the present study showed that faculty members and students had a sound knowledge on informed consent in ICMR guidelines and it was well understood by study population. Knowledge on other ethical codes were poor, like Nuremberg code, Helsinki declaration were not familiar with respondents. Majority of participants agreed that they are not aware of Nuremberg oath (64%), whereas equal proportion (18%) agreed and disagreed with the Nuremberg code even though the Nuremberg oath was not given appropriately.

In a comparative study, the status of knowledge about ethical codes among students and faculty members of selected population were equated. There was no statistical significant difference between the faculty members and students regarding the understanding of various ethical codes of medical ethics such as Hippocratic oath, Nuremberg code, Helsinki oath, Belmont report and ICMR guidelines ($p>0.05$). However present study findings demands the prioritization for incorporation of knowledge on ethical codes into curriculum and training programme for faculty members.

Discussion

This study is the novel one to explore knowledge on ethical codes among undergraduates and faculty members of a medical college. In the present study, knowledge on informed consent was well understood by 62 % of respondents. Again 34% of the population was not aware of the contents of Hippocratic Oath, However 32% of the population knew the contents of Hippocratic Oath. More than 50% of study population including students and faculty members were not aware of contents of Nuremberg oath, Helsinki oath and Belmont reports **[Table 1].** Studies of the present study showed that faculty members and students had a sound knowledge on informed consent in ICMR guidelines and it was well understood by study population. Knowledge on other ethical codes were poor, like Nuremberg code, Helsinki declaration were not familiar with respondents. These results are in consistent with the findings reported by northern part of India and India previously[7, 8]. Majority of participants agreed that they are not aware of Nuremberg oath (64%), whereas equal proportion (18%) agreed and disagreed with the Nuremberg code even though the Nuremberg oath was not given appropriately.

In a comparative study, the status of knowledge about ethical codes among students and faculty members of selected population were equated. There was no statistical significant difference between the faculty members and students regarding the understanding of various ethical codes of medical ethics such as Hippocratic oath, Nuremberg code, Helsinki oath, Belmont report and ICMR guidelines ($p>0.05$). However present study findings demands the prioritization for incorporation of knowledge on ethical codes into curriculum and training programme for faculty members. It was earlier reported that majority of medical doctors were knowledgeable about codes of ethics. Sex, level of education, and attitudes towards codes of ethics were significantly associated with knowledge of codes of ethics. A significant proportion of medical doctors had unfavorable attitudes. Level of education, work experience, and knowledge of codes of ethics were significantly associated with attitudes toward codes of ethics. They were of the opinion that; it is important to raise awareness and if necessary change attitudes of medical doctors toward codes of ethics [9].

Conclusion

Present study findings demands the prioritization for incorporation of knowledge on ethical codes into curriculum and training programme for faculty members. Integrated clinical approach is best suited to teach medical ethics which was highlighted in the present study.

Automatic Insulin Analyser

Vasukidevi Ramachandran[1], R. Kishore Kanna[2], S. Geetha[2], R.Vasuki[3]

[1]Associate Professor, [2]Assistant Professor, [3]Professor and Head, Department of Biomedical Engineering, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Medicines are an important part of modern health care system. The market for pharmaceutical medicines runs in billions of dollars a year. Butrecently a new problematic phenomenon has risen which is termed as "Poor Medication Adherence". In simple terms it refers to improper intake of medicines as prescribed by doctor. Study shows that the reason for it is forgetfulness. So the instrument devised here is to address the problem by building a wearable non invasive device which can alert the patient in time. Since the device is in its initial stage so it was built for only glucose detection to control insulin intake by diabetic patients. Near Infra Red light when passes through a tissue its absorbance is changed due to interaction with glucose molecules present. By detecting the level of glucose one can determine the insulin requirement of the patient. Glucose is one of the important biochemical produced in the process of metabolism in human body. But also a proper level of glucose amount will ensure the health of a human. Insulin regulates the amount of glucose level to be maintained in the human body.

Keywords: *Poor Medication Adherence, glucose, insulin, Near Infra Red.*

Introduction

According to a publication in 2011 in National Center for Biotechnology Information the benefit of medication for chronic diseases is 50% of the time not realized due to improper intake. Medically it is termed as 'Poor Medication Adherence'. It renders a huge loss not only in the part of the patient also it creates looses for the entire health system of the country. In US alone the loss is estimated to be $100 billion annually[1]. Also it is cited that 90% of the reason for poor medication adherence is due to personal negligence or forgetfulness due to lack of proper reminding system on a personal level [1]

There are wide ranges of medicines available on the market for each of known illness. Most of the time patients suffering from chronic disorder where they are required to take medicines for a very long period of time are usually a problematic[2]. People who cannot afford a full time care taker would sometimes might skip the medication due to negligence. This results in the loss of the patient in the form of money as well as health. The current project will try to address this problem by devising a non invasive wearable device which can be used to monitor the level of medicine used. Since it's in initial stages only one medicine will be considered for this- Insulin[6].

Future work will be extended to all the medicines available. Insulin is a very important biochemical produced in human body which helps to keep the glucose level in check. But when a person is not able to produce the required amount of insulin by itself than it has to be supplied from the outside. Based on the type of diabetes a person is suffering from different doses of insulin is administered. A non invasive glucose meter is non painful and easy to carry and use, so it is much preferable than any other conventional method of insulin and glucose monitoring[5]. The basic principle involves the use of Near Infra Red light source as it has much penetrating power and is non lethal to humans[7].

The light rays will penetrate through the tissue and will be detected by a detector on the other side. It is known that the absorbance and the intensity of Infra Red reduce after interaction with glucose molecule. By

Corresponding Author:
Vasukidevi Ramachandran
Associate Professor, Department of Biomedical Engineering, Bharath Institute of Higher Education and Research, Agharam Road, Selaiyur, Chennai-73
e-mail:vasukideviram@gmail.com

measuring the amount of infra red absorbed one can find the glucose level and can determine the need of insulin[6]. The device was made to be worn in the wrist but a more effective way will be to make it use in the ear lobe as it has no bones for hindrance. Presence of bones effects the infra red on emergence. Future scope includes extending the device capacity to detect most of medicines available on the market and customize it according to the patient's prescribed medication[4]

Methodology

It is a non invasive wearable device solely made for the easy use by patients. The simple construction of the device is the use of NIR emitter at one side of the device and a NIR detector/sensor is placed, which is connected to the microcontroller, which is further connected to seven segmentdisplay unit. Seven segment display displays the output ration of the subject. Also the buzzer trigger the alarm[7].

Use of Near Infra Red Emitter and Sensor: Near infra red is that portion of IR radiation spectrum with wavelength 700nm to 950nm used for medical diagnostics like detection of blood sugar and oxygen saturation. This application is carried out by employing a IR source and a IR detector based on radiation fluctuations when it passes through a medium[4]

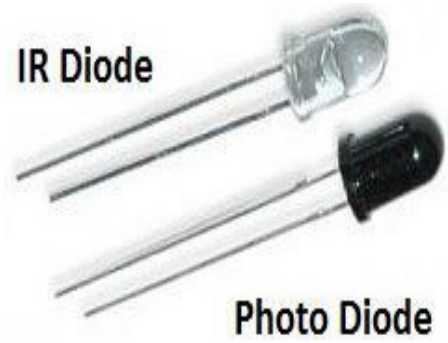

Fig 1 Near Infra Red Sensor

Use of Seven Segment Display: This is electronic display which shows less complex physiological computations in easy understanding digits rather than the complex decimal ones[3]

Use of Sensor: The source and detector of IR are placed on either sides of the ear lobe. The NIR LED emits the radiation which passes

Application of Microcontroller: A microcontroller is a simple integrated circuit which is used for various applications ranging from gaming to rocket science. Here we are using pre-programmed microcontroller to assess the variation of normal glucose values like 120mg/dl This microcontroller also aids in activating the alarm system (buzzer) to produce sound for blind persons.

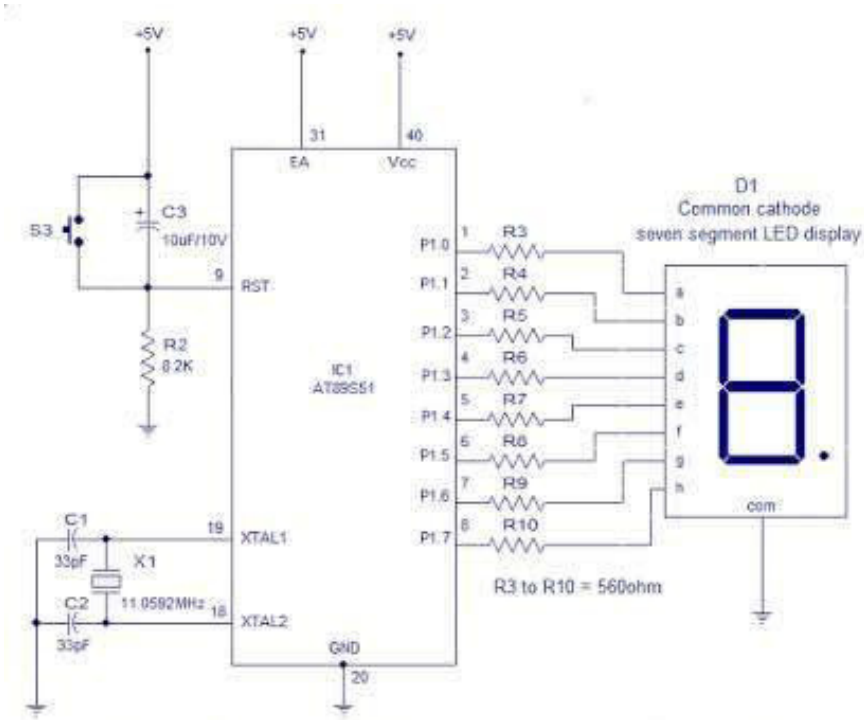

Fig 2: Microcontroller

Through the earlobe and reaches the IR detector. The detector detects the intensity, scattering and absorption of the NIR according to Beer Lambert's Law. The light intensity increases with the cardiac diastole that means when heart relaxes and the intensity of light decreases when the heart contracts (cardiac systole)[5].

Use of Crystal Oscillator: A crystal oscillator is an electronic device which uses the resonance of a piezoelectric material. This oscillator aids in vibrating the component buzzer and amplifies thekilohertz frequency for better performances.

Fig 3: A miniature 4 MHz crystal

Findings and Discussion

The purpose of glucose monitoring system is to analyse, monitor and offer some indications when the glucose level exceeds or decreases then the normal limit. This system is also aimed to analyze the concentration of natural insulin which is secreted by Inlets of Langerhan's of pancreas. It can be expanded to other medicines.

Conclusion

Examinations of sensor glucose designs following insulin suspension enacted by LGS recommend that this innovation is protected and probably not going to be related with unfavorable results.

A Survey of Human Papilloma Virus

Vasukidevi Ramachandran[1], R. Kishore Kanna[2], S. Geetha[2], R. Vasuki[3]

[1]Associate Professor, [2]Assistant Professor, [3]Professor and Head, Department of Biomedical Engineering, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

The main concept of our projectis to survey our nearby areas and to find and treat patients having warts, which is caused by the infection which is also known as human papilloma virus infection. So we are providing a confidential discussion with the patient which will of course be between the patient, us and our guide Dr. Vasukidevi. The information given by them would not be shared or disclosed to anyone else.

And basically we will be working on the preparation of medicine which is of course a herbal one to treat them without any invasive or incision in their body. As it is herbal cure it would not have any side effects too. There are various natural substances that can be used for this herbal cure like curcumin, aloe Vera, apple cider, castor oil seeds, turmeric and many of these. Therefore, we are expecting some good results in future in our perspectives in these herbal curing field as we are also the one to support it.

Keywords: *Human Papilloma virus, curcumin, castor oil seeds.*

Introduction

Human papilloma virus are infection that is caused by human papilloma virus. In some they persists and results in warts and precancerous lesions[1]. The precancerous lesions increase the risk of cancer in the cervical area, vagina area,anus and throat. The cancers are also linked to HPV, HPV6 and HPV11 are common causes of genital warts.

HPV infection is caused by a *human papilloma virus*. 40 types are transmitted through the sexual contact. Risk factors for persistent HPV infections include early age of sexual intercourse, multiple partners, smoking, and poor immune function[2]. It can transfer from mother to child during pregnancy. People can infected with anyone type of HPV,HPV.

Warts: Skin warts are most common in childhood and adults suffer from recurring skin warts,the appearance of symptoms warts[3]

Material and Method

Pineapple: The natural pineapple acids and enzymes will helpful. Fresh pineapple directly to the wart several times a day.

Garlic: Apply paste to the warts,mixer of garlic with water. Put a bandage on top until the wart is gone.

Vitamins: Vitamin C tablet with water to make a thick paste. Apply to the wart and cover with a bandage. Vitamin E break a capsule, rub on the warts to cover.

Aspirin: Make a aspirin paste, apply to the warts until gone.

Tea tree oil: Apply directly to the warts.

Bee propolis: Apply propolis directly to the warts several times a day

Aloe vera: Apply fresh aloe vero gelto the warts.

Medicines that your doctor may use or prescribe for you include:

- Retinoid cream. It disrupts the wart's skin cell growth[1].
- Cantharidin . This medicine causes the skin under the wart to blister, lifting the wart off the skin. This

medicine is applied to the wart at your doctor's office[4]

- Immunotherapy medicines, which help your body's immune system fight viruses, including the human papillomavirus (HPV) that causes warts. These medicines may include imiquimod, contact sensitizers, and interferon[5.]
- Bleomycin injection, which destroys the skin containing the warts. But bleomycin isn't often used, because it is painful during and after the injection.
- Other medicines used for warts include 5-fluorouracil, which is more often used on genital warts, and cimetidine. Cimetidine can be taken by mouth (orally) or as an injection.

Result and Discussion

We were used various natural substances like herbal cure curcumin, aloe vera, apple cider, castor oil seeds, turmeric, pineapple,tea tree oil,Garlic etc., Its expected better results. These herbal curing the warts[6].

The potential approaches to reducing costs may also include delivery of a single dose and removing the need for cold storage. Developing vaccines that are lyophilized to a powder allows for easier storage and delivery[5]

Different Method of Temperature Monitoring System

S. Geetha[1], Vasukidevi Ramachandran[2], V. Gomathy[2], R. Vasuki[3]

[1]Assistant Professor, [2]Associate,Professor, [4]Professor and Head, Dept of Biomedical Engg, BIHER

Abstract:

Temperature is the degree or intensity of warmth present in a substance or thing, particularly as passed on by a relative scale and appeared by a thermometer or seen by touch. Here I am utilizing LM35. The LM35 strategy are exactness combined circuit temperature gadgets with a yield voltage direct in regard to the Centigrade temperature. The LM35 contraption has a favoured position over direct temperature sensors balanced in Kelvin . Restorative sorts of apparatus impacted by warming are given this sensor to change over warmth into voltage in controlled manner to shield the equipment from overheating. The sensor equipment is fixed and not presented to oxidation.

Keywords: *LM35 Temperature sensor; Thermocouple; Impedance; Self-heating.*

Introduction

Temperature and warmth are not a comparative miracle. Temperature is an extent of the power or dimension of hotness in a body. Indeed, it is constrained by getting the ordinary speed of a body's particles[1]. Warmth is an extent of the measure of warmth imperativeness present in a body. The spatial transport of temperature in a body chooses warmth stream. Warmth constantly spills out of more blazing to colder areas. The warmth held in a thing relies upon its temperature just as its mass[5]

Temperature can be estimated more precisely by this sensor than with any thermostat. Also, Thermocouple. Gadgets estimating different physical parameters are being utilized widely all through the world. the parameters might be power, temperature, weight and so forth .This task is intended to control and gauge the temperature. For this reason, transduction guideline is utilized as sensors;changing over a sign starting with one type of vitality then onto the next type of energy[6]. This transduction framework comprises of two sections which are detecting or recognizing component and transduction component. Here we are changing over warmth vitality into voltage so as to anticipate self-warming of sensor and the concerned gadget effective[4].

Materials and Method

Model of a Virtual Medical Centre to Home Care patients: This paper displays the structure and usage of a Virtual Medical Center (VMC) for home consideration. The framework is committed for giving telemetric home checking of asthma and heart minded at their homes and network. The particular type of this structure enables the framework to be changed for different applications. This likewise guarantees the utilization of advanced thermometer utilizing LM35 sensor.

Advanced monitoring of pH and temperature of fish farms: This paper displays the remote sensor system to detect the pH and temperature for a fish ranch. The application requires two various types of modules: the sensor to gather the information and the remote module to transmit the information. Gathered data is transmitted to the focal unit, which deals with the system and stores all the got information utilizing LM3535

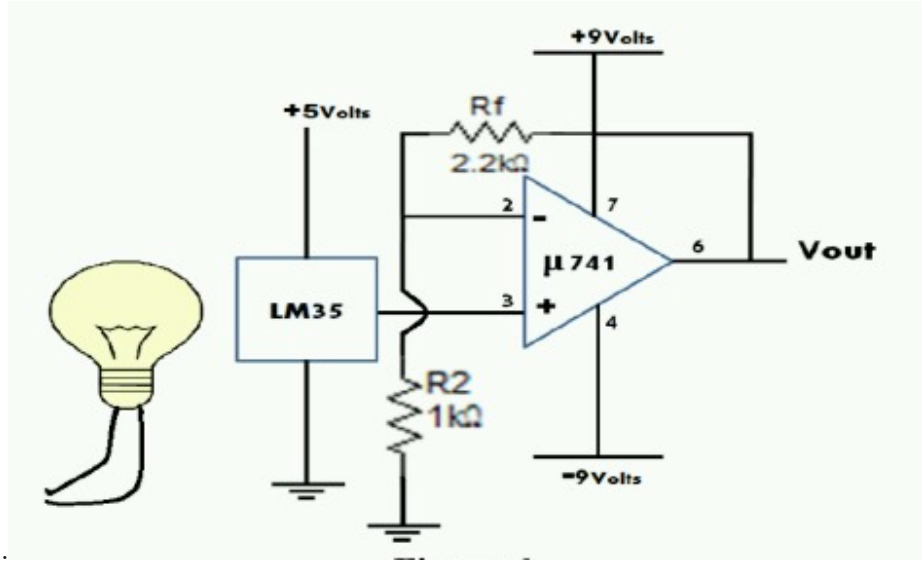

Fig. 1: Circuit Diagram of Temperature Sensor

A Real-Time Wireless Physiological Monitoring System: This paper speaks to a framework that gathers information, for example, body temperature, circulatory strain, and pulse, and afterward the information are put away in the PC of a system the board focus. In this manner, it is simple for the medicinal staff in a nursing focus to screen continuously or break down in cluster mode the physiological changes of the patients under discernment. The structure proposed in the paper has low power use, is down to earth. The proposed structure has the capacity of working openly similarly as prepared for improving the organization quality.

Discussions

So as to screen the temperature of any therapeutic gadget or material, the warmth detecting framework is utilized. Here I am utilizing LM 35 temperature sensor which is productive in detecting temperatures because of its direct voltage attributes. The temperature once detected is appeared as the LED shine which demonstrates that the gear is heated. LM358N is additionally utilized for the intensification of even little info signals which is likewise having exceptionally low supply current channel (500) miniaturized scale amps. The upside of utilizing this sensor is that it has more memory, preparing and less-self warming when contrasted with different sensors. Truth be told this does not require any outer adjustment or cutting to give run of the mill correctness's of + ¼0c at room temperature.

Conclusions

In order to monitor the temperature of any medical device or material, the heat sensing system is used. The LM 35 temperature sensor which is very efficient in sensing temperatures due to its linear voltage characteristics. The temperature once sensed is shown as the LED glow which indicates that the equipment is heated. LM358N is also used for the amplification of even small input signals which is also having very low supply current drain (500) micro amps. The advantage of using this sensor is that it has more memory, processing and less-self heating as compared to other sensors. The upside of utilizing this sensor is that it has more memory, preparing and less-self warming when contrasted with different sensors. Truth be told this does not require any outer adjustment or cutting to give run of the mill correctness's of + ¼0c at room temperature. Sub-Lethal Effects of Triazine Herbicides on Oxidative Stress and Antioxidant Response in Poecilia Sphenops Tissues

S. Vasanth[1], G. Bupesh[2]

[1]Junior Research Scientist, *[2]Associate Director, Sree Balaji Medical College & Hospital (SBMCH), Chennai*

Abstract

The use of herbicide in farming fields has a series of toxicological trouble. Atrazine is a commonly used herbicide and is vastly harm to non-target living beings. In the present research was expected to evaluate the impact of atrazine herbicide (1/10th of LC 50, 2.5ppm, 1/20th of LC 50, 1.25ppm and1/30th of LC 50, and 0.83ppm for 100 day) in *Poecilia sphenops* were studied on the basis of superoxide dismutase (SOD), catalase (CAT), glutathiones transferase (GST), reduced glutathione (GSH) and Lipid peroxidase (LPO). Changes in the antioxidant enzymes activity were seen in every single tried focus when contrasted and the control gathering. The general outcomes recommend atrazine is a strong toxicant to aquatic environment.

Keywords: *Atrazine, Oxidative Stress, Antioxidant, SOD, CAT, GST, GSH, and LPO Poecilia sphenop.*

Introduction

Green revolution is the motto of our nation to feed the exploding population. In this regard for modern for modern agricultural practices are adopted to enhance food production. As a result of horticulture overflow, downpours, water system waters, wetland applications, and so on herbicides are released into aquatic ecosystems. Among the different herbicides utilized, atrazine (2-chloro-4-ethylamino-6-isopropylamino-1, 3, 5-triazine), as a result of its high steadiness and diligence in the aquatic environment attracts special attention. Atrazine is readily absorbed through the gastrointestinal tract, even though low dimension of bioaccumulation of atrazine in fish, it accumulates in bladder, liver, gut and cerebrum of fishes[1].

The metabolism of atrazine are usually separated into Phase I and Phase II responses, complex of metabolic procedure are including a few gatherings of xenobiotic processing catalysts, for example, cytochrome P450 isozymes and GST (Glutathione-S-Transferase). GST is a major group of phase II enzyme; associated with the detoxification forms it catalyzes the conjugation of a few xenobiotics with endogenous glutathione (GSH)[2].

Under typical conditions these antioxidants prevention agents shield the cells and tissues from oxidative harm. The cell reinforcements in fish can be utilized as biomarkers of presentation to amphibian pollutants[3]. Oxidative pressure is an unavoidable part of high-impact life. It is the consequence of an irregularity between the creation of receptive oxygen species (ROS) and antioxidants prevention agent protections in living organisms[4]. Receptive oxygen species are incited by substances, for example, transitional metal particles, pesticides, and oil products[5, 6]. During typical cell digestion, free radicals are additionally delivered by endogenous cell sources. Mitochondrial breath is the primary endogenous wellspring of ROS.

Oxidation of bio molecules, changes in gene expression, and alterations in cell redox eminence can be caused by elevated production of ROS[7]. Oxidative stress is incited by numerous synthetic compounds, including a few pesticides. These contaminants may animate receptive oxygen species and modification in cancer prevention agent frameworks. Star oxidant figure activities fish can be utilized to survey contamination of explicit regions or overall marine pollution[8, 5].

In aquatic animals, assortments of physiological procedures have been influenced by atrazine. It is promptly retained through the gastrointestinal tract, brain, nerve bladder, liver and gut of some fishes[1]. Pesticide incited oxidative pressure have additionally been a focal point of toxicological research for the last decade[9]. Oxidative stress prevention agent barriers, for example, SOD, CAT, GST, GSH and LPO are included to balance the poisonous quality of responsive oxygen species[10].

Materials and Method

Chemicals: 99.9% purity of atrazine was procured from agchrochemical store. All other chemicals utilized in the study were of analytical grade and were acquired from Merck Pharmaceuticals, India.

Experimental procedure: The newly hatched *Poecilia sphenops* juveniles/fries were separated from their respective mother and kept up in 100 L tank. A sum of 200 fries (0 day fry) were isolated and used in four equal treatment groups. Fifty individuals' fries in each group were exposed to three different concentrations ($1/10^{th}$ of LC 50, 2.5ppm, $1/20^{th}$ of LC 50, 1.25ppm and$1/30^{th}$ of LC 50, 0.83ppm) of atrazine and control also maintained simultaneously. They were used for the experiment in the same day hatching. The young ones are nourished with commercial granular feed all through the exploratory period. The aquarium system was static and washing medium was changed once in seven days with same dose of atrazine was recharged. Periodically one or two experimental fishes were sacrificed and dissected out the required organ for analysis.

Enzyme extraction: Liver, gonads and gill homogenise with 50mM Tris HCL pH 7.0. The homogenate were centrifuged at 12,000rpm at 4ºC for 15min. The supernatant was used study.

Antioxidant enzymes: SOD activities were resolved from their capacity to restrain the autoxidation of pyrogallol utilizing an alteration of the technique[11]. CAT activity was tested by the technique[12]. The GSH and GST activity was determined using spectrophotometer according to[13]. The concentration of malondialdehyde (MDA) as a marker of Lipid peroxidase (LPO) was resolved by the strategy of[14].

Protein content: The protein content was determined using Bradford reagent and bovine serum albumin as the standard. Estimation of protein substance was important to calculate the exercises of SOD, CAT, GST, GSH and LPO.

Statistical Analysis: The obtained values are communicated as mean ± SE. Contrasts between gatherings were surveyed by single direction investigation of fluctuation (ANOVA) utilizing the Statistical Package for Social Sciences (SPSS) programming bundle for windows (adaptation 16.0). Post-hoc testing was performed for inter group correlations utilizing the least noteworthy distinction (LSD) test $p<0.05$ was considered measurably critical.

Results and Discussion

Effect on superoxide dismutase: The activities of the enzyme SOD in the liver of *Poecilia sphenops* exposed to atrazine herbicide are presented in Fig. (1). SOD activity is significantly ($p< 0.05$) elevated in the liver at all the concentrations of atrazine exposed experimental group.

The activities of SOD in the liver of *Poecilia sphenops* treated to atrazine herbicide are showed in Fig. (1). SOD action is significantly ($p< 0.05$) rise in the liver at all the groupings of atrazine uncovered exploratory gathering. SOD movement in gonad of *Poecilia sphenops* is shown in Fig. (2). A dose dependant enhancement was noted in testis. Whereas in the ovary SOD activity showed a gradual dose related increase from 60 to 80 days and decline in 100 days but in all the case a dose dependant increase was noted. Marked increase up to end of the study days of atrazine tested at all concentrations respectively, over control values ($p< 0.05$). SOD activity in gill tissue of *Poecilia sphenops* exposed to atrazine is shown in Fig. (3). However, activities of the enzyme in the gill are in the similar pattern as SOD in the liver that is gradual hike over increasing dose.

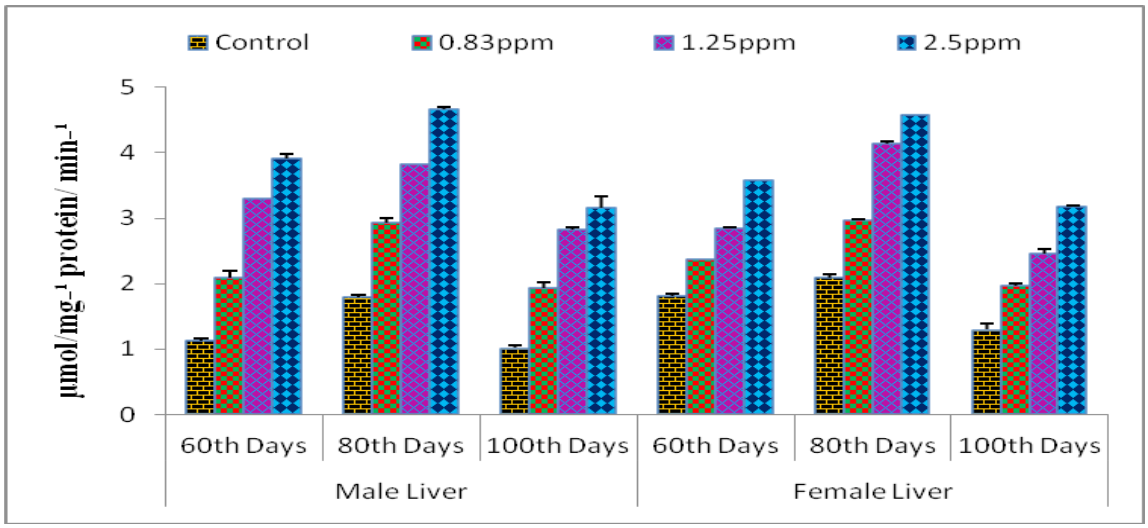

Fig. 1 SOD activity in Liver of Poecilia sphenops exposed to Atrazine

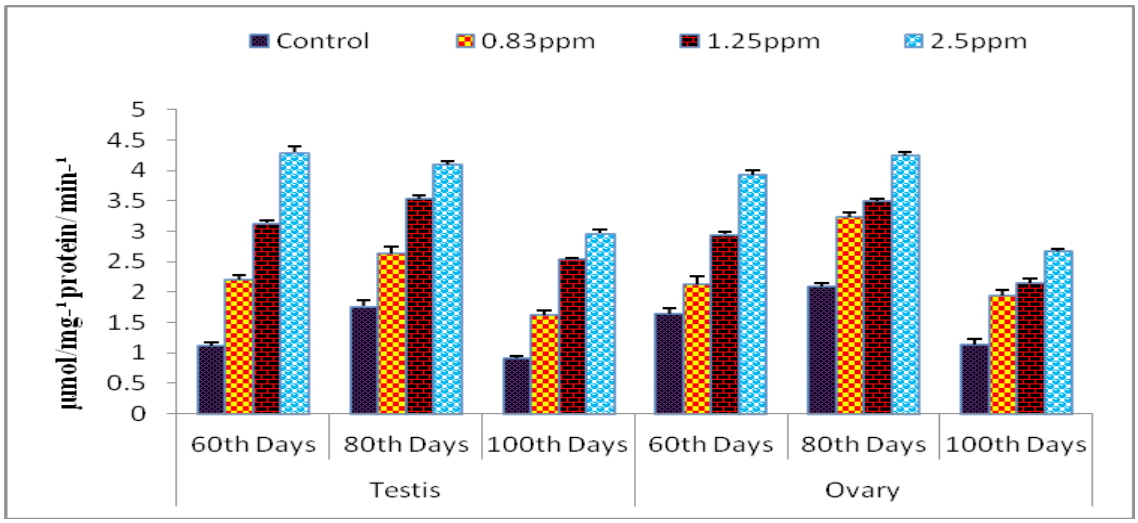

Fig.2. SOD activity in Gonads of Poecilia sphenops exposed to Atrazine

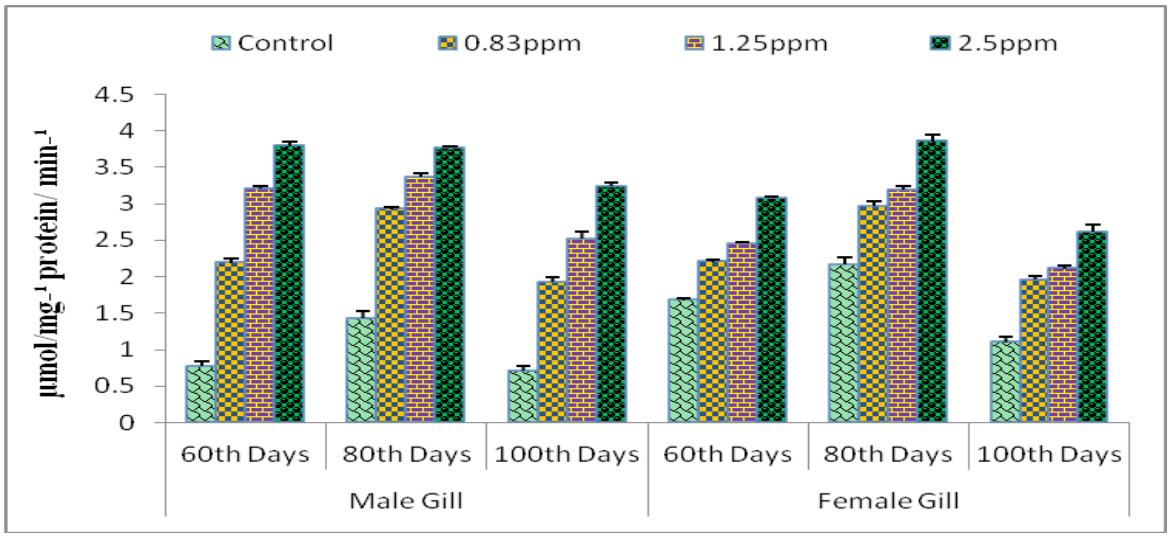

Fig.3 SOD activity in Gill of Poecilia sphenops exposed to Atrazine

Effect on catalase: The changes in the catalase action in various organs of *Poecilia sphenops* treated with atrazine are presented in Fig.4 to Fig.6. The activity in the liver is significantly higher than the untreated *Poecilia sphenops* ($p< 0.05$). The catalase action is considerably ($p< 0.05$) increased in the liver of exposed with atrazine. The CAT activity gradually increased up to 100 days of atrazine administration. Similarly the activity of enzyme in the gonads and gills is in the same pattern as in the liver.

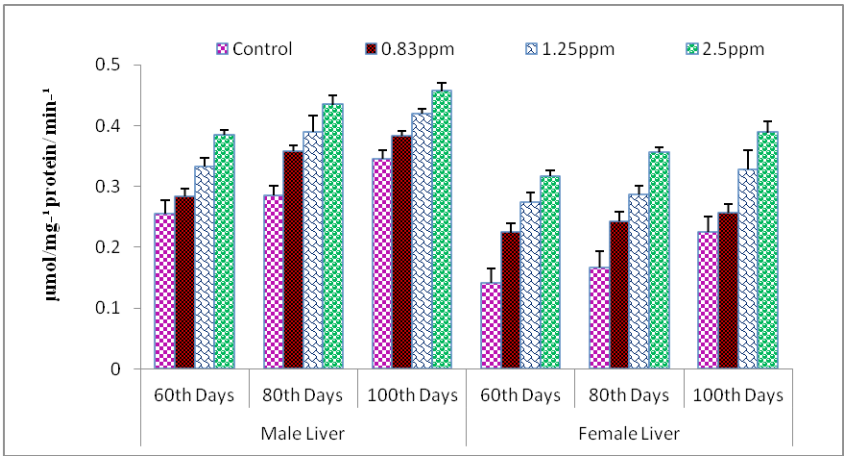

Fig.4. CAT activity in Liver of Poecilia sphenops exposed to Atrazine

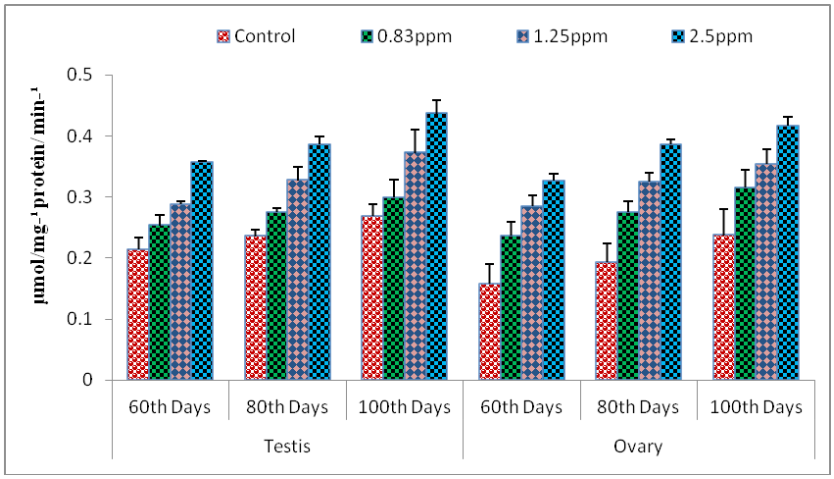

Fig.5. Cat Activity In Gonads Of Poecilia Sphenops Exposed To Atrazine

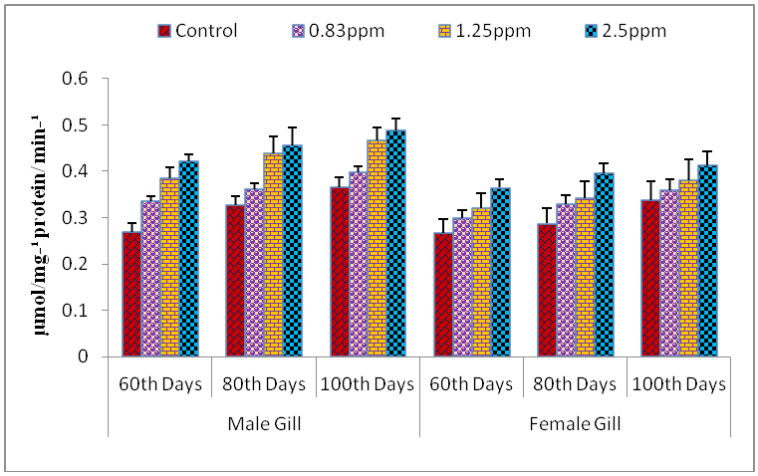

Fig. 6. CAT activity in Gill of Poecilia sphenops exposed to Atrazine

Effect on glutathione-s-transferase: In the present survey, GST activity is increased statistically in the liver of the fish treated to atrazine up to an optimum dose, then decline in higher concentration (Fig.7 to Fig.9). The activity was more in male than female. Time dependency of exposure is observed in the *Poecilia sphenops* exposed to atrazine. Maximum increase is observed in1.25ppm atrazine exposure but in higher concentration (2.5ppm) it is decreased. The levels of GST in gonads and gill of *Poecilia sphenops* in experimental group are significantly increased ($p< 0.05$) compared to the untreated group. On the other hand, the GST activity in the gonads and gills is significantly increased ($p< 0.05$) when compared to liver.

Effect on reduced glutathione: There is significant decrease ($p< 0.05$) in reduced glutathione activity in *Poecilia sphenops* liver exposed to all the doses of the atrazine compared with the untreated (Fig.10 to Fig 12). Reduced glutathione activity is significantly increased ($p< 0.05$) throughout the experiment. The activity of reduced glutathione in gonads and gill of *Poecilia sphenops* is significantly less ($p< 0.05$) in all tested groups compared to liver.

Effect on Lipid peroxide: Determination of Lipid peroxide by the malondialdehde formation is most commonly used markers of oxidative stress. The effects of altered dose of atrazine on malondialdehde development in the liver of *Poecilia sphenops* are showed (Fig.13 to Fig.15). The significant ($p < 0.05$) effect of all doses and period of exposure is observed in the *Poecilia sphenops* exposed to atrazine. The levels of LPO in gonads and gill of *Poecilia sphenops* in experimental group are significantly increased ($p < 0.05$) compared untreated.

Discussion

In this study we discovered increased levels of CAT, SOD, GST and LPO activity in almost all tested *Poecilia sphenops* contrasted with the control. But the reduced GSH level in the atrazine treated *Poecilia sphenops* could be the consequence of diminished usage of GSH for initiating poisonous quality. Just the test group presented to the most elevated centralization of atrazine (2.5ppm) indicates relatively lower action of these antioxidant enzymes (GST).

A raise in antioxidant enzyme activities contributes to the elimination of ROS, which is induced by atrazine. Similar results were reported in *Channa punctatus* exposed to atrazine[15]. They recorded significant increase of SOD action in liver. The SOD activity increases gradually from low concentration to higher concentration on days 60, 80 and 100 of atrazine treatment, when contrasted with the control. The increase in activity of SOD in our investigation reflects compensatory component of expanded oxidative stress. It has been documented in the previous study that exposure of animals to pesticides increases SOD activity in different tissues[16.]

In all experimental groups, CAT activity in *Poecilia sphenops* is increased contrasted with the control group. Similar results are observed in different tissues of common carp after chronic simazine exposure[17]. High level of CAT activity was reported in freshwater fish Channa punctatus after atrazine exposure[18].

In addition to this, there is an elevation in GST activity connected with dose up to 1.25ppm but at higher concentrations (2.5ppm) there is decrease in this activity on 60, 80 and 100 days of atrazine exposure in *Poecilia sphenops* as contrasted with controls. Related results were watched in the level of GST in the zebra fish embryos of after atrazine introduction in dose dependent manner, but at higher concentration this activity is generally decreased[19]. A considerable decrease in GSH level in all the tissues in *Poecilia sphenops* after atrazine exposure is indicated in pro-oxidant conditions. Reduced in GSH levels after of different pesticides are all around reported in literature[20].

The reduced degrees of GSH in the atrazine treated *Poecilia sphenops* could be the consequence of either expanded usage of GSH for conjugation or cooperation of GSH as cell reinforcement in ending free radicals delivered because of atrazine-initiated harmfulness. In the present examination diminished degrees of GSH in the atrazine controlled *Poecilia sphenops* could be the result of decreased utilization of GSH for inducing toxicity. It is like the individuals who recorded a checked reduction in GSH content in *Carassius auratus* and grown-up female Danio rerio exposed to alachlor and atrazine herbicides[21]. A few results of lipid peroxidation are usually utilized and most likely assessment of malondialdehyde levels. Most much of the time it is estimated with thiobarbituric acid[22]. In our investigation, we discovered critical increment in lipid peroxidation in *Poecilia sphenops* exposed to atrazine. Our outcomes are in concurrence with who revealed that there is a raised degree of lipid peroxidation in liver *of Channa punctatus* because of atrazine exposure[15].

Conclusion

The present study concluded that atrazine treated *Poecilia sphenops* generate increased oxidative stress, altered antioxidant status. Along these lines, these parameters can be utilized as markers of atrazine lethality.

Performance Analysis of FPGA Based Fund Us Image Processing

R. Kishore Kanna[1],T. Manoj Prasath[1], R. Vasuki[2]

[1]Assistant Professor, [2]Professor and Head, Dept of Biomedical Engg,
Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Image processing techniques is been applied to process of imaging to obtain a more suitable output image for certain specific applications. Image processing improves the interpretability of an image for a human viewer. Visible quality of an image is enhanced by varying brightness, contrast, & histogram equalization. The analysis of image from tissues is very important for the detection of abnormalities. The images from abnormal regions are processed for distinguishing normal and abnormal regions. Commonly used method for analysis of medical images are based on software algorithm and the image enhancement algorithm with field programmable gate arrays (FPGA) implemented in hardware is a high performance. The image processing uses MATLABsimulator for processing. The proposed system of fundus image for detecting fluid filled abnormal regions of retina. The performance of the proposed system is evaluated[1]

Keywords: *Image enhancement; FPGA; Histogram; MATLAB simulator.*

Introduction

Picture taking care of is the technique to change over a picture to be modernized structure and search out explicit surpassing on it, so as to get an overhauled picture or to dispose of few containing data from it. It is a sort of sign guidelines wherein information is image[6], similar to video cuts or photograph's and yield might be picture or attributes joined with that picture. All around Image Processing framework circuits considering pictures to be multi dimensional sign while embeddings formally set of signs preparing method to them. Picture pre-getting ready fuses picture improvement, modifying, and selection[6]. Picture improvement recognizes a propelled picture as data and produces an updated picture as a yield; in this special circumstance, improved techniques more noteworthy in some respects[3]. It joins building up the separation, ousting geometric contorting, smoothing the edges, or changing the image to energize the illustration of its information content. In picture remaking, the debasement is ousted from the image to make a picture that takes after the first underrated picture[4]. In picture enrolment, the effects of sensor advancements are ousted from the image or to join different pictures gotten by different sensors of a comparable field Image taking care of is seen as a champion among the most rapidly propelling regions of information advancement, with creating applications in all fields of learning. It comprises a centre territory of research inside the software engineering and building disciplines, given the enthusiasm of potential applications extending from picture upgrading to programmed picture getting, apply autonomy and PC vision picture handling applications, particularly therapeutic picture preparing applications for article recognition, necessitate that few activities be performed on every pixel in the picture bringing about an even huge number of tasks per second[2].

Methodology and Material

This area talks about the hypothesis of most generally utilized picture upgrade calculations like

1. Negative Transformation,
2. dark Thresholding

1. **Negative Transformation:** There are different applications in which negative of the electronic pictures are serene helpful. For example[4], appearing

to be medicinal pictures and getting a screen with monochrome positive film with using the consequent negatives as standard slides. The negative of the moved picture is gotten by using the change work: J(r) = (L-1)- I(r) Where L is the proportion of reduce estimations, I(r) is input pixel diminish estimation and J(r) is yield changed lessening estimation. The considering is to change the mentioning from decrease to white with the objective that the power of the yield picture diminishes as the force of the data increases.

2. **Lessen thresholding:** Thresholding an image means changing all pixels in two properties as it's been said. This is the sublime sort of quantization isolating the pixel regards and a given edge regard. Thresholding makes yield picture with only two properties that is 0 and 255 for 8bit reduce estimation picture[6].

   0, if I(r) <=T J(r) = 255, if I(r) > T

Working out as expected of Thresholding picture is a high multifaceted nature picture, this have just two reduce estimation respects[7]

Result

The equipment based execution of picture upgrade calculation is completed on Spartan-3[E] group of FPGA. In this product advancement device utilized for creating and confirming the structure is the Xilinx. The picture demonstrates how much zone is influenced and whether the picture is ordinary or strange.

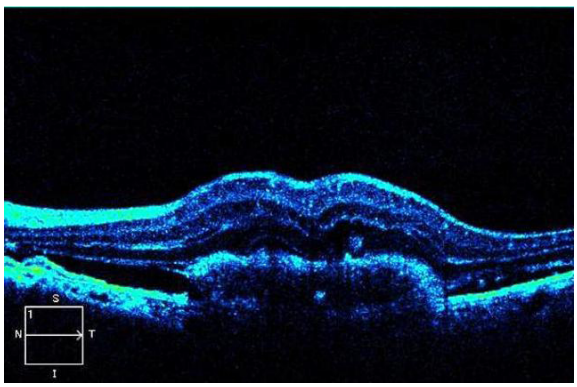

Fig 1: Images showing abnormal region with processing

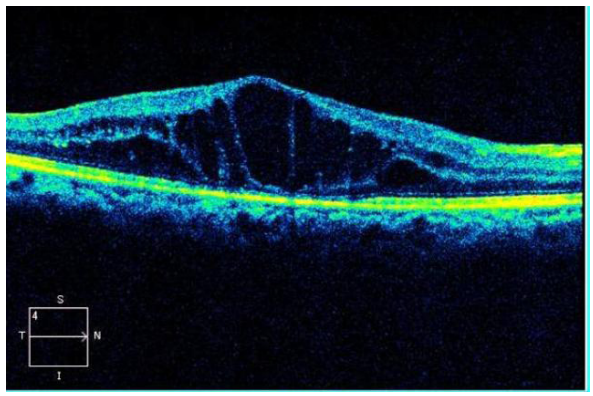

Fig 2: Images showing abnormal region without processing.

The proposed design was applied for the processing and acquired abnormal images. The measurements of abnormal areas were taken and were observed by changing filter in real-time[4].

Figure 3: Shows the area of abnormality displayed on LCD.

The proposed model uses spartan 6E of FPGA family for the handling of pictures. The connected FPGA system give better execution and the region of anomaly can be effectively recognized for the typical regions. The proposed equipment strategy utilizes FPGA system and it supposedly provided preferable execution over the ordinary programming procedure connected.

Conclusion

Picture preparing calculations executed in equipment have as of late risen as the most feasible answer for improving the exhibition of picture handling frameworks. This paper executed for rapid picture improvement applications utilizing fpga. The picture improvement procedures, for example, brilliance and differentiation modification are significant particularly in medicinal pictures. This paper likewise clarifies usage of Negative change, Gray thresholding, calculations on fpga. Then calculations is been actualized on Spartan-3E fpga advancement pack. It computerized pictures in great brilliance/difference and it improves nature of pictures. This systems utilized for various applications relies upon necessity and need.

Design of a Light Activated Switch for Persons with Cerebral Palsy

R. Kishore Kanna[1], T. Manoj Prasath[1], R. Vasuki[2]

[1]Assistant Professor, [2]Professor and Head, Dept of Biomedical Engg., Bharath Institute of Higher Education and Research, Chennai-73

Abstract

A light activated switch for persons to operate switch-controlled computer software or other communication device has been developed. A light emitting diode is attached to the user's forehead. An array of photo transistors is mounted at a fixed position from the body. It requires a small but controllable motion to activate the switch by aiming the LED beam at the target area of the receiver. The false activation due to uncontrollable motion will be a problem associated with cerebral palsy. The LED in the transmitter is driven by oscillator at 1 kHz and the band pass filter which is in receiver is tuned at that frequency[1]. The level of received is detected by an amplitude demodulator once the signal is filtered. When the signals amplitude reach's the threshold, a one short timer is triggered which then latches the switch for predetermined period. The system was tested by an 8 year old child and has demonstrated a satisfactory result. The sensivity and specificity are important factors for reliable operation of the light activated switch associated with the cerebral palsy[6]

Keywords: *Switch technology; Computer access; Cerebral palsy (CP); Spastic cerebral palsy; Assistive technology (AT).*

Introduction

For some individuals with inabilities like cerebral paralysis or spastic cerebral palsy, a switch controlled framework is the main instrument to manage these sorts of issues effectively[5]. Cerebral paralysis is a gathering of changeless development issue that show up in early childhood[2]. Side effects regularly incorporate poor coordination, firm muscles, feeble muscles and tremors. There might be issues with sensation, vision, hearing, gulping and talking and the patient don't move over, sit, slither or stroll as normal[6]. It is brought about by anomalous advancement or harm to the pieces of cerebrum that controls development, balance, act. Cerebral paralysis is halfway preventable through vaccination of the mother and security improvement ought to be taken 4. There is no remedy for cerebral paralysis anyway steady medications and medical procedure may support numerous people. These medicines incorporate active recuperation and language training. There is currently assistive innovation intended to help when managing cerebral paralysis. The principle goal of assistive innovation is to add to the powerful improvement of the lives of individuals with inabilities and old individuals by surviving and tackle their utilitarian issues, decreasing reliance on others and adding to the reconciliation into their families and society[5].

People with an examination of cerebral loss of motion (CP) much of the time have basic physical imperatives that foresee examination and full collaboration to the earth. AT systems can outfit open entry ways for people with CP to interface with their world, engaging correspondence, and consistently living aptitudes. Capable access and control of the advancement are essential for successful use; regardless, developing enduring access is much of the time inconvenient because of the possibility of the improvement precedents shown by people with CP[6].

Material and Methodology

The framework comprises of a couple of transmitter and collector. The oscillator at 1 KHz in the transmitter infers a light radiating diode a variety of photograph resistors in the collector detects the light. The detected light is then amplified1, separated by a band pass channel and sufficiency demodulator[2]. At the point when the came about sign surpasses or achieves the edge, a switch is actuated by setting off the one short clock. At the point when the hand-off gets shut, a switch sign is given to the PC. The framework is intended to a separation of 6-8 inch between the beneficiary and the transmitter. When we increment the current to the LED we can without much of a stretch increment the separation between the beneficiary and the transmitter. A 9v battery is likewise used to control the framework.

Reasons for Using Phototransistor: The collector has a variety of phototransistors by which the light is detected. The phototransistor is a semiconductor light sensor shaped from an essential transistor with a straightforward spread that gives much preferable affectability over a photodiode. There is a wide determination of photosensitive gadgets that are accessible to the electronic originator. While photograph diodes satisfy numerous necessities, phototransistors or photograph transistors are likewise accessible, and are progressively reasonable in certain applications. Giving large amounts of addition and standard gadgets are minimal effort, these phototransistors can be utilized in numerous applications[4]. The possibility of the photograph transistor has been known for a long time. William Shockley initially proposed the thought in 1951, not long after the standard transistor had been found. It was then just two years before the photograph transistor was illustrated. From that point forward phototransistors have been utilized in an assortment of utilizations, and their improvement has proceeded from that point forward.

Use of Oscillator: An oscillator is a circuit which delivers a consistent, rehashed, rotating waveform with no information. Oscillators essentially convert unidirectional current stream from a DC source into a substituting waveform which is of the ideal recurrence, as chosen by its circuit segments. The essential guideline behind the working of oscillators can be comprehended by investigating the conduct of a LC tank circuit appeared, which utilizes an inductor L and a totally pre-charged capacitor C as its parts. Here, at first, the capacitor begins to release by means of the inductor, which results in the change of its electrical vitality into the electromagnetic field, which can be put away in the inductor. When the capacitor releases totally, there will be no present stream in the circuit[5].

In any case, by at that point, the put away electromagnetic field would have produced a back-EMF which results in the progression of current through the circuit a similar way as that of previously. This flow move through the circuit proceeds until the electromagnetic field breakdown which result in the back-change of electromagnetic vitality into electrical structure, making the cycle rehash. In any case, presently the capacitor would have accused of the contrary extremity, because of which one gets a wavering waveform as the yield.

Purpose of Amplitude Demodulator: The detected light from the phototransistors is enhanced and separated by a band pass channel and abundances demodulator. The way toward isolating or separating the tweak from a sign is called demodulation or identification. For Major change, the method of demodulation or area can be developed in all regards simply using a diode, or it may be practiced in various ways that give progressively incredible demodulation of the waveform. As plentifulness modification is still comprehensively used due to its ease, authorities melding AM demodulators are manufactured in measures of an enormous number each year. Inside these radios a fundamental AM identifier containing a diode is used. Here are different habits by which an AM sign can be demodulated. There is an equality that ought to be made of the introduction of the circuit that is required against the multifaceted nature, and thus the cost that can be persevered.

Band Pass Filter: Band Pass Filters can be utilized to segregate or sift through specific frequencies that exist in a specific band or scope of frequencies. The cut-off recurrence or fc point in a straightforward RC uninvolved channel can be precisely controlled utilizing only a solitary resistor in arrangement with a non-enraptured capacitor, and relying on which path around they are associated, we have seen that either a Low Pass or a High Pass channel is acquired.

One basic use for these kinds of uninvolved channels is in sound enhancer applications or circuits, for example, in amplifier hybrid channels or pre-intensifier tone controls. Now and then it is important to just pass a specific scope of frequencies that don't start at 0Hz,

(DC) or end at some upper high recurrence point yet are inside a specific range or band of frequencies, either limited or wide.

By interfacing or "falling" together a solitary Low Pass Filter circuit with a High Pass Filter circuit, we can create another kind of latent RC channel that passes a chose range or "band" of frequencies that can be either thin or wide while weakening each one of those outside of this range. This new sort of inactive channel game plan delivers a recurrence specific channel referred to normally as a Band Pass Filter or BPF for short.

PROCESS Of Cerebral Palsy-Indication: This process of cerebral palsy indication involves the number of phototransistors and their positions to indicate the geometry of the target area that sensed the light. These photo sensor arrays are mounted on the left side of the face about 6 inches away when the LED is taped on the user's forehead. A slight left turn of the head directs to the light beam onto the target and triggers the switch[6]. The operation requires a head turn in a specific direction for a specific angel. The process to indicate the specific area which is affected by cerebral palsy requires the design of a system which consists of receiver and transmitter. The receiver transmitter distance can be adjusted for an appropriate trade off between sensivity and specificity. When the distances between the two is increased, sensivity decreases but specificity decreases. The configuration of the sensor array not only indicate the geometry of the target area but also provides the possibility for optimizing the system performance[6].

Result

The prototype of this system gives an indication when the switch is activated. This indication can be delivered by either a LED indicator or buzzer. The design of this system is easy. It is easy to achieve the operation under normal conditions also. Material used in designing the system is very low costly. The quantity of photograph transistors and their positions decide the objective territory that detects light. The light actuated switch is the straightforward and reasonable answer for people with spastic cerebral paralysis.

Conclusion

It gives a basic, modest answer for people with spastic cerebral paralysis. On the basis of specificity and sensitivity of the system, the transmitter-receiver area can be adjusted. Due to the more stringent requirement on head movement to trigger the switch, sensivity decreases as the distance increases but specificity increases. Another possibility for increasing the system performance is to provide configuration of the sensor array.

IR Sensor Based Drowsiness Detecting During Driving System

T. Manoj Prasath[1], Geetha S.[1], R. Kishore Kanna[1], R. Vasuki[2]

[1]Assistant Professor, [4]Professor and Head, Department of Biomedical Engineering, BIHER, Chennai-73

Abstract

Sleepiness either by Drowsy or Alcoholic is the main cursory factor for road accident and daytime malfunction. Especially, distinguishing driver's laziness could capture drivers from impacts brought about by lazy driving. This paper point is to permit the dependable sign for identifying driver frumpiness dependent on the infrared sensors. In this paper we connected IR sensors which measure the beats every minutes (BPM) inconstancy of the driver which indicates tiredness of the subject. The target of this task is to plan and advancement of inbuilt IR sensor inside directing wheel of the vehicles. This laziness discovery framework is savvy and increasingly precise to lessen the episode of street mishap.

Keywords: *Sleepiness; IR sensors; beats per minute; in built IR sensor; drowsiness detection.*

Introduction

The inclination to rest over the span of day by day life, when expecting to remain alert, speaks to a noteworthy new general wellbeing danger since it adds to traffic and work mishaps. A pulse screen is an individual checking gadget that enables a subject to gauge their pulse continuously or record their pulse for later study[1]. Numerous examinations of wake-rest change have been made. Driver laziness is a significant factor in the motoring of vehicle mishaps PC vision ways to deal with location of weariness has been centered around the examination of squints and head movements[7] Be that as it may, in the weakness recognition frameworks created to date, sleepiness cautioning framework utilizing picture handling has turned out to be most generally utilized in light of the fact that it gives a remote detection[6.] Because of the expansion in the measure of vehicle as of late, issues made by mishaps have turned out to be progressively intricate also. Conventional transportation framework is no higher adequate. As of late, the savvy vehicle framework has risen and turned into a well known point among transportation specialists[5]. In any case, the exploration of wellbeing in vehicle is a significant subset of shrewd vehicle framework examine. Interim, dynamic cautioning framework is one of the structures on dynamic security framework. The security cautioning frameworks, generally dynamic cautioning frameworks for anticipating car crashes have been drawing in specialists[4].

Sorts of Drowsiness: This therapeutic manifestation data demonstrates the different kinds of Drowsiness, and other related side effects or conditions, including their causes and determination.

- Daytime sluggishness
- Daytime tiredness
- Yawning
- Adaptive impact
- Yawning Excessively

Different calculations For detection of Drowsy:

1. Conduct with object
2. Eye investigation

The main meddlesome strategies of some of non-nosy. The meddlesome strategies incorporate ECG, EOG and Eye movement. In The portion kind of techniques drivers needed to wear a head gear while driving. While in different techniques Are utilized heartbeat identifier set in the guiding haggle the back of the seat. These excessively were not dependable more often than not. That is the reason this method was very little embraced

Corresponding Author:
T. Manoj Prasath
Assistant Professor, Department of Biomedical Engineering, BIHER, Chennai-73
e-mail: mprasath.t@gmail.com

for everyday citizens. Strategies to identify laziness based on vehicle practices, for example, vehicle guiding movement, vehicle speed and vehicle control position are additionally grown yet they to moderate to even consider alerting the driver before he mode off these techniques alarms driver simply after they nodded off not before they were in the scene of the tired state[5].

Material and Method

Aurdino UNO: Arduino Uno goes with USB interface for instance USB port is incorporated the board to make successive correspondence with the PC. Aurdino in the heap up that goes with different features like timekeepers, counters, meddles with, PWM, CPU, I/O sticks and reliant on a 16MHz watch that associates in conveying more repeat and number of bearings per cycle. It is an open source organize where anyone can change and update the load up subject to the amount of headings and errand they have to achieved[7].

IR Sensor: This venture includes measure and controls the eye flicker utilizing IR sensor. The IR transmitter is utilized to transmit the infrared beams in our eye. The IR beneficiary is utilized to get the reflected infrared beams of eye. In the event that the eye is shut method the yield of IR recipient is high generally the IR beneficiary yield is low. This to realize the eye is shutting or opening position. This yield is provide for rationale circuit to demonstrate the caution. This venture includes controlling mishap because of oblivious through Eye squint. Here one eye flicker sensor is fixed in vehicle where in the event that anyone looses cognizant and demonstrate through caution. A vehicle test system study was intended to gather physiological information for approval of this innovation. Strategy for investigation of physiological information, free evaluation of driver sluggishness and improvement of languor identification calculation by method for successive fitting and determination of relapse models is displayed. Edge.[6]

Inbuilt IR sensors Steering wheel: A controlling wheel (likewise called a driving wheel or a hand wheel) is a kind of guiding control in vehicles. Directing wheels are utilized in most present day land vehicles, including all large scale manufacturing autos, just as transports, light and overwhelming trucks, and tractors. The directing wheel is the piece of the controlling framework that is controlled by the driver. Inbuilt IR sensors controlling wheel helps in identifying languor of the driver.

Sluggishness Detection System: Sluggishness is a condition of diminished mindfulness or readiness related with a longing or inclination to nod off. Sluggishness is thusly the cerebrums last advance before nodding off. The instance of the result is physical work or different exercises that uses the vitality supply arrangement of the body. It is an ordinary and normal partner of weakness yet it appears alone. Specialists state, languor amid the day, notwithstanding amid exhausting exercises, demonstrates a resting issue. Tiredness recognition framework that catches, forms, perceives and gives results to the client, which client can take activities on the occasions, and the perception of eye developments and flicker designs. By observing the eyes, it is trusted that the side effects of driver exhaustion can be distinguished sufficiently early to maintain a strategic distance from an auto crash. The prerequisites for a compelling sleepiness identification framework are as per the following:

- A non-meddling observing framework that won't divert the driver.
- A ongoing observing framework, to protect precision in distinguishing sluggishness.
- A framework that will work in both daytime and evening time conditions.

Recognition of weakness includes a succession of pictures of a face, and the perception of eye developments and flicker designs.

Method for Detecting Drowsiness:

Eye Blink Idtinfication: The explanation behind estimating the start and end focuses where a large portion of the adequacy is come to, is in light of the troubles to precisely decide the start and end purposes of the squint complex in the EOG signal. The focuses where a large portion of the plentifulness is come to, in any case, can be decided all the more precisely, as they are fairly unaffected by little blunders in the area of the squint start and end focuses.

Processing Of Blink Data: In view of the gathered EOG information, squints were recognized in the EOG signal The flicker recognition program distinguished begin, pinnacle and stop positions in the squint edifices. Pinnacle positions were distinguished as nearby maxima of the flicker edifices over a movable limit an incentive to alter the edge esteem and to address for erroneously recognized flickers and squints passed up. This was done by taking a gander at a 30 second window and moving forward.

Statistical Approach for Drowsiness Detection: A creative picture getting ready figuring as Drowsy driver acknowledgment procedures can shape the reason of a system to perhaps diminish accidents related to lethargic driving. an image taking care of estimations close by non-intruding strategy. The headway proposed ensures the security and happiness of dozen and scores of driver's life. Relationship of both the drivers‟ with and without shows was made, course of action and outline was plotted with the quantifiable characteristics for each packaging, which exhibits that the truthful motivating force for the edges were generally near for the driver's with and without presentations.

Compact Vehicle Detection System: In this paper, a non-intrusive driver's tiredness structure has been shown reliant on PC vision and picture dealing with. This system uses visual information to inspect and screen driver's eye state at close steady and certifiable driving conditions. The proposed figuring for eye disclosure and eye following is solid and accurate under varying light, outside edifications impedance, vibrations, changing establishment and facial headings. Also, all drivers used in these examinations were introduced to a combination of inconvenient conditions typically experienced in a roadway. This confirmations and insists that these preliminaries have exhibited healthiness and adequacy in certified surge hour gridlock scenes.

Discussion

This investigation paper depicts the various techniques for recognizing driver's tiredness by exploring circulatory strain through fingertip using IR sensor. Distinguishing proof of the BPM is done by the infrared sensors. In the second step all the recorded parameters sent back to the Aurdino UNO board. System distinguishes the driver's beats each minutes through fingertip. In future use of this structure with facial acknowledgment would be almost the most definite and exceedingly alright for drivers.

Future Scope: Later on, I might want to make this framework outfitted with another framework which incorporates camera and facial recognition. More highlights separated from caution will be the vibration of guiding wheel. A source which produces vibration will be joined to the controlling wheel which would vibrate and make driver cognizant and alert while driving.

Ethical Clearance: No ethical clearance was necessary for this research work.

Correlation of Parenchymal Thickness of Kidneys with Ultrasonography in Various Clinical Stages of Chronic Type-II Diabetes

M. Jayanth[1], V. Chandrasekhar[2], M. Prabakaran[2]

[1]Post Graduate, [2]Professor, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Ultrasonography is used as a first line imaging technique to differentiate between acute and chronic kidney diseases in type 2 diabetes. The renal parenchymal thickness of left and right kidneys were compared and a detailed documentation was made. Our study included adult male and female population who were known case of Diabetes Mellitus, above 18 years of age and biochemically diagnosed for nephropathy. All patients were subjected to ultrasonography evaluation of the renal parenchymal thickness and the findings were documented.

Keywords: *Ultrasonography, Type II Diabetes.*

Introduction

Ultrasound images are useful at characterizing the pelvis, assessing renal dimensions, parenchymal thickness and evaluating their characteristics and distribution[1-4]. Cortical thickness should be estimated from the base of the pyramid and is generally 7–10 mm[5]. If the pyramids are difficult to differentiate, the parenchymal thickness can be measured instead and should be 15–20 mm [4]

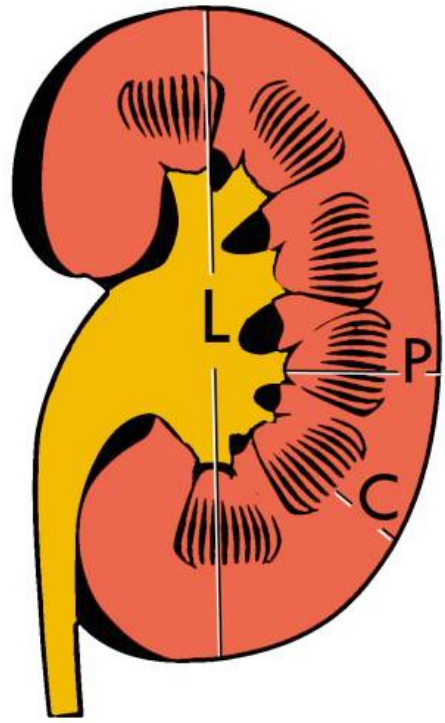

Figure 1: Measures of the kidney. L = length. P = parenchymal thickness. C = cortical thickness

Findings: Based on the measurement of right and left renal parenchymal thickness sonologically in diabetic nephropathy subjects, the following were interpreted.

Diabetic nephropathy Group III C	10.7	10.9	10.77	.09	10.75	10.7, 10.87
One-way ANOVA with LSD post-hoc test used; F-value= 518.7, p<.001						

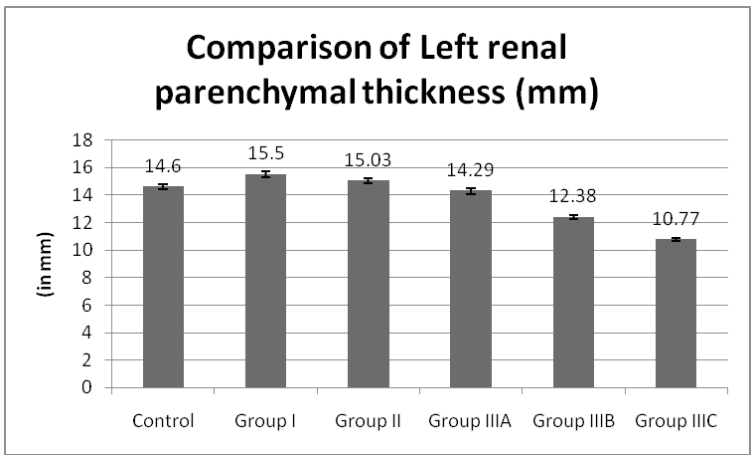

Figure 3: Comparison of left renal parenchymal thickness

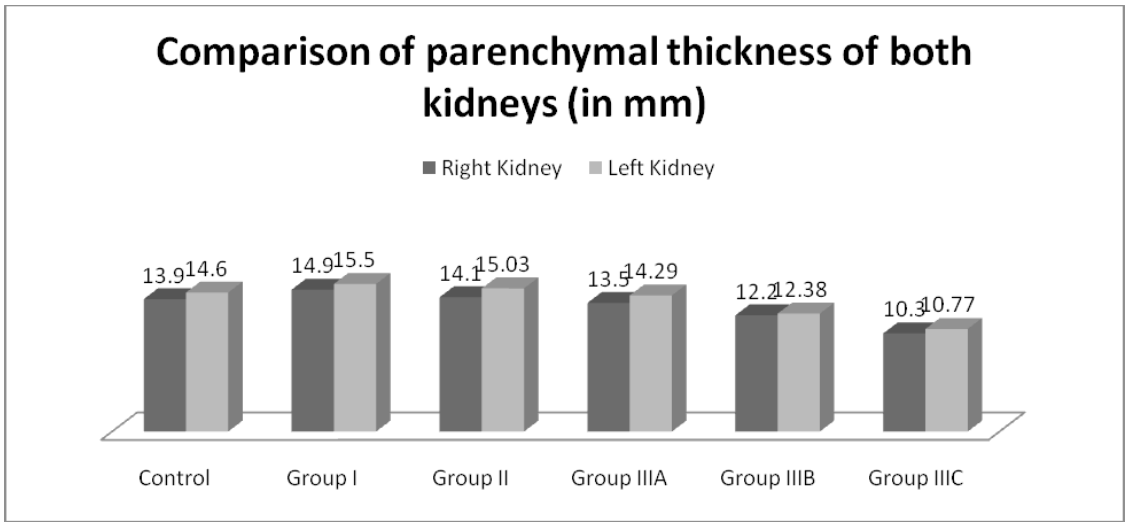

Figure 4: Comparison of parenchymal thickness of both kidney

Discussion

The renal parenchymal thickness between the groups of right kidney was evaluated. The range, mean and standard deviations, median and inter-quartile range were decimated. The mean and SD of controls, group I, group II, group IIIA, group IIIB, group IIIc were 13.9 ± .17, 14.9 ±.30, 14.1 ± .28, 13.5 ± .23, 12.2 ± .47, 10.3 ± .10 millimeters respectively. Their lparenchymal thickness ranged from 13.7 to 14.3, 14.0 to 15.3, 13.8 to 14.4, 13.2 to 14.3, 11.8 to 13.5 and 10.2 to 10.4 among the controls, group I, group II, group IIIA, group IIIB, group IIIc respectively. The median (50th percentile) parenchymal thickness (inter-quartile range, i.e between 25th percentile and 75th percentile) fluctuated with values of 13.9 (13.8, 14.0), 15.0 (14.9, 15.1), 14.15 (15.0, 14.3), 13.5 (13.4, 13.67), 12.05 (11.9, 12.27) and 10.3 (10.22, 10.3) respectively among controls, group I, group II, group IIIA, group IIIB, group IIIc that have been included in this study. Florini F et al.,[1] in their study have observed progressive parenchymal thickening in parallel with the stages of DKD and thence the results support our evidence convincingly.[2]

The renal parenchymal thickness between the groups of left kidney was evaluated.[3] The range, mean and standard deviations, median and inter-quartile range were decimated. The mean and SD of controls, group I, group II, group IIIA, group IIIB, group IIIc were 14.6 ± .19, 15.5 ±.23, 15.03 ± .21, 14.29 ± .20, 12.38 ± .13, 10.7 ± .09 millimeters respectively. Their parenchymal thickness ranged from 13.7 to 14.3, 14.0 to 15.3, 13.8 to 14.4, 13.2 to 14.3, 11.8 to 13.5 and 10.2 to 10.4 among the controls, group I, group II, group IIIA, group IIIB, group IIIc respectively. The median

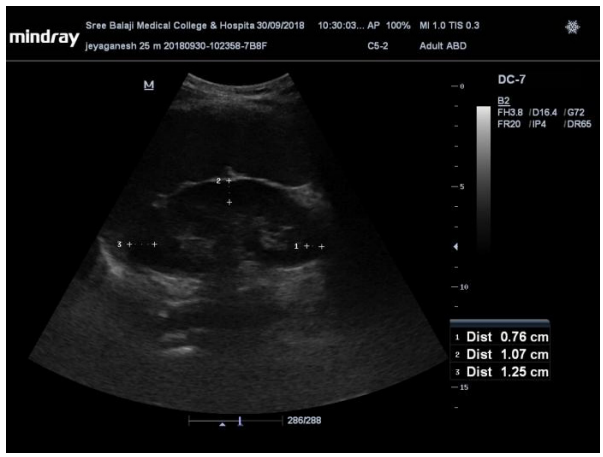

Figure 5: Ultrasound image of the measurement of renal parenchymal thickness

(50th percentile) parenchymal thickness (inter-quartile range, i.e between 25th percentile and 75th percentile) fluctuated with values of 14.6 (14.5, 14.72), 15.6 (15.4, 15.7), 15.0 (14.9, 15.2), 14.25 (14.12, 14.47), 12.4 (12.3, 12.5) and 10.75 (10.7, 10.87) respectively among controls, group I, group II, group IIIA, group IIIB, group IIIc that have been included in this study.

Conclusion

Based on the measurement of right and left renal parenchymal thickness sonologically in diabetic nephropathy subjects, it was interpreted that the renalparenchymal thickness diminished while the disease was getting progressed.

Prevalence of Menstrual Abnormality in Adolescent Girls

E. Abirami[1], K. Saraswathi[2]

[1]Professor, [2]Professor, Department of General Medicine, Sree Balaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Menstrual disorders are common sources of morbidity among adolescent girls and often cause anxiety for these girls and their families. Todetermine the patterns of menstruation as well as the prevalence of menstrual disorders among adolescent girls in south Chennai. The study employed a descriptive cross-sectional design. The data were collected from 300 adolescent girls fromOut patient clinic and In-patients of Gynaecology department, Sree Balaji Medical College and Hospital and also from schools and colleges from south Chennai . Data was collected by adopting a structured questionnaire on prevalence of menstrual irregularity among adolescent girls in the age group of 13-19years. 300 adolescent girls completed the questionnaires in the age between 13 and 19years.Among which 66% were from urban and 34% from rural. Girls were from socio economic status I to V and maximum in the lower middle group. The mean age of menarche was 12.3years. BMI is significantly associated with menstrual disorders. The most common menstrual problem seen in adolescent girls is dysmenorrhea (38%) followed by HMB (27%), oligomenorrhea (21%), and polymenorrhea (11%) and hypomenorrhea of 3%.Among 300 girls,36% of girls had awareness about menstruation before menarche and 64% were unaware of it. The prevalence of menstrual disorders among adolescents girls in south Chennai is high.so, steps to be undertaken for early diagnosis and prompt treatment.Health education among adolescents and their mothers about menstrual disorders and to mitigate their effects on the social and academic lives of these adolescents should be made.

Keywords: *Adolescent girls; menstrual disorders; dysmenorrhea; heavy menstrual bleeding (HMB), oligomenorrhea; polymenorrhea; hypomenorrhea.*

Introduction

The word adolescence in latin means to grow up. Adolescence is a transition period from childhood to adults and it involves various physical emotional and psychosexual changes in a girl[1].WHO defined adolescence as progression from appearance of secondary sexual characters to sexual and reproductive maturity and development of adult mental process[2].Adolescent age group defined by WHO is between 10-19 years for girls[3].One fifth of world's population is between 10-19 years[4]. Menstrual cycle is a normal physiological process that is characterized by periodic and cyclic shedding of endometrium accompanied by loss of blood, which is an additional vital sign and adds as a powerful tool for the assessment of normal development and the exclusion of pathological conditions in adolescent . Some variety of menstrual dysfunction occurs in adolescent girls which may affect normal life of adolescent. Physical, Social, Psychological, Reproductive problems are often associated with menstrual irregularities. Menstrual disordersis a major problem among women who attend gynaecological OPD. Especially in adolescent girls, menstrual disorders constitute an even greater burden of gynaecological problems all over the world. Common menstrual disorders reported among young menstrual disorders include dysmenorrhea, HMB, premenstrual syndrome, amenorrhea, polymenorrhea, and oligomenorrhea[5].

Adolescent girl constitute amajor part of vulnerable group, particularly indeveloping countries like India

where female child is neglected. Although menstrual irregularities maybe normal during the early post menarcheal years, pathological conditions require proper and prompt treatment. Hence this study was undertaken to study the various problems related to menstruation in adolescent girls.[6-13]

Materials and Method

This is a descriptive study among 300 adolescent girls between the age group of 13-19 years. The data were collected from adolescent girls fromout patient clinic and In-patients of Gyneacology department, Sree Balaji Medical College and Hospital and also from schools and colleges from south Chennai. Data was collected by adopting a structured questionnaire about personal details, socio demographic variables and evaluation of menstrual disorders were obtained. The adolescent girls those who have menstrual irregularity were included in the study. This study was approved by the Ethical committee board. The purpose of the study was explained to the girls and an informed consent was obtained in their own language. IBM SPSS statistical software version 21 was used for data analysis. P value <0.05 was considered as statistically significant.

Findings: Among the total girls with menstrual disorders, maximum of 36 % were from the age of 13 years, 31 % belonged to the age group of 14 years, 12 % were from the age group 15 years, 8 % belonged to the age group 16, 6% were from the age group 17, 5 % were from the age group 18 and 1 % were from the age group 19. The study population was distributed as 66 % from urban and 34 % from rural. This study covered students of all socio economic status from class I to V with maximum number (51%) in class III, followed by class IV (41%) and remaining 4 %, 3 % & 1 % in class II, class V & class I respectively. Among the study population, maximum of 46% of girls are overweight,32% are normal weight. Rest 12%,9%,1% are having underweight, obese class I & obese class II respectively.

Table 1: Association of menstrual disorders & BMI among the study population (n = 300)

BMI	Menstrual Disorders (No of cases)					
	Polymenorrhea	Dysmenorrhea	HMB	Oligomenorhea	Hypomenorrhea	Total
Under Weight	17 49 %	9 26 %	8 22 %	0 0 %	1 3 %	35
Normal Weight	12 13 %	77 80 %	7 7 %	0 0 %	0 0 %	96
Over Weight	1 1%	15 11 %	53 38 %	60 43 %	10 7 %	139
Obese Class I	2 7 %	12 43 %	12 43 %	2 7 %	0 0 %	28
Obese Class II	0 0 %	0 0 %	2 100 %	0 0 %	0 0 %	2
Total	32	113	82	62	11	300

For the comparison of BMI with menstrual disorders,test applied–Chi-square.

Chi Square Value	P Value
235.975	0.000

BMI has significance association with Menstrual Disorders since P Value <0.05 .

From the above table it is evident that girls who are under weight, 49 % had polymenorrhea, 26 % had Dysmenorhoea, 22 % had HMB, 3 % had Hypomenorrhea. In girls who had normal BMI, 13% had polymenorrhea, 80 % had Dysmenorhoea, 7 % had HMB. Of the over weight girls, 1 % had polymenorrhea, 11 % had Dysmenorhoea, 38 % had HMB, 43 % had Oligomenorhoea and 7 % had Hypomenorrhea. Among girls with obese class I, 7 % had polymenorrhea, 43 % had Dysmenorhoea, 43 % had HMB, 7 % had Oligomenorhoea. 2 girls in the obese class II had HMB.

Table 2: Distribution of Age of Menarche among the Study Population (N = 300)

Age of Menarche	No of Cases	Percentage %
10	5	02
11	65	22
12	112	36
13	71	24
14	47	16
Total	300	100 %
Mean	12.30	
S D	0.963	

Regarding the age of menarche, among the study population 05 % attained menarche at the age of 10 & 65 % at the age of 11 years. However, 36 %, 24 % & 16 % attained menarche at the age of 12, 13 & 14 years respectively. Mean age of menarche is 12.years.

Table 3: Prevalence of Menstrual Irregularities among the Study Population (N = 300)

Menstrual Irregulaties	No of cases	Percentage %
Polymenorrhoea	32	11 %
Dysmenorrhoea	113	38 %
HMB	82	27 %
Oligomenorrhoea	62	21 %
Hypomenorrhoea	11	03 %
Total	300	100 %

Among 300 adolescent girls with menstrual disorders, 32 reported to have Polymenorrhoea, 113 had Dysmenorrhoea, 82 had Heavy menstrual bleeding, 82 girls had Oligomenorrhoea & 11 girls suffered with Hypomenorrhoea.

It is found girls who Dysmenorrhoea was the most prevailing menstrual irregularities among all with 38 %.

Figure 1: Prevalence of Menstrual Irregularities among the Study Population

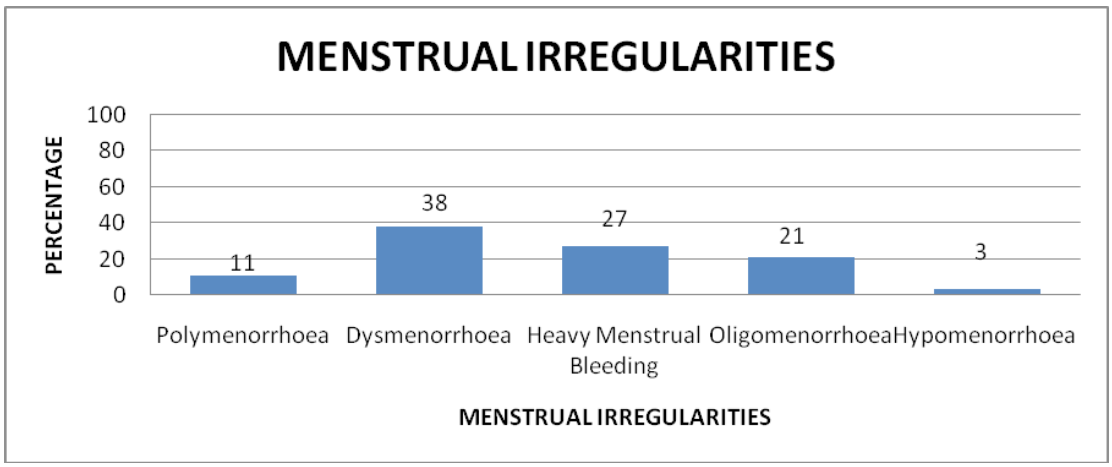

Table 4: Distribution of Premenstural Complaints among the Study Population (N = 300) and its Association with QoL

Premenstrual Complaints	Yes	Percentage %	No	Percentage %	Total
Abdominal Cramps	161	54	139	46	**300**
Leg Cramps	158	53	142	47	**300**
Emotional Liability	143	48	157	52	**300**
Breast Pain	87	29	213	71	**300**
Bloating	60	20	240	80	**300**
Vomiting	52	17	248	83	**300**
Headache	48	16	252	84	**300**
Giddiness	15	5	285	95	**300**
Loose Stools	8	3	292	97	300

Among the adolescent girls, majority had abdominal cramps (54%) and leg cramps (53%). Followed by emotional liability (48%), breast pain (29%), bloating (20%), vomitting (17%), headache (16%), giddiness (5%) and loose stools (3%)

Table 5: Distribution of Hospital Visits for Menstrual Disorders among the Study Population (N=300)

Menstrual Disorders	No of cases	No of cases with hospital visits	Percentage %
Polymenorrhea	32	23	72 %
Dysmenorrhea	113	95	84 %
Heavy menstrual bleeding	82	77	92 %
Oligomenorrhea	62	37	60 %
Hypomenorrhea	11	05	4 %

Among the total cases, 80 % sought medical advice. It is evident that 72 % of the adolescent girls who had polymenorhoea, 84 % who had dysmenorrhea, 92 % who had HMB, 60 % who had oligomenorrhea and 4 % who had hypomenorrhea visited hospitals.

Out of the total study population, 36 % had awareness of menstruation. 64 % were not aware of menstruation before menarche. Among the total cases, 71% had the awareness through their mother, 8% through teacher, 4% through peer group, 15% through relatives and 2% through mass media.

Discussion

This study was conducted among 300 adolescent girls with menstrual disorders from gynaecology Out patient clinic and In-patients of Sree Balaji Medical College and Hospital and,also from schools and colleges from south Chennai.

The age of menarche did not vary from that of other studies. The age of menarche ranged from 10-14 years, maximum between 12-13years, with mean of 12.3 years. This is similar to the study done by Lee & Chen et al from Malaysia (2006) showed age of menarche ranged from 9-17 years with mean of 12.3+/- 1 year[6]. The most common menstrual problem seen in adolescent girls is dysmenorrhea (38%) followed by HMB (27%), oligomenorrhea (21%), and polymenorrhea (11%) and hypomenorrhea of 3%.

Oligomenorrhea was more commonly associated in girls who are over weight (43%) and polymenorrhea was more prevalent in girls who are underweight (49%).This is indistinguishable from the study done by Anupriyaet al[7] which showed oligomenorrhea was associated with increasing BMI and polymenorrhea was seen associated with girls who are under weight. Dysmenorrhea is prevalent more among normal weight adolescent girls (80%).This is comparable to the study done by Khodakarami B et al (2015)[8] showed who found the frequency and severity of dysmenorrhea to be higher in the normal-weight group than other subjects.

In our study the prevalence of polymenorrhea accounts for 11% which is similar to study done by WasiuOlalekanAdebimpe et al from Nigeria (2017) showed polymenorrhea in 9.1% of adolescent girls [9].

Heavy menstrual bleeding represents 27% in our study population this is similar as the done by Wasiu Olalekan Adebimpe et al (2017) which showed HMB represents 21%[9].

Our study concluded, 21% of adolescent girls had oligomenorrhea**,**which is similar to the study done by Abdul GhaniNurAzurah et al (2013) where oligomenorrhea accounts for 19.6%.[10]

In our study,the prevalence of hypomenorrhearepresents 3%, which is similar to the study done by Franco Rigon (2012) [11] where hypomenorrhea accounts for 3.2%

In our study dysmenorrheais the most common menstrual disorder accounts for 38%. This is identical to the study done by Abdul GhaniNurAzurah et al (2013) [10] where dysmenorrhea accounts for 38%.

In our study 80% of adolescent girls with menstrual disorder seek medical advice which is contrast to the result obtained in the study done by Anupriyaet al[7] where 5.9% of girls seek medical advice. In our study 92% of girls with HMB, 84% with dysmenorrhea, 72% with polymenorrhea, 60% with oligomenorrhea had hospital visits which is contrast to the study done by Veena G. Rahatgaonkar et al[12] where 25.7% girls with HMB, 26.7% with dysmenorrhea, and 33% of girls with irregular cycles took medical advice.

Awareness on menstruation before menarche was found to be 36% in our study, while study done by Das Gupta et al[13] (2007) showed 67.5% of girls having awareness regarding menstruation before menarche. In our study, girls with awareness on menstruation have good QOL score than girls who are unaware of it with P value of 0.016.

Mother is the primary source of information regarding menstruation which accounts for 70%

Conclusion

Attainment of menarche at right age is an important milestone during adolescence, which signifies the normal functioning of the female reproductive system. Study revealed that majority of adolescent girls had attained menarche at appropriate age. There is high prevalence of menstrual disorders among adolescent girls in Chennai. Dysmenorrhoea was the commonest problem among the adolescents. Dysmenorrhea was severe enough to disturb the daily activities. The disturbances ranged from inability to sleep, inability to read, poor class performance, and school absenteeism. Thus more attention should be paid to identify and treat these menstrual abnormalities. Like wise, health education on menstrual problems targeting female students and their parents should also be given by health care workers.

Congenital Anamolies Prevalence in Routine Antenatal Ultrasound

Vathsala Venkatesan[1], M. Kavimani[1]

[1]Professor, Department of Anatomy,Sree Balaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Objectives: To assess the antennatal prevalence of significant lcongenitallanomalies. Study design: To evaluate the incidence of important lcongenitallanomalies in the antenna. Setting: Department of Radiology, Sree Balaji Medical College and Hospital, Chrompet, Chennai. Duration: 19 months from March 2017 to September 2018. Sample size: 2839

Material and method: Review assessment of lallantennatal patients undergoing obstetric ultrasound was performed. During the course of the study, obstetric ultrasound tests were conducted for 2839 lpatients. In order to identify the incidence of lcongenital anomalies, lData was evaluated from all antenatalllultrasound examinations. LData was placed in the Excel ldata sheet and the suitable data analysis was carried out.

Results: 55 instances of birth defects were identified. The incidence of antennatal anomalies was 19.43 per 1000 and 1.9 per cent. The median maternal angel at diagnosis was 26.7 lyears. The average gestation at diagnosis was 21 weeks+/-three days. The most frequent were Central nervous system, cardiovascular and gastrointestinal lanomalies. Conclusion: The incidence of important congenital lanomalies in population studies was 1.9%. Brainstem malfunctions were most prevalent, preceded by cardiovascular and urogenital system malfunctions.

Keywords: *Palavras-chave, congenitalanomalies, antenatal, ultrasound.*

Introduction

Congenital lanomalies may be defined as organizational or severe lanomalies (e.g. nutritional disorders) that happen throughout uterine life and may be recognized as lprenatal, lbirth or lateral in life[1]. 2.761 million fatalities occurred after the lneonatal era in 2013, worldwide[2.3] and 2.5% in India[4]. LBirthldefects are active in around 3% of lnewborns in LUSA [5 6]. It is lnot only a lleading cause of fetal lloss, but also lcontributessignificantlyl to preterm lbirth, childhoodl and adult lmorbidityalongl with lconsiderablelrepercussion on the lmothers and ltheirlfamilies[7 8]. l2-3% of alllNewbornslrequire at leastl one mainlabnormality, 10% newbornsl have slightlabnormalities. Congenital lanomalies are loftencategorizedl into four ldifferent types: lmalformations, ldeformations, ldisruption and ldysplasia[9]. l Malformation is a lmorphologicalldefect of an lorgan, portionlof an lorganbeforellargerregionl of lbody that lresults from labnormalldevelopmental lprocess Dysplasial is an labnormallorganization of lcells in to ltissues and its lmorphologicall results. The most lcommonlconditions include lcongenitallheartldefects[10] loro-faciall clefts, lDown syndrome [11], and lneuralltubeldefects.

Reasons and Risk Factors: Even though 50% of all anomalies can not be linked to a specific cause, there are diseases that cause or trigger negative reactions

Socioleconomic and demographicl factors Although small economic gain could also be an implicit factor

Corresponding Author:
Vathsala Venkatesan
Professor, Department ofAnatomy,Sree Balaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Agharam Road, Selaiyur, Chennai-73
e-mail.vathsala_iyer@yahoo.com

in determining, intrinsic anomalies are also common among asset-constrained households and nations. It can be calculated that there are ninety-four serious inherent anomalies In small-and medium-income nations, where women typically fail access to appropriate nutritional food, and might have increased sensitivity to carriers or factors, including such illnesses and alcohol, that cause or boost the incidence of abnormal antennatal growth. In addition, the enhanced maternal age improves the chance of body defects as well as congenital disorder, while the youthful maternal age rises.

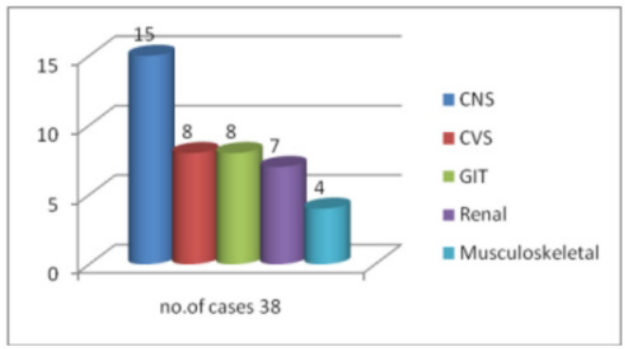
Genetic factors Consanguinityl Increasesl the lprevalenceofl rare lgeneticlcongenitallanomaliesland nearly doublesl the risk for lneonatal and lchildhoodldeath, lintellectualldisability and lotherlanomalies in lfirst-cousin lunions. Some lethnicl populations Need a comparatively elevated incidence of common genetic defects, leading in a higher danger of inherent abnormalities.

Infections: Parental diseases like lsyphilis and lrubella are a significant cause of lcongenital anomalies in limited-income households.

Maternal nutritional status: Iodine deficiency, B insufficiency, obesity and diabetes are combined with a number of intrinsic anomalies. As an example, the deficiency of B will increase the risk of a baby having an ectoderm defect. Increased axerophthol consumption could also have an AN impact on the standard growth of the rudiment or foetus. ***Environmental factors*** Maternal sensitivity to some pesticides and other materials, as well as certain drugs, alcohol, tobacco, psychotropic drugs and radiation during childbirth, may improve the danger of developing a fetus or neonate that is impacted by congenital anomalies. Functioning or live near or in waste locations, furnaces or mines might also be a health risk, particularly if the mother is subject to other circumstances.

Materials and Method

This is a cross sectional observational study from the Department of Radiology, Sree Balaji Medical College and Hospital, Chrompet, Chennai.



Ultrasound scanning is an important component of antennatal care. It is a secure, non-invasive technique used to assess the fetus. The goal of this research was to assess the incidence of congenital defect in obstetric individuals. Department of Radiology, Sree Balaji Medical College and Hospital, Chrompet, Chennai A total of 2839 obstetric scans were conducted during the study period from March 2017 to September 2018. Scans were conducted either trans abdominally or transvaginally on the mindray device after acquiring written permission. Obstetric and medical history has been observed, particularly Background of drug use, viral infection and acute disability, such as diabetes mellitus or high blood pressure. At the beginning of the research, the form of congenital malformation, the age of the mom and the gestational age were observed.

Findings: A total of 2839 antenatal instances were evaluated during the study period. L Congenital defects have been recognized in 55 instances. They l shape the population of the research. The incidence of lcongenital anomalies was 1.9 per cent. The median motherly angel at analysis was 26.7 years old.

Table 1: Nurturing age wise evaluation

Maternal age (years)	No of cases
<20	1 (2.6%)
20-25	16 (42%)
26-30	15 (39.4%)
31-35	5 (13.1%)
36-40	1 (2.6%)
>40	0

Parental age intelligent delivery presented that 81% of cases were between 20 and 30 years of age, reflects the detail that the highest total of cases of l pregnancy occurred in such a age group (Table 1).

*Five foetuses had anomalies involving multiple systems.

The spectrum of anomalies noted is shown in Table 2.

Table 2: Spectrum of anomalies

Central nervous system 15(39%)	Hydrocephalus	8
	Inferior vermian agenesis	2
	Meningocele	2
	Arnold-Chiari	1
	Microcephaly	1
	Encephalocele	1
	Agenesis of corpus callosum	1
Cardiovascular system 8(21%)	Tetrology of Fallot	1
	Atrioventricular septal defect	5
	Situs inversus	2
	Ventricular septal defect	2
Genitourinary system 7(18%)	Pelvi-ureteric junction obstruction	3
	Multi cystic dysplastic kidneys	2
	Poly cystic kidneys	1
	Posterior urethral valve	1
	Unilateral renal agenesis	1
Gastrointestinal system 8(21%)	Diaphragmatic hernia	6
	Omphalocele	1
	Cleft lip and palate	1
	Bowel obstruction	2
Musculo- skeletal system 4(10%)	Mesomelia	2
	Talipes equinovarus	1
	Cystic hygroma	1

Some of the anomaliesl noted are illustratedl in l**Figures 1l-4**.

Figure 1: Sonographic limaging demonstrates latrio-ventricularl septal defectl in the fetusl of al39 year old lfemale at 24 lweeks and 3 ldayslgestation.

Figure 2: Sonographicl imaging demonstratesl dilatedllaterallventricles and thirdl ventricle - lhydrocephalus in the lfetus of a 26 yearl old lfemale at l18 weeks and 5 ldays gestation.

Figure 3: Image ldemonstrateslprotrusion over loccipitallregion of lfetal head lencephalocele in the lfetus of

a 32 lyear old lfemale at 14l weeks lgestation.

Figure 4: Sonographicl imaging ldemonstratesllumbosacrallmeningomyelocelelin the lfetus of a l28 year oldl female at l22 weeks and l6 days lgestation.

Discussion

The model and incidence of lcongenitallanomalies may differ Over moment or with a geographic location. With enhanced disease control and nutrient deficiency infections, hereditary defects have develop significant reasons of neonatal circumcision in developed countries.

In present studies, the incidence of inherited malformations in fess-lnatallperiod was 1.9%, that is comparable. to previous research in India, which reported an occurrence of 2.72 per cent and 1.9 percent. With respect to the The most common pattern of congenital anomalies in the studies was the central nervous system (39%), followed by the gastrointestinal tract (GIT) (21%), the cardiovascular system (21%) and the kidney system. (18 percent of the population). This was similar to the studies carried out by others. However, some studies have revealed greater cases of retransplanting GIT The function of testing in the identification of fetal anomalies depends on the incidence of anomalies in the sample population and the capacity of the investigator., the birth weight of the test, the description of main and secondary Anomalies and the determination of postnatal abnormalities. The ability and exercise of sonographers is a critical element in the identification of fetal defects.Level with a frequency amount of 1.6 per cent-2.7 per cent of genetic disorders, there are no excellently-received reactive interventions in many other developed countries. It shows that there is a need for powerful protective measures for genetic abnormalities in this region. Increased awareness of maternal care during childbirth, congenital malformation education programs and the implications of consanguinous relationships need to be highlighted in order to reduce the occurrence and comorbidity of congenital anomalies.

Conclusion

This revision has identified the incidence of congenital anomalies in our locality. Context-independent consultations theory-internal treatment stay suggested on behalf of l prevention, early lintervention and leven proposed cessation if needed.

Pattern of Depression among Adolescents in an Urban Area of Kancheepuram District, Tamil Nadu

K. Prabhu[1] Archana Rajasundaram[1]

[1]Professor, Department ofAnatomy,Sree Balaji Medical College & Hospital, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

To assess the pattern of the depressionamong adolescents in an urban area of Kancheepuram district, Tamil Nadu. WHO says adolescence occurs in every human growth and it happens after childhood and before adulthood during the age of 10 to19. Adolescence is a transitional developmental period characterized by pronounced biological as well as social changes. It represents one of the critical transitions in the life span of a human being and is characterized by a tremendous pace in growth and change that is second only to that of infancy. The process of adolescence is a period of preparation for adulthood. The world has 1.2 billion individuals in the age group of 10–19 years. Adolescents aged between 10 to 19 years account for more than one-fifth of the world's population. South Asia is home to nearly 340 million adolescents. In India, this age group covers 241 million (21.4%) of the total population.

Keywords: *Depression,Adolescents.*

Introduction:

Depression is a state of mental illness which is characterised by deep, long lasting feelings of sadness or despair. It can change an individual feelings/thinking and also affects his/her social behaviour and sense of physical well-being. Depression is a syndrome characterized by a group of symptoms with changes in one's mood (sadness, guilt), behaviour (isolation), thought and perception patterns (less concentration, less self–esteem), with physical complaints (sleep, hunger, sex) and high risk of suicide. Depressive disorders are identified by the World Health Organization (WHO) as priority mental health disorder of adolescence because of its high prevalence, recurrence and ability to cause significant complications and impairment.[1] Major depressive disorder is estimated to be the second disabling disease of mankind in 2020.[2,3] Depression occurs with people of any genders, age and social class.[7 8] However, the first episode usually occurs during adolescence and early adulthood and is one of the common and ignored psychiatric problems . It is more common among women especially due to hormonal changes.[4,5]

Materials and Method

Study design: A Community based cross sectional descriptive study done in Anakaputhur, an Urban area of Kancheepuram district, Tamil Nadu.

Study area: The study was conducted in the urban field practice area of the Urban Health Training and Centre attached to our Institution, located at Anakaputhur in Kancheepuram District of Tamil Nadu. Kancheepuram district is one among the 32 districts of Tamil Nadu. According to the census of India 2011, Kanchipuram district covers an area of 4433sq.km with a population of 39.98 lakhs comprising of 20.12 lakhs males and 19.8 lakhs females. Kancheepuram, the temple town is the headquarters of the district for administrative reasons, the district has been divided into 4 revenue divisions comprising of 11 taluks with 1137 revenue villages.

Anakaputhur is a Municipality city in the district of Kancheepuram, Tamil Nadu. It is divided into 18 wards. The study was conducted in Anakaputhur an urban field practise area of Department of Community Medicine of Sree Balaji Medical College and Hospital (SBMCH), located at a distance of 7 kilometres from the institution with an area covering approximately 16 sq. kilometres.

Study Period: The study was conducted between June 2017 to July 2018.

Study Participants: According to the 2011 census, Anakaputhur urban field practice area had a total population of 48,050 of which 24,158 were males, 23,892 were females with 8890 adolescent (Individuals aged 10-19 years) . Total number of houses in Anakaputhur is 12,146. The study was done among adolescent who are residing in the study area permanently at the time of the study.

Inclusion Criteria: The inclusion criteria for the study were adolescent people of both the genders of age group (13–18) residing in the study area, who were willing to participate in the study were included.

Exclusion Criteria: The exclusion criteria for the study were adolescents who have any physical illness, severely ill and those who were not willing to participate in the study were excluded.

Sample size: Sample size was calculated from a previous study conducted by Kunal Kishore et al among school going adolescents in urban area of Bihar in 2016, prevalence of depression recorded in this study was 49.2%.This was taken as the reference value for calculating sample size. The sample size was calculated using the formula.

$$N=Z\ a^2pq/[L]^2$$

Where, Z = 1.96 at 95% confidence interval, p= Expected prevalence rate, q=100-p, L =Relative precision, which is assigned as 10% of p (10% of 49.2% = 4.92) for this study.

Substituting in the formula,

Z = 1.96, p =49.2 %, Q=50.8% [100–49.2], precision=10 % of prevalence

= 1.96* 1.96 *49.2*50.8/24.20

= 396

= 396 which was rounded off to 400. [N = 400]

Sampling method: Anakaputhur had a total population of 48,050 as per 2011 census. As per census data, the adolescent age group (10–19) were identified and there were 8890 adolescent residing in the study area. The sampling technique followed for this study was **Systematic random sampling technique**. Sampling interval K= (N/n) is calculated as follows, where K is the sampling interval

K = Total adolescent in Anakaputhur/sample size

K = N/n = 8890/400 = 22nd. Every 22nd adolescent were selected. The name and address of the person was noted and was visited for the data collection. If the person corresponding to the number did not give informed consent or absent,the next number was chosen and the next person was selected and interviewed. Likewise, 400 adolescents who gave informed consent and willingly participated in the study were identified.

Study tools: A pretested structured questionnaire was used as a study tool to interview the study participants. The questionnaire was prepared in English and translated to Tamil. It was conducted by face to face interview by the investigator herself and the responses were recorded in the questionnaire.

Informed consent: The details and purpose of the study and the confidentiality of their identity were explained to each and every participant those who were willing to participate in the study were required to sign the informed consent, after which they were included in the study . The informed consent was in Tamil,the local language of the study participants.

Pilot study: A pilot study was conducted among 40 adolescent residing in urban area of Pammal which is the adjacent area to the study area and also located in Kancheepuram district. It was done for a period of one month during the month of July 2017. Based on the results of the pilot study, the necessary changes were incorporated in the questionnaire and the study was conducted. The samples included in the pilot study were not included in the present study.

Data Collection Period: Data was collected from the study participants for a period of one year from June 2017 to July 2018.

Data Collection Method: Using systematic random sampling study subjects were identified. The adolescents of both the genders were identified after obtaining their written consent in the informed consent form. The

interview was conducted by the investigator herself. The pilot study questionnaire was used to interview each participant by one to one individual method on socio-demographic details, family history, questions regarding depression etc.PHQ–9 depression scale, questionnaire was used for ascertaining the prevalence of depression. Anthropometric measurements such as height, weight were measured among the study participants.

Data Analysis: The data was entered in Microsoft Excel 2007 version and analysed using Statistical Package for the Social Sciences for Windows (SPSS) version 20.0. Prevalence data were presented in the form of numbers, percentages, tables and figures. The analytical statistics used were chi- square, Odds Ratio and Confidence Interval. Binary logistic regression was used to calculate the adjusted odds ratio. P value< 0.05 was considered as statistically significant value.

Findings:

Socio demographic characteristics of the study population: Table 1 shows the socio demographic details of the study population. Among the study participants, maximum of 292 (42.8%) participants belonged to 13-15 years age group followed by 99 (24.8%) belonged to 16-17 age group and only 9 (2.3%) of the respondents were of 18–19 age group. About 48.7% were females and 51.3% were males. Majority of the study participants 349 (87.3%) were Hindus while Christian were 43(10.8%), Muslim were 7(1.8%) and others 1(0.3%). Maximum number of the participants belongs to ninth class 147(36.8%) followed by tenth 141(35.3%), eleventh 55(13.8%) and twelfth 57(14.3%). Most of the participants were Day scholar 397 (99.3%) whereas only 3 are hosteller (0.8%). Among the study participants, most of them are living with both parents 352(88.8%) followed by single parent 21(5.3%), Grandparents 18(4.5%) and Guardian 6(1.5%). Most of the study participants' father were Graduate 132(33%) followed by Higher secondary school 92(23%), Diploma 59(14.8%), Middle school 50(12.5%), Post graduate 40(10%),Primary school 23(5.8%), Illiterate 4(1%)

Among the study participants, most of the study participants' mother were Graduate 122(30.5%) followed by Higher secondary school 108(27%), Middle school 63(15.8%), Diploma 40(10%),, Post graduate 38(9.5%),Primary school 21(5.3%), Illiterate 8(2%). out of the 400 study population, 208 (52%) of the father were professional followed by skilled 81(20.3%), semi-professional 60(15%), semi-skilled 37(9.3%), unskilled 14(3.5%) and unemployed 0 (0%).most of them were unemployed 254 (63.5%) followed by professional 67 (16.8%), skilled 32(8%), semi-skilled 19(4.8%), semi-professional 15(3.8%), and unskilled 13(3.3%). Out of the 400 study population, most of them belonged to upper class 369(92.3%).upper lower class contribute only 6(1.5%) in the study area based on B.G. Prasad socio economic classification Status scale.

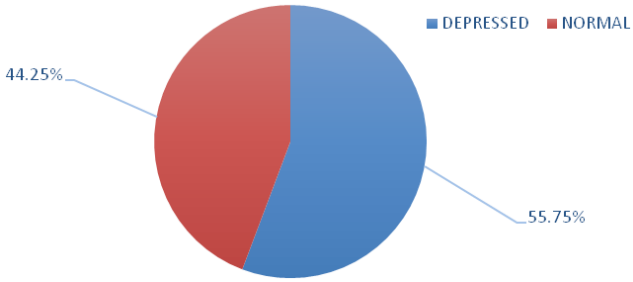

Figure 1: Prevalence of Depression

Figure 1 shows the prevalence of depression in adolescents in urban area of Kancheepuram district was found to be 55.75%.

Discussion

Prevalence of Depression: The present study comprising of 400 study participants. Three fourth (73.0%) belonged to the age group of 13-15 years. Out of 400 study participants, 205(51.3%) were males and 195(48.8%) were females. Majority of the study participants were Hindus, maximum number of participants belonged to ninth class 147(36.8%) followed by tenth class 141(35.3%),eleventh 55(13.8%) and twelth class 57(14.3%).Most of the study participants belonged to upper class 369(92.3%) and only 6(1.5%) in upper lower class, according to BG Prasad scale of socio economic status.

Prevalence:

The overall prevalence of depression among adolescents in our study was observed as 55.25% (table18). Almost similar prevalence was observed in a study conducted by Manisha Malik et al in Jaipur in 2015 among adolescents which showed the overall prevalence of depression was found to be 52.9%. Another study done by Manmohan Singh et al in Chandigarh in 2015 also found that the overall prevalence of depression was 50% which is in line with our study results.[76] Various study from different parts of the India found that the prevalence of depression among adolescents in the range of 18.4%

to 79.2%.[75–86]. This might be due to usage of different screening instruments such as PHQ-9, beck depression inventory, MINI-KID centre for epidemiological study-depression scale.

Conclusion

1. This study shows that the Prevalence of depression among adolescents in Anakaputhur area of Kancheepuram district was found to be 55.75%.
2. The depression observed was more among males than female .
3. The depression observed was more among the upper socio economic class than lower and middle class.

Prevalence of Escherichia Coli in Urine Samples in a Tertiary Care Hospital

V. Naveen Kumar[1], Chitralekha Saikumar[2]

[1]Post Graduate, [2]Professor and Head of Department, Microbiology, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Agharam Road, Selaiyur, Chennai-73

Abstract

The study was carried out in the Central laboratory Department of Microbiology Sree Balaji Medical College and Hospital, Chrompet, Chennai for a period of one year from August 2017 to August 2018. A total of 3580 urine samples was received in Central lab during the study period and the samples were analyzed for the prevalence of Escherichia coli and its antimicrobial susceptibility pattern. Out of a total of 3580 urine samples received, majority of the samples were from inpatient departments (2800) while 780 samples were from outpatient.

Keywords: *Escherichia coli, Tertiary Care Hospital.*

Introduction

Urinary tract infection (UTI) is defined as the microbial invasion of genitourinary tract. It is a bacterial infection that affects any part of the urinary tract. UTI is the most prevalent infections worldwide with a high global burden[1]. UTI is known to affect approximately 150 million people each year and is responsible for approximately seven million doctor visits per year[2,3] .UTI may be induced by gram-negative bacteria such as Escherichia coli, Klebsiella species, Enterobacter species, Proteus species and Gram-positive bacteria such as Enterococcus species and Staphylococcus saprophyticus. Escherichia coli, the most common optional gram-negative bacillus in human fecal flora, generally hinders the colon as an innocuous commensal. UTIs are the most common type of Escherichia coli extraintestinal infection, and Escherichia coli is the most widespread cause of UTIs.At some stage in their life, at least 12 per cent of males and 10-20 per cent of females experience acute symptomatic UTI, and even more grow asymptomatic bacteriuria.[4,5] .

Corresponding Author:
V. Naveen Kumar
Post Graduate, Department of Microbiology, Bharath Institute of Higher Education and Research, Agharam Road, Selaiyur, Chennai-73

Materials and Method

UTI is divided into two broad categories.

1. Lower UTI
2. Upper UTI.

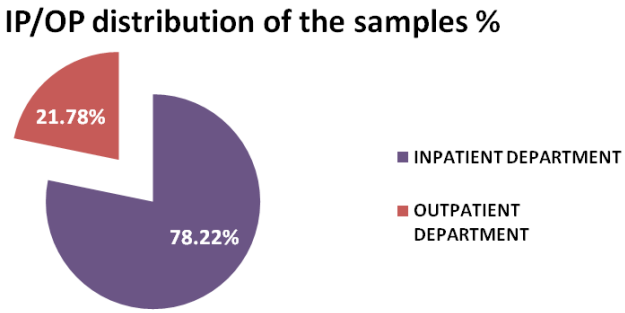
The lower UTI is mainly due to the ascending infection caused by faecal coliforms and it causes Urethritis, cystitis and Prostatitis. Upper UTI involves the Kidney (Pyelitis & Pyelonephritis). Pyelonephritis is through hematogenous spread of infection. Incidence of UTI is more in females as compared to males due to shorter urethra and proximity to anus. In elderly males, UTI due to enlarged prostate is very common. Other causes of UTI includes pregnancy, prostatic hypertrophy, reflux of urine from bladderupto the ureters and into renal pelvis, neurogenic bladder dysfunction, multiple sclerosis etc[6] E. coli is responsible for about 90% of the first episode of UTI in children 7. Uropathogenic Esherichia coli (UPEC) has several virulence factors that allow it to colonize and cause inflammatory modifications in the mucosa of the body. Extended spectrum β lactamase (ESBL) produced by the Enterobacteriaceae family is progressively recognized as the main pathogens that have become endemic in many service settings. The incidence of ESBL produced by strains among Gram Negative Bacilli differs extensively depending on the clinical environment and geographic region. The growing incidence of ESBL-producing

organisms is seen primarily in the elderly population, patients who are seriously ill and urinary tract infections, patients with indwelling urinary catheter, malignancy, patients who have a lengthy hospital stay and intensive care units. (ICU), Patients who are functionally dependent on them. Infections caused by ESBL boost the price of therapy as well as mortality and morbidity. In the current scenario, drug resistant pathogens carry higher morbidity and mortality and also they are difficult to identify by routine laboratory method and hence the diagnosis is delayed and finally there is delay in administration of appropriate anti-microbial therapy. The major concern is the lack of new antibiotics for multi drug resistant strains of uropathogenic E.coli that produces ESBL. In June 2010, the Infections Disease Society of America (IDSA) testified to the critical need for antimicrobials and the urgent need for research and development in newer therapy before the House Energy and Trade Subcommittee on Health.According to Rishi H.P, Dhillon et al, Risk variables for the acquisition of UTI-associated society include recurrent UTI, previous antibiotic use, diabetes mellitus, prior urinary tract equipment, female sex and age over 65 years of age.[8].Complications have increased because ESBL producing pathogens are resistant to most commonly prescribed empiric therapy antibiotics.Despite widespread availability of antibiotics, UTI is considered to be The most prevalent incurable disease in medical practice developing countries, with incidence of 250 million people are affected worldwide[9]. Long term UTI leading to immunological and inflammatory response causing renal injury and scaring, which leads to end stage renal failure. Obstructive uropathy, renal calculi, vesico urethral reflex disease and voiding disorders leads to stasis of urine and becomes a predisposing factor of recurrent UTI and its complicationsIt is predicted that almost 10% of the global population is living with UTI. [10] .Since antibiotics are empirically used before urine culture report an increasing antibiotic resistance in uropathogens are reported.Liberal use of Fluoroquinolones and β lactams have triggered bacterial resistance worldwide. Due to rapidly evolving adaptive In recent years, the etiology of UTI and the resistant bacteria profile of uropathogens have altered significantly, both in the society and in genital infections.

Findings

ESBL: The first ESBL producing organism was detected in Europe in 1983. ESBL is primarily produced by Enterobacteriaceae family of Gram negative organism particularly E.coli and Klebsiellaspecies. ESBL'sBeta lactamases capable of hydrolyzing oxyiminocephatosporins ESBL are ploidy or plasmid mediated β lactamases that have mutated from pre-existing wide spectrum β lactamases (TEM-1,TEM-2,SHV-1) due to extensive use of 3rd generation Cephalosporins as well as Aztreonamamide. [(11,12).] ESBL's might be repressed by β lactamase inhibitors, for example, Clavulanic corrosive or Sulbactam. However,several inhibitor-safe ESBL makers are additionally experienced, by uprightness of Amp-C lactamase hyper generation or loss of porin13. Creation of ESBL catalysts gives numerous medication opposition, making diseases hard to treat .Patients admitted to clinics are bound to fill in as stores for these safe living beings and in the end, the patients in the network obtain ESBL-delivering strains[14].Investigation of medication opposition among uropathogens has as of late picked up significance since the system of obstruction of ESBL creation may shift. Also, the tremendous number of species incorporated into the family enterobactericeae further adds to the demonstrative and clinical entanglements related with UTI's. ESBL-delivering qualities are ordinarily harbored on plasmids 80kb in size or bigger and frequently convey obstruction determinants for Aminoglycosides, Fluoroquinolones, Tetracyclines, Chloramphenicol and even Cotrimoxazole, making the microorganisms oppose a wide assortment of drugs15. ESBL creation gives protection from all the beta-lactam anti-microbials aside from Carbapenams and Cephamycins.

The efficacy of the antibiotic given to the patient relies on the location and severity of the disease, liver and kidney function, the presence of implants and local resistance patterns. It is also thought that age and pregnancy in the patient decide the efficacy of the antibiotic used.[15].ince the use of β-lactam antibiotics is still widespread, the development of β-lactamase products has become a matter of severe concern. Various drug resistance mechanisms in gram-negative bacilli include the development of β-lactamases, AmpC lactamases, Efflux systems and Porindeficiency. The current research is done to study the incidence of uropathogenic E. coli and its antibiotic sensitivity pattern with unique regard to ESBL.



Discussion

The study was carried out in the Central laboratory Department of Microbiology Sree Balaji Medical College and Hospital, Chrompet, Chennai for a period

of one year from August 2017 to August 2018. A total of 3580 urine samples was received in Central lab during the study period and the samples were analyzed for the prevalence of Escherichia coli and its antimicrobial susceptibility pattern.Out of a total of 3580 urine samples received, majority of the samples were from inpatient departments (2800) while 780 samples were from outpatient.

Table 1: IP/OP distribution of the samples

S.NO.	IP/OP	Total	Percentage %
1.	Inpatient Department	2800	78.22%
2.	Outpatient Department	780	21.78%
		3580	

Out of the total 3580 urine samples received in the Central lab, **987** samples (27.56%) showed No growth, **1786** (49.88%) showed growth of Gram negative bacilli and **807** (22.54%) showed Gram positive cocci.

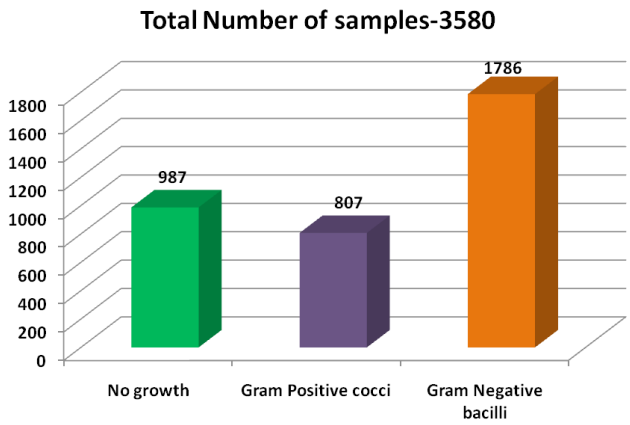


Table 2 : Distribution of Pathogens in UTI

S.No	Oraganism	Frequency (n=2593)	Percentage (%)
1.	Escherichia coli	1081	41.7%
2.	Klebsiella species	520	20%
3.	Pseudomonas aeruginosa	155	6%
4.	Proteus species	104	4%
5.	Citrobacter koseri	39	1.5%
6.	Enterobacter	33	1.3%
7.	Acinetobacter	52	2%
8.	Staphylococcus aureus	259	10%
9.	CoNS	311	12%
10.	Enterococcus species	39	1.5%
	Total	2593	100 %

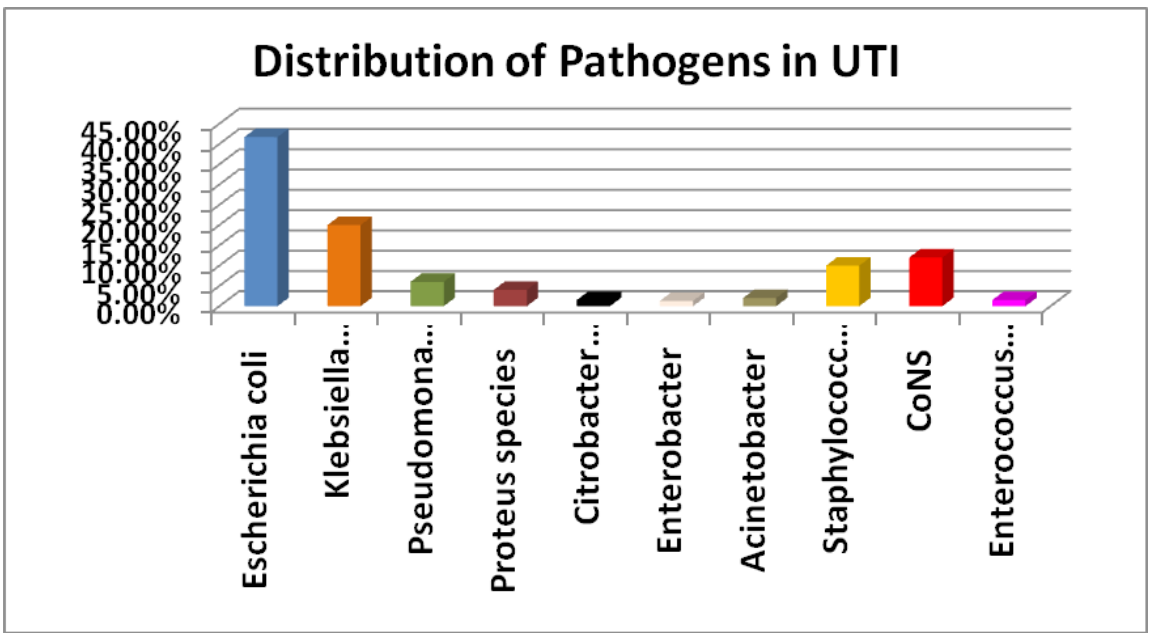

Table 3: Comparison of Common organisms causing UTI

Organisms	Latin America 16	India 2	Tamilnadu 18	Present study
E.coli	60.4%	61%	30.2%	41.7%
Klebsiella	11.1%	22%	22%	20%
Pseudomonas	8.3%	4%	12.35%	6%
Acinetobacter	10%	3%	8.3%	2%
Proteus	4.6%	-	6.7%	4%
Enterobacter	14%	-	35%	1.3%
Citrobacter	7%	2%	2.5%	1.5%
ConS	-	7%	5%	12%
Enterococcus	2.3%	1%	9.5%	1.5%

Conclusion

In the present study, E.coli (41.7%) was the commonest organism isolated form urine samples among UTI patients followed by Klebsiella (20%), Cons (12%) and the least isolated was Enterobacter, Citrobacter, Enterococcus and Acinetobacter with prevalence of 1.3%, 1.5%,1.5% and 2% respectively. These findings were consistent with the outcomes of other research undertaken globally, which decided that E. coli is the main pathogen that causes UTIs. Since E. coli is a significant ordinary flora in the intestine, bad sanitation will lead to trans-contamination and then urinary tract infection. The study conducted in India by Akram et al [2] and in Latin America by Ana.C.Gales et al(1998) [16] showed that E.coli was the commonest organism isolated followed by Klebsiella.

In the present Study, only 1.3% of Enterobacter was isolated, but the study conducted by Ana.C.Gales et al (1998) [16] showed prevalence of 14% and Ramesh et al (2008) [18] Tamil Nadu showed 35%.Worldwide, E. coli was the predominant pathogen isolated from community-acquired UTI patients. The present research indicates a prevalence of 41.7 percent of E. coli isolated from urine specimens from patients with urinary tract diseases. This result is in agreement with different studies conducted worldwide. . Mohanthy et al 2005 [19] documented a prevalence rate of 46% E.coli in New Delhi among UTI patients while a study conducted by Baby Padmini and Appalaraju in Chennai in 2004 showed a prevalence similar to our present study (49.3%)[20].

Acoustic Radiation Force Impulse in Alcoholic Liver Disease

Kulbhushan Vishnoi[1], I. Venkatraman[2], M. Prabakaran[2]

[1]Final Year Resident, [2]Professor, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

The most prevalent liver disease is alcoholic liver disease (ALD). It is undervalued and diagnosed. An early diagnosis is totally vital as it helps define patients at genetic danger for ALD; can cause effective abstinence, particularly in non-addicted patients; and start screening programs to avoid complications that threaten life. In the evaluation of liver fibrosis in alcoholic liver disease, acoustic radiation force impulse (ARFI) elastography has excellent usefulness. For several liver wounds, liver fibrosis is a prevalent condition. Our study was done on 50 patient suspected to have alcoholic liver disease for ultrasound scan of abdomen. The mean liver stiffness in normal patients was found to be 1.087 m/s. Mean ARFI velocity in ALD in our research, the biopsy was 1.83 m/s. ARFI imaging is a successful imaging method for evaluating the existence or lack of developed fibrosis in liver disease patients

Keywords: *Arfi, ALD, Elastography, Fibrosis.*

Introduction

Alcoholic liver disease (ALD) is one of the most prevalent problems caused by liver cirrhosis and its complications and a major cause of alcohol-related death. In 2004, alcohol consumption accounted for 3.8 percent of all worldwide fatalities and 4.6 percent of worldwide disability-adjusted life-years [1-4]. For several liver wounds, liver fibrosis is a prevalent condition. Accurate evaluation of the degree of liver fibrosis is essential to estimate prognosis and to determine a suitable course of therapy for instances of chronic liver disease (CLD) with different etiologies. There is a huge need for non-invasiveand accurate exams that correctly assess the degree of liver fibrosis due to the intrinsic constraints of liver biopsy. Ultrasound (US) elastography is regarded to be a non-invasive, useful and accurate method for assessing liver stiffness to determine the degree of liver fibrosis.

Recently a fresh method of ultrasound has appeared: elastography of the acoustic radiation force stimulus (ARFI). The unit produces an ultrasonic acoustic pulse of short duration (262 ms). This pulse generates mechanical excitement and tissue displacement. A soothing method follows the distortion caused by the electromagnetic stimulus, after which the tissue returns to its initial setup, creating a shear wave. This wave's velocity is calculated to provide a quantitative metric. The present study aim is to assess the liver stiffness in various forms of ALD and FLD/NAFLD as assessed by conventional ultrasound and thus evaluating the role of ARFI elastography.

Materials and Method

Our study aims to assess the role of ultrasound based elastography method of liver called ARFI elastography in present day radiology practice and how it can aid in early diagnosis of fibrosis along with the conventional ultrasound of liver. The research was conducted at the Department of Radiodiagnosis at Sree Balaji Medical College and Hospital, Chennai, on 50 patients accused of having alcoholic liver disease and fatty liver disease for ultrasound stomach scanning. Inclusion criteria: All patients clinically suspected to have ALD and FLD referred for ultrasound abdomen and Daily alcohol consumption of > 20g/dl

Exclusion criteria: History of drug intake that cause fatty liver, Other liver diseases other than ALD

and Clinical history suggestive of viral hepatitis in the past US of abdomen were performed using 4C-1 probe on SIEMENS S-2000 machine.

All patients were also subjected to ARFI elastography using intercostal approach from right lobe of liver (segment VI). Patients were positioned in supine position with arm abducted. Region of interest is selected free of vessels and ducts within 8cm from capsule of liver preferably about 2cms from liver capsule. Patients were then instructed to stop breathing for a moment and push pulse is sent and shear wave velocity is obtained. Ten valid measurements are taken. Using image-based localization and the patented application of ARFI technique, shear flow velocity can be quantified in a accurate anatomical area centered on a area of concern with a predefined volume given by the scheme. Measurement value, size and elasticity outcomes are also recorded in m/s[5,6]. ARFI imaging provides the option to perform a quantitative assessment of hepatic parenchyma elasticity during standard US assessments without needing extra transducers or other equipment[7] Piscaglia et al[8] demonstrate that Virtual Touch Tissue Quantification is capable of accurately identifying the existence of cirrhosis and generates outcomes that are linked with those acquired by Fibroscan transient elastography.

Findings:

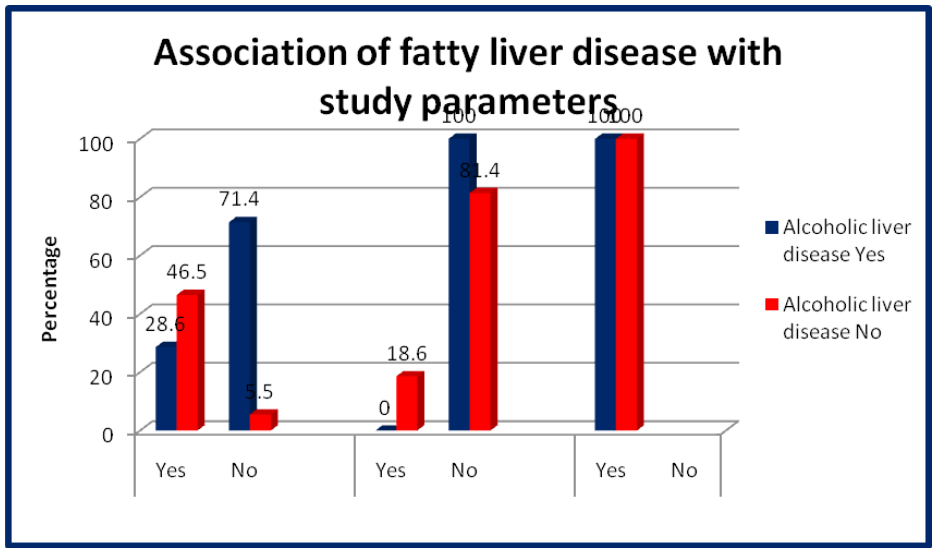

Table 1: Association of Fatty Liver Disease with Study Parameters

		Fatty liver		P Value
		Yes	No	
Alcohol dependence	Yes	4	18	
		15.4%	75.0%	<0.001
	No	22	6	
		84.6%	25.0%	
Coarsened texture	Yes	3	5	
		11.5%	20.8%	0.37
	No	23	19	
		88.5%	79.2%	
Biopsy	Yes	5	2	
		100.0%	100.0%	
	No	0	0	

Sensitivity = 71.4%, Specificity = 61%

Only 4(15%) of the fatty liver patients were alcohol dependent out of total 26 patients. This difference was found to be statistically significant.

Only 3 (11.5%) of the fatty liver patients had coarsened ecotexture out of total 26 patients. But, this difference was not found to be statistically significant.

Table 2: Association of Fatty Liver Disease with Alcohol Dependence Study Parameters

		Alcoholic liver disease		P Value
		Yes	No	
Alcohol dependence	Yes	2	20	
		28.6%	46.5%	0.37
	No	5	23	
		71.4%	53.5%	

		Alcoholic liver disease		P Value
Coarsened texture	Yes	0	8	0.21
		.0%	18.6%	
	No	7	35	
		100.0%	81.4%	
Biopsy	Yes	1	6	
		100.0%	100.0%	
	No			

Sensitivity = 74.2%, Specificity = 59%

Only 2(28.6%) of the alcoholic liver disease patients were alcohol dependent out of total 7 patients. But, this difference was not found to be statistically significant. None of the fatty liver patients had coarsened ecotexture out of total 7 patients & this difference was not found to be statistically significant.

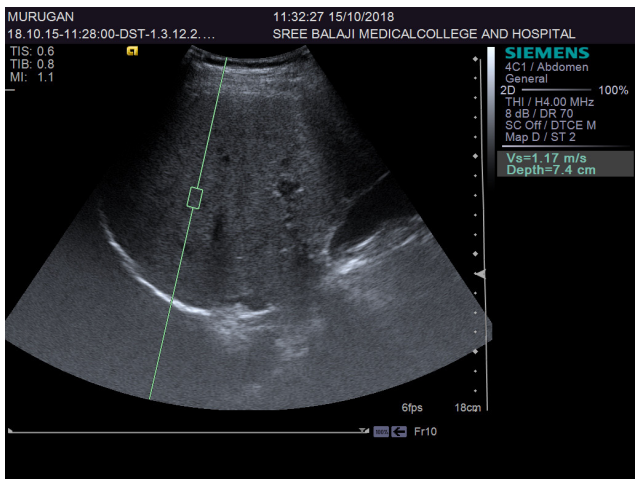
ARFI Velocity	1.8324	.60079
	5.6418	1.25239

Discussion

In our study fatty liver is classified into three grades using conventional US. Also paitent with coarse liver echo texture are identified. Liver stiffness now is categorized into different stages of fibrosis using the predictive values given by Fierbinteanu Braticeviciet al.[9]

In our study commonest age group in patients with ALD was found to be between 51 to 60 years with 38.0% of paitents falling in this group. This is followed by 61 years and above group with 26.0% of patients. In our study 64% were male and 36% were female with a ratio of almost 2:1.

In our study 28.5% of the alcoholics had changes consistent with alcoholic liver disease which is in concordance with study by McCullough et al.[10]



ARFI elastography had a mean value of liver stiffness in the spectrum of F0F1 fibrosis phase. Eiler et al.[11] found that in ordinary patients the average liver stiffness was 1.16 m/s. Mean liver stiffness by Sporea et al. [12] was 1.19 m/s. Similarly, Yoon et al [13], Horster et al [14], Goerts et al[15], Fierbinteanu Braticevici et al [9], Friedrich Rust et al[18], Pisgaclia et al [8] and D Onofrio et al [16] showed the mean liver stiffness in normal patients as 1.06, 1.19, 1.09, 1.18, 1.13, 1.13 and 1.56 m/s respectively.

Association of alcohol dependence with our study parameters showed sensitivity = 71.4% and specificity = 61%, Only 4(15%) of the fatty liver patients were alcohol dependent out of total 26 patients. This difference was found to be statistically significant.

However liver biopsy was done only for 7 patients in the present study which proved 100% of ARFI values positive to confirm the presence of fibrosis Limitation of this study is liver biopsy. This is due to various drawbacks of liver biopsy most important being its invasiveness and lack of consent by patient for benign condition like ALD.

ALD and FLD/NAFLD is a disease of higher age group with male preponderance. Most of the participants in the age group of 51-60 (38%), while 88% had age more than 40 years.64%were males & ~ 3% were females. Data regarding alcohol dependency shows that almost half of them were alcohol dependent. Only 16 % participants had coarsened ecotexture. 52% had fatty changes in liver & ~86% had alcoholic liver disease.

Mean ARFI velocity in ALD and fatty liver in our study was 1.83 & ARFI depth was 5.64, which denoted F3-F4 fibrosis stage. In comparison to the cut off given by Toshima et al(17) 1.88 m/s and Fierbinteanu Braticevici et al.[9] The mean liver stiffness in normal patients was found to be 1.087 + 0.087 m/s which is in agreement with most of the studies. This also proves high specificity of ultrasound in detecting normal liver without fatty infiltration.

Conclusion

Alcoholic liver illness (ALD) and fatty liver is the major cause of liver disease, either alone or in combination with other comorbidities like obesity or viral hepatitis. It is a disease of higher age group with

male preponderance. Most are milder forms of fatty liver with benign outcome. The mean liver stiffness in normal patients was found to be 1.087 + 0.087 m/s. Mean ARFI velocity in ALD and fatty liver in our study was 1.83 + 0.074 m/s which is in agreement with most of the studies. The limitation of this study was that liver biopsy was not used on all patients to confirm the histology and therefore there is a need for future study with liver biopsy. ARFI imaging is a successful imaging method in patients with liver disease to assess the existence or lack of developed fibrosis. ARFI is a fresh non-invasive imaging technique capable of estimating with excellent precision the liver rigidity diagnosing cirrhosis. Therefore, the first evaluation of patients with liver disease suspicion can be carried out in a single phase with both standard ultrasonography and ARFI for liver stiffness evaluation.

ALD Risk Factors and Epidemiology

Kulbhushan Vishnoi

Final Year Resident, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

More than 1 million fatalities are caused worldwide by liver cirrhosis and most of these fatalities are preventable. There is a noticeable geographical variation in mortality levels owing to cirrhosis, and this difference in the burden of liver disease illustrates the connections between the liver disease and mortality population hazards. The varying geographical allocation of significant risk variables for the growth of body illness, including alcohol intake, hepatitis C virus (HCV) infection, hepatitis B virus infection, and obesity and metabolic syndrome, has the ability to highlight possibilities for action, while the evolution of these risk variables offers perspectives into understanding the future burden of liver disease. This study focuses on using population information to define regions and communities at high risk that would profit from preventive measures to decrease liver disease death. To demonstrate the effect these can have if commonly applied, specific policies that are efficient at policy and government health levels are addressed. Also outlined is the effect of therapies that can alter the natural history of liver disease, including immediate antivirals for HCV infection. Finally, the difficulties of explaining non-alcoholic fatty liver disease epidemiology are outlined to demonstrate the need to know the natural history of the disease in order to explain and influence the growth of novel therapies.

Keywords: *Epidemiology, Hazards, Hepatitis.*

Introduction

Cirrhosis epidemiology was strongly related to alcohol usage kinds and habits. Other variables in the growth of liver disease may also be at job. For instance, the danger of cirrhosis mortality and mortality rates are significant and long-standing gender differences. As shown in figure 1, mortality levels of cirrhosis in males are about twice as high as in females. These levels represent the reality that males usually drink more than females, and the percentage of heavy drinkers and alcoholics among males is much greater. However, as mentioned earlier, it also appears that females are more likely to develop cirrhosis than males at any specified stage of alcohol consumption. (See figure 2) (Tuyns and Péquignot 1984).This phenomenon is not well known, but it has been given several feasible reasons. One is that concentrations of alcohol dehydrogenase, an enzyme engaged in breaking down alcohol, may be smaller in female stomachs than in men, resulting in greater concentrations of blood sugar in women than in men consuming equal quantities of alcohol (Frezza et al. 1990). Because liver damage is a feature of blood alcohol levels and exposure time, variables leading to greater blood alcohol concentrations could at least partly justify the greater alcohol-related alcohol-related danger of women [1-3].

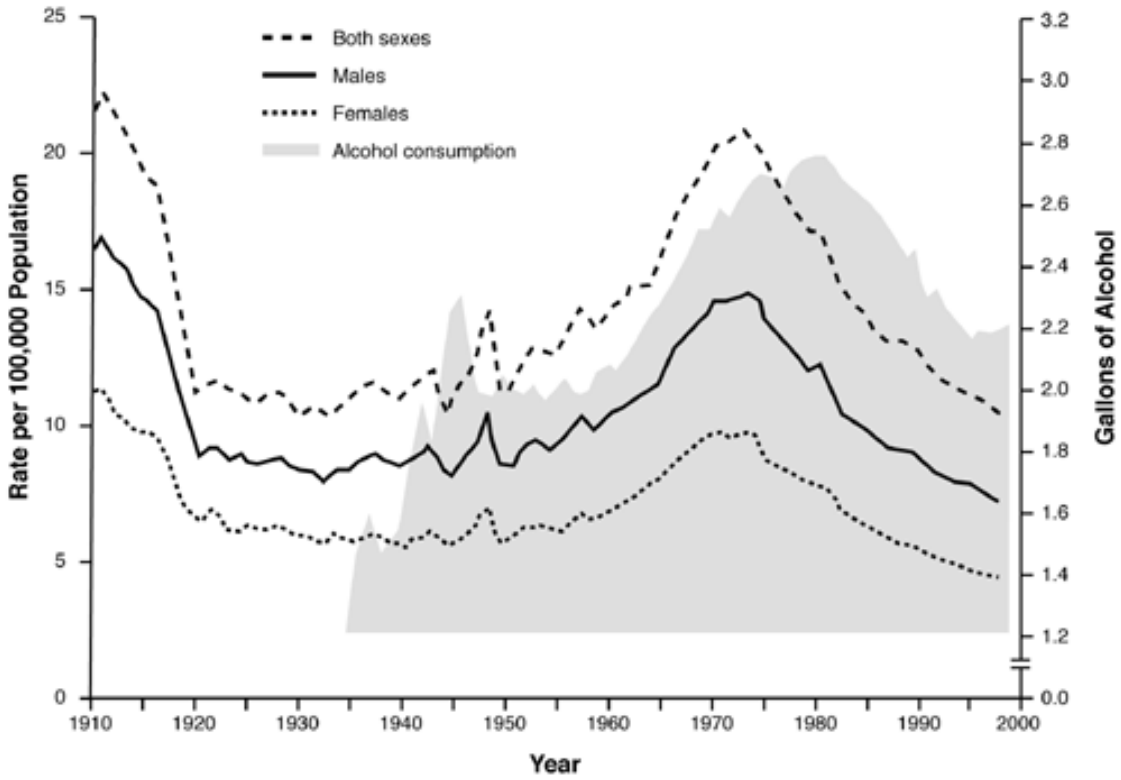

Fig 1 Age-adjusted mortality rates of gender-based liver cirrhosis, 1910–1932 in registered death states, and 1933–1997 throughout the United States. The mortality levels of U.S. cirrhosis were high at the start of the 20th century, decreased sharply with the advent of Prohibition, and rose again at the end of Prohibition. Mortality rates continued to rise until the mid to mid-1970s, when these prices started to reach the levels seen in the century's first decade. Cirrhosis mortality levels started to decrease again in the mid-1970s, as they had with the advent of Prohibition, and they continued to decrease.

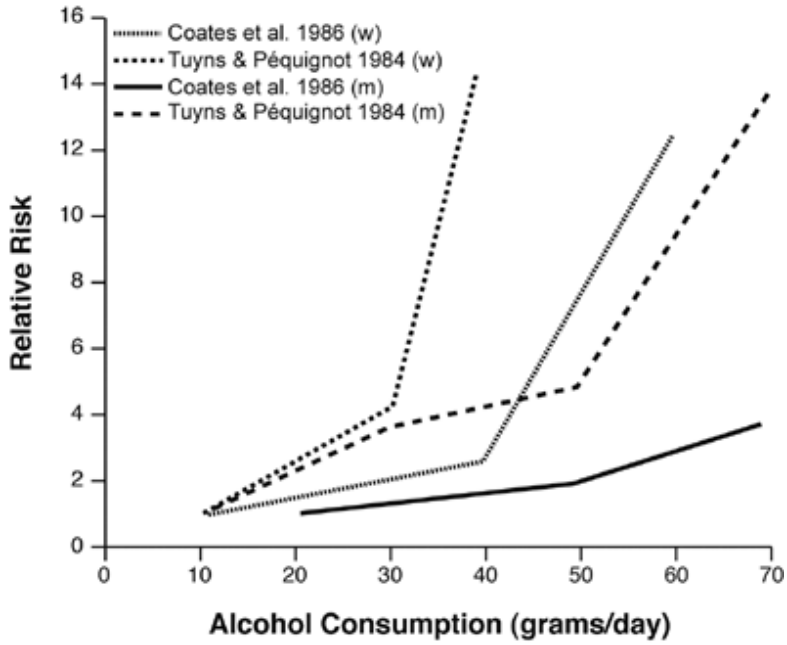

Fig 2 Consumption of alcohol and incidence of liver cirrhosis in males (m) and females (w). Studies have shown a close relationship between alcohol consumption and cirrhosis risk.

Note: Data truncated at 70 g/day.

Materials and Method

The study was done on 50 patient suspected to have alcoholic liver disease and fatty liver disease for ultrasound scan of abdomen to the Department of Radiodiagnosis at Sree Balaji Medical College and Hospital, Chennai by purposive sampling technique.

Source of data: The Department of Radiodiagnosis at Sree Balaji Medical College and Hospital, Chennai

Method of collecting data:

Duration of the study: December 2016 to September 2018.

Sample size: 50 cases

Inclusion criteria:

- All patient clinically suspected to have ALD and FLD referred for ultrasound abdomen
- Daily alcohol consumption of > 20g/dl

Exclusion criteria:

- History of drug intake that cause fatty liver
- Other liver diseases other than ALD and FLD
- Clinical history suggestive of viral hepatitis in the past.

Findings: Patients were selected according to the inclusion criteria. Informed written consent was taken from each patient under the study. US of abdomen were performed using 4C-1 probe on SIEMENS S-2000 machine. Liver was assessed for the presence or absence of fatty infiltration based on increased echogenicity compared to right kidney. It graded the fatty liver. Degree 0 is usual. Grade 1 (mild) is depicted in the hepatic parenchyma by a slight diffuse rise in fine hints with standard visualization of the diaphragm and intrahepatic tract boundaries. Grade 2 (mild) is a mild diffuse rise in fine emissions with mildly reduced intrahepatic and diaphragm visualization. Grade 3 (serious) is a noticeable rise in good waves with bad or no visualization of the ships and edges as well. Patients with mildly coarsened echo texture without irregular margins and those with features of both coarse echo texture and irregular margins were identified.

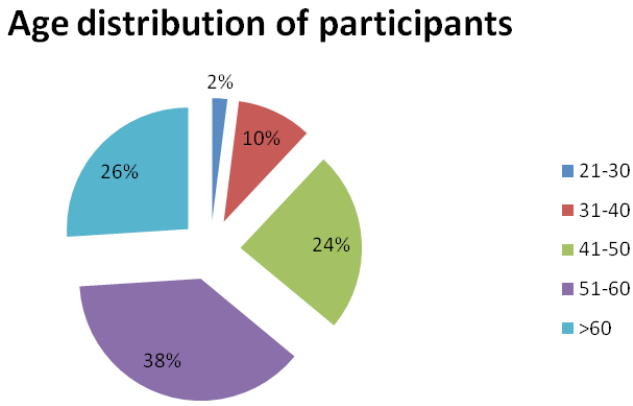
Discussions

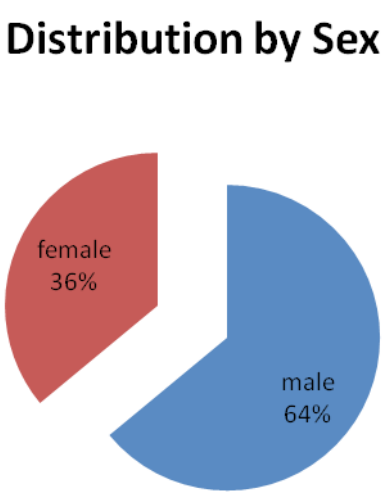
All patients were also subjected to ARFI elastography using intercostal approach from right lobe of liver (segment VI). Patients were positioned in supine position with arm abducted. Region of interest is selected free of vessels and ducts within 8cm from capsule of liver preferably about 2cms from liver capsule. Patients were then instructed to stop breathing for a moment and push pulse is sent and shear wave velocity is obtained. Ten valid measurements are taken. Reliable readings were described as: average value of 10 valid readings with a success rate (SR= proportion of the amount of effective purchases separated by the complete amount of purchases) > 60% and an interquartile range interval (IQR= the gap between the 75th and 25th percentiles, basically the mid 50 percent range of the information) > 30 percent. From these ten readings, the median value is chosen.

Liver stiffness is now characterized into different stages of fibrosis using the predictive value given by Fierbinteanu Braticevici et al [4].

The age, presence or absence of diabetes mellitus, lipid profile, fasting blood sugar, liver function test and alcohol tolerance test are collected from patients.

The impulse elastography of the acoustic radiation force is conducted with an ultrasound scheme from Siemens Acuson S2000TM (Siemens AG, Erlangen, Germany). The establishment of this technique is the tissue shearing being analyzed, which actuates a diminished worry in hard tissues than in delicate ones. The ultrasound sensor creates naturally the beat of an acoustic push that produces shear waves proliferating into the tissue. Their speed, estimated in meters/second (m/s), is appeared on the screen. Spread speed increments with fibrosis earnestness. In an exact anatomical district, shear wave speed can be evaluated utilizing picture based confinement and the exclusive use of ARFI innovation; shear wave speed can be measured in an exact anatomical locale, concentrated on an area of enthusiasm, with a predefined size gave. Measurement value, depth and elasticity outcomes are also recorded in m/s[5,6,7]





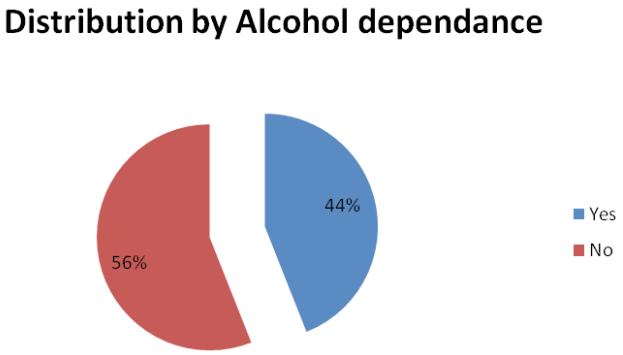


Table 1: Descriptive Statistics of Study Participants

		Mean/Freq	SD/Percentage
Age		62.9800	62.34581
Age	21-30	1.0	2.0
	31-40	5.0	10.0
	41-50	12.0	24.0
	51-60	19.0	38.0
	>60	13.0	26.0

Descriptive Statistics of Study Participants

Sex	Male	32	64
	Female	18	36

Descriptive Statistics of Study Participants

Alcohol dependence	Yes	22	44
	No	28	56

Conclusion

Alcoholic liver disease is a significant cause of morbidity and mortality associated with alcohol. Cirrhosis of heavy drinkers and alcoholics can increase from fatty liver to alcoholic hepatitis, and cirrhosis is anticipated to increase from 10% to 15% of alcoholics. Recent studies also show that the risk of cirrhosis and other liver disease can be multiplicated by alcohol and hepatitis C.

To date, proof suggests that increased involvement in AA and other alcohol abuse therapy has played a significant part in decreasing mortality rates for cirrhosis. Other study has proposed that cirrhosis death levels may be more strongly linked to the intake of certain alcoholic beverages There have also been significant variations in ALD levels among males and females as well as among distinct racial communities.

Comparison of Serum Lipid Profile Level in Hypothyroid Patients and in Healthy Control

Leishangthem Rina[1], V.S. Kalaiselvi[2], B. Shanthi [3]

[1]Post Graduate, [2]Professor, [3]HOD, Department of Biochemistry, Sree Balaji Medical College and Hospital, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Studies have identified the relationship between the amount of thyroid hormones and the lipid profile in individuals with hypothyroid. This research is used to assess the serum lipid profile concentration in individuals with hypothyroid and to combine it with good checks. A total of 50 hypothyroid patients within aged group 20-60 years and healthy controls within 20-60 years of both sexes were enrolled in the study after taking written consent. lipid profile were measured by standard procedures. Data collected was analysed using Stata version 14.1 software. Result shows that there is significant increase in serum TC,TG,LDL-C levels among hypothyroid patients when compared to controls whereas there is a decreased in serum HDL-C level among hypothyroid when compared to controls

Keywords: *Hypothyroid, Lipid profile.*

Introduction

Dyslipidaemia is a common metabolic abnormality in patients with hypothyroidism, either in the open or subclinical forms of the disease, resulting in the effect of thyroid hormones in all aspects of lipid metabolism resulting in various quantitative and/or qualitative changes in triglycerides, phospholipids, cholesterol and lipoproteins, including LDL-Cholesterol, HDL-Cholestein. In hypothyroid disease, the elevated likelihood of cardiovascular disease is explained by dyslipidaemia and coexisting metabolic abnormalities in conjunction with thyroid hormone-induced hemodynamic changes[1-4].

Materials and Method

A total of 50 hypothyroid patients within aged group 20-60 years and a total of 50 healthy controls within 20-60 years of both sexes were enrolled in the study.

After obtaining informed consent from patient, a detail history was taken followed by laboratory investigation as under:

- Estimation of serum TC by cholesterol oxidase peroxidase method
- Estimation of serum TG by enzymatic method (glycerol phosphate oxidase-phenol aminoantipyrine method)
- Estimation of serum HDL by Direct method
- Estimation of serum LDL by Friedewald formula

The data was entered in Stata version 14.1 software, where mean, standard deviation, correlation coefficient and percentage were calculated and results were obtained

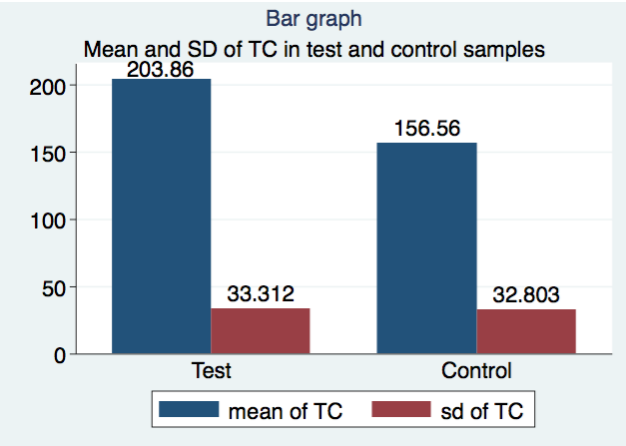

Figure 1: Comparison of Serum Total Cholesterol (TC) levels in both test and control samples.

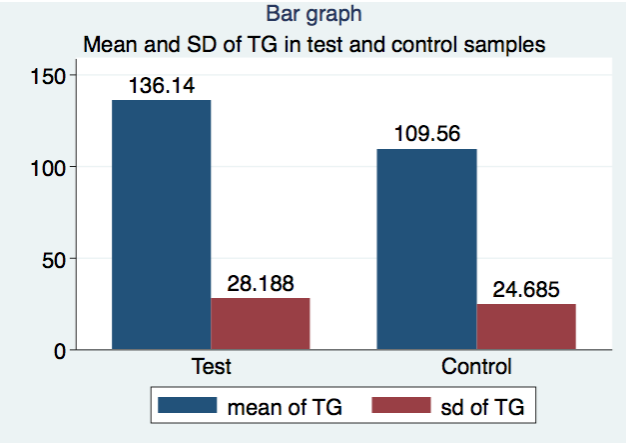

Figure 2: Comparison of Serum Triglyceride (TG) levels in both test and control samples.

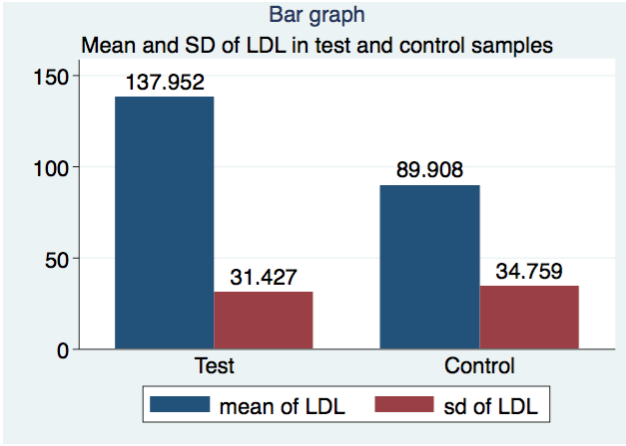

Figure 3: Comparison of Serum LDL levels in both test and control samples.

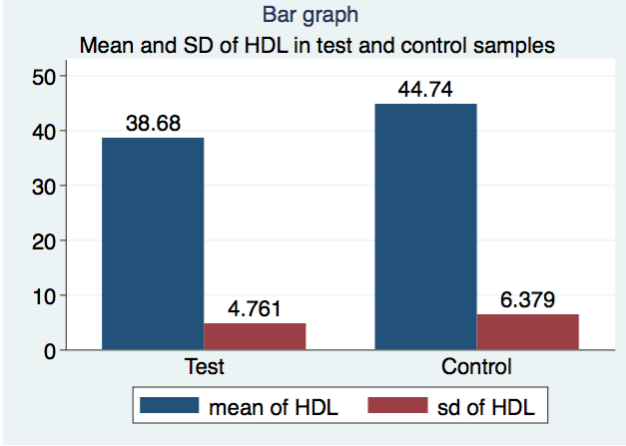

Figure 4: Comparison of Serum HDL levels in both test and control samples.

A total of 100 topics have been chosen for this research as the research unit. This involves 50 hypothyroid instances and 50 good checks. Serum levels TC, LDL-C, VLDL, TG, and HDL-C have been predicted for all research group samples. Using Friedewald formula, LDL-C was calculated. Serum LDL-C were significantly higher in hypothyroid patients (137.952±31.427) compared to control subjects (89.908±34.759) with t-value = 7.2498 ($p < 0.001$).

Serum TC were significantly higher in hypothyroid patients (203.860±33.312) compared to control subjects (156.560±32.803) with t-value = 7.1540 ($p < 0.001$).

Serum TG were significantly higher in hypothyroid patients (136.140±28.188) compared to control subjects (109.560±24.685) with t-value = 5.0161 ($p < 0.001$).

Serum HDL-C level were significantly lower in hypothyroid patients (38.680±4.761) compared to control subjects (44.470±6.379) with t-value = −5.3834 ($p < 0.001$).

Discussion

This study also shows that the fasting serum LDL-C levels among hypothyroid patients were significantly higher than the controls subjects. The mean value of LDL- C was 137.952±31.427 mg/dl in hypothyroid group whereas for the control group it was 89.908±34.759 mg/dl.

In hypothyroidism, thyroid hormone impacts on reduced production of LDL receptors and cholesterol biliary excretion outweigh the impacts of reduced synthesis of hepatic cholesterol, resulting in elevated serum concentrations of LDL, IDL cholesterol (IDL), and complete cholesterol levels [5-8].

The study also showed that serum HDL-C levels among hypothyroid patients were significantly lower than normal healthy controls. The mean value of HDL-C was 38.680 ±4.761 mg/dl in hypothyroid group whereas for the control group it was 44.470 ± 6.379 mg/dl.

Thyroid hormones are also engaged in HDL development by enhancing the plasma activity of a variety of dna components such as Lecithin cholesterol acyl transferase (LCAT), cholesterol ester transport factor (CETP) and hepatic lipase [9]. LCAT esterifies free cholesterol to cholesterol esters, thereby encouraging the transformation of lipid-poor preβ-HDL to bigger, spherical HDL particles [10]. As a result of this method of transferring cholesterol ester, the cholesterol content of HDL is reduced. At the same time, HDL is transferred to triglycerides in the opposite direction, resulting in HDL particles enriched with triglycerides. HDL triglycerides are then hydrolyzed by hepatic lipase, resulting in smaller HDL particles[11]. LCAT, CETP and hepatic lipase alterations behave in conjunction with serious hypothyroidism to reduce HDL-cholesterol and HDL. This study shows that the fasting serum TG levels among hypothyroid patients were significantly higher than the normal controls. The mean value of serum TG was 136.140 ±28.188 mg/dl in hypothyroid group whereas for the control group it was 109.560±24.685 mg/dl.

Thyroid hormones boost the mobilization of stored triglycerides by promoting lipolysis of the adipose tissue[12-15]. Thyroid enzymes also induce β-oxidation of the hepatic fatty acid. As a consequence of these divergent behavior, hypothyroidism most likely encourages accumulation of hepatic triglycerides[16] which is a major driving force for enhanced manufacturing of big, very low-density lipopride.

Conclusion

Lipids parameter like LDL-c,TC,TG show positive correlation with TSH, and negative correlation with FT3 and FT4 levels suggesting that estimating the level of lipids parameters in hypothyroid patients can predict the risk of developing cardiovascular events in hypothyroid patients.

A Various Method of Surgical Management in Patients with Acute Intestinal Obstruction: A Case Series

V. Naveen Kumar[1], G. Swaminathan[1], K.S. Ravishankar[1]

[1]Professor, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Background: Bowel obstruction remains one of the most prevalent intra-abdominal issues encountered by general surgeons in their exercise, whether triggered by hernia, neoplasm, adhesions or linked to biochemical disturbances, tiny or big intestinal obstruction remains a significant source of morbidity and death. Identifying and analyzing the different operating procedures in patients with severe intestinal obstruction.

Objective: To analyse the various method of surgical managements in a patients with acute intestinal obstruction.

Materials and method :In all patients registered with intestinal obstruction regardless of age group, the research was performed in Sree Balaji Medical College and Hospital, Chennai over a span of 19 months. Results: There were 50 instances of severe intestinal obstruction in the entire age range in the research group. The commonest surgical procedure done for intestinal obstruction is release of adhesion with hernioplasty done in 32% of the cases, release of adhesions only done in 30% cases & resection anastamosis in 18% of cases.

Conclusion: Success in managing severe intestinal obstruction is mainly dependent on early diagnosis, skillful leadership and therapy of the obstruction's pathological consequences as much as the cause itself. There is no statistically significant difference between cure rates and death rates due to various surgeries, probably because our sample size was too small. P value 2.0(>0.05).

Keywords: *Intestinal obstruction, release of adhesions, hernioplasty.*

Introduction

Bowel obstruction remains one of the most prevalent intra-abdominal issues encountered by general surgeons in their exercise, whether triggered by hernia, neoplasm, adhesions or linked to biochemical disturbances, tiny or big intestinal obstruction remains a significant cause of morbidity and mortality. For severe abdominal problems, they account for 12 to 16 percent of surgical admissions[1-5]. Acute intestinal obstruction manifestations can vary from a relatively decent appearance with only mild abdominal discomfort and distension to a hypovolemic or septic shock (or both) condition needing urgent surgery. Death from severe intestinal obstruction is declining with a stronger understanding of pathophysiology, improved diagnostic method, replacement of fluids and electrolytes, a lot of powerful anti-microbials, and knowledge of intensive care. Most deaths happen in older people seeking early therapy and related pre-existing illnesses such as diabetes mellitus, heart disease or respiratory disease. Early obstruction diagnosis, adequate surgical technique and extensive postoperative therapy bring a grateful outcome[6-8].

Materials and Method

The study was conducted in Sree Balaji Medical College and Hospital, Chennai over a period of 19 months in all patients admitted with intestinal obstruction irrespective of age group. Study design - Prospective observational study. Patients with subacute intestinal obstruction handled conservatively were removed from the research and only those instances of severe intestinal

obstruction surgically controlled were analyzed in order to determine the pathology of intestinal obstruction with the objective of knowing how it was presented, the physical results, the radiological and haematological results, the operational results and the results of the research. Clinical information was registered as per Proforma after the patient was admitted. The diagnosis is focused primarily on clinical examination and is often endorsed by haematological and radiological tests[9].

Findings:

Table 1: Management

Management	Number of cases	Percentage
Release of adhesions & hernioplasty	16	32
Release of adhesions	15	30
Derotation of Volvulus & Sigmoidopexy	2	4
Resection & Anastomosis	9	18
Hartman's procedure	2	4
Resection Anastomosis and Herniorrhaphy	5	10
Transverse Loop Colostomy	1	2
Total	**50**	**100**

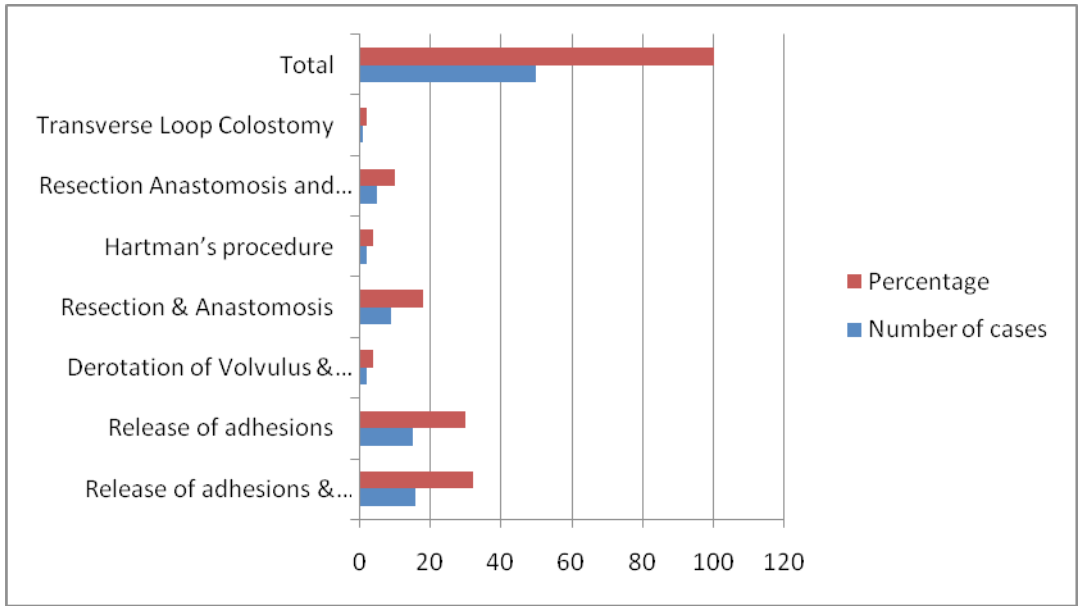

Figure: Management

In our study of 50 cases as accordingly with the etiology the management and the surgical procedure was done as shown in the table and pie diagram, release of adhesion with hernioplasty done in 32% of the cases, release of adhesions only done in 30% cases & resection anastamosis in 18% of cases.

Discussion

The prevalence of acute intestinal obstruction is 0.95% of complete surgical instances in our clinical research. In Souvik Adhikari et al., the incidence of complete surgical instances was 9.87 percent. The occurrence in the sequence of Bhargava Anderson was 3% of complete surgical instances. It was discovered that the most common cause was obstructed/strangled hernia, accompanied by postoperative adhesions, malignancy, intussusception, volvulus, tuberculosis, and mesenteric ischaemia[10]. In developing countries like India, the commonest cause used to be obstructed/strangulated hernia. In our study of 50 cases where surgical procedure was done release of adhesion with hernioplasty done in 32% of the cases, release of adhesions only done in 30% cases & resection anastamosis in 18% of cases[11].

Conclusion

Success in managing severe intestinal obstruction is mainly dependent on early diagnosis, skillful leadership and therapy of the obstruction's pathological consequences as much as the cause itself. There is no statistically significant difference between cure rates and death rates due to various surgeries, probably because our sample size was too small. P value 2.0(>0.05).

Pattern of Ocular Morbidity among School Going Children of 6-16 Years in Kancheepuram District, Tamil Nadu

S. Sundari[1], P. John Solomon[1]

[1]Professor, Department of Paediatrics, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Among the leading childhood morbidities in developing nations,after malnutrition, diarhheaetc childhood blindness and other ophthalmic morbidities causing visual impairment also hold a place. The major causes of blindness in children encompass intrauterine and acquired infectious diseases, teratogens and developmental and molecular genetics, nutritional factors, the consequences of preterm birth, and tumors. A multidisciplinary approach is therefore needed. To assess the pattern the ocular morbidity among school going children of an urban area in Kancheepuram district, Tamilnadu were studied.

Keywords: *Morbidity, Children, Infectious Diseases, Preterm Birth.*

Introduction

The global child mortality rates, though lower than the under 5 mortality rates are themselves as close to 1 million children aged 5–14 in 2017. The probability of dying among children aged 5–14 was 7.2 deaths per 1,000 children aged 5 in 2017–substantially lower than the probability of dying among children under age 5 (39 deaths per 1,000 live births).[1,2]

Health and well-being of 362 million adolescent (10–19 years) boys and girls in the South-East Asia Region will be the key to the national development of Member States as they progress towards achievement of the Sustainable Development Goals. Regional Strategic Guidance on accelerating actions for Adolescent Health (2018–2022) provides a way forward to countries to build upon the existing national adolescent health plans using intersectoral approach and for providing comprehensive and multi-dimensional services.[3]

Among the leading childhood morbidities in developing nations,after malnutrition, diarhheaetc childhood blindness and other ophthalmic morbidities causing visual impairment also hold a place.

The major causes of blindness in children encompass intrauterine and acquired infectious diseases, teratogens and developmental and molecular genetics, nutritional factors, the consequences of preterm birth, and tumors. A multidisciplinary approach is therefore needed. This is because the underlying causes closely reflect socioeconomic development and the social determinants of health, as well as the provision of preventive and therapeutic programs and services from the community through to tertiary levels of care. The control of blindness in children therefore requires not only strategies that reflect the local epidemiology and the needs and priorities of communities, but also a well functioning, accessible health system which operates within an enabling and conducive policy environment[4,5].

Materials and Method

Study Design: This study is a community based cross-sectional study conducted in urban area of Kancheepuram district, Tamil Nadu.

Study Area: This study was conducted in Anakaputhur which is the urban field practice area of the Urban Health and Training Centre (UHTC) attached to our Institution (Sree Balaji medical college and hospital.

Anakaputhur is a municipality city in the district of

Corresponding Author:
S. Sundari
Professor, Department of Paediatrics, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Kancheepuram, Tamilnadu. It is divided into 18 wards for which elections are held every 5 years. The study was conducted in Anakaputhur which is located at a distance of 7 kilometres from the institution with an area covering approximately 16 sq. kilometres. (Annexure).

Study Population: According to the 2011 census, Anakaputhur urban field practice area had a total population of 48,050 of which 24,158 were Males, 23,892 were Females and 9850 were Children (6-16 years of age). Among the children 5045 were Males and 4805 were Females. Total number of houses in Anakaputhur is 12,146 The study was done among Children (6-16 years of age) residing in the study area permanently at the time of the study.

Study Period: The study was carried out from December 1st 2017–May 31st 2018

Sample Size: Sample size was calculated from a previous study conducted by Deshpande Jayant D in a rural area of North Maharashtra in the year 2011. The study recorded a prevalence of 27.6% This was taken as the reference value for calculating sample size. The sample size was calculated using the formula:

$N = Z\acute{a}^2pq/[L]\ 2$

Where, Z = 1.96 at 95% confidence interval

p = Prevalence of disease/event (referred value)

q = 100–P

L =Relative precision, which is assigned as 13% of p (15% of 27.6-3.588 for this study

Substituting it in the formula,

[Z = 1.96, p = 27.6%, q =72.4 (100-27.6), L = 3.588]

N = 1.96 x 1.96 x 27.6 x 72.4/3.588x3.588 = 599

Accounting 10% for non-response, the final sample size was calculated as 658 (rounded off to 672). [N = 672]

Inclusion Criteria: The inclusion criteria for the study were children of age group (6-16 years) residing in the study area, who gave consent to participate in the study.

Exclusion Criteria: The exclusion criteria for the study were Children who were mentally retarded, who are severely ill and those who didn't give consent to participate in the study were excluded.

Sampling Method: Anakaputhur had a total population of 48,050 as per 2011 census. As per the data available in the UHTC register there were 9850 children (6 - 16 years) residing in the study area. The sampling technique followed for this study was **Systematic random sampling**.

Total number of children belonging to 6-16 years of age, N=9850; which was divided by the total sample size, n = 672, to obtain the k value.

K value = N/n = 9850/672 = every 14th participant.

Every 14th participant from the records was chosen and the name and address of the person was noted and was visited for the data collection. if the person corresponding to the number did not give informed consent or was absent, the next number within the respective ward was chosen and the 14th person from that particular person was selected and interviewed. Likewise, 672 children who gave informed consent and willingly participated in the study were identified.

Study Tool: A pretested structured questionnaire was used as study tool for data collection, by interviewing the study participants. The questionnaire was prepared in English and translated to Tamil. The interview was conducted by the investigator herself and their responses were recorded in the questionnaire. The questionnaire consisted of the following sections:

Section I: Socio-Demographic Factors: Family background characteristics, including socio-demographic factors (age, sex, standard, family income, religion family type, and socio-economic status).

Section II: History Regarding Refraction: History regarding refraction like whether wearing spectacles, duration, refractive power, family history of refractive error.

Section III: Eye Complaints: History of eye complaints like redness, watering, itching, difficulty in night vision, difficulty in reading books etc.

Section IV: Nutritional Status: History of fruit and vegetable intake and history of Vit A supplementation.

Section V: Physical Measurements: Physical measurement such as, Height, weight, BMI were taken from the study participants.

Section VI: Ophthalmic Measurements: Ophthalmic measurements like visual acuity, corrected visual acuity and colour vision were taken using Snellen chart and ishihara chart respectively.

Informed Consent: Informed Consent was obtained from each participant prior to the administration of the interview schedule. The Informed Consent was prepared in the local language and is based on ICMR guidelines [Annexure].

Ethical Approval: The study proposal was presented and approval from Institutional Ethics Committee was obtained prior to the pretesting. The approval letter is enclosed in Annexure.

Pilot Study: A pilot study was carried out among 70 participants in the Anakaputhur area, which is a in Kancheepuram District. The questionnaire consisted of socio-demographic characteristics, details regarding the risk factors for ophthalmic morbidity, history regarding refraction, nutritional status and physical measurements. Based on the results of the Pilot study, the necessary changes were incorporated in the questionnaire and the study was conducted. The samples included in the pilot study were not included in the present study.

Data Collection Period: Data was collected from the study participants for a period of 6 months from December 2017 to May 2018.

Data Collection Method: Using Multi stage Sampling technique samples were selected. The data was collected by visiting the designated place of residence as per the sampling frame. On obtaining the informed consent, the interview was conducted by the investigator herself. Each participant was interviewed for 10 to 15 minutes.

Findings:

Sociodemographic Variable		Frequency (N=672)	Percentage

	Muslim	32	4.7
	Christian	47	7.7
	Others	5	0.6
Family type	Nuclear	452	67.5
	Joint	188	27.8
	3 generation	32	4.7

Socio-demographic characteristics of the study population is shown in table 1. Among the study participants, 36.9% belonged to 13-16 years of age,34.1% belonged to 10-12 years and 28.9% belonged to 6-9 years of age. 280 students belonged to 1-5th standard, whereas only 156 belonged to the 6-7 category. About 54.1% of the study participants were females and 44.9% were males. According to the modified Kuppusamy's scale, 48.6% belonged to upper middle class, 22.9% belonged to upper class whereas only 2.8% belonged to lower class. Coming to literacy of the head of the family,269 of them had passed higher secondary whereas 258 of them had a diploma degree in hand. There were no entries in middle school and graduate category whereas 49 & 62 of them were primary school and illiterate category respectively. More than half of them 87% were hindus, whereas 4.7% and 7.7% of them were muslims and Christians,only 0.6% of them belonging to religions other than this. Almost half of them(452) hailed from a nuclear family, whereas 188 of them were from a joint family and 32 of them from a 3 generation family.

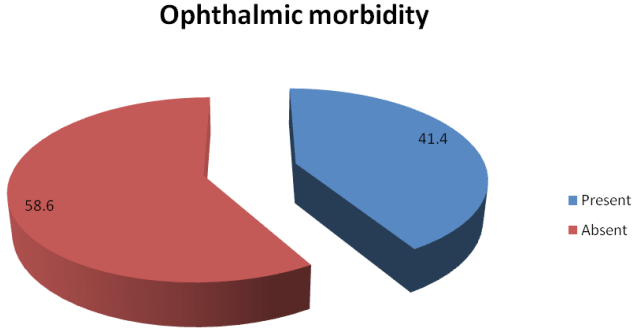

Figure 1: Prevalence of Ophthalmic Morbidity

As in figure 1, in our study population 41.4% had one or the other ophthalmic morbidity, whereas 58.6%

did not suffer from any ophthalmic morbidity.

Discussion

Socio-Demographic Characteristics of the Study Population:

Age: In this study,36.9% belonged to 13-16 years of age,34.1% belonged to 10-12 years and 28.9% belonged to 6-9 years of age. In a study by Desai S 67% were distributed in the age group of 7 to 12 years, 84.9% were in the age group of 13 to 18 years.In a similar study done by Prasanna Kamath, 53% were in the age group of 6 to 10years, 26.9% were in the age group of 11 to 12 years, 20% were in the age group of 15-20 years. This variation in the age groups is due to the different study setting and variation in the socio-demographic characteristics of the study population.

Sex: In our study, 54.1% of the study participants were females and 44.9% were males. In a study done by M Gupta, 52.08% were males, 47.9% were females. In a similar study done by Datta A, 59.5% were males, 41.5% were females.

Socio-Economic Status: According to the modified kuppusamy's scale, 48.6% belonged to upper middle class, 22.9% belonged to upper class whereas only 2.8% belonged to lower class.In a study done by Deshpande, 30.1% belonged to upper lower and 26.8% belonged to lower middle class,whereas only 7.4% belonged to upper class.In a similar study done by Prajapati, 32.1% belonged to upper lower class and 23.3% belonged to lower middle class,and only 6.1% belonged to upper class.

Religion: More than half of them 87% were hindus, whereas 4.7% and 7.7% of them were muslims and Christians,only 0.6% of them belonging to religions other than this. In a study done by Deshpande, 75.8% were hindus, 17.8% were muslims, 2.8% were Christians, 3.3% belonged to religions other than this.In a similar study done by Datta A, 44.8% were hindus, 55.2% were muslims.

Family Type: Almost half of them(452) hailed from a nuclear family, whereas 188 of them were from a joint family and 32 of them from a 3 generation family. In a study done by Prajapati, 50.3% belonged to nuclear family category, 49.7% belonged to joint family category. In a similar study done by Deshpande, 42.2% belonged to nuclear family category, 57.8% belonged to joint family category.

Prevalence of Ophthalmic Morbidity: In this study, the prevalence of ophthalmic morbidity is 41.4%, similar to a study done by P Kamath, where the prevalence of ocular morbidity was 44.77%, also comparable to the one reported by Chaturvedi,[6](more than 40%) in rural Delhi and Kalikivayi*et al* [7](43.5%) at Hyderabad.Moderateprevalence,but lower than the current study wasreported by Rajesh Kumar, (24.6%) from Delhi, Deshpande Jayanth D and Malathi K, (27.65%) from rural Maharashtra and Madhu Gupta (31.6%) from Shimla.In a study done by V Kalikivayi, the prevalence of ophthalmic morbidity was found to be 13.9%.

Conclusion

This study assessed the prevalence of ophthalmic morbidity among the school going population of Kancheepuram District, Tamil Nadu. The study reveals that among the study participants, 36.9% belonged to 13-16 years of age and about 54.1% of the study participants were females. According to the modified Kuppusamy scale, socio economic classification, 48.6% belonged to upper middle socio economic category.

Occupational Health Hazard in Sewage and Sanitary Workers

Raghav Prashar[1], Mohan Kumar P.[2], Gopal Krishnan S.[2]

[1]Post Graduate, [2]Professor, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

The working conditions of the sterile workers have stayed in every way that really matters unaltered for over a century. Beside the social shock that these labourers face, they are displayed to certain restorative issues by integrity of their occupation. These prosperity risks consolidate prologue to damaging gases, for instance, methane and hydrogen sulphide, cardiovascular degeneration, musculoskeletal disperses like osteoarthritis changes and intervertebral plate herniation, illnesses like hepatitis, leptospirosis and helicobacter, skin issues, respiratory system issues and balanced aspiratory work parameters. This can be deflected through structuring, remedial and managerial measures. While the structure assessments will help in verifying against exposures, the therapeutic evaluations will help in early disclosure of the effects of these exposures. This can be mostly cultivated by structure up an effective world related prosperity organization for this social occasion of specialists. Furthermore, standard care ventures should be coordinated to concede preparing as for increasingly secure work frameworks and usage of individual guarded devices.

Keywords: *Sanitary specialists, sewage labourers,occupational maladies.*

Introduction

Some place in the scope of 2002 and 2003, the Indian Ministry for Social Justice and Empowerment admitted to the nearness of 676,000 scavengers[1]. However, these figures may have been put down in light of the fact that scrounging is unlawful. As shown by one investigation by Bezwada Wilson of the Safai Karmachari Association, a normal 12 lakhs (1.2 million) scroungers are accessible in the country[2]. According to Sulabh, four to five million people were filling in as foragers in 2005 and were every now and again used by the close-by friendly bodies to clean compost in open places[1]. This situation drives forward despite the way that the Employment of Manual Scavengers and Construction of Dry Latrines (Prohibition) Act[3], 1993, is in approval, which obliges the preclusion of crafted by manual foragers similarly as advancement or continuation of dry restrooms and for the rule of improvement and upkeep of water-seal toilets for ensuring the regard of the individual, as valued in the Preamble to the Constitution[3-15]

The working conditions of the perfect workers have stayed in every way that really matters unaltered for over a century. Using only a stick floor brush and a little tin plate, the spotless workers clear poor from open and private restrooms onto bushels or various holders, which they by then carry on their heads to dumping grounds and move regions. A couple, nevertheless, are given push trucks or trucks by the metropolitan masters.

Beside the social hulks that these workers face, they are moreover exhibited to certain medicinal issues by uprightness of their occupation. These prosperity risks fuse prologue to damaging gases, cardiovascular degeneration, musculoskeletal disarranges, maladies, skin issues and respiratory system issues. [16-24]

Classes of Sanitary Workers:

Materials and Method.

Manual Scavenger: Iinfers an individual attracted or used on ordinary or customary reason by an individual or a close-by master or an open or private office,for

Corresponding Author:
Raghav Prashar
Post Graduate, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Agharam Road, Selaiyur, Chennai-73

physically cleaning,carrying, disposing of or for the most part managing in any capacity, human excreta in an insanitary restroom or in an open channel or pit into which human excrete from insanitary toilets is disposed of, or on a railroad track, before the excreta totally crumbles.

Safai Karamcharis or Sanitary Workers: Ordinarily join individuals associated as 'Sweepers 'or 'sanitation/cleaning workers'' in locale, government and private working environments. They may be prompt specialists of these bodies or may be on contract. However, Safai Karamcharis, per se, are not manual scroungers.

Sewer vent WORKERS an enormous bit of the districts in India are not outfitted with the latest machines to clean the sewage structure and therefore, sewage pros used under motivation to enter the underground sewage lines through the sewer vents and cleanse them wherever the lines are ceased up for whatever reason. The control of the sewage worker is to look at and keep up the underground framework pipes that make up sewerage system. Sewage authorities need to remove solid substance wastes which are responsible for blockage of stream of fluid waste in sewage system.

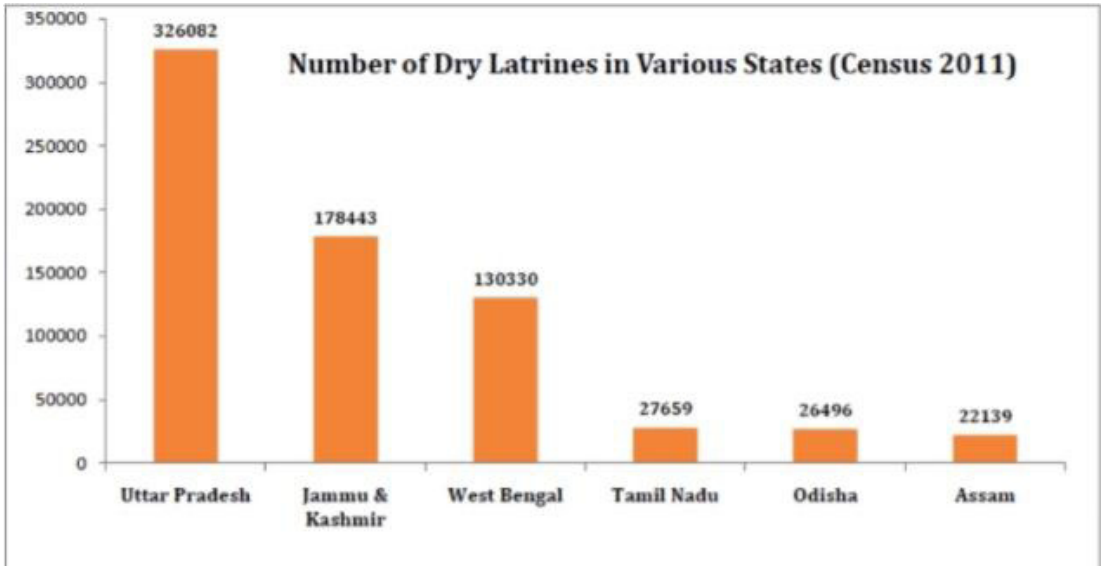

Figure 1: Exposure to Harmful Gases

Findings: The workers are routinely exhibited to gases like hydrogen disulfide, methane, smelling salts and carbon monoxide. Watt et al[4]. Considered 26 sewer workers introduced to smell and found that 53.8% made sub-extreme signs including sore throat, hack, chest cosiness, brevity of breath, thirst, sweating, crabbiness and loss of drive. Earnestness of signs had all the earmarks of being segment related. Richardson[5]. Considered prologue to hydrogen sulphide in 68 sewer workers and found that the FEV1/FVC characteristics were lower in sewer pros who had a high H2S introduction.

Hurtful Effects of Hydrogen Sulphide: Hydrogen sulphide is a flammable gas, which touches off with a blue flame, offering climb to sulphur dioxide, a very irritating gas with a trademark smell. Mixes of hydrogen sulphide and air in the dangerous range may explode viciously.

Without a doubt, even at low obsessions, hydrogen sulphide has an aggravation movement on the eyes and the respiratory tract. Intoxication may be hyper acute, serious, sub acute or unending. Hydrogen sulphide enters the body through the respiratory structure and is immediately oxidized to shape blends of low hurtfulness. There are no storing up wonders and transfer occurs through the stomach related framework, pee and the ended air. In occurrences of slight hurting, following introduction from 10 to 500 ppm, a cerebral torment may latest a couple of hours, torment in the legs may be felt and, every so often, there may be loss of insight. In moderate hurting (from 500 to 700 ppm), there will be

loss of comprehension persevering through two or three minutes yet with no respiratory inconvenience. In cases of genuine hurting, the subject drops into a noteworthy stupor state with dyspnoea, polypnoea and a slate-blue cyanosis until breathing restarts. Tachycardia and tonic–clonic fits are seen.

Internal breath of colossal measures of hydrogen sulphide will rapidly make anoxia achieving demise by asphyxia. Epileptiform seizures may occur and the individual falls clearly unmindful and may fail miserably without moving yet again. This is a confusion typical for hydrogen sulphide hurting in sewer workers. Regardless, in such cases, introduction is oftentimes a direct result of a mix of gases including methane, nitrogen, carbon dioxide and smelling salts.In sub-extreme hurting, the eyes are impacted by palpebral edema, bulbar conjunctivitis and mucopurulent discharge with, possibly, abatement in visual sharpness–these bruises generally being particular. This issue is alluded to sugar and sewer workers as "gas eye".

Muscoskeletal Disorders

Discussion.

Osteoarthritis changes and intervertebral plate herniation are the fundamental spinal varieties from the standard point by point in these workers[6]. Friedrich[7] analyzed 255 sewage authorities to choose the inescapability of spinal burdens (i.e., neck, upper back and lower back misery [LBP]). He nitty gritty that the year transcendence rates of neck, upper back and LBP were 52.4%, 54.8% and 72.8%, separately. The regularity of spinal burdens extended with age. Work powerlessness during the initial a year due to LBP was out and out unequivocally associated with age, handicap, step by step term of stooping and lifting 5 years heretofore and higher surprising disease direct scores (chances extent some place in the scope of 1.26 and 0.94).

Diseases: The techniques for introduction for the various pollutions are according to the accompanying:

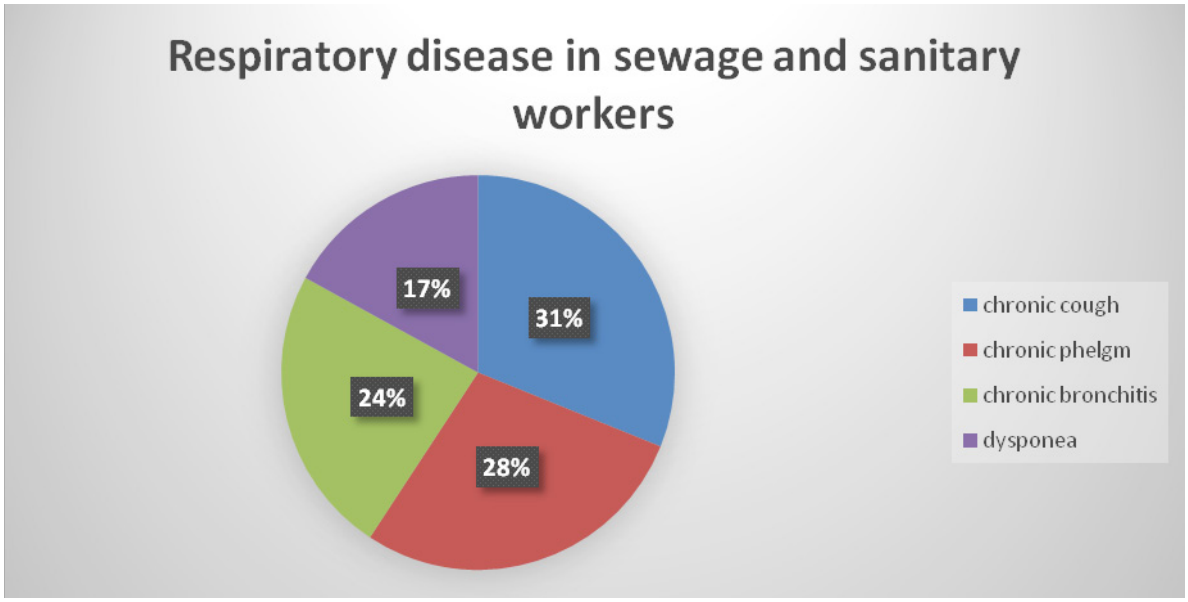
- The most fundamental way is by hand-to-mouth contact during eating, drinking and smoking, or by cleaning the face with debased hands or gloves or by licking sprinkles from the skin.
- By skin contact, through cuts, scratches or entering wounds, i.e., from discarded hypodermic needles. Certain living things can enter the body through the surfaces of the eyes, nose and mouth.
- By breathing them in as build up, airborne or haze.

The ailments ordinarily mulled over among this social event of workers consolidate leptospirosis, hepatitis and Helicobacter pylori defilement.

Leptospirosis: Leptospirosis is a huge word related disorder impacting people associating with animals and their discharges. The occasion of malady in ones workplaces is associated with the earth to which the worker is revealed and the adaptability of the living being in that work environment. Rodents for the most part have a lot of underground sewers and are transporters of leptospira. The pee of rodents and various animals present around there is presumably going to sully these sewers. Leptospira are released in the pee of the corrupted animals. In this manner, sewer workers are at a potential risk of leptospirosis. The normality rate was seen to be 16.6%. Verification of leptospiral pollution was seen to be most noteworthy in sewer masters during the zones of the city that were attacked with rodents and stray animals. De Serres et al.[9] found that sewer workers had a more noticeable transcendence of antibodies against leptospirosis than controls (12% versus 2%, P = 0.003).

Hepatitis: Hepatitis A (HA) contamination is the regularly times happening vaccination preventable ailment. Albeit enormous self confining, serious hepatitis An is connected with liberal terribleness and related fiscal weight. Barely any examinations reported an extended HAV resistant reaction titter among sewage workers[10, 11]. While various examinations suggest that workers in the solid waste industry may just speculatively be at an extended risk of getting compelling afflictions occupationally[12, 13]. Even an efficient audit did by Glasset al[14].does not affirm an extended peril of clinical HA in authorities displayed to sewage. Vaidya[15]. Uncovered that an enormous climb in antagonistic to hepatitis E disease motivation ($P < 0.05$) was recorded in sewage workers working for > 5 years. Another case report prescribes that sewer workers may be at an extended threat of contracting hepatitis C[16, 17]. Another examination by Arvanitidou et al.among specialists of a sewage association insists that lone introduction to sewage was openly associated with motivation for hepatitis B disease (HBV) defilement ($P < 0.001$). They recommended that workers displayed to sewage should as such be considered for vaccination against HVB

Helicobaterpylori:



Conclusion

An extended danger for gastric threatening development among sewage workers has been depicted in a couple of examinations. During the latest decade, the bacterium Helicobacter pylori has ascended as one noteworthy danger factor for gastric illness and is by and by seen as a class I disease causing operator by the International Agency for Research on Cancer. Friiset al[18].thought about the inescapability of immunoglobulin G (IgG) antibodies against H. pylori in a social event of 289 metropolitan workers. The ordinariness of IgG antibodies against H. pylori among sewage workers did not differentiate from that of the referents. Regardless, a development in the inescapability of IgG antibodies against H. pylori with growing age was viewed. Beside these normally thought about infections, a couple of various pollutions like intestinal parasitic defilements, gastroenteritis and Pontiac fever are moreover delineated among the sewage workers.

Dermatitis: Generally, the dermatitis is a non-infective one. It comes about because of trying to mineral oil and tar. Anerupt of occasions of airborne exacerbation contact dermatitis has been represented among incinerator workers used in a sewage treatment facility[19].

Respiratory Symptoms and Function: A couple of examinations have been finished to think about the respiratory limit of sewage workers, with all of them uncovering that respiratory symptoms are common [20-22]. Among this social affair of pros. The respiratory limit considers moreover revealed bizarre respiratory limits in these masters. These appearances may be a direct result of introduction to end toxins and airborne microorganisms by strategy for bio aerosols. Zuskin et al. uncovered that the example ventilator farthest point was basically decreased differentiated and the foreseen characteristics in sewage experts. In particular, the characteristics for FEF25 - 50 were reduced[23], prescribing obstructive changes in smaller flight courses. They referenced that sewage workers are exhibited to different word related destructive experts, which may incite the improvement of interminable lung work changes[24].

Along these lines, to consolidate, the sewage and sterile pros experience the evil impacts of compound and natural risks. This can be balanced through structuring, helpful and legitimate measures. The structure measure should focus on making the technique progressively foolish. These workers should in like manner be benefitted by word related prosperity organizations, which should consolidate pre-game plan and discontinuous prosperity watching. Further fruitful utilization of the Employment of Manual Scavengers and Construction of Dry Latrines (Prohibition) Act, 1993, will help in the annulment of manual scrounging. Also, ordinary care ventures should be coordinated to concede preparing as for increasingly secure work systems and use of individual guarded devices.

Pediatric Diabetes: Review Article

Bavishna B.[1], Uma Devi R.[2], Gopala Krishnan S.[3]

[1]Post Graduate, [2]Professor, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

The incidence of type 1 diabetes and heftiness in youngsters and immature is rising. Today it commonest endocrine cum metabolic issue of youth and immaturity with extensive consequences for kid's physical and passionate advancement. It is assessed that youth diabetes represents about 5% of absolute populace of diabetes. In India alone, there are likely going to be around 4,00,000 babies and kids with this disease[1]. Diabetes the board rules offered by the American Diabetes Association and Health care terms naturally place a high weight of duty on parental figures to check youthful kids' blood glucose levels, manages insulin, and screen diet and physical action with extreme objective of keeping up high glycemic control. Type 1 diabetes can be physiologically hard to control, child rearing pressure can be raised; Despite the conceivably extraordinary administration needs explicit training and clinical administrations for overseeing diabetes in youthful youngsters are seldom offered and conduct examine with this youthful tyke age gathering has been constrained in degree and quantity[1].

Keywords: *Young kids, child rearing, examinations, insulin.*

Introduction

Diabetes mellitus is a typical perpetual youth issue in western world yet is less among Asians. Starting at 2009, there are 4,79,600 kids with type 1 diabetes mellitus in the realm of which 23% from Southeast Asia and 6.3% originates from western Pacific district. The yearly increment in episodes is 3% every year around the world. Ethnic gatherings with low occurrences of ailment take on a high frequency of diabetes. This recommends ecological elements are significant. Early introduction and high dietary admission of dairy animals' milk protein past earliest stages increment the danger of type 1 diabetes. Drawn out breastfeeding and nutrient D supplement diminished danger of type 1 diabetes mellitus. Utilization of sustenance high in additives and nitrosamines is related with expanded danger of type 1 diabetes mellitus. The cleanliness speculation recommends that great cleanliness, inoculation and diminished youth contaminations in early life prompts adjustment of invulnerable framework supporting an expanded danger of improvement of immune system ailments like type 1 diabetes mellitus. There has likewise been a wide geographic distinction in rate of adolescence and immature diabetes[3].

Diabetes mellitus is conceivably a considerably more intense ailment in kid than in the grown-up. The beginning is set apart by polyuria, inordinate thirst and quick loss of weight over a time of 2 a month and a half. Different patients may give optional nighttime enuresis, regurgitating, stomach agony and stomach distension which may emulate intense abdomen[4]. In untreated express, a youngster can give diabetic ketoacidosis (DKA) and can be conceded in a condition of significant parchedness with indented eyes, dry tongue and scaphoid belly. The tyke can slip by into unconsciousness. Breath is moaning, fast and pauseless (Kussmaul relaxing). An irregular glucose more than 11 mmol/L helps in finding of type 1 diabetes mellitus. Diabetic ketoacidosis is available if blood pH is under 7.3 bicarbonate is under 15 mmol/L within the sight of hyperglycemia and overwhelming glycosuria and ketonuria[3].

Etiology: Despite the fact that the exact reason for type 1 diabetes has stayed slippery, a few hereditary elements assume a noteworthy job and likely associate with ecological components to deliver the illness. A few gatherings have tentatively concentrated the concordance rates of T1DM in monozygotic and dizygotic twins. Concordance rates of monozygotic twins have extended from 17% to 30% which is significantly higher than the concordance rates revealed in dizygotic twins or nontwin kin of people with T1DM[10]. In Caucasians, there is a relationship with T1DM and the HLA histocompactablity complex on chromosome 6 and insulin quality variable number of couple rehashes (VNTRs) polymorphism on chromosome 11. These affiliations are less solid in Asian diabetic patients. All things considered, T1DM is a polygenic issue. Anyway hereditary elements do not represent the entire hazard and different components must assume a job.

The sort 1 diabetes is brought about via immune system annihilation of pancreas. Patients with T1DM have serious insulin deficiency.In the vast majority with sort 1 diabetes, the body's resistant framework–which regularly battles unsafe microorganisms and infections–erroneously wrecks insulin-delivering (islet) cells in the pancreas.

Hazard Factors

Findings: Hazard factors for sort 1 diabetes in youngsters include:

Family ancestry. The youngsters with parentor kin with sort 1 diabetes have a marginally expanded danger of building up the condition. In an investigation done in locale Abidjan, 4.9% of kids who partook in that review had atleast one diabetic parent. The extent of members with a diabetic dad (3.8%) was double the extent with a diabetic mother (1.9%) and this was measurably significant[11]. Hereditary helplessness. The nearness of specific qualities shows an expanded danger of creating type 1 diabetes. Recently, numerous genome wide affiliation investigations of T1DM have recognized in any event 24 qualities and chromosomal loci each passing on a little increment in danger of creating Type 1 DM. Race in the United States, type 1 diabetes is more typical among non-Hispanic white kids than among different races.

Natural hazard components may include: Certain infections presentation to different infections may trigger the immune system demolition of the islet cells. Diet No particular dietary factor or supplement in earliest stages has been appeared to assume a job in the advancement of sort 1 diabetes. Be that as it may, early admission of dairy animals' milk has been connected to an expanded danger of sort 1 diabetes, while bosom nourishing may bring down the risk[3]. The presentation of oat into an infant's eating routine likewise may influence a youngster's danger of sort 1 diabetes. An examination directed in Basrah proposes that introduction to ecological hazard factors during pregnancy (tea drinking, pre-eclampsia, and irresistible illnesses), neonatal period (respiratory trouble, jaundice and contaminations) and early outset are said assume a significant job in setting off the insusceptible procedure prompting B-cell devastation and the advancement of sort 1 diabetes mellitus.

Examinations: The analysis of diabetes in kids is a two section process. Specialists initially decide if their kids have diabetes and after that decide their sort. Specialists presume diabetes when kids have run of the mill indications or when a pee test done during a routine physical examination uncovers glucose. The determination is affirmed by estimation of the blood glucose level. Blood glucose levels can be estimated toward the beginning of the prior day kids eat (called the fasting glucose level) or without respect to suppers (called the arbitrary glucose level). Kids are considered to have diabetes on the off chance that they have both regular indications of diabetes and a high blood glucose level. On the off chance that the fasting glucose level is 126 mg/dl or higher on 2 distinct events, youngsters have diabetes. On the off chance that the arbitrary glucose level is 200 mg/dl (11.1 mmol/L) or higher, kids have diabetes[12].

Discussion

Specialists additionally measure the degree of a protein in the blood called hemoglobin A1C (glycosylated hemoglobin).When blood is presented to high blood glucose levels over some undefined time frame, glucose connects to the hemoglobin and structures hemoglobin A1C. Since hemoglobin A1C sets aside a generally long effort to frame and to separate, levels change just over weeks to months instead of from moment to moment like blood glucose levels do. Hemoglobin A1C levels along these lines reflect blood glucose levels over a 2-to 3-month timeframe. Individuals whose hemoglobin A1C level is 6.5% or higher are considered to have diabetes. Hemoglobin A1C levels are increasingly useful in the conclusion of sort 2 diabetes in youngsters who don't have run of the mill symptoms[13].

Another sort of blood test called an oral glucose resistance test might be done in kids who have no side effects or whose side effects are mellow or not regular. In this test, kids quick, have a blood test taken to decide the fasting glucose level, and afterward drink an uncommon arrangement containing a lot of glucose. Specialists at that point measure blood glucose levels 2 hours after the fact. In the event that the level is 200 mg/dL (11.1 mmol/L) or higher, kids are considered to have diabetes. This test is like the test that pregnant ladies need to search for gestational diabetes[4].

Blood tests to check for antibodies that are regular in sort 1 diabetes.Urine tests to check for the nearness of ketones, which additionally recommends type 1 diabetes in youngsters. The tyke's circulatory strain and development are additionally decided. The youngster is likewise screened for celiac ailment at the season of conclusion of diabetes and at regular interims. Ordinary eye examinations are likewise required.

Insulin: Insulin in low portion routine is the present proposal. A day by day portion of 0.5 unit/kg body weight of soluble insulin is given in a vast lion's share of cases. The complete portion is partitioned into two sections, 2/3 to be infused before breakfast and 1/third before dinner. It is informed to give 5 units with respect to insulin on remission[4]. The utilization of exogenous insulin controls serum glucose by expanding its take-up into muscle and fat tissue and diminishing hepatic glucose generation. Weight addition, hypoglycemia, and fringe hyperinsulinemia are the most well-known unfavorable impacts related with insulin. The accompanying sorts of insulin are demonstrated for use in kids:aspart, glulisine, lispro, customary, impartial protamine Hagehorn (NPH), detemir and glargine. Professionals frequently postpone the utilization of insulin in youngsters with T2DM because of the routine multifaceted nature and unfriendly occasions.

Biguanides: Unless there are contraindications, all youngsters with T2DM ought to be begun on metformin. Metformin works by diminishing hepatic glucose creation and animating glucose take-up into fringe tissues. Metformin ought to be started in kids 10 to 16 years old at a portion of 500 mg day by day with sustenance and titrated up by additions of 500 mg each 1 to about fourteen days until an objective portion of 2000 mg every day is reached[20].

A later preliminary (TODAY Study), inspected the toughness of metformin in 699 patients 10 to 17 years old with T2DM. Following a 2-to half year run-in time of metformin monotherapy (target portion 2000 mg every day), patients were randomized to metformin alone, to metformin in addition to rosiglitazone 4 mg twice day by day, or to metformin in addition to way of life intercessions. The essential result, treatment disappointment, was characterized as a determinedly raised A1c focus (≥8%) over a time of a half year. Rates of treatment disappointment were 51.7% in the metformin gathering, 38.6% in the metformin in addition to rosiglitazone gathering, and 46.6% in the metformin in addition to way of life mediation gathering. Metformin in addition to rosiglitazone created a 25.3% lessening in treatment disappointment contrasted with metformin alone[22].

Conclusion

The case predominance of diabetes in the investigation done in Abidjan among youngsters and teenagers in the present day study was 0.4% altogether more subjects were seen with hyperglycemia from the rustic regions contrasted with the urban territories. Impeded fasting glycemic was seen in 14.5% of study members. A sizeable number of study subjects had diabetic guardians with dads being more influenced than moms. In 2006, International Federation of diabetes (IDF) assessed the quantity of kids with sort 1 diabetes to 4,40,000 with a yearly increment in 3% per annum and 70,000 newfound cases for every year. T2D in youth is a rising infection and is more forceful than T1D, the more typical diabetes structure in kids. The intricacies seen in T2D are broad, and numerous patients have unfriendly medical issues identified with diabetes at analysis. Because of its oddity, this illness isn't completely comprehended, and treatment choices past metformin and insulin are constrained.

Over the coming years, randomized controlled preliminaries are expected to test new and old medicines including blend treatments to characterize the best treatment choices for these patients. Further comprehension of the characteristic history of infection related comorbitities is required to decide ideal screening times and frequencies and better treatment alternatives must be made accessible. Lamentably, this will require some serious energy, which is something these adolescent don't have as they fight this ailment.

Non-Governmental Organizations (NGOs) have a

job in both anticipation and treatment. In India, NGOs use noteworthy power–much happens at the grass roots level to shield the young from the entanglements. NGOs additionally can help with the arrangement of multi-sectoral worldwide systems and partnerships to advocate for approach change, information age, and interpretation of research discoveries for policymakers. Scholastics and specialists ought to connect by improving exploration and reconnaissance frameworks and preparing youthful experts to handle these intricate issues. Needs incorporate network based investigations of essential counteractive action and recognizable proof of more secure and less expensive medications to anticipate diabetes when way of life mediation isn't achievable or falls flat; epidemiological and financial matters research and wellbeing frameworks and operational research.

India has adopted strides toward a coordinated strategy to diabetes aversion and control, yet these thoughts are not completely executed, somewhat on account of lacking subsidizing. Open private associations for executing better treatment choices.

Recommendation: Across the country mindfulness battles about diabetes in youth ought to be organized and where effectively existent ought to be heightened with the goal that the general populations are taught properly in regards to the indications of the malady and anticipation systems were pertinent. Endeavors are expected to teach people in general about diabetes hazard variables, anticipation, and confusions, utilizing clear and straightforward messages. Worldwide proof demonstrates that mindfulness fortifies national approach endeavors and improves wellbeing results. The media are starting to connect however could accomplish more. Legitimate child rearing is required for helping the kids to be free from diabetes. The guardians must concentrate more on the tyke's eating regimen plan and standard screening of the youngster's glucose level and rouse the kid to rehearse physical exercise and spurring them to transfer on more open air amusements than being on the cell phones and computer games.

The legislature should likewise find a way to avoid low quality nourishment publicizing on TV or different modes and furthermore spur cycling in younger students for better outcomes. To forestall diabetes through more beneficial weight control plans, India's dietary rules ought to be modified to reflect standards of endless infection counteractive action and wellbeing advancement; sustenance accessibility and reasonableness ought to mirror these rules through rural policies. The private segment can team up to execute a considerable lot of the anticipation situated legislative arrangements, through subsidizing, mastery in dispersion frameworks for arrangement of more advantageous nourishments (and minimal effort drugs for treatment), and market development empowering smart dieting and physical movement.

Prevalance of Stress among Medical Interns

Lakshita S.[1], Shanthi Edward[2], Gopala Krishnan S.[2], Thandapani R.[4]

[1]Post Graduate, [2]Professor, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Background: Temporary job in India alludes to the year after the undergrad restorative course and incorporates necessary pivots in prescription, medical procedure, obstetrics, genecology, and network medication. Therapeutic science is seen as a distressing instructive profession, and medicinal understudies experience immense pressure, which influences their intellectual capacity, down to earth life, and patient consideration. Recently graduated doctors who embrace a temporary job welcome that the entry level position is the most upsetting period in the life of a restorative specialist.

Objective: To survey the pervasiveness of self-saw worry among new restorative alumni during their temporary job preparing. To investigate the Method used to adapt to work place.

Method: A cross-sectional diagnostic illustrative examination was led on 60 restorative assistants from Sree Balaji Medical College and Hospital by helpful testing strategy. Information was gathered utilizing Perceived pressure scale poll and dissected by SPSS programming form 20.

Result: Our results demonstrated that the majority of the understudies were influenced by a moderate degree of stress (71.6%), trailed by high (16.6%) and low (11.6%) levels of pressure. Just 61.7% of the assistants took endeavours to ease the pressure.

Determination: An altogether abnormal state of pressure was found among the medicinal assistants, despite the fact that there was no critical contrast between the subgroups (male/female). High pressure may effectsly affect subjective working, learning, and patient consideration. Thus, therapeutic understudies need support and consequent mediations to adapt to pressure.

Keywords: *Medical assistants, saw pressure, adapt.*

Introduction

Temporary position in India alludes to the year after the undergrad restorative course and incorporates obligatory revolutions in drug, medical procedure, obstetrics, gynecology, and network medicine[1]. Recently graduated doctors who embrace a temporary position value that the entry level position is the most upsetting period in the life of a therapeutic specialist. Medicinal training has injurious outcomes. Learners (understudies, assistants, and inhabitants) endure large amounts of pressure, which lead to liquor and medication abuse[2]. relational relationship difficulties,[3] despondency and anxiety,[4, 5] and even suicide.

Stress is an abstract wonder that outcomes from an occasion that produces physical or mental torment. Stress is a typical piece of regular day to day existence; it might either be sound or unhealthy[6]. Healthy stress is useful as an adapting procedure to keep mindfulness, parity, and connection. Also, it can create attractive impacts, for example, resistance of uncertainty, self-assurance, and development, and it might animate the obtaining of information and skills[7] Stress may likewise hurt learners' expert viability: it diminishes consideration, lessens focus, encroaches on basic leadership aptitudes, and decreases students' capacities to set up solid doctor

Post Graduate, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

persistent relationships[8]. Great individual adapting abilities can counter the impact of worry to a limited degree, with the goal that the strain can be alleviated. Many studies have evaluated the impact of an unpleasant existence of an individual on the results of his profession, particularly in the medicinal field. The most negative effect on the inhabitants' feelings happens over and over amidst the temporary job year[9].

This examination tries to investigate the pervasiveness of employment related pressure and the strategies utilized by assistants to adapt to occupation stress.

1. To evaluate the degree of worry among understudies.
2. To give suggestive measures to defeat pressure.
3. To investigate the Method used to adapt to work place.

Materials and Method

Study design: This was a cross sectional examination done among 60 restorative assistants by helpful

Testing technique: Study Area and Population: The study was done in 60 restorative assistants from SREE BALAJI MEDICAL COLLEGE AND HOSPITAL. Out of the 60 PUBG players, 24 were guys and 36 were females. Assent was gotten from them before taking the overview. Consideration Criteria: All the medicinal understudies who were in the clinic.

Prohibition Criteria: All the individuals who are not medicinal understudies and the individuals who finished their CRRI

Test Size and Sampling Technique: A aggregate of 60 restorative assistants were taken as the sample estimate. The testing method is helpful inspecting.

Study Period: A time of one month June 2019 was taken.

Study Tool: Information was gathered utilizing Perceived pressure scale survey which is utilized to evaluate the degree of stress.

Stastical Analysis: SPSS programming variant 20 was utilized to break down the information.

Moral Approval: The endorsement for the examination was gotten from the Ethical board of Sree Balaji Medical College and Hospital. Educated assent was acquired from the subjects before filling the survey.

Findings: Of the 60 tests taken, 24 were guys and 36 were female therapeutic assistants. Out of them 71.6%(n=43) were influenced by a moderate degree of stress, pursued by 16.6%(n=10) by high pressure and 11.6%(n=7) were influenced by low degrees of stress. Just 61.7% (n=37)of the understudies took endeavours to calm the pressure. Among them 70%(n=27) of the understudies had the option to adapt up to the pressure. There was no noteworthy distinction between the subgroups (male/female).

Most respondents adapted to occupation worry through discussions with associates and companions/ family (62% and 48%respectively). 30%coped through undesirable dietary patterns.

It is obvious that almost 55% of understudies rest a lot to dispose of pressure. This rose out as the most overwhelming adapting technique, which is similarly favoured by guys and females. 'Communication with companions and use humour' was additionally favoured adapting procedure embraced by about 62% of the understudies. Barely any different systems like to drink espresso and tea was favoured by 38% of understudies.

Figure 1: Efforts made to relieve stress

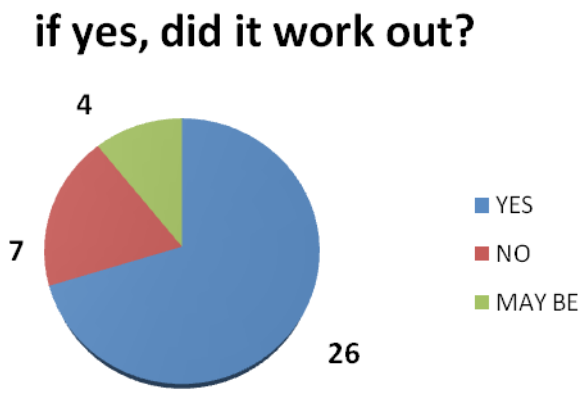

Figure 2: If yes, did it work out.

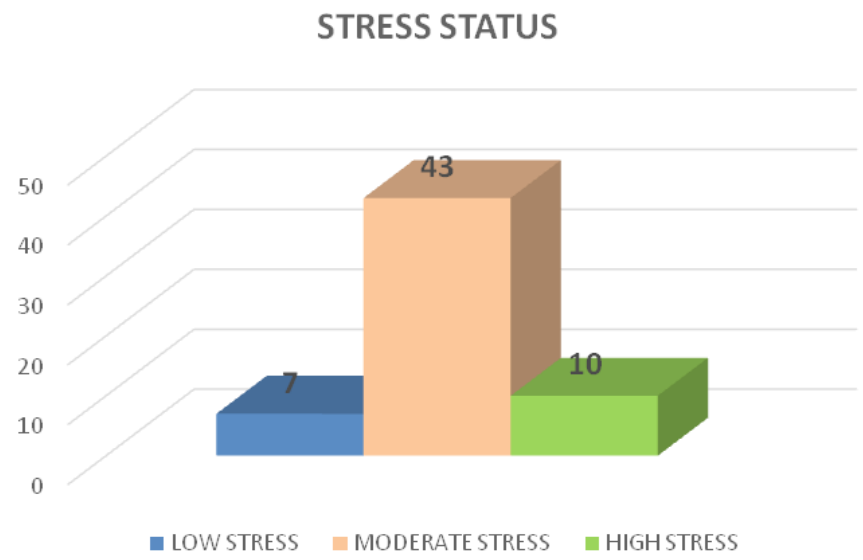

Figure 3: Status of stress

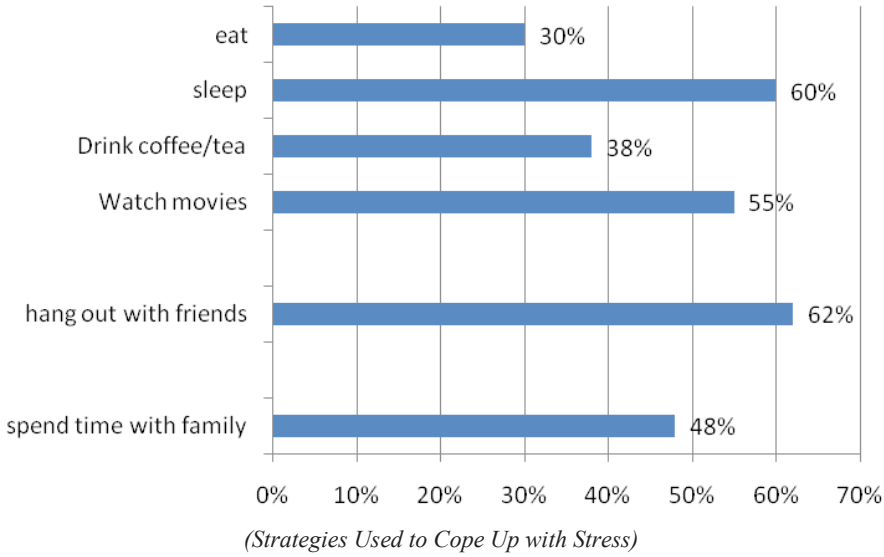

Figure 4: Strategies used to deal with stress.

Discussion

In this examination, 60 Medical understudies were taken as test. Level of pressure was estimated by taking an overview utilizing PERCEIVED STRESS SCALE questionnaire. The Perceived Stress Scale (PSS) is the most generally utilized mental instrument for estimating the impression of stress. It is a proportion of how much circumstances in a single's life are evaluated as stressful[10]. We can decide PSS score of every person. Individual scores on the PSS can go from 0 to40 with higher scores showing higher saw pressure.

- Scores extending from 0-13 would be viewed as low pressure.
- Scores extending from 14-26 would be viewed as moderate pressure.
- Scores running from 27-40 would be viewed as high pressure

While it might be contended that pressure is a characteristic piece of the way toward learning and aptitude securing and enables understudies to develop into develop, certain specialists - abnormal amounts of pressure involve worry as pressure not just diminishes consideration and focus along these lines disabling judgment limit; it additionally hinders arrangement of a remedial union among doctor and patient[10, 11].

A few examinations in different nations additionally proposed that remaining task at hand is a standout amongst the most significant hazard factors for pressure[12]. This might be because of superior desires, high working hours and remaining task at hand in residency programs. This demonstrates we should give more prominent consideration to remaining task at hand arranging and commonsense arrangements to decrease weakness and outstanding task at hand force during occupant preparing programs. No huge connection between age gatherings and stress was found. Likewise, no noteworthy connection among sex and stress was found.

Adapting techniques are characterized as how an individual responds or reacts to a pressure. Compelling and suitable adapting methodology may limit the effect of unpleasant circumstance on one's prosperity. Adapting procedures allude to explicit endeavors, both conduct and mental, that individuals utilize to ace, decrease, endure, or limit worry because of undesired occasions. 'Dynamic adapting' signifies making a move or applying endeavors to evacuate or bypass the stressor, while 'Acknowledgment' signifies tolerating the unpleasant occasion, 'Arranging' comprises of pondering how to face the stressor, 'Positive' reframing means making best of the circumstance by developing from it and 'Disavowal' is an endeavor to dismiss the truth of upsetting occasion and 'Conduct separation' signifies surrendering or pulling back endeavors to accomplish goal[13].

Conclusion

This investigation affirms that there is predominance of moderate to apparent worry among therapeutic understudies. 'Scholastic'- related issues are the more noteworthy seen stressors. Audit of scholastics and examination calendars and examples, better communication with the personnel and legitimate direction, mediation projects and advising for the focused on ones could assist a great deal with reducing worry in restorative understudies.

Stress influences inhabitants' personal satisfaction contrarily, which thus can impact on patient's social insurance and results. As indicated by the after effects of the present and past investigations, it is basic to give more consideration to inhabitants. Stress can be diminished by decreasing the outstanding task at hand and working hours, especially first and second year of residency. It tends to be directed by steady measures.

Prevalence of Food Allergy among Young Adults: A Cross Sectional Study

Janarthanan R.[1], Krishnakumar J.[2], Gopala Krishnan S.[3]

1Post Graduate, [2]Professor, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Chennai-73

Abstract

Nourishment hypersensitivity is an unusual resistant reaction to sustenance. The indications of the hypersensitive response may go from mellow to serious. They may incorporate irritation, swelling of the tongue, regurgitating, the runs, hives, inconvenience breathing, or low pulse. This ordinarily happens inside minutes to a few hours of introduction. At the point when the side effects are serious, it is known as hypersensitivity. Regular sustenance's included incorporate dairy animals' milk, peanuts, eggs, shellfish, fish, tree nuts, soy, wheat, rice, and natural product. The normal sensitivities shift contingent upon the nation. In the created world, about 4% to 8% of individuals have at any rate one nourishment sensitivity. Nourishment hypersensitivity (FA) pervasiveness has expanded in the most recent decades, yet epidemiologic investigations could show overestimated results.

The goal of this examination is to gauge the commonness of nourishment sensitivity in youthful adults; an online overview was disseminated to neighborhood college understudies. An investigation was directed; selecting a grown-up populace matured 18–35 years. In the primary stage, members addressed a self-regulated poll for nourishment sensitivity screening. Around 100 grown-ups finished survey. Announced FA happened in 19 (19%) subjects, and the more continuous references were cow's milk, pork, organic products, shrimp, and vegetables. The principle sustenance's were natural products, trailed by bovine's milk, shrimp, fish, and vegetables. Side effects, for example, tingling, hives and swelling were the real indications found in the general population who had nourishment hypersensitivity and is for the most part brought about by milk, shellfish, peanuts and vegetables. Out of 19% individuals with sustenance sensitivity just 4% of the general population use epinephrine infusion and 8% felt successful.

Keywords: *Food allergy, Prevalence, Epidemiology, Allergy. epinephrine.*

Introduction

Sustenance hypersensitivity is an antagonistic safe reaction that happens reproducibly upon contact with predetermined nourishment. Sustenance Allergy recurrence has expanded by 18% over the most recent 10 years, however predominance concentrates dependent on self-revealed Food Allergy demonstrate a high natural and individual impression of Food Allergy. In this specific circumstance, the target of this examination is to evaluate the pervasiveness of Food Allergy in youthful grown-ups, utilizing a survey to attempt to decrease misperceptions about FA response[1,2].

Approach: The examination plan - cross sectional investigation. Subjects of age bunch 18 to 35 were chosen. All members were educated about this investigation, and marked assent was gotten. An example space of 100 youthful grown-ups will be taken by arbitrary testing strategy. The pervasiveness and the side effects of Food allergy was evaluated utilizing an online questionnaire. The information gathered was about sexual orientation, age, any atopy (history of rhinitis, atopic dermatitis, and asthma), and detailed FA and unfavorably susceptible

Corresponding Author:
Janarthanan R.
Post Graduate, Department of Radiodiagnosis, Sree Balaji Medical College, Bharath Institute of Higher Education and Research, Agharam Road, Selaiyur, Chennai-73

indications identified with sustenance, including the kind of nourishment and the side effects experienced. This survey gave increasingly point by point inquiries regarding the nourishment engaged with the FA response, related side effects, and the beginning of the FA response. The subsequent information is analyzed statistically[3, 4].

Consideration criteria: every one of the individuals will's identity present upon the arrival of study and the individuals who consent to take an interest in the examination will be incorporated.

Avoidance Criteria: The individuals who don't give assent will be barred.

Results

A sum of 100 people reacted to the overview. Nineteen (19%) of 100 respondents announced they had a known nourishment sensitivity or likely had an unfavorably susceptible response inferable from a sustenance. These 19 respondents responded to further inquiries concerning their response qualities and were incorporated for further examination. 19 respondents revealed side effects that fulfilled the criteria for hypersensitivity. The most widely recognized manifestations announced for every sustenance are definite in Figure 1.

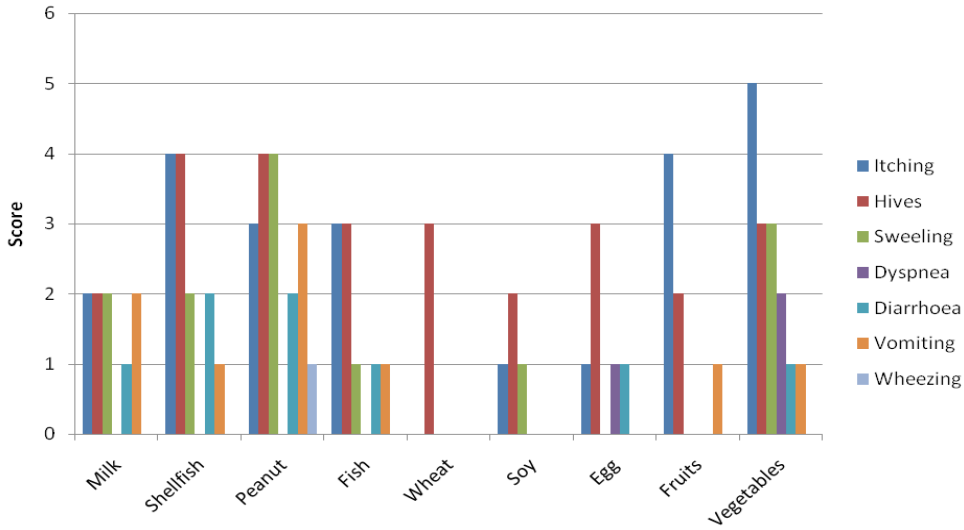

Figure 1: Scores for different causes for various eatables.

Only 15 (15%) of 100 reported that a physician informed them of this. Foods reported as Food allergens are given detailed in **Figure 2**. Milk (14.3%), Shellfish (21.4%), peanut (25%), Fish (14.3%), Wheat (3.6%), Egg (10.7%), Fruits (14.3%) and Vegetables (25%) and other foods (32.1%) were significantly more commonly reported foods symptoms of anaphylaxis.

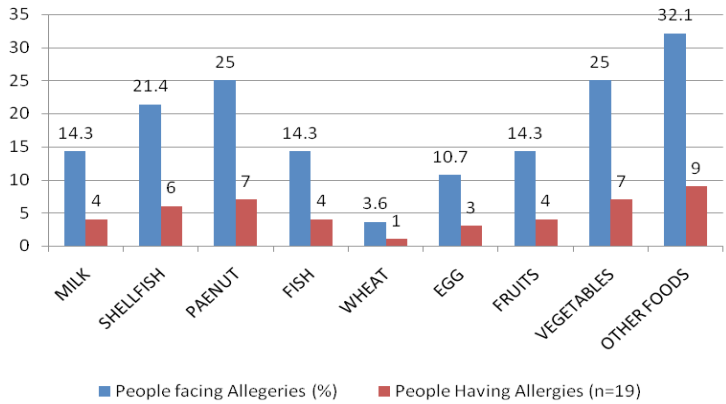

Figure 2:

Out of the people who reported with food allergy only 4.5 % of the people required an Epinephrine injection 95.5 % did not require an Epinephrine injection as shown in Figure 3. About 6 % found that epinephrine injection was not effective and 5 % find it moderately effective and 4 % find it highly effective as shown in Figure 4.

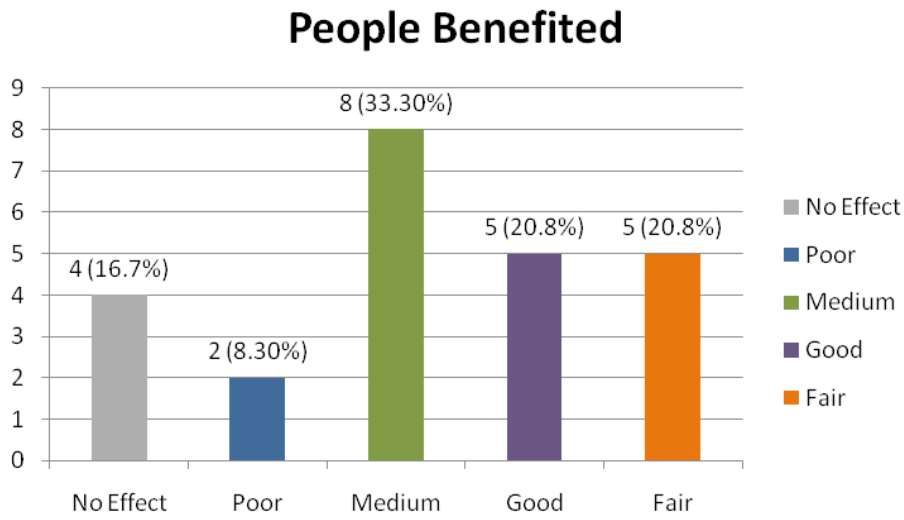

Figure 4:

Discussion

Around 100 finished surveys with marked assent structures were gotten. There was critical male sexual orientation prevalence of 58% and female sex around 42 % in these returned things. Announced Food Allergy happened in 19 (19%) polls and around (81 %) had no sustenance hypersensitivity. The nourishments embroiled in the Food hypersensitivity, the side effects related with a sustenance response. A few different nourishments were referred to in the overviews, everyone in limited quantities. A Food sensitivity response to Milk was referred to 4 (14.3 %); shellfish was 6 (21.4%), Peanuts was 7 (25%), Fish was 4(14.3 %), wheat was 1 (3.6%), Egg 3 (10.7%), Fruits was 4 (14.3%) and Vegetables was 7 (25%). About 16% of the surveys were determined to have sensitivity by human services supplier. Out of the 19 individuals with sustenance sensitivity 18 of them had nourishment hypersensitivity from adolescence and 1 had turned out to be susceptible to nourishment after high school. Surveys with nourishment sensitivity had encountered side effects, for example, tingling, hives, and swelling, and dyspnea, looseness of the bowels, heaving and wheezing. Out of these side effects tingling, hives, swelling and retching were increasingly normal. Out of the 19% individuals with nourishment sensitivity 4 % individuals required an epinephrine infusion and 25 % felt it was not powerful and 33.3% felt it was reasonably compelling and 41.6 % discovered it exceedingly viable.

Late work has assessed the commonness of sustenance sensitivity in young people to be roughly 2.3%. In spite of the fact that it is obscure whether this is likewise a similar rate of sustenance hypersensitivity among understudies entering school, this number likely speaks to a nearby gauge. As per the latest US registration information, there were roughly 10.9 million full-time understudies in the United States, yet this figure increments to 17.5 million if low maintenance understudies and non-multiyear organizations are included.17 If an all the more generally cited number for the pervasiveness of nourishment hypersensitivity in youngsters and adolescents is utilized (4% to 8%), when extrapolated, this would appraise around 436,000-700,000 school matured understudies who may have sustenance allergies. This gives some gauge proof that there may be significant on-grounds atopic ailment, including sustenance sensitivity. Inside our populace, we feature a few issues. The low rate of detailed upkeep of any crisis prescription, including SIE, is disturbing. Warning examples demonstrate that nearby grounds contacts, grounds wellbeing administrations, and eating administrations are regularly not made mindful of these understudies' nourishment allergies.

Presently, universities probably won't be prepared to deal with the requirements of understudies with sustenance sensitivity. Given our discoveries, we see proof that grounds eating administrations would profit by guaranteeing that nourishments are plainly marked for fixing content, changing readiness territories to evade cross-defilement, and giving sans allergen sustenance's on solicitation. So also, it may be fitting for college wellbeing administrations to screen people for sustenance hypersensitivities through admission frames before the understudy's landing on grounds. This will better recognize such people for further training and give intermittent follow up to confirm that SIE medicines are being conveyed consistently.

Conclusion

As indicated by this investigation predominance of sustenance hypersensitivity has diminished yet this examination has impediments, the way that it was directed in universities, yet these constraints don't nullify the information. Another significant point is identified with those people who rejected a particular nourishment or a gathering of sustenance's after one disengaged response; since they had no reproducible response in a rehashed sustenance admission, the analysis of FA by our survey was unrealistic and could have diminished the assessed pervasiveness. Be that as it may, even in the clinical methodology, reproducibility is one of the real mainstays of FA determination. Taking everything into account, after utilization of a particular survey to perceive likely IgE-interceded FAs, a low recurrence of FA was considered in this populace. Utilization of a coordinated poll controlled via prepared analysts could be an option for epidemiological IgE-intervened FA concentrates to accomplish progressively precise outcomes.

Prevalence of Alcohol Consumption among Medical Students in Kancheepuram

Sathish T.[1], Mohan Kumar[2], Gopala Krishnan S.[3]

[1]MBBS III Year Student, [2]Professor, [3]Professor & HOD, Department of Community Medicine, Sree Balaji Medical College & Hospital

Abstract

Background: Dependence on liquor remains a noteworthy social and monetary issue, to some extent as a result of the high inspiration for liquor that people show and the risky gorge consumption this advances. The connection between liquor use in teenagers and youthful grown-ups and results has not been generally explored in India. The point of the present examination was to comprehend the present status of drinking conduct of youth changing into adulthood.

Aim: This article gives data on the Awareness and Prevalence of liquor use among undergrads in a urban territory of Kancheepuram.

Method: A cross-sectional examination was directed among 100 undergrads in a urban region of Kancheepuram from April 2019–June 2019. A self-managed survey was given and the outcomes were classified and dissected. The information was entered in exceed expectations sheet and examined utilizing SPSS programming. Moral board of trustees freedom has been acquired.

Results: Out of 100 understudies, 72 were guys and 28 were females. About 73% of the understudies are not devouring liquor and 89% know about maladies brought about by alcoho l.27% of the understudies are liquor purchasers.

Conclusion: It was seen that about 75% of the understudies are not drinking liquor and know about infections brought about by it. Understudies ought to be given mindfulness about the harm brought about by liquor to physical and emotional wellness.

Keywords: *Prevalence, mindfulness, liquor use.*

Introduction

Mixed refreshments, the most across the board and socially acknowledged psychoactive substances in all age bunches more than 15, and their maltreatment is named unsafe to wellbeing[1, 2]. Tobacco and liquor are among the principle hazard factors for sudden passing and grimness in Europe [3, 4]. In a 2013 positioning of the main 25 driving wellbeing danger factors on the planet, tobacco and liquor were in the second and sixth spot, separately[5]. Liquor is a substance utilized by young people in right on time and late adolescence, causing a genuine general wellbeing concern[6, 8]. Medical issues are not only the space of individuals dependent on liquor, as they are likewise seen among individuals who misuse liquor on a transitory or infrequent premise[9]. Cutoff points of liquor utilization have been received by numerous nations to recognize dangerous drinking; over these breaking points, individuals are presented to a more serious danger of encountering negative wellbeing impacts. The breaking points as a rule vary somewhat among nations and societies and, as on account of Slovakia; there might be no official definition for the unadulterated liquor substance of standard beverages[10].

The degree of liquor utilization has social, good,

Dr. S. Gopala Krishnan
Professor, Department of Community Medicine, Sree Balaji Medical College and Hospital, Chennai

religious, and financial determinants, as depicted in various distributions[11]. Liquor utilization differs enormously relying upon sex, age, and area. Investigation of the writing regarding the matter shows that the size of liquor utilization and the determinants and results of its maltreatment are territories important to numerous writers. The consequences of distributed research affirm that hazardous liquor utilization is seen in youthful grown-ups.

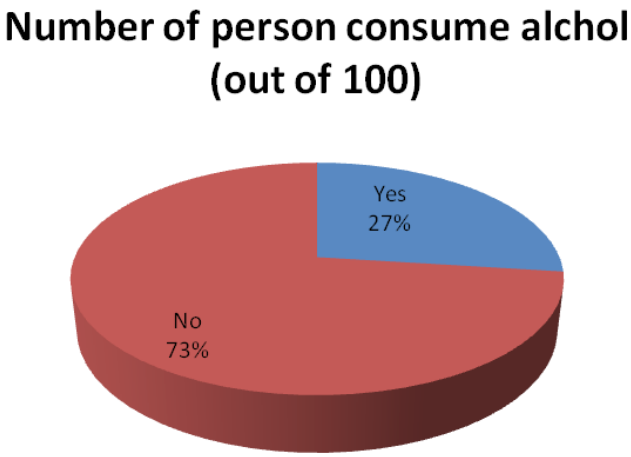
Materials and Method

The investigation was done in a urban territory of Kancheepuram locale. It is a cross sectional expressive examination.

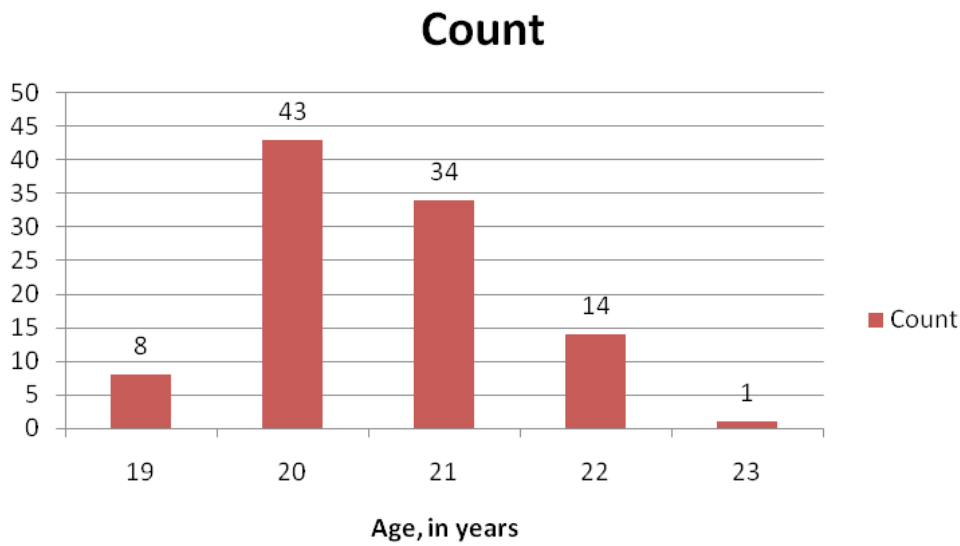
A pretested organized poll is utilized which incorporates questions dependent on predominance and consciousness of liquor utilization. It is a self managed poll.

It was done among understudies concentrating in 3 unique universities inside the age gathering of 17-23 years (100 understudies approx). The testing technique utilized here is Probability corresponding to size (PPS).

Incorporation criteria: Students among the age bunch 17-23 were incorporated into the examination.



Rejection criteria: No avoidance criteria.



The information gathered and the investigation will be finished utilizing Microsoft Excel and SPSS programming.

The examination was directed during the period April 2019–June 2019.

The investigation was affirmed by the institutional Ethics Committee, Sree Balaji Medical College and Hospital

Findings:

If yes, why do you drink alcohol containing beverages.

Options	Percentage (%)
Stress relief	22.2%
occasions	40.7%
Cool thing to do	25.9%
other	11.1%

	Yes	No	May be
Is it good for health	11%	75%	14%
Awareness of diseases caused by alcohol	89%	5%	6%

Discussion

Liquor, likewise known by its concoction name ethanol, is a psychoactive substance that is the dynamic fixing in drinks such as lager, wine, and refined spirits (hard alcohol). It is one of the most established and most regular recreational substances, causing the trademark impacts of liquor inebriation. Liquor creates a state of mind lift and happiness, diminished nervousness, expanded amiability, sedation, impedance of subjective, memory, engine, and tactile capacity, and summed up sadness of focal sensory system work.

Consequently the present examination was led to survey the predominance and attention to liquor utilization among undergrads in Chennai, Tamil Nadu. In the present examination, a critical extent had not expended liquor (73%students) and they know about its belongings (89% understudies). The report says that regarding 30 percent of India's populace, only not exactly 33% of the nation's people–devoured liquor regularly[3].

Rather than our discoveries, contemplates in different nations indicated higher predominance rates of liquor use. An investigation from Russia found that 75% of the men drank spirits [9], while a Thailand consider which was done among subjects who were matured 12-65 years, demonstrated the predominance of current consumers to be 28.6% [7]. An examination which was done in Finland demonstrated the commonness of perilous drinking to be 5.8%. The distinction which was seen in pervasiveness might be because of contrast in the presentation status of related hazard factors in various topographical areas. From the outcomes, it very well may be deciphered that the vast majority of the understudies don't drink liquor containing refreshments and know about ailments brought about by it

Conclusion

The investigation finished up with 3/fourth of the understudies are not liquor purchasers and they know about maladies brought about by liquor use. Be that as it may, there are still misinterpretations with respect to the hazard in liquor utilization. Consequently, the school experts and the others concerned should approach to structure mindfulness battles to support the understudies.

Study on Increase in Usage of Alcohol among College Students

Jeevan Prakassh B.[1], Krishna Kumar[2], Gopala Krishnan[3]

[1]MBBS III Year Student, [2]Professor, [3]Professor & HOD, Department of Community Medicine, Sree Balaji Medical College & Hospital

Abstract

Foundation: Liquor is a main source of worldwide torment. Levels of utilization are raised among college understudies. In this manner, this writing survey means to outline the flow investigate on liquor utilization among undergrads. A large number of these youthful understudies will be uncovered, during this transitional period, to considerable changes in living plans, socialization gatherings, and social exercises. This sort of progress is regularly connected with unsafe conduct, for example, inordinate liquor consumption. And now in India there is progressively utilization of liquor among the school and college understudies in the ongoing years generally from 2010.

Techniques: In May and June 2019 a poll was given to school and ace understudies. The review took a gander at drinking conduct, social association, drinking standards, and positive drinking results. By utilizing the questionnaire reactions from different undergrads were recorded for examination.

Results: Around 100 examination populace were selected, with age going from 17-29 of the two students and post graduates undergrads. Discovered that the more an understudy was presented to school lodging ecological variables, the more prominent the danger of overwhelming, continuous, and harsh drinking. Liquor utilization expanded for understudies living on grounds, living in an imparting space to a higher number of flat mates, and having been in the school for a long spell. About 10% of understudies have revealed that they have an overwhelming day by day use of liquor in the school inns. These days the is increment in utilization of liquor on account of a purpose behind to attempt in any event once among the vast majority of the undergrads. What's more, through the review about 56.6% understudies have flushed liquor atleast once. Among these 81% were guys and 19% were females.

Conclusion: Instructive and school experts need to recognize colleges' obligation in connection to their understudies' drinking conduct and to invest in help a situation of dependable drinking. It has been generally expanded use among the two guys and females among the understudies

Introduction

India's notoriety for being a nation with a culture of forbearance particularly in issues in regards to liquor is underserved. Alcohol utilization is of impressive general wellbeing concern and a main source of worldwide enduring. Of specific concern are the medical problems and social impacts related with its utilization[1]. Examples of liquor utilization extend among mainlands and nations. Ongoing figures from the World Health Organization (WHO) exhibit that the European Region is the heaviest savoring district the world. By the European area our asian locales have higher liquor consumption[2].

Raised degrees of liquor utilization among youthful grown-ups matured 18–29, of which college understudies speak to an extraordinary populace, is of specific concern[3]. Research proposes that understudies today drink more, with expanding accentuation on hard-core boozing and intoxication than among prior ages.

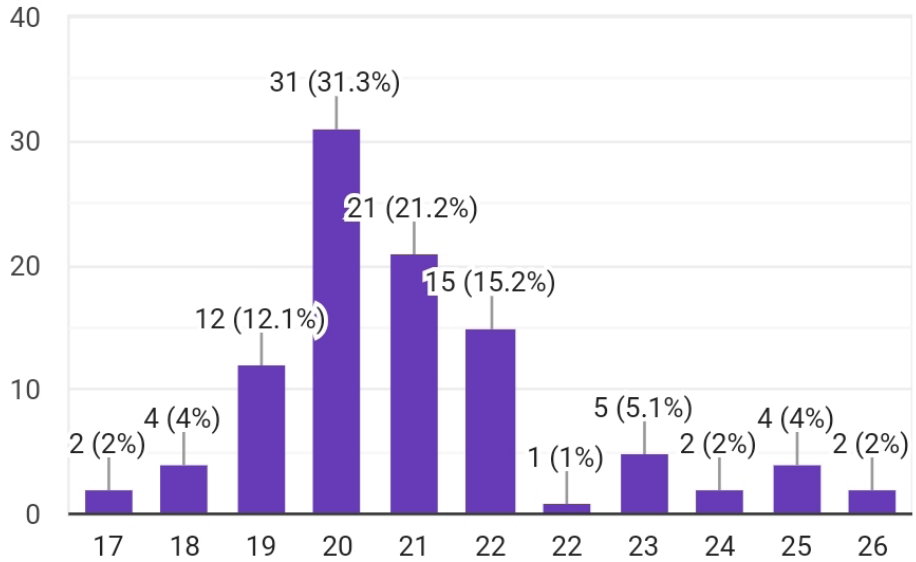
There has been a quick multiplication of city bars and dance club lately and individuals are quick shedding its hindrances about liquor as a direction for living. This situation has prompted fears of an undocumented ascent in liquor maltreatment among all areas of society.

The expanding utilization of liquor and its beverage related issues has just risen as a noteworthy general wellbeing worry in India and which should be addressed[4]. A vast greater part of male consumers meet criteria for risky liquor use, characterized as examples of utilization that expansion hazard for hurtful ramifications for the client or others. Along these lines, in this examination we have worried on liquor abuse and its related issues related with individual issues.

Materials and Method

The present investigation was a cross sectional examination which was led through a survey given to the understudies in Chennai universities and encompassing schools from April 2019 to may 2019. Moral clearance was acquired.

Inclusion Criteria: Colleges understudies who had given their assent for the examination both male and females.



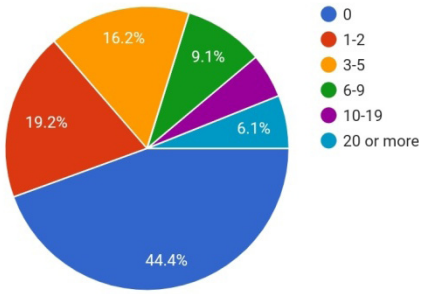
Exclusion Criteria: Understudies who does not give their assent for the examination and those are not willing for interest

Sample Size: No of tests for the exploration is 100

Data Collection: An organized survey to be utilized for liquor utilization which incorporate socio statistic subtleties, characters of individual to the liquor, mental and physical conduct questions. Composed educated assent was acquired preceding information accumulation.

Data Completion and Analysis: Information section and investigation was finished utilizing SPSS adaptation 22 programming. Distinct measurements were determined for foundation factors and the pervasiveness of liquor addiction. What's more, engaging measurements and rate was determined from the got information.

Findings: An aggregate of 100 understudies were taken on the investigation. The mean age of the examination members was 21 years. The predominance of liquor addiction among the examination members was 56.6. Among the 100 members 19 were females and 81 were guys.



The Mean Age Limit of The Study Comes As 21±

Table 1: Socio-Demographic Characteristics of Study Populaton

Characteristic	Percentage
Education:	
1. 1st Year College	13.2%
2. 2nd Year College	12%
3. 3rd Year College	49.5%
4. 4th Year College	12%
5. Internship	5.8%
6. Postgraduate	7.5%

Here the 44.4% indictes no of persons who doenot consume alcohol even once. Rest all indicates the no of percentage the students have taken alcohol atleast once in their life.

The above pie chart denotes the number of % students consumed alcohol (No. of times).

Alcohol consumes characteristics: Among the study population females who consume alcohol comes as 5%, 51.6 % were males who consume alcohol. In this the quantity of alcohol intake varies among the study population as by which 200ml or more intake of alcohol comes as 17.2%, and 100-200ml as 23.4% population.

This shows that about 40% of alcohol consumers intake about more than 100ml once everytime. And about 33.3% people who take alcohol without knowing to their parents in which 1/3rd population intake alcohol without knowing to their parents alone in college hostels or in parties etc.,

Table 2: Represents the Characteristics of Alcohol Intake of Study Population

Alcohol Intake [No. of Times]	
1. 0	44.4%
2. 1-2	19.2%
3. 3-5	16.2%
4. 6-9	9.1%
5. 10-19	5%
6. 20 or More	6.1%
Quantity of Intake	
1. 50 ml or Less	37.5%
2. 50 to 100 ml	21.9%
3. 100 to 200 ml	23.4%
4. 200 ml or More	17.2%
Last Day of Intake	
1. 1-7 Days	15.2%
2. 8-14 Days	10.1%
3. 15-30 DayS	12.1%
4. 1 Month-1 Year	14.1%
5. Never Drink	48.5%
Whether Known to Parents (About Alcohol Consumption)	
1. Yes	19.2%
2. No	33.3%
3. Don't Drink	47.5%

Discussion

Liquor abuse is one of the real general medical issues in both created and creating nations[5]. The 32nd World Health Assembly announced that "issues identified with liquor and especially to its unnecessary utilization rank among the world's real general medical issues and comprise genuine risks for human wellbeing, welfare and life" [6]. The World Health Organization (WHO) assessed that there are around two billion customers of mixed drinks and 76.3 million individuals with diagnosable liquor use issue worldwide[7]. The consequences of the present investigation demonstrated that the mean age of the purchasers at the commencement of expending mixed refreshments was 21± Years, which is consider to be a noteworthy hazard factor among the examining school going students[3]. There is an extreme increment in the utilization of liquor among the understudies up and coming days as a reason of pride and pleasure.

In the present investigation, the predominance of liquor addiction was 56.6% which was equivalent to before concentrates done in parts of southern and northern India delighting the pervasiveness of liquor use to be from 33% to half and 25% to 40% individually[3]. The general past examination pervasiveness of liquor use was 30-35per penny, 48-53 percent among male understudies and 4-6 percent among female understudies[8-10]. The previous two decades has seen an expansion in female liquor consumption and a concentrated exertion on promoting liquor legitimately at youthful female ladies. Handling liquor related damage among college undergrads and the all inclusive community does not have a solitary arrangement but rather requires a suite of activities. The school social condition builds drinking

through a blend of social exercises and regulating and persuasive desires. It puts understudies in danger of successive and injurious drinking since understudies anticipate positive social results, due to social exercises, for example, pre-gatherings, and due to injunctive and expressive drinking standards. Numerous types of extreme drinking cause generous hazard or mischief to the person. These incorporate abnormal states drinking every day, rehashed scenes of toasting inebriation, and drinking that makes an individual liquor subordinate. Accordingly, the recognizable proof of consumers with different sorts and degrees of in danger liquor utilization has an extraordinary potential to decrease a wide range of liquor related damages[11]. This recommends social learning is a key factor that adds with the impact of the school social condition on drinking conduct, as found somewhere else.

Conclusion

One of the key contentions for limiting the utilization of liquor, and notwithstanding disallowing it, is the damage it can cause for wellbeing: the significant article in the Indian constitution alludes to preclusion as a general wellbeing measure as opposed to one to do with convention or profound quality. Specialists caution that drinking is on the ascent in India, and that the greater part of the individuals who drink do as such to a risky degree. A well-arranged across the nation program for the avoidance and control of this social pathology is required. The present investigation was embraced with the destinations to distinguish the examples of liquor admission among various understudies and to survey the clinical indications of ceaseless destructive liquor use so it may be useful in arranging, usage, and assessment of suitable projects for the disposal of this social abhorrence. Mindfulness among the populace and important restoration and self improvement projects will help in cutting down the predominance of liquor addiction. Appropriate mindfulness among the understudies and legitimate standards in the school grounds can control the utilization of liquor both among male and females. Schools need along these lines to recognize their job in this issue and to subscribe to bring down introduction to unreasonable liquor utilization. Specifically, they have to join staggered systems: individual, gathering, and association level, from a network wellbeing advancement point of view.

Awareness about Breast Cancer and its Risk Factors among College Students

Shwetha Gowthaman[1], Swetha N.B.[2], Gopala Krishnan S.[3]

[1]MBBS Student, [2]Assistant Professor, [3]Professor and HOD, Department of Community Medicine, Sree Balaji Medical College and Hospital

Abstract

Background: Breast Cancer has turned out to be one of the main sources of death in many nations. It is a standout amongst the most widely recognized diseases influencing ladies. Whenever analyzed at a prior stage it very well may be dealt with. Many hazard elements lead to bosom disease. Mindfulness about the hazard components and strategies for screening among ladies can be a successful method for handling the malady at a previous stage and lessen dreariness and mortality.

Point: The point is to consider the consciousness of bosom malignancy and its hazard factors among understudies.

Strategy: This cross-sectional investigation was led in a urban territory of Chennai among the female undergrads of age bunch 18-25 years. An organized poll was utilized for the investigation that included information, practice and mentality questions. The inquiries assed the hazard factors for bosom malignant growth and a couple of general parts of it. An example of 205 youthful grown-ups is taken by advantageous inspecting strategy.

Result: Many understudies thought about bosom malignant growth and its hazard factors. 204 out of 205 understudies thought about it and 158(74.1%) realized that bosom malignant growth is the most predominant disease among ladies. Lion's share realized the conceivable hazard factors separated from family ancestry. Over 72.7% of understudies thought about bosom self examination.

Conclusion: Thus we finish up from this investigation that the female understudies know about carcinoma of bosom and its hazard factors. Still there is more mindfulness required among the uneducated pieces of the nation.

Keywords: *Breast self examination, mammography, prevention, screening.*

Introduction

The development of mankind has been a productive occasion with real innovations and revelations. The requirement for survival has constantly kept people considers potential approaches to beat any obstacle. Finding a fix to the deadliest illnesses has been the primordial objective. A standout amongst the most pulverizing reasons for sick wellbeing is the uncontrolled development of cells in the body that if unnoticed can prompt passing. Malignant growth has ended up being one of the main sources of mortality. In this manner mindfulness about malignancies is urgent theme of discourse.

The weight of malignant growth around the world: There were 14.1 million new cases and 8.2 million malignant growth related passings worldwide in 2012. The quantity of new malignancy cases every year is relied upon to ascend to 23.6 million by 2030[1]. Breast malignant growth is the second reason for disease worldwide and the fifth reason for malignancy mortality

Corresponding Author:
Dr. S. Gopala Krishnan
Professor, Department of Community Medicine, Sree Balaji Medical College and Hospital, Chennai

around the world[2]. By the year 2030 the general weight of bosom malignant growth is relied upon to cross 2 million, with expanding extents from creating nations[3].

In India: With over 0.8 million new cases and 0.5 million passings happening every year in India malignancy commonness is assessed around 2.5 million[4]. In guys the basic locales for disease in India are oral cavity, lungs, throat and stomach and among females cervix, bosom and oral depression. Among ladies in India Breast malignancy represents 19-34% of all disease cases[5-7]. According to National Cancer Registries and Regional Cancer Centers, it is the commonest disease among ladies in Delhi, Mumbai, Ahmedabad, Kolkata and Trivandrum[5-9]. In the other disease libraries, it is recorded as the second most across the board malignancy among ladies. There is an expansion in the frequency of bosom malignant growth as per the information from national and provincial malignancy focuses from 1984 to 2002 and furthermore observed to be bit by bit overwhelming disease of the cervix[5-7]. Only when the infection is genuinely best in class a large portion of the patients look for restorative counsel. In addition 70% of the cases report for symptomatic and treatment benefits in cutting edge phases of the malignancy,this outcomes in poor survival and high death rates[10]. Early Breast Cancer (EBC) establishes 60-70% of cases in the created world,while it comprises just 30% of the bosom malignant growth cases seen at various disease focuses in India[11]. Compared to 0.25 in North America in India the rate/mortality proportion is 0.48[12].

There are many hazard factors for creating bosom malignant growth that incorporate heftiness, absence of physical exercise, drinking liquor, hormone substitution treatment during menopause, ionizing radiation, early age at first feminine cycle, having kids late or not in any manner, more established age, earlier history of bosom disease, and family ancestry[13]. An audit of the writing uncovers that low bosom malignant growth proficiency as to hazard factors among Indian ladies, independent of their social, financial and instructive foundations, alongside little connection between's mindfulness levels and quality of proof of the hazard factors[14]. High death rates are because of hindrances, for example, 'low disease mindfulness', otherwise called 'mindfulness deficiency' or 'shortage of mindfulness' among ladies, the nearness of shame, dread, sexual orientation imbalance and diminished commitment in screening practices, similar to bosom self-examinations[15]. Breast self-examination (BSE) is a screening strategy for the most part used to identify early bosom malignancy. This technique includes the lady herself taking a gander at and feeling each bosom for potential knots, twists or any swelling.

Counteractive action remains the foundation of the battle against bosom malignant growth internationally. Despite the fact that counteractive action strategies have been proposed, many stay difficult to reach to ladies in creating nations who need them the most. Bosom self-examination (BSE), in spite of the fact that hasn't demonstrated to be powerful in decreasing mortality,[16] is still prescribed as a general way to deal with expanding bosom wellbeing mindfulness and accordingly possibly take into consideration early identification of any inconsistencies[17].

It is basic that Indian ladies know about both modifiable and non-modifiable hazard factors for bosom malignant growth to receive proper practices for counteractive action. Powerful country and state-widecancer education projects are the need of great importance just as commitment with network level associations and the wellbeing framework[18]. Preparing on the most recent proof with respect to bosom malignant growth and its hazard components ought to be offered to all human services suppliers and network specialists to raise their disease proficiency so they would then be able to transmit this information to different segments of the general public so mortality levels lessen and early finding is encouraged. Proceeding with therapeutic instruction programs that accentuation on bosom malignancy in the educational programs of nursing at institutional level and other medicinal services preparing establishments ought to be a need for ladies' wellbeing in the nation[14].

This examination centers around the learning of young ladies over bosom malignant growth and its hazard factors. A youthful populace of ladies was an able examination bunch as it would make more mindfulness and furthermore helps in the early analysis. Since they are the future age its increasingly powerful on the off chance that they are the objective populace. Numerous investigations have been directed on ladies in different parts yet the measure of information that they have is low because of their absence of mindfulness. The more the mindfulness made the lesser the losses of life because of malignancy.

Materials and Method

This is an expressive cross-sectional examination.

It was led among 205 female undergrads in the age gathering of 18 to 25 years during the period of May 2019 to July 2019. Advantageous example technique was utilized and 205 female understudies' reactions were gathered during the recommended examination time frame. Information was gathered subsequent to acquiring Institutional Ethical Committee Clearance. A pre-tried, organized poll was self directed in the wake of getting educated assent from the members. The poll comprises of information, frame of mind and practice questions with respect to carcinoma of bosom, the hazard factors; bosom self examination and clinical examination of bosom. The poll was passed to understudies doing building, law and expressions in different universities of Chrompet. The inquiries were alluded from a survey that was obtained from http://www.cancerjournal.net/articles/2017/13/2/pictures/JCanResTher_2017_13_2_268_188433_sm12.pdf. The Likhert scale was utilized for the disposition questions. There were an aggregate of 26 inquiries in the survey. Incorporation Criteria-All understudies who gave assent. The information gathered was entered in an exceed expectations sheet and broke down utilizing SPSS programming and results displayed as tables and figures.

Findings: The information was gathered and examined utilizing SPSS programming, with a sum of 205 reactions. The time of investigation of the understudies from various school caries from the first to last and furthermore incorporates assistants, with 116 (56.6%) of understudies from third year. This is trailed by 30(14.6%) understudies from definite year and 24(11.7%) understudies from first and second year. There are an aggregate of 11(5.4%) understudies. Table 1 demonstrates the reactions given by the undergrads when posed inquiries to evaluate their insight on bosom malignancy. The learning level was great among them about the infection. At the point when asked in regards to any individual influenced in their family with bosom malignancy an aggregate of 161(78.5%) understudies addressed No, while 40(19.5%) addressed Yes. Figure 1 delineates that books and media were the commonest wellspring of data of bosom malignancy. Figure 2 incorporates the reactions given when they were gotten some information about the commonest age gathering influenced by bosom malignancy.

Figure: 3 portrays the learning of hazard factors among the understudies. The vast majority of them realized that family ancestry of bosom malignancy was a hazard factor alongside hormonal treatment, overweight, unpleasant life and so forth.

Discussion

Bosom malignant growth is a standout amongst the most widely recognized sorts of disease influencing ladies, it is likewise one of the real reasons for death. On the off chance that it is analyzed at a beginning period it very well may be dealt with and death rates decline. This investigation is to test the learning of female understudies about carcinoma of bosom and furthermore will in general make mindfulness among them. Realizing the hazard variables help in the early conclusion. On the off chance that individuals know about the hazard factors and the manifestations, at that point passings because of malignant growth can be decreased. Bosom self examination encourages them asses their bosoms and encourages them in recognizing any variation from the norm, along these lines they can approach the specialist at a quicker pace. Clinical bosom examination is done once there is a variation from the norm noted during bosom self examination. A normal self examination demonstrates as a lifeline. Numerous understudies thought about bosom malignancy and its hazard factors. 204 out of 205 understudies thought about it and 158(74.1%) realized that bosom malignant growth is the most common disease among ladies. Over 146(71.2%) knew the manifestations and dominant part realized the conceivable hazard factors separated from a family ancestry. Despite the fact that 72.7% of understudies thought about Breast self examination just 50.7% practice BSE.

Numerous investigations have been done over the consciousness of bosom malignancy and its hazard factors. A comparable report was done among the school understudies in Turkey by Özgül Karayurt et al in which 718 female understudies were surveyed. Similarly as in this investigation the bosom self examination was noteworthy with the time of study. While 65% had little information about BSE in that review there is a noteworthy increment in the learning about BSE with a 80%. The outcomes demonstrated that a large portion of the understudies had little information of the bosom malignant growth hazard factors. The most generally realized hazard factors by the understudies were close to home history of bosom disease (68.7%) and family ancestry of bosom malignant growth (67.0%). As it were, understudies knew that bosom malignant growth was related with hereditary components, which positively affects bosom wellbeing among youthful women[19]. In logical inconsistency to that numerous understudies thought about the hazard factors with lion's share of them mindful about a large portion of the variables.

Another comparative examination was led among the female college of Malaysia by Muhammad A Hadi et al, 200 members were incorporated into the investigation from various divisions. Like the past examination referenced, the outcomes demonstrated that by far most of the female college understudies had lacking learning of bosom malignant growth. The mean all out learning score of the understudies was 60.7%. Indian understudies had altogether less learning of bosom malignancy contrasted with their Chinese and Malay partners ($p<0.05$). Be that as it may, in excess of two third of the understudies knew about bosom self examination (BSE) and clinical bosom examination (CBE) proposals. Besides, the understudies had positive observations towards the treatment results of bosom cancer[20]. But in logical inconsistency to that the understudies in this investigation were very much aware about the hazard factors and bosom disease. They were additionally especially mindful about the bosom self examination and there is likewise a smart thought about clinical bosom examination with 76%.

An investigation by Victoria Paecey et al calls attention to the general low learning about bosom disease around the world. This study examined on the consciousness of bosom malignant growth hazard factors in college understudies from 23 nations somewhere in the range of 1999 and 2001. Information were gathered on attention to joins with heredity, liquor use, work out, stoutness, stress, smoking and diet. Very nearly 33% of ladies didn't know that any of these components impacted bosom cancer[3]. There was impressive universal variety, with most abnormal amounts of mindfulness in understudies in the United States of America (USA)[21]. At long last in the present examination when the understudies were inquired as to whether they will make mindfulness among the overall population about mindfulness about bosom disease it was a certifiable answer with a 100% willing to spread mindfulness.

Conclusion

In this manner from this examination we can reason that the female understudies know about disease of bosom and its hazard factors. There is additionally significant learning about bosom self examination and clinical examination of bosom, while the act of bosom self examination ought to be energized. The primary thought is to advance early identification by making

more mindfulness. In spite of the fact that in the urban regions individuals are to some degree mindful there ought to be more mindfulness made in different pieces of the nation. This can diminish the death rates by early conclusion.

Awarness and Acceptance of HPV Vaccination among School Teachers: A Cross Sectional Study

Divya Reddy V.[1], Krishnakumar J.[2], Gopala Krishnan S.[3], Thandapani R.[4]

[1]MBBS Student, [2]Assistant Professor, [3]Professor and HOD, [4]Assistant Professor of Statistics, Department of Community Medicine, Sree Balaji Medical College and Hospital

Abstract

Background: Since most cervical malignancy cases are brought about by determined high-chance human papillomavirus contamination, learning of HPV among teachers is basic for the forestall of cervical disease. This investigation was meant to survey information among teachers about HPV and its relationship with cervical disease, and to evaluate their acknowledgment of HPV inoculation. Most cervical malignant growth cases are brought about by diligent high-hazard human papillomavirus contamination. HPV contamination is explicitly transmitted, and most HPV diseases are transitory and asymptomatic, and cleared by body's invulnerable reaction without treatment, co-components to the suspected infections are essential. Current clinical rules suggest screening ladies matured 30 and more seasoned utilizing a Deoxyribonucleic corrosive (DNA)- based HPV test. This test is likewise prescribed for ladies of all ages with irregular cytology results. Accordingly, advancing attention to HPV and its connect to cervical malignant growth among explicitly dynamic ladies is basic for the clinical routine with regards to HPV-DNA test in cervical disease screening.

Techniques: An example of teachers working in the establishments at Adyar, chennai between april 2019 and june 2019 finished a poll.

Results: An aggregate of 50 polls were appropriated, and 48% of teachers just know tat all malignant growths are not preventable. In any case, 72% realize that cervical malignancy is preventable by immunization. 74% of teachers realize that the causative living being of cervical disease is infection. cervical malignancy inoculation is accessible in india is known by 62% of teachers. 64% level of teachers are eager to take the HPV immunization and 78% think its safe. The snag which is keeping them from taking up the immunization in 54% of teachers is deficient data.

Conclusion: Albeit the majority of the teachers need fundamental learning about HPV, in any event 64% of teachers are eager to take the HPV antibody. General wellbeing endeavors to instruct the teachers and open about HPV and its association with cervical malignancy ought to be reinforced and extended.

Introduction

Cervical malignancy or the carcinoma of cervix is the second most basic kind of disease found in ladies around the world. In creating nations, including India, it is the most widely recognized malignant growth causing demise in ladies. In India, consistently 1,22,800 ladies are determined to have cervical malignancy and practically 50% of them kick the bucket from the malady. Indian ladies face a 2.5% combined lifetime chance and 1.4% aggregate passing danger from cervical malignant growth. Alarmingly, about 6.6% of ladies in the all inclusive community are assessed to harbor cervical HPV disease. Late location because of nonexistent or deficient screening choices and inaccessible or unreasonably expensive standard

Corresponding Author:
Dr. S. Gopala Krishnan
Department of Community Medicine, Sree Balaji Medical College and Hospital, Chennai

treatment has highlighted the issue in creating nations. The HPV serotypes 16 and 18 represent about 76.7% of cervical malignancy in India. The illness is a colossal weight on society as it devours assets at a stunning rate in the method for medicinal, nonmedical spending, and lost efficiency. As per late ICMR discoveries, passings because of cervical malignant growth in India have expanded quickly during the most recent 2 years[1, 2].

Most cervical disease cases are brought about by persevering high-chance human papillomavirus contamination. HPV contamination is explicitly transmitted, and most HPV diseases are brief and asymptomatic, and cleared by body's resistant reaction without treatment, co-elements to the suspected infections are important. Current clinical rules suggest screening ladies matured 30 and more established utilizing a Deoxyribonucleic corrosive (DNA)- based HPV test. This test is additionally suggested for ladies of all ages with anomalous cytology results. In this manner, advancing consciousness of HPV and its connect to cervical malignant growth among explicitly dynamic ladies is basic for the clinical routine with regards to HPV-DNA test in cervical disease screening. The acknowledgment of HPV immunization will be relied upon to rely upon components, for example, learning of HPV disease and its connect to cervical malignancy[3].

In any case, levels of HPV mindfulness among the overall public are poor all through the world. Orderly survey of concentrates from a few nations recommends that solitary 15–31% of respondents have even known about HPV, paying little heed to age, while just 0.6–11% realize that HPV is a hazard factor for cervical disease The aftereffects of this investigation may help control the plan and improvement of mediations and battles to sharpen ladies to HPV contamination and inoculation, in this manner decreasing occurrence of cervical malignancy[4].

Despite the risk presented because of cervical malignant growth, numbness, and less adequacy of screening just as of immunization is a major test in the counteractive action of the illness. In perspective on this, the present investigation was attempted in Chennai to evaluate the mindfulness about cervical malignant growth and, acknowledgment of HPV immunization among teachers[5].

Materials and Method

Study plan: All members give educated composed agree to participate in our examination. Solid teachers working in the foundations in Adyar, Chennai between april to june 2019 were welcome to take a solitary surve. To be taken a crack at the investigation, teachers must most likely read the poll without anyone else and comprehend it all alone or with the assistance of staff, they were given the paper-based survey to finish independent from anyone else and after that arrival to staff.

Study Area and Population: The investigation is done in the organizations in Adyar,Chennai among the teachers. An example size of 50 educators were taken and were approached to fill the poll.

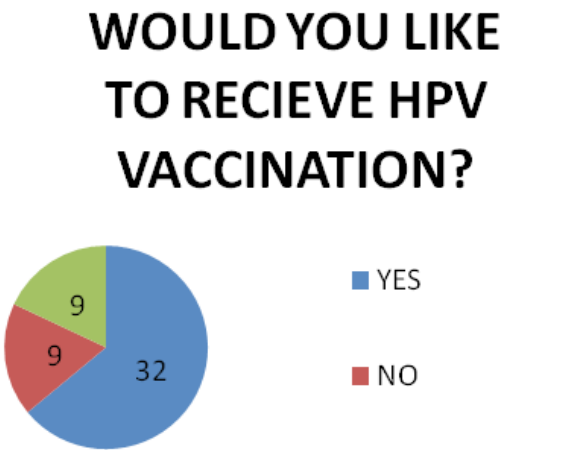
Incorporation Criteria: 50 educators were chosen haphazardly from the organizations in Adyar, Chennai.

Rejection Criteria: Individuals other than teachers were rejected.

Test Size and Sampling Technique: 50 educators were chosen haphazardly from the organizations in Adyar, Chennai and were approached to top off the poll.

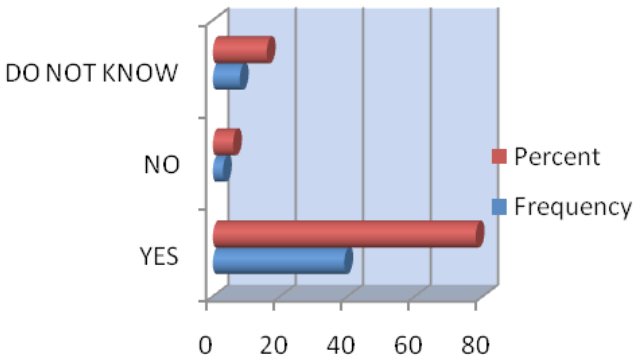
Study Period: To conceal the example size of 50 contemplate period taken was 2 months from April to June 2019.

Study Tool: A poll was readied and 50 teachers were arbitrarily chosen to top off the structure.



Measurable Analysis: The gathered information was broke down utilizing SPSS adaptation 20.

Moral Approval: The endorsement for the examination was acquired from the moral council of Sree Balaji Medical College And Hospital. Educated assent was gotten was acquired from the teachers before filling the poll.



Findings: An aggregate of 50 surveys were disseminated among the teachers working in and around the foundations of Adyar, Chennai. Among the 50 teachers, Only 24 educators (48%) realize that all malignant growths are not preventable. 74% of teachers are very much aware about the cervical cancer which I have examined through specific inquiries in the questionnaire. 72% of the teachers realize that cervical disease is preventable by vaccination. But just 62% of the educators know about the accessibility of cervical malignant growth immunizations in India. But just 64% of teachers are happy to take the HPV inoculation. The

hindrance which is keeping them from taking up the immunization in 54% of teachers is lacking data about the antibody.

Is cervical cancer preventable?	Frequency	Percent	Valid Percent	Cumulative Percent
Yes	36	72.0	72.0	72.0
No	8	16.0	16.0	88.0
Do Not Know	6	12.0	12.0	100.0
Total	**50**	**100.0**	**100.0**	

Do You Think HPV Vaccination is Safe?

Discussion

We found that educators who took an interest in the exploration had some thought regarding hpv and hpvinoculation. For the most part, most respected an immunization to avoid cervical malignancy and most educators said they would consent to have themselves inoculated. Most had a solid conviction that antibodies avoid infections.

Lion's share of members in our investigation was very much aware of the preventable idea of cervical malignant growth. A large portion of them thought about its viral etiology[6]. An examination led by Saha et al in Kolkata, India uncovered a low degree of mindfulness among the alumni and postgraduate understudies about this significant general medical problem. Another as of late distributed poll based examination led to discover mindfulness about the hazard factors for cervical disease among the informed youth in India, Sri lanka and Nepal. The normal mindfulness in such manner was observed to be cervix malignancy was 66% in India, 58.8% in Nepal and 57.7% in Srilanka. The thing that matters is on the grounds that the populace thinks about by us are understudies in restorative calling, which isn't the impression of all inclusive community. Mindfulness with respect to the accessibility of immunization against cervical disease in an investigation directed among ladies going to routine gynecological consideration in Belgium was just half. We found that restorative training definitively affected the comprehension of this significant general medical problem, concerning etiology, of cervical malignant growth, accessibility of the antibody and its defensive viability. Be that as it may, there were practically identical mindfulness with respect to target populace for inoculation and antibody dose among the controls. In general acknowledgment of HPV antibody among the populace contemplated was 64%. The real hindrances to execution of HPV immunization programs in our nation as referenced by Bhatla N et al included cost, worthiness, absence of open mindfulness and foundation, worry about obscure symptoms and social and religious boundaries. In their survey article by Bharadwaj at el, surprising expense of the immunizations was expressed as the real worry for mass inoculation program in India. Lion's share of members concurred that most significant deterrent in execution of HPV immunization program in our nation is deficient data[7].

According as far as anyone is concerned present investigation is the principal activity to discover the degree of mindfulness around one of the right now most examined point of cervical disease immunization, among the future human services suppliers. The other quality of our investigation was that we didn't stop at simply discovering the mindfulness and frame of mind rather in our second session we attempted to instruct and educate them. This sort of useful session to the open personalities quickly following the interrogative session, as we would see it will have a constructive effect.

To close HPV immunization for essential counteractive action of cervical malignancy is a generally new idea. Wellbeing expert will most likely assume a critical job in promoting this procedure. Our scholarly educational program in the therapeutic schools

needs to concentrate more on such high need pragmatic up and coming issues. Better comprehension of the real preventive general medical problems by medicinal services experts will be proliferated well in the general public. Every single medicinal understudy (today) won't be instructors in therapeutic schools, however they are the reliable sources to the general public brimming with data in this web period.

Can Yoga and Meditation Mitigate Physical and Emotional Fluctuations in Perimenopausal Women

Swathi S.[1], V.M. Anantha Eswar[1], S. Gopala Krishnan[2]

[1]Student, [2]Professor, Department of Community Medicine, Sree Balaji Medical College and Hospital, Chennai

Abstract

Background: Perimenopause is the menopausal progress which starts quite a long while before menopause. There is progressive decrease in ovarian capacity because of which ladies experience different indications influencing their personal satisfaction. Serious side effects are being overseen by Hormone Replacement Therapy [HRT] which is related with entanglements including danger. Subsequently elective treatments are expected to adapt to the manifestations. Yoga is one among the most usually utilized integral techniques for menopausal side effects.

Technique: A cross sectional comparitive investigation was done in the urban territory of Kancheepuram locale among 120 perimenopausal ladies inside the age gathering of 35 to 55 considered into two gatherings as ladies normally rehearsing yoga not rehearsing yoga by irregular inspecting strategy. An organized poll including the MRS scale is appropriated and reactions gathered in the wake of acquiring educated assent. MS Excel is utilized for information examination.

Result: The investigation of the gathered information uncovered an essentially less score on all the subscales among ladies rehearsing yoga and contemplation normally than among ladies not rehearsing yoga. Yoga as a compelling elective treatment to diminish menopausal indications is entrenched through the examination. A huge connection between span of rehearsing and control in the menopausal manifestations is likewise reported.

Conclusion: Yoga and reflection rehearsed normally can be powerful in dealing with the troubling manifestations of menopause and improving the personal satisfaction among perimenopausal ladies.

Keywords: *Perimenopausal Quality of Life, MRS scale, Alternative treatment.*

Introduction

Perimenopause-progress to menopause, denoting the finish of conceptive life is a significant occasion in the life of ladies, related with different regenerative and hormonal changes. Starting with the beginning of menstrual inconsistency and completion with a year of amenorrhea the perimenopausal stage is constantly connected with a few side effects influencing the personal satisfaction of ladies. These indications run from: physical-hotflushes, night sweats to passionate moodswings, depression[1].

Menopause is generally expected to occur between 40-55 yrs and quite a while before menopause denotes the perimenopause. Perimenopause and menopause are characteristic and a sound piece of a ladies' life and are not diseases. It is a time of hormonal changes stamping physical, mental and neuroendocrine maturing in ladies and loss of richness. Perimenopause isn't the equivalent in each person. Thus numerous ladies are uninformed of these progressions occurring in their body and spend their significant long periods of life attempting to adapt up to menopausal side effects. Hence it is imperative to make them mindful of measures to control these manifestations to improve the nature of life[2, 3].

Corresponding Author:
Dr. S. Gopala Krishnan
Professor, Department of Community Medicine, Sree Balaji Medical College and Hospital, Chennai

Materials and Method

An engaging cross sectional similar examination was done in the urban territory of Kancheepuram area including 120 ladies of perimenopausal age gathering (35-55yrs). Members are chosen by helpful examining and partitioned into two gatherings. 60 ladies who rehearsed yoga consistently and another 60 who did not rehearse any types of yoga were chosen. Every one of these subjects fulfilled the incorporation criteria of:

Avoidance criteria were:

1. Ladies not willing to give assent
2. Ladies with careful menopause and getting any sort of hormone treatment
3. Dynamic mental issue or some other therapeutic issue.

Moral freedom was acquired from the institutional audit board and educated assent was gotten from the members before the examination.

Subjects were from nearby network and an organized survey was utilized which incorporated their menopausal indications for which MENOPAUSAL RATING SCALE was utilized, specifics about the yoga or reflection rehearsed, length, recurrence, and for ladies not rehearsing yoga-explanations behind not rehearsing.

Findings: For examination, out of the 120 reactions, the gathering comprising ladies not rehearsing yoga is recognized as the CONTROL GROUP, and the other gathering of ladies rehearsing yoga consistently are distinguished as YOGA GROUP. Members had a place with age bunch between 35 to 55 years. The mean period of lady associated with the investigation displaying menopausal side effects was 45±5.7. The biggest classifications of ladies were between 35 to 40 years in yoga gathering and between 46 to 50 years in control gathering.

Joint and solid torment is the transcendent manifestation in all respects seriously influencing the control gathering pursued by physical and mental weariness. Around thirteen percent of ladies is influenced by extremely serious joint and strong agony. Around 33% of ladies from control gathering background extreme hot flushes, night sweats and discouragement. Rest unsettling influence, tension, peevishness and dryness of vagina are additionally moderate concerns influencing one fifth of the control gathering. Different side effects of bladder incontinence, hindered memory, heart manifestations are being milder grievances.

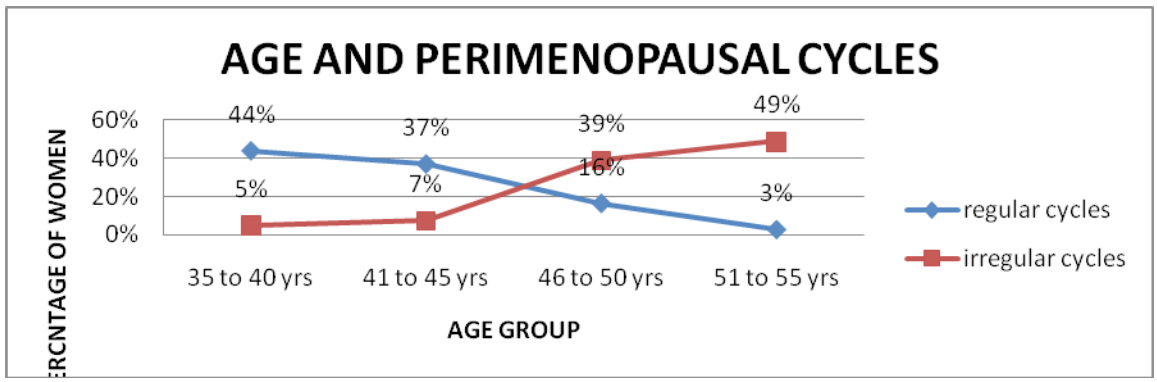

Figure 1: Association of age to perimenopausal cycles

Each subscale of the MRS scoring is additionally thought about between the gatherings. [Table1.2] Psychological and somatovegetative indications are similarly experienced by all ladies, the main distinction being they influence ladies with higher seriousness in the control gathering and lesser seriousness in the yoga gathering. Urogenital manifestations influence just in milder levels nearly in the majority of the ladies. The all out MRS score correlation unmistakably demonstrates the viability of yoga as an elective treatment in treating menopausal side effects in the perimenopausal ladies. In excess of 90% of the ladies of the yoga gathering has answered to encounter just milder indications while around 50% of ladies in the control gathering knowledge moderate to serious manifestations and extreme side effects can likewise not be led off the image in the

control group. [table 1.3] A noteworthy connection can be built up between impact of yoga on somatovegetative indications and impact of contemplation on mental symptoms. [figure 6] ladies rehearsing just yoga had a lesser soma to vegetative subscale score than mental score and on the other hand ladies rehearsing just reflection had a lesser mental score than somatovegetative score, inferring on the impact of yoga on manifestations like hot flushes, rest unsettling influences, rest issue, joint agonies and impact of reflection on menopausal gloom, touchiness, nervousness

Age is also associated with the severity of menopausal symptoms.[Figure2] As women ages they experience more severe symptoms of menopause. The increase in the MRS score implies the increase in severity of symptoms as age advances.

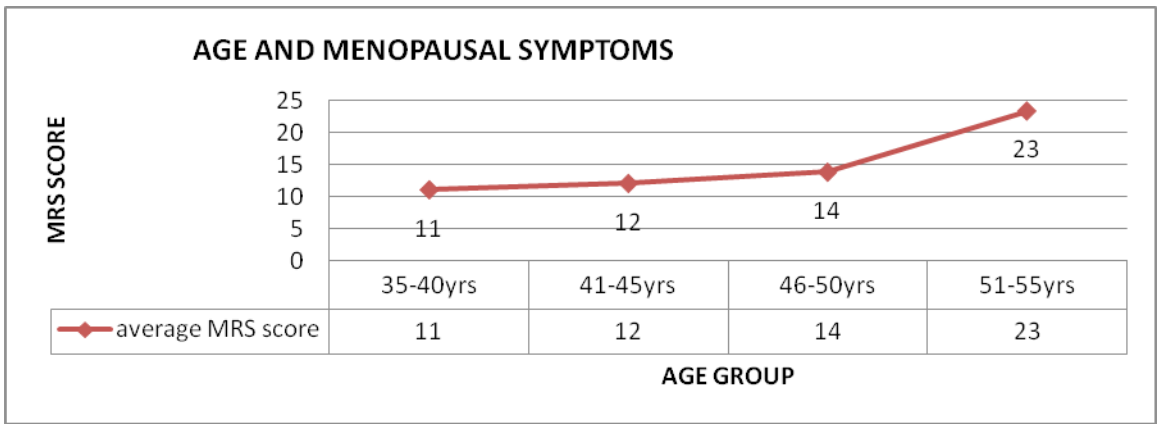

Figure 2: Association of age and severity of symptoms

The prevalence of psychological, somato vegetative and urogenital domain symptoms and the comparison between the groups were analysed. Table 1.1 shows the frequency and percentage of women experiencing the various grades of menopausal symptoms.

Table 1: Frequency and Percentage Table of Women Experiencing Grades of Menopausal Symptoms

Dryness of vagina	16(27%)	44(73%)	19(32%)	12(10%)	17(28%)	1(1%)	7(12%)	1(2%)	1(2%)	2(3%)
Joint and muscular pain	0(0%)	8(13%)	5(8%)	32(27%)	23(38%)	20(17%)	24(40%)	0(0%)	8(13%)	0(0%)
Average	**15(25%)**	**35(58%)**	**17(28%)**	**20(19%)**	**16(27%)**	**5(4%)**	**10(17%)**	**0(1%)**	**2(2%)**	**0(0%)**

Women belonging to yoga group were enquired regarding the particulars about practicing yoga. Of which 61% of women practiced both yoga and meditation, 22% of women practiced only yoga and 17% of women practiced only meditation. Table 2 gives the frequency of practicing yoga therapy and most of the women included in the study practiced yoga daily or for about 3 times a week regularly.

Table 2: Frequency of practicing yoga therapy

	No (%)
Daily	40 (67%)
More than 3 times a week	8 (13%)
2-3 times a week	10 (17%)
weekly once	2 (3%)

Table 3: Variables regarding yoga practise

Duration of Practising in a Day	Less than 30 mins no. (%)	30-45 mins no. (%)	1 Hour no. (%)	More than an hour no. (%)
Yoga	9 (18%)	34 (68%)	5 (10%)	2 (4%)
Meditation	12 (26%)	35 (74%)	0 (0%)	0 (0%)
Reasons given by women for taking up yoga therapy	General fitness 43%	To reduce anger levels 10%	To reduce stress and depression 13%	To reduce body weight 17%
Reasons given by women of control group for not practising yoga	Time restraints 58%	Not interested 12%	Not aware of the need or importance 30%	

Table 4: Time period of practicing and MRS score- comparison

Time since practicing (% of women)	Average MRS score
1-4 months (3%)	15.5
4-8 months (13%)	6.75
8-12 months (23%)	5.64
More than a year (60%)	5.25

A critical finding of this examination is that the time length of rehearsing yoga treatment likewise significantly affects menopausal symptoms.[table 4]. Ladies who rehearsed yoga for over a year had a lesser mean MRS score than ladies who began rehearsing yoga for only 1 to 4 months. It is obvious that rehearsing yoga for 4-8 months consistently itself demonstrates a checked abatement in the seriousness of menopausal side effects experienced. The consequences of the examination presumed that there is a critical improvement in the personal satisfaction experienced by ladies of the yoga bunch when contrasted with ladies of the control gathering.

Discussion

Numerous such comparable examinations have been directed all around the globe in different time allotments, among perimenopausal ladies and menopausal ladies about the side effects and its treatment with hormone substitution treatment or elective treatment. An investigation led among the North Indian sub populace uncovered An altogether higher % of perimenopausal ladies (36%) demonstrated a Psychological score of ≥7; while a higher % of postmenopausal indicated Somatic score and Urogenital score ≥7[8]. Another investigation including the number of inhabitants in Uttarkhandrevelaed. An increment in the level of event and seriousness of manifestations with change to menopause was watched. The most predominant side effect was muscle and joint agonies (55.81%), trailed by inclination tired or absence of vitality (51.19%), and feeling miserable or discouraged (36.43%)[9]. One examination led among the ladies of Kerala demonstrated the mean time of achieving menopause was 48.26 years and Only 22.4% of ladies knew the right aim of menopause[10]. One concentrate incorporated the use of different elective treatments like utilization of herbs like ginseng, licorice root, wholesome tablets, phyto-oestrogens, loosening up back rubs, needle therapy etc[11]. Investigations of this benevolent underlined on the need of measures to fix the irritating side effects among ladies. Adequacy of yoga on menopausal indications has been examined in numerous examinations. One such examination finished up a fundamentally more prominent level of reduction in Perceived Stress Scale scores (P G 0.001,) in the yoga gathering contrasted and controls with a higher impact estimate in the yoga gathering (1.10) than the

control (0.27) and demonstrated that impact sizes were higher in the yoga bunch for all factors[12]. A deliberate survey study discovered moderate proof for momentary viability of yoga for mental indications in menopausal ladies[13]. A randomized clinical preliminary revealed that the yoga gathering had essentially lower post treatment scores for climacteric side effects and a sleeping disorder seriousness and higher scores for personal satisfaction and obstruction period of stress when contrasted and the control gathering and the decrease in a sleeping disorder seriousness in the yoga gathering was fundamentally higher than that in the control and detached extending groups[14].

Conclusion

Identifying perimenopause early and making safeguard strides won't just assistance encourage a smoother change, however lay the preparation for better wellbeing, parity, and vitality in the years following menopause. Yoga isn't just an approach to keep up physical wellness and capacity, the training encourages us oversee pressure, which is a noteworthy supporter of hormone awkwardness. Yoga postures can diminish numerous regular menopausal side effects, for example, hot flashes, temperament swings, and rest disturbances. Thus from every one of these examinations we can reason that our well established treatment, Yoga, a free-of-cost noninvasive strategy, is genuinely viable in giving physical, mental, and passionate medical advantage and is firmly prescribed to all ladies of menopausal age.

Correlation between Gastrointestinal Disorders and Stress among it Professionals

Harshan R.[1], Krishnakumar J.[2], Gopala Krishnan S.[3]

[1]MBBS Student, [2]Assistant Professor, [3]Professor and HOD, Department of Community Medicine, Sree Balaji Medical College and Hospital

Abstract

Background: Gastrointestinal disorders have become the leading cause of disterss in the recent years. This is due to the change in the food style and altered eating habits. Working hours, job related and emotional stress also contribute making gastroenterological problems the second largest cause of distress next to psychological problems. This is significant in the information technology professionals which makes it a problem to be looked into.

Point: to find the correlation between gastrointestinal disorders and stress among the people working in information technology sector. To assess the food intake pattern and the state of health of the alimentary system. To find out the stress levels of people working in information technology sector. To find a link between the gastrointestinal disorders and the stress in them

Technique:

Study zone: Chennai, Tamil nadu

Study populace: Male and female IT experts over the age of 22 years

Study test: An example space of 140 IT experts is taken by helpful inspecting strategies

Study technique: Cross sectional distinct investigation

Incorporation Criteria: All the individuals who gave assent

Avoidance Criteria: People with history of past stomach medical procedures. Information Collection An organized poll will be utilized which comprises of inquiries relating to gastro esophageal reflux illness, peptic ulcer, and stoppage. This likewise incorporates parts of emotional well-being and the workplace of subjects.

Measurable Analysis: Data will be associated in Microsoft Excel and examination performed utilizing SPSS.

Result: The reactions to the survey were examined it was discovered that a huge extent of the examination populace had gastrointestinal misery, and it was discovered that their workplace, mental state and way of life was a contributing variable to those scatters.

Conclusion: It is accordingly finished up from the investigation that individuals working in IT segment have increasingly gastrointestinal issue and there is a pressing need to spread mindfulness on the crumbling gut wellbeing so they don't confront future wellbeing complexities and personal satisfaction can be improved by basic measures and way of life alterations.

Introduction

The world is always loaded up with steady changes. New advancements are being created constantly for the improvement and help of human race trying to make life

simpler. Therefore individuals are in an uncontrolled flood for new revelations and a mission to satisfy it stays since days of yore. Data Technology is a sprouting field and the biggest wellspring of work in urban regions particularly in metropolitan urban areas which discovers new prospects with its Herculean and enormous labor. Because of its magnetic guarantees in salary and way of life, individuals work day and night neglecting to take legitimate consideration of their wellbeing, particularly the gut. Skipping suppers, eating undesirable sustenance from cafés because of their tight work routine has supported in the improvement of various issue, for example, GERD, Acid peptic diseases(duodenal and gastric ulcers) and obstruction.

Added to this, flighty dozing hours, insufficient rest, work related pressure and strain ads to the previously mentioned illnesses. Individuals additionally use over the counter drugs to handle these issues which makes conclusion and treatment troublesome as years cruise by. Useful gastrointestinal ailment is a standout amongst the most successive findings made by gastroenterologists. By definition, an irregularity in gut capacity is suspected as the reason for the side effects, however no basic or biochemical variation from the norm can be related to utilization of the standard tests. Our destinations in the present investigation were to[1] decide the analytic worth scores got from the writing in correlation with side effect score models got from our past approval examine, [2] decide if manifestations could recognize a mental illness, somatoform clutter, from practical gastrointestinal infection.

The pervasiveness of gastroesophageal reflux ailment (GERD) ranges from 10% to 30% in the number of inhabitants in Western nations. There is lack of information with respect to the size of the issue in India. GERD as an illness element has differed introductions. The side effects may not associate with the endoscopic picture. The patients may present as any of the accompanying:

1. Common acid reflux and reflux indications with endoscopic proof of mucosal damage.
2. Indications of indigestion and reflux however a typical upper gastrointestinal endoscopy
3. No esophageal reflux indications however proof of mucosal damage on upper gastro esophageal endoscopy.
4. Atypical manifestations, for example, dyspepsia, hack, asthma, and so forth.

Corrosive peptic illnesses result from particular however covering pathogenic instruments that commonly include corrosive impacts on lessened mucosal resistance. Conditions, for example, indigestion, harm the esophageal mucosa, and furthermore possibly cause laryngeal tissue damage with ensuing improvement of pneumonic side effects. A peptic ulcer is histologically characterized as a mucosal deformity that stretches out to or past the muscularis mucosa, with mucosal harm because of pepsin and gastric corrosive emission. Most ulcers happen in the stomach and proximal duodenum while less generally in the lower throat, the distal duodenum or the jejunum.

Corrosive related issue impacts the personal satisfaction and profitability of burdened patients and is normal and significant reasons for bleakness and mortality. Roughly 40% of grown-ups in the USA gripe of month to month, 20% of week after week, and around 7% of day by day indigestion, making gastroesophageal reflux infection (GERD) one the most widely recognized gastrointestinal (GI) issue with resultant expenses of more than US$10 billion every year. In spite of a declining rate inferable from expanded utilization of annihilation treatment against Helicobacter pylori, peptic ulcer infection (PUD) burdens a few million individuals in the USA consistently.

Stoppage alludes to solid discharges that are inconsistent or difficult to pass. The stool is regularly hard and dry[4]. Other manifestations may incorporate stomach torment, swelling, and feeling as though one has not totally passed the solid discharge Blockage may result from a few causes including a terrible eating routine, poor entrail propensities, or issues in end of stool, regardless of whether physical, practical, or deliberate.

- Difficulty in beginning or finishing defecation
- Infrequent and troublesome entry of stool
- Passing hard stool after delayed stressing

The typical recurrence of defecations in grown-ups is between three every day and three every week Inferable from most of populace in urban zones working in IT industry, this examination intends to draw out the predominance of practical entrail issue in this populace.

Materials and Method

This is an unmistakable cross-sectional investigation, which was directed among 140 IT experts working in Chennai arranged in the southern piece of Tamil Nadu from the period of April to June 2019. Helpful example strategy was utilized and 140 reactions were gathered during the recommended investigation time frame. Information was gathered subsequent to acquiring Institutional Ethical Committee Clearance. An organized survey was self managed subsequent to getting educated assent from the members. The poll comprised of statistic subtleties, physical action, smoking and drinking propensities, eating design and the kind of nourishments they like, questions identified with GERD, for example, indigestion and spewing forth, question to recognize duodenal and gastric ulcer, the normality of their solid discharge.

Added to that, different parts of their workplace and their resting example were investigated.

The scales utilized in this investigation are inquiries from the standard GERD poll, Likert scale, the Perceived Stress Scale and the Hamilton scale. There is an aggregate of 37 questions barring the statistic subtleties questions. Consideration Criteria-Males and females over the age of 22 years. The individuals who offered agree to the investigation Rejection criteria-People with past history of stomach medical procedures.

The information gathered was entered in an exceed expectations sheet and dissected utilizing SPSS programming and results displayed as tables and figures.

Findings:

Table 1: Food Preferences

Eating Food at the Same Time Everyday			Beverage preferences			Feel Like Eating When Idle			Frequency of eating outside food in a week		
	Frequency	Percent		Frequency	Percent		Frequency	Percent		Frequency	Percent
Late (due to work)	46	32.9	Coffee	51	36.4	Yes	58	41.4	1-3 Times/ week	50	36
No	40	28.6	tea	89	63.6	No	82	58.6	3-5 Times/ week	23	16
Yes	54	38.6							Everyday	26	19
									Rarely or Never	41	29
Total	**140**	**100**		**140**	**100**		**140**	**100**		**140**	**100**

Table 2: Diet Preferences and tea/Coffee preferences

Diet			Number of Meals Per Day			Consumption of Coffee or Tea in a Day		
	Frequency	Percent		Frequency	Percent		Frequency	Percent
Mixed	116	82.9	>3	11	7.9	>3 Times	12	8.6
Vegetarian	24	17.1	2.00	25	17.9	1 Time	25	17.9
			3.00	104	74.3	2-3 Times	69	49.3
						Rarely	34	24.3
Total	140	100.0		140	100.0		140	100.0

Table 3: Alcohol and smoking preferences

Alcohol Consumption			Smoking			Eating During Stressful Situations		
	Frequency	Percent		Frequency	Percent		Frequency	Percent
No	97	69.3	No	120	85.7	Eating something at that time	64	45.7
Yes	43	30.7	Occasional	4	2.8	Not eating	76	54.3
			Yes	16	11.4			
Total	**140**	**100.0**		**140**	**100.0**		**140**	**100.0**

Table 4: Bowel Movement

Regurgitation after a Meal			Indigestion			Regularity of Bowel Movement		
	Frequency	Percent						
3-5 Times a week	5	3.6	Always	3	2.1	3-5 Times a week	11	7.9
After every meal	6	4.3	Never	18	12.9	5-6 Times a week	6	4.3
Everyday after ateast one meal	4	2.9	Often	11	7.9	Daily	90	64.3
Only after a heavy meal	36	25.7	Rarely	63	45.0	Irregular	33	23.6
Rarely or never	89	63.6	Sometimes	45	32.1

5.00	13	9.3	5.00	28	20.0
Total	**140**	**100.0**	**Total**	**140**	**100.0**

Discussion

The most widely recognized useful gastrointestinal issue in the cutting edge time incorporate Gastro esophageal reflux sickness, Acid peptic maladies (duodenal and gastric) and blockage. This investigation directed among the IT expert of Chennai has uncovered that practically a large portion of the subjects who were engaged with the examination had at least one utilitarian inside illness, which was demonstrated by close to home collaboration and the poll in spite of the fact that they didn't understand with the with the side effects and they had likewise not searched out a therapeutic consideration for these indications which are minor yet assume a mammoth job in the working their everyday schedule which can be rectified by a straightforward course of drug for a brief span.

It has been discovered that individuals who are overweight and hefty have more measure of heartburn contrasted with different individuals in the examination populace. Individuals who smoke and devour alcohol additionally have heartburn and gastric aggravation. Individuals who will in general pressure eat, eat when they are inert, who skip or eat a dinner at unpredictable occasions have an expanded recurrence of heartburn and corrosive peptic maladies. Individuals who have diminished dozing hours, low nature of rest, expanded worry at their specific type of employment condition, enthusiastic unsettling influences and have low inspiration in their lives have appeared to have a higher occurrence of stoppage and heartburn. Albeit just a little populace of the general population picks espresso over tea as their drink, they have higher recurrence of gastric disturbance alongside which the occasions they have espresso in multi day assumes a noteworthy job in this. Regardless of their activity related pressure, rest and BMI, the individuals who will in general have a tendency towards hot sustenance, café nourishment, and their decision of an alternate dinner separated from their local style supper have a higher rate of indigestion and obstruction.

Individuals who additionally work late much of the time and who use sustenance conveyance applications have more rate of all the three referenced practical entrail issue as they have a higher proclivity towards zesty and overwhelming nourishment.

Comparative examination led by the Mayo center for corrosive peptic sicknesses and the All India Institute Of Medical Sciences in Delhi for recurrence of GERD have demonstrated comparable outcomes in the arbitrary populace with a lesser however noteworthy degree of the investigation gathering having useful issue. There have been thinks about which independently center around each utilitarian inside maladies yet not consolidated together in IT experts.

A nitty gritty history taking and basic indicative test, for example, a gastroscopy by an expert, trailed by certain way of life adjustments and drugs if fundamental can essentially decrease the frequency of inside maladies in IT experts like Barrett's throat, draining peptic ulcer, colonic and gastric carcinoma, gave quality in work spot is improved and decision of eating regimen changes for the advancement of these individuals.

Conclusion

The reactions to the survey was dissected it was discovered that a critical extent of the examination populace had gastrointestinal pain, and it was discovered that their workplace, mental state and way of life was a contributing variable to those clutters.

Cross Sectional Study on Hearing Ability and its Association with Usage of Earphones among Medical Students

Shini Yassmin S.[1], Swetha N.B.[2], Gopala Krishnan S.[3]

[1]MBBS Student, [2]Assistant Professor, [3]Professor and HOD, Department of Community Medicine, Sree Balaji Medical College and Hospital

Abstract

Background: Hearing misfortune influences the personal satisfaction to a more noteworthy degree. It represents an issue to carry on a typical way of life. It frequently goes unnoticed by the people. This examination is to set up a connection between the meeting misfortune and utilization of headphones. It is utilized to decide the elements related between the consultation capacity and headphone use. This examination helps in bringing a connection between elements like volume of headphone utilization and hearing misfortune among them.

Technique: After getting the moral endorsement from the institutional moral panel, 200 undergrads the two people of age bunches 17-25 were taken. A survey and online audiometry and recurrence test has been led to evaluate the conference misfortune among the undergrads. The assent of the understudies was acquired during this examination. The information gathered was entered and examined by utilizing SPSS programming.

Results: Of the 200 subjects, 28 subjects were found to have gentle hearing misfortune as indicated by the unadulterated tone audiometry test. The survey results demonstrate that solitary 6 understudies use headphones with low volume.

Conclusion: This investigation demonstrates that there is a lot of individuals with gentle hearing misfortune. The Questionnaire demonstrates that the vast majority of them use headphones for a more drawn out time frame. The examination likewise demonstrates that a large portion of them utilize high and medium volume while hearing with headphones.

Keywords: *Hearing misfortune, audiometry test, recurrence test.*

Introduction

The typical hearing recurrence of people is 20 to 20000 hertz. Loss of capacity to hear this recurrence is alluded to as hearing disability. The personal satisfaction is influenced because of utilization of headphones. Hearing misfortune influences the everyday exercises. Headphones utilization is expanding among undergrads because of different reasons and is transforming into an essential device these days. In spite of the fact that understudies will in general know about danger of hearing misfortune because of headphones, they will in general show less significance to it because of their dependence on music. Music assumes a significant job in the life of youthful grown-ups. Music helps in changing the disposition of people. Other than Music, understudies will in general use it while working out, learning and for watching addresses and so forth. Because of accessibility of music includes in different devices, the availability to headphones have turned out to be simple. This outcomes in abuse of headphones among undergrads. Anyway examines on reactions of utilization of headphones are less in literature[1]. Impermanent and lasting hearing misfortune have turned out to be regular among youngsters and youthful grown-

Corresponding Author:
Dr. S. Gopala Krishnan
Professor, Department of Community Medicine, Sree Balaji Medical College and Hospital, Chennai

ups because of the utilization of versatile players[2]. Usage of headphones for more noteworthy term and at high power causes dynamic loss of external and inward hair cells and harms it and prompts demise of the Organ of Corti, ischemia of the internal ear and builds the metabolic action prompting age of intemperate receptive oxygen species and peroxidation of lipid[3]. Tuning in to music for an extensive stretch of time and at a high power causes a few sound-related manifestations, for example, transitory edge shifts, tinnitus, commotion affectability and contortion which can expand the danger of creating changeless hearing loss4[1-4].

Impacts of Earphones among Students in their Day to Day Activity: Correspondence assumes a significant job among undergrads. With the expansion utilization of headphones, understudy's hearing to other external sounds is hidden. They will in general disregard the outside world. Their public activity likewise is influenced. Different impacts are that use of headphones during driving or riding might be hazardous and some may include in a street auto collision. Those with mellow hearing misfortune because of headphone use may discover trouble in tuning in to addresses, which thusly will influence their scholastic execution. They neglect to appreciate regular sounds existing and are making tracks in an opposite direction from genuine world. Understudies get disengaged from their environment. Hearing misfortune cause melancholy, absence of self-assurance making them feel unreliable, social detachment, sentiments of vulnerability or anger[5]. In spite of the fact that brief span of headphone use does not cause perpetual hearing misfortune, the harm because of delayed use in youngsters can turn into a significant one in adulthood[6]. This kind of shortage ought to be distinguished when possible[5]. Prevention of hearing misfortune starts with making more mindfulness focusing on kids and youthful adults[6]. Henceforth this examination was directed with the goal of evaluating the headphone utilization design among understudies and its belongings among unending clients of headphones[5].

Materials and Method

This expressive cross sectional investigation is surveyed with the assistance of organized poll and different tests. The investigation was directed after the endorsement of moral council of Sree Balaji Medical School and Hospital. Advantageous testing of test estimate 200 was taken. Therapeutic understudies of age 17–25 years were taken in this investigation. An organized poll was filled by the understudies simply in the wake of getting an educated assent from them. The survey comprises of different inquiries which aides in sorting the members as high, medium and low headphone clients and after that the online unadulterated tone audiometry and recurrence tests was directed with the assistance of headphones in a quiet domain. The survey was self-controlled. The internet hearing test was finished with the assistance of same headphones for every one of the members.

Audiometry Test: This test is finished with the recurrence of 800 to 2500 hertz and is set apart in an audiogram from which we can order them into gentle, moderate and serious hearing misfortune as indicated by the decibels they hear.

Recurrence Test: A Sound of recurrence 20 to 20000 hertz is approached to tune in by the understudies. These aides in recognizing the recurrence hearing misfortune among the understudies. The subsequent information is broke down factually. The information was entered in Microsoft Excel and was examined in SPSS Software.

Findings: Out of 200 understudies, 71 (31.5%) were male and 129 were female (64.5%). Out of 200 understudies, 79 (39.5%) were 20 years of age, 53(26.5%) were 19 years of age,, 39(19.5%) were 21 years old,14 (7%) were 22 years of age, 10 (5%) were 23 years old, 5(2.5%) were 18 years of age. Use of headphones in hours out of every day, 68(34%) use it for 1 hour for each day, 48 (24%)use for 2 hours out of every day, 38(19%) use for 3 hours of the day, 29(15%) for 5 hours of the day. This demonstrates a large portion of them use it for 1-2 hours out of each day. Table 1 portrays the qualities of utilization of headphones.

Dominant part of them reacted as incessant clients. The vast majority of them picked headphones as they were agreeable and furthermore it gave them security. Larger part of them utilized headphones for watching recordings and they utilized medium volume to hear it. Some of them likewise heard in high volume.

Table 1: Earphone Usage Characteristics

Topic	Frequency	Percentage
1. Frequency of usage		
Always	24	12
Frequently	91	45
Sometimes	65	32.5
Rarely	18	9
Never	2	1
2. Reasons for choosing earphones		
Stylish	4	2
Portability	29	14.5
Comfortable	100	50
Privacy	115	57.5
Others	1	0.5
3. Volume of earphone usage		
High	50	25
Medium	144	72
Low	6	3
4. Purpose of using earphone		
Exercising	26	13
Learn	25	12.5
Watch video	113	56.5
Privacy concerns	37	18.5
For beauty	0	0
Listening songs	14	7
Other	2	1

Multiple responses were analyzed: Figure 1 depicts the results of audiometry test. Majority of them heard at 10-20db sound. Table 2 demonstrates the effects of usage of earphones. Although not many of them experienced any major symptoms but few of them who used earphones had experienced some disturbances. Table 3 demonstrates the relationship between volume of usage of earphones and hearing loss. When Chi-square test was applied and association was seen between volumes of usage and hearing loss a statistical significance was found. (p value <0.05).

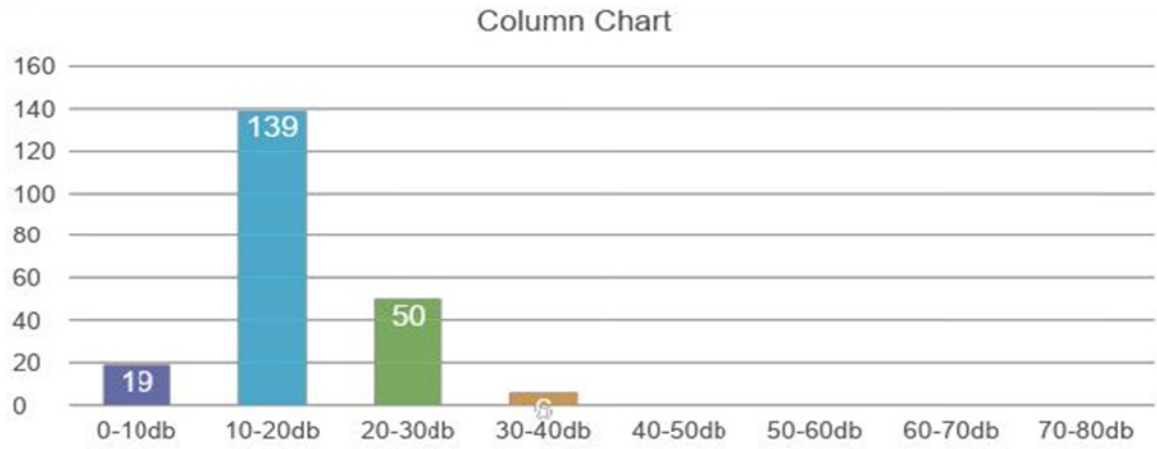

Figure 1: Audiometry Test

Table 2: Effect of Usage of Earphones

Topic	Frequency	Percentage
Felt unsafe while using earphone		
Yes	82	42
No	118	59
Finding it difficult to understand conversation in a party		
Yes	54	27
No	146	73
Peoples voice appear mumbled or muffled		
Yes	40	20
No	160	80

Table 3: Comparison between the Volume of Usage and Audiometry Results

Volume	High Volume	Medium Volume	Low Volume
Range of Hearing Loss			
Normal	40	98	6
Mild	9	47	0
Moderate	0	0	0
Severe	0	0	0
Total	**49**	**145**	**6**

Table 4: Comparison of Students who Use High and Medium Volume with Normal and Mild Hearing Loss

Range of Hearing	Normal Hearing	Mild Hearing Loss
Loss Volume		
Medium Volume	98	47
High Volume	40	9

The chi square value is found to be 3.519 and p value is found to be <0.05.

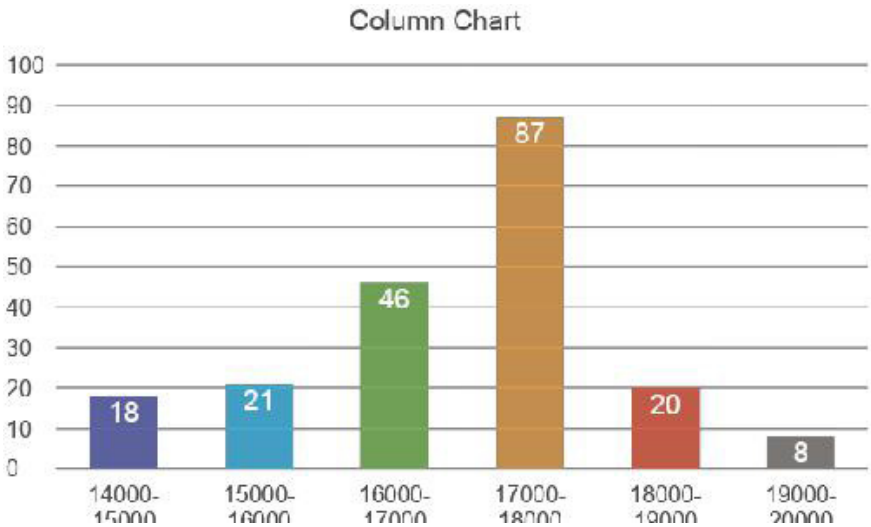

Figure 2: Frequency Test

The normal hearing range is 0-20 decibels. The range for mild hearing loss is 20-40 decibels. The range of moderate hearing loss is 40-60 decibels. The range for severe hearing loss is 60-80db.

Discussion

In this examination just 6% of understudies will in general use headphones at a lower volume. Subsequently a large portion of the understudies are at a more serious danger of creating hearing misfortune. This investigation led in kancheepuram locale shows intriguing outcomes. The predominance of mellow hearing misfortune in audiometry test is observed to be 28%. The recurrence test was likewise directed which demonstrates that 19.5 % cannot hear recurrence from 16000 to 20000 hertz. This examination demonstrates that 24% of understudies use headphones for a time of 2 hours out of each day. It demonstrates that out of 49 understudies utilizing headphones with high volume 9 understudies are influenced with mellow hearing misfortune and out of 145 individuals utilizing at medium volume 47 understudies are influenced with gentle hearing misfortune and understudies utilizing headphones at low volume have ordinary hearing capacity. The p worth was observed to be measurably huge. (<0.05)[6, 7].

In a comparable report led in US kids 6 to 19 years of age, 12.5% (roughly 5.2 million) are assessed to have Noise Induced Hearing Threshold Shifts in 1 or both ear (Niskar AS Et Al)[7]. The predominance of any HL (PTA of either ear better at high frequencies [3, 4, 6, and 8 kHz] or discourse frequencies [0.5, 1, and 2 kHz] ≥ 15 dB) were 17.9% and 16.5% among center and secondary school understudies, respectively (Rhee J Et Al)8. The above examination shows results like my investigation. This examination demonstrates that 45% of understudies use headphones much of the time. The predominance of mellow hearing misfortune in my examination is observed to be 28 %. In a comparable report led in south korea of 16,630 members, 58.4% had typical hearing, while 37.4% had Mild hearing Loss9(Choi JE Et Al)[8].

The day by day use of headphones in span of hours out of each day demonstrates that about 34% understudies use it for 1 hour. 24% understudies use it for 2 hours, 19% understudies use it for 3 hours, 15% understudies use it for 5 hours and 9 % understudies use

it for 4 hours However the commonness in a comparable report led in Korean populace demonstrates the Daily utilization of individual music players went from 1 to 3 hours in 229 understudies (46.7%). What's more, 164 understudies (33.5%) utilized these players for under 1 hour of the day, 62 (12.7%) utilized them 3 to 5 hours out of each day, 7 (1.4%) utilized them for over 5 hours out of each day (1.4%), and 28 (5.7%) did not utilize individual music players (Table 2). The general use time of individual music players ran from 1 to 3 years in 237 understudies (48.4%), under 1 year in 108 (22.0%), 3 to 5 years in 93 (19.0%), and over 5 years in 24 (4.9%) (Kim MJ Et Al)10[9,10].

The yield of study is that there is a decline in the impression of high recurrence hearing sounds. A few people will in general have gentle hearing misfortune which can advance on the off chance that they keep on utilizing headphones. This investigation demonstrates that the greater part of the understudies will in general use headphones for a more drawn out term every day. It likewise demonstrates that about 42% of understudies feel dangerous while wearing headphones. This investigation demonstrates that the vast majority of the understudies use headphones much of the time on a likhert scale premise.

Conclusion

The examination reasons that use of headphones has been expanding hugely because of a few factors. This persistent use of headphones influences the consultation capacity of the individual. Usage of headphones is a preventable measure which can be experienced. Be that as it may, it takes a ton of effort to totally stop the use of headphones. Henceforth it tends to be halted gradually step by step with extraordinary exertion. Use of outside speakers can be prescribed rather than headphones. Mindfulness among understudies and individuals assumes a noteworthy job in counteracting hearing misfortune because of use of headphones.

Trend of Caffeine Use among People of Different Occupation and Age Group and Its Health Implications

Pinaki N.[1], Stephen T.[2], Gopala Krishnan S.[3]

[1]MBBS Student, [2]Assistant Professor, [3]Professor and HOD, Department of Community Medicine, Sree Balaji Medical College and Hospital

Abstract

Background: Caffeine is a generally expended concoction having disputable impacts. Caffeine may cooperate with the satiety and might be related with feelings of anxiety. The recurrence of caffeine utilization among individuals is known to be high nowadays because of expanded pressure. The point of the examination was to evaluate the connection between age, occupation and caffeine dependence and its wellbeing suggestion.

Strategy: A cross sectional examination with advantageous testing was done from a urban region of Kancheepuram locale. Information gathered included occupation, day by day espresso utilization, withdrawal side effects assuming any and generally speaking dependence on caffeine. An organized poll was utilized for information accumulation.

Results: In the 18-23 age gathering individuals devouring 0 cups multi day were 41.77%, 1 cup multi day were 35.44%, 2 cups multi day were 13.92%, 3 cups multi day were 5.66%, 4 cups multi day were 2.53% and 5 cups per day 1.26%. In the 24-29 age gathering individuals devouring 0 cups multi day were 19.01%, 1 cup multi day were 42.85%, 2 cups multi day were 28.57% and 4 cups multi day were 9.5%. Espresso utilization was most noteworthy in I.T. experts with individuals taking at any rate one mug of espresso being at 66.7%. The following most elevated utilization was among understudies with at any rate 1 mug of espresso admission being at 33.7%. I.T. experts expending 4 cups of espresso was at 16.7% while that of understudies was exactly at 3.4%.

Conclusion: Coffee utilization was most noteworthy in I.T. experts; the following most astounding utilization was among understudies.

Keywords: *Caffeine fixation, Occupation, Withdrawal manifestations*

Introduction

Caffeine is a characteristic stimulant most normally found in tea, espresso and cacao plants. It works by animating the cerebrum and focal sensory system, helping you to remain alert and averting the beginning of tiredness. Espresso was allegedly found numerous years after the fact by an Ethiopian shepherd who saw the additional vitality it gave his goats. Juiced soda pops hit the market in the late 1800s and caffeinated drinks before long pursued. These days, 80% of the total populace devours a charged item every day[1].

Once devoured, caffeine is immediately assimilated from the gut into the circulatory system. From that point, it goes to the liver and is separated into exacerbates that can influence the capacity of different organs. That being stated, caffeine's fundamental impact is on the cerebrum. It works by hindering the impacts of adenosine, which is a synapse that loosens up the mind and makes you feel tired. Typically, adenosine levels develop throughout the day; making you progressively increasingly worn out and making you need to rest[2].

Adenosine is a modulator that has an inescapable and by and large inhibitory impact on neuronal action.

Corresponding Author:
Dr. S. Gopala Krishnan
Professor, Department of Community Medicine, Sree Balaji Medical College and Hospital, Chennai

Tonic actuation of adenosine receptors by adenosine that is typically present in the extracellular space in mind tissue prompts inhibitory impacts that have all the earmarks of being interceded by both adenosine A1 and A2A receptors. Help from this tonic hindrance by receptor rivals, for example, caffeine represents the excitatory activities of these specialists. Portrayal of the impacts of adenosine receptor agonists and rivals has prompted various speculations concerning the job of this nucleoside. Past work has set up a job for adenosine in a various cluster of neural marvels, which incorporate guideline of rest and the degree of excitement, neuroprotection, guideline of seizure powerlessness, locomotors impacts, absence of pain, intervention of the impacts of ethanol, and endless medication use[3].

It's great to remember that caffeine is addictive and a few people's qualities make them increasingly touchy to it. Some reactions connected to abundance admission incorporate nervousness, fretfulness, tremors, sporadic heartbeat and inconvenience dozing[4]. A lot of caffeine may likewise advance cerebral pains, headaches and hypertension in certain people[5].

Justification of Study: This investigation was attempted to evaluate the dependence on caffeine among individuals of differed age gathering like those in the teenagers or mid 20s or individuals in their mid 20s and legitimize the reason for such results. This investigation additionally survey the caffeine reliance among understudies, it experts, government workers and so forth and legitimizes the reason for such a result.

Survey Literature: An investigation on caffeine utilization and its relationship with stress and hunger among call focus representatives in Mumbai city, India by Lakshmi B. Kale, Kejal Joshi Reddy; 25 January 2017. This was an investigation directed to survey the caffeine admission and its relationship with hunger and feelings of anxiety among call focus representatives matured between 25-35 years. An examination on Caffeine Withdrawal and Dependence: A Convenience Survey among Addiction Professionals by Alan J. Budney, Pamela C. Darker, Roland R. Griffiths, John R. Hughes, and Laura M. Juliano. This was an examination directed to survey the convictions of compulsion experts about the clinical significance of caffeine withdrawal and reliance. An investigation on Caffeine resilience and decision in people by Suzette M. Evans, Roland R. Griffiths; July 1992.

The investigation reported resilience advancement to the emotional impacts of caffeine: after ceaseless dosing, organization of caffeine created huge abstract impacts in the interminable fake treatment gathering however not in the constant caffeine gathering. The investigation additionally given backhanded proof to resistance advancement: during perpetual dosing, the incessant caffeine and fake treatment gatherings did not vary definitively on evaluations of temperament and abstract impact. At the point when subjects were arranged into caffeine choosers or no choosers, caffeine choosers would in general report positive emotional impacts of caffeine and negative abstract impacts of fake treatment. - Nonchoosers, interestingly, would in general report negative emotional impacts of caffeine. Incessant caffeine did not adjust the fortifying impacts of caffeine as surveyed by caffeine versus fake treatment decision, potentially on the grounds that the generally brief length of caffeine forbearance in the fake treatment condition was not adequate to result in maximal withdrawal impacts after end of the moderately high caffeine portion. This investigation gives the clearest proof to date of complete resilience improvement to a CNS impact of caffeine in people.

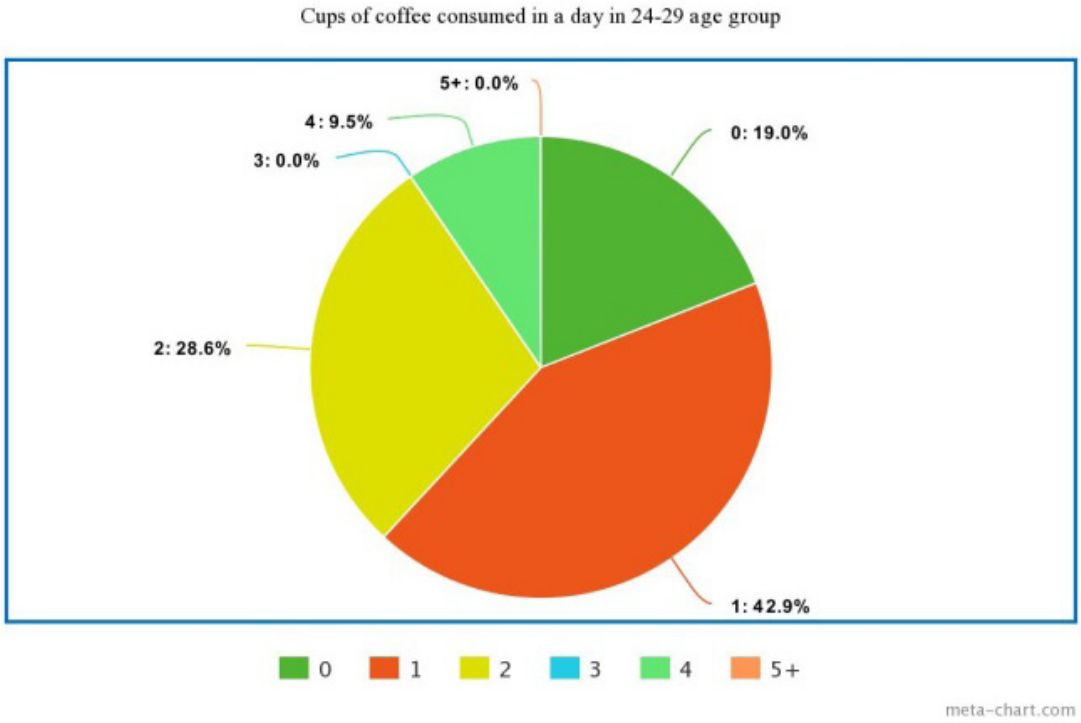
Materials and Method

Test Size: Reactions from 100 subjects have been gathered.

Testing Type: Advantageous inspecting

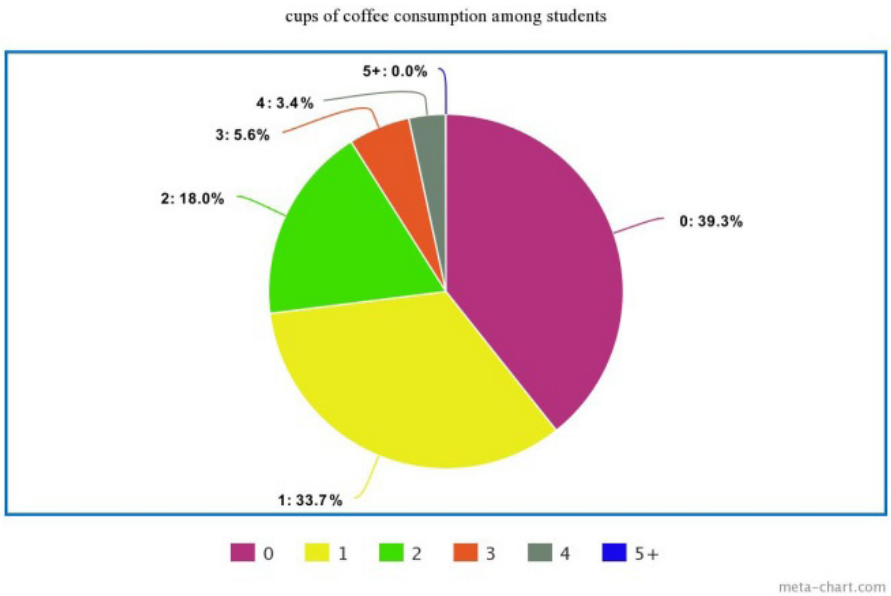
Testing Frame: Testing edge incorporates anybody in the urban zone of Kancheepuram region

Incorporation Criteria: Each one of the individuals who gave assent were incorporated into the investigation



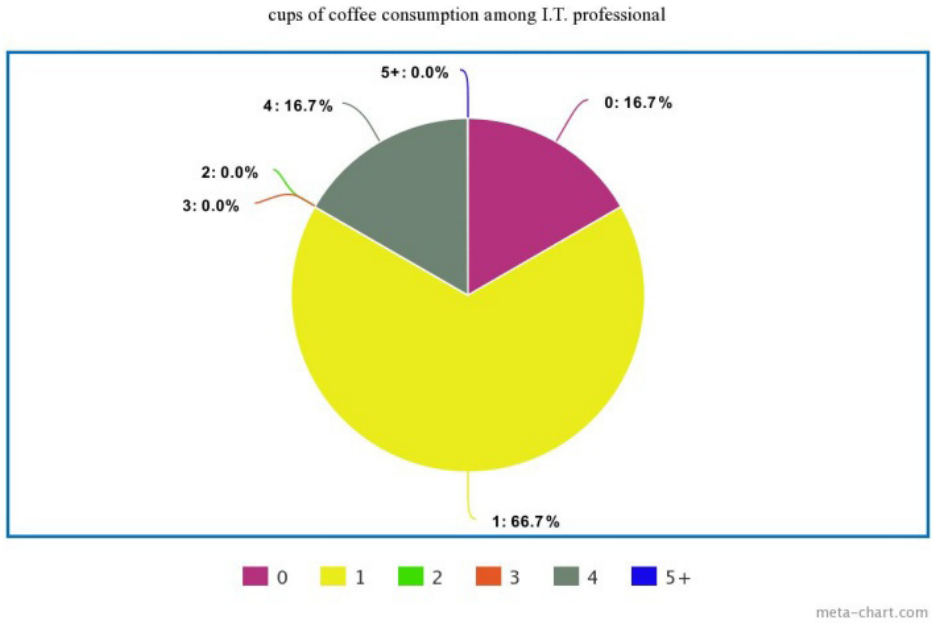
Rejection Criteria: The individuals who didn't give assent were incorporated into the examination

Territory of Study: Study was directed at a urban region of Kancheepuram area



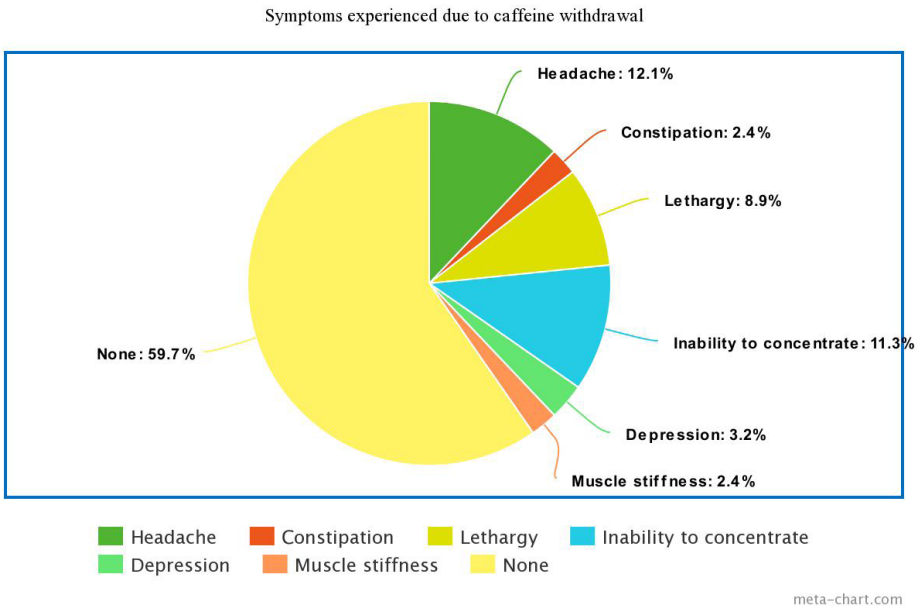
Findings: The survey managed two fundamental territories of intrigue, age gathering and control of the subject. 79% of the subjects were between the age bunch 18-23 and 21% of the subjects were between the age bunches 24-29. Under espresso admission in the 18-23 age gathering individuals with zero espresso admission were very high pursued by individuals with only a solitary mug of espresso daily. In the 24-29 age gathering

individuals taking a solitary mug of espresso every day were the most noteworthy pursued by individuals with 2 cups for each day. People were gotten some information about the quantity of cups of espresso they devoured in multi day. The examination was then isolated into 2 age gatherings in particular 18-23 and 24-29.



In the 18-23 age group people consuming 0 cups a day were 41.77%, 1 cup a day were 35.44%, 2 cups a day were 13.92%, 3 cups a day were 5.66%, 4 cups a day were 2.53% and 5 cups a day 1.26%.

In the 24-29 age group people consuming 0 cups a day were 19.01%, 1 cup a day were 42.85%, 2 cups a day were 28.57% and 4 cups a day were 9.5%.



Individuals were asked about the number of cups of coffee they consumed in a day. The study was then segregated into 3 groups namely students, I.T. professional and others.

In the pie chart above it is clearly seen that coffee consumption is highest in I.T. professionals with people taking at least one cup of coffee being at 66.7%. The next highest consumption is among students with at least 1 cup of coffee intake being at 33.7%. I.T. professionals consuming 4 cups of coffee is at 16.7% whereas that of students is just at 3.4%.

This result is probably due to the stress taken up by I.T. professionals which is alleviated by caffeine use. The use of caffeine among students is also significant which may be due to the stress taken up by them due to exams, assignment and other academic pressure on them.

Discussion

Caffeine is a stimulant and the most normally utilized medication on the planet. Consistently, millions expend it to expand alertness, ease weakness, and improve fixation and core interest. In the midst of fantasies and contention about whether caffeine is fortunate or

unfortunate for us, proof recommends that moderate espresso utilization can bring the two advantages and dangers. Be that as it may, a high utilization of caffeine may not be stimulating. What's more, the ongoing pattern of adding caffeine to beverages and tidbits that don't normally contain it has raised new concerns[6].

Under espresso consumption in the 18-23 age gathering individuals with zero espresso admission were very high pursued by individuals with only a solitary mug of espresso daily. In the 24-29 age gathering individuals taking a solitary mug of espresso every day were the most elevated pursued by individuals with 2 cups for each day. In the 18-23 age gathering individuals devouring 0 cups multi day were 41.77%, 1 cup multi day were 35.44%, 2 cups multi day were 13.92%, 3 cups multi day were 5.66%, 4 cups multi day were 2.53% and 5 cups per day 1.26%. In the 24-29 age gathering individuals expending 0 cups multi day were 19.01%, 1 cup multi day were 42.85%, 2 cups multi day were 28.57% and 4 cups multi day were 9.5%. Espresso utilization was most noteworthy in I.T. experts with individuals taking in any event one mug of espresso being at 66.7%. The following most astounding utilization was among understudies with in any event 1 mug of espresso admission being at 33.7%. I.T. experts expending 4 cups of espresso was at 16.7% while that of understudies was exactly at 3.4%. The withdrawal side effects were not all that prevalent in the screened populace without any manifestations accomplishing the most noteworthy figure at 59.68%, cerebral pain and failure to aggregate tailing it at 12.01% and 11.29% separately, next being torpidity at 8.87% and misery, stoppage and muscle firmness with insignificant estimations of 3023%, 2.42% and 2.42% individually. This outcome is presumably because of the pressure taken up by I.T. experts which is reduced by caffeine use. The utilization of caffeine among understudies is additionally critical which might be because of the pressure taken up by them because of tests, task and other scholastic weight on them.

Conclusion

Therefore in the midst of legends and discussion about whether caffeine is fortunate or unfortunate for us, proof proposes that moderate espresso utilization can bring the two advantages and dangers. Nonetheless, a high utilization of caffeine may not be invigorating. Moreover, the ongoing pattern of adding caffeine to beverages and bites that don't normally contain it has raised new concerns. Caffeine is fundamentally utilized for purposes like Migraine cerebral pain, Headache following medical procedure, Tension cerebral pain. It is likely successful for mental readiness. It is additionally potentially successful for Asthma, Athletic execution, Diabetes, Gallbladder illness and so on[7]. It isn't probably going to have a considerable amount of withdrawal manifestations. Espresso utilization was most elevated in I.T. experts with individuals taking in any event one mug of espresso being at 66.7%. The following most elevated utilization was among understudies with at any rate 1 mug of espresso admission being at 33.7%. I.T. experts expending 4 cups of espresso was at 16.7% while that of understudies was exactly at 3.4%. This outcome is presumably because of the pressure taken up by I.T. experts which is eased by caffeine use. The utilization of caffeine among understudies is additionally critical which might be because of the pressure taken up by them because of tests, task and other scholarly weight on them.

Suggestion: Caffeine is a settled ergogenic help, exhibited to improve execution over a wide scope of limits through an assortment of components[8]. As caffeine is generally expended, with various social and medical advantages outside of execution improvement, a down to business approach is to comprehend that most of individuals will devour caffeine. In light of the proof exhibited here, it seems moderate (~3 mg/kg)[8] every day dosages of caffeine won't be hazardous.

Funding: No funding sources.

Conflict of Interest: None declared.

Ethical approval: The investigation was endorsed by the Institutional Ethics Committee, Sree Balaji Medical College and Hospital.

Using Machine Learning as a Diagnostic Tool for Pneumonia Using Chest X-Ray Images

Harsha M.S.[1], Krishna Kumar J.[2], Gopala Krishnan S.[3]

[1]MBBS Student, [2]Assistant Professor, [3]Professor and HOD, Department of Community Medicine, Sree Balaji Medical College and Hospital

Abstract

CXRs are the most commonly performed diagnostic imaging study. A number of variables alter the appearance of the X ray image such as positioning of the patient and depth of inspiration which makes the diagnosis a daunting challenge. In addition, clinicians are faced with reading high volumes of images every shift. We are trying to develop a diagnostic tool using machine learning so that the clinicians can confirm their diagnosis and help reduce the error.

Keywords: *Machine Learning, Pneumonia, Chest X-Ray Images, Tensorflow, Keras, Python.*

Introduction

Pneumonia is an acute respiratory infection of lungs. Usually the gas exchange happens in alveoli of lung, but in pneumonia the effective gas exchange is retarded due to fluid and pus buildup in alveolar sacs. Most common cause of bacterial pneumonia is streptococcus, haemophilus influenza type B and of viral is respiratory syncytial virus. Pneumonia accounts for over 16% of all deaths of children under 5 years old internationally. In 2015, 920,136 children under the age of 5 died from the disease. In the United States, pneumonia accounts for over 500,000 visits to emergency departments and over 50,000 deaths in 2015, keeping the ailment on the list of top 10 causes of death in the country.

Diagnosis of pneumonia is an arduous task. The physician may start by asking the symptoms and then by listening to abnormal lung sounds such as crackling, rumbling and wheezing. If the symptom and the general examinations compare to that of pneumonia, they will order for a Chest X ray. An X ray will allow the doctor to see your heart, blood vessels and lungs which will aid in the diagnosis. In the X ray image the doctor may look for opacities(white spots) which suggests an infection in your lungs[1].

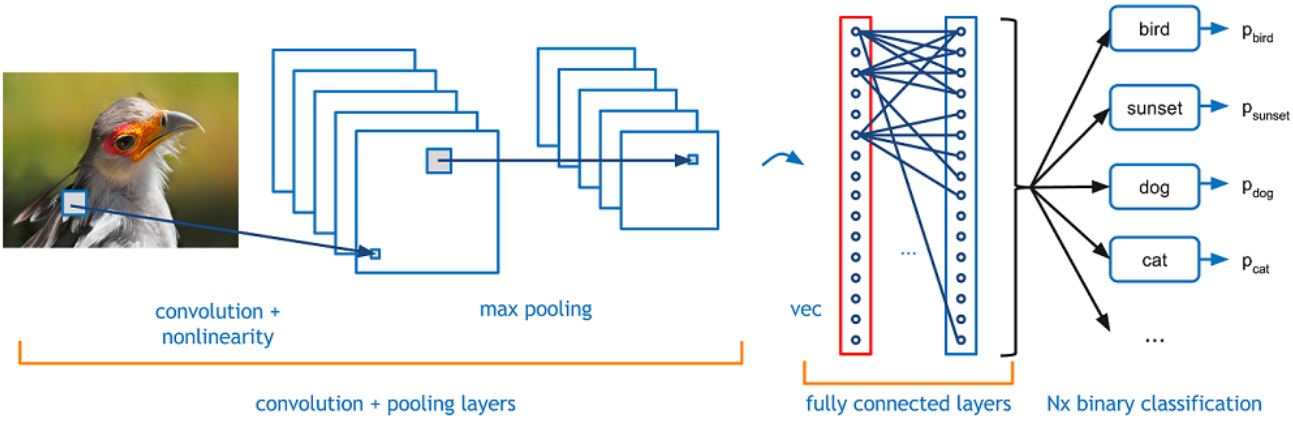
CXRs are the most commonly performed diagnostic imaging study. A number of variables alter the appearance of the X ray image such as positioning of the patient and depth of inspiration which makes the diagnosis a daunting challenge. In addition, clinicians are faced with reading high volumes of images every shift. We are trying to develop a diagnostic tool using machine learning so that the clinicians can confirm their diagnosis and help reduce the error.

Materials and Method



A Machine Learning model is a specific architecture that consists of some parameters. The Machine Learning (ML) model "learns" inference rules from training data that is supplied to it while training it.

For example: In our case, We supply the ML model with training data consisting of chest x-rays that have been segregated into "Normal/Virus/Bacteria" indicating the type of infection or lack thereof. We then train the ML model using this data. The Model learns generalized features in the set of images that it can use to classify the images into different classes.

For image processing all the state-of-the-art Machine learning architectures use some variant of the Convoluted Neural Network. (CNN). The basic structure of a CNN consists of linear layers of Convolution and Pooling layers that end with a fully connected dense layer whose output represents the different classes that we need to classify the images into.

The following is an example of object classification:

The picture went through the model from the left and a class is alloted to the picture as it turns out toward the finish of the model. For this situation, We will have ⅔ classes to be specific, Normal, Bacterial and Virus[2].

The particular CNN engineering we are going to utilize is the Inception Net (Inception Net V2) which has a precision of 93.7% on standard datasets like Image Net[3]. the earth we have constructed the model is Tensor flow, Keras and Python.

Findings and Discussion

The Data consists of Chest X-ray images that have been segregated into Normal, Virus and Bacterial. The Owner of the data is the University of California, San Diego. The data has been made available to use through the internet[4].

Training Data:

Normal Images	1341
Viral	1345
Bacteria	1952

Testing Data:

Normal Images	234
Viral	148
Bacteria	242

Conclusion

The proposed method detects pneumonia using Chest X-Ray and classifies into 3 categories Normal, Bacterial and Viral with an accuracy of 85.6%. The model uses machine learning to detect the character of opacities (infiltrates) in lung tissue. Whether the opacities are consolidated, disperse or none and then classifies into different classes. We can further increase the accuracy and decrease the error by feeding the program with more Chest X Ray images with better quality or by implementing better architecture.

Abstract

The main cause of male infertility is Sperm dysfunction. In this experimental 30 male mice were divided randomly into three groups, ten included in each. The control group received tap water while the second and third groups treated with 200 and 400 mg/kg/B.W of *Petroselinumcrispum* extract respectively. After completion of the treatment, the result showed significantly increased (P≤0.05) in the weight of the body, testes, prostate and seminal vesicles as compared to the control group. On other hand significantly increased (P≤0.05) in the percentage of motility and life of sperm while significant decreased (P≤0.05) showed in the percentage of denaturation of sperm vesicles as compared to the control group. However significant increased (P≤0.05) in the serum hormone level (FSH,LH and testosterone) for both groups treated with extract as compared to the control group.

Keywords: *Petroselinumcrispum, mice fertility, body weight.*

Introduction

Petroselinumcrispum belongs to family Umbelliferae, it's locally known as Baqdunis (parsley), has been used medicinally for many centuries in Mediterranean,European and Asian countries[1]. Parsley is one of the most popular spice vegetables used in Poland. Both roots and leaves were used for garnish and flavoring dishes[2]. Parsley is rich with vitamin A, B, C, β-carotene and an antioxidant substance that includes luteolin, flavonoid which eradicates free radicals that cause oxidative stress in cells[3]. The fresh leaves are highly rich with mineral and vitamin; root was used to treated flatulence, cystitis, and rheumatic conditions. Parsley is also valued as a promoter of menstruation, being helpful both in stimulating a delayed period and in relieving menstrual pain[4]. The herbs have used a long history in order to fertility regulation and increase activity of sexual organs[5,6]. Parsley is used to treat various diseases such as Alzheimer's disease, strokes, thrombosis and against cardiovascular diseases[7, 8]. It also used to treated jaundice, colic, edema, rheumatism, diseases of prostate ant anemic, antimicrobial, anticoagulant, antimenorrhagia, antihepatic fibrosis and antioxidant, anticoagulantas a blood pressure regulator, to treat eczema, knee nose bleed[9,10,11]. The aim of this study was to evaluate *P. crispum* effect on sperm parameters, body weight andserum reproductive hormone levels in male mice.

Materials and Method

Extract preparation: *Petroselinumcrispum* were collected from local market**.** The dried seed were pulverized into fine powder using a grinder and stored in an air tight container, (100 g) were extracted by adding 1000 ml distilled water boiled for 30 minutes. The extract was then filtered and the filtrates were evaporated using rotary evaporator under reduced pressure to dryness. The dried matter was dissolved in distilled water for using in the experimental studies[12].

Animals and experimental design: A total number of 30 male albino mice (25 ± 30 g) (8-10 weeks age) from the animal house in pharmacy college, Karbala university were used in the present study. The animals were kept one week before the initiation of the experiment for adaptation. The animals were allowed free access to waterand fed on a standard diet. Malemice were randomly divided into 3 groups, each of 10 animals. Treatments occur by orally for 30 days.

Group I: Control group- male mice received orally tap water.

Group II: The animal received **aqueous** extract of *Petroselinumcrispum*in a dose of 200 mg/kg

Group III: The animal received **aqueous** extract of *Petroselinumcrispum*in a dose of 400 mg/kg. The volume for each dose 0.1ml/B.W administrated by micropipettes.

Progressive sperm motility

Progressive sperm motility was assessed by haemocytometer slide according to[13].

The percentage of living and denaturation sperms

The testis was immediately cut transversely into two parts and fresh smear was taken by allowing the cut surface of the testis to touch a clean and warm slide (37ºC) then added 1-2 drops of physiological saline, 1-2 drops of eosin-necrosin, then detected percentage of abnormalities sperms by accounted in a hundred sperm within the microscope field according following equation:

(Percentage of Sperm abnormality %=number of abnormal sperms/total number of sperms *100)[14].

Body weight: Total body weight for each mouse was calculated and recorded at the beginning and end of the experimental work by using a mechanical balance

Testis, prostate, seminal vesicles and Epididymis (reproductive organs) weight: At the end of experiments, the animal were sacrificed to open abdomen and remove both testis,epididymis, seminal vesicles and prostate were removed, cleaned from adherent tissues these organs were washed in water twice then dried and weighted by using electronic balance immediately.

Blood sample collection and hormonal assay: The blood samples withdraw after 24 hours from the last dose, before killing the animal using cardiac puncture. Serum was obtained by centrifuging blood sample at 6000 rpm for 10 min and subsequently used for the determination of follicle stimulating hormone (FSH), luteinizing hormone (LH) and testosterone hormone. Prepared kit was used for hormones assayed depends on Bio Meriux kit (French) principle of Radio-immunoassay technique using Mini VIDAS apparatus.

Statistical analysis: Data were analysed' using SAS View 512+ Software (Abacus Concept, Inc. Calabasas, CA, USA). Differences among groups were measured using one way analysis of variance (ANOVA) followed by the least significant differences. The results were expressed as means ±SEM and differences were considered statistically significant at ($P \leq 0.05$) [15].

Results

Result of present study revealed significant differences($P \leq 0.05$) in the total of body weight after treated with both doses of *Petroselinumcrispum*as compared to the control group (table1). Present result showed significant differences ($P \leq 0.05$) in the weight of reproductive organs (tests, prostate gland and seminal vesicles) for all groups treated with different doses of *Petroselinumcrispum*as compared to the control group (table 2). The result of table (3) showed significant differences ($P \leq 0.05$) in the Percentage of motile and life sperm for both groups treated with extract as compared to the control group, while result showed significant decrease ($P \leq 0.05$) in the Percentage of denaturation sperm for both groups treated with extract as compared to the control group. Table (4) revealed significant differences ($P \leq 0.05$) in the concentration of testosterone and LH hormone for both groups treated with extract as compared to the control groupon other hand result found no any significant differences in the concentration of FSH hormone for these groups as compared to the control group.

Table 1: The effects of different doses of aqueous extract from Petroselinumcrispum on total body weight

Body Weight after treated (g)	Body Weight before treated (g)	Treatment
22.50±0.76 B	*21.50±0.71 A**	Control
24.00±0.36 A	21.66±0.66 A	200 mg/ml

Discussion

Not hidden from anyone the importance of fertility and procreation as a factor for survival[16]. One of the target tissues of plant extracts are reproductive organs, such as testis and sperm parameters[9]. In the present study significant increase in the total body weight after treated with extract,this results can be attributed to increase appetite, metabolic rate, some hormone such as growth and thyroid hormones another reason for this increase may be to the high concentration of protein and carbohydrates in this extract, this study in agreement with what found by[17] who demonstrated increase body weight of rats after treated with extract of *Allium cepa*, which both plant contain coumarins, flavonoids, and terpens. Also the result showed increase weight of testes, prostate and seminal vesicles after treated with extract this may be due to high levels of vitamin A in extract of *P. crispum* which is considered as a growth factor[18]. [19]also found extract of *P. crispum* contains various minerals such as vitamins A, B, C and, and iron vitamin A is known for proliferation of epithelial cells in seminiferous tubules then the diameter of these tubules increased. Present study showed increased in the percentage of motile and life sperm, on other hand decrease percentage of denaturation of sperm that may be due to inhibitory effects of extract on apoptosis because have increase cellular antioxidant defenses system, this study in agreement with [20]who revealed that increased Sertoli cells which are major components of seminiferous tubules after treated with extract which are greatly linked to total sperm production and activity, present study in agreement with [21] who demonstrated that antioxidant properties of *P. crispum*can improve the sperm quality by increasing the anti-oxidant genes expression, on other hand [9]indicated a significant relationship between the *P. crispum* extract and sperm motility. The present results in agreement with [22]

increase of motile sperms and decrease denaturation of sperm as a result of existing flavonoid antioxidants that cause increases glutathione peroxidase in *P. crispum* extract.[23]Also found increase sperm concentration and sperm quality (viability, motility, and normal morphology) after treated with ginger. While the present study disagreement with [24]found increase in sperm anomalies with decreased sperm motility, count, sperm speed after treated with *Boswelliapapyrifera and Boswelliacarterii*. Present data revealed increased in reproduction hormone testosterone, FSH and LH this result in agreement with [25]who found significant increase in FSH, LH and testosterone serum of infertile patients after treated with ginger. As well as [26]found increased serum testosterone levelsin male rat after treated with ginger extract because have potent androgenic activity. However the present study disagreement with [27] which found does not have any effect on serum levels of testosterone, FSH and LH after treated with celery seed extract. [28]found decrease in LH concentration while FSH and testosterone concentration change wasn't observed after treated with *Citrus aurantifolia*.

Conclusion

Based on the results of this study, it seems that the extract of *P. crispum* can affect some reproductive parameters such as weight of body, testis, prostate, seminal vesicles and sperm motility. As well as serum levels of LH, FSH and testosterone show considerable increased,and thus extract can be used as the potential fertility herbs in male.

Immunohistochemical Expression of GLUT-1 and Carbonic Anhydrase IX in Major and Minor Pleomorphic Adenoma PF the Salivary Glands

Abeer Salah Salman[1], Layla Sabri Yas[1]

Departmentof Oral Pathology, Collage of Dentistry, University of Baghdad, Baghdad, Iraq

Abstract

This study aimed to evaluate and compare the immuno expression of glucose transporter-1 (GLUT-1) and Carbonic anhydrase IX(CA IX) between major and minor salivary pleomorphic adenomas (PAs),to better understand the differences in the biological behavior of these tumorsand determine whether these proteins participate in the development of these tumors. Thirty three cases of PAs, 16major and 17 minor were submitted to morphological and immunohisto chemical analysis. Immuno expression of GLUT-1 and CA IX was evaluated semi quantitative fields in all cases. The cases of GLUT 1 were classified according to the scores: 0 (0% positive cells), 1 (<25% of positive cells), 2 (25–50% of positive cells), and 3 (>50% of positive cells) While for CA IX cases were classified according to the scores: 0 (0% positive cells), 1 (<10% of positive cells), 2 (10–50% of positive cells), and 3 (>50% of positive cells. The statistical analysis was performed using Pearson's chi-square, Fisher 's exact test. Higher GLUT-1 and CAIX immuno expression was observed in the minor PA compared to major PAs(p = 0.05, 0.01) respectivelly. Results suggest that differences in biological behavior of the studied tumors are related to GLUT-1 Which may be involved in the metabolic regulation of glucose in PAs. In addition, CA IX appears to influence the development of major andminor PA which can explain the differences their biological behavior.

Keywords: *Pleomorphic adenoma, carbonicanhydrase IX, glucose transporters, immunohistochemical.*

Introduction

Pleomorphic adenoma (PA) is the most common benign tumor of salivary glands, mostly affecting parotid glands followed by minor salivary glands of palate. The features of neoplastic cells and their interaction with the supporting stroma have been studied in an attempt to better understand the clinical behavior and prognosis of salivary gland tumors, as well as to establish more effective treatment protocols [1,2]. In an attempt to elucidate the differences in the behavior of tumor cells, studies have suggested that increased expression of proteins associated with cellular metabolism can be advantageous for these cells to obtain nutrition. The over expression of GLUT-1 favors an increase in glucose intake, through the membrane, which will supply the tumor cells with the necessary metabolic requirements for their rapid proliferation[3,4]. Under physiological conditions, situations of increased metabolic demand increase the expression levels of GLUT-1. Under pathological conditions, the high expression of this protein in some neoplasms is considered to be an indicator of tumor progression and aggressiveness [4,5]. Another example is the carbonic anhydrase IX (CA IX), a trans membrane enzyme induced by hypoxia that catalyzes the reversible hydration of CO_2 supplying bicarbonate ions for intracellular neutralization and protons for extra cellular acidosis, which contributes to the survival of tumor cells [5]. Studies have shown that these proteins are correlated with the progression of some types of cancer and as there are still some aspects related to the clinical behavior of major and minor PA that are not yet clear, we have proposed to investigate the expression of these proteins in PA. The aim of this study to evaluate and compare the immuno expression of GLUT-1 and CA IX between major and minor PAs of the salivary glands, to better understand the differences in the biological behavior of these tumor and determine whether these proteins participate in the development of these lesions.

Materials and Method

Thirty three cases of PAs (16 major and 17 minor PAs cases were studied .Paraffin-embedded specimens were obtained from the archives of the department of oral and maxillofacial pathology, College of Dentistry, Baghdad University covering the period 2002-2016.

For morphological analysis, 4-µm-thick histological sections were cut and stained with hematoxylin–eosin, and examined by two investigators under light microscopy. PAs were classified as classic, myxoid, or cellular using a method adapted from[6].

Immunohisto chemistry: For immunohisto chemical study, 4-µm-thick sections were obtained from paraffin-embedded tissue blocks. The sections were deparaffinized and immersed in 3% hydrogen peroxide to block endogenous peroxidase activity. Next, the tissue sections were washed in phosphate-buffered saline (PBS) then few drops of protein block were added to slides to block nonspecific background staining. The antigen retrieval procedure, antibody dilution,and catalog number of the GLUT-1 and CAIX antibodies are shown in Table 1. The sections were incubated with the primary antibodies in a moist chamber at room temperature for one hour, then put in the refrigerator at 4˚C overnight. The tissue sections were then washed twice in PBS Then secondary antibody was added and incubated in humid chamberto bind the primary antibodies. Then detection solution (streptavidin-HRP reagent) were applied onto the sections, chromogen solution (Liquid DAB + Substrate, abcam) was added which resulted in a brown reaction product. Finally,the sections were counter stained with hematoxylin and covers lipped.

Positive control samples were obtained according to the manufacturer's recommendations, squamous cell carcinoma of esophagus for GLUT-1 and clear cell renal cell carcinoma (ccRCC) for CA IX. Erythrocytes present in each section served as internal positive control for the GLUT-1. Negative control samples were treated with 1% bovine serum in PBS instead of primary antibodies.

Table 1: Catalog number, specificity, company, dilution, antigen retrieval, and incubation of the primary antibodies

Catalog number	Specificity	Company	Dilution	Antigen retrieval	Incubation
Ab15309	GLUT-1	abcam	1/200	Not required	Overnight
Ab128883	CAIX	abcam	5µg/ml	Citrate, pH 6.0 Pascal, 90-95 C, 20 min	Overnight

Immunostaining assessment and statistical analysis: The tissue sections were analyzed by a light microscope (Olympus Japan Co., Tokyo, Japan). The immuno expression of GLUT-1 was analyzed qualitatively and semi-quantitatively at×400 magnification. For qualitative analysis, the localization of immunostaining in neoplastic cells (membrane, cytoplasmic or nuclear, or all three compartments) was evaluated. For semi-quantitative analysis, the percentage of immunopositive neoplastic cells was determined using the following scores adapted from the study of[7], 0 (negative), 1 (<25% immunostainedcells), 2 (25–50% immunostained cells), and 3 (>50% immunostained cells).

Samples were considered positive for the expression of CA IX if cells in the tissues sampled presented brown staining on the membrane, nucleus, or cytoplasm or all three compartments. A semiquantitative analysis was performed following the methodology proposed by [8] and modified for this study. Five representative areas of the tumor were evaluated on a light microscope under 400X magnification. Specimens were categorized according to the stained area with the following scores: 0 (0% of positive cells), 1 (<10% of positive cells), 2 (11–50% of positive cells), and 3 (>50% of positive cells).

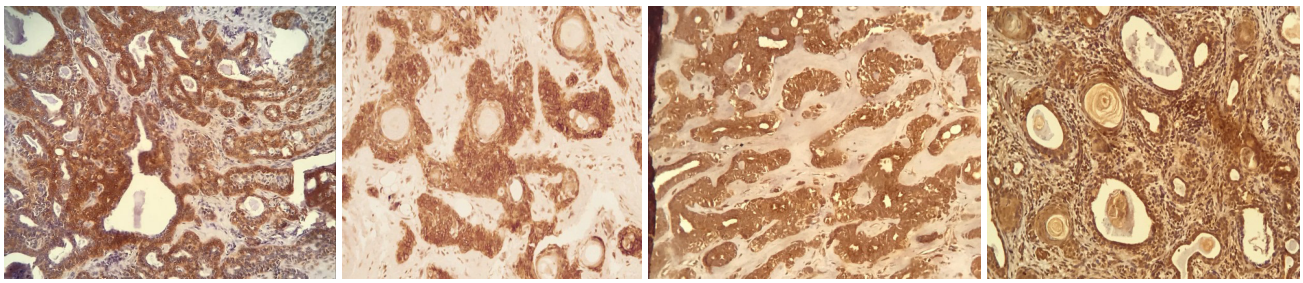
After immunohistochemical analysis, the results were compiled on a database using the software SPSS 20.0 (Statistical Package for the Social Sciences), and statistical analysis was performed using Pearson's chi-square and fisher exact tests. A significance level of 5 % was adopted for all tests.

Results

Morphological analysis of the major PA specimens revealed six (37.5%) cases of the stroma-rich subtype, five (31.25%) of the classic subtype, and five (31.25%) of the cell -rich subtype.In the group of minor PAs

specimens,10 (58.82) cases of cell–rich,7 (41.17) of classic subtype and no case of stroma–rich was observed. Analysis of GLUT-1 immuno expression showed positive staining in 13 (81.25%) cases of major PAs and all cases of minor PAs. There was a predominance of combinednucleus and cytoplasmic staining in tumor cells, and foci of membrane staining were occasionally observed. Nuclear staining alone was not detected in any of the tumors studied. Strong immunostaining for GLUT-1 was observed in areas of squamous metaplasia in both major and minor PAs.

In the group of major PA, score 3 was the most frequent (*n* = 7;43.75%), followed by scores 1 (*n* = 3; 18.75%), 2 (*n* = 3;18.75%), and 0 (*n* =3; 18.75%). There was a predominance of score 3 in the group of minor PA, (*n* = 15; 88.23%),followed by scores 1 (*n* = 1; 5.9%), 2 (*n* = 1; 5.9%)with differences between these two groups being statistically significant (P = 0.05) . the distribution of GLUT-1 immuno expression scores in major and minor PA show in Table 2.



Analysis of carbonic anhydrase IX immuno expression showed positive staining in both major and minor PA with the greatest incidence of score 3. There was a predominance of combined nucleus and cytoplasmic staining in tumor cells. Nuclear staining was detected in two cases of the major PA.

In the group of major PA, score 3 was the most frequent (*n* = 13;81.25%), followed by scores 2 (*n* = 3; 18.75%). Minor PA had the greatest percentage (88.24%) of score 3 between the two tumors followed by scores 2 (*n* = 2; 5.9%), with differences between these two groups being statistically significant (P = 0.01). The distribution of CAIX immuno expression scores in major and minor PA show in Table 2.

Table 2: Distribution of cases of major and minor pleomorphic adenoma, according to the scores of positivity for GLUT-1 and carbonic anhydrase IX.

Discussion

Benign tumors develop in multiple steps which are important for tumor progression and range from molecularly altered cells to clinically visible tumors [9].A peculiar feature of tumorigenesis is the change in the energy metabolism of neoplastic cells from aerobic toanaerobic, despite a considerable demand of oxygen. In this respect, GLUT-1 is important protein involved in the transport of glucose into the intracellular medium[10].

GLUTs are intrinsic proteins of the plasma membrane which are expressed according to the tissue in which they are found. They are regulated by hormonal

and metabolic signals. These proteins are stored in specialized endosomes until the cell is stimulated to increase glucose intake [11].

The expression of GLUT-1, which has been identified in different malignant neoplasms, has been suggested to be an indicator of tumor progression and aggressiveness[10,12]. In the case of salivary gland tumors, studies on this topic are sparse and restricted to certain groups of neoplasms[13]. However, GLUT1 expression in benign salivary gland tumors has not been investigated fully. In the present study, the expression of GLUT1 was found in 30 (90.90%) of 33 cases .Similar results have been reorted by [14]who stated the analysis of GLUT-1 immuno expression showed positive staining in 90% of PA.

These findings indicate a high expression of GLUT-1 in the epithelial and stromal component of these tumors and suggest that both tumors utilize the anaerobic glycolytic pathway as an energy source for growth as well as the important role of this protein in glucose uptake by tumor cells. On the other hand, significant differences in GLUT-1 immuno expression were observedbetween major and minor PA, suggesting that the expression oft his protein is implicated in the differences in the biological behavior of these tumors and an increase in cell proliferative capacity and metabolic needs. The increased energy consumption is required for neoplastic proliferation, which reflects an adaptation to adverse conditions in the studied lesions.

Pleomorphic adenoma is considered to be a precancerous tumor. Atypical tumor cells in 51 (51%) of 101 PAs examined histpathologically, and indicated that such atypicalcells, with p53 protein accumulation in their nuclei, could be regarded as cells in a precancerous state[16]. Horiuchi et al. [15] referred that probable that the energy gained from glycolysis was used not only to grow PAs but also to facilitate malignant transformation.

Carbonic anhydrase IX is an isozyme normally found in the gastrointestinal tract, predominantly in the stomach, gallbladder, and small intestines epithelia and also detected in many tumors. Several studies have shown that CA IX may contribute to the growth, survival, and invasion of tumor cells by lowering the extra cellular pH in response to hypoxia, and also participate in bone resorption. This isozyme is not commonly found in healthy tissues and its strong association with neoplasms has been suggested as a promising diagnostic and prognostic marker[17,18].Few studies have evaluated the expression of CA IX in benign neoplasms; thus, its role in the development of these tumors is still unknown.

The results of present study revealed strong positive CAIX expression in major and minor PA with statistical difference between two groups (p =0.01). Minor PA showed the highest percentage of positive cells (88.24%). These results suggest that CA IX may influence the growth capacity of these tumors. This finding comes in accordance with the results of previous study performed by Ivanov et al.[19]who reported that CAIX was expressed in all PA cases. Furthermore, this finding comes in accordance with studies in other tumor such as Vasconcelos et al.[20] who reported that CAIX was expressed in most of benign odontogenic lesions.

To our knowledge this is the first comparative analysis of the immunohistochemical expression of GLUT1 and CAIX in major and minor PA.

In conclusion, the results of the present study may indicate a higher cellular metabolism and proliferative potential in minor PAs and a high immunoreactivity of both antibodies may predict a risk of rapid proliferation, invasion, and possibility of malignant transformation in PA, the matter that requires more attention to this tumor.

Clinical Study for Testosterone, Progesterone and Oxidative Stress During Phases of Menstrual Cycle in Women with Bronchial Asthma

Khalid A. Edam[1], Husam M. Kredy[1], Majeed M. Al-Hamami[2]

[1]Chemistry Department, College of Science, [2]Internal Medicine Department, College of Medicine, Thi-Qar University, Ira

Abstract

This study aims to evaluate the hormones (testosterone (T) and progesterone (P)) and oxidative stress malondialdehyde (MDA), ceruloplasmin (CP) and transferrin (Tf) during Phases of menstrual cycle (follicular and luteal phase) in females with asthmatic. Included (70) women patients with bronchial asthma without taking contraceptive pills aged (14-45 years). Included (70) women as a control group supposed healthy without taking contraceptive pills with the same age in this study. The results showed a significant decline in levels of the Progesterone (P) and Testosterone (T) and significantly higher in levels of the (MDA) and (CP) in all patients in both follicular phase as well in the luteal phase in compared with control group in the follicular and luteal phase respectively (P≤0.05).We did not notice any significant difference in concentration of serum TF in all patients in both follicular phase as well in the luteal phase in comparison with control group in the follicular phase and luteal phase respectively (P≤0.05).Showed serum levels of Testosterone and Progesterone significantly higher in all patients in the luteal phase when comparison with all patients in the follicular phase (P≤0.05). We did not notice any significant difference in (MDA, CP and TF) levels in all patients in the luteal phase when comparison with all patients in the follicular phase (P≤0.05).

Keywords: *Asthma, menstrual cycle, Testosterone, Progesterone, Lipid peroxidation, Ceruloplasmin, transferrin.*

Introduction

Bronchial asthma is a common persistent inflammatory disease of airways, which leads to variable or even persistent airflow limitation. The essential symptoms are chest tightness,persistent cough, wheezing and dyspnoea. The prevalence of bronchial asthma in humans varies around the world affecting 1 to 18% of any investigated population [1]. Women are more often affected by asthma. The mechanisms underlying the gender differences in asthma prevalence are still under investigation but refer mostly to hormonal differences and differences in lung capacity [2].

The spread and severity of bronchial asthma are often linked with moments are necessary for the reproductive life of a female. As a result, it has been speculated that the changes hormonal in the menstrual could play a vital in the pathophysiology of bronchial asthma, leading to worsening of disease severity. Women's seem to experience an increase of bronchial asthma symptoms through the menstrual phases of or premenstrual[3].

A response to the gonadotropins, sex hormones will be secreted testosterone, Progesterone, andestradiol is excreted and, thus, feedback on the level of the pituitary and hypothalamusto control natural reproductive mission[4]. Progesterone hormone is produce to a lesser extent in the placenta through the pregnancy and the adrenal glands. Thus, cyclical hormone exposure she started at menstruation and ends at menopause occurs monthly both differentiation and growth are regulated through specialized tissue within the reproductive system and breast tissue[5]. Testosterone is also produced, to a smaller degree, in the ovaries and adrenal cortex in women. The central nervous system stimulates the hypothalamus to begin testosterone production, which suggests a strong link between the nervous and endocrine systems[6].

Oxidative stress is as a disorder in equilibrium between (ROS), freeradicals (FR_s), and endogenous

antioxidant defencemechanisms [7], or more simply, it is a disturbance in the equilibriumbetween oxidant-antioxidant states, favouring the oxidant environment[8]. **Oxidative stress results because of an imbalance between neutralization and the formation of** ROS/ RNS**. Or on the other hand, oxidative stress can arise when cells are unable to destroy the overabundance of free radicals resulting.[9].**

Malondialdehyde is appreciatedto impair lots of physiological mechanisms in the human body during its ability to react with molecules, for example, proteins and DNA. MDA is used as a biomarker in an organism to measure the level of oxidative stress.[10].

Ceruloplasmin (Cp) is one of the main proteins taking part in copper metabolism by distributing it in the human body. It is responsible for carrying more than 95% of copper in blood serum[11]. Transferrin a glycosylated Fe^{3+} binding protein, which is found in blood plasma, lymph, and other body fluids and it is synthesized in the liver, central nervous system, testes, ovaries, spleen, mammary glands, and kidneys.

Materials and Method

This study was conducted at "AL Hussein Teaching Hospital in Dhi-Qar", especially, in respiratory counselling, Biochemistry Laboratory at the College .of Science, University of Dhi-Qar at the period between 1/9/2017 to 1/6/2018.

The study included (140) subjects, (70) controls and (70) patients of women only. It is notable that the smokers were excluded.

The controls and patients were divided into two groups:

1. **Control group:** Included (70) supposed healthy subjects of women without taking contraceptive pills aged (14-45 years).
2. **Patient group:** Included (70) patients with bronchial asthma of women without taking contraceptive pills aged (14-45 years).

Blood Samples Collection: About 8mL of blood samples from bronchial asthma controls and patients two phases. The first sample was taken from the females in the follicular phase and the second sample was taken from the same females in the luteal phase. This applies to all patients and controls. The serum was separated immediately in order to allow clotting at room temperature. The blood was centrifuged at 3000rpm for 10 minutes and stored in plain pipes at (-20ºC) until used or immediately analysed.

Serum Hormones (Progesterone and Testosterone): Serum progesterone (P4) and Testosterone concentrations are determinedby enzyme-linked through enzyme linked fluorescence test using the Mini-VIDAS Automatic immunofluorescence assay system (bioMerieux, Marcy letoile, Lyon, France.

Measured of Serum Malondialdehyde (MDA): The level of serum malondialdehyde (MDA)was measured spectrophotometrically through the method of Muslih *et al*[12]. It concentrations were calculated using the extinction coefficient of MDA (εMDA) equivalent (0.156 x18 nmol/ml).

Measured of Serum Ceruloplasmin (CP): Serum Cp concentration was determined through the method of Menden *et al*[13] which using the extinction coefficient of ceruloplasmin (εCp) equivalent (0.68) to calculate its concentration.

Measured of Serum Transferrin (Tf): The Serum Tf concentration was measuredthrough colorimetric method Burtis *et al*[14]. Where excess iron is added to the saturated serum the transferrin. Unregulated iron has been accelerated with basic magnesium carbonate. The iron in the supernatant is determined by centrifugation. Where the concentration of residual iron is tested and the result expressed as (Total Iron Binding Capacity). Where Tf concentration is calculated for the following equation.

(Serum Tf (g/L) = TIBC (μmol/L)/25.1)[15]

Statistical Analysis: Statistical analysis was done using the software [SPSS] the "results were expressed" as mean ± SD with LSD. Way analysis of variance [ANOVA] test was used to compare parameters different studied groups. A"*P* values ≤ 0.05" was considered statistically significant".

Result and Discussion

General Comparison for all Studied Parameters:

Serum Testosterone Concentration: The mean of serum testosterone level in the patients groups which was found to be significantly lower (P≤0.05) than that control group in both two phases as in the table (1).

That certain systemic chronic inflammatory disorders and a few pulmonary diseases affect testosterone (T) biosynthesis[16]. Testosterone and its metabolites contribute to the physiological balance between autoimmunity and protective immunity by maintaining regulatory T cells. Testosterone has immunosuppressive effects and is probably also protective against immuno-inflammatory processes that trigger asthma[17].

Table 1: Serum Testosterone levels in control and patient groups in the menstrual phases

Testosterone (ng/mL) Mean±SD			
Group	**No.**	**Follicular**	**Luteal**
Control	70	0.82±0.06A	0.90±0.15A
Patient	70	0.50±0.09B	0.71±0.10B
L.S.D		0.03	0.15

Note: "Each value represents mean ± S.D values with non identical superscript (A, B or C... etc.) were considered as significant differences (P≤ 0.05)."

No: Number of subjects., **SD:** Standard deviation., **LSD:** Least Significant Difference.

Serum Progesterone Concentration: The mean of serum progesterone level in the patients groups which was found to be significantly lower (P≤0.05) than that control group in both two phases as in the table (2).

Women report more pronounced symptoms, which seem to change with the various life stages such as menstruation, pregnancy and menopause and in association with female sex hormone levels[2]. These hormones cause differences in the clinical manifestation of asthma. Thus, oestrogen promotes bronchial hyperreactivity, and both FEV1 and exhaled nitric oxide (NO) show a cycle-dependent course. Twenty to forty percent (20-40%) of premenopausal women suffer from pre- or peri-menstrual asthma (PMA) and experience an exacerbation in the week preceding menstruation, based on increased inflammation in the bronchi[1].

Table 2: Serum Progesterone levels in control and patients groups in the menstrual phases

Progesterone (ng/mL) Mean±SD			
Group	**No.**	**Follicular**	**Luteal**
Control	70	0.57±0.07A	8.80±1.11A
Patient	70	0.38±0.06B	6.65±0.77B
L.S.D		0.02	0.32

Serum Malondialdehyde Concentration: Table (3) shows significantly higher in concentrations of serum malondialdehyde (MDA) in all patients in both follicular phase as well in the luteal phase in comparison with a control group in the follicular phase and luteal phase respectively (P≤0. 05).

There is a growing lot of evidence indicating the oxidative stress in the pathogenesis of bronchial asthma. In allergic inflammation exist overproduction of (ROS). Reactive oxygen species may induce symptoms characteristic of bronchial asthma: bronchial hyperresponsiveness, bronchospasm, mucus hypersecretion, beta-adrenergic receptor, dysfunction and activation of an arachidonic acid cascade, bronchial epithelial damage and increased permeability[18].

Increasing the arachidonic acid in airway inflammatory cells in asthma patients. This arachidonic acid may lead to oxidation produce an end product of (LPO). So MDA is increased in bronchial asthma due to generation by decomposition of arachidonic acid and larger PUFA through enzymatic and nonenzymatic processes[19].

Table 3: Serum MDA levels in control and patients groups in the menstrual phases

MDA (µmol/L) Mean±SD			
Group	**No.**	**Follicular**	**Luteal**
Control	70	2.07±0.29B	2.26±0.33B
Patient	70	3.14±0.53A	3.06±0.49A
L.S.D		0.14	0.14

Serum Antioxidant Concentrations: Table (4) shows significantly higher in the concentration of serum Ceruloplasmin (CP) in all patients in both follicular phase as well in the luteal phase when comparison with a control group in the follicular phase and luteal phase respectively (p≤0. 05).

The same Table shows no a significant difference in concentration of serum Tf in all patients in both follicular phase as well in the luteal phase incomparison with a control group in the follicular phase and luteal phase respectively (P≤0. 05).

Ceruloplasmin is known for the preservation of considerable peroxidase activity and capable of suppression superoxide radicals. This is in charge of restricting the damage caused through these radicals[20].

Note that the elevation of CP is part of the increase in iron metabolism proteins and part of bronchial asthma and chronic obstructive pulmonary disease,

probably as an anti inflammatory response to the airway inflammation which characterizes these conditions[21]. Ceruloplasmin can be used as non-invasive biomarkers for evaluation of chronic airway inflammation and can be useful in determining the severity of asthma[22].

Table 4: Serum antioxidant levels in control and patients groups in the menstrual phases

		CP (g/L) Mean±SD		TF (g/L) Mean±SD	
Group	**No.**	**Follicular**	**Luteal**	**Follicular**	**Luteal**
Control	70	2.26 ± 0.37^{B}	2.21 ± 0.35^{B}	4.08 ± 0.76^{A}	3.96 ± 0.71^{A}
Patient	70	3.62 ± 0.71^{A}	3.55 ± 0.66^{A}	4.09 ± 0.85^{A}	3.97 ± 0.78^{A}
L.S.D		0.18	0.17	0.31	0.29

Comparison for all Studied Parameters in patients According to the follicular and luteal phase:

Serum Hormones Concentrations: Table (5) shows significantly higher in concentrations of Testosterone and Progesterone in all patients in the luteal phase when comparison with all patients in the follicular phase (P≤0. 05).

Women of reproductive age face periodic changes in concentrations the sex hormones. Through the follicular phase of menstrual cycleremain testosterone hormone level and progesterone hormone level low, while (FSH) hormone and (LH) atthe highest level. Finally, by the luteal phase, (FSH) level and (LH) level are low, While the level of each of the following hormones 17-β-estradiol, testosterone, and progesterone are moderately high[23].

Patients who suffer from premenstrual asthma (PMA) are frequently affected by the periodic changes in serum levels for progesterone hormone.[24]Indicate earlier studies that an increase in the progesterone hormone secretion possibility it has a role for hyperventilation in the luteal phase[25].

Table 5: Levels serum Testosterone and Progesterone during the follicular and luteal phase in patients.

Menstrual Phase	**No.**	**Testosterone (ng/mL) Mean±SD**	**Progesterone (ng/mL) Mean±SD**
Follicular	70	0.50 ± 0.09^{B}	0.38 ± 0.06^{B}
Luteal	70	0.71 ± 0.10^{A}	6.65 ± 0.77^{A}
L.S.D		0.03	0.19

Serum Oxidative Stress Concentrations: Table (6) shows no significant difference in concentrations of serum (MDA, CP and TF) in all patients in luteal phase in comparison with all patients in follicular phase (P≤0.05).

Sex hormones work on the production of reactive oxygen species (ROS) via neutrophils which may have immune functions, and these reactive oxygen species (ROS) are reported to be involved in the occurrence of ovulation in the ovaries[26]. After ovulationthe corpus luteum is created and progesterone hormone is secreted, a process of functional corpus luteum regression begins if pregnancy is not established. Reactive oxygen species (ROS) are also thought to play a role important in promoting this functional corpus luteum regression[26] and reactive oxygen species (ROS) production may be regarded as important in maintaining homeostasis in ovarian function[27].

Table 6: Levels serum Oxidative Stressduring the follicular and luteal phase in patients.

Menstrual phase	**No.**	**MDA (µmol/L) Mean±SD**	**CP (g/L) Mean±SD**	**TF (g/L) Mean±SD**
Follicular	70	3.14 ± 0.53^{A}	3.62 ± 0.71^{A}	4.09 ± 0.85^{A}
Luteal	70	3.06 ± 0.49^{A}	3.55 ± 0.66^{A}	3.97 ± 0.78^{A}
L.S.D		0.16	0.20	0.29

Conclusion

From the data in this study we can conclude the following points: Bronchial asthma decreases the levels of both testosterone and progesterone. Lipid peroxidation associates with bronchial asthma. Disorder the antioxidant system in patients with bronchial asthma, according to the levels of (ceruloplasmin and transferrin). Phases of menstrual cycle have effect on (testosterone, progesterone).

Detection of Rota Virus by Rapid Test in Comparison with Enzyme Linked Immunoassay in Acute Diarrhea Children in Babylon Province

Ayam M. Salih

University of Babylon, Hammurabi Medical College, Iraq

Abstract

Globally, human rotavirus is considered as a major etiologic agent of acquired diarrhea which infect young kids as well as infants. For the purpose of efficient treatment, early diagnosis is of high importance. Group-A Rotavirus are in responsible for serious watery diarrhea in young kids. Rapid analysis of the Rotavirus associated diarrhea can prevent inappropriate supervision of antibiotics and help in stopping the pass on of multi- drug resistance. Rotavirus antigen is discovered by ELISA and with one step rapid antigen test showed an occurrence of 23% using ELISA and 22.5% using Rapid test respectively. Fast showed a tenderness of 96.97% and specificity of 100% in comparison to ELISA. The Rotavirus infection was maximum in age group of one years to two years (60.86%) in male and in addition tofemale (39.13%). Throughout the winter, the infections was at its highest levels, also it has been appeared with triad of diarrhea, fever and vomiting. Severe dehydration and watery diarrhea has been the main cases of this infection.

Keywords: *ELISA, Group A Rotavirus, Immunochromatography, Watery diarrhea.*

Introduction

Extreme diarrheal disease is a significant public health problem leading to notable rate of death and morbidity in advanced and emerging nations such as India. Globally, the infection of Rota virus is considered as the third most widespread reason of severe diarrhea in young kids[1]. The vast majority of kids experienced the infection of Rota virus in the course of time when they are five years of age. Approximately that Rota Virus infection annually result in 111 million episodes of gastroenteritis which requirescare at home, five million clinicvisit, 1 millionhospital admission and about 600 mortality rates in kids less than five years old throughout the world[2]. Presently there are seven Rota virus groups seen to infect the humans, among them the most dominant is group A [3]. WHO estimated that diarrhea is in charge of 18% deaths among children less than five years of time [4]. Every year, there are some seasonal peaks of diarrhea in Bangladesh and ICDDR, B alone has to treat more than 100,000 patients a year[5]. The data on clinical characteristics and treatment outcome of rotavirus diarrhea are likely to be helpful for the medical professionals and health care providers working at the grass root levels who have the tendency to refer any acute watery diarrhea with or without vomiting to other secondary/tertiary level hospital for better management[6]. This study was intended to explore the clinical severity, nature of disease and to observe the treatment outcome of both Rota and non-rotavirus diarrhea in children of Bangladesh the justification of such a huge referral of diarrhea cases to higher centers[7]. One of the main causes of illness and mortality in Iraqi kids is Diarrhea. Nevertheless, some researchers in Iraq reported various degrees of infectivity with Rotavirus in the governorates of Iraq. Rotavirus is accountable 30 percent of acute diarrhea in hospitalized kids in Baghdad, 18.5 percent in Tikrit, 24 percent in Basra, 37 percent in Erbil[8-10]. So, the presented research has been conducted for estimating the spread of Rotavirus in the governorate of Babylon through utilizing 3 commercial diagnostic kits, followed by a study to detect the rotavirus genotyping circulating between populations through the use of RT-PCR molecular diagnostic kit[11].

Materials and Method

The presented study has been carried out from January 2018 to October 2018. 200 sample of stool was collected in sterilized box from children have diarrhea

and transport to microbiology section. Samples stored at 4ċ and tested within twenty four hours of collection. Forty six samples was positive for rotavirus antigen. ELISA test for human Rotavirus Antigen kit (USA) can be defined as a qualitative determination of the Rotavirus antigen in feces. The above mentioned test has been implemented in accordance with the specifications of the manufacturer. The one step test device for the Rotavirus (Acon, Germany) can be considered as rapid chromatographic immunoassay for qualitative detection of Rotavirus in the specimens of human feces for the purpose of aiding the process of diagnosing the infection of rotavirus.

Results and Discussion

Positive Rota virus antigen has been identified in 46 from 200 samples 23 percentvia ELISA, and 22 percent via rapid test table (1 and 2). The percentage of females in Rota virus positive patients have been 39,13 percent, while the percentage of males have been 60.86 percent. Most the of Rotavirus positive cases have been spotted in kids younger than six years of age and kids in the age group of (1-2) years indicating the highest percentage of infectivity 19.5%, whereas the age group (4-5) years revealing the lower percent of rotavirus infection 6.52%. While the age (5-6) years do not show any rotavirus infection the percentage was 00.0% table (3). Rapid test indicated a specificity of 100 percent and sensitivity of 96.97 percent as shown in table (4). ELISA is clearly the most sensitive method for detection of rota viruses and is perfect for screening large number of fecal specimens in a single sitting. The infection was maximum during the winter months as show in table (5).

Worldwide, there has been a decrease in the mortalities related to diarrhea, mostly due to the improved therapeutic interventions in addition to the provision of safe water drinking, enhancement of sanitation and popularization of main activities related to healthcare[12]. Many studies across the world indicated that the Rotavirus is considered as a cause of diarrhea in kids both in advanced and emergingnations[13]. We conducted this study to estimate the diarrheal disease burden due to rotavirus infection amongst under five years-old children with diarrhea in Bangladesh[14]. The infections rotavirus was identified to follow seasonal pattern in our region, in which it is related with drier atmosphere and cooler temperatures. The seasonal distribution related to this infection during cooler months was indicated before for temperate regions[15]. Like our study, significant association of nausea and vomiting with rotavirus diarrhea is also evident in some other studies[16-17]. Many studies across the world have indicated the importance of Rotavirus as a cause of diarrhea in kinds both in advanced and emerging nations[18-21].

Table 1: Age & Sex Distribution of Diarrhea Cases

Age	Male	Female	%	Total	%	%
1-2 years	39	32	16.00%	71	35.5%	19.5%
2-3years	31	25	12.5%	56	28.00%	15.5%
3-4 years	19	15	7.5%	34	17.00%	9.5%

Accuracy	99.33%

Table 5: Monthly Distribution of Rotavirus Positive Cases

Number of Rotavirus Positive Cases by ELISA	Number of cases	Months
8	40	Jan
6	30	Feb
8	29	Mar
5	24	April
4	21	May
4	14	June
4	11	July
3	11	Aug
1	10	Sep
1	10	Oct
46	200	Total

Conclusions

This study raveled that the prevalence of rotavirus infection among children under the age of five is high. Also, the study show that the male have higher rotavirus infection than female. The findings also provide useful information to the existing national program for the fight against diarrhea and to all other actors developing targeted interventions for preventing childhood diarrhea. The rotavirus infection occurin winter more than in hotter month.

The Relationship of the Genotype Effect to FGFBP1 Gene in Some Productive Traits in Broiler Type Ross 308

Ayman Hashem Essa[1], Abdul-Jabbar A. Al-Rawi[1], Rehab Subhi Ramadhan[2]

[1]College of Agriculture, University of Anbar, [2]College of Biotechnologies, University of Al Nahrain, Iraq

Abstract

Total 150 birds of the Ross 308 type were raised in the fields of the Faculty of Agriculture/Anbar University. The breeding period lasted for 42 days. At the end of the breeding period, 60 birds were randomly selected. The blood samples of the birds were individually taken through the jugular vein. The genetic analysis was carried out in the laboratories of the Faculty of Biotechnology/University of Nahrain. The aim was to separate the genetic material and thus determine the genotype of the FGFBP1 gene. The study examined the diagnosis of genetic markers that are related to important characteristics of the carcass and the relationship between the study genes, the weights of the living birds, the measurements of the birds before the slaughter, and the characteristics of the carcass (carcass weight, net weight of the carcass and the percentage of carcasses, Abdominal fat in the carcass and internal weights of the intestines that include liver, heart and legumes) for the Ross 308 meat breeds are under study, thus identifying the frequency of the genotypes and replicating the gene to obtain the best possibility to improve the economic characteristics of the chicken. The FGFBP1 gene was identified in the current study birds based on the packages that resulted from the DNA transfer of the individuals after the electrical transfer was carried out using the PCR-RFLP technique and the restriction enzyme Pst 1. The gene fragments (AA, AB, BB) were identified for FGFBP1 gene and were replicates of the genotypes (30.00, 48.33, 21.67) respectively. The replication of gene A 0.54 and gene B 0.46 exceeded the genetic makeup of the gene FGFBP1 The rest of the genotypes in the vivo characteristics of the first week and the rate of increase in weight For weekly in the first week and the amount of feed consumed in the week, second, third and feed conversion efficiency in the first week, the fourth week and the length of the chest, chest width and depth of the chest in the first week of the period of education and carcass weight and net carcass and the weight of the liver, heart and gizzard exceed significantly (0.05> P). FGFBP1 mutations were identified after sequencing of mutations of 65% for each and 35% for the Ross 308 meat samples.

Keywords: *FGFBP1, Sequencing, RFLP PCR. Broiler.*

Introduction

The increase in the world population has led to increased demand for animal products and for purchasing it. In a way, the poultry industry helps to improve the productivity rates mainly through the use of genetic improvement programs [1]. The growing global demand for poultry meat has put the pressure on the breeders to increase growth and muscle mass while reducing abdominal fat. Currently, chickens are marketed in the same market as the previous age with a double body weight when it is compared to the last 50 years[2,3].

Genetically modified birds can be identified for carcass traits using genetic markers that bind to the genes that are responsible for carcass traits under study. The development of molecular genetics has led to the emergence of new tools to identify the genetic regions and salons involved in economically significant traits [4]. Several sites have been assigned quantitative traits location (QTL) for the performance of carcass recipes in different chromosomes in a study by [5,6]. (QTL) was assigned as a percentage between Drumstick and Thigh in the chromosome region 4, as this region is specific to the growth factor genes[7]. The QTL study also nominated two associated genes with specific traits (FGFBP1), since FGFBP1 is the link between fibroblast growth factors (FGFs) such as FGF1 and FGF2 [8,9]. Studies indicate that the protein binding of the growth factor of muscle cells FGFBP1 is able to transfer FGF2 from extra cellular filling as well as to improve the biological activities of

FGF1[10,11]. In previous studies, FGFBP1 was associated with the development of fetal muscle growth in broiler chicken embryos and contributed to the development of muscle mass of broiler chickens [12]. This study aimed to identify the multiple forms of FGFBP1, as well as the correlation between a polymorphism (SNP) with carcass traits, muscle development, and meat quality in the chicken groups tested.

Materials and Method

150 birds of commercial broiler chickens were raised Ross 308 in the poultry field of the Faculty of Agriculture/Anbar University, from 20/9/2017 to 2/11/2017. In a way the birds were breed in battery system, each battery consists of four cages have meters and feeders. Then, the birds were split to cages, for each cage 10 birds and the weight of birds is taken every week. Blood samples were collected from the jugular vein in the neck randomly for 60 male birds and 5 ml females. The samples were placed in test tubes containing K2 EDTA. These samples were kept in a chilled box and then transferred to freezing under 20°C. The blood samples were collected from the Faculty of Biological Agriculture/Al-Nahrain University/King Abdulaziz University for Science and Technology (Heredity).

Table 1: Sequence of primers used in the study

Name gene	Oligo nucleotides	Tm C°	Product size	Sequence (5'-3')	Ref.

Results and Discussion

DNA extraction: Figure (1) shows the results obtained from the transfer of DNA samples using the acarose gel, which contains the dye of the aldehyde bromide.

Figure 1: For DNA samples extracted from Ross 308

Gene FGFBP1: The FGFBP1 gene was amplified using the PCR technique, in which several PCRs, Forward and Revers were used from each gene and isolated DNA samples. The PCR was determined according to the materials and Method of work. The multiplication samples were then injected by injecting 7µL from each sample and using 4 µL of the size pieces (100-1500) in the 2% karose gel. The voltages were measured at 100 volts for 10 minutes and the voltages were then reduced to 80 volts for an hour and a half. To view the output of the relay to ensure the success of the extraction process and to obtain the size of the required parts as shown in Figure (2).

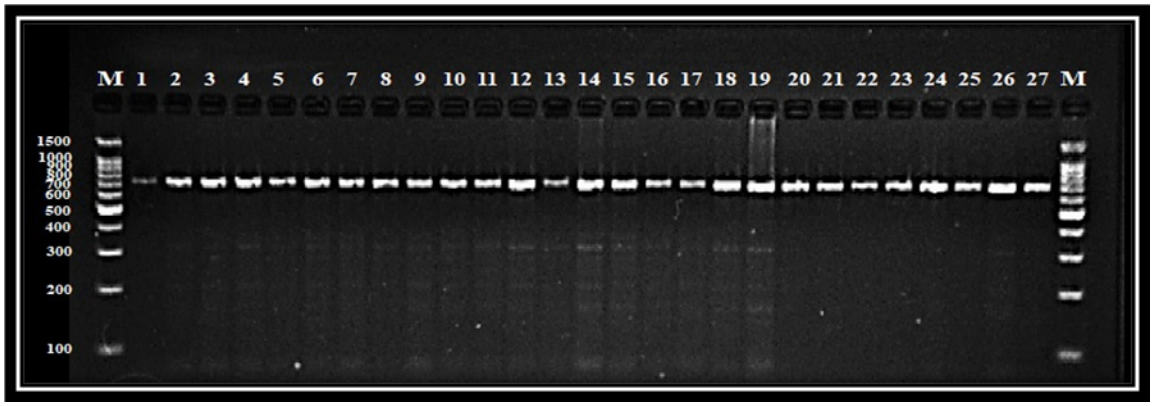

Figure 2: Product of the PCR technique for FGFBP1 gene after it was placed in the alakaroz gel

The genotypes of the Ross 308 meat broiler were selected for FGFBP1 using RFLP and Pst 1, according to the separation of the materials and Method of work. The multiplication samples were carried out by injecting μL8 from each sample and using 4 μL of pieces of size information (100-1500) In a 2% concentration of alcohols. The voltages were measured at 100 volts for 10 minutes and the voltages were then reduced to 80 volts for an hour and a half. The output was filmed to ensure that the extract was successful and to obtain the required cutting size as shown in Figure 3.

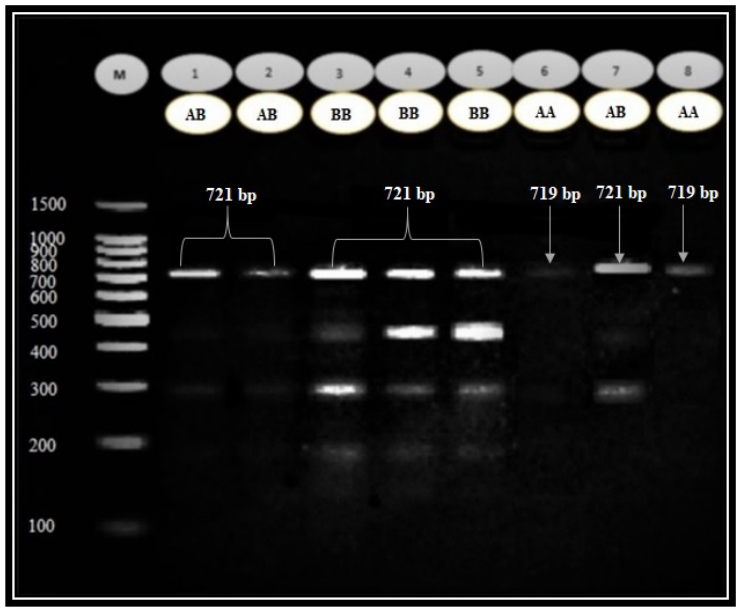

Figure 3: The product of digestion of the FGFBP1 gene using the restriction enzyme Pst 1 after the exposure of the dyed alkaloids to the amygdala bromide to the ultraviolet ray represents the column M Particles Size Information (100-1500) Base pair, column (6, 8) (3, 4, 5) are similar to the alleles and symbolized by BB, and finally column (1, 2, 7) are similar to alleles and are symbolized by AB.

Distribution of FGFBP1 genes in the genotypes of chicken meat samples Type: Ross 308 Table 2 shows the numbers and the percentages of the genotypes of the FGFBP1 gene as the percentage distribution of the genotypes (AA, AB, BB) is 30.00, 48.33, 21.67. This superiority shows that the mean values of gene replication should be taken into consideration if the selection is to be made through the abundance of FGFBP1 genes, followed by individuals with a genetic makeup of AA and then BB. The latter is low in value for low The FGFBP1 gene in this structure.

Table 2: Distribution of number and percentages of genotypes of FGFBP1 for Ross 308 meat chicken samples

% percentage	The number	Genotype
30.00	18	AA
48.33	29	AB
21.67	13	BB
%100	60	Total
Non-Significant		Significant level

The Relationship of the Genotype with The weight of the carcass to broiler type Ross 308: Table (3) explains the results of the present experiment for the rate of the weight of the carcasses and the relationship of the genotypes with FGFBP1. There were no significant differences in the characteristics shown in the table due to the relative stability between the weights of the traits. These results were consistent with [12,13], when they conducted an experiment on the quality of the meat and its genetic relationship with the muscle characteristics of the line. The results showed that there was no significant difference in the weight of the carcass.

Table 3: Meanings ± The standard error of the weight characteristics of the carcasses of the genotype of the FGFBP1 gene in the meat breeder Ross 308

Mean ± standard error (gram)							(Genotype)
Neck weight	Back Weight	Brest Weight	wings Weight	Weight of the thigh	The weight of the drummer stick	Percentage of abdominal fat

Gene Structure of FGFBP1 in the Weighting of the Internal Intestines of the Ross 308: Table (4) explains the results of the present trial of the internal weight of the internal organs (liver, heart and Gazard) and the relationship of the genotypes with FGFBP1. There was a significant superiority (0.05> P). The results of this experiment were consistent with [7]. Significant correlations were found for the weight of the liver, heart, and leg of the chicken meat line carcasses through the effects of growth factor genes, including FGFBP1 in the internal parts of the intestine.

Table 4: Meanings ± The standard error for the internal weight of the genotype of the FGFBP1 gene in the meat broiler

Study of Sequence Analysis of FGFBP1 for Chicken Meat Type Ross 308: `Forty samples of a PCR product were sent to Ross 308 meat chicken samples for the analysis of sequences of the FGFBP1 gene. The sequences were compared with the National Center for Biotechnology Information (NCBI) for the detection of sequences in the FGFBP1 gene. Amplifies part of the FGFBP1 gene by acting on Exon 2 in the gene. The variance obtained for FGFBP1 from the chicken meat samples under study is found in Exon 2 as compared to the National Center for Biotechnology Information (NCBI).

Types of mutations and their effect on the FGFBP1 gene: The differences in the sequences of nitrogen bases indicated the substitution mutations that affect the work of FGFBP1 gene. The type of variations of the types of codes that produce the protein in Ross 308 meat, chickens were identified by using Mega 6 program and as explained in Table 5.

Table 5: The variations in protein production after mutations

Effect on the translation	Type of mutation	The location of the nucleotide	Heterogeneity of amino acid	Type of heterogeneity	Wild style	name of the gene
Missense	substitution	516	Glu - Arg	CAG	CGG	FGFBP1
Missense	substitution	529	Asn - Lys	AAC	AAG	
Nonsense	substitution	535	Tyr – Stop codon	TAT	TAG	

Conclusion

The replication of gene A 0.54 and gene B 0.46 exceeded the genetic makeup of the gene FGFBP1 The rest of the genotypes in the In vivo characteristics of the first week and the rate of increase in weight For weekly in the first week and the amount of feed consumed in the week, second, third and feed conversion efficiency in the first week, the fourth week and the length of the chest, chest width and depth of the chest in the first week of the period of study and carcass weight and net carcass and the weight of the liver, heart and gizzard increased significantly (0.05> P).

Qualitative Remedial Approach by Using Assistive Devices and Tools for Dorsal Dystrophy Assessment in Children at the Age (10-12)

Asaad Tareq Ahmedhmde[1], Imad Azez Nashmie[1], Hazim Ali Ghazi[2]

[1]Al-Muthanna University, [2]AL Qadisiyah University/The College of Physical Education and Sports Sciences/Iraq

Abstract

The research goals to prepare Qualitative Remedial Approach by using Assistive Devices and Tools for Dorsal Dystrophy Assessment furthermore to identify the effect of the therapeutic approach in the development of some physical abilities (strength - power range - flexibility) in addition to the identification of the effect of physical abilities elements in dorsal dystrophy assessment. Weassumed that there are statistically significant differences between the pre-test and remote tests in the results of tests and the benefit of the post-test. We also hypothesize that there are statistically significant hypotheses between the development of some physical abilities and the dorsal dystrophy assessment. We conducted a field survey distributed to primary schools for boys and for ages (10-12) years to the center of Muthanna province of the Directorate of Education Muthanna (33) schools. We excluded (9) schools from girls' schools. Therefore, 24 schools were stable. The sample of the study was deliberately selected by researchers in patients with dorsal dystrophy, And to benefit from this research in the development of the bulges, if any,continue to exercise on the devices and tools for the purpose of prevention and prevent the recurrence or aggravation of the situation, with emphasis on safety and safety in practical lessons.

Keywords: *Remedial, Assistive Devices, Dorsal Dystrophy.*

Introduction

The developed countries head for taking care of the individual and his health during the various stages of growth. During doing the exercise various events, activities of life and sports the human is subject to a lot of pressure and burdens that lead to various disabilities and physical malformations, which have a direct impact on the human strength and lack of acquisition of the natural form because of the dorsal distortions distort and hinder movement. The spinal column is a basic pillar in the human body, because it has the characteristics that qualify it to carry the body weight and transport it to the lower limbs and carrying the head and the upper limbs and thorax, as well as the passage of the spinal cord within the vertebral canal within the vertebrae that the most parts exposed to the effort are those that carry the weight of the body and maintain balance in the course of stability and movement. We have been acquainted with many studies and recent researches, which confirm that the causes of deformities of the practice of "wrong habits and malnutrition in early childhood[1], which leads to the possibility of such distortions and lack of interest in the study of physical education to lose its basic components (sports equipment)[2.] All of this has helped to spread the chronic disabilities and deformities in children at high rates and at an early age[3.]

Throughout noting that they are teaching and interested in this important segment of society, which is the childhood that is the most vulnerable to the incidence of deformities of the spine and the emergence of chronic disabilities, which identify and inhibit the development of the child properly and leaving these distortions exacerbate. Due to improper use of the balance of the strength of ligaments, muscles and unsuitable use of body parts in weightlifting, as well as wrong habits, erroneous training, malnutrition and other reasons that increased the rate of deformities at this stage. Which is an obstacle to the introduction of the main community class to primary school students should be studied and identify the reasons.

Materials and Method

The following experimental approach was used to serve as a search for the most accurate results. This method is especially adapted to studies of physical preparation, learning and growth. The experimental approach is one of the Method and process used to study and solve the problem with the discovery of the facts[4].

Research Sample: A field survey was conducted on primary schools for boys and ages (10-12 years) for the center of Al-Muthanna Governorate (33 schools). We excluded (9) school girls' schools, so it settled on (24) schools as the sample was selected deliberately by people with dorsal dystrophy. (12) students and homogeneity and equivalence as in Table (1).

Table 1: Schools Field Survey

No.	Variables	Units	Arithmetic mean	Standard deviation	Bending correlative
1	Elastic spine to front	Cm	4.43	1.397	0.566-
2	Backbone elasticity	Cm	32.46	4.54	0.510-
3	Elastic spine of the left side	Cm	22.00	2.768	0.396-
4	The power of background backgammon	Kg	6.57	1.28	0.22-
5	Strength of abdominal muscles	No.	6.8571	0.69	0.174
6	Strength of back muscles	Second	14.28	1.252	0.740-
7	Strength of abdominal muscles	No.	14.14	1.676	0.309-

Procedures of data collection

Instruments and tools:

The following instruments and tools were used:

1. Dynomater device
2. Electronic stopwatch.
3 Tape measure, to measure the elasticity of the back and lateral spine.
4 Wooden box indicator of positive and negative to measure the flexibility of the front spine of the stand.
5 chalk + pencil + ruler measuring 100 cm.
6 whistle number (1).
7 cords (8) to install the devices prepared.
8 Mat length (12) meters.
9 plastic cards ** number (4) personalities.
10 device Aqla ** height of 2 m and a width of 1.5 m.
11. Using the wall ladder **.
12. Manual calculator for the extraction of statistical results.
13. Camera.
14. Video camera.
15 Computer for the extraction of statistical operations (SPSS)

Measurements and tests used in research:

Physical measurements:

A. **Measuring the degree of deformity of dorsal deformity:** After the diagnosis of the injured students from the specialized doctors, X-rays were taken to the students. The aim was to measure the lateral bending angles of the spine in the chest area. The radiograph was taken from the lateral lying position of the body on the floor and the student was then visualized.

- Recording the degree of deformity by the specialist doctor according to the Newburgh form to diagnose the specific strength of the degrees of those abnormalities according to their severity as shown[5].

Second. Physical tests included:

1. Test the strength of the back muscles using Dynomometer[6]:
    - Objective of the test: Used to measure the strength of the muscles of the back and legs.

Registration: The best attempt is recorded for each laboratory of (2, 3) attempts.

Test the strength of the abdominal muscles:[7]

Sit down from lyingin 10 seconds.

- Purpose of the test: Measure the strength of the abdominal muscles.

- Tools used: Stopwatch - Flat surface - Registration form.
- Performance specifications: The student lies on the back above (flat level) with the opening of his feet by 30 cm with the contact of the palm of the neck from the back and elbows are installed (the colleague installs the two men immediately after hearing the starting signal of the referee), the laboratory to bend the trunk to reach the position of sitting tall and knees Repeat by as many times as possible in 10 seconds.

Recording: The number of times the correct performance in (10) seconds.

2. Test measuring the strength of the back muscles[8]:

- Purpose of the test: Measurement of the time of carrying the muscles back.
- Tools used: Stopwatch - Registration form.

Registration: Recording the time of student stability in the situation to the voltage.

3. Test measure the strength of the abdominal muscles[9]:

Purpose of the test: Measure the skin of the abdominal muscles.

Tools used: Stopwatch - Registration form.

Performance specifications: From the status of the back of the student raise the two men high together to the vertical position to repeat the performance as many times as possible (the colleague fixation of the region of the humerus from the inside)[10.]

Registration: The student records the number of correct attempts made by him.

4. Testing the measurement of the flexibility of the spine from standing [11]:

Purpose of the test: Measure the elasticity of the spine to the front.

Tools used: wooden box height 50 cm ruler measuring 1 m height–registration form.

Performance description: from standing on the box bend the trunk down with the extension of the arms to the bottom and pointing to the measurement procedure to determine the degree at the edge of the fingers after the stability of the situation on that number.

5. **Registration:** The best attempt recorded from (2, 3) attempts.

Test the elasticity of the spine of stand:[12]

Purpose of the test: Measure the elasticity of the backbone.

Instruments used: Measurement tape - Registration form.

6. **Performance description:** From the position of standing in front of the wall with a direct appeal to the chest area where the student pulls the feet back together and then measured the distance between the feet and the wall.

Recording: Recording the distance between the wall and the feet for the best attempt of (2, 3) attempts.

7. **Test the measurement of the flexibility of the spine from standing[13] :**

- Purpose of the test: Measure the elasticity of the spine for both sides (right–left).
- Instruments used: Measurement tape-Registration form.
- Performance description: the position of standing on the wall and arms side of the body, the knees included, measuring the distance between the ground and the tip of the middle finger of the hand at the tilt of the trunk aside to the maximum extent possible and measure distance again and calculate the difference between the two measurements.

Steps to implement the curriculum:

First week: The first week of the curriculum included a one-week teaching unit, three days a week, where the curriculum will be applied on Saturday-Monday-Wednesday. The unit time was 45 minutes. The preparatory section includes (5) minutes and the main section for 25 minutes divided into two sides. I teach for a period of (7) minutes, and my second application (18) minutes. The course includes six stations where the exercises will be performed on the equipment and tools and distributed in a circular manner for 3 minutes per station.

Second, third and fourth week

Number of units: three units per week

Application days: Saturday + Monday + Wednesday

Unit Time: 45 minutes

The course included six stations in which the exercises will be performed on the equipment and tools in a circular manner for (28.45) minutes

Number of courses: 1

The fifth, sixth and seventh week

Number of units: three units per week

Application days: Saturday + Monday + Wednesday

Unit Time: 45 minutes

The course includes six stations where the exercises are performed on the devices and the aids are distributed in a circular manner for 30 minutes.

Number of courses: 1

Week Eight, Nine and Ten

Number of units: three units per week

Application days: Saturday + Monday + Wednesday

Unit Time: 45 minutes Preparatory Section + Master Section + Final Section.

The course included six stations in which the exercise was conducted in a circular manner for 36 minutes.

Number of courses: 1

Week Eleven

Number of units: three units per week

Application days: Saturday + Monday + Wednesday

Unit Time: 45 minutes Preparatory Section + Master Section + Final Section.

The course includes six stations where the exercises are conducted in a circular manner for 30 minutes and apply this week the vocabulary of the approach of the eighth week for the purpose of reaching a state of adaptation to the injured.

Post-tests: From 12/5 to 14/5/2018, we conducted remote tests and observed the sequence of tests and measurements as applied in the pre-tests.

Statistical means:

The SPSS was used to process the data

Results and Discussion

Table 2: The t-test values for the pre-test and post-test of the physical test variables in the dorsal group

Tests / Statisticalmeans	Meas. Unit	F	FA	T Value		Significance of differences
				Accounted	Scheduled	
Flexibility of the spine	Cm	2.57	0.78	8.64	2.447	Morally
Backbone elasticity	Cm	3.00	1.41	5.61	2.447	Morally
Flexibility of the spine of the side	Cm	4.00	1.52	6.92	2.447	Morally
Strength of back muscles	Kg	2.14	0.62	9.04	2.447	Morally
Strength of abdominal muscles	Second	3.14	1.06	7.77	2.447	Morally
Strength of back muscles	Second	2.14	0.69	8.21	2.447	Morally
Durability Abdominal muscles	Second	3.71	0.95	10.33	2.447	Morally

Table 3: The values of the amount of change between the computational circles and the percentage of change (evolution) between the results of the pre and post tests of the dorsal group of the physical variables under study

Tests / Statisticalmeans	Pre-test	Post-test	Variable value	Percentage of variable %
	C	C		
Flexibility of the spine	2.42	7.00	4.58	189.22%
Backbone elasticity	32.42	35.42	3.00	9.25%
Flexibility of the spine of the side	22.00	26.00	4.00	18.18%
Strength of back muscles	6.57	8.71	2.14	32.57%
Strength of abdominal muscles	6.57	10.00	3.42	51.97%
Strength of back muscles	14.28	16.42	2.14	14.98%
Durability Abdominal muscles	14.14	17.85	3.71	26.23%

Table 4: The values of the computational arithmetic and the standard deviations of the pre and remote tests, the t-test value of the corresponding samples and the percentage for measuring the degree of deformity of the dorsal

Tests Statisticalmeans	Pre-test		Posttest		T Value For corresponding samples		Significance of differences	Amount of change	Percentage of the amount of change
Dorsal Dystrophy	3.072	0.189	4.143	0.378	6.608	2.447	Morally	1.071	34.87%

Conclusions

1. The effect of the curriculum prepared under study well in the tribal and remote tests where there was no significant variation in the results of treatment and rehabilitation of those distortions under study.
2. In the light of the results between the tribal and remote tests, the application of the therapeutic exercise on the devices and aids has led to a significant improvement in strength, strength and flexibility (front, back and side) of the spine muscles as well as reducing the degree of deformity of all the injured. That is, the curriculum was in line with those distortions.
3. The rate of development between the results of the tribal and remote tests of the variables under study were effective and in favor of the post-test (dystrophy).

Recommendations

1. We recommend to generalize the schools of the country using the physical assessment of students at the beginning of each academic year to find out the nature of the bodies of students and to benefit from this research in the development of bulges, if any.
2. Continue to perform exercises on equipment and tools for the purpose of prevention and prevent the recurrence or aggravation of the situation ?.
3. Emphasize the safety and safety Method in the practical lessons for school students and take care of the correct techniques during the exercise on these devices and tools and comply with medical instructions regarding cases of deformity in order to reduce complications in the chronic stages.

Evaluation of Hepatoprotective Activities of Pomegranate Crude Extract in Steatosis Induced Obese Mice

Liqaa Oday Ali[1], Nada M. AL-khafaji[1]

Department of Basic Sciences, Faculty of Dentistry, University of Babylon, Iraq

Abstract

The current study is aimed to reconnoiter the effective role of Pomegranate Crude Extract (PCE) in the liver tissues of castrated male mice, for this 45 male Albino mice [4 weeks] aged, were distributed in to 3 groups N=15 for each group. From a period February to May 2018. The results showed there were histological variations were detected in the liver of induced castrated mice demonstrated by the form of disturbed hepatic structures, reduction in sinusoids, cytoplasmic vacuolation in hepatocytes, accumulation of lipid [microvesicular steatosis & macrovesicular steatosis], these variations related with inflammatory of lymphocytes in addition, all these histological changes were less pronounced in the group that treated with (PCE), this study was concluded that [PCE] has marked improving effects against liver steatosis complications. For this reason, we recommend that you use the pomegranate fruit or its juice in the (daily food table) against the increase in hyperlipidemia.

Keywords: *Castration, Pomegranate Crude Extract, Mice, Steatosis.*

Introduction

It has been noted through previous research that with progress in age men there is a diminished in the levels of testosterone levels and this decline has others complications represented by [obesity, hyperlipedmia & insulin resistance][(1)], testosterone deficiency which donate the progress of non-alcoholic fatty liver disease [NAFLD][(2)], currents tudies have proved that most men who have a decrease in the levels of testosterone are more susceptible to steatosis[(3)]. In addition, other studies done on rats suffering from the reduction of testosterone more prone to the occurrence of fatty degeneration in the liver [(4)]. The incidence to increase the blood cholesterol and triglycerides caused by the lack of testosterone has an impact in Increasing the incidence of hepatic degenerative fatty disease[(5)]. Based on your guide, different animals, such as rodents, were used to confirm the effect of testosterone deficiency on [NAFLD][(6)]. Large animals were also used for this purpose, such as pigs, because the similarity with human physiologic system[(7)]. All of these studies conducted that the increase the levels of cholesterol and triglycerides lead to obesity and hyperlipidemia[(8)]. [Punicagranatum L.], known as the pomegranate fruit, one of the types of fruits that grow in the tropical regions, which has been used in the treatment of many diseases within ancientnations[(9)]. Pomegranate rich with many polyphenolic compounds like, [anthocynins; hydrolysable tannins; punicalagin, punicalin, and gallic acid][(10)]. It has become increasingly common as a result of its benefit to human health[(11)].

Previous studies confirmed the importance of the use of roots, barks, peel and pomegranate juice to treat many disease like [hemorrhage, diarrhea, helminthiasis and microbial infections][(12)].

Materials and Method

Preparation of PCE: To prepare the extract of [PCE] has included washed the fruits well with water and then was using about 500 gm without separating their peels and seeds, the fruits was cut into small pieces then squeezed using an electrical blender and filtered to eliminate the remainder by filter with Whit man filter paper [2ǂ]. The extract was used after 1 h[(13)].

Experimental Design: Total of (45) male albino mice weighing between [14-20] gm, with age [4 weeks], were obtained from the Faculty of Animal Sciences/ University of Babylon, mice were divided into 3 main groups:

Group I [Control group]: Included 15 mice, preserved on the rodent food pellets for 12 weeks.

Group II [castration group] Included 15 mice, preserved on the rodent food pellets for 12 weeks.

Group III [castrated treated with [PCE] included 15 mice, preserved on the rodent food pellets and were given [PCE] orally by gastric tube at a dose of [20 ml/ kg] body weight daily for 12 weeks[14]. in the end of all experiments, all mice were fasted during the night, and after that, they were anesthetized using ethyl ether [15].

The preparations of routine histological sections: After opening the abdominal cavity .The liver was extracted then it was immediately kept by using formaldehyde with [10%] for 24 hours. The tissues were passed with an ascending of alcohol. This process was followed by the embedding of paraffin. The sectionswere cut to 5 microns then stained with H & E to examine the general histological structures [16].

Results

The liver sections that obtained from Group Ishowed classic of hepatic lobules and can identify the [central vein] at its center, and Each classic hepatic lobule was formed of hepatocytes with one cell thick arranged in plates or cords, they alienated by sinusoids as in (figure 1A). The liver sections that obtained from Group II showed histopathological changes in the form of narrowing in sinusoids, most hepatocytes showed cytoplasmic vacuolation appeared with ballooned in shaped with inflammatory of lymphocytes between hepatocytesas in (figure 1B), in addition [figure 1C] showed multiple small vacuoles (microvesicular steatosis) and other have large vacuoles with peripheral nuclei (macrovesicular steatosis). The liver sections that obtained from Group III showed most of the hepatocytes restoration of their cytoplasmas same as the control as in [figure 1D].

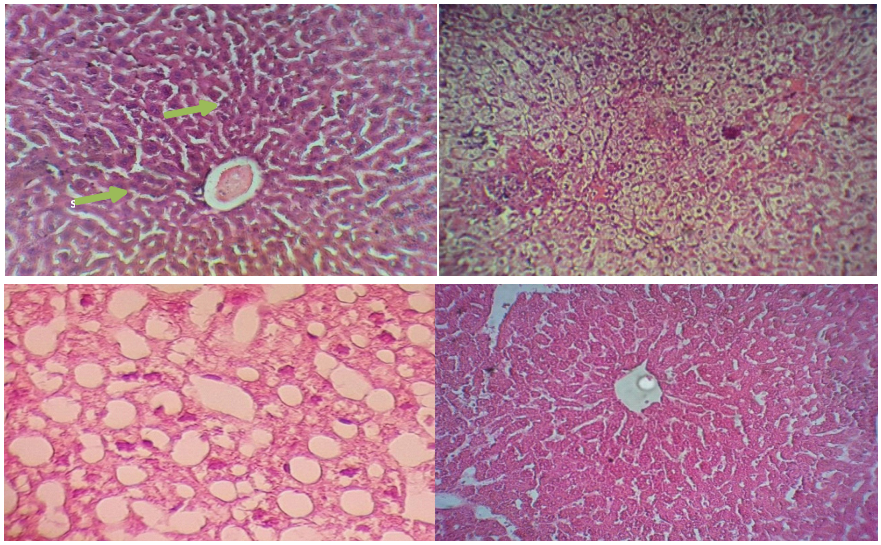

Figure 1: A: Liver sections for G1 group showed a) central vein (C) sinusoids (S) lined with hepatocytes (H) (H & E A 200X) Liver sections from GII Group (B) showed Ballooning degeneration(B), inflammatory of lymphocytes. C: showed micro & macro vesicular steatosis (M) (H & EB 200X, C400X) Liver sections from GIII group showed normal liver architectures (H & EX 200).

Disscusion

The fatty liverdisease define as the accumulation of fat (triglycerides) inside the hepatocytes, which either be alcoholic or non-alcoholic liverdisease, the disease may be converted from simple steatosis to fibrosis or liver cancer and even to liver failure [17].

Testosterone deficiency is the major way to development of hepatic steatosis in castrated animal like male mice. In recent years, naturally occurring anti–inflammatory and anti-oxidant Some of the components of the diet have occupied a distinguished position and great attention by several researches [18].

Livers obtained from GII group showed micro & macrovesicular steatosis, disturbed hepatic structure of the liver which observed in this study thisexplained as to increased oxidation of proteins in hepatic cells and

necrosis abnormalitiesin the hepatocytes that lead to irregularity in the orientation of the hepatocyte plates and disturbing hepatic architecture. Cellular infiltrations between hepatocytes considered the adipocytes in fatty liver are main cells that secrete many immune modulator agents to the pro-inflammatory cytokines, IL-6 and TNF-α with (ROS), that lead to increase fatty liver degeneration[19].

Ballooning degeneration described as microvesicular and macrovesicular steatosis(20), it is explained as abnormalities in the production, conveyance, digestion, and transfer of the fat, with imperfect in the beta-oxidation of fattyacids. Furthermore, cytoplasmic vacuolation may recognized to fatty peroxidation, oxidative stress that damage cell membrane as well as membranes of cell organelles. leading to increase in their permeability and disturbance of the ions concentrations in the cytoplasm and cell organelles(21).

In the present work, it was observed that daily administration of pomegranate crude extract after castration ameliorate the previous changes,this results agreement with(22) who concluded that pomegranate juice protects against steatosis in high fatty diets albino rats also(23) noticed that pomegranate juice had a protective effect against hepatic damage in rats,this effect could be attributed to the radical scavenging antioxidant constituents . The active substances found in the pomegranate of flavonoids, which have an antioxidant effect, have contributed greatly to the process of repair and regeneration the hepatocytes,this is due to the destruction of free radicals or the accelerated repair mechanism of damaged cell membrane (24).Pomegranate juice was also shown to have significantly higher levels of antioxidants in comparison to commonly consumed fruit juices, such as grape, cranberry, grapefruit, or orange juice, Furthermore, pomegranate extract has also been shown to preserve the antioxidant enzymes catalase, glutathione peroxidase, and superoxide dismutase from the effects of toxic chemicals(25).In addition, the ability of pomegranate extract to protect DNA and preventing chromosomal damage in mice was proved(26).

Conclusion

PCE has marked improving effects against liver steatosis complications. For this reason, we recommend that you use the pomegranate fruit or its juice in the (daily food table) against the increase in hyperlipidemia.

A Vital Role of Aqueous Extract of the Plant Eugenia Caryophyllata (Clove) in Treatment of Trichomonas Tenax Infection for Patients Attended Dental Clinics, Kufa University

Shaimaa A. Shlash[1], Hussein A. Kadhum[2]

[1]Pharmacy College, Kufa University, [2]Faculty of Dentistry, Al-kafeel University, Iraq

Abstract

The current study aims determined incident of *Trichomonas Tenax* infection for people by oral diseases compare to healthy people and extent of the connection with operators of sex, age, habitation and educated level using macroscopic and microscopic routes and the vital role of hot aqueous extract *Eugenia Caryophyllata* buds to treatment of this parasite infection come dental clinics/kufa university in Al-Najaf governorate.

This study was carried out at dental clinics/kufa university from July,2017 to May, 2018. Where included the disclosure of the incident to 100 patients with *T.tenax*in mouth of people depending on sex, age, habitation and educated level, diabetes and take insulin and non-take insulin also role of the aqueous extract of hot buds *E.caryophyllata* on patients in inhibition for this parasite where take four groups including treated three groups with concentrations 100, 200 and 300mg/ml respectively of body weight used as Gargling by mouth while fourth group was left with positive control (non-treated). The experiment continued for 10 days at dose is 5 ml daily for all studied groups. Incident of *T.tenax* parasite in people mouth to 100 patients, The total number of the infected 74% where appeared depending on age group 38-47 and rate was 93.75%, proportion of males was 32% while of females was 42%, depending on habitation was 84.4% while educated level was 90.6% while depending on taking insulin while patients who are non-taking insulin males and females reached 35% and 25%respectively, total incidence rate was parasitic 76.92%.

Results showed that hot buds aqueous extract of *E.caryophyllata*predestined on patients in inhibition of the parasite where used four groups were showed the total proportion of healing was 51.38% appeared highest healing rate reached 100% with concentration 300mg/ml gave significantly ($p<0.05$) compared with control groups (non-treated).This study find that giving the hot aqueous extract of *E.caryophyllata* buds as a gargle with concentration 300mg/kg led to parasite killing and complete recovery without side effects of both sexes.

Keyword: *Eugenia Caryophyllata*, *Trichomonas Tenax*, Gargling, Clove, Healing.

Introduction

*Trichomonas tenax*is one Trichomonadidae family members, an anaerobic commensal of human oral cavity whichlives in mouth of the patients with poor oral hygiene and advanced periodontal diseases [(1)]. Live intarter between the teeth gingival margin concerning the gum and tonsillar crypts[(2)]. Transmission through saliva droplets pray, kissing and water drink[(3)].These parasites were correlated with age and sex of the host is protozoa found in human oral cavity from seen in swabs taken from dental pockets on the surface of periodontium[(4)]. Studies show that people with diabetes are more likely to get periodontitis than people without diabetes [(5)]. In Iraq there is study which showed a prevalence of periodontis 8.4 % with *T.tenax* by direct smear [(6)], remarked World Health Organization has indeed recognized medicinal plants as best source for obtaining a variety of synthetic drugs[(7)].

Cloves are aromatic dried flower buds of a tree (*Syzygiumaromaticum*or *Eugenia caryophyllus*) belonging to Laminaceae family, mainly used several parts of the plant such as leaves and buds in cooking, food processing, pharmacy and cosmetics [(8)]. Clove is natural antimicrobial, antiviral, anti-fungal agent, parasitic infestations and toothaches [(9)]. In Iraq a major therapeutic role where using clove in different local

plants to treat patients biological and pharmacological properties [10] .The aqueous extract of clove causes inhibit both acute and chronic inflammation, dental caries and pyorrhea[11]. Showed inhibit the growth of *Trypansomacruzi* parasite which causes Chaga's disease to successfully inhibit *T.cruzi,* with 50% of cells inhibited at 57.5 micrograms/ml [12]. The current study aims to determine the incidence of *T. tenax* infection in people with oral diseases compared to healthy people by using the macroscopic and microscopic Method and the vital role of the hot aqueous extract of *E.caryophyllus*buds in the treatment for patients attended dental clinics/kufa university in Al-Najaf governorate.

Materials and Method

This study was carried outfor period from beginning of July 2017 to May 2018. These study included 100 individuals 74 patients 42 female and 32 male, their age ranged from 18-77 years old with periodontitis patients who attended to dentistry clinics/kufa university and 26 healthy controls, Laboratory examination included Macroscopical examination where watching white layer covering the surface of the teeth, observation of tooth decay, color and texture of the gums and presence of yellow layer in the supporting tissue (tar-tar) [13]. Microscopically examination either by Direct smear method by taking a sample from the mouth of the patient and then placed directly on the slide and examine by the microscope under the small and large forces and used phase contrast microscope which makes easy to see movement oft he parasite,to see movement oft he parasite[14],Or by Wet preparation method the sample taken from the mouth of the patient and moistened with saliva and placed on clean slide without adding as distilled water tomaintain the cellularstructure of the parasite then put cover slide and examined under (400x), establisheda spear-shaped flagellated trophozoite about 5-13µ long with circular movement and each sample stained with Giemsa staining[15]. *E.caryophyllus* buds were obtained from local markets, washed well with water, dried then grinded and diagnosed in the science collage/kufa university, hot aqueous extract of clove blossoms was prepared by taking 10gm of plant powder after mill by an electric mill and then placed in glass beaker capacity 500mL, add 200 ml of boiled distilled water and leave to cool with continuous stirring. The solution is then filtered through layers of gauze and then filter paper. The leaky is then taken to be dried by an electric oven at a temperature (45-50ºC) collected and keep in a clean and dark glass bottle and put in the refrigerator to a degree (4ºC) untilused. Prepare the stock solution where 1gm of extract and solvent in 10ml of distilled water, so have a concentrated solution 100gm/ml and attended the following concentrations 50%,75% and 100% [16]. Effect of hot buds aqueous extract in patients,72 infected randomly divided into 4 groups each group contain 18 patients oral cavity as Gargling.

The patients in group 1 (infected parasite) which not treated give saline as positive controls, The patientsin group 2 (treated parasite) with *E.caryophyllata*buds aqueous extract orally (100mg/ml) from body weight as gargling for 10 consecutive days with dose 15 ml once a day, The patients in group 3 (treated parasite) for the same extract orally (200mg/ml) from body weight as gargling for 10 consecutive days with dose 15ml once a day and group 4 (treated parasite) for the same extract orally 300mg/ml from body weight as gargling for 10 days with dose 15ml once a day.

The statistical analysis was performed using ANOVA ($p<0.05$) for study the correlation between parasites of oral disease among different age and sex.

Results

Table 1: Trichomonas tenax Infection to infected and uninfected patients with Oral diseases

Health status of patients	Examined No.	No. of Infected	(%)
Infected patients	72	57	79.2%
Uninfected patients	28	17	60.7%

Discussion

*T.tenax*presence in the oral cavity sign of low interest in oral hygiene, dental care and gum disease where can be transmitted by kissing, flying spray and drinking utensils [17]. The incidence of *T.tenax*infection has reached 100 in infected and uninfected patients and rate was 74%, This study was identical with[18]hygiene factor including the oral infection of this parasite is increased by lack of hygiene but the excessive increase in cleanliness has a negative impact in many diseases for immunity because of the inefficiency of the immune system and not being exposed to such parasite. As in Table 1.

The study indicated total number *T.tenax* infection was 100 distributed between 42 female and 32 male infections where ages were from 18-77 years, was highest rate of infection in the age group 38-47 and rate was 93.75%.

These study showed the infection with *T.tenax*tend to increase in females and this result coordinated with[19]confirms that females are more probable than males where proportion of males formed 32% while proportion of females 42% only. The physiological and immunological status of females may play a large role in increasing proportion. The results of the statistical differences were significant, confirmed the existence of positive relationship between sex and infection with this parasite. As in Table 2 Infections number with this parasite in countryside and city was 44,30 respectively where ages 18-77 years was highest rate of infection in the age group 38-47, rate was 84.4% and recorded the highest rate infection in patients living in countryside 44% compared to the city 30%. May be due to the lack of awareness of the importance of oral hygiene and dental care and gums in the countryside as well as frequent exposure to pollutants such as smoking, alcohol and contaminated foods thus providing an conducive environment to oral diseases and parasites while people with old age, most of their teeth are damaged and most oft hem do not have teeth or take a lot of drugs as a result of other diseases may effect these drugs in parasites and prevent infection [20], as in Table 3.

Infections number with this parasite in cultural level in low, intermediated and good was 37, 22 and 15 respectively and highest rate of infection in the age group 38-47, rate was 90.6%.This may be due to neglect of this behavioral habits and lack of interest in personal hygiene as well as the use of the same tools from one person to another this consistent with his findings [21]as in Table 4.

*T.tenax*infection rate for both male and female was 46.8%,28.12% respectively, taking insulin while non-taking insulin males and females reached was 35%,25% respectively, overall infection rate 76.92% .Significant differences between taking insulin and non-insulin users sex differences, This study agrees with [22]. *T.tenax*infection in diabetic, an increase in accident of oral parasites in diabetic patients with five times the incidence of healthy people. Maybake Hyperglycemia lead to be Advanced Glycation Endproducts (AGEs) in turn stimulates monocytes and endothelial cell to produce inflammatory mediators and gathered in plasma and tissues for patients with diabetes leads to the enrichment of gum tissue by vascular permeability breaks the fibrinogen fibers which increases the exposure oft he se patients to the infection of many types: fungi, bacteria and parasites. As in Table 5.

E.caryophyllata used in treated various disease, including intestinal parasites, migraine headaches, cold and application directly tot he gum or skin to alleviate dental pain and reduce inflammation of the mouth and throat places because of some important components: Flavonoids, Phenolic acids, Alkaloids,Tannins and contain rich minerals such as: iron, calcium, phosphorus, sodium, potassium and vitamin C and vitamin A[23].

The results showed that total proportion was 51.38% appeared highest healing rate reached 100% with concentration 300 mg/ml of the aqueous extract and lowest healing was 20% with concentration 100 mg/ml, the best concentration of healing is 300 mg/ml with doses 15 ml in tenth day without side effects comparison with control group results showed that patients remained intact and none of them were cured and clinical symptoms including gum swelling, as in Table 6.

This may be due to the presence phenolic compound interfere the energy generation mechanism by uncoupling the oxidative phosphorylation and interfere with the glycoprotein of the cell surface of parasite and cause death or because of the existence alkaloids which act as an antioxidant capable of reducing the nitrate generation which can interfere in local homeostasis is important for developed of parasite, These results are matched with[24].

Conclusion

Giving the hot aqueous extract of *E.caryophyllata* buds as a gargle with concentration 300mg/kg led to parasite killing and complete recovery without side effects of both sexes.

Marginal Fitness of Monolithic Zirconia Crowns Fabricated from Direct Digital Scanning, Impression Scanning & Indirect Digital Scanning Using Different Impression Materials

Ayat S. Mahdi[1], Manhal A. Majeed[2]

Conservative Department, College of Dentistry, University of Baghdad, Baghdad, Iraq

Abstract

Aim: To evaluate and compare the marginal fitness of zirconia crowns fabricated from direct digital scanning, scanning of conventional impressions made with different impression materials and indirect scanning of the resulting stone dies using an extra-oral scanner.

A metal die for a prepared maxillary right first molar was used as a master model for this study. A total of fifty-six zirconia crowns were then fabricated using CAD/CAM system according to the following sample grouping: Group I: Crowns fabricated from direct digital scanning of the metal die (8 crowns), Group II: Crowns fabricated from scanning of the conventional impression, which was further subdivided into three subgroups of 8 crowns according to the type of impression material used: (Subgroup IIA: condensation silicone, Subgroup IIB: PVS and Subgroup IIC: VPES). Group III: Crowns fabricated from scanning of the stone dies obtained from pouring of the conventional impression, which was also subdivided into three subgroups of 8 crowns as for Group II. The marginal gap of each crown was then measured using digital microscope at a magnification of 230x. The recorded measurements were then subjected to statistical analysis using One-way ANOVA test, Dunnett's test, Tukey's HSD test and Holm-Bonferonni test at a level of significance of 0.05.

The results of this study showed that the lowest mean value of marginal gap was recorded by crowns fabricated using direct digital scanning (Group I) with statistically highly significant differences when compared with other groups. On the other hand, the highest mean value of marginal gap was recorded by crowns fabricated from scanning of stone dies obtained from pouring of condensation silicone impressions (Group IIIA).

Conclusions: The mean values of marginal gap of zirconia crowns of all groups are within the clinically acceptable limit of 120 µm except those of crowns fabricated using condensation silicone impression material. Crowns fabricated by direct digital scanning showed better marginal fitness than crowns fabricated by the indirect method which showed more discrepancy.

Keywords: *CAD/CAM System; Marginal gap; Digital Impression;Conventional Impression; PVS; VPES.*

Introduction

The major goal in making an accurate final impression is to obtain a final restoration with a clinically acceptable marginal adaptation. The increase in the marginal gap between the crown and the prepared tooth promotes a washout of the luting material, microleakage, and plaque accumulation. This can result in secondary caries, pulp inflammation, and periodontitis, which could lead to a failure of the restoration[(1)]. Recent studies have indicated that the clinically acceptable limit of marginal opening should be less than 120µm[(2)].

Despite technical improvements in the field of computer-aided design\computer-aided manufacturing (CAD\CAM) systems and 3-dimentional imaging procedures, the conventional impression procedure still has a role in transferring information from the patient to the dental laboratory[(3)].

An accurate impression is the first most important step in the procedure of obtaining a perfect restoration[4]. Among the impression materials available, synthetic elastomers such as polyvinyl siloxane (PVS), the so called "addition silicone", is more popular because of its excellent detail reproduction and good dimensional stability[5]. However, condensation silicones are still widely used because they are more economical than addition silicones (Zhermack, 2017).

On the other hand, vinyl polyether silicone (VPES) products are a new group of impression materials. These elastomeric impression materials are a combination of polyvinyl siloxane and polyether and are promoted as hydrophilic materials that presumably maintain the stability and characteristics of the parent products [4,5].

The introduction of digital technology using intra-oral scanners claims to eliminate most errors associated with conventional impression taking including dimensional changes of the impression material and gypsum used to fabricate master model[6]. Compared with conventional impression, intra-oral digital scanning eliminates tray selection, material dispensing, material setting, material disinfection,gypsum pouring, die sectioning, and articulation [7].

Many CAD/CAM systems start with either digitizing an existing conventional dental impression/ dental cast or through capturing digital intra-oral impression[8]. Digitizing a master model poured out of a conventional impression remains at present the preferred technique of many dental laboratories for obtaining digital data of crown preparation [6]. On the other hand, digitizing a conventional impression eliminates most errors associated with fabrication of master model. However, there is no available study dealing with the effect of scanning of conventional impression made with different impression materials and scanning of the stone dies obtained from pouring of these impressions on the marginal fitness of crowns versus direct digital scanning of the preparation.

Materials and Method

A metal die for a prepared maxillary right first molar tooth with chamfer finishing line of 0.8mm and occluso-gingival height of 4.5 mm with total convergence angle of 6°was used as a master model. Eight identical custom trayswere fabricated from self-cured acrylic resin with 2mm spacing. A total of fifty-six zirconia crowns were then fabricated using CAD/CAM system (MC X5, Sirona, Germany) according to the following sample grouping: Group I: Crowns fabricated from direct digital scanning of the metal die using CEREC Omnicam digital intra-oral scanner (Sirona Dental Systems, Bensheim, Germany) (8 crowns), Group II: Crowns fabricated from scanning of the conventional impression using InEos X5 inLab scanner (Sirona Dental Systems, Bensheim, Germany). This group was further subdivided into three subgroups of 8 crowns according to the type of impression material used to take the final impression: (Subgroup IIA: condensation silicone (Zetaplus soft, Zhermack, Italy), Subgroup IIB: PVS(Elite P & P, Zhermack, Italy) and Subgroup IIC: VPES (Exalence™, Gc, Japan). Group III: Crowns fabricated from scanning of the stone dies obtained from pouring of the conventional impression using InEos X5 inLab scanner. In Group I, the metal die was powdered with a thin layer of titanium dioxide powder (NHT, Korea) prior to scanning to provide a matt finish of the surface and decrease its reflection. The same was done for the conventional impressions of the different subgroups of Group II. Conventional impressions were taken using two-step putty/wash impression technique with spacer. The conventional impressions werethen pouredafter 30 minutes with type IV gypsum after their scanning. The marginal gaps of the fabricated crowns were measured using a digital microscope at a magnification of 230x. The measurement of the marginal gap was made at four points determined on each surface of the crown using Image J software. Sixteen measurements were obtained for each crown and the mean of these measurements was taken.

Results

The descriptive statistics of the marginal gap in μm of different groups are shown in Table 1.

Table 1: Descriptive statistics of the marginal gap measured in µm for each group.

Groups	Minimum	Maximum	Mean	±SD
Group I	31.780	40.790	36.430	2.629
Group II A	108.740	133.900	121.366	10.185
Group II B	72.420	91.040	77.675	5.853
Group II. C	71.160	92.300	83.628	8.243
Group III. A	129.150	158.590	147.895	10.209
Group III. B	67.750	99.170	85.463	9.502
Group III. C	84.900	94.650	90.068	2.884

Comparison of significance among the different groups by one-way ANOVA test revealed a statistically highly significant difference among groups (p<0.01) (Table 2).

Table 2: One-way ANOVA test for comparison of the marginal gap among the groups.

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	59168.953	6	9861.492	166.060	.000 (HS)
Within Groups	2909.868	49	59.385		
Total	62078.821	55			

Dunnett's test revealed statistically highly significant differences between the marginal gap of crowns fabricated by digital impression (Group I) and other groups (p<0.01) (Table3).

Table 3: Dunnett's test for comparison of the marginal gap between digital impression and different conventional impression groups.

(I) Groups	(J) Groups	Mean Difference (I-J)	Sig.	95% Confidence Interval	
				Lower Bound	Upper Bound
Group I	Group IIA	84.93625	.000	74.6913	95.1812
Group I	Group IIB	41.24500	.000	31.0000	51.4900

Discussion

Comparison of the marginal gap between digital impression and different conventional impression groups: The statistically highly significant differences in the marginal gap between Group I and the other groups could be due to the direct scanning of the preparation in Group Ithat eliminates the multiple steps of the conventional workflow that can influence the accuracy and precision of restorations[9].

This finding is in accordance with Syrek*et al*.[10],Seelbach*et al*.[11],and Al-Atyaa and Majeed[12]who all found that intra-oral digital impression, regardless of the type of the scanner used, provided better marginal fitness than conventional impressions regardless of the diversity in the conventional impression technique used.

Comparison of the marginal gap of crowns fabricated from scanning of different conventional impressions:

The better fitness of crowns fabricated from scanning of PVS and VPES impressions could be due to the combination of excellent dimensional stability over time and temperature of these two materials with superior elastic recovery and precise detail reproduction. PVS materials possess almost ideal dimensional stability due to the absence of a volatile by product during polymerization and thus can be poured within 1 to 2 weeks after making the impression without the concern for dimensional inaccuracy [13]. It has been found that PVS has the smallest dimensional changes (−0.15%) at 24 hours [14]. Meanwhile, VPES materials have dimensional changes of ≈–0.2% at 24 hours [4].

On the other hand, condensation silicones have the highest dimensional changes during setting (−0.38%) at 24 hours owing to the volatile ethyl alcohol produced as a by product of the setting reaction which tends to evaporate from the surface of the set impression, resulting in distortion[14].

Deformation of the impression while removing from the prepared tooth might be a possible source for inaccuracy[15]. The condensation silicone has a permanent deformation of (2-3%), while PVS has a permanent deformation of (0.2-0.5%)[14]. On the other hand, VPES has significantly less elastic recovery than PVS materials[16].

Comparison of the marginal gap of crowns fabricated from scanning of stone dies obtained from different conventional impressions:

The same scenario of results of the marginal gap of crowns fabricated from scanning of the conventional impression was seen again when scanning of the stone dies was done. This is a predicted finding as each stone die represents a replica of its corresponding impression. However, the overall marginal fitness of crowns fabricated from scanning of the stone dies was lower than that of crowns fabricated from scanning of the conventional impressions. The greater marginal gap of crowns fabricated from scanning of condensation silicone impressions as compared with PVS and VPES could be attributed to the greater contact angle of condensation silicone which has been found to be around 68.6° [17]. On the other hand, the statistically non-significant differences in the marginal gap of crowns fabricated from scanning of PVS and VPES could be due to that VPES impression material is intrinsically hydrophilic because of its polyether content with a contact angle around 35°. Meanwhile, the addition of nonionic surfactants to PVS elastomers provided super hydrophilicity of this material with a contact angle <20[18].

Comparison of the marginal gap of crowns fabricated from scanning of impressions versus scanning of the stone dies

The results of this study showed a statistically non-significant difference in the marginal gap of crowns fabricated from scanning of PVS and VPES impressions when compared with that of crowns fabricated from scanning of the stone dies obtained from pouring of the impressions made with these two materials. This could be attributed to the high dimensional stability, elastic recovery and accuracy of these two materials as discussed earlier. However, scanning of the stone dies showed greater marginal gap of crowns than scanning of their respective impressions. This could be attributed to the setting expansion of the gypsum product used (0.06-0.5%)[19]. On the other hand, scanning of condensation silicone impressions showed less marginal gap of crowns than crowns fabricated from scanning of the stone dies with statistically highly significant difference. This could be attributed to the polymerization shrinkage, poor wetting ability of condensation silicone impression material and the linear setting expansion of the gypsum[19].

Conclusions

1. The mean values of marginal gap of zirconia crowns of all groups are within the clinically acceptable limit except those of crowns fabricated using condensation silicone impression material.
2. Digital intra-oral scanner showed better marginal fitness of crowns than conventional impression with different impression materials with statistically highly significant differences.
3. No significant difference was found in the marginal gap of crowns fabricated from scanning of PVS and VPES impressions, while scanning of the condensation silicone impressions resulted in crowns with the greatest gap.
4. Scanning of PVS and VPES impressions or stone dies showed no significant difference, while scanning of condensation silicone impressions showed less marginal gap of crowns than scanning of the stone dies.

Non-Adherence among Iraqi ACNE Patients: Dermatosemiotics Study

Ali Tareq Abdul Hasan[1], Kadhem Madjeed Haddao[2]

[1]Dermatology Dept., College of Medicine, [2]Basic Medical Science Dept., Dent. College, University of Kerbala, Iraq

Abstract

One public health dilemma in Iraq and around the world is the adherence to medications and medical advices for Acne. Non-adherence (semiotic) is problem that underpin failure of communication which is considered as a financial burden on health care system.

This qualitative Study aims to improving adherence to treatment for Iraqi Acne Patients, using complexity science and system thinking as dermatosemiotic paradigm, it was conducted from January 2016 to December 2017, data collected from thirty patients (male: female, 2:1), age ranged from (16-25). Collected data were analyzed using dermatosemiotic analysis. The findings are presented and discussed under the themes of life world as articulated by the five emergent themes of Ann Hemingway.

Adherence of acne patients to medical and behavioral intervention is improved after creating dialogical space with patient that gives opportunity to share the new semiotic view of health and skin problem. The results refers that induction of paradigm shift from linear thinking to system thinking manifested clinically as behavioral change from non-adherence to adherence.

Keywords: *Acne vulgrais, Non-adherence, dermatosemiotics, system thinking.*

Introduction

Acne vulgaris is one of the most common dermatologic conditions,it is associated with psychological problems[1] that involve both innate and acquired immunity[2] make acne lesions manifested in different degree of severity and following an unpredictable course[3-5] .

Non-adherence is an integral part of the crisis of medicine which is grounded in this marginalization of the semiotic phenomenological dimension of human being that make him an embodied mind[6,7]. Dermatosemiotics view skin is a prototype that can restore the centrality of touch, feeling, empathy to the heart of medical encounter which dictating a semiotic perspective towards patients giving opportunity for using our both eyes.

Understanding human being as complex adaptive system starting from the skin [8,9]. Our ordinary conceptual system, in terms of which we both think and act, is fundamentally metaphorical in nature[10,11].

Semiotics "observant of signs" was a very precise sense to denote the branch of medical science relating to the interpretation of signs and diagnosis of diseases[12].

Acne vulgrais is complex adaptive system which need new kind of medicine embedded in lifeworld approach to human being as relational, semiotic adaptive system. Adherence to treatment is possible only if patient understands the semiotic nature of their illness as complex adaptive system[12,13].

The World Health Organization (WHO) recognizes two distinct categories of nonadherence–preventable (eg. patient forgets, misunderstands) and nonpreventable (eg. life-threatening side effects)–and recommends tailored treatment interventions for the former[14].

Poor adherence is a common cause for treatment failure in skin diseases such as acne vulgaris[15,16]. There are many models of adherence that have been developed[17,18,19] (1) Biomedical model (2) Behavioral model (3) Communication model (4) Self-regulatory model (5) Transtheoretical model (6) Cognitive model

We cannot access paradigm or intentionality only through action, language which are visible like skin.

Materials and Method

Study conducted in a private clinic of the 1st researcher in this workin karbala governoratein Iraq, from January 2016 to December 2017, Data collected from thirty patients (20 males,10 female), their age range from (16-25). Informed consent is taken. Collected data were analyzed using dermatosemiotic analysis, searching for the signs of themes that unify different patients' experiences.

Interviews are conducted one to three time per month and each interview lasted up to 1 hour. Interview session terminated when rich data achieved Semi-structure method is very suitable for our study as it is in congruence with principles of complex adaptive system which are the underpinning framework of study. The questions used to open the interview focused on probing patient lifeworld:

What is like to live with acne vulgaris?

How acne affect your self-image, and why.

How acne vulgaris change your relationship to yourself and space, time and others.

How you can describe your nonadherence to treatment, what is the alternative.

What is the conditions that make person adhere to therapy?

How your relationship with your doctor increase or decrease adherence?

Is your perception of acne and your self-image affected by being participants such interview?

These questions are used as trigger to let the participant speak out their lived meaning and perception about their experience of acne and their non-adherent behavior. The data collected from this semi-structure interview served as data for thematic analysis.The analytic process used to elicit the pattern of meaning, themes, as following we read the transcribed text number of times using critical system thinking searching for the whole (theme) that organizes the parts:

1. The semiotic analysis of the patient narrative reveals shared meaning diagnosed as themes.
2. collective intentionality is what make non-adherence emerge as pattern represented by different patients' groups.
3. The shared themes are organized in 5 categories corresponding to the elements of lifeworld as described by Ann Hemingway.
4. Sharing these themes with participants creating semiotic awareness.

Results

The literature review and my personal clinical encounter with non-adherent patients-to pharmacological and behavioral interventions–show that non-adherence is as sign of embodiment of the linear machine thinking which is grounded in the Cartesian dualism that produced non-adherence between the mind and body, the subjectivity and objectivity, the perception and the world. This attention to only medical signs made them blind to other signs of the patient lifeworld which embody their belief, perception and expectation which are responsible for their adherence or non-adherence.

Restoring the primacy for skin as tactile system is the result of adopting dermatosemiotic as paradigm that facilitate psychosocial adherence\connection, empathy and communication. Informed consent is taken, collected data were analyzed using dermatosemiotic analysis, searching for the signs of themes that unify different patients' experiences. The semiotic analysis revealed that root cause of non-adherence is machine system paradigm\mental model that systematically structure nonadherence as a pattern and event.

The process of analysis produced a number of emergent themes regarding the impact of acne upon participant's lifeworld. The findings presented were discussed under the following themes which represent the themes of lifeworld as articulated by Ann Hemingway as five emergent themes:

1. **Mood: Affectivity theme:** All the participants shared the negative mood which is expressed as self-hate, low-self-esteem, shame and hopeless.
2. **Interpersonal problem: relational theme:** All patients report great care for their peer negative feedback about their facial appearance and this negativity triggered by watching mirrors, by remembering, imaging, their peers are present as long as their acne not disappeared. Acne vulgrais lived as stigma, this perception condition negative

psychological and social behavior filled with anger and fear.

3. **Embodiment:** Every human being has two bodies: objective body which given to others and subjective body (lived body) which lived by us, phenomenology concerned with the subjective body. Patient participate in this work are lived acne experienced as severe one although dermatological consultation revealed its mild sate and their phenomenological attitude lived by researcher facilitate emergence of the patient lived acne showing for them the critical difference between their view and peer view and medical view.

4. **Temporality:** All participants are not living in the present, they are adherent to the past where their face is clear and beautiful and fully accepted by their peers and family and the future which they appear to them as scaring and filled with post-acne pigmentation. They swing between past and future forgetting that the present is the only real moment. U–lab used for these participants which is journey to the presenting after stopping downloading of the past prejudices.

5. **Spatiality:** Participants favored to be room ridden, they leave only for work or study. Their problems are meeting people, their mood is dependent on the place they found themselves in. This isolation becomes source of negative energy and increasing patient resistant to accept their illness. Lifeworld is embodiment of all these five themes. Acne vulgrais severity measured by the degree of changing our lifeworld, our relationship to our self, others, time, place.

Discussion

This study demonstrates that without changing the root (paradigm) we cannot change the fruit (nonadherence). Nonadherence behavior is outcome of linear machine paradigm. The problem arises when the disease is chronic and the drug needed for long time. In this studywe found that the threshold concept in health care system is caring, which entail the positive relation to patient as whole, as complex dynamic system, and we will give primacy for patient lifeworld and their perception and kind of thinking process which determine how they receive our instruction and therapy.

Interview with participants show deep ignorance of the process that lead to their decreased quality of life and negative self-image.

Conclusion

The results of this work elucidate that the adherence or non-adherence is an output of complex adaptive system which derived its input from clinical meeting with health care professional, the patient expectation about self-image and beauty, their family and peers. This make nonadherence emergent phenomenon which is irreducible to any part of this complex system. All these different parts of health care system including the patients should work in synergy for insurance of sustainable health outcome. Our study is about disclosing the condition that make nonadherence and adherence possible by showing that the intentionality of the patient which can be linear or systemic is the root cause that nonadherence or adherence manifested as event. To solve the problem of nonadherence we need new kind of medicine, in this study it called lifeworld medicine, which can ensure I-You relationship with patient condition the possibility of emergence of empathy, listening and adherence. This study showed the primary role of the patient perception of their self, their health, their acne as complex adaptive system which required open mind, open heart and open will[20,21] .

This study confirms relational nature of skin problems and its direct effect on patient lifeworld mediated by disfiguring self-image.

Advanced Study of Some Hormonal and Genetic Factors Affecting the Causes of Secondary Infertility

Manar Mohammed Jasim[1], Asma Hashim Shaker[1], Buthainh Jasim Yousif[1]

[1]*Department of Chemistry, College of Education for Girls, University of Tikrit, Iraq*

Abstract

Our study aimed to determine the extent of the effect of pancreatic hormone (insulin) for secondary infertility in the city of Tikrit and its environs. Infertility was determined by laboratory tests of 80 male and female patients. Their ages ranged from 20-50 years of reviews to the women's external clinics in Tikrit, They were compared with 40 control groups. The age groups of secondary infertility were identified and the relationship of these hormones to the age group and the relationship of these hormones to the mass index. The study included the relationship of concentrations of these hormones with secondary infertility. The outcome of the current study for insulin hormone was 107.936 ± 19.274, 85.480 ± 4.591 women and men respectively, and non-infected 344.287 ± 19.651 and 305.660 ± 5.951 women and men, respectively. Female infertility and associated diagnoses have overall health implications. Beyond treatment of patients' immediate reproductive needs, healthcare professionals must be aware of the broader health impact of specific causes of infertility in order to provide accurate counseling regarding long-term risk. [1] As for the genetic experiments, the study showed no significant difference (P <0. 05) for insulin receptor gene for secondary infertility group between men and women compared with control group. The results showed that there was an actual relationship between the gene and secondary infertility, where the results showed that there was a gene in 32 samples out of 38 infected samples. Which was 86.49% and the evidence of infection was the presence of the gene 317 markedly and showed the sequences of TT (317bp), the 274bp was the base pair CC, the transient relay, the genetic sequence 43bp was the first pair CT.

Keywords: *Secondary infection, Hormones, Genetic factor.*

Introduction

The problem of infertility is one of the main reasons for the lack of happiness in homes and the deterioration of the state of family tranquility between couples because they are closely linked to the ultimate goals of the completion of happiness and family integration and infertility is defined as failure to reproduce after a year of regular intercourse of married people over the age of 35[2]. Epidemiological statistics suggest that 10-15% of all couples have primary infertility or have secondary infertility after having the first and second child and then have infertility called secondary infertility[3]. The problem of infertility is multidimensional, with social, financial and cultural implications that can take on threatened dimensions in infertile countries, a global phenomenon recognized by the World Health Organization (WHO) all over the world. The Family Growth Survey, which used data collected in 2006 to 2010 to estimate the equivalence of infertility in the United States, indicated that women aged 15-55 years with double pregnancies after the first or second child were 9-10% of married women and infertility[4]. A genetic study (Viville *et al*., 2000) also referred to patients with sperm deformation (during the chromosome analysis of the genetic material in the sperm nucleus) due to an increase in chromosomal heterogeneity in the large-headed sperm and the absence of chromosomal changes for the rest of the other abnormalities in the form Sperm, and another study showed an increase in chromosomal abnormalities in the amorphous head with four increased auerageof vertical heand for sperms[5]. The increasing incidence of DM worldwide will inevitably result in a higher prevalence of this pathology in men of reproductive age and sub fertility or infertility associated with DM is expected to dramatically rise in upcoming years. From a clinical perspective, the evaluation of semen parameters, as well as spermatozoa deoxyribonucleic acid (DNA) integrity, are often studied due to their direct implications in

natural and assisted conception[6]. Where it is associated with diabetes by increasing the mitochondrial DNA (mtDNA) responsible for sperm ratio, which affects men's reproductive capacity[7]. It affects the quality of sperm and also affects the mechanism of ejaculation[8]. On women who have diabetes-dependent insulin, it reduces their pregnancy and childbirth[9]

Materials and Method

Samples Collection: The study was conducted in the central labs of Tikrit University. The samples were collected from the women's' clinics after being diagnosed by the specialist doctor and separated in the civil laboratories in the field of science. The study included 80 females, 40 of them women and men suffering from secondary infertility, 40 of them were women and men who were not infected, They are between 50 and 20 years old.

ELISA was conducted according to the manufacturer's recommendations.

The OD is read for each hole at each 450nm wavelength of the osmotic reader.

Determination of insulin hormone in the serum: Enzyme-Linked Immunosorbent Assay (ELISA) measurements have been following the steps accompanying the LDN Labor Diagnostika Nord. The principle is based on the competitive correlation. The antibodies against the hormone insulin are placed in the solid phase Depending on the principle of Sandwich Principle, the microbial pot is covered by the antigen in the insulin molecule.

A part of the patient's insulin-containing sample is incubated in a tap and is usually coated with anti-insulin agents and then washed to get rid of the uninhibited enzyme.

During the second step of the incubation, the streptafidine peroxidase enzyme complex is associated with the insulin biotin body, corresponding to the amount of peroxidase associated with the insulin concentration in the sample. The color density appears after the addition of the base solution. The concentrations of insulin hormone in the blood vessels are estimated by means of the standard curve in which the hormone concentration of the standard solutions is adjusted with the absorbance, where the measurement is at 450nm, as in Fig. 1.

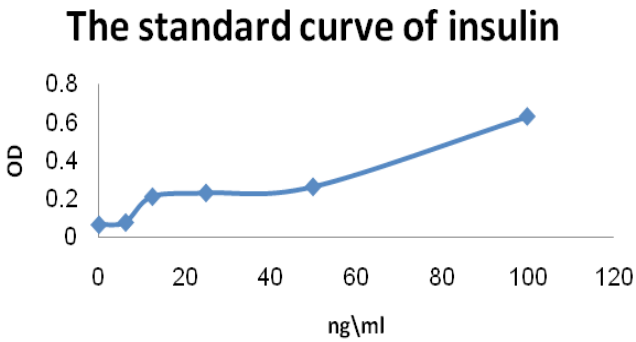

Figure 1: The standard curve of insulin

Molecular diagnosis of insulin

DNA Extraction from blood: DNA was isolated from all blood samples kept in the EDTA tube for patients with secondary and healthy infertility, as applied to Roulston and Bartlett[10] and modified by Al-azawy[11] 2012.

DNA was extracted from the blood sample preserved in EDTA tubes according to the manufacturer's instructions. Electrophoresis of the DNA on the agarosgel was conducted to ensure DNA extraction success.

Investigation of the *INSR* gene. The polymerase chain reaction (PCR-RFLP) technique was used to detect the presence of insulin DNA, using specialized primers designed for this purpose and PmlIrestraction enzyme. The *INSR* gene was detected following the method of[12] Mukher and others. PCR conditions are mentioned in Table 1.

Table 1: PCR Conditions

Number of cycles	Time	Temperature	Steps
1	5 min	94°C	Initial denaturation
35	30 sec	94°C	Denaturation
	30 sec	61°C	Annealing
	40 sec	72°C	Extension
1	10 min	72°C	Final extension

Results and Discussion

Diabetes (DM) is a chronic condition for life and are directly related to each other because of the effect of metabolic disease in the reproductive function in humans where diabetics, type I and type 2, in males and females in the relationship of infertility[13]. The results of the study showed a significant increase in $P < 0.05$ in insulin concentrations. The meanof insulin concentration

in male patients was 85.480 ± 4.591 ng/ml compared with control group (305.660 ± 5.951ng/ml) (Figure 1). The meanof insulin concentration for female patients (107.936 ± 19.274ng/ml) and control group (344.287 ± 19.651ng/ml) (Figure 2). This is a sign of lower insulin hormone in patients compared with healthy for both sexes. This is consistent with Basmatzou*et al*. [14] 2016.

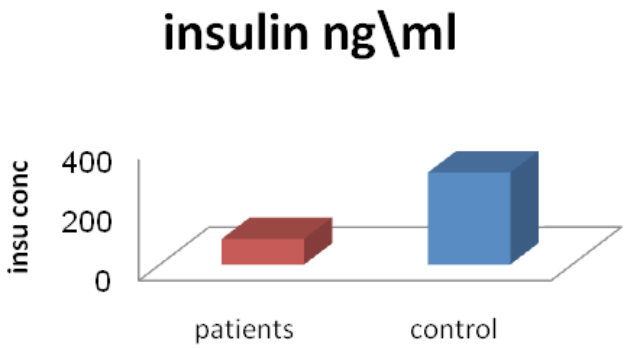

Figure 2: The level of concentration of insulin hormone for male blood transfusions compared to healthy patients

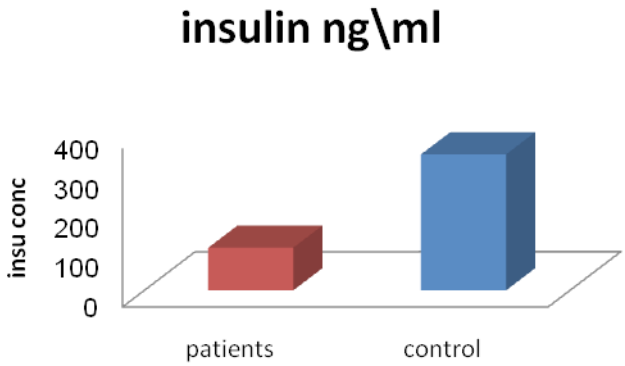

Figure 3: The level of concentration of insulin hormone for blood vessels of women compared to healthy patients

Women with polycystic ovary syndrome (PCOS) exhibit elevated androgen levels, oliguanovulation, infertility, and insulin resistance in metabolic tissues. The aims of these studies were to determine the role of insulin signaling in the development and function of ovarian theca cells and the pathophysiologic effects of hyperinsulinism on ovarian function in obesity[15]. This is consistent with Moamar[16]. PCOS is also often associated with insulin resistance and hyperinsulinemia[17]. and an elevated risk for subfertility among couples in which the male partner is obese. Obesity is, therefore, associated with a higher incidence of male factor infertility[18]. The prevalence of obesity and overweight are increasing and have become an epidemic worldwide. Obesity has detrimental influences on all systems, including reproductive health. [19]In light of new evidence that the Sertoli cells of the testis secrete insulin, it is currently unclear whether diabetic subfertility is the result of deficiency of pancreatic insulin, testicular insulin, or both[20]. There are many genetic mutations that lead to infertility in humans and accurate diagnosis of these mutations is not complete now, and the most important characteristic of these mutations in society is the imbalance in the maturity and fertility of individuals, although some people show a natural attainment but is associated with infertility, a number of genes responsible for puberty and reproduction have been identified, and the mutagenicity of these genes can lead to a failure in puberty and reproduction in humans. The process of puberty and reproduction in humans depends on the integration of the hypothalamus-pituitary[21].

Extraction of the DNA: DNA extraction was successful in 45 samples out of a total of 69 samples. This was confirmed by the output of the agarose gel. The *INSR* gene demonstrated three packages, 274-bp, 317-bp and 43bp. After the PmIIrestraction process, the PCR results showed three types of normal homozygous (TT) genotypes: the 317 bp, heterozygous (CT), (43) and Mutant Homozygous (CC)The replacement boom of the T-T base, which converts it to base C in the insulin receptor gene, resulted in a cut-off enzyme site Pm1I, So when treated with the PCR product of this enzyme will work to cut the resulting result of the multiplication of the molecular size 317 bp to the first two pieces of size 274 bp and the second size of 43 bp If the person is not borne mutation and in both alleles will have the genotype TT heterozygous naturally and will appear One 317 bp package when relaying PCR-RFLP output because there is no sequence required for Pm1I to be interrupted. The results of Mukher*et al*(2009)[22] were consistent with the results obtained as in Figure (4) and (5)

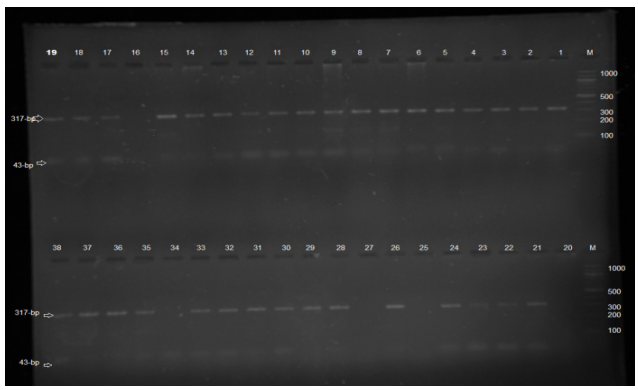

Figure 4: PCR relay output of INSR gene on 2% agarose gel

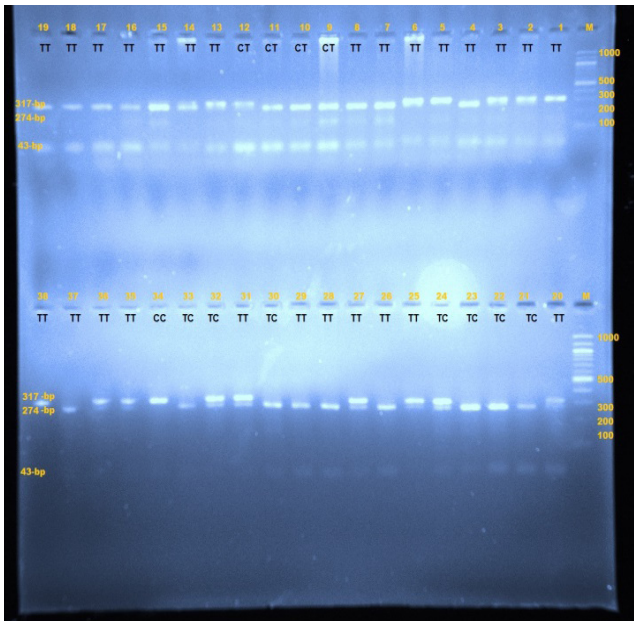

Figure 5: PCR-RFLP relay output for the INSR gene after addition of the cutting enzyme

Conclusion

The presence of the gene in the infected was higher than in non-infected men and women.

Carotid Stenting and Angioplasty in Iraqi Patients Presenting with Stroke Using Drug Eluting Coronary Stents and Peripheral Vascular Stents

Fizel Abbas Himyari[1], Wissam Tajaldin[2]

[1]Hammurabi Medical College, University of Babylon, [2]Consultant Cardiologist, Almahrab Cardiac Center, Babylon, Iraq

Abstract

Stroke causes death andlongterm disability. Heart disease and cancer are considered the first 2 causes followed by stroke as third cause. The aim of the study is to assesscarotid stentingin patients presenting with stroke using drug eluting coronary stents (type Biomatrix and type Everolemus)and peripheral vascular stents.

Seventy four patients with stroke (ischeamic)were enrolled in the study. The male patients were(42)and the female patients(32)with age between (41-82).Patients were examined neurologically and carotid Doppler study was done before the neurointervention procedures and during followup for one to sixmonths. Distal protection device (filter wire) was used during all the cases.

Technical access and success was achieved in all the seventy four patients using transfemoral route. There was no neurological periprocedural complications. The coronary drug eluting stents were used in forty patients, while the peripheral vascular stents were used in thirty four patients only. The degree of stenosis using drug eluting coronary stents was reduced from 80%(as a mean)to 30%(as a mean)immediately after the procedure, while there was full dilatation on using the peripheral vascular stents.

Carotid stenting and angioplasty results were best using the peripheral vascular stents because the peripheral vascular stents are more flexible with good sizes in comparism to the size of the internal carotid artery. The coronary drug eluting stents can be displaced from its deployment site in the Internal carotid artery especially if small sizes used. Flexible stents such as the peripheral stents are good for the internal carotid artery because the neck is highly movable area. The carotid walstents (Boston Scientific)areself expanding and also flexible stents.

Keywords: *Stroke, carotid stenting, embolic protection device.*

Introduction

Strokecauses death (after heart disease and cancer) and disability. It commonly causes the permanent type of disability[1,2].10% to 20 % of all strokes or transient ischemic attacks maybe caused by stenosis of the internal carotid artery. Stenting of the carotid artery has become an alternative revascularization procedure toendarterectomy of the carotid artery inpatients with carotid stenosis.

Carotid recanalization byballon angioplasty was entered in the beginning of the 1980s. Stent technology was introduced in the mid-1990s allowing protection against dissections and a restenosis rate in the single-digit range. Embolic protection devices (EPDs)advent and use in the year 2000 made carotid artery stenting a safer procedure[3].

Some Stroke Studies announced approximately 700, 000 stroke events occur yearly, of which 500, 000 are new strokes and 200, 000 are recurrent ones[4].Many deaths caused by stroke occur in most racial/ethnic minority groups compared with whites especially in those less than 65 years old[5].

In one study the prevalence rate of more than 50% of carotid stenosis was 7% in women and 9% in men between the age of 66 to 93 years[6]. While persons older than 65 years of age, 7% of men and 5% of women had moderate (50-74%) carotid stenosis, severe (75-100%) stenosis was detected in 2. 3% of men and 1. 1% of women in another study[7]. Other population-based studies of patients with transient ischemic attacks, showed 10% of those doing carotid ultrasound had more than 70% stenosis of at least one internal carotid artery[8].

The definition of brain infarction caused by extracranial carotid or vertebral artery disease is a clinical stroke with evidence of infarction on neuro-imaging with more than 60% stenosis or occlusion of an extracranial carotid or vertebralartery seen by non-invasive imaging or an angiogram. Almost 7% of all first ischemic strokeshad extracranial carotid stenosis of 60% or more[9]. Other studies showed 18% of all first ischemic strokeswere caused by extracranial or intracranial large vessel disease[10], but the report did not separately classify those with extracranial or intracranial vascular disease. Stroke needs hospitalization more frequently than other neurological diseases[11]. Leadingto more than half a million hospitalizations annually[12]. Those who live face risk of recurrent stroke as high as 4% to 15 % within a yearafter incident stroke and 25% by 5 years[13,14].

To the best of our knowledge, this the first study in Iraq evaluating drug eluting coronary stents and peripheral vascular stents in carotid stenosis in patients presenting with ischemic stroke.

Materials and Method

Patient selection and preprocedural evaluation: seventy four patients with ischemic strokes were enrolled in the study. Thirty two patients were female (43.2 %)and 42 were males (56.7 %). Examination to all the patients was done by a neurologist prior to the procedure. Stent placement indication was given by Doppler U/S and C.T. angio of the brain at ShaheedAl-Mahrab Cardiac Cath.and Surgery center in Babylon–Iraq. Patients with total occlusion lesion, bleeding diathesis, brain malformations and cerebral tumours were excluded from the study.

Stenosis grading before the placement of a stent was done by using the NASCET criteria[15]and ranged from 50% to 95%. Baseline cerebral C.T.or M.R. imaging was done to all patients.

Stent placement method:All the patients agreedto do the procedure (they gave informed consent). 75 mg of clopidogrel and 100 mg of aspirin for3 days before procedure was given to them or they were given 6 tablets of clopidogrel (450mg)one night before the procedure plus aspirin (325mg).Dual antiplatlet medication was maintained forone year after treatment, and aspirin for life. Intravenous bolus of 5, 000 I.U. of heparin was given immediately after the placement of the sheath. The procedures were done by an interventional Neurologist. Under local anaesthesia, a transfemoral approach was used with a 8 French sheath introduced followed by a 6 French JR. or multipurpose diagnostic catheter. An exchange wire was used (0.021-0. 038inch), then a 7 or 8 french guiding catheter was introduced near the stenotic segment. A 0.014 inch microguide wire was used to cross the stenotic segment. A filter wire (protection device)was introduced and advanced above the stenotic segment at the petrous segment of the internal carotid artery. Then advancing and deploying of abiomatrix flex drug eluting coronary stents (Biomatrix Flex DES) was done in (20) patients andtype Everolimus eluting coronary stent system in(20)patients with stent diameter of 4mm. Angioplasty was done to the nominal pressure and rated burst pressure inorder to achieve stent diameter of 4.5mm and this was followed by stent deployment. Inflation and Deflation of the ballon was done twice during each procedure. Peripheral vascular stents (Express Vascular SD Monorail Premounted Stent System) size 5mmx 30 mm and 6 mm x40 mm were used in 34 patients with achievement of full dilatation as in the images below. Atropin was only used in 3 patients because of bradycardia during the procedure. The filter wire was retrieved with it's retriever after deploying the stent. Cerebral angiograghy was done at the end. Compression of the puncture site was done manually after the procedure.

The followup with C. T. scan or M. R. imagingwas done 72 hours after the procedure. Patients were discharged and followed by clinical examination and with Doppler U/S study for one to six months after the procedure.

The statistical analysis were done through descriptive calculations of percentages and chi-square.

Results

The population study consists of seventy four patients with history of ischemic stroke for at least one

month and carotid stenosis more than 50 %. Forty two patients are males (56. 7%)and 32 are females (43. 2%).

Technical success[16]was achieved using the trans femoral route in all the patients. The level of stenosis was reduced from an average of (80%) before the procedure to(30%)after coronary drug eluting stent placement. There was no neurological periprocedural complications. Three patients experienced intraprocedural bradycardia and five hypotension. There was obvious thrombi and debris in the filter wire after retrieving it in ten patients.

Transient ischemic attacks happened after 3 months in tenpatients of the Everolemus group and 4 patients of the Biomatrix group. Stroke happened in one patients of the everolemus group due to instent stenosis or restenosis. This was solved by angioplasty or restenting, while there was no restenosis (no stroke or T.I.A)in the peripheral vascular stents. There was significant difference between the three groups according to the below tables:

Table 1: Complications regarding drug eluting coronary stents

Complications	Everolemus group	Biomatrix group
T. I. A	11	4
Without	9	16
P value	0. 022*	

Table 2: Complications between drug eluting coronary stents and peripheral vascular stents

Complications	drug eluting coronary stents	peripheral vascular stents
T. I. A	15	0
Without	25	34
P value	0. 0002**	

Discussion

Carotid stenting is a less invasive in consideration to carotid endarterectomy[17]. Some carotid artery stenting trials that used protection device showed equivalence with endarterectomy by achieving the same or lessperiprocedural risk[18-20]. The Carotid Revascularization Endarterectomy Versus Stent Trial(CREST)(in patients with low risk for surgery) showed no significant difference between stenting and surgery. Ipsilateral stroke risk at 4-year followup was similiar 2% and 2. 4% respectively[17]. The Stenting and Angioplasty with Protection in patients at high risk for Endarterctomy (SAPPHIRE) Trialalso compared carotid endarterctomy and carotid stenting with embolic protection device[18].

To the best of our knowledge, this is the first study in Iraq evaluating drug eluting coronaryand peripheral vascular stents in ischemic stroke patients with carotid stenosis. In this study the protection device is very important because the stents used are ballon mounted. So there is angioplasty followed by stent deployment. The risk of embolization increases when there is angioplasty. Unlike carotid endarterectomy, carotid stenting and angioplasty is now well established in Iraq with high successrate. Further study is going on using carotid self-expanding stents with protection devices. The Biomatrix Flex drug eluting coronary stent system is a drug eluting stent (DES)system for coronary use with a biodegradable polymer coating. The DES is a combination of two parts, the stent (which includes the active pharmaceutical ingredient BA9 (Biolimus A9) incorporated into a polymer coating, and the delivery system. The BA9 drug inhibits smooth muscle cell proliferation within the stent proximity. Poly-lactic acid is combined with the BA9 drug and actsas the carrier to control the release of the drug from the stent. The everolimus eluting coronary stent system, type Xience Prime and Xience Prime LL were used in our patients.We recommend to our colleagues in Iraq to use the peripheral vascular stents because of good sizes and more flexible than the drug eluting coronary stents. Peripheral vascular stents can be used in the developing countries incase when carotid walstents are not available.

Conclusion

Carotid stenting and angioplasty results were best using the peripheral vascular stents because the peripheral vascular stents are more flexible with good sizes in comparism to the size of the internal carotid artery. The coronary drug eluting stents can be displaced from its deployment site in the Internal carotid artery especially if small sizes used. Flexible stents such as the peripheral stents are good for the internal carotid artery because the neck is highly movable area. The carotid walstents (Boston Scientific) are self-expanding and also flexible stents.

Gene Expression Analysis of Colorectal Cancer Specific Marker CXCL1 Gene in Iraqi Patients

Athraa Falahalshimerry

Department of Pathology, College of Medicine, University of Babylon, Babylon, Iraq

Abstract

Background: Colorectal carcinoma is a third most common malignant tumor worldwide and the third largest cause of tumor-related death in Western countries. Chemokine ligand CXCL1 was shown to be involved in chemoattraction, inflammatory responses, tumor growth and angiogenesis. The main objective of current study was to analyze CXCL1 gene expression levels in colorectal carcinoma and to study the impacts of CXCL1 gene as genetic factors that contribute to development and prognosis of bladder cancer.

Method: The specimens were formalin-fixed, paraffin embedded tissue blocks. Forty samples (32 males and 8 females) with carcinoma were included in this study, their ages ranged from 30 to 80 years.Forty specimens of non-tumorous colonic tissues were considered as controls. Total ribonucleic acid (RNA) was extracted from tissues using (TRIzol® reagent kit, Bioneer, Korea). A total of 100ng/ul of RNA was reverse-transcribed using M-MLV Reverse Transcriptase kit (Bioneer, Korea) to synthesis complementary DNA (cDNA). Data were summarized, presented and analyzed using two software programs. These were Microsoft Office Excel 2007 and the statistical packages for social sciences (SPSS, version 18) using *t*-test, ANOVA and Chi-squared tests at a level of significant alpha<0.05.

Results: Analysis of data of CXCL1 gene expression revealed that the expression of this gene were found to be 12.389 folds in colorectal cancer in relation to normal colonic tissue. CXCL1 genes were observed to be expressed excessively in old age patients and advanced stage tumors.

Conclusions: CXCL1 may represent a novel colonic tumor marker with prognostic significance that could be introduced in plans of colorectal cancer management.

Keywords: *Colorectal cancer, CXCL1, Real time PCR, chemokine, angiogenesis.*

Introduction

Colorectal cancer (CRC) is the third most commonly diagnosed malignant tumor and constitutes the third leading cause of cancer-related death worldwide[1] and early diagnosis and molecular characterization is considered essential to decrease CRC-related deaths[2].

The 5-year survival rate after curative surgery ranges between 40% and 60%[3] and the challenge of how best to predict prognosis and, thereby optimized therapy remains. At present, established clinico-pathological criterions are used to estimate risks of recurrence in stage II and III disease, and this is usually used in the selection of patients for adjuvant systemic therapy following surgery. The clinical outcomes of patients who receive such adjuvant treatment can, however, vary widely when additional molecular factors are taken into deeming[4]. Acquainting of quenching prognostic markers is, therefore, vivacious in improving the prognosis of this disease[5]. Many factors both environmental and genetic are involved in the pathogenesis of colorectal carcinoma. The former are largely dietary, particularly consumption of diet rich in fats and animal protein, because of their influence on the microflora of intestine and eventually on the chemical composition of the intraluminal contained[3]. Among various trophic factors, chemokines have a predominant role[6].Chemokine, a chemotactic cytokine which mediates leucocyte migration (chemotaxis), is a small-sized protein expressed by various cells (leucocytes, epithelial cells, endothelial cells, and fibroblasts), including tumour cells[7,8], that are increasingly magnetize consideration in the study of pathogenesis of tumor within malignant cells and the tumour micro environment. They are divided into four

large categories as follows: C, CC, CXC and CX3C, depending on the position of their cysteine residues[9].

Previous study revealed that CXCL1 is up-regulated in some types of human cancers, including colorectal, bladder, prostate, hepatocellular carcinoma and skin cancers [10-14].

The aim of current study was to study the level of CXCL1 mRNA expression in colorectal tumors and correlate findings with clinicopathological parameters in Iraqi patients.

Materials and Method

The specimens were formalin-fixed, paraffin embedded tissue blocks. Forty samples (32 males and 8 females) with carcinoma were included in this study, their ages ranged from 30 to 80 years. Forty specimens of non-tumorous colonic tissues were considered as controls.

All cases were staged and pathologically graded according to the TNM staging system for colon andrectal cancer of the Union for International Cancer Control/ American Joint Committee on Cancer (UICC/AJCC, 7thedition).

Extraction of RNA: Total ribonucleic acid (RNA) was extracted from tissues using (TRIzol® reagent kit, Bioneer, Korea) according to manufacturer's instructions. The extracted total RNA were treated with DNaseI enzyme for removing the trace amounts of genomic DNA by using samples (DNase I enzyme kit) and done according to method described by Promega company, USA instructions.

Complementary DNA (cDNA) synthesis: A total of 100ng/ul of RNA was reverse-transcribed using M-MLV Reverse Transcriptase kit (Bioneer, Korea) to synthesis complementary DNA (cDNA). Using mRNA molecule as a template, reverse transcriptase synthesizes a single-stranded DNA in the presence of primers, which can be either oligod T (annealing to poly A tails of mRNA) or random hexamers (annealing to total RNA). The first new strand DNA molecule can then be used as a template for double-stranded DNA synthesis.

Quantitative Real-Time PCR (qPCR): The complementary deoxyribonucleic acid (cDNA) was then subjected to real-time polymerase chain reaction with specific primers for CXCL1. Five µLcDNA, 2µmol/L forward primer and 2µmol/L reverse primer 25 2X green star master mix 16 DEPC water were added to AccuPower^{TM} 2X Green Star qPCR master mix kit(Bioneer, Korea) in a total volume of 50µL.

The amplification protocol was used as follows: initial denaturation at 50°C for 1 hour for 1 cycle, then 40 cycle 95°C for 20 seconds, then followed by 40 cycles of 60°C for 30 seconds and 1 cycle of 60-95°C for 0.5 seconds. The sequence of the forward primer for CXCL1 was 5′-CCAAAGTGTGAACGTGAAGTCC-3′, and that of the reverse primer was 5′-AAGCTTTCCGCCCATTCTTG-3′. The sequence of the primers used for glyceraldehyde 3-phosphate dehydrogenase (GAPDH) was 5′-AATTCCATGGCACCGTCAAG-3′ (forward) and 5′-ATCGCCCCACTTGATTTTGG-3′ (reverse); (Bioneer company, Korea). The relative amount of CXCL1 messenger RNA (mRNA) to GAPDH was calculated as the average $2^{-\Delta Ct}$ where ΔCt (cycle threshold) = Ct − CtGAPDH

Statistical analyses: Data were summarized, presented and analyzed using two software programs. These were Microsoft Office Excel 2007 and the statistical packages for social sciences (SPSS, version 18) using *t*-test, ANOVA and Chi-squared tests at a level of significant alpha<0.05.

Results

CXCL1 gene expressions (mean fold change±SD) were found to be 1.3492+0.98851in normal colonic and 12.3884+8.54458in malignant tissue. So, according to independent *t*-test, CXCL1 gene expression significantly (P<0.0001) raised in colorectal carcinoma in relative to normal colonic tissues (Table 1).

Table 1: Relative expression results of CXCL1 gene in both normal colonic mucosa and colorectal carcinoma

CXCL1 gene expression	No.	Mean	Std. Deviation	P value	95% Confidence Interval of the Difference	
					Lower	Upper
Normalcolonic tissue	40	1.3492	0.98851	0.000	-11.03920-	1.72031
Colorectal carcinoma	40	12.3884	8.54458			

* The mean difference is significant at the 0.05 level.

According to ANOVA test there was significant difference between well differentiated and moderately differentiated tumor (P=0.000) and between well differentiated and poorly differentiated tumor (P=0.000), but there was no difference between poorly and moderately differentiated (P=0.51) and between poorly and normal colonic tissue (P=0.396) (Table 2) in which the mean of well differentiated tumor was 18.785, that of moderately differentiated tumor was 6.288 and that of poorly differentiated tumor was 2.546.

Table 2: CXCL1 gene expression level in relation to grade

(I) grade	(J) Grade	Mean Difference (I-J)	Std. Error	P*	95% Confidence Interval	
					Lower Bound	Upper Bound
Well	Moderately	12.49700*	1.60326	.000	9.2698	15.7242
	Poorly	16.23833*	1.50159	.000	13.2158	19.2609
	Normal tissue	17.43580*	1.02725	.000	15.3681	19.5035
Moderately	Well	-12.49700-*	1.60326	.000	-15.7242-	-9.2698-
	Poorly	3.74133	1.86343	.051	-.0096-	7.4922
	Normal tissue	4.93880*	1.50759	.002	1.9042	7.9734
Poorly	Well	-16.23833-*	1.50159	.000	-19.2609-	-13.2158-
	Moderately	-3.74133-	1.86343	.051	-7.4922-	.0096
	Normal tissue	1.19747	1.39898	.396	-1.6185-	4.0135
Normal-colonic tissue	Well	-17.43580-*	1.02725	.000	-19.5035-	-15.3681-
	Moderately	-4.93880-*	1.50759	.002	-7.9734-	-1.9042-
	Poorly	-1.19747-	1.39898	.396	-4.0135-	1.6185

*The mean difference is significant at P≤0.05.

To highlight the involvement of CXCL1 gene in the progression of the disease, expression results were analyzed with respect to the tumor stage. According to ANOVA test there was significant difference between stage T1 and stage T2 (P=0.000) and between stage T1 and stage T3(P=0.000), also there was significant difference between stage T2 and stage T3 (P=0.000),but there was no significant difference between stage T1 and normal colonic tissue (P=0.254) (Table 3), in which the mean of T1 was 2.871, T2 was 10.133 and that of T3 was 19.067.

Table 3: CXCL1 gene expression level in relation to stage

(I) stage	(J) stage	Mean Difference (I-J)	Std. Error	P*	95% Confidence Interval

*The mean difference is significant at P≤0.05.

Discussion

Studying the prognosis and prognostic factors to expect the risk of recurrence and metastasis for colorectal carcinoma patients are continued and could impact clinical practice. Biomarkers which are established such as BRAF, KRAS and microsatellite instability status outplay conclusive roles in anticipating prognosis and in the choosing of patients favorable for subjective therapy[15].Obviously, much research has focused on understanding the biology of colorectal carcinoma. Early metastatic pathological signs include invasion to blood vessel,lymphatic vessel, perineural invasion, or multiple presentations [16]. During the process of metastasis, tumour cells seceded from their primary site, enter the angio-lymphatic systems and other organs, and then adhere to the endothelial cells. Oneof these mechanisms is by adhering to chemokine receptors [17].

Nowadays, the chemokine family is receiving increased interest as multifunctional proteins that organize many cellular phenotypes in addition to their essential roles as chemotactic particles[18]. According to the tumor biology, specific chemokines are angiogenic orantistatic[19,20], othersorganize survival, cell cycle progression, growth, and cell–cellinteraction[21-24].

Previously, several gene expression studies have been performed on colonic tissue whether normal or diseased. In general, a genome broadmethod has been applied to determine genes dysregulated in malignant tissue that can be targeted in treatment strategies and for staging[25-27].

Previous studies had identified that increased levels of CXCL1 in human colonic cancer cells promotes tumourogenicity and are upregulated in human ulcerative colitis and colonic cancer[28-32].

In the present study, we investigated the level of CXCL1 mRNA expression in CRC of Iraqi patients by Real Time PCR and found that CXCL1 mRNA expression was significantly higher in cancer tissues(12.39 fold) than in normal colonic tissues (1.35) ($P<0.0001$) (Table 1).

Such results suggested that up-regulation of the expression of CXCL1 gene during carcinogenesis.

Findings of the up-regulation of CXCL1 expression in colorectal carcinoma patients were in concordance with the data of[33].

In this study, the relationship between tumor grade and CXCL1 mRNA expression was examined. Analysis of variance (ANOVA) showed that there were significant difference between well differentiated and moderately differentiated tumor ($P=0.000$) and between well differentiated and poorly differentiated tumor ($P=0.000$),but there was no difference between poorly and moderately differentiated ($P=0.51$) (Table 2) in which the expression level (mean fold change) was very high in well differentiated tumor (18.785), while[33] found that high mean fold change was in moderately differentiated tumor .

To highlight the involvement of CXCL1 gene in the progression of the disease, expression results were analyzed with respect to the tumor stage. A significant ($P=0.000$) rise of CXCL1 gene expression fold was observed in those of stage T3 when they were compared with those of stage T1. Similarly,CXCL1 gene expression was evident to be increased significantly ($P= 0.000$) in tumor of stage T3 with respect to those of stage T2 (Table 3).

In the current study CXCL1 expressions were found to be elevated as the stages advanced. These results were in consistence with previous reports[33]who had pointed out significant correlation of CXCL1 expression with advancing of colorectal carcinoma stages.

Conclusion

Current study suggested that highly elevated CXCL1 expression promotes tumourogenicity and served as a poor prognostic biomarker in advanced age colorectal carcinoma patients and in advanced stage patients. Moreover, CXCL1 may serve as a new biomarker and potential therapeutic target for CRC treatment.

Comparison of Modified Ashworth Scale and Modified Tardieu Scale on Assessment of Lower Limb Spasticity in Hemiplegic and Diplegic Cerebral Palsy

Aditi Singh[1], Meenakshi Singh[2]

[1]Physiotherapist, [2]Assistant Professor-III, Amity Institute of Physiotherapy, Amity University, Noida, UP, India

Abstract

Background & Objectives: Cerebral palsy or CP is a non-progressive deficit of central nervous system. Spasticity is the most common muscle tonus problem. Most common spasticity assessment scales used for lower limbs in CP cases is Modified Ashworth Scale and Modified Tardieu Scale. The objective of the present study is to assess the better applicability of assessment of spasticity in lower limb muscles of hemiplegic and diplegic CP using Ashworth Scale (Modified) and Tardieu Scale (Modified).

Method: This study included 30 participants with 19 males and 11 females. The patients were assessed on Modified Ashworth Scale and Modified Tardieu Scale for lower limb muscles including Quadriceps, Hamstrings and Gastrocnemius. Observations assessed during the study were analyzed to find out the conclusion of the study and at the end results are compared.

Results: The current study showed statistical significance for Right Hamstrings ($p \leq 0.05$) in both Modified Ashworth Scale and Modified Tardieu Scale. On contrary, right side Quadriceps and Gastrocnemius and left sided all group of muscles including Quadriceps, Hamstrings and Gastrocnemius ($p \geq 0.05$)showed no statistical significance.

Discussion & Conclusion: No statistical significance was found in both Modified Ashworth Scale and Modified Tardieu Scale for Quadriceps, Hamstrings and gastrocnemius. But right-side hamstring showed significant difference between both the scales. So, either of the scales can be used to assess the spasticity in CP cases.

Introduction

Cerebral palsy or CP is a non-progressive deficit of central nervous system[1]. Spasticity is the most common muscle tonus problem and leads to loss of performance and retardation of motor functional capacity development.[2,3]

Damage to brain can lead to impairments such as spasticity or hyper tonicity, abnormal patterns of muscle activation including increased co-contractions.[4] Causative factors for Cerebral Palsy are: Idiopathic which is still the commonest cause, asphyxia (or lack of oxygen), after birth Bacterial meningitis, viral infection during pregnancy[5].

The increase in the muscle tonus limits functional skills, inhibits isolated joint movement, interrupts voluntary movements and in severe cases causes delay in motor development stages.[6,7,8]

As per Rehabilitation Council of India report, the prevalence of CP is in the range of 1.5 to 2.5 per thousand live births, while exact figures are unavailable in India[9].

In the definition of spasticity by Lance, clinical feature of spasticity is rise in the muscle tone which however is velocity dependent. High velocity stretching of muscle is essential to produce a reflex (stretch) at particular angle in ROM, more quickly the stretch, reflex feature of the increased tone of muscle will be stronger and earlier.[9] This stretch-related muscle activity is shown in many studies, validating the velocity dependency[10-13].

To examine or assessing the spasticity clinically (i.e. without use of devices which are special), tone intensity of muscle at very quick and slow, passive range of motion is assessed and comparison is made and graded. Assessment of spasticity can also be done by examining the angle of joint at which the increased tone of muscle is elicited in a quick stretch and comparison was made with joint angle in slow PROM.

Many clinical scales are used to evaluate and quantify spasticity. In various researches, 13 kinds of grading scales were there for clinical evaluation of spasticity of Cerebral palsy child.

These scales were divided in 3 main groups, based on quantification and procedure. The very first group is the "Ashworth-similar scales or Ashworth like scales", which was given by Ashworth. It was the Ashworth scale which was original.[14] Three modifications were there in AS. By adding an extra intermediate grade, first modification was made, Ashworth scale (modified)–Bohannon[15]. Second modification Ashworth scale (modified)–Peacock or P.[16] And the third modification, combined the Ashworth Scale with ROM at a quick velocity stretch, known as NY University Tone Scale .[17]

Group second is called 'Tardieu similar like scales', given by Tardieu, defined the spasticity grading and quantification principle by angle of measurement of joint which was performed at different velocities of stretch of muscle. Resultant grading found are the TS[18] by which the assessment and grading of spasticity is done by passively moving the joints in 3 different velocities which were specified, i.e. 'slow', 'under gravity' and 'fast' and the intensity and time of the muscle reaction to stretch (*X)* is scored on a 5-point grading scale, Y or angle of joint at which this reaction of muscle was first assessed. Technique requires a lot of time. That is why it was converted to Modified Tardieu Scale.[19]

And the 3rd one is "other grading clinical scales, it includes Duncan-Ely test, Modified Composite Spasticity Index, and other nameless scales.

Reliability of Ashworth Scale (modified) was varied from 'low' to 'average' and reliability which was intraobserver of MAS was found significant ($p<0.01$). Intrarater reliability of Tardieu scale (modified) ranged as 'average', 'good' and 'excellent' and reliability was significant ($p<0.01$)[20.]

Considering these variations in assessment of spasticity in CP, the present study was planned to have a comparative study of two most commonly used grading scales-Ashworth Scale (modified) and Tardieu Scale (modified), to establish the better application of the two scales for the assessment and quantification of spasticity of lower limb in Hemiplegic and Diplegic CP children.

Method

Source of Collection of Data: Special schools, OPD's.

Sample Size: 30 cases

Study Design: Observational study.

Instrumentation:

- Goniometer
- Modified Ashworth Scale
- Modified Tardieu Scale

Inclusion Criteria:

- Diagnosed case of spastic diplegic & spastic hemiplegic CP.
- Age group 2 to 18 years of either sex.[20]
- Upto level IV of GMFCS scale.[26]
- Parents of the ward willing to sign consent form.

Exclusion Criteria:

- Children with other forms of CP such as dyskinetic, ataxic or mixed type CP.[20]
- Behavioral impairment which can interfere with cooperation ability of patient.[21]
- Ortho related surgery, Inj.Botulinum Toxin during last 6 months.[20]
- Intrathecal or oral myo-relaxant drugs within 30 days of research.[21]
- Cast on the body on affected side.[21]

Sampling Method: Convenient Sampling.

Outcome Measures:

1. Lower limb spasticity
2. Modified Ashworth Scale
3. Modified Tardieu Scale

Procedure:

1. 30 Cases was selected as per inclusion criteria and divided into two groups: Diplegic CP & Hemiplegic CP.
2. The functional level of subjects was classified according to Gross Motor Function Classification System (GMFCS) for cerebral palsy as Level 1, 2,3 and 4.[22]
3. Written consent was acquired from each participant's parent.
4. In all cases of the groups, Ashworth (modified) and Tardieu (modified) scales was applied to assess the status of spasticity.
5. Following group of Lower Limb muscles are assessed for spasticity in both the groups
   a. Quadriceps
   b. Hamstrings.
   c. Gastrocnemius.
6. Tone is assessed in both the groups, i.e. spastic diplegic and spastic hemiplegic CP using Ashworth Scale (modified) and Tardieu Scale (modified) three times maximum.
7. As described by Bohannon and Smith, for standardization of stretching speed, passive movements were made in one second for Modified Ashworth Scale.
8. Duration between Ashworth (modified) and Tardieu (modified) scales wassame day on the same child. The scoring was done on the muscles first with the Ashworth (modified) and second with Tardieu (modified) scales. There was a minimum of 10 minutes of rest between the two assessments.[20]

Statistics Method: After complete data collection, the information was entered into the SPSS version 20 Statistics program. The same was also reconfirmed by use of 'Graph Pad' software.

Results

Total number of patients was 30; mean age of all the 30 subjects was 11.76 years with 19 males and 11 female participants of hemiplegic and diplegic CP.

The study showed no statistical significance for Quadriceps and Gastrocnemius muscle groups but hamstring muscle showed statistical significance. Table 1 and 2 shows Ashworth Scale (Modified) and Tardieu Scale (Modified) on all the three muscles, i.e. quadriceps, hamstrings and gastrocnemius of right and left side respectively. Overall comparison of MAS and MTS is shown in table 3 and 4.

Table 1: MAS vs MTS on all the three muscles of right side

Muscle	Modified Ashworth Scale (MAS)	Modified Tardieu Scale (MTS)
Quadriceps	2.40±1.48	2.13±1.22
Hamstring	3.13±1.66*	2.27±1.44*
Gastrocnemius	2.67±1.65	2.30±1.37

*$p \leq 0.05$ so this difference is considered to be statistically significant.

Table 2: MAS vs MTS on all the three muscles of left side

Muscle	Modified Ashworth Scale (MAS)	Modified Tardieu Scale (MTS)
Quadriceps	2.17±1.21	2.20±1.19
Hamstring	2.43±1.48	2.23±1.46
Gastrocnemius	2.80±1.61	2.50±1.33

Comparison:

Table 3: Modified Ashworth scale vs Modified Tardieu scale (right side)

Group	Modified Ashworth Scale	Modified Tardieu Scale
Mean±SD	8.20±3.55	6.70±3.31

Table 4: Modified Ashworth scale vs Modified Tardieu scale (left side)

Group	Modified Ashworth Scale	Modified Tardieu Scale
Mean±SD	7.40±3.62	6.93±3.00

Figure 1 and 2 depicts comparison of both MAS and MTS of right side and left side on muscle tone.

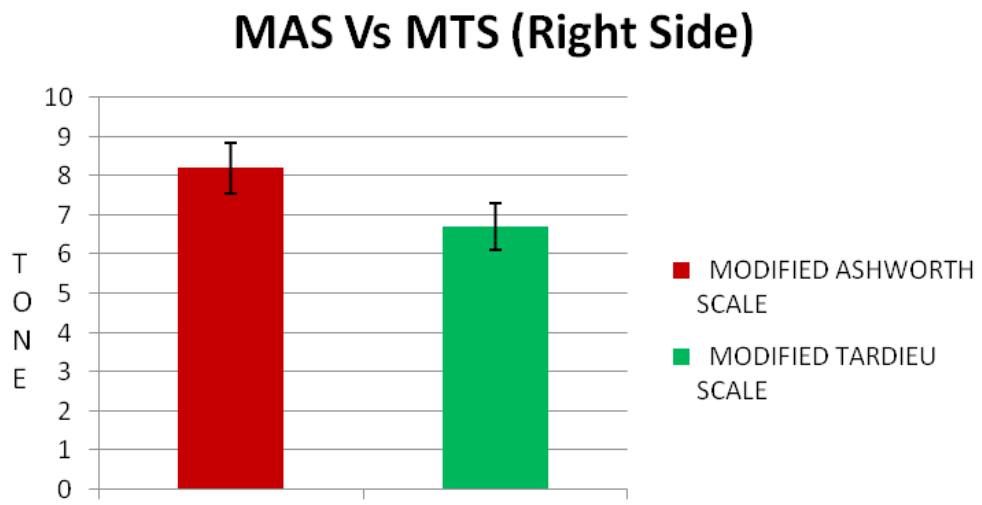

Figure 1: Comparison between MAS and MTS (Right side)

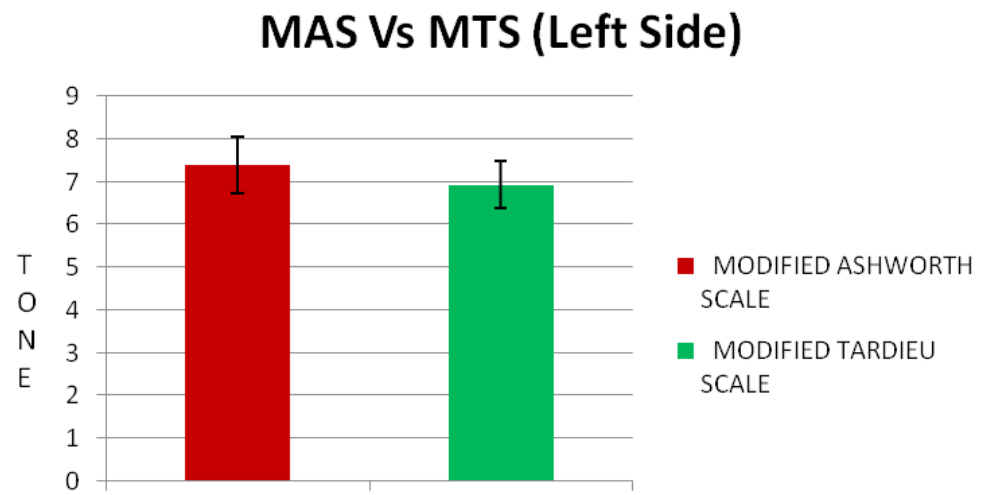

Figure 2: Comparison between MAS and MTS (Left side)

Discussion

For assessing and quantifying spasticity clinically, various ordinal scales are used, most common of which is Ashworth Scale (Modified). Although its widespread use, Ashworth Scale (Modified)'s reliability has questioned in some previous researches.[20]

Therefore, the present study done to assess the better applicability of assessment of spasticity in lower limb muscles of hemiplegic and diplegic CP. The muscles of lower limb were chosen because they are the most commonly affected muscles by increased muscle tone and these muscle groups are also important for rehabilitation aspect[25].

According to the extremity dispersal, the current study has mostly spastic diplegic variants of Cerebral Palsy with 27 out of 30 cases.

Musclewise Significance of MAS and MTS: The current study shows, by conventional criteria, no statistical significance in the right Quadriceps ($p>0.05$) and left side Quadriceps ($p>0.05$), right Gastrocnemius ($p>0.05$) and left Gastrocnemius ($p>0.05$) and left Hamstrings ($p>0.05$). But Right Hamstrings ($p<0.05$), by conventional criteria, shows statistically significant result.

When compared with the current literature, the findings of the present study are consistent with the study of Clopton et al, where they found moderate intraobserver reliability for the Ashworth Scale (Modified) (although MAS has exception of good reliability (interrater) for Hamstrings and poor for other muscles)[20]. As the present research showed statistically significant difference for Hamstrings for AS (Modified) and TS (Modified), so this can be assumed, also taking into account previous

studies, that Ashworth Scale (Modified) is better for assessment of spasticity of Hamstring muscles than Tardieu Scale (Modified) as Ashworth Scale (Modified) quantify good reliability for hamstring muscles. For other muscles of lower limb i.e. Quadriceps and Ankle plantar flexors (Gastrocnemius), Tardieu Scale (Modified) is reliable for assessment of spasticity than Ashworth Scale (Modified) as Tardieu Scale (Modified) far better assess the concept of spasticity for all muscles as it assesses the static as well as dynamic component of spasticity.

This study indicates no statistical significance of Ashworth Scale (Modified) and Tardieu Scale (Modified) for Quadriceps muscle. In previous studies, for MAS, interrater reliability for quadriceps was 0.45 with low reliability.[20] In one another study, the interrater reliability for quadriceps was found to be 0.28 and intrarater reliability to be 0.66 for Ashworth Scale (Modified).[25]

Gastrocnemius (ankle plantar flexors) shows no statistical significance in the current study with ICC value of Ashworth Scale (Modified) 0.35 and for Tardieu Scale (Modified) was 0.63.[20] As the ICC values showed difference, although not much, but it can be assumed that though in present study no significance is shown statistically but Tardieu Scale (Modified) assess spasticity better than Ashworth Scale (Modified).

In a study published in 2008 to assess reliability of Ashworth and Modified Ashworth in CP children suggested the interrater as well as intrarater reliability for Hamstrings found to have good ICC values for interrater[22] Also in other previous research where reliability of Tardieu Scale in CP children was done and found that reliability of Tardieu Scale was lower for Hamstrings for the measurements of angle[21.] Both the studies are in consistent with the current study in which p values for Ashworth Scale (Modified) is more than Tardieu Scale (Modified). Mackey et al also indicated that there is 'limited ability' of Tardieu Scale to assess spasticity in CP children [24.]So all these studies going in accordance with the present study and can be assumed that for Hamstring muscles Ashworth Scale (Modified) is efficient than Tardieu Scale (Modified) in assessing spasticity in CP children.

Clinical Implication of the Study: Clinical significance of study shows that both Ashworth Scale (Modified) and Tardieu Scale (Modified) can be used as a clinical spasticity measurement tool. Ashworth Scale (Modified) is most widely used tool for quantifying spasticity as it is not much time consuming and also it does not require any instrumentation. Tardieu Scale (Modified) assess both the static as well as dynamic aspect of spasticity. So, any of the scales can be used for assessing spasticity for assessment as well as outcome purposes post interventions.

Scope for Future Research: Future research studies are required to assess spasticity in diplegic and hemiplegic variants with large sample size. Also, to assess whether spasticity measured by both the scales will show differences in post treatment assessment too or not.

Limitations of the Study:

- Limitation of this study primarily is the small sample size (n=30). The population size is not large enough to tell the evident results for both the scales for assessing spasticity.
- Representation of Hemiplegic CP cases should be almost equal to Diplegic CP group to achieve appropriate input.

Conclusion

The study showed statistically significant difference for Hamstring Muscles whereas not such significant difference statistically on assessment of lower limb muscle spasticity by Ashworth scale (Modified) and Tardieu scale (Modified) on assessment of lower limb muscle spasticity of Quadriceps and Gastrocnemius in hemiplegic and diplegic variants of Cerebral Palsy cases.

Physical Activity Changes Impact the Nutritional Status of the Elderly: A Longitudinal Study

Eka Rosiyati[1], Ratu Ayu Dewi Sartika[1]

[1]*Department of Nutrition, Faculty of Public Health, Universitas Indonesia*

Abstract

This study to determine the impact of physical activity on the nutritional status of elderly people. This longitudinal study used 2007 pre erlderly aged 55-59 years (808 subjects) and followed for 7 years untuil 2014. Data physical activity were assessed to evaluate changes in nutritional status as body mass index (BMI). The factors associated with nutritional status are reported in this study. For 7 years, no physical activity changes were reported (60,8%). Physical activity changes were only reported by a few subjects (16,1%), and improved from no physical activity to periods of < 30 min or ≥ 30 min. BMI increased as physical activity decreased, in terms of both types and duration. Regular physical activity is an important factor to enhance the quality of life for elderly people.

Keywords: *Nutritional status, body mass index, physical activity, elderly, pre-elderly.*

Introduction

The composition of elderly population is increasing rapidly in both developed and developing countries because of increased life expectancy. Data from Ministry of Health Indonesia reported that since 2015 Asia and Indonesia have an era characterized by an aging population because > 7% aged 60 years and older. The elderly population experience decreased physical endurance and are more susceptible to diseases, the elderly morbidity rate of 28.2% in 2015 [11].

Nutritional status is a n indicators used to measure the health status of people. The nutritional status of the adult population (> 18 years old) can be determined by body mass index (BMI). The BMI is divided into categories of thin (< 18), normal (≥18–< 24.9), overweight (≥25–< 27.0) and obese (≥27.0) (10). Ferra *et al* [6] stated that low or high BMI is associated with several general conditions and diseases in elderly and it indicates that nutrition is an important part in medical evaluation in elderly patients. Study from Hwang *et al* found that BMI is a predictor for mortality in the elderly, with obesity (BMI > 25) as the significant independent predictor for all causes of mortality, whereas being overweight (BMI > 23) elevates the risks of mortality caused by cancer, cardiovascular disease, and diabetes [8].

Physical activity determines a person's health. Excess energy due to a low level of physical activity can increase the risks of being overweight and the risk of obesity [18]. Regular physical activity of moderate intensity has significant health benefit and may decrease the risks of cardiovascular disease, diabetes, breast cancer, and depression. Physical activity performed regularly tends to fix body composition by the reduction of abdominal fat and overall improvement toward weight control [17].

The WHO[17] has published globally recommended physical activities for the health of adults aged 18–64 years, which include free-time physical activities, transportation (i.e. walking or cycling), occupation (jobs), household chores, games, and sports or planned exercise, in the contexts of daily life, family, and community activities. The present study, we aimed to analyze physical activity as a risk factor for pre-elderly and elderly obesity using BMI values published in the Indonesia Family Life Survey (IFLS) from 2007 and 2014 data.

Materials and Method

Study Design: This study was a longitudinal study. This design was deemed the best way to analyze body mass index and other factors that were measured repeatedly over a certain period time, between individuals and between times. The data were collected from secondary data by the Indonesian Family Life

Survey (IFLS), which was a public domain from IFLS4 (2007) and IFLS5 (2014) data. This research was done in 13 selected provinces from Indonesian Life Households Survey. Altogether these provinces represented approximately 83% of Indonesia[15].

Subjects in this study was comprised of the elderly (55-59 years old) in 2007 then followed for 7 years until they were 62-66 years old in 2014. The number of individuals for was 808 subjects. The independent variable for this study was physical activity and dependent variable was nutritional status (BMI). Subjects were divided into three groups in terms of physical activity: 1) those not performing reguler physical activity (mild, moderate or heavy), 2) those performing physical activity for periods of < 30 min, and 3) those performing regular physical activity for periods ≥ 30 min. Additional variables were observed including age sex, marital status, tribe, education level, occupation status, income, insurance ownership, smoking habits, accident records, fall records, nutritional status, and eating habits.

Univariate and bivariate analysis were performed. Univariate analysis was performed as the frequency distribution of the mean and standard deviation sociodemographic data. Bivariate analysis was performed to know relationship between independen variable and dependen variable.

Findings: The sociodemographic featurs are shows that 200 people (24.8%) were 55 years old, the greatest number of elderly subjects. The sex of elderly subjects was evenly distributed with 50.4% male and 49.6% female. Most subjects were married (71.2%), were Javanese (68.9%), were not elementary graduates (50.5%), were employed (68.8%), had income at percentile 1 (31.8%), did not posses insurance (54.8%), were non-smokers (57.9%), did not not have accident records (87.5%), had never fallen (89.5%), had normal nutritional status (58.4%), practiced physical activities for ≥ 30 min (70.8%), frequently consumed carbohydrate in a week (68.3%), frequently consumed protein (54.8%), and frequently consumed vegetables (59.7%) and fruits (61.3%).

Table 1 shows that the mean elderly BMI was 22.64, The mean carbohydrate consumption score, protein, fat/ oil, vegetable and fruit respectively was 2.99, 1.94, 2.22, 3.75, 1.16.

Table 1: Body mass index (BMI) and food consumption scores of the subjects in 2014 (n=808).

Variable	Mean	SD	Min-Max	95% CI
BMI (kg/m^2)	22.64	3.84	12.78-32.85	22.37-22.90
Score of Carbohydrate Consumption (day/week)	2.99	0.77	1.33-7.00	2.94-3.04
Score of Protein Consumption (day/week)	1.94	1.31	0.00-7.00	1.85-2.02
Score of Fat Consumption (day/week)	2.22	2.63	0.00-7.00	2.04-2.40
Score of Veg Consumption (day/week)	3.75	2.69	0.00-7.00	3.57-3.94
Score of Fruit Consumption (day/week)	1.16	1.08	0.00-6.00	1.09-1.23

Table 2 indicates that the mean BMI decrease as physical activity increases in duration. This could be seen through the mean BMI, which decreased from 23.5 kg/m^2 to 22.7 kg/m^2 when the physical activity increased to ≥ 30 min. In contrast, the mean BMI increased from 22.7 kg/m^2 to 23.0 kg/m^2 when the physical activity decreased to durations of < 30 min or didn't perform physical activity.

Table 2: Physical activity changes and mean BMI of subjects in 2007 and 2014 (n = 808)

Physical Activity Changes	n	%	Mean BMI 2007 (kg/m^2)	Mean BMI 2014 (kg/m^2)	P Value
No changes in Physical Activity	491	60.8	22.4	22.4	-
Increase in Physical Activity, if: no physical activity → physical activity < 30 min, and/or physical activity < 30 min → physical activity ≥ 30 min	113	14.0	23.3	23.5	0.008*
Increase in Physical Activity, if: no physical activity → physical activity ≥ 30 min	17	2.1	22.7	22.7	0.762

Physical Activity Changes	n	%	Mean BMI 2007 (kg/m^2)	Mean BMI 2014 (kg/m^2)	P Value
Decrease in Physical Activity, if: physical activity ≥ 30 min → physical activity < 30 min, and/or physical activity < 30 min → no physical activity	107	13.2	22.8	23.0	0.176
Decrease in Physical Activity, if: physical activity ≥ 30 min → no physical activity	80	9.9	22.1	21.9	0.248

Note: * significant statistic p<0.05

Table 3 reveals a significant relationship between the mean elderly BMI ($p < 0.05$) and sex, education level, occupation status, income, and smoking habits. The mean BMI in females (23.4 kg/m^2) was higher than that in males (21.8 kg/m^2). Higher levels of education correlated with higher mean BMI values in the elderly. The highest mean BMI was found in the elderly group that graduated from senior high school (23.8 kg/m^2) whereas the lowest was observed in the elderly group that had not graduated from elementary school (22.2 kg/m^2). The unemployed elderly exhibited a higher mean BMI (23.2 kg/m^2) value than observed in those who were employed (22.4 kg/m^2). The non-smoker elderly group had a higher mean BMI (23.4 kg/m^2) than the smokers (21.6 kg/m^2).

Discussion

The nutritional status of elderly subjects in the present study was determined using BMI as an indicator and we found that mean BMI of females was observed to be greater (23,4%) than that of males (21,8%). This result agrees with the observations of the NCD Risk Factor Collaboration [11] which reported the 2014 the prevalence of obesity in females greater than males. BMI influences by change in body composition of the elderly and related to the aging process, which increases BMI by 1.5–2.5 kg/m^2. Decreasing height is another characteristic of the aging process, resulting from spinal thinning or osteoporosis. The decrease in height starts after the age of 30 years, with continued decrease approximately 1 cm per decade until the age of 70 years, and 0.5 cm per year afterwards [2].

The mean BMI of the elderly in this study is associated with education level which is higher education correlating with a higher mean BMI. It was observed that the primary school-graduated and secondary school-graduated elderly group had an mean BMI that differed significantly compared with the elderly group who had not graduated from elementary school. This result is consistent with that reported in the study by Zhoua *et al.,* (17) which showed that greater BMI is found among those with elementary level of education or above compared with those less educated. A higher level education is associated with a better socioeconomic condition as supported by an adequate income.

The smoker elderly have a lower BMI (21.6 kg/m^2) than the smoker elderly (23.4 kg/m^2). This supports the results published by Jitnatrin *et al*., [9] showing that the BMI of smoker males was lower (21.6 kg/m^2) than that of non-smoker males (22.2 kg/m^2) with similar results observed for the mean BMI of smoker females (22,1 kg/m^2) which was lower than that of non-smoker females (22.9 kg/m^2). This may be due to the elevation of metabolic rate and/or reduced appetite caused by nicotine in smokers.

Most of the elderly (68.8%) in the present study were employed, and the mean BMI of the employed elderly was lower (22.4 kg/m^2) than that of the unemployed elderly (23.2 kg/m^2). A statistically significant relationship was observed between the BMI values of subjects with employed versus unemployed status ($p < 0.05$). This is likely due to greater physical activity performed by employed people than unemployed people.

Data on physical activities in the elderly group show that the majority (70.8%) spent ≥ 30 min performing physical activities. Most of the elderly subjects (491 people) did not exhibit changes in the type of physical activity although a small proportion (17 people) increased their physical activity from zero time spent to ≥ 30 minutes. The mean BMI increases as both type and duration of physical activity decrease, and vice versa. The mean BMI can reduced when physical activity is performed after not doing so.

Age and levels of sports and recreational physical activity are associated with fat-free mass change[7]. The fat-free mass contributes 19% in people who experience weight gain when decreasing physical activity. The fat-free mass represents 33% of the weight lost in people who experience a decrease in weight. The fat-free mass in the male elderly drops with age (0.2% per decade), whereas the fat mass is gained equally gains in both sex (7.5% per decade). Nelson *et al* [13] stated that the recommended physical activity for the elderly is to enlarge the volume of aerobic physical activity, helping to prevent unhealthy weight. Additional physical activities also help prevent weight gain in the elderly. The recommended goal includes aerobic physical activity performed 30–60 min per day moderate activity.

Barrigan *et al*., [3] showed that the elderly aged 60–69 years generally only have 6–10 min for physical activity with moderate intensity or more per day. Duray & Genc [4] showed that due to decreased aerobic capacity in elderly people, walking and balance changes may cause a decrease in functional capacity. The WHO[17] recommends that physical activity should be performed

at least 150 min a week for moderate-intensity physical activity, 75 min a week for high-intensity physical activity, or an equal combination of the two activities.

In the present study, most of the elderly possessed normal nutritional status and practiced constant activities, except for increasing or decreasing physical activity due to spesific physical limitations. Aging itself can be defined as the progressive deterioration or loss of functional capacity that occurs in an organism after a period of reproductive maturity. Specific functional capacities change with age and the physiological capacities of organs show aging at different rates. Between individuals, more difference is noted in older people than younger people [1]

According to Sun *et al*.,[16] regular physical activity can lead to a significant health improvement at all ages, and can prolong the active years of independent living as well as enhance the quality of life for the elderly. The decrease in physical activity is due to indications of constant work and dietary changes. Physical activity in the elderly is needed to inform public health strategies for improved quality of life for the elderly. Sahin *et al.* [14] have determined that elderly people may become more dependent on additional assistance at advanced ages for some instrumental activities.

Conclusion

However, our findings suggest that increased physical activity influences the nutritional status of elderly people, by reducing BMI. These results will help to improve the quality of life and strongly indicate the importance of a regular physical activity program.

Dosing of Erythropoietin Stimulating Agents in Patients on Hemodialysis: A Single-Center Study

Thuraya Salim Abed[1], Jawad Ibrahim Rasheed[1], Hayder Adnan Fawzi[2]

[1]Lecturer, Baghdad Medical City Campus, Ministry of Health and Environment, [2]Asst. Prof., Department of Pharmacy, Al-Esraa University College, Baghdad, Iraq

Abstract

Objective: Study the relationship of dialysis adequacy with the effectiveness of erythropoietin for the management of anemia in hemodialysis patients.

Materials and Method: A retrospective cohort study, conducted in the Medical city complex from January 2019 to June 2019, the study involved 162 ESRD patients on regular hemodialysis sessions.

Results: Change in Hb (percentage and value), was significantly higher in patients receiving once-weekly erythropoietin compared to both twice and thrice and more dosing per week. Overall only 33 (21.2%) of the patients achieved target Hb (10–11 mg/dL) with 6 months of follow-up. There was an inverse significant correlation between percentage change after 6 months with baseline Hb, baseline ferritin, and baseline albumin. While with urea at baseline, number of weekly sessions, and Kt/V the relationship becomes direct and significant. There is an increased risk (2 folds) of not achieving target Hb (10-11 mg/dL) in patients with DM compared to those without DM.

Conclusion: Once weekly regimen appeared to superior to other regimens (twice or more per week).

Keywords: *Erythropoietin, dialysis, hemoglobin, anemia, weekly dosing.*

Introduction

End-stage renal disease (ESRD) occurs when there is a progressive loss of kidney function over a period of months to years to the point where the kidneys can no longer maintain normal function [1]. Anemia is common among patients with chronic kidney disease (CKD). Anemia underlies many of the symptoms associated with reduced kidney function and is associated with increased mortality and hospitalizations [2]. The anemia of CKD is, in most patients, normocytic and normochromic and is due primarily to reduced production of erythropoietin by the kidney (a presumed reflection of the reduction in functioning renal mass) and to shortened red cell survival[3]. The primary therapeutic options for the anemia of CKD include iron, erythropoiesis-stimulating agents (ESAs), and, rarely, red blood cell (RBC) transfusions. The treatment depends on the severity of anemia and iron deficiency. ESAs are administered to most CKD patients who have hemoglobin (Hb) <10 g/dL, providing the transferrin saturation (TSAT) is >25 percent and ferritin >200 ng/mL[4]. The current work aimed to study the relationship of dialysis adequacy with the effectiveness of erythropoietin for the management of anemia in hemodialysis patients.

Method

Patients: A single-center study involved 162 ESRD patients on regular hemodialysis sessions

Data Collection: Demographic characteristics, cause of end-stage renal disease, time on dialysis, and type (epoetin alpha) and the dose of erythropoietin (50 to 100 units/kg/dose 3 times weekly, SC), type and dose of iron preparation.

Two consecutive (every 6 months) laboratory records of the patients were collected by trained nurses and data were entered into a specifically designed datasheet.

Laboratory analysis: Laboratory data collected from patients' charts included hemoglobin level, serum ferritin, and single-pool Kt/V, serum albumin, blood urea, and serum creatinine.

Inclusion criteria:

1. Age above 18 years
2. Patients on regular hemodialysis
3. End-stage renal disease

Exclusion criteria:

1. Pregnant women
2. History of hematologic disorders such as thalassemia, sickle cell disease, and hematologic malignancies
3. Patients with active or past cancer

Statistical analysis: Discrete variables presented using their number and percentage, chi-square test used to analyze the discrete variable. One-way ANOVA used to analyze the differences between more than two groups after that in the results is significant post hoc Tukey test will be used. Linear regression analysis performed to assess the relationship between different variables, r (correlation coefficient or standardized beta is a representative of magnitude and direction of the relationship), negative sign indicates inverse relationship, but positive sign represents direct relationship. SPSS 22.0.0 (Chicago, IL), Minitab 17.1.0, software package used to make the statistical analysis, p-value considered when appropriate to be significant if less than 0.05

Results

The study included 162 patients, with mean age of 52.7 ± 15.9 years, 57.4% of them were males. There was no significant difference in the age of patients when divided by gender (50.6 ± 13.6 vs. 54.3 ± 17.3 years, female vs. male, p-value = 0.128), as illustrated in table 1.

Table 1: Baseline Characteristics and Demographic Data

Variables	Value
Number	162
Age (Years), mean ± SD	52.7 ± 15.9
Gender, n (%)	
Female	69 (42.6%)
Male	93 (57.4%)
Medical Diseases	
Hypertension, n (%)	147 (90.7%)
Dry weight (kg), mean ± SD	70.2 ± 14.7
Cause of end-stage renal disease, n (%)	
Diabetic nephropathy	66 (40.7%)
Glomerulonephritis	27 (16.7%)
Polycystic kidney disease	21 (13.0%)
Hypertensive nephropathy	36 (22.2%)
Obstructive uropathy	24 (14.8%)
Dialysis duration, n (%)	
<1 Year	72 (44.4%)
≥ Year	90 (55.6%)
Vascular Access	
Temporary double-lumen	126 (77.8%)
Tunneled	12 (7.4%)
Fistula	24 (14.8%)
KT/V	0.85 ± 0.31
Dialysis adequacy (Kt/V ≥1.2)	30 (18.5%)

After 6 months of therapy with EPO, 6 patients (3.7%) stop their EPO since they maintain Hb level above 10 mg/dL during this period, the rest of the patients (156, 96.3%) categorized according to dosing intervals, in which 27 (17.3%) used single weekly dose, 63 (40.4%) used twice weekly doing, and 66 (42.3%) used trice weekly dosing.

Change in Hb (percentage and value), was significantly higher in patients receiving once-weekly EPO compared to both twice and thrice dosing per week (see Figures 3 and 4). Overall only 33 (21.2%) of the patients achieved target Hb (10–11 mg/dL) with 6 months of follow-up, as illustrated in table 2, figures 1.

Table 2: Assessment of the effect of EPO on Hb

	Once Weekly	Twice Weekly	Trice Weekly	p-value
Number	27	63	66	-
Baseline Hb	8.6 ±2.0	8.6 ±1.5	7.4 ±1.2	<0.001

	Once Weekly	Twice Weekly	Trice Weekly	p-value
Hb% change	26.6 ±35.1	6.4 ±21.4	9.9 ±23.8	0.003
Hb change	1.7 ±2.1	0.3 ±1.6	0.6 ±1.7	0.002
Patients achieved 10-11 mg/dL	15 (55.6%)	9 (14.3%)	9 (13.6%)	<0.001
Hypertension, n (%)	24 (88.9%)	57 (90.5%)	60 (90.9%)	0.956
DM, n (%)	6 (22.2%)	30 (47.6%)	33 (50.0%)	0.039

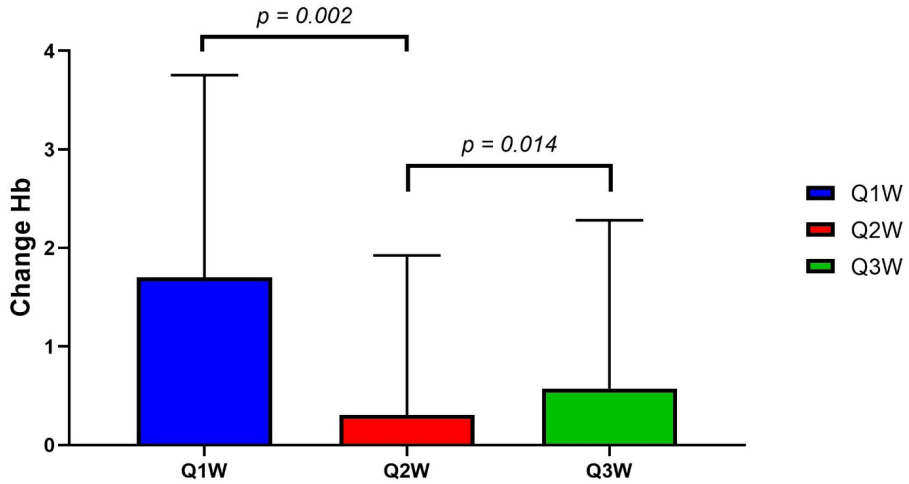

Figure 1: Assessment of the change in Hb from baseline to 6 months

There was a direct relationship between baseline urea, number of sessions per week, and Kt/V with percentage of Hb change.

There was an inverse relationship between baseline hemoglobin, baseline ferritin, and baseline albumin with percentage of Hb change, as illustrated in table 3.

Table 3: The relationship between change in Hb after 6 months and various variables

Variables	Percentage change in Hb	
	r	p-value
Age	0.084	0.288
Dry Weight	-0.088	0.266
Dosing Interval	-0.122	0.130
Hb at baseline	-0.629	<0.001 [S]
Ferritin at baseline	-0.194	0.013 [S]
Albumin at baseline	-0.284	<0.001 [S]
Urea at baseline	0.270	0.001 [S]
Creatinine at baseline	0.116	0.141
Ferritin after 6 months	-0.091	0.247
Albumin after 6 months	-0.110	0.162
Urea after 6 months	-0.060	0.448
Creatinine after 6 months	0.099	0.210
Session Per week	0.214	0.007 [S]
Kt/V	0.263	0.001 [S]

There an increased risk (1.943 folds) of not achieving target Hb (10-11 mg/dL) in patients with DM compared to those without DM, as illustrated in table 4.

Table 4: The relationship between DM and patients achieving target Hb

	Not DM	DM	OR	95%CI	p-value
Achieved target (%)	27 (29.0%)	12 (17.4%)	1.943	0.903–4.183	0.090
OR: odds ratio, CI: confidence interval					

Patients with higher Kt/V value had increased odd of achieving target Hb (1.5 folds), however, it did not reach statistical significance, as illustrated in table 5.

Table 5: The relationship between targets Hb with Kt/V

Variable	Target Hb		OR	95%CI	p-value
	Not achieved	Achieved			
Kt/V	0.84 ± 0.33	0.88 ± 0.24	1.548	0.498-4.809	0.450
OR: odds ratio, CI: confidence interval					

Discussion

In the current study, only 33 (21.2%) of the patients achieved target Hb (10–11 mg/dL) with 6 months of follow-up, with mean Hb after 6 months (8.8 ± 1.5 mg/dL), which lower than reported by international studies[5-9].

In the present study, there was a direct relationship between number of sessions with change in Hb (*r = 0.238, p-value = 0.001*), indicating that patients offered higher number of sessions had better anemic response. Although iron deficiency is probably the most important factor affecting the response to erythropoiesis-stimulating agents (ESA) in most patients, occult blood loss, infection, and inflammation also are important. Adequate dialysis can contribute to anemia correction by removing small and possibly medium/large molecules that may inhibit erythropoiesis [10].

Several metabolites have been implicated as potential EPO toxins, including various polyamines, such as spermine, spermidine, putrescine, and cadaverine, and parathyroid hormone. However, these substances have been found to be general bone marrow toxins and not specific suppressors of erythropoiesis. More recently, polymeric polyamine-protein conjugates have been shown to have a selective inhibitory effect on colony-forming units-erythroid proliferation without any appreciable effect on burst-forming units-erythroid[10].

In the present study we found that a once-weekly regimen is better than two or three times per week's regimens. This finding is unique since it is not reported in the literature.

In the present study patients with diabetes had two folds (OR = 1.94 3, 95%CI: 0.903–4.183) increased risk of not achieving target Hb (10–11 mg/dL). Diabetes is known to be a risk factor for the severity of anemia in non-dialyzed patients with renal failure, as well as in patients who require maintenance dialysis. Few studies have evaluated the difference in response to erythropoietin therapy in diabetic and non-diabetic patients [11, 12].

Despite the similarity of the response offered by erythropoietin therapy on Hb among various regimen, the overall percentage of patients achieving target Hb (10–11 mg/dL) was low 33 (21.2%), with once-weekly regimen offered the highest proportion (55.6%) within target, while the rest of the regimens offered lower percentage (14.3%, and 13.6% for Q2W, and Q3W respectively). This was in disagreement with previous studies in which the percentage of achieving target was higher (80–90% in most studies)[6-8].

In the present study Dialysis adequacy (defined at Kt/V ≥1.2 according to KDOQI guideline [13]) achieved in 30 (18.5%) of the participants, which is lower than other reported studies like Nafar et al with 58% achieving dialysis adequacy [14], and once-weekly than Amini et al with 43.3% achieving dialysis adequacy[15].

Because anemia improves after the start of dialysis, adequate dialysis is of paramount importance in correcting anemia by removing small, and possibly medium/large molecules that may inhibit erythropoiesis. Even if previously underestimated, the role of dialysis dose per se on anemia and response to ESA has progressively come to the scene. In a previous study a direct relationship between hematocrit level and urea reduction ratio (URR) after adjustment for other factors; at logistic regression analysis, an 11% increase in URR doubled the odds that a patient would have a hematocrit higher than 30%. Twenty consecutive patients receiving inadequate dialysis (baseline URR, 65%) received an increase in dialysis dose and were compared with another 20 End-stage patients receiving inadequate dialysis and in whom the dialysis schedule was not modified. 19 After 6 weeks, in parallel with an increase of mean URR to 72%, the hematocrit level increased from 28.4% ± 0.78% to 32.3% ± 0.71% (P-value 0.002), whereas it remained unmodified in the control group, without any difference in ESA dose in the 2 groups explained [10].

Data on the possible role of dialysis dose on anemia correction also come from the dialysis center in Tassin, France. In this facility, patients are treated with long

hemodialysis sessions lasting 8 hours. Fifty-nine of these patients were compared with 53 patients from Sweden receiving conventional hemodialysis lasting 3 to 5 hours.23 Even if the mean hematocrit level was similar in the 2 groups, the proportion of patients treated with rh-EPO was much higher and the mean Kt/V was significantly lower in the Swedish than in the Tassin group. The better control of anemia observed in the patients from Tassin mainly is owing to a higher depuration rate, but it also is possible to hypothesize an effect of dialysis time per se, independent from dialysis adequacy[10].

In the present study, there is direct correlation between dialysis adequacy with increase in Hb (r = 0.263, p-value =0.001), which is in agreement with other studies.[16,17]

One of the major determinants of anemia severity and ESA responsiveness is dialysis adequacy[18]. Patients with an inadequate dialysis dose are resistant to ESA, and their target Hb is harder to reach[19]. In hemodialysis, there is an inverse relationship between the achieved Kt/V and ESA dose, while increasing the dialysis dose is associated with an increase in hematocrit level [20]. Uremic toxicity in general and/or retention of some direct inhibitors of erythropoiesis results in aggravated anemia and poor response to ESA treatment [17].

Conclusion

Once weekly regimen appeared to superior to other regimens (twice or more per week).

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the Arabic Board of Medical Specializations.

Therapeutic Uses of Momordica Cymbalaria: Review

S. Kiruba[1], Govindarajan Sumathy[2], S. Sivakumar[3]

[1]Department of Anatomy, [2]Professor & Head, Department of Anatomy, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Chennai, [3]Research Advisor, Department of Bio-chemistry, Asthagiri Herbal Research Foundation, India

Abstract

Momordica cymbalaria plant belongs to Cucurbitaceae family which is widely spread in southern parts of India. *Momordica cymbalaria* is a well known plant species since in ancient times the use of plant parts such as root, leaves and fruit were treated for various ailments. Recently, it is well documented that this species found to have various significant activity. This plant Momordica cymbalaria has numerous therapeutics value and antioxidant properties. Treatment with conventional drugs has increase in side effects. Hence, natural remedy with herbal drugs mainly *Momordica cymbalaria* possess a well known properties as hypolipidemic, hypoglycaemic, neuroprotective, cardio Protective, nephroprotective and hepatoprotective. This traditional drug as a possible alternative in treatment to various conditions and it has been viewed in this paper.

Keywords: *Momordica cymbalaria, Cucurbitaceae, Natural remedy, Hypolipidemic, Herbal drug.*

Introduction

The plant *Momordica cymbalaria* belongs to the Cucurbitaceae family which is commonly called as melons, cucurbits or gourds. *Momordica cymbalaria* is a wild crop, well known as "Athalakkai" in Tamil. This family Cucurbitaceae also includes the crops like cucumbers and squashes. *M.cymbalaria* is largely distributed in and around the southern parts of India. The edible parts of this species are the fruits, which is rich in nutritional value. The fruit of *Momordica cymbalaria* contains high levels of calcium, potassium, vitamin C and it is rich in fibre content .This plant parts were traditionally used as a tonic, stomachic, stimulant and laxative to control the skin diseases, rheumatism, ulcer, diarrhoea and diabetic diseases by the South Indian populations[1]. In near future the use of herbal medicines worldwide has provided an opportunity to Indian pharmaceutical companies to look for therapeutic leads from Indian traditional system of Ayurveda and siddha that could be utilized for the development of herbal drug[2].

The *Momordica cymbalaria* flowers are unisexual. The fruits of *Momordica cymbalaria* are pyriform in nature with 8 sharp ridges in it, which is attenuated at the apex region and with the base narrowed into the curved peduncle, which is fleshy with dark green and ribbed. The seeds is ovoid in shaped with smooth and shiny surface. Flowering occurs during the month of October; fruits are harvested from November to January. The tender fruits closely resemble the shape and size of small variety of bitter gourd. Athalakkai is used as a vegetable by the rural people of South Tamil Nadu and North Karnataka, India[3]. The phytochemicals reported in this plant athalakkai are tannins, alkaloids, phenols, proteins, amino acids[4], Vitamin C, carbohydrate and ß-Carotene[3]. The fruits of this plant reported anti diabetic and antihyperlipedimic activities. The tubers were reported as antiovulatory activity[4,5].

Furthermore, the literature of *M. cymbalaria* revealed that the juice of the leaves used for whooping cough, tubers used for abortion, paste of tubers are used for applying boils, ulcers, and snake bite[6].

Nutritional Composition: The nutritional content of plant *M .cymbalaria* is reported by author *Gopalan et*

al., T The percentage of moisture content of this species is about 84.30. Energy value is about 3.00kcal/100g. The carbohydrate and protein constitute is about 12.60 mg/100gm and 2.15 mg/100gm respectively. Minerals like calcium, Potassium, Sodium, iron, Copper, Manganese, Zinc, Phosphorus and Vitamin C are present. Therapeutic uses of this species are mainly of its rich content of calcium, Potassium and vitamin C, which elevates most of the pathological conditions.

Phytochemical Screening: Phytochemical screening of tubers of *Momordica cymbalaria* species shows the presence of sterols, triterpene, saponins, carbohydrates and cardiac glycosides[8]. The leaf showed the presence of flavonoids along with other phytoconstituents[9]. The fruit contains flavonoids, tannins, alkaloids, carbohydrates, glycosides, Vitamin C, β-carotene, polyphenols and amino acids. The amino acids present in *M.cymbalaria* are Momordicin, Ascorbigen and Pipecolic acid .The unripe fruits contain the amino acid Luteolin[3].

Therapeutic Uses: *Momordica cymbalaria* species is widely used in ancient days. Rationally the extracts and decoctions of fruits, tuberous roots and leaves of in *M.cymbalaria* have been used in many researches to proven the positive effects for the various clinical conditions. The fruits of this plant reported anti-diabetic, anti-microbial and anti-hyperlipedimic activities. The tubers were reported as antiovulatory activity. Tradional juice of the leaves *M .cymbalaria* revealed that used for whooping cough, tubers used for abortion, paste of tubers used for applying boils, ulcers, and snake bite[6].

Hepatoprotective Activity: The ethanolic extracts of tubers of Momordica tuberosa possess antioxidant property by preventing the formation of trichloromethyl peroxy radical there by reducing tissue damage[10]. The lipid peroxidation initiates a chain of reactions leading to tissue necrosis. Thus the root extract of *M .cymbalaria* preventing the tissue damage and oxidative stress by inhibiting the formation of trichloromethyl peroxy radical. Hepatoprotective activity by using 70% ethanol extract of tubers of *Momordica* against thiacetamide (100 mg/kg of body weight) induced hepatotoxicity in Wistar albino rats[11].

Antihyperglycemic Activity: The antihyperglycemic action was reported from the aqueous extract of the plant *M. Cymbalaria* fruits. The diabetic rats showed a reduction in blood glucose levels at a dose of 0.5 g/kg of body weight[12]. Diabetic induced rats STZ (65mg/kg) treated with saponins present in of *M. Cymbalaria* showed significant decrease in serum glucose level where as significant increase in serum insulin and liver glycogen level proves that increase insulin secretion, increases hepatic glycogen level and attenuates Hyperinsulinemia. rats[13]. Antidiabetic action was present in the aqueous extract of fruits of *M. Cymbalaria* proved by the presence of17 kDa protein also called M. Cy protein. The 'M. Cy protein', available in the fruits of *M. Cymbalaria* is showed an effective antihyperglycemic active principle in STZ induced diabetic rats at a dose of 2.5 mg/kg of body weight[14]. Insulin mimetic peptide was reported in *M. Cymbalaria* and in other plant species related co namely Canavaliaensiformis, Vigna unguiculata and Bauhinia variegate[15] in compared with bovine insulin.

Hypoglycaemic and Antidiabetic Activity: The hypoglycaemic and antidiabetic activity of fruit powder of the plant *M. cymbalaria* was evaluated in comparison with normal rats and alloxan-induced diabetic rats. The fruit powder of the plant *M. cymbalaria* is treated with a dose of 0.25 g/kg of body weight for a period of 15 days showed a significant decrease in the blood glucose levels and a weight loss in alloxan induced diabetic rats. The natural ability of the *M. cymbalaria* fruit powder is to enhanced the rate of glycogenesis and protect the body weight loss due to its antidiabetic activity[16]. *M. cymbalaria* fruit extracts stimulates the secretion of insulin from the remnant α cells by lowering the effect of blood glucose exhibiting antihyperglycemic activity[4]. Oral administration of alcoholic extract of fruit *M. cymbalaria* dose of 175 mg/kg for 31 days showed significant regression of the diabetic state and restored the level of the serum glucose, cholesterol, triglycerides, serum insulin and HDL parameters in STZ induced type II diabetes rats. The serum insulin levels were significantly increased after treatment with the extract *M. cymbalaria* both at lower and higher doses, the same extract of the plant *M. cymbalaria* might be the proposed mechanism of action for reduced the glucose levels in normal glycemic rats. Therefore based on these observations the alcoholic extract of *M. cymbalaria* might be useful in treating type-II diabetes[17].

Antihyperlipedimic and Cardio protective Activity: Hypertriglyceridemic patients are clinically at a risk for cardiovascular disease characterized by elevation of all lipids causing the myocardial membrane damage. The plant *M. cymbalaria* extract, at dose of 500

mg/kg body weight, prevents the alterations in marker enzymes of myocardial infarction and the free radical formation along with uric acid. When compared to the cardiac sections of the isoproterenol treated animals and the rats pre-treated with *M. Cymbalaria*, showed the normal structures of myofibrillar with a striations and protection by the extract against myocardial necrotic damage. The rats pre-treated with *M. cymbalaria* shows elevated in HDL Cholesterol level and decreased the LDL cholesterol level[18]. These experiments proves a growing body of evidence from epidemiologic, clinical, and laboratory data indicating that the elevated triglyceride levels itself cause a risk factor for cardiovascular disease. The promising activity of the plant extract *M. Cymbalaria* shows Cardioprotective, Antihyperlipidemic, Antidiabetic and antioxidant effect.

Antiulcer Activity: Anti ulcer property was experimentally proved by the aqueous extract of *Momordica tuberosa*, which shows the significant reduction in non-protein sulfhydryls concentration, gastric content, haemorrhage and ulceration in the ulcer induced Wistar albino rats . This study suggested that the anti ulcer activity of *Momordica* tuberose aqueous extract is due to the presence of polyphenolic constituents[19].

Antidiarrhoeal Activity: Many of the patients with a sudden onset of diarrhoea have self-limited illness, it doesn't require treatment. However, in some severe cases, dehydration and electrolyte imbalance are the principal risk factor, particularly in infants, children and elderly patients, thus requiring adjuvant non-pharmacologic treatments, such as oral rehydration therapy (ORT) and zinc supplements, and pharmacological treatments[20]. The use of naturally available compounds in those cases is needful. The *Momordica cymabalaria* fruit extract had possess a similar activity as that of anti diarrhoeal drug diphenoxylate, shows a statistically significant reduction in the frequency of diarrhoea and the wetness of the faecal droppings when compared to untreated control rats. For this experiment, castor oil is used to induce diarrhoea in Wistar rats. *M. Cymbalaria* fruit ethanolic extract inhibit the prostaglandin E2 pathway (PGE2 is responsible for diarrhoea in both animals and humans) thereby preventing the fluid accumulation in intestine [21].

Antimicrobial Activity: The extracts of Petroleum ether, chloroform, ethanol, and aqueous of *M. cymbalaria* has shown a inhibitory effect against the organisms, Staphylococcus aureus, Klebsiella pneumonia, Escherichia coli, Pseudomonas aeruginosa, and Aspergillus niger when its compared to the standard antibiotics. The standard antibiotics zone of inhibition was less than the extracts of *M. cymbalaria* indicates that this plant effective against these organisms[22]. The activity of *M .cymbalaria* fruit extracts, may be useful as a broad-spectrum antimicrobial agent, and also used in treatment of fever, wound infections, and intestinal disorders[23] because of its prominent inhibitory potential.

Antidepressent: Depression is a common, mental or behavioural disorder, sometimes the state of depression leads to serious life-threatening illness with an increased incidence of morbidity and mortality. In spite of using antidepressant drugs, use of natural plant product will minimise the side effects and paves a positive response. Hydro-alcoholic extract of fruit *Momordica cymbalaria* and the antidepressant drug imipramine were used for the experiment to identify the effect of *M .cymbalaria.* To examine the efficacy of Hydro-alcoholic extract of fruit *Momordica cymbalaria* the dose range of 200mg/kg, 400mg/kg, 600mg/kg, was examined by using the behavioural models like forced swim test experiment and tail suspension test experiment in mice. Both imipramine and extract of fruit *Momordica cymbalaria* showed significantly reduction in duration of immobility in both the behavioural models. The antidepressant activity of Hydro-alcoholic extract of *Momordica cymbalaria* fruit was comparable to that of standard drug, indicate that the potential for use of *Momordica cymbalaria* as an adjuvant in the treatment for neuro depression[24].

Anticarcinogenic Activity: Methanol extract of *M. cymbalaria* at a dose of 200 mg/kg of body weight has possess the significant anticancer activity as compared to standard drug cyclophosphamide against the ehrlich ascites carcinoma induced cancer in mice[25]. The cytotoxic effects of saponins derived from *M. cymbalaria* indicate anticancer activity in mice [26].

Nephroprotective Activity: Tubers of *M. cymbalaria* possess tremendous nephroprotective activity and counteract the toxicity induced by nephrotoxins, so it could be a promising role in treatment of acute renal injury[26].

Anti-implantation And Anti-ovulatory Activity: The roots of the plant *M. Cymbalaria* were used for the mensural irregularies, antifertility, antiovulatory and abortifacient activities. *koneri et al* identifies that the anti-implantation activity of the root extract *M. cymbalaria*

in female rats is not due to the activity of estrogen and progesterone[27] and also reported the antiovulatory and abortifacient action of the root extract of *M. cymbalaria* on female rats.

Conclusion

The traditional uses of herbal drug formulations are more widely used than the allopathic drugs. The use of herbal formulations throughout the world exceeds that of the conventional drugs by two to three times higher. The ever increasing use of herbal products has some very important implications for the geriatric population and for those heading towards their senior years. Geriatric patient has a higher incidence of illness and chronic conditions and generates a higher per capita number of different prescription medications. This renders them to be more cautious when adding herbal medications to their health regime. Nowadays diabetes is common in all population, misuse and indiscriminate treatment with synthetic drugs have allowed the rapid selection of herbs against resistant diabetic populations. In future the use of natural products especially *M. Cymbalaria* would enable them to easily overcome many compliance such as diabetic, antihyperlipidic, antiovulatory, whooping cough and so on. The Additional use of the natural plant products like M. *Cymbalaria* will increase the therapeutic value and possibly minimize the side effects of the allopathic drugs. Thus, the development of herbal formulations has become necessary to develop experimental research studies aimed at searching complementary alternatives to traditional Method.

Assesement of Relationship between Cheiloscopy and Personality/Character among Human Volunteers in the Age Range of 21 to 40: A Cross Sectional Study

R. Senthil Kumar[1,2], Govindarajan Sumathy[3]

[1]Research Scholar, Department Of Anatomy, Sree Balaji Dental College & Hospital, Bharath Institute of Higher Education and Research, [2]Reader, Department Of Anatomy, Sri Venkateswara Dental College & Hospital, Thalambur, Chennai, [3]Professor & Head, Department Of Anatomy, Sree Balaji Dental College And Hospital, Bharath Institute of Higher Education and Research, Chennai

Abstract

Background: Cheiloscopy (quiloscopy) can be defined as a method of identification of a person based on characteristic arrangement of lines appearing on the red part of lips. Biometric parameters like fingerprints and cheiloscopy may be employed to determine/understand the personality of an individual. Assessment and prediction of personality anomalies like psychosis and criminal tendencies may potentially be guided by biometrics like cheiloscopy

Materials and Method: A cross sectional study was conducted among adult population of age range 21-40 who were selected by eligibility criteria after informed consent. They were given a questionnaire adapted from the Eysenck personality questionnaire revised form and then cheiloscopic impression was obtained. Types of lip prints were correlated with determined personality types.

Results and Conclusion: A total of 524 individuals were selected and questionnaire data and lip prints were correlated. Type II and Type IV lip patterns were predominantly males and were associated with psychotism. Early diagnosis and counselling can potentially help in criminal jurisprudence.

Keywords: *??*

Introduction

Among the different forensic techniques available in the modern day scenario, cheiloscopy holds a prominent place in personal identification. The word "cheiloscopy" derived from Greek word, "cheilos" which means lips [(1)]

Cheiloscopy (quiloscopy) can be defined as a method of identification of a person based on characteristic arrangement of lines appearing on the red part of lips or as a science dealing with lines appearing on the red part of lips. It is unique to an individual, except for monozygotic twins.[(2, 3)]

Corresponding Author:
Govindarajan Sumathy,
Professor & Head, Department Of Anatomy, Sree Balaji Dental College And Hospital, Bharath Institute of Higher Education and Research, Chennai

In 1932, Edmond Locard, French criminologist, proposed cheiloscopy for personal identification. Scientific studies correlating the finger prints to the personality/character of a person has helped to understand the personality of an individual whether he/she is an extrovert or introvert or both based on the direction of flow of psychological energy, which the scientist say can be known from the direction of the frictional ridges. If it is in outward direction then the person is said to be extrovert, if it is in inward then introvert, and if both are present then the person has mixed personality.

The use of cheiloscopy in crime investigation is not commonly implicated in India. Mostly studies have been done on cheiloscopy to determine their age and gender. But, in this study, using cheiloscopy, it will be possible to determine the personality of an individual. Apart from regular age and gender determination using lip print, this study helps to identify the psychoticism personality of

the individuals and identify the crime prone groups with their lip print pattern. The aim of the study is to analyse the personality of persons using lip prints. Identification of psychoticism personality of the individuals, can thereby identify the crime prone groups with their lip print pattern.

Materials and Method

A Cross sectional study was conducted to sample the population regarding their personality traits and lip patterns. Inclusion criteria were age of 21-40 years. Conditions where the normal lip print cannot be determined secondary to trauma, developmental or any pathology, Congenital anomalies of lip and limbs, Skin diseases, orthodontically treated patients were excluded. Data collection was done using questionnaire and cheiloscopic examination as done by Suzuki and Tsuchihashi. Simple Random Sampling was done for selection of participants. Sample size was derived using formula $N= 4pq/L^2$ and established to be 524. In calculating the sample size, the prevalence is taken as 74%.

After Informed consent was obtained from individuals, Demography details and Personality of the individual was obtained by questionnaire manual (Eysenck personality questionnaire revised form). EPQR-S is a self-reported questionnaire. It has 48 items, 12 for each of the traits of neuroticism, extraversion and psychoticism, and 12 for lie scale. Each question has a binary response, 'yes' or 'no'. Each dichotomous item was scored 1 or 0, and each scale had a maximum possible score of 12 minimum of zero.

Cheiloscopic analysis and Classification was done using Suzuki and Tsuchihashi classification:

- Type I: Vertical pattern, comprising of complete (end to end) longitudinal fissures/patterns
- Type I': Incomplete longitudinal fissures
- Type II: Branching Y-shaped pattern
- Type III: Crisscross pattern
- Type IV: Reticular pattern, typical checkered pattern, fence like.
- Type V: Grooves do not fall into any of the

Operational Definition:

Lie Scale: In psychometrics, lie scale items included within a test or questionnaire designed to detect whether respondents have responded truthfully to the items.

Extroverts: Extroverts are often described as talkative, sociable, action-oriented, enthusiastic, friendly, and out-going. On the negative side, they are sometimes described as attention-seeking, easily distracted, and unable to spend time alone.

Neuroticism: They are instability, is made up of a number of factors such as anxiousness, depression, feelings of guilt, low self-esteem, tenseness, irrationality, being shy and moody, and emotional.

Psychoticism: They are aggression, coldness, egocentricity, an impersonal attitude, impulsivity, antisocial behaviour, lack of empathy, creativity, and a tough-minded attitude characterize people with high levels of psychoticism.

Ambivert: The person having characteristics of both extrovert and introvert. An ambivert is moderately comfortable with groups and social interaction, but also relishes time alone, away from a crowd.

Introvert: The person who tends to shrink from social contacts and to become preoccupied with their own thoughts. They are reserved, plan their actions and control their emotions. They tend to be serious, reliable and pessimistic.

Extrovert Neuroticism: They possess the characters of both extrovert and neuroticism.

Extrovert Psychoticism: They possess the characters of both extrovert and psychoticism.

Ambivert Neuroticism: They possess the characters of both ambivert and neuroticism.

Ambivert Psychoticism: They possess the characters of both ambivert and psychoticism.

Introvert Neuroticism: They possess the characters of both introvert and neuroticism.

Introvert Psychoticism: They possess the characters of both introvert and psychoticism.

Statistical Analysis: Data were entered in excel and was analysed using SPSS version 20.Qualitative data is given in frequencies with their percentage. All analysis including Association of the lip print and gender was analysed using Chi square test.

Results

Table 1: Frequency distribution of lip print pattern

Lip Print Pattern	Frequency	Percent	Cumulative Percent
Type I	232	44.3	44.3
Type II	43	8.2	52.5
Type III	209	39.9	92.4
Type IV	29	5.5	97.9
Type V	11	2.1	100.0
Total	**524**	**100.0**	

The above table shows that 232 (44.3%) study participant had Type I lip pattern which was predominant type, followed by Type III which were seen in 209(39.9%) and Type II 43(8.2%).

Table 2: Frequency distribution of personality

Personality	Frequency	Percent	Cumulative Percent
Ambivert	95	18.1	18.1
Ambivert Neuroticism	118	22.5	40.6
Ambivert Psychoticism	7	1.3	42.0
Extrovert	142	27.1	69.1
Extrovert Neuroticism	80	15.3	84.4
Extrovert Psychoticism	10	1.9	86.3
Introvert	1	.2	86.5
Introvert Neuroticism	62	11.8	98.3
Introvert Psychoticism	9	1.7	100.0
Total	**524**	**100.0**	

Distribution of personality among 524 individual showed predominance of Extrovert-142 (27.1%) followed by ambivert neuroticism-118 (22.5%) and ambivert-95(18.1%).

Association between Personality and Lip Print Pattern:

Table 3: Association between personality and lip print pattern

Lip Print Patterns	Personality									Total
	Ambivert	Ambivert Neuroticism	Ambivert Psychoticism	Extrovert	Extrovert Neuroticism	Extrovert Psychoticism	Introvert	Introvert Neuroticism	Introvert Psychoticism	
Type I	63	84	0	20	18	0	0	47	0	232
Type II	10	13	5	5	1	0	0	4	5	43
Type III	16	13	1	111	56	0	1	9	2	209
Type IV	3	5	1	4	4	10	0	0	2	29
Type V	3	3	0	2	1	0	0	2	0	11
	95	118	7	142	80	10	1	62	9	524

The above table shows that Type III lip pattern exhibited a predominance of Extrovert behaviour and Type I lip pattern showed a pedominance of Ambivert neuroticism. There was statiscally significance associate between the study participant personality and lip print pattern.

Discussion

Identification of an individual gain paramount significance during investigation of a crime disaster or during other calamities.[4]

The aim of this study was identifying the personality

of the individuals using lip print. So far there has been only study in literature, by Mohammed Abidullah et al[5], which had a similar objective, however identification of psychoticism personality (crime prone group) using cheiloscopic techniques have been addressed in this study

Investigators can rely on cheiloscopy along with other supportive evidence in specific investigations. Extensive studies have been conducted in cheiloscopy in the later half of 20th century; two Japanese scientists, Yasuo Tsuchihashi and Kazuo Suzuki established that the arrangement of lines on the red part of the human lip is individual and unique for each human being and these grooves can be used to determine identity.**(6)**

In the present study, lip prints were classified using the classification proposed by Suzuki and Tsuchihashi, also known as Tsuchihashi classification. **(6)**

- Type I - Vertical pattern, comprising of complete (end to end) longitudinal fissures/patterns
- Type I' - Incomplete longitudinal fissures
- Type II - Branching Y-shaped pattern
- Type III - Crisscross pattern
- Type IV - Reticular pattern, typical checkered pattern, fence like.
- Type V-Undetermined.

Personality, in psychology, the pattern of behaviour, thought, and emotion unique to an individual, and the way they interact to help or hinder the adjustment of a person to other people and situations.**(1)** A number of theories have attempted to explain human personality

There are various Method to determine the character of an individual:

- Eysenck's Personality Inventory,
- Bernreuter's Personality Inventory,
- Miller's,Personality Inventory
- Multivariable Personality Inventory, and
- Minnesota Personality Inventory.

Eysenck (1952, 1967, and 1982) developed a very influential model of personality. Based on the results of factor analyses of responses on personality questionnaires he identified three dimensions of personality: extraversion, neuroticism and psychoticism.

Cheiloscopy holds a prominent place in personal identification among various forensic aids. The aim of this study was identifying the personality of the individuals using lip print. In our study 524 samples were collected from common population between the age group of 21 to 40

The purpose of age selection between 21 to 40 years in our study is justified as these age group exhibited reliability in lip pattern than other age groups, similar to the studies done by K. Randhawa et al[7].

Lip print samples were obtained in white bond sheet using lip colour and analysed using magnifying lens and patterns were analysed. Suzuki and Tsuchihashi[6] classification was used to differentiate the lip prints. Similar procedure and classification was done in many studies like Suzuki and Tsuchihashi in 1974[6], Preeti sharma et al[8], Chaitanyaa babu et al[9], Mohammed Abidulla et al[5], Neeti Kapoor et al[10], Suraj multani et al[11].

The personality of the study participant in this study was obtained using Eyesenck personality questionnaire revised form[12]. No previous studies were done using Eyesenck personality questionnaire correlating with lip pattern. In this study the predominant personality is extrovert followed by ambivert neuroticism, ambivert, extrovert neuroticism, introvert neuroticism, introvert psychoticism, extrovert psychoticism and ambivert psychoticism.

In this study Type I lip print was predominantly seen in female followed by Type II and Type III. In males Type III lip pattern was predominantly followed by Type I and Type IV. Female had Vertical pattern, comprising of complete (end to end) longitudinal fissures/patterns whereas Males had Crisscross pattern. Similar finding were observed in Vahanwala et al[13], who observed Type I and I' pattern predominantly in females and Type III and IV among males. Chaitanya Babu et al.[7], observed Type I and II patterns predominantly in females and Type III and IV in males, Suraj Multani et al[11] reported Type III was the most common lip print pattern in males, and among females Type I pattern was commonly found.Gondivkar et al.[14], observed Type III lip pattern predominantly in males and Type I in females. K. Randhawa et al,[7] found the most predominant pattern in the entire study population to be Type I (32.33%).

Contradictory to our findings, studies done by *Mohammed Abidullah et al* [5] Patil *et al* [15]found out

that the predominant lip pattern in males was Type I and in females was Type II.

According to Hans Eyesenck theory, women tends to have higher neuroticism score than men,[16] which is in concordance with our study results where majority of female shows Ambivert neuroticism as their personality whereas male showed extrovert as their predominant personality.

According to Hans Eyesenck men score much higher in psychoticism than women,[14] These results are comparable with our findings where Men showed greater psychotism behavior and in addition these psychoticism were predominant among type II and type IV lip patterns. There are no studies in the past comparing psychotism and lip pattern.

This study concludes that there is a positive association between the Lip pattern and Individual's behavior. Majority of the participants exhibiting psychoticism had type II and IV lip pattern thereby showing that individuals with these patterns have greater tendency to exhibit aggressive behavior. This fact can be a useful tool in forensic odontology and can aid in early intervention among these individuals through behavior modification therapy.

Conclusion

The use of cheiloscopy in crime investigation is not commonly implicated in India. The prevalence of crime rate in India is 44.8%. Mostly studies have been done on cheiloscopy to determine the age and gender. There is no study done correlating the lip pattern and psychotic personality of individuals which can identify the crime prone group. In this study, Type II and Type IV lip prints were noticed in individuals with Psychoticism personality and predominately seen in males. So this method can be used as a prime adjuvant procedure in victim identification in crime scene. Thus the lip print obtained from the crime scene help to assess the personality of the victim during the times of crime or calamity. This study eases the investigating procedure, narrow down and also short list the suspected victims resulting in short time identification of the victim. The current study can guide to arrive a clue for those having criminal attitude which help to intervene them for positive reinforcement, motivation and counselling which can reduce the crime in future.

Abstract

Highly motile sperms with good morphology are more capable of fertilizing an oocyte and increase the pregnancy rate during the process of ART. In swim up method and density gradient method, multiple centrifugation leads to ROS production that can cause DNA damage to the sperms. Microfluidic chips are one of the Method of sperm separation to eliminate DNA fragmentation in sperm. It is thought that the separation of sperm by centrifugation method used in sperm separation in IVF (in vitro fertilization) laboratories leads to sperm DNA fragmentation. By using microfluidics sperm sorting device, spermatozoa do not undergo such physical stress. Therefore it is possible to obtain sperms with ICSI criteria of good motility and in higher concentration with the use of micro fluidic sperm sorting device.

Keywords: *Sperm Concentration, Motility, Oligozoospermia, Asthenospermia, micro-fluidic sperm sorting device and ICSI.*

Introduction

Microfluidics technology has emerged as an enabling technology for different fields of medicine and life sciences. Microfluidic technologies are enabling optimization of sperm sample preparation and analysis in the field of male infertility**.** This device have been developed to balance or even succeed the existing sample handling processes connected with cell culturing, cell separation, and DNA analysis. Microfluidic systems have been make use of in the field of assisted reproductive technologies (ART) to support with sperm classification[1], oocyte manipulation[2], insemination[3], embryo culturing[4], and for evaluate sperm and embryo quality. [5] Microfluidics is expected to help to improve the efficiency of sample preparation, enable consistency in cell/embryo culturing and operation environments, and reduce human error.

Microfluidic sperm sorters are used to isolate morphologically normal human spermatozoa with high motility and with no debris. This isolation is based on fluid dynamics in a microenvironment or nanoenvironment, relying on variables such as fluid density, viscosity, velocity, and size/geometry of the environment. [6]Microfluidics have been widely applied to biomedical fields, because the control of fluid transport is useful for cell analysis systems, drug delivery systems, assisted reproductive technologies, and in numerous biological applications specifically for the miniaturization and simplification of laboratory techniques.[7] Selection of the sperm is based on the two gravity-driven laminar flows within the central microfluidic channel. The semen and the medium dispensed into inlet A and B, respectively, flow parallel to each other and exit through their respective outlets (A/D and B/C). Spermatozoa are sorted depending on their ability to swim across these two streams. Only motile spermatozoa swim toward outlet C whereas immotile spermatozoa keep flowing to outlet D.[8] Hence, this method does not allow spermatozoa to undergo added physical stress from sources such as a centrifuge and thus minimize DNA damage.

The objective of the present study is to increase the ICSI success rate in both normal and oligozoospermic patients using the micro fluidic sperm sorting device. Since this method of sorting does not require centrifugation, recovery of sperm with normal morphology and without DNA fragmentation will be possible.

Materials

The semen samples were collected from 25 patients who visited sumathi fertility center at Madurai for semen analysis in the year 2019. The subjects were explained about the study and a written consent was obtained from them. The semen analysis was carried out as per WHO guidelines. The subjects were split into two groups- normospermia patients (n=21) and oligoasthenospermia patients (n=4) patients

Method

I. Preparation:

- Allow semen sample to liquefy after ejaculation.
- Sperm wash medium kept incubator at 37 degree Celsius before starting the procedure.
- Dilute liquefied semen with sperm washing medium at the ratio of 1:1
- Fix the microfluid sperm sorting device in a 60mm dish

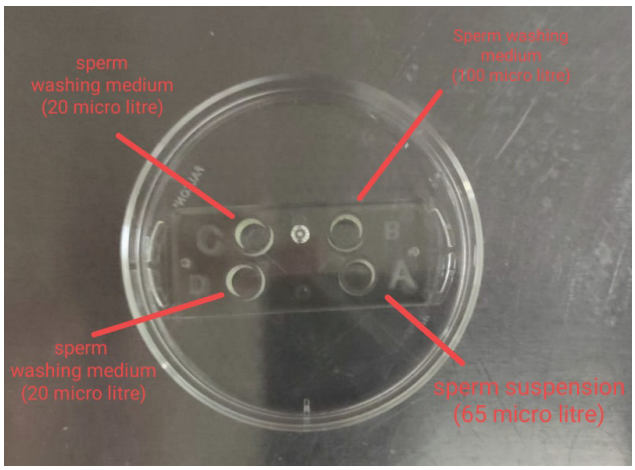

Fig 1: Qualis sperm sorter device

II. Procedure:

Microfluidic sperm sorters Qualis (Fig 1) allow the effective recovery of sorted motile sperm without DNA damage compared with the centrifugation and swim-up procedure.

- Load 100ml sperm washing medium into chamber A, B, C and D to create streamlines in the micro fluidic chambers.
- The Medium was pulling out from all the chambers.
- Load 20ml sperm washing media into chamber C and D respectively and load 100ml into chamber B
- Load 65ml sperm suspension into chamber A
- Adjust the amount of sperm washing medium in chamber B until the width of laminar flow from Chamber A reach 40% of the overall width of the micro channel.
- Allow device to stand for 30 minutes under laminar flow and extract completely isolated sperms from Chamber C.

Statistical Analysis:

Table 1: Sperm Concentration in Normospermia

Normospermia	Impression	N	Mean	SD	P-Value
Sperm Concentration	Positive	14	36.4	19.3	.032 Sig
	Negative	7	19.3	3.5	

In our study the average Sperm Concentration positive and Negative was 36.4 million and 19.3 million respectively. The difference was statistically significant with p value of 0.032 ($p<0.05$)

Table 2: Sperm Motility in Normospermia

Normospermia	Impression	N	Mean	SD	P-Value
Motility	Positive	14	37.1	12.2	.006 Sig
	Negative	7	22.1	4.9	

In our study the percentage motility positive and negative was 37.1% and 22.1% respectively. The difference was statistically significant with p value of 0.006 ($p<0.05$)

Table 3 Sperm Concentration in Oligoasthenospermia

Oligoasthen-ospermia	Impression	N	Mean	SD	P-Value
Sperm Concentration	Positive	3	1.3	.58	.004 Sig
	Negative	1	12.0		

In our study the average Sperm Concentration positive and Negative was 1.3 million and 12.0 million respectively. The difference was statistically significant with p value of 0.004 ($p<0.05$)

Table 4 Sperm Motility in Oligoasthenospermia

Oligoasthenospermia	Impression	N	Mean	SD	P-Value
Motility	Positive	3	4.3	1.2	.050 Sig
	Negative	1	10.0	.	

In our study the percentage Motility positive and Negative was 4.3% and 10% respectively. The difference was statistically significant with p value of 0.050 ($p<0.05$)

Discussion

In swim up method and density gradient method undergo multiple centrifugation leads to ROS Production from leukocytes and immotile sperms can have negative impact on fertilizing capacity[9] and producing adverse consequences during the post implantation development of embryo[10] so, best choice to avoid ROS generation, micro fluidic device (Sperm sorter Qualis;Menicon, Kasugai, japan) used for ICSI to acquire high motile and good morphology sperms are more capable of fertilizing an oocyte and increase pregnancy rate during the process of ART.

DNA integrity plays an important role in fertilization. Repeated centrifugation protocol used in sperm preparation technique leads to DNA fragmentation that can affect the viable pregnancy and normal embryonic development [11] to minimize DNA damage micro fluidic sperm sorter device used for both normal and oligoasthenospermia patients which increases ICSI success rates because it doesn't require centrifugation.[10] Based on the ability of motile sperm to cross streamlines in a laminar fluid stream, the device isolates motile sperm from non-motile sperm and other cellular debris,.[12] Separation of DNA from epithelial (victim) and sperm (perpetrator) cells requires in the field of Forensic for DNA analysis of sexual assault evidence . As a result the separation of sperm from a biological mixture containing epithelial cells has been demonstrated on a microfluidic device. [13]

Preference of the best spermatozoa and deletion of damaged spermatozoa are critical for successful IVF and ICSI in infertility clinics. The most widespread Method for the isolation of motile spermatozoa are density gradient separation and swim-up Method. Therefore, MFSS (Microfluidic Sperm Sorting) is the most commonly used device for sorting highly motile spermatozoa with less DNA integrity damage without subjecting sperms to undergo repeated centrifugation.

Conclusion

Based on statistical analysis, Microfluid sperm sorter device can be used efficiently and reliably not only for normal patients but also for oligoasthenospermia patients considered as alternative approach in ART to improve ICSI success rate.

Abstract

Reactive oxygen species (ROS) were once considered to be deleterious agents, contributing to a vast range of pathologies. Both their damaging and beneficial effects are initiated when they target distinct molecules and consequently begin functioning as part of complex signal-transduction pathways. The recognition of ROS as signaling mediators has driven a wealth of research into their roles in both normal and pathophysiological states. The present review assesses the outline of current perspectives on redox-signaling mechanisms.

Keywords: *Reactive oxygen species,oxidative stress, nitric oxide.*

Introduction

Reactive oxygen species (ROS), generated through a variety of extracellular and intracellular actions, are novel signal mediators which are involved in growth, differentiation, progression, and death of the cell[(1)]. ROS comprise free radicals such as superoxide anion radical, hydroxyl radical, and singlet oxygen, as well as non radical species such as hydrogen peroxide formed by the partial reduction of oxygen. Oxygen free radicals are highly reactive and have the capacity to damage cellular components such as proteins, lipids, and nucleic acids. ROS were released by neutrophils and macrophages for destructing exogenous pathogens and regarded as host defending molecule. However, accumulated evidence indicates that ROS play a central role as second messenger and stimulate various signaling molecules[(2)]

ROS are capable of damaging cell membranes and a wide variety of biomolecules. The direct role of oxygen radicals in microbial killing is well established[(3)]. Free radicals are important in the activation of nuclear factor kappa-B cells (NF*k*B), a factor in the important transcription of a number of genes of IL-2, TNF-α and IL-2 receptor and MHC class I genes. Free radicals have been implicated in IL-1 induced osteoclastic bone resorption[(4)]. Free radicals damage may account not only for the production of altered IgG but also for many autoantibodies, their production not depending on a polyclonal activation of B cells but on the sensitivity of individual molecules to different radical generating systems. ROS can also modify aminoacids such as methionine, histidine, cysteine, proline and lysine, which cause alterations in the protein structure, conformation and antigenicity. Fragmentation of proteins by ROS can also cause crosslinking and aggregation of proteins and proteins are more susceptible to proteolysis[(5)].

Sources of ROS: ROS are generated in numerous cellular compartments and by multiple enzymes within the cell[(1)]. Mitochondria generate oxygen during oxidative phosphorylation. During this process, the flow of electrons processed through the components of respiratory chain .

Nitric oxide (NO) is an inorganic, gaseous free radical· Identified as the "endothelium relaxing factor" (EDRF), with its role in regulating blood pressure, the molecule now has several other functions. NO is a potent vasodilator *in vitro,* thus contributing to the cardinal signs of inflammation, heat, redness and swelling. Other cellular sources of NO include macrophages, neutrophils, T-lymphocytes, chondrocytes and synoviocytes[6]. NO, a pleiotropic mediator of inflammation plays an important role in the vascular and cellular components of inflammatory responses. NO and its derivatives are microbicidal and thus NO is also a mediator of host defense against infection[7].

In order to combat these deleterious effects of oxidant, cells are endowed with an antioxidant defence system, consisting of variety of enzymatic and non-enzymatic antioxidants thereby protecting cellular macromolecules such as proteins, lipids, and DNA from oxidative damage.

Antioxidants are compounds that dispose, scavenge and supress the formation of free radicals or oppose their actions. Antioxidant defence system is very dynamic and responsive to any disturbance taking place in redox balance of the body[8].

Antioxidants can be regulated to neutralize free radicals formation that could take place due to oxidative stress. In normal cells, there is a steady balance between oxidative damage and antioxidative protection. The shift in balance between oxidants and antioxidants in favour of the oxidants is "OXIDATIVE STRESS". This conspectus is intended to provide a critical up to date summary of the field with particular emphasis on the evidence for oxidative damage and compromised antioxidant status in periodontal diseases[9].

Natural human antioxidant defenses are not always sufficient to maintain the proper ROS balance. Also, a normal process can become pathological when it persists long term. The mechanisms of senescence involve a contribution from free radicals, leading to the proposition more than fifty years ago that the aging process results partly from oxidative damage. The primary defense systems against oxidative threat such as CAT, SOD, glutathione peroxidase and glutathione-s-transferase decomposed $O_2^{\bullet -}$ and H_2O_2 before interacting to form the more reactive hydroxyl radical. The cooperative interaction between these antioxidants in plasma is crucial for maximum suppression of oxidative stress[10]. The secondary defense consisted of ascorbic acid, α-tocopherol, ceruloplasmin, and reduced GSH which scavenged residual free radicals escaping decomposition by the antioxidant enzymes.

They dispose, scavenge, and suppress formation of free radicals or oppose their actions. Several biologically important compounds have been reported to have antioxidant functions[11]. These compounds have low activation energy to donate hydrogen atom and therefore, cannot initiate the second free radicals. The free radical electrons are stable and thus, slow down the oxidation. Cells contain many antioxidant systems to prevent injury. It is essential for cell's life to Prevent excessive ROS production and repair of cellular damage. The balance between oxidation and antioxidation is critical in maintaining healthy biological systems. The human antioxidative defense system including superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), glutathione (GSH) facilitates the elimination of excess ROS. In addition to endogenous antioxidant defense systems, exogenous originating reducing compounds such as vitamin C, vitamin E, carotenoids, and polyphenols are also required[12]. SOD were the first ROS-metabolizing enzymes discovered. SOD isoenzymes, Mn-SOD, present in mitochondria, and the cytosolic dimeric Cu/Zn-SOD. Catalase function by catalyzing the dismutation of hydrogen peroxide to water and molecular oxygen. Catalase also has functions in detoxifying different substrates as well as having an antioxidative role. GPx can catalyze the reduction of H_2O_2 and also reduce other peroxides to alcohol. GSH functions mainly as a sulfhydryl buffer but also serves to detoxify compounds . Vitamin E suppresses the generation of lipid peroxidation and together with vitamin C it inhibits hydroperoxide formation. It is also capable of scavenging free radicals, as is vitamin A. Vitamin E and carotenoids quench singlet oxygen and as such contribute to the first defense line against oxidative stress. Polyphenolic compounds, such as flavonoids are recognized as potent antioxidants due to their ability to scavenge free radicals by single-electron transfer[13]

Redox-signaling is achieved when the oxidants produced modulate a signal-transduction pathway. These ROS must then trigger the oxidation-induced modification of specific target molecules. Some ROS are superior signaling molecules to others.H_2O_2 is an excellent signaling molecule, as it is highly ubiquitous, can diffuse easily and is relatively stable allowing it time to encounter specific targets. It is perhaps for these

reasons that H_2O_2 is the prevailing intracellular redox-signaling molecule. Hydroxyl is an inadequate signaling molecule due to its high oxidation rate constant, which leads to highly nonspecific oxidation. Peroxyl and alkoxyl possess aggressive reactivity and lack enzymatic removal resulting in the outcome of their reactions being mainly irreversible oxidation events, ultimately leading to damage. Singlet oxygen rarely occurs intracellularly and so it is doubtful that it contributes to signal transduction. In contrast, HOCl has been suggested to function as a signaling mediator in immune cells[14]

Mechanism of ROS signaling:

Signalling pathways invoking ROS: In many ways, ROS are ideally suited to be signalling molecules: they are small, and can diffuse short distances; there are several mechanisms for their production, some of which are rapid and controllable; and there are numerous mechanisms for their rapid removal. Work based on the release of ROS by cells which do not have a role in phagocytosis, and where ROS have no obvious function, along with work on host defence systems in plants has led to the conclusion that ROS are key signalling molecules, although, to date, their exact mode of action still needs to be elucidated. Many studies have indicated a role for ROS in the induction or inhibition of cell proliferation, in both activation and inhibition of apoptosis, and, at higher concentrations, in the induction of necrosis. Some of the biochemical effects of ROS on cells will be discussed below Several signal transduction pathways lead to changes in gene expression, while others might lead to the modulation of enzyme activities[14]

ROS and NFκB (nuclear factor kappa-light-chain-enhancer of activated B cells) signaling pathway: The transcription factor NF-*κ*B is crucial in a series of cellular processes, including immune, inflammatory response, cellular adhesion, differentiation, proliferation, autophagy, senescence, and apoptosis[15]. ROS influence the activation of NF-*κ*B pathway mainly by inhibiting the phosphorylation of I*κ*B*α (*inhibitor of kappa B*α)* . Meanwhile, NF-*κ*B pathway also can influence the ROS levels by increasing expression of antioxidant proteins such as Cu-Zn-SOD(copper zinc super oxide dismutase), Mn-SOD(manganese superoxide dismutase), GPx (glutathione peroxidase), GST (Glutathione-s-transferase).[16]

The mitogen-activated protein kinase (MAPK) cascades: The mitogen-activated protein kinase (MAPK) cascades, consisting of the extracellular signal-related kinases (ERK1/2), the c-Jun N-terminal kinases (JNK), the p38 kinase (p38), and the big MAP kinase 1 (BMK1/ERK5) pathway, are major intracellular signal transduction pathways, that play an important role in various cellular processes such as cell growth, differentiation, development, cell cycle, survival, and cell death. Similarly, ERK, JNK, p38, and BMK1 are all serine/threonine kinases that are directed by a proline residue[17]

ROS and Protein Kinases: Recently, it is becoming increasingly apparent that, like physiological second messengers in signal transduction, ROS function in various cellular processes via oxidating sulfhydryl (SH) groups of cysteine residues in protein kinases including protein kinase A (PKA), protein kinase C (PKC), protein kinase D (PKD), receptor tyrosine kinase (RTK), and Ca/calmodulin independent protein kinase II (CaMKII) and then activated protein kinases phosphorylate their target proteins which are involved in different cellular signaling mechanisms.[18]

Conclusion

It has been clearly demonstrated that redox equilibrium plays pivotal roles in cells' physiological and pathological events due to ROS's ability to activate or deactivate a variety of receptors, proteins, ions, and other signaling molecules. When the redox equilibrium is disturbed due to the excessive accumulation or depletion of ROS, many cellular signaling pathways are influenced which confers to the cellular dysfunction and subsequently the development of various pathologies. Therefore, unveiling the mechanisms of ROS regulating redox-associated signaling pathways is essential in providing relevant targets in order to develop innovative and effective therapeutic strategies.

Abstract

Adipocytokines are mainly adipocyte-derived cytokines regulating metabolism and are key regulators of insulin resistance. Visfatin is a newly discovered adipocyte hormone with a direct relationship type 2 diabetes mellitus. Visfatin/NAMPT (nicotinamide phosphoribosyltransferase) is a protein with diverse functions. Although the first discovery of this molecule as a pre-B-cell colony-enhancing factor suggested primarily a cytokine function, its rediscovery as the key enzyme in nicotinamide adenine dinucleotide generation has considerably widened its potential biological activities. Its broad spectrum of effects is being regarded as a potential approach to prevent and treat various pathological conditions.

Keywords: *Adipose tissue, adipokines, quinolinc acid, insulin resistance.*

Introduction

Adipose tissue, an active endocrine organ and a main energy reserve of the body. The main role of white adipose tissue (WAT) is triglycerides storage during energy consumption and fatty acid release over periods of starvation[(1)] Adipose tissue has emerged as an important endocrine organ producing a variety of secreted factors including of bioactive polypeptides, i.e., adipokines[(2)]. Adipokines act centrally to regulate appetite and energy expenditure, and peripherally affect insulin sensitivity, oxidative capacity, and lipid uptake. In recent years, the number of adipokines has expanded rapidly and these include adiponectin, resistin, visfatin, apelin, retinol binding protein-4, serum amyloid A, plasminogen activator inhibitor-1, angiotensinogen, vaspin, omentin, chemerin and zinc-alpha2-glycoprotein. Several of these mediators are predominantly synthesized by adipose tissue and called adipocytokines. Recently, the adipocytokine family has been extended by a novel member—visfatin is named so because it is derived from the word "VISceral FAT". Though it is preferentially produced in the visceral adipose tissue it can be expressed in the isolated subcutaneous adipose tissue as well[(3)]

History: Visfatin was identified first as Pre B cell Colony Enhancing Factor (PBEF), to be secreted by human peripheral blood lymphocytes. It acts like an enzyme (Nicotinamide phosphoribosyl transferase) NAMPT, which is involved in NAD+ salvage pathway. Recently, PBEF was identified by Fukuhara et al, as visfatin a novel adipokine-a protein mediator secreted by visceral fat cells[(4)]. Analysis of the amino acid sequence of visfatin revealed it to be identical with PBEF/ NAMPT. Three different biological names with three

different functions for a single protein (as amino acid sequence is same for these three proteins) have made it, unique and biologically indispensable; hence the names are used interchangeably[5].

NAMPT displays hematopoietic, immunomodulatory, pro-inflammatory, pro-angiogenic, pro-chemotactic, and anti-apoptotic activities. In its extracellular form, it is also known as an adipokine visfatin, which demonstrates hormone-like insulin-mimicking properties[6 & 7].

Functions:

As a Immunomodulator: Visfatin can be considered a new proinflammatory adipocytokine. It upregulates the production of the pro-and anti-in-flammatory cytokine. These cytokines play a substantial role in a wide range of infectious and inflammatory diseases[8]. High circulating visfatin levels have been observed in rheumatoid arthritis and acute lung injury . Significantly higher visfatin mRNA expression was found in inflamed inflammatory bowel disease[9]. There are several reports demonstrating enhanced tissue expression of visfatin in inflammatory conditions including clinical sepsis[10], and severe generalized psoriasis. Macrophages have been suggested as a significant source of this protein in addition to adipose cells, as visfatin/PBEF/Nampt; positive macrophages have been identified in adipose tissue and in the submucosa of the colonic wall. It has several immunity functions that are secreted by neutrophils in response to inflammatory stimuli and upregulates the production of cytokines such as various interleukins, and tumor necrosis factor alpha in human monocytes. This mediator was found to be present in a variety of cell types, including macrophages, lymphocytes, peripheral blood monocytes, and dendritic cells. An increase in the levels of proinflammatory cytokines in the periodontal tissues can induce visfatin production. Visfatin levels are strongly correlated with amount of visceral fat in humans which is positively correlated with obesity[11].

Mimics Insulin: In 2005, visfatin, a new protein with potential insulin-mimetic action was discovered Fukuhara *et al* [4]. There are controversies regarding the association of visfatin with overweight/obesity, type 2 diabetes mellitus, insulin resistance (IR), Chang et al[5], suggested that the use of visfatin may be promising for predicting obesity, diabetes status, insulin resistance. Insulin secreted from B-cells of pancreas into circulation, binds to the insulin receptors of insulin sensitive targets, leading to internal signaling etc. The binding affinity of visfatin/PBEF/NAMPT to the IR (insulin receptor) was found to be similar compared with that of insulin. Many studies have demonstrated an increased levels of visfatin in diabetes mellitus. Whether visfatin binds to insulin receptors and exerts its insulin mimetic activity is still a controversy, but recent research has shown that visfatin helps in regulation of glucose homeostasis[4].

Visfatin as an Anti Apoptotic Molecule: Recent reports have provided evidence that visfatin may mitigate cell injury by affecting the inflammatory response and apoptosis. Visfatin significantly reduces the cell apoptosis induced by palmitate and improves cell viability and protects against H_2O_2-induced apoptotic damage in H9c2 cardiomyocytes. Visfatin has recently been described as an adipokine with potentially important effects on apoptosis. Visfatin protects macrophages from endoplasmic reticulum stress-induced apoptosis . Visfatin also exerts anti-apoptotic effects in liver cells through enzymatic synthesis of nicotinamide adenine dinucleotide[12]

PBEF/NAMPT/Visfatin as an Enzyme: It is involved in the salvage pathway of NAD+. NAD+ synthesis in mammals occurs by one of two principle pathways. It can be synthesized from the *de novo* pathway or from one of the three salvage pathways. *De novo* synthesis begins with tryptophan, which undergoes several reactions to form quinolinic acid, which is converted to NAD+ .The three salvage pathways are a) nicotinic acid pathway, b) nicotinamide pathway, nicotinamide is salvaged by Nampt/PBEF to be activity of key regulators of cellular longevity; (c) nicotinamide ribose pathway. To replenish the decreased stores of NAD+ the salvage pathways are must, specially the nicotinamide pathway, which involves the Nampt enzyme. visfatin/Nampt acts like an enzyme helping in the production of NAD+. NAD+ is an essential cofactor in a number of fundamental intracellular processes like (a) Transfer of electrons during redox reactions; (b) To modulate Visfatin is now regarded as an extracellular nicotinamide phosphoribosyltransferase (eNampt) enzyme and it seems to play an important role in insulin secretion from pancreatic β cell by systemic NAD biosynthesis[13 & 14].

Conclusion

Since evidence of a direct link between visfatin genotype and human type 2 diabetes mellitus is still

weak, more molecular, physiological and clinical studies are needed to determine the role of visfatin in the etiology and pathogenesis of type 2 diabetes mellitus. Visfatin/NAMPT effects on cytokine and chemokine secretion, macrophage survival, leukocyte recruitment make this adipokine an active factor in the development and progression of pathogenesis. Further research is required to fully understand the mechanisms mediating the cellular actions of visfatin to characterize the factors regulating visfatin/Nampt expression and release in all these pathologic scenarios.

Influences of Sweetened Medication and Dental Caries: A Review

Alagarsamy Venkatesh[1], Dhakshinamoorthy Malarvizhi[2], Newbegin Selvakumar Gold Pearlin Mary[3], Ramachandran Tamilselvi[4]

[1]Professor, [2]Professor, [3]Reader, [4]Reader, Department of Conservative Dentistry & Endodontics, Sree Balaji Dental College & Hospital, Bharath Institute of Higher Education and Research, Narayanapuram, Pallikaranai, Chennai, TamilNadu, India

Abstract

Due to the aversive taste of medications, there is said to be a struggle in making the child consume it. The ease of administration of liquid suspensions makes it accepted by parents & children for oral administration. Because of the aversive taste of medications, cariogenic sugars such as sucrose is said to be added as a flavoring agent to mask the unpleasant taste. This sucrose in the medication is said to cause dental caries. The dental professionals have the opportunity to provide advice regarding the importance of diet & the role of sugars in caries formation. The dentist should be familiarized with alternatives to sugar & the type of food products that are available to substitute with sweetening agents.

Keywords: *Cariogenic bacteria, sweetening agents, sucrose, risk factors.*

Introduction

Due to the aversive taste of medications, there is said to be a struggle in making the child consume it. The ease of administration of liquid suspensions makes it accepted by parents & children for oral administration. Because of the aversive taste of medications, cariogenic sugars such as sucrose is said to be added as a flavoring agent to mask the unpleasant taste.[1] This sucrose in the medication is said to cause dental caries. The dental professionals have the opportunity to provide advice regarding the importance of diet & the role of sugars in caries formation. The dentist should be familiarized with alternatives to sugar & the type of food products that are available to substitute with sweetening agents.[2] The most common oral disease in childhood is "dental caries[3]".

Dental caries is of multifactorial etiology where there is an interplay of 3 factors: the host {saliva & teeth}, the micro flora {plaque}, & the substrate {diet}. Miller in 1890 described dental caries in his chemo parasitic theory.[4] Dental caries occurs due to the dissolution of teeth which is caused by the acid produced by oral bacteria in the presence of dietary carbohydrates. The main organism involved in caries formation includes: mutans Streptococci & lactobacilli.[5]

Sucrose the Archcriminal: Caries occurs mainly when sucrose {cariogenic sugar} is metabolized by or bacteria particularly streptococcus mutans into weak organic acids, which causes a fall in Ph below the critical value [5.5] leading to demineralization {loss of minerals}[6,7]. Remineralization occurs {redeposition of minerals} the pH of the plaque rises. Major destruction occurs if the mineral loss is greater than redeposition of the minerals. An imbalance between the tooth structure & oral environment is related to dental caries, where the 3 factors play an important role in disease initiation and pregression.[8]

Purpose of Sugars in Medications: Sugars include all monosaccharide's & disaccharides which includes glucose, fructose, sucrose, maltose, & lactose.[9] Purpose of sucrose in medications is to act as a preservative, anti-

oxidant, solvent & thickening agent. It has a pleasantly sweetish taste which encourages the children to accept the medicine. It is of low-cost & non hygroscopic.[10]other ingredients are also combined with sucrose to make it more pleasant to taste and increase its acceptance by the children. "Sucrose is the most commonly used sweetener in pediatric pharmaceutical preparation & is most cariogenic of sugars"[11, 12].

Substitutes of Sugar [Classification]:

1. **Caloric/Nutritive Sweetners:** These sweeteners provide flavor & bulk when added to food. It also maintains the freshness & contributes to product quality. These are further classified into:

   a. **Polyols/Sugar Alcohols:** They are derivatives of sugars in which the reactive aldehyde/keto group is reduced to hydroxyl group.

      Examples:

      - Xylitol
      - Sorbitol

   b. **Hydrogenated Starch Hydrolysate:** they are derived from starch by partial hydrolysis and subsequent hydrogenation.

      Examples:

      - Lycasin
      - Palatinit

   c. Coupling Sugars: They include monosaccharide, glucosylsucrose, malyosylsucrose and oligosaccharides which are obtained by enzymatic treatment of starch.

      Examples:

      - Sorbose
      - Palatinose

2. **Non Caloric/Non Nutritive Sugars:** They contain 0 calories but provide sweet taste. These are all chemically processed. They are:

   A. Cyclamate

   B. Saccharin

   C. Aspartame

   D. Sucralose

   E. Neotame

3. **Based on Origin:**

   A. **Natural:** Monellin, licorice, dihydrochalcone, miraculin.

   B. **Artificial:** Aspartame, saccharin, cyclamate, sucralose[13].

Sugar Alcohols/Polyols: These sugars are not fully absorbed from the gastrointestinal tract & are less available for energy metabolism[14] . They are considered non-cariogenic because they are weakly fermented by oral bacteria[15]. Park et al. compared polyols with sucrose/fructose and said there is significantly less acid formation in interproximal plaque than fermentable carbohydrates. These provide bulk & calories similar to sucrose.

Adverse Effecs: When these are taken in excess, it causes abdominal discomfort, flatulence, softened stools & diarrhea.

Xylitol: It was derived from the "GERMAN WORD XYLIT BY PROFESSOR EMIL HERMAN, FISCHER & HIS ASSISTANT RUDOLF STABEL IN 1890". Xylitol is said to have an insulin independent metabolism[16]. The sweetness of xylitol is similar to sucrose.

Properties: It is a flavor enhancer of tablets/syrups. It helps in masking the unpleasant taste of some active ingredients in pharmaceutical formulation[17].

Sorbitol: Most commonly used sugar alcohol. It has a sweetness of about 60-70% that of sucrose. Though Streptococcus.mutans has the enzyme to degrade sorbitol, they have slower fermentation process and very little drop in pH of dental plaque when compared with sucrose.

Available: In the form of chewable tablets {due to its pleasant taste and cooling effect}. Also used in liquid preparations-as a sugar free formulation[17].

Artificial sweeteners such as saccharin, cyclamate, aspartame and sucralose are all high intensity sweeteners-because they sweeten the medication with little volume, however they offer no energy[18].

Aspartame: It is said to be 160-220 times sweeter than sucrose and glycemic[14] response is limited. It can be used for children with autosomal recessive phenylketonuria as it is a source of phenylalanine[19].

Available: In the form of chewable tablets and liquid considerations

Saccharin: Due to its sweetening power it is used in hypo caloricfood. It is said to have 200-500times more sweetness when compared with sucrose. It is non-cariogenic[14, 18, 20]and non caloric. Cross sensitivity reactions occurs in children with sulfonamide allergy[21].

Sucralose: It is non caloric, has no nutritive value, and is non cariogenic. Sweetness is said to be 600times sweeter than sucrose. It is synthesized by the reaction of sucrose with theonyl chloride.

Lycasin: It consists of a mixture of sorbitol, malitol and hydrogenated dextrins[16]. It is a hydrogenated starch hydrolysate

Palatinit: It is an equimolar mixture of disaccharide alcohol. It is said to have the characteristics similar to sorbitol[16].

Sorbose: L-SORBOSE is an isomer of D-fructose. It is a reducing agent. Streptococcus .mutans is unable to form intercellular polysaccharides in the presence of sorbose.

Palatinose [Isomaltulose]: This is produced by the enzymatic conversion of sucrose from a glucosyl[1,2] fructoside to a glucosyl[1,6] fructoside. Palatinose and other isomers are said to be not utilized by oral bacteria.

Difficulties in the Substitution of Sucrose: The amount of sweetness in different sugars are said to be varied. That is if the sweetness of sucrose is 1, and lactose is 0.2. Whereas the sweetness of saccharin is about 300. When alternative sweeteners are used instead of conventional sucrose, there is a change in the recipe. So if sucrose is replaced by another new sweetener,the new product differs from sucrose not only in sweetness, but also in other properties[2.]

Acceptance of Sugar and Sugar Substitutes by Public: Saccharin can be substituted for taste of sugar. Lactose/sorbitolor water for weight or bulk of the sugar. Xylitol can be substituted for both taste and bulk. The substitute of sugars should have taste similar to sucrose so that it is accepted by the public.

Cariogenic Potential of Pediatric Medications: Sometimes children are required to take medication on a daily basis for long periods of time. So chronically ill children are exposed to a greater sugar load from the oral medications than healthy children leading to increased risk of developing caries.[22,23,24]

So What Can be Done to Save Your Tooth from Decay?: There must be a need to focus on prevention of dental caries during pediatric child visits by education and motivating parents about the importance of oral hygiene practices and awareness on sugar-containing medicines and suggest alternative options. Oral hygiene must be insisted for all children taking sweetened medication after each dose of medication-as a primary step for minimizing the risk of dental caries[23, 10, and 25]. Patients are encouraged to take medicines at mealtime only. It is avoided at bed time, due to decreased oral clearance [salivary secretion] at night. Whenever possible, the use of non-cariogenic substances in medicines should be suggested.

Conclusion

It can be concluded that sweeteners used in medications have the potential to increase the risk of dental caries in susceptible individuals. So whenever possible the use of non-cariogenic substances in medicine or the use of sugar free medicines should be advised.

Management of Midline Diastema by Direct Composite Resin Using Putty Index: A Case Report

Tamizharasan Sangavi[1], Arunajetasan Subbiya[2], Nagarajan Geethapriya[3], Venkatachalam Prakash[4]

[1]First Year PG Student, [2]Professor and Head of the Department, [3]Reader, [4]Professor, Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Narayanapuram, Pallikaranai,Chennai-600100, Tamilnadu, India

Abstract

Maxillary anterior spacing is one of the most common aesthetic issues .It is atechnical challenge for clinicians. Treatment is mainly for esthetic and psychological reasons, Numerous materials are available for diastema closure. Case should be carefully analyzed with proper history for etiological factors and best possible treatment plan. This case report highlights an esthetic closing of a gap spacing between maxillay central incisor teeth with direct composite using putty impression to provide an acceptable esthetic outcome.

Keywords: *Midline diastema, Etiology, Analysis, Composite resin.*

Introduction

H. J. Keene described midline diastema as anterior midline spacing greater than 0.5 mm between the proximal surfaces of adjacent teeth[1]. Etiological factors are numerous listed in literature [2] which includes:

1. **Tooth Material Discrepancy:**
   - Microdontia
   - Macrodontia
   - Missing laterals
   - Peg laterals
   - Extracted teeth

A clinical examination revealed a wide space between maxillary central incisors.his past dental history revealed removal of mesiodens followed by closure of midline diastema with composite.The patient did not prefer orthodontic managment due to prolonged treatment time and cost concern. The treatment planis to provide an esthetically favorable relation between the maxillary anterior teeth by closing the diastema using composite resin.

A study model was fabricated (Figure 2) to measure the actual length between the top of the papilla and incisal edge of the central incisor. The mock up study model was prepared (Figure 3). The analysis of the length and the width of the upper central incisors demonstrated an unfavorable proportion after the closure with composite resin but, the patient was satisfied with the result of the study model. Therefore, direct composite Resin was decided as restorative material. Putty impression was made from the mock up study model (Figure 4) .This procedure helps the clinician to build up the composite using it as guide. 37% phosphoric acid used to etch the tooth surface for 15 seconds followed by rinsing application of an adhesive, the palatal portion of tooth was built up with a dentin shade using putty index as a guide incremental build up was done followed by light curing of each layer. The final layering was done with selected vita shade A2 followed by finishing and sequential polishing (Figure 5).

Discussion

Highly aesthetic restorations made of composite resins are now possible due to constant improvements in techniques, materials, and technology**.**Orthodontic closing diastema is indicated for all type of diastema. It is a very conservative option but it is time-consuming and financially demanding. Freehand direct resin composites provide an esthetic and conservative approach for closing diastema. Composite resin is a single-visit procedures does not require laboratory work [3,4]. Composite resins has a overall survival rate higher than 88% up to10 years [5].On the other hand, the major causes of failure are chipping and color mismatch, which can many times be solved by repairing andpolishing[5,6,7].Among the different diastema closure techniques, the most typical one relies on creating a wax-up restoration, in order to simulate the diastema closure, and building a silicone index to guide the final composite resin restoration [8]. This technique is extremely usefulbecause it makes it easy to reproduce the previously created anatomyof the teeth by the wax up. In the present technique, the principles of the golden proportion was taken into consideration when performing the wax mock up in the study model, previous to the restoration procedure, It hasbeen suggested as a possible mathematical approach for developmentofan ideal size and shape for maxillary teeth[9].Success of a restorative treatment in anterior teeth depends on the esthetic integration between soft and hard tissues[10].

Figure 1: Preoperative

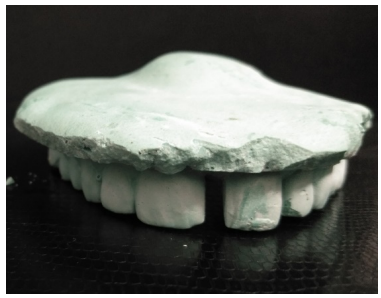

Figure 2: Study Model

Figure 3: Wax Mockup

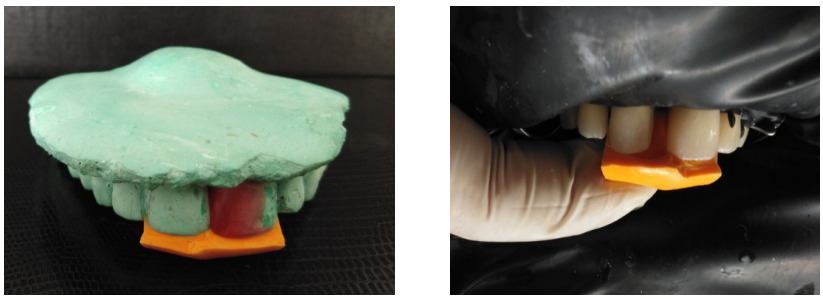

Figure 4: Fabrication of Putty Index

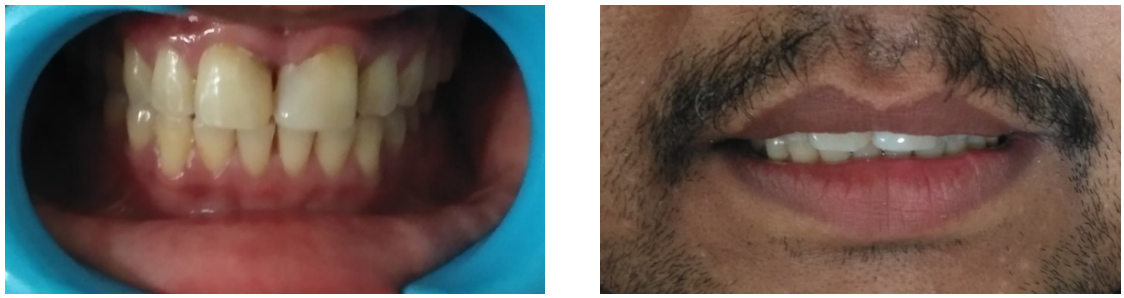

Figure 5: Postoperative

Conclusion

The management of diastema is really an esthetic challenge. Many treatment options are used such as orthodontic treatment, composite restoration, veneers, and crowns. Their indications are related to the case selection such as width of diastema, occlusion, patient motivation and practitioner skills.

Diastema Closure using Porcelain Veneers: A Case Report

Bharadwaj B.[1], Nagarajan Geethapriya[2], Paramasivam Vivekanandhan[3], Arunajetasan Subbiya[4]

[1]I Yr. Post Graduate, [2]Reader, [3]Professor, [4]Professor & Head, Department of Conservative Dentistry & Endodontics, Sree Balaji Dental College & Hospital, Bharat Institute of Higher Education & Research, Narayanapuram, Pallikaranai, Chennai–600100, Tamil Nadu, India

Abstract

Veneer is a layer of tooth colored material that is applied to a tooth to restore a localized or generalized defect and intrinsic discoloration. This case report describes closure of midline diastema using porcelain laminate veneers. Advances in the bonding between porcelain and tooth structure make this treatment a fantastic alternative to restore teeth with alteration in shape and position; severe discoloration and in cases where the aesthetic demand is high. The rationale for various choices in this treatment protocol is detailed with reference to the pertinent literature. Thus the clinical success depends on identification of cases, type of tooth preparation design, impression and bonding technique.

Keywords: *Veneer, Diastema Closure, Lithium Di-silicate, Resin Coating Technique.*

Introduction

Veneers were invented by California dentist Charles Pincus in 1928 to be used for a film shoot for temporarily changing the appearance of actor's teeth. Later, in 1937 he fabricated acrylic veneers to be retained by denture adhesive, which were only cemented temporarily because there was very little adhesion[1]. The introduction of etching in 1959 by Dr. Michael Buonocore aimed to follow a line of investigation of bonding porcelain veneers to etched enamel[2]. In 1982 Simonsen and Calamia revealed that porcelain could be etched with hydrofluoric acid, and bond strengths could be achieved between composite resins and porcelain that were predicted to be able to hold porcelain veneers on to the surface of a tooth permanently[3]. Since 1983 veneers were considered as one of the most viable treatment modality due to its strength, longevity, conservative nature, biocompatibility, and aesthetics[4]. Veneers are indicated in the following cases: a) Discoloured teeth due to many factors such as tetracycline staining, fluorosis, amelogenesis imprefecta, age etc. b) Restoring fractured and worn teeth c) Abnormal tooth morphology d) Correction of minor malposition e) Intraoral repair of fractured crown and bridge facings[5]. Contraindications for dental veneers include : a) Patients with parafunctional habits such as bruxism b) Edge to edge relation c) Poor oral hygiene d) Insufficient enamel e) Crowded or malaligned teeth[6]. With the thicknesses of veneers ranging from 0.2 to 0.5 mm, ceramic laminate is absolutely capable of reproducing natural teeth with great color stability[7]. It also offers biocompatibility with the periodontal and dental substrates and it may be used with minimal wear or even without preparation[8]. Thus the clinical success that the technique has found can be attributed to great attention to detail in a set of procedures, including planning the case, with the correct indication; conservative preparation of the teeth; proper selection of ceramics to use; proper selection of the materials and Method of cementation; and proper planning for the ongoing maintenance of these restorations[9]. Therefore the aim of the report was to re-establish the aesthetics by closure of midline diastema through porcelain veneers.

Case Report: A 32-year-old patient reported to the hospital complaining spacing between upper front teeth.

Following the clinical and radiographic evaluations, presence of midline diastema in the maxillary central incisors was found (figure 1). After discussion of all possible treatment modalities with the patient, the decision was made to prepare the maxillary central incisors for lithium disilicate porcelain veneers to re-establish the aesthetics of his smile. A wax up model (figure 2) was done before initiation of preparation and analysed. Shade selection was done prior to tooth preparation under day light (figure 3). The selected shade was B2.

Tooth preparation for veneers should be uniform and restricted entirely to the enamel. This goal was achieved in the present clinical case by means of calibrated spherical diamond burs at the cervical region and burs with a depth-limiting device on the facial surface of the tooth. The remaining facial enamel was reduced to the level of these grooves using a tapered-cylinder, round-end diamond bur (figure 4). For the proximal area, finish line was placed slightly supragingivally in order to facilitate the definition of the proximal margin, the impression procedure and the positioning of the veneers. A feather edged incisal modification was done as there was minimal overjet. Finally all angles were rounded, and an extrafine, tapered-cylinder, round-end diamond, abrasive disks and felt disks were used to smooth the prepared surface.

Two stage Putty wash technique was followed (figure 5). Two retraction cordsof different diameters were placed in the gingival sulcus and a complete impression with a double-viscosity polyvinyl siloxane material was made after removal of the second cord. The first retraction cord was also removed, and the desired color for the porcelain veneer was selected using a special scale. This is an important step in determining the final results, requiring effective communication between the practitioner and the technician. Finally, provisional restorations were made with a bis-acryl resin. The maxillary and mandibular casts were sent to the dental technician for pouring, creation of dies and fabrication of Lithium disilicate porcelain veneers.

After receiving the veneers from the laboratory, they were carefully tried in to verify marginal fit, position and alignment, shape and color for complete satisfactory results. The conditioning of internal surfaces of the restorations was performed through application of 9.5% hydrofluoric acid for 20 seconds and washing under running water for 1 minute and air-drying. A silane coupling agent was applied. After isolation, prepared teeth were etched with 37% phosphoric acid for 30 seconds, rinsed and careful dried. Next step, a one-bottle bonding agent was applied using an applicator tip and the surface was gently air-dried and polymerized for 40 seconds. The veneers were luted using dual cure resin individually over the prepared tooth after completion of the etching and bonding procedures. Resin was applied on inner surface of the veneers and the veneers were positioned. After polymerization for 5 seconds, excess cement was carefully removed using a brush. The veneers were once more light cured on facial as well as palatal aspect for 40 seconds (figure 6).

Discussion

The cosmetic improvement of the smile is possible with both direct and indirect techniques the latter procedures might require more than one appointment but are preferred when multiple teeth are involved in the treatment plan and when accurate tooth reshaping or color matching is needed[10]. Previsualization of the final esthetic result is extremely useful both for the clinician and for the patient: in this way, desires and preferences related to the new smile are tested before carrying out irreversible teeth preparations[11]. The preparation should terminate in enamel for better bonding of veneers[12]. Although few previous studies may suggest very minimal or no preparations current studies believe in removal of varying amount of tooth structure[13]. Zarone et al found out incisal overlap with chamfer finish line had more survival probability than window preparation whereas other studies conducted by Schmidt et al, Castelnuovo et al and Lin et al concluded that incisal butt joint preparation aided in increasing the survival probability of veneers than that of incisal overlap with chamfer finish line[14,15,16,17]. In our case we had to give a feather edged incisal preparation as there was only a minimal overjet and a chamfer finish line. Study conducted by Caselnuovo et al concluded that incisal butt joint preparation and feather edged incisal modification showed highest survival of veneers[16]. Bonding of veneers to dentin and patients with bruxism were two major factors that affected the survival of porcelain veneers[17]. In cases of dentin exposition, sealing this structure with a dental bonding agent is suggested immediately after the completion of tooth preparation and before the final impression itself because the newly prepared dentin is ideal for the adhesion. This technique is called as the resin-coating technique[18]. It consists of interposing a layer of low viscosity resin

between the dental substrate and the luting cement. This procedure seems to produce an increase in the union strength and a reduction of crack formation, bacteria infiltrations, and postoperative sensitivity, as it allows for acid conditioning of the enamel while avoiding the conditioning of the dentin and allowing better control of the conditioning of the enamel[19,20]. The survival period for veneers is usually 10-15 years. Studies conducted by Magne et al and Chen et al showed 100% survival of veneers at the end of of 4.5 years and 2.5 years respectively[10,21]. A study conducted by Brier et al concluded that survival probability of Porcelain veneers was 94% in 5 years, 93% in 10 years and 82% in 20 years[22]. Similarly a 21 year follow up study conducted by Layton and Walton showed veneer survival rate of 96% at the end of 10 years and 91% at the end of 20 years[12]. Thus successful anterior restorations can be achieved using a detailed treatment plan considering both the aesthetic and the functional parameters.

Conclusion

Characteristic properties of ceramics indicate that they are materials capable of mimicking human enamel and their mechanical properties are widely expanding their day to day clinical applications. This clinical report describe that the laminate veneers can be used as an excellent option for effective and conservative aesthetic treatment. Therefore it can be concluded that the clinical success of laminate veneers depends on both the suitable indications of the patient, diagnosis and treatment planning, the correct application of the materials and techniques available for that, in accordance with the necessity and goals of the aesthetic treatment.

Green Dentistry an Innovative Approach: A Review

Nagarajan Geethapriya[1], Arunajetasan Subbiya[2], Balasubramanian Anuradha[3], Ramu Shobhana[4]

[1]Reader, [2]Professor and Head, [3]Reader, [4]First Year Postgraduate Student, Department of Conservative Dentistry & Endodontics, Sree Balaji Dental College & Hospital, Bharath Institute of Higher Education & Research, Narayanapuram, Pallikaranai, Chennai, Tamilnadu, India

Abstract

Green dentistry or eco-friendly dentistry, emerging as a new concept towards sustainability. Dentistry has a great impact on the environment due to the large amount of waste generated by various dental procedures along with excessive use of water and electricity, which emphasizes to move towards 'Green dentistry'. Hence, conserves money and time with the innovation of latest techniques and procedures and inculcating it in our daily practice. Eco-friendly dentistry if adopted will safeguard the environment and the human race from the harmful risks of rapid urbanization in developing countries. Thus, there is a need to emphasize the practice of eco-friendly dentistry in a developing country like India, with an approach to conserve resources and curb environment pollution.

Keywords: *Ecofriendly dentistry, Environment friendly, Green dentistry, Innovative dentistry.*

Introduction

Presently dentistry, which generates a significant amount of waste on a regular basis, has adopted the concept of "Going Green" so as to make it environment-friendly. Materials that have a minimum effect or cause no harm to the environment are known or defined as eco-friendly or environment friendly [1].

The green colour indicates healing and is understood to be the most restful and relaxing colour. Renewal, growth, and hope are related to this colour and indicates safety in the advertising of drugs and medical products[2]. Green Dentistry combines dental practices and environmental conservation.

Though individual dentists generate only small amounts of environmentally "unfriendly waste," the accumulated waste generated by the profession may have an environmental impact [3]. It is an emerging concept in dentistry. It is an approach, by which there is reduced impact by dental practices on the environment and is moving more towards an ecologically sustainable health care system [4].

The key concept of this practice is to conserve water and energy, use of non-toxic products, reduction of waste, and eradication of hazardous toxins that has negative impact on patients and the environment and to promote 'green' products.

In 2008, Eco-friendly Dental Association (EDA) was co-founded by Dr. Fred Pockrass and his wife Ina Pockrass. EDA provides Education, standards and connection to dentists who have Incorporated green dentistry in their daily practice. EDA promotes to help dentists Come up with ideas for safe and reusable alternatives that will lower dentists operating cost by replacing paper with digital media wherever possible. Thus, aims in reducing waste and pollution and to save energy, water, and money. Hence, it mainly involves the concept of "4R" -Reduce, Reuse, Recycle, and Rethink[5]. According to a 2007 article by the Canadian Dental Association, environmental-friendly dentistry attempts to reduce the detrimental impact of industries on environment and promotes awareness and sustainability to patients[6].

Components of Green Dentistry:

It Includes Four Categories:

1. Reducing dental waste
2. Pollution prevention
3. Conservation of water, energy, and money
4. Hi-tech dentistry.

Reducing Dental Waste: A large number of biomedical waste products are produced in dental clinics, such as blood-soaked materials, syringes etc. Waste should be properly disposed using colour coded bins. The four procedures which can contribute to pollution are[7]:

1. Removal dental amalgam restorations.
2. Conventional radiographs.
3. Infection control protocols including disposable barriers, sterilization items and toxic disinfectants.
4. Conventional vacuum saliva ejectors.

Dental amalgam is used as a restorative material for more than 150 years. It includes 50% mercury with silver, tin and lead and other minerals that has various negative effects on the environment. Mercury is converted by the bacteria in water or soil into methyl mercury, a potent neurotoxin that has a serious impact on the brain, kidney and lung damage in humans [8]. Therefore, various Method to dispose of the mercury has been proposed which as follows [9]:

i. Usage of alternates like GIC, composite.
ii. Use of amalgam separator in clinics.
iii. Recycling waste amalgam.

Conventional dental radiographs are commonly used in dental offices and institutions. This method involves two significant environmental hazards: silver and lead. The source for Silver is unused fixer and unused films and for lead, it is lead foil in film packet and lead apron/ shield.

The various forms of waste generated as a result of X-ray processing in the dental offices are as follows[10]:

1. X-Ray equipment.
2. Undiluted developer.
3. X-Ray film: lead and silver.
4. Used fixer contains silver.
5. Developer systems cleaner containing chromium.

Ways for preventing X-Ray waste pollution are[7]:

1. Use of digital imaging.
2. Usage of non-chromium developer cleaners.
3. Collect waste lead.
4. Filter used fixer.

According to the updated colour coding for Biomedical Waste Management–2016, waste should be disposed in following suitable colour bags[11]:

1. **Yellow:** Use of non–chlorinated plastic bags or containers.
   - Involves Soiled waste such as cotton, gauze, mask, head cap, gutta percha, dental cement, human anatomical waste (teeth).
   - Expired or discarded medicines.
2. **Red:** Use of non-chlorinated plastic bags or containers.
   - Involves plastic items such as rubber dam sheet, gloves, suction tips, syringe, apron, X-ray film, X-ray cover, x-ray lead foil, syringe (plastic portion +hub)
3. **White:** Use of puncture-proof, leak-proof containers.
   - Involves sharps
   - BP blade, wires, broken burs, matrix bands, damaged crowns, needles.
4. **Blue:** Use of cardboard boxes with blue coloured markings.
   - Involves glass items
   - LA bottles, glass bottles, ampules, broken glass slab, broken motor/pestle.

Saves water, energy and money: Conservation extends the life of our dental equipments and in addition enables us to save money. We should make sure that when we leave our working place we should check and look for those blinking lights from electrical equipment[12]. It can include computers, intraoral cameras, television, or lights left on when no one is in the office. By turning off these items, we can conserve a lot of energy.

Use of LED operatory lights reduces electricity consumption by 70% thus, eliminates the need for

expensive halogen bulbs. Currently, a new waterless vacuum system has been developed, which save about 360 gallons of water per day[9,10]. If every dental office installs one of these waterless systems, there will be energy conservation as many as nine billion gallons of clean, drinkable water a year [3,6]. This is how we can come up with new ideas to promote green dentistry. 50%-60% dentists use reusable drinking cups and metal suction tips. Usage of these should be promoted as this can be sterilized and are eco-friendly[13].

Hi-tech Dentistry: High-tech alterations play an important role in helping dental professionals in deduction and resource conservation. Digital technologies offer premature diagnosis, preventive therapies, and education that aim to serve the needs of the patients and seeking to avoid unnecessary or expensive procedures [14].

Here are some high-tech innovations that are part of dentistry's green future[15]:

1. Digital imaging system
2. CAD/CAM systems
3. In-office sharps disposal equipment that renders sharps inert
4. Steam sterilizers that eliminate the use of chemicals
5. Digital patient charting, scheduling, and billing
6. Digital paperless patient communication system such as E-mail appointments, reminders, and saving staff time
7. Using diode lasers instead of packing cords
8. Using website to promote and like a primary marketing tool
9. Switch to electronic patient record format
10. Use of oil-free compressors.

Green Dentistry–Wellness-based: Every branch of medicine is moving towards wellness-based concept that is based on prevention, early detection with less invasive treatment procedures.

Followings are wellness-based modalities that are part of dentistry's green future[15].

1. Early detection of caries by using laser diagnostic tools
2. Oral cancer diagnostics tool, like VELscope technology for early detection
3. Salivary testing to identify the pathogenic bacteria
4. Use of Laser treatment for periodontal disease
5. Aromatherapy which helps the patients to relax naturally
6. Homeopathic treatment can reduce swelling and bruising for the patients after dental procedures without drug interaction
7. Hand or foot massage to relax patients
8. Placing live green plants in the operatory area to increase oxygenation
9. HEPA type air purifier or UV germicidal in-operatory air purifiers can be used to remove particulates from air
10. Nutrient coenzyme like CoQ10 antioxidant can be used for general well-being of health.

Conclusion

Green dentistry is an emerging field which has promising benefits in the field of dentistry. Hence, there is need for creating awareness among dental professionals and budding dental students regarding eco-friendly dental practice through formal and continuing dental education. Further steps should be taken to encourage new innovations to take green dentistry to next level. Practicing green dentistry can reduce supply costs and Ultimately patients get benefitted reduction in treatment costs. Thus, let us take our first step towards eco-friendly dental practice.

Salivary Secretory Proteins- Unveiling Genetic Polymorphism and Diseases

Usha Subbiah[1], Harini Venkata Subbiah[2], Athira Ajith[2], Sonaa Elango[3]

[1]Associate Professor and Head, [2]Research Assistant, Human Genetics Laboratory, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Chennai, Tamil Nadu, India, [3]Professor, Department of Life Science, School of Natural Sciences, University of Suwon, Wau-ri, Bongdam-eup, Hwaseong-si, Gyeonggi-do, Republic of Korea

Abstract

Saliva, the "mirror of the body," is an ideal non-invasive source of complex genetic information. The complexity of the salivary peptidome is mainly due to the high number of genetic polymorphisms. This review shows an association between the genetic polymorphisms of salivary secretory proteins and the endangerment of several diseases. Different secretory protein single nucleotide polymorphisms whose genetic positions are related to oral and other diseases are listed from SNPedia deposits and tracked using a variety of techniques. Besides being circulating salivary biomarkers, single nucleotide polymorphisms of salivary secretory proteins acts as a possible genetic susceptibility factor and aids in the early detection and prevention of various oral and systemic diseases including cancer and rare syndromes in a quick and non-invasive manner. This would pave the way for the development of array-based technologies using saliva sample for genetic analysis.

Keywords: *Single nucleotide polymorphism, Saliva, Secretary proteins, Oral diseases*

Introduction

Saliva, a mirror to health seems to be attractive over the others fluids due to its non-encroaching nature, lower economic cost and greater clinical safety[1]. Human saliva is a rich reservoir of proteins and peptides and contains a complex mixture of the secretions from the salivary glands. Proteins present in saliva include mucins, amylases, defensins, cystatins, histatins, proline-rich proteins, statherin, lysozyme, lactoferrin and immunoglobulins. Major families of secreted salivary proteins are polymorphic, and undergo post-translational modifications before secretion such as phosphorylation, glycosylation and proteolytic cleavages [2].

Single Nucleotide Polymorphism analysis in salivary secretory proteins: Single nucleotide polymorphisms (SNPs), have adverse effect on the structure and function of salivary secretions to several diseases.

β-defensin 1 polymorphism: DEFB 1 variant was associated with caries susceptibility in children born with cleft lip and/or palate (CL/P)[3]. DEFB1 harbors potentially important polymorphic variants associated either with an increased expression of variant allele marker rs11362 (G-20A) or with decreased expression of variant allele marker rs179946 (G-52A) that are clinical markers for caries risk in humans [4].

Cystatin polymorphism: Cystatins occurring in salivary glandular secretion belong to the "secretory type 2" cystatins and the five genes encoding for cystatins were CST1,2, 3, 4, and 5, respectively. CST1 gene encodes for cystatin SN, CST2 gene comprises

e-mail: ushat75@yahoo.com

two alleles cystatins SA1and SA2. The CST3 gene for cystatins C, CST4 gene was represented by four alleles, encoding for unphosphorylated cystatin S and three phosphorylated isomers S1, S2, and SAIII andcystatin D for CST5 gene[5].

Histatin Polymorphism: Allelic variation Arg22 was replaced by Gln22 in Histatin (HIS2) encoding for histatin 32 in subjects of African descent. This homozygous mutation led to the loss of the proteolytic cleavage site after Arg22 without apparent pathological consequences[6].

Lactoferrin Polymorphism: Lactoferrin exon 2 Lys/Arg polymorphism was associated with susceptibility to dental caries in Brazil[7]. The two lactoferrin variants (Lys/Arg at position 29 in exon 1) were functionally different and contributed to the pathogenesis of localized juvenile periodontitis[8].

Proline-rich proteins polymorphism: Genetically determined polymorphism in acidic proline-rich proteins of caries in saliva encoded at two loci, PRH1 and PRH2. The PRH1 locus (Db, Pa, and Pif) and the PRH2 (Pr1 and Pr2) allelic polymorphism in African Americans are involved in protecting them from caries when compared with Caucasians[9]. The genes encoding the basic PRPs (PRB1 through PRB4) lie together with the acidic PRPs (PRH1 and PRH2) as a cluster and PRB alleles are in linkage disequilibrium with Db and involved in reducing caries[10].

Genetic Diseases associated with salivary secretions: Salivary secretary proteins cause local and systemic disorders and interrupt the complex balanced functions thereby led to mucosal and tooth damages and local or systemic malfunctions[11].

Burning Mouth Syndrome: The pathogenesis of burning mouth syndrome was due to genetic polymorphisms (C/T) interleukin-1beta but another study identified that there were no significant differences in the genotypes of IL-1β and MUC7 genes[12,13].

Kostmann Syndrome: Kostmann syndrome had reduced concentrations of α-defensins HNP 1-3 with deficient LL-37, that was associated with maturation arrest in myelopoiesis [14] and this deficiency led to the recurrent oral infections associated with this disease [15].

Metabolic Syndrome: The increased salivary AMY1 gene copy number was positively associated with lower body mass index and obesity risk with low levels of salivary amylase production and high amounts of starch intake, thus providing a genetic link between efficiency of starch digestion and low BMI with risk for developing the metabolic syndrome[16].

Papillon–Lefevre Syndrome: Papillon–Lefevre syndrome patients lack serine protease activity that is necessary for LL-37. Its deficiency activates cathepsin C and protease 3 in severe periodontitis[17].

Sjögren's Syndrome: Sjögren's syndrome with diminished salivary gland function led to subsequent loss of the antibacterial properties of saliva and accelerate the infection, tooth decay and periodontal disease[18]. The majority of under expressed proteins found in the whole saliva from primary sjögren's syndrome patients were carbonic anhydrase VI, cystatins, lysozyme C, calgranulin A, prolactin-inducible protein and von Ebner gland protein[19].

Periodontitis and other Oral Diseases: Salivary α-defensin was higher in patients with oral lichen planus, Behçets disease and recurrent aphthous stomatitis[20]. Periodontal pathogens induced the upregulated expression of β-defensin in oral keratinocytes [21]. Lower amounts of PRP-1, PRP-3, histatins and statherin in caries-susceptible group increased the susceptibility to dental caries [22]. The saliva of patients with oral lichen planus, leukoplakia and glossitis associated with iron deficiency were significantly increased in α-defensin 1[23] and increased transferrin levels[24].

Discussion

Saliva has a tremendous medical and scientific value. The salivary secretions and their polymorphism in the gene for various salivary secreted proteins that are associated with a protective effect against various diseases have been discussed. From this review, it is very well understood that saliva can be used as a diagnostic medium for the mass screening of genetic polymorphism in a large population. In addition, the advancement of salivary diagnostic tools is of paramount importance, especially in identifying high-risk group of different diseases and disorders.

The most important factor in selecting saliva as a diagnostic tool is that it also contains the fallen cells in oral cavity which allow saliva to be the first option to test and identify potential biomarkers in different diseases, including pre-malignant patients and patients with prior

cancer history. With an alarming increase in genetic variants in population, the non invasive fluid should be an ideal sample to explore various polymorphisms of secretory proteins and susceptibility to disease carriage by populations. The library of potential salivary proteins in combination with genetic polymorphisms, provides opportunity to test the models that involve multiple pathways driving to the pathogenesis of the disease in clinical diagnostics.

Esthetic Correction of Anteriors: A Case Report

Loganathan Saatwika[1], Venkatachalam Prakash[2], Balasubramaniam Anuradha[3], Arunajetasan Subbiya[4]

[1]I Yr Post Graduate, [2]Professor, [3]Reader, [4]Professor and Head, Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Narayanapuram, Pallikaranai, Chennai-600100, Tamilnadu, India

Abstract

The common aesthetic complaint of patients is the presence of anterior spacing.It has a multifactorial etiology such as labial frenulum, microdontia, mesiodens, peg-shaped lateral incisors, agenesis, cysts, habits such as finger sucking, tongue thrusting, or lip sucking, dental malformations, genetics, proclinations, dental-skeletal discrepancies, and imperfect coalescence of interdental septum. Based on time, physical, psychological, and economical limitations treatment is planned. Direct composite resins give immediate esthetic changes in diastema cases. In this case report anterior spacing was closed with direct composite resin restoration in a single appointment and the patient was recalled after 6 months.

Keywords: *Esthetic, spacing, composite, anteriors.*

Introduction

Diastema or spacing between the maxillary anteriors is a common aesthetic complaint of patients[1]. It hinders the harmony of patients smile. Midline diastema was described by Keene as an anterior midline spacing greater than 0.5 mm between the proximal surfaces of adjacent teeth[2]. Midline diastema is more prevelant in maxila than in mandible[3]. The midline diastema has a multifactorial etiology. Habits such as thumb sucking, tongue thrusting, or lip sucking, dental-skeletal discrepancies, malformations, maxillary incisor proclination and imperfect coalescence of the interdental septum should also be considered in addition to the labial frenulum, microdontia, mesiodens, peg-shaped lateral incisors, lateral incisor agenesis, cysts in the midline region[4,5]. The width to length ratio of the central incisors determines the treatment plan. Amount of distal proximal reduction, the placement of convextites and concavities to create deception,the decision for full-veneers or the interproximal addition are decided based upon the width–length ratio[6]. The restorative approach is the simplest, fastest, most predictable solution among the various options for diastema closure such as orthodontics, restorative dentistry, and prosthodontics. Direct composite resins in diastema closure cases allow dentist to satisfy the patient immediately[7]. To fulfill their patients aesthetic demands improved materials and techniques are often introduced leading professionals to endless improvement[8]. Recent aesthetic composite resin materials have an appearance like natural dentin and enamel and possess similar physical and mechanical properties[9]. There are wide range of shades of varying opacities for layering technique was designed recently[10].This case report describes direct aesthetic midline diastema closure with composite layering technique.

Case Report: A 32-year-old male patient reported to the department of Conservative dentistry and Endodontics with the chief complaint of spacing in his upper front tooth region. Patient's medical history did not reveal any systemic diseases and on intraoral examination midline spacing was seen between maxillary central incisors due to high frenal attachment. In both clinical and radiographical examinations there

was no dental caries. The patient refused for frenectomy and so a more conservative, economical, aesthetic, and quicker option, direct composite restoration build-ups for both maxillary central incisors were considered.

On shade selection A1 shade of Vita guide was considered to restore the diastema in order to simulate a natural look and were used together as layers. No preparations were performed before the restoration procedure. All maxillary incisors were isolated with rubber damand the adjacent central incisor was covered with Teflon band while the other was restored. 37% phosphoric acid was applied on the mesial surface to be restored for 15 seconds, rinsed for 20 seconds, and dried with air slightly. Then a single bottle bonding agent was applied and polymerized for 20 seconds with a LED light generator. Light cure composite are added in 1 to 2mm increments and each increments is cured for 20 seconds. Labial surfaces of the restorations were smoothed by using a knife-edge tip diamond bur. Polishing discs were used for detailed polishing from rough to fine grains by using a low speed handpiece. (Figure-1)

The patient was given oral hygiene instruction and informed for recalls. At the 6-month recall the restorations were just polished using polishing discs. At one-year recall there was no sensitivities,discolorations, or fractures detected.

Discussion

The direct composite resin restorationsdont require preliminary models or wax-ups, laboratory fees that intensify prices,however they are often placed during single visit. In terms of aesthetic odontology, these restorations provide various advantages in contrast to other treatment options such as ceramic veneers and orthodontic treatment. They are compatible with the opposing dentition compared to ceramic materials[11]. Unforeseen fracture can be treated easily using direct composite restoration compared to expensive and tedious repairs for porcelain alternatives[12]. Compared to some indirect restorations there are also some disadvantages of direct composite resin restorations such that it has less fracturaltoughness,compressivestrengthandaren'tsuited to ultra-high-stress areas found in clinical situations[13]. Presence of parafunctional habits like bruxism,nail biting, Class III end-to-end occlusal schemes, can potentially hinder the longevity of direct composite resin restorations[14,15].Although glazed ceramics have better color stability than direct composite resin restorations with the quality of finishing and polishing procedures the esthetic harmony is established[16,17]. Despite of these disadvantages of direct composite resin restorations with the developing adhesive techniques and better quality resin materials provide dentists the possibility to create more conservative, functional, aesthetic, economic, and long lasting restorations also in a very short chair time [18,19].Common method for this kind of cases is to create a wax up restoration and silicon matrix to guide the final composite restoration[19].In this case report, diastema closure was done by building up the mesial surfaces of central incisors one by one. The teeth were isolated with rubber dam and teflon band were used to cover the central incisor adjacent to the one to be restored. Teflon band is used to create close contact and perfect isolation preventing the adherance of resin based restoration materials. This type of isolation helped us to create two separate restorations having contacts points as naturally without creating a dark triangle .The teeth were restored one by one by layering technique[10].In this technique, dentist can decide the position of the midline and the location of the contact area to simulate a natural outlook. Experience of the dentist is very important in order to create a correct midline as well as a natural smile design. Indirect ceramic restoration is another treatment option for these cases that is prepared in a laboratory and attached to previously prepared area of tooth. The disadvantage of this technique compared to direct technique is that it needs atleast two appointment. According to technician, the restorations by using ceramic fragments simulate natural esthetics and is more functional[9].Recent studies showed direct composite resin restorations if done by using appropriate techniques are more functional, stable, aesthetical, and cheaper[19].In case of fractures it can be repaired easily which is another important advantage of direct composite resin restorations. In this case report, direct composite resin restorations were decided as the treatment method because the patient had a very limited time.

PRE & POST OPERATIVE

Figure 1: Preoperative and Postoperative Midline Diastema Closure

Conclusion

The general outlook of the maxillary anterior teeth was considered natural and aesthetical at six month and one year interval. Although one-year follow-up is not sufficient, restoration problems such as marginal leakage, discolorations, fractures on the restoration margins and debonding of composite resins did not occur. By taking this into consideration, direct composite resin restorations can satisfy patients, with proper case selection and by using an appropriate technique.

Genetic Analysis in Pain Associated Deep Caries

Athira Ajith[1], Usha Subbiah[2], HariniVenkata Subbiah[3]

[1]Research Assistant, [2]Associate Professor and Head, [3]Research Assistant, Human Genetics Laboratory, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Chennai, Tamil Nadu, India

Abstract

The influence of genetic variation on gene expression appears to play a major role in the susceptibility of individuals to deep caries. Genotypic profile of an individual can manage disease treatment decisions and minimize adverse reactions. The type of inflammation in the tooth affected by a carious attack is determined by the permeability of dentin and the closeness of the carious lesion to the pulp. Generally*polymorphism*s in cytokines contribute to an individual's susceptibility in response to *deep carious* lesions. In this review, we discuss single nucleotide polymorphism and gene expression of pain receptor genes such as transient receptor protein channels, proteinase-activated receptor, voltage-gated sodium channels, and cyclooxygenase 2 that are involved in inflamed pulp and deep caries. We conclude that our review on genetic variations and expressions in pain associated deep caries could aid in better understanding of genes involved in dental pain management.

Keywords: *Polymorphism, gene expression, pulpitis, pain receptor channels.*

Introduction

All humans 99.9% of the genetic information is shared and 0.1% variation in it makes them unique. The most common genetic variation in humans is the single nucleotide variation or polymorphism. The genetic contribution in many diseases is involved in understanding the gene variation for the development of diseases. Single nucleotide polymorphism studies can help in navigating and targeting the precise molecular network and the genetic mutation that drive the disease. In cases of dental diseases, they are not inherited as a single gene defect instead they result from gene and environment interactions[1]. Identifying specific genetic markers and their genetic correlation of dental caries explain the reason behind the higher susceptibility to deep caries and pain in pulpitis. Dental pain or toothache is the pain in teeth or their supporting structures and which have an impact on daily activities. The most common types of dental pain are dentine hypersensitivity and pulpitis associated pain. If the cavities are not treated properly, deep carious lesions develop, and this leads to inflammation of the pulp[2]. The symptomatic pulpitis is accompanied by severe pain, thereby patients seek dental treatment. Approximately 35-55% of caries phenotypic variation in the permanent dentition is attributable to genes.There are many reports that the pattern of host inheritance leads to either increased susceptibility or resistance to dental caries[3].Twin studies provide evidence of partial genetic control in the etiology of caries. In monozygotic twins, the variables including the number of teeth present, percentage of teeth restored, surfaces restored, teeth affected by caries showed a considerable correlation but not in the case of dizygotic twins[4]. The amount of genetic variation with heritability varying from 20% to 80% in twins reported in the US, Brazil, and China depending on the disease-related variables.Molecules expressed in the cascade of tissue inflammation serve as biomarkers for the presence of inflammation in pain in deep caries.Single nucleotide polymorphism in cytokines, matrix metalloproteinases (MMPs), heat shock protein genes, contributes to the increased susceptibility to apical tissue destruction in

response to deep carious lesions. Cytokines are involved in caries, pulpal, and periapical tissue destruction associated with increased levels of inflammation. Single nucleotide polymorphism in a variety of cytokines including IL1B, IL6, IL10, TNFA, and TLR4can help in predicting the caries risk in individuals[5]. The genetic variation in pain receptor channels can lead to painful pulpitis and deep carious lesion. Pain receptor channels such as transient receptor protein channel (TRPs), voltage-gated sodium ion channels and pain receptors like protease-activated receptor 2(PAR-2) and COX genes play an important role in the transduction of pain in the inflamed dental pulp. The polymorphism and expression studies in these genes are discussed below.

Genetic Analysis in Pain Associated Deep Caries

Gene polymorphism and expression in TRP channels: Transient Receptor proteins are integral pore-forming membrane proteins that function as non-selective ion channels[6]. Seven TRP subfamilies are identified and among them the four members of the TRPV subfamily (TRPV1, TRPV2, TRPV3, TRPV4), four members of the TRPM subfamily (TRPM2, TRPM3, TRPM7, TRPM8), two members of the TRPC subfamily (TRPC1, TRPC6), and one member of the TRPA subfamily (TRPA1) have been found in dental tissues such as dental primary afferent neurons (DPAs) and odontoblasts. TRPV1 has a prominent role in pain sensation and is proven in knockout mice experiments[7]. Many single nucleotide polymorphisms (SNPs) with or without amino acid substitutions have been identified in the human TRPV gene, and this variation leads to altered human phenotypes. The activation of distinct agonists by the nonsynonymous SNPs will change the functional properties of the TRPV1 gene[8][9]. Nozomu et al. 2008 [10] compared the sequences of the TRPV 1 gene in Japanese adults sensitive to burning pain and capsaicin and showed low correlation between the two sensitivity subjects. Kim et al. 2004[11] studied caucasian females with TRPV1 Val allele in the vanilloid receptor subtype 1 gene and showed greater pain tolerance to experimental cold in varied ethnic populations. When dental primary afferent neurons were stimulated by increasing temperature (>43°C), TRP channels enhanced the intracellular Ca^{2+} concentrations and elicited the inward currents in afferent neurons [2].

Gene polymorphism and expression in sodium channels: Voltage-gated ion channels (VGICs) are transmembrane proteins that have an important role in electrical signaling processes in neurons and other excitable cells. Many experimental studies in animals and few human studies demonstrated that VGICs increased the pain by activating of pain pathways[22]. Mutation in genes like SCN4A, SCN5A, SCN9A, SCN10A encode voltage gated sodium channels Nav 1.4, Nav 1.5, Nav 1.7, Nav 1.8 isoforms are involved in painful neuropathy[23]. Davison suggested that the sodium channels were highly expressed in neural satellite cells butnot in odontogenic cells[24]. In an *in vitro* study, Allard et alfound that voltage-gated tetrodotoxin (TTX)-S developed an action potential and expressed odontoblasts [25]. Several studies supported the expression of NaV1.7, NaV1.8, and NaV1.9 in human dental pulp with irreversible pulpitis when compared to the dental pulp of non-painful teeth[26]. SCN9A, a strong contributor to human pain sensitivity showed polymorphism in SNP rs6746030, thereby altered pain sensitivity in osteoarthritis and spinal nerve root pain[27]. The novel heterozygous mutation Q10K in exon 2, *de novo* splicing mutation (IVS8-2A>G), variant (P610>T) and major allele splice junction variant (IVS24-7delGTTT) was identified in SCN9A gene in caucasian primary erythromelalgia population[28][29]. The SCNA genetic variants was associated with the risk of chronic OXAIPN in south Indian patients of Gastro intestinal tract cancer who are undergoing OXA based chemotherapy[16].

Single nucleotide polymorphism in Protease activated receptor: Protease-activated receptors (PAR) are present in periodontal tissues that are involved in inflammation and repair processes. PAR is a G-protein-coupled receptor with seven membrane domains that mediate cellular response to extracellular proteinases. The PAR-2 expression is significantly upregulated in chronic periodontics.*In vivo* studies have suggested the influence of PAR-2 in the initiation and development of chronic periodontics[30].Many cytokines and mediators including IL-6, IL-8, Il-1, IFN-γ, PGE2, and MMP-9 are produced by the stimulation of PAR-2 [31]. Single nucleotide polymorphism studies in PAR-2 and the SNPs rs1529505 and rs2242991 have a high risk of Knee Osteoarthritis [20]. Previous studies illustrated thatPAR-2 in tissue fibroblasts constitutively expresses minimal PAR-2 *in vivo*. But in another study spindle-shaped, vimentin-expressing dental pulp cells expressed PAR-2 in carious teeth *in vivo*, supporting the view that these are expected to be dental pulp fibroblast-like cells. The regulation of PAR-2 expression to the area of caries access suggests control over its expression *in vivo*[32].

Cyclooxygenase polymorphism and expression in deep caries: Cyclooxygenase (COX) is the enzyme that produces prostaglandins and its candidate genes COX 1 and 2 are involved in modulation of pain. COX-1 is expressed naturally and produces prostanoids in response to hormonal stimuli, and COX-2gets activated during inflammation and produces proinflammatoryprostanoids[33][34]. The conversion of arachidonic acid to prostaglandin H2 and different prostaglandin synthases convert PGH2 to PGE2, PGD2, PGF2alpha, PGI2, and TXA2. PGE2 showed a significant role in pain signaling[35]. COX-2genes polymorphism and its differential expression might develop inflammation and prevent the synthesis of prostaglandins 3 and 4 that sensitize pain fibers in acute dental caries condition[36].Polymorphism in the SNP regions of COX-2rs5277, rs5275, rs2383515, rs2206593 was associated between the severity of preoperative pain and the extent of acute postoperative pain in endodontic patients[17].In a case-control study and meta-analysis, the COX-2 association was not identified with an overall risk of chronic periodontics (CP) but in the north Indian population female-specific risk of CP was shown in rs20417-765GC genotype. In a meta-analysis study in the Chinese population, COX-2 polymorphism was correlated with a reduced risk of CP[18]. This review gives an overview of genetic analysis including gene polymorphism and expression in above discussed *pain associated receptors and* COX-2 *in* deep carious lesions. Future detailed studies in acquired and hereditary diseases related to dental pain could help to design drug targets for therapeutic intervention in dental pain treatment and management.

Conclusion

Identification of the genetic causes of an individual's response to treatment and progressing genotyping technologies impact the development of personalized medicine.The studies examining the dental pain atgeneticlevel provide a better-detailed representation of the gene expression that produces inflammatory changes in the dental pulp and we can use this information as the biological basis for studying acute dental pain. The genes associated with deep caries can be used as new targeting agents and as an adjunt therapy to inhibit pain in deep caries. The understanding of genetic polymorphism helps in determining the host susceptibility to pain in deep caries and promoting further varied treatment in endodontic therapy.

Nanotechnology and its Application in Re-mineralization of the Tooth: A Review of Literature

Sahithi Reddy[1], Alagarsamy Venkatesh[2], Nagarajan Geethapriya[3], Ramachandran Tamilselvi[3]

[1]Second Year PG Student, [2]Professor, [3]Reader, Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Narayanapuram, Pallikaranai,Chennai-600100, Tamilnadu, India

Abstract

There are two possible mechanisms for size influenced consequences of nanomaterials in preventive dentistry: one, interaction with bacterial attachment and biofilm establishment, two, the effect on de-and remineralization. As the process of demineralization begins at nanolevel, it is imperative to provide nanosized units for optimized remineralization. This is applicable for particle size-related interactions with bacteria and it's bacterial, as the nanoparticles are more effective than microparticles. Many preparations have been developed, many of them are in the experimental state, and a few are already available. Nanoparticles for major tooth repair may progress through various stages of technological development. Many naniparticles are made available which help in teeth repair and regeneration process. This article is a review on nanomaterials for remineralisation. Which are Nano hydroxy apetite, Nano calcium fluoride, Beta Tricalcium Phosphate, nano Bioglass, Nano CCP-ACP and nano Bioinert zirconia.

Keywords: *Remineralisation, Nanoparticles, Caries Prevention.*

Introduction

The primary cause of oral pain and tooth loss is dental caries, and ironically it is one of the most common preventable diseases which were recognized. It hinders the achievement and maintenance of oral health in all age groups[1]. Despite great improvements in the oral health of population oral disease still prevails[2]. If complete mechanical biofilm management is done every day on every part of the teeth, there will be no spread or new caries lesion formation. And also, added strategies and preparations for biofilm management and remineralization of incipient dental lesions are needed.

A large number of artificial materials and products are available accessible for oral healthcare and preventive dentistry. However, they are not as effective as is essential and are not biomimetic. Hence, additional strategies are required for prevention of demineralization and to improve remineralization. The application of nanotechnology and nanobiomaterials to overcome these challenges is seen to be effective. Nature has designed several biological systems, including structures of the oral cavity, within the nanometer range. Nanos, which means "dwarf," in greek and one nanometer (nm) = 0.000000001 meter. Dr. Nori Taniguchi, in 1974 defined as "the processing of separation, consolidation, and deformation of materials by one atom or one molecule"[3]. Properties of these materials are easy preparation and diversity in preparation techniques, large-scale manufacturing, batch-to-batch reproducibility, better stability in biological fluids and during storage and controlled release. The large surface area causes nanosystems to be more reactive and improved physical properties. The effects of nano-materials are governed by surface interactions and bioadhesion at the tooth surface are useful for caries prevention[4]. This applies for physiological as well as pathophysiological mechanisms

and processes taking place at the tooth biofilm saliva interface. Thereby, strategies mimicking nature at the nanolevel seem to be the most promising approaches as they try to avoid successfully unpredictable adverse effects potentially caused by artificial agents[5].

There are two possible mechanisms for size influenced consequences of nanomaterials in preventive dentistry: one, interaction with bacterial attachment and biofilm establishment, two, the effect on de-and remineralization. As the process of demineralization begins at nanolevel, it is imperative to provide nanosized units for optimized remineralization. This is applicable for particle size-related interactions with bacteria and its bacterial, as the nanoparticles are more effective than microparticles. Many preparations have been developed, many of them are in the experimental state, and a few are already available. Remineralization can be achieved by simultaneously supplying calcium, phosphate, and fluoride ions to the teeth in order to induce the formation of various apatites that remineralize and strengthen the tooth. Therefore, more investigations on the remineralizing potential of formulations based on nanotechnology are in progress. Nanomaterials might enhance the process of remineralization. One, they can fit to the nanoscopic defects, two, they can serve as carriers for remineralizing ions with high affinity to the pellicle. A supersaturation at the tooth surface or in the pellicle layer can be achieved, leading to a slow-release depot.[6]

Nanodental techniques for major tooth repair may evolve through several stages of technological development, using genetic engineering, tissue engineering and tissue regeneration, and later involving the growth of whole new teeth in vitro and their installation. Nanomaterials for remineralisation are Nano hydroxy apetite, Nano calcium fluoride, Beta Tricalcium Phosphate, nano Bioglass, Nano CCP-ACP and nano Bioinert zirconia

Nano Hydroxyapatite: Hydroxyapatite nanocrystals provide excellent biological properties such as biocompatibility, lack of toxicity, as well as lack of inflammatory and immunological responses. In early in vitro studies, the effects of nano-HA on enamel remineralization were evaluated in static models[7]. The studies reveal that nanosized hydroxyapatite has a potential to remineralize incipient caries lesions. It also promotes preferential mineral deposition in the outer layer of the initial caries lesion and had a limited capacity to reduce lesion depth or to increase the mineral content in the body of the lesion[8]. Interestingly, the remineralization effect strongly depends on the pH during application of the nanosized hydroxyapatite: under neutral conditions, the full remineralization effect is no achievable, while under acidic conditions (pH of 4.0) nanohydroxyapatite can significantly increase the depth of penetration and the extent of remineralization of artificial incipient caries lesions[8]. Even though various advantages are seen, hydroxyapatite is highly brittle and cannot be used for load-bearing areas. A varied range of techniques are developed to increase the mechanical toughness of this Hap. It is similar to the apatite crystal of tooth enamel in morphology and crystal structure. In vitro data show that n-HAP with a size of 20 nm fits correctly with the dimensions of the defects on the enamel surface. The n-HAP particles can strongly attach to the demineralized enamel surface and inhibit further acidic attack. It isobserved that biomimetic synthesis of enamel-like structures composed of n-HAP is a suitable approach to repair enamel microcavities. It has significantly higher bio-activity when compared to microHAps, as determined by an enhanced bone-bonding ability. The hydroxyapatite nanoparticles when added to a polymer matrix leads to increased mechanical strength. Addition of nHAp to chitosan scaffolds enhances the proliferation of bone marrow stem cells and an upregulation of several genes, together with myosins. nHAp showed nuclear localization along with enhanced osteocalcin production. nHAp-reinforced nanocomposites or surface coating increases mechanical stiffness and bioactivity of implants and can be used for dental restoration[9].

Nano Calcium Fluoride: Nano CaF_2 powder containing clusters of 1015 nm sized crystallite particles has been prepared from $Ca(OH)_2$ and NH4F solutions using a spray-drying technique displayed much higher solubility and reactivity than its macro-sized counterpart. The CaF2 nanoparticle (nano-CaF_2) has a 20-fold higher surface area compared with traditional CaF_2 thereby show increased fluoride release. Unfortunately, current dental materials with high fluoride release generally have poor mechanical properties [10]or release only a small amount of fluoride with low fluoride-recharge capability [11,12] . It can be tackled by designing dental composites with calcium fluoride (CaF2) nano-particles which shows high fluoride release but still maintains strength and wear resistance[13,14].

Nano calcium phosphate: Nanoparticles of

the more soluble calcium phosphate phases, such as monocalcium phosphate monohydrate (MCPM), dicalcium phosphate anhydrous (DCPA), tetracalcium phosphate (TTCP), and amorphous calcium phosphate (ACP), have been developed to release calcium (Ca) and phosphate (PO_4) ions, increasing the mineral content in the caries lesions [15]. These nanoparticles have better ion-release profiles than microparticles: a small particle can release Ca and PO_4 ions at higher concentrations[16].

Nanocomplexes of Casein Phosphopeptides Amorphous Calcium Phosphate: It is observed that the CPP attaches to the spontaneously forming ACP nanoclusters under alkaline conditions. It gives rise to a metastable colloid of nanocomplexes of CPP-ACP. Nanocomplexes of CPP-ACP provide a new effective remineralization method thus helps in the treatment of hypersensitivity. The mechanism of CPP-stabilized ACP is transforming itself into HAP crystal in the process of biomineralization of dental hard tissues[17].

Beta Tricalcium Phosphate: β-TCP acts as a bioactive source of mineralizing agents. f β-TCP is the functional form. The combination of f β-TCP and fluoride gives stronger, more acid-resistant minerals relative to fluoride, native β-TCP, or fβ-TCP alone. The nanomaterials of β-TCP can achieve more effective remineralizing results[17].

Bioglass: Bioactive glass was introduced by Hench et al. in 1960[18]. It is made of silicon dioxide (SiO 2), sodium oxide (Na 2 O), calcium oxide (CaO), and phosphorous pentoxide (P 2 O 5) in specific proportions. It favors the formation of hydroxycarbonate apatite/ hydroxyapatite layers on the surface. It has also bone bonding ability. BAG is brittle and has a low wear resistance. By reinforced bioglass with yttria-stabilized zirconia nanoparticles. The yttria-stabilized zirconia bioglass (1YSZ-2BG) coating showed significantly higher bonding strength compare to conventional one[19]. Nanoparticles of BAG is used for the treatment of hypersensitivity. E.g. NovaMin®

Bioinert Zirconia Nanoparticles: Zirconia (or zirconium dioxide) is a polycrystalline biocompatible ceramic. It has low reactivity, high wear resistance, and good optical properties. The properties of zirconia particles can be enhanced by reducing the grain size of zirconia to nano scale, by incorporation of nano sized yttria stabilized tetragonal zirconia, or by incorporating various nanoparticles like carbon nanotubes and silica nanoparticles[21]. Fabrication of Y-TZP nanocomposite by reinforcing with silica nanofiber showed significant increase in the flexural modulus (FM), fracture toughness, flexural strength, and energy at break (EAB) compared to Y-TZP.This nano filled zirconia particles promote bone bonding, mineralization, and dental tissue repair[22]

Conclusion

Time ahead, tooth repair by fabricating the nanorobots and introduction of a biologically mimicking whole-tooth replacement with both mineral and cellular components it is envisaged, that nanotechnology will have a great advantage in dental research and in improving the current treatment procedures, thereby providing to superior oral health care.

Designing Universal Primer for the Identification of Erythromycin and Tetracycline Resistance Genes in Oral Streptococci

Angeline Julius [1], UshaSubbiah[2], SonaaElango[3]

[1]Research Associate, [2]Associate Professor and Head, Human Genetics Laboratory, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Chennai, TamilNadu, India [3]Professor, Department of Life Science, School of Natural Sciences, University of Suwon, Wauri, Bongdam-eup, Hwaseong-si, Gyeonggi-do, Republic of Korea

Abstract

Oral streptococci being the early colonizers of oral biofilm have a high impact on the health status of an individual. The resistance of streptococci to erythromycin and tetracycline possess a global threat in oral health by harboring the *erm* and *tet* resistant genes which are proved to be correlated with each other. Considering the high prevalence of *erm* and *tet* resistance in oral streptococci, identification of universal primers for these genes are necessary to characterize these genes. Our work has put forth a heuristic approach in designing universal primers to detect genetically diverse *erm* and *tet* resistant genes in streptococci. The *erm* and *tet* primers were validated to be universal among the streptococci group. The universal primers designed for *erm* and *tet* generetrieved 100% and 72.7% of sequence similarity of streptococcus deposited in NCBI gene repository. Identification of universal primers for the successful amplification of *erm* and *tet* genes of streptococci for the first time will minimize the usage of multiple primers to isolate resistant streptococci for rapid detection of antibiotic-resistant genes.

Keywords: *Antibiotic resistance; Erythromycin; Streptococcus; Tetracycline;Universal primers.*

Introduction

The Oral microbiome is an important determinant that fills the gap between health and disease. Microbes in the oral cavity exist as a community where commensals, symbiotic organisms and pathogens live in the same space [(1)]. Bacteria adhere to form a complex biofilm, which uninterrupted results in dental caries. Dental caries has been reported with a high abundance of streptococcus[(2)], worsening its spread, mainly due to the flourishing of streptococci, that limit the growth of other bacterial species and species diversity. The oral cavity of healthy individuals was predominated with *S. sanguinis*, *S. parasanguinis, S. mitis*[(3)] while the virulent pathogen *S. milleri* resides as a part of normal flora[(4)]. Early colonizers *S. sanguinis* cause infective endocard itis due to dissemination through the bloodstream[(5)].

Among oral Streptococci, S. sanguinis, S. mutans, S. angionus, S. salaivaris, S. panodentisare more predominant.Streptococci have a main role in the emergence of resistant species by interchanging of genetic contents within other species of bacteria. Streptococci with resistance towards penicillin G and erythromycin A has been reported to transfer genetic content and responsible for antibiotic resistance of S. pneumoniaeor, S. pyogenes, thus acting as a resistance reservoir.

There is an increase in streptococci related disease burden in India at an alarming rate[(6)], especially with invasive infections by Group A streptococci (GAS) has increased its importance of extensive research[(7)]. Therapeutic failure of treating macrolide resistance

e-mail: ushat75@yahoo.com

has been increasing and is found to be mainly due to the methylation of the adenine residue of the target, 23S rRNA, encoded by ermfamily genes. On the other hand, GAS has gained resistance to tetracycline due to the incorporation of ribosomal protection genes–tetO and tetM, associated with conjugative chromosomal elements, that encode their transfer [8].Oral samples all over the world revealed more than 80% of tetracycline resistance acquired by the streptococcus strains, among which, 25% were resistant to erythromycin[9]. tetM displayed a highly significant association with ermB[10].

Erythromycin-resistant methylase is encoded by erm genes (ermB, ermA, erm G, erm T).The erm family-encodes methylases that methylate an adenine residue in 23S ribosomal RNA resulting in coresistance to macrolide, lincosamide, and streptogramin B antibiotics, as a result of the loss of binding ability to the ribosome. Among the members of the family, erm (B) is the most predominant and showed a high level of resistance in streptococci[11]. Resistance to macrolides can occur due to target site modification regulated by the ermgene, resulting in resistance to macrolide, lincosamide, and streptogramin B group antibiotics.

Confirmation of the presence of a resistance gene in a genus of bacteria involves the use of specific primers that could initiate amplification of the desired resistance gene in the polymerase chain reaction. Primers specifically designed for a gene could miss out amplification due to gene mutations and different gene forms. Hence it is necessary to design primers that could identify particular antibiotic resistance gene, present in the bacterial genus, in spite of sequential differences between the species. We have designed specific universal primers for erythromycin and tetracycline-resistant gene of streptococcus, that could retrieve the majority of erm and tet genes present in the streptococci group, to rule out false-negative results during amplification of these genes. Our work signifies designing of universal primers to amplify highly prevalent ermandtetgenes of streptococcus.

This studyexploits the available information of *erm* and *tet* of streptococcus to design the universal primers for their identification in the vast group of resistant streptococci. Designing of universal primers for a particular gene that could efficiently identify the gene from all species of a particular genus will be a heuristic approach in primer designing.

Materials and Method

Erythromycin and Tetracycline resistant genes (*erm* and *tet*) present in streptococci were retrieved fromthe NCBI gene database. Selection of universal primers was done using primer-BLAST. FASTA format sequences of the genes were given as a template to pick primers using Primer-Basic Local Alignment Search Tool (BLAST). Primer-BLAST aid selection of primers for the gene of interest using optimized primer parameters and identifies intended and unintended templates for the selected primers. Use of Primer-BLAST for primer designing enables identification of all possible DNA templates, to which the designed primers can bind. Accession ID of the gene of interest was given as a query for primer-BLAST.

General conditions for primer selection were optimized, considering basic primer designing criteria involving parameters, primer size, primermelting temperature (tm), primer GC% and, Maximum self-complementarities checked for potential hairpin loop formation.

Criteria considered for primer designing using Primer-BLAST:

1. Identification of universal primers for resistant genes from non-redundant databases favored retrieval of the majority of resistant genes. Non-redundant database (nr) contains non-redundant sequences from GenBank along with sequences from other databanks (Refseq, PDB, SwissProt, PIR, and PRF).
2. Enabling primer amplification of mRNA splice variants favors the identification of specific primers.
3. Selection of user-guided protocol for searching against streptococci will cut down search time and irrelevant off-target binding.

False positives can be controlled by applying stringent parameters that help to detect specific DNA templates. The primer pairs were checked for the satisfaction of primer criteria's using OligoCalc: Oligonucleotide Properties Calculator for the optimized search of targets.

Results

Selection of primers for *erm* gene of streptococci:

NCBI Search for *erm* genes in streptococcus resulted in retrieval of six 23S rRNA (adenine (2058)-

N (6))-methyltransferase) template sequences that were analyzed for template selectionfor universal primer designing for erythromycin resistance gene of *streptococci.*Primer–BLAST retrieved ten primer pairs for each template. Primer pair for each template was selected based on its qualification of primer criteria's to retrieve appropriate streptococci.

Primer 1 from Template, 23S rRNA (adenine (2058)-N(6))-methyltransferase *ErmB* (Table 1) of *Streptococcus infantis*retrieved 20 *Erm*gene targets from streptococci group, in comparison with other erm templates. Primer 3 from the template, *ErmT* of *S.pyogenes*, retrieved six *erm* gene targets, followed by primer 5, Methylase of *S.pyogenes* (*ermT*) and primer 6 with the retrieval of 5 and 4 targets respectively.

Primers of tet gene of streptococci: Gene search in NCBI for *tet* gene of streptococcus resulted in retrieval of twelve template DNA sequences of *tet* gene that encode ribosomal protection protein (*tet* protein) responsible for the increase in antibiotic resistance. Generation of primers for each template using Primer–BLAST was followed by the qualification of primers to identify primers that satisfy all primer criteria.

Primer 4 from Template, *TetM* of *Streptococcus anginosus* retrieved twelve *tet* gene targets from streptococci group, in relation with other available DNA templates of *tet* gene. Primer 2 and primer 3 from templates, *TetM* of *Streptococcus infantis* and *TetM* of *Streptococcus gallolyticus* retrieved eight *tet* gene targets from streptococci group. Primer 8 from *TetM*of *Streptococcus sui s*retrieved seven *tet* genes from the streptococci search group. Other identified primers, 1, 5, 6, 7, 9, 10, 11 and 12 retrieved less than seven streptococci associated *tet* genes.

NCBI-primer blast provides the primer paring between the query and the selected forward, reverse primer, and unintended templates that bind to the primers. Identification of universal primers for a gene of a particular organism would be a heuristic approach in molecular genetics to identify the presence of an antibiotic resistance gene in a specified group.

Validation of universal primers of ***erm*** and ***tet*** genes of streptococci:

The identified universal primer for the *erm* gene of streptococcus was validated for the identification of all possible streptococci in the gene repository of NCBI. Table 4 shows the *erm* genes of streptococci deposited in the Gene database of NCBI.

The identified universal primer of the *erm* gene retrieved all streptococci deposited in the GenBank . Meanwhile the universal primer retrieved *erm* genes of other streptococcus species, *S.pasteurianus, S.salivarius, S. parauberis, S. iniae, S. gordonii, S. intermedius, S. lutetiensis, S. pseudopneumoniae, S. oralis, S.uberis, S. thermophiles, S.hyointestinalis* and *S. faecalis* from the non-redundant database, that are not deposited in the GenBank. The percentage of primer recognition of the streptococcus was 100%, when compared to other primers of *erm* genes. This proves the potentiality of primer 1 to be used as a universal primer for the *erm* gene of streptococcus.

Similarly, identified universal primers for the *tet* gene of streptococcus were validated in relation with the *tet* genes present in the gene repository of NCBI. Table 4 lists *tet* genes of streptococcus in the NCBI gene database.

The identified universal primer of *tet* gene retrieved eight out of eleven genes of streptococcus deposited in the NCBI gene database besides with *tet* genes present in the genome of *S. pseudoporcinus, S.porcinus, S.pseudopneumoniae, S.constellatus,* and *S. parauberis* from non-redundant database. The percentage of primer recognition of the streptococcus was 72.7%, higher than any other primer sets of *tet* genes. This confers the importance of primer 4 in the identification of *tet* genes of streptococcus group.

Discussion

Universal primers have been used for species identification by the recognition of 16 S rDNA sequence and amplification that allows prompt and accurate identification of the species of bacteria [12] and other organisms[13][14] based on universal distribution of species-specific 16S rRNA region. Furthermore, universal primers are used to assess the total bacterial load of a clinical sample to detect all bacterial species invariably[15]. Our work focuses on the identification of universal primers for the most prevalent antibiotic resistance genes *erm* and *tet*, to identify their presence in streptococcus group. This study signifies identification of *erm* and *tet* genes with a universal primer to minimize the usage of multiple primers in the identification of genetic variants of the gene among the streptococcus species.

Conclusion

Designing of universal primers for a resistance gene present in a genus, besides the identification of bacterial species would be a novel and cost-effective approach in the primer designing strategy. This work highlights designing of the universal primers for *erm* and *tet* gene of streptococcus. The designed universal primers identified 100% and 72.7% of *erm* and *tet* of streptococcus group respectively. Designing of universal primers for resistance genes of an organism will provide a rapid, cost-effective, accurate method of identification among the species of the group favoring antibiotic resistance research.

Importance of CBCT in Endodontic Failure: A Case Report

Tamizharasan Sangavi[1], Arunajetasan Subbiya[2], Nagarajan Geethapriya[3], Suresh Mitthra[3]

[1]First Year PG Student, [2]Professor & Head of the Department, [3]Reader, Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Narayanapuram, Pallikaranai, Chennai-600100, Tamilnadu, India

Abstract

A definitive diagnosis of vertical root fracture (VRF) is often a challenging diagnosis for clinicians. This is because periapical radiographs are usually unable to detect the fracture line due to two dimensional image. This case of root canal treated with apical periodontist was diagnosed with vertical root fracture based on findings from clinical, radiographic, and cone-beam computerized tomographic (CBCT) examinations. CBCT aids in information regarding fracture line which cannot be detected in radiograph due to the direction of x-ray beam. Hence CBCT greatly helps in the diagnosis and management of VRF. However, the clinical and radiographic data is also much need hence CBCT can be used as an adjunct for cases with difficult diagnosis.

Keywords: *Cone-Beam Computed Tomography, Dental Radiography, Diagnosis, Endodontics, Tooth Fractures.*

Introduction

The main motive of root canal treatment is to disinfect the root canal system followed by obturating the space created so as to entomb any microbes that have escaped elimination and to prevent reinfection; without causing any iatrogenic damage. [1, 2]

The success of root canal treatment in teeth with noninfected vital pulps depends on preventing root canal infection, while in teeth with infected necrotic pulprelies on complete removal or at least reduction of bacterial counts for perirradicular tissue healing. [3] Post-treatment apical periodontitis is the form of disease associated with root filled teeth and is usually associated with a persistent or secondary root canal infection.[4,5]

e-mail:drsubbiya@gmail.com

The vast majority of previous studies evaluating the prevalence of post-treatment apical periodontitis and its risk factors were based on radiographic examinations. [6] Because they provide only two-dimensional information, radiographs may not reveal missed canals in all cases. In such conditions using cone-beam computed tomography (CBCT), which provides three-dimensional information and a higher sensitivity to evaluate hard tissue changes. [7] Cone beam computed tomography (CBCT) is a relatively advanced method to visualize an individual tooth ordentition in relation to surrounding skeletal tissues and to create three-dimensional images of the area to be examined.[8] The use of CBCT in Endodontics is rapidly increasing worldwide.

Costa et al showed the importance of CBCT which will be able to expose primary cause in endodontic failure such as missed canals, inadequate obturation in oval shaped canals, vertical root fracture etc.[9] This case report is one such persistent endodontic infection diagnosed by CBCT.

Case Report: This case report discusses about a 56 year old male patient reported to the department of conservative dentistry and Endodontic, Sree Balaji Dental College and Hospital, Chennai, India with a chief complaint of pain in right upper posterior region of the jaw.

Past dental history reveals endodontic treatment in relation to 17 before 4years. On examination, pain on percussion in relation to 17 with visible swelling on palatal aspect was noted. IOPA was taken in buccal [fig A] and distal angle[fig B]. Radiograph shows presence of periapical rarefaction in relation to mesial root [fig A] and angled radiograph [fig B] did not confirm any missed canal.The provisional diagnosis was root canal treated tooth with apical periodontitis in relation to mesial root of 17. Since radiograph reveals radiolucency in relation to mesio buccal root [fig A] whereas the intraoral swelling is present in palatal root, patient was advised to take CBCT to rule out the confusion.

CBCT images did not reveal any missed canal in mesiobuccal root and showed no radiolucency around the tip of mesiobuccal root but presence of radiolucency around the tip of palatal root was noted [fig C].CBCT also revealed unusual morphology of fused mesiobuccal and palatal root [fig D, red arrow] .Careful examination of mesiobuccal and palatal root reveals a vertical root fracture in palatal root of 17 [fig D,yellow arrow] .Since vertical root fracture does not have a good prognosis for retreatment 17 was extracted under local anesthesia.

A B C D

Fig (A) IOPA buccal angulation in relation to 17 revealing radiolucency in relation to mesiobuccal root, (B) IOPA distal angulation in relation to 17 with no periapical radiolucency.(C) CBCT image showing periapical radiolucency in palatal root in relation to 17, (D) CBCT image showing fused mesiobuccal and palatal root(Red Arrow) with radiolucency around palatal root and followed by vertical root fracture in relation to palatal root (yellow arrow) of 17.

Discussion

In this case the radiograph revealed radiolucency in mesiobuccal root whereas the intraoral swelling was noted in palatal root, on examination, CBCT showed unusual morphology of fused mesiobuccal and palatal root [fig D, red arrow] .vertical root fracture was also noted in palatal root [fig D, yellow arrow]. Hence the radiolucency in palatal root has been reflected in the radiograph of mesiobuccal root due to their fusion which wouldn't have been in cases of individual roots.

When the nature of the dento-alveolar root fracture and dental injuries couldnt be diagnosed from a conventional examination and radiographs, Cone beam computed tomography has been suggested as an adjunct imaging tool[10].

CBCT is a three-dimensional imaging method that gives the possibility to view an individual tooth or teeth in any view. Hence CBCT play a vital role in endodontic diagnosis, treatment planning and follow-up. Whereas the limitations of CBCTand radiation dose to the patients must always be taken into consideration when selecting them odes of diagnostics. There is a need for evidenced-based guidelines on when to use CBCT in Endodontics, thus aiding the decision on when is it appropriate to take a CBCT scan ideally.

It is clear that CBCT reveals a considerable amount of information about the nature of dento-alveolar injuries. This information may not only help in formulating diagnosis but also improves the management. Ultimately,this may improve treatment outcomes. Hence when the diagnosis from clinical and conventional radiographic assessment is inconclusive, CBCT should be considered as a potentially useful imaging device.

Conclusion

Cone-beam CT which offers immense amount of radiological information not only improves pre-operative and surgical planning, but the 3D models provided can be used to further educate and inform patients and guardians regarding further management.

Closure of Midline Diastema by Composite Resin Build-up: A Case Report

Tamizharasan Sangavi[1], Arunajetasan Subbiya[2], Nagarajan Geethapriya[3], Suresh Mitthra[3]

[1]First Year PG Student, [2]Professor and Head of the Department, [3]Reader, Department of Conservative Dentistry and Endodontics, Sree Balaji Dental College and Hospital, Bharath Institute of Higher Education and Research, Narayanapuram, Pallikaranai, Chennai-600100, Tamilnadu, India

Abstract

Maxillary anterior spacing is one of the most common aesthetic complaints of young patients. It is an esthetic and technical challenge for clinicians. Treatment is mainly for esthetic and psychological reasons, rather than functional ones, numerous materials are available for diastema closure. Case should be carefully analyzed with proper history for etiological factors and best possible treatment plan. The aim of this study is evaluate the efficiency and performance of composite resin in closure of midline diastema.

Keywords: *Midline diastema, History, Analysis, Composite resin.*

Introduction

The midline diastema is a space between the maxillary or mandibular central incisors [1]. The presence of a midline diastema represents an esthetic and psychological impairment and distress for patients[2]. Maxillary midline diastema has a multitude of underlying etiological factors that might be interdependent or independent.

Numerous etiological factors for maxillary midline diastema has been listed by literature[3].Among them are the developmental factors like.

- Diastema
- Mesiodens
- Abnormal frenum attachment
- Missing or undersized lateral incisor
- Thumb sucking
- Mouth breathing
- Tongue thrust
- Dentoalveolar disproportion
- Generalized spacing
- Ankylosed central incisor
- Rotated or flared central incisors
- Macroglossia
- Closed bite
- Facial type
- Ethnic
- Familial characteristic

Other Factors Include:

- midline pathology
- gingival recession
- and pathological tooth migration

In adults, tooth-size discrepancies found to be the most common factor in the development of diastemas.

The incidence of diastemas varies greatly with race and age.The space can be a normal growth characteristic

e-mail: sangavi2707sang@gmail.com

during the primary and mixed dentition and is closed by the time the maxillary canines erupt[4].

Diastemas can be treated in a multitude of ways including orthodontic closure, restorative therapy, surgical correction or multidisciplinary approach depending upon the nature of case and the etiology of diastema[5,6]. A carefully developed differential diagnoses allows the practitioner to choose the most effective treatment plan. Diastemas based on tooth-size discrepancy are most amenable to restorative solutions[7,8]. Direct composite veneers, indirect composite veneers, porcelain laminate veneers, all ceramic crowns, metal ceramic crowns and composite crowns are the various techniques available for restorative closure of midline diastema [9].

Case Presentation: A 29 year old female patient reported to the department of conservative dentistry and Endodontics, Sree Balaji Dental College and Hospital, Chennai, India with a chief complaint of midline spacing between her upper anterior teeth. The spacing was a discomfort to the patient, and was affecting her self-confidence.

A clinical examination revealed 2 mm space between maxillary central incisors at incisal and middle third, with favorable gingival hygiene. The patient didn't want orthodontic or prosthodontic considerations. The treatment plan is to provide an esthetically favorable relation between the maxillary anterior teeth involved closing the diastema using composite

A study model was fabricated to measure the actual length between the top of the papilla and incisal edge of the central incisor. The mock up study model was prepared. The analysis of the length and the width of the upper central incisors demonstrated an unfavorable proportion after the closure with composite resin but, the patient was satisfied with the result of the study model. Therefore, direct composite Resin was decided as restorative material. According to Willhite the diastema closure using a narrowed Mylar strip and cotton pellet to increase the emergence profile and gingival tissue recontouring. According to this same procedure was applied in this case. The patient was anesthetized, and teeth were isolated with insertion of a gingival retraction cord. The narrowed strip was fully seated into the sulcus and a small cotton pellet was placed between the tooth and the Mylar strip, and gently packed into the sulcus. After 5 minutes, cotton pellet was removed to gain the empty space through the gingival contouring. The narrowed Mylar strip was then set aside. 37% phosphoric acid used to etch the tooth surface for 15 seconds. After water rinsing followed by the application of an adhesive, the narrow Mylar strip was replaced, and the tooth was built up with composite resin, shade A2 and cured. The narrowed Mylar strip was used for gingival contour to the contact point. Finishing and polishing were accomplished. Procedure was repeated on the opposite side. Figure 1 shows the pre-operative and postoperative esthetic correction.

Discussion

With the current trend towards minimally invasive dentistry, direct composite restoration has provided clinician with added advantage of achieving predictable esthetic results with immediate closure and minimized trauma to the teeth. The simple closure may not offer a natural and pleasant solution to the cases where there is wide space between teeth. Patient has to be explained that the stability of composite closure may not be as high as veneer or crownhence necessary precautions to be taken,patient's concern is mandatory before the procedure.

The appropriate technique and material for a patient are based on width to length ratio time, physical, psychological, and economic limitations [10,11].

Newer materials and techniques are introduced in the improvement while fulfilling their patients' aesthetic demands [12]. Recent advancement in composie resinshave improved its physical and mechanical properties similar to that of the natural tooth and possess an appearance like natural dentin and enamel [13]. Nowadays a wide range of enamel shades and varying opacities designed specifically for layering technique whereas early brands of composite resins offered only "body" shades and appeared dull and dense [13-15]. The modern composite restorative materials are remarkable with their improved physical and esthetic properties, used to create good quality esthetic restorations with sufficient wear resistance providing satisfactory years of service.

PRE & POST OPERATIVE

Figure 1: Preoperative and Postoperative midline diastema closure

Conclusion

Midline diastemas cause psychological issues and make an individual feel inferior . Such midline diastema are successfully closed by direct composite .

Role of Prophylactic Antibiotics in the Surgical Treatment of Maxillofacial Fractures

Chandhini Asokan[1], Vijay Ebenezer[2], Balakrishnan Ramalingam[3]

[1]Post Graduate, Department of Oral and Maxillofacial Surgery, Sree Balaji Dental College and Hospital, Velachery Main Road, Narayanapuram, Pallikaranai, [2]Professor, Head of the Department of Oral and Maxillofacial Surgery, Sree Balaji Dental College and Hospital, BIHER, [3]Professor, Department of Oral Maxillofacial Surgery, Sree Balaji Dental College and Hospital, BIHER, Chennai, Tamilnadu, India

Abstract

Objective: A systematic review of the literature was undertaken examining data to find the evidence of prophylactic administration of antibiotics inrelation to treating patients of maxillofacial fractures.

Study Design: Studies that fulfilled most of the requirements pertaining to it were retrieved. A computerized search was carried out using PubMed, and MEDLINE databases with the logical operators: "antibiotic" and "prophylaxis" and "maxillofacial trauma."

Results: A survey of these studies showed a drastic decrease in the infection rate of mandibular fractures in the antibiotic treated groups when being compared with the control groups. A variety of antibiotics had been used with an apparently constant effect. An"once a day"regimen ora1-day treatment course had a similar or perhaps even better result than 7 days of treatment. No infections were corresponding to condylar, maxillary, or zygomafractures.

Conclusion: An "once a day" regimenor 1-day administration of prophylactic antibiotics seem to be the best documented to reduce infections.

Keywords: *Antibiotics, Fracture, Prophylaxis.*

Introduction

This systematic review aims at producing the current evidence in treatment strategies, and thereby give the clinician an unbiased tool in keeping up with an exponentially growing knowledge base.

For several years, prophylactic antibiotic treatment remained as a must in the surgical treatment of jaw fractures.[1] The evidence for this preventive intervention, however, is not sufficient in a literatures of other surgical disciplines.[2-5] In several indications, prophylactic antibiotics has shown no positive and sometimes even a negative effect.[6] The negative effect can be explained by the fact that no single antibiotic can eliminate all kinds of invading bacteria and thereby may give way for opportunistic infection.[7]

Before evaluating specific role of a prophylactic antibiotic regimen, several factors with a known impact on the incidence of infections in relation to maxillofacial trauma must be taken into consideration.

Two different situations exist in relation to the invasion of bacteria's into the fracture site, namely a closed fracture (eg, mandibular condyle and ramus fractures and maxillary Le Fort I–III fractures) on 1 side and open fractures with direct communication to the oral cavity and/or the skin surface on the other. No study has so far evaluated the actual invasion of

bacteria in a healing fracture site; but the importance of this differentiation is apparent by the fact that healing of fractures located in the condylar region is never followed by infection compared with the more frequent occurrence of infections in the mandibular angle, body, and symphysis regions.[8]

The type of treatment procedure (open or closed) should be taken into consideration when analyzing the effect of antibiotics. It became apparent that an open procedure may lead to a 4-fold higher rate of infection from previous analysis.[9]

Mandibular fractures are more prone to infection than maxillary fractures[8]; and within the mandible, the location of the fracture in the dental arch also seems to be of importance with the third molar region showing the highest frequency of infections.[8] Thus, the topography of the jaw fractures is another factor to be considered.

The variables that have significant influence on the chance of avoiding infection are, the type of antibiotics administered; the dose, duration, and route of administration, and finally the timing of administration in relation to injury and surgical treatment.[5]

The term prophylaxis implies preventive use of antibiotics. In the present review, antibiotic prophylaxis is interpreted as given, when no clinical signs of infection are present at the time of surgery, although it may be argued that any fracture open to the skin or oral cavity should be considered contaminated, and that antibiotics thereby are indicated as a part of treatment rather than prophylactic.

Finally, an analysis of the literature should concentrate on randomized studies, and in this regard whether the studies meet the requirements for a reliable study design, proper randomization, limited number of drop-outs, sufficient number of patients included, and utilization of relevant statistical Method.[10]

It was the purpose of the present systematic review to evaluate available randomized clinical trials to answer the following questions:

1. Does antibiotic prophylaxis decrease the incidence of post-trauma infections in jaw fracture treatment?
2. Are there situations where an antibiotic prophylaxis is not indicated?
3. Which antibiotic is the drug of choice? In what dose? And for how long?

Material and Method

Analysis if the Literature: The databases MEDLINE and Cochrane were searched for relevant studies, using the following key words: jaw fractures, mandibular fractures, maxillary fractures, antibiotic treatment, infection, and randomized studies. This search was supplemented by a hand search of relevant German journals not electronically listed and by a review of reference lists of potentially eligible studies.

For each retrieved study, the following questions were asked:

1. Were the patients randomly allocated to the treatment groups?
2. Were the patients blind to treatment allocation?
3. Were the treatment outcomes assessed blind?
4. Were all dropouts to follow-up accounted for?
5. Were the clinical outcome variables clearly defined?
6. Were details given of the statistical evaluation method?

Based on this, each individual study was characterized as a randomized controlled trial or a controlled clinical trial. To meet the criteria of a randomized controlled trial, the study should involve at least 1 test treatment and 1 control treatment and concurrent enrollment and follow-up of the test-and control-treated groups, in which the treatments to be administered are selected by a random process such as a random number table. Studies where the patients are appointed to the different treatment groups using quasi-or pseudo-randomization techniques such as coin flips, social security numbers, or days of the week, are considered controlled clinical trials.[11]

Results

Four randomized studies[8,12-14] were retrieved concerning the possible benefit of prophylactic antibiotics in the treatment of maxillofacial fractures. Two clinical randomized studies were found that compared different antibiotic regimens without including a control group.[15,16] A critical analysis of these showed that none of them fulfilled all the requirements for a randomized controlled trial. However, as these studies represent the best knowledge available at the present time, the results are summarizedbelow.

The first randomized study on the effect of prophy-lactic antibiotics in the treatment of compound mandibular fractures was published by Zallen and Curryin 1975.[12] The material consisted of 32 patients with compound mandibular fractures who received antibiotics (a wide variety of different antibiotics), and 30 patients treated without antibiotics. A control of the stratification was made and shown to be effective. The administration of antibiotics was in 20 cases par-enterally and in 10 cases orally. A highly significant difference in complication rates was found as 6% developed infection complications in the antibiotic-treated group, where as 53% developed infection in the nontreated group (P = .0001).

In 1983, Aderhold et al[13] published a study on the effect of antibiotic treatment of 120 mandibular fractures. All fractures had communication to the oral cavity and were treated with miniplate osteosynthesis. Forty cases were treated without antibiotics, 40 cases with antibiotic coverage up to 48 hours, and 40 cases with treatment for more than 48 hours. Type and dosage of the prescribed antibiotics are not presented. Proper stratification was checked and found to be reliable, and the numbers of open and closed reductions in the 2 groups are comparable. An almost significantly higher infection rate was found in the nontreated group (20%), whereas cases treated with short-term antibiotics showed a frequency of 5% and beyond 48 hours of 10% (n = .06). It was concluded that short-term antibiotic prophylaxis was effective in reducing infection; furthermore, that long-term treatment did not significantly reduce the risk of infections as compared with the control group.

In 1987, Chole and Yee[8] reported a prospective clinical trial of 101 patients with facial fractures. The patients were randomly assigned to either no antibiotic treatment or a short-term prophylaxis with an intravenous administration of cefazolin 1 g (a cephalosporin) 1 hour before surgery and 8 hours after. A total of 150 fractures were diagnosed in the 101 patients (6 maxillary, 24 zygomatic, and 120 mandibular fractures). None of the maxillary, zygomatic, and subcondylar mandibular fractures got infected, irrespective of antibiotic prophylaxis given or not. In the 79 patients with mandibular fractures, the 37 who received antibiotics experienced an infection rate of 14%, whereas 42 patients in the control group developed infections in 43% (*P* = .01) of the cases.

It was concluded that antibiotic prophylaxis is indicated for mandibular fractures.

In 1988, Gerlach and Pape[14] examined the influence of antibiotic treatment on infection rates in 200 mandibular fractures all treated with open reduction and miniplate aestheticism through an intraoral approach. In group I (n = 50), a 1-day antibiotic treatment was given, starting immediately before surgery. Ingroup II (n=50), a1-shotprophylaxisofantibiotics was administered immediately before surgery. In group III (n = 51), a 3-day course was used. Finally,a control group (n = 49) received no prophylactic antibiotics. The control group showed a significantly higher infection rate (22%) compared with the 3 pro-phylactic groups (2%, 6%, and 8%, respectively) (*P*=.001). It was concluded that a "1-shotadministration"of antibiotics in relation to intraoral osteosynthesis in the mandible is sufficient to protect the patient from wound infection.

Two different antibiotic prophylactic regimens were compared in a prospective and nonrandomized clinical study by Heitet al[15]in 1997. A total of 90 patients with compound mandibular fractures were divided into 2 groups of 45 patients. In group I, the prophylaxis consisted of ceftriaxone (a cephalosporin) 1 gdaily pre-and perioperatively until the intravenously administration was discontinued and thereafter penicillin VK 500 mg every sixth hour orally 1 week postoperatively. GroupII received an intravenous administration of penicillin G 2 million U every fourth hour pre-and perioperatively until the intravenously administration was discontinued and thereafter the same orally administered doses of penicillinVKasforgroupI.Twopatientsineachgroup developed an infection and thus there could not beademonstrated significant difference between the 2 regimens.

Abubaker and Rollert[16]reported in 2001 preliminary results of a comparative, double-blind, placebo-con-trolled study of a 1-day prophylaxis versus a 5-day treatment with penicillin. In a limited number of patients (n = 30), no benefit of a prolonged administration of antibiotics could be seen. However, the results should be interpreted with caution because of the small numberofpatientsandthatbothopenandclosedreductions were mixed in thematerial.

Discussion

In maxillofacial fracture treatment a multitude of external sources exist for contamination of the wound. In this aspect the fracture can, in most cases, be considered contaminated, implying an elevated risk ofinfection.[17]

From this perusal of the literature, it appears strongly indicated to use a short-term antibiotic coverage to decrease the infection rate in relation to the treatment of compound mandibular fractures. Approximately a 4-fold reduction in the number of infections was found. It is also of interest to observe that open reduction was highly influenced by the use of antibiotics. This seems to indicate that the cause of infection could be related to the surgical approach itself, namely damaging the principal blood supply to perform an osteosynthesis and thereby additionally exposing an injured area to bacteria from the oral cavity or external environment.

An interesting analogue to the surgical treatment of jaw fractures appears in orthognathic surgery where the infection rate is normally very low, and in 3 studies has been shown not to be related to the administration of antibiotics.[18-20] Only 1 study has shown a positive effect on infection rates.[21] It might be expected that the same exposure to all bacteria may occur in orthognathic surgery.

However,-in jaw fracture treatment a multitude of external sources exist for contamination of the wound. In this aspect the fracture can, inmost cases, be considered contaminated,[17] with the known elevation in infection risk and that was also the general finding in this survey.

However, the difference might be that the injured tissue had a short exposure to oral bacteria in comparison to jaw fractures where bacteria might have invaded the tissues for days (although it was shown that the time delay until treatment did not influence the infection rate).[8]

Combining the evidence from all 4 studies, the following can be concluded about infection rates: It appears that there is a significant reduction in the number of post injury infections. As a whole, a3-fold decrease in the infection rate took place by the ad-ministration of antibiotics.

Infection Rates in Different Locations: All studies had their analysis primarily confined to the dentate part of the mandible (ie, excluding the condylar region). In 1 study, the infection rate was compared between various locations (Table 3). It appears that infection was not found in the maxilla, the condylar region, orthezygoma, irrespective of administration accountability

Infection Rates Related to Antibiotic Administration: There appears to be no difference in the reduction rate of infection in the 4 studies.

Infection Rate Related to the Length of Antibiotic Administration: Three studies analyzed this parameter.[13,14,16] It ap-pears that a "1-shot" or 1-day administration worked equally, or maybe even better (however, not significantly), than a 7-day course. A similar finding has been made for other approaches in oral and maxillofacial surgery[22] and in orthopedicsurgery.[3,23]

The present study based on 4 quasi-randomized studies appeared to show a significant decrease in wound infection (4-fold when antibiotics were administered). This finding can be compared with similar effects in the treatment of bone fractures of the ex-tremities.[24] This effect can be explained in the way that antibiotic treatment will reduce or eliminate bacteria that have entered the wound before treatment. The first event seems to be the most obvious explanation, as prophylactic administration of antibiotics has not resulted in a significant reduction in wound infection after orthognathic surgery. In this situation, presurgical bacteria contamination is not present.

An analysis oft he bacteria flora infections related to jaw fractures is very sparse. In 1 study, a mixed infection with aerobic and anaerobic flora and a pre-dominance of staphylococcus aureus seems to indicate that specific antibiotics may be indicated.[25]

The great variety of antibiotics used in the cited studies with varying specificity against the presumed bacteria flora gives no significant clue concerning the selection of proper antibiotic.

The specific preference of wound infection to the angular region does support a dental origin (pulp canal or periodontal flora related to the molar may play a role). This phenomenon will be further analyzed in a subsequent study.

Conclusion

A short-term antibiotic therapy (less than 48 hours), possibly a 1-shot administration, appears to be effective in protecting compound mandibular fractures from infection, especially open re-duction. Because of the very low infection rate in maxillary fractures, zygoma fractures, and the non-existence of infection complications in condylar fractures, antibiotic treatment in the latter types of fractures does not seem indicated.

Permanent Mandibular Second Premolar with Vertucci Type II Configuration: A Case Report

Ramu Shobhana[1], Arunajetasan Subbiya[2], Nagarajan Geethapriya[3], Balasubramanian Anuradha[3]

[1]First Year Postgraduate Student, [2]Professor and Head, [3]Reader, Department of Conservative Dentistry & Endodontics, Sree Balaji Dental College & Hospital, Bharath Institute of Higher Education & Research, Narayanapuram, Pallikaranai, Chennai-600100, Tamilnadu, India

Abstract

Mandibular premolars are one of the most difficult teeth to treat endodontically as it shows high incidences of aberrant root canal anatomy. Complete cleaning and shaping with copous irrigation is the key to successful endodontic treatment. Careful understanding of the internal anatomy and morphology of the root canal system is an important task when performing cleaning and shaping procedures. This article describes mandibular second premolars with Vertucci Type II root canal anatomy, treated successfully by conventional endodontic treatment.

Keywords: *Abberant anatomy, Mandibular second premolar, Root canal anatomy, Vertucci.*

Introduction

A complete knowledge of internal anatomy of root canal system makes endodontic treatment successful [1],[2]. Understanding the presence of aberrant internal root canal morphology leads to success and increase in overall prognosis of endodontically treated teeth. Inability to locate, prepare, or fill all roots and/or root canals may cause posttreatment disease of endodontically-treated teeth [2],[3].The risk of missing canals during root canal treatment is high because of the complexity of the root canal system.

Thevariations in canal anatomy have been observed in each tooth as in number of roots, canals, isthumi, and apical foramen. Mandibular first premolar has varied variation in root canal system, so it is known as enigma to endodontists. However, various studies and case reports stated varied anatomy with MSP, so this tooth can also be considered as enigma to endodontist[5,6,7,8].

Mandibular second premolar(MSP) usually have two pulp horns, the buccal located at a higher level than the lingual. Usually, MSP has single root and single canal (97.5%),[9] however, incidence of two (2.5%),[9] three (0.4%),[10] and four roots were also found. Accessory apical foramen was seen in 47% of MSPs.[10] Singh and Pawar observed that MSPs showed single root in 92% and >2 roots in 8%, 58% had one apical foramen, and 12% showed two apical foramen in South Asian population.[11]In 2007, Cleghorn et al. reviewed studies that evaluated the morphology of first [4] and second [12] premolars. They found that although the majority of first (97.9%) and second (99.6%) premolars had one root, multiple root canals were evident in 24.2% and 9% of the first and second premolars, respectively. Slowey (1979), who suggested that mandibular premolars possess the greatest anatomical challenges of all teeth with regards to achieving successful root canal treatment[13].

The in vitro Method such as clearing technique, sectioning and scanning electron microscopy analysis, and the techniques which can be used both in vitro and in vivo are exploration, radiography, cone beam computed tomography (CBCT), and micro CT. The clinical techniques are radiographs in different angulation (SLOB rule), radiopaque dyes, loupes, and dental operating microscope (DOM).

This case report presents the nonsurgical endodontic management of a mandibular left second premolar with 2 orifices with 1 apical foramina (Vertucci Type II).

Case Report: A 57-year-old female patient reported to the Department of Conservative Dentistry and Endodontics, with the chief complaint of pain in lower left back tooth. The patient gave a history of dull, continuous and gnawing pain. On intraoral examination, disto-occlusal caries with amalgam restoration in the occlusal surface was seen with tooth #35, and tenderness on percussion was present. Radiographically, disto-oclusal radiolucency was approximating pulp [Figure 1]A. A diagnosis of Secondary dental caries with symptomatic irreversible pulpitis with symptomatic apical periodontitis was made having Vertucci's Type II canal configuration. Nonsurgical root canal therapy (NSRCT) was planned for 35. Local anesthesia was administered and isolation was achieved with rubber dam. Complete carious removal was done. The access cavity preparation was doneand canals were accessed with #10 K file. Working Length was achieved and radiograph was taken [Figure 1]B. Biomechanical preparation was carried out using conventional hand instruments. 2.5% of Sodium hypochlorite and 17%EDTA were used for irrigation. The canals were irrigated with normal saline after each instrument change. After completion of cleaning and shaping, master cone radiograph was taken[Figure 1]C. This was followed by obturation with cold lateral compaction technique. A post-obturation radiograph with different angulations and the coronal access cavity was restored [Figure 1]D.

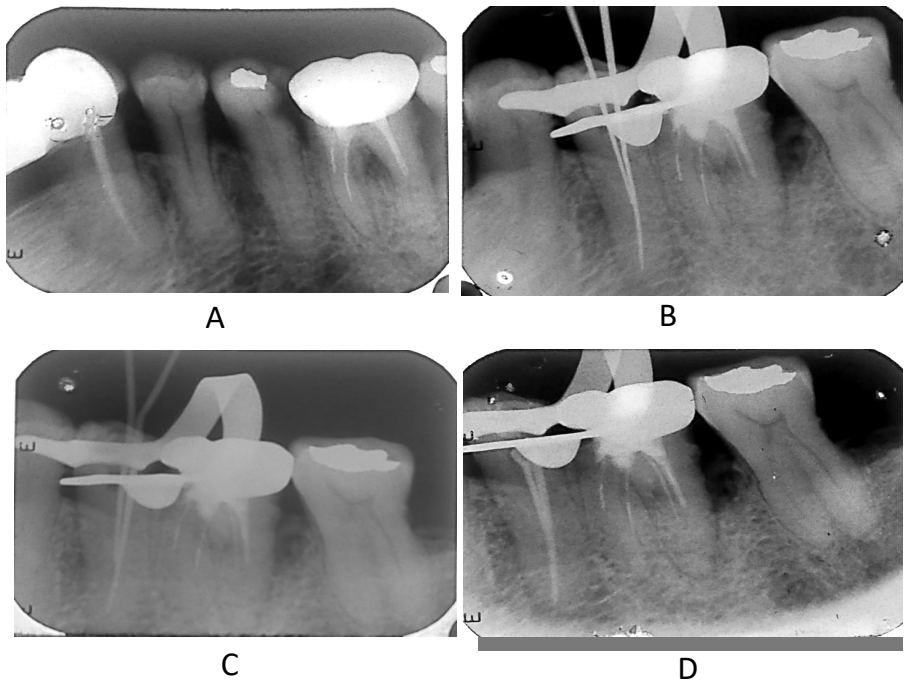

Figure 1: A. Preoperative radiograph, B. Working length determination, C. Master cone radiograph, D. Obturation

Discussion

The root canal system shows complex anatomical features where the presence of extracanals is an endodontic challenge. The canal systems were classified by Weine [14] and Vertucci,[9] respectively.

Endodontic success depends on many factors; nevertheless, 42% of endodontic retreatment is because of missed canal.[15] This diagnosis of aberrant root canal anatomy clinically starts from first step that is preoperative intraoral periapical radiograph. If there is overlapping of roots or if the radiograph shows unusual finding, then radiograph shall be taken following Clark's rule.

Exploration of root canal orifices also plays an important role for diagnosing extracanals. This orifice can also be located by dentinal mapping and developmental grooves.

The root shape, root position, and relative root outline should be carefully noted from the radiograph. The observations made in a study concluded that broad, flat roots are much more likely to contain multiple canals and intracanal ramifications. In such cases, angled radiographic view will reveal the true dimensions of the root canal[16]. The sudden radiographic disappearance of a canal may be evidence of a dividing canal.

Exploration of root canal orifices also plays an important role for diagnosing extracanals. This orifice can also be located by dentinal mapping and developmental grooves.

ElDeeb for the first time treated MSP with three canals[17]. A maximum of 5 canals have been reported in MSP.[18]Reports have shown that mandibular premolars are possibly the most difficult teeth to treat endodontically due to wide variation in root canal morphology[10]. One of the most difficult aspects of treating this anatomy is the predictable removal of pulp tissue in the isthmus.

Antibacterial irrigation in association with mechanical debridement of the root canal is essential to treat endodontic infections[19]. With all the Method established, the protest is still to penetrate, reach, and kill bacteria, which are well-known to protect themselves from the dentinal mud, their own secretions, and biofilms. Ample of irrigation and disinfection aids in the success of root canal therapy. In the present case, 5.25% (NaOCl) and 17% (EDTA**)** were the active irrigants.

This article describes a case report with aberrant morphology of root canals of mandibular premolars and their successful endodontic management. The paper points were used to remove excess moisture from the canals. Obturation was done using lateral compaction technique.

Conclusion

The mandibular premolars show complex root and root canal morphology. For successful and predictable endodontic treatment requires knowledge on biology, physiology, and root canal anatomy. A complete knowledge of root canal anatomy and its variations with careful interpretation of the radiograph and clinical inspection of the floor of pulp chamber and proper access opening are essential for a successful treatment outcome. This case report details the endodontic management of mandibular second premolar with Vertucci Type II canal configuration which ended with a favorable outcome.If aberrant anatomical variation is misdiagnosed will lead to failure and if diagnosed correctly leads to successful treatment.

Endodontic Retreatment of Mandibular Second Molar with Middle Mesial Canal: A Case Report

Ramu Shobhana[1], Arunajetasan Subbiya[2], Nagarajan Geethapriya[3], Balasubramanian Anuradha[3]

[1]First Year Postgraduate Student, [2]Professor and Head, [3]Reader, Department of Conservative Dentistry & Endodontics, Sree Balaji Dental College & Hospital, Bharath Institute of Higher Education & Research, Narayanapuram, Pallikaranai, Chennai-600100, Tamilnadu, India

Abstract

Elimination of microbes from root canals and impeding of further reinfection is the objective behind an endodontic treatment. This is achieved by overall disinfection and shaping of canals which can then be filled using a three-dimensional filling with a fluid-tight seal. However, this process becomes complicated with the presence of additional root canal systems. To achieve these goals, the clinician must have proper knowledge of regular anatomy and anatomic variants of root canals. One such variant configuration in mandibular molars is the presence of a third canal in the mesial root called middle-mesial canal. The purpose of the present article is to report successful non-surgical retreatment of a mandibular first molar with earlier missed Middle Mesial Canal.

Keywords: *Accessory mesial canal, Intermediate mesial canal, Mandibular molar, Mid-mesial canal.*

Introduction

An endodontic therapy is considered successful when thorough debridement of the root canal system with necrotic or infected pulp tissues, microbes, followed by complete sealing of the root canal space is done. This will prevent reinfection and chances of re-endodontic therapy. Endodontic failure can be determined on the basis of clinical signs and symptoms and radiographic findings of root canal treated tooth. The etiology of endodontic treatment failure is multifactorial, the inability to identify and debride all the existing canals is one among the main causes [1]. A study shows that there is a strong relationship between untreated canal space and presence of periapical lesions [2,3]. Infected canals that are missed and untreated will harbour bacteria in sufficient numbers to maintain or cause disease. Canals that are Initially noninfected and left untreated during endodontic therapy may function as a possible site of re-infection [4]. There are reports of unusual canal anatomy associated with all teeth, and the mandibular molars are no exception. Therefore, a thorough knowledge regarding internal root canal anatomy is required [5].

Mandibular first molars commonly have two roots and three root canals [6]. A classic study by Hess on 512 mandibular first molars reported that 0.3% of the teeth had only one, 17.7% ha d two, 78% had three and 4% had four canals [7]. Vertucci and William, as well as Barker et al. first described the presence of a fifth canal called the middle mesial canal [8,9]. Also known as intermediate canal, mesio-central canal, third mesial canal, accessory mesial canal. Various Method have been used for detection of these MM canal, and the frequency with which the canal occurs ranges between 0% and 46.2% [10]. In addition, the MM canal has not been clearly defined in the literature. Pomeranz et al defined the MM canal as either a fin, confluent, or independent canal between the mesiobuccal (MB) and mesiolingual (ML) canal [11]. Goel et al suggested mandibular first molars had MM canals in 15.0% of specimens. Among these MM canals 6.7% of MM canals were independent

[12]. Thus, to ensure the long-term prognosis of a tooth undergoing RCT, morphology and numerous variations in the root canal system have to be assessed properly before initiating RCT.

In a study by Costa et al showed that frequency of untreated canals was higher in maxillary molars (57%), followed by mandibular molars(26%), maxillary premolars (10%) and mandibular premolars (6%).The frequency of apical periodontitis in teeth after root canal treatment with at least one untreated canal was found to be 98%[4].

The present case report is about retreatment of a failed Mandibular molar with middle mesial canal. The objective is to identify and management of the earlier missed middle mesial canal. This case report describes the endodontic retreatment performed on a mandibular molar diagnosed with chronic apical periodontitis. This status resulted as a consequence of the failure of the first endodontic treatment performed, where the middle mesial canal was undetected and untreated.

Case Report: A male patient aged 58 years reported to the department of conservative dentistry and endodontics with acute pain in right posterior tooth region. History reveals patient had undergone endodontic treatment in 46, 47. On examination there was no swelling in relation to right posterior region but pain on percussion was elicited on 46. Intraoral periapical radiograph revealed presence of periapical lesion in relation to mesial root of 46 with well obturated mesial and distal root canals. Patient was advised re-root canal treatment in 46. Crown was removed and rubber dam was placed. Access was gained and the gutta percha was removed in mesiobuccal and mesiolingual canals. On careful probing an additional orifice adjacent to mesiolingual canal was identified. This middle mesial canal was found to be untreated. The middle mesial canal was enlarged up to size 20-6%. Canals were irrigated with 2ml with 3% Sodium hypochlorite after every instrumentation followed by saline as final irrigant. Interappointment dressing with Calcium hydroxide was given for 2 weeks. After 2 weeks canals were irrigated with 10m 17% Ethylenediamine tetracetic acid followed by 10 ml of 3% Sodium hypochlorite. Final irrigation with saline was done and obturation was done with lateral condensation using seal apex sealer. Ceramic crown was given after 2 weeks. A follow up radiograph was taken after 6 months and 1 year. At the end of 1-year complete periapical healing was observed.

Discussion

Clinicians normally begin root canal procedures based on observation of external root canal anatomy as guided by radiographs. However, the presence of internal anatomic variances and anomalies is not uncommon. Among these internal deviations, the incidence of middle mesial canals ranges from 0.5% to 15% based on several case reports which make them difficult to locate [13,14]. A study revealed that the mesiolingual canal was the most frequently untreated canal in first (29%) and second mandibular molars (62%) [4].

Nosrat et al. and Versiani et al found significant differences in the incidence of MMC between White (12.2%) and non-White (29.4%) patients [15,16]. A study by Harris et al studied the internal anatomy of 22 mandibular molars in Indian population resulted in presence of isthmus in 100% of the specimens, and 36% had more than 2 canals [17].

Patients of 20 years or younger showed an incidence of 32.1% for negotiable MM canals in mandibular molars[15]. Gu et al studied the isthmus anatomy of 36 mandibular first molars in vitro. They showed a significantly high prevalence (50%) of isthmuses in patients aged 20–39 years compared with 24% in patients older than 60. This inferences that clinicians should spend more time to evaluate the pulp chamber floor area between the MB and ML canals to search for an isthmus when treating mandibular first and second molars of younger patients [18].

Sherwani et al observed that MMC is more prevalent in mandibular first molars which have two distal canals (45.4%) than in those with one distal canal (13.7%) [19]. In contrast, Nosrat et al. found no significant association between MMC and the presence of separate distal canal[15].

Earlier studies reported only independent configurations of middle canals[8]. However, with the introduction of the classification of configuration types by Pomeranz et al the other types were also observed. In the study more numbers of fin configuration were identified than confluent configuration [11]. In contrast, De Pablo et al reported an equal incidence of independent and confluent MMC at the apical third[20].

A study by Karapinar-Kazandag showed that Fin types are likely to be removed during the preparation of the main canals, and may not affect the outcome of the

treatment [21]. On the other hand, confluent type shows separate orifices which eventually merges with the main canal and leads to lateral interconnection/transverse anastomosis thus, connecting the Mesiobuccal and Mesiolingual canals. It is commonly found at the level of 3–6 mm coronal to the apical foramina [22]. While in Independent type there are separate orifices and exit, so undoubtedly needs to be treated.

Considering all the points discussed above, middle mesial canal cannot be negotiated while endodontic therapy of mandibular first molars. The treatment of additional aberrant canals can be challenging, but the inability to find root canals may cause failure.

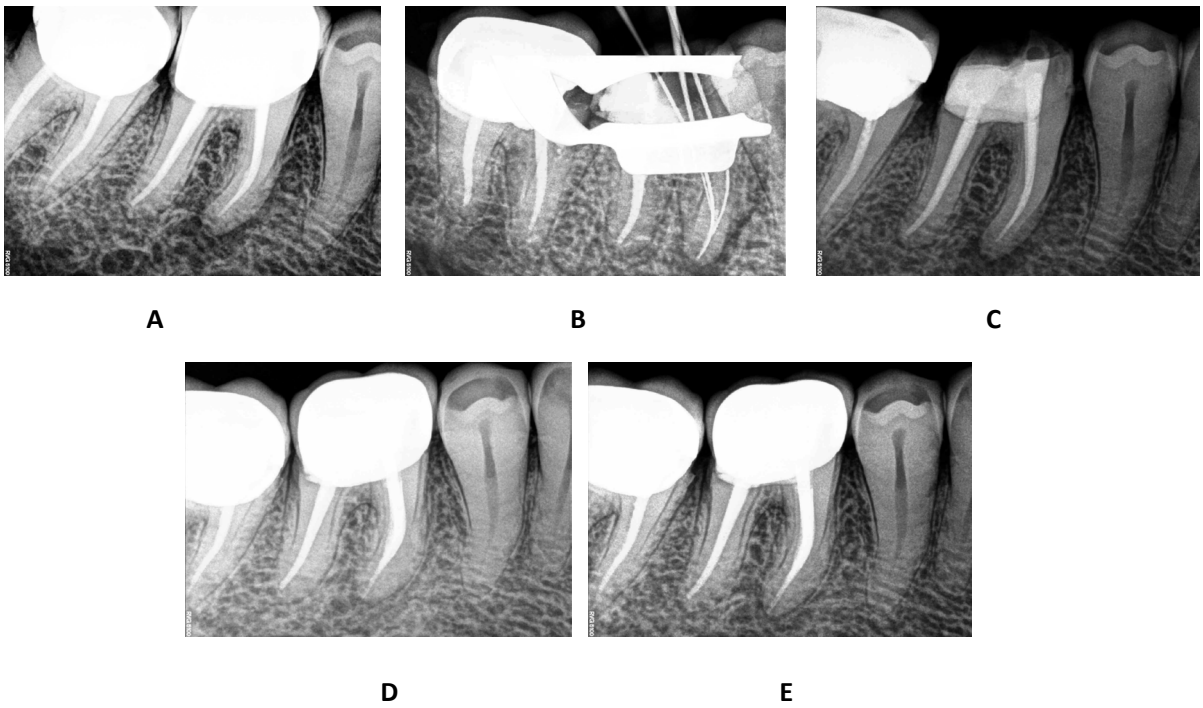

Figure 1: A. Preoperative radiograph, B. working length determination, C. Obturation, D. Recall after 6 months, E. Recall after 1 year

Conclusion

The main goal of this case study is to report a successful endodontic retreatment of a mandibular molar with middle mesial canal. We can conclude that missing a middle mesial canal, improper cleaning shaping-obturation will lead to endodontic failure. This sooner or later will result in periapical infection. Hence, middle mesial canal shouldn't be overlooked while doing RCT in mandibular molars.

Abstract

Amalgam has been replaced by Composite restoration in clinical practice in recent years because of esthetics and improved physical and mechanical properties. But composite resin is a very technique sensitive material and clinician should be aware of the problems in restoring with composite. The principle problem in resin composite are secondary caries, post-operative sensitivity, enamel fracture, cuspal fracture, maintaining proper contour and contact, micro leakage and nano leakage resulting in debonding. Many of these problems can be controlled by the operator. This review gives us insight into difficulties and problems associated with posterior resin composite. As a clinician, it is our responsibility to understand trouble shooting in posterior composite and ways to overcome them for successful long lasting composite restoration.

Keywords: *Composite restoration, Secondary caries, Post-operative sensitivity, Enamel fracture, Debonding.*

Introduction

Posterior composite resin restorations are currently used in 50% of all posterior direct restorations. Posterior composite restorations offer a number of advantages in comparison with other restorative material. Composites are available in various shades, tints, and opaqueness, which allow the clinicians to place highly aesthetic restorations. Composites bonds to tooth, it minimizes the leakage and prevent early loss of restoration. Physical properties of composites are also enhanced. But there are few challenges in using posterior composites they are very technique sensitive material; they depend on cavity size [1], and material properties [2]. Other problems associated with them are discoloration, micro leakage resulting in secondary caries. Polymerization stresses produces residual stresses which could result in debonding of restoration, which results in crack propagation and post-operative sensitivity [3].

Post-operative sensitivity: Polymerization shrinkage stress has the potential to initiate failure of the composite tooth interface if the force of polymerization exceeds dentin bond strength. Gap is produced this results in percolation of oral fluids, Such gaps between the resin and cavity walls may cause post-operative sensitivity[4], microleakage and secondary caries. Post-operative sensitivity accounts for 0-30% of study population n[5]. There could be other factors like acid etching, cuspal deflection due to polymerization shrinkage[6], and microorganism reaching pulp resulting in post-operative sensitivity[7].

Post-operative sensitivity can be prevented or reduced by using low shrinkage composite, following incremental technique, applying RMGIC, desensitizing agent like oxalate[8], HEMA and gluteraldehyde and liners especially in deep cavities. Soft start method of curing will initiate polymerization gradually using low intensity light curing unit to reach gel point and then

increase to higher intensity to complete polymerization of composite[9].

Enamel fracture, cracked cusp, cuspal movement: This stress can exceed the tensile strength of enamel and results in stress cracking and enamel fractures along the interfaces.

Polymerization shrinkage can cause cuspal flexure due to internal stresses that are generated by tooth substrate resisting shrinkage [10]. Tooth deflection, tooth fracture, interfacial debonding, deformation of the contracting composite and deformation of bonding component and liner are associated with stress generated during contraction of dental composite. Fractures within enamel near margins have been directly related directly to curing contraction of dental composite. The factors that determine the cuspal deflection are bonding interface[11], temperature and humidity[12] and amount of remaining tooth structure[13].

Incremental technique reduces polymerization shrinkage and cuspal fracture one popular technique is oblique incremental, because it reduces C-factor. Light curing Method like soft start and pulse delay reduce polymerization shrinkage stresses but still maintaining degree of conversion[14]. Modification of composition of composite for example low shrinkage composites likes silorane they have less of polymerization shrinkage.

Secondary Caries: Secondary caries is a main cause of failure of composite[15]. Polymerization shrinkage is decrease in volume of the resin during and after polymerization reaction, resulting in volumetric contraction of 1.5-5%[16].There is decrease in molecule to molecule distance between monomer in a liquid state and those that are covalently bond. This shrinkage creates polymerization stresses as high as 13MPa between composite and tooth structure. These stresses severely strain the interfacial bond between the composite and the tooth, leading to a very small gap that can allow marginal leakage of saliva. Microgap between tooth and composite facilitates microorganism entering between the tooth and restorative interface resulting is secondary caries[17]. Composite does not poses antibacterial property[18] and buffering properties could result in secondary caries[19].

Poor Retention: Poor retention will result in restorative failure. Causes of poor retention are inadequate preparation form, adequate bevels or flares and secondary retentive feature should be provided wherever needed. Contamination of operating area due to improper isolation, rubber dam is mandatory to keep the area of operation dry. Poor bonding technique, acid etching and bonding agent should be followed according to manufactures direction. Clinical factors affecting adhesion are moisture contamination from handpiece, and saliva, oil contamination from handpiece, surface roughness of teeth, Mechanical undercuts in tooth preparation, presence of calculus and dehydration. Physic chemical properties of enamel, dentine and the effect of acid etching technique, dentine permeability, the dentine smear layer, Moist versus dry dentin surfaces. Hydrolytic degradation and enzymatic activity in dentine could result in adhesive failure of composite [20]. Matrix metallo proteinase and cysteine cathepsins are endopeptidase capable of degrading extracellular matrix protein in presence of bacterial acids resulting in bond disruption[21]. Chlorhexidine, Quanternary Ammonium compounds they have anti-MMP property could reduce bond disruption thereby reduce Nanoleakage and this intern would reduce debonding. Improved adhesive technology has reduced debonding nevertheless complexity of dentine makes it a challenge when compared to enamel.

Maintaining proper contour and contacts: One problem regarding posterior resin composite restorations is the difficulty achieving ideal proximal contours and contacts in Class II cavities. Open contacts lead to food impaction, periodontal disease, tooth inclination, faulty occlusion and excessive wear. The selection and placement of matrices to restore proximal boxes with composite resin are very important for obtaining an adequate restoration.

Traditional, relatively thick metal matrices used for amalgam placement often do not yield good results. Various preformed clear plastic or polyster (Mylar) bands also have yielded unpredictable results for some clinicians. New matrices and contact-forming instruments have been developed to compensate, not only for the thickness of the matrix band, but also for the shrinkage and lack of body of the composite resin. There are numerous sectional matrix system have come into market. Proximal contour and contact should be precisely reconstructed.

The Palodent System (Darway Inc.) and Composi-Tight System (Garrison Dental Solutions)-consist of sectional matrices and bitine or G-shaped rings that engage the undercuts to stabilize the bands. Pressure from the rings and wedges helps separate adjacent teeth

to achieve interproximal contact. This system consists of one size of contoured sectional matrix bands and a "BiTine" ring. The purpose of the BiTine ring is two-fold:To apply an interproximal wedging force to enhance contact formation and to aid in the proximal contouring of the restoration. Study done by Loomans et al showed sectional matrix with separator ring was better than toffelmiersystem[22].

V Ring Sectional Matrix System-facilitates the contouring of posterior Class II composite restorations. The V-Ring separator has a stainless steel inner ring and a nickel-titanium outer spring with V-shaped tines. The tines are placed over the wedge on the buccal and lingual surfaces to enhance tooth separation,V3 ring and palodent plus are made of same element, in both this system they recommend to remove metal fin of the wedge once the cavity is finished and inserting the matrix with the wedge placed interproximally[23][24].

Quickmat sectional matrix system-This has been designed to produce anatomically accurate approximal amalgam or composite fillings in the posterior region, The contoured matrices adapt fully to the contact area of the adjacent tooth and, in conjunction with the wooden wedges, surround the cervical shoulder.

The Microband (Dental Innovations)-is a new micromachined matrix band developed specifically for Class II posterior composite resin restorations.

Hawe Blue and Transparent Adapt Sectional Matrix System-the approximal shaperis the component which complements the sectional in the form of a ring with special fittings: The shaper is transparent so as not to obstruct light-curing. It is intended to be disposable, to eliminate problems of hygiene and substance fatigue.

Conclusion

The demand for tooth-colored restorations has grown considerably during the last decade. However, successful adhesion can be highly technique and substrate sensitive, often hinging on proper material and patient selection. Evidence–based dental research offers a dispassionate reference for the applicability, procedures, and prognosis of tooth–colored restorations.

Abstract

Aim and Objectives: The study aims in investigating the awareness of dyslexia among school teachers (primary, secondary and higher secondary) of Chennai, India and also to determine whether age, years of experience of school teachers, location and type of school (Government/Government aided or private) influence awareness of dyslexia in teachers.

Materials and Method: The study sample consists of 249 teachers from schools in Chennai. A validated questionnaire consisting of 20 questions was used to assess the knowledge of dyslexia among school teachers.

Results: The results show that the overall awareness of dyslexia among school teachers varied between inadequate knowledge to adequate knowledge. Age and years of experience has an influence on the awareness of dyslexia. But the location and type of school did not show statistically significant difference.

Conclusion: Majority of the school teachers (54.6%) were found to be fairly adequate knowledge on dyslexia. Thus, educating all the teachers about the characteristics of dyslexia and guiding them in identifying and providing adequate support to the dyslexic children is one of the important aspects that has to be focused. Thereby, providing educational training program will aid in early identification and intervention for children with dyslexia.

Keywords: *Dyslexia; Teachers; Awareness; Chennai.*

Introduction

Specific learning disorder is the basis for the abnormalities at a cognitive level that are associated with the behavioural signs of the neurodevelopmental disorder. This first manifests during the years of formal education and is characterized by persistent and impairing difficulties with learning foundational academic skills in reading (Dyslexia), writing (Dysgraphia), and/or math (Dyscalculia). The prevalence of specific learning disorder across the academic domains of reading, writing, and mathematics is 5%-15% among school-age children across different languages and cultures [1]. In India the prevalence of learning disorder among school children is around 13-14%[2].

An alternative term used to refer to a pattern of learning difficulties is 'dyslexia' which is characterized by problems with accurate or fluent word recognition, poor decoding, and poor spelling abilities [1]. Dyslexia is a specific developmental disorder in learning to read, which is not the direct result of impairments in general intelligence, gross neurological deficits, uncorrected visual or auditory processing deficits, emotional disturbances or inadequate schooling[3,4,5]. Dyslexia is the most common one, affecting 80% of all those identified as learning-disabled[6]. Significant gender differences were reported, with boys being more affected than girls (4:1).

Identification of a learning-disabled child is the first step to prevent learning disabilities. Children with mild learning disabilities are often unnoticed and are enrolled in normal schools. In such circumstances, teachers should play a vital role in identifying children with dyslexia as they are the child's first contact after school entry and are the ideal person to detect a learning difficulty. Thus, there is a need that the teachers should have a higher level of awareness about dyslexia for the timely diagnosis of the disorder [7]. Unfortunately, these children are often missed, as most of the teachers and parents either ignore the child's difficulties or blame it on their personality considering it as laziness, an attitude problem or aggression and so the child continues to graduate from one class to the other, totally incompetent at handling the pressure of the higher classes, leading to behavioural problems. A study conducted on elementary school teachers in India showed that Only 1 in 3 teachers had adequate knowledge of dyslexia[8].

Aim and Objectives: This study aims in determining the awareness of dyslexia among school teachers educating students enrolled in regular schools irrespective of medium of education (English or Tamil). Objectives include:

- To assess and profile the awareness of dyslexia among school teachers currently working in regular schools of Chennai.
- To determine whether age, years of experience, location of school influence awareness of dyslexia in school teachers of Chennai.
- To study whether type of school (Government/ Government aided or private) influence awareness of dyslexia among school teachers.

Materials and Method

Tools for data collection: A questionnaire was developed to assess the awareness of dyslexia among currently working school teachers of Chennai. 40 statements were developed based on the general myths and characteristic features of dyslexia which includes following domains: language, reading, writing, math, attention, social/economic factors. Using a likert's scale of 7-point rating, content validation of the statements was done with the help of experienced clinical psychologists and speech language pathologists in terms of the statement's level of appropriateness to the study. Repetitive items were omitted and 20 high scored statements were considered to be most appropriate and were selected for the final questionnaire.

Area of the Study: Schools in Southern and Central parts of Chennai, irrespective of medium of education were selected.

Inclusion and Exclusion Criteria: Regular school teachers who are currently working in Chennai regardless of the standards handled (primary, secondary and higher secondary) were included in the study. Teachers who have qualification in special education or certification in dyslexia were excluded from the study.

Participants: The convenient sampling method was adopted. 257 school teachers had participated in the study. 8 teachers were excluded due to their certification in special education and the responses of 249 teachers were taken for data analysis. Among the 249 teachers 224 participants were females and 25 participants were males with a mean age of 39 years (20-61 years). Their experience year ranged between 4 months to 32 years with a mean of 11.17 years. The participants were grouped based on the following: age, years of experience, type of school, and location/area of the currently working school.

Procedure: A self-rating questionnaire consisting of 20 items which can be graded on a 5-point level of agreement scale (Strongly disagree to strongly agree) were circulated among teachers through school-wise distribution with prior permission from the authorities and as online forms to assess their knowledge. Cross-sectional study design was used and the data was collected with informed consent obtained from all the participants. The purpose of the study was explained and the participants were assured of anonymity of their responses. The collected data were tabulated for analysis and statistical computation.

Results

Responses of 249 participants based on their agreement with all the 20 statements were listed in table 2. The mean scores obtained by the participants for each statement and the statement's level of appropriateness towards the questionnaire (chi square values and p-values < 0.05) were tabulated in table 3. The overall awareness of dyslexia was categorized based on the scores obtained by the participants. A score of less than or equal to 10, 11-15, greater than 15 were considered to be inadequate, fairly adequate and adequate knowledge respectively and the results revealed among the 249 participants 65

teachers had inadequate knowledge, 136 teachers had fairly adequate and 48 teachers had adequate knowledge on dyslexia as shown in figure 1.

Pearson's correlation analysis was performed to identify if significant relationship exists between age and awareness score. Results revealed significant correlation between awareness score and age (p value 0.00) since the p-value is less than 0.05. The strength of correlation was found to be mild as the correlation score is between 0.01-3. Similarly, relationship between years of experience and awareness score was established which revealed highly significant correlation (p value 0.00) with mild correlation strength.

The 249 participants were divided into 2 groups based on their age. Group 1 included individuals less than 40 years that is young teachers (142 participants) and group 2 included individuals greater than 40 years that is older teachers (107 participants). Mean scores of the groups revealed group 1 with a mean of 58.03 ± 18.517 and group 2 with a mean of 65.42 ± 14.796. Independent t-test was performed to compare between 2 groups the results showed statistically significant difference between young teachers and older teachers with p value of <0.05. Similarly, difference between the 2 groups based on their years of experience that is less experienced (less than 10 years of experience-135 participants) and highly experienced teachers (greater than 10 years of experience-114 participants) were assessed using independent t-test. Since p value is < 0.05 significant difference was observed between the 2 groups. Mean scores of the groups revealed 58.41 ± 19.13 for group 1 and 64.52 ± 14.42 for group 2.

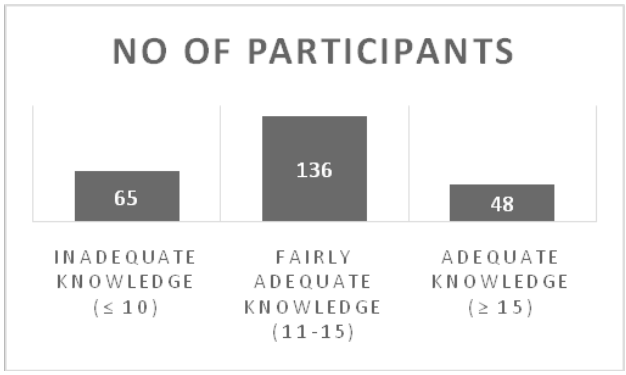

Figure 1: Overall knowledge of the participants

No significant difference was obtained between awareness of government and government aided schools (Group 1) versus private school teachers (Group 2) based on independent t–test analysis as the p value obtained was not less than 0.05. The mean scores of the above groups were 61.83 ± 14.754 and 60.85 ± 18.735, respectively.

On obtaining the difference in dyslexia awareness among school teachers working in different areas of Chennai city that is Central Chennai and South Chennai also reveals that there is no significant difference between the groups and the mean values are 61.51 ± 14.232 and 61.08 ± 18.562, respectively.

Discussion

The aim of the study was to determine the awareness of dyslexia among school teachers in Chennai and also to determine whether age, years of experience, location and type of school influence awareness of dyslexia in teachers. The study was conducted on 249 school teachers of Chennai using a validated questionnaire. The results revealed 48 (19.2%) teachers had adequate knowledge, 136 (54.61%) teachers had fairly adequate and 65 (26.10%) teachers had inadequate knowledge indicating that a majority of the respondents had a fairly adequate knowledge which is contradicting to the literature studies that the school teachers exhibited low level of awareness or inadequate knowledge towards dyslexia. [8, 9, 10, 11]. One of the literature studies shows similar results as 39 (35.5%) had average knowledge, 32(29.1%) had below average, 30(27.3%) had good and very few of them had 9(8.2%) excellent knowledge. [12]. Most of the studies showed inadequate knowledge while our study shows majority have fairly adequate knowledge. This increase in knowledge level could be because of source of information from books, movies, shared knowledge from colleagues, television and newspapers with major source of information from books [8]. Though, there is a slight increase in knowledge is seen, this growth in knowledge still remains insufficient in supporting children with dyslexia. It requires an art and skill to guide these children in their way to make them understand the concepts and sufficient knowledge is required to counsel and guide their parents in getting the help of Speech language pathologists/Special educators and learning the strategies to have a grip on these children, thereby providing these children a timely grip and confidence to succeed in their lives.

In determining the correlation between the age and experience of teachers against their level of awareness, the results supported with the literature indicating that the age and years of experience of teachers influence their awareness level, though, their correlation

strength was mild[9,12]. A highly significant correlation obtained between years of experience of teachers and their awareness level shows a significant association, indicating that as their teaching experience increases, their level of knowledge towards these symptoms increase[12]. Also, few other studies in the literature has even shown that there is no association between age and teaching experience of the respondents to their awareness level[10].

In studying whether the type and location of school has any influence over the awareness of school teachers working currently in Chennai, this study revealed that there is no association that is existing between the locality and the type of school. Irrespective of where the school is located, whether in central parts or southern parts of Chennai and whether the school is Government/ Government aided or private, this study reveals that the awareness does not depend on these factors, but on the teacher's self-knowledge. There are both supporting and opposing studies available in the literature. [9, 10]. But there are no literature studies that is carried out on location same as our study (central parts or southern parts of Chennai).

Conclusion

In conclusion, the present study reveals that the awareness and knowledge level of school teachers on dyslexia is fair and their awareness level shows a positive correlation with their age and teaching experience. Thus, this study clearly depicts that the school teachers are still in need of education and training towards identifying children with dyslexia, in spite of the advancements made in improving their awareness [13]. Regular updates and training sessions for the school teachers would benefit these children and acts as a great leap in enhancing the awareness of the community. As well, it also requires the interest and commitment of both the teachers and the SLPs in learning, educating the fellow professionals and implementing the knowledge in action.

Abstract

Chronic rhinosinusitis leading to nasal polyps affect approximately 4.3% of the population. Most of the people with Chronic rhinosinusitis have a history of allergy. Here in a case report of a sinonasal polyp with an impact of allergy in pathophysiology . We are presenting a rare case report of Sino nasal polyp, which initially posed a diagnostic dilemma due to its intriguing clinical presentation. Computed tomography (CT) Investigation is the preferred method for the paranasal sinus pathologies, because of the exquisite bony detail of the PNS anatomy.

Keywords: *Chronic rhinosinusitis, Sino nasal polyp, Computed Tomography.*

Introduction

Of people with chronic rhinosinusitis (CRS) 10% to 54% have allergies.[1] The term polyp is derived from Greek word meaning many footed.[2]Nasal polyps occur more frequently in men than women with increased prevalence over the 40 years of age. Sino nasal polyp refers to hypertrophied oedematous prolapsed nasal or sinus mucosa due to infection, inflammation,allergy. It is considered as one of the possible diagnosis in atopic patients. The exact aetiology of Sino nasal polyps is unknown.[1] Polypoid nasal mucosa and polyp formation is a poorly understood condition that may be a multifactorial (Allergy, chronic inflammation, turbulent air flow and gravity).[3] Allergy has been implicated as possible aetiology.[4] The basic mechanism behind polyp formation is the allergy leading to chronic inflammation of the mucosa termed sinusitis, thereby under certain circumstances the mucosa gets thickened and frequently forms into irregular folds called polyps.

Case Report: The patient 45 year old man complained of pus like discharge from the upper left posterior region for about 1 week. History of presenting illness revealed that pus discharge was preceded by pain followed by mild swelling of the left side of the face for the past 3 months. By occupation the patient was a carpenter, who is frequently exposed to saw dust. Habitually the patient was a chronic smoker for about 25 years, smoking 2-3 cigarettes/day. Past dental history revealed the sinus tract opening on the left sub mandibular region [Figure 1] with nocorrelation to the present chief complaint. On extraoral examination mild facial asymmetry is detected on the right side of the face .No secondary changes over the left half of the face. On intra oral examination, poor oral hygiene with generalised chronic gingivitis with localised periodontitis in relation to 26,27,36 along with furcal involvement is seen. Denuded bone is seen along with pus discharge in relation to buccal aspect of attached gingiva of maxillary posterior, extending from distal aspect of 23 to mesial aspect of 26 anteroposteriorly and superoinferiorly extending above the CEJ till the buccal vestibule .[Figure 2] On palpation the denuded bone was mildly tender and compressible.

On examining the hard palate, a diffuse swelling [Figure 3] is seen extending from the palatal aspect of 21 to mesial aspect of 26, not involving the midline, with

no secondary changes. The swelling was firm and tender on palpation. Based on the age, history and clinical presentation of the lesion provisionally the condition was diagnosed as osteomyelitis of left maxilla. Blood investigation revealed increased and fasting blood sugar level-320 mg/dl, post prandial blood sugar level–480 mg/dl,H b1Ac–11.3%.Eosinophil count was markedly increased. Swab culture was taken,which revealed the presence of gram positive bacteria on agar agar medium.

Intraoral radiograph revealed bone loss, widening of PDL space in relation to 24, 25, 26 and occlusal radiograph revealed mild haziness. OPG revealed haziness on left maxillary sinus.PNS view shows deviation of nasal septum towards right and haziness corresponding to radiopaque lesion on left maxillary antrum with intact sinus wall [Figure 4].

CT scan was taken at 120kv,200 m As. Coronal CT and Axial CT showed hypodense mass in the left maxillary sinus with bony erosion, peripheral mucosal thickening [Figure 5,5a]. Nasal septum deviation was seen towards the right. Radiographic provisional diagnosis of maxillary antrum carcinoma was given based on CT findings. Patient was referred to ENT department for further evaluation. Nasal endoscopy [Figure 6] was performed and revealed the presence of single large growthextending from the maxillary sinus into the nasal cavity via the ostium. Incisional biopsy was performed under aseptic condition and the specimen was sent for histopathologic evaluation. Histopathology revealed, the presence of Chronic inflammatory cells and muco serous glands in the stroma with remarkably large number of eosinophils [Figure 7] suggestive of allergic in nature.

Considering the occupational history, radiographic presentation, and nasal endoscopic findings and correlating the same with histopathological evaluation, the case was finally diagnosedas a sino nasal polyp of left maxillary antrum. Patient was put on antibiotics to overcome the super added bacterial infection following which he was referred to ENT department and diabetologist for further management.

Discussion

Polypoid nasal mucosa and polyp formation is a poorly understood mechanism that may be a multifactorial[3] 25% percent patients with allergic rhinitis develop polyp. Allergy has been considered as the possible etiologic factor. As an occupational hazard, the patient was frequently exposed to saw dust, stressing the role of allergy in the etiology of polyp formation. Males are more commonly affected than females but no such specific genetic or environmental factors plays role in the development of this disorder. It affects middle age with the average age of onset being 42 years and the typical age of diagnosis ranging from 40–60 years.[5]

Clinical features of sinonasal polyp include nasal congestion,blockage, rhinorrhoea, posterior nasal drip, and decreased sense of smell and taste.[6] Our patient does not revealed any such symptoms,except for the history of pain and pus discharge which posed a varied diagnostic information. About 63%,Chronic rhinosinusitis patients show colonization of *Staphylococcus aureus* and develop specific Ig E antibodies against S.aureus.[7] S. aureus, play a role in disrupting the epithelial barrier leading to increased bacterial colonization.[8] In our case we have isolated gram positive *Staphylococcus aureus* from the swab obtained at the clinical site.

Coronal computed tomography has become the primary imaging modality,replacing plain radiography since 1990's. In our case,we have performed CT imaging apart from OPG,PNS view, followed by functional endoscopy to clinically assist in the final diagnosis and treatment procedure. Overall mucosal thickening corresponding to sinusitis and bone destruction is common in polyps. It is evident in our case and more appreciated on CT rather than plain radiography. Nasal septal deviation is an indicator for sinus inflammation. [9] In our case,nasal septum deviation was seen towards the right due to the obliteration of the maxillary sinus by the mass and extending via the ostium to the left nasal cavity.

A combined medical and surgical approach has been advocated by other studies to be an efficient option in its management[10]. In our case, incisional .biopsy was performed with the help of functional endoscopy and sent for histopathologic examination. Antibiotic was prescribed, Amoxicillin–500 mg tid, metronidazole–400 mg bid.Chronic rhinosinusitis patients without DM, have less prevalence for nasal polyp compared to patients with Diabetes mellitus. [11].In our case, the lesion was devastating due to the high blood sugar levels which lead to colonisation of bacterial infection leading to

destruction of the palate.

Figure 1. Denuded bone with pus discharge in relation to 23 to 26 buccal aspect

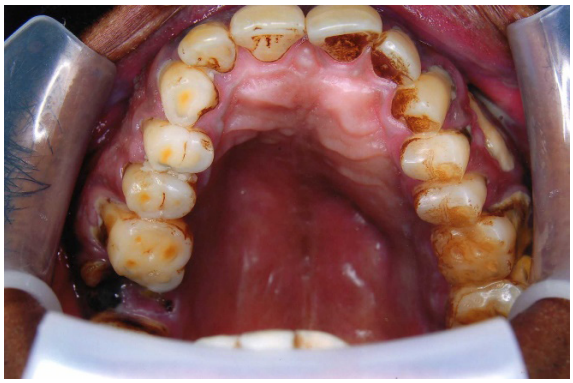

Figure 2. Hard palate examination revealing a diffuse swelling

Figure 3. Coronal CT and Axial CT showing hypodense mass in the left maxillary sinus with bony erosion, peripheral mucosal thickening

Figure 4. Nasal endoscopy revealing the presence of growth

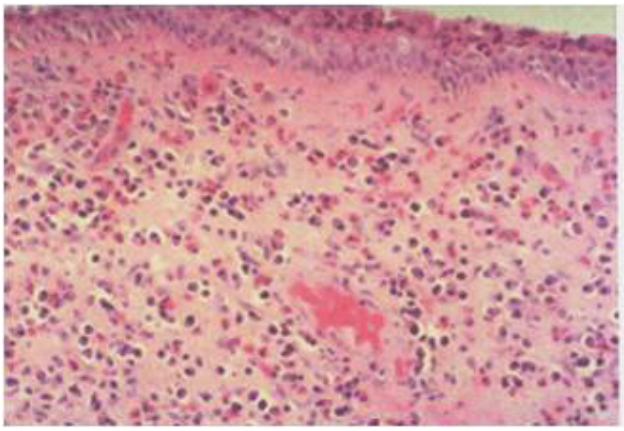

Figure 5. Histopathology of sinonasal polyp

Conclusion

Sino nasal polyps can have multitude presentations, often simulating infectious and malignant pathologies. Hence diagnosing them correctly is of paramount importance. It is mandatory to rule out the possible etiological factors hailing from personal history, occupational history, past medical and dental history, as it provides additional and more important guidelines for deriving the final diagnosis.

Corticotomy Assisted Fixed Orthodontic Treatment vs Non Corticotomy Assisted Fixed Orthodontic Treatment: A Randomised Clinical Trial Study

Deepak C.

Professor, Department of Orthodontics Sree Balaji Dental College & Hospital BIHER Chennai

Abstract

The rate of Orthodontic tooth movement has always been of interest as the treatment is generally of a long duration . Several issues of a long Orthodontic treatment include maintenance of oral hygiene and patient compliance .

Corticotomy assisted fixed orthodontic treatment uses the phenomenon of RAP (regional acceleratory phenomenon) . This study (Split mouth randomised clinical trial study) aims to quantify the rate of tooth movement between the corticotomy and non corticotomy sides . The Corticotomy side showed a significant rate of tooth movement (Canine retraction) compared to the control side .

Keywords: *Rate of tooth movement, Corticotomy, RAP.*

Introduction

Fixed Orthodontic treatment has always had the bane of being that off a long duration, the treatment involves meticulous oral hygiene and compliance from the patient, apart from social effects of visible appliances. Several attempts have been made to see if the rate of tooth movement by fixed orthodontics could be speeded up. Corticotomy assisted fixed appliance treatment has shown to improve the speed of the treatment, mainly due to the effect of RAP (Regional acceleratory phenomenon) first described by Frost[1]. The basic mechanism of RAP seems to accelerate the rate of alveolar bone turn over, compared to the non RAP treatment[2] . Several studies have been done using RAP and techniques like the PAOO by the Wilkco brothers and the micro osteotomies have been shown to increase the rate of alveolar bone remodelling[3,4,7].

The aim of this study to understand the effect by quantification of the fixed orthodontic treatment by RAP corticotomy versus the non corticotomy. The study is designed to a randomised clinical trial study.

Method and Methodology

51 fixed Orthodontic patients were selected for the study including boys and girls in the age group of 16 to 25. The exclusion criteria included patients with periodontal breakdown. The patients were evaluated by two examiners and were divided into two groups, the group was selected by picking of lots and the maxillary right canine retraction was selected as controls . The Experimental side, the flap was raised from the canine till the second molar and horizontal cuts of 0.5 mm were placed to simulate RAP . The retraction of the canines both experimental and control was done simultaneously using a 100 g force NiTi closed spring.

The rate of canine retraction was measured at the start of treatment (T1) and the end of three months (T2).

Results

Patient approval was taken before starting the treatment . The process was explained and consent forms signed. The results showed a significant difference in the rate of canine movement between the experimental and control sides, 1 patient discontinued the study due to personal reasons.

Discussion

The Rate of tooth movement was always been a topic of study as more and more patients opted for Orthodontic treatment but the duration of the treatment had been a deterrent to the treatment [9] . Several studies have been done on animals and humans to determine the best means to accelerate orthodontic tooth movement, off the different means coticotomy assisted tooth movement seems to have sufficient evidence[3,4,5,6,7,8]. The present study aimed at understanding the role of corticotomy in accelerating tooth movement . The rate of tooth movement which was increased in the experimental side seems to be mostly due to tipping rather than a bodily movement, but as the retraction was done along the arch wire this was an accepted outcome[10.11.12].

The current study was focused on understanding the role of corticotomy assisted orthodontics and increased rate of tooth movement (canine retraction) in patients undergoing orthodontic treatment. The study was designed as a ramdomised split mouth study . Both the patients and evaluators were blinded .

Conclusion : The study of effect of corticotomy in orthodontic treatment was designed as a randomised split mouth study, the results showed a significant increase canine movement between the control and experimental side . The role of corticotomy in fixed orthodontic patients seems to increase the rate tooth movement and thereby affect the timing of orthodontic treatment.

Comparison of the Characteristics of Dental Stem Cells vs Umbilical Cord Stemcells

Arun T.[1], Ponnudurai Arangannal[2], Jeevarathan J.[3], Vijayakumar M.[4], Amudha S.[5], Aarthi J.[5]

[1]Post Graduate Student, Department of Pedodontics, [2]Professor and Head of the Department, [3]Professor, [4]Senior Lecturer, [5]Reader, Sree Balaji Dental College, BIHER, Pallikarani, Chennai

Abstract

Mesenchymal Stemcells-have been considered a promising tool for tissue repair and regeneration. Different sources of mesenchymal stem cells may differ in their biological characteristics and clinical applications. This short communication gives an over view about the isolation, characterization, multi lineage and proliferation capacity of mesenchymal stem cells from umbilical cord and stem cells from human exfoliated deciduous teeth (SHED).The differences may be associated with different levels of cytokines, growth factors, surface markers, fibroblast growth factors, vascular endothelial growth factor expression and receptor activity.

Keywords: *Mesenchymal stem cells, dental stem cells, umbilical cord stem cells, stem cells from human exfoliated deciduous teeth.*

Introduction

History of adult stem cells starts in the late 1960s. Researchers discovered two kinds of bone marrow cells,namely hematopoietic stem cells and stromal stem cells. Hematopoietic stem cells have the capacity to form blood cells and stromal stem cells have the capacity to form progenitor cells.[1] An ideal stem cells should have the ability to self-renew themselves throughout life,should have the capacityto differentiate into progenitor cells and Should renew the tissue that they populate. Stem cells can be harvested at all stages of life from the inner cell mass of 5 days old embryo as well as collected from the olfactory epithelium of seniorcitizens. [2] Depending on the plasticity, stem cells are divided into three groups–namelytotipotent, pluripotent and multipotent. Totipotent cells are able to divide and produce all the cell in an individual, including embryonic tissues. Pluripotent stem cells can be differentiate into any of three germ layers and multipotent stem cells can develop into more than one cell type, but they are more limited than pluripotent cells; adult stem cells and cord blood stem cells are considered as multipotent cells.

Dental Stem Cells: Dental and umbilical cord stem cells are great sources of stem cells because of their non aggressive isolation method and they can be obtained from discarded medical tissues.[3] Stem cells from human exfoliated deciduous teeth (SHED) havethe capacity to differentiate into osteogenic cells, odontogenic cells, adipocytes and neural crest cells. They are derived from an accessible tissue source and capable of high proliferation and express high telomerase activity during their exfoliation. [4] Dental tissue derived stem cells are more restricted in their differentiation potency when compare to other sources of stem cells. Also, dental mesenchyme is termed as ectomesenchyme because of its earlier interaction with neural crest, from this perspective ectomesenchyme derived stem cells can possess different characteristics of neural crest cells.[5]

Stem cells from human exfoliated deciduous teeth (SHED): SHED proliferates faster with population doubling than dental pulpal stem cells and bone marrow stem cells. SHED shows the capacity of osteogenic and adipogenic differentiation (Miura et al., 2003). Pulp tissues are obtained from the exfoliated primary teeth of children aged between 8 and 15 yrs. In vitro cultured SHED express variety of neural cells marker. In vivo

Corresponding Author:

Department of Pedodontics & Preventive Dentistry, Sree Balaji Dental College & Hospital, Narayanapuram, Pallikaranai, Chennai 600100
e-mail: drapdurai66@gmail.com

studies, SHED produce dentine-pulp like structure but without complex formation. Osteogenic capacity of SHED can be inducing recipient murine cells to differentiate into bone forming cells. Neurogenesis of SHED was studied by injection of SHED into the dentate gyrus of the hippocampus of immunocompromised mice. In this study SHED showed the capacity to survive more than 10 days inside the mice brain and expressed neural markers[6]

Umbilical cord stem cells (UCMSC): With the concern of parents, Blood can be collected from the umbilical cord tissue of healthy newborn shortly after birth,instead of discarded as biological waste. This procedure does not hurt the baby or mother in anyways and it is free of ethical issues. Umbilical cord blood mainly contains hematopoietic cells and mesenchymal stromal cells. Umbilical cord derived mesenchymal stem cells have excellent proliferation potency. Umbilical cord blood has been shown to be therapeutically useful for rescuing patients with bone marrow related deficit and inborn errors of metabolism and it has less incidence of graft vs host disease and can be used allogenically.[6][7] Mesenchymal like cells from umbilical cord blood can express neural markers when differentiated. In vitro umbilical cord mesenchymal cells can be induced to become cells with morphological and biochemical characteristics of neurons[8]

Comparison: SHEDs and UCMSCs have high proliferation potential[9][10] and the proliferation capacity of SHEDs is relatively stronger since they are in an active state and show high telomerase activity when deciduous teeth are replaced by permanent teeth[11] Mesenchymal stem cells originating from both tissues are highly similar but their differences are functionally related to their origin;for example, Mesenchymal stem cell derived from dental pulp tissue is more committed to the osteoblastic and odontogenic lineages, whereas mesenchymal stem cells derived from umbilical cord tissue would be more committed to angiogenesis.[11] SHED and Umbilical cord stem cells derived mesenchymal cells expressed intermediate filament protein Nestinand NANOG homeobox protein, these are the markers of embryonic stem cells, and they play an important role in the maintenance of pluripotency and self-renewal[12] Differentiation potential for osteogenesis is significantly higher in dental stem cells than umbilical cord stem cells[13] Experimental studies on animals have proved that dental stem cells especially SHED have multiple lineage and it can differentiate into active neurons, which prove its usefulness in management of degenerative diseases such as Parkinsonism and Alzheimer's.[14] Dental stem cells showed the ability to regenerate in an infarct area in experimental rats after inducing myocardial infarction with angiogenesis and improved ventricular function.[15]

Conclusion

Mesenchymal stem cells derived from umbilical cord and pulp tissue of SHED have self-renewal capacity and multipotentiality. Compare with UC, SHED mesenchymal stem cells have the advantage of treating bone injury due to the higher osteogenic differentiation ability and SHED stem cells have lower cell apoptosis than that of umbilical cord. Dental stem cell banking has more advantage over umbilical cord stem cell banking. SHED stem cells can be harvested in later part of life even if the parents missed the chance of storing umbilical cord and it can be stored at various stages,it is cost effective than cord stem cell banking. Dental stem cells can be used as a tool in the regeneration of different body tissues in future.

An Update of Pulpotomy Medicaments in Primary Molars and Shift to Nature

Ishwarya R.[1], Aarthi J.[2], Ponnudurai Arangannal[3], Jeevarathan J.[4], Amudha S.[5], Vijayakumar M.[5]

[1]Post Graduate Student, Department of Pedodontics, [2]Reader, [3]Professor and Head of the Department, [4]Professor, [5]Reader, Sree Balaji Dental College, BIHER, Pallikarani, Chennai

Abstract

Over the years several products have been proposed and testified as pulpotomy medicaments for primary teeth. Formocresol has been considered as gold standard for this procedure. Despite its clinical success, the use of formocresol has declined due to its apparent mutagenic and carcinogenic property. Controversies regarding the use of formocresol has urged the researchers to constantly pursuit for a promising alternative. Phytotherapy has been a recent trend. The aim of this paper is to analyse the existing literature on the various pulpotomy medicaments available for primary teeth and the evolution of natural products for the same.

Keywords: *Pulpotomy medicaments, Formocresol, controversies, phytotheraphy.*

Introduction

The main objective of paediatric dentistry is to preserve the primary teeth until their exfoliation. Primary teeth is the best space maintainer. Pulpotomy is indicated in primary teeth with deep caries. Pulpotomy is a widely accepted procedure in which the entire coronal pulp is removed with the aim of removing all the infected pulp tissue and radicular pulp is treated using a suitable medicament. Over the years various medicaments have been used which includes formocresol, glutaraldehyde, ferric sulphate, calcium hydroxide, MTA etc. One recent trend has been the use of natural product as pulpotomy medicaments. This is due to their profound antibacterial and anti inflammatory properties. This paper aims to analyse clinical and radiographic success of various pulpotomy medicaments including that of the natural alternatives.

Formocresol: Formocresol, a benchmark medicament for pulpotomy in primary teeth has been subjected to controversies due to two main reasons. It causes devitalization of radicular pulp tissue and is regarded as cytotoxic and carcinogenic.[1]

Mechanism of Action: Protein bonding inhibition of enzyme fixation of pulp tissue **(hyaluronidase).** The primary component in formocresol is formaldehyde which is toxic to living tissues.

Formaldehyde is a small molecule and hence it penetrates the apical foramen easily[2]. In 2004, International Agency for Research on Cancer (IARC) reclassified formaldehyde as a known carcinogen from human probable carcinogen. The second active ingredient in formocresol is cresol. It does not enter systemic circulation because of its poor solubility. Despite its controversies the clinical success rate of formocresol is reported to be 93%-98%.

WHO has estimated daily consumption of formaldehyde to be 15 to 14 milligram per day. But the formaldehyde dose associated with pulpotomy procedure is 0.02-0.10 mg. **DPx (DNA–protein cross links)** is a DNA damaging product produced by formocresol when it is exposed to cells. It causes mutation and cell death. However, DPx does not sustain in tissues for more than few hours due to its spontaneous hydrolysis. Hence the role of DPx in formaldehyde induced carcinogenesis is controversial[3]. Milnes published an extensive review on carcinogenicity of formaldehyde and concluded that

Corresponding Author:
Aarthi J.
Reader, MDS, Department of Pedodontics & Preventive Dentistry, Sree Balaji Dental College & Hospital, Narayanapuram, Pallikaranai, Chennai 600100
e-mail: aarthijagadeesan@gmail.com

formaldehyde is not a potent human carcinogen under conditions of low exposure[4].So evidence presented in the review of the existing literature indicates that formocresol is a safe medicament when used judiciously. However the reports of some studies are not in favour of formocresol. Hence, the obsolescence of formaldehyde is still under debate.

Alternatives to formocresol:

Glutaraldehyde was introduced by Kopel in 1979. It has been suggested as an alternative to formocresol because of its superior fixative property, low antigenicity and low toxicity. Glutaraldehyde is a bifunctional reagent. It forms both intra and inter molecular protein bonds which leads to superior fixation by cross linkage[3]. The molecular size of glutaraldehyde is larger than that of formaldehyde. Hence, it does not penetrate the apical foraman[2].Tsai and Tseng have reported long term (36 months) success of glutaraldehyde with clinical and radiographic success rates to be 98% and 79% respectively.

Ferric sulphate received attention as an alternative to formocresol because of its hemostatic property and favourable pulpal response. It is a non-aldehyde compound which forms a metal–protein complex at the pulp stump. This metal protein clot act as a barrier to irritating component of the base. Since ferric sulphate being a non–fixative agent does not play a direct role in the healing process. The base which is in direct contact with the pulpal surface plays a vital role in the healing process[5]. Zinc oxide is used as a base in most of the studies which may cause necrosis and inflammation of the underlying pulpal tissues[3]. Studies conducted by Fei and Fuks et al have shown the clinical success rate for FS to be 96% and radiographic success rate was 84%[5].

Calcium hydroxide was the first agent used in pulpotomy to induce regeneration of dentin. The high ph of calcium hydroxide facilitates the healing of pulp by initiating the inflammatory cascade[15]. But it is no longer used in pulpotomy procedure since it causeinternal resorption. Because internal resorption is an indication of chronic inflammation of residual pulp[3].

MTA (mineral trioxide aggregate) proves as a promising alternative to formocresol by its excellent biocompatibility, regenerative property and superior sealing property. The composition of MTA includes tricalcium silicate, tricalcium aluminate, tricalcium oxide, silicate oxide, Bismuth oxide. Grey MTA contains tetracalciumaluminoferrite, while it is absent in White MTA. MTA induces hard tissue formation by the release of cytokines and interleukin. MTA showed a higher clinical success rate than any other pulpotomy medicament. Despite of higher success rate, MTA has several disadvantages like tooth discoloration, cost and prolonged setting time[6].The presence of iron [tetracalciumaluminoferrite] in grey MTA causes tooth discolouration. Hence white MTA was introduced to reduce or eliminate the tooth discolouration.

To overcome the disadvantage of MTA, Bio **dentin (bioactive tricalcium silicate)** was developed which has dentin like mechanical properties. It has shorter setting time in contrast to MTA[7]. During the setting phase of biodentin, calcium hydroxide ions are released which increases P^H to 12 which inhibits the growth of microorganism and induces minerlization[14].

Harvinder et al recommend **MNP** (magnetic nanoparticles) as an effective pulpotomy medicament with hard tissue barrier formation. Properties of magnetism and nanostructured materials are used in biomedical engineering. Histological evaluation revealed a zone of odontoblastic proliferation and it could be considered as dentin bridge. Hence, MNPs possess a regenerative capacity in contrast to the devitalization technique[8].

Antioxidant mix has been a recent trend in pulpotomy. It works on the principle of wound healing. Antioxidant encounters free radicals which cause cell damage. It showed higher clinical and radiographic success rate but further studies are required to prove its efficiency in long-term follow[9].

Shift towards Nature: The treatment of medical conditions using plants or substances made from plants is called phytotherapy. Controversies regarding various pulpotomy medicaments led to a shift towards phytotherapy. Various plants with antimicrobial property were extensively studied.

Aloe vera (Aloe barbadensis) exhibits antibacterial and antioxidative property. Gupta et al evaluated the effect of Aloe vera gel as a pulpotomy medicament in deciduous molar and concluded that it can be used as pulpotomy agent[(10,13)].Kalra et al compared the efficacy of MTA and Aloevera gel and proved that MTA was superior compared to Aloe vera gel[10]. **Allium sativum** is commonly known as garlic contains allicin produced by enzyme allicinase which possess antibacterial activity. Mohammed et al compared the efficacy of Allium

sativum oil and formacresol and concluded that Allium sativum oil was superior compared to Formacresol[11,13].

Propolis has gained popularity in pulp therapy due to the presence of flavonoids, aromatic acids and esters which possesses antibacterial property. Propolis is a resinous mixture produced by honey bees[11].Rashmi et al proved that propolis can be used as a vehicle for calcium hydroxide[12].

Turmeric powder (Curcuma longa) possesses anti-inflammatory and anti-bacterial properties. Hugar et al used **turmeric gel** as pulpotomy medicament with good clinical and radiolographic success[13.]

Kumari et al studied the use of **honey** as a pulpotomy agent. Honey gained its popularity in folk medicine due to anti-bacterial and wound healing property. The acidity of honey and potential to release cytokines play a significant role in tissue repair and regeneration[13.]

Conclusion

In the recent past Pediatric dentistry has focused more towards regenerative procedures rather than devitalization. Hence regenerative materials like MTA and biodentin have appeared to be a suitable pulpotomy medicaments. Further studies should be undertaken to explore newer regenerative materials and to improve the efficacy of existing materials. In spite of being good alternative natural products have not emerged as promising pulpotomy medicaments. As shift towards nature occurs, newer medicaments will gain limelight in the recent future.

Shortcomings of Caries Vaccination

Madhumitha M.[1], Vijayakumar M.[2], Ponnudurai Aranganal[3], Jeevarathan J.[4], Amudha S.[5], Aarthi J.[5]

[1]Post Graduate Student, Department of Paedodontics, [2]Senior Lecturer, [3]Professor and Head of the Department, [4]Professor, [5]Reader, Sree Balaji Dental College, BIHER, Pallikarani, Chennai

Abstract

Background: Dental caries is an infectious microbiologic disease of the teeth and is one of the most common diseases in humans .It is a multifactorial disease caused by interaction between four principal factors-the host (saliva and teeth), the microflora, the substrate(diet) and the time. Targeting the microbial factor of the disease, researchers have been developing vaccination to protect the caries prone children and adults. Immunization includes active and passive immunization. Vaccines should be safe and effective. This article gives an insight into the shortcomings and challenges of caries vaccinations.

Keywords: *Caries vaccination, active immunization, passive immunization.*

Introduction

Dental caries is one of the most prevalent oral disease formed by the interaction of 4 factors namely: The host (saliva and teeth), the microflora, the substrate (diet) and the time. Among the various microorganism that are responsible for caries formation and progression, the main causative agent for initiation is Streptococcus mutans.[1,2]At present there are various caries prevention Method of which developing vaccination against S.mutanshas been of greater interest among researchers for past few decades.[3,4]

In late 1969, the modern era of vaccination began with intravenous immunization experiments conducted by William Bowen on animals.Earlier whole cell S.mutanswere found to be used for vaccination[2]. At present virulent factors of bacteria are used to induce immune response.[5]

Routes of Immunization Include Passive and Active Immunization[1,2,3].

Types	
Active	**Passive**
• Common Mucosal routes • Oral • Intranasal • Tonsillar • Systemic route • Subcutaneous route • Active gingivo salivary route Active immunity acquired by induction of salivary antibody production and memory formation	• Egg yolk Antibodies • Bovine Milk antibodies • Monoclonal Antibodies • Transgenic Plant Antibodies Passive immunity obtained by external supplementation of antibodies through the above mentioned types

Shortcomings of Caries Vaccine: All vaccines, even if properly manufactured and administered, seem to have risks. Active immunization has shortcomings due to reasons stated below. The most serious is that sera of some patients with rheumatic fever who show serological cross-reactivity between heart tissue antigens and certain antigens from haemolytic Streptococci[1,3]. Experiments from antisera from rabbits immunized with whole cells of S. mutans and with a high molecular weight protein antigen of S. mutans were reported to cross react with normal rabbit and human heart tissues. Polypeptides (62-67 KDA) immunologically cross-reactive with humanheart tissue and rabbit skeleton muscles myosin are found in the cell membrane of S. mutans and Streptococcusratti.[3,4] On the other hand, demonstrations showed thatrabbit antiserum to high molecular weight, Todd-Hewittbroth components reacted with monkey

cardiac musclewith S. mutans coated with medium components. Heartcross-reactive antibodies do not develop in rhesus monkeysor rabbits immunized with purified Ag I/II from S. mutans. It is possible that increased production of heart-reactive antibody in rabbits immunized with mutans streptococci results in injury of heart tissue as a consequence of binding of this low molecular weight Streptococcal polypeptide[2,4]. Because of the potential of Streptococcal whole cells toinduce heart reactive antibodies, the development of asub-unit vaccine for controlling dental caries has been the focus of intense research interest[4,5]. Glucosyltransferase was also tested for cross-reactivity with human heart tissue and the results were negative. Further research showed that the C-terminal part of Ag I/II contains an epitope, which is cross-reactive with human IgG. Although the clinical significance of this observation is unknown, it appears that this potentially harmful epitope should be excluded from acaries vaccine.[4,8] The human IgG cross-reactive region is alsopresent in other mutans streptococci such as Streptococcussobrinus as well as in non mutans streptococci. Also usage of animal has been a concern for animal welfare teams[10]. Bulk production of vaccination is not efficient and was costly[6,7,10,11].

Passive immunotherapy overcame many of the disadvantages of active immunization. Few other risks of this immunization are stated below. Transgenic plant antibodies due to its nicotine content may cross react and is harmful[8,11]. Also passive immunity is obtained only for a shorter period of time and hence places the need for repeated vaccination and these booster doses also needs patient compliance.

Conclusion

Active and passive immunization strategies, which target key elements in the molecular pathogenesis of mutans Streptococci, hold promise. Integrating these approaches into broad-based public health programs may yet forestall dental caries disease in many of the world's children, among whom those of high risk might derive the greatest benefit.

Along with established Method of caries prevention, caries vaccines have the potential of making a highly valuable contribution to disease control. In the meantime, basic research on the mode of action of caries vaccine and the search for new, economical, efficient bulk production. Procedure of Active and Passive Immunization to work against pathogenesis of S. Mutans in oral cavity holds promise. In order to make it feasible on human, more of clinical trials are required primarily on experimental animals[5]. The main aim of vaccine should be long term prevention from dental caries, as the disease is gradual developing process. The vaccine should be safe and effective. Caries vaccine if successful tested on humans could be a valuable immunomodulator as compared to other caries preventive measures[12].

Lasers and its Application in Periodontology: A Review

Preethi Padmanabhan

Reader, Department of Periodontitis, Sree Balaji Dental College and Hospital, BIHER, Chennai, Tamilnadu, India

Abstract

Dental Laser is available for several decades. Laser is a new technology widely used in medicine, kind to tissue and excellent in healing. Laser is an alternative to remove diseased soft tissue, target microorganism,as well as stimulated wound healing. In 1960, Maiman introduced "Light amplification by stimulated emission of radiation, Laser using Einstein's theories about stimulated emission. Since then, different laser such as diode, co2, Nd:YAG, Er:YAG,Cr:YSGG have been developed and within few years have been used in dentistry.

Keywords: *Laser, uses, application in dentistry, hazards in dentistry.*

Introduction

Laser is defined as:

L - Light

A - Amplification

S - Stimulated

E - Emission

R - Radiation

Historical Perspective:

1917 - Principle of stimulated emission by Albert Einstein.

"Zur Quantern Theorie der Strahlung"

1954 - Townes and Gordon- MASER.

1957 - Gordon Gould introduced the term LASER.

1960 - Theodore Maiman- First LASER- ruby – active medium.

1961 - Javan.- He-Ne laser.

1964 - Nd YAG- Geusic.

1965 - Co2 Laser- Patel.

1989 - Myers and Myers-FDA approval for use of laser in dentistry-Nd YAG laser.

1990 - Opthalmic application- ruby laser.

1995 - Dental use started.

Masers and Lasers: Nearly 40 years later, American Physicist Charles H. Townes Introduced frequencies, Microwave Amplification by stimulated Emission of Radiation(MASER) used for first time in 1951. In 1957 an American Physicist Gordan could gave the term LASER(Light Amplification Stimulated emission of Radiation) was invented. 1 In 1960, H Theodore Maiman was operated the first laser–a solid state of ruby laser.

In 1960, Sorokin and Steven-Solid state uranium laser.

In 1960, Ali Javan and William R Bennett and Donold Herriott/Constructed the first gas laser, using helium and neon.

In 1961, Neodymium laser by Jhonson and Nassau was demonstrated.

In 1962, parliamentarian N Hall incontestable the primary optical device diode device, made of Gallium arsenide.

In 1964, Geusic Marcos and Van incontestable metal doped Yttrium-metallic element mineral optical device.

In 1964 Patel demonstrated Co2 Carbon dioxide laser.

In 1964, Hughes Laboratories developed Argon laser.

Properties of Laser:

1. Monochromatic-Concentrate in narrow range of wave length (one specific colour).
2. Coherent-All emitted photons bear a constant phase relationship with each other in both time and phase.
3. Collimated-perfectly parallel beam of directional light.
4. Directional-A very tight beam which is very strong and concentrated.

Monochromatic-Monochromatic light has a very narrow range of frequency and single wave length (ie It is only made of light of one colour).

Coherent-All the emitted photons are in phase with each other and have identical peaks and valleys.

Collimated-Perfectly parallel beam of directional light.

Directional-A very tight beam which is very strong and concentrated.

Parts of Laser:

1. Active medium/Gain: Gas, Solid,liquid suspended in an optical cavity.
2. Power supply: External energy source-flash lamp/ electrical energy.
3. Optical resonator: Mirrors for amplification.
4. Cooling system, Control system, Delivery system.

Examples of laser:

GAS: Argon, Co2

SOLID: Diode

SOLID : NDYAG

SOLID: ERYAG

LIQUID : RED DYE

Articulated Arms:

- Consist of a series of rigid hollow tubes with mirrors at each joint (called a knuckle).
- Mirrors reflect the energy down the length of the tube.
- The laser energy exits the tube through a handpiece

Disadvantages:

1. Awkward 3-D maneuverability of the arm.
2. Mirrors at each knuckle must be aligned precisely.
   - A misalignment of the mirrors could cause a drop-off in the amount of energy transmitted to the handpiece.

Hollow Wave Guide: Semi rigid hollow tube with reflective interior mirror finish.

- Laser energy is reflected along this tube and exits through ahandpiece at the surgical end with the beam striking the tissue in a noncontact fashion.

This handpiece can be attached to an accessory tip of sapphire or hollow metal for contact with the surgical site.

- lenses within the laser instrument focus the beam

Optic Fiber: Smaller in diameter with sizes ranging from 200-1000 μm in diameter.

- Fits into a handpiece
- Used in contact or noncontact mode
- Focal point is at or near the tip, which has the greatest energy.

Laser Delivering System:

Delivery system type

Articulated arm	Hollow tubes, 45 degree mirrors
Hollow waveguide	Semi-rigid tube with internal reflective pathway
Optic fiber/rigid tip	Quartz-silica flexible fiber with quartz, sapphire tip
Hand held unit	Low power lasers.

Mechanism of Action: In 1960 Maimann was the first to introduced laser Device. Since then, in the field of medicine and surgery lasers are routinely used . The Laser light is a single Photon wavelength. The process laser wave formation occur of lasing others, when an excited atom is stimulated to emit photon. Spontaneous emission of photon. This stimulated emission generates a very coherent (synchronous Waves), Monochromatic (a single Wavelength)and collimated form (parallel rays of light)[3].

The Laser type of electromagenetic wave generator. By the lasers electromagnetic energy is converted to thermal energy .

It has 3 characterstic options (1) Monochromatic : that comprises waves of same frequency and energy.

Mode of Operation of Laser:

- Continuous wave
- Gated pulsed mode (Physical gating of beam)
- Free running pulsed mode (Property of the active medium.

LASER in pulsated mode-targeted tissue has time to cool before next pulse of laser energy is emitted. Continuous mode–clinician must cease the laser emission manually so that thermal relaxation of tissue may occur. Thin fragile soft tissue should be treated in pulsed mode to prevent irreversible thermal damage of tissues. Water spray and gentle air stream from high volume suction aids in Keeping the area cooler.

Continuous Mode: The laser wave emits energy in continuous mode at average power till they are cutoff using an external source like foot switch or presenting in the laser unit. This type of energy is useful in ablative procedures or coagulating[2].

Laser Operated Parameters:

1. Focused/Defocused
2. Contact/Decontact

Focused-Laser beam hits tissue at its focal point–Narrowest diameter

It is in cutting mode

De focussed-Beam moved away from the focal point. Wide area of tissue affected as beam diameter increases. It is in ablative mode

Contact - Tipis Kept from 0.5 to 1 mm away from tissue.

Laser energy delivered at the surface is reduced.

Biologic Rationale for Laser Use Laser-Tissue Reaction:

1. Reaction
2. Transmission
3. Scattering
4. Absorption

1. **Absorption:** Depends on tissue characteristics, such as pigmentation an water content, and on the laser wavelength and emission mode.
2. **Hemoglobin:** Is strongly absorbed by blue and green wavelengths (500-1000nm).

The pigment melanin which imparts the colour of the skin, is strongly absorbed by short wavelengths. (Diode and NDYAG).

3. **Transmission:** Water, for example, is relatively transparent to the shorter wavelengths like argon, diode, and Nd:YAG, whereas tissue fluids readily absorb the erbium family and CO2 at the outer surface, so there is little energy transmitted to adjacent tissues.
4. **Reflection:** A Caries-detecting laser device uses reflected light to measure the degree of sound tooth structure. This reflection can be dangerous because the energy is directed to unintentional target, such as the eyes; this is major safety concern for laser operation[2].
5. **Scattering:** Weakening the intended energy and possibly producing no useful biological effects. Causes heat transfer to the tissue adjacent to the surgical site and unwanted damage could occur. However a beam deflected in different directions is useful in facilitating curing composite resin or in covering a broad area.

Benefits of Laser–Tissue Interaction

Soft tissue :

Cut, coagulate, ablate or vaporize target tissue elements.

Sealing small blood vessels

Sealing of small lymphatic vessels.

Sterilising of tissue

Decreased post operative tissue shrinkage.

Laser Effects are Due to:

1. Photochemical
2. Photo thermal
3. Photoacuostic

4. Biostimulation
5. Photodynamic
6. Photovaporolysis
7. Photo plasmolysis

Photothermal effects

Tissue Temperature (Degree Celsius)	Observed effect
37-50	Hyperthermia
>60	Coagulation, protein denaturation
70-90	Welding
100-150	Vaporization
>200	Carbonization

1. **Photoacuostic:** The Photoacuostic effects is a conversion between light and aquostic wave due to absorption and localized thermal excitation. When rapid pulses of light are incident on a sample of matter,they can be absorbed and the resulting energy will be radiated as heat. This heat causes detectable sound waves due to pressure variation in the surrounding medium
2. **Photovaporolysis:** Ascendant heat levels-phase transfer from liquid to vapour
3. **Photoplasmolysis:** Tissue removed by formation of electrically charged ions and particles in semi-gaseous high energy state.
4. **Absorbtion by chromophores:**
5. Tissue response in term of change of covalent structure.
6. **Biostimulation:** Believed to work towards healing by stimulation factor and processes involved in healing. Below the surgical threshold level. Useful for pain relief, increased collegen growth and anti-inflammatory activity.

Classification:

Laser are named according to

1. Active medium
2. Wavelength
3. Delivery system
4. Emission modes
5. Tissue absorption
6. Clinical application

II. Based on safety:

A. Based on the potential of the primary beam laser or the reflected beam to cause biological damage to the eyes or skin.

B. Class I:

Class II: a, b

Class III: a, b

Class IV

Class I laser:

Do Not Pose a health hazard.

Beam is completely enclosed and does not exit the housing. Max power output: 1/10 th of milliwatt. Eg: CD player

Class II Lasers: Visible light with low power output. No hazard-blinking and aversion reaction. Max power output is 1 mW. Eg: bar code scanner, laser pointer

Two subdivisions:

IIa: dangerous->1000 sec.

IIb: ¼ th of second.

Class IIIa: Any wavelength. Max Output power: 0.1 to 0.5 W. Danger > ¼ th of a second.

- Caution label

Class IIIb: Hazard to eye-direct or reflected beam, irrespective of time of exposure.

- Safe with matted surface and no fire hazard.
- Max output power: 0.5 to 5W.

Class IV lasers: Hazardous for direct viewing and reflection.

- Max output power > 5 W.
- Fire and skin hazards.
- Use safety glasses

Dental lasers are Class IIIb or Class IV lasers.

Absorption Characteristics of Dental Lasers

Laser Wavelength Type Chromophore

Argon 488-515 nm Gas Hemoglobin, melanin

He Ne 632 nm Gas Melanin

Diode 810-980 nm Solid Melanin, hemoglobin.

Nd: YAG 1064 nm Solid Melanin, water

Ho: YAG 2120 nm Solid Water, HA.

Erbium family 2790-2940 nm Solid Water, HA.

Co2 9300, 9600, GAS WATER HA

10600 nm

Argon Laser

LASER characteristics

Wavelength 488 to 514 nm

Active medium Argon Gas

Delivery system Optical fiber

Mode of operation Continuous wave

Chromophore Melanin pigment, hemoglobin, hemosiderin.

Applications Soft tissue only.

Pocket debridement and deepithelialization

for GTR

"Laser Pocket thermolysis": Finkbeiner 1995-absorption by black pigmented bacteria-bacterial load reduction in the periodontal pocket.

Argon Laser:

- Acute inflammatory periodontal disease and highly vascularized lesions, such as a hemangioma, are ideally suited for treatment.
- The poor absorption into enamel and dentin is advantageous when using this laser for cutting and sculpting gingival tissues because there is minimal interaction and thus no damage to the tooth surface during those procedures.

Diode Laser:

LASER characteristics

Wavelength 810 to 980 nm

Active medium Semi-conductor diode

Delivery system Optical fiber-quartz or silica

Mode of operation Continuous wave, gated pulsed mode.

Used in focused and de-focused modes.

Chromophore Melanin, hemoglobin.

Applications Primarily soft tissue applications-all minor surgical procedures.

The chief advantage of the diode lasers is one of a smaller size, portable instrument.

NDYAG Laser:

Laser Characterstics:

Wavelength 1064

Activemedium Neodymnium in YAG crystal

Erbium Family of Lasers:

Er YAG-2940 nm: Zharikov et al 1975.

Er Cr YSGG-2780 nm: Zharikov et al 1984 and Moulton et al 1988.

1988: Phagdiwala: Er YAG laser: ability to ablate the dentinal hard tissue.

1989: Pulsed Erbium laser: Keller and Hibst-enamel,dentin and bone.

1995: Commercially available.

1997: introduced for use in dentistry.

Deliver system-Opticalfiber

Mode of operation-continuous wave, Pulsed wave.

Chromophore-Haemoglobin, melanin and water

Application–Effective for Hard and soft tissue-Haemostasis, treatment of apthous ulcer or pulpal analgesia . Causes more thermal damage Earliest FDA approved laser for dental use. Do not use for disinfection of implant surfaces-damage to sandblasted and acid etched surfaces (Kreisler et al 2002)

MOA of Er Laser–Photoablation

Layers formed–superficial significantly altered

Intermediate

Deeper/less affected

Superficial layer-Microcracking, disorganization,slight recrystallization of apatite, reduction of surrounding organic matrix.

Intermediate layer-micro-explosion due to energy accumulation Deep-no change

Co2 Laser:

Wavelength 9300, 9600, 10600 nm

Active medium carbon di oxide gas

Delivery system Articulated arm

Mode of operation Continuous wave, gated pulsated mode. Used

In focused and defocused modes.

Chromophore water Hydroxyapatite

Limitation: High risk of carbonization (Water absorbtion → generates more heat → Carbonizes tissue

Carbonized/charred layer act as biological dressing.

Lasers Advantages/Disadvantages

Advantages:

1. Haemostasis
2. Ablation
3. Detoxification
4. Bactericidal activity
5. Osseous tissue removal and contouring easy with Er family

Disadvantage:

1. Hard tissue damage
2. High cost
3. Risk of pulpal damage
4. Single wavelength can treat all disease

Laser Saftey:

Regulatory organization

CDRH Centerfor deviceand radiological health

ANSI ↗ American National Standards institute

OSHA ↗ Occupation saftey and health administration

Laser safety officer

Environment: Warning signs, restricted access, reflective surface is minimized

- Laser use documentation
- Training
- Eye and tissue protection

Application in Dentistry:

1. Biopsy
2. Apicoectemy
3. Teeth preparation
4. Epulisfissuratum
5. Residual ridge modification
6. Bleaching
7. Impaction
8. Pontic site preparation
9. Tori reduction
10. Soft tissue modification
11. Impacted teeth exposure-orthodontic movement
12. Caries removal
13. Root canal disinfection

Clinical Application in Periodontics:

1. Intialnon surgical pocket therapy
2. Frenectomy
3. Gingivectomy
4. Soft tissue grafting
5. De-Pigmentation
6. Desenstization
7. Removal of granuation tissue
8. Osseousrecontouring
9. Crown lengthening
10. Surgery-implants
11. Peri-Implantitis
12. Operculectomy

Advantages of Laser in Periodontics Over Conventional Method:

1. Effective haemostasis
2. No Suturing
3. Faster Healing
4. Minimal/no Postoperative complication
5. Laser sterilization of wound site
6. Laser Bandage

Application of Laser in Periodontal Treatment

Laser in Diagnosis:

1. Detection of caries : Caries detection with laser works on principle of differential Fluoresce between healthy and diseased tooth.
2. Detection of calculus :Wavelength of 655 nm can be used for calculus detection. Calculus Fluoresce (glow) differently than healthy tissue.

Laser in prevention: Laser tooth brush: Laser tooth brush is is designed to provide an antibacterial effect in oral cavity using an irradiating laser beam of 630 nm low output semiconductor laser.

Laser in non surgical pocket therapy: Laser Bacterial Reduction (LBR): It is a simple nonsurgical procedure to eliminate or, at least, reduce the number of viable bacteria in the gingival sulcus. In this procedure a diode laser is used with a thin fiberoptic fiber[6].

Calculus removal: If the calcified accretions on the root surface are not removed, the therapy is doomed to fail. Laser now are being used for this procedure.

Not only does the laser remove the calculus on the root surface, but it also alters the cementum surface in such a way that it makes it favorable for fibroblast attachment.

Photodynamic therapy: Photodynamic therapy or photochemotherapy uses a photoactive dye that isactivated by exposed to the light in the presence of oxygen with specific wavelength, forming free radical species that kill target microbes.

Laser in the treatment of hypersensitivity: Low-level laser therapy (LLLT) has shown in the hyperemiaand inflammation of the dental pulp by resulting antiinflammatory, analgesic and cellular effects. For the treatment of hypersensitivity, a 780nm diode laser can be used at a power of 30m W, or Nd: YAG laser at low power can be used[7].

Laser in surgical procedures: LNAP (laser new attachment procedure): the laser is used to remove the epithelial lining of the sulcus aswell as junctional epithelium.

Biopsy and excision of soft tissue pathologies[4]:

Soft tissue application: Gingival soft tissue procedures: Laser is generally accepted and widely used as a tool for soft tissue management. The major advantageous properties of a laser are relative ease of ablation of tissues together with effective hemostasis and bacterial killing. The most popular procedures such as Crown lenghthening, Gingivectomy, Gingivoplasty, and frenectomy which carried out using a laser. Compared with the use of a conventional scalpel, lasers can cut, ablate, easily reshaping of the oral soft tissue, less bleeding and a little pain with a few sutures. Laser surgery occasionally requires no local anesthetic or only topical anesthetics.

Esthetic gingival procedures: Laser can apply in esthetic procedures such as recontouring or reshaping of gingival crown lengthening. For the esthetic periodontal soft tissue management Er: YAG laser is very safe and useful. The precisely ablating soft tissues using the laser is capable to fine contact and wound healing is fast[7].

The major indication of laser is soft tissue surgery. The CO2, Nd: YAG, diode, Er: YAG lasers are generally accepted as useful tools for this type of surgery.1

Osseous surgery: The use of erbium lasers is becoming increasingly popular for bone surgery. Erbium lasers, in general, offer more precision and better access than mechanical instruments. They reduce the risk of collateral damage, particularly when compared with rotary instruments that may become entangled with soft tissue. Lasers also improve the comfort of both patients and surgeons by markedly reducing the noise and eliminating the grinding of the bone tissue.

Lasers in implant therapy: Use of laser in implant may have several advantages, including improved hemostasis, production of a fine cutting surface with less patient discomfort during the postoperative period, and favorable and rapid healing following abutment placement, thus permitting a faster rehabilitative phase because of the ability of the laser to produce effective bone tissue ablation.

Periodontal pocket treatment: One of the possible advantages of laser treatment of periodontal pockets is the debridement of the soft tissue wall. Gold and Vilaridi reported that Nd: YAG laser is safe for removal of the sulcular epithelium in periodontal pockets. It has an added advantage of protecting the underlying connective tissue by causing necrosis or carbonization[5] .

Conclusion

Laser treatment is expected to serve as a adjunct to conventional mechanical periodontal treatment. The use of laser should based on proven benefits of haemostasis, dry field, reduced surgical time and less post operative swelling. So laser is safe and efficient for periodontal bone surgery when used concomitantly with water irrigation. This is an exciting field with promising possibilities to be investigated and represents an area that might ultimately prove to be rich with utility in context of periodontics.

Oral Hygiene Practices among Psychiatric Outpatients in Chennai

Anita M.[1], Vidhya Rekha U[2], Sadhana K.[2]

[1]Reader, [2]Senior Lecturer, Dept. of Public Health Dentistry, Sree Balaji Dental College and Hospital, BIHER

Abstract

Aim: To assess the oral hygiene practices among psychiatric outpatients in Chennai.

Materials and Method: A cross–sectional descriptive study was carried out on patients receiving care at the Outpatient Wing of The Department of Psychiatry, Stanley Medical College and Hospital, Chennai. A cluster sampling technique was employed. The study sample consisted of 159 males and 145 females.

An operator administered, close ended questionnaire was used. Oral Hygiene Index Simplified index was recorded. Data was analyzed using SPSS (Version 15) software. Chi–square test, Trend Chi–square test and Multiple linear regression analysis were employed.

Results: The usage of tooth brush and tooth paste was highest in the < 19 yrs age group (100%) and least in the > 50 years age group. Among the male subjects; 9 (5.6%), 75(47.2%) and 75(47.2%) had good, fair and poor oral hygiene, respectively. Among the female subjects; 9(6.2%), 87(60%) and 49(33.8%) had good, fair and poor oral hygiene, respectively.

Conclusion: The oral hygiene status of psychiatric outpatients is very poor and warrants vast improvement.

Keywords: *Oral hygiene Practices, Psychiatric outpatients.*

Introduction

Illness, whether physical or mental may lead to deterioration in self care and have an adverse effect on the holistic wellbeing of the individual[1]. Among the unique population groups, people with psychiatric disorders deserve special attention. The term psychiatric illness is used to describe clinically recognizable patterns of psychological symptoms or behavior causing acute or chronic ill health, personal distress or distress to others[2].

Psychiatric illness is not a single condition nor do psychiatric patients form a homogenous group of the sick in the society. Rather, it is a continuum ranging from minor distress to severe disorder of the mind or behavior[3].

Studies have shown that oral hygiene in psychiatric patients is poor due to lack of knowledge about the cause of oral disease, relatively high frequency of non-compliance with oral health practices, embarrassment regarding neglected oral care, attitudes to and value of oral health, low perception of dental treatment needs, inability or unwillingness to accept treatment, high sugar content in diet and mistrust of dental health professionals[4]. Furthermore, psychotropic medications contribute to xerostomia which has a significant impact on oral health[5].

Borge Hede et al (1988)[6] conducted a study among 84 Danish psychiatric patients. One of five participants did not perform oral hygiene as a daily routine and 45% did not visit the dentist regularly. 40% of the subjects reported symptoms from teeth or gingiva within the previous year.

Routine dental health care for institutionalized psychiatric patients are provided within many of the large institutions, but only a small portion (2.35%) of psychiatric patients are users of mental health services[7]. A vast majority of adults with mental illness live in the community. These patients have increasingly been given responsibility for arranging their own dental care, usually with a general dental practitioner. This move towards independence means that patients need a greater understanding of the potential risks of dental disease[8].

About 2-5% of India's population suffers some form of mental or behavioural disorder. 10-15% of those attending general health facilities have a common mental disorder[9]. Among the states of India, Tamil Nadu has the maximum number of mental health institutions. Yet, the population is so vast and diverse that majority of mentally ill patients are still treated as community dwelling outpatients[10].

Chennai is the capital city of Tamil Nadu and has an estimated population of over 8.5 million (2009)[11]. In the light of the dental fraternity's constant endeavor to meet individual treatment needs in a comprehensive and effective manner, it is imperative that health professionals are aware of the impact of psychiatric illness and its treatment on oral health as people with psychiatric problems are entitled to the same standards of care as the rest of the population.

Hence, an attempt was made to determine the oral hygiene practices among psychiatric outpatients in Chennai.

Materials and Method

Study design: A cross–sectional descriptive study

Study area: Four government administrated facilities cater to the treatment needs of community dwelling psychiatric outpatients in Chennai. This study was conducted at Stanley Medical College and Hospitals, which is one of the four facilities.

Inclusion criteria:

- Subjects who had been diagnosed with psychiatric illness at least 5 years ago.
- The patient must be currently receiving treatment for the psychiatric illness.

Exclusion criteria:

- Those who are not stable to give informed consent.
- Those who are not willing to participate in the study.

Approval and informed consent: Ethical approval was obtained from the Institutional Review Boards of Stanley Medical College and Hospital and Saveetha University.

Informed consent was obtained from all the participants and minors were examined only after obtaining consent from their parents or guardian.

Sample size estimation: The sample size was calculated on the basis of the prevalence (P) of periodontal disease (98.1%) among psychiatric patients in Davangere[12]. The final sample size was 42 subjects .

Sampling methodology: A cluster sampling technique was employed. A list of Government administrated psychiatric outpatient facilities in Chennai was obtained from the Department of Health and Family welfare, Government of Tamil Nadu. One hospital was selected from the aforementioned list by simple random sampling using lottery method.

The study sample consisted of 159 males and 145 females. Among the study population; 87, 78, 75 and 64 subjects were diagnosed with schizophrenia, mood disorder, organic brain damage and other psychiatric illness respectively. All willing, eligible participants within the cluster were enrolled into the study, yielding a total sample of 304 individuals.

Survey instrument: An operator administered pre-tested questionnaire, specially designed for this purpose was used. Demographic information, information about diagnosis, duration of illness and current medications were obtained from hospital records. Information on personal habits, mode and materials used for cleaning teeth, frequency of cleaning teeth, frequency of changing tooth brush, occurrence of dental problem in the past one year and choice of treatment provider were obtained by interviewing the patient. Oral hygiene index-simplified index was recorded.

Clinical Examination: Dental examinations were conducted by a single examiner who had been trained through a series of clinical training sessions at the Department of Public Health Dentistry, Saveetha Dental College, Chennai. After recording the questionnaire, dental examinations were conducted in supine position under natural light by means of mouth mirror and a CPI probe. Instruments were sterilized using standard protocol. Only completely filled forms were considered for analysis. The intra examiner reliability was calculated using the data obtained by re-examination of first and eleventh subject of each day after scheduled number of subjects were examined for the day (K=0.81).

Results

The study sample consisted of 304 psychiatric out-patients. 159 (52.3%) of the respondents were males and 145 (47.7%) were females. The study subjects were
